Technical and Bibliographic Notes/Notes techniques et bibliographiques

The Institute has attempted to obtain the best original copy available for filming. Features of this copy which may be bibliographically unique, which may alter any of the images in the reproduction, or which may significantly change the usual method of filming, are checked below.

L'Institut a microfilmé le meilleur exemplaire qu'il lui a été possible de se procurer. Les détails de cet exemplaire qui sont peut-être uniques du point de vue bibliographique, qui peuvent modifier une image reproduite, ou qui peuvent exiger une modification dans la méthode normale de filmage sont indiqués ci-dessous.

The copy filmed here has been reproduced thanks to the generosity of:

Library Division
Provincial Archives of British Columbia

The images appearing here are the best quality possible considering the condition and legibility of the original copy and in keeping with the filming contract specifications.

Original copies in printed paper covers are filmed beginning with the front cover and ending on the last page with a printed or illustrated impression, or the back cover when appropriate. All other original copies are filmed beginning on the first page with a printed or illustrated impression, and ending on the last page with a printed or illustrated impression.

The last recorded frame on each microfiche shall contain the symbol → (meaning "CONTINUED"), or the symbol ∇ (meaning "END"), whichever applies.

Maps, plates, charts, etc., may be filmed at different reduction ratios. Those too large to be entirely included in one exposure are filmed beginning in the upper left hand corner, left to right and top to bottom, as many frames as required. The following diagrams illustrate the method:

L'exemplaire filmé fut reproduit grâce à la générosité de:

Library Division
Provincial Archives of British Columbia

Les images suivantes ont été reproduites avec le plus grand soin, compte tenu de la condition et de la netteté de l'exemplaire filmé, et en conformité avec les conditions du contrat de filmage.

Les exemplaires originaux dont la couverture en papier est imprimée sont filmés en commençant par le premier plat et en terminant soit par la dernière page qui comporte une empreinte d'impression ou d'illustration, soit par le second plat, selon le cas. Tous les autres exemplaires originaux sont filmés en commençant par la première page qui comporte une empreinte d'impression ou d'illustration et en terminant par la dernière page qui comporte une telle empreinte.

Un des symboles suivants apparaîtra sur la dernière image de chaque microfiche, selon le cas: le symbole → signifie "A SUIVRE", le symbole ∇ signifie "FIN".

Les cartes, planches, tableaux, etc., peuvent être filmés à des taux de réduction différents. Lorsque le document est trop grand pour être reproduit en un seul cliché, il est filmé à partir de l'angle supérieur gauche, de gauche à droite, et de haut en bas, en prenant le nombre d'images nécessaire. Les diagrammes suivants illustrent la méthode.

PREFACE

TO THE TWELFTH EDITION OF THE AMERICAN COAST PILOT.

NEARLY *forty years* have elapsed since the subscriber commenced this work. To it he has devoted the largest portion of his life, unwearied labor, and great expense; and the reception it has met with from that respectable class of society by whom it is used, may be inferred from the fact, that **ELEVEN EDITIONS**, comprising *thirty-seven thousand* copies, have been sold, previous to the publication of the present edition.

The difficulties of procuring all the improvements incident to a work of this character, not only intended to enable the mariner to recognize the coast at a distance, but to direct him into a port when pilots cannot be obtained, render it a work of great labor and responsibility. The life of the most experienced is more endangered when he approaches the coast, than when exposed to the tempests which agitate the mid-ocean. Pilots, who are not always to be found in the discharge of their duty, are often prevented by storms and violent winds from offering their services to vessels endeavoring to make a harbor. In such cases, unless the masters are acquainted with the port, the safety of the vessel depends upon the accuracy of the Sailing Directions. Charts are intended rather to give a general idea of the coast, than minute and accurate descriptions of particular harbors. It is, therefore, to their printed directions that they must resort, to procure information which at such moments is vitally important. Their instruments and charts, by which they have been enabled to shape their course through a trackless ocean, are rendered useless from their ignorance of the channel by which they are to enter the harbor; and mariners, who have escaped all former dangers of the voyage, are often shipwrecked upon some sunken rock or shoal, at the entrance of their destined port. The knowledge of such dangers, important as it is to seamen generally, is particularly so to those of the United States. Navigating waters filled with shifting sand-banks and bars, which are formed by the Gulf Stream, and by the mighty rivers which discharge themselves from the coast of the North American continent, they require no ordinary skill and knowledge to avoid those extensive and intricate shoals that line our shores. This coast is rendered still more dangerous by rapid tides and eddies peculiar to the American seas, and by a strong current running counter to the Gulf Stream, from the Banks of Newfoundland to Cape Florida. The boisterous and variable weather, so common in this climate, also tends to increase the difficulties and dangers of our coasting trade.

The Charts of the American Coast, of foreign publication, were drawn from information obtained previous to the revolution, from the imperfect sketches of such ports as the policy of the British government caused to be surveyed at the time it held us as colonies. These were few in number, and, since the publication of American charts, the English charts have fallen entirely into disuse. In general the mariners were left to acquire their knowledge from the shipwrecks of others. Those we now publish, are from authentic sources; and from the surveys of our own government, the observation of ship-masters, and our own exertions, we derive that information which is here published concerning the coast of the United States.

In preparing the *American Coast Pilot* for press, recourse has been had to every Nautical work of merit; and with the assurance that neither pains nor expense have been spared, it is presented to the world as perfect as the nature of the work will admit. Every source of marine intelligence which

our country affords has been successively restored to. Letters have been addressed to the Collectors and Pilots in the several ports of the United States, requesting nautical information, which they have given with commendable promptitude.

Surveys, in pursuance of various acts of Congress, have been made of Savannah River, Capes Fear, Hatteras, and Look-out; of the entrance of the Chesapeake, the river Darien, Isles of Shoals, Portsmouth, Boston, and Newport harbors; copies of which the author has been permitted to take, and which are inserted in this edition of the Pilot. These, however, are but part of the improvements. The Bahama Bank and the adjacent keys, which lie directly in the course of all vessels bound to New Orleans and Havana, and which have long been the dread of our West India mariners, were surveyed in 1820, at the expense of the subscriber. The next year, the sloop *Orbit*, a surveying vessel in his employ, was sent to examine the South Shoal of Nantucket, the extent and situation of which he had long suspected to be incorrectly described. It was then ascertained that this Shoal, which had been laid down in all the English charts, as extending to the south as far as lat. $40^{\circ} 42' N.$, in fact terminated in lat. $41^{\circ} 4' N.$ The importance of this discovery to the navigation of the United States, may be easily conceived. Heretofore, mariners bound from Europe, or from the eastern ports to New York, Philadelphia, or any of the southern ports, in their desire to avoid this dangerous shoal, kept so far to the south-east as often to run into the Gulf Stream, and were thereby retarded from 60 to 70 miles per day. By this survey, a clear and perfectly safe channel, twenty-two miles wide, is added to the space, supposed to be between the stream and the shoal, which will enable them to keep more to the north-west, and to take advantage of the south-west current on the inner edge of the Gulf. An average gain of twenty-four hours may be thus made in the home passage of most European traders.

The accuracy of this survey, which was at first disputed, has been fully proved by two different expeditions subsequently sent from Nantucket to ascertain the extent of the shoal.

The surveying sloop *Orbit* also accompanied a vessel sent by Capt. *Isaac Hull*, at the request of the subscriber, to examine St. George's Bank, and the result is published in this edition of the American Coast Pilot.

Since the publication of the eleventh edition, Messrs *E. & G. W. Blunt* have made a minute survey of Long Island Sound, and also completed their survey of New York Harbor. Great improvements have been made in the directions for the coasts of Newfoundland and Nova Scotia, for which the author is indebted to the surveys of Messrs. *Bullock, Lane* and *Lockwood*, under the direction of the British Admiralty. He has also availed himself of the labors of Baron *Rouissin*, who, since the publication of the last edition of the Pilot, surveyed the coast of Brazil, from St. Catharine to Maranhau, by order of the French Government, and of the continuation of that survey from St. Catharine's to the River La Plata, by *Lt. Barrel*. To the care and ability of Capt. *King*, of the British Navy, who has completed the survey of the Straits of Magellan, he is indebted for the directions of those straits in the following work.

To Capt. *Beaufort*, hydrographer to the British Admiralty; Capt. *R. Owen*, of the British Navy; Don *Martin F. de Navarrete*, hydrographer to the Spanish government; Lt. Col. *Abert*, of the U. S. topographical engineers; and to the officers in the British, French, Danish, and Dutch service, his thanks are particularly due for the new and valuable information which they have voluntarily furnished of the coasts that have fallen under their observation, and in a manner which indicate that, in their opinion, the

advancement of the science of Hydrography is the common interest of all nations.

Many improvements are made in this, which have increased its contents one-third over the last edition, by sailing directions for every harbor in the West Indies, Spanish Main, &c. &c., with a full description of the many Beacons, Buoys, and the new Lighthouses, which have been erected on the coast of the U. S.; together with the alterations that have been made in some of the Lighthouses, and a complete revision of the Latitudes and Longitudes, adapted to recent observations.

These are part of the improvements of the present edition; though some material corrections have been made, whenever the author was satisfied, by the testimony of mariners, or by surveys, that his former directions were inaccurate. Alterations have not, however, been made, unless upon stronger evidence than what prompted him to insert the original directions.

In presenting the *TWELFTH EDITION* of the American Coast Pilot to the public, the author does not flatter himself that it will prove entirely free from errors. The shifting nature of certain parts of the coast, may occasionally present deviations from the present directions. Imperfection too is the lot of man, and in attempting to give directions for the navigation of a coast 6000 miles in length, and which was discovered long after the European coast had been fully explored, he is sensible that he has undertaken a duty, the performance of which belonged **RATHER TO THE GOVERNMENT THAN TO AN INDIVIDUAL**. Of such a momentous task, it is matter of astonishment that so much has been done, and not that so much remains to be performed. During the many years devoted to its execution, his zeal has not been excited, nor his industry quickened by the consciousness that he was engaged in a brilliant undertaking, which would attract the attention of mankind; neither was there opportunity or place in a work addressed to a class using a peculiar dialect, and who required only perspicuity and accuracy, for the beauties of style and language. His pecuniary reward has hitherto been nothing, the profits of the work having been wholly absorbed in the expense of improvements.

It is, however, no small satisfaction to reflect, that the average rate of insurance, since the first publication of the Pilot, has been diminished more than one-half upon coasting vessels, and four-fifths upon vessels bound to New Orleans, and that, among other causes, the improvements in hydrography must have contributed to effect this great reduction. Still more satisfactory is the consciousness derived from many public and private acknowledgments that, in no small number of instances, by following his directions, both vessels and crews have been saved from the rage of a merciless element, when the pilots were unable to come to their assistance.

This conviction of the utility of his labors has encouraged him to continue them even when the embarrassments of our commerce had extinguished all expectation of any adequate recompense. For the greater part of his life he has devoted himself to the improvement of American hydrography; and with a constitution broken by exposure and fatigue, and a fortune literally "cast upon the waters," he now retires from the superintendance of a work which his increasing infirmities will not permit him any longer to continue, with an expression of gratitude to that class of our citizens

"Whose march is on the mountain wave,"

for the encouragement given him in their uniform preference of his publications, and parts from them with a wish, that the *American Coast Pilot* may long prove a safe and unerring guide in their journeys through the trackless ocean.

JULY, 1833.

EDMUND M. BLUNT.

PREFACE
TO THE
FOURTEENTH EDITION.

IN preparing this edition for the press, every care has been taken, many additions have been made, and such errors as existed in the thirteenth edition, and have been discovered, have been corrected.

The editors feel indebted for many communications to this work; more especially to Capt. **BEAUFORT**, hydrographer to the Admiralty, for the continuation of his valuable favors; to Lieut. **BEECHER**, R. N., and to the invaluable work, the English Nautical Magazine, he edits; to Commanders **OWEN** and **BARNETT**, R. N., for their surveys of the West Indies and Great Bahama Bank; to Lieut. Com. **POWELL**, and Lieut. **Jos. F. BORDEN**, U. S. N., for their information of the Coast of West Florida; and to Capts. **GREEN WALDEN** and **JOSIAH STURGIS**, of the U. S. Revenue Service, for their description of part of the Coast and Harbors of the State of Maine. **WILLIAM C. REDFIELD**, Esq., of this city, has contributed the articles on Storms and Currents.

The Tables of Longitudes and Latitudes have undergone an entire revision, and have been adapted to those observers who have been deemed most worthy of credit, viz:

The Gulf of St. Lawrence and adjacent coasts, from the observation of Capt. **R. N. BAYFIELD**, R. N., and other British officers. Those of our own coasts from different authorities; but more especially on our southwestern coast to Capt. **A. TALCOTT**, who determined the longitude and latitude of the Balize, and the other mouths of the Mississippi, after many observations; Major **J. D. GRAHAM**, U. S. T. E., who determined the longitude and latitude of the Sabine; and Capt. **CAMPBELL GRAHAM**, U. S. E., for points on the coast of East Florida.

The longitudes and latitudes of the West Indies have been taken from the chronometric surveys of Com. **R. OWEN** and **E. BARNETT**, as far as finished; and in the absence of their observations, the French and Spanish authorities have been consulted.

The longitudes and latitudes of the coast of South America, from **Maranham** to **Rio Janeiro**, from the observations of **Baron ROUISSIN**. The English determination of **Rio Janeiro** has been preferred; from thence to the **River La Plata**, the French; and from the **River La Plata** to **Cape Horn**, the observations of Capts. **KING** and **FITZROY**, of the R. N., are adopted.

Much yet remains to be done to make this work as perfect as the editors desire. This is only to be attained by continued industry, by collecting and carefully collating the various descriptions of places, sailing directions, surveys of harbors, coasts, &c. The important survey of the coasts of the United States, now in progress, under charge of **Professor HASSLER**, aided by a corps of scientific assistants, will, at a future day, afford materials for further corrections and improvements. To this survey of the American Coast, and to the surveys of the English and French hydrographers, of the coasts, harbors, &c. embraced in this work, to communications and sailing directions from intelligent ship-masters, and to an extensive correspondence, the attention of the editors is constantly directed.

JANUARY 1, 1842.

E. & G. W. BLUNT.

P R E F A C E

TO THE

SIXTEENTH EDITION.

THE editor renews his thanks to those mentioned in the preface to the Fourteenth Edition, and who have continued their communications.

Since the publication of the Fourteenth Edition, Professor HASSLER, who originated the U. S. Coast Survey, has died, and Professor A. D. BACHE has taken charge of the work; and it has progressed with great activity. The editor is under many obligations to him for permission to use the information in the Coast Survey Office; and also the directions of Lieuts. Com'g. BLAKE, BACHE and DAVIS, U. S. N., Assistants U. S. Coast Survey, embodied in this work. To Lt. M. F. MAURY, U. S. N., who has charge of the Observatory and Hydrographic Bureau, he is also indebted. To Lt. CHARLES H. MORRIS, U. S. N., whose early death before Tobasco destroyed the promise of an useful life, the editor is under obligations.

Captains W. F. W. OWEN and R. BARNETT, of the Royal Navy, have favored the editor with their communications, not being influenced by the misrepresentation of their acts and motives charged by a portion of the American Press, who could not see, in their earnest labor for information and in the cause of humanity any thing but the proceedings of spies, sent "to spy out the nakedness of the land."

Many alterations and additions have been made in this edition; and it is a matter of congratulation, that the getting and printing of accurate nautical information has become a subject of general national importance. Heretofore, in our own country, up to 1834, there had been no surveys of any part of our sea-coast north of the Chesapeake, and very little south of it, excepting those made at the expense of E. M. Blunt, or by and at that of E. & G. W. Blunt; but a better day has dawned, and the progress of the U. S. Coast Survey, under its energetic head, and those general surveys on our continent, by order of the British Admiralty, at the suggestion of their distinguished hydrographer, Admiral F. BEAUFORT, leaves the task for the future comparatively easy.

The name of the subscriber only is used, as Edmund Blunt has been for the last sixteen years engaged as one of the first Assistants on the U. S. Coast Survey. His duties upon that work have thrown the responsibility upon

G. W. BLUNT.

ST. PAUL'S.....On the northern extremity of the Island of St. Paul's entrance to the Gulf of St. Lawrence.....	68
ST. PAUL'S.....On the southern extremity of the Island of St. Paul's.....	68
S. W. POINT.....Island of Anticosti.....	69, 77, 79'
HEATH POINT.....On the western extremity of the Island of Anticosti.....	78
POINT ESCUMINAC....On the south side of the entrance of Miramachi Bay, Gulf of St. Lawrence.....	88
PICTOU.....On the south side of the entrance of Pictou Harbor, Gulf of St. Lawrence.....	90
GUT OF CANSO.....West side of the north entrance to the Gut of Canso.....	92
SYDNEY.....On a low point which you leave on your larboard hand going in, at the entrance of the Harbor of Sydney, Cape Breton Island.....	97
SCATARA.....On the N. E. point of Scatara Island, Cape Breton Island.....	98
CRANBERRY ISLAND...On Cranberry Island, off the eastern coast of Nova Scotia, near Cape Canso.....	99
OUTER BEAVER.....On Beaver Island, on the S. E. side of the Coast of Nova Scotia.....	102
BRIER'S ISLAND.....On the western part of Briar's Island, at the entrance of Ship Harbor, Nova Scotia.....	103
SAMBRO.....On Sambro Island, on the S. W. side of the entrance to Halifax Harbor.....	105
MAUGER'S BEACH....Halifax Harbor.....	105
CROSS ISLAND.....On Cross Island, at the entrance of Lunenburg Harbor, Nova Scotia.....	111
COFFIN'S ISLAND....On Coffin's Island, at the entrance of Liverpool Bay, Nova Scotia.....	113
LOUISBOURGH.....On the East Head, at the entrance of Louisbourg Harbor, S. E. side of Cape Breton Island.....	98
SHELburne.....On the S. E. point of McNutt's Island, at the entrance of Shelburne Harbor, Nova Scotia.....	115
SEAL ISLAND.....Off the southern coast of Nova Scotia, near Cape Sable.....	120
BRVER'S ISLAND....On the western side of St. Mary's Bay, at the entrance to the Bay of Fundy.....	123
POINT PRIM.....At the entrance of Annapolis Gut, western coast of Nova Scotia.....	124
BLACK ROCK POINT...On the western coast of Nova Scotia, near the Basin of Mines.....	124
CAPE ENRAGE.....On the northern shore of Chignecto Bay, Nova Scotia.....	125
CAPE CAPSTAN.....To mark the entrance of Apple River, Nova Scotia.....	125
QUACO.....On a small rock off Quaco Head, north coast of the Bay of Fundy.....	125
PARTRIDGE ISLAND...On Partridge Island, two miles to the south of St. John's Harbor, New Brunswick.....	126
CAPE FOURCHU.....At the entrance of Yarmouth Harbor, on the western side of the coast of Nova Scotia.....	122
GANNET ROCK.....At the entrance of the Bay of Fundy, S. S. E. 6½ miles from the S. W. head of Grand Manan.....	129
SEAL ISLANDS.....Off Machias Bay at the entrance of the Bay of Fundy, W. by S. ½ S. from Grand Manan.....	129
CAMPO BELLO.....On the north-east point of the Island of Campo Bello.....	134
PORTLAND.....Portland Head, off Portland Harbor, south side.....	151
SEGUIN.....On the Island of Seguin, off the mouth of Kennebec River.....	147
WHITEHEAD.....On Whitehead Island, S. W. of W. entrance to Penobscot Bay..	143
FRANKLIN ISLAND...On the north end of Franklin Island, W. of entrance to St George's River.....	145
WOOD ISLAND.....On Wood Island, near the entrance to Saco Harbor.....	155
WEST QUODDY HEAD..On West Quoddy Head, near Eastport, S. side of entrance to W. Quoddy Bay.....	134
PETIT MANAN.....On the South end of Petit Manan Island.....	137, 138
POND ISLAND.....West side to the entrance of Kennebeck River.....	149
BURNT ISLAND.....On Burnt Island, West side of Townsend Harbor, Maine.....	149
LIBBY ISLAND.....On Libby's Island, entrance of Machias Bay.....	136
MONHEGAN ISLAND..On Monhegan Island, Lincoln county, Maine.....	145
OWL'S HEAD.....Off Thomaston Harbor, Maine, on the west side of the west entrance of Penobscot Bay.....	141
MOOSE PEAK ISLANDS, On Mistake Island, S. W. of W. entrance to the Bay of Fundy..	136
MATINICUS ROCK....On Martinicus Rock, off Penobscot Bay.....	140
PENMEQUID POINT....On Penmequid Point, S.W. of the entrance to Bristol Bay, and E. side of entrance to John's Bay.....	145
BAKER'S ISLAND.....On Baker's Island, off Mount Desert, and S. of entrance to Frenchman's Bay.....	138

WINDS.

WIND is a sensible current or movement of the atmosphere over the earth's surface. *Wind.* The winds are divided into Perennial, Periodical, and Variable. They are also divided into General and Particular. Perennial, or Constant Winds, are those which always blow the same way; such is that easterly wind, between the tropics, commonly called the Trade Wind. Periodical Winds, are those which constantly return at certain times: such are land and sea breezes, blowing alternately from land to sea, and from sea to land. Variable, or Erratic Winds, are such as blow now this way, now that, and are now up, now hushed, without regularity either as to time or place: such are the winds prevalent to the northward of 30° N. latitude.

PERENNIAL, or TRADE WIND.—Over extensive tracts of ocean, in the lower latitudes, or toward the equator, Perennial or Trade Winds are found to prevail, which follow the course of the sun: thus, on the Atlantic Ocean, at about 100 leagues from the African shore, between the latitudes of 10 and 26 degrees, a constant breeze prevails from the north-eastward. Upon approaching the American side, this N. E. wind becomes more easterly, or seldom blows more than one point of the compass from the east, either to the northward or southward.

The Perennial, or Trade Wind, on the American side of the Atlantic, extends, at times, to 30 degrees of latitude, which is about 4 degrees farther to the northward than on the African side. Likewise on the south of the equator, the Perennial Wind, which is here from the S. E., extends 3 or 4 degrees farther towards the coast of Brazil than on the opposite side of the ocean. The general cause of this wind is the motion of the earth, in its diurnal rotation, connected with its orbital movements.

HEAT increases evaporation, and renders the atmosphere capable of supporting a greater quantity of moisture than it would do in a cooler state: were the atmosphere of one continued warmth, and its motion uniform, there would be no rain; for it would not imbibe more moisture in exhalation than it could support. Heat often produces diversity in winds and weather, for near the land, when the sun has great influence, it occasions land and sea breezes near the shore; and, in particular situations, heavy gusts and squalls of wind.* *Heat.*

Small islands, lying at a great distance from the main land, operate very little upon the Trade Wind. If elevated, these islands are more subject to rain than if low: this may be occasioned, principally, by the ascent given to the wind, or atmosphere, in rising over the tops of the hills; when, being cooled, it condenses into small drizzly rain. This is an effect peculiar to all mountains, even in the middle of continen s, when the atmosphere is sufficiently charged with moisture. For the sun's rays, by heating the atmosphere, according to its density, renders it much warmer at the bottom than at the top of hills. Upon a mountain sloping from the sea towards the top, and about 700 yards in height, a pleasant breeze has been observed in shore, and fine clear weather; the air in ascending, (being condensed by cold,) at about half way up, had the appearance of fog, or thin light flying clouds; but at the top was a misting rain; and this may frequently be seen in any mountainous country.†

The clouds, in the higher regions of the air, are frequently seen to move in a direction contrary to the wind below. The N. E. Trade Wind has frequently a south-westerly wind above it; and a S. E. wind often prevails beneath one whose direction is N. W. It is found that, just within the limits of the Trade Wind, the wind generally blows from the opposite quarter. The counter current of air, above, is often seen in a fresh Trade Wind.

* The causes of tornadoes, hurricanes, and squalls, have been thus assigned by Dr. Hare, of Philadelphia: The air being a perfectly elastic fluid, its density is dependant on pressure, as well as on heat, and it does not follow that air, which may be heated in consequence of its proximity to the earth, will give place to colder air from above. The pressure of the atmosphere varying with the elevation, one stratum of air may be as much rarer by the diminution of pressure consequent to its altitude, as denser by the cold consequent to its remoteness from the earth, and another may be as much denser by the increased pressure arising from its proximity to the earth, as rarer by being warmer. Hence, when unequally heated, different strata of the atmosphere do not always disturb each other. Yet, after a time, the rarefaction in the lower stratum, by greater heat, may so far exceed that in the upper stratum, attendant on an inferior degree of pressure, that this stratum may preponderate and begin to descend. Whenever such a movement commences, it must proceed with increasing velocity; for the pressure on the upper stratum, and of course, its density and weight, increases as it falls; whilst, on the contrary, the density and weight of the lower must lessen it as it rises, and hence the change is, at times, so much accelerated as to occasion the furious and suddenly varying currents of air which attend tornadoes, hurricanes, and squalls.—SILLIMAN'S JOURNAL, No. 12.

† Oriental Navigator, or East India Directory.

There are several heights of clouds on the coast of North America; the highest and those which appear of the finest texture, (if I may be allowed the expression,) float highest in the atmosphere. Clouds of this description always come from the westward; just before the appearance of an easterly storm, they gather in the S. W. and S. S. W., and if a glim (as the sailors call it) in the N. E. and N. N. E., their appearance in the sky indicates a N. E. storm of snow or rain. All great storms which are met with above the latitude of 30°, whether snow or rain, begin to the westward and advance gradually to the eastward, along the coast of North America, in conformity with the general atmospheric current of the region. When a S. W. wind, in the upper regions of the atmosphere, is attended with a N. E. or opposite wind below, the latter is commonly accompanied with low flying clouds, which drive before the wind, while the higher clouds go in a contrary direction.

Ship-masters and pilots, on leaving the coast, outward bound, may notice that so long as these higher clouds do not gather and thicken in the W., or S. W., so long a heavy or long storm of snow or rain will not occur. Any rain or foul weather, that proceeds from winds which rise from the eastward, and drive before the wind to the westward, without a fall of the barometer, is not attended with violent wind.

The space from latitude 25° to 28°, or 29° between the Variable and Trade Winds, is remarkable for a continual change of winds, with sudden gusts and calms, rain, thunder and lightning. This space has been called the Horse Latitudes, because it has often been found necessary here to throw overboard the horses which were to be transported to the West Indies, &c. To the northward of these latitudes, upon the American coast, and more than one-third over the Atlantic, westerly winds prevail nearly nine months in the year.

In the latitude above the Trade Winds, the wind from the W. S. westward being replete with moisture, from the great exhalation between the tropics, as it approaches the cold and higher latitudes, becomes condensed into showers of hail, rain, or snow.

There is often an interval of calm between the Trade Winds and the opposite winds in high latitudes. This is not, however, always the case; for, if the Trade Wind in its borders be much to the eastward, it frequently changes gradually round without an interval of calm. There is generally also a calm in a certain space between the two prevailing winds blowing in opposite directions, as between the Trade Wind and the westerly wind on the African coast. In the limits of the Trade Wind, a dead calm is generally the prelude to a storm, and it ought always to be considered as a prognostic thereof, though a storm often appears without this warning.

When the sun is at its greatest declination, north of the equator, the S. E. wind, particularly between Brazil and Africa, varying towards the course of the sun, changes a quarter or half a point more to the southward, and the N. E. Trade Wind veers more to the eastward. The contrary happens when the sun is near the southern tropic; for then the S. E. wind, south of the line, gets more to the east, and the N. E. wind, on the Atlantic, veers more to the north.

On the African side of the S. Atlantic, the winds are nearest to the south, and on the American side nearest the east. In these seas, Doct. Halley observed, that when the wind was eastward, the weather was gloomy, dark, and rainy, with hard gales of wind; but when the wind veered to the southward, the weather generally becomes serene, with gentle breezes next to a calm.

The EQUATORIAL LIMITS of the N. E. or Perennial Trade Wind, between the meridians of 18 and 20 degrees west, have been found, upon the comparison of nearly 400 journals, English and French, to vary considerable even in the same months of the year. We have shown, by the annexed table, where the N. E. Trade, according to the probable mean, may be expected to cease in the different months: and it will be found to answer the purpose with sufficient precision.

In this table the columns of extremes show the uncertain termination of the Trade Winds, as experienced in different ships. The annexed columns show the probable mean; and the last column exhibits the mean breadth of the interval between the N. E. and S. E. winds.

Thus the table shows, that, in the month of January, the N. E. Trade has been found sometimes to cease in the parallel of 10°, and sometimes in that of 3° N. That the probable mean of its limit is about 5° N.; that the S. E. Trade, at the same time, has been found to cease sometimes at only half a degree north of the line, and sometimes at 4 degrees; that the probable mean of its limit is, therefore, two degrees and a quarter; and that the interval between the assumed means of the N. E. and S. E. Trade Winds is equal to 2½ degrees: and so of the rest.

In the space of variable winds between the trades, exhibited in the last column, it has been found that southerly winds prevail more than any other; more particularly when the sun has great northern declination. Homeward bound East India ships are therefore enabled, at this season, to cross the space more quickly than those outward bound; which they do, in some degree, at all other times. Yet calms and variable winds are experienced in every month in the year within this space; but the former, which are more generally in the vicinity of the N. E. Trade, seldom continue long. These calms are frequently succeeded by sudden squalls, against which every precaution should be taken, as many ships have lost their topmasts, and have been otherwise damaged by them. Whirlwinds have sometimes accompanied these squalls.

On the eastern coast of North America, and among its islands, the course of the general easterly or trade wind is uninterrupted, though subject to some modifications in direction and force. At a short distance from the land the sea breeze calms at night, and is replaced by the land breeze. This variation happens every day, unless a strong wind prevails from the northward or southward; the first of these being experienced from October to May, and the second in July, August and September.

To the southward of Newfoundland, shifts of wind are very common, and it frequently happens that, after blowing a gale upon one point of the compass, the wind suddenly shifts to the opposite point, and blows equally strong. It has been known that while one vessel has been lying to, in a heavy gale of wind, another, not more than 30 leagues distant, has, at the very same time, been in another gale equally heavy, and lying to, with the wind in quite an opposite direction. This fact shows the whirlwind character of these gales, the opposite winds being on opposite sides of the circuit of the gale.

In the year 1782, at the time the Ville de Paris, Centaur, Ramillies, and several other ships of war, either foundered, or were rendered unserviceable, on or near the banks, together with a whole fleet of West Indianmen, excepting five or six, they were all lying to with a hurricane from E. S. E., the wind shifted in an instant to N. W., and blew equally heavy, and every ship lying to, under a square course, foundered.

This disaster was owing to their being hove to on the wrong tack. We insert the following, as it has met the approval of some of our most experienced ship-masters:

"Heaving To."—The recent disasters which have occurred to American ships, such as the *Dorchester*, *Medora*, *Ambassador*, and many others, have caused some inquiry, and it has been suggested by experienced men, borne out by the facts, that the disasters may be traced to the "heaving of ships to" on the wrong tack; that is, that vessels bound to the westward from Europe, instead of "heaving to" with their larboard tacks on board, in a southwesterly gale, as is too often the case, should "heave to" on the starboard tack.

Heaving to.

It is well known that our heavy westerly gales, in the winter season, often begin at the south or southwest, and as they increase in intensity, haul round gradually, but oftentimes suddenly, in a squall, to the northwest. Take, then, the case of a ship bound to the westward, the wind commencing at the south or southwest, the ship on the larboard tack; the master, anxious to get to the westward, carries his canvas as long as possible, and continues on that tack until he has his ship under a close reefed main-top-sail, mizen staysail or trysail—in fact, "hove to" on the larboard tack, the sea making heavy from the southwest, the wind keeps hauling to the westward, and the ship falls off with it until she lays in the trough of the sea—the sea then having the control over, and breaking with its full force on the broadside, there is no canvas at this time set that she can ware under.

with safety—the ship is then disabled, and sometimes founders—the fact is, over anxiety to get to the westward has kept the ship too long upon this tack.

Now, what is the best course, as a general rule, to be adopted? We think that the rule should be laid down, that when it is blowing so hard as to make it necessary to furl the foresail, or head sails, previous to doing so, the ship should be wore round, and “hove to” on the starboard tack; and as the wind hauls, she comes up heading the sea more and more, until it is on the bow, and of course in the best position to avoid its shock.

Again, often the wind shifts so suddenly in a S. W. gale, that a ship is taken aback by being on the larboard tack, which is fearful at any time, and particularly so at such a time. Those who have experienced it on a winter’s passage from Europe, with a crew worked down with hard weather, and on a dark night, can only imagine what a scene it is.

This cannot occur on being “hove to” on the starboard tack.

The winds within the gulf are not so liable to sudden shifts as on the outside, or to the eastward of, Breton Island. The weather to the southward of Magdalen Islands, between them and Prince Edward Island, is generally much clearer than on the north.

On the Winds, as influencing the tracks sailed by Bermuda Vessels; and on the advantage which may be derived from Sailing on Curved Courses when meeting with progressive Revolving Winds.

In high latitudes the prevailing atmospheric currents, when undisturbed, are westerly, particularly in the winter season. As storms and gales revolve by a fixed law, and we are able by observation to distinguish revolving gales from steady-blowing winds, voyagers may be shortened by taking advantage of them.

The indications of a Progressive Revolving Gale, are, a descending barometer with a regularly veering wind, or with the wind changing suddenly to the opposite point.

In the Northern Hemisphere Storms revolve from right to left.

In the Southern Hemisphere Storms revolve from left to right.

The indications of a steady-blowing wind which will not revolve, but blow in a straight-line direction, is a high barometer remaining stationary. When the steady wind blows from either pole, according to the side of the equator, the atmosphere will be both dry and cool. An increase of warmth and atmospheric moisture, are indications of the approach of a Progressive Revolving Wind.

Sailing from Bermuda to New-York.—The first half of a revolving gale, is a fair wind from Bermuda to New-York, because in it the wind blows from the east; but the last half is a west wind from New-York to Bermuda. During the winter season, most of the gales which pass along the coast of North America are Revolving Gales. Vessels from Bermuda bound to New-York, should put to sea when the north west wind which is the conclusion of a passing gale is becoming moderate, and the barometer is rising to its usual level. The probability is, more particularly in the winter season, that, after a short calm, the next succeeding wind will be easterly, the first part of a fresh Revolving Wind coming up from the south-west quarter.

A ship at Bermuda bound to New-York or the Chesapeake, might sail whilst the wind is still west, and blowing hard, provided the barometer indicate, that this west wind is owing to a Revolving Gale which will veer to the northward. But as the usual track which gales follow in this hemisphere is northerly or north-easterly, such a ship should be steered to the southward. As the wind at west, veers towards north-west and north, the vessel would come up, and at last make a course to the westward, ready to take advantage of the east wind, at the setting in of the next revolving gale.

Sailing from New York to Bermuda.—A vessel at New York and bound to Bermuda, at the time when a Revolving Wind is passing along the North American coast, should not wait in port for the westerly wind, but sail as soon as the first portion of the gale has passed by, and the N. E. wind is veering towards north, provided it should not blow too hard. For the north wind will veer to the westward, and become every hour fairer for the voyage to Bermuda.

Sailing between Halifax and Bermuda.—A great number of gales pass along the coast of North America, following nearly similar tracks, and in the winter season make the voyages between Bermuda and Halifax very boisterous. These gales by revolving as extended whirlwinds, give a northerly wind along the shore of the American Continent, and a southerly wind on the Whirlwind’s opposite side far out in the Atlantic. In sailing from Halifax to Bermuda, it is desirable for this reason to keep to the westward, as affording a better chance of having a wind blowing at north, instead of one at south; as well as because the current of the Gulf Stream sets vessels to the eastward.

From Barbadoes to Bermuda.—When vessels coming from Barbadoes or its neighboring West India Islands, sail to Bermuda on a direct course, they sometimes fall to the eastward of it, and find it very difficult to make Bermuda when westerly winds prevail. They should therefore take advantage of the trade wind, to make the 68° or 70° of west longitude, before they leave the 25° of latitude.

Sailing from England to Bermuda.—On a ship leaving England for Bermuda, instead of steering a direct course for the destined port, or following the usual practice of seeking for the trade winds, it may be found a better course, on the setting in of an easterly wind to steer west, and if the wind should veer by the south towards the west, to continue on the port tack, until by changing, the ship could lie its course. If the wind should continue to veer to north, and as it sometimes does even to the eastward of north, a ship upon the starboard tack, might be allowed to come up with her head to the westward of her direct course. On both tacks she would have sailed on curved lines, the object of which would be, to carry her to the westward against the prevailing wind and currents. There is reason for believing that many of the Revolving Winds of the winter season, originate within the tropics: and that ships seeking for the steady trade winds, even further south than the tropic at that period of the year will frequently be disappointed. How near to the Equator the revolving winds originate, in the winter season, is an important point not yet sufficiently observed. The quickest voyage from England to Bermuda, therefore, may perhaps be made, by sailing on a course composed of many curved lines, which cannot be previously laid down, but which must be determined by the winds met with on the voyage. This principle of taking advantage of the changes of Revolving Winds, by sailing on curved lines, is applicable to high latitudes in both hemispheres, when ships are sailing westerly.

GOVERNMENT HOUSE, BERMDA,
21st March, 1846.

W. R.

The above, by C. Reid, then Governor of Bermuda, exhibits the general character of the winds in both hemispheres, in high latitudes.

"The general easterly wind of the tropical regions is felt on the coast of Guyana, and on the coasts of the Caribbean and Mexican Seas, but with variations which may be denominated diurnal and annual. The diurnal period is that which the sea breeze ceases, and which strikes the coast usually at an angle of two points, less or more, according to the locality and other circumstances; and then the land wind, which, coming from the interior, blows across offshore. The sea breeze comes on at about nine or ten in the forenoon, and continues while the sun is above the horizon, increasing its force as that luminary augments its altitude, and diminishing, in a similar proportion, as the sun's altitude decreases. Thus, when the sun is on the meridian, the sea breeze is at the maximum of its strength; and at the time the sun reaches the horizon, this breeze has perceptibly ceased. The land breeze commences before midnight, and continues until the rising of the sun, sometimes longer. A space of some hours intervenes between the land breezes ceasing and sea breezes coming on, during which there is a perfect calm.

"The annual period of the trade wind here is produced by the proximity or distance of the sun, which occasions the only two seasons known in the tropic—the rainy and the dry seasons. The first is when the sun is in the tropic of Cancer, and heavy rains with loud thunder are prevalent. In this season the wind is generally to the southward of east, but interrupted by frequent calms, yet it occasionally blows with force and obscures the atmosphere.

"When the sun is into the tropic of Capricorn, the dry season commences, and then the trade wind, which is steady at N. E., is cool and agreeable. At this season, N. and N. W. winds are sometimes found blowing with much force, and, indeed, in some degree, they regularly alternate with the general wind, as they are more frequent in November and December than in February and March.

"In the change of the seasons there is a remarkable difference: for in April and May no change is experienced in the atmosphere, and the weather is, in general, beautifully fine; but in August, September, and October, there are usually calms, or very light winds; and dreadful hurricanes in these months sometimes render the navigation perilous. From these perils, however, are exempted the Island of Trinidad, the coasts of Colombia, (late Terra Firma,) the Gulfs or Bays of Darien and Honduras, and the Bight of Vera Cruz, to which the hurricanes do not reach.* In the space of sea between the Great Antillas and the coast of Colombia, the general N. E. or trade wind regularly prevails; but near the shore the following peculiarities are found:

"At the Greater Antillas, the sea breeze constantly prevails by day, and the land breeze by night. These land breezes are the freshest which are known, and assist vessels much in getting to the eastward, or remounting to windward, which without them would be almost impossible. At the Lesser Antillas, as Dominica, Martinique, and St. Lucia, &c., there are no land breezes.

"On the coasts of Guyana there are no land breezes, nor more wind than is generally experienced between the tropics. In January, February, and March, the winds here blow from N. to N. E., and the weather is clear. In April, May, and June, the winds are from E. to S. E. In July, August, and September, there are calms, with tornadoes from S. to S. W.; and in October, November, and December, there are continual rains, while

* Hurricanes have sometimes occurred in these regions.—W. C. R.

the sky is, in general, obscured by clouds. In the dry season, which is from January to June, the heat is very great; and in the wet season rains and thunders are constant and violent.

"On the coasts of Cumana and Caraccas, to Cape la Vela, the breeze follows the regular course; but from that cape to Cape San Blas the general wind alters its direction; for it blows from N. E. to N. N. E., excepting in the months of March, April, May, and June, when it comes to E. N. E., and is then so uncommonly strong as to render it necessary for vessels to lie to. These gales, which are well known to mariners, extend from about mid-channel to within 2 or 3 leagues of the coast, where they become weak, especially at night. On this coast, about the Gulf of Nicaragua, are westerly winds, which the pilots of that country call *vendavales*, (rainy winds,) in the months from July to December; but these winds never pass the parallel of 13° N., nor do they blow constantly, but alternate with the sea breeze.

"Upon the Mosquito Shore, Honduras, and eastern coast of Yucatan, the general winds or breezes prevail in February, March, April, and May; but during the first two of these months they are occasionally interrupted by norths. In June, July, and August, the winds here are from the eastward and westward of south, with tornadoes and calms. In September, October, November, December, and January, they are from the northward or southward of west, with frequent gales from W. S. W., W., N. W., and north.

"On the northern and western coasts of Yucatan, between Cape Catocho and Point Piedras, or Descondida, and thence to Campeche, there is no other than the N. E. or general wind, interrupted by hard norths in the season of them; and about the end of April, tornadoes commence from N. E. to S. E. These tornadoes generally form in the afternoon, continue about an hour, and then all the serenity of the atmosphere is re-established. The season of the tornadoes continues until September, and in all the time there are sea breezes upon the coast, which blow from N. N. W. to N. E. It has been remarked that, as the sea breeze is more fresh, the more fierce is the tornado, especially from June to September. The sea breezes come on at about 11 of the day; and at night the wind gets round to E., E. S. E., or S. E., so that it may be in some degree considered as a land breeze.

"On the coast of the Mexican Sea, from Vera Cruz to Tampico, the breeze from E. S. E. and E. prevails in April, May, June, and July; and at night the land breeze comes off from S. to S. W.; but if the land breeze is from the N. W., with rain, the wind on the following day will be from N., N. N. E., or N. E., particularly in August and September: these winds are denominated in the country, '*vientos de cabeza*, o *vendavales*,' (head winds, or rainy winds); they are not strong, nor do they raise the sea; with them, therefore, a vessel may take an anchorage as well as with the general breeze; but they impede getting out, for which the land breeze is required. The *vientos de cabeza*, or head winds, reach to about 20 or 30 leagues from the coast, at which distance are found those at E. and E. S. E.

"From the middle of September until the month of March, caution is necessary in making Vera Cruz, for the norths are then very heavy. The narrowness of this harbor, the obstruction formed by the shoals at its entrance, and the slender shelter it affords from the norths, render an attempt to make it during one of them, extremely dangerous, for it will be impossible to take the anchorage. The following description of the winds here, has been written by Don Bernardo de Orta, a captain in the Spanish navy, who has been captain of the Port, and who surveyed it:

"Although in the Gulf of Mexico we cannot see that there is any other constant wind than the general breeze of this region, notwithstanding that, from September to March, the north winds interrupt the general course, and, in some degree, divide the year into two seasons, wet and dry, or of the Breezes and Norths: the first, in which the breezes are settled, is from March to September; and the second, in which the norths blow, is from September to March. For greater clearness we shall explain each separately.

"The first of the norths is regularly felt in the month of September; but, in this month and the following one, October, the norths do not blow with much force. Sometimes it happens that they do not appear, but, in that case, the breeze is interrupted by heavy rains and tornadoes. In November the norths are established, blow with much strength, and continue a length of time during December, January, and February. In these months, after they begin, they increase fast; and in four hours or a little more, attain their utmost strength, with which they continue blowing for 48 hours; but afterwards, though they do not cease for some days, they are moderate. In these months the norths are obscure and north-westerly, and they come on so frequently, that there is, in general, not more than 4 or 6 days between them. In March and April they are neither so frequent, nor last so long, and are clearer; but yet they are more fierce for the first 24 hours, and have less north-westing. From
the day

we have said, the norths are established, the weather is beautiful, and the general breeze blows with great regularity by day; the land breeze as regular by night.

"There are various signs by which the coming on of a north may be foreseen: such are, the wind steady at south; the moisture of the walls, and of the pavements of the houses and streets: seeing clearly the Peak of Orizaba and the Mountains of Perote and Villa-Rica, with the cloud on those of St. Martin, having folds like a white sheet; the increase of heat and dew; and a thick fog or a low scud, flying with velocity to the southward; but the most certain of all is the barometer: for this instrument, in the time of the norths at Vera Cruz, does not vary more, between its highest and lowest range, than eight-tenths; that is to say, it does not rise higher than $30\frac{7}{8}$ inches, nor fall lower than $29\frac{1}{8}$ inches. The descent of the mercury predicts the norths; but they do not begin to blow the moment it sinks, which it always does a short time before the norths come on; at these times lightnings appear on the horizon, especially from N. W. to N. E.; and the sparks, cobwebs are seen on the rigging, if by day; with such warnings trust not to the weather, for a north will infallibly come on.

"This wind generally moderates at the setting of the sun: that is it does not retain the same strength which it had from 9 in the morning to 3 in the afternoon, unless it commences in the evening or at night, for then it may increase otherwise. Sometimes it happens that, after dark, or a little before midnight, it is found to be the land-wind, from the northward and westward; in which case, should it get round to the southward of west, the north will be at an end, and the general breeze will, to a certainty, come on at its regular hour; but if it does not happen at the rising of the sun, or afterwards, and at the turn of the tide, it will return to blow from the north, with the same violence as on the day before, and then it is called a Norte de Maren, or Tide-North.

"The Norths also, sometimes, conclude by taking to the northward and eastward, which is more certain; for, if the wind in the evening gets to N. E., although the sky remained covered the day following, but by night the land breeze has been from the northward and westward, the regular breeze will surely ensue in the evening, good weather succeeding and continuing for 4 or 6 days; the latter period being the longest that it will last to, in the season of the norths; but, if the wind retrograde from N. E. to N. N. E., or N., the weather will be still unsettled.

"Examples are not wanting of norths happening in May, June, July, and August, at which times they are most furious, and are called Nortos del Mueso Colorado; the more moderate are called Chocولاتeros, but these are rather uncommon.

"The wet season, or the season of the breezes, is from March to September; the breezes, at the end of March, and through the whole month of April, as already explained, are from time to time interrupted by norths, and are from E. S. E. very fresh; the sky sometimes clear, at other times obscure. At times these touch from S. E., and continue all night, without giving place to the land-breeze, which prevails, in general, every night, excepting when the north wind is on. The land-breeze is freshest when the rains have begun.

"After the sun passes the zenith of Vera Cruz, and not till he returns to it, that is, from the 16th of May to the 27th of July, the breezes are of the lightest description: almost calms, with much mist or haze, and slight tornadoes. After that time, the pleasant breezes from the N. W. to N. E. sometimes remain fixed.

"From the 27th of July to the middle of October, when the norths become established, the tornadoes are fierce, with heavy rains, thunder, and lightning; those which bring the heaviest winds are from the east, but they are also of the shortest duration.

"In the season of the breezes, the total variation of the barometer is four-tenths; the greatest ascent of the mercury is to 30 inches thirty-five-one-hundredths, and its greatest descent to 29 inches ninety-six-one-hundredths. The thermometer in July rises to 87° , and does not fall to $83\frac{1}{2}^{\circ}$; in December it rises to $80\frac{1}{2}^{\circ}$, but never falls below $66\frac{1}{2}^{\circ}$.— This, it must be understood, was ascertained in the shade, the instrument being placed in one of the coolest and best ventilated halls in the castle.

"In the months of August and September, rarely a year passes without hurricanes near Florida and the northern Antillas; but to Vera Cruz, or any part of the coast thence to Campeche, they never arise: all that is felt being the heavy sea, which has arisen in the higher latitudes. Hurricanes begin blowing from the northward and eastward; and although they do not always go round the same way, yet in general they next go to the southward and eastward, with thick squally weather and rain."

From Tapico to Bay of St. Bernard, the winds are continually from E. to S., and light from the month of April to August; the contrary is experienced in the other months. This coast is exposed on account of the hardness of gales from E. and E. S. E., which blow without intermission for two or three days before hauling to the northward.

In latitude $26^{\circ} 30' N.$, there are land breezes at night, which blow from midnight to nine A. M.

From Bay St. Bernard to the Mississippi, there are land breezes at daylight, and on the days entering, the winds haul to S. E. and E. S. E., and in the afternoon it generally

hauls S. W. In winter the southerly winds are very tempestuous, and blow for the space of two or three days. The months most to be feared to navigate this sea, are August, September, October, and November, in which there are hurricanes and winds on shore so heavy that no canvas can stand them; upon the Mississippi, and all its mouths, there are very thick fogs very frequently, especially in February, March, and April, and in June and July.

From the Mississippi to lat. 28° N., in the month of April to July, the reigning winds are generally from N. to E. and from E. to S. in the morning, and in the afternoon they haul S. W. These S. W. winds are tempestuous in August, September, and October, an epoch in which are also experienced heavy southers and hurricanes. From November to March the winds blow from the northward, beginning first from S. E. and S. with heavy rain, when it hauls to S. W. and W., and blows very heavy, till it hauls to N. W. and N., when it clears the weather, and then to N. E., and is mild.

From lat. 28° N., to the southernmost of the Florida Keys, the trade wind reigns in the morning, and at mid-day it hauls in from the sea. This happens in summer, but in winter, especially from November to March, the winds blow from S. to W., and raise a very heavy sea.

In the new channel of Bahama, the reigning wind is the trade, interrupted in winter by norths, and in summer by calms. Although the northern limit of this channel is in 28° 30' N., and consequently within the limits of the trades, yet it is necessary to keep in mind that in winter, that is, from November to April, you will meet with the variables at or before you arrive to lat. 27°, which variables are from E. to S. and from S. to W., and in summer you have calms and light airs from S. to W. and from W. to N.

On the eastern coast of Brazil.

ON THE EASTERN COAST OF BRAZIL, between the months of September and March, the winds generally prevail from N. by E. to N. E. by E. Between March and September the prevailing winds are from E. by N. to E. S. E.

The former of these is generally termed the northerly monsoon, and the latter, the southerly one; although there appears, in fact, to be no direct and opposite change in them on or about the equinoxes, as is generally the case with the winds so called.

These winds are simply a continuant on of the S. E. trade, which changes its direction as above described, and is influenced by the land on its approach thereto. When the sun is to the northward, no particular difference is observed in the S. E. trade, but it may be carried within sight of the coast, with scarcely any deviation; nevertheless, about both equinoxes, but more especially when the sun is advancing to the northward, calms and very light winds, with apparently no settled quarter, will prevail near the coast; and this may be said to be more particularly the case on that part of it between the Abrolhos and Capo Frio. As the sun advances to the southward, the trade wind will generally come round to the north-eastward, and will have its retrograde movement with the return of the sun to the equinox. At this latter season, ships, on approaching the coast, will begin to observe this northerly inclination of the S. E. trade, when within four or five degrees of it, and which they will find gradually to increase as they incline to the westward.

Within a few miles of the coast, and in the different roadsteads and harbors, the wind generally blows directly upon it; and in the deep harbors, and upon the shore, this is generally superceded by a land breeze which sometimes lasts a greater part of the night. About Rio Janeiro this land breeze sometimes extends as far seaward as Round Island, while at Pernambuco it rarely reaches the roadstead.

The preceding remarks are those of Lieutenant Hewett. Pimentel, and, after him, M. D'Apres, has said that the winds of the northerly monsoons, between September and March, are from N. E. and E. N. E., or less northerly than as above; and that those of the southerly monsoon are from E. S. E. to S. S. E., or more southerly. It may therefore be admitted, that they do sometimes prevail more from the south, and that those near the north but seldom occur.

Mr. Lindley, in his narrative of a voyage to Brazil, having resided a considerable time on shore, at Bahia, &c., has described the in-shore wind as follows:—"From Cape St. Augustine, (southward,) the wind blows, 9 months in the year, chiefly north-easterly in the morning, and north-westerly during the evening and night. This continues gradually changing along the coast, till, at Rio Janeiro and the Rio Plata, it becomes a regular land breeze from evening to morning, and throughout the day the reverse. During the three stormy months, that is, from the latter end of February to that of May, the wind is generally southerly, blowing very fresh and squally, at times, from the south-west.

Lieutenant Hewett has observed, that the winds off Cape Frio are seldom found to the southward of east; and in the northern monsoon they are generally to the northward of N. E. Heavy and violent squalls are occasionally met with in rounding the Cape, to obviate the effects of which every precaution is required.

The same officer adds, that at Rio de Janeiro, the sea breeze varies in its commencement from ten to one o'clock in the forenoon, and ceases in the evening between the

hours of N. W., lasting for

hours of seven and eleven. At the full and change of the moon, violent squalls from the N. W., named by the Portuguese "Tere Altos," immediately supersede the sea breeze, lasting from four to six hours.

The late Captain John M'Bride, of the Royal Navy, kept a regular journal of the winds and weather at the Falkland Islands, from 1st of February, 1766, to 19th January, 1767, which was published in 1775, by Mr. Dalrymple. The journal concludes with the following general remarks :

"From going over the following journal of the winds, for the space of one year, they will be found to prevail in the western quarter, and generally blow a close-reefed topsail gale, with a cool air. In November the winds begin to be more frequent in the N. W. quarter, generally hazy weather, and for the most part blow about 16 or 20 hours, when it begins to rain: the wind then regularly shifts into the westward, and so on, till it gets to the S. W. by S., and S. S. W., when it blows fresh, and clears up. This S. S. W. wind continues for about 16 hours, then dies away, when the wind shifts again to the N. W. quarter; this continues during December, January, and February, and changes in the manner above mentioned, every three or four days. As March comes on you have these changes but seldom; and as the winter advances, they are seldom in the N. W. quarter, but rather incline to the E. N. E., which is generally accompanied with sleet and snow. There is not the least proportion in the gales between winter and summer. In summer, (as I have before observed,) as the winds are in the westward, they blow in such heavy squalls off the tops of the mountains, that it is sometimes an hour before a cutter can row to the shore, although the water is smooth, and the distance of but one cable and a half off. In the winter, the winds are pent up by a keen frosty air. The most lasting gales are those from S. by E. to S. by W., and are extremely cold."

Observations on the Winds, by Captain Frederick Chamier, R. N.

"The trade winds, in the West Indies, generally blow from N. E. to S. E., varying according to circumstances, which will be hereafter expressed. About Barbadoes and the Windward Islands, that is, from Tobago to Barbuda, the wind will be found to veer more to the northward in the early part of the year, than in the months of June, July, and August. In the more northern islands, such as Dominica, Montserrat, Antigua, Nevis, &c., the wind, in the evenings of January, February, and March, veers round to about north, or N. N. E., blows very fresh in squalls; and from the extensive space of ocean over which it travels, becomes cool and very refreshing. The thermometer, even in English Harbor, in the above months, at 8 o'clock, P. M., I never saw above 76°. In this season of the year, the sickness of the hot months is no longer experienced; the general lassitude of the mornings and noons of July and August seems forgotten; and no man who visited these islands during the first three months of the year, would believe that the change of seventy or eighty days could make such an amazing difference in the look, as well as in the energy, of the inhabitants of the Windward Islands. In the change of seasons (from wet to dry) a great difference is experienced in the winds. In April and May, the atmosphere is in general clear, and fine weather prevails; but in August, September, and October, calms or very high winds are not uncommon. Strong hurricanes blow in these months.

"In speaking of hurricanes, they are well known to have been very rarely experienced in Trinidad. The main land of Colombia, the Gulf of Darien and Honduras, and likewise Vera Cruz, are almost exempt from this scourge. In the Derrotero de las Antillas, however, mention is made of a hurricane having been experienced on the morning of the 18th of August, 1810.

"In the greater Antillas, such as Jamaica, Cuba, St. Domingo (or Hayti) and Porto Rico, the sea breeze blows by day, and the land wind by night; but in the lesser Antillas, such as Martinico, Dominica, St. Lucia, Antigua, &c., land winds are very uncommon; and certainly, in all my cruising in these seas, about these islands, I never experienced the land wind.

"From the Coast of Cumana to Punta Aguja, the common trade wind constantly blows at E. S. E. to E. N. E., the land wind being uncommon, but still not unknown.—At anchor, in La Guayra Road, in February, 1827, a very light cool land wind, from the S. S. W. occasionally reached the ship, but I doubt its ever extending more than five miles to sea. On the evening of the 20th October, 1816, a heavy squall came from the S. S. W. off Cape la Vela, and blew for some time with violence. I have merely mentioned the two above facts, because in the Derrotero it is asserted that land winds are rarely known on this coast.

"The coast between Cape la Vela and Santa Martha seems more accustomed to changes of wind than any other part of the West Indies. Although the remarks of some celebrated Spanish navigators would lead us to believe that the winds blow so fiercely from the E. N. E. that ships are obliged to lie to; yet I have, in the month of August,

by keeping close in shore between Punta Aguja and Cape la Vela, had the wind at west for two or three days together; and until we had passed Rio de la Hacha, and opened Cape la Vela, we neither had easterly winds nor westerly currents.

"In that part of the coast of Yucatan, between Cape Catocho and Punta Piedras, or Deconocida, and that coast which trends to the southward to Campeche, the trade winds have generally been at E. N. E. In the evening, towards September, the wind occasionally veers to the E. S. E., and this has been called a 'land wind' by many authors.

"At all seasons of the year, I have experienced land winds on the coast of Cuba; that is, from Cape Corrientes to St. Jago de Cuba. If the sea breeze, which in Cuba as well as Jamaica and St. Domingo (or Hayti,) generally begins about nine o'clock in the morning, and freshens until noon, should in the evening about sun-set dwindle to nearly a calm, you may be certain of a light air off the land:—a mark to judge by, and which I never knew to fail, was the clouds hanging heavily over the blue mountains of Jamaica, or Copper Hills of Cuba.

"The winds operate very little upon the thermometer. From May to October, in Jamaica, at day-dawn, 82° will be the average; it will be 88° at noon, and again, 82° in the evening. To find the thermometer at 78° during the night, even in a place where the wind circulates freely, cooled also by the dew, is a luxury so rarely likely to occur, that in looking over my private journal for two years, I cannot discover one instance of it in the above months; yet still, the land winds, to those who have been long residents in the country, is a luxury most eagerly expected, and most welcome received. It is of so different a kind from the sea breeze, that respiration becomes easy; whereas, with the thermometer at 90° at Port Royal, and the sea breeze blowing nearly a gale, I have found inhaling the hot wind very oppressive and relaxing.

"Between Jamaica and Maracaybo, and in the space between the latter and St. Domingo, I have always observed, that should the trade wind at daylight be at E. N. E., at noon it will generally be about E. by S., if the day is clear. The knowledge of this gives a great advantage in a windward bent; and by this means, watching the variation of the wind, you will be able to head the current for some hours,—an advantage which every one must perceive."

U. S. S. MISSISSIPPI, at Sea, Dec. 31, 1846.

Sta.—In compliance with your request, I have the honor to make the following remarks (the results of observations) in the manner in which the barometer is affected by the changes of weather in the Gulf of Mexico, and the indications it gives of such changes. I have kept a memorandum of the barometer since this ship left Boston, in August, 1845. I noted the height of the barometer at 8 A. M., 12 M., 4 P. M., and 8 P. M., and was also observant of the changes of weather that took place.

The general range of the barometer, for fair and pleasant weather, is from $30\frac{10}{100}$ to $30\frac{20}{100}$ inches; although I have often seen extremely unpleasant weather (mist, and what may be termed a double-reefed topsail breeze) when the barometer was at this range, particularly when on the coast of Yucatan; and I have, at such times, observed that the wind would be from the north and northward and eastward, whilst, on the western coast, and at Vera Cruz, the wind was from the northward and westward; but, previous to this, the barometer had fallen to 30, or even below 30 inches.

It is said that these are unfulfilling indications of the approach of what is called a "Norther"—those severe gales that prevail in the Gulf from the month of September to April. These indications are, the clearness of the atmosphere, known by the high lands being visible, particularly Mount Orizaba; heavy dews, and the falling of the barometer: but I have often noted the appearance of these indications when the norther did not succeed. I have also known northers to take place when not preceded by these indications, particularly when Mount Orizaba had not been visible for many days; but I have never known a norther to happen without being preceded by a fall of the barometer—and its intensity may be determined by the degree of the change, and its rapidity. If the fall of the barometer be from $30\frac{10}{100}$ to $30\frac{20}{100}$, in three or four hours, you may look for a change of weather; and if it be during the season for northers, you may expect one in a few hours; if in the tornado months, you may expect one of them, or a sudden violent squall.

I have also noticed that a change is indicated rather by the *rapidity* than by the *extent* of the fall of the mercury in the barometer. The barometer falls before a norther, and then rises as it comes on, and continues rising as the intensity of the gale increases. When the barometer again commences falling, it is an indication that the gale is at its greatest height, and that it is about abating.

I have also noticed that the barometer falls when the wind is southerly, particularly when from the southward and eastward, and that it rises when the winds are from the northward.

I have already noticed that the winds seldom blow from the northward and westward on the coast of Yucatan. During the northers, vessels bound north, and those at anchor

off Tampico, make for the Campeche Banks, where the northers are not felt, but a moderate N. E. wind prevails.

I would suggest the supposition that these violent northers are met by the N. E. trades, which prevent the northers from blowing home on the Campeche Banks, and render these Banks a safe retreat for vessels in cases of violent northers.

I am, Sir, with sentiments of respect, your obedient servant,

M. H. BEECHER, *Prof. Math.*

Com. M. C. PERRY, *U. S. S. Mississippi.*

CURSORY REMARKS AND SUGGESTIONS ON VARIOUS TOPICS IN METEOROLOGY.

BY AN AMATEUR OBSERVER.

The science of Meteorology is not only interesting to the philosophic observer, but the natural phenomena of which it takes cognizance are such as daily affect the interest and comfort of every member of the human family. But to no class of persons are these phenomena, as exhibited in various parts of the world, of so much practical importance as to the members of the nautical profession. A competent knowledge of these exhibitions, or of geographical meteorology, is therefore an important element of that varied knowledge which is acquired by the skilful navigator.

In the preceding pages of the American Coast Pilot, will be found a valuable collection of observations on the winds which have been found to prevail in the Atlantic Ocean, and on different portions of the American Coast. We now proceed to exhibit a more general and cursory view of the atmosphere and winds, and of various atmospheric phenomena which occur in these regions.

General View of the Atmosphere.

The transparent aerial fluid which surrounds our globe, and which we denominate the *atmosphere*, forms a comparatively thin stratum or envelope, which in the immediate vicinity of the earth, is greatly compressed by its own weight, and which in its most expanded and tenuous state is supposed to extend itself to the height of only forty-five or fifty miles from the earth's surface. Its superincumbent pressure or weight is ascertained by means of the barometer, and is equal to a column of mercury about thirty inches in height. By means of this instrument we learn that one-half its weight or actual quantity is within three miles and a half of the surface of the ocean; and it is within this limit that nearly all the visible or important phenomena of the atmosphere are apparently developed. The lower surface of the atmosphere is equal to about 200,000,000 square miles; and as a compression of the whole mass to the common density which it exhibits at the sea level, would reduce its entire height to about five miles, it follows that by this standard of comparison the height or thickness of the atmosphere is to its superficial extent in the proportion of only 1 to 40,000,000.

These several facts are too important to be lost sight of in our general reasonings upon the phenomena of the atmosphere; and the more so, as we are prone to give too much *altitude* to our conceptions on these subjects. If we even consider the proper height or thickness of the atmosphere as equal to fifty miles, still, as compared with its entire surface, this is only equal to one-five hundredth of the proportion which the thickness of a common sheet of paper, of the foolscap size, bears to its surface dimensions; and if we view the atmosphere either as condensed to the mean of the surface pressure, or in relation to the actual limit of all its tangible phenomena, it will only be equal to one-five-thousandth part of the proportional thickness above mentioned. We may hence perceive the inapplicability of analogical reasonings that are founded on the movements which occur in a chimney, or in an inclosed apartment, that are attempted to be applied in explanation of the general movements of the atmosphere.

Two instruments of modern invention, the *barometer* and *thermometer*, are truly invaluable as testing the condition of the atmosphere, and their use should be familiar to every navigator. By the first, as we have seen, the amount or weight of the superincumbent atmosphere, at any place, may always be accurately known, and by the indications of the other, the temperature of the air, as well as of the ocean, may be ascertained with equal precision.

Among the most striking peculiarities of the atmosphere, are its rapid and almost constant movements of progression or circulation, which, with some unimportant exceptions, appear to prevail throughout the globe. These movements evidently show the

continued operation of some powerful impulse, which, to the writer at least, does not appear to have been satisfactorily explained. It is estimated from the average rate of sailing of ships during long voyages through different seas, and from other data, that the average velocity of the wind near the surface of the ocean is equal to eighteen miles an hour throughout the year, and in the common region of the clouds the velocity must be much greater.

Temperature of Elevation.

Elevation above the level of the sea, or the general level of a country, causes a regular variation in temperature. The first 300 feet usually causes a difference of about one degree of Fahrenheit's thermometer. After ascending 300 feet, it is estimated that the thermometer falls a degree in 295 feet, then at 277, 252, 223, and 192 feet; but 300 feet to a degree is a common rule. On these principles the limit of perpetual frost has been calculated. It is made a little more than 15,000 feet at the equator, and from that to 13,000 between the tropics, and from 9,000 to 4,000 feet between latitudes 40° and 59°.

It has been found, however, that the above rule is subject to great variations, owing, probably, to the course, temperature, and super-position of the atmospheric currents which prevail in different regions at different altitudes. Colder currents are often found resting upon, or interposed between, those of a higher temperature, and *vice versa*. On the Himalayan Mountains, in Asia, between the latitudes of 28° and 34° north, the region of vegetation has been found to extend several thousand feet above the supposed line of congelation in those latitudes. It is also remarkable, that the line of perpetual snow is found at a much greater altitude on the northern side of these mountains than on the southern side, in a lower latitude. From this it may be inferred that the temperature in high regions, as well as in lower situations, is greatly affected by the geographical course and physical condition of the currents of atmosphere which prevail in these regions.

Stratification and Elevation of the Currents of the Atmosphere.

It is obvious, from the courses of the clouds and other light bodies which sometimes float in the atmosphere, that the movements of the latter are mainly horizontal, or parallel to the earth's surface. Notwithstanding this, the common theory of winds supposes a constant rising of the atmosphere in the equatorial regions, connected with a flow in the higher atmosphere towards the polar regions, and a counter flow at the surface towards the equator, to supply the ascending current. This ascending movement, however, has never yet been discovered, and it is easy to perceive that if it existed in the manner supposed, its magnitude and velocity must be altogether too great to have eluded observation.

It is apparent, however, that different currents often prevail at different altitudes, superimposed one upon another, and moving at the same time in different directions. These currents are often of different temperatures and hygrometrical conditions, and are found moving with different degrees of velocity. It is by the influence of these currents that volcanic ashes, and other light substances, which are elevated by means of whirlwinds to the higher regions of the atmosphere, are conveyed to great distances, and in directions which are often contrary, to the prevailing wind at the surface. On the eruption in St. Vincent, in 1812, ashes were thus deposited at Barbadoes, which is 60 or 70 miles to the windward, and also on the decks of vessels still further eastward, while the trade wind was blowing in its usual direction. On the great eruption of the volcano of Cosiguina, on the shores of the Pacific, in Guatemala, in January, 1835, the volcanic ashes fell upon the Island of Jamaica, at the distance of 800 miles in a direct line from the volcano. Facts like these ought to put at rest the common theory of the trade winds, according to which, these ashes would sooner have fallen upon the northern shores of the Gulf of Mexico, or the peninsula of Florida. On the same occasion the volcanic ashes were also carried westward in the direction contrary to the trade wind on that coast, and fell upon H. M. ship Conway, in the Pacific, in lat. 7° N., long. 105° W., more than 1,200 miles distant from the volcano, in the direction which is nearly opposite from Jamaica. These phenomena were doubtless the effect of two different currents prevailing at different elevations; but we shall seek in vain, in these developments, for proof of the commonly received but imaginary system of the trade winds.

The occasional interposition of a warmer current of atmosphere between the lower current and the higher regions has been proved by the observations of aeronauts. In countries situated like the United States, where the surface is often occupied in winter, for long periods, by an intensely cold stratum of air from the interior elevations, the warm currents from lower latitudes appear to find their way at a superior elevation; and their presence in this position is often demonstrated by the phenomena which they induce.

The atmosphere, and the thermometers, are assumed to be in an assumed state, the atmosphere will not rise, fields, are, it is to be great variations, as pertaining to the following:

1. Like
2. A cold
3. A cold
4. A system
5. The
6. The
7. A cold

The circumference of its height is Dew is a substance, floating in the air, is solved. In their weight, then decrease, drops in the ground, the rain are the same.

Owing to the interposition of a five miles, above the earth's surface, by their weight, and undetermined.

Hail of the atmosphere, a stratum warmer than affords, perhaps, a limited number, or to be the upper cold stratum surface, is warm and densation, column, is carried up the successive stratum, which, the or perhaps the vortex action, some

Clouds, Fogs, and Rain.

The atmosphere is always pervaded by water in the form of transparent or invisible vapor, and the process of evaporation is continually carried on, except in cases where the thermometer is below what is called the dew point, or when the vapor is being condensed in the form of clouds, fogs, or rain. "Clouds and fogs are the same thing, being an assemblage of small vesicles of water floating in the atmosphere. At a distance in the atmosphere we see the whole as a cloud, but when the vapor sinks to the earth, or will not rise, and we are immersed in it, we call it a fog. Dew fogs, which hang over fields, are *stratus* clouds; and fogs which involve elevated objects, are *cumulous* clouds." It is to circumstances of distribution, light, shade, distance, and perspective, that the great variety in the appearance of the clouds is owing; and on this variety of appearance the following classification has been founded, by which the clouds have been considered as pertaining to seven classes:

1. Like a lock of hair, or a feather, called *cirrus*.
2. A cloud in conical or rounded heaps, called *cumulus*.
3. A horizontal sheet, called *stratus*.
4. A system of small fleecy or rounded clouds, called *cirro-cumulus*.
5. The wavy or undulating stratus, called *cirro-stratus*.
6. The cumulus and cirro-stratus mixed, called *cumulo-stratus*.
7. A cumulus spreading out in cirrus, and raining beneath, called *nimbus*.

The cirrus is usually the most elevated—sometimes as a gauze veil, or parallel threads. Its height is apparently from one to four miles.

Dew is the condensation of aqueous vapor upon the surface of a condensing body or substance. Clouds and fogs are watery particles condensed from aqueous vapor while floating in the atmosphere, where they continue to float till precipitated, or again dissolved. If by the concentration of these particles, or by any additional condensation, their weight be increased beyond that which the extent of their surface can sustain, they then descend in the form of rain; and as the condensation ordinarily increases as the drops increase in magnitude, it is common to have more rain fall on the surface of the ground than on an equal space upon the top of a house or church. Clouds, fogs, and rain are therefore essentially the same, the latter being the continuation or extension of the same process which produced the former.

Owing to the evaporating qualities of the atmosphere in the higher regions, as well as to the intensity of cold which there uniformly prevails, distinct clouds are seldom, if ever, found at a greater elevation than the summits of the highest mountains, which is about five miles. At an intermediate region, however, the clouds are often at a temperature above freezing, while the air at the surface is much below the freezing point, and the earth covered with snow. This condition of the clouds seems not unfrequently evident by their appearance to the eye of an observer. Snowy or frozen clouds are usually dim and undefined in their aspect or appearance; and a fall of snow may not unaptly be termed the fall of a frozen cloud.

Of Hail.

Hail of small size, as it falls in wintery storms, appears as frozen rain-drops. From the occurrence of this phenomenon in a freezing state of weather, we find evidence that a stratum of air in the region of clouds is at a temperature above the freezing point, or warmer than that which is found at the surface at the same time. A heavy fall of snow affords, perhaps, the same indication.

Summer hail of large size, which is deposited in a definite bath or vein, or in a locality of limited extent, is usually accompanied by heavy thunder and vivid or continued lightnings, or a heavy rumbling sound or rapid concussions, high winds, &c., and is believed to be the production of a vortex or whirlwind in the atmosphere, which is connected at its upper extremity with an overlaying stratum of unusually cold air. A portion of this cold stratum probably descends on the exterior of the vortex, and reaching the earth's surface, is pressed into the vortex, and there entwined or laminated with the layer of warm and humid air of the surface, which is drawn in at the same time. A rapid condensation, as is known, thus commences at the lower extremity of the whirling mass or column, and the condensed drops, alternately in a freezing and unfrozen layer of air, are carried upward by the powerful whirling and ascending action of the vortex, till, with the successive contingents of condensation received, they are finally discharged into the cold stratum at the upward extremity of the vortex, owing to the reduced temperature of which, they are prepared to receive a renewed accession during their fall to the earth; or perhaps by their accumulated weight they are sometimes thrown through the sides of the vortex before reaching its higher extremity. By this violent gyratory and elevating action, some of the hail-stones are thrown against each other and broken; and each suc-

cessive layer of congelation may be often seen in the fractured sections of the hail. In all vorticular condensations of this character, when the cold is not sufficiently intense to produce hail, drops of rain are produced of a much greater size than are ever found in a common and direct fall of rain.

Hail storms of this character are less frequent in the tropical regions than in the temperate latitudes, for the reasons, probably, that a stratum of sufficient cold to produce the hail is seldom found so near the inferior stratum, that a vorticular communication can be established with the former, by means of an ordinary gust, spout, or whirlwind. Nor does this ordinarily happen in the temperate latitudes; but only when the lower warm stratum becomes overlaid, in close proximity, by a stratum from a colder region; an event which is not unfrequent in most countries within the temperate latitudes. It commonly happens, therefore, that several hail storms, of greater or less magnitude and violence, occur on the same day, or about the same period.

Of Thunder Storms and Gusts.

When a cold stratum or current of the upper atmosphere moves or rests upon a warm one which is next the earth, neither stratum, as such, can penetrate or displace the other. Nor can a sudden interchange or commingling take place between the masses or particles of which these strata are composed, except by the slow and tedious process of the successive action and convulsion of single particles, or small groups of particles, upon or around each other; but if a communication or interchange between the two strata becomes established by means of the action of a gradually excited whirlwind or water-spout, or if, owing to any inequality of surface or other accident, a depression is made upon the lower stratum, so as to enable the colder air to descend at this point, then an immediate gyration or convulsion will take place in the two masses at this point, the warm air rising as it becomes displaced, and copious condensation will immediately follow. It is movements of this character which produce the dense and convoluted appearance known as a thunder-cloud, and the thunder and lightning, rain, and perhaps hail, follow as necessary results.

The precipitation of the colder stratum thus commenced, is regularly continued and enlarged till an equilibrium is produced, and the thunder storm thus engendered, assumes, of course, the direction of the upper current to which it is appended, and which, in the temperate latitudes, is commonly from the western quarter. The warm surface air which is thus displaced at the commencement of the process, rises immediately in front of the colder intruding mass, and by the gyrotory action thus commenced becomes convoluted in detached masses or layers, with the colder surrounding air, and by the reduction of temperature thus produced, furnishes the large supply of aqueous vapor which is first condensed in the heavy thunder-cloud, and then precipitated in a heavy fall of rain; and the electric phenomena which are induced by this sudden contact or intermingling of masses of air of different temperatures and hygrometric conditions, becomes highly vivid, and too often destructive. The active gyration which is commonly produced within the body of the thunder storm or gust, is in the direction of the advance of the storm, and of the rising warm air which is forced upward, or in the direction of forward and upward at the lower front of the storm.

In consequence of this gyrotory action, a storm which advances at the rate of fifteen or twenty miles an hour, is often known to exhibit a velocity of wind during the period of its greatest violence, of sixty or eighty miles an hour. If the axis of this gyration in a thunder storm assumes, from any cause, a vertical position, we then have a perfect whirlwind or tornado, which, if it be so situated as not to reach the earth by its direct action, will exhibit to us the phenomenon of a heavy thunder storm accompanied by rumbling sounds and concussion, and a fall of hail in or near some portion of its path. But if the regular action of the whirlwind should reach the earth, and continue for some time, great destruction may be expected to follow. The path of these destructive whirlwinds is generally narrow, and often but a few hundred yards in width.

From the nature of the causes which we have set forth as being favorable to the occurrence of a thunder storm, it follows that many of these storms will be likely to occur on the same day, in different parts of the same country, as has been already remarked in the case of hail storms, with which they are often identical; and the writer has often found this to be true to a remarkable extent. The fatal accidents by lightning, in different parts of the country, have often happened on the same days, and we have reason to believe that scores of tornadoes, hail storms, and thunder storms, have sometimes occurred on the same afternoon. It usually happens that the precipitations of colder atmosphere at those numerous points of disturbance is sufficient to produce a marked change in the temperature of the surface stratum within a period of 12 hours thereafter.

Atmospheric disturbances of this kind, which do not produce violent thunder or hail, are usually denominated *squalls*; and it appears highly probable that the presence of air of a temperature considerably above the freezing point is necessary to the production of

thunder and lightning. In the Strait of Magalhães, in Patagonia, where the air at the surface is neither warm nor yet very cold, the squalls, called by the sailors, williwaws, are very frequent, and tremendously severe; but, according to the observations of Capt. P. P. King, lightning and thunder are seldom known.

The heavy condensation presented in a thunder cloud is often spoken of in a manner which implies that the cloud possesses some mechanical or other energy, by means of which the violent wind is sent forth; but nothing can be more unreal than such a supposition. The cloud may indeed be the means of electric development, and furnishes also the watery depositions for the hail or rain, but all the particles of the cloud are passively inert, like those of a common fog or mist, and the violent winds and disturbing forces which may be present, operate to produce the cloud, but do not, in any important sense, result from its action.

Water-spouts and Whirlwinds.

The character of these meteors has already been described, in a measure, in our account of hail and thunder storms. The identity of whirlwinds and water-spouts was maintained by Franklin, and although at a later period this has been called in question, it appears to have been done without sufficient reason.

From the equal distribution of the atmosphere as the oceanic envelope of our earth, it results, that no movement of great violence can take place in any of its parts, except by means of a direct circuit of rotation in the form of a vortex or active whirlwind.

A vortex will not be regularly formed, nor continue itself in action, without the aid of an external propelling force, and a constant spiral discharge from that extremity of its axis towards which is the tendency of motion. Both these conditions, it is believed, are fulfilled to the letter in the case of a common whirlwind or water-spout. The air at the upper extremity of the whirling column, owing to its elevation, is rarer than at the base, and the column itself, particularly in its central portions, is mechanically rarified by the centrifugal effect of its own whirling motion. We have thus a sort of rarified chimney into which the denser air at the base of the column is continually forced by the pressure of the surrounding atmosphere; not to ascend in a separate current, as in the common chimney, but entering into the organization of the whirling vortex, to supply the place of the preceding portions of air which are winding inwards and upwards to be again discharged at the upper extremity. The condition of force by which the propulsion is maintained, is found in the pressure of the surrounding atmosphere upon all sides of the mechanically rarified column, and if the expansive whirling motion be sufficiently active to produce near a vacuum at the centre, the external propelling force will be nearly fifteen pounds to the square inch; and as the whirling column turns within its own compass like a top or any other rotative body, this force is quite sufficient to account for all the violence that is ever produced.

Were there no vorticular or whirling action already excited, and no discharge from the upper extremity of the vortex, the external pressure, it is true, could not produce rotation; but this movement and upward discharge having once commenced, from any cause, the particles near the exterior of the column, like those of water in a funnel, yield at a little more than a right angle, to the external pressure, in their spirally approximating course towards the rarified centre. By the slowness of this central approximation as compared with the whirling action, the intensity or magnitude of the external pressure becomes merged in the velocity of the rotative action. As the area of the spiral circuit decreases rapidly as we approach the centre, it follows that the velocity of the whirling movement must be proportionably increased, as we perceive it to be in the funnel and in all regular formed vortices. Thus, if the rotative velocity near the exterior of a column be at the rate of but ten miles an hour, at one-third nearer the centre, the velocity must be more than doubled, and at two-thirds of the distance from the first named point to the centre, the absolute whirling velocity must be increased nine fold, which in this case is equal to ninety miles an hour; and in consequence of the reduced diameter of the circuit of gyration, at the last point, the number of revolutions must here be as four hundred, to one of the point first mentioned. The increased ascending velocity, however, is not here taken into account, which may perhaps reduce the number of comparative revolutions in the central portions of the column. The condensing and electric effects which often attend or follow these active whirlwinds, have been cursorily noticed under the head of thunder storms.

It is not intended to dwell here upon the causes by which whirlwinds and spouts are excited or first set in motion, but the local disturbance of heat is probably the chief exciting cause as in thunder storms. The agency of heat may also be effective in continuing the upward discharge and vorticular organization, in cases where there is great disparity in the temperatures of the air at the upper and lower extremities of the whirling mass or column, but it is to the mechanical expansion of the centrifugal action and the powerful impulse of the atmospheric pressure, that the increase and powerful activity of the whirlwind is chiefly to be referred.

The term *water-spout* is undoubtedly a misnomer, as there is no effect produced of which this term is probably descriptive, although the term *air-spout* would not be greatly inappropriate. The visible column of condensed vapor, which often appears in the rarified centre of the vortex when the latter is not enveloped in cloud, has probably given name to this meteor. But the water of the sea is not taken up by the spout or whirlwind, except in a slight degree and in the form of fine spray, like other light matter which is swept from the surface. This cloudy stem or column frequently appears and disappears, while the action of the whirlwind continues without any important change. Owing to this fact, observers sometimes believe that they witness the commencement of a water-spout, or tornado, when the same has previously been in action for one or more hours, and when the cloudy pipe or pillar happens to disappear the spout is supposed to have 'burst,' while, often, it has undergone no important change, except, perhaps, a slight decrease in its activity. The active and violent portion of the whirlwind surrounds the spout invisibly, and is probably of much greater diameter at a distance from the surface of the earth than at the base of the spout. Thus, when a spout or whirlwind has passed near a ship, the upper spars have been converted into a wreck while no violence of wind was felt on the deck.

Water-spouts follow the course either of the surface wind or of the higher current with which they may communicate, or their course may be modified by both these influences without being absolutely determined by either. They abound most, however, in those calm regions which are found at the external limits of the trade winds, and in the regions near the equator.

It has been common to ascribe whirlwinds and water-spouts, as well as larger whirlwind storms, to an impulse produced by the meeting of contrary currents, but the laws of distribution and of motion in an oceanic body, are such as do not permit the movements of its different currents and gyrations to meet in conflict with each other, besides any conflicting movement in the air would necessarily produce a rise in the barometer, whereas it is generally known to fall at the commencement of a storm, either of large or small extent. We may observe, also, that whirlwinds and spouts appear to commence gradually, and to acquire their full activity without the aid of foreign causes: besides, it is well known that they are most frequent in those calm regions where, apparently, there are no active currents to meet each other, and they are at least frequent where currents are in full activity.

Of Trade Winds and the Circuitous Character of the Atmospheric Currents.

It is found that in almost every country, and in every sea, the wind is more or less predominant in a particular direction. In open sea, between the equator and the 30th parallel of north and south latitudes, the wind, for the most part, blows from the eastward; but near the eastern borders of any ocean, below these latitudes, the wind blows in a direction more towards the equator than in its central or western portions.

In the higher latitudes north of 30°, the westerly winds are found greatly to predominate, although the eddying or rotative action which is acquired by large portions of the lower stratum of air in these latitudes, causes much diversity and frequent changes in the initial direction of the wind. But in the common region of clouds where this eddying movement is less frequent, the main atmospheric current, at least in the United States, is fully as constant from the westward as is the trade wind from the eastward in any tropical region.

At New York, in four successive years, the westerly winds have been found to be to the easterly, as nearly two to one. Observations on the courses of the clouds for the same period, show the prevalence of an atmospheric current from the westward at that elevation to be, as compared with those from the eastward, nearly as fourteen to one; the prevailing wind being south-westerly. At Montreal, in Lower Canada, as appears by the observations of J. McCord, Esq., the westerly surface winds also appear to exceed the easterly, in the proportion of more than four to one. In consequence of the general prevalence of westerly winds and currents in these latitudes, the passages of the fastest ships, from Europe to America, are found to occupy a much longer period than from America to Europe.

The first movement of the trade winds towards the equator and westward, necessarily occasions an equal movement from the higher latitude to supply their place; and as the trade winds in their progress westward are opposed by the American and Asiatic continents, across which these winds do not pass, it follows that these winds become deflected or thrown off towards the poles in order to support an equal distribution of the atmosphere in the higher latitudes; but the air thus transferred to these latitudes, carries with it the rotative impulse which it acquired in the tropical latitudes, and by reason of the slower rotative motion which here prevails, is thrown to the eastward in the form of westerly winds.

An entire circuit of atmospheric currents is thus maintained on both sides of the equator, the most equable and determinate portion of which is to be found in the region of the trade winds; and this appears to be the general outline of the great system of circulation in our atmosphere, as well as in the ocean itself. It is to the geographical course pursued by the winds in different portions of these great circuits, that the peculiarities of temperature and climate pertaining to different countries lying in the same latitudes, are chiefly to be referred, as also the remarkable absence or predominance of rain which is peculiar to certain regions.

The monsoons of the Indian Seas are but a modification of the same system of circulation; the regular trade wind, instead of turning towards the higher latitudes, being here deflected across the equator, where it returns to the eastward in the form of the *westerly* monsoons; the *easterly* monsoons being the regular trade wind. The monsoons have, indeed, been ascribed to local refraction in Asia and New Holland, but the north-westerly monsoon, regardless of this hypothesis, sometimes sweeps over half the breadth of the great Pacific in its eastwardly progress.

The foregoing generalization may also be expressed in the following form:

- I. Between the two parallels of 30° N. and S. the atmosphere at the earth's surface, for the most part, revolves around the axis of the earth with a slower motion than the earth's crust, or is constantly being left behind in the movement of rotation.
- II. The space previously occupied by the atmosphere so left behind, is by the centrifugal action of the earth's rotation, constantly supplied from the higher latitudes.
- III. That portion of the atmosphere which is left behind in the tropical latitudes, and passes westward by the earth's rotation, as above described, is, by the force of direct gravitation, constantly transferred to the higher latitudes; thus preserving the equilibrium of distribution, so far as the same is ever maintained in these latitudes.
- IV. That portion of the atmosphere which is so transferred to the higher latitudes after having acquired the high rotative velocity of the equatorial regions, is, by this previously acquired impulse, thrown rapidly eastward in the form of westerly winds, thus completing the great circuit of perpetual gravitation, which is developed in each of the oceanic basins on both sides of the equator.

It is by the currents of these natural circuits of gravitation, that hurricanes and storms are found to be transported from one region or locality to another; and the track of these storms affords demonstrative evidence of the predominating course which these currents pursue. The currents themselves often become modified in their apparent courses from various causes, and being often stratified, or as it were *shingled* upon each other, they exhibit in their crossings, initial movements in different directions, and frequent changes at the surface, while still performing with no little regularity the systematic courses which have been summarily pointed out. One obvious cause of the irregularity and superposition of these currents is found in the retardation to which the lowest portions are subject, owing to the resistance of the earth's surface.

The rotative motion of the atmosphere and the earth's surface in the latitudes between the trade winds and the returning westerly winds being nearly equal, this region is necessarily subject to calms, and to those sudden gusts and squalls which are usually excited in warm regions in the absence of a prevailing wind. This region, in the North Atlantic, is known to navigators as the *horse latitudes*, because the traders between New England and the West Indies, in consequence of the lack of sustenance occasioned by these calms, were sometimes under the necessity of throwing overboard the whole or a part of their deck loads of horses. The great circuits of winds intersect and cross these latitudes in both directions on almost every meridian, but with little sensible effect at the surface, except towards the eastern margin of the Atlantic, where the northerly winds decidedly prevail; and towards the western margin of the Atlantic and in the Gulf of Mexico, the southerly winds are usually prevalent.

Similar results are found in nearly all the regions which separate the great natural circuit of winds from each other, and these tracts of ocean are known by the designation of the *calms*, and sometimes are called the *rains* or the *variables*. Such is the region about the equator, which separates the northern from the southern trade winds, and the easterly from the westerly monsoons. The easterly monsoons in approaching the equator, where they run into the westerly monsoons, necessarily acquire the same velocity of rotation as the earth's crust, which of course produces calms; the northerly or southerly tendency of the monsoons being here too small to produce a leading breeze at the surface.

Land and Sea Breezes.

Near the shores of an island or country it is often found that the wind, during different hours of the day and night, blows alternately to and from the land. Or in the case of a general or trade wind which is parallel to the coast, its course becomes alternately modified by an approximation to the above result. This effect has probably been ascribed to

the influence of diurnal heat and cold. Not that any vacuum is created by the heat into which the surrounding air rushes, as has sometimes been supposed; for, aside from the general error of this notion, a flat, low, and strongly heated island or coast, has less effect in producing these breezes than a high sloping country of more even temperature.

The truth appears to be that when the stratum, which lies upon the inclined surface of a coast becomes warmed and rarified by the daily heat, it is forced by the increment of pressure at its lowest margin to move along the inclined surface in the direction of greatest elevation, or as near that direction as the prevailing tendency of the lower current will allow. Owing to the cooling process which goes on during the night, the specific gravity of the inclined stratum becomes predominant, and the reverse movement then commences and continues into the following morning. We find, too, that on the slopes of certain coasts and islands where there is sufficient elevation, the higher margin of this stratum, at certain seasons, will daily reach an altitude at which it is brought in contact with a higher stratum sufficiently cold to set in operation a squall or thunder storm, at a certain hour; after which, the equilibrium is restored, and the usual counter movement again follows in its turn.

Some diurnal effect of this kind upon the wind is observed at times in almost every region; and, taken altogether, it is probably the most extensive agency which is exercised by heat in the production of winds.

OBSERVATIONS

ON THE

HURRICANES AND STORMS OF THE WEST INDIES AND THE COAST OF THE UNITED STATES.

BY W. C. REDFIELD.

From a careful attention to the progress and phenomena of some of the more violent storms which have visited the Western Atlantic, I have found that they exhibit certain characteristics of great uniformity. This appears, not only in the terminate course which these storms are found to pursue, but in the direction of wind and succession of changes which they exhibit while they continue in action. The same general characteristics appear also to pertain, in some degree, to many of the more common variations and vicissitudes of winds and weather, at least in the temperate latitudes. The following points I consider as established:

1. The storms of greatest severity often originate in the tropical latitudes, and, not unfrequently, to the eastward of the West India Islands; in the tropical regions they are distinguished by the name of *hurricanes*.

2. These storms cover, at the same moment of time, an extent of contiguous surface, the diameter of which may vary in different storms, from one hundred to five hundred miles, and in some cases they have been much more extensive. They act with diminished violence towards the exterior, and with increased energy towards the interior, of the space which they occupy.

3. While in the tropical latitudes, or south of the parallel of 30° , these storms pursue their course, or are *drifted* by the natural atmospheric current of the region towards the west, on a track which inclines gradually to the northward, till it approaches the latitude of 30° . In the vicinity of this parallel, their course is changed somewhat abruptly to the northward and eastward, and the track continues to incline gradually to the east, towards which point, after leaving the lower latitudes, they are found to progress with an accelerated velocity.

The rate at which these storms are found thus to advance in their course, varies in different cases, but may be estimated at from 12 to 30 miles an hour. The extent to which their course is finally pursued, remains unknown; but it is probable that as they proceed, they become gradually extended in their dimensions, and weakened in their action, till they cease to command any peculiar notice. One of the hurricanes of August, 1830, has been traced in its daily progress, from near the Caribbee Islands to the coast of Florida and the Carolinas, and from thence to the banks of Newfoundland, a distance of more than three thousand miles, which was passed over by the storm in about six days. The duration of the most violent portion of this gale, at the different points over which it passed, was about 12 hours, but its entire duration was in many places more than twice that period. Another hurricane which occurred in the same month, passed from near the Windward Islands, on a more eastern but similar route, and has also been traced in its

daily stages by means of the journals and reports of voyagers, near two thousand five hundred miles. It was in this storm that the Russian Corvette, Kensington, Captain Ramsey, suffered so severely. The hurricane of August, 1831, which desolated the Island of Barbadoes on the 10th of that month, the daily progress of which has also been ascertained, passed in nearly a direct course to the northern shores of the Gulf of Mexico and New Orleans, where it arrived on the 16th of the same month, having passed over a distance of twenty-three hundred statute miles in 6 days after leaving Barbadoes.* Many cases of like character might be adduced

4. The duration of the storm, at any place within its track, depends upon its extent and the rate of its progressive velocity, as these circumstances are found to determine the time which is required for the storm to pass over any given locality falling within its route. Storms of smaller extent, or dimensions, are usually found to move from one place to another with greater rapidity than larger storms.

5. The course thus pursued by the storm, is found to be entirely independent of the direction of wind which it may exhibit at the different points over which it passes—the wind in all such storms being found to blow after the manner of a whirlwind, around a common centre or vortex, during their entire progress, and in a determinate direction or course of rotation, which is from *right to left* (or in the direction from west to south) horizontally. The direction of the wind, therefore, for the most part, does not coincide with the course of the storm.

6. In the lower latitudes, while drifting to the westward, the direction of the wind at the commencement, or under the most advanced portion of these storms, is from a *north-eastern* quarter, usually at some point from north-east to north-west, and during the latter part of the gale, it blows from a southern quarter of the horizon, at all places where the whole effect of the gale is experienced.

7. After reaching the more northern latitudes, and while pursuing their course to the northward and eastward, these storms commence with the wind from an eastern or southern quarter, and terminate with the wind from a western quarter, as will appear more distinctly under the three following heads, the latter portion of the storm being usually attended with broken or clear weather.

8. On the outer portion of the track, north of the parallel of 30°, or within that portion of it which lies *farthest* from the American coast, these storms exhibit at their commencement a *southerly* wind, which as the storm comes over, *veers gradually to the westward*, in which quarter it is found to terminate.

9. In the same latitudes, but along the *central portions of the track*, the first force of the wind is from a point near to *south-east*, but after blowing for a certain period it *changes suddenly*, and usually after a short intermission, to a point nearly or directly opposite to that from which it has previously been blowing, from which opposite quarter it blows with equal violence till the storm has passed over, or has abated. This sudden change of a south-easterly wind to an opposite direction, *does not occur towards either margin of the storm's track*, but only on its more central portion, and takes effect in regular progression along this central part of the route, from the *south-west* towards the *north-east*, in an order of time which is exactly coincident with the progress of the storm in the same direction. It is under this portion of the storm that we notice the greatest fall of the barometer, and the mercury usually begins to rise a short time previous to the change of wind. In this part of the track, the storm is known as a *south-easter*, and is usually attended with rain previous to the change of wind, and perhaps for a short time after.

10. On that portion of the track which is *nearest* the American coast, or which is *farthest inland* if the storm reaches the continent, the wind commences from a more eastern or north-eastern point of the horizon, and afterwards veers more or less gradually, by north, to a north-western or westerly quarter, where it finally terminates. Here also the first part of the storm is usually, but not always attended with rain, and its latter or western portion with fair weather. The first or foul weather portion of the storm, is on this part of its track, recognised as a *north-easter*.

It should be noted, however, that near the latitude of 30°, and on the shores of Carolina, where the storm enters obliquely upon the coast, while its track is rapidly changing from a northwardly to an eastwardly direction, the wind on the central track of the storm, will commence from an eastern or north-eastern point of the compass, and will gradually become south-easterly as the storm approaches its height.

11. A full and just consideration of the facts which have been stated, will show conclusively that the portion of the atmosphere which composes for the time being the great body of the storm, whirls or blows as above stated, in a horizontal circuit, around a vertical or somewhat inclined axis of rotation which is carried onward with the storm; that the course or direction of this circuit of rotation is from *right to left*; and that the storm operates nearly in the same manner as a tornado or whirlwind of smaller dimensions;

* The tracks of these and other hurricanes appear on the annexed chart.

the chief difference being in the more disk-like form of the whirling body and the magnitude of the scale of operation.* This view of the subject, when fully comprehended, affords a satisfactory solution of the otherwise inexplicable phenomena of storms, and will also be found to accord entirely with the fact which appears in the above statement, that in the phases or changes which pertain to a storm, the wind, on one margin of its track, veers *with the sun*, or from *left to right*, while under the opposite margin of the same storm it veers *against the sun*, or from *right to left*; for this peculiarity necessarily attends the progressive action of any whirlwind which operates horizontally.

12. Owing to the centrifugal action of these rotative storms, the barometer, whether in the higher or lower latitudes, always sinks while under the first portion or moiety of the storm on every part of its track, excepting, perhaps, its extreme outward margin, and commonly affords us the earliest and surest indication of the approaching tempest. The mercury in the barometer always rises again during the passage of the last portion of the gale, and commonly attains the maximum of its elevations on the entire departure of the storm.

The great value of the barometer to navigators is becoming well understood, and its practical utility might be greatly increased by hourly entries of the precise height of the mercurial column, in a table prepared for the purpose. Its movements, unless carefully recorded, often escape notice or recollection; which may easily happen at those times when a distinct knowledge of its latest variations might prove to be of the greatest importance.

In the foregoing statements our design has been to designate in a summary manner the principal movements which, in these regions at least, constitute a storm; and we do not attempt to notice the various irregularities, and subordinate or incidental movements and phenomena of the atmosphere with which a storm may chance to be connected, or which may necessarily result from such violent movements in a fluid which is so tenuous and elastic in its character. It may be remarked in general, that the most active or violent storms are usually the most regular and uniform in the development of those characteristic movements which we have already described. It is also probable, that the vortex or rotative axis of a violent gale or hurricane, oscillates in its course with considerable rapidity, in a moving circuit of moderate extent, near the centre of the hurricane; and such an eccentric movement of the vortex may, for ought we know, be essential to the continued activity or force of the hurricane. Such a movement will fully account for the violent *flashes* or *gusts* of wind, and the intervening *lulls* or remissions, which are so often experienced towards the heart of a storm or hurricane, when in open sea; but of its existence we have no positive evidence.

In Purdy's Memoir of the Atlantic Ocean, it is stated "that while one vessel has been lying to in a heavy gale of wind, another, not more than 30 leagues distant, has at the very same time been in another gale equally heavy, and lying to with the wind in quite an opposite direction."

This statement is obviously to be understood as applicable to two vessels falling under the two opposite sides or portions of the same storm, where the wind in its regular circuit of rotation must, of course, blow from the opposite quarters of the horizon. We will suppose one of the vessels to be at A and the other at B, in the annexed figure.—

The storm is pursuing its course from W. towards N., will strike the first mentioned vessel in the direction which is shown by the wind arrows at the point c, which, if the position be in the temperate latitudes, north of 30°, will be from eastward. Now, it is obvious, that as the storm advances in its course north-eastward, this vessel, if nearly stationary, will intersect the body of the gale on the line c A d. As the storm advances, the wind must also veer to the northward, as shown by the arrows, being at N. E. when the vessel is brought under the point A, and near the close of departure of the storm by its further progress eastward, the wind will have further veered to the direction shown at d, which, with due allowance for the

* It is to be understood that the diameter of the whirlwind which constitutes the storm is commensurate with the width of the track over which the storm passes. The main body of the storm is supposed to move in the form of an extensive disk, whirling around its own centre as it advances in its regular track—with this difference, that the rotative movement is far more rapid in the interior portions of the whirling body, than towards its exterior limits.

progressive motion of the storm, we will set down at N. N. W. The other vessel, as is equally obvious, will first take the wind from the southward, as shown at *e*, in which quarter it will blow, with no great variation, till, by the advance of the storm, the ship is brought under the point B. The barometer, which had previously been falling, will now commence rising, and the wind, veering more westerly, will at the departure of the storm, be found in the direction shown at *f*; which, after the allowance already referred to, may be stated at W. N. W. Such, substantially, are the facts commonly reported by vessels which fall under the lateral portions of the Atlantic storms, and it is readily seen, that the opposite winds which are exhibited on the two different intersections of the storm, as above described, will very naturally be mistaken for two separate and distinct gales.

The phases of the wind in these gales are, however, in all cases modified more or less by the course or changing position of the vessel exposed to its action. For example; a ship on taking the gale, say at E. S. E. at the point *h*, on the figure, and lying to with her head to the northward, may by that means be brought to intersect the storm on the line *h i*, and, at the point *i*, would suddenly be taken aback, with the wind, say at N. N. W., as in the case of the Jamaica homeward-bound fleet in 1782, and the barometer, which reaches its lowest depression under the central portion of the storm, would about this period be found to have commenced rising with some degree of rapidity.

A further reference to the figure will show that a ship, which may be at the point G during the passage of the gale, would be exposed to a heavy swell from the southward and westward; but, being beyond the organized limits of the storm, may remain entirely unaffacted by the violence of the wind, which at the same time may be raging with destructive fury at the distance of a few leagues. The writer has knowledge of many such examples.

It has been suggested that "the larboard tack is the proper one to lie to on, as the wind will then be found to draw aft;" but this will frequently prove erroneous, as the wind may draw either way, on either tack, according to the position and course of the ship, in the storm, and the extent and rate of progress of the latter. In the case of the fleet which encountered the gale of 1782, it was probably the best course to carry sail to the northward at the very commencement of the gale, and as far and as long as possible. By this means the fleet might, perhaps, have been drawn as far northward as the point A on the figure, and the change of wind to the northward and westward would have been rendered more gradual. The chief difficulty and danger, is when the direction of the wind at the first setting in of the gale, is found to be nearly at right angles with the known course of the storms in the region where the gale is encountered, and it is then desirable to pursue such a course as to avoid, if possible, falling into the heart of the storm.

It frequently happens that a storm, during the first part of its progress over a given point, fails to take effect upon the surface, while it exhibits its full activity at a greater altitude. This commonly happens when this portion of the storm arrives from, or has recently blown over a more elevated country, or is passing or blowing from the land to the sea. On land, the most violent effects are usually felt from those storms which enter and blow from the open ocean upon the shores of an island or continent. Upon the latter, under such circumstances, the *first* part of the gale is usually the most severe, and that coast of an island upon which a storm first enters, or blows, also suffers most from the early part of the gale, but its later, or receding part, often acts with the greatest fury upon the opposite side of the island, which had previously derived some degree of shelter from the intermediate elevations and other obstacles opposed to the force of the wind, the benefit of which is now lost by its counter direction from the open ocean. Owing to similar causes, the force of the storm is sometimes very unequal at different places, situated in nearly the same part of its track, and such inequality, as we have before intimated, necessarily pertains to two places, one of which is near the centre and the other towards the margin of the route.

Of the multitude of facts by which these views might be illustrated, we will only state, that in the late hurricane at Barbadoes, (that of August, 1831,) the trees near the northern coast of that island, lay from N. N. W. to S. S. E., having been prostrated by a northerly wind in the earlier part of the storm, while in the interior and some other parts of the island, they were found to lay from south to north, having fallen in the latter period of the gale. That after the same hurricane, advices that were received from the islands of St. Croix and Porto Rico, (which lay near the northern margin of its track,) stated that no hurricane had been experienced at those islands; but it afterwards appeared that some portions of these islands had suffered damage from this hurricane in the night of the 12th to 13th of August, two days after it passed over the Island of Barbadoes.—That the sea-islands which border the coast of Georgia and the Carolinas, are known to suffer greatly from these tempests, while little or no injury is sustained in the interior at the distance of a few miles from the coast. One of the most striking characteristics of these storms is the *heavy swell* which in open sea is often known to extend itself on both sides of the

track, entirely beyond the range of the gale by which it was produced. The last hurricane to which we have alluded, threw its swell with tremendous force upon the northern shores of Jamaica, having passed to the northward of that island.

So strong is the influence of our established modes of thinking on this subject, that it seems to be difficult, even for those who admit the rotative character of these hurricanes, to understand correctly the true bearing and relations of the different phases of the wind, which are presented at two or more points or places visited by the same storm, unless the subject has been thoroughly and carefully studied. Speculative opinions, also, upon a course of a storm, are usually, if not always, founded upon the erroneous notion of a rectilinear course in the wind. In the accounts received of the hurricanes at Barbadoes, on the 3d September, 1835, which raged for a few hours from E. N. E., fears were expressed for the safety of the islands to the northward; but subsequent intelligence from Guadaloupe and Martinico showed that the gale had not extended to these islands. Had the direction and changes of the wind in this storm been viewed in their true relations, it would have been perceived that the heart of the gale must have passed to the southward of Barbadoes; and, as a general rule in the West India latitudes, where the onset of the storm is found to be in the general direction of the trade wind, or more eastward, the observer may consider himself as under the northern verge of the gale; but if the onset of the gale be from north-westward, veering afterwards by west to the southern quarter, the heart of the storm will be found to have passed to the northward of the point of observation, the latter being under the southern margin of the gale.

In order to illustrate the foregoing statements, I annex a chart of the Western Atlantic, on which is delineated the route of several hurricanes and storms, as derived from numerous accounts which are in my possession, by which their progress is specifically identified from day to day, during that part of their route which appears on the chart.

The route designated as No. I, is that of the hurricane which visited the islands of Trinidad, Tobago, and Grenada, on the 23d June, 1831. Pursuing its course through the Caribbean Sea, it was subsequently encountered by H. M. schooner Minx, and other vessels, and its swell was thrown with great force upon the south-eastern shores of Jamaica, on the 25th, while passing that island, where the wind, at this time, was light from the northward. After sweeping through the Caribbean Sea, this hurricane entered upon the coast of Yucatan, on the night of June 27, having moved over the entire route from Trinidad to the western shore of the Bay of Honduras in a little more than a hundred hours, a distance of about seventeen hundred nautical miles, which is equal to nearly seventeen miles an hour. I have no account of this storm after it crossed the peninsula of Yucatan, and it is probable that it did not again act with violence upon the ocean level. Its course of track to Honduras was N. 74° W.

Track No. II is that of the memorable hurricane which desolated Barbadoes on the night of August 10, 1831, and which passed Porto Rico on the 12th, Aux-Cayes and St. Jago de Cuba on the 13th, Matanzas on the 14th, was encountered off the Tortugas on the 15th, in the Gulf of Mexico on the 16th, and was at Mobile, Pensacola, and New Orleans on the 17th; a distance of 2000 nautical miles in about 150 hours, equal to something more than 13½ miles an hour.* Its course, until it crossed the tropic of Cancer, was N. 64° W., or W. N. W., nearly. In pursuing its northern course, after leaving the ocean level, it must have encountered the mountain region of the Alleghanies, and was perhaps disorganized by the resistance opposed by these elevations. It appears, however, to have caused heavy rains in a large extent of country lying north-eastward of the Gulf of Mexico.

Track No. III is that of the destructive hurricane which swept over the Windward Islands on the 17th of August, 1827; visited St. Martin's and St. Thomas on the 18th; passed the north-east coast of Hayti on the 19th; Turk's Island on the 20th; the Bahamas on the 21st and 22d; was encountered off the coast of Florida and South Carolina on the 23d and 24th; off Cape Hatteras on the 25th; off the Delaware on the 26th; off Nantucket on the 27th; and off Sable Island and the Porpoise Bank on the 28th. Its ascertained course and progress is nearly 3000 miles, † in about eleven days; or at the average rate of about eleven miles an hour. The direction of its route, before crossing the tropic, may be set down at N. 61° W., and in latitude 40° while moving eastward, at N. 58° E.

Track No. IV is that of the extensive hurricane of September, 1804. It swept over the Windward Islands on the 3d of that month: the Virgin Islands and Porto Rico on the 4th; Turk's Island on the 5th; the Bahamas and Gulf of Florida on the 6th; the coast of Georgia and the Carolinas on the 7th; the great bays of Chesapeake and Delaware, and the contiguous portions of Virginia, Maryland, and New Jersey, on the 8th; and the states of Massachusetts, New Hampshire and Maine, on the 9th; being on the highlands of New Hampshire a violent snow storm. The destructive action of this storm

was widely extended on both sides of the track indicated upon the chart, and the same fact portends, in a greater or less degree, to the other storms herein mentioned. It appears to have passed from Martinico, and the other Windward Islands, to Boston, in Massachusetts, by the usual curvilinear route, in about 6 days; a distance of more than 2200 miles, at an average progress of about 15½ miles per hour.

Track No. V represents the route of the hurricane which ravaged the Islands of Antigua, Nevis, and St. Kitt's on the night and afternoon of August 12th, 1835; St. Thomas, St. Croix, and Porto Rico on the 13th; Hayti and Turk's Island on the 14th; the vicinity of Mutanzas and Havana on the 15th; was encountered off the Tortugas, in the Gulf of Mexico on the 16th; in lat. 27° 21', long. 94°, and other points, on the 17th and 18th; and also at Matamor, on the coast of Mexico, (lat. 26° 4',) on the 18th, where it was most violent during the succeeding night.* This storm is remarkable, as moving more directly, and further to the west, than is usual for storms which pass near the West India Islands, it having reached the shores of Mexico before commencing its sweep to the northward. Its course, so far as known, is N. 73° W. Its progress more than 2200 miles in 6 days, which is nearly equal to 15½ miles per hour.

Track No. VI is that of the memorable gale of August, 1830, which, passing close by the Windward Islands, visited St. Thomas on the 12th; was near Turk's Island on the 13th; at the Bahamas on the 14th; of the gulf and coast of Florida on the 15th; along the coast of Georgia and the Carolinas on the 16th; off Virginia, Maryland, New Jersey, and New York on the 17th; off George's Bank and Cape Sable on the 18th; and over the Porpoise and Newfoundland Banks on the 19th of the same month: having occupied about seven days in its ascertained course from near the Windward Islands, a distance of more than 3000 miles—the rate of its progress being equal to 18 miles an hour.† If we suppose the actual velocity of the wind, in its rotary movement, to be five times greater than this rate of progress, which is not beyond the known velocity of such winds, it will be found equal, in this period, to a rectilinear course of 15,000 miles. The same remark applies, in substance, to all the storms which are passing under our review. What stronger evidence of the rotative action can be required than is afforded by this single consideration?

Route No. VII is that of an extensive gale, or hurricane, which swept over the western Atlantic in 1830, and which was encountered to the northward of the West India Islands on the 29th of September. It passed on a more eastern route than any which we have occasion to describe, to the vicinity of the Grand Bank of Newfoundland, where it was found on the 2d of October, having caused great damage and destruction on its widely extended track, to the many vessels which fell on its way. Its course is quite analogous to that which we have considered as having been probably pursued by the hurricane of October 3d, 1780. The ascertained route may be estimated at 1800 miles, and the average progress of the storm at 25 miles an hour.

Route No. VIII is that of a much smaller but extremely violent hurricane, which was encountered off Turk's Island on the 1st of September, 1821; to the northward of the Bahamas, and near the lat. of 30°, on the 2d; and on the coast of the Carolinas early in the morning of the 3d; and from thence, in the course of that day, along the sea coast to New York and Long Island; and which, on the night following, continued its course across the states of Connecticut, Massachusetts, New Hampshire, and Maine. We are not in possession of accounts by which its farther progress can be successfully traced.‡—The diameter of this storm appears not to have greatly exceeded 100 miles; its ascertained route and progress is about 1800 miles in 60 hours; equal to 30 miles an hour.

The last mentioned route may also be considered to be nearly the same as that of a similar, but less violent storm, which swept along the same portion of the coast of the United States on the 28th of April, 1835.

No. IX represents the route of a violent and extensive hurricane, which was encountered to the northward of Turk's Island, on the 23d of August, 1830; northward of the Bahamas on the 23d; and off the coast of the United States on the 24th, 25th, and 26th of the same month.

* Since the above was written, it is ascertained that this storm also passed over Galveston Bay on the coast of Texas, where the hurricane blew with violence from the N. E., while at the mouth of the Mississippi, and along the northern shores of the gulf, the gale was not felt. Such facts appear quite sufficient to overthrow the hypothesis of Franklin relating to north-east storms, and are equally fatal to the more common theories. At Galveston, this storm, in passing over, veered by east to the south-east; the rationale of which may be made evident by drawing a line through the northern side of the figure on the chart, parallel to the track of the storm. A little farther attention to the figure will also illustrate the general character of the northers, which are so common on the coast of Mexico during a considerable portion of the year.

† For a more extended notice of this storm, see American Journal of Science, vol. xx pp. 31-33.

‡ The phenomena and progress of this storm have been more fully noticed in Silliman's Journal, vol. xx, pp. 24-27.

Much damage was done on the ocean by this storm; but it scarcely reached the American shores. Its duration off this coast was about 40 hours, and its progress appears to have been more tardy than that of some other storms.

No. X represents the track of a violent hurricane and snow-storm, which swept along the American coast, from the latitude of 30° N., on the 5th and 6th December, 1830.

The last mentioned track also corresponds to that of another storm, of like character, which swept along the sea-coast on the 13th, 14th, and 15th of January, 1831. These violent winter storms exhibit nearly the same phases of wind and general characteristics, as those which appear in the summer and autumn.

Track No. XI represents a portion of the general route of the violent inland storm which swept over the lakes Erie and Ontario, on the 13th of November, 1835. This storm was very extensive, spreading from the sea-coast of Virginia into the Canadas, to a limit at present unknown. The anterior portion of this gale was but moderately felt, and its excess was noted, chiefly, by the direction of the wind, and the great fall of the barometer; the violence of the storm being chiefly exhibited by the posterior and colder portion of the gale, as is common with extensive overland storms. The regular progression of this storm in an easterly direction is clearly established, by facts, collected by the writer, from the borders of Lake Michigan to the Gulf of St. Lawrence and the sea-coasts of New England and Nova Scotia.

We have thus given a summary description of the route of twelve storms, or hurricanes which have visited the American coasts and seas at various periods, and at different seasons of the year. The lines on the chart, which represent the routes, are but approximations to the centre of the track, or course, of the several storms; and the gales are to be considered as extending their rotative circuit from 50 or 300 miles, or more, on each side of the delineations; the superficial extent of the storm being estimated both by actual information and by its duration at any point near the central portion of its route, as compared with its average rate of progress. The figure which appears upon the chart, on tracks Nos. I, V, and VII. will serve, in some degree, to illustrate the course of the wind in the various portions of the superficies covered by the storm, and, also, to explain the changes in the direction of the wind which occur successively at various points, during the regular progress of the gale. The dimensions of the several storms appear also to have gradually expanded during their course.

Storms of this character do not often act with great violence on any considerable extent of interior country to which they may arrive. Even upon the coasts on which they enter, such violence is not often experienced upon the posterior limb of the gale which sweeps back from its circuit over the land, the usual woodlands and elevations being a sufficient protection. Often, indeed, the interior elevations afford such a shelter as entirely to neutralize the effect of the wind at and near the surface, and the presence and passage of the hurricane is, in such cases, to be noted chiefly by the unusual depression, which the great whirling movement of the incumbent stratum of air produces in the mercury of the barometer, which thus indicates the presence or passage of the hurricanes in positions where the force of the wind is not felt at all, or only with a moderate degree of violence. The action of these storms appears, indeed, to be at first confined to the stratum or current of air moving next the earth's surface, and they seldom, while in this position, appear to exceed a mile or so in altitude; and the course of the next highest or overlaying stratum does not, in these cases, seem to be at all affected by the action of the storm below. During the progress, however, by the influence of high land and other causes, the storms often become transferred, in whole or in part, to the next higher stratum of current. Thus we sometimes see a stratum of clouds moving with the full velocity of a violent storm, while the stratum of surface wind is nearly at rest, or moves with its ordinary velocity; and thus, also, it happens that balloons, ascending under such circumstances, are carried forward with a velocity of from 60 to 100 miles an hour. The foregoing remarks are by no means hypothetical, but are the result of long continued observation and inquiry.

It will hardly escape notice, that the track of most of the hurricanes, as presented on the chart, appears to form part of an elliptical or parabolic circuit, and this will be more obvious if we make correction, in each case, for the slight distortion of the apparent course in the higher latitudes, which is produced by the plane projection. We are also struck with the fact that the vertex of the curve is uniformly found on or near the 30^{th} degree of latitude. In connection with this fact it may also be noted, that the latitude of 30° marks the external limit of the trade winds, on both sides of the equator; and perhaps it may not prove irrelevant to notice, even further, that by the parallel of 30° the surface area, as well as the atmosphere, of each hemisphere, is equally divided; the area between this latitude and the equator being about equal to that of the entire surface between the same latitude and the pole. It is not intended, however, to make these facts the basis of any theoretical inductions on the present occasion.

A variety of deductions may be drawn from the general facts which we have stated, some of which, though deeply interesting to the philosopher and votary of science, might

be out of place in a nautical work of this description. For ourselves we disclaim any bondage to existing theories in meteorology; and shall on the present occasion only proceed to notice a few of the more practical inferences which, to navigators and others, may, perhaps, be of no doubtful utility.

1. A vessel bound to the eastward between the latitudes of 32° and 45° in the western part of the Atlantic, on being overtaken by a gale which commences blowing from any point to the eastward of S. E. or E. S. E., may avoid some portion of its violence, by putting her head to the northward, and when the gale has veered sufficiently in the same direction, may safely resume her course. But by standing to the southward under like circumstances, she will probably fall into the heart of the storm.

2. In the same region, vessels, on taking a gale from S. E., or points near thereto, will probably soon find themselves in the heart of the storm, and after its first fury is spent, may expect its recurrence from the opposite quarter. The most promising mode of mitigating its violence, and at the same time shortening its duration, is to stand to the southward upon the wind, as long as may be necessary or possible; and if the movement succeeds, the wind will gradually head you off in the same direction. If it becomes necessary to heave to, and the wind does not veer, be prepared for a blast from the north-west.

3. In the same latitudes a vessel scudding in a gale, with the wind at east or north-east, shortens its duration. On the contrary, a vessel scudding before a south-westerly or westerly gale, will thereby increase its duration.

4. A vessel which is pursuing her course to the westward or south-westward, in this part of the Atlantic, meets the storms in their course, and thereby shortens the periods of their occurrence; and will encounter more gales in an equal number of days, than if stationary, or sailing in a different direction.

5. On the other hand, vessels while sailing to the eastward or north-eastward, or in the course of the storms, will lengthen the periods between their occurrence, and consequently experience them less frequently than vessels sailing on a different course. The difference of exposure which results from these opposite courses, on the American coast, may in most cases be estimated as nearly two to one.

6. The hazard from casualties, and of consequence the value of insurance, is enhanced or diminished by the direction of the passage, as shown under the two last heads.

7. As the ordinary routine of the winds and weather in these latitudes, often corresponds to the phases which are exhibited by the storms as before described, a correct opinion, founded upon this resemblance, can often be formed of the approaching changes of wind and weather, which may be highly useful to the observing navigator.

8. It will be perceived, from the foregoing facts, that the occurrence of a storm at a particular locality, has no immediate connection with astronomical periods, such as the changes of the moon, or the time of the equinoxes.

9. A due consideration of the facts which have been stated, particularly those under our twelfth head, will inspire additional confidence in the indications of the *barometer*, and these ought not to be neglected, even should the fall of the mercury be unattended by any appearances of violence in the weather, as the other side of the gale will be pretty sure to take effect, and often in a manner so sudden and violent as to more than compensate for its previous forbearance. Not the least reliance, however, should be placed upon the prognostics, which are usually attached to the scale of the barometer, such as Set Fair, Fair, Change, Rain, &c., as in this region at least they serve no other purpose than to bring this valuable instrument into discredit. It is the mere rising and falling of the mercury, which chiefly deserves attention, and not its conformity to a particular point in the scale of elevation.

10. These practical inferences apply, in terms, chiefly to storms which have passed to the northward of the 30th degree of latitude on the American coast, but with the necessary modification as to the point of the compass, which results from the westerly course pursued by the storm while in the lower latitudes, are, for the most part, equally applicable to the storms and hurricanes which occur in the West Indies, and south of the parallel of 30° . As the marked occurrence of tempestuous weather is here less frequent, it may be sufficient to notice that the direction of the winds of the West Indian seas, is from 8 to 11 points of the compass *more to the left* than on the coast of the United States in the latitude of New York.

Vicissitudes of wind and weather on this coast which do not conform to the foregoing specifications, are more frequent in April, May, and June, than in other months. At this season it is not uncommon to find a regular current of easterly wind prevailing for many days, producing sometimes heavy rains, and always an elevated state of the barometer. Easterly or southerly winds under which the barometer rises, or maintains its elevation, are not of a gyratory or stormy character; but such winds frequently terminate in the falling of the barometer and the usual phenomena of an easterly storm.

The typhoons and storms of the China sea and eastern coast of Asia, appear to be similar in character to the hurricanes of the West Indies and the storms of this coast, when

prevailing in the same latitudes. There is reason to believe that the great circuits of wind, of which the trade winds form an integral part, are nearly uniform in all the great oceanic basins; and that the *course* of these circuits and of the stormy gyrations which they may contain, is, in the southern hemisphere, in a *counter direction* to those north of the equator, producing a corresponding difference in the general phases of storms and winds in the two hemispheres.

From the foregoing results we infer the value and importance of correct marine reports relating to violent gales. Those reports should always comprise the *date, the latitude and longitude, and the principal direction and changes of the wind.*

CURRENTS.

A CURRENT is at present to be understood as a stream on, or a particular set in the direction of, the surface of the sea, occasioned by winds and other impulses, exclusive of (but which may be influenced by) the causes of the tides. It is an observation of Dampier, that currents are scarcely ever felt but at sea, and tides but upon the coasts; and it is certainly an established fact, that currents prevail mostly in those parts where the tides are weak, and scarcely perceptible, or where the sea, apparently little influenced by the causes of the tide, is disposed to a quiescent state. This will be obvious by an attentive consideration of the following descriptions. The necessity of attention to the silent, imperceptible, and therefore dangerous, operation of currents, will be equally apparent.

The currents of the Atlantic are often of a local and temporary nature; yet experience has shown where and how they predominate, and reason will inform the mariner where he is to expect and allow for their operation.

With the greatest velocity of the equinoctial current we cannot pretend to be accurately acquainted. Its central direction, when in full force, is W. N. W., and generally, it is imagined, about one mile and a half in the hour, but increasing to the westward; so that off the coast of Guyana it commonly sets at the rate of two or three miles.

At any considerable distance from the coast of America, the easterly current, caused by the action of violent W. or N. W. winds, is seldom felt to the southward of lat. 36°; consequently the sea about the Bermudas, and thence to southward, is free from the influence of this current. The currents here, though slow, are produced in the direction of the wind, particularly when it is of long continuance. These currents are found stronger near the islands and rocks of Bermudas than at a distance. In a brisk gale, the current here has been experienced from 12 to 18 miles in 24 hours, in the direction of the wind; at other times, when the wind was not settled, no current has been found.

To continued westerly winds are to be attributed the common occurrence of a passage from Halifax to the English Channel in 16 or 18 days, with such currents as those which carried the bowsprit of the *Little Belt*, sloop of war, lost near Halifax, in 18 months, to the entrance of Busque Roads. The currents of the Atlantic have sent to the shores of the Hebrides the products of Jamaica and Cuba, and of the southern parts of North America.

The easterly and south-easterly currents are blended in their southern regions with the Florida or Gulf Stream, hereafter described, and they do not seem to prevail to the S. W. of the Azores. On the contrary, to the W. S. W. and S. W. of those islands, the currents appear to follow the course of the trade winds towards the Caribbean Sea; and to the southward of the tropic they blend with the equatorial current, which sets from E. S. E. to W. N. W. and W. Towards the west, they occasionally extend to the northward of the Bermudas, and even unite with the southern edge or reflow of the Gulf Stream. The existence of these currents has long been known, but a farther examination and more precise information are still desiderata. The recent examples of them which we have to adduce are not numerous, but they are satisfactory; they also accord with natural facts, and are in unison with that theory which derives its currents from the rotary movement of the earth, and the operation of the trade winds.

"The currents of the Caribbean Sea are probably varied by the influence of the moon, and combine, in some degree, with the tides, especially about Cuba, Jamaica, and St. Domingo."

The Derrotero adds, "this idea is confirmed by what Don Torquato Pedrola, the captain of a frigate, has communicated to the Hydrographic Board. 'Although, generally,' says this officer, 'the currents between the Spanish Main and the West India Islands set towards the fourth quadrant, (that is, north-westerly,) yet it sometimes, though seldom, happens that they are found setting to the first quadrant, or N. E.;" in proof of which he states that he perfectly remembers, though he cannot give the elements, in

consequence of having lost his journals, that in July, 1795, or 1796, when sailing with a fresh breeze from Santa Martha to Jamaica, in a schooner, he steered for Morant Point; but considering that by keeping as close hauled as that course required, he must be unable to make it before the day was spent, he preferred keeping away, to make the land to leeward of it, and did so at 8 A. M., thus augmenting the rate of the vessel's sailing. At noon he observed the latitude, in conjunction with the pilot, Don Miguel Patina, and found that they were some minutes to the northward of Morant Point; and keeping away W. by S., they saw it at 2 P. M. Although they calculated the direction and velocity of the current, he remembers only that it was to the N. E., and that they were three days crossing from Santa Martha to Jamaica.

"On leaving the parallel of the Bago del Comby (15° 30') the first time that the Spanish surveying vessels went in search of it, and being to leeward of the meridian under which the charts placed it, by 12 leagues, they made sail so that, at the rate of sailing, they expected to join the brig *Alerta* next evening, as they knew she was waiting for them at her anchorage at the southernmost of the Pedro Keys. At 8 A. M. next day, a vessel was seen ahead, which at first they mistook for a rock, but soon made out that it was a vessel at anchor: and by 9 A. M. they saw not only the *Alerta* at anchor, but also the Pedro Key, towards which the current carried them with much strength; and in spite of having to make several tacks, in order to fetch the proper channel, they were anchored beside the *Alerta* by mid-day. The commander does not recollect the longitude he observed that morning, but remembers that the current had carried them to the northward. In the next year, when surveying the west end of the Pedro Shoals, they found the current nearly the same; and this ought to be a warning to navigators not to make too free with the southern edge of the Pedro Shoals during the night.

"Much current has also been found near the Baxo Nuevo, lat. 15° 50', and long. 78° 40', as was remarked by the brig *Alerta*, when near its northern extremity. The same is the case on its southern side; for in prior years, the schooner *St. Gregorio*, bound from Carthagena to Trinidad, saw the south end of the shoal at 4 P. M. At 5 she was three miles from it; but noticing that the current set strongly towards the shoal, they set all sail and ran to the south until they considered the vessel 9 miles from the southern point: and the following morning tacked to sight it, which she did not effect, having doubtless passed to leeward of it."

"In more than thirty voyages made by Captain Pedrola, from the Spanish Main to Porto Rico, St. Domingo and Cuba, sometimes with chronometers, and others without them, he remarked that between the last two islands and the coast of the main, sixteen miles daily might be counted on for a westerly current, but not so much for the former."

In the Memoir, 3d edition, pp. 68-9, was this passage:—"The trade wind blows with strong and continued vigor at certain seasons, particularly in the winter months, and rolls the waves over a great extent of sea, into the great bay westward of Carthagena, which we have called the Bay of Guatemala. This may cause, at times, an outset, but no constant current is to be found." To this is added, in the *Derrotero*, "among the original papers possessed by the Deposito Hydrografico, the following observations, by different officers, have been found, which may tend to throw some light upon the matter:

"In the examination of the coast between Porto Velo (Porto Bello) and the Bocas del Toro, made in 1717, by Don Fabian Abances, he found on that coast, in the month of April, strong currents setting to the E. N. E., at the rate of two miles an hour; so that, heaving to at night, off Cocle Point, he found himself in the morning up at Chagre. The winds at the time were either calm or squally from the south-westward. Don Fabian proceeded to the northward, to the parallel of 10°, and then met with winds from N. and N. N. E., with which he steered W. and W. N. W., until he considered himself 10 leagues to the west of the Bocas del Toro; but the current had carried him to the E. S. E., so that, when he expected to make the Bocas, he found himself at the point of Miguel de Borda, about 5 leagues to the westward of Chagre. During the whole time, from leaving Porto Velo, he never gained an observation, the weather being adverse. On the 11th May he noticed that the waters of the Lagoon of Chiriqui ran out through the Bocas with violence, and formed, at a short distance from the coast, an angle bending to the E. S. E."

Again, "The captain of the ship of the line *Don Pedro de Obregon*, in the month of July, was bound from the Rio Tinto (Black River) to the Havana, and he experienced currents to the north-westward, with winds from the N. E., E. N. E. squalls and calms, and in such a manner that he made the Tortugas Bank of Florida, without having been able to sight Cape Antonio or west end of Cuba."

"Don Joaquim de Asunsola and la Azuela, in July, found strong currents to the S. W. of Capo Gracias a Dios, after having strong winds from the E. N. E. and E. S. E., with squalls; and from the said capo to the westward he found, also, that the current took the same course; and he concludes that, after he had made Providence Island, and until he arrived at Black River, the currents were strong to the W. and S. W."

"The captain of a frigate, Don Gonzalo Vallejo, when at anchor on the Mosquito coast, near Barrancas, or Bragan's Bluff, observed that the current set to the north, at the rate of rather more than half a mile in the hour."

Finally, "Don Ignacio Sanjust, commanding the frigate Flora, on a voyage from Havana to the Gulf of Honduras, and being off Cavallos Point, noticed that the current ran with much force to the N. E. in the month of December; and he adds that, in this gulf, the currents followed no known rule; that near the keys they run with violence, and into the channels between them; so that by them a vessel, during a calm, may soon be carried on the reefs. In the channel between the keys and coast of Honduras, to the south, the water was found setting to the N. E., and, near the coast, to the east."

Near the parallel of 10° N., the currents produced by the N. E. and S. E. trade winds may be imagined to unite; and this united stream, being divided by the Island of Trinidad and the Southern Antillas, thence passes into the Caribbean Sea.

From the mouths of the Amazon, Orinoco, and other rivers, a vast efflux of water falls into the Equatorial Sea, more particularly in the wet season: what effect this water may have on the current is at present unknown. But we learn from the *Derrotero de las Antillas*, that "off the coasts of Guyana there are two currents: 1st. The general or equinoctial current, and another caused by the tides: the boundary of the first is 12 leagues from shore, or in the depth of 9 fathoms of water from which towards the shore that of the tide is experienced. The ebb sets to the N. E., and the flood towards shore. In the Gulf of Paria, also, the tide influences the currents.

"In the southern straits or channels of the Antillas, the velocity of the current inward is seldom under a mile an hour; but its changes are so great that it is impossible to point out its exact direction, or to establish any general rule for its velocity."

"On the Colombian coast, from Trinidad to Cape la Vela, the current sweeps the frontier islands, inclining something to the south, according to the straits which it comes from, and running about 1½ mile an hour with little difference. Between the islands and the coast, and particularly in the proximity of the latter, it has been remarked that the current, at times, runs to the west, and at others to the east. From Cape la Vela, the principal part of the current runs W. N. W.; and as it spreads, its velocity diminishes; there is, however, a branch, which runs with the velocity of about a mile an hour, directing itself towards the coast about Carthagena: from this point, and in the space of sea comprehended between 14 degrees of latitude and the coast, it has, however, been observed that, in a dry season, the current runs to the westward, and in the season of the rains, to the eastward.

"On the Mosquito Shore, and in the bay of Honduras, no rule can be given for the alterations of the current. All that can be said is, at a good distance from land, it has generally been found setting towards the N. W.

"In crossing from the coast, or from Carthagena, to the islands, it has been observed that from Laquayra to the eastern part of St. Domingo, on a voyage made in December, a difference of 106 miles to the westward was found during the seven days the voyage lasted."—*Derrotero de las Antillas*.

Mr. Town, in his *Directions for the Colombian Coast*, has said, "although between the Island of Jamaica and the Spanish Main westerly currents are most frequent, yet they do not always prevail; for ships have been known to be driven by the current from 50 to 60 miles to the eastward in 4 or 5 days. From the beginning of May till November, (the rainy season,) the sea breeze seldom or never blows home to the main; and ships going there should never go to the southward of the latitude of 11°, until they are, at least, 40 or 50 miles to the westward of their intended port; after which they may make a south course, as the land breeze, which is generally from the S. W., and the strong easterly current, will set you to the eastward of your intended port, if great care be not taken. When to the eastward, if light winds prevail, you must stand to the northward until you meet the sea breeze, which will be between the latitudes of 10 and 11 degrees, and then run to the westward.

"Being off Porto Bello, in his Majesty's ship *Salisbury*, on or about the 12th of August 1816, and being a little to the eastward of that port, with light variable winds for several days, the ship was set to the eastward, at the rate of 50 miles per day; and, having been afterwards placed in the same situation, I found it necessary to make the land well to the westward, and to keep close to it. From November until May, (the dry season,) you should endeavor to make the land well to the eastward, and run along shore, as the sea breezes generally blow very strongly, and the current sets to the westward at the rate of about 2 or 3 miles in an hour.

"Between Chagre and Porto Bello, during the rainy season, there is generally a northerly current, at the rate of from 1½ to 2½ miles an hour. After the end of the rainy season the current sets to the southward and westward, and strong southerly and easterly winds prevail here. From November until May, (the dry season,) the southerly and westerly are very light winds, except in squalls, which end with very heavy rain. In sudden squalls you will often have the winds from all points of the compass.

"If at Chagre, at any time during the rainy season, (May till November,) and bound to the eastward, endeavor to get 4 or 5 leagues from the land so soon as you can; for the winds are, in general, very light, and the current very strong. The latter sets from Chagre directly on the rocks of Porto Bello, and thence along the land from E. by N., E. N. E., E. S. E., and according as the land lies; its general rate being from $1\frac{1}{2}$ to $2\frac{1}{2}$ miles in an hour. Great care should be taken when near the land, if a heavy squall and rain appear to be coming on. During this you will have the wind from all points of the compass, and often so strong that all sail must be taken in.

"In crossing the Gulf of Darien, little or no current will be found; whenever there is any, it sets about south, S. by W., or S. by E., up the Gulf.

"Near Carthagena the current generally goes by the wind; but off the islands of Rosario it sets to the N. W., and N. N. W., from one to two miles an hour.

"Between Carthagena and the Magdalena, in the rainy season, you cannot put any dependence on the winds or currents; but, from November to May, the trade wind blows home.

"I should recommend, if turning to windward, with strong trade winds, to keep the shore close to; whereas, by going off from the land, you will not only have a heavy sea, but also a strong N. W. current. If you have light variable winds, approach no nearer to the land than 4 or 5 leagues, as you may be certain of an easterly current."

Captain Livingston says, "during 5 weeks in which I remained at Carthagena, in June and July, 1817, the current in-shore, set constantly and strongly to the northward, at a rate, I am convinced, of not less than $1\frac{1}{2}$ mile an hour, or nearly as strong as the Mississippi at New Orleans. I have seen the Esk, sloop of war, current-rode against a very fresh sea-breeze, when at anchor, nearly west from the city, distant about 1 mile."

Upon the current between the Grand Cayman and Cape Antonio, Captain Monteath has said, "in the months of May, 1814 and 1815, (two voyages in which I was chief-mate of the ship Prince Regent, from Kingston,) in June, 1817, in the ship Fame; and in April and December, 1820, in the ship Mary, between Grand Cayman Island and Cape Antonio, I invariably found the current setting strong to the eastward, or E. S. E.; and I have heard it generally remarked that, vessels shaping a course from the Caymans for Cape Antonio, have found themselves off, or even to the eastward of Cape Corrientes; this has, in the above cases, invariably happened to myself."

Farther on, "in my passage from Kingston, towards Campeche, in the ship Fame, June, 1817, between Cape Antonio and Cape Catoche, I found the current to set due north 27 miles in a run of 18 hours."

We have already given in the preceding page, the remark of the Spanish navigators on the currents of the Mosquito Shore and Bay of Honduras. We now add those of Captains W. J. Capes, of London, and John Burnett, of Port Glasgow.

Captain Capes says, "between Jamaica and Bonacca the current generally sets to the northward and westward. Here, in May, 1816, I was set 60 miles to the westward by the current, and found that it set rather northerly, from one quarter to half a mile an hour. Between Jamaica and Bonacca are the islands called the Swan Islands, in latitude $17^{\circ} 22'$, longitude $83^{\circ} 36'$. I would not advise any one bound to the Bay to make these islands, for it cannot be of service, and the current is so very irregular about them, that the attempt serves only to bewilder the navigator; and by falling in with them in a dark night, a ship would be in danger of running on shore, as the land is very low.

"About the southern Four Keys the currents are very uncertain. I have known three ships to be lost on these Keys by lying to for the night, after they have made them; for, at all times, the current sets strongly on them; and, in two of the cases the ships were every two hours, with an intention to keep their station. In one voyage I took my departure from Bonacca at four P. M., with a strong breeze from the east, which continued till midnight; it then died away, (no uncommon circumstance in this part,) so that I did not lift the southern Four Keys before four P. M. the next day, from the fore-yard. I then made all snug, and plied to windward, under single-reefed topsails and top-gallant sails over them; tacked ship every three hours during night, and, to my surprise, in the morning, we were not more than one or two miles to windward of them: so, if I had heve the ship to, I have no doubt but she would have been driven on shore by the current.

"If a ship be lying to under Rattan, it will not be amiss to try the current. It is my opinion, that the current about Bonacca takes two different directions; one part setting to the N. W. and the other part branching to the S. S. W. I have found it so on several trials, which is the reason that I prefer taking a departure (for the bay) from the middle or east end of Rattan; for, if a ship take her departure from the west end her course will be N. N. W.; but it very frequently happens that ships get down on those reefs when they take their departure from the west end. The reason is this: a ship steering N. W. from the west end has more of the current on her beam, which sweeps round the west end of Rattan very strong at times; consequently, ships that take their departure from the east or middle part do not feel so much of the current."

Captain Burnett, in his directions for sailing from the Bay of Honduras, says, "when the trade wind prevails, a current, often very strong, sets down between Mauger Key and the Northern Triangle; there, dividing itself, it sets to the southward, between Turneff and the Main Reef, and to the northward between the Triangle Reef and Ambergris Key. It is most advisable, with the wind from the east to the E. S. E., to sail to leeward of the Triangle, as you will have a strong current in your favor so soon as you bring it to the eastward of you.

In the channel, between the island Cozumel and the shore, the current along shore runs at the rate of nearly 2½ miles an hour, till lost in the Mexican Sea.*

Mexican Stream, &c.

MEXICAN STREAM, &c.—It is, we believe, a well established, although a controverted fact, that there is a constant indraught on the western side of the Channel of Yucatan, into the Mexican Sea; and that there is commonly a reflow on the eastern side of the same channel around Cape Antonio, &c.

With the former in its favor, his Majesty's ship *Resistance*, Captain Adam, off the Bank of Yucatan, made a course W. N. W. ¼ W., nearly 80 leagues, in the 24 hours, December 16 and 17, 1806; * and we have no doubt that many instances may be found to prove the same effect; on the Cuba side only, it appears that vessels have been set to the southward; and Captain Manderson has stated, that, when a strong easterly wind has been blowing between Cuba and Florida, vessels heaving to off the south side of Cape Antonio, at about two leagues from shore, have, in the course of one night, been carried against a strong sea breeze, nearly as high as Cape Corrientes, being a distance of 10 leagues.†

From Cape Antonio the current sets, at times, to the E. S. E. past the Isle of Pines. Captain Livingston has informed us that, in Murch, 1818, he found the current between the Great Cayman, and Isle of Pines to set in that direction, at the rate of full 2 miles and a half an hour, or 60 miles in the 24 hours. In August, 1817, he found the set nearly the same, but the current not half so strong. The Spanish Directory says, "from Cape de Cruz, on the south side of Cuba, it is noticed that there is a constant current to the westward, with some inclination to the southward or northward, and which has been known sometimes to set 20 miles in a single day." In opposition to this, the exact words of Captain Livingston are, "I have twice experienced a strong current setting about E. S. E. between the Caymans and Isle of Pines; and on the latter of these occasions, both my mate and myself separately calculated it to set about 60 miles per day, or 2½ per hour. This, however, I incline to think a very particular case, such as may but seldom occur. The winds at this time were light and westerly. On the other occasion, so far as I recollect, it set about 12 or 14 miles per day only. All my papers on these subjects have been lost; but the first instance, was too remarkable to be forgotten."

On the northern coast of St. Domingo, and in the windward passages, there does not appear to be any general current. On the north side of Cuba the case is nearly the same; but in the channel here is a regular tide throughout the year, subject, however, to certain variations.

The currents of the Caribbean Sea, are probably varied by the influence of the moon and change of seasons, and combine, in some degree, with the tides; especially about Cuba, Jamaica, and St. Domingo.‡

In an old book, (Kelly's Navigation, vol. i. 1733,) is an abstract from a journal, which contains the following passage:—"between the west end of Hispaniola and the island of Jamaica, if I took my departure upon a full or change of the moon, I found that I made many leagues more than I did at the quarters of the moon. At the full and change, I was looking out for the land long before I saw it; and, at the quarters, I was down upon it long before I looked for it. The reasons, as I found afterwards, were that the full and change made a strong windward current, and the contrary on the quarters. This has been exemplified in many instances."

On this subject Captain Livingston says, "it is a prevailing opinion with many, that the moon governs entirely the currents among the West India Islands. No doubt the moon has some effect on them, but I am of opinion that the winds have a still more powerful influence.

"It is rarely, indeed, on the north side of the Island of Jamaica, that there is a westerly current when the north and N. W. winds prevail; the current then always, or almost always, setting to the eastward.

* The northernmost part of the track extends to 24° 50' N., longitude 90° 39' W.

† Captain Rowland Bourke, when once lying to for the night, off Cape Antonio, found himself next morning off Cape Corrientes.

‡ Captain Cotter, of the ship *Robert*, from the Clyde, some years since threw a bottle overboard to the eastward of Alto Vela, on the south coast of Hayti, and about thirteen months afterwards he saw a Charleston newspaper, at Kingston, Jamaica, which stated that the bottle had been picked up on the shore, near St. Mary's, in Florida.

"On the south side of Cuba, when the wind is westerly, which it often is, you are always certain of a re-flowing current round Cape Antonio. This is easily accounted for: as, when the fresh trade wind ceases, and the westerly winds set in, the barrier is, in some degree, removed, which confined the waters in the Gulf of Mexico, and they seek to regain their level as well by the Channel of Yucatan as by the Strait of Florida."

In the windward Channel of Jamaica, the current generally sets with the wind to leeward, or S. W., yet both here and at Jamaica, it is variable. Some have affirmed that, when a current runs to leeward, on the south side of Jamaica, there is frequently one setting eastward on the north side; and, at other times, no current is to be perceived; also that, when a lee current runs on the north shore, the same circumstances may be perceived on the south shore as were before observed on the north.

But between the Mona Passage and the Caymans, south of the islands, the tendency of the currents towards shore is most commonly found to the north-westward.

In the Bahama Passages the currents are devious; both weather and lee currents having been found. These also appear to be influenced by the tidal causes; for the tides are operative on the banks, and sometimes set strongly.

The following is an additional detail of the best information we have been able to collect, of the currents in the Caribbean and Mexican Seas, from the Derrotero de las Antillas, &c.

In the channel between Trinidad and Grenada the current has been found to set nearly west; on the south side half a point southerly, and on the north side half a point northerly. Its velocity from a mile to a mile and a half per hour.

Between Grenada and St. Vincent's, among the Grenadines, the currents are devious; but the general inset appears to be W. by N.

Between St. Vincent's and St. Lucia, the current, from the eastward, sets in more northerly; and within, on the west, it has been found setting to the N. W. Between these islands it seems to be as strong as in any other part of the range.

Between St. Lucia and Martinique it has been found nearly north. Very variable on the western side of the latter.

The current sets nearly in the same manner between Martinique and Dominica; but to the north-westward of the latter, it has been found nearly S. W. three-fourths of a mile hourly. Northward of Guadaloupe it sets W. $\frac{1}{2}$ S., and between Monsterrat and Antigua N. W.

Between Redonda and Nevis it has been found W. S. W. half a mile hourly.

Without Barbuda and the northern isles, it has set about W. by N., and to the northward of the Virgin Isles and Porto Rico about W. S. W.

At the distance of about one degree, within the range of the Caribbee Islands, and to the Virgin Islands, the current has been found setting, in general, to the W. N. W., from one mile to one mile and a half an hour.

In the Mona passage, between Porto Rico and Hayti, the current has been marked as frequently setting to the N. W., and we have instances of a set through to the S. W., but Captain Montearth, in February, 1816, when proceeding southward towards Porto Rico, in from latitude $23\frac{1}{2}^{\circ}$ to 22° , and longitude 64° to 65° , found the current setting N. N. E. at the rate of 20 miles in the 24 hours: and he says that, off the N. W. end of Porto Rico, it invariably set from the Caribbean Sea to the north and N. N. E. On the western side of the passage it set north, two miles an hour.

From Trinidad, westward, and off the north side of the Spanish leeward Isles, the current has been found setting west and S. W. to the Gulf of Maracaybo; thence S. W. also to Carthagena; but it varies, as has been already noticed.

From Carthagena towards the channel of Yucatan, it has been found N. N. W., N. W., W. N. W., and N. W. by N., from 1 to nearly 2 miles, and then decreasing to $1\frac{1}{2}$ mile per hour. It has also been found setting to the eastward, as shown in the preceding pages.

At about 40 miles northward of Cape Catoche, the current has been found N. W. by W.: changing thence to S. S. W. off the N. W. point of Yucatan, nearly at the same distance from the coast. Rate something less than half a mile an hour. Between this and Vera Cruz the current ceases.

The action of the S. E. trade wind, in the equatorial regions, and the apparent disposition of the waters in these regions to retire westward, which has been attributed to the rotary motion of the earth, are considered as the causes of a current which is known to flow, during a great part of the year, from the Ethiopic Ocean to the Caribbean Sea, and which has frequently carried ships considerably to the west and W. N. W. of their reckonings, when off the N. W. part of Brazil.

On the east coast of Brazil the currents generally partake of the direction of the monsoons, as before explained, but vary in velocity according to the advance and decline of them, as well as the part of the coast.

Lieutenant Hewett says, during the southerly monsoon, the currents to the southward of Cape St. Augustin are not so powerful as to the northward, where they increase in

strength until the months of June and July, and then gradually decline. On the contrary, in the northerly monsoon, they are generally very strong to the southward of Cape St. Augustin, when they are weak to the northward, as they have some difficulty in detaching themselves from the stream, which runs from the S. E. trade around Cape St. Roque.

Mr. Lindley also notices that, "a strong current runs southward from Cape St. Augustin, commencing about the middle of October, and continuing until January, after which there is no particular current till the middle of April, when a powerful one sets in northerly till July, and then subsides in like manner."

The currents of the River Plata, and other local currents near the shores, have been before noticed, in the Descriptions and Sailing Directions.

The following facts establish the existence of a combined current; and they show, in some degree, its force and direction towards the Brazilian coast:

1. In June and July, 1795, the Bombay Castle, East Indiaman, between the Isle of Palma (of the Canaries) and the coast of Brazil, experienced a westerly current, amounting to $6\frac{1}{2}^{\circ}$.

2. On May 20, 1802, the Cuffnells, East Indiaman, lost the N. E. trade in $8\frac{1}{2}^{\circ}$ north, long. 22° . Gained the S. E. trade June 4, in 5° N., long. 21° . From the equator the current was found to set W. and W. by N., from 30 to 52 miles daily, till the coast of Brazil was in sight on the 14th in 8° S.

3. May 23, 1802, the Sir Edward Hughes lost the N. E. trade in 6° N., long. 23° , and the wind was from S. S. E. on the 25th, in 5° N., and 23° 30' W. The trade kept far at southward, and the current set strongly to the west.

4. October 16, 1805, the European fleet lost the N. E. trade in 11° N., long. 28° , and gained the S. E. trade on the 26th, in 4° N., long. 29° . On the 4th of November, the land of Brazil was seen in lat. 6° S.; the wind near the land was at E. by S. and E. S. E. By proceeding too far to the westward, two ships of the fleet were wrecked in the morning of the 1st of November, on the Roccas, or Low Keys, in lat. 3° 52' S. and $33\frac{1}{2}^{\circ}$ W., and several others had nearly shared the same fate. This catastrophe had probably been avoided by a due knowledge of, and attention to, the effects of the current, which was subsequently ascertained to set $2\frac{1}{2}$ miles per hour to the westward near the Roccas.

5. On the 1st of June, 1793, the King George, East Indiaman, crossed the line in 30° W., and from the 2d to the 5th experienced a westerly current of 1° 33'. On the 5th Cape St. Roque was in sight, and the ship was kept working until the 10th, endeavoring ineffectually to weather it. She then stood to the north-eastward, closely hauled, to lat. 1° N., in order to regain the variable winds in north latitude, and then proceeded to cross the equator, which was at length effected.

6. In May and June, 1807, the transports laden with ordnance stores, for the army at Monto Video, by crossing the equator too far to the westward, were carried so far in this direction by the current, that they could not get to the southward of Cape Augustin, (lat. 8° 23' S.) and were twice obliged to stand to the northward, into variable winds, to regain easting, after having attempted ineffectually to gain the regular south-east trade wind.

7. It is a well known fact, that several ships have made the isle of Fernando Noronha, on their outward bound passage to India, by currents having set them to the westward, after the failure of the N. E. trade wind. The current runs strongly about this island.

GULF STREAM AND STRAIT OF FLORIDA.

THAT immense current which continually sets from the gulfs of Mexico and Florida, to the northward and north-eastward, should be well understood, as all who navigate the coast of North America, experience more or less of its influence.

Three degrees to the N. N. E. of Vera Cruz, the current has been found setting to the N. E. one mile an hour. Then N. N. E. and N. by E., and again N. E., nearly to the parallel of $52\frac{1}{2}^{\circ}$, long. $91\frac{1}{2}^{\circ}$. Here it changes more to the east, and becomes in lat. 26° E. by S., changing southward to S. E. by S. In the direction of the River Mississippi, and lat. 25° 30' N., the current sets variously to the south-eastward. Its extent and exact direction are here unknown, but it is certain, that setting towards the N. W. part of Cuba, and striking on the banks of Isabella and Colonos, a portion of it winds round Cape Antonio to the south-eastward, while the great body of it sets eastward, to the northward of Cuba, winding to E. N. E., N. E., and N., through the Strait of Florida, into the Atlantic Ocean.

The Derrotero de las Antillas says, "By the Strait of Florida, we understand the space included between the meridian of the Dry Tortugas and the parallel of Cape Canaveral. The simple inspection of the chart will show this to be a bed or course, which, like a river, conducts the water to the northward. This river, or general current, flows first to the E. N. E. as far as the meridian of the western part of the Double Shot Keys, by which keys the stream is diverted from E. N. E. to N. by E., the direction which it pursues on the parallel of Cape Florida: thence to Cape Canaveral it runs north, inclining a little to the east.

"On the meridian of the Havana, stripes of current are at times found setting to the E. S. E. and S. E. from the Tortugas soundings. Care should be taken not to confuse the southern differences, caused by this branch of the current, with those caused by the eddy current near the Colorados—the one giving eastern departure, the other west. The distinction is very clear, and can admit of no doubt, because the eddy current is met only from the meridians of Cavanas and Bay Honda to Cape Antonio, and not farther out from the coast than the parallel of 23 degrees.

"As the velocity of the current varies, it is requisite for every navigator to ascertain its strength as frequently as possible, while within the stream. Every one who enters this channel, having marked well either the lands of Cuba or the Florida Reef, so as accurately to establish this point of departure, ought to determine, in his first day's work, the velocity of the current by the difference of latitude, by account and observation. We say during the first day's work, because the generality of common navigators make use of meridian altitudes and the sun alone, to find the latitude: but it is very clear, that altitudes of the planets and fixed stars ought not to be neglected; not only because by this you cannot be in doubt of your real latitude, but also because they may be more exact than latitudes deduced from meridian altitudes of the sun, when that luminary passes in the proximity of the zenith, and because these repeated observations during the night assume, as much as possible, the situation of the ship. Thus you may go on, with a clear idea of the operation of the current, and the way that the ship is making. Having ascertained the velocity of the current, use can be made of it to find the ship's departure, and this knowledge will be most important when you fail in obtaining observations for latitude; because, in such a case, wanting a knowledge of the difference of latitude given by the current, you will be in want of every thing; but if you know the velocity of the current, and with it the course which it follows, you may find the difference of latitude and departure which the current gives, and which, though it will not give the position of the ship with that precision with which it might be obtained by latitude observed, will still approximate sufficiently to the truth to enable one to avoid danger, if prudence and seaman-like conduct are combined."

For those who have little experience in the art of navigation, we add—

1. That it is most convenient to direct your course in mid-channel, not only because it is the furthest from danger, but because you will there have the strongest current, which is desirable. (See Remarks of Mr. Romms on the Gulf Stream.)

2. That, as you cannot ascertain with all necessary certainty the position of the ship, notwithstanding the rules given to diminish the errors occasioned by the currents, you ought, with the utmost care, to shun the eastern coast of Florida, as being very dangerous, the trade wind blowing upon it, while there is not the least risk in running along the Salt Key Bank, and the edge of the Great Bank of Bahama. Upon the latter, also, you meet with good anchorages, very fit to lie in during the hard northerly gales experienced between November and March, and which do not fail to cause much damage, and sometimes even force vessels to bear away, which is always dangerous, for the weather is generally thick, with such winds, and the greatest danger will be to run, in one of them, ashore upon the coast of Cuba, when hoping to have made Havana or Matanzas. Therefore, so soon as there is an appearance of a northerly gale, the best way is, if near the Salt Key Bank, to anchor on it; and if near the great Bank, to approach the edge of it, in order to be able to anchor when it may be necessary; for, although you may have a hard norther, so long as you can lie to in it, you ought to pursue your voyage, as the current will certainly carry the ship through the strait.

3. It is very necessary to sight the keys on the bank, even though you have no fear of a norther, and there may be occasions in which every exertion should be made to see them, especially if, from want of observations, the situation of the ship is not well known.

4. When, owing to calms or light winds, a vessel not bound to the northward is in danger of being carried through the strait by the current, she ought immediately to approach the edge of the Salt Key Bank, or of the Great Bahama Bank, and return from thence by the Santaren Channel to the coast of Cuba, without trying to beat back the lost ground; for by doing this, she would only render the chance of being carried through more certain.

5. Should you involuntarily approach the coast of Florida, you should take extraordinary care to examine whether you have advanced out of the general current, and into the eddy. That you may know this, observe the eddy forms a remarkable and visible

line between it and the general current, which line of division is, in many places, out of sight of land; that in general you have no soundings on it, and that it shows, not only by the change in the color of the water, but that also in it, during the greatest calms, there is a kind of boiling or overfalling of the water. From this line of division the water gradually changes color, so that near the Florida Keys it is a beautiful sea green, and at last it becomes almost as white as milk.

6. When in the eddy, you have to make the correction of currents on courses entirely different from those in the stream. This is the more necessary to be attended to, because, from ignorance of this circumstance, many have been shipwrecked.

7. When you enter the channel, or strait, from the Tortugas Bank, with the intention of passing through, take care to become certain of the land of Cuba, or some part of the Reef of Florida, in order to have a good departure; for although the latitudes and soundings on the Tortugas Bank are more than sufficient to ascertain the place of the ship, yet the variable set of the current toward the Havana may produce a serious error, if not properly attended to. The meridian of the Havana is, in a word, the best point of departure for ships bound to the north-eastward.

At about 34 degrees north of Cape Antonio, the current has at times been found setting to the S. W., winding towards the northern edge of the Yucatan Bank; but at a degree thence eastward, setting nearly S. E. Off the west end of Cuba, at 10 leagues N. W. from Cape St. Antonio, it has been found setting S. W. by W. one mile an hour. But these cannot be considered as its "general directions."

The stream in mid-channel, on the meridian of Havana, acquires the direction of E. N. E., and velocity of about 2½ miles an hour. On the meridian of the southernmost point of Florida, its velocity, at about one-third over from the Florida Reefs, is commonly 2½ to 3½ miles. Between the Bemini Isles and Cape Florida, its direction is about N. by E., and velocity the same.

On the Cuba side the stream is weak, and it sets to the eastward. On the opposite side, along the Florida Reefs and Keys, there is a re-flow or counter current, setting to the S. W. and W. By the assistance of the latter, many small vessels have navigated through the strait from the northward; but this navigation is too dangerous to be attempted by strangers. The tides set strong among these reefs, and are more particularly described in this work.

The winds are found to affect the position of the stream considerably. Between Cuba and Florida northerly winds press it southward towards the shore of the former; southerly winds have a contrary effect. When turned to the north, easterly winds press it to the Florida side, and westerly winds nearer to the Bahamas. Southerly winds cause it to spread, and so may those from the north.

In the Strait of Florida, within the Bahamas, when a northerly gale increases to a storm, it opposes the stream in its course, and its adverse power causes it to fill all the channels and openings among the isles and reefs, and to overflow all the low coast. Shipping have even been carried over the low keys, and left dry on shore.* The water is supposed at times to have risen to the height of 30 feet, and to have been running against the fury of the winds at the rate of 7 miles an hour. During these times the Strait of Florida exhibits a scene terrific beyond description.

Remarks on the Stream, &c., by Captain J. Steele Park.

"Sailed from Jamaica for London, on the 20th May, 1824. At noon, on the 27th, was off the S. W. side of Cuba, in latitude 21° 26', longitude by chronometers and lunars 84° 47' W. Here was discovered a current setting to the N. W. at the rate of 2 miles an hour. At 7h. 30m. Cape Antonio bore N. W., 5 or 6 miles. The current to the N. W.," says Capt. Park, "swept us into the Gulf of Mexico; and there we were beating about three or four days, making nothing and westing in spite of our teeth. All this time the wind was easterly, and we might have cruised about there till Christmas, had the wind not got a little to the southward of east, which enabled us to get over to the N. E. side, where we found the current running directly opposite to the former, being now in the Florida stream.

"After rounding Cape Antonio the land of Cuba was not seen. At this time, (the latter days of May, 1824,) the stream along the Florida side, and even in the strait, was by no means so strong as it is generally found. In the narrowest part, where, of course, we had a right to expect the greatest velocity, it was running at the rate of only 2½ miles in the hour. This was correctly ascertained by meridian altitudes of sun and moon, and an excellent chronometer.

*In the month of September, 1769, there happened an inundation, which covered the tops of the highest trees on the Cayo Larga, &c., and during which the Ledbury Snow, John Larin, master, was carried over the reef by the N. W. current of the stream, caused by a gale from N. E. The vessel bilged in shallow water, but an anchor was thrown out, and the next day the vessel was found to have grounded on Elliot's Key with its anchor among the trees.—[De Brialion's Atlantic Pilot.]

"When we cleared the Gulf," (Strait) Capt. Park adds, "I was anxious to keep in the influence of the stream, and pass near the Tail of the Bank of Newfoundland, but it came on to blow hard from the northward, in latitude $34^{\circ} 35'$, and longitude $72^{\circ} 20'$ (E. by S. from Cape Hatteras,*) This, of course, drove us away to the eastward, out of the favorite track, and we passed about 300 miles to the northward of the Bermudas. During this gale, for several days a current was found to proceed from the eastward to the W. S. W., but in latitude 38° and longitude about 59° , the ship was in the Gulf Stream, setting finally to the N. E.

"On June 23d, at noon, lat. $37^{\circ} 51'$, long. $61^{\circ} 54'$; June 24th, lat. $39^{\circ} 56'$, long. $57^{\circ} 26'$ (by altitudes and chronometer. Here the ship really made $4^{\circ} 28'$ of easting in the 24 hours run, and the log gave only $3^{\circ} 16'$. In the same time nothing was made. The true difference of latitude was 125 minutes, but the log gave about 80 only. The vessel had been running all the time E. by N., by compass, and went through the water 173 miles. Allowing half a point of variation, gives the true course N. E. by E. $\frac{1}{4}$ E. Subsequently, on making Scilly, there was not an error in the watch of a single mile.

"After the gale from the northward subsided, the winds became variable between N. W. and S. W. The ship passed near the Tail of the Great Bank, and continued to carry a fine north-easterly current, at the rate of 30, 25, and 20 miles a day, until she reached lat. $43^{\circ} 35'$ and long. $36^{\circ} 50'$, where it ceased."

Currents from the Bay of Honduras, and thence through the Strait of Florida, as observed by Capt. W. J. Cupes, in Jan. 1824.

From the S. W. corner of the Tortugas Bank, the current has, at times, been found to set S. S. W. directly over to the Coloradns. But between the Tortugas and Bahia Honda, or Port Cavañas, it takes its regular set to the eastward.

The boisterous east, N. E., and N. winds, which affect the Gulf Stream, generally begin in September, and continue until March.

On the southern edge of the Tortugas Soundings, lat. $24^{\circ} 30'$, long. $83^{\circ} 30'$ the current sets about E. by S. 20 miles in the 24 hours; and in lat. 24° , long. $82^{\circ} 20'$, it sets about E. by N. 42 miles.

Remarks on the Stream, by Captain W. J. Monteath.

Between latitude $25^{\circ} 40'$ and $28^{\circ} 20'$, Captain Monteath found the current in the Strait had set 80 miles in the 24 hours of June 27, 1820. On the southern border of the stream, (northward of the parallel of Cape Hatteras,) 6th July, 1820, lat. $35^{\circ} 20'$ to $36^{\circ} 30'$, long. $72^{\circ} 30'$ to $71^{\circ} 3'$, Captain M. found the current setting N. E. 75 miles in the 24 hours. Next day, July 7, to lat. $37^{\circ} 40'$, long. 69° , he found it N. 53° E. 86 miles in 24 hours. On the following day, July 8, to lat. $38^{\circ} 39'$, long. 67° , it ran N. 58° E. 30 miles. July 9, to lat. $39^{\circ} 10'$, long. $66^{\circ} 10'$, westward, only 10 miles. The observations were continued each day by chronometer, which agreed within a few miles.

The stream, from lat. 26° to 28° , generally sets north, rather easterly; from 28° to about 31° , it appears to run north, inclining a little in the direction of the coast, rather westerly; it thence suddenly turns to the N. E. by E., or a little more easterly, to latitude 35° , or about the parallel of Cape Hatteras, where it runs within about 18 miles of the Cape.

The stream, in the neighborhood of the coast at Cape Hatteras, inclines more to the eastward, at the rate of about 24 knots; then the shoals of Nantucket appear to front it, and to throw it off to the E. N. E. and E. by N. northerly. In about the parallel of $39\frac{1}{2}^{\circ}$,

* A scientific navigator says, "When in the Gulf, eastward of Hatteras, I generally endeavor to get out of it as early as possible, especially with a strong N. E. wind, for I think the advantage of the current will not compensate for the effects of the destructive sea and squally weather, which generally attend that part of the ocean."

longitude $63\frac{1}{2}^{\circ}$, it has been found to run at the rate of two knots between E. by N. and E. N. E.

Col. Williams, in his "Thermometrical Navigation," states that the whirlpools on the northern edge of the stream, have been seen in lat. $41^{\circ} 57'$ long. $65^{\circ} 1'$. He also observed great quantities of weed, supposed to be on the northern edge of the stream, in latitude $41^{\circ} 53'$, long. $65^{\circ} 33'$. It has subsequently been ascertained by Lieut. Charles Hare, R. N., that on the meridian of $57^{\circ} W.$, in the summer season, the northern edge of the stream ranges up to $42\frac{1}{2}^{\circ} N.$, and even in the winter months to above $42^{\circ} N.$ This has been confirmed by twenty-five voyages across the Atlantic, assisted by chronometer, thermometer, &c., the last of which was made in the fall of the year 1824.

It is, however, to be considered, that a north, N. E. or east wind forces the stream towards the coast, contracts its breadth, and thus increases its rapidity. On the contrary, S. W., west, and N. W. winds, force the stream further into the ocean, and diminishes its strength.* It is clear, then, that the stream fluctuates in its direction and force, according to circumstances, and no absolute rule can be given for ascertaining its more ordinary boundaries; it therefore follows, that a description of the indications by which it may be known, is of more importance. These are, the appearance and temperature of the water; the stream, in its lower latitudes, and usual course in fair weather, where it flows uninterruptedly, may be known by its smooth and clear surface, and blue color. The margin of the stream is marked by a ripple on its edge; the water in some places appears like boiling water; and in other places, it foams like the waters of a cataract, even in dead calms, and in places which are fathomless; and during strong N. E. winds, that part from Cape Roman to the north and east breaks violently, so much so that it has been mistaken for shoals during the night.

On the outer edge of the stream, especially in fair weather, there are great rippings, which are very perceptible; and it has been observed, by many navigators, that in the Gulf the water does not sparkle in the night, but with south-easterly winds it does as much as in other parts of the ocean. The appearance of the weed called Gulf-weed is also an indication of being in or near the stream, as it is never seen far north of it.

By the advantage of knowing how near to the coast a ship may venture, and how to distinguish the Gulf Stream from the water between it and the coast, we can be sure of a favorable current either way; and a small vessel might make a short voyage from Halifax to Georgia, which is thought by some a longer one than to Europe. Suppose you had the wind ahead all the way; take your departure and stand for the stream; so soon as you find the water to increase in heat about half as much as you know it would when in the stream, heave about and stand for the coast; you will infallibly discover the edge of soundings by the cooling of the water; then stand off again, and so on to the end of the voyage; when it is almost certain, that the distance would be run in a shorter time than if there were no stream, for you would have a favorable inside current. On the return passage, take your departure, and run off till you get into the warmest water, which will be the middle of the stream, and take the advantage of its currents.

The following fact may serve to illustrate the propriety of these directions. In June, 1798, the Mail-Packet for Charleston, had 25 days' passage in going, but returned in 7. The captain accounted for this by having calms, or very light airs and a northerly current. This was the true cause. He was in the middle of the stream, where there generally are calms or light winds; the edges only, which come in contact with colder regions being tempestuous. After being in the latitude of Cape Hatteras, he found himself in that of Cape Henry, (100 miles to the northward.) The vessel, however, arrived at last; and on the return voyage, the captain steered the same course back again; and, with the same light airs, he performed the voyage in seven days. Had this captain known the use of the thermometer, need he to have been much longer in going than in coming?

The thermometer is not only useful for ascertaining when in the Gulf Stream, but it is likewise advantageous in discovering the approach to soundings on the Coast of North America between Cape Canaveral and the Island of Newfoundland.

We believe the thermometer only indicates the difference of temperature caused by going into or leaving the Gulf Stream, on the principle that its temperature is influenced

* An experienced navigator, before quoted, says, "It is always found that the strongest current is in the warmest water. I have observed the greatest degree of heat of the Gulf, between the meridian of Cape Hatteras and that of Nantucket, to vary at different times from 75° to 67° of Fahrenheit, and the strongest current to differ from 3 to $1\frac{1}{2}$ miles per hour; that the breadth of the stream current is much less than is generally supposed, and that the winds cause a great effect on the Gulf; for instance a wind that would produce a current of one knot, would retard one of 3 knots to 2 knots if opposed to it; and would accelerate the same to 4 knots, if in the same direction; and that a wind crossing a current obliquely, would affect it as the sine of the angle at which it is opposed. The direction of a current cannot, however, be materially changed, when forced against an opposing barrier."

and governed entirely by the fact that it comes from the Tropical regions, where the mean temperature is 82° , and it requires a long time before so large a body of water loses or changes its temperature in a very great degree.

At the edge of the Great Bank of Newfoundland, the water has been found 5 degrees colder than the deep ocean to the eastward. The highest part of the bank is 10 degrees colder still, or 15 degrees colder than the ocean eastward.

On the coast of New England, near Cape Cod,* the water out of soundings is 8 or 10 degrees warmer than in soundings in the winter; and in the stream it is about 8 degrees warmer still, so that, in coming from the eastward, a fall of 8 degrees will indicate your leaving the stream, and a further fall of 8 degrees will indicate your being on soundings.

On the coast from Cape Henlopen to Cape Henry, the water out of soundings is five degrees warmer than in soundings in the winter; and in the stream about 5 degrees warmer still; so that, in coming from the eastward, a fall of 5 degrees will indicate your leaving the stream, and a further fall of 5 degrees will give notice of soundings.

Mr. Williams recommends to seamen to take three thermometers. "Let them," he says, "be kept in one place some days previous to sailing, in order to try their uniformity. The plate should be made of ivory or metal, for wood will swell at sea; and as the glass tube will not yield, it is from this reason very liable to break; bell metal is the best. Let the instrument be fixed in a square metal box, the bottom of which, as high as the mark 30° , should be water tight; so that, in examining the degree of heat, the ball may be kept in the water; the remainder of the length should be open in the front, with only two or three cross-bars to ward off any accidental blow, like the thermometer used by brewers. Fix one instrument in some part of the ship, in the shade, and in open air, but as much out of the wind, and in as dry a place as possible. The upper part of one of the after stanchions, under the quarter rail, may answer, if no better place can be found.

"Let the second instrument be neatly slung, with a sufficiency of line to allow it to tow in the dead water of the wake.

"Put the other away safely, to be ready to supply the place of either of the others in case of accident."

About the edges of the stream there is generally a current running in a contrary direction, which is accelerated by the wind, in proportion to its strength, blowing contrary to the stream, and retarded, or perhaps altogether obstructed, by the wind blowing in the direction of the stream. In the latter case, the limits of the stream will be extended.

In the winter, heavy and continued gales very frequently prevail, which commonly proceed from between the north and west, across the course of the Gulf Stream, from Cape Hatteras until past George's Bank, and bend its direction more to the eastward; being aided at the same time by the discharge of the great bays and rivers, increased by the force of the wind blowing down upon them, and the constant supply of stream that passes along the coast of the Carolina, the whole produces so strong a current to the eastward as to render it impossible for a ship to approach the coast until there is a change of wind.

During the prevalence of a southerly or south-easterly wind, it has been found that the current is forced close to the shore. This proves the gulf is influenced by winds,—Being thus pent in between the wind and the shoal grounds near the shore, the breadth is greatly diminished, and the velocity proportionally increased. This circumstance has been, in particular, observed from about the longitude of Block Island, along the edges of Nantucket Shoal, thence beyond George's Bank; it has the same effect along the coast of Georgia and part of South Carolina. In the first place, the southerly winds forced the current to the edge of the soundings, where it then ran from $1\frac{1}{2}$ to 2 knots; and, in the latter place, that the easterly wind forced the current upon soundings.

With west and N. W. winds, the stream would be removed some leagues farther off. These remarks are sufficient to show the uncertainty of the boundaries or edges of the stream. These eddies on the inner edge are inconsiderable; but on the outer one, in fine weather, they are strong, and of considerable extent.

By an ingenious work, entitled "Thermometrical Navigation," written by Mr. John Williams, and published at Philadelphia, in 1799, we are informed that Commodore Traxton has often ascertained the velocity of the Gulf Stream, to the northward of Cape Hatteras, and found it to be seldom less than one knot, and never more than two knots, an hour. The temperature of the air and water without the stream was generally the same; that is, the difference seldom exceeded 2 or 3 degrees; the air being sometimes the warmest, at other times the water.

Capt. Livingston says, "it set me off Cape Hatteras, one degree and eight miles,

* The bank, from Cape Cod, extends almost as far as Cape Sable, where it joins the banks of Nova Scotia, deepening gradually from 30 to 50 or 55 fathoms, which depth there is in latitude 43° . In crossing the bank between lat. 40° $41'$ and lat. $43'$, the bottom is very remarkable. On the outside it is fine sand, shoaling gradually for several leagues. On the middle of the bank, it is coarse sand or shingle with pebbles. On the inside it is muddy, with pieces of shells, and deepens suddenly from 45 or 48 to 150 or 160 fathoms.

by sidereal and solar observations, to the northward, in 16 hours, by dead reckoning; and Capt. J. Coltast, of Philadelphia, informed me that it set occasionally with greater velocity."

Mr. Williams observes, "In the stream the water is much warmer than the air; indeed, I have known it 10 degrees warmer; but so soon as you get within the stream, (that is, between it and the coast,) the water becomes colder than the air; and the more as you get on soundings and approach the shore.* If mariners, who have not the opportunity of determining their longitude by celestial observations, will only *carry with them a good thermometer*, and try the temperature of the water, and compare it with that of the air every two hours, they may always know when they come into or go out of the Gulf Stream. Indeed, I have always made a practice, when at sea, of comparing the temperature of the air and water daily; and often very frequently during the day throughout my voyage: whereby I immediately discovered any thing of a current that way going, and afterwards found its strength and direction by observations for the latitude and longitude. It is of the utmost consequence, in making a passage to and from Europe, to be acquainted with this Gulf Stream; as by keeping it when bound eastward, you shorten your voyage, and by avoiding it when returning to the westward, you facilitate it inconceivably; so much so, that I have frequently, when bound from Europe to America, spoken European ships, unacquainted with the strength and extent of it, off the banks of Newfoundland, and been in port a very considerable time before them, by keeping out nearer the inner line of it, by choice, than 10 or 15 leagues; and then the probability will be, that their passage will be assisted by the help of a counter current which often runs within it. In coming off a voyage from the southward, be sure to steer N. W. when approaching the stream, if the wind will permit you; and continue that course till you are within it, which may be easily known by the temperature of the water, as before mentioned. I have always considered it of the utmost consequence, when bound in, to cross the stream as speedily as possible, lest I should be visited by calms or adverse winds, and by these means drove far out of my way, which would prolong the voyage considerably, especially in the winter season.

The course of ships bound from Europe to the ports of the United States is controlled, in a great degree, by the operation of the Florida Stream. Little, therefore, requires to be added to the subject here. Those bound to the northern and middle ports, when passing the shoal grounds on George's Bank, should take care to pass between these shoals and the stream. Also, when passing the Nantucket Shoals, to keep between them and the stream.

Ships crossing the stream, when bound to the westward, must get over as quickly as possible; or it is clear that they will be carried far out of their course.

It has been remarked that "ships from sea, approaching any part of the American coast between Long Island and Cape Hattens, if in doubt about their reckoning, should take notice of what is commonly called the gulf-weed," which is in greater plenty, and in larger clusters, to the eastward of the Gulf Stream than in it, where the sprigs are but small and few. Within the stream there is no weed, unless in rare instances, and there the color of the water changes to a still darker and muddy color.

The outer edge of the bank off this part of the coast appears to be very steep; for it has been frequently found that, while the lead has been kept going, there have been found 45 fathoms, soon after 35, and a mile nearer the shore only 25 or 20 fathoms; from these depths the shoaling to the shore varies in different directions.

Sir Charles Blagden, M. D. and F. R. S., in the transactions of the Philosophical Society, says, "During a voyage to America, in the spring of the year 1776, I used frequently to examine the heat of sea water newly drawn, in order to compare it with that of the air. We made our passage far to the southward. In this situation, the greatest

* By the journals of Capt W. Billings, of Philadelphia, it appears that in June, 1791, the water on the coast of America was at the temperature of 61°, and in the Gulf Stream at 77°. By those of Mr J. Williams, it appears that in November, 1789, the water on the coast was 47°, and in the Gulf Stream at 70° viz.:

The difference of heat is therefore greater in winter than in summer.

Captain A. Living-ston says, "On my voyage from Philadelphia to Kingston, Jamaica, October, 1817, I particularly attended to the thermometer. Close off the mouth of the Delaware, in about 16 fathoms, it stood at 69°; on the maer edge of the Gulf Stream it rose pretty rapidly to 66°, and in the course of an hour to 70°; next morning 78°, which heat continued till we were to the southward of Bermuda, whence it gradually increased until between Cuba and St. Domingo, and at Jamaica it was 82°, which appears to me to be the mean temperature of the sea water about Jamaica.

head of the water, which I observed, was such as raised the quicksilver in Fahrenheit's thermometer to 77° . This happened twice; the first time on the 10th of April, in lat. $21^{\circ} 10'$ N., and long., by reckoning, 52° W., and the second time, three days afterwards, in lat. $22^{\circ} 7'$, and long. 55° ; but in general, the heat of the sea, near the tropic of Cancer, about the middle of April, was from 76° to 77° .

"The rendezvous appointed for the fleet being off Cape Fear, our course on approaching the American coast, became north-westward. On the 23d of April, the heat of the sea was 74° , our latitude, at noon, $28^{\circ} 7'$ N. Next day the heat was only 71° ; we were then in latitude $29^{\circ} 12'$; the heat of the water, therefore, was now lessening very fast, in proportion to the change of latitude. The 25th, our latitude was $31^{\circ} 3'$; but though we had thus gone almost 2° farther to the northward, the heat of the sea was this day increased, it being 72° in the morning, and $72\frac{1}{2}^{\circ}$ in the evening. Next day, 26th of April, at half past 8 in the morning, I again plunged the thermometer into sea water, and was greatly surprised to see the quicksilver rise to 78° , higher than I had ever observed it even within the tropic. As the difference was too great to be imputed to any accidental variation, I immediately conceived that we must have come into the Gulf Stream, the water of which still retained great part of the heat that it had acquired in the torrid zone. This idea was confirmed by the subsequent regular and quick diminution of the heat; the ship's run for a quarter of an hour had lessened it 2° , the thermometer, at three-quarters after 8, being raised by sea water, fresh drawn, only to 76° ; by 9, the heat was reduced to 73° ; and in a quarter of an hour more, to 71° nearly; all this time the wind blew fresh, and we were going seven knots an hour on a north-western course. The water now began to lose the fine transparent blue color of the ocean, and to assume something of a greenish olive tinge, a well known indication of soundings. Accordingly, between 4 and 5 in the afternoon, ground was struck with the lead, at the depth of 80 fathoms the heat of the sea being then reduced to 69° . In the course of the following night and next day, as we came into shallower water, and nearer the land, the temperature of the sea gradually fell to 65° , which was nearly that of the air at the time.

"Unfortunately, bad weather on the 26th prevented us from taking an observation of the sun; but on the 27th, though it was then cloudy at noon, we calculated the latitude from two altitudes, and found it to be $33^{\circ} 26'$ N. The difference of this latitude from that which we had observed on the 25th, being $2^{\circ} 23'$, was so much greater than could be deduced from the ship's run, marked in the log book, as to convince the seamen that we had been set many miles to the northward by the current.

"On the 25th, at noon, the longitude by our reckoning was 74° W., and I believe the computation to have been pretty just; but the soundings, together with the latitude, will determine the spot where these observations were made, better than any reckoning from the eastward. The ship's run on the 26th, from 9 in the forenoon to 4 in the afternoon, was about 10 leagues on a N. W. by N. course; soon afterwards we have to in order to sound, and finding bottom, we went very slowly all night, till noon the next day.

"From these observations I think it may be concluded that the Gulf Stream, about the 33d degree of north latitude, and the 76th degree of longitude west of Greenwich, is, in the month of April, at least 6 degrees hotter than the water of the sea through which it runs. As the heat of the sea water evidently began to increase in the evening of the 25th, and as the observations show that we were getting out of the current when I first tried the heat in the morning of the 26th, it is most probable that the ship's run during the night is nearly the breadth of the stream, measured obliquely across; that as it blew a fresh breeze, could not be less than 25 leagues in 15 hours, the distance of time between the two observations of the heat, and hence the breadth of the stream may be estimated at 20 leagues. The breadth of the Gulf of Florida, which evidently bounds the stream of its origin, appears by the charts to be 2 or 3 miles less than this, excluding the rocks and sand-banks which surround the Bahama Islands, and the shallow water that extends to a considerable distance from the Coast of Florida; and the correspondence of these measures is very remarkable, since the stream, from well known principles of hydraulics, must gradually become wider as it gets to a greater distance from the channel by which it issues.

"If the heat of the Gulf of Mexico were known, many curious calculations might be formed by comparing it with that of the current. The mean heat of Spanish Town and Kingston, in Jamaica, seems not to exceed 81° *; that of St. Domingo, on the sea coast, may be estimated at the same, from Mons. Godin's observations; † but as the coast of the

* History of Jamaica, London, 1754, vol. iii. page 652, 653. The different observations of the heat recorded in that work, do not agree together, but those adopted here are taken from that series which appeared to me most correct.

† Mousier Godin's experiments upon the pendulum were made at the petit grove. They continued from the 24th of August to the 4th of September, and the average heat during that time was such as is indicated by 25° of M. de Reaumur's thermometer, (see Mem. Acad. Science, 1735, p. 5, 7.) According to M. de Luc's calculation, (see Modifications de l'Atmosphere, vol. i. p. 376.) the 25th degree of Reau-

continent, which bounds the gulf to the westward and southward, is probably warmer, perhaps a degree or two may be allowed for the mean temperature of the climate over the whole bay; let it be stated at 82 or 83 degrees. Now there seems to be great probability in the supposition that the sea, at a certain comparatively small distance below its surface, agrees in heat pretty nearly with the average temperature of the air, during the whole year, in that part; and hence it may be conjectured that the greatest heat of the water, as it issues out of the bay to form the stream, is about 82 degrees,* the small variation of temperature on the surface not being sufficient to affect materially that of the general mass. At the tropic of Cancer, I found the heat to be 77°; the stream, therefore, in its whole course from the Gulf of Florida, may be supposed to have been constantly running through water from 4 to 6 degrees colder than itself, and yet it had lost only 4° of heat, though the surrounding water, where I observed it, was 10° below the supposed original temperature of the water which forms the current. From this small diminution of the heat, in a distance of probably 300 miles, some idea may be acquired of the vast body of fluid which sets out from the Gulf of Mexico, and of the great velocity of its motion. Numerous observations of the temperature of this stream, in every part of it, and at different seasons of the year, compared with the heat of the water in the surrounding seas, both within and without the tropic, would, I apprehend, be the best means of ascertaining its nature, and determining every material circumstance of its movement, especially if the effect of the current, in pushing ships to the northward, is carefully attended to, at the same time with the observations upon its heat."

On the 25th September, 1777, as the ships which had transported Sir William Howe's army up Chesapeake Bay were returning towards the Delaware, with the sick and stores, they were overtaken, between Cape Charles and Cape Henlopen, by a violent gale of wind, which, after some variation, fixed ultimately at N. N. E., and continued five days without intermission. It blew so hard that they were constantly losing ground, and driven to the southward. We also purposely made some easting, to keep clear of the dangerous shoals which lie off Cape Hatteras.

On the 28th, at noon, our latitude was 36° 40' N., and the heat of the sea, all day, about 65°. On the 29th our latitude was 36° 2'. We had, therefore, in the course of these 24 hours, been driven by the wind 38 nautical miles to the southward. The temperature of the sea continued nearly at 65°. Next day, the 30th, our latitude, at noon, was 35° 44', only 18 miles farther to the southward, though in the opinion of the seamen aboard, as well as my own, it had blown at least as hard on this as on any of the preceding days, and we had not been able to carry more sail; consequently it may be concluded that some current had set the ship 20 miles to the northward. To know whether this was the Gulf Stream, let us consult the thermometer. At half past nine in the forenoon of this day, the heat of the water was 76°, no less than 11° above the temperature of the sea, before we came into the current.

Towards evening the wind fell, and we stood N. W. by N., close hauled. As the sea still ran very high, and the ship scarcely went above two knots an hour, we did not make less than three points of leeway on this tack. The course we made good, therefore, was W. N. W., which on the distance run by noon next day, gave us about 16 miles of northing; but that day, the first of October, our latitude was 36° 22', 38 miles farther to the north than we had been the day before; the difference, 22 miles, must be attributed to the Gulf Stream. This, however, is only part of the effect which the current would have produced upon the ship, if we had continued in it the whole 24 hours; for though we were still in the stream at five in the afternoon of the 30th, as appeared by the heat of the water, being then above 75°, and at eight in the evening the heat being still 74°, yet by seven the next morning we had certainly got clear of it, the heat of the sea being then reduced to the former standard of 65°. On this occasion, therefore, we did not cross the stream, but, having fallen in with it obliquely on the western side, we pushed out again on the same side, as soon as the gale abated.

These observations having been made 3° to the northward of my former ones, it is curious to observe that the heat of the Gulf Stream was 2° less. The seasons of the year, indeed, were very different; but, perhaps under such circumstances, that their effects were nearly balanced. In the latter observations, the meridian altitude of the sun was less, but than a hot summer preceded them; whereas in the former, though the sun's

mer's true thermometer answers to about the 85th of Fahrenheit's; but the average heat in Jamaica, during the months of August and September, is also 85°; hence we may conclude that the mean heat for the whole year is nearly the same on the sea coasts of both islands.

* The lowest calculation of the mean temperature of the gulf is preferred on this occasion because of the constant influx of new water from the Atlantic Ocean, produced by the trade winds, which water, not having been near any land, must, I think, be sensibly colder than that which has remained some time enclosed in the bay. On this subject, the observations made by Alexander Dalrymple, Esq., relative to the heat of the sea, near the coast of Guinea, ought to be consulted.—See Phil. Trans. vol. lxxviii. p. 394, &c.

power was become very great, yet the winter has been passed but a short time. Calculating upon this proportion, we may be led to suspect, that about the 27th degree of latitude, which is as soon as the stream has got clear of the Gulf of Florida, it begins sensibly to lose its heat from 82° , the supposed temperature of the Gulf of Mexico, and continues to lose it at the rate of about 2° of Fahrenheit's scale to every 3° of latitude, with some variation, probably, as the surrounding sea and the air are warmer or colder at different seasons of the year.

The preceding facts had made me very desirous of observing the heat of the Gulf Stream on my passage homeward, but a violent gale of wind, which came on two days after we had sailed from Sandy Hook, disabled every person on board, who knew how to handle a thermometer, from keeping the deck. The master of the ship, however, an intelligent man, to whom I had communicated my views, assured me, that on the second day of the gale, the water felt to him remarkably warm; we were then near the 70^{th} degree of west longitude. This agrees very well with the common remark of seamen, who allege that they are frequently sensible of the Gulf Stream off Nantucket Shoals, at a distance of more than 1000 miles from the Gulf of Florida. According to the calculation I have before adopted, of the loss of 2° of heat of every 3° of latitude, the temperature of the Gulf Stream here would be nearly 73° , the difference of which from 59° , the heat that I observed in the sea water, both before and after the gale, might easily be perceived by the master of the vessel. This was in the winter season, at the end of December.

An opinion prevails among seamen, that there is something peculiar in the weather about the Gulf Stream. As far as I could judge, the heat of the air was considerably increased by it, as might be expected, but whether to a degree or extent sufficient for producing any material changes in the atmosphere, must be determined by future observations.

Perhaps other currents may be found, which, issuing from places warmer or colder than the surrounding sea, differ from it in their temperature so much as to be discovered by the thermometer. Should there be many such, this instrument will come to be ranked amongst the most valuable at sea, as the difficulty of ascertaining currents is well known to be one of the greatest defects in the present art of navigation.

In the mean time, I hope the observations which have been here related are sufficient to prove that in crossing the Gulf Stream, very essential advantages may be derived from the use of the thermometer; for if a master of a ship, bound to any of the southern provinces of North America will be careful to try the heat of the sea frequently, he must discover very accurately his entrance into the Gulf Stream by the sudden increase of the heat; and a continuance of the same experiments will show him, with equal exactness, how long he remains in it. Hence he will always be able to make a proper allowance for the number of miles a ship is set to the northward, by multiplying the time into the velocity of the current. Though this velocity is hitherto very imperfectly known from want of some method of determining how long the current acted upon the ship, yet all uncertainty arising from thence must soon cease, as a few experiments upon the heat of the stream, compared with the ship's run, checked by observations of the latitude, will ascertain its motion with sufficient precision. From differences in the wind, and perhaps other circumstances, it is probable that there may be some variations in the velocity of the current; and it will be curious to observe whether these variations may not frequently be pointed out by a difference in its temperature, as the quicker the current moves, the less heat is likely to be lost, and consequently the hotter will the water be. In this observation, however, the season of the year must always be considered, partly because it may perhaps in some degree affect the original temperature of the water in the Gulf of Mexico, but principally because the actual heat of the stream must be greater or less, in proportion as the track of the sea through which it has flown, was warmer or colder. In winter I shall suppose that the heat of the stream itself would be rather less than in summer, but that the difference between it and the surrounding sea would be much greater; and I conceive that in the middle of summer, though the stream had lost very little of its original heat, yet the sea might, in some parts, acquire nearly the same temperature, so as to render it scarcely possible to distinguish by the thermometer when a ship entered into the current.

Vessels may with safety avoid the eddy of the gulf, or make allowance for it in their calculations; that is, if they cannot help falling into them, after they have taken all the precautions by soundings in blue water, and when they had bottom. stood off, they will naturally subtract what longitude they make in the eddy, from what they had made in the stream, and begin a new departure, being at the same time very precise in their morning and meridian observations. Many ships bound through the Strait of Florida, unacquainted with the stream's eddy, and ignorant also of the soundings being under blue water, have been lost in fair weather. They were swept insensibly by the eddy to the westward, and when they found by their calculations that they had a sufficient offing east

of Cape Florida, they stood north, and instead of entering the strait, ran directly upon a reef.

If with adverse northerly, easterly, or N. E. winds, vessels happen to be in the mouth of the Gulf of Mexico, that is, between the Havana and Cape Florida, they had best endeavor to make the Bahama Islands, or at least the soundings of them, and proceed under the lee side; but when they are to the north of them, it is best to keep in the eastern extent of the stream, or else they will not be able to clear their way through the strait, nor along the coast of East Florida, and may get on shore upon the reefs either of Cape Florida or Cape Canaveral, if not upon the bench between the two capes, which is the least evil of the two; for thus the crew and cargo may be saved; and some vessels may also be brought off, provided the storm ceases before the vessel is made a wreck of. But if at any time of the south sun, or at any other time, the winds are westwardly, then the Atlantic coast affords the most eligible lee for navigators who do not choose to take the stream; but if the current in the gulf is well understood, it will greatly facilitate the progress, when bound to the northward.

Speaking of the GULF STREAM, Mr. Romans,* whose surveys of the coast of Florida reflected great credit on him, says: "The All-gracious Ruler of the Universe, has so disposed the several shores of this mazy labyrinth, as to cause this current to run in a direction N. E. and at the rate of 2 and 3½ miles in an hour; by which means we are enabled better to avoid the imminent dangers of the reef, where it becomes a lee shore; for the violence of the easterly gales beats the gulf-water over the reefs, so as to destroy the effect of flood-tides, by causing a constant reverberating current from the shore over the reef, inasmuch that a vessel riding under the reef will lay with her stern to windward.

"I once came out from Matcumbe, and was scarcely clear of the reef, before I was overtaken by a gale from the eastward, which was very violent. It was 5 o'clock in the evening, and it being dark, to attempt a re-entrance of the reef, I was forced to leave the vessel to, which I did under the balanced mainsail; she was a heavy schooner of about 70 tons, and a dull sailer. The succeeding night I passed in the deepest distress of mind, seeing the burning of the breakers in constant succession on the reef, till past one o'clock; the storm continued till ten next morning, when I made sail to the northward, and at noon, to my utter astonishment, I had an observation of the sun's altitude, which proved me to be in 26° 50' latitude, by which I had made a difference of latitude of 118 miles, in the short space of 19 hours, 17 of which I lay to.

"I am an utter enemy (continues Mr. Romans,) to all theoretic and systematic positions, which has caused in me an indefatigable thirst for finding, in my experience, causes for all extraordinary appearances, be they what they may. And my experimental position of the cause of the increase of this current, during the gales that blow contrary to its direction, is no other than the reverberating current occasioned by the swelling of the water within the reef, which in the memorable gale of October, 1769, when the Ledbury was lost, was no less than thirty feet above its ordinary level."

Besides the convenience of correcting a ship's course, by knowing how to make a proper allowance for the distance she is set to the northward by the current, a method of determining with certainty when she enters into the Gulf Stream, is attended with the farther inestimable advantage of showing her place upon the ocean in the most critical situation; for, as the current sets along the coast of America, at places on soundings, the mariner when he finds this sudden increase of heat in the sea, will be warned of his approach to the coast, and will thus have timely notice to take the necessary precautions for the safety of his vessel. As the course of the Gulf Stream comes to be more accurately known, from repeated observations of the heat and latitudes, this method of deter-

* Mr. Romans observes, "If by keeping to the northward, the current of the Mexican Gulf has set you on soundings on Tortugas Shoal, these soundings, in foggy weather, may be a guide, being properly laid down in the chart. You do not change the color of your water till you get well in with the shoal, but there is generally an eddy current so soon as you are on soundings; therefore if you stand over to the Florida shore so soon as you are up to the latitude of 23° 25', keep as much to the eastward as N. N. E. or N. E. by N., till you get soundings. And, whatever terrible idea people may have of that shore, if the wind will allow you, keep it on board, especially in the autumn and winter seasons, when the N. and N. W. winds are frequent, and the current often runs to leeward. In those seasons, you may take an advantage of the tides on soundings, by carefully observing their times; and this conduct will tend to shorten your passage. When, however, you are got as far windward as the south end of Matcumbe Reef endeavor to get all the easting you can possibly acquire in order to get the Bahama shore on board, which is the most eligible in going northward. The proximity of the Reef of Florida will manifest itself clearly in daylight by the white color of the water, and thus there may be no danger of approaching it; but this is far from being the case at night when it ought to be carefully avoided, and the lead kept constantly going; because having soundings to the distance of two miles without the western part of it, they will show the proximity of danger."

mining the ship's place will be proportionably more applicable to use. And it derives additional importance from the peculiar circumstances of the American coast, which from the mouth of the Delaware to the southernmost point of Florida, is every where low, and beset with frequent shoals, running out far into the sea. The Gulf Stream, therefore, which has hitherto served only to increase the perplexities of seamen, will now, if these observations are found to be just in practice, become one of the chief means of their preservation upon this dangerous coast.

Off-Set from the Gulf Stream.

From the superior elevation of the Gulf Stream, its water, about the Bahamas, appears to have a declivity or tendency to the eastward; and there is reason to believe that an off-set of the stream, from without the Maternillo Bank, sets, if not generally, very frequently, to the eastward and S. E. With the usual set of the currents, along the eastern range of the Bahama Islands, we are not accurately acquainted; but, with a N. W. wind, we have no doubt that it is in a S. E. direction. The Europa, a ship of war, returning to Jamaica, by this passage, from a cruise off Havana, in 1787, steered east on the parallel of 30° N. with a westerly wind, until the run was supposed to have brought her on the meridian of Turk's Islands, by which it was intended to pass southward, but an easterly current had swept her along as high as that of the Mona Passage. Captain Manderson, of the Royal Navy, who first noticed this event, observes, "if it were once ascertained that a current was common in that part of the ocean, might it not be favorable for vessels bound from Jamaica to the Carribee Islands, especially in the summer months, during the prevalence of the sea breeze?"

"The ship Fame, Captain J. W. Montearth, a good lunarian, assures me," says Captain Livingston, "that he had been carried three degrees and upwards to the eastward, between the time of his departure from the American coast and making the Windward Passage; but this may have been partly occasioned by the Gulf Stream, which he may have crossed too obliquely in proceeding from Norfolk." The Fame above mentioned was bound from Norfolk, in Virginia, to Kingston, Jamaica, in May, 1816; and in a run of thirteen days, until in the latitude of 29°, and longitude 61°, it was found that the current had set the vessel 3° 10' E.

"Captain Hall, in the Brig Lowland Lass, passed to windward of Porto Rico, when he thought that he had run through the Mona Passage. Captain Patterson, of the brig Clyde, as I am informed, passed down the Anegada Passage, when he intended to have made the Mona."

Capt. Romans, before quoted, says, "within the edge of the stream is a smooth eddy, gradually changing, as it approaches Hawke Channel and its islands, from the stream's deep blue to a beautiful sea green, and at last into a milk white. The soundings, under the blue colored water, are generally on a fine white marl; under the sea green, on the said marl, you meet with sponge, white coral, sea-fenchers, turtle-grass, and sometimes banks of rocks; and under the white colored water, the soundings are on white marl, with banks of rocks, or white sand. The eddy takes its current in an opposite direction from that of the contiguous stream, viz. south-westwardly."

The soundings of the eddy, provided no reef be in the way between the stream and the Hawke Channel, run from 20 fathoms to 2½; and when the reef divides the stream and the Hawke Channel, the soundings, in some places, are from bottomless at once to 12 or 11 fathoms. Hawke Channel is the channel between Florida Reef and Keys.

"In addition to the above notices, I have been assured, by an intelligent Spanish navigator, that, about thirty years since, vessels bound from Havana to Europe, used generally to cut off three degrees of longitude from their reckoning, on account of this set, which he said, was considered then as certainly existing. At that time the charts were about a degree wrong, which would reduce the Spaniard's allowance to two degrees, or thereabout.

"These notices tend to prove that an easterly off-set, from the Gulf Stream, sets to the northward of the Bahamas; of this I am so firmly convinced, that if, in charge of a ship from the Havana, or even New Orleans, bound to Jamaica, I should, if allowed to follow my own plan, run out the Strait of Florida, and attempt making my passage with the aid of this off-set. This is to be understood in case I should not have westerly winds in the southern parallels; for such winds are, I am told, more frequent than formerly; and I know that they are by no means of rare occurrence on the S. W. of Cuba."

* Captain Thomas Hamlin, in the brig Recovery, then in the Gulf Stream, was set to the northward 104 miles, in the 24 hours of the 20th of March 1820. The ship's place, at noon, 23° 4' N. 79° 5' W. To the north-eastward, on the next day, without the stream in lat. 29° 35', long. 77° 25' the current was found to have set only 11 miles north but considerably more to the eastward.

On the 16th of February, 1818, the ship Mars, under the same commander, was at the back of the

It has been found that when Cape Henry, (the south point of the Chesapeake,) bore N. W., 160 leagues distant, a current was setting to the southward, at the rate of 10 or 12 miles per day, which so continued until Cape Henry bore W. N. W. 89 or 90 leagues; the current was then found setting to the N. E. at the rate of 33 or 34 miles per day, which continued until within 32 or 30 leagues of the land; then a current set to the southward and westward, at the rate of 10 or 15 miles per day, to within 12 or 15 miles of the land. This current, (which is a continuation of the Labrador current,) sets, more or less, to the S. W., according to the figure of the coast.

It has also been observed by others, that a southern and western current constantly sets in high latitudes between the Gulf stream and coast, more particularly in soundings, at the rate of half a mile an hour, or more, according to the wind.

An experienced officer of the navy before quoted, has said, that "in all the observations I made, during five years cruising on the American coast, I never found this eastern current to the southward of latitude 36°, and only once, (the above mentioned time,) so far; it generally prevailing between the latitudes of 37° and 40°, from the longitude of 60° to that of 69°. And I have often, about the latitude of 36° or 37°, and about the above longitude, found a strong current to the south, and south-west. Therefore, ships from Europe, bound to America, should endeavor to make the passage either to the southward of latitude 37°, or to the northward of latitude 40°: that is to say, when as far, or to the westward of the Banks of Newfoundland, they should, as much as possible, avoid beating against the wind to the westward, between the latitudes of 37° and 40°.

Upon soundings, along the coasts of Georgia, Carolina, Virginia, Now Jersey, and New York, the current runs, in general, parallel to the shore; and is, in general, influenced by the wind, which mostly prevails from between the south and west, producing a slow current of about one or a half knot to the N. E.; but when the N. and E. winds prevail, the current along shore to the south-west will frequently run two knots: on which, the pilots of this coast remark, that the south and S. W. currents, though they but seldom happen, yet they are always stronger than those to the northward, which are more frequent. It is probable the tides may have some influence on these currents, particularly near the entrance of the great bays and inlets. The flood on this coast comes from the N. E. In the months of April and May I have observed, on crossing the Gulf Stream in the latitude of Cape Henry, that, when near the inside of the stream, the water begins to color of a deeper green; and thence to the edge of soundings there is a strong current from the eastward. The color of the water from green, turns to muddy when on soundings, the current still continuing until within the influence of the tide; this eastern current is, no doubt, occasioned by the discharge of water out of the Chesapeake, by the floods from the snow melting in the country; and it prevails, in some degree, throughout the year, but its effect is greater at this time. It is probable that a similar current prevails off the mouth of the Delaware.

Round the east end of Long Island, and thence to the eastward round Nantucket Shoals, across George's Bank, to Cape Sable, a strong tide runs; the flood setting to the north and west, in order to fill up the bays, rivers, and inlets, and the ebb the contrary. The tides that set across George's Bank into the Bay of Fundy, are very much influenced by the winds, particularly if, after a strong S. or S. E. wind, it should suddenly change to W. or N. W. (circumstances that often happen,) ships will then find themselves drifted by the outset 50 or 60 miles in the 24 hours, or more, to the S. E. The indraught is also great with S. or S. E. winds, which ought to be paid particular attention to.

Upon the Nova Scotia coast the currents run parallel to the shore, but more frequent from the eastward than from the westward, particularly in the spring: the southerly

Maternillo Bank, and no northerly current was found; and nearly two degrees further eastward, in 39° 7' N. and 76° 58' W., the current, in 24 hours, had set 3° S. and 14° E. The ship was, therefore, evidently in the off-set of the Gulf Stream.

In proceeding onward towards Ireland, in March, Capt. Hamlin passed about four degrees to the northward of Azores, and was favored by an easterly current from the parallel of 35½°, and meridian of 57°, until he reached the Salters, on the S. E. coast, where his difference amounted to 30° 36' E.

Captain Hamlin, in the Recovery, on his passage outward to Halifax, September, 1819 found the current westerly, from 45° to 30° per day, between the parallels of 51° and 46° long. 29°, to 37°. A gale from the 23th to the 30th of Sept., disturbed the ship's course in about 43° N and 41° W., after which to the eastward of the Newfoundland Bank, the current was found to set strongly to the eastward. The ship passed over the bank in the parallel of 44°; the current still strong to the eastward; apparently, the Gulf Stream. The Recovery thence proceeded to the southern edge of Banquereau still finding a strong easterly current, but with diminished strength, which continued thence to the Bank of Sable Island.

The brig afterwards proceeded from Halifax to Jamaica; and on the 23d of Nov., 1819, in 109° N 69° W., found a slight current to the southward; which in the parallel of 29° to 33°, near the meridian of 61°, had changed to the eastward, but on approaching the Silver Key passage, a slight current to the westward appeared to prevail.

winds force them upon the shore by the water running in to fill up the bays and inlets. and N. and N. W. winds have the same effect in forcing them off shore. A regular tide here runs along shore; the flood from E. N. E.

Remarks on the General Character of the Currents near the coast of the United States, by W. C. Redfield.

It appears from observations found on the pages of the Coast Pilot, that immediately contiguous to the borders of the Gulf Stream, on the coast of the United States, a moderate current is generally found setting to the southward and westward, or in the direction which is opposite to the stream, and parallel to the American coast. By a familiar association, this is usually called an *eddy current*; but we shall probably find, on more particular inquiry, that it has little or no claim to this character. An eddy, as is well known, is usually caused by some fixed obstacle opposed to a stream, and exhibits a rotary movement. It also derives its waters from the parent stream, and necessarily partakes of the same temperature. I must, therefore, dissent from the views of those persons who refer this current to the eddying action of the Gulf Stream, for the following reasons:

1st. Because, in open sea, it nowhere assumes the *form* of an eddy; but, when unobstructed by violent winds, pursues its course towards the south-west, parallel to the general direction of the coast.

2d. Because, on the edge of the Gulf Stream, on this coast, there are no obstacles presented which could divert the progress of a portion of the stream, or circumscribe the same in eddies.

3d. Because, if this current was derived from the Gulf Stream, it must necessarily partake of its temperature, as above suggested; but the sudden reduction of temperature on leaving the margin of the Gulf Stream is most remarkable, and is almost unparalleled, except in the immediate vicinity of ice.

We shall in vain attempt to explain this extraordinary change of temperature by the proximity of shallows or soundings, for this cannot avail if the water itself be derived from the Gulf current, to say nothing here of the general unsoundness of this explanation.

I have long since become satisfied that the current in question is neither more nor less than a direct continuation of the polar or Labrador current, which bears southward the great stream of drift ice from Davis' Strait, and which, in its progress to the lower latitudes, is kept in constant proximity to the American coast by the same dynamical law or influence which, in the northern hemispheres, causes all currents which pass in a southerly direction to incline to the westward, in consequence of the increasing rotative velocity of the earth's surface in the opposite direction, as in the case of the trade winds in the lower latitudes.

In collating the observations of various navigators, we find reason to conclude, that, in ordinary states of weather, this current may be traced from the coast of Newfoundland to Cape Hatteras, and, perhaps, to Florida, the reflux influence which sometimes follows a violent gale being of short duration.

According to this view of the case, the Gulf Stream in its course from Florida to the Bank of Newfoundland, is in part imbedded upon a colder current which is setting in the opposite direction, in its progress from the polar regions. The impulses by which these opposite currents are maintained, being as permanent and unchanging as the diurnal rotation of our planet, their opposite courses on this coast, while in contact with each other, are no more surprising or inexplicable than those of two opposite currents of atmosphere moving in the same manner, and the latter are often known to maintain opposite courses for a long period and at high velocities.

From the fact that these great currents have their origin, one in the tropical and the other in the polar seas, their presence can be determined, in most cases, by means of the thermometer; and with the aid of good chronometers their position and extent may be ascertained with greater certainty than has yet been done, particularly in the latitudes between Nantucket and Florida. In this department of hydrology every navigator may contribute something of value to his profession and to science, for which no other qualifications are required than frequent observations and proper attention to the ship's place. It is desirable, therefore, that every ship master who traverses this region, should make and record his observations hourly upon these currents.

The drift ice from the polar basin is all found in the western portion of the Arctic and North Atlantic oceans, notwithstanding the influence of violent westerly winds. A writer in the London Nautical Magazine,* supposes that a portion of the polar current, after bearing the ice along the eastern edge of the Grand Bank into the Atlantic, there

* Nautical Magazine for March, 1837, p. 139. He states that between 42° and 43° west, is the farthest easterly position in which floating masses of ice have been found; but we have shown that they sometimes extend to long. 39°.

becomes exhausted, or joins the Florida Stream. By its action the great stream of ice is undoubtedly thus brought within the dissolving influence of the Gulf Stream, and the Grand Bank itself, perhaps, owes its origin to the deposits which have resulted from this process during a long course of ages. But this portion of the polar current probably, "joins" the Gulf Stream in no other manner than by intruding upon and passing under the same, the order of super-position being determined by the diversity of temperature, or by the deeper position of the polar stream. The icebergs being thus carried southward by the deeper polar current, their rapid destruction is here effected by the water of the Gulf Stream, and we are thus relieved from these dangerous obstructions, which would otherwise be found in the lower latitudes of the Atlantic. These two streams of current, therefore, do not coalesce in any proper sense, but like other currents, both atmospheric and aqueous, pursue each its determinate course, the Gulf Stream being thrown eastward by the greater rotative velocity which it acquired in latitudes near the equator, and the polar current being thrown westward along the shoals and soundings of the American continent, and its contiguous ocean depths, by the slower rotation which it derived in higher latitudes.

The writer above alluded to, supposes the natural course of the polar current from Davis' Strait, to be towards the coast of Morocco, in North Africa; but a little attention to the effect of the earth's rotation on this current, will show that both it and the ice drifts that are borne on its surface must be turned westward as here described, in despite of the powerful westerly gales which prevail in these latitudes. Light articles, however, like bottles, which are set afloat to determine the drift of currents, will not only yield greatly to the influence of these winds, but on falling into the surface current of the Gulf Stream will, of course, accompany that current in its progress to the coast of Europe, where a leading branch of this stream is found penetrating the polar sea along the coast of Norway, and appears to be ultimately resolved into the polar current. The south-easterly branch of the warm stream assumes the shorter and more direct circuit of gravitation, by the coast of North Africa to the tropical latitudes, from whence it again merges in the Florida Stream. It is by this system of compensation, aided by various subordinate circuits, such for instance as Rennel's current, that the great mechanical system of oceanic circulation is apparently maintained; and were the influence of winds wholly unfeelt upon the ocean, it is probable that the same system would still be maintained, in all its essential features, by the mechanical influences of the earth's rotation, combined with the tides and a state of unstable equilibrium.

From the temperature of the sea upon the North American banks and soundings, and in some other positions which are analogous, it has been assumed that the mean temperature of the sea is lower on shoals, than in deep water, but it seems difficult to account satisfactorily for such a result, unless upon the ground already mentioned. It has indeed been ascribed to increased radiation from the bottom, and again it has been denied that such radiation can be carried on through water from a non-luminous body; and, as the colder particles can have no tendency to rise towards the surface, it does not appear how the supposed reduction in the temperature of the bottom can materially affect the temperature of a current of fifty or sixty fathoms in depth, which is derived from a foreign source; for on none of these shoals or soundings is the water permanently quiescent. Were it otherwise, we might reasonably expect a diminution of temperature on shoals in winter, and an increase of temperature in summer, with a permanent increase if in tropical latitudes. I am informed by Mr. Geo. W. Blunt, one of the proprietors of this work, who has kept a thermometrical journal while crossing the Atlantic, that on entering upon soundings in the English Channel, he has found an increase of temperature in the water of 2°, Fahrenheit. Those who differ from our views in regard to these currents, ought therefore to propose some more rational hypothesis to account for the great reduction of temperature in the waters which lave the Atlantic coast of the United States. Were these waters derived as an eddy current from the Gulf Stream, it is probable that they would no longer serve for the myriads of codfish which now frequent our shores, and which are known to inhabit the coldest waters.

Many experiments upon the drift of currents have been made with bottles containing memorandums of the date and locality in which they were committed to the sea. These experiments are not without their value, although it is obvious that a circuitous course is liable to be construed into a direct one, and that storms and the common drift caused by the prevailing winds may greatly affect the course of such objects upon the surface of the ocean, while an important diversion may result from a more superficial cross current, as we have noticed in the case of the Gulf Stream. Perhaps the suspension of a light weight to these floats with a line from five to twenty fathoms in length, would afford results of a more satisfactory character, although the duration of such pendulous fixtures can hardly be relied on. If fitted in this manner the fact should be noted upon the memorandum inclosed, which should specify also the length of line which may be attached.

It was hoped something more would be found. Some alterations were wanting a great deal.

A series of observations were made in 1845, traversing the Gulf Stream, and commencing until the following day, Hatteras, but on Sept. 1846, the vessel was washed overboard.

ADDITIONAL REMARKS.

It was hoped, when this edition was commenced, that the editor would be able to add something more precise about the Gulf Stream; but this hope has been disappointed. Some alterations and additions have been made in the preceding pages; but there is still wanting a general and well-digested collection of facts.

A series of observations had been commenced by order of Professor Bache, U. S. C. Survey; and Lt. Chas. H. Davis, U. S. N., in the U. S. Brig Washington, in the year 1845, traversed that portion immediately S. E. of Nantucket; but his work did not commence until late in the season, and Lt. Geo. M. Bache, U. S. N., took charge of the vessel the following year. He traced three sections S. E. of Sandy Hook, extending to Hatteras, but on his return to the Chesapeake, he was overtaken by the violent gale of Sept. 1846; and while endeavoring to save his vessel and crew, was unfortunately washed overboard, and perished with ten of his seamen. Most of his observations were lost, as the deck cabin was swept overboard.

A few general facts have been collected:

1. That in the summer the temperature of the Gulf water, south of Hatteras, is about the same as the water on soundings. In the months of July and August, 1845, the temperature of the water from the Mississippi to Cape Hatteras, both in and out of the stream, even to the very mouth of the Atlantic rivers, was 84° to 82° . This fact was ascertained by journals kept for the editor.

2. That the temperature of the Gulf, south of Hatteras to Savannah, in the winter months, is from 72° to 75° , and that on soundings, on the same limit, at the same time, 59° to 68° ; and north of Hatteras, 48° to 64° , showing a difference of from 11 to 5 degrees higher temperature to the south of the cape.

3. The general direction of the Gulf Stream, from Key Biscayno until it gets to the lat. of $31^{\circ} 10'$, is North, velocity 3 to $3\frac{1}{2}$ knots; from thence it turns to the N. N. E., and as it progresses to the north, it turns more to the N. E. On the western edge of the Stream the Gulf-weed is mixed with the river sedge; on the eastern edge it is clean as when first torn from the rocks. It appears from a notice in the Nautical Magazine, that some of the weed grows on the shores of the Andros Islands.

4. The western edge, from Key Biscayno to lat. $31^{\circ} 10' N.$, is generally on the meridian of 80° , the eastern edge, after passing the Little Bahama Bank, in about 79° , until in the latitude of $30^{\circ} 30'$, when it is turned more to the eastward. This, however, is in moderate weather. During heavy gales from the N. E. to the S. E., the stream is forced immediately on and over the shoals of the Capes of North Carolina; and with N. W. and Westerly gales, the stream is driven from the shore, and no limit within thirty miles can be fixed to it; and under such circumstances the warm water of the Gulf is displaced, so that at times there will be no current in the warm water, and current in the cold water.

5. The edges, in moderate weather, are shown by the rippings in the low latitudes, and in the high latitudes, during the winter, with northerly weather, by the evaporation from the surface.

6. The precise part where the stream begins to form is not known. It is shown before, under the general article of "Currents," that the current sets to the W. N. W. and N. W., over the Campeche Bank; and that at a short distance West of the Tortugas the current sets to the S. S. E.; but where the proper head of the current is, is yet to be found.

COAST OF LABRADOR,

FROM YORK POINT TO SANDWICH HARBOR,

Variation allowed from York Point to Sandwich Harbor 2½ and 3 Points.

YORK, or CHATEAUX BAY, lies about 16 miles N. W. ¾ N. from the south-western point of Belle Isle, and 8 leagues N. ¾ W. from the harbor of Quirpon; it may easily be known by two very remarkable hills, situated on Castle and Henley Islands, which lie at the entrance of the bay; these rocky hills appear flat at the tops, and the steep hills around them have the appearance of castle walls; the islands form the eastern side of the entrance to the bay, while the Capes York and Temple are to the westward; but as the mariner may not be able to discover the above hills at a distance, because of the high land behind, the better marks will be, to observe that all the land to the westward is of a high and uniform figure, terminating at the west side of the bay with a conspicuous knob or hillock, while the land to the eastward of Chateaux Bay is hilly and broken, having many islands near the shore; while to the westward there are none.

To sail into Chateaux Bay, you must leave Castle and Henley Islands on your star-board side, and endeavor to keep Point Grenville, which has a beacon upon it, on with the western point of Henley Island; this point is a smooth black rock, having a little dark rock just appearing above water off its point; keep this mark on until you get abreast of Whale Island, then to avoid the middle rock, over which are only 9 feet of water, and which lies nearly midway between the east point of Whale Island and the black point of Henley Island, haul over close to Henley Black Rock, or borrow towards, but not too near, to Whale Island, for here it runs off shallow and flat; and when you are so far advanced as to open the narrow channel into Temple Bay, with the view of sailing up into Pitt's Harbor, then haul to the westward, until you bring the outer point of Castle Island a little open of Whale Island; this mark will lead you up into Pitt's Harbor, which is spacious, clear from danger, and well sheltered from all winds; here you may ride in 10 or 14 fathoms, with plenty of timber ready for your use, and every convenience for carrying on your fishery. There is also a narrow passage into Pitt's Harbor, to the northward of Henley Island, through which you will have 3 fathoms water.

One mile to the eastward of Henley Island, lies Seal Island, and 3½ miles further is Duck Island; between these is Goose and Bad Bay, full of rocks both above and below the water, and also open to easterly winds. To the eastward of Seal Island, distant 6 miles, are St. Peter's Islands, a cluster of barren rocks, within which is St. Peter's Bay, a good place of anchorage, but too much exposed to the south and south-easterly winds to be much frequented.

CAPE CHARLES.—To the north-eastward of St. Peter's Island is Cape Charles, making with a high hill, steep to seaward, and sloping down inland, so that when you are to the westward of Chateaux Bay, it has the appearance of an island. Cape Charles Island lies S. E. by E. ¼ E. distant about one and a half mile from Cape Charles; it is of moderate height, and has several small rocks both to the eastward and to the westward of it. From St. Peter's Islands to Charles Island the course is E. N. E. ¼ E. distant 14 miles; between them lies Niger Sound, an inlet about two leagues deep, and having several small islands before it; to enter Niger Sound you may pass either to the southward or northward of these islands, and obtain anchorage on the northern side of the sound, in 9 fathoms water; the course in will be nearly N. by W.

CAPE CHARLES HARBOR.—From the north point of Cape Charles Island to Cape Charles Harbor, the course is N. W. ¾ N. distant 4 miles; this harbor is formed by Eyre and Little Caribou Islands, on the eastern sides, and by the main on the west; there is a very good anchorage in from 17 to 22 fathoms water in it, on a muddy bottom, and you may sail in on either side of the centre island; but the best passage is between it and Little Caribou.

From Cape Charles Island to the Battle Islands the course is E. N. E. ¼ N. and the distance 4½ miles; this course will carry you clear to the eastward of the rocks which lie a large mile to the eastward of northernmost Battle Island, which will appear high and round at the top.

From the northernmost Battle Island to the River Islands, your course will be N. W. ¼ W. distant 2 leagues; here, to the westward of Poelington, which is one of the River Islands, you will find anchorage in 30 and 35 fathoms water, with the bottom of mud; and vessels may pass to the southward of these islands up the river St. Lewis.

CUTTER HARBOR.—From the south point of Poelington Island to Cutter Harbor, the course is W. ¾ S. distant one mile: in this harbor there is good anchorage for small vessels.

PORT CHARLOTTE is the middle harbor, and fit for any ships; there is a low flat island on the starboard side of its entrance, from which runs a reef of rocks one-third of the channel over; to avoid this, keep the southern side on board; you will then have 9 fathoms close to the shore, until you get a quarter of a mile up within the harbor; you may then anchor in any part in from 12 to 17 fathoms, only giving the starboard side a berth to avoid a reef that lies on that side. *Port Charlotte.*

MICKLEBURGH HARBOR is the northernmost of the three harbors, and turns in N. N. W. $\frac{1}{2}$ N. and N. W. by N. about two miles; in the lower part of this harbor there are 20 fathoms, but as you advance the water lessens, and in the upper part there are no more than 12 fathoms for ships to moor in. To sail up to the head of the bay, you must keep the harbour side nearest, in order to avoid the ledge of rocks that lies on the starboard, about 30 fathoms from the shore. These rocks lie within the narrowest part of the harbor, and above the low point on the starboard side; the best anchorage is at the head of the harbor. *Mickleburgh Harbor.*

ST. FRANCIS HARBOR.—From Point Spear to Cape St. Francis, the course and distance are nearly north 6 miles, and from the Islands at the entrance of the three harbors to Cape St. Francis N. E. $\frac{3}{4}$ N. about 5 miles; between them and nearly half a mile to the westward of the cape, is St. Francis Harbor. This is a snug and secure harbor, though small and generally filled with vessels during the fishing season, considerable fisheries being carried on in its vicinity. To enter this harbor there are two entrances, one being to the northward, the other to the south-westward of Pigeon Island, this island lying directly before its entrance; the south-eastern channel leads to a small but narrow inlet called Round Harbor; every where clean ground, with 10 fathoms in the channel as you enter, and the depth gradually decreasing as you advance towards its head, where you have 5 and 3 fathoms. In entering to the south-westward for St. Francis Harbor, you should beware of and give a berth to the western side of Pigeon Island, for a rocky reef off it: give this a berth, proceed on N. N. E. $\frac{1}{2}$ N. and having got fairly between the two points of the harbor, you will perceive on your starboard side a small white rock; go no nearer to it than 7 fathoms, steer up north, and having passed mid-channel, or rather nearer the starboard shore, the rocks above water, which you will see on each side of you, turn westerly, and anchor in 4 or 5 fathoms. Small vessels go to Birnell's Beach, or up to the cove at the northern extremity of the harbor, *St. Francis Harbor.*

CAPE ST. FRANCIS is the eastern point of an island, between which and Granby Island is a very narrow passage for boats, with 4 fathoms water in it. From this cape, in a N. N. Westerly direction, about $\frac{3}{4}$ of a mile, is Indian Point, between which and Jasper Island's south-eastern point, is an opening leading into Indian Bight and Shoal Tickle, two narrow coves, the latter being shallow, and with only 2 and $1\frac{1}{2}$ fathoms water in it. To the northward of Indian Point are Hare and Fox Islands, having a narrow passage running northward between them; on crossing from Indian Bight to the channel, you will have deep water, but when you enter the passage it will shallow to 5, 4, 3, and 2 fathoms; this flat will continue for a quarter of a mile, you then deepen your water again to 5, 7, 10, and 12 fathoms; vessels frequently anchor in this place, on the western side of Hare Island, or, rounding the northern end of Fox Island, run through Pearee's Tickle into Sealing Bight. *Cape St. Francis.*

SEALING BIGHT is a very commodious and convenient place for the fisheries; the best anchorage is on the southern part of the bay, to the westward of Jasper Island; here you may safely ride in 8, 10, or 11 fathoms, or further in with less water. There are several coves situated along shore, to the northward of this anchorage, where small vessels may anchor; fresh water can easily be obtained, but wood is scarce; the southern entrance to this place is between Indian Point and Jasper Island, on one side, and Hare and Fox Islands on the other; the water is deep and there is no danger, except a reef which stretches out to the south-westward from Gull Island, over which the sea breaks very high in stormy weather; it will, therefore, to avoid this reef, be always prudent to borrow close towards Indian Point, in either sailing in or out of Sealing Bight. Merchantman Harbor is about 2 miles W. $\frac{1}{4}$ S. from St. Francis Island; it is small, but has from 7 to 15 fathoms water. *Sealing Bight.*

FISHING SHIP HARBOR.—From St. Francis Island to the northernmost Fishing Island, the course is N. N. E. $\frac{3}{4}$ N. distant 3 miles. The Fishing Islands are three in number; the two northern ones are connected by a beach, which, with the main, forms Fishing Ship Harbor, where vessels may ride land-locked, and secure from all winds, in from 5 to 14 fathoms water, the entrance being to the southward of the Southern Fishing Island; the best passage will be between the two western islands, that entrance bearing from Hare Island N. by W.; there is no danger in this channel, and vessels may sail right through it, in nearly a N. by W. direction, up to the very head of the harbor, and anchor in 12 fathoms, having good room for ships to moor; there are two other passages into this place, one to the westward from the entrance of Gilbert's River, the other to the northward of all the Fishing Islands; the latter has 7 fathoms throughout, but is so narrow that you will have some difficulty in discovering the opening. *Fishing Ship Harbor.*

Gilbert's River.

GILBERT'S RIVER.—Between Fishing Island and Granby Island is the northern entrance to Gilbert's River; the southern entrance is between Donbigh Island and the main, and this is much the wider of the two; there is also a channel between Deubigh and Granby Islands. The passage in has deep water every where; and the course of the river is nearly N. W. by N. for about 6 miles; it then divides into two branches, one running N. W. by N. 7 or 8 miles, the other S. W. by W. about 6 miles; both these branches are full of rocks, small islands, and shoals; but in the middle the anchorage is good all the way up from 20 to 10 fathoms: this river has also a passage out to sea, between Hare and the Fishing Islands.

Cape St. Michael.

CAPE ST. MICHAEL.—Six miles N. N. E. $\frac{1}{2}$ N. from the northernmost Fishing Island, and 16 miles N. N. E. $\frac{3}{4}$ N. from Point Spear, is Cape St. Michael, high and steep, and easily known by a large bay to the northward of it.

Occasional Harbor.

OCCASIONAL HARBOR.—About 2 $\frac{1}{2}$ miles to the southward of Cape St. Michael, is Occasional Harbor, easily known by the twins, two large rocks lying two-thirds of a mile outside of the entrance; they are very near each other, and vessels may pass on either side of them; the entrance to the harbor is between two high lands, and runs in W. by N. for 2 miles, then N. W. by N.; both sides are steep to, without any dangers, and having good anchorage in from 10 to 7 fathoms, about 2 miles from the entrance; the wind between the high lands always sets right into or out of the harbor.

St. Michael's Bay.

ST. MICHAEL'S BAY.—From Cape St. Michael to Cape Bluff, the course is nearly N. N. E. about 7 $\frac{1}{2}$ miles, and these two capes form the points of entrance to the Bay of St. Michael, which contains a vast number of islands, inlets, and rivers; the largest island is named Square Island, lying at the mouth of the bay, and being 3 $\frac{1}{2}$ miles long and very high; its N. E. point forms a lofty round hill, and makes, in coming from the southward, like a separate island, being only joined by a narrow neck of land; the best anchorage for small vessels is on the southern side of St. Michael's Bay; to go there you should keep Cape St. Michael's shore on board, then run along the south side of the first island you meet with, which is called Long Island, till you get nearly to its western end, there you may anchor in from 12 to 20 fathoms, land-locked, and can work out to sea again on either side of the island. From Cape St. Michael to the entrance of Square Island Harbor, the course is N. N. W. 3 $\frac{1}{2}$ miles; at the entrance lies a small Island of moderate height, to the westward of which is the best passage into the harbor, there being only 2 fathoms in that to the eastward of it. About a league N. N. W. from Square Island round hill is the entrance to Deadman's Harbor, which is formed by a number of little islands, and fit only for vessels of small dimensions. There is a passage between these islands and Cape Bluff, by which vessels may put out to sea.

Cape Bluff is very high land, rugged at top, and steep toward the sea; it may be seen 15 or 16 leagues. Cape Bluff Harbor is a small place, and unfit for large vessels; to sail into it you should keep the cape on board until you reach a small island, which you should pass to the eastward, and then anchor. The several Bays and inlets in St. Michael's Bay are well stored with wood.

From Cape Bluff to Barren Island, the course is N. Eastward about one league; and from the south point of Barren Island to Suag Harbor, N. W. by W. 1 $\frac{1}{2}$ mile. Suag is a small harbor, but in it is very good anchorage in 26 fathoms, and no danger to be apprehended either in sailing in or out of it. About one mile to the northward of Barren is Stony Island, and within these islands, on the main, are Martin and Otter Bays; in the northernmost is good anchorage, and no invisible danger in entering; wood and water are plentiful.

Duck Harbor.

DUCK HARBOR lies on the western side of Stony Island, and is a very convenient place for small vessels; large ships may also anchor between the west point of Stony and Double Islands, in from 20 to 24 fathoms, sailing from thence to seaward on either side of Stony Island in great safety.

Hawke Bay.

HAWKE BAY.—About one mile to the northward of Stony Island lies Hawke Island, within which is Hawke Bay, running in westerly 2 leagues; it then divides into two branches, one going W. by S. 6 miles, the other N. W. by W. 5 miles; the shores of these are well supplied with wood. After you get within Pigeon Island, the anchorage is good up to the very head of both branches.

Eagle Cove.

EAGLE COVE lies on the south side of Hawke Island; this place affords good riding for large ships in 30 or 40 fathoms of water, and also for smaller vessels in 7 and 8 fathoms at the upper end of the Bay.

Caplin Bay.

CAPLIN BAY.—On the main, within Hawke Island, and nearly 5 miles E. by N. from Hawke Bay, is Caplin Bay, having good anchorage and plenty of wood.

Partridge Bay.

PARTRIDGE BAY lies 4 $\frac{1}{2}$ miles to the northward of Hawke Island; the anchorage is good, but the bay is difficult of access, unless to those who are well acquainted with the place, on account of the numerous small islands which encumber its entrance; but the land hereabout may be very easily known, for the southern point of the bay is a remarkable high table hill of very barren appearance, and all the land between it and St. Michael's Cape is high, while that to the northward is low.

SEAL ISLANDS.—From Cape St. Michael to the southernmost Seal Island, the *Seal Islands*. course is N. E. $\frac{1}{2}$ N. distant nine leagues, and from thence to Round Hill Island N. E. $11\frac{1}{2}$ miles; this latter island is the easternmost land on this part of the coast, and may also be recognized by a remarkable high round hill on the western part of it.

SHALLOW BAY.—From Round Hill Island to Spotted Island, the course is N. N. *Shallow Bay*. W. $\frac{1}{2}$ N. distant $4\frac{1}{2}$ miles; and from Spotted Island the land turns N. N. Westward, and is fronted with numerous Islands. From the southernmost Seal Island to White Rock, the course is N. N. E. $\frac{1}{2}$ E. about 5 miles; and from this rock, to enter Shallow Bay, you must steer W. $\frac{1}{4}$ S. nearly 4 miles; there is very fair anchorage within this bay, and no danger, excepting a small rock which lies off a cove on the larboard hand, about one-third over the bay; this rock is visible at low water, and at other times the sea breaks over it: there is little wood visible on the shores of this bay.

From White Rock to Porcupine Island, the course is N. N. W. distant 2 leagues; this Island is high, barren, and steep to; vessels may pass on either side of it to Porcupine Bay, where the riding is good, but little or no wood.

SANDY BAY lies on the southern part of the Island of Ponds, and N. $\frac{1}{2}$ W. from *Sandy Bay*. White Rock, from which it is distant 5 miles. There is good anchorage in this bay, with 10 fathoms water, on a bottom of sand, and would be a very convenient resort for the fishing ships, but for the total absence of wood. Between this bay and Spotted Island are numerous islands and rocks, both above and under the water, rendering this part of the coast extremely dangerous.

SPOTTED ISLAND is high barren land, and may be recognized by several white *Spotted Island*. spots on its eastern side; it is about 3 miles long, and of nearly a similar breadth: the northern part lying in latitude $53^{\circ} 30' N.$ To the westward, and within side this island, is Rocky Bay. To sail into this bay, you should run in to the northward of Spotted Island, and go between either of the islands that lie before the entrance of the bay; but there is no good anchorage in it, the bottom being so rocky, until you get between Level Point and Eagle Island, where you may ride in 8 or 10 fathoms, the ground good and clean, only taking care to give Level Point a free berth; the best anchorage will be on the western side of Eagle Island, in 8 or 9 fathoms, mud. In passing between Eagle Rocks and the Duck Rocks, you may borrow on either side to within two-thirds of the length of a cable, or you may run up and anchor on the southern side of Narrow Island, in Narrow Harbor, and be handy for both wooding and watering.

From Spotted Island to Wolf Rock, the course is N. N. E. $\frac{1}{2}$ N. about 18 miles; this rock is above water, and lies 14 miles from the main; there are some sunken rocks about it, and several islands between it and the coast. About two miles to the northward of the entrance to Rocky Bay, is Indian Island; this is remarkable high land, particularly at the western end; between the island and the main is tolerably good shelter for small vessels, and it appears to be a fit place for a seal fishery.

SAND HILL COVE.—This place is so called from several sand hills lying on the *Sand Hill Cove*. southern side of its entrance; it is situated 4 good leagues to the westward of Indian Island; here the anchorage is good about half a mile up from its entrance, in 4 or 3 fathoms water, sandy ground. When you are sailing into this cove, you should take care to give the north point a good berth, because of a ledge of rocks which stretches off about a cable's length from the point, and runs westward along shore the length of two cables.

TABLE BAY.—The southern head of this bay lies about two leagues N. by W. from *Table Bay*. Sand Hill Cove, and may be known by a remarkable table hill on the north side of the bay, about 8 miles within the entrance; this hill may be seen from the Wolf Rock, which lies N. W. $\frac{1}{2}$ N. $7\frac{1}{2}$ leagues from the entrance of the bay. In this bay, about 4 miles from its entrance, lies Ledge Island, so called from a ledge of rocks stretching westerly from the island up the bay for 2 miles. On the southern side of this island is anchorage, in 12 or 14 fathoms, in what is called South Harbor; or you can run further up, and anchor in Table Harbor. On the north side of the Bay, just within Ledge Island, lies North Harbor, having very good anchorage in it. In sailing up to Table Harbor, you should take care to keep the main land close on board, in order to avoid a rock that lies half way between the ledge that runs off Ledge Island and the main.

The GANNETS are a cluster of islands, lying from 7 to 11 miles off the main land; *The Gannets*. the outermost island bears from the Wolf Rock N. N. W. $\frac{1}{2}$ W. distant 10 leagues.

CURLEW HARBOR lies nearly S. W. of the Gannet Islands, on the main, and may *Curlew Harbor*. be distinguished by a green round island lying before its entrance; the channel into the harbor is between this island and a low point to the southward, having a small rock above water close to the point; there is no danger in sailing into this place; the best anchorage will be about one mile within its entrance; here large ships may ride in safety, bringing the small rock off the entrance point on with the northern point of Long Island; they will then ride in 14 or 15 fathoms water, good holding ground. Long Island lies about $1\frac{1}{2}$ mile N. by W. from Green Island. Small vessels run higher up the bay, and generally anchor in from 10 to 7 fathoms. On the southern side of the harbor is a shoal, lying at a small distance from the shore; wood is scarce in this bay, but water plentiful.

Isthmus Bay. **ISTHMUS BAY.**—This bay lies round the western point of Curlew Harbor, sailing from whence you should endeavor to keep Great Island on board, in order that you may get clear of a shoal that stretches off the point towards the island. There is also another passage into Isthmus Bay, between the western point and a small bare rock of moderate height, that lies off the south point of the Great Island; this channel is narrow, and has a depth of three fathoms within it. Both wood and water may be obtained here.

Hare Harbor. **HARE HARBOR.**—One league to the westward is Hare Harbor, fit only for small craft, the bottom being foul, except towards the head, where you may anchor in 3½ fathoms water, the ground tolerably good. Hare Island, which lies before the entrance to the harbor, is high land. The eastern point of Huntingdon Island lies about 2 miles to the northward of Hare Island, and W. S. W. ¾ W. about 13 miles from Gannet Island; it is moderately high, and in length, from east to west, 7 miles; off its eastern point are some small islets, named Sudler's and Leveret's Island, and a little to the northward of the latter is a rocky flat; these lie ¼ mile off the extreme point of Huntingdon Island. There is a safe passage, above a mile wide, along the southern side of Huntingdon Island; this leads into Huntingdon Harbor, opposite which you may ride safely in from 5 to 13 fathoms water; further in towards the island it shallows, but the best anchorage is behind Egg Island, in 6 fathoms, near that Island; here you will be secure from all winds, and ride very convenient for both wooding and watering, there being abundance of both on the island.

Sandwich Bay. **SANDWICH BAY,** called by the natives Netsuctoke.—On the south-western side of Huntingdon Island are Earl and Diver Islands, on either side of which is a passage into Sandwich Bay; but the channel between Diver Island and Earl Island, called Diver's Tickle, is very narrow, and has in some places not more than 6 feet water, while that between Diver and Huntingdon's Islands is over a sandy flat 9, 12, and 18 feet water, and consequently not to be attempted by large vessels. To the eastward is Cartwright's Harbor, leading to the Favorite's Tickle, and thence to Sandwich Bay; this has deeper water, and by keeping the southern land well open of Earl's Island, you will go through it until you reach the Narrows, when the two points forming the Narrows must be brought on with each other, and this will lead between the eastern small island and the main, in 4, 7, and 9 fathoms; between the Narrows are 18 fathoms. Sandwich Bay is a very fine harbor, 6 or 8 miles broad, and 6 leagues deep, with plenty of wood and water, and four rivers running into it, abounding with salmon. There is very good riding in a cove on the eastern side of the bay, and also on the northern side, under a mountain; from the shore at the foot of the mountain, and five miles to the westward, the soundings stretch gradually off the shore, from 5 to 25 fathoms, muddy ground, and extend full three miles from the land. The passage into the bay, on the western side of Huntingdon and Earl Islands, is the widest and best channel, for that to the southward we have just shown to be narrow, shallow, and inconvenient; to enter to the northward of Huntingdon Island you must beware of the flats which lie a little to the northward of Leveret's Island; there is deep water at the entrance, and you will see the Island of Plantation to the northward, a little to the westward of which is Henrietta's Island; between these two is Independent Harbor, a snug retreat running in north, and having every convenience for the fisheries. Directly before this harbor, and in the fairway of the channel to Sandwich, are the Double Islands; in entering you will leave Wedge Island and Bellows Rock to the northward, and Gull Island to the southward, and pass on either side of the Double Islands; your course then will be N. W. by W. 4½ miles; and having got beyond the N. W. point of Huntingdon Island, you will perceive Entrance Island lying midway between the point and the opposite shore: the channel now bends to the S. Westward, and is bounded to the northward by the North River Flats, and to the south by Huntingdon Flats. The deep water passage being about a mile broad: you may sail in on either side of Entrance Island; proceed W. by S. towards Main Tickle Point; from off this point a spit extends E. N. E. ¼ mile, contracting the channel, and making the navigable passage very narrow for large ships to enter; on the starboard side are the two Brenton Islands, situated in Table Hill Cove; when you get these open of each other, a line passing directly between them, or when the North Brenton opens its own length to the eastward of the southern one, you will clear the spit in 4½ fathoms; when these islands come on with each other, you will pass over the spit in 2 fathoms water; the cross mark is Green and Leading Murk Islands in one; these lead on to the centre of the spit, and are two Islands situated on Huntingdon Flats; the leading mark to go through the Main Tickle Passage is Leading Murk Island on Old Man's Head: this will carry you clear of the shoals on both sides, in from 6 to 14 fathoms, right into Sandwich Bay; to sail out of the bay, bring the hollow part of Leading Murk Island in one with the gap of Old Man's Head, until you are within three cables' length of the former, then give the island a berth of equal distance in passing, and steer direct for Entrance Island.

FROM CHATEAUX BAY TO THE ESQUIMAUX ISLANDS, AT THE
ENTRANCE OF THE RIVER ST. LAWRENCE.

Variation allowed 2 Points.—It now is (1850) 2½ Points.

From *Yon' Point*, the southern entrance of *Chateaux Bay*, to *Barge Point*, the course and distance are W. by S. 5¼ leagues; from *Barge Point* to *Saddle Island* is nearly west 10 miles; between these is *Green Bay*, a place where small vessels may anchor in 12 fathoms water, but open to the S. Easterly winds

REID BAY.—This is an excellent harbor, and may always be known by *Saddle Island*, *Red Bay*, which lies at its entrance; this island rises up at each end, and sinks down in the middle, somewhat similar to a saddle; there is also a remarkable round hill on the western side of the bay, and opposite to the west end of *Saddle Island*, which will tend to point out the harbor; the land on the west side of the bay is high, the eastern side rather low, and the head of the bay is high and woody: in sailing into this place there is little danger, the passage is to the westward of *Saddle Island*, only taking care to give a berth to the rock, which at a quarter ebb is above water, and lies off the western point of the main land, and also not to come too near to the inner part of *Saddle Island*, as a shoal stretches off it about the length of a cable. The western bay lies in to the northward of the western point, and has very good anchorage with westerly winds, but somewhat open to the eastward; there is no passage, except for boats, to the eastward of *Saddle Island*; vessels coming from the eastward must be careful to go clear of a small rock, which lies about a mile from the two black rocky islets, which are at the east end of *Saddle Island*, and near a mile off the shore: the high round hill at the west side of the bay on with the saddle of *Saddle Island*, will lead you directly upon the rock, and the sea commonly breaks over it.

BLACK BAY lies to the W. S. Westward, distant 10 miles from *Saddle Island*; the anchorage here is tolerably good, but too much exposed to the S. E. winds. S. W. by S. from *Ship Head*, which is the western point of entrance to *Black Bay*, distant 1¼ mile, is *St. Modeste Island*; it is small and low, but vessels frequently run into a place within the island, called *St. Modeste Bay*, and anchor; but this, though occasionally used, cannot be recommended.

WOLF'S COVE, OR L'ANCE DE LOUP.—S. W. by S. from *St. Modeste Island*, distant 4½ miles, begin some remarkable red cliffs, which continue full 2 miles, and form the eastern point of *Wolf's Cove*; this is high table land, terminating with steep cliffs towards the sea. The entrance to *Wolf's Cove* is about 2 miles wide, the two points of the cove bearing from each other S. W. and N. E.; there is good anchorage at the head of this cove in 12 fathoms water, and also on the western side, in *Schooner's Cove*, where small vessels may lie safely in 7 fathoms, on a bottom of sand.

FORTEAU BAY lies 5 or 6 miles to the westward of *Wolf's Cove*; the shore between them is rather low: *Forteau Bay* is about 3 miles broad, and runs in nearly the same distance; on the western side, near the head of the bay, is good riding, in from 10 to 16 fathoms, but exposed to the southward. Off the east point of the bay is a rock, which appears like a shallow under sail; and on the western side of the bay is a fall of water, which, on coming from the eastward, will easily be perceptible. West 7 miles from the western point of *Forteau Bay* is *Island au Bois*, and 2 miles westward of that is *Green Island*; the former of these is of moderate height, and has a good passage round it; it lies in front of *Blanc Sablon Bay*, where a vessel may occasionally find anchorage; but the ground is loose sand, and will not hold. The channel between *Bois* and *Green Islands* is good, and has 11 fathoms water in it; there is a cove on the eastern side of *Green Island*, where a fishery is sometimes carried on; there is also a passage between *Green Island* and the main, which leads to *Brador Bay* and Harbor; but you should be careful to give *Grand Point* a good berth in passing, as some sunken rocks lie directly off it.

LABRADOR HARBOR.—From *Green Island* to *Island of Ledges*, the course is nearly north, distant 5 miles; the Harbor of *Brador* may readily be known by the land between it and *Point Belle's Amour*: the point itself is low and green, but about a mile inland it rises up to high table land; and further inland are three remarkable hills, called *Our Lady's Bubbies*; these are round, and may be seen all along the coast, lying to the N. Eastward about 2 leagues distant from the *Island of Ledges*; this island is of moderate height, having a great many islets and rocks about it; on its eastern side is *Blubber Cove*, where small vessels may anchor in 2 and 2½ fathoms. There are two passages into *Brador Harbor*, but that to the northward of the *Island of Ledges* is by no means safe, on account of the number of rocks scattered about it. To enter the eastern passage, you must take care to avoid a small rock, which lies about S. W. by W. a quarter of a mile from the low point on the main, where the houses stand; on this rock the sea commonly breaks and shows itself at quarter ebb; on the eastern side, within this rock, is *Shillop Cove*;

from the point above the cove a shoal stretches off about a cable's length from the shore, and continues nearly the same distance quite to the head of the harbor.

Esquimaux River & Bay. **ESQUIMAUX RIVER AND BAY**—From Point Belle's Amour to the outer Esquimaux Island, the course and distance are W. by S. 10 or 11 miles, N. N. E. about 4 miles from which there is good anchorage, between two high islands, for small vessels; and within these lies the River Esquimaux. From hence to Dog Island is a chain or cluster of small islands and rocks, the easternmost of which are commonly called the Esquimaux Islands; the middle ones, the Old Fort Islands; and the western ones, the Dog Islands; within these, and on the main land, are various good bays and places of shelter; but the entrances to them are so intricate, narrow and dangerous, that no person, unless well acquainted, should attempt to navigate a vessel through them. Those islands extend from the outer Esquimaux Island nearly 4 leagues, and some of them are full 4 miles from the land.

Little Bay. **LITTLE BAY**.—W. N. W. about 5 miles from the Dog Islands, is Little Bay, in which small vessels may find very good anchorage; nearly a mile to the westward of Little Bay, is the Bay D'Omar; this Bay runs up N. E. by N. nearly 3 miles, the land on both sides being very high, but the western shore is the highest; its width is about two cables' length, but off the coves it is broader; outside of the eastern point of the bay are two small islets a cable's length from land. This bay has good anchorage, the best place being 2 miles within the entrance, opposite a woody cove on the west side, where you will lie secure in 14 and 16 fathoms, with abundance of wood and water. On the west side, also, a mile within the entrance, is a remarkable green cove, but this becomes shoal a short distance from the shore. From the entrance of the Bay D'Omar to Bowl Island, the course and distance are W. S. W. $\frac{1}{2}$ S. 2 miles. This is a remarkable round island, of moderate height, and lies a mile from the main land; about it, and between Bowl Island and Shecatia, are a great number of islets and rocks, the coast being thereby rendered dangerous to navigate, unless you have a fresh of wind; the rocks will then show themselves by the sea breaking over them.

From Bowl Island to Shecatia, the course is W. by N. about 2 leagues; and 3 miles E. N. E. from Shecatia Island is the Bay of Petit Pene, running in N. N. E. about 5 miles; but this place is scarcely fit for vessels to go into, because the water is too deep, the entrance too narrow, the ground bad, and the whole bay open to the southerly winds.

Mistanoguo Bay. **MISTANOGUE BAY** lies about 2 miles to the westward of Petit Pene; there is a good channel between the Island Shecatia and the main, and many seals are frequently caught there. Before the entrance to the Bay of Mistanoguo lies an island of the same name; here, between the island and the river, the anchorage is good, with from 15 to 20 fathoms water; the ground holds well, and there is room enough to moor. To go into this road, you should pass round the western end of the island, which is bold to, or else round its eastern end, and between it and Shecatia; but this latter passage is fit only for small vessels. In the Bay of Mistanoguo the anchorage is good up to the very head, the channel is both long and narrow; the island and the main land, at the entrance, has a barren appearance, and is high; but both wood and water may be obtained in the bay.

Shecatia Bay. **SHECATIA BAY** runs close in to the westward of Mistanoguo Island, and extends many miles up the country, its course bending to the northward, and having various branches and turnings, with numerous islands, capable of giving shelter to vessels of all descriptions; but these are little frequented, and consequently not well known; besides the passages are too narrow for strangers to attempt the navigation of.

Shag Island and Rocks. **SHAG ISLAND AND ROCKS**.—Nearly S. W. by W. distant above 2 leagues from the Island of Mistanoguo, is the Shag Island and Rocks; the island is small, high, and has a round peaked hill in the middle; to the eastward of it are a number of rocks above water, the outermost lying E. S. E. $\frac{1}{2}$ E. one mile and one-third from the island.

Cumberland Harbor. **CUMBERLAND HARBOR** lies N. N. E. $\frac{1}{4}$ N. about three miles from the outer Shag Rocks, and may readily be distinguished by a remarkable high hill on the main land, appearing like a castle at its summit, being a steep cliff looking like walls; this hill lies N. by W. nearly 3 $\frac{1}{2}$ leagues from the entrance to the harbor. The outer Islands, which form the harbor, are called the Duke and Cumberland Islands; these are moderately high, the eastern one making in two round hills. To enter this harbor there is no danger but what appears above water, except one small rock, which lies south about half a mile from the western head; the entrance to the harbor is a quarter of a mile wide, and the inlet half a mile long; from the eastern head you must steer for the inner point on the western side, and after you reach that point, haul over to the eastward, and anchor in from 20 to 7 fathoms, excellent ground, and room enough for any ships; this is by far the most commodious and best harbor on the coast, and also the easiest of access; fresh water is plentiful, but for wood you must go to Shecatia Bay.

Sandy Island Bay. **SANDY ISLAND BAY**.—N. W. by N. about 2 $\frac{1}{2}$ miles from Shag Island, is the bay and harbor of Sandy Island; to sail into this you should pass to the eastward of the Murr Rocks, keeping the starboard point of the bay on board; you will then perceive a small rock above water to the N. N. Westward; this lies off the entrance to the harbor; you

may pass on either side of this rock, and then steer in N. N. E. $\frac{1}{2}$ N. for the harbor; there is no other danger; here you will have room enough to moor in 5 and 6 fathoms water, with good ground and safe riding; there is no wood here, but water in plenty.

PORT AND RIVER ST. AUGUSTINE.—The entrance to the Port and River St. Augustine, is between Shag Island and St. Augustine Square; the West Island, which is easily to be distinguished at a distance, on account of the islands within it being much higher; a third of a mile to the eastward of this is the East Island, somewhat larger, not quite so high, but even at the summit; between these islands, after passing the Chain and Square Islands, is a safe passage for small vessels to enter this port; and they can anchor between the West and Round Islands, or run to the northward, pass Round Island, and stop in 6 or 7 fathoms, with plenty of room to moor. S. W. by W. about half a league from west part of St. Augustine's Islands, is a string of small islands, commonly called St. Augustine's Chain, the outermost of which is a remarkable smooth round rock, and to the westward of this, one quarter of a mile, are several rocks under water, over which the sea is constantly breaking; some of these are visible at one-third ebb; half a mile W. S. W. from these is a high black rock above water, and between these two is the best passage for large vessels into the Port of St. Augustine. You should steer from this black rock, towards a remarkable low point, which will bear N. N. E. $\frac{1}{2}$ N. until you open the port; then haul in and anchor as before directed; or you may steer up the passage between this point and Round Island, and anchor.

THE RIVER ST. AUGUSTINE is $\frac{1}{2}$ leagues from the entrance of the port, and lies to the N. N. W. having several islands lying in the passage; but the river is shallow, and only fit for boats to enter; there is a sandy bar across, which dries at low water. Two miles up, it divides into two branches, both running to the N. N. Westward for 14 or 15 leagues; wood and water are plentiful.

From St. Augustine's Chain to the bluff head of Great Mecatina Island, the course and distance are W. S. W. 8 leagues and 1 mile; the coast is lined with islands, within and about which are many harbors; the main land, in sailing along this part from Shecatia to Ha Ha Bay, cannot be seen, and the adjacent islands are so high, so numerous, and so near each other, that although there are navigable passages between them, yet you cannot discover their entrances, nor perceive them to be islands, until you get near and entangled among them.

EAGLE HARBOR.—This lies at the western end of Long Island, to the eastward of Ha Ha Bay, and is formed by a cluster of islands, being capable of holding a great number of vessels in security; in it are from 20 to 10 fathoms water, the ground holding well. In order to find out this anchorage, it will be advisable to make for the Great Island of Mecatina, from whence you should shape your course for the Fox Islands, which lie S. S. E. $\frac{1}{4}$ S. one large mile from the westernmost entrance of the harbor; it may also be known by a deep bay to the eastward, without any islands in it, while to the westward there are a great many. But if you intend sailing in to the eastward, you should steer from the Fox Islands N. N. E. $\frac{1}{4}$ E. $\frac{1}{2}$ miles, into the bay, when you will observe to the N. N. Westward of you, a remarkable high island, round which, to the northward, is a safe passage of 3 fathoms into the harbor, where you will ride with safety, well sheltered from all winds. In the western passage to this harbor, there are $2\frac{1}{2}$ fathoms; this is, however, a narrow channel, fit only for small vessels, and running in between many small islands.

This part of the coast is very dangerous for any vessels to fall in with, in dark and foggy weather, on account of the infinite number of small low islets and rocks about it, many of the latter being under water, and to avoid which no practical mark can be given; it will, therefore, always be advisable and prudent to keep off the coast to a considerable distance.

HA HA BAY lies on the main, to the westward of Eagle Harbor, and has several small islands at its entrance, forming separate entrances; the best of these is that which lies between Seal Point and Round Island, leaving all the islands on the starboard side; this is a wide and safe passage, having no danger but what is visible. Ha Ha Bay runs in to the northward about 7 miles, and has many islands at its head, on the starboard side; within these islands, to the eastward, are numerous anchorages, with from 9 to 20 fathoms water; vessels may also occasionally anchor all along the eastern side of the bay in 12 and 14 fathoms, muddy bottom, but on the western side the water is too deep. N. N. W. $\frac{1}{4}$ N. about two miles from the entrance on the west side, is a high bluff head; round this head N. W. by W. half a mile, is a small, but safe harbor for small vessels, in which you will have 12 fathoms, good ground; this harbor is formed by an island, on either side of which there is a narrow but safe passage.

LITTLE FISH HARBOR is to the southward of Ha Ha Bay, and runs in westerly; it is small, and formed by an island covered with wood; you may sail in on either side of the island; but the northern passage is considered to be the better of the two; in the bay to the southward of the island, is a ledge of rocks, partly visible at all times. S. E. by E. from the Woody Island lies a rock, on which are only 2 fathoms at low water. You may

anchor in the harbor at the back of this island in 7 or 8 fathoms, and have plenty of room to moor. Off the northern point at the entrance to this harbor, called Seal Point, are two little islands, and a small sandy cove, where a seal fishery is carried on.

Between Fish Harbor and Ha Ha Bay there is a very remarkable round high hill, making a peak, which may serve as a landmark to point out either of these places of anchorage.

Great Mecatina Island.

GREAT MECATINA ISLAND lies three miles off the main land; it is $3\frac{1}{2}$ miles long, and about 3 miles broad, being the most remarkable land at this part of the coast; it rises up in the middle, which is much higher than either of the ends; its E. N. E. point makes like a bluff head, and round this head to the northward, within a cluster of small islands, there is a cove running in about one mile and a half; in this cove vessels can safely anchor, in from 14 to 20 fathoms, good ground, and may obtain both wood and water.

Mecatina Harbor.

MECATINA HARBOR.—This harbor is formed behind Mecatina Island on the main, it is safe but small, yet will admit vessels of burthen, there being not less than 3 fathoms at low water, in either passage to it; but they must moor head and stern, there being no room to moor otherwise. To sail in through the western passage there is no danger, but to sail in through the eastern channel you must observe the following directions. From the eastern point of Mecatina Island steer north towards the main land; keep that close on board until you get the western point of the island on with the point of Dead Cove; this is a small cove on the main, which lies open to the eastward; the land which forms it is very low, with some brushwood upon it; then sail on in that direction until you get above a stony point, which is to the north side of the said cove; or until you bring the north point of Gull Island, which is a small island lying E. by N. distant one mile from Mecatina Island, on with the E. N. E. point of Mecatina Island; you will then be within a spit of rocks which stretches off the island, and must haul over for Mecatina Island, in order to avoid a ledge which runs off from the point of Dead Cove; and when you bring the western passage open, you may anchor in 6 or 7 fathoms water. Vessels coming from the eastward, and bound for the Harbor of Mecatina, in passing to the northward of Gull Island, should be careful either to keep Gull Island or the main land close on board, in order to avoid a sunken rock that lies near half way between Gull Island and the main, on one part of which there are not above 3 feet water. The highest part of the land between Grand Point and Ha Ha Bay is directly over the Harbor of Mecatina.

The Grand Point of Mecatina.

THE GRAND POINT OF MECATINA is the extremity of a promontory, which runs out from the main land; it is low at the point, but rises inland, sloping gradually up until it becomes of considerable height; it may easily be recognized by the adjacent islands and rocks which are about it; the nearest is a small low rock, not far from the point; two of these islands are much larger, and rise much higher than the others; and the outermost are small low rocky islands, lying $2\frac{1}{4}$ miles off the point. S. E. by E. five miles and a half from the Grand Point are the Murr Islands and rocks, and these are the most southerly islands on all the coast. The northernmost Murr Island bears from the other north a little westerly, distant one mile: they are remarkable objects, being two barren rocks, of moderate height and steep all round. About half a mile E. S. E. from the southern Murr Island, are the two Murr Rocks, both appearing above water, and E. $\frac{1}{4}$ S. from the same island lies a ledge of rocks, under water, on which the sea generally breaks.

Bay de Portage.

BAY DE PORTAGE.—N. W. by N. from the Murr Islands, distant two leagues, is the Bay de Portage, the land over which makes in a valley, each side being high; at its entrance lies an island of moderate height, which forms the harbor; you may enter on either side of this island, but the eastern passage is fit only for small vessels, there being only 2 fathoms, in some parts of it, at low water. The western channel is sufficiently large and safe for any vessel to turn, there being from 6 to 8 fathoms in it; but they must be careful to avoid two sunken rocks, on which are only $2\frac{1}{4}$ fathoms at low water. The northernmost of these lies from Mutton Island S. by W. distant one mile and a half; the southernmost rocks bear from the Seal Rocks N. E. $\frac{1}{4}$ N. distant half a mile; they are both bold to, and vessels may borrow within a cable's length of Mutton Island or the Seal Rocks.

The land from the Grand Point of Mecatina runs about W. S. W. 15 leagues, to Cape Whittle, and is skirted by many islands and rocks, some of which lie 7 miles off shore; therefore, in coasting along, the land must always have a wide berth given to it; vessels entering the Strait of Belle Isle, and being abreast of Chateaux Point, distant 7 or 8 miles, or having brought the Red Cliffs to bear west, distant 5 or 6 miles, may steer a W. S. W. $\frac{1}{2}$ W. course, and they will go clear of all dangers; when having passed the Southmaker's Ledge, which is the outermost reef, distant 7 miles from Cape Whittle, and brought that cape to bear N. by W. or N. distant 8 or more miles, they may steer W. by N. past Wolf Island, until they see Mount Joli*, a sandy ridge, on the main land; bring that to bear N. W. by N. and a N. W. $\frac{1}{2}$ W. course will take them to St. Genevieve Island.

REMARKS.—All the islands along the coast of Labrador have a barren appearance, the outer ones being, for the most part, small low rocky islets, and the inner ones large and high, covered with a sort of green moss. There is no wood to be obtained, except at those places where we have mentioned.

TIDES.—The course and flowing of the tides along the whole coast are irregular and uncertain, depending much upon the prevailing winds; and when the weather has been settled, it was high water at Shecatia, full and change, about 11 o'clock, and at Mecatina at half after two, the rise of the tides being about 7 feet.

At Red Bay the tide flows, full and change, at half past nine o'clock; at Forteau Bay at eleven; at Labrador at half after eleven; and at all these places, spring tides rise 7 feet, neaps 4 feet.

*This is a sandy ridge, with spruce trees, near the S. W. extremity of Natashquan Point. Between Musquarn and Natashquan, parallel to the shore, from 6 to 11 miles distant, there are sand banks, with from 24 to 43 fathoms water, abounding with codfish.

GENERAL DESCRIPTION OF THE ISLAND AND * BANKS OF NEWFOUNDLAND.

The Island of Newfoundland.

THE ISLAND OF NEWFOUNDLAND is situated on the eastern side, and directly in front of the Gulf and River St. Lawrence, its northern part being separated from the coast of Labrador by the Straits of Belle Isle; and its south-western extremity from Breton Island and Nova Scotia, by the great entrance into the gulf. Its length, from Cape Race to Cape Norman, is nearly five degrees and a half; and its breadth, from Cape Spear to Cape Anguille, about 5 degrees 13 miles; being very narrow at the northward, but becoming wide as you approach southerly: its extremes lie between the latitudes of 46° 40' and 51° 40' and the longitudes of 52° 25' and 59° 23' west. The whole circuit of the island is indented with inlets and bays, many of which are extensive, commodious, and well sheltered, where vessels ride in perfect security. Into these bays and harbors numerous rivulets continually run, which, besides the fine purity of their water, afford abundance of trout and other fish. Most of their harbors have complete anchorages, with clear and good channels into them, so that they can be navigated at all times without the assistance of a pilot; they are frequently situated so near to one another, that, in many places, they form a succession of harbors, but they are not all inhabited. The towns and villages are in general to be found in the larger branches only, where the situation and soil are most convenient; the inhabitants, therefore, are not numerous, and the settlements but small.

Great Bank of Newfoundland.

THE GREAT BANK OF NEWFOUNDLAND is to the eastward of the island, and extends from about the latitude of 42° north to 50° or upwards, but recent observations seem to prove that its southern extent does not exceed the parallel of 42° 50' north. Its form like those of the other banks, is irregular, and not easily ascertained or defined; but about the latitude of 45°, its breadth, including the Jaquet and Whale Banks, is nearly 4 degrees. To the northward and southward it narrows almost to a point, and seems insensibly to drop into fathomless water. The Jaquet and Whale Banks may be fairly considered parts of the Great Bank, being only divided from it by channels of somewhat deeper water. The Jaquet lies to the eastward, and has 55 fathoms upon it. Its edge is very steep. Between it and the edge of the Great Bank are 112, 120, and 160 fathoms. The mariner, when entering upon the Great Bank, will change his soundings from 60 to 30, 37, 44, 45, and 60 fathoms; and as he advances towards the Whale Banks, he will have 55 and 60 fathoms. Between the Great Bank and the Whale Bank are 72, 75, and 80 fathoms, and upon the Whale Bank 50, 45, 55, and 60 fathoms; being over which, you again drop into 100 and 200 fathoms, no ground. On the western side of the Great Bank, and to the southward of the Island of Newfoundland and Nova Scotia, a chain of banks extends almost two degrees from the land. These are called Green Bank, Banquereau, Sable Island Bank, &c. All these have soundings over them of various depths, from 20 to 70 fathoms, admirably situated, in dark weather, to warn the mariner of his approach towards the land.

Outer, or False Bank.

THE OUTER, or FALSE BANK, called also the *Flemish Cap*.—This is a patch of rising ground lying two degrees to the eastward of the edge of the Great Bank, in latitude 46° 50' and longitude 45°. Its length is supposed to be about 90 miles, and breadth 50 miles. On it are from 100 to 158 fathoms. Between it and the eastern edge of the Great Bank is much deeper water, the bottom being very fine sand and ooze, which will hardly stick to the lead. As you enter upon the Great Bank you will have fine whitish sand, speckled black. These banks are frequently enveloped in most horrid fogs, which, from the middle of spring to December, have been known to last 8 and 10 days successively. At such times they are often so thick that you will not be able to see any object at ten fathoms distance. A continual drizzling rain is dropping from your sails and rigging, a general calm prevails, and sometimes attended with a considerable swell of the sea, so that you are constantly in fear of running foul of some vessel, or being drifted by the currents upon some danger, which, from the total inability of discovering, you will have great difficulty to avoid. Added to this, the currents which surround the Island of Newfoundland are frequently so violent and so irregular, sometimes driven towards the shores, and sometimes towards the sea, that the greatest caution will always be found necessary, while the known current coming from the northern regions, sweeps along the shores of Labrador, and in the spring detaches immense icebergs, which float to the southward, and become exceedingly dangerous, especially in foggy weather. Some of these masses will frequently be grounded in 40 or 50 fathoms water, and others will be met with further out to seaward, at the distance of 125 or 130 leagues from the land. Fortunately, these formidable

ble objects may generally be discovered, even in dark weather, by a white and bright appearance on the sky above them, and also by the roar of the waters breaking against them; they also may be apprehended by the intense coldness they diffuse to a great distance around them. They continue and are usually met with as late as June, July, and August. Your approach towards the Banks may be known by the numerous sea fowls which will attend you, as rochos, malimauks, and divers. These latter are seldom found more than 30 leagues off the banks. Malimauks and others are occasionally seen all across the Atlantic, but in the vicinity of the banks they become numerous.

The following directions are translated from the report of a recent survey of the Banks of Newfoundland by the French:

"The quality of the bottom varies greatly; but we will remark, that on the Great Bank of Newfoundland the bottom is generally of sand, or sand mixed with gravel; seldom of pebbles.

"The eastern approach is a fine white or whitish sand, often brilliant. In the deep places which separate the banks, and more particularly in the Whale's Hole, the muddy bottom which is found, has a fetid smell.

"The currents on the Great Bank of Newfoundland have a variable direction. The wind is not the sole cause of them. It is not rare for the current to be against the wind. We think that the tide has also some influence; for we have remarked, while at anchor, that the direction of the current varied as well as the velocity. Veracious fishermen have assured us, that the current daily made the round of the compass. However, we can say with a certainty which results from what we have seen and discovered during our navigation on these coasts, that most frequently beyond the meridian of Cape Race, the current runs to the westward; that to the north as well as to the south of the Great Bank of Newfoundland, and on the eastern approach, its direction varies little from E. S. E. to S. S. E., and most generally is between these points. The velocity, which is seldom below 8 or 10 miles in 24 hours, increases sometimes to 24 or 30 miles.

"We should inform navigators that on the outside approaches of all the banks, and principally on the southern approach of the Great Bank, the currents boil and form eddies in such a manner that a vessel becalmed, or with a light wind, cannot estimate their course with exactness.

"The courses on the parallels between 45° and 46° of latitude, are the best for crossing the Great Bank of Newfoundland, and arriving at Green Bank and St. Peter's Bank. When these are reached, if you are bound to St. Peters, in foggy weather, you must keep on the northern side of St. Peter's Bank, and wait a favorable opportunity of reaching land.

"By sounding frequently, the position of the vessel will be known well enough to arrive at the islands of St. Pierre and Miquelon."

THE VIRGIN or CAPE RACE ROCKS are extremely dangerous. They extend *The Virgin or Cape Race Rocks.* in an irregular chain or cluster S. W. by W. and N. E. by E. 800 yards, the breadth varying from 200 to 300 yards. The least water on a white rock is 4½ fathoms, with from 5 to 6½ fathoms, about one hundred yards all around it, the bottom distinctly visible.

Towards the extremities of the shoal, the soundings are from 7 to 9 fathoms, on detached rocks, with deep water between them, the current setting a mile an hour to the W. S. W. with a confused cross swell to the S. E. South, S. W., West, and W. N. W. of the shoal, the water deepens gradually to 30 fathoms, half a mile distant, to the N. W., North, and N. E., one-third of a mile, and to E. N. E., East, and E. S. E. a mile.

The bank upon which the shoal is situated extends E. by N. and W. by S. 4 miles and a quarter; and 2½ miles across its broadest part, with regular soundings of from 28 to 30 fathoms, until they suddenly deepen on its outer edge to 39 and 43 fathoms.

The bottom is seen, and large patches of sea-weed on the sand around them. Over them the sea breaks so violent as to make it unsafe to pass in a gale. Lat. 46° 26' 15" N., Long. 50° 57' 30" W.

A SHOAL of 21 feet is said to have been found by Capt. Ryder, of Provincetown, *A Shoal.* Mass., in Lat. 46° 30'. It is a rock between one and two hundred feet surface, about 50 miles east of the Virgin Rocks.—See the Chart.

EAST COAST OF NEWFOUNDLAND,

FROM CAPE RACE TO ST. JOHN'S HARBOR,

Variation, 26° West.

CAPE RACE is the S. E. point of Newfoundland, and lies in 46° 39' 44" north latitude, and in 53° 05' longitude west from Greenwich. It is table land, moderately high. Near it is a black rock, and several smaller ones around it.

E. S. E. from Cape Race is a fishing bank, over which are from 17 to 25 fathoms water. It is named the New Bank, and is about 5 miles long and 2 miles broad.

From Cape Race to Cape Ballard the course is N. E. by E. distant $8\frac{1}{2}$ miles. About one mile southward of Cape Ballard is Chain Cove Head, appearing high and dark. Between the points is a cove, and to the westward of Chain Cove Head is Chain Cove, having a black rock above water lying before it.

Renowes.

RENOWES.—About three-quarters of a league N. E. from Cape Ballard lie some small rocks, off Small Point; and $3\frac{1}{2}$ miles beyond Small Point are the Renowes Rocks. They are moderately high and bold to, being distant from the land about one mile. One mile and three-quarters to the northward of these lies Renowes Island, situated near the main land, and about one mile to the southward of the entrance to Renowes Harbor, which is but an indifferent place of shelter, with a depth of water 15 feet. To sail into it you must keep the north shore on board, for several rocks lie scattered about its entrance, and S. E. winds commonly send in a very rough sea.

Fermose.

FERMOSE.—Near 3 miles further north is Fermose or Fermouse Harbor, and between them is Bear's Cove, off which a sunken rock lies a cable's length from the shore. There is no danger in sailing into Fermose Harbor, though the entrance is narrow. Just within it, on the northern side, is a small cove, where a fishery is carried on, but the anchorage is indifferent. Further in is Admiral's Cove, where merchant vessels ride land-locked in 7 and 8 fathoms; and one mile within that is Vice Admiral's Cove. Large ships anchor on its south side in 12 and 15 fathoms, muddy ground, and very convenient for both wood and water. On the same side, further in, is Sheep's Head Cove, directly off which, near the middle of the channel, is a bank with only 9 feet, constituting the only known danger within this harbor.

From Fermose Harbor, about one mile N. E. by E. is Bald Head. N. by E. from which, one mile further, is Black Head.

Aquafort.

AQUAFORT.—From Black Head to the entrance of Aquafort Harbor the course is N. by W. distant one mile, at the mouth of which is a rock above water. To the northward of this rock is the passage in, having 15 fathoms water. The harbor runs in N. N. W. about 3 miles, becoming narrower as you advance. Here you have 4 fathoms water. Within the narrows, on the northern shore, is a little cove, where vessels may heave down, the shore being steep. To sail up, give the stony beach on the north shore a berth, it being shoal, except at the point of the narrows, where it is bold to.

Ferryland Harbor.

FERRYLAND HARBOR is to the northward; and its entrance is between Ferryland Head and Bois Island, being little more than half a cable's length wide. Ferryland Head has two rocks near it, called the Hare's Ears. When you have passed these and are within Bois Island, it becomes wider, having good anchorage with 8 and 10 fathoms, but north-east winds send in a heavy sea over the lower rocks, which run from Bois Island to the main.

From Bois Island to Goose Island the course is N. N. E. $\frac{3}{4}$ E. distant half a mile; and from Goose to Stone Island the course is N. N. E. $\frac{1}{4}$ N. distant half a mile.

Caplin Bay.

CAPLIN BAY.—Two and a half miles from Goose Island is Caplin Bay, running in N. W. by N. There is a passage into it on either side of Goose Island. To the northward of Goose, and between it and Stone Island, there is no danger, the islands being bold to; but in passing between it and the Island of Bois, take care to keep the point of Ferryland Head open to the eastward of Bois; by which means you will avoid a sunken rock, having only 2 fathoms water over it. This rock lies nearly midway between Goose Island and Cold East Point; and having passed this rock, no other danger will be found in sailing up the bay to the best anchorage, which is abreast of a cove on the harbour shore, and half a mile within Seogin's Head, with 16 fathoms water.

From Ferryland Head to Cape Broyle, the course is nearly N. N. E. distant $2\frac{1}{2}$ miles. Cape Broyle is high land, making somewhat in the form of a saddle. South of the north part of the cape, $\frac{3}{4}$ of a mile, lies the Old Harry Rock, over which are only 3 fathoms water, though between the main and it are 20 fathoms. E. N. E. of the cape, distant $\frac{3}{4}$ of a mile, are the Horse Rocks, having from 7 to 14 fathoms over them. The mark for these rocks is a white house on Ferryland Downs open with Stone Islands; and the head of Cape Broyle Harbor open will lead directly upon them. In stormy weather the sea breaks very high over them.

Cape Broyle Harbor.

CAPE BROYLE HARBOR runs in about 4 miles, between Cape Broyle and Brigus Head, their distance from each other being $1\frac{1}{2}$ miles. Within the entrance, on the north side, is Admiral's Cove, where you may anchor in 12 fathoms water, good ground, but exposed to the S. E. The best anchorage will be found above the Narrows, in 7 fathoms. The only danger in the way is the Saturday's Ledge, which lies about $1\frac{1}{2}$ cable's length outside of the Narrows, on the north shore. Bring the saddle of Brigus Head open of the point of Admiral's Cove, and you will clear it; and after you get beyond the Narrows anchor in 7 fathoms, good ground, very convenient for both wood and water.

Brigus.

BRIGUS.—This is a small cove, or harbor, a little to the northward of Brigus Head; but it is only fit for boats.

Four and a half miles from Cape Broyle is Cape Neddick, a kind of table land modernly elevated, and steep to. From Cape Neddick to Bahus Head is $1\frac{1}{2}$ mile. One quar-

directions o

ter of a mile to the northward of this is Baline Cove, fit only for boats. The outer part of Great Island is about 2½ miles N. E. by E. ¼ E. from Cape Neddick; and from Baline Head to Spear Island, the course is N. N. E. ¼ E. distant one mile. Within this island is a fishery, but the anchorage is unsafe, and the bottom rocky. One mile to the northward is Tond's Cove, fit only for boats; half a mile from which is Tinker's Point, the southern boundary of Mombles Bay; this place is nearly one mile deep; it is open, and its northern point forms the southern part of Witless Bay; about three-quarters of a mile from which is Green Island; and the same distance to the northward of Green Island, is Gull Island, about a mile in length, and a quarter of a mile in breadth, the land appearing high.

WHITTLE BAY extends inwards full two miles from Gull Island, but lies open to the sea; the ground is tolerably good, and the depth of water moderate; but half way up is a ledge of rocks off the northern shore, part of which are seen at half tide. *Whittle Bay.*

BAY OF BULLS.—One mile and a quarter to the northward of Gull Island is the southern point of the Bay of Bulls, and from hence to the northern point, called Bull Head, the course is E. N. E. ¼ E. distant one mile and a quarter; between these points the bay runs up N. W. by W. nearly two miles, and then N. W. by N. one mile further to the river head. Within this bay the riding is good, in from 20 to 16 fathoms; and after you have passed Brendam and Cheese Point there is a cove; off this latter point lies a sunken rock, at the distance of about half a cable's length, having passed which, the bay is free from danger, and the shores bold; run up and anchor over against John Clay's Hill, bringing it to bear N. E. by N. having 12, 13, and 14 fathoms; the merchant vessels run further in to 10 and 7 fathoms. *Bay of Bulls.*

From Cape Broyle to the Bay of Bulls, the course is N. E. by N. distant 4½ leagues. From Bull's Head to the south point of Little or Petty Harbor, from which a reef of rocks stretches out about a quarter of a mile, the course is N. E. distant 8½ miles. The south point of Petty Harbor is distant from the north point 2½ miles, between which lies the bay, running in two miles; at the bottom of this is a cove and fishery. About midway between the Bay of Bulls and Little Bay, is a cavern, having an opening at its summit, through which, whenever the sea runs high, the water spouts through, forming a remarkable appearance, which may be seen far off: it is therefore significantly enough named the Spout.

From the North, or Lady Point of Little Harbor, Cape Spear bears N. E. distant 2½ miles; it has a low and ragged appearance, and is the easternmost part of Newfoundland, and lies in latitude 47° 30' 53" N. and in longitude 52° 39' 20" W. Vessels from the eastward, upon getting into soundings, and bound for St. John's, generally steer for this point. Between the cape and the entrance to St. John's, are three bays; the first is called Cape Bay, and lies between Cape Spear and Black Head; the second is called Dendman's Bay, and lies between Black Head and Small Point; and the third is called Freshwater Bay, and lies between Small Point and Fort Amherst.

There is a lighthouse on Cape Spear, containing a revolving light, elevated 275 feet above the level of the sea. The times of light and darkness are equal.

ST. JOHN'S HARBOR is one of the principal places in Newfoundland, being the seat of government; and although its entrance is narrow, its harbor is excellent, and its situation readily known, both by the blockhouse built on Signal Hill, at the north side, and Fort Amherst, on which there is a fixed light, on its south end or point of entrance. The channel, from point to point, is only 360 fathoms wide; but it gets wider just within the points than between them, decreasing again as you approach the Chain Rock, for from the latter to the Pancake Rock, the distance is only 95 fathoms; these are rocks, both being above water, and steep to; Chain is the northern rock, and Pancake rock lies on the south side of the channel. *St. John's Harbor.*

In approaching the Harbor of St. John's with a large ship, care must be taken to avoid the Vestal Rock, which lies about 50 fathoms off the southern, or Fort Amherst Point; over this rock are 25 feet water; the marks for it are Fort William, or the Old Garrison, just open of the south head; and the outer Wash Bull Rock open to the eastward of the Cuckold's Head: these latter rocks lie close to the northern point of the harbor, and are always above water, being steep to, and therefore not dangerous. The course is N. W. by W. the shores continuing bold until you get near the Pancake, then give the south side a small berth, continue the same course, or rather more inclined to the westward, keeping Fort Amherst Flagstaff open to the northward of Frederick's Battery Flagstaff; you will by these means avoid the Prosser, a rock on the harbour side, running off the end of another rock, formed like a saddle, with 18 feet water in the hollow, and only 5 feet on its outside; yet it is steep to, having not less than 5 fathoms close to it; so soon as you are within, and have passed the Prosser rocks, you may steer up as you please, both shores being clear of dangers, and anchor in from 4 to 10 fathoms water, on a bottom of mud, and lying quite land-locked.

The winds from the S. W. to the southward, as far as N. E. by E. blow in, all other directions of the wind either baile or blow out of the Narrows; with the latter winds you

must warp in, for the convenience of doing which, rings are fixed in the rocks on each side: the anchorage within the Narrows has from 10 to 16 fathoms, and a little before you enter the Narrows there are 20 fathoms.

Vessels bound into St. John's at night can have a pilot by hoisting a light at the yard-arm. The tides rise 6, 7, and 8 feet, but very irregular, being much influenced by the winds.

FROM ST. JOHN'S HARBOR TO BACCALOU ISLAND.

We recommend the mariner to be careful, lest, if a stranger to the coast, he should mistake Kitty Vitty, a small place fit only for boats, lying about one mile to the northward of St. John's, for St. John's itself; at a distance it has the appearance of a good harbor; he will therefore observe, that at Kitty Vitty's south side is a round hill, shaped like a hen's cock, standing upon Cuckold's Head; while St. John's Harbor may be distinguished by Fort Amherst, which appears white; and by the Flag-staves on the hill, over the north point of entrance; these will sufficiently denote the right entrance.

About one mile from Cuckold's Point, is a small point or projection of the land; and two miles further is Sugar Loaf Point tapering upward, and much resembling a sugar loaf. One league further is Red Head; between Sugar Loaf Point and which is Logy Bay.

Torbay.

TORBAY.—One mile and a half from Red Head is the south point of Torbay, which is somewhat lower than the others. From this Point to Green Cove, the customary place where vessels anchor, the course is W. N. W. about two miles, where you may ride in 14 and 12 fathoms, but it is much exposed to seaward. This bay is large, being full a league in extent; from off its northern point is a flat rock, where the sea breaks; a heavy swell sets from the eastward into the bay, so that it is not a good place to lie in.

From Flat Rock Point, which is low dark land, the coast runs northerly to Red Head, a distance of two miles; and from thence to Black Head, N. E. by E. two miles more; the latter bearing north, distant 6½ miles from Torbay South Point.

Cape St. Francis.

CAPE ST. FRANCIS.—From Black Head to Cape St. Francis the course is N. N. W. distant one league. Cape St. Francis has a white appearance, and is itself low, but above it the land rises high. A little south of the Cape is Shoe Cove, a place used in bad weather for splitting and salting fish. Off the Cove there is good fishing, and with northerly, westerly, and southerly winds you will lie safe within the cove.

About one mile and a half east of the cape lie the Brandy Rocks, in triangular position, the outermost being distant from the cape 1½ mile: the sea breaks over them, and there is a channel between them and the cape, but too dangerous to be attempted. These rocks considerably add to the safety of Shoe Cove.

There is also another small cove, fit for boats, to the northward of the cape, which may be used with the wind off shore.

Conception Bay.

CONCEPTION BAY.—Cape St. Francis, which we have already described, is the southern point of Conception Bay. From Cape St. Francis to the southern point of Baccalou Island, which may be considered the other point or boundary of Conception Bay, the course and distance is N. N. E. ¼ N. 5½ leagues; this is an extensive and deep bay, running to the south-westward, and comprehending many lesser bays and inlets.

Belle Isle.

BELLE ISLE.—Four leagues S. W. by W. from Cape St. Francis is Belle Isle, in length 3½ miles, in breadth about two; this island is lofty, and its eastern side is near three miles off the main; there is on this side a beach, to the southward of which is good anchorage, in 30 fathoms, sandy ground; and a league further, near the south part of the island, is also tolerable anchorage in from 15 to 30 fathoms. At the south end of the island is a small cove, called Lanco Cove, which fishing vessels sometimes resort to, and find good shelter for five or six vessels. One mile from the south part of the island lies a rock, over which are 2½ fathoms water. Two miles S. by W. from Lanco Cove, lies a small low island, called Little Belle Isle, W. S. W. of which, distant 1½ mile, is Kelley's Island, of middling height, and about three-quarters of a mile in length.

Within Belle Isle, on the main, is Portugal Cove, the anchorage within which is not considered safe. To the southward is Broad Cove, and at the bottom of the bay, is Hollyrood Harbor, in depth about 3½ miles; in a cove on the west side of which is good anchorage, in 8, 9, 10 or 12 fathoms water, and room enough to moor.

Following the coast, about 1½ mile from Hollyrood entrance, is Harbor Main, about 1½ mile in depth, and half a mile wide; it is an open place, but near the upper part you may anchor in from 7 to 10 fathoms water.

Salmon Cove.

SALMON COVE.—One mile further is Salmon Cove, the entrance to which is a mile wide; the course in is W. S. W. about 2½ miles: it then divides into two branches, one to the westward about one mile, the other southward one mile and a half; in either of these branches the anchorage is good, but the southern river is considered the better one, there being no danger in entering. In the western branch a rock lies at a small distance from the starboard shore, having on either side a passage, but the southern one is the wider of the two.

Collier's Bay.

COLLIER'S BAY.—To the northward near one league, lies Collier's Bay, running inward south-westerly full two leagues; one mile and a half from the entrance of which

lies a sunken rock is visible in 10 fathoms may go, and further distance anchorage is g

lies a sunken rock, nearly mid-channel, on both sides of which the channel is good; this rock is visible at three-quarters ebb. Two and a half miles up the bay is good anchorage in 10 fathoms water, on the eastern side and opposite a small cove; into this cove vessels may go, and ride in 3 and 4 fathoms water. Higher up the bay is another cove, at the further distance of 1½ mile, but it is both foul and shallow. Near the head of the bay the anchorage is good in 8, 9, and 10 fathoms.

BRIGUS BAY is two miles to the northward of Collier's Bay, and seldom frequented *Brigus Bay*. but by small vessels, it being open, and too far up Conception Bay; it runs in from Brigus Head about 1½ mile, and has anchorage in from 10 to 15 fathoms; or at the head of the bay, behind a small island, on the south side, small craft may lie secure from all winds, with 3 and 4 fathoms water, and moor to the shores. The south point of Brigus Bay may be known by its peculiar ragged appearance.

PORTGRAVE, or PORT DE GRAVE BAY, lies to the northward of Brigus, and *Portgrave Bay*. has within it Sheep's and Cupid's Coves; the latter is on the south side of the bay, and is a good place for 2 or 3 ships to ride in, with 4, 5, and 6 fathoms water, almost land-locked, and having not above one point open. Its north side is bold, and you may lie alongside the rocks and take in your cargoes. The shore on the northern side is remarkably high, and called Spectacle Head. Sheep's, or Ship Cove, will accommodate small vessels in 4 and 5 fathoms water, mooring head and stern, having their S. W. anchor in 22 fathoms, about a cable and a quarter's length from the ship.

Portgrave is about three-quarters of a mile to the westward of Ship Cove; the water within the islands is shallow, but without them the anchorage is 20 and 25 fathoms deep, where you will be quite exposed to south-easterly winds. Burnt Head is the south point of Portgrave Bay; from whence 2½ miles N. E. ¼ N. lies Bay Roberts Point, the southern point of the entrance to Roberts Bay, which is 1½ mile broad, and runs in to the south-westward 5 miles. One mile above Bay Roberts Point is Blow-me-down Head, which is higher than any land near it; half a mile within this is a cove.

BAY ROBERTS has no invisible danger at its entrance; you may borrow on either *Bay Roberts*. side or go close to the island, which lies further in on your starboard side; having passed which, you may run on about a mile, and lie land-locked in 9 or 10 fathoms. Between the island and main vessels can anchor, but the ground is foul and bad; and there are two sunken rocks, one being near the inner part of the island, the other above the island and near the main. Two miles above the island is excellent anchorage, in the N. W. arm or branch of the bay, on muddy ground. Give the south point a good berth in sailing in, as some rocks under water lie near it, and the starboard shore shoals near half a cable's length.

SPANIARD'S BAY is divided from Bay Roberts by an isthmus, or neck of land. *Spaniard's* this bay is deep and extensive, but open to the S. Easterly winds. There is anchorage *Bay*. within it, nearly all over, especially at its head, in 7 and 8 fathoms water.

Two leagues N. E. from Spaniard's Bay are the islands of Harbor Grace; they are distant from Cape St. Francis about 6 leagues, bearing E. ¼ S. To the southward is Brant's Cove, a good place for fish, but not for shipping. There is a rock midway of the entrance. You may sail in on either side of this rock, and find good anchorage in 4 and 5 fathoms water. The ground within the rock is clean.

HARBOR GRACE.—The entrance to the harbor is to the northward of the islands, *Harbor Grace* for to the southward, and between them and the shore, the channel is narrow and the ground is foul; the course in will be nearly west. Almost mid-channel is the Salvage Rock; no danger is outside of this rock. There is also another rock, called the Long Harry, lying near the north shore; both these rocks are above water, and always visible. When you are within the Salvage, go no nearer the west shore than just to open a passage on the west side of the Long Harry, the leading mark for sailing in being the high point of the main, called Mosquito Point, just open to the eastward of Long Harry Rock; this will carry you in with not less than 22 fathoms, quite up to the harbor, clear of all dang.; but toward the eastern shore, you may stand over until you bring the Western Landmark on with the Cupola of the Chapel; you will then be up to the north side of the bar, and must take care not to open these marks, especially if the mark in the Cove at Ship's Head is open with the mark on the point of Admiral's Beach; but if you can bring the Western Landmark at the back of the Chapel on with the Cupola, before the mark at the Cove at Ship's Head comes on with the mark at the point of Admiral's Beach, then you will be in the narrows, and must not stand farther over to the eastward than to bring those marks in one, and continue turning with these marks to the east and west, until you bring the Eastern Landmark at the back of the Chapel on with the Cupola; then you will be within the bar, and should stand well over to the eastward. About half way down this harbor a broad spit of sand runs off from the southern shore, extending full two-thirds over towards the Chapel; this appears to be what Mr. Lane has called the bar; it has 14, 2, 3 and 3½ fathoms in some places over it; but there is a channel between it and the northern shore, with 4 and 5 fathoms water; to sail through which bring Otterbury Head on with the point of the beach, at Ship's Head; this will also lead to the northward of the isl

when you have passed it, anchor in 4 or 5 fathoms. This cannot be considered a good harbor, as the ground is bad for holding, and with the wind at N. W. you will then be obliged to buoy your cables. From Old Perlican to Salvage Point the course is W. $\frac{1}{2}$ N. distant 5 miles. Salvage Point requires a good berth, having a reef of rocks running out from it; the point itself is low. From Salvage Point to Hants Head the course is W. by S. distant 7 miles; and one mile to the eastward of the head is Hants Harbor, fit for small craft only; two miles off which is Hants Harbor Rock, over which the sea generally breaks; bring King's Head open of the Sugar Loaf, and you will clear it to the northward. Two miles further is King's Head, and from King's Head to the Sugar Loaf the course and distance is S. W. $\frac{1}{2}$ W. about 3 miles.

Eastward of the Sugar Loaf is Sillee Cove, fit only for boats, and unsafe for vessels.

NEW PERLICAN.—From the Sugar Loaf to the north point of the entrance of New *New Perlican.* Perlican, the bearing is S. W. $\frac{1}{2}$ W. distant 2 miles; and one mile further is the harbor, small, but tolerably good, within which you may ride land-locked in from 5 to 10 fathoms. The shores are bold to, and free from danger. The entrance is nearly two miles wide, being bounded by Smutty Nose Point on the east, and Gorlob Point on the west; but as you advance the harbor becomes narrower, so that at the anchorage it will scarcely be half a mile broad.

HEART'S CONTENT.—Three miles from New Perlican is Heart's Content, a good *Heart's Con-* harbor, fit for any ship, with excellent anchorage towards the north shore, in from 8 to 12 tent. fathoms water. One league further is Heart's Desire, fit for boats only; and $3\frac{1}{2}$ miles beyond that is Heart's Delight, another cove, adapted for small craft only. From Heart's Delight, about three miles, is Long Point projecting considerably into the bay, and a league further is Witless Bay, by no means a place of safety, being too much exposed, and the bottom rocky. Between Long Point and Witless Bay are two small islands, which you leave on your larboard side.

One mile from Witless Bay is Green Harbor, where vessels may anchor in from 7 to 10 fathoms. Three miles further is Hope-all-a-head; two miles beyond which is New Harbor, a place of shoal water, and only fit for boats.

DILDO HARBOR.—Two and a half miles from New Harbor is Dildo Harbor, with *Dildo Harbor.* in which is very good anchorage, in a cove, at the northern side of the entrance, in from 10 to 20 fathoms water, good clean ground. Three miles from thence is Chapel Bay, the mouth of which is a mile broad, and the bay about three miles deep. Here, behind a small island, about two miles in, is good anchorage in from 8 to 12 fathoms. About 5 miles to the northward is Collier's Bay, very similar, and running nearly in the same direction to Chapel Bay. Seven miles further is the Point of Tickle Harbor Bay, which runs inward, in a southerly direction, full 8 miles; there is no danger in the way, and though little frequented, the anchorage is safe.

BAY OF BULLS.—To the northward is the Bay of Bulls, running in a N. N. West- *Bay of Bulls.* erly direction to within 2 miles of Clinaco River, in Placentia Bay. There is very good anchorage in various parts of this bay, in 12 and 10 fathoms water, particularly on the western side in a cove, about one mile and a half from the entrance, with from 10 to 15 fathoms, sandy ground. To the N. E. is Bull Island, and 5 miles further Copper Island. Both these lie very near the shore. We now open Deer Harbor, a place extensive, and good for anchorage, but barred with many shoals. The first shoal lies midway between Tickle Point and Deer Island, having 6 fathoms on its shoalest part, and therefore not dangerous; but one-third of a mile further in, is a bank with only 2 and $2\frac{1}{2}$ fathoms water; bring the point of the N. E. cove open of Shallop Cove Point, and you will go clear to the westward in 7 fathoms water. There is also another shoal lying off the point on the outside of Shallop Cove, on which are $2\frac{1}{2}$ fathoms. This will be avoided by just opening the point of Deer Island with the first point on the main, within Deer Island; and after you have passed Harbor Island, you may anchor on good ground, in from 10 to 26 fathoms. The entrance of Deer Harbor bears from the north point of Bacalieu Island W. $\frac{1}{4}$ S. distant about 13 leagues.

Full 24 miles N. E. from the entrance to Deer Harbor is Jones' Harbor, the mouth of which is not above a quarter of a mile wide, and the channel in is, in several parts, still less. It runs in $2\frac{1}{2}$ or 3 miles, and has good anchorage in from 5 to 24 fathoms water. To the southward is a high and steep island, called Jones' Island; about 4 miles from which is Bald Head; and 2 miles further Gauny Cove; its entrance is confined, being not more than a quarter of a mile wide; there is, nevertheless, good riding within it, in 10, 12, and 15 fathoms. About a cable's length off the north shore, just at the entrance, lies a sunken rock, and about a mile S. S. E. from the south point of Long Island, is another rock, by some called White Island, just appearing above water. This rock bears S. W. from Random South Head.

Random North Head lies W. by N. distant $9\frac{1}{2}$ leagues from the north end of Bacalieu Island, and about 44 leagues N. by W. from New Perlican.

RANDOM SOUND lies to the westward, and comprehends several arms and harbors: *Random* thus Random and Smith's Sounds unite and form Random Island, the channel's being *Sound.*

narrow, long, and circuitous. At the junction of the two sounds is a small island with a bar of only two fathoms water, the passage being not a mile broad. About 3 leagues from Random North Head, lies Hickman's Harbor, where you will find good anchorage in 15 fathoms. Random North Head bears from Random South Head N. E. $\frac{1}{2}$ E. distant 3 miles. When you are within the entrance of Random Sound there is a branch runs in toward the south; about 1 mile within which is Fox Cove, fit for boats, and 2 miles further Little Heart's Ease, a similar cove, running in a quarter of a mile, then dividing into two branches; the western one has 4 and 5 fathoms within it, but the eastern branch is shallow and adapted for boats only. There is also an anchorage 2 miles further, on the same side, in a cove with an island before it, with 8 fathoms; and not far from this is another cove on the northern side, where a vessel may ride in 7 fathoms.

Smith Sound. SMITH SOUND has generally deep water, and is, in most places, one mile wide, until you get near the head. Shut-in Harbor is on the starboard side; it is nearly at the entrance, and has no safe anchorage, the ground being rocky. Three miles further up is Pope's Harbor; this also is encumbered with rocks, a shoal lying near the middle of it. The direction of the channel is westward about $7\frac{1}{2}$ leagues. To the eastward of Random Island are Duck and Green Islands, both lying a considerable distance from the main; the latter is high, and may be seen as far as Trinity Harbor; it bears from Bonaventure Head S. W. $\frac{1}{4}$ S. distant about 6 miles; and Bonaventure Head bears from the entrance of Smith's Sound E. N. E. $\frac{1}{4}$ E. distant 5 miles. To the north-westward of Green Island is Anthony Island and Ireland's Eye; the latter is $3\frac{1}{2}$ miles in length, and lies in a S. W. and N. E. direction, making the larboard side of the entrance to Smith's Sound. The northern point of Ireland's Eye bears from Bonaventure Head nearly S. W. distant $5\frac{1}{2}$ miles.

There is a small place of anchorage, called Ryder's Harbor, formed by a little island near the main, and bearing from Green Island S. E. $\frac{1}{4}$ E. distant 4 miles; the passage to it is round the west end of the point, off which are some scattered rocks, both above and under water. Within this harbor are 3 fathoms water, and about a quarter of a mile from Ryder's Island the N. W. arm branches off, running westward one mile, and being about a quarter of a mile wide; here are 7 fathoms and good anchorage. From Bonaventure Head to Port Bonaventure is 2 miles; but when you are a mile off, and to the southward of the Head, the harbor to the Admiral's Stage will lie about N. by W.

Port Bonaventure.

PORT BONAVENTURE'S best entrance is between two small islands; but you may go on either side of them in 3 and 4 fathoms water: with a landing wind there will be little danger; and when you are within, and have passed these islands, anchor in 4 and 5 fathoms. Southerly winds here send in a very heavy sea; there is, however, a secure place for boats within a point behind the Admiral's Stage, appearing like a great pond, where 100 boats may lie, even with bad weather, in safety.

From Bacaleu North Point to Bonaventure Head the course and distance is N. W. $\frac{1}{4}$ W. $22\frac{1}{2}$ miles. Bonaventure Head is remarkably high and steep.

From Bonaventure Head to the entrance of Trinity Harbor the course and distance is N. E. $\frac{1}{4}$ N. $4\frac{1}{2}$ miles; and from Bonaventure Head to the Horsechops E. N. E. $\frac{1}{2}$ E. 8 miles.

Trinity Harbor.

TRINITY HARBOR is considered one of the best and largest harbors in all Newfoundland, having several arms and coves, where some hundred ships may ride land-locked. It is a place which you may safely turn in or out, being hold to on each side, and having no danger but what is visible, except when going into the S. W. arm. Where the Admiral's Stage usually is, there is a shoal, called the Muscle Bank, from which shoots off the point within the small island on the larboard side going in, and extends over N. N. W. about a third of the breadth of that arm. Being within that bank, which will discover itself by the color of the water, you may edge over close to the south shore, or keep your lead going to avoid the Muscle Bank, giving it a little distance; the mark for avoiding it is the house, standing over the steep perpendicular rock, situated between Tavernor's Point and Ship Cove, open of the Neddick. Keep this mark on until you are half way over to the Neddick, then haul toward the S. W. branch, taking care to avoid the south shore till you shut in Tavernor's Point with the Neddick; you will then go within the Muscle Bank. You may anchor in from 14 to 10 fathoms, and approach near to the stage on shore, so as to make a stage with topmasts to your stage on shore, to load or unload your ship. This will be found a most excellent harbor; for, after you are in the S. W. arm, you will perceive another branch running up to the N. W. which is continued by another to the S. W.; but there is a bar or ledge at the entrance of the S. W. arm. The N. W. arm is also a large place, having good anchorage for 500 sail of ships. Besides the fore-mentioned arms, the main harbor turns up to the north.

Ships, being within the harbor's mouth, may safely ride in a large cove on the starboard or east side, land-locked, on good ground; here the planters live. Over against that cove, on the larboard or west side, are two other coves; the southernmost of them is called the Vice Admiral's Cove, very convenient for curing fish; and above, or to the northward of that, is a large cove or arm, called Gut's Cove, where there is room enough

for 300 or 400 sail of ships to ride, all on clear ground; there neither winds nor sea nor tide can hurt you; and in this place ships may lie undiscovered until the weather becomes clear and open.

There are several other anchoring places in this harbor, with good clean ground. The bottom every where is tough clay, with 4 and 5 fathoms water, within two boats' length of the shore; and 6, 7, 8, 9, 10, 12, and 14 fathoms; and in some places more, in the middle of the arms and channels. You may turn in or out readily, observing your tide, which rises about 4 feet, and sometimes more.

ROBINHOOD'S BAY.—Sherwick Head, which is the eastern point of Trinity Harbor, forms also the south-western boundary of Robinhood's Bay, the entrance to which is a mile wide, and the bay extends northward nearly two miles. Here vessels frequently ride and fish, in from 7 to 17 fathoms water. At the further or upper end of this bay there are some spots of shallow water, but at its entrance, and between Sherwick and Fox Island Points there is no danger whatever.

SALMON COVE and **ENGLISH HARBOR** lie to the eastward of Robinhood's Bay, being only divided from it by a narrow neck of land, called Fox's Island. The former of these runs in northerly, and is considered a good fishing place; it is clear and deep, and has a good depth of water, from 17 to 10 and 8 fathoms; the eastern shore is bold to, and at the further end of the cove there is a small run of water, which extends about two miles to the northward.

ENGLISH HARBOR is situated at the south-eastern entrance of Salmon Cove. It is a clean bay, where you may ride in 4 and 5 fathoms water. From hence the coast rounds to the eastward to the Horsechops, a distance of more than three miles; it is all high land, steep to and without danger. To the north-eastward of Horsechops is Green Bay, open and entirely exposed to the southward. At the eastern part of this bay is a small sandy beach with a rivulet of water. This place is little frequented, and is neither convenient for ships to fish or ride in. When you have passed this bay there is no sheltering cove or place until you reach Ragged and Catalina Harbors.

RAGGED HARBOR is so named from the rough and craggy appearance of the surrounding rocks, which render it unsafe for either boats or ships to enter; but for those who intend going there, we shall observe, they must go to the northward of the reef of rocks at its entrance, running on north, until the harbor becomes quite open, then you may steer in between the Round Island near the main, and a large black rock, being the outermost of the ragged ones before mentioned. Sail on until you are to the westward of them all, or until you get the south head of Catalina to appear between the westernmost rock and the main, then anchor. A river of good water is at the head of the harbor.

CATALINA HARBOR is nearly two miles to the northward of Ragged Harbor, and is in the latitude of $48^{\circ} 31' 15''$ N. bearing from the north point of Baculien Island nearly north, distant 24 miles. It is a good harbor for small vessels, and may be known by a singular green island at the south points of its entrance. Near half a mile to the north of this island is the Brandy Rocks, a ledge over which the sea frequently breaks. You may go on either side of these rocks, giving the little island a berth, or with a leading wind between the island and the main, though this passage is exceeding narrow, in 4 and 5 fathoms. Just within the entrance of the harbor is Charlton Rock or shoal, lying near mid-channel, over which are only 8 feet water. You must avoid bringing the north point of Green Island on with Burnt Head, the south point of the harbor, for that will carry you right upon the rock; there is a passage between the island and rock, and also between the rock and the north shore, only steering nearer the main, about two-thirds over.

LITTLE CATALINA BAY lies inwards on the northern side. From Catalina Harbor to Little Catalina, the course is about N. E. $1\frac{1}{2}$ mile; and thence to the north head of the bay E. N. E. a little easterly, $4\frac{1}{2}$ miles. When within the harbor you may anchor close to the shore in 4 and 5 fathoms, land-locked; or to the southward of the Little Green Island in $3\frac{1}{2}$ fathoms, or by running up two miles further obtain fresh water. In the S. W. arm or branch of the river, where there is anchorage in 5 fathoms, the harbor runs westerly. Sometimes the water in this harbor will suddenly rise 3 or 4 feet, then fall again, and in certain seasons it will often do so 2 or 3 times in 3 or 4 hours. It abounds with salmon, and the herb Alexander grows luxuriantly on the Little Island. Near a small cove, at the N. W. is a sort of mineral, of a glittering nature, generally called Fire Stone; excellent willicks may be found on the rocks.

From the south to the north head of Catalina the course is N. E. $\frac{1}{2}$ E. distant $5\frac{1}{2}$ miles, and between them are from 13 to 5 fathoms water. The whole way is a kind of broken ground, and in blowing weather the sea frequently breaks high over it.

From the north head of Catalina to Flower's Point, the course is N. N. E. $\frac{1}{2}$ E. distant $2\frac{1}{2}$ miles; and one mile to the eastward of the point lie some sunken rocks; you may go between Flower's Point and these rocks in 6 fathoms water; but it is more advisable to pass on the outside of them; this you will readily do by bringing Gull Island open of Spiller's Point, or by keeping the south head of Catalina open of the north head.

From Flower's Point to Bird's Island is 2 miles. Within Bird's Island is a small bay where ships can occasionally ride, in one branch which runs up towards the west, and in the other, amidst some rocks, which are above water. Bird's Island Bay extends so far as Cape L'Argent.

From Flower's Point to Cape L'Argent is $3\frac{1}{2}$ miles. It is rather a low rocky point, having also a large rock above water lying off it.

From Cape L'Argent to Spiller's Point is $1\frac{1}{2}$ mile. Between these points the lead falls into very deep water. Spiller's Point is steep and bold to, but not very high, with rock above water near it. Over the point, you may discern the high land of Port Bonnavista a great way off at sea.

From Spiller's Point to Cape Bonavista the course is north, distant almost one league. Between them is a deep bay, which might be mistaken for the Harbor of Bonnavista, from the head of which it is only divided by a neck of land. Two miles over, and from Red Head Bay, it is not above a musket shot.

Hitherto the allowance made for the variation of the compass has been two points west; which, it is presumed, will be found sufficiently near to the truth for all the purposes of navigation; but from hence to the northward it appears to have generally increased. At the Capes which form Bonavista Bay, the variation in 1820 was $30^{\circ} 28' W.$; at Barrow Harbor $28^{\circ} 30' W.$; and at Happy Adventure only 28° .

FROM CAPE BONAVISTA TO CAPE FREELS (NORTH.)*

Cape Bonavista.

CAPE BONAVISTA is in latitude $48^{\circ} 42' N.$ and longitude $53^{\circ} 05' W.$ On it there is a revolving light of two minutes intervals, showing a red and white light alternately. It is 150 feet above the level of the sea. Kept open with Spiller's Point, it keeps vessels clear of the rocks called the Flowers.

The cape appears from a distance of a bluish color, and is a steep rocky point, having 4 fathoms close to the shore. Somewhat less than three-quarters of a mile N. N. E. from the extremity of the cape lies Gull Island; which, though small, may easily be recognized, by being of moderate height, and elevated in the middle, making something like a round hat with broad green brims, and visible 4 or 5 leagues off, when the weather is clear. N. N. E. $\frac{1}{2}$ E. distant $3\frac{1}{2}$ miles from Gull Island, is the Old Harry Rock, having only 13 feet water over it. From this a reef or bank extends to the N. E. nearly three miles, having several dangerous spots upon it, of only 18 feet and 3 or 4 fathoms. The outer edge of this danger is called the Young Harry. At its northern extremity are 10 fathoms water, and a little farther off 45 fathoms. Between the Young Harry and the middle ground of 18 feet, are 12, 20, and 50 fathoms; to the northward of the middle ground are 60 and 40 fathoms; to the eastward are 19 and 20 fathoms; to the southward, and between it and the Old Harry, 26 and 31 fathoms. At the north part of the Old Harry are 11 fathoms; to the westward 30 fathoms; to the S. W. 9 fathoms; and a little further S. W. 57 fathoms. Abundance of fish are caught by the boats which frequent this bank, but it is very dangerous for shipping. The sea commonly breaks over Old Harry, unless in fine weather, and the water be very smooth; but the other part of the shoals show themselves only in, or immediately after, heavy gales on the shore.

In order to avoid the Old Harry, you should bring Gull Island on with the Green Ridge, which lies considerably inland; but you must beware, for this mark will carry you too close to the Young Harry. Vessels running along shore, to avoid these rocks, must be careful in keeping Cape Bonnavista open with the westernmost extremity of a high range of land to the southward, called the Inner Ridge; these dangers, together with the long ledge, called the Flowers, already noticed, render it very imprudent for a mariner to attempt making land hereabout in thick or boisterous weather; indeed, at any time, the Island of Bucefieu is the best and safest landfall for the stranger that is bound to any part of Bonavista Bay.

Bonavista Bay.

BONAVISTA BAY.—This extensive bay is formed on the south by Cape Bonavista, and on the north by Cape Freels. These capes lie N. $\frac{1}{2}$ E. and S. $\frac{1}{2}$ W. from each other, and comprehend a distance of 40 miles; between which the coast is much indented with bays and inlets of the sea, most of which are navigable, but difficult, rocky, and dangerous. The land, on the south, is generally high and mountainous, and the shores steep and iron-bound; the north side is low and marshy, from which the water runs off shoal to a considerable distance. The whole bay abounds with small islands, and is on every side encompassed with dangers. The harbors, sounds, and inlets, are deep, extensive, numerous, well sheltered, and safe; but they are generally so deeply embayed, the passages into them so intricate, and the surrounding land so similar in appearance, that few, except those to whom the navigation is familiar, ever attempt to enter them. Of those which seem to offer the best refuge to strangers, who from necessity should be compelled to seek a place of shelter, the following appear best calculated to suit his circumstances:

Barrow Harbor, or Great Chance Harbor, on the south; and New Harbor, or Cat Cove, on the north side of the bay; but the extreme narrowness of the entrance to New Harbor is a great impediment, and renders Cr. Cove the most to be preferred.

PORT BONAVIDA, or Bonavista Harbor, lies within and about $3\frac{1}{2}$ miles to the *Port Bonavista* south-eastward of Cape Bonavista; and vessels intending to rendezvous there, may either pass to it between Gull Island and the Cape, or between Gull Island and the Old Harry Rock, or to the northward of the Young Harry altogether; if the former, between Gull Island and Bonavista. The passage is about three-quarters of a mile wide, and both the cape and island steep to, having 4 fathoms water close to each side, and 16 or 18 fathoms mid-channel; but it will be advisable not to go too near to the Gull Island, on account of a rock under water, which lies about 300 yards off the S. E. part of the island. Having passed through this channel, and finding yourself to the westward of the cape, you will see Green Island, distant about half a mile from the cape. Large vessels commonly leave this island on their larboard side, in their passage to Port Bonavista, going between Green and Stone Islands. The channel is full one mile and a quarter wide, and with 12, 16, and 18 fathoms water in it, and no danger whatever, except a sunk rock of 3 fathoms water, which lies about 200 yards to the N. E. of Green Island; or they may go to the westward of Stone Island, and run on southerly until they open the points of the harbor, and having passed Moses Point, sail to the southward of the Swerry's Rocks; these are always visible, and have no passage between them and the point. Here they may anchor in 10 or 8 fathoms.

The inner passage, between Cape Bonavista and Green Island, is frequently attempted by small vessels. The channel is in some parts narrow, and the ground foul. About a mile to the south-eastward of the Green Island is the ledge of red rocks; you may go between these and the land into Red Cove. There are 6 fathoms water, and in the cove, 4, 4, and 3 fathoms; but the ground is all foul. There is a passage also to the southward of these rocks, and between them and Western Head, in which are 6 fathoms. A little to the eastward of Western Head there is a small rock under water. It lies about a cable's length from the shore, and the sea commonly breaks over it, but boats can go between it and the shore. To the southward is Red Head, or Point, and further on, is Moses Point. Between these is another opening, called Bayley's Cove. You may, in case of extreme necessity, run in here and anchor, but the ground is foul and rocky throughout. There was on the north side of this cove a stage for fishing. Moses Point is the northern point of Bonavista Bay. This place is a very eligible situation for carrying on the fishery; but it is so open to the weather, that with north-westerly gales, following a continuance of strong winds from seaward, the waves break right athwart of the harbor's mouth, and sometimes the whole of the fishing boats founder at their anchors, and not unfrequently many of their stages are destroyed. Vessels during the summer months commonly moor under Swerry Head in 8 or 10 fathoms; but even here, and in every other part of this harbor, the ground is so rocky and uneven that you will be obliged to buoy up your cable.

BLACK HEAD BAY.—This is a wide and deep bay, comprehended between *Black Head* Head to the eastward and Southern Head to the westward. *Black Head* bears from *Black Head* Cape Bonavista W. S. W. $\frac{1}{2}$ S. distant $5\frac{1}{2}$ miles; Southern Head bears from Cape Bonavista W. $\frac{1}{2}$ N. distant 12 miles; and *Black Head* and Southern Head bear from each other E. S. E. $\frac{1}{2}$ S. and W. N. W. $\frac{1}{2}$ N. being nearly 8 miles apart. On the western side of *Black Head* Bay is King's Cove distant about 4 miles from Southern Head. This also is a fishing establishment, but still more objectionable, as a place of shelter, than Bonavista, for this is directly open to seaward, and the ground is all foul.

KEELS.—This is another establishment for the fisheries, and situated in one of the *Keels* coves about midway between Southern and Western Heads. Between these two heads are four other coves; but neither *Keels* nor any of these coves are fit or good places for anchorage, especially with ships of burthen.

From Western Head the land bends W. S. W. $\frac{1}{2}$ S. and leads to numerous coves, bays, and arms of the sea, most of which have deep water, and places of anchorage. We shall here enumerate the principal of these, with their respective situations; but, as many of them are too deeply embayed for general navigation, we shall not extend our directions to a minute or particular description of them all, but confine ourselves to such only as are situated in prominent parts of the bay, and are mostly fitted for general use, and commonly frequented.

We have already stated, that from Western Head the land turns W. S. Westward, and leads to Plate Cove, Indian Arm, and Southward Bay.

PLATE COVE is situated on the coast about $7\frac{1}{2}$ miles distant from Western Head, *Plate Cove*. Its entrance, between Arrow Point and Plate Cove Head, is three-quarters of a mile wide, from whence it bends in more than a mile to the southward. At its eastern extremity is a run of fresh water, but the bottom is foul and rocky. It is, therefore, not much frequented.

INDIAN ARM lies about S. W. by W. from Plate Cove Head, distant 3 miles. It is a narrow inlet running in nearly S. W. about two miles, and terminates in a rivulet of fresh water.

Southward Bay.

SOUTHWARD BAY is separated from Indian Arm only by a narrow neck of land. This is an extensive branch of the sea. Its entrance, between Red Head and Kate's Harbor Head, is a full mile wide, with 30, 50, 80, and 90 fathoms water, mid-channel. From hence it bends to the south-westward $7\frac{1}{2}$ miles, becoming narrower as you advance, but with deep water and no danger. On the western side there is an opening, called Hayes Cove. It lies about two miles from Kate Harbor Head.

Bacon-Bone Rock.

BACON-BONE ROCK.—It will be proper here to remark, that vessels intending to seek either of these places, must beware of the Bacon-Bone Rock, a danger of only 18 feet water over it: this lies W. $\frac{1}{2}$ N. distant one mile from Western Head, and directly in the fairway of the navigation. To avoid this danger, do not shut in Southern Head until Little Denier comes on with the outer Shag Island.

Kate Harbor.

KATE HARBOR lies to the westward of Plate Cove. Its entrance is three-quarters of a mile wide, and the harbor runs in about one mile and a quarter. The depth of water is 36, 29, and 27 fathoms mid-channel, decreasing as you advance to the further end. There is a rock under water off its entrance, with 7, 8, and 9 fathoms round it; this lies nearer to Kate's Head, but there is a passage between them, and also a still wider channel on the western side of the rock.

Sweet Bay.

SWEET BAY.—This is another extensive inlet, lying to the westward of Kate Harbor. Its entrance is between Cutler's Head and Chance Point, and leads also to Maiden-hair Cove, and Little and Great Chance Harbors. Sweet Bay is the easternmost inlet, which having entered and passed Cutler's Head, which is rocky and steep to, you will see Turfpook Island: it is small and narrow. About half a mile to the S. W. of this is Woody Island, and between them a rock under water. There is a passage on either side of these, and when you get beyond Woody Island, the bay becomes about three-quarters of a mile wide, with 60 fathoms water, mid-way. Advancing still further, you will observe several islands in your passage. There is also a rock under water on your starboard side, three-quarters of a mile beyond Woody Island. It lies abreast of a little island which is mid-channel. Further on is Wolf Island, between which and the main there is no passage. Off this lies Gooseberry Island; between which and Wolf Island there are 30 fathoms water, but the channel is narrow, and that on the eastern side of Gooseberry Island is much wider. Sweet Bay here divides into two branches; that to the eastward is called the south-west arm, and has directly before it entrance Hunt's Island, the channel to the eastward of which has 10, 12, and 14 fathoms water, and that to the westward 7 and 9 fathoms. You will then see on your starboard side a small island: you may pass it on either side; and having so done, will drop into 24, 22, and 20 fathoms water. The head of the arm is foul and rocky. The N. W. arm is divided from the S. W. arm a little below Hunt's Island, and at the further end of Wolf's Island is nearly a mile wide; from whence it runs south-westerly $3\frac{1}{2}$ miles, with good depth of water, and clear of dangers. At the bottom is a sandy beach and a small rivulet.

Great Chance Harbor.

GREAT CHANCE HARBOR.—This is an excellent and convenient place of anchorage, the entrance to which lies W. $\frac{1}{2}$ S. distant $10\frac{1}{2}$ miles from Western Head. Vessels sailing for this place should recollect the mark already given to avoid the Bacon-Bone Rock. Having passed this danger, you may sail on directly for the harbor; the course will be W. $\frac{1}{2}$ N. until you get abreast of Chance Point. You will now guard against a sunken rock at the southern part of the entrance, which has only 16 feet water over it. To avoid and go clear of this danger, be careful not to shut in the westward Mustard-bowl Island with the eastern one: these are situated at the larboard side of the channel. Having passed the eastern island, stand boldly in, approaching each side as nearly as you like, and anchor any where above the narrows in from 11 to 5 fathoms. The ground is good and holds well. You will lie sheltered from all weather, and may procure wood and water with great facility. Chance Point and Cutler's Head are both steep to. Off the former, and directly in a line between the southern part of Long Islands, there is a spot of ground with only 7 fathoms of water; during heavy gales from the seaward this will show itself by the sea breaking over it, but in fine weather it is not dangerous. N. E. a little northerly, distant almost one mile, is the Chance Gull Rock, steep to, and always visible. To the westward is Deer Island, one mile and a quarter long, but narrow. There is a good channel between it and the main to Chandler's Reach.

Chandler's Reach.

CHANDLER'S REACH is the channel leading to Goose Bay and Clode Sound; the course through which is W. $\frac{1}{2}$ S., which, from the N. W. point of Deer Island, will take you to Connecting Point; this is the point of the peninsula that divides the former from the latter.

Goose Bay.

GOOSE BAY runs in south-westerly about $7\frac{1}{2}$ miles, and by keeping in mid-channel you will meet with no danger, but have 47, 40, and 36 fathoms water, until, having passed Lubber's Hole, the depth decreases to 12, 13, 10, and 8 fathoms, when you will see a small island situated to the westward of Goose Head; behind, and to the westward of this, you may anchor in from 4 to 7 fathoms, or further to the southward in 5 $\frac{1}{2}$ fathoms. In most of these inlets you will lie perfectly safe, and entirely land-locked. Fresh water and wood are plentiful, and easily obtained.

CLODE SOUND is a fine branch of the sea, running in from Chandler's Reach full 20 miles. It has many good places of very good anchorage, and without any danger. Vessels may find perfect safety on the northern shore, at Brown's Cove, or further in, at Long Cove, or Platter Cove; or on the southern shore, at Bunyan's and Love Coves; or, passing the Platter Rocks, and steering westward, at Freshwater Cove. The mid-channel has all the way deep water, and there are no rocks except near the shores. *Clode Sound.*

LION'S DEN.—This is an opening lying at the N. W. end of Chandler's Reach; to enter which you must sail to the northward of the Deer and Cluster Islands, and pass the narrows, which is about one-third of a mile wide, and has 24 fathoms water in it. Having passed the entrance about one mile, there is a sunken rock, round which are 4, 5, and 6 fathoms: you may then perceive the inlet to branch off into two divisions; that to the N. W. is very narrow, and has a rocky islet at its entrance: but that which runs to the S. W. is broader, and has 11, 14 and 10 fathoms water in it. It runs in from the sunken rock about 1½ mile, and at its further end becomes shoal, narrow and rocky. *Lion's Den.*

THE LONG ISLANDS are 4 in number, having narrow channels between them, some of which are encumbered with rocks, and dangerous. The eastern island is the largest and broadest; the next to it is the longest; the two western ones are smaller and narrower. They form the northern boundary of the passage from Western Head to Chandler's Reach; and also the southern boundary to Swale Tickle and Newman's Sound. Off the north-eastern point of the largest Long Island lies a sunken rock; it is close to the land, and therefore may easily be avoided; this point bears from Western Head nearly W. by N. distant 6 miles. *The Long Islands.*

NEWMAN'S SOUND.—This is a large arm of the sea, running in W. by N. having at its entrance Swale Island, which is nearly 4½ miles long, and not one broad in the widest part. This divides the entrance into two channels; the southern passage is called the Swale Tickle, and the northern one goes by the general name of Newman's Sound. To sail from abreast of the Western Head into the Swale Tickle, you must steer W. N. W. ¼ W. To sail from abreast of the Bonavista Gull Island, steer W. N. W. ¾ W. 29 miles, and it will carry you a little to the southward of Little Swale Island, and in the fairway of the passage; but in advancing through this channel there are several obstructions, and the passages from thence into Newman's Sound are so narrow, that it will always be advisable to go to the northward of the Great Swale Island. To do this, having rounded the Gull Island, steer W. N. W. ¼ W. 27 or 28 miles; you will then have the sound open, and can proceed accordingly. It is full 1¼ mile wide, and extends in nearly a N. by W. direction from the N. E. point of Swale Island 11 miles, having several places of good anchorage. Those on the southern shore are South Broad Cove, Minchin's Cove, and Stanford Cove. *Newman's Sound.*

SOUTH BROAD COVE is situated two miles and a half beyond the western point of Swale Island, and is a place of great safety. The passage in is to the south-westward, and you will ride well sheltered in 10 fathoms, free from any danger. There is a small island at the entrance, which you will leave on your larboard side. *South Broad Cove.*

MINCHIN'S COVE is to the westward; to go to this place, there is a long narrow point of land running out to the northward, which you will round, and turning southerly, the cove will appear open: here you will lie in 5 fathoms, opposite a sandy beach. To the westward is Mount Stanford, off the point of which lies a small island, reaching half way over the passage, making the channel in this part very narrow. The best course through is to the eastward of this island, in 9 fathoms. Here an opening appears to the eastward, called Buckley's Cove, fit for small vessels. The coast now winding to the westward forms a broad bay, with 20, 26 and 27 fathoms water in it, free from any danger, and shallowing on each side towards the shores. At the south western part of this is Stanford Cove, having a sandy beach, the approach towards which shallows gradually. *Minchin's Cove.*

The anchorages on the northern shore are, North Broad Cove, Great and Little Happy Adventure Coves, and Barrow Harbors. Barrow Harbor is tolerably safe, and the most convenient harbor on the south side of Bonavista Bay; it is situated on the southern side of the peninsular which divides Newman's Sound from Salvage Bay, and is formed by three large islands, Keat's, Goodwin's and Richard's Islands. That part between Goodwin's Island and the main is the entrance, about 500 yards wide, and not difficult of access. The harbor is a full mile in length, the outer part is rocky and not well sheltered, but the inner part is completely land-locked, and has good holding ground. Vessels taking their departure from Gull Island, Bonavista, should steer N. W. by W. ¾ W. about 22 miles. But if coming from the northward, their course from the Eastern Gooseberry Rock, towards Barrow Harbor, will be S. W. ¼ W. 18 miles. Gooseberry Rock appears just above water. In this course they will have to avoid the Malone Rock and Ledge, the latter being a shoal, lying S. ¼ W. distant one mile from the rock, which is always above water; this shoal has never less than 4 fathoms over it, so that, in fine weather, no danger whatever is to be apprehended. In sailing on, and approaching Little Denier Island, which is almost opposite the harbor's mouth, you must be particularly careful of the outer Rock, lying N. ¾ W. of Denier, distant three-quarters of a mile; this has only 4

and 6 feet upon it, but fortunately the sea constantly breaks over it, thereby pointing out its situation, and enabling the mariner to guard against, and steer clear of the danger. Having reached the Little Denier, it will be better to go on its northern side, for between Little Denier and Richard's Island there lies a dangerous reef of rocks, called the Brandishes; these extend nearly in a line, but at various distances, almost half way over the channel. Upon these rocks are from 12 to 17 feet, with narrow channels of 7 and 8 fathoms between them; to navigate this passage, therefore, requires a pilot. To clear the Brandishes, you should keep Wedge Point a little open to the southward of Smoky Ridge, which is a range of high lands at the top of the harbor, until you bring Broom Head on with the Middle Shag Island; the passage then will be open, and without obstruction, until you get near to Wedge Point; off which, only 70 yards, lies a sunken rock, with 8 feet water; you may then sail up Pudner's Cove, until you are entirely shut in from the sea; then you can anchor in from 10 to 18 fathoms. Some vessels prefer anchoring in Garland's Creek, but without running well up, the ground is foul. The land about Barrow Harbors is higher than the neighbouring shores, and, consequently, may be the more readily recognized by its projection.

Sandy Cove.

SANDY COVE lies further up Newman's Sound, and has good anchorage; it may readily be known, having the only sandy beach on the north side of the sound. There is no danger in entering, and it is perfectly safe, the depth of water being from 10 to 20 fathoms. In sailing to this place, and keeping along the northern shore, between Barrow Harbor and Sandy Cove, you will meet with a rocky islet, called the Half-way Rock; it is steep to, and has 4 fathoms close to it; there is also a deep water channel between it and the main, but keep outside and pass to the southward of it, and there will be no danger.

Great & Little Adventure Coves.

GREAT AND LITTLE ADVENTURE COVES.—These are two snug little coves lying about three-quarters of a mile above Sandy Cove, and on the same side of Newman's Sound; but from the narrowness of their entrances they are fit only for small vessels. Between these coves, and off a point of land which separates them, lies a sunken rock, about 80 yards from the shore, with only 4 feet over it. Off the entrance to Great Adventure Cove, lies Sidney Island; the passage in is to the northward of this island, for between the island and Harbor Head, there is no thoroughfare.

North Broad Cove.

NORTH BROAD COVE.—The entrance to this place lies one mile and three-quarters from Harbor Head, and is on the northern shore. It is a convenient and well sheltered anchorage, and may be easily known by a round island lying at its western side: this is named Black Duck Island. Sailing into the cove you should keep the island on board until you make a tinkle* between it and the western shore, to avoid a sunken rock at its eastern side; after which, it is advisable to keep as close as possible to the eastern shore, for there is a dangerous rock lying mid-channel; being inside this rock, you may anchor in from 10 to 25 fathoms, muddy ground.

In advancing further up Newman's Sound, there are some other dangerous rocks, lying off the northern shore; one of these is called the Shag Rock, and lies three-quarters of a mile beyond Black Duck Islet; and one mile further on is Hall's Rock; both these are under water, and distant about a cable's length from the land; they have 4 and 5 fathoms close to them, and a passage between them and the shore of 6 and 7 fathoms; therefore, in sailing up Newman's Sound, the northern shore should always have a good berth. Keep nearly half a mile off, and you will avoid them all.

Salvage Bay.

SALVAGE BAY lies on the northern side of the promontory which divides it from Newman's Sound; it has several runs of fresh water within it, but no place of good shelter.

Damnable Harbor.

DAMNABLE HARBOR lies to the northward of Salvage Bay; between them are several small islands and rocks; the largest of these is named the Baker's Loaf, and is a narrow island, about three-quarters of a mile long. To go to this place from Gull Island, Bonavista, you should steer W. N. W. $\frac{3}{4}$ N. about 7 leagues, and round the Shag Islands; proceed thence to the northward of the Baker's Loaf, or steer N. W. by W. from the Gull towards the Ship island, which may readily be known by a remarkable bald point, like a sugar loaf; then W. $\frac{1}{2}$ S. from Ship Island $\frac{5}{8}$ miles, will bring you to the entrance of Damnable Harbor. This place is well adapted for the reception of small vessels, but its very narrow entrance disqualifies it for ships of burden. There is a rock off the southern part of the entrance, and another off the northern side of the island, which lies in the middle of the harbor; there is good anchorage all round the island in 4 and 5 fathoms, sandy bottom.

Morris's Cove.

MORRIS'S COVE.—This lies on the north side of Morris's Island, and is considered to be a safe anchorage. In sailing for this place, keep Ship Island well on board, on account of a dangerous reef, which extends from Flat Island nearly two-thirds of the way towards Ship Island, on some parts of which there are not above 17 or 18 feet; proceed therefore to the northward of Ship Island, passing at not more than half a mile distance;

and when you are well inside, avoid shutting in Lackington Rock with Varket Island; this latter will be known by its appearing like two singular hummocks, on account of there being several clusters of rocks between Ship and Horsechop Islands. Steer for Varket until you get abreast of Lackington Rock, then keep Lackington Rock on the northern extremity of Ship Island, until the Varket bears north, in order to clear the two sunken rocks off the end of Morris Island; you may then steer directly for the cove, which you can enter without fearing obstruction, and anchor in any part thereof, in 25 to 5 fathoms; but the western side of the cove is to be preferred.

BAY OF FAIR AND FALSE.—This place may contain several good anchorages, *Bay of Fair and False.* but it is so filled with small islands and rocks, that no description we could give would be of any use to the mariner. A cluster of large islands extends off the frontage of this bay, full 20 miles, or so far as Offer Gooseberry Island; between these are passages innumerable, with deep water; there is also a wide channel, running from Fair and False Bay, and Morris Island, to the northward. This leads to Bloody Bay, which then turns westward, and is divided into various branches, forming the N. W. arm, the middle arm, and the north-east arm; this latter being a peculiar and extensive channel, running in one direction, southward, almost to Newman's Sound; and in another, almost to Damnable Harbor: all these are navigable, and afford places of good anchorage, and plenty of both wood and water. There is also an open strait from Bloody Bay to the eastward, through Bloody and Cattel's Reaches, and out to the northward of Offer Gooseberry Island.

Other channels branch off to the northward from Bloody and Cattel's Reaches, and between the Lakeman's Islands, running into Pitt's Sound, Locker's and Content Reaches; and thence to Freshwater Bay: within these, and on the northern shore, are Hare, Locker's Trinity, Indian, and many other lesser bays, coves, and inlets, abounding with good anchorages, and calculated to afford shelter for shipping of all descriptions, in cases of necessity: these are, at present, but little known, and frequented only by the constant traders; we shall, therefore, proceed to those which are the usual places of resort, and are better situated for the purpose of fishing.

Vessels coming from the south-eastward, and bound to the northward, for New Harbor, Greenspond Tickle, Cat Cove, the N. W. arm, or anchorages adjacent, frequently take their departure from Cape Bonavista; in which case, their course will be N. by W. to clear the Eastern Rock, which lies E. S. E. distant one mile and a quarter from Offer Gooseberry Island. From thence they should steer N. $\frac{1}{2}$ E. to Copper Island, at the mouth of Greenspond Tickle; here pilots may frequently be obtained to conduct you to this, or any of the adjoining anchorages. There is good holding ground between Greenspond Island and the main; but the water is generally so deep that a vessel is liable to be drifted on shore in the act of weighing; nor is there sufficient room to veer out a lengthened cable in heavy gales from the S. W., to which quarter it is much exposed.

Ships coming from the eastward, or round Cape Freels, must be careful to go clear of the Charge Rock, which lies S. E. $\frac{1}{2}$ S. two and a half miles from Gull Island off Cape Freels. This has only six feet water over it, and is circumscribed by a large spot of rough fishing ground, with from 8 to 30 fathoms upon it. From the Gull Island of Cape Freels you may run immediately for the Stinking Islands, taking care not to open Cape Freels to the eastward of the former; this will carry you inside the danger. You should keep a good look-out for the mid-rocks, which appear just above water, and lie two miles N. E. by E. $\frac{1}{2}$ E. from the Stinking Islands; but vessels not bound up the bay, are strictly recommended to keep outside of them all; for, should the weather become suddenly thick and foggy, a circumstance by no means unusual, more especially with an easterly wind, you will run great hazard of getting bewildered among the innumerable rocks, which are scattered so profusely about this part of the coast; and from which neither compass nor chart can extricate you. In the winter months, when the north-easterly gales are generally heavy and continuous, the sea breaks exceedingly high over several spots of the Stinking Banks, which lie E. by N. $\frac{1}{2}$ N. from the islands, distant about $2\frac{1}{2}$ miles; in two places there are only 7 fathoms over these banks; and in such weather, although a ship would not strike, she would be in great danger of foundering in the tremendous sea which would then frequently break over her; but when the weather is settled, and the sea smooth, they are by no means dangerous.

Having rounded the Stinking Islands, and wishing to sail into New Harbor, or Cat Cove, you may, with propriety, steer S. W. by W. $\frac{1}{4}$ W. directly for the Offer Gooseberry Island, until you bring Pouch and Flower Islands to touch each other; you will then be two miles outside of the three rocks, which lie $1\frac{1}{2}$ mile to the southward of Flower Island; the outer rock has 3 fathoms over it, the middle rock 14 feet, and the inner rock only 11 feet. You will now alter your course to W. $\frac{1}{4}$ S. keeping the white face of Chalky Hills a little on the starboard bow, which will take you clear of Copper Island dangers; then should the inclemency of the weather prevent you getting a pilot on board, you can continue this course until you bring Shoe Cove Point, which may be distinguished by its semblance to white marble, to bear N. W. $\frac{1}{4}$ W., then shape your course W. N. W. for Indian Bay.

New Harbor. NEW HARBOR is situated on the eastern side of Indian Bay, about two miles from the Shoe Cove Point. This place, during the easterly winds, will be quite inaccessible, on account of its narrow entrance: in this case, you must proceed onward, about four miles, for Cat Cove.

Cat Cove. CAT COVE.—In order to reach this place, you will proceed between Silver Hair and Brown Fox Islands and the main; and as you approach the latter the channel narrows, and you will have a narrow island on your starboard side; this is Cat Island, behind which is Cat Cove. You will have no difficulty in distinguishing this island, it being the only part that is covered with live woods, for the surrounding forests have all been destroyed by some general conflagration. Off the upper part of Cat Island lie two high green rocks; you must go round these, for the water is too shoal to go between them: having done so, you may run on until you get some distance inside the upper point of the island, when you may anchor in from 5 to 13 fathoms, with a hawse open to the N. W., the winds from that quarter being most heavy and equally. In working in, you may stand close to either shore, except off the point of the island, as there is a sunken rock within 100 yards of it, with not more than 10 feet water over it.

North-west Arm. NORTH-WEST ARM.—This is situated on the main, and is the place of safety nearest to Cape Freels; but its entrance is very difficult, on account of the number of islands that surround it, and these islands are almost undistinguishable one from the other, from their similarity of appearance. In coming from the southward for the North-west Arm, the greatest danger which you will have to encounter is the Northern Rock, which never has less than 22 feet over it; this lies N. E. distant one mile and three-quarters from the Copper Island; this island you will easily recognize by its having no wood upon it, and by its height. In fine weather, and a smooth sea, vessels pass over it in perfect safety; but in hard gales, the waves beat over it incredibly high. To avoid it, be careful to open Fool's Island, which is somewhat higher, and more prominent than the rest, and which is covered with trees, except about the summit, to the westward of the Western Pond Rock, until you get Butterfly Island to touch the inner part of Flower Island, or until Puffin and Copper Islands touch each other; then, leaving the Pond Rocks on your starboard side, steer in for Fool's Island. It is advisable to keep this island well on board, for there is a sunken rock, lying mid channel, exactly between it and Partridge Island Rocks; this danger has only 18 feet water over it; but no mark can be given to avoid this rock. The course then up the arm will be N. W. $\frac{1}{2}$ W.; and so soon as you get inside of Odd Island, you may anchor, on muddy ground, in from 7 to 9 fathoms, Fool's Island Hill bearing S. E. to S. E. by S.

Greenspond Tickle. GREENSPOND TICKLE.—Greenspond is a square island, about a mile in breadth each way. A reef of rocky islets runs off its southern part all the way to Puffin Island. Greenspond Tickle lies on the south-eastern part of the island, and is of very little importance, being incapable of receiving any vessel whose draught of water exceeds 14 feet. The dangers in going to this place are, the Northern Rock, the Cook-room, and Harbor Rocks; but it will be almost impossible to get into this harbor with an adverse wind, or even with a fair one, without the assistance of a pilot.

Ships sometimes run in, and anchor between Greenspond Island and the main, but the channel is narrow, the water is very deep, and it lies too open to the S. W. winds to be considered a place of safety. In order to sail into it you must get to the westward of the Copper Islands; in so doing, be careful of the Midsummer Rock, which lies nearly W. by S $\frac{1}{4}$ S. distant one mile from Copper Island, and has only 5 and 6 feet water over it. Observe, when you shut in Silver Hair Island by Shoe Cove Point, you will be within side of the danger; it is also necessary to give Newal's and Ship Island a wide berth, as the water shoals off them to a considerable distance.

CAPE FREELS TO THE STRAIT OF BELLE ISLE.

Cape Freels. CAPE FREELS is formed of three points, the South Bill, the North Bill, and the Middle, or Cape Freels. There are many shoals and rocky dangers about them all, therefore a wide berth should be given them at all times. Over these points is some high land, commonly called the Cape Ridge, which is visible at a considerable distance.

Funk Island. FUNK ISLAND.—N. 54° E. from Cape Freels, distant 27 miles, lies the Funk Island. This is little more than a sterile rock, and cannot be seen further than at the distance of 10 or 12 miles; but it will always be distinguished by the great number of birds which continually hover over it. About 200 yards north of Funk Island is a large rock above water, and N. W. by W. 180 yards from this are still larger rocks; they are all barren, and only the resort of sea birds, that inhabit and breed there. Between these rocks are 18, 37, and 42 fathoms water, with a clear passage; but between the eastern rock and Funk Island there is a dangerous sunken rock, of only 10 feet water, over which the sea generally breaks: near this sunken rock are 14 and 16 fathoms, and between it and Funk Island, 30, 25, 56, 38, 24, and 17 fathoms. Off the western point of Funk Island are some rocks, and at its eastern part a sort of creek with 5 fathoms in it. It is also reported that a ledge of rocks lies S. W. from Funk Island, distant about 7 miles.

DUREL'S LEDGE, or Snap Rock.—This is a dangerous reef, and said to lie about 7 *Durel's* leagues N. W. by N. from Funk Island. The sea breaks over it continually; and nearly *Ledge.* N. W. by W. distant 3 leagues from Durel's Ledge, is another danger, named Cromwell's Ledge. It is supposed to bear E. S. E. $\frac{1}{2}$ E. distant 10 or 16 miles from Little Fogc. sands.

N. N. W. $\frac{1}{2}$ W. from Cape Freels, distant 6 $\frac{1}{2}$ miles, is the Outer Cat Island. It is connected to the main by a sandy reef, which is impassable for shipping, and forms the southern point of Deadman's Bay. A little before you come to the Outer Cat, you will see a remarkable hill, called the Windmill Hill, and near it the Little Cat Island. In sailing to or from Cape Freels the shore should have a good berth, although there are soundings all the way, and they decrease gradually towards the shore. Deadman's Bay is formed by the outer Cat Island to the southward, and Deadman's Point to the northward. The soundings within it are regular, and the bay without rocks, unless close to the shore; but it is totally unsheltered, and open to all easterly winds.

Having passed Deadman's Point, you will approach the Penguin Islands. These are 2 in number, and bear from Cape Freels N. N. W. $\frac{1}{2}$ W. distant 14 and 15 miles. Between them the passage is clear, with from 5 $\frac{1}{2}$ to 7 fathoms water; but vessels should not go within them and the shore, for there are several rocky reefs, which render it particularly dangerous.

RAGGED HARBOR lies to the north-westward of the Penguins, distant 6 $\frac{1}{2}$ miles. *Ragged Harbor.* The main land hereabout is low and sandy, and the passage from the eastward rocky and dangerous; it should, therefore, not be attempted by a stranger, or without a pilot. To the north-westward is Ludle Cove Island, and 7 miles beyond that is Rocky Bay. At its entrance, which is wide, lie three islands, Noggin Island, Green Island, and further south is White Island. You may pass between each of these in 7 fathoms; between Rocky Point and Green Island in 7, 8, 13, or 10 fathoms; and between Green and White Islands in 13 and 14 fathoms. Between Noggin Island and the western point of the bay there are 3 $\frac{1}{2}$, 7, 12, 9, and 4 fathoms. The bottom of these bays, for there are 3 openings, is rocky, and vessels cannot go far into them.

THE WADHAM ISLANDS.—These are a cluster of islands lying to the north- *The Wadham* westward of Cape Freels. They consist of 8 or 10 scattered islands, separated from each *Islands.* other by channels more than 1 and 2 miles wide. The largest of these is called Peckford's Island, which is almost a mile long, lies in the direction of north and south, and bears from Cape Freels nearly N. by W. distant 20 miles. From its southern part, towards the land about Ragged Harbor, there are a number of rocky islets and reefs, with channels between them, rendering the navigation of this part extremely hazardous. N. N. W. $\frac{1}{2}$ N. 1 $\frac{1}{2}$ mile from Peckford's Island is White Island, but a passage between them should not be attempted, for there are several small rocks lying off the north and north-western part of Peckford's Island, some of which stretch out almost as far as White Island. N. W. by W. from Peckford's Island, about 4 $\frac{1}{2}$ miles, is Copper Island. Green Island lies W. N. W. $\frac{1}{2}$ N. 2 $\frac{1}{2}$ miles from Peckford's Island, and about a similar distance S. S. E. $\frac{1}{2}$ E. from Copper Island. There are also some small rocks lying off the N. W. end of Green Island, which being visible, can always be avoided with ease.

S. W. ROCK.—This is a small detached Rock above water, bearing from Peckford's *S. W. Rock.* Island S. S. E. $\frac{1}{2}$ E. distant 3 $\frac{1}{2}$ miles: near it are 13, 17, and 21 fathoms. About N. N. E. distant 2 miles from the S. W. Rock, is a small flat island; and a little more to the eastward is Offer Island; this is the most easterly of all the Wadham Islands. There is yet a rock to describe, which lies E. S. E. $\frac{1}{2}$ E. from Offer Island, distant about one mile and a half: this is dangerous, and must have a berth in passing either north or south of it.

THE FOGO ISLANDS lie to the north-westward of the Wadham Islands. *The Fogo* Fogo is a large island, 4 leagues long and 9 miles broad. Off its south-western point lie *Islands.* the Indian Islands; and N. E. by N. 4 miles from the body of Great Fogo, are the Little Fogo Islands.—Numerous other rocks and small islands are scattered about.

SHOAL BAY.—This harbor is very secure, with good anchorages in any part above *Shoal Bay.* the Harbor Rock: it has two tickles, so called in Newfoundland, and intended to describe narrow passages between islands and rocks: these may be entered with any wind except from the south to the S. W. which wind blows out of both. To enter the Eastern Tickle, you should borrow on Ring's Island, keeping the extreme of Fogo Island nearly open of Lane's Island, until Guppy's Island comes open of Simon's Island; you will then clear the shoals of Filly's Point. To avoid the Harbor Rock, bring Shade and Cox's Flagstaff on with the eastern chimney of their dwelling house: it will be necessary to get this mark on before Boutsuain's Island closes Bullock's Point. In coming from the westward, it is advisable to make free with Fogo Island, in order that you may distinguish the small islands that form the tickle, which, if passed with westerly winds, can never be regained, owing to the constant set there is to the eastward. Having passed Little Motion, keep the extreme point of the head over the Narrows Point, until you get past Bullock's Point, when the above directions will clear all the harbor's dangers.

Coming from the eastward, and bound to Fogo Harbor, N. W. part of Fogo Island, you must be careful to avoid the Denn's Rock, which is a sunken rock, and lies between Joe

Batt's Point and the Harbor. Steer W. N. W. until Brimstone Hill, a remarkable round mountain, appears in the centre of the harbor; then steer for the East Tickle, which may be known by the lantern on the top of Sim's Island. Make the west side of the tickle. Give a good berth to the point on the starboard side, and run right up the harbor, keeping near the south side, and you will carry from 5 to 3 fathoms through. Immediately you get round the point, steer S. W. to avoid the Harbor Rock, and follow the directions given above for anchoring. The middle tickle appears the widest, but it is fit only for boats. The other two must be adopted as best suits the wind.

Little Fogo Islands.

LITTLE FOGO ISLANDS lie nearly N. E. distant $4\frac{1}{2}$ miles from Joe Batt's Point. There are numerous rocks about them, both above and under water, making this part of the coast exceedingly dangerous. A little to the eastward of Little Fogo is a small rock just above water, called the North-eastern Rock; and somewhat in this direction, distant 10 or 11 miles, is said to lie Cromwell's Ledge, whose exact position is not well determined, although it is considered to be extremely dangerous. Northward of Little Fogo are the Turr Rocks, and from hence in the direction of the western side of Great Fogo Island and the Storehouse Rocks, the Seal Nests, Gappy and Stone Islands, the Jigger and Black Rocks, and various other dangers, all having deep water round them, and tending to increase the difficulty of the navigation.

Change Island and Tickle.

CHANGE ISLAND TICKLE.—This harbor is accessible when Fogo Harbor is not. It is very secure, and has good anchorage with 6 or 7 fathoms, muddy bottom. In general the islands about it are low and marshy, but there is abundance of firewood, though water is scarce. The passage in from the eastward is between Ruth's Rock and the Tobacco Islands, the mark being Brimstone Head kept between both; this will clear all the dangers on the northern shore, and also off Skinner's Harbor; or you may bring the tickle to the westward between the points of the land, and steer directly through in great safety.

Toulinquet Harbor.

TOULINQUET HARBOR.—This harbor is sheltered from all winds but those which blow from the north and north-east, when, in heavy gales, it becomes dangerous. In entering, either by the east or western channel, you must take the greatest care to avoid the White Ground, to clear which, you must bring Messrs. Slade's dwelling-house open of Sim's Island, and keep it so, until French Head opens through the Eastern Passage. This is very commonly called Burnt Island Tickle, and should not be attempted without you are thoroughly acquainted with the navigation, or in cases of great emergencies. The anchorage is mostly foul, but the best and most secure is about 5 or 6 fathoms, off Colburn's Stores. Both water and wood are scarce. If the mariner should be here either early or late in the year, Back Harbor, which lies off the western side of the table land, will be found a preferable place for shelter, and a few small vessels may ride there with much safety. You may proceed in on either side of Gull Island, lying with the Western Head open of Batrux Island and the Bluff Head, or with the Eastern Stage on Batrux Island. The islands about the harbor of Toulinquet are moderately high, and bounded by dark colored slate cliffs. It may readily be known by the Gull Island or table land.

Fortune Harbor.

FORTUNE HARBOR.—This harbor lies between the Bay of Exploits and New Bay. It is good when attained; but the entrance, which is the Western Tickle, is extremely narrow and dangerous, on account of the high land around it; from which all winds baffle, except those blowing directly in.

Triton Harbor.

TRITON HARBOR. (Great Triton Island.)—The entrance to this harbor is between the Great and Little Denier Islands. In entering you will see Francis Island, which has a reef running to the south-westward. Give this a berth; but both the Denier Islands are bold to and free from danger. Little Denier Island lies S. W. three miles and a quarter from Sculpin Rocks; on approaching which, the harbor opens off the high land of Great Denier. Its shores are exceedingly bold, and therefore it is always to be preferred to Cutwell Harbor. Its great depth of water will be avoided by running into Inspector's or Scrub Cove, where vessels may moor with hawsers to the trees, in perfect security.

The tides here, and also upon all the eastern coast of Newfoundland, have nearly the same rising, the springs being about 6 feet, neaps 4 feet; but these are much influenced by the winds.

Cutwell Harbor.

CUTWELL HARBOR (Bong Island.)—This harbor has a spacious entrance, sufficient for the largest ship to beat in to secure anchorage, in from 10 to 5 fathoms, sand and mud. The best anchorage is about W. by N. distant three miles from the southern head. The arm runs in full one mile and a half above the narrows, in which is abundance of wood and water, and well adapted for heaving down and refitting vessels. At the entrance is the Fool's Cup Rock, the marks for which are Copper Island seen through Indian Tickle, and Mark Island on with the White Point. To clear the Fool's Cup Rock, keep the extremity of Southern Head touching the north end of Hardrix Island, until Green Bay Gull Island opens to the westward of the Hag Rock. The only danger within the heads is the rocks on the eastern shore, and most of these are visible at half tide.

THE ISLAND OF TOULINQUET lies to the westward of Fogo, and has several small islands about it. Here is situated what is called Toulinquet Bay; and to the south-westward of Toulinquet Island is the Harbor of Herring Neck. This is said to be a spacious, fine harbor, and fit for any vessels. *The Island of Toulinquet.*

CAPE ST. JOHN.—From Toulinquet Bay to Cape St. John, the course is N. W. by N. distant 12 or 13 leagues. This is a high and rugged point of land, and may readily be known by the small high round island to the south-eastward, distant from the northern pitch of the cape about $2\frac{1}{2}$ or 3 miles. This is called the Gull Island, and is the third of that name on this side of Newfoundland. Perhaps, it would be better we should hereafter distinguish this as the Northern, or St. John's Gull; that near Cape Freels, as the Middle, or Cape Freels Gull; and the one lying off Cape Bonavista, as the Bonavista, or South Gull. *Cape St. John.*

Between the Fogo Islands and Cape St. John the charts commonly represent various deep bays and inlets, but their particulars are very little known, although there can be little doubt the Great Bay and River Exploits, and the Bay of Notre Dame, afford many places of good anchorage, and of easy access, which, when fully explored, may become hereafter frequented, better understood, and prove highly beneficial.

LA SCIE.—About 5 miles to the westward of Cape St. John, is the Little Harbor or Cove, of La Scie; to sail into which there is no danger whatever, and you may anchor any where in from 3 to 8 fathoms. It is easy of access, and open to the N. N. W. winds, which throw in a heavy sea. The best holding ground is just within a little cove on the starboard side, in 15 fathoms, muddy ground; but further in the ground is not good. *La Scie.*

GREAT AND LITTLE ROUND HARBORS.—The former of these is a good and convenient place for vessels engaged in the fishing trade. There is no danger in sailing in or out of it, both shores being bold to. The anchorage lies within the two inner points, where vessels may ride in 4 or 5 fathoms water, secure from the weather and entirely land-locked. But Little Round Harbor, which lies round a point to the north-eastward, about one mile and a half distant, is merely a cove, and totally unfit for shipping. *Great and Little Round Harbor.*

NIPPER'S HARBOR.—This harbor lies to the north-eastward of Green Bay Island about 4½ miles, and is fronted by several small islands, between which are several channels; but the best and safest is between them and the northern shore, in which the water is very deep and the shores bold. The harbor is rather confined and small, and therefore only fit to accommodate small vessels; but it is the most safe and secure on the shores of Cape St. John, and has an excellent anchorage with from 7 to 14 fathoms water. The land about it is high and barren, but it is well supplied with water, and may be easily distinguished by the islands which lie off it. *Nipper's Harbor.*

PAQUET HARBOR.—About 5 miles N. W. by N. from Great Round Harbor lies Paquet Harbor. Its entrance bears from the channel between the Horse Islands, nearly S. W. by S. It may be known by its Southern Head, which is a high and rocky mountain. The Northern Head is somewhat lower, and there are three rocky islets lying directly off its point. Both points are bold to; but a little to the southward of the three rocky islets is a small shoal with 2½, 3, and 4 fathoms upon it. The channel between it and these three rocks has 7, 8, and 9 fathoms; and the water across the entrance is from 8 and 9 to 19 and 20 fathoms. A similar depth continues more than a quarter of a mile in, where the harbor divides into two channels, the one running northward, the other west and south-west. The northern arm is about one-quarter of a mile long, and has 20, 18 and 19 fathoms at its entrance, becoming shallower as you advance. Vessels running in here should keep the starboard shore on board, for about two-thirds up the channel. On the larboard side there is a rocky shoal, a small part of which occasionally appears above water. On the other part of this shoal are from 3 to 4 fathoms. Having passed this shoal, steer up mid-channel and anchor in 5, 7, or 8 fathoms. The northern part near the land becomes shallow, and a rivulet here falls into the bay, which is said to issue from some extensive lakes about two miles inland. The south-western channel is somewhat narrower than the northern one, but is quite free from danger. The shores on both sides are steep to, and bold, and you will have 12, 10, 9, 8, and 7 fathoms for half a mile in; it then shallows to the head of the bay, where there is a sandy beach and a river running southward. This is a snug and secure place for vessels to run into whenever occasion may require. To the northward of the northern point is a mountain called Signal Hill, commonly having a signal-post upon it, and serving to point out its situation. *Paquet Harbor.*

THE HORSE ISLANDS are situated nearly equi-distant between Partridge Point and Cape St. John, bearing from the latter N. by W. and N. N. W. distant about 5 leagues. These are two islands, and form a circuit of nearly two leagues, appearing moderately high. There are three rocks above water lying to the northward of the easternmost; and on the east side of the same island there are some sunken rocks, which stretch out in some places near a mile from the shore. At the S. E. part of this island there is also a little cove, fit only for bouts. There is probably a safe channel between these islands, but it is seldom attempted. The eastern island is the largest. *Horse Islands.*

Following the shore of Newfoundland to the north-westward of Cape St. John, there

are two bays, called Pine Bay and Bay Verte; but although these may be places of good anchorage, they are little frequented by shipping.

Fleur de Lis Harbor.

FLEUR DE LIS HARBOR.—This harbor lies to the south-eastward of Partridge Point, from which it is distant one league, and derives its very appropriate name from three remarkable hillocks just over it. It is small, but safe, and secure from all winds, having excellent anchorage in its N. E. arm, in 4 fathoms water. To avoid a rocky shoal that lies about 100 yards off the island, borrow towards the eastern shore, until you get Bluff Head open to the eastward of the island. There is plenty of wood, but in a dry season water becomes scarce. It is, however, very conveniently situated for the fishery, and commonly is frequented by 8 or 10 French Vessels.

White Bay.

WHITE BAY.—This is a large and extensive arm of the sea, being at its entrance, from Cape Partridge to Cat Head, full 4 leagues wide, and running in a south-westerly direction about 14 leagues to its head, where it is contracted to a river's mouth $\frac{1}{2}$ mile wide. In this bay or gulf are several Islands, coves, and inlets, affording both anchorage and shelter; these are Lobster Harbor, Southward Arm, Middle Arm, Pigeon Islands, Westward Arm, Purwick Cove, Gransby's Island, Gold Cove, or River's Head, Goat and Sop Islands, Sop's Arm, Jackson's Arm, French Cove, Great and Little Coney Arms, and Great and Little Cat Arms.

Lobster Harbor.

LOBSTER HARBOR.—This is a small round harbor, with a shallow narrow entrance, having at low water, in some places, not above 8 or 9 feet water; but when you are once entered, you will have 12 and 13 fathoms all over the harbor. Small vessels, therefore, sail in commonly at the flood tides.

The Southward Arm.

THE SOUTHWARD ARM lies about 8 miles from Lobster Harbor, and further up the bay. Here a ship may anchor with great safety, in 17 fathoms water, about 3 miles within the heads; but there is also good anchorage in any part below this, and before you are advanced so far up in 20 and 25 fathoms. A little above the inner point, on the northern side, is a muscle bank, which stretches quite across the arm, and nearly dries at low water; and when you have passed this, you will have 11 and 12 fathoms water, and the Channel continues deep until you approach the River's Head. This is the first great inlet on this side of the gulf, and may therefore be readily recognized.

Middle Arm.

MIDDLE ARM.—This inlet lies about $\frac{1}{2}$ mile S. W. from the Southward Arm; at its entrance is a rocky island, which is joined to the shore by a shoal, over which are 1, 2, and, in some places, 3 fathoms water. This inlet runs in to the southward, about 3 or 4 miles. To enter it you will do well in keeping the larboard shore on board: it is fitted only for small vessels. Two leagues W. by S. from Middle Arm, is Hawling Point; and between them lie the Pigeon Islands, about which the ground is good for fishing.

Westward Arm.

WESTWARD ARM.—This lies E. S. E. $\frac{1}{4}$ S. of Hawling Point, and runs up nearly 4 miles. Here large vessels may anchor in 18 fathoms water: there is a cove on each side of its entrance; that to the north-eastward is named Bear Cove, where smaller vessels may moor securely, and ride safe from all winds, in about 12 fathoms water. The other is called Wild Cove, a very indifferent anchorage, open to the north-westerly winds, and the bottom rocky and foul.

Purwick Cove.

PURWICK COVE.—About five leagues down from the River's Head, and near the S. E. side of the bay, lies Gransby's or Mid Bay Island, without either cove or place of shelter: on the south-eastern part of this island is a shoal running off the length of two cables, with not more than 9 feet water over it; and nearly abreast of this island, on the S. E. side of White Bay, is Purwick Cove, where shipping may find safe anchorage, and lie with good conveniences for the fisheries.

Having passed to the southward of Gransby's Island, the bay narrows and runs up about 5 leagues towards Gold Cove, where the river branches out into several streams, and is commonly called the River's Head.

On returning up the western side of White Bay, you will perceive Sop's Island, about 3 miles in length, and 11 miles in circuit; near its southern end is Goat's Island; these form a long passage, or arm, called Sop's Arm, at the north part of which a vessel may safely anchor, just inside the north side of Sop's Island; this will be the best side of the channel, or passage, in the arm; but there is anchorage in deep water between Sop's Island and the main before you reach so far up as Goat's Island: there is also a small cove at the north end of the island, called Sop's Cove, and two other coves opposite the main, called Heart's Coves, in which the fisheries are carried on, although ships generally anchor in the upper part of the arm, and within side of Goat's Island.

Jackson's Arm.

JACKSON'S ARM.—About 4 or 5 miles to the northward of Sop's Island, is Jackson's Arm, to enter which, you will pass a rugged point, low and round; the water here is deep, except in a small cove on the starboard side, where a vessel should moor head and stern. This place affords the largest timber in White's Bay. Frenchman's, or French Cove, is about a league to the northward of Jackson's Arm, and offers good and safe anchorage.

Little & Great Coney Arms.

LITTLE AND GREAT CONEY ARMS.—Nearly 4 miles to the north-eastward of Frenchman's Cove, is Coney Arm Head, the most remarkable land on the western side

of White Bay here projects this place the westward is too shallow

But this bay ENGLE place, you n entrance to which make the point, fo in from 15 t

of White Bay, and bears W. N. W. $\frac{1}{2}$ W. distant 6 leagues from Cape Partridge; the land here projects out one mile and a half, forming a deep bight, called Great Coney Arm. In this place there is no good shelter for shipping; but in Little Coney Arm, which lies to the westward of the head, is convenient anchorage for small vessels, although its entrance is too shallow for large ships. Here fishing craft frequently rendezvous.

GREAT AND LITTLE CAT ARMS.—To the north-eastward of Coney Arm Head, distant 3 miles, lies the Great Cat Arm, and 5 miles further is Little Cat Arm. This latter inlet runs up to the westward full two miles. Off its northern point are some rocks above water; to avoid which, keep near to the southern shore. You will find the water deep, and no good shelter, unless you approach the head or further end of the arm, where you will lie secure and land-locked.

LITTLE HARBOR DEEP.—You will now be to the northward of White Bay, and following the shore, will perceive the entrance to Little Harbor Deep, called by the French La Vache. This place is much exposed to south-easterly winds, and by no means a good harbor: off its northern point are some rocks which are always above water; they lie half a mile from the shore, and afford good fishing about their environs. The water is not very deep in any part of this inlet, and when you get half way from the entrance to the head, or further end, it becomes quite shoal.

GRANDFATHER'S COVE, or L'ANCE UNION, is an inlet about two miles deep, lying one mile and a half from Little Harbor Deep. This is also open to the southerly winds, and may be known, when near the shore, by the northern point appearing like an island, and bearing N. N. W. $\frac{1}{4}$ N. from Cape Partridge. It is but an indifferent place for shipping, and seldom frequented.

ORANGE BAY, or GREAT HARBOR DEEP.—This may be known from any other inlet, by the mud at its entrance being much lower than any land on the north side of White's Bay, and by its bearing north, distant 5 leagues, from Cape Partridge. It forms a large harbor, and when you get about three miles within its entrance, divides into three branches. In the northern arm the water is too deep for vessels to anchor, until they have run up near the head; but the middle arm has a good bottom, and safe anchorage in 6 and 7 fathoms water. A little within the entrance of Orange Bay there is a cove on each side, frequented by the fishing vessels; but these are very dangerous for a ship to lie in, for, although they moor head and stern, yet should a gale come on from the eastward, there is little safety to be depended upon.

FOUCHEE.—This place is little frequented, and there is no anchorage until you approach its further end, where you will find a cove on the northern side. This cove is 2 or 3 miles above the entrance, and very small vessels may anchor there in 18 fathoms, mooring head and stern. The land on both sides is extremely high and steep to the shore. There is also another arm running in above two miles further than the cove; but it is so narrow, and has such a depth of water, that it is almost useless to shipping.

HOOPING HARBOR.—About eight miles to the north-eastward of Fouchée, and a little to the south-westward of Canada Head, lies the entrance to Hooping Harbor, or Sans Fond. This place has two arms or bays, one running up northward, the other westerly. Like many of the adjacent inlets, there is deep water all the way, until you get near to the head of the northern branch; there the bottom is a kind of loose sand, open to the southerly winds, and by no means a safe place to lie in; but in the western arm a vessel may anchor in a moderate depth with safety.

CANADA HEAD lies about three miles to the south-westward of Canada Point, or Bide's Head. It is elevated land, and very easily to be distinguished, either from the northward or southward; but when you are directly to the eastward of it, it becomes hidden by the high land up the country, commonly called the Clouds.

CANADA BAY.—This is an inlet of considerable size and extent. At its southern entrance is Canada Head; from whence it runs N. N. Easterly full 5 leagues. Here vessels caught in easterly gales may seek shelter, and anchor in safety. In entering, when you get above the two rocky islets which lie near Bide's Head, and called the Cross Islands, you will see a low white point, and another low black one a little beyond it. Off this latter, distant two cables' length, lies a sunken rock; keep therefore towards the middle of the bay, and you will find no danger, except a rock above water, which lies about a mile below the point of the narrows; this you will endeavor to keep on your larboard hand, keeping mid-channel, and you will have 18 fathoms through the narrowest part. Soon after you have passed the narrows, the bay widens, and is above a mile across, and you may then anchor in from 18 to 20 fathoms, good holding ground, and secure from all winds. But this bay is not much frequented, and only occasionally resorted to in case of necessity.

ENGLE'S HARBOR is situated on the north side of Canada Bay. To sail into this place, you must pass a low point, appearing white, and forming the northern point of entrance to Canada Bay; then keep near the shore until you get abreast of the next point, which makes the harbor: haul round it to the S. E. taking care not to come too near the point, for it should a full cable's length off. Having so far advanced, you can anchor in from 15 to 7 fathoms, good holding ground; but this is well up the cove, which is too

Great and Little Cat Armes.

Little Harbor Deep.

Grandfather's Cove, or L'ance Union

Orange Bay, or Great Harbor Deep.

Fouchée.

Hooping Harbor.

Canada Head.

Canada Bay.

small to lie in, unless you moor head and stern. In Bide's Arm, which runs up N. N. E. from Englé Island almost 2 leagues, there is no good anchorage, the water being too deep; but within the south end of Englé Island is a good harbor for shallops, although from thence to where the ships lie there is no channel, even for boats, unless at high water, or beyond half tide.

Conch Harbor.

CONCH HARBOR bears nearly E. N. E. $\frac{1}{2}$ E. distant 7 or 8 miles from the entrance of Canada Bay. It lies very open to the winds from the south, but has good anchorage well up to the head, in 11 fathoms water, good holding ground. S. by W. from Conch, distant 2 leagues, is Hilliard's Harbor, called by the French, Botitot. This is a bad place for shipping, but very convenient for the fishing craft.

Cape Rouge Harbor.

CAPE ROUGE HARBOR.—This harbor lies to the westward of Gronois and Belle Isle Islands, which contribute to shelter it from the heavy swells of the Atlantic. The southern part of its entrance is shallow and rocky, and in the S. W. arm is the Harbor Shoal. The best anchorage is in the northern arm, in any depth of water. Ships may beat in or out, but the centre of the harbor is too deep for anchorage. Directly opposite to its entrance is a small island, which is named after the harbor, Rouge island. Its northern end requires a berth in passing.

Belle Isle.

BELLE ISLE and GROAIS ISLAND.—These are high islands, lying off the N. E. coast of Newfoundland, from which they are separated 9 or 10 miles. Belle Isle is the southernmost and the larger island, being 8 miles in length and 3 broad. There is a little harbor at its south part, where fishing craft occasionally resort, but not calculated for shipping. Other coves may be found about the shores of the island, where shallops sometimes take shelter. Off its south-eastern side lies Green Island, a small rocky islet, and to the southward a bank of soundings extends with 12, 20, 25, and 30 fathoms. There are some rocks, both above and under water, at the south point of Belle Isle; but these lie close in to the land.

Groais Island.

GROAIS ISLAND lies to the north-eastward of Belle Isle, and is about 8 miles in length and $2\frac{1}{2}$ miles broad; its northern point lying in latitude 51° . Off this end, and also off the N. W. part of the island, are several rocks above water; otherwise this island is bold all round; and between it and the main are from 20 to 70 fathoms water. There are also two islets mid-way; the southern one is commonly called Red Island. They are both steep to, and without any known danger.

Croque Harbor.

CROQUE HARBOR.—The entrance to this harbor is half a mile wide, and somewhat difficult to discover. It bears N. W. from Groais, distant 3 leagues. When the north point of Belle Isle is clear of the southern point of Groais, you will be a little to the southward of Croque; and this mark will not fail pointing out to those unacquainted with this navigation the fairway to its entrance, especially as the headland forming the southern shore is bare of trees and has a round appearance, with some rocks, which are always visible, and lie about 40 yards to the S. E. of it. The shores of the harbor are bold to, and even a frigate may easily work into it. The anchorage is excellent, being good holding-ground, of dark slate-colored mud. Having opened the harbor's mouth, steer in N. W. by N., proceed mid-channel, and when you have advanced up about a mile, you will see the river divide into two branches. Anchor hereabout. There is a little cove at the southern entrance, called Irish Bay, in which are 13, 10, 8, and 5 fathoms, and two rocks above water at the head of the bay, near which is a little rivulet of fresh water.

Great and Little St. Julien.

GREAT AND LITTLE ST. JULIEN.—To the north-eastward of the harbor of Croque, lie Negro and St. Julien's Islands, near which are the harbors of Great and Little St. Julien, and also that of Grandsway. These are all adjacent to the Island of St. Julien, and bear to the north-westward of the northern part of the Island of Groais. The S. W. end of the Island of St. Julien is but little separated from the main, and cannot be distinguished to be an island until you arrive very near it. There is, at this end, no passage except for boats; therefore, to sail into either of these harbors, you may keep close to the north-east end of the island, and in passing that the harbors will open to your view.

Great St. Julien is the easternmost harbor, to which there is no danger, until you get within the entrance; then you will find the starboard shore to be about nearly one-third over; but when you have passed the first stages, you may anchor in from 8 to 4 fathoms water.

To sail into Little St. Julien's you will first steer for Great St. Julien's Harbor, in order to clear a sunken rock, which lies directly before the harbor's mouth; and having arrived opposite the entrance of Grandsway, steer into the harbor, and anchor in 5 or 4 fathoms water. It will be requisite for all ships which go into either of these harbors to moor both head and stern; but Grandsway is not a harbor for shipping, although it is extremely convenient for fishing craft.

Cremallire and Goose Coves.

CREMALLIRE and GOOSE COVES.—These places lie on the northern shores of Harp Bay. Cremallire has spacious and good anchorage in 7 or 8 fathoms, and is supplied with abundance of wood and water. Trois Montagnes is merely a small creek, in which a few French vessels moor during the winter season. It is situated to the south-westward of Cremallire, and has a rivulet which extends eastward to Goose Covo.

Goose Cove is situated on the western side of Goose Cape; it is small, but very secure, and has most excellent anchorage in 4 and 5 fathoms. Vessels can sail into it with a westerly wind, or into Cremallire with an easterly one.

ST. ANTHONY'S HARBOR.—This lies a little to the north-eastward of Cremallire Bay, and is a very safe place, having good anchorage with 6 and 7 fathoms water, on a bottom of blue clay. Its entrance lies west, distant one mile and a half from Cape St. Anthony. It cannot be easily mistaken, from the remarkable high land on its southern shore. It is well supplied with wood and water, and is commonly frequented by some French fishing vessels.

BRAHA HARBOR.—This harbor is small but safe, having good anchorage within it; the bottom is sandy, and the shores are bold and steep to. The Braha Shoal lies S. 74° E. (true) distant 1½ mile from the Needle Rocks; it is reported to have not more than 6 feet water over it, but Capt. Bullock says he never found less than 16 feet. With a little sea it occasions breakers, but the common current will always create a constant ripple.

HOW HARBOR lies on the northern shore of Hare Bay. The entrance to this place bears N. 48° W. distant 12 miles from Fishot's Northern Island, and is by far the best harbor in Hare Bay, having safe anchorage over every part. The surrounding hills are barren, but small stunted wood may be found in the valleys. To the northward a range of marshes and ponds extends as far as Pistolet Bay. The harbor is about half a mile wide, and a full mile and a half long. A small rock lies off the western point, but it is very near the land, and the upper part of the harbor shoals gradually.

ST. LUNAIRE BAY.—This excellent harbor will contain 100 vessels in perfect security, is remarkably easy of access, and may always be recognized by the appearance of the White Cape; the best and most convenient anchorage will be found at Amelia Cove, in from 5 to 7 fathoms. The approach and entrance are bold and steep to, only observing to give the point of the Southern Islands a good berth. Both wood and water are to be obtained without difficulty, and it affords in every respect a good and secure anchorage.

GRIGUET BAY AND CAMELS' ISLANDS HARBOR.—The North Bay is insecure in spring and fall, on account of its being exposed to the southerly gales; the S. W. Bay is therefore recommended, where there is good anchorage in 5 or 6 fathoms water. Camels' Islands Harbor will always be found too intricate for a stranger, and should never be attempted without the assistance of a pilot.

THE NORTH HARBOR runs in with Stormy Cape, and has at its entrance a rock above water, which is bold to all round, and vessels may sail on either side of it, and anchor in 6 fathoms water. In the passage which leads to the N. W. and S. W. Harbors, there is an island which contracts the channel, rendering the passage narrow; the best and safest entrance is the northward of this Island, giving the outer point of the N. W. Harbor a little berth, and so soon as you get within the island you will open both harbors; that which runs in north-westward is the larger of the two, and is two miles deep; you should sail up on its western side, having 14, 16 and 18 fathoms, until you get inside the point, a little within which is a bank of 7 or 8 fathoms; but when you have passed over this, you will again drop into 16 and 17 fathoms; and as you approach the head of the bay, you will lessen your water to 7, 6 and 5 fathoms, every where good anchorage, and well sheltered from all winds. The two islands of Griguet lie outside of Camels' Island, and together form between them several small but snug harbors for fishing vessels.

WHITE ISLANDS.—You will now perceive the White Islands, lying to the northward of Stormy Cape, from which they are distant one league and about 2½ miles from the shore opposite; they are small, of moderate height, and have several rocks inside, both above and under water; but these are not considered to be dangerous, as they are easily discoverable, even in fine weather, and the passage between them and the main is very safe.

QUIRPON ISLAND.—This lies off the north-eastern part of Newfoundland, and forms the S. E. point of entrance to the Strait of Belle Isle. It is large, high, and barren, and Cape De Grat is visible, in clear weather, full 12 leagues to seaward.

LITTLE QUIRPON.—There is a narrow channel which runs in to the southward of Quirpon and divides it from the main; here lies Little Quirpon Harbor, to enter which there is no danger but what you will easily perceive. Vessels commonly moor head and stern, and lie there perfectly secure.

DEGRAT AND PIGEON COVES.—These coves lie on the eastern side of Quirpon Island, and to the northward of Cape Degrat; at their entrance are several small rocky islets and rocks above water, and affording behind them very fair security for shipping in 4 fathoms water, and good conveniences for fishing. Bauld Cape, which is the northern extremity of Quirpon Island, lies in latitude 51° 39' 45" N. and in longitude 55° 27' 50" W.; it is rocky and steep to, and may be approached very near, with great safety. Having rounded this cape you will perceive a rocky point to the southward leading to the Harbor of Quirpon.

GREAT QUIRPON HARBOR lies on the N. W. side of the island, and its entrance is between it and Grave's Island; in your approach towards it from the northward you may borrow as close as you please to Bauld Head, there being no invisible danger until

Great Quirpon Harbor.

you arrive at the entrance to the harbor, where there are some shoals which must be left on your larboard side; to do this keep Black Head on Quirpon Island open of all the other land, until Raven Point comes over Noddy Point, then haul in for the harbor, going not nearer than the distance of half a cable's length from the point of Grave's Island; the anchorage within the island is every where good, with room and depth enough for any ship, and the ground holds well; but the best place to ride in will be towards the upper end of Grave's Island, abreast of Green Island, in 9 fathoms water; the passage to the Inner Harbor, on either side of Green Island, is very good for ships of moderate water, through which you will have 3 fathoms, and above Green Island you have excellent riding in 7 fathoms. There is also a passage to this harbor through Little Quirpon Harbor, but it is too narrow and intricate for any one to attempt, unless they are perfectly acquainted with the navigation.

Noddy Harbor.

NODDY HARBOR.—This place lies a little to the westward of Quirpon Harbor, and runs in between Noddy point and Cape Raven; there is no danger in entering, and you will pass to the starboard of the little island that lies about a mile within the entrance, and anchor above it in 5 fathoms water; or you may, with a small vessel, run further up into the basin, and anchor in 2½ or 3 fathoms; here is a stage within the island, and on the eastern side of the harbor, with convenient room for many vessels.

Gull Rock and Maria's Ledge.

GULL ROCK and MARIA'S LEDGE.—The Gull Rock lies W. N. W. from Bauld Cape, in the island of Quirpon, distant 2½ miles; and N. N. E. ½ E. nearly 3 miles from Cape Raven; it is always above water. Maria's Ledge lies nearly S. W. from the Gull Rock, distant 2 miles, and N. by E. 1½ mile from Cape Raven, being distant about a mile from Maria's Head. In standing in from the northward for either QUIRPON or NODDY HARBORS, you need be under no apprehension of danger from the Gull or Maria's Rocks, for both are above water, the passage between them is half a league wide and very safe; but it will be prudent to pass nearer the Gull Rock, because of the N. W. Ledge, which never appears but in bad weather: this N. W. Ledge bears W. a little S. distant 1½ of a mile from the Gull Rock, and you should not attempt the passage between it and the main, on account of other rocks that are said to lie about it, and places of shallow water.

To the westward are the Sacred Islands: Great Sacred Island lies about N. W. by W. ¼ W. from Bauld Cape, distant 5½ miles, and S. E. by E. ¼ E. from Cape Norman nearly 13 miles. Little Sacred Island is one mile to the southward of the great island; the passage between them is safe, and you may sail round both, for they are high and bold; within them on the main and to the W. South-westward is Sacred Bay, tolerably large, with numerous rocky islets within it: the shores of this place abound with wood, and therefore it is much resorted to for the use of the fisheries at Quirpon and Grignet, &c. Cape Guion forms the north point of Sacred Bay, being high and steep; near it is a remarkable rock called the Mewstone, and much resembling that in Plymouth Sound. There is a little cove to the southward of this rock, where a vessel may occasionally resort to with safety.

Ha Ha Bay.

HA HA BAY.—From Cape Onion to Burnt Cape the course is W. ¼ N. about 6 miles; it has a white appearance, and rises from the seaward to a considerable height. On the eastern side of Burnt Cape is Ha Ha Bay, which runs in southerly about 2 miles; it lies open to northerly winds, but when you are within the cape you will find anchorage in 6 or 7 fathoms; or you can go further up and ride well sheltered in 3 or 2½ fathoms. This is a convenient place for the fisheries, and has plenty of wood.

Pistoleto Bay.

PISTOLET BAY.—This bay lies between Burnt Cape and the Norman Ledges, which bear from each other N. W. by N. and S. E. by S. distant 8 miles; the bay is extensive, and reaches several miles each way, having good anchoring ground in most parts, particularly on the western side, a little above the islands, in about 5 fathoms water; the shore is tolerably well furnished with wood, and contributes to supply those places which are destitute of that article.

Cook's Harbor.

COOK'S HARBOR lies in the N. W. part of Pistoleto Bay, and within the islands, about two miles above Norman Ledge Point. These ledges are about one mile to the eastward of the north point: to clear these dangers as you enter, be sure to keep Burnt Cape well open of the outer rocks, that lie off the islands at the western entrance to Pistoleto Harbor; and if going in, so soon as you consider yourself to be to the southward of these ledges, steer in for the harbor, leaving the islands and rocks on your larboard side; keep the southern shore on board, for fear of a ledge of rocks that juts out from a little rocky island on the other side; and so soon as you get within the island haul over for the northern shore, and anchor in 4 or 5 fathoms water. This harbor is capable of being made very convenient, and several fishing rooms and proper stages for the boats to resort to, and cure their fish, might be erected in all the coves between it and Cape Norman.

Cape Norman.

CAPE NORMAN is the northernmost point of Newfoundland, being of a moderate height, and very barren appearance, which continues fir inland; it is about a league to the north-westward of the ledges; from Cape Norman the shores of Newfoundland turn south-westerly, and will be described hereafter.

The V
land, the

BELLE ISLE.—This island, which lies at the entrance of the strait to which it communicates its name, should be called the Northern Belle Isle, to distinguish it from those we have already described, lying to the southward; it is about 8 miles long and 3 broad, or 7 leagues in circumference, being distant from Bauld Head, in Quirpon Island, about 14 miles, and from the coast of Labrador 12 miles; it is moderately high, and wears a uniform sterile appearance. On its north-western shore there is a small harbor, called Lark Cove, or Harbor, lying within an island almost close to the land, and fit only for small craft; and at the eastern side of this island is another cove, called Batteaux Creek, frequented occasionally by shallops. About two miles to the north-eastward of this island lies a ledge of rocks, part of which appear above water, and over these the sea breaks very high; this is called the N. E. Ledge; you will have 15 and 20 fathoms close to it, and 55 between it and the north part of the island. The soundings about this Belle Isle are very irregular; near the island you will seldom find less than 20 fathoms, except on a small bank said to lie to the northward, distant 4 miles from its north-eastern part, whereon are only 5 fathoms. The northern part of this island is said to lie in about the latitude of $51^{\circ} 57' N$.

SOUNDINGS IN THE STRAIT OF BELLE ISLE.—In crossing the Strait of Belle Isle from Quirpon to Chateaux Bay, your soundings will be irregular; from 20 to 30 fathoms on the Newfoundland side, and in some places from 30 to 33 fathoms; in the stream or middle of the strait, you will find 25 and 35 fathoms, coarse sand and broken shells; and towards Chateaux Bay, 45 to 80 fathoms, and within a mile of the coast of Labrador, 35, 30, and 25 fathoms. To the northward, between Belle Isle and St. Peter's Bay, there are 59, 87, 96, 63, and 20 fathoms.

*Belle Isle.**Soundings in the Strait of Belle Isle.*

THE SOUTHERN COAST OF NEWFOUNDLAND,

FROM CAPE RACE TO CAPE CHAPEAU ROUGE.

PRELIMINARY REMARKS.—Vessels bound towards the Gulf of Newfoundland should take the greatest care to notice and make a proper allowance for the currents, which set from the eastward, all along the southern coast of Newfoundland, with frequently fatal velocity, causing an impetuous indraught into the various bays, and occasioning the much-to-be deplored loss of many lives, and the wreck of numerous vessels. These local currents chiefly prevail on that part between Cape Race and Cape Ray; more vessels have been cast away on the small point of land which divides the two Bays of Trepassay and St. Mary than on any other part of the island: that these accidents were occasioned by the currents there can be little doubt.

An able navigator, who has been 20 years employed in the fisheries, and who is a native of Newfoundland, observes, it is well understood by all the boat masters, that there is in general a strong current setting in from the eastward, along the western coast of Newfoundland, which, after passing Cape Pine, runs more towards St. Mary's and Placentia Bays; this current will be felt at least 20 leagues to the S. W. of Cape Pine, and becomes more rapid as you approach the land; its velocity increasing as the winds favor its direction; but at all times of sufficient magnitude to endanger the safety of any vessel approaching from the south or west in foggy weather, and being ignorant of its existence.

In order to avoid the danger arising from this current, the fishermen, in foggy weather, when returning from the western coast to their homes on the eastern shore, invariably use the lead, depending more upon the depth of water than their compass, and always keeping a sufficient distance from the land to insure the safety of the vessel. On passing to the eastward of Cape Race they never approach nearer to the land than 35 fathoms water; the ground being more of an inclined plane on the west than on the east coast, you will find that depth of water at a considerable distance; the ground becomes more broken, and the depth of water increases so fast, that in your course from Cape St. Mary's to avoid Cape Race you will, when to the eastward of it, find yourself in 50 fathoms, and when advanced a very short distance further, you will drop into 60 and 70 fathoms; consequently, you will then be clear of any land, and may safely pursue what course you think proper; but, in all this navigation, the mariner's safety may be insured by a due attention to the lead.

CAPE RACE is situated on the southernmost part of Newfoundland, and lies S. W. $\frac{1}{2}$ W. distant 3 leagues from Cape Ballard; before it lie 2 or 3 rocks above water; these are close to the land, and have 10 fathoms water very near them. Between 6 and 7 miles E. S. E. from Cape Race is the New Bank, being 4 miles long and $1\frac{1}{2}$ broad, and lying N. E. by N. and S. W. by W.: on it are 17, 20 and 25 fathoms, with very deep water on its outside, and 30 fathoms just within it. Vessels making this part of the coast may know their approach toward the land, by suddenly lessening their water to the above depths.

The Virgin Rocks, which are dangerous, lie in the direct track to Cape Race, Newfoundland, the point which vessels bound to Quebec generally endeavor to make. (See p. 13.)

Cape Race.

Near Cape Race is a small inlet named Cripple Cove; the land then turns westerly towards Mistaken Point, a distance of $4\frac{1}{2}$ miles; the shores are bold, and off Mistaken Point is a rock above water. N. W. by W. about two miles, is the French Mistaken Point; this also has a rock off its extremity. From thence the shore winds N. by W. into Trepassey Bay, at the northern part of which lies Biscay and Mutton Bays, and Trepassey Harbor. The two former of these are seldom frequented, and is considered dangerous to get embayed there, for the sea commonly drives in, and there is hardly any current to help you out again. Mutton Bay is formed to the eastward by Cape Mutton, and to the westward by Cape Powles; this last is the extreme point of a narrow neck of land that divides Mutton Bay from Trepassey Harbor; it is a long, low, sandy, and stony beach, over which the ships lying in Trepassey Harbor can be distinctly seen. Mutton Bay is about two miles deep, and has from 12 to 3 fathoms water in it; but the bottom is foul and rocky.

Trepassey Harbor.

TREPASSEY HARBOR.—The entrance to this harbor is to the eastward of Cape Powles, and the direct course in will be N. E. $\frac{1}{2}$ E. Cape Powles lies from French Mistaken Point N. W. about 8 miles; from Cape Mutton W. S. W. $\frac{3}{4}$ W. one mile; and from Cape Pines N. E. by E. 5 miles. The entrance to Trepassey Harbor is three-quarters of a mile wide, and continues of that breadth full $2\frac{1}{2}$ miles up; it then narrows to less than half a mile, and opens again to its former width, and there vessels commonly ride. To enter this harbor ships commonly steer over from Mistaken Point towards Cape Pine, until you fairly open the harbor; you may then safely run along the shore, for it is bold. In sailing into the harbor, you will meet with a rock on the south-eastern shore, lying about a mile from Powles Head, and one-third of a cable's length off the shore. There is, also, on the northern side, a shoal which runs along up the harbor, so far as a low green point; to clear this shoal, bring Baker's Point on with a low rocky point at the entrance of the harbor; and when you get so far up as the low green point, you may steer more westerly, and anchor either in the N. W. or N. E. arm, in 5 or 6 fathoms water. Both wood and water can be obtained with ease.

Lighthouse building.
1850

From Mistaken Point to Cape Pine the course and distance are W. N. W. $\frac{1}{4}$ W. 4 leagues and a half; and from Cape Pine to Cape Freeels, west, one mile. The land about Cape Pine is barren and moderately high; from Cape Freeels, the shores extend W. N. W. one mile to Black Head, and thence N. W. $\frac{3}{4}$ W. to the eastern reef, and head of St. Shot's Bay.

St. Shot's Bay

ST. SHOT'S BAY.—This is the fatal spot where so many vessels have been recently wrecked; the bay is about a mile deep, and from the eastern to the western head, the bearing is N. by W. $\frac{3}{4}$ W. distant two miles; it lies entirely open and exposed to the sea.

St. Mary's Bay.

ST. MARY'S BAY.—This is an extensive bay, or gulf, commencing on the eastern side at St. Shot's, and on the western side at Point Lance; the course from the eastern head of St. Shot's to Point Lance being N. W. $\frac{1}{4}$ W. about 20 miles; from thence the land runs up E. N. E. 9 leagues and a quarter; the land on each side being moderately high, and having several good harbors in it. In proceeding from St. Shot's along the eastern shore you will pass two little coves, and reach Gull Island; this lies close in to the land, and bears from the western head of St. Shot's N. $\frac{1}{4}$ E. distant 4 miles.

From Gull Island to Cape English the bearing and distance are N. by E. $\frac{3}{4}$ E. two leagues; Cape English is high table-land, terminating in a low rocky point, and forming a bay, about a mile deep, to the southward of it; at the bottom of this bay is a stony beach, within which is Holyrood Pond, running E. N. E. nearly six leagues, and from half a mile to 3 miles in breadth; this occasions the cape to appear like an island when you are to the southward of it. One mile and three-quarters N. E. $\frac{1}{4}$ N. from Cape English is False Cape; six and a half miles E. N. E. from Cape English is Point la Haye: this is low, and has a ledge of rocks running from it about a quarter of a mile into the sea, and above a mile along the shore, on which the waves break furiously in bad weather: this is the only danger you will meet with in St. Mary's Harbor.

St. Mary's Harbor

ST. MARY'S HARBOR.—From Point la Haye to Double Rond Point, which is the southern extreme of St. Mary's Harbor, the course and distance are E. N. E. one mile and a half; the land between is low and wears a barren appearance. Within Double Rond Point is Ellis' Point, distant half a mile; these two form the starboard points of entrance to the harbor, which is here nearly a mile wide. You will now perceive the river to be divided into two branches, the one running E. N. E. into what is called Mal Bay, the other south-easterly into St. Mary's Harbor. When you are within Ellis' Point, in St. Mary's Harbor, you can haul to the southward, and anchor abreast of the fishing-stages and houses, upon a flat, in 4 or 5 fathoms water, where you will ride land-locked; this flat runs off shore about half a mile, and between it and the opposite shore are from 15 to 30 fathoms water. The best anchorage is about two miles above the town, opposite to Brown's Pond, where it is above half a mile wide; here also you will lie land-locked in 12 fathoms, and have excellent ground to the further end of the bay.

Mal Bay.

MAL BAY, on the E. N. E. branch, is about one mile wide, and runs up $2\frac{1}{2}$ miles; but the anchorage is not good; a heavy sea frequently sets into it, and unless you run up to

its very head, in 5 or 6 fathoms, you can have no place even for occasional security. It therefore is seldom resorted to. The entrance to these harbors bears from Point Lance nearly east, distant 19 miles. From Trapeau Point, the coast runs N. N. E. $\frac{1}{4}$ N. above two miles, to Shoal Bay; and opposite to the northern point of this Shoal Bay lies Great Colinet Island. This is about a league in length and one mile broad; the southern end of which bears from Cape English N. by E. distant three leagues. There is a safe channel on either side of this island, only taking care to give Shoal Bay Point a good berth of a quarter of a mile, in order to avoid some rocks which lie off it. On the northern side of the Great Colinet is a stony beach, off which runs a bank with from 7 to 17 fathoms water, rocky ground. One mile and a half north-eastward from Great Colinet is Little Colinet Island, above a mile in length, and half a mile in breadth. There is deep water all round it.

GREAT SALMON RIVER.—E. N. E. five miles and a half from the northern part of Little Colinet Island is the entrance to Great Salmon River, which is nearly three-quarters of a mile wide, and runs E. N. E. 7 or 8 miles. About three miles up this river, and on its southern shore, is an opening called Little Harbor. Opposite this, in a small cove, is the best anchorage in the river, although it is generally good throughout. Here you may ride safely in 5 or 6 fathoms water. The river narrows as you advance up it, and towards its furthest end becomes very shallow.

COLINET BAY.—N. W. by N. from the entrance of Great Salmon River, distant 2 $\frac{1}{4}$ miles, and N. E. $\frac{1}{4}$ E. 5 $\frac{1}{2}$ miles from Little Colinet Island, is the mouth of Colinet Bay. Between Salmon River and Colinet Bay, is a cove a good mile and a half deep, with from 13 to 4 fathoms in it, but it is exposed to the S. W. and therefore not much resorted to. Colinet Bay runs in N. E. by N. about two miles, where the point of an island on the starboard side narrows the passage; having passed which the channel opens wider again, and the top of the bay is a sandy shallow beach. Throughout the whole of Colinet Bay, the anchorage is good. You will have from 12 to 6 fathoms water up to the narrows. In pushing the narrows there are 7 and 8 fathoms, and above it 6, 5, and 4 fathoms; all good ground.

NORTH HARBOR.—To the W. S. W. of Colinet Bay, 4 miles, and N. by E. about 2 miles from the northern end of Little Colinet Island, is the entrance to North Harbor, which is three-quarters of a mile wide, and runs up to the northward 3 miles. The anchorage is very good about two miles up the river, where it is half a mile wide, in 5 or 6 fathoms; or vessels may run further up, where two sandy points stretch out, being half a cable's length asunder; keep the starboard point on board, and anchor close within the starboard shore. In entering North Harbor always keep mid-channel, for the eastern land is somewhat shallow.

The land now trends W. S. W. $\frac{1}{2}$ S. towards Point Lance. There are one or two coves in the way, but no place fit for the reception of shipping.

POINT LANCE lies in lat 46° 48', and is a low ragged point, although the land in the interior rises up and becomes highly elevated. We have already stated that the course and distance from the eastern head of St. Shot's to Point Lance is N. W. $\frac{1}{4}$ W. about 22 miles; from Point Lance to Cape St. Mary is N. W. $\frac{1}{4}$ W. about 6 $\frac{1}{2}$ miles.

CAPE ST. MARY is a high bluff point of land, making like Cape St. Vincent's on the coast of Portugal; the land to the northward along shore, to a considerable distance, has an even appearance, and is nearly of equal height with the cape itself. W. by S. from Cape Lance, distant full two miles, lie the Bull and Cow Rocks: these are two flat rocks lying very near each other, and having many small rocks about them. About a similar distance, but nearer to the main, is another rock, appearing at half tide: there are 10 fathoms between it and the shore, and 15 fathoms between it and the Bull and Cow Rocks. In a similar direction to the Bull and Cow Rocks from Cape Lance, but at 3 leagues distance, and nearly S. S. W. distant 7 $\frac{3}{4}$ miles, from Cape St. Mary's, are two other little rocks, appearing just above the surface of the water, and having the sea constantly breaking over them. They lie S. S. E. and N. N. W. from each other, distant 3 cables' length, and have 15 fathoms between them. The same depth of water is all round them, excepting towards the S. S. E. where only 6 fathoms will be found 2 cables' length off. Between these Rocks and Cape St. Mary are 32, 25 and 19 fathoms water; and near the Cape are 13, 14 and 15 fathoms. Vessels therefore may proceed between them, and also between the Bull and Cow Rocks and the main, if necessary, for there is no hidden danger; but perhaps it will always be more prudent to go to the southward of both.

PLACENTIA BAY.—The entrance to Placentia Bay is formed by Cape St. Mary on the east, and Cape Champeau Rouge, or Mountain of the Red Hat, on the west; the former lying in latitude 46° 49' N. the latter in 46° 53' N. bearing from each other W. N. W. and E. S. E. distant 17 leagues. Cape Champeau Rouge is the most remarkable land on all the coasts, appearing higher than the surrounding shore, and somewhat like the crown of a hat, from which singularity it obtains its name; it is visible 11 or 12 leagues to seaward, in clear weather.

From Cape St. Mary to Cape Brene your course will be N. by E. about 9 miles, and from Point Brene to the Virgin Rocks N. E. by E. 13 miles: these rocks lie $\frac{1}{2}$ mile from the main, and always appear above water; a little to the southward of the Virgin

Great Salmon River.

Colinet Bay.

North Harbor.

Point Lance.

Cape St. Mary.

Placentia Bay.

Rocks are some whitish cliffs in the land, by which it may be known if falling in with the land hereabouts in thick weather.

From the Virgin Rocks to Point Verde, the southernmost point of Placentia Harbor, the course and distance are N. E. by E. $\frac{1}{2}$ E. 5 miles. From St. Mary's Cape to Verde Point there is no harbor or place of shelter for ships of any size.

Placentia Harbor.

PLACENTIA HARBOR.—Point Verde, or Green Point, is low and level, and forms the southern point of the road. It has a pebbly beach on each side, and several fishing stages within it. At the end of this beach is a high rocky cliff, extending to the S. E. corner of the bay, where it again terminates in a pebbly beach. This beach then runs E. N. E. one mile to the Fort Point, and on the inside, which faces the S. E. arm of the harbor, stands the town of Placentia. A little southward of the town is a high hill, with a remarkable cliff on the middle of the beach. The outer side of the north point is level, with a clay cliff on its outer part, bearing nearly N. E. by N. distant from Point Verde $\frac{1}{4}$ mile. From this point the land forms a small bay, with a stony beach round it, to the corner of the cliff under Signal Hill. This cliff continues to Freshwater Bay, which is formed in a valley between Signal Hill and Castle Hill, having a pebbly beach round it. Here a small rivulet runs down the valley, at which vessels may obtain water. To sail into this road, if coming from the southward, you should keep a league off the land, in order to avoid the Gibraltar Rock, which lies about two miles to the westward of Green Point, and has only 8 feet water over it: the mark to go to the northward of which is the castle, standing on a hill at the northern side of the harbor, and very conspicuous to seaward, open of Point Verde. When you have this castle on with the point, you will pass a little to the northward of the rock; but when you have the castle well open of the point, you will give the rock a wide berth: run in with this mark; keep your lead going; for there are regular soundings on both sides, and give Green Point a good berth of two cables' length, passing it in 4 fathoms water: then proceed to the anchorage in Freshwater Bay, and under Castle Hill, at three-quarters of the distance over from that side, where you will lie in 6 or 7 fathoms water, good ground. At the bottom of the road is a long beach, which terminates in a point to the northward, on which stand some houses and an old fortress. There is also a fort on the opposite point. The entrance to the harbor is between these. It is very narrow, not above 60 fathoms across, and has 3 $\frac{1}{2}$ fathoms water in it. When you get within these points the harbor opens, becomes one-third of a mile wide, and extends E. N. E. above $\frac{1}{2}$ mile, where ships may lie in perfect security, with 6 and 7 fathoms water. In going in, keep nearer to the starboard side. The stream runs into the harbor more than 4 knots an hour. The tide rises 6 or 7 feet; and it is high water, full and change, at 15 minutes after 9 A. M.

N. E. $\frac{1}{4}$ E. from Point Verde, distant two miles, and N. N. W. from Moll Point, about $\frac{3}{4}$ of a mile, is the Moll Rock, over which are only 12 feet water, with 8 and 10 fathoms near it. N. E. by N. 5 $\frac{1}{2}$ miles from Point Verde, is Point Latina. S. W. from Point Latina, distant one mile, is the Wolf Rock. These lie about half a mile from the main, and between Placentia Harbor and Point Latina, and therefore must have a good berth in passing. The shore all the way is low near the sea, but high and ragged inland. A large mile to the eastward of Point Latina is Point Roche, which has a shoal off it extending one-quarter of a mile out.

Little Placentia Harbor.

LITTLE PLACENTIA HARBOR runs in to the southward from Point Roche; and S. E. by E. $\frac{1}{2}$ E. from Point Roche, distant 2 miles, is the opposite, or Fox's Point, which may be considered to be the eastern entrance to Placentia Sound. On the western side of this sound is the harbor of Little Placentia, which extends W. by S. above $\frac{1}{2}$ mile, and is nearly half a mile broad. There is good anchorage in a cove on the northern shore, which you may know by the western side of it being woody. Off the east point of the cove lies a shoal, stretching nearly one-third across the channel. In this cove are 7 and 8 fathoms water. To the eastward an arm also runs in almost a league, with deep water, but little frequented: it is called Placentia Sound. Fox's Harbor is a small sandy cove, fit for boats only.

Ship Harbor.

SHIP HARBOR.—From Point Latina to Ship Harbor the course and distance is east nearly 7 miles. This inlet runs up northerly two miles and three-quarters, and is half a mile wide. The best anchorage is in a cove on the west side, in 10 fathoms water, about one mile from the entrance.

Fox Island.

FOX ISLAND is small and round, and lies N. E. $\frac{1}{2}$ N. distant three miles from Point Latina, and N. W. by W. full three miles from Ship Harbor Point: this latter is a low stony point, lying a mile and a quarter from the entrance of the harbor. Between Fox's Island and Ship Harbor Point is a ledge of rocks, which, in bad weather, will show breakers quite across. Between the rocks are 2 $\frac{1}{2}$, 5, 7, and 10 fathoms water. N. N. W. one mile and a half from Fox's Island, is Fishing Rock, a steep rock always above water; and N. N. E. one mile and a half from Fishing Rock, is Rowland's Sunken Rock, over which the sea most commonly breaks.

The Ram Islands.

THE RAM ISLANDS.—This is a cluster of high islands, lying nearly N. E. $\frac{3}{4}$ E. from Fox Island, distant three miles. On the eastern side of these islands is Long Harbor.

GRAMM

There is no danger in entering this place, but the best anchorage will be on the northern side, to the eastward of Harbor Island, between it and the main, in 6 or 7 fathoms water, where you will ride secure from all winds.

From Long Harbor the shore runs N. N. E., N. by E., and N., full 15 miles, having no harbor or place fit for the reception of vessels, until you reach Little Harbor, Little South Harbor, and Great South Harbor. Within this space are said to be several low islands and rocks; one of which, called the White Rock, from being covered with the dung of birds, lies N. E. by N. from Point Latina, distant 13 miles, and direct mid-way between Fox Island and Little Harbor. It is abreast of a small place called Tinny Cove, and full 2 miles off the land. Vessels pass on either side.

LITTLE HARBOR has very bad anchorage, and is much exposed to S. Westerly winds; therefore not much frequented.

LITTLE SOUTH HARBOR lies one mile to the N. Westward of Little Harbor, and has several rocky islands at its entrance, which, in sailing in, must be left on your starboard side, excepting one, on either side of which there is a good passage, with 15 fathoms water. On the southern shore, within these islands, is a sunken rock, over which the sea continually breaks: it lies about a cable's length from the land. Nearly opposite are also some rocks, half a cable's length from the shore, which appear at half ebb. This harbor is one mile and a half long, half a mile wide, and has 7, 8, 10, and 12 fathoms water in it; and the ground, except where these rocks are situated, tolerably good.

GREAT SOUTH HARBOR lies one mile to the northward of Little South Harbor, its entrance is between the middle point and the Isle au Bourdeaux, one mile and a quarter wide, with from 20 to 30 fathoms water. There is no danger in going in, and the anchorage one mile and a half up, or near the head of the harbor, is very good, in 6 and 7 fathoms water.

CHANCE HARBOR.—The Isle au Bourdeaux is a high round island, from which the coast runs N. Easterly 4 miles, to the entrance of an inlet, called Come-by-Chance. This runs up full 3 miles, and has from 20 to 3 fathoms water, gradually decreasing in depth unto the further end. Vessels may anchor here on a sandy bottom, but they will be quite exposed to S. Westerly winds.

NORTH HARBOR.—About N. N. W. 3 miles from the entrance of Come-by-Chance, is that of North Harbor. It is above a mile wide, and there is no danger in sailing into it; but like the former, it is too open to be trusted to. There is, however, fair anchorage about 2 miles up in 7 fathoms water.

PIPER'S HOLE.—N. W. by N. distant 2½ miles from the entrance to North Harbor, is that which leads to Piper's Hole. The channel in it is between Sound Island and the main. In the passage you will have 19, 15, and 12 fathoms; and when to the northward of the island 8, 7, and 6 fathoms. From hence Piper's Hole runs to the northward full five miles; but the water is shallow and unfit for shipping. From Piper's Hole in a S. W. direction, lie Sound, Woody and Barren Islands, having a channel between them and the N. Western shore half a mile wide, in which are from 7 to 20 fathoms, and good anchorage all the way. Between woody and Sound Islands is a passage with from 7 to 16 fathoms water in it; that between Woody and Barren Islands is much wider and deeper, having 40 and 50 fathoms. Opposite the northern part of Barren Island is a small cove, called La Plant, fit only for boats. Barren Island is 3½ miles in length and 1 in breadth; it is high land, and at its S. Eastern part is a small cove, in which is tolerable good anchorage, in from 8 to 16 fathoms. N. W. by W. from the southern part of Barren Island is Gulsh, an inlet of very little importance. Further south-west are Great and Little Sandy Harbors.

GREAT SANDY HARBOR lies W. ¼ S. distant four miles from the south end of Barren Island. To this place there is a passage between Ship Island and the main, with 7, 9, and 17 fathoms water; but the entrance to the harbor is very narrow, and much encumbered with rocks: these are all above water, and have channels between them; but when you get within the harbor there are 6 and 7 fathoms, and good shelter.

LITTLE SANDY HARBOR is a quarter of a mile to the southward of the Great Harbor: in it you will have 6 and 7 fathoms water, good ground. In sailing in, you should pass to the northward of a low rock which lies at the entrance. You may readily know this harbor by the Bell Island, which lies S. E. ¼ E. one mile and a half from the mouth of it, and N. E. by N. 13 miles from the western point of Morashoon Island. This island has a remarkable appearance, resembling a bell with the bottom upwards.

CLATISE HARBOR, &c.—S. W. by S. from Bell Island lie the Burgoe Islands, and farther south the White Islands. S. W. by W. from the Burgoe Islands, nearly 5 miles, is the entrance to Clatise Harbor, between the Great Isle of Valen and the main. The shore all along from the Sandy Harbors is steep to, and the passage to Clatise three-quarters of a mile wide, with 40 and 50 fathoms water; but the cove itself is very narrow. The best anchorage is in the western branch, which is a mile long, in from 10 to 17 fathoms, good ground. There is also a good channel from the southward, between great and Little Valen Islands and the main, with 20, 30, and 50 fathoms in it.

GRAMMER'S ROCKS.—These are a cluster of low rocks just appearing above wa-

Little Harbor.

North Harbor.

Piper's Hole.

Great Sandy Harbor.

Little Sandy Harbor.

Clatise Harbor.

Grammer Rocks.

Fort Harbor, a very good inlet, having in it from 14 to 7 fathoms water, good ground. The entrance is more than a quarter of a mile wide, and lies N. E. distant 5 miles from the south point of Long Island, and N. by E. $2\frac{1}{2}$ miles from the north point of the same. There is no danger in going in; and the best anchorage is on the starboard or eastern side, for S. E. winds heave in a great swell on the western shore, when it blows hard. Noanch Harbor has no good anchorage.

CAPE ROGER HARBOR lies close to the westward of Cape Roger, which is a high, round, barren head, lying N. 4 E. $3\frac{1}{2}$ miles from the south point of Long Island. There are several low rocks and islands lying off the eastern point of the entrance. In the harbor, at a quarter of a mile within, on the western side, lies a small island, to the northward of which, between it and the main, is a very good anchorage in 7 or 8 fathoms water, or farther up in 6 or 7 fathoms.

GREAT GALLOWES HARBOR.—N. N. W. 2 miles from the south point of Long Island, lies a small green island, which has a shoal all round, to nearly a cable's length. From Green Island N. N. W. $2\frac{1}{2}$ miles, lies Great Gallowes Harbor Island, which is high. Vessels may pass on either side of this island into Great Gallowes Harbor, which lies one mile to the E. N. E. of the island. In this harbor is exceedingly good anchorage in 7 fathoms water, on the starboard side, just within a low stony point, taking care to give the point a small berth, in order to avoid a rock, which is alternately covered and uncovered with the tide.

LITTLE GALLOWES HARBOR lies close round to the eastward of Great Gallowes Harbor, and is only fit for small vessels, which must be moored to the shore. Above water lies at the entrance, and the two harbors are only divided by a narrow neck of land. To the north-westward of Great Gallowes Harbor are Little Harbor, Bay de L'Eau, and Bont Harbor: the first of these is only fit for boats. Bay de L'Eau runs in a full league, and has deep water all the way up, except at its head, where there appears a sandy beach. Here vessels may ride in 3 fathoms.

BOAT HARBOR lies round the western point of Bay de L'Eau, off which is a rock above water; this harbor runs up N. E. 3 miles, with deep water, until you get near its farther end. The land from hence runs south-westward to Bune Harbor: this lies on the main land, and is fronted by several islands, the largest of which is called Cross Island, being two miles in length, and one in breadth. The other islands are named Gooseberry, Pet-licont, Gull and Jerseyman's Islands, and are situated between Cross Island and the main.

BANE HARBOR is a good place for small vessels; its entrance is narrow, but when you are within it, there is sufficient room to moor with 3 fathoms water. There are good channels between all these islands, through which vessels may pass to the harbors at the northward. One mile and three-quarters S. W. from Bane Harbor is Rashoon, to the northward for any vessels; and about the same distance from Rashoon is Broad Cove; here the anchorage is exceedingly good, with 8 and 9 fathoms water; it lies to the north-eastward of a point of land, which juts out, and is named Broad Cove Head.

RED HARBOR lies 3 miles from Broad Cove Head, and is a good harbor, but too open to the southward; in it are 17, 13, and 9 fathoms. S. W. from hence, distant $3\frac{1}{2}$ miles, and situated on the main, is John le Bay; in your passage to which, and nearly mid-channel, between Flat Islands and the shore, is a cluster of small islands, with deep water all round them; and further on, near the land, is a rock above water; you may sail on either side of this; the channel between it and the land is narrow, and has 17 fathoms; that on the eastern, or outside, has 18, 25, and 26 fathoms, and leads directly out to Placentia Bay.

AUDIERNE ISLAND lies half a mile to the northward of Cape Jude, or Middle Island, on the west side of which there is a tolerably good harbor. At about a cable's length from Audierne Island, to the southward of the harbor, is a sunken rock, the mark for avoiding which, in coming in from the southward, is not to haul in for the harbor till you open a remarkable green point on the southern side of the harbor. The best anchorage is on the north shore, just within a small island. A spit of rocks stretches off the green point on the south shore, which is covered at high water.

Vessels bound for Audierne Harbor may pass between Cape Jude, or Middle Island, and Audierne Island, and between Crow and Patrick's Islands, which are two small islands lying off the S. W. point of Audierne Island. Off the eastern point of Audierne is Ford's Island, to the west of which is a sunken rock, about a cable's length from the island, and another on the eastern side, which almost always breaks. W. by N. about $1\frac{1}{2}$ mile from Ford's Island is Green Island, having a little rocky islet off its eastern, and another off its western end; there is deep water all round it, 11 fathoms close to the rocky islets, 70 fathoms between it and Ford's Island, 73 and 63 fathoms between it and Long Island, and still deeper water towards the Gallowes Harbors.

THE SADDLE BACK is an islet lying E. N. E. $8\frac{1}{2}$ leagues from Corbin Head; E. by N. from Mortier West Point, and E. $\frac{3}{4}$ S. 3 leagues from John the Bay Point. Between it and the main are a great number of rocks and little islands, which render this part of the coast very dangerous. A chain of rocks extends N. E. by E. 2 miles from the Saddle Back.

CAPE JUDE, or MIDDLE ISLAND, is about $2\frac{1}{2}$ miles in length, 2 in breadth, and lies $1\frac{1}{2}$ mile north of the Saddle Back. On the south end of it is a round hill, which is

Cape Roger Harbor.

Great Gallowes Harbor.

Little Gallowes Harbor.

Boat Harbor.

Red Harbor.

Audierne Island.

The Saddle Back.

Cape Jude or Middle Island.

called the Cape. Between this island and the main are a cluster of islands and low rock with a great number of sunken rocks about them, called the Flat Islands, the innermost of which lies about one mile from the main.

West $3\frac{1}{2}$ miles from the south-eastern Flat Island, and 2 miles to the N. N. W. of John the Bay Point, lies John the Bay, in which there is tolerably good anchorage, with about 5 fathoms water, sandy bottom.

Rock Harbor. ROCK HARBOR.—From John the Bay Point to Mortier East Head, the bearing and distance are S. W. $\frac{1}{4}$ W. 8 miles. Two miles S. W. by W. from John the Bay Point lies Rock Harbor, not fit for shipping. Between lie two sunken rocks, nearly half a mile from the shore.

Mortier Bay. MORTIER BAY.—Two miles W. S. W. from Rock Harbor is the opening into Mortier Bay, at the western entrance of which is a small harbor, called Boboy, of only 5 feet water. The course into Mortier Bay is N. N. E. for about 2 miles; and in it there are from 50 to 70 fathoms water, the land on each side being high. It then extends westward about 2 miles, and is nearly 2 miles wide. On the eastern side, at about 3 miles from the entrance, is an exceedingly good harbor, called Spanish Room, in which vessels may anchor in from 4 to 6 fathoms water, good ground, and secure from all winds. There is not the least danger in going into this harbor, only giving the low rocks above water, on the larboard hand at the entrance, a berth of one cable's length.

Little Mortier Bay. LITTLE MORTIER BAY.—Two miles and a half from the entrance of Mortier Bay lies Crony Point and Islands. About 2 miles further southward, and nearly a mile westward of Mortier East Point is Little Mortier Bay, at the entrance of which is a round island, called Mortier Island, lying one-third of the distance from the west side; it is bold to all round, and may be passed on either side. Close to the first point beyond the island, on the larboard side going in, is another little island, close under the land; and two cables length from it, in a direct line towards the latter island, is a sunken rock, on which the sea breaks in bad weather, which is the only danger in the bay. At the bottom of it, $1\frac{1}{2}$ mile from Mortier Island, on the east side, is a cove, called Fox Cove, where there is fair anchorage, and room for one ship to moor in 9 fathoms, good holding ground, two points open to the sea, from S. S. E. to S. E. On the west side of the bay is the harbor, which is small and narrow, but a very good one for small ships, where they lie moored to the shore. Off the starboard point, going in, is a rock, which is always covered at high water.

One mile and a half S. W. by W. from Mortier East Point lies Mortier West Head, one mile beyond which is Iron Island; and S. E. $\frac{1}{4}$ E. 2 leagues from Iron Island, and S. W. $\frac{1}{4}$ W. 5 leagues from Cape Jude, lies the Mortier Bank, the shoal part of which is about one league over, and on which there are said to be only 4 fathoms. The sea breaks heavily on it in blowing weather.

Iron Island. IRON ISLAND is small and high. Off its S. W. point is a rock under water. Three quarters of a mile to the southward of it is Gregory's Rock, S. $\frac{1}{4}$ W. $\frac{1}{4}$ of a mile from which is Galloping Andrews; and S. E. by E. from Iron Island is the White Horse of 8 fathoms. A West S. W. course from Marticot's Island will clear all these dangers.

Great and Little Burin Harboas. GREAT AND LITTLE BURIN HARBORS.—S. W. $\frac{1}{4}$ W. from Iron Island, distant one league, is the S. E. point of Great Burin Island; and W. N. W. $1\frac{1}{2}$ mile from it is the north part of Parly's Island. On the main, within these islands, lie the harbors of Great and Little Burin. Vessels bound for Burin may pass on either side of Iron Island. The only danger in passing to the northward is the ledge called the Brandlys, which almost always breaks; they lie near a quarter of a mile to the southward of a low rock, above water, close under the land of Mortier West Head. By keeping Mortier West Head open to the westward of Iron Island, you will avoid Gregory's Rock, on which are only 2 fathoms water, and which almost always breaks. Vessels may pass with safety between this rock and Iron Island, by giving the latter a berth of above a cable's length.

Galloping Andrews. GALLOPING ANDREWS.—On the main, within Parly's Island, are two remarkable white marks in the rocks; the northernmost of these brought on with the north part of Parly's Island, and Iron Island N. E. $\frac{1}{4}$ N. will lead on the Galloping Andrews, a shoal with 5 fathoms water on it.

The White Horse is a shoal with 8 fathoms on it, which bears S. E. by E. one mile from Iron Island.

The Dodding Rock lies about one quarter of a mile from the easternmost part of Great Burin Island

Great Burin Island is about 24 miles in length, lying N. N. E. and S. S. W. being high land. Near its south end is Cat Island, high and round, lying E. N. E. nearly 4 miles from Corbin Head.

From Corbin's Head to Shalloway Point the bearing and distance are N. E. $\frac{1}{4}$ N. $\frac{1}{4}$ miles. Between them, and nearly in the same direction, lie Corbin and Little Burin Islands, both high and round, not more than a cable's length from the shore.

Shalloway Island. SHALLOWAY ISLAND lies N. N. W. $\frac{1}{4}$ W. one mile from Cat Island, and N. E. by E. a quarter of a mile from Little Burin Island. The passage into Burin Harbors, from the southward, is to the westward of Shalloway Island.

In sailing in, take care to give Poor Island a berth on your larboard hand, and when within Shalloway Island, you may anchor in safety between it and Great Burin Island, in from 12 to 18 fathoms. The best anchorage in Great Burin Harbor is in Ship Cove. The course up to it, after you are within Neck Point, which is to the westward of the Shalloway Island, is N. N. E. about one mile. It is nearly a quarter of a mile wide. In sailing keep the west shore on board, in order to avoid a sunken rock on the east shore, at about half way up, and near a cable's length from the shore. Directly off this is a remarkable hole in the rock, on the same side, and a gully in the land from top to bottom, on the western shore. Another rock, with 2 fathoms on it, lies above a cable's length to the S. W. of Harbor Point, which is round and green, and of a moderate height, joined to Great Burin Island by a low, narrow, sandy neck.

BURIN BAY is about one mile N. N. E. of Little Burin Island. It is clear, and about a mile wide every way. Here ships may occasionally anchor, and lie almost land-locked. In this bay are two islands, one called Poor Island, low and barren; the other lies to the northward, before the entrance of Burin Inlet, and is high and woody.

BURIN INLET may be entered on either side of the island. It extends up 5 miles. A little within the entrance, on the east side, half a cable's length from the shore, is a rock, covered at three-quarters flood; and $1\frac{1}{2}$ mile from the entrance, near the middle, is another rock, to the westward of which is good room and fair anchorage, in from 7 to 12 fathoms. There are 15 fathoms in the entrance, and in the middle, two miles up, 15 to 20 fathoms; and thence up to the head are from 10 to 5 fathoms.

The east passage in is between Parady's Island and Iron Island; but is not safe without a commanding gale, and that between the N. N. E. and S. E.

CORBIN HARBOR is about a mile to the northward of Corbin Head, and is a good harbor for small vessels. A quarter of a mile eastward from this harbor, and two cables' length from the shore, is a sunken rock, of 5 or 6 feet water, on which the sea braks in bad weather. Vessels bound for this harbor must also avoid a shoal of two fathoms water, which lies E. S. E. from the south point of the entrance, distant half a mile. The best anchorage is in the north arm, and about half a mile within the entrance, opposite a cove on the starboard side.

From Corbin Head, which is high bluff land, to Small Point, the lowest hereabout, the course and distance are W. S. W. $2\frac{1}{2}$ miles; and from Small Point to Sauker Head, W. S. W. 2 miles. There are many head-lands between, which form coves, but afford no shelter. The coast is clear of rocks, and there are 30 fathoms water close to the shore; but a little to the S. Westward of Sauker Head there is a small rock under water. It lies close in with the land.

From Sauker Head, which is a high hill in the shape of a sugar-loaf, to Cape Chapenu Rouge, the bearing and distance are west, 3 miles; between lie the harbors of Great and Little St. Lawrence.

LITTLE ST. LAWRENCE.—The harbor of Little St. Lawrence is the first to the westward of Sauker Head. To sail in you must keep the west shore on board, to avoid a sunken rock which lies a little without the point of the peninsula, which stretches off from the east side of the harbor. The anchorage is above the peninsula, (which shelters from the sea winds), in 3 or 4 fathoms water, a fine sandy bottom. Ships may anchor without the peninsula, in 12 fathoms, good ground; but this place is open to S. S. E. winds.

GREAT ST. LAWRENCE.—The harbor of Great St. Lawrence, which is the westernmost, is close to the eastward of Cape Chapenu Rouge. To sail in, you should be careful with westerly, particularly with S. W. winds, not to approach too near the Hat Mountain, in order to avoid the flaws and eddy winds under the high land. There is no danger but what is very near the shore. The course in is, first, N. N. W. till you open the upper part of the harbor, then N. $\frac{1}{2}$ W. The best anchorage for large ships is before a cove, on the east side of the harbor, in 13 fathoms water. A little above Blue Beach Point, which is the first on the west side, you may lie, only having two points open, and may anchor any where between this point and the point of Low Beach, on the same side, near the head of the harbor, observing that, close to the west shore, the ground is not so good as on the other side. Fishing vessels commonly lie at the head of the harbor above the beach, sheltered from all winds.

Garden Bank, whereon are from 7 to 16 fathoms water, lies about half a mile off Little St. Lawrence, with Blue Beach Point on with the east point of Great St. Lawrence.

FROM CHAPEAU ROUGE TO CAPE RAY.

FERRYLAND HEAD lies W. S. W. one mile from Cape Chapenu Rouge. It is a high rocky island, just separated from the main, and with Chapeau Rouge, are infallible objects to point out the harbor of St. Lawrence.

LAUN BAY.—W. N. W. 8 miles from Ferryland Head, lies the point of Laun, from whence the land turns to the northward, and forms the Bays of Laun. Here are two small inlets, called Great and Little Laun. Little Laun is the easternmost, lies open to the S. W. winds, and therefore is no place to anchor in. Great Laun runs in N. E. by N. two

Burin Bay.

Burin Inlet.

Corbin Harbor.

Little St. Lawrence.

Great St. Lawrence.

Laun Bay.

miles; is near half a mile wide, and has from 14 to 3 fathoms water. In sailing in, be careful to avoid a sunken rock which lies about a quarter of a mile off the east point. The best anchorage is on the east side, about half a mile from the head, in 6 and 5 fathoms, tolerably good bottom, and open only to the S. and S. by W. winds, which cause a great swell, as the head of this place is a bar harbor, where boats can ascend at high tide, and find conveniences for fishing, with both wood and water.

Laun Islands.

LAUN ISLANDS lie off the west point of Laun Bay, not far from the shore: the westernmost and outermost of which lies W. N. W., westerly, 14 miles from Ferryland Head. Nearly a quarter of a mile to the southward of this island is a rock, whereon the sea breaks in very bad weather. There are other sunken rocks about these islands, but not dangerous, being very near the shore.

*Taylor's Bay.
Point Aux Gaul.*

TAYLOR'S BAY lies open to the sea, about 4 miles to the westward of Laun Islands. Off the east point are some rocks, near a quarter of a mile from the shore.

POINT AUX GAUL is a low narrow point of land, which stretches out a little to the westward of Taylor's Bay. A rock lies off it above water, half a mile from the shore, called Gaul Slug Rock, which bears from Ferryland Head W. N. W. $\frac{3}{4}$ W. 6 $\frac{1}{2}$ leagues: there are 14 fathoms close to the off side of it, but some rocks on its inside. From Point Aux Gaul Shag Rock to the Lamelin Islands, the bearing and distance are N. W. by W. one league. Between is the Bay of Lamelin, which is unfit for shipping, being shallow, and having several rocks and islands about it. The river at the bottom of the bay abounds with salmon.

Near the south point of the westernmost Lamelin Island is a rock high above water, called Lamelin Shag Rock. From Lamelin Shag Rock to Point May the distance is 9 miles. Between lie the Lamelin Ledges, which are very dangerous, some of them being 3 miles from the land. To avoid them, in the day time, you should not bring the Lamelin Islands to the southward of E. S. E. until Point May bears N. E. by N. from you; you may then steer northward, between Point May and Green Island, with safety. By night, approach no nearer than in 30 fathoms water.

REMARK.—Mariners who navigate this part of the coast, will do well by observing the appearance of the land, for all that part of Chapeau Rouge and Laun is very high and hilly close to the sea; from Laun Islands to Lamelin it is only moderately high; and from Lamelin to Point May the land, near the shore, is low, with beaches of sand, while inland it becomes mountainous.

St. Pierre, or St. Peter's Island.

ST. PIERRE, or ST. PETER'S ISLAND.—The island of St. Pierre lies 13 leagues W. by N. from Cape Chapeau Rouge. It is about 4 leagues in circumference, and pretty high, with a craggy broken, uneven surface. On coming from the westward, Point Cronier, which is the S. E. point of the island, makes in a round hummock, like a small island, separated from St. Pierre. A little to the N. E. of Point Cronier lie three small islands, the innermost of which is the largest, and called Dog Island; within it are the road and harbor of St. Pierre. The harbor is small, and has from 20 to 12 feet water; but there is a bar across the entrance, with only 6 feet at low water, and 12 or 14 at high water. The road lies on the west side of Dog Island, and will admit ships of any burthen, in 8, 10, or 12 fathoms water. The best anchorage is on the north side; but in general it is rocky, and exposed to the N. E. winds. Be cautious, in going out, of some sunken rocks which lie about a mile E. S. E. from Bour Island, which is the easternmost of the three islands above mentioned. This is the only danger about St. Peter's, but what lies very near the shore.

Lighthouse.

On Cannon Point, the north side of the entrance to the inner harbor, there is a lighthouse containing a fixed light, which is lit from the 1st of May to the 15th of November. With this light bearing W. by N., or W. $\frac{1}{4}$ N. about two cables' length distant, there is anchorage in 5 $\frac{1}{2}$ and 6 fathoms water.

Lighthouse.

A fixed light of the second class, 210 feet high, is on Gallantry Head, the south side of the Island of St. Peter.

Island of Columbiar.

THE ISLAND OF COLUMBIAR lies very near to the N. E. point of St. Pierre. It is rather high. Between them is a passage one-third of a mile wide, with 12 fathoms water. On the north side of the island is a rock, called Little Columbiar; and about one quarter of a mile E. N. E. of it is a sunken rock, with two fathoms on it.

Green Island.

GREEN ISLAND is about three-quarters of a mile in circuit, and low. It lies E. N. E. about 5 miles from St. Pierre, and nearly in the middle of the channel between it and Point May, in Newfoundland. On its south side are several rocks, above and under water, extending 14 mile to the W. S. W.

Langley, or Little Miquelon.

LANGLEY, or LITTLE MIQUELON.—Langley Island lies to the N. W. of St. Pierre, with a passage of about 2 $\frac{1}{4}$ miles wide between, free from danger. It is about 8 leagues in circuit, of a moderate and equal height, excepting at the north end, which is a low point, with sand hills; off which, on both sides, it is a flat little way; but every other part of the island is bold to. There is anchorage on the N. E. side of the island, near Seal Cove, in 5 or 6 fathoms, a little to the southward of the sand hills, on a fine sandy bottom.

Great Miquelon.

GREAT MIQUELON.—From the north point of Langley to the south point of Miquelon, the distance is scarcely one mile, and the depth of water between is 2 fathoms,

From the

Miquelon is 4 leagues in length from north to south, and is about 5 miles in breadth at the widest part. The middle of the island is high land, called the High Lands of Dunne; but down by the shore it is low, excepting Cape Miquelon, which is a lofty promontory at the northern extremity of the island.

On the S. E. side of the island is the little Harbor of Dunne. It is a bar harbor, admitting fishing shallops at half flood, but no way calculated for shipping.

Miquelon Rocks stretch off from the eastern point of the island, under the high land, 1½ mile to the eastward. Some are above, and some under water. The outermost are above water, and there are 12 fathoms water close to them, with 18 and 20 a mile off. N. E. ¼ E. about 4½ miles from these rocks, lies Miquelon Bank, on which are 6 fathoms water.

Miquelon Road, which is large and spacious, lies towards the north end, and on the east side of the island, between Cape Miquelon and Chapeau, which is a very remarkable round mountain near the shore, off which is some sunken rocks, at the distance of about a quarter of a mile; but every where else it is clear of danger. The best anchorage is in 6 or 7 fathoms, near the bottom of the road, on fine sandy bottom; but there you lie exposed to easterly winds.

The Seal Rocks, two in number, are above water, and lie about 1½ league off from the north-west side of Miquelon. The passage between them and the island is very safe, and there are 14 or 15 fathoms water within a cable's length, all round them.

Point May has a rocky islet at its point, and from thence the land turns N. N. E. towards Dantzic Cove and Point, and thence E. N. E. towards Fortune Head.

FORTUNE BAY, &c.—From Point May to Pass Island, the bearing and distance *Fortune Bay.* are N. ½ E. 12 leagues. Between them is the entrance to Fortune Bay, which is about 22 or 23 leagues deep; and in which are numerous bays, harbors, and islands.

BRUNET ISLAND.—The Island of Brunet lies nearly in the middle of the entrance *Brunet Island.* into Fortune Bay; it is above 5 miles in length, two in breadth, and of moderate height; the eastern part appears, in some points of view, like islands. On its east side is a bay, wherein there is tolerable anchorage for ships, in 14 or 16 fathoms water, sheltered from southerly and westerly winds. In the bottom of the bay, at about a quarter of a mile from the shore, are some rocks, which must be avoided. Opposite to this bay, on the south-west side of the island, is a small cove, with 6 fathoms water. The islands lying off the west end of Brunet, to the southward, are called the Little Brunets, which, with Brunet, may be approached within a quarter of a mile all round.

The Plate Islands are three rocky islets, of a moderate height, the nearest of which lies W. S. W. one league from the west end of Great Brunet. The southernmost is about 2 miles farther off, and bears from Cape Miquelon E. ¼ S. 3½ leagues; and in a direct line between Point May and Pass Island, 17 miles from the former, and 19 miles from the latter. E. S. E. a quarter of a mile from the Great Plate, (which is the northernmost,) is a sunken rock, whereon the sea breaks, and this is the only danger about them. There are several strong and irregular settings of the tides or currents about the Plate and Brunet Islands, which seem to have no dependency on the moon, and the course of the tides on the coast.

SAGONA ISLAND, which lies N. E. 2 leagues from the east end of Brunet, is about *Sagona Island.* a mile across each way, of a moderate height, and bold to all round; on its western side there is a small creek, admitting fishing shallops; in the middle of the entrance to this, is a sunken rock, which occasions it to be difficult of access, except in very fine weather: a sand bank surrounds this island, running westerly full 7 miles, upon which are 14, 17, and 20 fathoms water.

POINT MAY is the southern extremity of Fortune Bay, and the S. W. extremity of *Point May.* this part of Newfoundland may be known by a great black rock, nearly joining to the pitch of the point, and set out higher than the land, which makes it look like a black bammoock on the point. At about a quarter of a mile directly off from this black rock are three sunken rocks, on which the sea always breaks.

DANTZIC COVES.—N. by E. 1½ of a mile from Point May, is Little Dantzic Cove: *Dantzic Coves.* and 2 miles farther is Great Dantzic Cove. From Dantzic Point, (which is the north point of the coves,) to Fortune Head, the bearing and distance are E. N. E. 2½ leagues; and thence to the town of Fortune, 1½ mile S. E. by E. This is a fishing village, and the road where the ships lie has from 6 to 10 fathoms water, quite exposed to nearly half the compass; it lies S. by W. from the east end of Brunet. To the N. N. Westward of Dantzic Point is the long narrow bank of Jerseyman's, with 24 and 25 fathoms over it, extending from abreast of the point in the direction of the Plate Islands.

SHIP COVE.—The Cape of Grand Bank is high, and lies one league E. N. E. from *Ship Cove.* Fortune. To the eastward of this cape is Ship Cove, where there is good anchorage for shipping in 8 or 10 fathoms water, sheltered from south, west, and north-westerly winds. Grand Bank lies S. E. half a league from the cape, and is a fishing village, where there is no security for shipping, and the entrance is barred.

From the cape of the Grand Bank to the Point Enragée the course is E. N. E. ¼ E.

distant 8 leagues. The coast between forms a circular bay, in which the shore generally is low, with several sandy benches, behind which are bar harbors, fit only for boats, of which the principal is Great Garnish, lying $4\frac{1}{2}$ leagues from the cape of Grand Bank; it may be known by several rocks above water, lying before it at two miles distance from the shore. The outermost of these is steep to; but between them and the shore are several dangerous sunken rocks. To the eastward, and within these rocks, is Prouchnan's Cove, where small vessels sometimes run in and anchor in 4 or 5 fathoms water, tolerably well sheltered from the sea winds. This is a convenient place for the cod fishery. The passage is to the eastward of the rocks that appear the highest above water. Between them and some other lower rocks lying off to the eastward of the east point of the cove, there is a sunken rock nearly in the middle of the passage, which you must be aware of. The shore is bold all the way from Point May to Cape of Grand Bank, there being 10 or 12 fathoms within 2 cables' length, and 30 or 40 at a mile off. Between the latter and Great Garnish the water is not so deep, and ships may anchor any where in 8 or 10 fathoms water, sheltered only from the land-winds.

From Point Enragée to the head of the bay, the course is, first, E. N. E. $\frac{1}{2}$ E. 3 leagues to Grand Jervey; then E. $\frac{1}{2}$ N. $7\frac{1}{2}$ leagues to the head of the bay. The land in general along the south side is high, bold to, and of uneven appearance, with hills and valleys of various extent, the latter mostly covered with wood, and having many fresh water rivulets.

*Bay L'Ar-
gent.*

Harbor Millé

BAY L'ARGENT.—Seven leagues to the eastward of Point Enragée is the Bay L'Argent, where there is anchorage in 30 or 40 fathoms water, sheltered from all winds.

HARBOR MILLE.—The entrance to Harbor Millé lies to the eastward of the east point of L'Argent. Before this harbor, and the Bay L'Argent, is a remarkable rock, which, at a distance, appears like a shallop under sail. Harbor Millé branches into two arms, one lying to the S. E. the other to the east: at the upper part of both are good anchorages. Between this harbor and Point Enragée are several bar harbors, or small bays, with sandy benches: but the water all along the coast is very deep. You may safely anchor any where, but it must be very near the shore.

Cape Millé lies N. E. $\frac{1}{2}$ E. one league to the Shallow Rock above mentioned, and near 3 leagues from the head of Fortune Bay; it is a high, reddish, barren, rocky point. The width of Fortune Bay at Cape Millé does not much exceed half a league; but immediately below, it becomes twice as wide, by which the cape may readily be known; and above this cape the land on both sides is high, with steep craggy cliffs. The head of the bay is terminated by a low beach, behind which is a large pond, or bar-harbor, fit only for boats. In this, and in all the bar harbors between this and the Grand Bank, are convenient places for building stages, and good benches for drying fish, fitted to accommodate numerous boats.

*Grand le
Pierre.*

GRAND LE PIERRE is a good harbor, situated on the north side of the bay, half a league from the head. The entrance cannot be seen until you are abreast of it. There is no danger in going in, and you may anchor in any depth, from 8 to 4 fathoms, sheltered from all winds.

*English Har-
bor.*

ENGLISH HARBOR lies a little to the westward of Grand Pierre; and to the westward of English Harbor is the Little Bay de L'Eau, both of which are small, and only fit for boats.

New Harbor.

NEW HARBOR is situated opposite to Cape Millé, and to the westward of the Bay de L'Eau; it is a small inlet, and has good anchorage on the west side, in from 8 to 5 fathoms, sheltered from S. W. winds.

*The Harbor
Femme.*

THE HARBOR FEMME lies half a league to the westward of New Harbor; it is narrow, and has in it 20 and 23 fathoms; before its entrance is an islet, near to which are some rocks above water; one league to the westward of Harbor Femme is Brewer's Hole, fit only for boats; before this cove is also a small island near the shore, and some rocks above water.

*Harbor La
Conte.*

HARBOR LA CONTE is situated one mile to the westward of Brewer's Hole; before there are some islands, the outer one is called the Petticoat Island, the inner Smock Island, there are also two smaller ones between these, and a sunken rock or two; the best passage in is on the west side of the outer island, and between the two larger ones; so soon as you begin to open the harbor, keep the inner island close on board, to avoid some sunken rocks that lie near a small island, which you will discover between the N. E. point of the outer island and the opposite point on the main: there is also another rock which appears at low water, and lies higher up on the side of the main; and when you get beyond these dangers, you may keep in the middle of the channel, and will soon open a fine spacious harbor, wherein you may anchor in any depth, from 6 to 16 fathoms water, on a bottom of sand and mud, shut in from all winds. To the eastward of the outer island there is a small cove, fit for small vessels and boats, and otherwise convenient for the fisheries.

*Long Har-
bor.*

LONG HARBOR lies 4 miles to the westward of Harbor La Conté, and N. E. by E. distant 5 leagues from Point Enragée. It may be known by Gull Island, which lies at its mouth, and a small rock, which lies half a mile without the island, and has the appearance of a small boat; there is a passage into this harbor on each side of this island; the

In this bay sage in is o vessels can

western one is the broader of the two : nearly in the middle of this channel, a little outside of the island, is a ledge of rocks, whereon are two fathoms water : and a little within the island, on the eastern side, are others, 2 cables' length from the shore : they lie off two sandy coves, and are visible at low water. Long Harbor runs 5 leagues up into the country, but the only anchoring place is in Morgan's Cove, on the N. W. side of the harbor, about 2 miles within Gull Island, in 15 fathoms water, unless you run above the Narrows : there is a salmon fishery at the head of the bay.

A little to the westward of Long Harbor, is Hare Harbor, fit for small vessels only. Two miles to the northward of Hare Harbor, is Mul Bay, having very deep water, extending north-easterly about 5 miles, and having no anchorage except at its furthest end : to the westward of Mul Bay, near the shore, lie the Rencontre Islands, the westernmost of which is the largest, has a communication with the main at low water. In and about this island is shelter for small vessels and boats.

BELLE HARBOR lies 4 miles N. W. by N. from the westernmost Rencontre Island; the passage into it is on the western side of the island, and so soon as you have passed the shoals you will open a small cove, on the east side, where small vessels can anchor, but large vessels must run up to the head of the harbor and anchor in 20 fathoms, where there is most room : it is but an indifferent harbor. About $1\frac{1}{2}$ of a mile westward of Belle Harbor is Lally Cove, behind an island, fit for small vessels only. The west point of this cove is high and bluff, and is called Lally Head; to the northward of this head is Lally Back Cove, where ships may anchor in 14 or 16 fathoms water.

Two miles to the northward of Lally Cove Head, are East Bay and North Bay; in both of these there is deep water, but no anchorage near the shore. At the Head of North Bay is the largest river in Fortune Bay, and appears to be a good place for the salmon fishery, from which circumstance it is named Salmon River.

CINQ ISLES BAY.—The Bay of Cinq Isles lies to the southward of the North Bay, and opposite to Lally Cove Head; there is tolerably good anchorage for large ships on the S. W. side of the islands, in the bottom of the bay. The north arm is a very snug place for small vessels, and salmon may be caught at its head.

CORBEN BAY.—A little to the southward of the Bay of Cinq Isles is Corben Bay, where there is good anchorage, for any ships, in 22 or 24 fathoms water. About 2 miles south-easterly from Lally Cove Head are two islands, about a mile distant from each other; the north-easterlymost is called Belle Island, and the other Dog Island; they are bold to all round. Between Dog Island and Lord and Lady Island, which lies off to the south point of Corben Bay, something nearer to the latter, is a sunken rock, with deep water all round it; and about a quarter of a mile to the northward of Lord and Lady Island, is a rock which appears at low water.

BANDE DE L'ARIER BAY lies on the west point of Belle Bay, and N. $\frac{1}{2}$ W. 3 leagues from Point Enragée; it may be known by a very high mountain over the bay, which rises almost perpendicular from the sea, called Iron Head. Chapel Island, which forms the east side of the Bay, is high land also; the harbor lies on the west side of the bay, just within the point formed by a narrow low bench, and is a snug place; between the harbor and Iron Head there is tolerably good anchorage, in 18 or 20 fathoms.

Bande de L'Arier Bank has 7 fathoms water on it, and lies with the beach of Bande de L'Arier Harbor just open of the west point of the bay, and Boxy Point on with the north end of St. Jaques Island.

ST. JAQUES.—Two miles to the westward of Bande de L'Arier is the Harbor of St. Jaques, which may be readily known by the island before it being high at each end, and low in the middle. The passage into the harbor is on the west side of the island, free from danger, as is the harbor, where you may anchor in from 17 to 4 fathoms.

BLUE PINION.—About one and a half mile to the westward of St. Jaques, is the harbor of Blue Pinion; and a little to the westward of that is English Cove.

BOXY HARBOR.—Boxy Point lies W. $\frac{1}{2}$ S. 6 miles from St. Jaques Island, and E. N. E. $\frac{1}{4}$ E. $12\frac{1}{2}$ miles from the east end of Brunet Island; it is of moderate height, and the most advanced to the southward of any land on the coast. Boxy Harbor lies N. E. 3 miles from Boxy Point, in which there is anchorage in 4 or 5 fathoms water, fine sandy ground : to sail in, bring Boxy Point open of a little black head just within the point, called Friar's Head; in this direction you will keep the middle of the channel, and between the shoals which lie off each point of the harbor where the stages are.

W. N. W. one mile from Boxy Point, is the Island of St. John; and N. N. W. half a league from St. John's Island is St. John's Head, high, steep, and craggy. Between St. John's Head and Boxy Point is St. John's Bay, quite exposed; in the bottom of this is John's Harbor, fit for boats only. On the north side of St. John's Head are two rocky islets, called the Gull and Slug; at the west end of which there are several sunken rocks.

GREAT BAY DE L'EAU is about $1\frac{1}{2}$ league to the northward of St. John's Head, in this bay there is good anchorage in various depths, sheltered from all winds. The passage in is on the east side of the Island, which lies in its entrance; for only very small vessels can enter to the westward.

Belle Harbor.

Cinq Isles Bay.

Corben Bay.

Bande de L'Arier Bay.

St. Jaques.

Blue Pinion.

Boxy Harbor.

Great Bay de L'Eau.

Barrysway Bay.

BARRYSWAY BAY—To the westward of Bay de L'Eau, about 3 miles north from St. John's Head, is Little Bay Barrysway; on the west side of which there is good anchorage for large ships, in 7, 8, or 10 fathoms; and both wood and water to be obtained with ease.

Harbor Briton.

HARBOR BRITON lies to the westward of Little Barrysway, and N. N. E. $\frac{1}{2}$ E. 2 leagues from the Island of Sagona. The heads which form the entrance are high, and lie from each other S. E. and N. W. distant about 2 miles. Near the east head is a rock above water. The only danger in going in is a ledge of rocks, which stretches 2 cables' length from the south point of the S. W. arm, which is more than a mile within the west head. The only place for ships of war to anchor in is above this ledge, before the entrance of the S. W. arm, in 16 or 18 fathoms, mooring nearly east and west: the bottom is very good, and plenty of wood and water is to be obtained here. Opposite to the S. W. arm is the N. E. arm or Jerseyman's Harbor, which is capable of holding a great number of ships, secure from all winds, in 6, 7, and 8 fathoms water: it has a bar at the entrance, on which there are 3 fathoms. The mark to sail over the bar is, the point of Thompson's Beach, which is the south point at the entrance into the S. W. arm, open of Jerseyman's Head, which is high and bluff on the north side of the entrance into Jerseyman's Harbor: so soon as you open the harbor, haul up to the northward, and anchor.

From the west end of Harbor Briton to Connaigre Head the bearing and distance are W. 5 miles; between are Gull Island and Deadman's Bay, off which there is a bank stretching from the shore between 2 and 3 miles, whereon the depths vary from 34 to 4 fathoms. The sea, during storms, will sometimes break for a considerable way out from Gull Island.

Connaigre Bay.

CONNAIGRE BAY.—From Connaigre Head, which is high and craggy, to Basserterre Point, the bearing and distance are N. W. $\frac{3}{4}$ W. 7 miles; between is Connaigre Bay, which extends about 4 leagues inland. In the mouth of the bay lie the Connaigre Rocks, above water, which may be approached very near, there being no danger but what shows itself: the channel between them and Connaigre Head is the safest, as a ledge of rocks extends a mile from the north shore, which renders the other channel rather dangerous.

Connaigre Harbor is near 5 miles above the head, within a point on the south side of the bay; it is very small, and the depth of water is 7 fathoms; the passage in is on the S. E. side of the island, which lies before it. Abreast of this harbor, nearly in the middle of the bay, are two islands; on the south side of the westernmost are some rocks above water.

Dawson's Cove is on the N. W. side of the bay, and bears N. N. E. about 4 miles from Connaigre Head, and W. N. W. 2 miles from the west end of the westernmost (and the greatest) island; the anchorage is in 6 or 5 fathoms, quite exposed to southerly winds. Basserterre Point, which forms the west point of Connaigre Bay, is of moderate height, clear of wood, and from thence to Pass Island, bold to: Pass Island lies nearly W. by N. distant 3 miles from Basserterre Point.

Pass Island.

PASS ISLAND, which is the north-western extremity of Fortune Bay, is a full mile in length, and narrow; it bears from the N. Point of Miquelon N. E. by N. 7 leagues, and from Point May, N. $\frac{1}{2}$ E. 12 leagues. It lies near the shore, and is rather lofty; on its S. Western side there are several rocks above water, which extend a full mile from the island; and to the N. W. is a sunken rock about a quarter of a mile from the island; there is a passage between this island and the main, about the length of two cables wide; it frequently is traversed by small vessels, who sometimes anchor there on fine sandy bottom, in 6 fathoms water. The cod-fishery about this part is generally considered good and productive.

REMARKS ON FORTUNE BAY.—The general appearance of the land on the northern side of Fortune Bay is hilly, rising directly from the sea, with craggy, barren hills, extending 4 or 5 leagues inland, having many rivulets and ponds; while that on the southern side of Fortune Bay has a very different appearance; having less of these rugged hills, and being better clothed with wood of a short brushy kind, giving to the country an air of greenness and fertility.

Soundings.

SOUNDINGS.—In the night time, or in dark foggy weather, the mariner should not place much dependance on the soundings in Fortune Bay, for therein they might be greatly and fatally deceived, inasmuch as, in many places, the water near the shores and in its creeks and harbors, is often deeper than in the middle of the bay itself.

Hermitage Bay.

HERMITAGE BAY.—This extensive bay is bounded on the S. W. by Pass Island, and to the northward by the islands that form the Bay of Bonne and Great Jarvis Harbor, the width being more than two leagues; and by the southern shores of Long Island, where it begins to narrow. In sailing along the southern coast from Pass Island, you will discover the Fox Islands, which are distant from Pass Island 10 or 11 miles; these islands are situated opposite to the entrance to Hermitage Cove, about $\frac{1}{2}$ of a mile from the land, and are said to have good fishing about them; off the Northern Fox Island are several rocks above water, and a sunken rock lies also off the south side of this Island. To enter Hermitage Cove you should keep between the islands and the shore, borrowing somewhat towards the main land, where you will find 30, 32, and 37 fathoms water; here you will see the cove open, and may turn in south, having deep water, and without the least danger; the anchorage is good, with every conveniency for fishing, and plenty of

both wood and water. From hence Hermitage Bay runs in nearly west for 12 miles, with very deep water, until you get near the head, where it gradually lessens to 25 and 22 fathoms, and further in to 9 fathoms; there is a small islet or two on the southern side, but no danger whatever.

LONG ISLAND, which separates the Bay of Despair from Hermitage Bay, is of a *Long Island* square form, about 8 miles long and nearly 8 leagues in circuit. The eastern passage is very good, but narrow, and is between the east end of Long Island and the main, called the Passage of Long Island. The west entrance into the Bay of Despair from Hermitage Bay is by the west end of Long Island. About half a mile from its S. W. point are two rocks above water, with deep water all round them.

GALTAUS HARBOR.—There are four harbors on the south side of Long Island, *Galtaus Harbor*. the easternmost of which is called Galtaus; this is but small, and lies near the south-east point of the island. The best channel into the harbor is on the west side of several rocky islands, which lie at the entrance, wherein are 4 fathoms; but in the harbor there are from 15 to 24 fathoms.

PICARRE HARBOR.—The next is Picarre, which lies N. by E. half a league from *Picarre Harbor*. the easternmost Fox Island. In going in here, keep near the west point, in order to avoid some sunken rocks off the other. The anchorage is in the first cove on the east side, in 9 or 10 fathoms, sheltered from all winds.

ROUND HARBOR.—The next harbor, called Round Harbor, is about 2 miles to the *Round Harbor*. westward of Picarre, and fit only for small vessels, the channel in being so narrow.

LONG ISLAND HARBOR is the fourth, and lies about 2½ miles from the west end of Long Island. This harbor has two arms, one running in to the north, the other to the eastward. They are both very narrow, and have from 40 to 7 fathoms water. The eastern arm is the deepest, and affords the best anchorage. The passage in is on either side of an island which lies off the entrance, and has several rocks above water about it.

BAY OF DESPAIR.—The entrance of the Bay of Despair lies between the west *Bay of Despair*. end of Long Island and Great Jarvis Island, (which lies in the mouth of the harbor of that name,) the distance between is one mile and a quarter, and midway no bottom is found with a line of 280 fathoms. The Bay of Despair forms two capacious arms, one extending full 8 leagues to the north-eastward, the other about 13 miles northward. In the N. E. arm are several arms and islands, and tolerably good anchorage in several places. In the north arm there is very deep water, and so anchorage excepting in the small bays and coves which lie on each side of it; but in an arm of this bay, which runs easterly, there is a fine salmon fishery, and wood in plenty. In the N. E. arm also there are good salmon fisheries at Little River and Conne River. All the country about this part is mountainous and barren, but about the head of the bay it becomes level, and has abundance of wood, such as fir, pine, birch, witch hazel, spruce, &c.

GREAT JARVIS HARBOR is situated at the west entrance into the Bay of Despair. *Great Jarvis Harbor*. It is a safe harbor, with good anchorage in every part of it, in from 16 to 20 fathoms, secure from all winds, and plenty of wood and water. The passage in is on either side of the Great Jarvis Island; but the southernmost channel is the safest, there being no danger in it but the shore itself. In the northern channel are several sunken rocks. To sail in you should bring the north point between the two rocks above water, on the starboard side, and then steer directly in. This will carry you clear of some sunken rocks which lie on the west point of the island. These rocks appear at low water. The entrance to this harbor may be known by the east end of Great Jarvis Island, which is a high, steep, craggy point, called Great Jarvis Head, and is the northern point of the south entrance to the harbor.

BONNE BAY lies about a league to the westward of Great Jarvis Head, and nearly *Bonne Bay*. N. by E. distant 7 miles from Pass Island. It has several islands at its entrance; the westernmost of which is the largest and highest. The best passage in is to the eastward of the largest island, between it and the two easternmost islands. The bay runs in north 4 miles, and there is no danger but what shows itself. You may go on either side of Drake Island, which is small and nearly in the middle of the bay; between which, and two small islands on the west side of the bay, within Great Island, there is anchorage in 20 or 30 fathoms; but the best place for large ships is near the head of the bay, in 12 or 14 fathoms, clear ground, and convenient for wood and water. On the N. W. side of Great Island, within the two small islands, is very good anchorage, in from 16 to 24 fathoms, secure from all winds. The entrance from this bay is to the northward of the two small islands. In sailing in or out of the bay, approach not too near the south point of Great Island, as there are some sunken rocks lying at one-quarter of a mile from the shore. A little to the westward of Bonne Bay is Mosquito Cove, a small inlet of from 30 to 47 fathoms water.

W. N. W. 4 miles from Bonne Bay, is the entrance to the Bays of Facheux and Dragon. This entrance being very conspicuous at sea, the coast may here be readily known.

FACHEUX, which is the easternmost branch, is very easily seen to seaward; it runs *Facheux*. in N. N. E. 2 leagues, and is one-third of a mile wide at the entrance, with deep water in

- most parts of it. On the west side of the bay are three coves, where ships may anchor in from 10 to 20 fathoms. Dragon Bay lies in N. W. one league, and is near half a mile wide, with 60 or 70 fathoms water, and no anchorage excepting near the head; and then you must lie very near the shore. One mile to the westward of Facheux is Little Hole, with shelter for small craft; and one league to the westward of Facheux is Richard's Harbor, a place fit only for small vessels and fishing shallops, with 23 fathoms water in it.
- Hare Bay.** HARE BAY.—N. W. by W. one league from Richard's Harbor is Hare Bay, which runs in N. N. E. about 5 miles, and is about one-third of a mile wide, with deep water, close home to both shores on all parts of it, except about one league up on the west side, where there is good anchorage, in from 8 to 15 fathoms, with plenty of wood and water, and a small cove about one mile up on the east side, where there are 30 fathoms, with gradual soundings to the shore.
- Devil's Bay.** DEVIL'S BAY.—N. W. about $4\frac{1}{2}$ miles from Hare Bay, and one league N. E. from Hare's Ears Point, is Devil's Bay, a narrow inlet, extending a league to the northward, with deep water, and no anchorage until you come close to the head.
- The Bay of Rencontre lies to the northward of Hare's Ears Point, and runs in N. W. by W. 2 leagues; it has deep water in most parts of it, and is near half a mile wide at the narrowest part. The anchorage is in 30 fathoms, above a low woody point on the south shore, quite land-locked. Hare's Ears Point is large, with a ragged rock upon it, which, from some points of view, looks like the ears of a hare. It lies W. by N. $\frac{1}{2}$ N. distant 10 miles from Richard's Harbor, divides the Bays of Rencontre and Chaleur, and bears N. W. $\frac{1}{4}$ W. 6 leagues from Pass Island. Off this point is a fishing bank, extending a full mile from the shore, having from 20 to 36 fathoms over it.
- Chaleur Bay.** CHALEUR BAY.—Two miles to the westward of Hare's Ears Point is the Bay of Chaleur, which runs in about 2 leagues N. N. W. It is very narrow, and has deep water in most parts. At the north entrance into the bay, and close to the land, is a small island of moderate height, and half a league within the island, on the N. E. side of the bay, is a rock above water; a little within this rock, on the same side, is a small cove, with a sandy beach, off which you can anchor in 28 fathoms, a cable's length from the shore.
- François Bay** FRANCOIS BAY.—West nearly half a league from the Bay of Chaleur, is the Bay of François, a small inlet running in N. W. $\frac{1}{4}$ W. one mile, being at the entrance about a quarter of a mile broad, and 17 fathoms deep, but just within are 50 and 60 fathoms. At the head are from 30 to 20 fathoms, good anchorage, and very convenient for carrying on the fishing business.
- Oar Bay.** OAR BAY.—Westward 4 miles from the Bay François, on the east side of Cape la Hune, lies Oar Bay. Off the east point of its entrance is a low rocky islet, and in the entrance of the bay is another, with a passage on each side of it. The bay runs in N. N. E. about 4 miles, and is one-third of a mile wide, with deep water close to both shores all the way up. At the head is a harbor for small vessels, with only 5 fathoms water. At the west side of the entrance into the bay is Cul de Sac, a little cove, with 3 and 4 fathoms water, and good shelter for small vessels.
- Capela Hune** CAPE LA HUNE is the southernmost point of land on this part of the coast, and lies in lat. $47^{\circ} 31'$ N. bearing W. N. W. $\frac{1}{4}$ N. 8 leagues from Pass Island, and N. N. W. $\frac{1}{4}$ N. 10 leagues from Cape Miquelon. Its figure much resembles a sugar loaf. This cape may also be known by the high land of La Hune, which lies one league to the westward of it, appearing flat at the top, and may be seen from a distance of 16 leagues.
- The Penguin Islands.** THE PENGUIN ISLANDS lie W. S. W. $\frac{1}{4}$ S. $10\frac{1}{2}$ miles from Cape la Hune, and N. W. $\frac{1}{4}$ N. 10 leagues from Cape Miquelon. They are an assemblage of barren rocks lying near to each other, and altogether about 2 leagues in circuit, and may be approached in the day time to the distance of half a league and. On the W. S. W. side of the large island, which is the highest, is a small cove for shallops, and convenient for the fisheries, and the ground about it is considered to be good for fishing.
- Whale Rock.** WHALE ROCK.—E. S. E. 8 miles from the Penguin Islands, and S. by W. 3 leagues from Cape la Hune, lies the Whale Rock, on which the sea generally breaks; it is about 100 fathoms in circuit, with 10, 12, and 14 fathoms close to all round it. From this rock a narrow bank extends one league to the westward, and half a league to the eastward, with from 24 to 58 fathoms water on it, rocky and gravelly bottom. In the channel between the shore and this rock, and also between the shore and the Penguin Islands, are 120 and 130 fathoms of water, muddy bottom, and there is the same depth of water at one league without them.
- La Hune Bay** LA HUNE BAY lies close to the westward of Cape La Hune. It is about two leagues deep, and one-third of a mile wide, with deep water in most parts of it; but there is a sunken rock which lies off the west point of the entrance, nearly one-third of the channel over. In sailing in or out of this bay, you should keep the eastern shore on board, in order to avoid a sunken rock which lies off the west point of the entrance into the bay, nearly one-third over. Two miles up the bay is Lance Cove, having anchorage in 14 and 16 fathoms water, good clean ground. A cable's length off the southern point of this cove is a small shoal with 9 feet water, and between it and the point there are 5 fathoms. To

... sail into this place, keep the east point of the bay open of a red cliff point, off which is a rock above water, until the round hill you will see over the valley of the cove is brought on with the north side of the valley; you will then be above the shoal, and may haul in to the cove with safety. There is a narrow bank which stretches quite across the bay, from the S. point of the cove to the opposite shore, whereon are from 27 to 45 fathoms.

LA HUNE HARBOR lies half a league to the westward of Cape La Hune; it has an island before its entrance, and is fit only for small vessels, and open to westerly winds, Before it lies an island near the shore. The channel into the harbor is on the N. W. side of the island. There is no danger in going in, and you must anchor close up to the head, in 10 fathoms water. This harbor is well adapted for the fishery, there being good fishing ground about it, and a large beach quite across from the head of the harbor to La Hune Bay; a space of 800 feet, exposed to the open air, and well calculated for drying fish.

La Hune Harbor.

Four leagues N. W. $\frac{1}{4}$ W. from Cape La Hune is the entrance of Little River, which is about 100 fathoms wide at the entrance, and 10 fathoms deep. A little way up there is anchorage in 10, 8, and 7 fathoms water, good ground. Between Cape La Hune and Little River, the land is tolerably high, and forms a bay, where there are several small islands and rocks above water, the outermost of which lie N. N. E. $\frac{1}{4}$ E. 3 leagues from the Penguin Islands, and are called the Magnetic Rocks.

S. by W. $\frac{1}{4}$ W. 7 miles from the entrance of Little River, and N. by W. $\frac{1}{4}$ W. from the Penguin Islands, lie the Little River Rocks, which are just above water, with very deep water all round them.

THE ISLES OF RAMEA, which are of various extent, both in height and circuit, lie N. W. $\frac{1}{4}$ N. $\frac{1}{2}$ leagues from the Penguin Islands, and one league from the main: they extend east and west 5 miles, and north and south 3 miles, and have several rocks and breakers about them; but more on the south side than on the north. The easternmost island is the largest, and is very high and hilly; the westernmost, called Columbe, is a remarkably high round island, of small circuit, with some rocky islands and sunken rocks near it.

The Isles of Ramea.

RAMEA HARBOR.—There is a harbor for small vessels, formed by the islands which lie near Great Ramea and the Columbe, called Ramea Harbor, where they may lie sheltered from all winds. To enter this from the westward, you should give the southern point a berth, on account of some rocks that lie off the starboard island; these are all above water: steer E. N. E. towards the harbor, keeping as nearly mid-channel as you can—the passage is above a cable's length broad—and run for the anchorage in Ship Cove: this is the second inlet on the north-western shore. You will here ride safely, on clean ground, in 5 fathoms water. To enter from the eastward, you must keep the northern side of Great Ramea on board, until you are up to the west end thereof, then steer S. W. into the harbor, keeping in the middle of the channel, in about three fathoms, and anchor as before directed. This harbor is very convenient for fishing vessels; in it, and also about the islands, are several places fit for erecting stages and drying fish, which seem to be well calculated for that purpose.

The Ramea Rocks are two in number, close to each other: they lie about south, distant 4 miles from the east end of Great Ramea. W. S. W. one league from these rocks, is a small bank with only 6 fathoms water on it; and nearly in the middle, between Ramea and the Penguin Islands, is the New Bank with from 14 to 50 fathoms water. To run upon the shoalest part of this bank, bring the two Ramea Rocks on with the south-western part of Ramea Islands, and between them and Columbe, and the entrance to Little River N. E. $\frac{1}{4}$ E.

OLD MAN'S BAY.—Four miles to the westward of Little River is Old Man's Bay, which runs in N. N. E. about 7 miles, and is nearly a mile wide. The water throughout the bay is very deep. About one mile and a half up the bay, on the eastern side, is a small island, called Adam's Island, behind which vessels can ride, if necessary, in 30 and 40 fathoms water; but the best anchorage is at the head, in 14 or 16 fathoms.

Old Man's Bay.

MOSQUITO HARBOR lies about half a league to the westward of Old Man's Bay, it is a snug and safe harbor, and will hold a great number of vessels in perfect security; but the entrance is so narrow, being only 48 fathoms in breadth, that it is difficult to get in or out. The land on both sides is high, and off the southern point of entrance is a large white rock, about a cable's length from which is a black rock above water, on the southern side of which is a suak rock, whereon the sea breaks. From this black rock to the entrance of the harbor, the course is about N. N. W. distant one-third of a mile. In sailing either in or out, you should give the black rock a small berth, keeping the western shore on board, and if obliged to anchor, be as quick as possible in getting a rope on shore, lest you drift on the rocks. In this harbor you will have from 18 to 30 fathoms water, with good riding every where, and plenty of both wood and water. In the narrows you will find 12 fathoms, the shores being bold to. South and easterly winds blow right in, northerly winds right out; and with westerly winds, it is commonly either quite calm or descends in irregular puffs.

Mosquito Harbor.

Fox Island Harbor is formed by an island of the same name. It lies about half a league

to the westward of Mosquito Harbor; between are several rocky islands and sunken rocks. This is a commodious harbor for small vessels, which may anchor in 8, 9, and 10 fathoms water. You may go in on either side of the island, and there is no danger but what shows itself.

White Bear Bay.

WHITE BEAR BAY lies about 2 miles to the westward of Fox Island Harbor, and N. N. E. one league from Great Ramea Island. It has several islands at its entrance. It runs in N. E. $\frac{1}{2}$ N. about 4 leagues, is near half a mile wide in the narrowest part, and has deep water close to both shores, in most parts, to the distance of 8 miles up; then the ground rises at once to 9 fathoms, whence it shoalens gradually to the head, with good anchorage. The best passage into the bay is to the eastward of all the islands. On the S. W. side of Bear Island, which is the easternmost and largest in the mouth of the bay, is a small harbor, running in about one half a mile, with from 10 to 22 fathoms of water; but there are several sunken rocks before its mouth, rendering it difficult of access. At the western entrance is a high, round, white island; and S. W. half a mile from this island is a black rock above water. The best passage into the bay, from the westward, will be to the westward of this black rock, and between White and Bear Islands. Some of the rocks are above a mile off the land.

Red Island Harbors.

RED ISLAND HARBORS.—Five or six miles to the westward of White Bear Bay, and nearly north from Ramea Columbe, are two small harbors, called Red Island Harbors, formed by Red Island, which lies close under the land. The westernmost is the largest and best, and has from 6 to 8 fathoms water, good anchorage. In going in keep the island close on board, the outer part of which is composed of steep red cliffs.

The Burgeo Isles.

The **BURGEO ISLES** are a cluster of islands extending about 5 miles along shore, and forming several snug and commodious harbors. They lie about 3 leagues N. W. by N. from Ramea Columbe. To sail into Burgeo from the eastward, the best passage is on the N. E. side of Boar Island, which is the northernmost, and lies N. N. W. from Ramea Columbe. S. E. by S. from this island, half a league, is a rock, uncovered at low water, on which the sea generally breaks. You may go on any side of this rock, the water being deep all round it. So soon as you are to the N. W. of it, keep the north side of Boar Island on board, and steer W. $\frac{1}{2}$ N. for Grandy's Cove, the north point of which is the first low point on your starboard bow; haul round that point, and anchor in the cove in 14 fathoms, and moor with a fast on shore. The best place for large ships to anchor in is betwixt Grandy's Cove and a small island lying near the west point of Boar Island, in 20 or 24 fathoms, good ground, and sheltered from all winds. To sail into Grandy's Cove, from the westward is dangerous, unless well acquainted. There are several safe passages in from the southward and eastward, between the islands, and good anchorage; and in bad weather all the sunken rocks discover themselves, and you may run in without any fear; but the islands do not afford either wood or water.

Wolf Bay.

WOLF BAY extends inward N. E. by E. one league; the entrance is E. N. E. two miles from Boar Island, and two miles to the westward of Red Island Harbor. The east point of the entrance is composed of low ragged rocks, off which is a sunken rock, at the distance of a quarter of a mile from shore, over which the sea breaks in bad weather. Near the head of the bay is tolerably good anchorage, and plenty of wood and water.

King's harbor lies round the west point of Wolf Bay, and runs in N. E. by E. three-quarters of a mile; before its mouth is a cluster of little islands. To sail in, keep the east point of these islands on board, and steer N. by W. and north for the entrance of the harbor, anchoring under the east shore, in 9 fathoms.

Ha Ha.

HA HA.—On the south side of the islands before King's Harbor, and nearly north one mile from Boar Island, is the entrance into the Ha Ha, which runs in W. N. W. one mile, and is about a quarter of a mile broad, with from 20 to 10 fathoms water, and good ground all over. Over the south point of the entrance into this harbor is a high green hill; and a cable's length and a half from the point is a sunken rock that always shows itself. Over the head of the Ha Ha is Richard's Head, a mark for running upon Ramea Shoal.

Great Barrysway.

GREAT BARRYSWAY.—About 4 miles to the westward of the Burgeo Isles is the Great Barrysway Point, which is low, white, and rocky; and E. N. E. $\frac{1}{2}$ E. half a league from this point is the west entrance into the Great Barrysway, wherein is room and depth of water for small vessels. Between the Burgeo Isles and the Great Barrysway Point are several sunken rocks, some of which are half a league from the shore.

Connoire Bay.

CONNOIRE BAY.—N. W. $\frac{1}{2}$ N. 4 leagues from the Burgeo Isles, is the east point of the Bay of Connoire. This point is so far remarkable, that it rises with an easy ascent to a moderate height, and much higher than the land within it. The west point of the bay is low and flat, and to the westward of this are several small islands. The bay runs in N. E. by N. about a league from the east point to the middle head, which lies between the two arms, and is half a league wide, with 14, 12, 10, and 8 fathoms close to both shores, good anchorage and clear ground, but open to S. W. winds. The N. E. arm affords shelter for small vessels from all winds. To sail in, keep nearest the starboard shore, and anchor before a small cove on that side, near the head of the arm, in $3\frac{1}{2}$ fathoms. Towards the head of the arm, on the north-western side, is a bank of mud and sand, upon which a vessel may run, if necessary, and receive no damage.

THE BAY OF CUTTEAU lies about 2 leagues to the westward of Connoiro. Its depth will admit small vessels only. Round the west point of Cutteau is Cinq Serf, wherein are a number of islands, which form several small snug harbors. Right off Cinq Serf, about half a league from the shore, is a low rocky island, westward of which is the safest passage into the largest harbor; keep near this rock, steering E. N. E. $\frac{1}{2}$ E. towards the south-eastern shore, until you get abreast of a small woody island; this is the easternmost except one, and lies about a quarter of a mile E. N. E. from a white rock in the middle of the channel: haul short round this island, and anchor behind it, in 7 fathoms water; here you will lie safely sheltered from all winds; or you may go further up, and anchor at its head, in 4 fathoms.

The Bay of Cutteau.

GRAND BRUIT.—Four miles to the westward of the rocky island of Cinq Serf, is the harbor of Grand Bruit, which is small but commodious, and may be known by a very high remarkable mountain over it, half a league inland, which is the highest land on all the coast; down this mountain runs a considerable brook, emptying itself by a cascade into the harbor. Before the mouth of the harbor are several little islands, the largest of which is of middling height, with three green hillocks on it. A little outside of this island is a round rock, rather high above water, called the Columbe of Great Bruit; and a quarter of a mile to the southward of this rock, is a low rock. In a direct line between the low rock and the rocky isles of Cinq Serf, half a league from the former, is a sunken rock, whereon the sea does not break in fine weather. The safest passage into Grand Bruit is to the north-eastward of this rock, and of the islands lying before the harbor, between them and the three islands, which are low, and lie under the shore; and, after you are to the northward of the sunken rock above mentioned, there is no danger but what shows itself. The harbor extends N. N. E. half a mile, and is but a quarter of a mile wide in the broadest part; but it is bold to on both sides, and has a depth of from 4 to 7 fathoms.

Grand Bruit.

BAY OF ROTTE.—To the westward of Grand Bruit, between it and La Poile Bay, lies the Bay of Rotte, wherein are a great many islands and sunken rocks. The southernmost is a remarkable high round rock, called the Columbe of Rotte, which lies N. W. by W. $8\frac{1}{2}$ leagues from the southernmost of the Burgeos. Between this island and Grand Bruit is a reef of rocks, some above and some under water, but they do not lie to the southward of the direct line between the islands. Within the Islands of Rotte there is shelter for shipping; the safest passage is to the westward of the islands, between them and Little Ireland, which lies off the east point of La Poile Bay.

Bay of Rotte.

LA POILE BAY is large and spacious, and has several commodious harbors. It may be known by the high land of Grand Bruit, which is only 5 miles to the eastward of it, and likewise by the land on the east side of the bay, which rises in remarkable high craggy hills. About $1\frac{1}{2}$ mile S. W. from its east point lies Little Ireland, a small low island, environed with sunken rocks, some of which are one-third of a mile off. North, about half a mile from Little Ireland, is a sunken rock that shows itself at low water; this is the only danger in going into the bay excepting such as lie very near the shore.

La Poile Bay.

GREAT AND LITTLE HARBORS.—Two miles within the west point of the bay, and N. $\frac{1}{2}$ W. 2 miles from Little Ireland, is Tweeds, or Great Harbor; its south point is low, and it extends inwards W. N. W. one mile; it is about $1\frac{1}{2}$ cable's length wide in the narrowest part; and the anchorage is near the head of the harbor, in 18 or 20 fathoms, clear ground, and sheltered from all winds. Half a mile to the northward of Great Harbor is Little Harbor, the north point of which, called Tooth's Head, is the first high bluff head on the west side of the bay; the harbor extends inwards W. N. W. about a mile. In sailing in, give the south point a small berth. You may anchor about half way up the harbor, in 10 fathoms water, before the stage which is on its northern side.

Great and Little Harbors.

GALLY BOY'S HARBOR lies on the east side of the bay, opposite Tooth's Head; it is small, snug, and convenient for ships bound to the westward. The north point is high and steep, with a white spot in the cliff, and near its southern point are some hillocks close to the shore. To sail in or out, keep the north side on board. You must anchor so soon as you are within the inner south point, in 9 or 10 fathoms, good ground, and sheltered from all winds. One mile to the northward of Gally Boy's Harbor, between two sandy coves on the east side of the bay, and nearly two cables' length from the shore, is a sunken rock that just uncovers at low water.

Gally Boy's Harbor.

Broad Cove is about two miles to the northward of Tooth's Head, on the same side of the bay. In this there is good anchorage, in 12 or 14 fathoms.

NORTH-EAST ARM.—About two leagues up the bay, on the eastern side, is the North-East Arm, which is a spacious, safe, and commodious harbor. In sailing in, give the low sandy point on the S. E. side a small berth, and anchor above it where convenient, in 10 fathoms water, good holding ground, sheltered from all winds, and very convenient for wood and water.

North-East Arm.

Indian Harbor and De Plate lie just within the outer west point of La Poile Bay; these are two small coves, conveniently situated for the fishery, but fit only for small vessels, who may get in at high water.

Little Ireland bears from the southernmost of the Burgeon N. W. by W. $\frac{1}{2}$ W. 9 $\frac{1}{2}$ leagues, and lies nearly 11 leagues to the eastward of Cape Ray.

Garia Bay.

GARIA BAY.—From Little Ireland to Harbor la Coue, and La Moine Bay, the course is W. N. W. $\frac{1}{2}$ W. 9 or 10 miles; between lies the Bay of Garia and several coves, fit only for small vessels; before these there are several islands and sunken rocks scattered along the shore, but none of them lie without the above course. In bad weather all the sunken rocks discover themselves. To sail into Garia Bay, you will, in coasting along shore, discover a white head; this is the south point of an island lying under the land, off the eastern point of the bay, and a little to the westward of two green hillocks on the main; bring this white point N. N. E. and steer directly towards it; keep between it and the several islands that lie to the W. S. Westward; from the white point, the course into the bay is N. by W.; barrow towards the eastern point, which is low. The Bay of Garia affords plenty of timber, large enough for building ships.

La Moine and La Coue Harbors.

LA MOINE AND LA COUE HARBORS.—The S. W. point of the entrance into Harbor la Coue, called Rose Blanche Point, (near to which are some rocks above water), is tolerably high, and the land near the shore over Harbor la Coue and La Moine Bay is much higher than any other land in the vicinity: by this they may be known. La Moine Bay extends inwards N. E. $\frac{1}{2}$ E. about 4 miles, and is one quarter of a mile broad in the narrowest part. Off the east point are some small islands, and rocks above water. In sailing in, keep the west point on board, until you have entered the bay; then edge over towards the east shore, and run up to the head of the bay, where you may anchor in 10 or 11 fathoms, good ground: here is plenty of wood and water. To sail into Harbor la Coue, which lies at the west entrance into La Moine Bay, steer in N. N. W. between a rock above water, in the mouth of the harbor, and the west shore. So soon as you are within the rock, haul to the westward, into the harbor, and anchor in 6 or 8 fathoms water, mooring with a hawser on shore; or you may steer into the arm, which runs in N. E. by E. from the harbor, and anchor in 20 fathoms, sheltered from all winds. This has been the resort of the small fishing vessels for many years.

Rose Blanche.

ROSE BLANCHE.—To the westward of Rose Blanche Point, is the harbor of the same name. It is small and snug, and the anchorage is in 9 fathoms water. The channel into the harbor is between the island lying off its western point, and Rose Blanche Point. Give the island a good berth, on account of some sunken rocks which lie on its eastern side, and keep the west side of a small island which lies close to the point, on board, anchoring within the N. E. point of this island in 9 fathoms. To enter into the N. W. part of the harbor would be dangerous, if a stranger, because of its numerous islands and rocks.

Mull race is a small cove 2 miles to the westward of Rose Blanche Point, wherein is anchorage for small vessels in 4 fathoms. Off the west point of the cove are two small islands, and several sunken rocks. The passage in is to the eastward of these.

Several miles to the westward of Rose Blanche Point are the Burnt Islands, which lie close under the shore, and are not easily to be distinguished from it. Behind these is a shelter for small vessels. Off these islands are sunken rocks, some of which are half a mile from the shore.

Conney and Otter Bays.

CONNEY AND OTTER BAYS.—Six miles, to the westward of Rose Blanche Point, are Conney Bay and Otter Bay, both of which are rendered difficult of access by several sunken rocks outside of the passage, which do not show themselves in fine weather: but when once you are safe within Otter Bay, there is good riding in 7, 8, and 9 fathoms water.

Dead Islands Harbor.

DEAD ISLANDS HARBOR.—W. N. W. $\frac{1}{2}$ W., nearly 4 leagues from Rose Blanche Point, are the Dead Islands, which lie close under the shore. In the passage to Dead Islands Harbor, between the islands and the main, is good anchorage for shipping in 6 or 8 fathoms, sheltered from all winds; but it is very dangerous of access to strangers, as there are several sunken rocks in both the east and west entrance. The eastern entrance can be known by a remarkable white spot on one of the islands. Bring this spot to bear N. by W. and steer in for it, keeping the starboard rocks on board, and leave the white spotted island on your larboard side. The western entrance may be recognized by a high point on the main, a little to the westward of the islands, on the western part of which point is a green hillock: keep this point close on board, until you get within a little round rock, near to the westernmost island, at the eastern point of entrance; then haul over to the eastward for the great island, distinguished by a high hill, and steer E. $\frac{1}{2}$ N. keeping the before mentioned little rock in sight.

Port aux Basque.

PORT AUX BASQUE.—From the Dead Isles to Port aux Basque, the course and distance are W. N. W. about 4 miles; between which lie several small islands close under the shore, and there are sunken rocks, some of which are half a mile from the shore. Port aux Basque is a small commodious harbor, which lies about 2 $\frac{1}{2}$ leagues to the eastward of Cape Ray. To fall in with it, bring the Sugar-Loaf Hill over Cape Ray, to bear N. N. W. $\frac{1}{2}$ W. or the west end of the Table Mountain N. N. W. Steer in for the land with either of these marks, and you will fall directly in with the harbor. The S. W. point,

called Point Blanche point is low and outer shoul, on mile from Point on the hill over Island. That di west rocks, the starboard hand board, in order to west shore, oppo N. called Point Blanche, is of a moderate height, and of white appearance; but the N. E. point is low and flat, and has, close to it, a black rock above water. In order to avoid the outer shoal, on which are three fathoms, and which lies E. S. E. three quarters of the mile from Point Blanche, keep the said point on board, and bring the flag-staff which is on the hill over the west side of the end of the harbor, on with the S. W. point of Road Island. That direction will lead you in the middle of the channel, between the east and west rocks, the former of which always show themselves, and these you leave on your starboard hand. Continue this course up to Road Island, and keep the west point on board, in order to avoid the Fryng-pan Rock, which stretches out from a cove on the west shore, opposite the island; and, so soon as you are above the island, haul to the E. N. E. and anchor between it and Harbor Island wherever you please, in 9 or 10 fathoms, good ground, and sheltered from all winds. This is called the Road or Outer Harbor, and is the only anchoring place for men of war, or ships drawing a great depth of water, but small vessels always lie up in the Inner Harbor. To sail into it, run in between the west shore and the S. W. end of Harbor Island, and anchor behind the said island, in 3 or 4 fathoms. In some parts of this harbor ships can lay their broadsides so near to the shore as to reach it with a plank. This place has been frequented by fishermen for many years. It is well situated for their purposes, and is capable of most excellent accommodations. One mile to the eastward of Basque is Little Bay.

GRAND BAY lies about two miles to the westward of Port aux Basque; there are several small islands and rocks in and before it, the outermost of which are not above a quarter of a mile from the shore; on these the sea generally breaks. It is only fit for small vessels.

Grand Bay.

From Port Aux Basque to Point Erangée, the bearing and distance are W. N. W. about a league, and thence to Cape Ray N. N. W. nearly $1\frac{1}{2}$ league. Point Erangée is low; off it and to the eastward of it, are some sunken rocks a mile from the shore, on which the sea breaks.

CAPE RAY is the S. W. extremity of Newfoundland; the land of the cape is very remarkable; near the shore it is low, but three miles inland is a very high table mountain, which rises almost perpendicular from the low land, and appears to be quite flat at the top, excepting a small hillock on the S. W. Point of it. This land may be seen, in clear weather, from the distance of 16 or 18 leagues. Close to the foot of the table mountain, between it and the point of the cape, is a high round hill, resembling a sugar loaf, (called the Sugar Loaf of Cape Ray,) whose summit is a little lower than that of the table mountain; and to the northward of this hill, under the table mountain, are two other conical hills, resembling sugar loaves, which are not so high as the former. One or other of these sugar loaf hills are, from all points of view, seen detached from the table mountain.

Cape Ray.

There is a sandy bay between Cape Ray and Point Erangée, wherein ships may anchor with the winds from N. N. W. to East, but they should be cautious not to be surprised there with S. W. winds, which blow directly in, and cause a great sea. The ground is not the best for sailing, being fine sand. Towards the east side of this bay is a small ledge of rock a mile from shore, on which the sea does not break, in fine weather. The best place for large ships to anchor in is, to bring the point of the cape N. W. and the high white sand-hill in the bottom of the bay N. E. in 10 fathoms water. Small vessels may lie further in. Be careful not to run so far to the eastward as to bring the end of the table mountain on with the sand-hill in the bottom of the bay, by which means the ledge of rocks before mentioned will be avoided.

N. W. $\frac{1}{4}$ W. nearly one mile from the point of the cape, is a small ledge of rocks, called the Cape Rocks, whereon the sea always breaks; and, one mile to the northward of the cape, close under the land, is a low rocky island. There is a channel between the ledge and the cape, with 14 and 15 fathoms water, and also between it and the island, with 4 and 5 fathoms; but the tides, which run here with great rapidity, render it unsafe for shipping.

The soundings under 100 fathoms do not extend above a league from the land to the southward and eastward of the cape, nor to the westward and northward of it, except on a bank which lies off Port aux Basque, between 2 and 3 leagues from the land, whereon are from 70 to 100 fathoms, good fishing ground. S. E. $\frac{1}{4}$ S. about 13 leagues from Port aux Basque, in the lat. of $47^{\circ} 14'$ north, is said to be a bank, whereon are 70 fathoms.

THE TIDES.—Between Cape Chapeau Rouge and Cape Ray, in all the bays, &c. the tide generally flows till 9 o'clock, on full and change, and its perpendicular rise is about 7 or 8 feet on springs; but it must be observed, that the tides are every where greatly influenced by the winds and weather. On the coast between Cape Chapeau Rouge and St. Pierre, the current sets generally to the S. W. On the south side of Fortune Bay, it sets to the eastward, and on the north side to the westward. Between Cape La Hune and Cape Ray, the flood sets to the westward in the offing, very irregularly; but generally 2 or 3 hours after it is high water by the shore. The tide or current is inconsiderable, excepting near Cape Ray, where it is strong, and at times sets quite contrary to what might be expected from the common course of the tides, and much stronger at one time than at another. These irregularities seem to depend chiefly on the winds.

Tides.

THE WESTERN COAST OF NEWFOUNDLAND, FROM CAPE RAY TO THE STRAIT OF BELLE ISLE.

FROM Cape Ray to Cape Anguille, the course and distance are N. $\frac{1}{2}$ E. 17 or 18 miles. Cape Anguille is the northernmost point of land you can see, after passing to the westward of Cape Ray. It is high table land, and covered with wood, in the country above it. Between the high land of the two capes the coast is low, and the shore forms a bay, wherein are the great and little rivers of Cod Roy; the northernmost is the great river, which has a bar-harbor, fit to admit vessels of 8 or 10 feet draught only at high water. The shore may be approached between the two capes to half a league, there being no danger so far off. It is a good salmon fishery, and for building small vessels and boats, there being timber in abundance.

Island of Cod Roy.

ISLAND COD ROY.—The Island of Cod Roy lies $1\frac{1}{2}$ or 2 miles to the southward of Cape Anguille, close under the high land. It is a low, flat, green island, of nearly 2 miles in compass, in the shape of a horse-shoe, forming between it and the main, a small snug bar harbor for vessels of 10 or 12 feet draught. The safest entrance to it is from the southward.

Cod Roy Road.

COD ROY ROAD.—South-eastward from the island is Cod Roy Road, wherein is very good anchorage for shipping, in 8, 7, or 6 fathoms, on a clay bottom. With the south point of the island bearing about W. N. W., and the point of the bench on the inside of the island, at the south entrance into the harbor, on with a point on the main to the northward of the island, you will lie in 7 fathoms, and nearly half a mile from the shore. One league to the southward of Cod Roy Island is a high bluff point, called Stormy Point, off which a shoal stretches out a full mile. This point covers the road from the S. S. E. winds, and there is good anchorage all along the shore, between it and the island.

St. George's Bay.

ST. GEORGE'S BAY.—From Cape Anguille to Cape St. George, the course and distance are N. N. E. $\frac{1}{2}$ E. nearly 12 leagues. These two capes form the Great Bay of St. George, which extends inwards E. N. E. 18 leagues from the former, and E. S. E. 11 leagues from the latter. At the head of this Bay, on the south side, round a low point of land, is a good harbor, with excellent anchorage in 8, 10, or 12 fathoms water. The river St. George empties itself into the head of this bay, but it is not navigable for any thing but boats. On the north side of the bay, before the isthmus of Port-a-Port, is good anchorage in 7 or 8 fathoms, with northerly winds. From off this place a fishing-bank stretches two-thirds across the bay, with from 7 to 19 fathoms water on it, dark sandy bottom.

Cape St. George.

CAPE ST. GEORGE may be readily known, not only by its being the north point of the bay of St. George, but also by the steep cliffs on the north part of it, which rise perpendicularly from the sea to a considerable height; and by Red Island, which lies 5 miles to the north-eastward of the cape, and half a mile from the shore. This island is about $1\frac{1}{2}$ mile in length, and of middling height; the steep cliffs around it are of a reddish color. There is anchorage with off-shore winds under the N. E. end of the island, before a sandy cove on the main, which lies just to the northward of the steep cliffs, in 12 or 14 fathoms. You will there ride, covered from the S. W. winds by the island, and from the southerly and easterly winds by the main land, but there is no shelter whatever with winds from the N. or N. W., although this place was heretofore much resorted to by vessels in the fishing trade.

Bearings and Distances.

From abreast of Red Island, distant 4 or 5 miles, to Long Point at the entrance into the bay of Port-a-Port, the bearing and distance are E. by N. 7 or 8 leagues. From Red Island to Guernsey Island, in the mouth of the bay of Islands, E. N. E. $\frac{1}{2}$ N. nearly 16 leagues; from Red Island to Cape St. Gregory, N. E. by E. full 20 leagues; and from Red Island to Point Echin, which is the north point of Ingornachois Bay, N. E. $\frac{1}{2}$ E. 43 $\frac{1}{2}$ leagues.

Port-a-Port.

PORT-A-PORT.—The land between Red Island and the entrance into Port-a-Port is rather low, with sandy beaches, except one remarkable high hillock, called Round Head, close to the shore, about 2 leagues to the E. N. Eastward of Red Island; but up in the country over Port-a-Port are high lands; and, if you are 3 or 4 leagues off at sea, you cannot discern the long point of land which forms the bay. This bay is capacious, being above 5 miles broad at the entrance, and 4 leagues deep, running in to the South and S. Westward, with good anchorages in most parts of it. Long point is the west point of the bay; it is low and rocky, and a ledge of rocks extends from it E. N. E. nearly a mile. S. E. by E. $\frac{1}{2}$ E. 4 miles from Long Point, and half a league from the east shore, lies Fox Island, which is small, but of middling height. From the north end of this island a shoal stretches out nearly 2 miles to N. N. Eastward, called Fox's Tail; and nearly in the middle of the bay, between Fox Island and the west shore, lies the Middle Ground, on one place of which, near the S. W. end, there are not above 3 or 4 feet water. From the head

of the bay, projecting out into the middle of it, is a low point, called Middle Point, off which, extending 2 miles N. E. by N. is a shoal spit, part of which dries at low water. This Middle Point divides the bay into two parts, called East and West Bays. From the head of the East Bay, over to the Bay of St. George, the distance is a large quarter of a mile: this isthmus is very low, and has a pond in the middle of it, into which the sea frequently dashes over, especially at high tides, and with gales of wind from the southward. On the east side of it is a tolerably high mountain, rising directly from the isthmus, and flat at top: to the northward of this, and at about 5 miles distance from the isthmus, is a conspicuous valley, or hollow, hereafter to be used as a mark. N. E. by E. $\frac{1}{2}$ E. above two leagues from Long Point, and half a league from the shore, lies Shag Island, which appears at a distance like a high rock, and is easily to be distinguished from the main: and W. N. W. about a league from it lies the middle of Long Ledge, which is a narrow ledge of rocks stretching E. N. E. and W. S. W. about 4 miles: the eastern part of them is above water, and the channel into the bay of Port-a-Port, between the west end of this ledge and the reef which stretches off from the west point of the bay, is a league wide.

In sailing into Port-a-Port, if coming from the S. Westward, advance no nearer to the Long Point of the bay than $1\frac{1}{2}$ mile, until you have brought the valley, in the side of the mountain before mentioned, (on the east side of the isthmus,) over the east end of Fox Island, or to the eastward of it, which will then bear south a little easterly; you will then be clear of the Long Point Reef, and may haul into the bay with safety; but, if coming from the N. E. without the Long Ledge, or turning into the bay, in order to keep clear of the S. W. end of Long Ledge, bring the isthmus, or the foot of the mountain, (which is on the east side of the isthmus,) open to the westward of Fox Island, nearly twice the breadth of the island: and it will lead you into the bay clear of Long Ledge; and when Shag Island is brought on with the foot of the high land on the south side of Coal River, bearing then E. $\frac{1}{4}$ S. you will be within the Long Ledge: there is also a safe passage into the bay, between the Long Ledge and the main, on either side of Shag Island, and taking care to avoid a small shoal, of 24 fathoms, which lies W. by N. one mile from the island.

To sail up in the West Bay and Head Harbor, keep the western shore on board; this shore is bold to. In turning between it and the Middle Ground, stand no nearer to the middle than into 8 fathoms; but you may stand to the spit of the Middle Point into 6 or 5 fathoms. The anchorage in West Bay is in about 8 fathoms, and in Head Harbor, in about 5 fathoms. The West Road lies before a high stone beach, about 2 miles southward of Long Point, where you may lie very secure from westerly and N. W. winds, in about 10 or 12 fathoms water: this beach is steep to, and forms an excellent place for landing and drying your fish; there is a good place at the northern end of Fox's Island for the same purpose. The whole bay and the adjacent coasts abound with cod, and extensive fishing banks lie all along the coasts.

The East Road lies between Fox Island and the east shore: to sail up to it, you should keep the high bluff head, which is about a league to the E. N. E. of the island, bearing to the southward of S. E. by E. $\frac{1}{2}$ E. until the isthmus is brought to the eastward of Fox Island; you will then be within the shoal called the Fox's Tail, and may haul to the southward, and anchor any where between the island and the main, in from 10 to 18 fathoms.

To sail up the East Bay, pass between the island and the east shore, and after you are above the island, come no nearer to the main than half a mile, until you are abreast of a bluff point above the island, called Road Point, just above which is the best anchorage with N. E. winds, in about 12 fathoms water; and to sail up the East Bay between the Middle Ground and the Fox's Tail, bring the said bluff point on with the S. W. point of Fox Island; this mark will lead you up in the fairway between the two shoals; give the island a berth, and anchor as before directed, in from 8 to 12 fathoms water.

BAY OF ISLANDS.—From the Long Point at the entrance of Port-a-Port to the Bay of Islands, the bearing and distance are N. E. by E. 8 leagues. Be careful to avoid the Long Ledge; the land between is of considerable height, rising in craggy barren hills, directly from the shore. The Bay of Islands may be known by the many islands in the mouth of it, particularly the three named Guernsey Island, Tweed Island, and Pearl Island, which are nearly of equal height with the land on the main. If you are bound for Lark or York Harbors, which lie on the S. W. side of the bay, and are coming from the southward, run in between Guernsey Island and the South Head, both of which are bold to; but with southerly and S. W. winds approach not too near the South Head, lest calms and sudden gusts of wind should proceed from the high land, under which you cannot anchor with safety. There are several channels formed by the different islands, through which you may sail in or out of the bay, there being no danger but what shows itself, except a small ledge of rocks, which lie half a mile north-eastward from the northern Shag Rock, and in a line with the two Shag Rocks in one. If you bring the South Shag Rock open on either side of the North Rock, you will go clear to the eastward or westward of the ledge. The safest passage into this bay from the northward, is between the two Shag Rocks, and then between Tweed Island and Pearl Island.

Bay of Islands.

Lark Harbor LARK HARBOR.—From Guernsey Island to Tortoise Head, which is the north point of York Harbor, and the S. E. point of Lark Harbor, the course and distance are nearly S. S. W. 6 miles; Lark Harbor extends inwards W. S. W. nearly two miles, and is one third of a mile broad in the entrance, which is the narrowest part: in sailing into it with a large ship, keep the larboard shore on board, and anchor with a low point on the starboard side, bearing W. N. W., N. N. W., or N. N. E., and you will ride in 6 or 7 fathoms water, secure from all winds.

York Harbor YORK HARBOR.—From Tortoise Head into York Harbor, the course and distance are W. S. W. nearly a league; there is good turning room between the Head and Governor's Island, which lies before the harbor: but you must be careful to avoid a shoal which runs off from a low beach point on the west end of Governor's Island, called Sword Point; there is also a shoal which spits off from the next point of Governor's Island, which must also be avoided: Tortoise Head just touching Sword Point will lead clear of it; in sailing in, give Sword Point a berth, passing which, the best anchoring ground is in 10 fathoms, along a sandy beach on the main, with Tortoise Head open of Sword Point; W. and N. Westerly winds blow here with great violence.

Harbor Island lies at the entrance of the River Humber, and S. by E. $\frac{1}{2}$ E. 7 miles from Guernsey Island: at its S. W. point is Wood's Harbor, which is unfit for shipping. The River Humber, at about 5 leagues within the entrance, becomes narrow, and the stream is so rapid in some places, far about 4 leagues up, to a lake, that it is with great difficulty that even a boat can stem the current.

The North and South Arms are both long inlets, with very deep water up to their heads. On the east side of Engle Island, between the North and South Arms, is anchorage in 8, 10, or 12 fathoms water. Under the North side of Harbor Island also is good anchorage with S. W. winds: and opposite to the S. E. end of Harbor Island, on the south side of the bay, is Frenchman's Cove, wherein is good anchorage in from 20 to 12 fathoms. The Bay of Islands was formerly much frequented by vessels in the cod fishery, and stages were erected at Small Bay, which lies a little on the outside of South Head; and the large beach on Sword Point, in Governor's Island, is an excellent place for drying the fish.

From the North Shag Rock to Cape St. Gregory, the course and distance are nearly N. E. 8 miles; and thence 13 or 14 miles, on a similar bearing, will carry you to the entrance of Bonne Bay. The land near the shore from the North Shag Rock to Cape St. Gregory is low, along which lie sunken rocks, a quarter of a mile from the shore: but a very little way inland it rises into a high mountain, terminating at the top in round hills.

CAPE ST. GREGORY is high, and between it and Bonne Bay the land rises directly from the sea shore to a considerable height; it is the most northerly land you can discern when sailing along shore between Red Island and the Bay of Islands.

BONNE BAY may be known, at the distance of 4 or 5 leagues, by the land about it; all that on the S. W. side of the bay being very high and hilly, and that on the N. E. side, and thence along the sea-coast to the northward, being low and flat; but, at about one league inland is a range of mountains, which runs parallel with the sea-coast. Over the south side of the bay is a very high mountain, terminating at top in a remarkable round hill, very conspicuous when you are to the northward of the bay. This bay extends inward E. S. E. nearly 2 leagues, then branches into two arms, one of which runs in to the southward, and the other to the eastward; the southern arm affords the best anchorage; small vessels should ride just above a low woody point at the entrance into this arm, on the starboard side, before a sandy beach, in 8 or 10 fathoms water, about a cable's length from the shore; there is no other anchorage in less than 30 or 40 fathoms, excepting at the head of the arm, where there are from 25 to 20 fathoms water; in sailing into the East Arm, keep the starboard shore on board; and, a little round a point at the entrance, will be found a small cove, with good anchorage in 17 to 20 fathoms, but you must moor to the shore. There is a snug cove also close within the North Point, with anchorage in 6 or 7 fathoms water; in sailing in or out of Bonne Bay, with W. S. W. winds, come not near the weather shore, lest you should happen to be becalmed, or should meet with heavy gusts of wind, as the depth of water is too great to admit of your anchoring.

Ten miles to the northward of Bonne Bay is Martin Point, high and white, off which, about three-quarters of a mile, is a small ledge of rocks, whereon the sea breaks. Broome Point is low and white, and lies about a league to the northward of Martin Point; about half a mile W. S. W. from it lies a sunken rock that seldom shows itself; on the north side of Broome Point lies the Bay of St. Paul, wherein vessels may anchor with off-shore winds, but it is quite exposed to the sea.

Cow Head.

COW HEAD lies about 4 miles to the northward of the Bay of St. Paul: this is a promontory, which has the appearance of an island, it being joined to the main only by a very low and narrow neck of land: about three-quarters of a mile off this head lies Steering Island, which is low and rocky, and is the only island on the coast between the Bay of Islands and Point Rich. Cow Cove lies on the south side of Cow Head, and ships may lie there in from 7 to 10 fathoms, sheltered from northerly and easterly winds. Shallow

Bay lies on the north side of Cow Head, and has water sufficient for small vessels; at the N. E. side of the entrance is a cluster of rocky islands, extending E. N. E. and W. S. W. and at the W. S. W. side are two sunken rocks close to each other, which generally show themselves; they lie a cable's length from the shore, and there is a channel into the bay on either side of them. Steering Island lies right before this bay, which you may pass on either side, but come not too near its N. E. end, as there are some sunken rocks extending from it. This is considered the best situated for a fishery of all the coast, and the ground about its environs is eminently productive.

INGORNACHOIX BAY.—From Steering Island to Point Rich the course is nearly N. E. distant 50 miles; Point Rich is the northern point of Ingornachois Bay. From Shallow Bay to the southern point of Ingornachois Bay the coast is nearly in a straight line, there being all the way neither creek nor cove, where a vessel can find shelter from the sea winds, although there are a few places where they might anchor occasionally with land winds. About 6 leagues from Steering Island there is a hill, standing half a mile inland, which is commonly called Portland Bill, probably because it resembles Portland Bill in the English channel, and alters not its appearance in whatever point of view it is taken.

PORT SAUNDERS and HAWKE'S HARBOR.—These are situated within, and to the eastward of Ingornachois Bay. At the entrance lies Keppel Island, which, at a distance, will not easily be distinguished from the main land. There is a passage on both sides of the island. To sail into Port Saunders there is no impediment or danger. You will leave Keppel Island on your starboard side, and when you get about half a mile within the entrance you can anchor in 12 or 14 fathoms water; but if you are intending to run up to the head of the harbor, you must keep the larboard shore on board, in order to avoid a ledge of rocks, which lies near the mid-channel. This is considered to be the best harbor for vessels that are bound to the southward.

HAWKE'S HARBOR.—To enter this harbor vessels commonly go to the southward of Keppel Island. The starboard shore is shoal, and has a sand bank which stretches along the land, and runs out two-thirds of the passage over great part of which dries at low water. Your course in will be E. S. E. keeping nearer to Keppel Island than to the main, until the eastern end of the island, which is a low stony beach, bears N. E. by N. or N. N. E. then steer S. S. E. $\frac{1}{2}$ E. for a small island you will see, situated farther up the harbor, keeping the larboard shore well on board; run direct for this island, and when you have brought the point at the south entrance of the harbor to bear N. N. E. $\frac{1}{2}$ N. and are at the S. S. E. point of a bay on the starboard side of the harbor, you will then be beyond the shoal ground, and may anchor in 12 fathoms water; or else run within half a mile of the small island, and anchor there, which will be more convenient for both wood and water. This is the best harbor for ships bound to the northward. The land round about these harbors is generally low, and covered with wood. You may occasionally anchor outside, in the Bay of Ingornachois, according as you find the prevailing winds.

POINT RICH is the south-western point of a peninsula, which is almost surrounded by the sea, being every where of moderate height, and projecting further to seaward than any other land on this side of Newfoundland, the coast from thence, each way, taking an inward direction.

PORT AU CHOIX.—Rounding Point Rich, on its northern side, you will meet with Port au Choix, small, but yet capable of admitting a ship of burden, mooring head and stern. To sail in you should keep the starboard shore on board, and anchor just above a small island lying in the middle of the harbor. In this place, and also in Bont Cove, which lies a little to the north-eastward, there are several stages and places for drying fish.

OLD PORT AU CHOIX lies to the eastward of Bont Cove; it is a small but safe harbor, having at its entrance an island called Harbor Island, and on its western side some rocks, both above and under water. There is also another island lying E. N. E. $\frac{1}{2}$ N. distant nearly a mile from Harbor Island, about which are several rocks, some of which stretch out towards Harbor Island, and render the passage very narrow between them. There are 4, 5, 6, and 7 fathoms water between Savage Island and the main, and 4 and 5 fathoms between Savage Island Rocks and Harbor Island; and nearly the same depth between Harbor Island and the western shore. To sail into Old Port au Choix, on the western side of Harbor Island, you must keep the island close on board; but to go in on the eastern side of the island, give the north-eastern point of the island a berth, and having well entered, you may anchor any where on the larboard side of the harbor, only avoiding the starboard side, for a shoal of sand and mud runs all along it.

BAY OF ST. JOHN.—This is an open and extensive bay, bounded by Point Rich to the southward, and Point Ferrolle to the northward, having several islands within it, and some sunken rocks. The largest of these islands is St. John's, about $2\frac{1}{2}$ miles in length, and 13 broad; this lies E. N. E. distant 83 miles from Point Rich; on its south-western side is a small harbor, well calculated for the cod fishery, but too much exposed for shipping, as south westerly winds commonly drive in a heavy sea. On the south-eastern or inner side of the island, and between it and One Head Island, vessels may lie much more secure, in 14 or 16 fathoms water, and sheltered from most winds; and this is considered

Point Rich.

Port au Choix.

Old Port au Choix.

Bay of St. John.

to be the only safe anchorage in the whole bay. West from St. John's Island, one large mile, is Flat Island, having a rock above water at its southern end. The channel between St. John's and Flat Island has from 13 to 35 fathoms in it, and they are both bold to. The Twin Islands lie N. E. by N. from Flat Island, distant one league, and have no danger about them. To the westward of the Twins are several scattered rocks above water, named the Bay Islands; they have deep water around them, but no anchorage. The land at the bottom of the bay is very high, and there is the little river of Castors, the entrance to which is dangerous and shallow, therefore seldom frequented. From the northern point of this bay a rocky shoal extends all the way to Point Ferolle, stretching out 2½ miles from the shore.

Point Ferolle. POINT FEROLLE lies N. E. by E. from Point Rich, distant 22 miles; it is of moderate height, and joined to the main by a neck of land, which divides the Bay of St. John's from New Ferolle Bay, making it appear like an island, when seen from a distance; its northern shore is bold to, and this part of the coast will easily be known by the adjacent table land of St. John's, the west end of which mountain lies from the middle of Ferolle Point S. by W. and its eastern end S. E. ½ S.

New Ferolle Bay. NEW FEROLLE BAY is a small cove lying to the eastward of the point, and is quite flat all over, there being not more than 2 and 3 fathoms at any part; it is quite open to the northerly winds, has a stage on each side of it, with plenty of room for others.

St. Margaret's Bay is large, and has several islands within it; also various inlets or coves affording good anchorage, particularly on its western side, which is the best situation for ships, being most clear of danger, and convenient for wooding and watering. On its banks are spruce and fir trees in plenty, and many rivulets of fresh water. Dog Island is to the eastward of Point Ferolle full 3 miles, and only divided from the main at high water; it is higher than any land near it, which gives it the appearance, when seen from the eastward, of an island situated at some distance from the main.

Old Ferolle. OLD FEROLLE.—To the eastward of Dog Island about 5 miles is Ferolle Island. This island lies parallel to the shore, and forms the harbor of Old Ferolle, which is very good and safe. The best entrance to it is at the S. W. end of the island, passing to the southward of a small island at the entrance, which is bold to. As soon as you are within it, haul up E. N. E. and anchor under the S. W. end of Ferolle Island, in 8 or 9 fathoms, good ground, quite land-locked. There is also good anchorage any where along the inside of the island, and a good channel up to the N. E. end thereof. There are some little islands lying at the N. E. end of Ferolle Island, and on the outside are some ledges of rocks a small distance off.

Bay of St. Genevieve. BAY OF ST. GENEVIEVE.—From the north end of Ferolle Island to St. Genevieve Head, the course is E. N. E. ¼ miles, and thence to the west end of Current Island it is north-eastward about 3 miles. There are several small islands lying in and before this bay, only two of which are of any considerable extent. The afore-mentioned Current Island is the northernmost of the two, and the largest; it is of a moderate height, and when you are to the E. N. E. of it, the western point will appear bluff but not high; and when you are to the westward of it, it appears flat and white. The other, called Gooseberry Island, lies nearly a mile to the southward of it, and its west point bears from the west point of Current Island S. S. W. ¼ W. nearly a mile. Gooseberry Island has a cross on its S. W. end, from which point stretches out a ledge of rocks near half a mile to the southward. There is also a shoal about half a mile to the W. S. W. from the S. W. point of Current Island. The best channel into this bay is to the southward of these islands, between the rocks which stretch off them and a small island lying S. S. W. from them, which island lies near the south shore. In this channel, which is very narrow, there are not less than 5 fathoms at low water, and the course in is E. by S. southerly, until you come to the length of the afore-mentioned island, passing which, you should haul to the southward, and bring St. Genevieve Head between the small island and the main, in order to avoid the middle bank. You may either anchor behind the small island in 5 or 6 fathoms water, or proceed farther, with the said mark on, until the S. W. arm is open, and anchor in the middle of the bay, in 7 or 8 fathoms water. Here is wood and water to be had. There is tolerably good anchoring in most parts of the bay, but the safest place is in the S. W. arm. The entrance to it is narrow, and has only 4 fathoms at low water. In coming into the bay, if you get out of the channel on either side, you will shoalen your water immediately to 3 or 2 fathoms.

Bay of St. Barbe. BAY OF ST. BARBE.—From the west end of Current Island to St. Barbe Point it is E. by N. 2½ miles, and from St. Barbe Point to Anchor Point it is N. N. E. nearly 1½ miles. Between them lies the Bay of St. Barbe; it runs in S. by E. about 2 miles from Anchor Point. To sail in, give Anchor Point and all the east side of the bay a good berth, to avoid the sunken rocks which lie along that shore. You must be well in before you can discover the entrance into the harbor, which is but narrow; then steer south, keeping in the middle of the channel, and anchor as soon as you are within the two points, in a small cove, on the west side, in 5 fathoms water, on sand and mud, quite land-locked. Near this place branch out two arms or rivers, one called the south, the other the east; the latter has 3 fath-

The main Newfoundland Ice.—And entrance and sometimes b often suffer n not frequent effect of the cept when th the temptati

come a good way up, but the former is shoal. Between the S. W. point of the bay and west point of the harbor is a cove, wherein are sunken rocks, which lie a little without the line of the two points. In the open bay are 7, 8, or 9, fathoms; but the N. W. winds cause a heavy sea to fall in here, which renders it unsafe.

From Anchor Point to the extremity of the Seal Islands, the course is N. E. $\frac{1}{2}$ E. one league. Off Anchor Point a ledge stretches itself W. by S. about one-third of a mile. There are no other dangers between it and the Seal Islands, but what lie very near the shore.

The Seal Islands are white and rocky, and must not be approached but with care on their north and western sides, because there are some sunken rocks near them.

From the N. W. Seal Island to the N. W. extremity of Flower Ledge, it is N. N. E. near two miles. Part of this ledge appears at low water, and there are 10 fathoms close on its off side.

MISTAKEN COVE.—From the north part of Flower Ledge to Grenville Ledge, it is about $1\frac{1}{2}$ mile E. by S., and Grenville Ledge lies about two-thirds of a mile W. by N. from the eastern point of Mistaken Cove; between which and Seal Islands lie also Nameless Cove and Flower Cove, neither of which are fit for ships.

SAVAGE COVE.—Close to the eastward of Mistaken Cove is Savage Cove, which has a little island in its entrance, and is only fit for small vessels and boats.

Sandy Bay lies 2 miles eastward from Savage Cove, where small vessels may ride in 3 or 4 fathoms water, with the winds from E. to S. W.

About E. N. E. 5 large miles from Sandy Bay, is Green Island; between them, at 3 miles distant, W. $\frac{1}{2}$ S. from Green Island, is the north extremity of Double Ledge, which extends nearly two-thirds of a mile from the shore, and has only 8 or 9 feet water on it.

Green Island lies about three-fourths of a mile from the main, is two-thirds of a mile in length, very low and narrow, and agreeable in color to the name it bears. From the east end of it a ledge of rocks extends three-fourths of a mile to the eastward, on which the sea breaks in bad weather. There are 4 or 5 fathoms water in the channel between the island and the main, where ships may anchor if necessary. To go in from the westward, keep the island close on board for the deepest water, which is 4 fathoms; and going in from the eastward, keep the main on board. From this island to the opposite part of the coast of Labrador, called Castles, or Red Cliffs, which is the narrowest part of the Strait of Belle Isle, the distance is about $3\frac{1}{2}$ leagues, and they bear from each other N. N. W. and S. S. E.

BOAT HARBOR.—From Green Island to Boat's Head it is E. $\frac{1}{2}$ N. eight leagues; between there is no shelter on the coast; but to the south-eastward of Boat's Head is a cove, called Boat Harbor, where small vessels and boats may lie very secure, except with N. E. winds.

Cape Norman lies E. 4 miles from Boat's Head, and is the northernmost point of land in Newfoundland. This has been already described. (See page 36.)

TIDES.—The tides flow at the full and change of the moon as follow: at New and Old Ferrolle, till a quarter after 11 o'clock; in the Bays of Genevieve and St. Barbe, at half after 10, and at Green Island until 9. Spring tides rise 7 feet, neaps 4 feet. In the Bay of Pistolet it flows till three-quarters after 6, and in Noddy Harbor and Griquet, until a quarter after 5. Spring tides rise 5 feet, neaps about 3. Before Quirpon, in settled weather, the tide sets to the southward 9 hours out of the 12, and stronger than the northern stream. In the Strait of Belle Isle the flood, in the offing, sets to the westward two hours after it is high water on the shore; but in blowing weather the stream is subject to many alterations.

GULF OF ST. LAWRENCE.

The following directions for navigating this Gulf are taken, with some alterations as to arrangement, from those of Captain H. W. Bayfield, R. N., who has been employed in a minute survey of this Gulf for some years.

The main entrance into this Gulf is between Cape Ray, the south-western point of Newfoundland, and Cape North, the north-east point of Cape Breton Island,

Ice.—Among the difficulties of navigation may be mentioned the ice. In spring the entrance and eastern parts of the Gulf are frequently covered with it, and vessels are sometimes beset for many days. Being unfitted for contending with this danger, they often suffer from it, and are occasionally lost; but serious accidents from this cause do not frequently occur, because the ice is generally in a melting state from the powerful effect of the sun in spring. In the fall of the year accidents from ice seldom occur except when the winter commences suddenly, or when vessels linger imprudently late from the temptation of obtaining high freights.

Fogs.

Fogs.—But all danger from ice is far less than that which arises from the prevalence of fogs: they may occur at any time during the open or navigable season, but are most frequent in the early part of summer. They are rare, and never of long continuance during westerly winds, but seldom fail to accompany an easterly wind of any strength or duration. The above general observation is subject, however, to restriction, according to locality or season. Thus winds between the south and west, which are usually clear-weather winds above Anticosti, are frequently accompanied with fog in the eastern parts of the Gulf. Winds between the south and east are almost always accompanied with rain and fog in every part. E. N. E. winds, above Point de Monts, are often E. S. E. or S. E. winds in the Gulf, changed in direction by the high lands of the south coast, and have therefore in general the same foggy character. I speak of winds of considerable strength and duration, and which probably extend over great distances. Moderate and partial fine-weather winds may occur without fog at any season, and in any locality. In the early part of the navigable season, especially in the months of April and May, clear-weather N. E. winds are of frequent occurrence, and they also sometimes occur at other seasons, in every part of the Gulf and River St. Lawrence.

The fogs sometimes last several days in succession, and to a vessel either running up or beating down, during their continuance, there is no safe guide but the constant use of the deep sea lead, with a chart containing correct soundings.

The fogs, which accompany easterly gales, extend high up into the atmosphere, and cannot be looked over from any part of the rigging of a ship. They, however, are not so thick as those which occur in calms after a strong wind, and which are frequently so dense as to conceal a vessel within hull; whilst the former often, but not always, admit the land, or other objects, to be distinguished at the distance of a half a mile or more in the day time.

The dense fogs which occur in calms, or even in very light winds, often extend only to small elevations above the sea; so that it sometimes happens, that when objects are hidden at the distance of 50 yards from the deck, they can plainly be seen by a person 50 or 60 feet up the rigging. In the months of October and November the fogs and rain that accompany easterly gales are replaced by thick snow, which causes equal embarrassment to the navigator.

Winds.

Winds.—The prevailing winds, during the navigable season, are either directly up or directly down the estuary, following the course of the chains of the high lands on either side of the great valley of the St. Lawrence. Thus a S. E. wind in the Gulf becomes E. S. E. between Anticosti and the south coast, E. N. E. above Point de Monts, and N. E. above Green Island. The westerly winds do not appear to be so much guided in direction by the high lands, excepting along the south coast, where we have observed a W. S. W. wind at the island of Bic become W., W. N. W. and N. W., as we ran down along the high and curved south coast, until it became a N. N. W. wind at Cape Gaspé. These winds frequently blow strong for three or four days in succession; the westerly winds being almost always accompanied with fine, dry, clear and sunny weather; the easterly winds as frequently the contrary, cold, wet, and foggy. In the spring the easterly winds prevail, frequently blowing for several weeks in succession. As the summer advances, the westerly winds become more frequent, and the S. W. wind may be said to be the prevailing wind in summer in all parts of the river and gulf. Light south winds take place occasionally; but north winds are not common in summer, although they sometimes occur. Steady N. W. winds do not blow frequently before September, excepting for a few hours at a time, when they generally succeed easterly winds which have died away to a calm, forming the commencement of strong winds, and usually veering to the S. W. The N. W. wind is dry, with bright clear sky, flying clouds, and showers. After the autumnal equinox, winds to the northward of west become more common, and are then often strong steady winds, of considerable duration. In the months of October and November, the N. W. wind frequently blows with great violence in heavy squalls, with passing showers of hail and snow, and attended with sharp frost.

Thunder storms are not uncommon in July and August: they seldom last above an hour or two; but the wind preceeding from them is in general violent and sudden, particularly when near the mountainous part of the coast: sail should, therefore, be fully and quickly reduced on their approach.

Strong winds seldom veer quickly from one quarter of the compass to another directly or nearly contrary: in general they die away by degrees to a calm, and are succeeded by a wind in the opposite direction. I do not mean, however, by this observation, that they may not veer to the amount of several points. N. W. winds seldom or never veer round by N. and N. E. to east and S. E.; but they do frequently, by degrees, to the S. W. after becoming moderate. S. W. winds seldom veer by the N. W. and north to the eastward, but sometimes by the south to S. E. and East. Easterly winds generally decrease to a calm, and are succeeded by a wind from the opposite direction.

In the fine-weather westerly winds of summer, a fresh topgallant breeze will often decrease to a light breeze or calm at night, and spring up again from the same quarter on

the following morning: under these circumstances only may a land breeze off the north coast be looked for. I have observed the same off the south coast also, but not so decidedly or extending so far off shore. I have occasionally carried the north land wind nearly over to the south coast just before daylight, but have never observed the south land wind extend more than 5 or 6 miles off, and that very rarely. Under the same circumstances, that is with a fine-weather westerly wind going down with the sun, a S. W. land breeze will frequently be found blowing off the north coast of Anticosti at night and during the early part of the morning. If, however, the weather be not settled fair, and the wind does not fall with the sun, it will usually prove worse than useless to run a vessel close in shore at night in the hope of a breeze off the land. Such is the usual course of the winds in common seasons, in which a very heavy gale of wind will probably not be experienced from May to October, although close-reefed topsail breezes are usually common enough. Occasionally, however, there are years, the character of which is decidedly stormy. Gales of winds, of considerable strength, then follow each other in quick succession and from opposite quarters.

BAROMETER.—The marine barometer, which is at all times of great use to the navigator, becomes particularly so in such seasons: and the following remarks upon its general indications, when taken in connexion with the usual course of the winds and weather in the St. Lawrence, may, therefore, be useful. The barometer has a range from 29 to 30.5 inches in the Gulf and River of St. Lawrence during the navigable season, and its changes accompany those of the winds and weather with a considerable degree of constancy. The fluctuations of the barometric column are much greater and more frequent there than in lower latitudes; and sudden alterations, which in other climates would be alarming, may occur there without being followed by, any corresponding change either in the wind or weather. But the navigator should not be inattentive to those minor changes, as a constant attention to the instrument can alone enable him to appreciate those decisive indications of the mercury which seldom or never prove deceptive. The following remarks will apply to those well-marked changes which usually indicate the approach of a gale of considerable strength, or of a shift of wind and weather; the correct anticipation of which is often of the utmost consequence to the safety of a vessel, as well as to the length of her voyage. When, after a continuance of westerly winds and fine weather, the barometer has risen nearly to its greatest height, say some tenths above 30 inches, or begins to fall a little, an easterly wind may be soon expected. If to this notice given by the barometer be added a warm hazy atmosphere during the day, and a heavy precipitation of dew at night, with very bright twinkling stars, or a colored aurora borealis, the approach of an east wind is almost certain. If land be in sight at such a time, and appears much distorted by terrestrial refraction, or if vessels in sight have the relative proportions of their hull and sails change by the *mirage*, or present double or treble images, such appearances will render the before probable indications of the barometer certain. At the commencement the easterly wind will probably be light with fine clear weather, but this will not last above a few hours if the barometer continues to fall; on the contrary, the wind will gradually increase, and as it does so the sky will become overcast by degrees until it is completely clouded. Rain and fog will follow, and continue during the continuance of the easterly wind with little intermission, until they are dissipated by a fresh breeze from the contrary quarter.

If the fall of the barometer, during the continuance of the easterly wind, be very slow, the gale will probably continue, and not be very violent; if rapid, it will probably be of short duration, and of greater strength: at any rate, when the mercury falls towards 29 inches, a change is certainly at hand, and the gale will in general come from the N. W. The strength of this succeeding gale will be in proportion to the fall of the barometer, and to the strength of the easterly gale which preceded it. In such a case there is seldom many hours interval between the one gale and the other. The east wind generally dies away to calm, and in a very few hours, or sometimes in much less time, the N. W. gale springs up. A heavy cross sea remains for some time from the previous gale. The barometer sometimes begins to rise in the interval of calm which precedes the N. W. gale, at others at its commencement: the fog and rain cease, and the weather becomes quite clear, generally in a few hours, and sometimes almost immediately. The strength of the westerly gale is usually greatest soon after its commencement, and diminishes as the barometer rises, veering gradually to the W. and S. W. It is worthy of remark, that the circumstances just mentioned are exactly the reverse of those attending the easterly gale. The latter usually commences with clear weather and a high barometer, light at first from the S. or S. E. and gradually increasing as it veers to the eastward, with a falling barometer. To return to the westerly gale.—If, after it has veered to S. W. and become moderate, the barometer remains steady at a moderate height, fine weather may be expected. If it remains at a considerable height, but still fluctuating and unsteady, within certain limits, variable, but not heavy winds, and variable weather may be expected. If, on the contrary, it rises quickly to a great height, a repetition of the easterly gale will not be improbable. We have experienced seasons in which the barometer may be said

Barometer.

to have been no sooner blown up by one wind, than it has been blown down by another, and this stormy alternation to have continued for several months, whilst in others we have scarcely had a double-reefed topsail breeze during the whole summer.

There is in fact so great a difference in the phenomena of the weather in different seasons, that it becomes very difficult to write any thing respecting it, that shall not be liable to many exceptions. There are, however, some strongly marked cases of connexion, between the indications of the barometer and changes of the winds and weather, which, within our experience of eight or nine years, have been subject to few, I might almost say no, exceptions. The first of these cases is that most common one, which I have endeavored to describe, of an easterly gale, with a falling barometer, being always wet and foggy, and succeeded by a strong wind from the opposite quarter with a rising barometer. A second case, not of so frequent occurrence in common seasons, excepting in spring or early in summer, is the easterly wind with a rising barometer; which, although it may not be at first for a few hours, will almost always become fine and clear, and end in fine weather. A third case may be considered certain; if the barometer fall suddenly and greatly, at any time, a northerly, and most probably a N. W. gale, of great strength, may be confidently expected. It does not follow that it will be immediate, for it may be preceded by a strong gale from S. W. for a few hours, during which the barometer will seldom rise, and even, probably, continue to fall, but when the S. W. gale dies away, the northerly, or N. W. will soon succeed, with a rising barometer.

In conclusion, I may remark that as, on the one hand, a considerable fall of the barometer may occur, without being followed by a strong wind; so, on the other, a breeze of considerable strength may come on without any indication from the barometer; but not any thing that deserves the name of a gale. There has never, within our experience, occurred a gale, so heavy as to be of serious consequence to a good vessel, the approach of which has not been indicated by the barometer. But it must be remembered that a high barometer, in this climate, and under the circumstances which I have mentioned, is often indicative of an easterly gale. It is remarkable that in the gulf and estuary of the St. Lawrence, a high barometer may be considered as the forerunner of wet and foggy weather, which usually accompanies its fall; whilst a low barometer renders it equally probable that dry weather will ensue, since it often accompanies its rise. I am fully of opinion, that the marine barometer is of the greatest assistance in the navigation of the Gulf and River St. Lawrence, and that by attending constantly to its state and changes, with reference to the winds and weather which preceded them, combined with the indications afforded by the appearance of the sky, &c., those changes of the wind and weather, which are about to take place, may be anticipated with a degree of certainty sufficient, in most cases, to enable us to avoid being caught on a lee-shore, or in an unsafe anchorage, as well as to regulate our course in a voyage, in anticipation of the coming change.

CURRENTS.—It is a generally received opinion that a current sets constantly to the south-eastward out of the Gulf of St. Lawrence, between Newfoundland and Cape Breton Islands, and also that it is frequently deflected to the southward, towards the shores of the island last named, by another current from the northward, which is said to enter the gulf by the Strait of Belle Isle.

I have myself observed that a current sets out, between Cape Ray and St. Paul Island, during westerly winds and in calm weather; but it is checked by easterly winds, and I believe that it may sometimes run in a contrary direction from the same cause. Northerly winds, and perhaps also the above named current from the northward, may cause the stream to set to the southward towards Cape Breton Island. But the truth is, that winds, both present and at a distance, possess so powerful and irregular an action upon the set and strength of the currents and tides in this entrance of the gulf, that I can say nothing certain or definite respecting them.

The reality of a current inwards through the Strait of Belle Isle, is confirmed by the presence of icebergs, which it transports into the gulf every summer, against the prevailing S. W. winds, frequently carrying them as far as Mecatina, and sometimes even to the neighborhood of the east point of Anticosti. It is probable that this is a branch of the great current from Davis Strait, which is known to run along the coast of Labrador, and to transport numerous icebergs far to the southward every year. Its strength is very much increased by a prevalence of N. E. winds; at such times it runs at the rate of 2 knots through the strait, and for 30 to 40 miles further to the westward, diminishing gradually in force as it spreads out in the wider parts of the gulf. Usually, however, its rate is much less. At times, when S. W. winds prevail, it becomes very weak: and it has even been reported to me, that a current has been observed setting out of the gulf, in a contrary direction, to the N. E. for days together, but this was never observed by us during either of the three seasons which we passed there. There is, however, no doubt that this current is extremely irregular, as might be expected at the narrow outlet of a great inland sea, where winds, both within and without, must of necessity possess great influence.

After entering the gulf, it runs along the north, or Labrador coast, at the distance of 2 or 3 miles from the outer islands, leaving a narrow space inshore, in which the streams of the tides, when uninfluenced by winds, are tolerably regular. Passing outside of Mistisnoque, the islands of Grand Mecatina, and the South Maker's Lodge, it pursues a direction given to it by the trending of the coast, till it is turned gradually to the southward, by the weak current which is often found coming from the westward between Anticosti and the north coast, during westerly winds, and which is set off to the southward from Natashquan Point. The united streams continue their southern course at a rate diminishing as they become more widely spread, and which seldom exceeds half a knot: and, finally, joining the main downward current out of the St. Lawrence, of which an account will be given immediately, they all pursue a S. E. direction towards the main entrance of the gulf, between Cape Ray and the Island of St. Paul. It is this current, from the northward, which is felt by vessels crossing from off the Bird Rocks towards Anticosti; and which, together with neglecting to allow for the local attraction of the compass, has been the principal cause of masters of vessels so often finding themselves unexpectedly on the south coast. Many shipwrecks have arisen from this cause near Cape Rosier, Gaspé, Mal Bay, &c.

Both these currents, viz., that from the northward, and the main downward current of the St. Lawrence, are modified by the tides, but in a way directly contrary; for the northern current, in through the Strait of Belle Isle, is accelerated by the flood, and checked by the ebb; whilst the other is accelerated by the ebb, and checked by the flood tide. These modifying causes, viz., the tides and winds, give rise to various combinations, and consequent irregularities, in the direction and strength of these streams, which it is extremely difficult at all times to estimate and allow for correctly.

TIDES IN THE STRAIT OF BELLE ISLE.—Near the shores, on either side, there is usually a regular alternation of flood and ebb in fine weather, but it is not constant.

The flood comes from the northward along the coast of Labrador, and also from the S. E., from Cape Bauld to Cape Norman. The latter stream, I have reason to believe, is often turned off to the northward by Cape Norman; and the same thing takes place at Green Island, on the Newfoundland side, towards Greenly Island, on the opposite side of the strait. There is, moreover, at times, a stream running from the S. W. for several days together, along the west coast of Newfoundland. This stream occasionally sets from Point Ferolle obliquely across the strait towards Forteau Bay. Sometimes, and especially with N. E. winds, the current runs directly in an opposite direction, along the west coast of Newfoundland, from Point Ferolle past Point Rich. In short, there is no constancy either in the rate or set of these streams, for the winds and the irregular tides modify the set and rate of the equally irregular currents, in a manner which it is extremely difficult, if not impossible, to calculate upon with any degree of certainty. The prevalent current from the northward comes from between Belle Isle and the coast of Labrador. It is often at the temperature of the *freezing point*, bringing many icebergs into the strait, and frequently carrying them through it many miles up the gulf. Some of these bergs ground in deep water, whilst others are continually changing their positions. They are much more numerous in some seasons than in others, as I have seen 200 bergs and large pieces of ice in the strait in the month of August, in one year, whilst there were not above half a dozen to be seen in the same month of the following season.

I have observed this current from the northward and eastward, assisted by a N. E. wind, running full two miles an hour, whilst at other times it was almost insensible. It is even reported that there is sometimes a current in the opposite direction, and I believe that this report of the fishermen is correct, especially during the ebb tide, and when S. W. winds prevail in the Gulf. At the same time that this current is running to the westward, there is at times a stream of warmer water running out to the eastward on the Newfoundland side, especially during the ebb tide.

From these remarks it will plainly appear that the navigation of this strait is attended with very great danger in dark or foggy nights, during which no vessel should attempt to run through, for I have found that, with all our experience, we could not be sure of the vessel's position within 10 miles, under such circumstances. On the approach of a dark or foggy night, therefore, it would be prudent to anchor in some one of the bays on the north side of the strait, rather than to continue under way. A vessel bound in to the Gulf, and running with an easterly wind, will, however, find no place fit for that purpose until she arrives at Black Bay, and that is not a very good anchorage, for Red Bay cannot be entered by a large vessel with an easterly wind. Loup Bay is the first good anchorage under such circumstances, and there the vessel would be so far advanced in her run through the strait that it would not be worth while to stop, since she might easily clear every thing in the remaining short distance. But with a S. W. wind, at the approach of night, and appearance of a fog, a vessel bound out through the strait to the eastward, had better stand off-and-on under easy sail, tacking by her deepsea lead from the Newfoundland side till morning, if she be not further to the eastward than Point Ferolle. If she be further advanced, she had better endeavor to make Forteau Bay

Tides.

before dark, and anchor there for the night. In light winds or calms, during dark nights or foggy weather, it is better to bring up with the stream anchor any where in the strait, than to drive about with the tides, without knowing whither; but then a look-out must be kept for drifting icebergs.

Island of St. Paul.

ISLAND OF ST. PAUL.—Vessels bound to Canada, or to any of the ports in the Gulf of St. Lawrence, should endeavor to make the Island of St. Paul, which, being of considerable elevation and bold all round, may, with care and a good look out, be made at night, or even in fogs, unless the former be very dark or the latter very thick.

Lighthouse.

On this island there are two lighthouses erected; one on the northern extremity, 130 feet high, containing a fixed light. This light can be seen on any bearing, excepting between N. by E. and E. by N., when it is obscured by the hills to the southward of it. The southern light can be seen on any bearing, except between S. S. E. and W., when it is obscured by the hills to the north of it.

This island lies in the main entrance to the Gulf of St. Lawrence, between Cape Ray, at the S. W. extremity of Newfoundland, and Cape North, near the northern extremity of Cape Breton Island. From the south point of the Island of St. Paul, Cape North bears W. S. W. $\frac{1}{2}$ W. by compass,* distant 13 miles; and from the north point of the same island, Cape Ray bears E. by N. distant 41 $\frac{1}{2}$ miles. In approaching St. Paul from the S. E. with northerly winds, the current, which is at times coming from the northward, and setting towards the shore of Cape Breton, should be guarded against. The south coast of Newfoundland, eastward of Cape Ray, is broken, rocky, and dangerous. The tides and currents, being influenced by the winds, are irregular; whilst all southerly and easterly winds, and often also south-westerly winds, bring a thick fog, which is most dense near the lee-shore. On these accounts this coast should not be approached, excepting with a decided northerly wind and clear weather.

St. Paul island is 2 $\frac{1}{2}$ miles long, by 1 mile broad. Its N. E. point is a small detached islet, although it does not appear as such from the sea. This islet is separated by a very narrow channel from a peninsula, between 3 and 400 feet high; which, together with the isthmus, is so precipitous as to be hourly inaccessible. The remaining greater part of the island, which is also very steep and precipitous towards the sea, has two parallel ranges of hills, that on the Atlantic coast being the highest, and attaining an elevation of about 450 feet. A valley runs through between these hills, having two small lakes or ponds, 2 or 300 feet above the sea. These supply the principal stream on the island, which is about a fathom wide, of yellowish-brown water, well tasted and wholesome, and descending into the sea in the southern part of Trinity Cove. There are several other, but much smaller, runs of water, one of which is into Atlantic Cove. These two coves are nearly a mile from the S. W. extremity of the island, the first being on the gulf side, and the other on that which is towards the Atlantic, as its name implies. They afford the only shelter for boats, and the only good landing on the island, which is easier of ascent from them than at any other part. Off the two coves just mentioned, small fishing schooners anchor, with the wind off shore, in 10 or 12 fathoms, sand and gravel bottom, and at the distance of 2 cables' length from the rocks. In very fine weather, large vessels might venture to ride with a stream anchor, in from 25 to 30 fathoms, about half a mile off shore, but should be in constant readiness to weigh at the first sign of a change in the wind or weather. Farther off shore the water becomes extremely deep, as will be seen in the chart, so that there is little or no warning by the lead in approaching this island in foggy weather.

The irregularity of the tidal streams and currents add much to the danger arising from the fogs, which prevail in southerly, easterly, and often also with S. W. winds. During the whole of a fine calm day, at the end of June, we observed the current to set to the S. E. at the rate of one knot, past the north point of the island.

After having made St. Paul, vessels bound to Canada should endeavor, if the weather be clear, to make the Bird Rocks, the largest or south-easterlymost of which bears from the north point of St. Paul N. N. W. $\frac{1}{2}$ W. 55 miles.

There is a deep channel between St. Paul and the bank on which the Magdalens, Bryon Island, and the Bird Rocks are situated. This channel is 12 miles wide, and no soundings have been found in it with 60 fathoms of line. Twelve miles N. W. from St. Paul, on the S. E. extremity of the bank above mentioned, there are 50 fathoms of water, over a bottom of fine sand; and 13 $\frac{1}{2}$ miles from the island, on the same line of bearing, there are 35 fathoms, the bottom being the same, with the occasional addition of gravel. From this point the water shoals gradually towards the Magdalens, distant 42 miles. Following the eastern edge of the bank to the northward, inclining gradually to the N. W., regular soundings extend from 28 to 35 fathoms, over sand, stones, and broken shells; the latter depth being where the Great Bird Rock bears W. N. W.; and when the same rock bears W. S. W. $\frac{1}{2}$ W. distant 13 $\frac{1}{2}$ miles, there will be 50 fathoms, over

fine sand, on the edge of the bank, off which there is no bottom with 70 fathoms of line. At the distance of 10 miles from the rock, and on the same line of bearing, there are 43 fathoms; and at 6 miles, 33 fathoms, shoaling gradually in to 24 fathoms, within a mile of the rocks. This bank is an excellent guide up to the Bird Rocks at night, or in thick weather, which almost always accompanies easterly and southerly winds; but under such circumstances it will be safer to run along the northern edge of the bank, taking care not to come into less than 40 fathoms, than to attempt to make the Bird Rocks. When well past them by the reckoning, a course can be shaped up the gulf.

In northerly winds the weather is usually clear; and, if the ship be far enough to windward, it will be advisable to stand to the westward, and endeavor to make Entry Island, taking care to avoid Doyle Reef, and the sandy spit off the east end of the Magdalens, by not approaching the islands in that part nearer than 20 fathoms. Under the lee of these islands a smooth sea will be found, sufficient guidance by the soundings, and good shelter and excellent anchorage in Pleasant Bay.

Another advantage of following this course arises from the circumstance that the N. W. winds very generally veer to the S. W., so that, if a vessel has passed to leeward of the Magdalens with the northerly or N. W. winds on the starboard tack, the succeeding S. W. wind will enable her to stand on the opposite tack towards Cape Gaspé.

From the north point of the Island of St. Paul to the east point of the Magdalens, the course is N. W. $\frac{1}{2}$ W. distance 56 miles; and to Entry Island, N. W. by W. $\frac{1}{2}$ W. 63 miles.

From the north Bird Rock the lighthouse on the S. W. point of the Island of Anticosti bears N. 46° $13'$ W. true, or N. N. W. by compass, 134 miles; and the east point of Anticosti N. 14° $46'$ W. true, or N. $\frac{1}{2}$ E. by compass, 80 miles.

After leaving the Bank of Soundings, northward of the Bird Rocks, the water is very deep all the way until near the shores of Anticosti, there being no bottom with 80 fathoms of line, nor probably at much greater depths. In making this part of the voyage up the gulf, the frequent current from the northward, mentioned as having been one of the causes of shipwrecks in the neighborhood of Capes Rozier and Gaspé, Mal Bay, &c., should be considered. Accidents, however, from this cause can never occur if the lead be used: for upon consulting the chart, it will be seen that there are soundings to be obtained nearly all the way upon, and to the southward of, a line joining the Bird Rocks and Cape Gaspé, whilst a few miles to the northward of that line there is no bottom with 80 fathoms of line.

With a fair wind the object should be to make the lighthouse or revolving light upon the S. W. point of Anticosti; and, with westerly winds, any part of the coast of that island which can be attained. When the lighthouse on Heath Point shall be lighted it will be easy to make the east end of the island at night, if the weather be clear; and, if the weather be thick, the Bank of Soundings, which extends off it 28 miles to the south-eastward, may seem to determine the vessel's position by the lead. At the distance from the island above named there are 62 fathoms of water, shoaling gradually in towards the island, as will be seen by the chart.

In the event of a vessel being near the eastern extremity of Anticosti, and having succeeded in making the east point, or the light on Heath Point, with a S. W. wind, it will often be preferable to proceed to the northward of the island, where there is a good channel, rather than to tack and stand back to the southward and eastward. Under the lee of Anticosti she will, in this case, have a smooth sea, and often also clear weather, whilst there is a heavy swell and frequently a thick fog to windward of it. She will, moreover, avoid the current out of the St. Lawrence, which runs constantly with westerly winds between the south coast and Anticosti, and thus be able, at all times, to make way to the westward in moderate weather. At night, or in foggy weather, the Bank of Soundings off the north coast, and further westward the banks off the Mingun Islands, will safely guide her, even although the land should not be visible.

THE MAGDALEN ISLANDS.—The Magdalens are a chain of islands, assuming an irregular curved direction, the greatest length of which, from the S. W. cape of Amherst Island to the east point, is 35 miles; but if the smaller isles be included, as they evidently form a part of the Magdalen group, the whole length of the range, from the Deadman to the Great Bird Rock, will be 56 miles, in an E. N. E. direction.

There are at present upon the islands about 1100 inhabitants, the majority of whom are of French extraction, and who all inhabit Amherst, Grindstone, and Alright Islands, with the exception of about 11 or 12 families divided between Entry Island, Grosse Isle, and East Island, near the N. E. extremity of the chain. Ships may obtain limited supplies of fresh provisions, especially at Entry Island, and water most readily from Amherst Harbor, either from a spring which issues from under the Demoiselle Hill, or from a small stream which falls into Ance à la Cabane, near the S. W. cape of the island. Wood for fuel is becoming scarce near the settlements. Large spurs are not to be had, unless when they chance to be saved from wrecks, but small ones, of spruce and juniper, may be obtained. The latter, of which the inhabitants build their fishing boats and shallops

Soundings.

Lighthouse.

The Magdalen Islands

or smaller schooners, somewhat resembles larch wood; it is said to be extremely strong and durable.

When first made from sea, the Magdalens appear like several hilly islands, with channels between, but on a nearer approach, they are seen to be all connected together, with the exception of Entry Island, by a double line of sand-bars and beaches, inclosing extensive lagoons, having very narrow entrances, by which the tide finds access and egress. These sand-bars are in some parts only a few feet above the sea, whilst in others they rise into hills of blown sand of considerable elevation. They appear to be increasing, since they are generally ridges of sand with from 9 to 12 feet water parallel to, and from 50 to 100 fathoms outside the beach. There are 3 and 4 fathoms of water between these ridges and the shore, a circumstance which has often proved fatal to the crews of vessels wrecked upon these shores. These hilly islands thus disposed in a curvilinear shape, and connected together by sand-bars, inclosing lagoons, reminds one forcibly of those islands in tropical seas which are connected together by coral reefs.

In a bright sunny day of summer, the cliffs of various colors, in which different shades of red predominate, and the yellow of the sand-bars contrasted with the green pastures of the hill sides, the darker green of the spruce trees, and the blue of sea and sky, produce an effect extremely beautiful, and one which distinguishes these islands from any thing else in the Gulf of St. Lawrence. In stormy weather, the appearance is equally characteristic. Isolated hills and craggy cliffs are then dimly seen through the rain and mist which accompany an easterly gale, and appear joined by long ranges of breakers which almost hide the sand-bars. At such times it is dangerous to attempt making the islands, for in approaching the lower parts, the breakers would probably be the first thing seen from a vessel.

The Magdalens possess no harbor for ships, but three for small vessels, named Amherst House, and Grand Entry Harbors, which will be noticed in the following concise description of the shores of the islands, and the dangers off them.

The east point of the Magdalens is of low sand, inclosing several shallow ponds, and having several sand-hills, some of which are near its extremity, while others, of greater elevation and further to the westward, extend in a chain nearly to the N. E. Cape. These last mentioned sand-hills are inland, and on the margin of the north-eastern part of the great lagoon. The N. E. Cape is a hill on East Island, which stands at the head of Grand Entry Harbor. It is a very remarkable cape, and its isolated cliffs, being 230 feet high, can be seen over all the sand-hills and sand-bars, so that when these last are below the horizon, the N. E. Cape appears to be the eastern extremity of the chain.

Long Spit.

LONG SPIT is a ridge of sand, with from 2 to 3 fathoms of water, which extends off the east point S. E. $\frac{1}{4}$ S. rather more than $\frac{1}{4}$ mile, and for $\frac{1}{4}$ mile further in the same direction, the depth is from 4 to 6 fathoms. To clear this spit observe the following remarks and directions. The southern part of Coffin Island is a peninsula, forming the southern shore of the Oyster Pond, and connected to the remainder of the island by a low neck or isthmus at the west end of the point. Now the mark for the 3 fathoms extremity of the spit is the north side of this peninsula on with the Old Harry Head; and the south side of the northern part of Coffin Island (where the narrow neck joins it, as above mentioned) on with the Old Harry Head, will lead over the spit in 4 fathoms. A person with our charts before him will have little difficulty in making out these leading marks, but may, if he pleases, pass round the spit, by the lead, in 5 or 6 fathoms, taking care not to bring the Old Harry to bear to the southward of west. To know when a vessel from the eastward has passed it, observe that the line of the summit of the north cape on with the east side of the N. E. cape clears it nearly half a mile to the S. W., which mark will also be useful to a vessel approaching it from the westward. The tides set rapidly over this spit, and, together with the shoal water, cause a heavy breaking sea. It is extremely dangerous, and vessels should take care not to get becalmed near it without an anchor clear.

Doyle Reef.

DOYLE REEF.—Doyle Reef lies S. $\frac{1}{4}$ E. distant 6 $\frac{1}{2}$ miles from the East Point, and consists of pointed rocks. It is very small, being only 300 fathoms long, and 50 fathoms wide, from 6 fathoms to 6 fathoms. The least water is 3 fathoms on one spot nearly in the centre, and there are 12 and 13 fathoms all round it. The only mark for this reef is the North Cape of the Magdalens open two-thirds of its breadth to the N. E. of the North-East Cape. On the reef the angle between these marks and the western point of Coffin Island is 24° 27'.

Lying completely in the way of vessels, and very seldom showing, the sea breaking upon it only in heavy gales, Doyle Reef may justly be considered as one of the worst dangers off the Magdalens. It has been examined and laid down by us for the first time, and was previously known only to a very few persons on the Magdalens.

Old Harry Head.

OLD HARRY HEAD.—Proceeding to the south-westward from the East Point, the first headland is the Old Harry, the S. E. point of Coffin Island, bearing from the E. point W. S. W. by compass, 4 $\frac{1}{2}$ miles. Between them is a sandy bay, in which vessels may anchor, with good shelter, in all winds from W. round by N. to N. E.: but it is not a place

to be recommended, because a vessel would be there very much embayed by the shoals on either side, and might find it difficult to get out on the occurrence of a sudden shift of wind, either at night, or attended with fog.

The Old Harry Head has red sandstone cliffs of a moderate height, with a reef off it to the south-eastward one-third of a mile.

COLUMBINE SHOALS.—From the Old Harry 2½ miles S. S. W. ¼ W. and S. *Columbine Shoals.*

S. E. by S. 2 miles from the east end of the cliffs, westward of the entrance of the Oyster Pond, lies the outermost of the Columbine Shoals, a patch of rocks, with 3 fathoms at low water. Within this, and towards Coffin Island, are numerous small shoal patches and pointed rocks, on some of which there are not more than 3 feet at low water, as will be seen in the chart. These shoals are extremely dangerous, and much in the way of vessels hauling round the east point of the Magdalens with northerly winds. To clear the east side of them, the whole of the high N. E. Cape must be kept well open to the eastward of the Old Harry. There are no good marks for clearing the west side, or for leading clear outside of them, so that the only guide for the latter purpose is not to bring the East Point to bear to the eastward of N. E. and, for the former, is not to bring the west end of Coffin Island to bear to the westward of N. W. ¼ N. But although there are no good marks, an angle with a quadrant will answer the purpose as well and as easily. On the outer edge of these shoals, the angle between the Old Harry Head and the left or west extremity of Coffin Island is 77°: consequently, with these points subtending any less angle, the vessel will pass outside of the shoals. Coffin Island extends 4 miles to the westward of the Old Harry, having on its south side a lagoon with a very narrow outlet, called the Oyster Pond, and which boats can only enter in fine weather. Off the coast of Coffin Island there are several rocks, besides the Columbine Shoals, but as these are in-shore, and out of the way of vessels, it is sufficient to refer to them, and to remark, that this is a very dangerous part of the islands, which should never be approached at night or in foggy weather.

GRAND ENTRY HARBOR.—At the N. W. end of Coffin Island, and between it and the sand-bars to the westward, is the entrance of Grand Entry Harbor, which has *Grand Entry Harbor.* water enough within for large vessels, and is superior in this respect to any other in the Magdalens. But its entrance is extremely narrow, not exceeding 50 fathoms in breadth, and the narrow channel leading to it, between sandy shoals which are said to shift, extends ¼ mile to the westward. These circumstances render instructions for entering it of no avail. A native pilot should be employed, or the channel buoyed or staked, and even then the entrance should not be attempted excepting with a leading wind, flowing tide, and fine weather. The depth that can be carried in, at low water, is 10 feet. At high water, neap tides, 12 feet; and in spring tides, 13 feet. There are 28 feet water at, and immediately within, the entrance. The ebb tide runs out with great rapidity, and the flood in is also strong. There are no settlements at Grand Entry Harbor, but there are a few families in the vicinity of the N. E. Cape, who breed cattle, and are of British extraction.

Within this harbor there is a large expanse of water, from 1 to 3 fathoms deep, extending north-eastward to the southern shores of Grosse Isle, and communicating by a very narrow channel with a large shallow pond, which washes the base of the N. E. Cape, and extends to within about 3 miles of the eastern extremity of the chain. This great lagoon also extends south-westward, between a double line of sand-bars, to the eastern shores of Grindstone Island, and is, in all, 23 miles long, and from half a mile to 3 miles wide. Throughout its whole extent there is a communication for boats, at high water, perfectly sheltered from the sea. There are, at present, 3 entrances into this lagoon from the sea, namely: Grand Entry Harbor, already mentioned; another 3¼ miles to the westward, which is very shallow; and House Harbor, near its S. W. extremity, between Alright and Grindstone Islands. There were formerly others, which have been closed since the time of Des Barres, 1778; and, on the other hand, the second mentioned above, has opened since his time.

SHAG ISLAND.—Shag Island is small and low, and of sandstone, lying about a half a *Shag Island.* mile from the sand-bars, nearly midway between Coffin and Alright Islands, and out of the way of vessels.

CAPE ALRIGHT.—Cape Alright bears from the Old Harry Head, S. 72° W. 16½ *Cape Alright.* miles. It is the southern point of Alright Island, and a very remarkable headland. The cliffs, of a greyish white color, with occasional brick-red low down, are 400 feet high, at the highest part, which is about a mile to the eastward of the cape; and those to the westward of the cape, towards House Harbor, are also very high, and of the same color.

ALRIGHT SUMMIT.—Nearly a mile inland is the summit of Alright Island, 420 *Alright Summit.* feet above the sea. Between this summit and the cape there is a very remarkable hill, named Bute-Ronde. The south extremity of the cape is low, with a small reef close off it.

ALRIGHT REEF.—Alright Reef lies S. 80° E. 3½ miles from Cape Alright to the *Alright Reef.* outer edge of the reef, which is 400 fathoms long, by 300 fathoms wide. It is of white

and pointed rocks, having over them 6 feet least water. On this reef the Bute-Ronde is on with the summit of Grindstone Island. The west side of Cape Alright is on with the west side of Cape Moule; and the whole of the woody Wolf Island is just open to the westward of Shag Island. Therefore, to clear the S. W. side, keep the well marked summit of Grindstone Island open to the south-westward of Cape Alright; and to clear the south-eastern side of this reef, keep the east side of the woods of Wolf Island (seen over the sand-bars) open to the eastward of Shag Island.

The N. E. point of Entry Island bears S. $\frac{1}{2}$ E. 7 miles from Cape Alright; and the channel between them leads into Pleasant Bay, passing previously between Alright Reef and the Pearl Reef.

Pearl Reef.

PEARL REEF.—The Pearl Reef is small and dangerous, and of white pointed rocks, like most of the reefs round these islands. It is round, and about 200 fathoms in diameter, with 9 feet least water. It bears S. 41° E. $8\frac{1}{2}$ miles from Cape Alright; and N. 80° E. $4\frac{1}{2}$ miles, from the N. E. point of Entry Island. Even with a moderate swell the sea breaks heavily upon it. The marks on this reef are the Demoiselle Hill, open one quarter of a point to the northward of the cliffs of Entry Island, and exactly on with the extremity of the N. W. spit, above water, of the same island. This spit, however, can be seldom seen from the reef. The cross mark is the three high cliffs, on the S. W. side of Alright Island, nearly in one, bearing N. 44° W., when the north-westward of those cliffs will be seen over the middle one, and between it and the south-easternmost. Hence, keeping all these cliffs open will clear the reef to the westward, and the north-westernmost cliff completely shut in behind the other two will clear it to the eastward. The Demoiselle Hill, shut in behind the north side of Entry Island will clear it to the southward; and, lastly, the Demoiselle kept more than half a point open to the northward of Entry Island will clear it to the northward.

To the N. W. of Cape Alright, and distant $2\frac{1}{2}$ miles, is the entrance of House Harbor, a narrow and crooked channel, with only 6 feet at low water.

Red Cape.

RED CAPE.—From Cape Alright, S. 80° W. 5 miles, across the bay in which is the entrance of House Harbor, brings us to Red Cape, the southern point of Grindstone Island, and the north point of Pleasant Bay. The opposite point of the bay, Sandy Hook, is the east point of Amherst Island, and bears from the Red Cape S. by E. $\frac{1}{2}$ E. 6 miles. From this line to the shore of Amherst Island at the head of the bay, the distance is $4\frac{1}{2}$ miles. Between Red Cape and House Harbor is Cape Moule, of grey sandstone, off which there is a rock, with 5 feet of water; and there is another rock, with 3 feet, off the west side of Alright Island. These will be seen in the chart, and as they lie out of the way of vessels, require no further notice.

Grindstone Island.

GRINDSTONE ISLAND.—Grindstone Island is the second largest of the chain, being, in this respect, intermediate between Amherst and Alright Islands. Its summit is elevated 550 above the sea at high water.

Amherst Island.

AMHERST ISLAND.—Amherst Island, the largest and south-westernmost of the Magdalens, is connected with Grindstone Island by a double line of sand-bars, inclosing an extensive lagoon, 5 or 6 miles long, and from 1 to 3 miles wide, the southern part of which is called Busquo Harbor. This lagoon is full of sands, which dry at low water, and has 30 outlets into Pleasant Bay, the southernmost being the deepest, but having only 3 feet water over its bar at low water. The others, including three through the sand-bars of the N. W. coast, will only admit boats at high water, and when the surf is not too high.

The hills in the interior of Amherst Island rise to the height of 550 feet above the sea. Towards the south-east part of the island, and about a mile to the N. W. of Amherst Harbor, is the very remarkable conical hill, named the Demoiselle, of trap rock, and 280 feet high. The perpendicular and dark red cliffs of the Demoiselle are washed by the waters of Pleasant Bay.

Amherst Harbor.

AMHERST HARBOR.—Amherst Harbor is formed by a peninsula, presenting cliffs of grey sandstone to seaward, in the S. E. corner of Pleasant Bay. Its entrance, between this peninsula and the sands to the southward, is $2\frac{1}{2}$ miles within, or to the westward of the extremity of Sandy Hook, which is a long and narrow sandy point with sand-hills. This harbor is the easiest of access and egress of any in the Magdalens, and has, moreover, the advantage of an excellent roadstead outside, where vessels may wait their opportunity of running in. Nevertheless, its entrance is extremely narrow and rather crooked, so that, without a pilot, it would be necessary to buoy or stake the channel. The depth over the bar, which is rocky, is 7 feet at low water, and from 9 to 10 feet at high water, according as it may be neap or spring tides. Within the harbor there are from 12 to 17 feet, over a bottom of soft, black, and fetid mud, well sheltered from every wind.

Pleasant Bay.

PLEASANT BAY.—Pleasant Bay is the best roadstead in the Magdalens, and the only one where vessels can venture to lie with all winds during the three finest months of summer, June, July, and August. In those months, a gale of wind from the eastward, so heavy as to endanger a vessel with good anchors and cables, does not occur above once in

it, nearly 14

3 or 4 years. The riding, however, is often heavy and rough enough in north-east gales, and a vessel should be well moored with a whole cable on each anchor, an open hawse to leeward, and all snug aloft.

The best and most sheltered anchorage is in 4 fathoms, with the rocky point of entrance of Amherst Harbor bearing S. W. $\frac{1}{2}$ W. two-thirds of a mile, and a little more than half a mile from high water mark on the sandy beach to the southward, upon a remarkable and high sand-hill will bear S. $\frac{1}{2}$ E. A large ship should anchor further off, and should take notice that there are only from 3 to 3 $\frac{1}{2}$ fathoms in one part of the bay, as will be seen in the chart. The bottom is every where excellent for holding, and of red sandy clay.

A vessel, anchored as I have recommended, will be sheltered from E. N. E. $\frac{1}{2}$ E. round by the southward and westward to N. E. $\frac{1}{2}$ N. and will, consequently, have only 3 points completely open. Even when the wind comes right in, the sea is much lessened by passing over so much of shoal water; nevertheless, I am of opinion, that the attempt to ride out a heavy easterly gale, either before June, or after August, would be attended with great danger, and do not recommend Pleasant Bay as a pleasant place under such circumstances at any time of the year. In the northern and western parts of the bay, sandy flats extend more than a mile from the beach.

SANDY HOOK CHANNEL.—From the Sandy Hook to the N. W. point of Entry *Sandy Hook Channel.* Island, the bearing is E., by compass, 2 $\frac{1}{2}$ miles. There is an extensive flat sandy shoal running out two miles from Sandy Hook towards Entry Island, which last has also rocky shoals off its west side. Sandy Hook Channel, between them, is two-thirds of a mile wide, and 4 fathoms can be carried through it by a good pilot, but 3 $\frac{1}{2}$ fathoms is the utmost that can be safely reckoned on by a stranger. There are several rocky patches of 2 $\frac{1}{2}$ fathoms off the S. W. point of Entry Island, reaching to fully three-quarters of a mile from the shore. The ebb tide sets strongly through this channel, and over Sandy Hook Flat, so that large vessels should go round to the eastward of Entry Island rather than encounter so many difficulties. To run through Sandy Hook Channel from the sea, keep the east side of Albright Island just open to the westward of the shingle and sandy spit forming the N. W. point of Entry Island, until abreast of the S. W. point of the last named island, then haul up for the summit of Grindstone Island, looking out for the edge of the land shoal to the westward, which can generally be seen.

ENTRY ISLAND.—Entry Island is the highest of the Magdalens, its summit being *Entry Island* 580 feet above the sea at high water. Its red cliffs are magnificent and beautiful, rising, at the N. E. point, to 350 feet; and at the S. point to 400 feet of perpendicular height. Off the N. E. point there is a high rock about half a cable's length from the cliffs, and on its north side the remarkable Tower Rock of red sandstone, joined to the island, and which can be seen from the S. W. over the low N. W. point, as well as from the N. E.

Vessels occasionally anchor under Entry Island in northerly and easterly winds, but it is rough riding, by reason of the sea which rolls round the island.

The inhabitants of Entry Island raise cattle and sheep, depending more upon the sale of fresh provisions than the fisheries. Vessels may, therefore, almost always obtain supplies.

From Sandy Hook, the south coast of Amherst Island, consisting of sand-hills and beaches, with shoal water half a mile off, curves round to the westward, for 6 or 7 miles, to the entrance of a basin, which extends nearly across the island to within less than half a mile of Pleasant Bay. The Basin is now so nearly closed with sand, that boats can only enter at high water, and in the finest weather; but, formerly, the entrance was deep enough for large schooners, and it has been frequented by those vessels within the memory of the elder inhabitants.

There is good anchorage off the entrance, in from 6 to 9 fathoms, sandy bottom, and with winds from the N. W. round by north to east.

AMHERST CLIFFS.—A mile and a half to the westward of the entrance of the *Amherst Cliffs.* basin, cliffs commence and continue, except in Cabane Bay, to the west cape, which is the highest cliff of Amherst Island, its summit being 300 feet above the sea. There is a remarkable rock above water close to the shore, and about a quarter of a mile to the southward of it.

CABANE BAY.—Cabane Bay is a small bight, between the south and S. W. capes *Cabane Bay.* of Amherst Island, where vessels may safely anchor with northerly and easterly winds, and where good water may easily be obtained. The best berth is in 8 or 9 fathoms, sandy bottom, off the centre of the bay, with the south cape and Cape Percé in one, three-quarters of a mile off shore.

From the west cape, the remainder of the sea-coast of Amherst Island consists of red cliffs, without beach, but having shoal water one-third of a mile off shore, all the way to West Lake, a small pond at the S. W. end of the sand-bars, which join Amherst and Grindstone Islands. At the N. E. extremities of these sand-bars is Gull Islet, which is small, rocky, and close to the western point of Grindstone Island, and has shoal water off its west point to the distance of one-third of a mile. About 1 $\frac{1}{2}$ mile south-westward of it, nearly 1 $\frac{1}{2}$ mile off the N. W. outlet of Basquo Harbor, and with the west side of Gull

Islet and Gros Cap in one, lies a rocky shoal with 3 fathoms at low water, and having no good passage between it and the shore. Close to the N. E. of Gull Island is the Etang du Nord, a small islet affording good shelter to boats.

Hospital Rock.

HOSPITAL ROCK.—The northern shore of Grindstone Island is of red sandstone cliffs, less high than those of Amherst Island. Near their N. E. extreme lies the Hospital Rock, close to the shore, and also some rocky 3 fathom patches, more than half a mile from the shore, as will be seen in the chart.

White Horse.

WHITE HORSE.—The White Horse is the name of a very dangerous reef, lying N. 60° E. 7 miles from Deadman Islet; and due W. N. W. 5½ miles from Gull Islet. It is extremely small, being scarcely more than a cable's length in diameter; and having 10 feet least water over pointed rocks, on which the sea often breaks. On this reef the summit of Entry Island is seen over a low part of the sand-bars at the N. E. outlet of Havre Basque, but this mark cannot be easily discerned by a stranger, nor is there any other; but the bearings and distances, together with the chart, will be a sufficient guide. To those that can take a terrestrial angle with a quadrant, a matter so simple that it is astonishing that it is not more generally known and practised, the following may be of use. When on the reef the western extremity of Amherst Island and Hospital Cape (the north-eastern extremity of the cliffs of Grindstone Island) subtend an angle of 91° 30'; consequently with these points subtending a less angle by 3 or 4 degrees, the vessel will pass outside of the reef. With a greater angle, 94 or 95 degrees, she will pass inside of it, or between it and the shore.

There are irregular soundings and foul ground between this reef and the shore, but nothing less than 5 fathoms, excepting what has been already mentioned.

The Pierre de Gros Cap is another dangerous reef of rocks, nearly of the same size as the White Horse, and having 18 feet least water. This reef is seldom seen, as the sea breaks upon it only in very heavy weather. It lies N. 62° E. 6 miles, from the White Horse; due north from the west point of Etang du Nord; N. 56° W. from Hospital Cape, and 3½ miles off Cape le Trou, the nearest point of Grindstone Island. The marks on this reef are—First, the summit of Alright Island seen over the N. E. point of Grindstone Island, which is in the lagoon, and very nearly on with Hospital Cape. Secondly, the Butte du Portage, a hill of Amherst Island, situated about 1½ mile N. W. of the Demoiselle, midway or in the centre of the narrow passage between Gull Island and the west point of Etang du Nord. These marks kept open will clear the reef to the N. E. and S. W. and a vessel will pass well clear outside of it, and also of the White Horse, if Deadman Islet be not brought to bear to the westward of S. W. ½ W.

From Hospital Cape to Wolf Island, off which there is a rocky 3 fathom shoal nearly half a mile from the shore, the northern coast of the Magdalens consists merely of sand-beaches and sand-hills for a distance of 9 or 10 miles. The low sandstone cliffs of Wolf Island, which is about three-quarters of a mile long, interrupt the continuance of the sandy shore for only half a mile; the sand-beaches then recommence, and continue, with high sand-hills occasionally, 9 or 10 miles further, to the north cape. In all this part the sand-bars may be safely approached by the lead as near as 9 or 10 fathoms of depth of water.

North Cape.

NORTH CAPE.—The North Cape of the Magdalens is the northern point of Grosse Isle, and a precipice of considerable height, but not so high as the west point of the same island, which is in the great lagoon, and 300 feet above the sea.

North Cape Rocks.

NORTH CAPE ROCKS.—The North Cape Rocks, and some of which always show, lie to the westward of the cape, the outermost being 600 fathoms off shore. The west end of these rocks bears S. S. E. from the high S. W. side of Grosse Isle, and their extent to the eastward is marked by the N. E. sides of the north and N. E. capes in one. Therefore, in running down from the westward to anchor under the north cape, do not come nearer to the shore than 1 mile until the above named marks open. In this anchorage, namely, to the eastward of the north cape, vessels may ride in 8 or 9 fathoms, over sandy bottom, with all southerly winds, and will find good holding ground, and plenty of room to get under way. Water may be had in small quantities near the houses on the east side of the north cape, but there are no good watering places excepting those already mentioned.

The coast continues from the north cape, in a curved line of sand-beaches and sand-hills, for about 6 miles, which distance again brings us to the east point, and completes the description of the Magdalens.

Although I have given a general description of the appearance of the Magdalens, yet as vessels passing to the southward of them have been directed to endeavor to make Entry Island, it may be useful to add, that that Island, when first made from the eastward, will appear like a double peaked hill, sloping somewhat abruptly down to perpendicular and high cliffs on either side. The S. W. point of Amherst Island is also a steep cliff, but of less height, and as there is no land to the southward and westward of it, it cannot be mistaken. The land rises from it in undulations to the highest parts of the island. Should the weather be foggy, the soundings, as shown in the charts, will safely guide vessels pas-

sing to these which extend time been come night or in following directions.

TIDES AND the currents will not be so intelligent fishing craft agree in stating unknown cause. Nevertheless subject to occur, will be

ing to the south-eastward of the islands. The general soundings around the Magdalens, which extend off them so many miles in every direction, and which have now for the first time been correctly laid down by us, thus affording an invaluable assistance to vessels at night or in foggy weather, will be better understood from the charts than by any written directions.

TIDES AND CURRENTS.—I have now only to notice the important subject of the set of the currents or tidal streams around these islands, respecting which I can say nothing that will not be subject to exception, for they are so irregular, that the most experienced and intelligent pilots for the islands, who are also fishermen, who have passed their lives in fishing craft around them, can give no certain account of their rate and direction, but all agree in stating, that they vary in both respects, either from the effects of winds, or other unknown causes.

Nevertheless, the following observations will hold good as a general rule, and although subject to occasional interruption, the set of the tidal streams, which I am about to describe, will be found to recur with considerable constancy in fine weather.

A few miles outside of Bryon Island and the Bird Rocks, there appears to be usually a current setting to the south-eastward, out of the gulf; but the stream of flood tide flows between them and the Magdalens. The stream of flood comes from the S. E. and is divided by the east point of the Magdalens. One branch of the stream sets strongly over the Long-spit, which, with the Old Hurry Head and the shoals off it, turn it off to the south-westward towards Entry Island, leaving nearly slack water in the bay between Coffin Island and Cape Alright, and also in Pleasant Bay. The other branch, to the northward of the islands, follows the shore from East Point round to the south-west cape of Amherst Island, whence the greater part of the stream continues its course to the S. W.; whilst the remainder following the shore, runs round and along the southern coast of Amherst Island, until it meets the before-mentioned other branch of the stream from the east point setting off the east side of Entry Island; it is overcome by this other branch, and turned gradually round to join the general weak stream of flood to the westward in the offing.

EBB STREAM.—On the S. E. side of the islands, the stream of the ebb tide sets strongly out of the lagoons and out of Pleasant Bay, between the Sandy Hook and Entry Island. It is also often found running to the westward along the southern shores of Amherst Island, and right round it in like manner, but contrary in direction to the course of the flood already described. In the offing, at the same time, the stream of ebb is from the S. W. and sets over the sand-spit off Sandy Hook Point, where it meets the stream from the N. W. which has followed the north shore of the islands, round from Amherst Island to the east point. The meeting of these two streams of the ebb tide, together with the shallowness of the water, causes so heavy a breaking sea in strong easterly winds, that the fishing shallops dare not venture at times to pass the point.

The rate of either stream seldom amounts to a knot, excepting close in shore, or round the points. The ebb, however, is generally the strongest stream, and its rate is increased by westerly wind, as is that of the flood by winds from the eastward.

DEADMAN ISLET.—The Deadman bears N. 52° W. 7½ miles nearly from the west cape of the Magdalens, and is very small, being not more than 300 fathoms long, in an E. S. E. direction, and less than half that breadth. It is about 170 feet high, with steeply sloping sides, meeting at the summit like a prism, so that when seen end on, it resembles a pyramid. When seen from a distance, with its longest side presented to view, its outline very much resembles that of a body laid out for burial, from which circumstance its name is derived. It is composed principally of trap rocks, and when seen close to, on a bright sunny day, with the white surf dashing against its variously colored sides, it is a very beautiful object. It is so bold on the west side that a vessel may pass within a couple of cables' length with perfect safety, but a reef extends towards Amherst Island one-third of a mile.

About a mile to the northward of it there is a rocky fishing ground with 8 fathoms least water; and 6 miles S. S. W. ¼ W. of it, there is another with 11 fathoms. There is no danger nearer than the "White Horses," to be mentioned hereafter, and vessels may safely pass between it and Amherst Island. It is, however, much in the way of vessels passing round the west end of the Magdalens, and they should beware of it at night, or in foggy weather, for the lead will give little warning, since there is nearly as much water within half a mile of it, as at the distance of several miles.

BRYON ISLAND, which is uninhabited, is rather more than 4 miles long, in a W. by N. and E. by S. direction, with the extreme breadth of rather more than a mile. Its eastern end bears from the east point of the Magdalens, N. by E. ¼ E. 10¼ miles, but its S. W. point approaches to within 8½ miles of the north cape of these islands.

A great part of the island is wooded with dwarf spruce trees, and there is a large upland tract covered with good native grass. Water is neither plentiful nor easy to be obtained, but it may be had in small quantities by digging, and there is a spring on the north side of the narrow isthmus which joins the eastern peninsula to the remainder of the island.

Tides and Currents.

Ebb Stream.

Deadman

Bryon Island.

Its shores are every where of rock, belonging to one great formation, namely, a very ancient secondary limestone, affording in some parts excellent building stone, of which the two lighthouses have been constructed.

Streams of excellent water descend to the sea on every part of the coast. They are generally too small to admit boats, becoming rapid immediately within their entrances, and even the largest of them, Observation River, to the westward of the S. W. point, is barred with sand, excepting for short intervals of time after the spring freshets or heavy rains.

Many of these streams abound with trout, and are visited periodically by great numbers of salmon, which are taken by the 2 or 3 resident families, and salted for the Quebec market.

Anticosti is estimated to be no where higher than 700 feet above the sea. Its south coast is low and shelving, with reefs of flat limestone which dry at low water. There is, however, a range of highlands in rear of the S. W. point, and extending for some miles both to the north-westward and south-eastward of it. The north coast, for 70 or 80 miles to the westward of the east point, is bold, precipitous, and of considerable elevation. Picturesque headlands, the eastern termination of parallel ridges of table land, that rise gently with the strata from the S. W. and in unguificent cliffs of limestone, which are externally so nearly white from the effects of weathering, as to resemble chalk. Some of these cliffs are upwards of 400 feet in perpendicular height. The remainder of the north coast is low, with reefs of flat limestone, like the southern shores.

It is unusual to find an island so large as Anticosti without a good harbor. Limestone coasts are in general characterized by deep inlets and bays, peninsulated points, and detached islets and rocks, but nothing of the kind will be found here, and there is not a single detached shoal off any part of the coasts.

This island has been generally believed to be extremely dangerous. Its reefs of flat limestone, extending in some parts to 1½ mile from the shore; the want of anchorage off most parts of the coast, and above all the frequent fogs, justify this belief in part, but not in so great a degree, as to render reasonable the dread with which it seems to have been occasionally regarded, and which can only have arisen from the natural tendency to magnify dangers of which we have no precise knowledge.

The people in charge of the lighthouses and provision posts, and one man at Fox Bay, *Provision posts.* are the only resident inhabitants of the island. The provision-posts have been established by the government and legislature of Lower Canada, for the relief of the crews of vessels wrecked upon the island. Vessels are more frequently lost here in the bad weather at the close of the navigable season, than at other times, and their crews would perish from want and the rigors of a Canadian winter, if it were not for this humane provision. The first of these posts is at Ellis Bay, the second at the lighthouse at the S. W. point, the third at Shallop Creek, (sometimes called Jupiter River,) and the fourth at the lighthouse on Heath Point.*

The lighthouse on the extremity of the S. W. point, has been built of a very beautiful *Lighthouse.* greyish-white ennerinital limestone, quarried on the spot. The tower is of the usual conical form, and 75 feet high. The light, which is bright, and revolves every minute, can be seen from N. N. W. round by west and south to S. E. by E. The lantern is elevated 100 feet above the sea at high water; consequently the light can be seen from a distance not exceeding 15 miles, when the height of the observer's eye is ten feet above the sea. When the height of the eye is 50 feet, the greatest distance from which the light can be seen will be about 19½ miles, and if the eye be elevated 100 feet the light will be visible as far off as 23 miles nearly, in the average state of the refraction. Hence by ascending the rigging till the light just shows above the horizon, and then measuring the height of the eye above the sea, a very near estimate of the vessel's distance at night may be obtained. This lighthouse and attached provision post, are in charge of Lieutenant Harvey, on the half pay of the navy.

The other lighthouse, on the southern extremity of Heath Point, is of the same form, dimensions, and color as the above, and is also built of the island limestone. It has not as yet been lighted, from want of funds, but is intended to show a bright fixed light from W. N. W. round by S. to N. E. by N. The lantern will stand 100 feet above the sea.

Having given this general description of the island, I will now notice more particularly its shores, reefs and anchoring places.

EAST CAPE.—The East Cape of Anticosti is a perpendicular cliff of limestone, rising *East Cape.* to the height of 100 feet above the sea. The ridge, of which it is the south-eastern ter-

*There are direction boards erected on the shore, or nailed to trees, from which the branches have been cut off, near the beach, and on various parts of the coast. These direction boards are intended to point out to shipwrecked persons the way to the provision posts. The direction boards were placed on the following parts of the shore, as I find from Mr. Lambly's remark-book, for I have not seen them all:—1st. On the west point. 2nd. Four leagues south-eastward of Ellis Bay. 3rd. 10 leagues westward of Shallop Creek. 4th. Seven leagues eastward of Shallop Creek. And there were formerly others on Heath Point and the S. W. Point, which the lighthouses have rendered unnecessary.

Lighthouse. mination, trends to the westward inland, and the extremity of the very low land to the southward of it is Heath Point, on which is the lighthouse, bearing from the east point S. W. 4 S. 34 miles. Between the two points is Wreck Bay, which is dangerous and affords no anchorage. Off to the S. E. from the east cape a reef extends rather more than one third of a mile.

Heath Point. **HEATH POINT.**—Heath Point is of limestone, about 10 feet high, with a superstratum of peat, in which there are several ponds of dark bog water. Being so low, this point disappears below the horizon at the distance of a few miles, the lighthouse then appears like a snail off the island, and is extremely useful in making the extent of the low land to vessels, either from the eastward or westward, as well as in showing its position from the southward, from which direction it cannot be made out at night, being hidden by the high land behind, or to the northward.

The most dangerous reef off this end of the island runs out from Heath Point to the E. S. E. nearly 2 miles, at which distance there are 5 fathoms of water. Within that distance the reef is composed of large square blocks of limestone, with very irregular soundings, varying from 2 to 5 fathoms. The rocky and irregular soundings, from 5 to 7 fathoms, extend nearly 3 miles off Heath Point, so that I recommend vessels not to approach nearer, on any bearing from the point between S. E. by S. and E. by S. With the east cape bearing N. by W. the vessel will pass just outside of the shallow and irregular soundings, at about 20 fathoms of water.

Off Heath Point, to the southward and westward, the shoal water does not extend beyond three-quarters of a mile, and further off on that side there is one of the best open anchorages on the island. The best berth is in 10 fathoms, over sand and mud bottom, with the lighthouse E. by N. and Cormorant Point nothing to the westward of W. N. W. The vessel will then be 2 miles off shore, and will be sheltered from all winds from W. N. W. round by the N. to E. by N.

Cormorant Point.

CORMORANT POINT.—From Heath Point Cormorant Point bears W. by N. 6 miles; and the south point bears W. N. W. 16½ miles from Cormorant Point. In this distance the coast is low and undulating, with points of low limestone cliffs, and beaches of sand and shingle in the bays, inclosing large ponds or lagoons, into many of which the tide flows, and also small streams from the interior of the island. This part of the coast may safely be approached by the lead, as will be seen in the chart, for the reefs no where extend further off than three-quarters of a mile till we come to the South Point.

South Point.

SOUTH POINT.—The South Point is a cliff of sandy clay, resting upon limestone. It is estimated not to exceed 60 feet in height, and there is nothing remarkable in its shape; but there is no other clay cliff near it, and as it is an extreme point, there will be little difficulty in distinguishing it by the trending of the land. The reef off it to the southward, runs out nearly 1½ mile, and the sea usually breaks upon it. The light on Heath Point and Cormorant Point in one, bearing E. by S. clear this reef at the distance of 2 miles, but I fear that the light will seldom be seen up to the reef, which is distant 22 miles from it. The leading mark will nevertheless be of use to vessels between South Point and Cormorant Point.

From South Point to the lighthouse on the S. W. point, a distance of 56 miles, there is such a sameness in the character of the coast, that it is very difficult to make out one part from another.

The houses, however, of Mr. Hamilton, in charge of the provision-post at Shallop Creek, will be seen 13 miles north-westward of the south point, and at the first limestone cliff to the north-westward of those houses is Pavilion River, 24 miles from South Point. In this distance the coast is very low, and may be approached safely by the deepest lead, the soundings in moderate depths extending from 5 to 8 miles off, as will be seen in the chart. The coast begins to rise at Pavilion River, there being a high ridge close in rear of the coast all the way to the S. W. point, and beyond it for some miles. This distance of 32 miles, between Pavilion River and the S. W. Point, comprises the boldest parts of the south coast of the island, but should be very cautiously approached in foggy weather, as there is little or no warning by the lead. When far enough to the westward, the light on South-west Point bearing nothing to the westward of N. N. W. as before directed, will be a sufficient guide.

In the whole distance from South to South-west Points, the reefs no where extend further off from high water mark than one mile, and the island may therefore be safely approached to within 2 miles.

Salt Lake Bay.

SALT LAKE BAY.—Eleven miles south-eastward of South-west Point, is Salt Lake Bay, which has fine sandy beaches, inclosing lagoons or ponds, into which the tide flows. Off the centre of this bay, and with its N. W. point bearing N. by E. 4 E. distant 1½ mile, there is very indifferent anchorage, in 7 fathoms, over sandy bottom. Vessels should be careful not to anchor further to the southward and eastward, since there is some foul and rocky ground about a mile in that direction from the position which I have recommended. There are 7 fathoms, rocky bottom, marked in the chart on the spot to which I allude, and there is probably less water between it and the south-eastern point of the bay, so that no one should attempt to pass between it and the shore.

The S. W. core on its north rear of this, there is a beach on the north side the point, and perpendicular to the point, and to the W. and there are 30 fathoms, at the westward of to 200 fathoms.

There is a fathoms, over point bearing ward will be W. and small in by westerly to be trusted, case of neces

Ellis B land being On a near the head of ridges, or

The S. W. point of Anticosti is a low projecting ridge of limestone, having a small cove on its north side, which forms it into a peninsula. The land rises gradually, in the rear of this, to the summit of the ridge above mentioned. On the south side of the point there is a beach of limestone gravel on which boats may land, as well as in the cove on the north side, when the wind is off the land, and the sea smooth. On the north side of the point, and for several miles along the coast, to Observation River, the cliffs are perpendicular and washed by the sea. The lighthouse stands on the western extremity of the point, and forms a very conspicuous land-mark. A reef extends out from the point, to the W. and S. W. not more than half a mile; and 2 miles off, in the same direction, there are 30 fathoms, over rocky bottom, deepening rapidly to 65 fathoms, with sand and shells, at the distance of three miles. At the distance of 6 miles, to the southward and westward of the point, the depth is about 110 fathoms, with mud bottom, and increases to 200 fathoms nearly midway towards the south coast.

There is a bay on the north side of the point, in which vessels may anchor in 12 or 13 fathoms, over a bottom of sand, gravel, and broken shells, and with the extremity of the point bearing S. S. W. $\frac{1}{2}$ W. distant three-quarters of a mile, when the cliffs to the eastward will be at the same distance. The shelter is from N. by E. round by E. to S. by W. and small vessels may lie close under the point, but it is a dangerous state to be caught in by westerly winds, which are preceded by a heavy swell. The ground, I think, is not to be trusted, so that, altogether, I do not recommend any vessel to anchor here unless in case of necessity.

There is no anchorage from South-west Point to Ellis Bay, and as I have already given directions respecting this part of the western coast, little remains to be noticed. The reefs of flat limestone extend from it, in most parts, fully a mile; and often have 10 or 12 fathoms of water close outside of them; but vessels, with the lead going, may safely stand in as near as 2 miles, or, which will be safer than an estimated distance, had better tack in 17 fathoms.

OBSERVATION RIVER.—Observation River, $\frac{5}{8}$ miles northward of South-west Point, is the largest stream on the island, having 5 or 6 feet of water in the entrance after the melting of the snows in the spring of the year, but soon becomes barred with sand by the S. W. gales. It becomes shoal and rapid immediately within, though it has a course from the eastward of many leagues. Its source does not appear to be known to the people of the island. Immediately to the northward of this river there are very conspicuous and high sandy cliffs. The St. Mary Cliffs, 21 miles from South-west Point, are also of sand, less high, and less remarkable, but yet not difficult to distinguish.

BESCIE RIVER.—Bescie River is a very small stream, at the head of a small cove, affording shelter to boats, and where there is a hut, at which a hunter and fisherman occasionally resides. It is 7 miles north-westward of the St. Mary Cliffs, and 12 miles south-eastward of Ellis Bay.

ELLIS BAY.—Ellis Bay affords the only tolerably sheltered anchorage in the island. Vessels, whose draught is not too great for a depth of 3 fathoms, may safely lie there during the three finest months of summer, namely, June, July, and August; but they should moor with an open hawse to the southward. Large vessels, whose object is to remain for a few hours only, may anchor further out, and in $3\frac{1}{2}$ and 4 fathoms, but neither the ground nor the shelter will be found so good as further up the bay.

The best berth is in a line between Cape Henry and the white cliff, bearing W. S. W. $\frac{1}{2}$ W. and E. N. E. $\frac{1}{2}$ E. respectively from each other; Gamache House, N. by E. and Cape Eagle between S. S. E. $\frac{1}{2}$ E. and S. S. E. $\frac{1}{2}$ E. The vessel will then be in 3 fathoms, over muddy bottom, distant about 300 fathoms from the flats on either side, and about half a mile from those at the head of the bay. The extremities of the reefs, off Capes Henry and Eagle, will bear S. W. by S. and S. $\frac{1}{2}$ E. respectively; thus leaving $3\frac{1}{2}$ points of the compass open, but in a direction from which heavy winds are of very rare occurrence, and never last long. Moreover, when they do chance to occur, the sea is much less at the anchorage than might be expected, although very heavy in the entrance between the reefs. These reefs are of flat limestone, and dry at low water; and as the tides only rise from 4 to 7 feet, the sea always breaks upon them when there is the least swell. The reef off Cape Henry runs out nearly a mile to the southward, and that off Cape Eagle near three-quarters of a mile to the westward. The entrance between them is 600 fathoms wide, from 3 fathoms to 3 fathoms. Extensive flats project from these reefs quite round the bay, and do not entirely dry at low water, excepting in very low spring tides, but there are immense boulder stones upon them which always show. These flats occasion the landing to be very bad, excepting at high water, which is the only time that supplies of good water can be obtained from Gamache River.

Ellis Bay can be easily made out from sea, for Cape Henry is a bluff point, and the land being very low at the head of the bay, occasions the opening to show distinctly. On a nearer approach, Cape Eagle and White Cliff on the east side, and the houses near the head of the bay, will be easily recognized with the assistance of our chart; whilst two ridges, or hills, will be seen far back in the country, and to the northward and eastward.

The long line of breakers on either side, and the numerous large stones so far from the shore ahead, will present any thing but an agreeable appearance to those who may approach this bay for the first time, but there will be no danger, if the following direction be attended to. In approaching the bay from the westward, with westerly winds, run down along the outside of the reefs off Cape Henry by the lead, and in 10 fathoms, until the following leading marks come on. Namely, the west side of White Cliff on with the east side of the westernmost of two hills, far back in the country, and bearing N. E. $\frac{1}{2}$ N.; then haul up with these marks on, and they will lead you into smooth water, close under Cape Henry Reef, in 3 $\frac{1}{2}$ fathoms. Continue running in, with these marks on, until Gamache House bears N. by E.; then haul up for it, and anchor in the berth which I have previously recommended. The lead should be kept going, and the reefs on either side should not be approached nearer than three fathoms, in any part, until you arrive at the anchorage.

In running for the bay from the south-eastward, with an easterly wind, come no nearer to the west point of Cape Eagle Reef than 7 fathoms, until the east side of White Cliff comes on with the east side of the same hill as before, then haul up with this mark on till the houses bear N. E. and proceed as above directed. Take notice that the west side of White Cliff is used for the leading mark in westerly winds, and the east side in easterly winds, the intention being to keep the vessel in either case from going too near the lee side of the channel.

On the outside of Cape Henry, and continuing to the west point of Anticosti, reefs extend 1 $\frac{1}{2}$ mile from the shore; and vessels approaching it should keep the lead going, and attend to the soundings in the chart.

West Point.

WEST POINT is low and wooded, with reefs which do not extend beyond a mile from the shore, and vessels may pass it in 15 fathoms, at the distance of 1 $\frac{1}{2}$ mile.

The north coast of Anticosti, between the west and north points, is low, with reefs of flat limestone, extending one mile from the shore. There are soundings, in moderate depths, for more than one mile out from the reefs. Vessels should not go nearer than 25 fathoms. In the rear of the coast, and about half way between the west and north points, are the two hills, or ridges, mentioned as forming one of the leading marks for Ellis Bay. From North Point to High Cliff, a distance of 13 miles, the coast is rather more bold and elevated, parallel ridges, in an east and west direction, and with small streams between them, beginning to abut upon the coast. North Point is wooded, of very moderate height, and without any cliff. It is so little remarkable as to be only distinguished by the change which takes place at it in the direction of the coast. High Cliff Cape is easily recognized, being the only cliff on the island that has a *talus* in front of it, or that has not its base washed by the sea at high water.

From High Cliff to White North Cliff, a distance of 26 miles, the coast is low in front, with ridges of considerable elevation a few miles back in the country. This is the most dangerous part of the north coast, for the reefs extend nearly 2 miles out from high water mark, beginning at some low cliffs 7 miles eastward of High Cliff Cape, and continue to do so for 4 or 5 miles to the south-eastward, after which they gradually diminish in breadth, till at White North Cliff they are not more than half a mile from the shore. There is, however, less warning by the deepsea lead all along this part of the coast until we approach White North Cliff, off which there are 70 fathoms, at the distance of 1 $\frac{1}{2}$ mile from the surf.

White North Cliff is very remarkable, for there is no other high cliff near it. It appears like a white patch on the land, and can be seen from a distance of 6 or 7 leagues.

Low cliffs commence 4 miles south-eastward of White North Cliff and continue to Carleton Point, under which vessels may anchor in fine weather and westerly winds, and obtain wood and water. Ten miles further to the south-eastward is Cape Observation, a bold, high, and remarkable headland. On its west side there is a magnificent range of greyish white cliffs, several hundred feet high. At the extremity of the cape, these cliffs become suddenly much lower, and then rise again to their former elevation for a short distance on the east side. As this is well described in the chart, the cape will be easily recognized. Vessels may anchor under it with westerly winds and fine weather, and obtain supplies of wood and water very conveniently. Twelve and a half miles further south-eastward, along a bold coast with high greyish white cliffs, and small bays between, brings us to Bear Head, also of greyish white cliffs, 400 feet high, and resembling in some degree Cape Observation. This last named cliff has no equally high cliffs to the westward of it, whilst Bear Head has a difference which will prevent the one from being mistaken for the other.

From the West Cliff to Bear Head the coast is extremely bold, there being in most parts 100 fathoms of water within 3 miles of the shore.

Bear Bay.

BEAR BAY is situated between Bear Head and Cape Robert, which are distant nearly 6 miles from each other, in a N. N. W. $\frac{1}{4}$ W. and S. S. E. $\frac{1}{4}$ E. direction nearly. It is by far the best roadstead on the north coast of Anticosti, and, indeed, the only one in which a large ship would like to anchor, unless she had some particular object in view.

It is sufficient and the shelter recognize this same color and cliffs 300 feet Point. Botw mer, as well a brown mud, is bert S. E. $\frac{1}{4}$ E. Bear Bay is mentioned. shingle, and Bear River, Tower Point. The cliffs in strata dipping the extremity phere so as to like appearance. From Cape coast is broke lands, termin of these bays from whence cliffs.

It is sufficiently roomy, the bottom is excellent for holding, the depth of water moderate, and the shelter extends from N. N. W. round by W. and S. to S. E. by S. In order to recognize this anchorage, it may be observed that Cape Robert consists of cliffs of the same color and elevation as those of Bear Head; and that there are two other points of cliffs 300 feet high within the bay, the south-easternmost of which is named Tower Point. Between Tower Point and Cape Robert, at a distance of one mile from the former, as well as from the western shore, and in 13 fathoms of water, over a bottom of brown mud, is the best anchorage, where Tower Point will bear N. W. $\frac{1}{2}$ W. Cape Robert S. E. $\frac{1}{2}$ S. and Bear Head N. by W. $\frac{1}{2}$ W.

Bear Bay is divided into three smaller bays by the two high points of cliff which I have mentioned. In each of these bays there are fine bold beaches of sand and limestone shingle, and streams where water may be easily obtained. But the principal stream is Bear River, which enters the southernmost of the three bays close to the S. E. side of Tower Point. It is too shallow and rapid to admit boats, but the water is clear and good. The cliffs in Bear Bay are magnificent: they are of greyish white limestone, in thin strata dipping very slightly to the southward, and are perpendicular or overhanging. At the extremities of the points the cliffs are rounded by the action of the waves and atmosphere so as to resemble towers, which resemblance is rendered stronger by the masonry-like appearance of the rock. The trees are of diminutive growth.

From Cape Robert to Table Head, a distance of 19 miles to the south-eastward, the coast is broken into small bays, with shingle beach and small streams between high headlands, terminating in perpendicular cliffs, the bases of which are washed by the sea. None of these bays afford good anchorage. Table Head is rendered remarkable by the hill from whence it derives its name, and which rises immediately from the summit of the cliffs.

FOX POINT is 4 miles further to the south-eastward, and much lower than Table Head. Fox Bay, which is a little less than 2 miles to the southward of Fox Point, is about 1 mile wide and deep, with sandy beach at its head, where there is a considerable stream issuing from a small lake. Boats may enter the outlet of this lake at high water. The house and store of M. Godin are on the N. W. side of the head of the bay, and are the scenes of the dreadful sufferings and melancholy fate of the crew and passengers of the ship *Graucius*, wrecked on this coast in November, 1828, and who all perished from want of food, after enduring the most horrible misery, before the following spring.

REEF POINT, of very low limestone, is the southern point of Fox Bay, from which a reef of flat limestone, covered with only a few feet of water, runs out to the distance of fully $1\frac{1}{2}$ mile. There is a depth of 10 fathoms close off the end of this reef, so that it is extremely dangerous. To be sure of clearing it to the north-eastward, a vessel should not be brought nearer by the lead than 17 or 18 fathoms; or if any of the land to the north-westward of Table Head be open clear of it, she will pass in safety.

NORTH REEF.—From the northern point of Fox Bay, which is a cliff of moderate height, another reef runs out more than a half a mile to the south-eastward. A point of the southern reef, before mentioned, extends to the northward in such a way as to overlap the reef off the northern point, leaving an entrance from the north-eastward between the two only a quarter of a mile wide, and 13 feet deep at low water. Inside there is a space half a mile wide, from 2 fathoms to 2 fathoms, and with 16 feet in the middle, over muddy bottom. A wind from E. by N. or E. N. E. blows right into the bay; but I am told that the sea does not roll in, but in heavy weather breaks on the reefs and in the entrance. This account I believe to be correct, and that small vessels would be perfectly safe there during the summer months.

Between Fox Bay and East Cape, the coast is of limestone cliffs, 100 feet in height, bold and free from danger. Between Cape Sand-top and East Cape vessels may anchor with all westerly winds in from 16 to 20 fathoms, over fine sand, at a distance of one mile from the shore.

Tides and currents around Anticosti are so irregular that I can add very little to that which has been already stated.

I have seen the stream run along the land for a whole day at the rate of a mile per hour, in either direction, without any apparent cause, and altogether regardless of the change of tide. At other times I have found the tides regular inshore. Under these circumstances it is evident that the set of the stream, at any time or place, cannot be reckoned upon with certainty.

However, in addition to my previous remarks, I may observe that there is usually very little stream in any direction on the north coast, from White Cliff south-eastward to Table Head. From the latter to East Cape, on the contrary, there is very frequently a stream from the northward, running at a rate varying from a half to one knot. In one or two instances I have seen this stream commence and end with the flood tide, so that I have been led to imagine a connection between them; and, if this be the case, it may arise from the circumstance of its being high water sooner on the north coast, up as high as the Esquimaux Islands, than at the east point of Anticosti. The waters having thus

attained a higher level to the northward may, in consequence, flow to the southward. On the other hand it must be mentioned that I have observed this stream during the ebb tide.

It frequently happens that, when this current from the northward is running, another from the W. N. W. comes along the south coast, in which case they meet at the reef off Heath Point, and cause a great ripple, or irregular breaking sea. When this has been observed by us, there has been usually a fresh breeze along the land on either side of the island; the wind on the north side of the island being from the N. or N. by E. whilst that along the south side was W. N. W. I have seen both these winds blowing a smart double-reefed topsail breeze at the same time, and for a whole day together, and yet never meet round the east end of the island, which is no where more than 200 feet in height. Between the two winds there was a triangular space of calm and light baffling airs; the base of this triangle extended from Heath Point to East Cape, and its apex from 5 to 8 miles to the eastward of the island. I mention this circumstance because it would be dangerous for a vessel to stand into the calm space between the two winds, where the high cross sea and constantly changing light airs might leave her at the mercy of the current, in no small danger of being set on the Heath Point Reef.

I have been for hours endeavoring to get out of this singular space, trimming sails to light airs, which did not remain steady to any one point for a minute of time; and I was finally, in spite of every effort to the contrary, carried over the reef by the current, seeing the rocks distinctly under the vessel's bottom, but fortunately drawing too little water to strike upon them.

THE SOUTH COAST OF THE GULF AND RIVER ST. LAWRENCE, FROM CAPE DESPAIR TO THE RIVER MAGDALEN.

Cape Despair.
Leander Shoal.

CAPE DESPAIR, the N. E. point of the Bay of Chaleur, consists of red sandstone cliffs, without bench, and of a moderate height above the sea.

LEANDER SHOAL bears from Cape Despair S. S. E. distant rather more than 1½ mile. It is about a quarter of a mile in diameter, from 4 fathoms to 4 fathoms, and has 16 feet least water on one spot, which, however, it is very difficult to find. It is a rocky shoal, and there is a clear passage between it and the cape. The leading marks are as follow: the line of the White Head, in one with the inner or N. W. end of Percé Rock, passes just outside of the shoal, in 7 fathoms: therefore the whole of Percé Rock, well open to the eastward of the White Head, will lead clear outside of all. From a half to the whole of the Percé Rock, shut in behind the White Head, will lead clear between the Leander and Cape Despair.

Bonaventure Island.

BONAVENTURE ISLAND has bold and perpendicular cliffs of red sandstone and conglomerate on all sides excepting the west. These cliffs, in some parts, attain an elevation of 250 feet above the sea, and their ledges and fissures are the habitation of innumerable gannets. From the west side, shoal water extends to the distance of a quarter of a mile, and there is anchorage in 15 fathoms between it and White Head; but the riding is insecure and heavy in consequence of the swell, which, in bad weather, rolls round the island. The channel between Bonaventure Island and the Percé Rock is about 1½ mile wide, and free from danger.

The Percé Rock.

THE PERCÉ ROCK is 288 feet high, precipitous all round, and bold to seaward. It is narrow, and about one-third of a mile long in a S. E. direction, being an outlier to the range of cliffs on the S. W. side of Mil Bay. It is rendered remarkable by two large holes which have been perforated through it by the waves, and through one of which a boat can pass at high water. Between this rock and the White Head is the Bay of Percé, having a reef at the distance of half a mile to the S. W. of the Percé Rock, and extending out nearly half a mile from the shore, as will be seen in the chart. Small vessels engaged in the fisheries anchor on either side of this reef with winds off the land, but it is a dangerous place, and not to be recommended for large vessels.

The town of Percé, principally inhabited by persons engaged in the fisheries, occupies the shores of the bay, and Mont Percé, or, as it is sometimes called, the Table Roulante, rises, immediately from it, to the height of 1230 feet above the sea. This mountain is very remarkable, and can be seen at sea from a distance of 40 miles. A reef connects the Percé Rock with Point Percé, and off the N. E. side of the latter small vessels anchor with westerly winds. There is generally a regular tide of flood and ebb, of about a knot, between Bonaventure Island and the main land: the flood tide running to the S. W. round Cape Despair and up the Bay of Chaleur; and the ebb in the contrary direction. Two or three miles outside, or to the eastward of Bonaventure Island, the current to the southward out of the St. Lawrence, will often be found running regardless of the tides.

Mil Bay.

MAL BAY is between 5 and 6 miles wide, by 4 miles deep, and entirely open to the S. E. On its S. W. side, and under the Percé mountains, there are magnificent cliffs 666 feet in perpendicular height above the sea. Its N. E. side has low cliffs of sandstone, with occasional beaches. A fine broad sandy beach extends right across the head of the

bay, and inclose charge their w called the Tick all round the a gale, and round an open cove close to the sho of navigation

DOUGLA on the rising in relation to

bay, and incloses a shallow lagoon. A considerable river, and several small streams, discharge their waters into the lagoon, which has an outlet in the N. W. corner of the bay, called the Tickle, admitting boats at high water and in fine weather. There is anchorage all round the shores of Mal Bay, but as a heavy sea and thick fog often precede a S. E. gale, and render it difficult for a vessel to beat out, it cannot be recommended. There is an open cove or small bay on the N. E. side, in which a vessel can be occasionally moored close to the shore, and in 3 fathoms water, but this is of no use for the general purposes of navigation.

POINT PETER is the N. E. point of Mal Bay, and the south point of Gaspé Bay; *Point Peter.*

It is of low sandstone, and thickly covered with the white houses of the fishermen. Flat Island lies about 400 fathoms off Point Peter, and is small, low, and of sandstone. There is a clear channel between the island and the point, but no good anchorage; for although vessels occasionally anchor to the northward of the island, yet the ground is so foul, that there is great danger of losing an anchor from its hooking the rocks.

From Flat Island to Cape Gaspé, across the mouth of Gaspé Bay, the course is N. N. E. 74 miles.

GASPE BAY.—The admirable Bay of Gaspé possesses advantages which may hereafter render it one of the most important places, in a maritime point of view, in these seas. It contains an excellent outer roadstead off Douglas Town; a harbor at its head, capable of holding a numerous fleet in perfect safety; and a basin where the largest ships might be hove down and refitted. *Gaspé Bay.*

The course up this bay from Flat Island to the end of Sandy-beach Point, which forms the harbor, is N. by W. $\frac{1}{2}$ W. rather more than 16 miles. From the Flower-pot Rock to the same point, the course is N. W. $\frac{1}{2}$ N. and distance nearly 114 miles.

From Point Peter the land rises in undulations to the chain of mountains about 5 miles inland from the south-western shore of the bay. These mountains, in some points, attain an elevation of 1500 feet above the level of the sea, and sweeping round Mal Bay, terminate with the Percé Mountains before mentioned. The south-western shore of Gaspé Bay, from Point Peter to Douglas Town, a distance of 12 miles, presents a succession of precipitous headlands; the cliffs, of bituminous shale and sandstones, being in their highest parts, 200 feet above the sea. Shoal water extends nearly a third of a mile from the cliffs, and vessels beating should beware of this, since the water shoals too rapidly to allow of much warning by the lead.

CAPE GASPE.—Cape Gaspé is an extremely remarkable headland, of limestone, having on its N. E. side a magnificent range of cliffs, which rise from the sea to the height of 692 feet. Flower-pot Rock lies close off the S. E. extremity of the cape, and is also a very remarkable object; the base of it being worn so small by the waves, that it appears astonishing that it can resist their force, or the pressure of the ice. It is sometimes called the "Ship's Head," at others the "Old Woman," by the fishermen, and is so bold that vessels may haul round it into the bay within the distance of a quarter of a mile. Boats may pass between it and the cape when there is no surf. The limestone of Cape Gaspé dips to the S. W. so that the cliffs within the bay are very much lower than those on the outside of the cape previously mentioned. *Cape Gaspé.*

The N. E. side of the bay is thickly covered with the houses of the fishermen for a distance of 5 miles within Cape Gaspé; the principal fishing establishments belonging, as at Percé, to Jersey merchants. There is an anchorage with good holding ground, but in not less than 17 fathoms, except within a quarter of a mile of the shore, abreast of St. George Cove, Grando Grève, and Little Gaspé. The word Cove is, however, inappropriately applied to any part of the shore between Grande Grève and the cape, for though there are fishing establishments there, there are no coves whatever. This side is bold, and free from danger in every part, with the exception of the seal rocks, which are the only detached danger in the bay.

SEAL ROCKS.—The Seal Rocks are 63 miles within Cape Gaspé, one mile S. E. by S. from Cape Brulé, and half a mile off shore. The length of this reef from 3 fathoms to 3 fathoms, and in a direction parallel to the shore, is half a mile; and its breadth a quarter of a mile. The least water is 4 feet, and there are 34 fathoms between it and the shore. When on the outer edge of the Seal Rocks, Cape Brulé is in one with the next cliffy point up the bay, bearing N. 35 W. by compass; and this only mark is sufficient for the safety of vessels beating, for the rocks are out of the way with fair winds. *Seal Rocks.*

At Grando Grève, 34 miles within Cape Gaspé, the ridge of land dips and narrows, so that there is a portage across it, leading to the settlements at Capu Rozier. On the N. W. side of the Portage a range of mountains commences, and they continue along the N. E. side of the bay, and the N. W. arm, till they are lost to view in the interior of the country. Opposite to the basin of Gaspé, they rise to the height of 1500 feet above the sea.

DOUGLAS TOWN.—Douglas Town is a village of fishermen and farmers, standing on the rising ground at the south side of the entrance of the River St. John. Its position in relation to Point Peter has been already mentioned. The water is very deep in *Douglas Town.*

outer parts of the bay, being from 30 to upwards of 60 fathoms, over mud bottom; but on approaching Douglas the depth decreases regularly to the anchorage.

Gaspé Bay.

GASPE BAY.—The roadstead off the town of Douglas is extensive, vessels may anchor in any part of it, and in any depth, from 11 to 6 fathoms, over sand and clay bottom; but the best berth is in 7 fathoms, with the entrance of the River St. John bearing N. W. by W. 1½ mile. The course and distance from Cape Gaspé to this anchorage is N. W. by W. 7¼ miles. There is, however, no shelter from winds between S. E. by E. and S. S. E. which blow directly into the bay, and roll in a heavy swell. The riding is, nevertheless, much less heavy on such occasions than might be expected; and as the ground is excellent for holding, a vessel may safely anchor here during the summer months.

Water may be obtained by ascending the River St. John to the islands, a distance of 2 miles. In the spring of the year there are often 9 feet water in the entrance of this river, which is between 2 points of sand, as will be seen in the chart; and there are 12 feet of water in the narrow channel for some distance within. At the islands the river becomes shallow and rapid.

*Cape Huld-
mand.*

CAPE HULDIMAND.—Cape Huldmand, 2 miles northward of Douglas, is a bluff point of Cliff, and the south-eastern termination of the range of hills which separates the harbor, basin, and S. W. arm, from the valley of the River St. John.

*Gaspé Har-
bor.*

GASPE HARBOR.—From the N. E. side of Cape Huldmand, Sandy-beach Point runs out to the northward, and forms the Harbor of Gaspé. It is a very low and narrow point of sand, convex to seaward, on which side the water deepens gradually from high water mark to the depth of 3 fathoms, a distance of nearly half a mile. On the inside it is as bold as a wall. Thus this spit, apparently so fragile, becomes a natural dam or break-water, upon which the heavy swell, which often rolls into the bay, can produce no effect, expending its strength in the shoal water, before reaching the beach. The water deepens immediately outside of 3 fathoms, all along the outside of Sandy-beach Point, and also off its north extremity; so that it is both dangerous and difficult to beat in or out of the harbor at night: the lead giving little or no warning.

To the northward of Sandy-beach Point, at the distance of nearly a mile, is the peninsula, which is a low sand, covered with spruce trees, and it has several whale sheds near its west point. Between the shoal water in the bay to the eastward of the peninsula, and that which extends from the extremity of Sandy-beach Point, is the narrowest part of the entrance to the harbor, which is 420 fathoms wide, from 3 fathoms to 3 fathoms, and upwards of 11 fathoms deep in the centre.

To run into the harbor of Gaspé attend to the following directions and remarks. On the N. E. side of the N. W. arm, there is a wooded point with low clay cliff, 2½ miles above the peninsula. This point appears as if it were the extreme on that side, when seen over the end of the peninsula from a vessel approaching the entrance of the harbor, and is called Point Panard. Now this point (seen over the peninsula,) in one with the inner or north side of the whale sheds before mentioned, is the mark for the northern extreme of the shoal off Sandy-beach Point. The extremity of the spruce trees is as far within the whale sheds as these last are from the sandy extremity of the peninsula. On the inner side of Sandy-beach Point, and near to its junction with the main land, stands a wooden windmill. Keep Point Panard in one with that extremity of the spruce trees on the peninsula, bearing N. 47 W. until the windmill, just mentioned, comes in one with the west or inner side of the end of Sandy-beach Point, bearing S. ½ W. when you may haul into the anchorage under the point, or steer for the basin, as may be desired.

When beating in, tack by the lead from the N. E. side of the bay, and in the board towards Sandy-beach Point, put the helm down the instant the marks for leading in, just given, come in one.

At night, when neither Sandy-beach Point nor the peninsula can be seen, it becomes rather a difficult affair to tack a vessel into the harbor. The only guide then is the lead. There should be a hand in each chain, one heaving when the other cries the soundings. Soundings should be first struck on the N. E. side of the bay, about 2 miles outside of the entrance of the harbor, and the edge of the shoal water on that side should be followed, in from 5 to 7 fathoms, until you judge by the distance run, and the change which takes place in the direction of the edge of the bank which you are running upon, that you are approaching the peninsula and have passed Sandy-beach Point, and can in consequence, venture to haul to the southward into the anchorage. To form this judgment accurately is the difficult part of the process, and as to fail in this would probably cause the loss of the vessel, if the usual heavy swell should be rolling into the bay with S. E. winds, I recommend a vessel rather to trust to her anchors off Douglas Town than to make the attempt. In case of a vessel which has lost her anchors, the directions which I have given may prove of use. Within Sandy-beach Point, that is in the harbor of Gaspé, the shelter is complete from all winds. The bottom is mud, and the depth no where exceeds 11½ fathoms.

Having now given directions to enable the seaman to take his vessel into a place of perfect security, from which he may proceed to the basin, or to any other part of the harbor, with the assistance of the chart, or of a pilot, I shall not swell these remarks by a minute description of the interior of the harbor, which the chart renders unnecessary, and which is not in any way essential to safety.

I shall merely add that the harbor is divided into the N. W. and S. W. arms. The N. W. arm has deep water for nearly 3 miles above the peninsula, and continues navigable for kaeled boats about 3 miles further, where the principal river of the harbor enters the arm between Marsh and Meadow Islands.

The entrance of the S. W. arm is about 180 fathoms wide, and between two sandy points, but the navigable channel is contracted by shoals on either side to about 60 fathoms; and 5 fathoms of water can be carried in. The deep water part of the S. W. arm, which continues for three-quarters of a mile within the entrance, is called the Basin of Gaspé. It has a depth of from 5 to 9 fathoms, over a mud bottom, and is sufficiently capacious to hold a very great number of vessels as securely as in a dock. Boats can ascend this arm by a narrow channel, between shoals, about 3 miles, as in the N. W. arm, and the navigation, for all but canoes or flat-bottomed boats, is terminated in the same manner, by shallow channels between Marsh and Meadow Islands. Above this part of the river it becomes contracted and rapid, and the water fresh. A small rivulet in the bay, on the inside of the south point of the entrance of the basin, is the most convenient watering place in the harbor. The Collector of Customs, and the principal families, reside on the shores of the basin. Most of these families, as well as those of the N. W. arm and the harbor generally, are farmers, but several of them are also engaged in the whole fishery, which they prosecute in small schooners. The cod fishery is carried on by the people of the bay outside, for the most part in connection with the Jersey merchants. The great majority of the fishermen are either from Jersey, or descended from the people of that island, whose language they retain.

There are regular but weak streams of flood and ebb in the entrances of the harbor and basin. In the bay the streams of the tides are so irregular, that I can say nothing certain respecting them. They are, however, usually almost imperceptible, excepting near the shores, and even there they are so weak as to be of little or no consequence to a vessel.

The current down the St. Lawrence runs strongly past Flower-pot Rock over towards Flat Island, especially in the ebb tide, which often increases its rate to 2 knots, and this should be remembered by vessels making the bay with a northerly wind. This current, when it meets the swell which so often prevails from the S. and S. E. causes a high, short, and breaking sea, all along the coast from above Cape Roxier to Cape Gaspé, and extending across the entrance of Gaspé Bay. When the wind is light, a vessel becomes quite unmanageable in this sea, and it is extremely dangerous to be caught in it, close to the shore, by a light breeze on the land.

In fine summer weather there is often a sea-breeze blowing right up the bay from about 9 A. M. until sunset. At such times, there is generally a light land-breeze at night down the arms, which often extends for several miles out into the bay. In the outer part of the bay, however, it will generally be found to be calm, even at times when a fresh breeze is blowing outside Cape Gaspé and Point Peter. The wind at sea on such occasions is generally from the S. W.

The soundings off this part of the coast will be seen in our charts for the first time; they will prove of very great use to vessels running up in foggy weather, and had they been previously known, might have saved many vessels. We had an opportunity of judging of this last spring, when a large ship, full of emigrants, ran stem on to Whale Island in Gaspé Bay. She was under all sail before a moderate S. E. wind, in a thick fog, and steering N. W. from which it appears that she must have been running in soundings from 20 to 40 fathoms, for at least 4 leagues, and, probably, for 3 hours before she struck. No lead was hove, the existence of the soundings being unknown. The vessel was conceived to be well to the northward, and, consequently, to be steering a safe course. One cast of the lead would have dispelled this delusion, and might have saved the vessel. Let this be a warning to seamen.

In the prolongation of the line of Cape Gaspé nearly, there are several rocky patches frequented by the fishermen. They all lie in the same direction from Flower-pot Rock, S. S. E. & E. The first is a small patch with 8 fathoms least water, the second has 16 fathoms, and the third 10 fathoms. Their distance from the rock are $\frac{7}{8}$, $\frac{1}{2}$, and 13 miles respectively. There is deep water and irregular soundings between them, and the last mentioned is on the banks of soundings which I have already alluded to, as lying off this coast.

The bold and high coast between Cape Gaspé and Cape Châté, a distance of 117 miles, will require only a brief notice, as it is free from dangers and destitute of harbors.

The mountains every where approach the shore, which is steep and rocky, displaying cliffs, often of great height, and without bench. After heavy rains, waterfalls, which are not to be seen at other times, descend from great heights, and small bays, with sandy

bench and rapid streams at their heads, occur occasionally; yet these features are not generally so strongly marked as to enable a stranger to make out one part of this coast from another with facility.

Cape Rozier. **CAPE ROZIER.**—Cape Rozier, which is nearly 7 miles N. $\frac{1}{2}$ E. from Cape Gaspé, is low, and of greywacke and slate rocks. The shoal water does not extend off it above one-third of a mile, but in the bay to the southward of it, at the distance of $1\frac{1}{2}$ of a mile, there is a reef which runs out half a mile from the shore. Vessels may find shelter under Cape Rozier from N. W. winds, but the ground is not very good, and the easterly swell that frequently rolls in, renders it a dangerous anchorage. There are fishing establishments on Cape Rozier, and in its vicinity.

Griffin Cove. **GRIFFIN COVE.**—Griffin Cove and River are $6\frac{1}{2}$ miles N. N. W. nearly, from Cape Rozier. A small bay here affords shelter to the boats of the fishermen, whose houses will be seen around it. There are from 2 to 3 fathoms of water in this bay, over sandy bottom. It is of no use to shipping, except to obtain supplies of water, wood, and occasionally, fresh provisions.

Great Fox River. **GREAT FOX RIVER.**—Great Fox River is $11\frac{1}{2}$ miles N. N. W. nearly, from Cape Rozier. It is a mere brook which enters a small bay about three-quarters of a mile wide, and half a mile deep. Off each point of the bay there are reefs, which diminish the breadth of the entrance to less than a quarter of a mile, and afford shelter to boats, and to very small schooners, in from 2 to $2\frac{1}{2}$ fathoms, over a bottom of fine dark sand. Round the head of the bay there is a fine sandy beach. Outside the reefs, which extend only a very short distance to seaward, there are 15, 18, and 24 fathoms, over a bottom of sand and broken shells, at the distance of a quarter, half, and one mile respectively. In fine summer weather a vessel might anchor off this place and obtain water, wood, and supplies of fresh provisions; but it is otherwise of no use to shipping. Seven families of fishermen and farmers resided here when I visited it in 1829, and had plenty of cattle, sheep, and swine.

Great Pond. **GREAT POND.**—Great Pond is a small creek which affords shelter only to boats, and will be known by the houses and sages of the Indians. It is 16 miles N. W. from Cape Rozier, and is a branch of the Great Fox River, and there are no more houses, along the coast, till we arrive at the River St. Ann.

Magdalen River. **MAGDALEN RIVER.**—The next place worthy of notice is the Magdalen River, which is 24 miles from Great Pond, in a N. W. $\frac{1}{2}$ W. direction, nearly. The mouth of this river is on the N. W. side of a sandy bay, and close under Cape Magdalen, its N. W. point, which is rocky, with cliffs of moderate height, and juts out a very short distance from the range of hills which forms the coast line. A reef of rocks, which dry in part at low water, extends from Cape Magdalen, about 200 fathoms to the S. E. parallel to the coast, and shelters the entrance of the river from the northerly winds. The river is 30 yards wide at the entrance, and 7 feet deep at low water; within, for a very short distance, there are 10 feet over a clean bottom of fine sand. Further up, the river becomes shallow and rapid, winding its way through a romantic valley between the mountains. Thirteen feet of water can be carried into this river at spring tides, so that it is a considerable stream, and is occasionally visited by schooners from 30 to 80 tons, which warp in when the sea is smooth and the weather fine. The bay is not deep, being merely a gentle curve with a sandy beach for about a mile to the S. E. of the river. Vessels may anchor here in 7 fathoms, over a bottom of sand, fine gravel, and broken shells, at the distance of three-quarters of a mile from the sandy beach, and from the N. W. point bearing W. N. W. The shelter is from W. N. W. round by S. W. and S. to E. S. E. but it is only a fine-weather anchorage, which may be of use to vessels wanting wood and water.

During two occasions, on which I anchored here, I observed a regular alternation of the stream of flood and ebb. The flood extended about $1\frac{1}{2}$ mile from the shore, running 1 knot, and at the line of junction with the almost constant downward current there was a strong ripple.

We extract the annexed manly testimonial to the merits of Captain Bayfield's predecessor in his arduous undertaking, from Captain Bayfield's book: (*B. & G. W. B.*)

"Our survey, from the Strait of Belle Isle westward, ended at Mistisnoque inclusive, and recommenced again at Grand Mecatina. The intermediate coast was surveyed in 1768 by Mr. Michel Laue, R. N. We examined it with his original chart in hand, and although his survey does not possess the exactness which superior instruments and an improved system of hydrography gives to modern maritime surveys, yet it is such as to confer honor on his memory, being quite sufficiently correct for the usual purposes of navigation."

We here conclude the extracts from Captain Bayfield's work.

CHALEUR BAY, TO THE GUT OF CANSO.

Chaleur Bay.

CHALEUR BAY.—Point Macquerean and Miscou Island form the entrance of Chaleur Bay, and bear from each other S. $\frac{1}{2}$ E. and N. $\frac{1}{2}$ W. distant 44 leagues. From

the entrance of Chaleur Bay to that of Ristigouche Harbor, which is at its head, the distance on a W. and N. W. by W. course, is 22 leagues. The bay is of moderate depth near the shore on both sides, and has towards the middle, from 45 to 20 fathoms water.

Nouvelle Harbor lies about 14 miles W. by S. from Point Macquereau, where are a church and several houses.

NEW CARLISLE.—The town of New Carlisle, the principal town of Chaleur Bay, *New Carlisle.* is situate in Coxé township, on the north shore, as shown in the chart.

BONAVENTURE.—In the adjoining township of Hamilton, on the west, is the vil- *Bonaventure.* lage of Bonaventure, containing a church and several houses, standing on level ground.

From Bonaventure the land turns N. W. by N. towards Cascapedia Bay, along an iron bound shore, and having several rivulets of fresh water. Within this bay is anchorage in 4, 5, and 6 fathoms water. This is in the township of Msria. The head of the bay is shoal, into which the Grand Cascapedia River empties itself.

In **RISTIGOUCHE HARBOR**, at the head of Chaleur Bay, there is good anchorage *Ristigouche Harbor.* in from 8 to 12 fathoms, land-locked from all winds; but it is so difficult of access, that it should not be attempted without a pilot. The tide flows here, on full and change, until 3 o'clock, and its vertical rise is $6\frac{1}{2}$ or 7 feet. *Tides.*

NIPISIGHT.—Vessels bound into Chaleur Bay should make for the Island of Miscou, *Nipisight.* which they can round by the lead, for it shoalens gradually from 20 to 3 fathoms, the latter depth being near Miscou Point. Should it be foggy, which in summer time is frequently the case, it will be advisable to steer from thence towards the northern shore,

when you will most probably fall in with Nouvelle Harbor; here stands a church, upon some rising ground to the northward of the town or village, which is built along the beach and lies low. Proceeding up the Bay of Chaleur from hence, you will pass round a low point and reach Carlisle; this is somewhat similar to Nouvelle, for the town stands on a low point and has a church above it; both are near the beach. Having got abreast of Carlisle, if you are bound across for Nipisight Roads or St. Peter's, then by keeping on the northern shore as thus directed, you will readily know how far you have proceeded up the bay, and may then haul across, with greater certainty, for the land, between Carquet Point and Cape Idas, which you may approach to by your lead without the least danger. The land on the northern shores of Chaleur Bay is in a high state of cultivation, when compared with the southern shores; and this, perhaps, is the principal cause why the fogs that obscure it are less heavy on the former than on the latter. From Cape Idas to Nipisight Roads, the shore is clear of all danger, and when the weather is dark or foggy, you may safely run along the land by your lead, only observing to come no nearer than 5 fathoms water, for in that depth you will be only 3 miles off the land. From abreast of Cape Idas, steer W. by S. about 9 miles; you will have from 5 to 7 fathoms all the way, clear of all danger, and get good anchorage. In opening the bay, you will see Mr. Miller's house and store standing on Carron Point, on the larboard land, and appearing like an island; there is a large grove of trees to the southward of the house, and the open space between that and Mr. Southerland's gives it that appearance; steer for the house and store on Carron Point until you get about 4 miles distant from it, then bring Mr. Miller's house on Carron Point to bear S. W. and anchor in from 7 to 5 fathoms, where you may heave your ballast; here a pilot will board you, but should no one come, and you are inclined to enter the river, your vessel having but a small draught of water, then the following directions by Captain Aldridge will prove acceptable, and lead you over both bars; and when you get inside of them you will find good anchorage to the northward of Carron Point, in 3 and 4 fathoms, good ground.

Bring Mr. Miller's house half a handspike's length off Indian Island; this has a round tuft of trees on it, and will lead you in mid-channel clear of all danger. When you arrive abreast of Carter's Point, you should open the upper part of Lathwood House; steer in that direction close to the beach, until you open the beach of Carron Point with Mr. Miller's house, then run a little further up, and anchor in 12 or 14 feet water, sandy ground. From Carron Point to Munro's Wharf there are three bars, with not more than 6 feet water over them, but there are places between them, with 16, 15, and 14 feet, where a number of vessels load.

The Tatigouche, or Little River, is only navigable by canoes. The middle river is deep, but bars run across the channel in many places; the banks on each side, from the village to Carron Point, dry at low water.

Tide.—It flows full and change at 3 o'clock, and the water rises on the inner bar 8 feet, on the outer bar 5 feet, and in the harbor 8 feet, with regular springs, but it is much influenced by the winds which prevail in the Gulf of St. Lawrence; in summer time no vessel should load down to more than 13 feet, and then the bar should be attempted with the first of the springs.

From abreast of the north point of Miscou Island to the south point of Shippigan Island, the distance is 19 miles, and the course is nearly S. W. by S. From the south point of Shippigan to Tracadie, the course and distance are S. W. $\frac{1}{4}$ S. 4 leagues. From Tracu-

die to Point Esquimaux, or Escuminac, on the south side of the entrance of Miramichi Bay, the course is S. by W. $\frac{1}{2}$ W. distant 9 leagues. On Point Escuminac there is a fixed light 70 feet high.

*Lighthouse.
Miramichi
Bay.*

MIRAMICHI BAY.—This is a spacious bay, having at its entrance several islands. The northern shore is fronted by some small sand islands, having channels between them and the main, into which boats may enter; behind these is an Indian village called Nego-wack, but the chief passage into the harbor is between Waltham, or Portage Island, and Fox Island: to enter this you must borrow towards the southern point of Escuminac, and pass to the southward of a long narrow shoal which stretches in front of Fox's Island, and forms the channel of $1\frac{1}{2}$ mile wide, with 4 and 5 fathoms water in it; having advanced to the northward of Fox Island, you must turn westerly, and pass between the southern point of Waltham Island and the northern point of Fox Island; on your starboard hand be 3 black buoys, which mark the edge of the Horseshoe Sand; there is also a red buoy on the larboard side of the western part of the Bay de Vin Island. Through this part of the channel you will have $3\frac{1}{2}$ fathoms, and having arrived abreast of the Red Buoy de Vin, you may steer W. N. W. for Oak Point, in 3, $3\frac{1}{2}$ and 4 fathoms; here the greatest care must be observed, in order to take the passage between Sheldrake Island and the Sandy Spit which runs off Point Chevill: run very near the N. E. point of that island, steer south-westerly for Nappan Bay, and round the south part of Sheldrake Island, you will then see *Old Custom House* situated upon the northern shore; from whence, by keeping mid-channel, and following the sinuosities of the river, you will safely pass Middle Island, and have 7 and 6 fathoms without any danger, until you reach the town of Newcastle; here the water lessens to 3 fathoms; ahead you will perceive Beaubac or Frazier's Island, dividing the channel in two passages; that to the south-eastward is the better one, and runs into the S. W. branch of the river; that to the northward leads into the N. W. branch; both these have their rise a considerable distance up the country. The New Custom House stands on the southern shore, about 2 miles beyond Middle Island. There are several places of good anchorage about this harbor, but the navigation is in general so intricate that a pilot will always be necessary, and he will point out the best places for riding. Spring tides rise 5 and 6 feet, and the buoys are frequently shifted.

Buoys.

Tides.

Anchorage.

There is good anchorage with off-shore winds in Outer Bay, but you must not go into less than 7 fathoms water. The pilot's houses are 4 or five miles to the westward of Escuminac Point, and pilots for this place are sometimes obtained from the Gut of Canso. Considerable quantities of timber have recently been shipped from this harbor for Europe, but a late tremendous and extensive fire having made great devastation in the adjacent woods, destroying the dwellings and property of most of the inhabitants, and reducing them to the greatest distress, it will take some considerable time before they can recover their losses, or resume their former occupations.

Soundings.

From the northern part of Miscou Island to Escuminac Point, the soundings are regular; and in thick weather the shore may be approached by the lead to the depth of 12 or 10 fathoms. In passing Escuminac Point you must give it a good berth, for a sandy spit runs off it a full league.

Richibucto.

RICHIBUCTO.—The depth of water at the entrance of this harbor is, at the best and highest tides, about 18 feet, and with common tides 16 $\frac{1}{2}$ feet. When you are off the harbor's mouth, in 6, 7, or 8 fathoms of water, you should endeavor to steer in, bringing the two large beacons in a line, and keeping them so, until you get up near to the Sand Hill; then run along the shore about N. W. in 3 or 2 $\frac{1}{2}$ fathoms, until you find yourself in safety. There is a large buoy, laid down in 5 fathoms, outside of the bar, which is a good guidance in, and may be seen as you approach, for upwards of a league off.

Buoy.

Within Cape Tormentin is the *chimus* and boundary between New Brunswick and Nova Scotia, the narrowest part of which, from the Bay Verte to Cumberland Basin, at the head of Chignecto Bay, is only $\frac{1}{2}$ miles in breadth.

*The Northern
Coasts of
Nova Scotia,
&c.*

THE NORTHERN COASTS OF NOVA SCOTIA, &c.—The general features of the Northern coast of Nova Scotia are pleasing; the land low and even, or slightly broken by agreeable inequalities. The few harbors are of a very limited capacity; the soil of the country is fertile, and the woods abound with beech, oak, elm, birch, maple, ash, pine, spruce, larch, juniper, hemlock, and fir. In the Strait of Northumberland, to an extent, from end to end, of not less than 100 miles, the bottom, in many places, is nearly level, and varies in its depth only from 20 to 10 fathoms, being generally a stiff clay, and the ground holding well.

Between Cocagne, on the west, and the high rock, called the Barn, on the east, the shore is in general bound with red cliffs, and beaches under them, and the island which lies between Tatmagouche and the basin of Colequod, appears remarkably high to vessels in the offing.

Having rounded Cape Tormentin, either inside or outside of the 6 feet ledge which lies off it, you will open to the westward of the Bay Verte.

are lined with flats, on which the water becomes shallow, but mid-channel the anchorages are good; here vessels of considerable burden may take in their cargoes of timber, &c. On the northern side of the bay, and near its head, is the small River of Gaspereau, on the southern shore of which stands the Fort Moncton, and on the southern part of the bay is another small rivulet called the River Tidnish; they are both too shallow for shipping to enter. The Bay of Verte is now rising into considerable importance, in consequence of its proximity to the Bay of Fundy; and the interior, from the bay to Amherst, Cumberland, La Plance, and Tantamaree, is in a highly improving state and increasing population.

RIVER PHILIP.—To the southward of Cape Tormentin, at the distance of $4\frac{1}{2}$ leagues, is the entrance to the River Philip, a bar harbor, having only 10 feet at the entrance. In advancing towards this place, when in the depth of 5 fathoms, another harbor will be seen on the eastern or larboard side, which is called Pogwash. In the latter, ships drawing 17 feet load with timber. This harbor is safe; but the entrance is so narrow as to require a pilot. Ships commonly anchor outside in 5 fathoms, at 3 miles distance from shore, with the entrance bearing to the S. E.

E. N. E. $4\frac{1}{2}$ E. about 8 miles from the entrance to the Bay of Pogwash is the Cliff Cape, and from Cape Tormentin to Cliff Cape the bearing and distance are S. by E. $\frac{3}{4}$ E. 16 miles; from Cliff Cape to Shoal Point S. E. 3 miles; and from Shoal Point to Cape John S. E. by E. 11 miles. Between the two latter lie the harbors of Ramsheg and Tatmagouche, which are good and well sheltered, but each require a pilot.

RAMSHEG HARBOR.—Off the northern or Shoal Point is Fox Island, the flats from which extend so far from shore, at the entrance of the harbor, as to leave but a narrow channel, through which, at all times, excepting at slack water, the tide runs with great velocity, and renders the navigation into it very unsafe, although the depth up to the anchorage is sufficient for a frigate; there being, in mid-channel, $3\frac{1}{2}$ fathoms at low water. In sailing in, steer south-westerly, towards Gravois Cliff, giving Shoal Point a berth of a mile, until the N. W. arm is well open; then steer for the latter, keeping your lead going, until the beach to the N. W. of Gravois Cliff bears S. W. by W.

TATMAGOUCHE is $6\frac{1}{2}$ miles to the westward of Fox Island, and the channel on the western side of Amet Isle is quite clear; but, in sailing in from the eastward, between Cape John and the isle, you should keep nearest to the cape, for a ledge extends from the isle to a considerable distance. Amet is a low island, without trees, and it will be most prudent to keep at least three-quarters of a mile from it every way. The best anchorage for ships is in the Harbor or River John, on the east side of the harbor, in 4 or 5 fathoms, muddy bottom. Small vessels may run up to Tatmagouche, and anchor off the town in 10 or 12 feet at low water. Here the tide rises 5 feet, on full and change, and flows till 7 o'clock.

RIVER JOHN.—In coming from the eastward, when between Amet Island and Cape John, your course towards River John will be W. by S. In passing between the island and cape, you will have $4\frac{1}{2}$ fathoms until you open the River John, on the larboard side. You will then have 7, 8, and 9 fathoms; and if bound for this river, or for Tatmagouche, may obtain a pilot, by making the usual signal. There is safe anchorage at 2 miles distance from shore.

In Ramsheg, Tatmagouche, and John Harbor, ships of fifteen feet draught commonly load with timber.

CARIBOU HARBOR.—From Cape John to Caribou Point the course and distance are E. S. E. 6 leagues. Here the water gradually shoalens to the shore, from the depth of 3 or 9 fathoms at two miles off. To strangers it may be dangerous to approach Caribou Harbor, as it has frequently been mistaken for Pietou, which lies to the south-westward, and some have run on shore before the error has been discovered. For it is to be observed that ships are seen riding, not in the entrance of the harbor, but within a sand-bank, which stretches from side to side, having not more than 3 or 4 feet over it, and which appears like a good channel. Small vessels load with timber here. The promontory of Caribou may be known from Pietou by observing that the hollow land over it appears like a deep inlet; but the highlands of Pietou seem to fold over each other, and blind the entrance. The ledges about Caribou extend upwards of a mile from shore, and some of them are dry at low water. Nearly in mid-channel, to the northward of Caribou Point, is a rocky shoal of 10 feet. It is a quarter of a mile in circumference, and round it the depths are 4, 5, and 6 fathoms. The tides, both ebb and flood, set rapidly over it.

SUNKEN ROCK.—Between Pietou Island and Caribou Point, is a sunken rock. The rock lies in the fairway between Pietou Island and Caribou Point, being distant about one-third the breadth of the channel, in a W. by N. direction from the western point of the island. The circumference of the rock is about 400 yards, and the tide was found to set over it at the rate of $2\frac{1}{2}$ miles per hour, the flood setting to the N. N. W. making high water at full and change at 9h. 30m. On its western edge, the rock has 4 and 5 fathoms close to it, and 5 to 7 fathoms on its eastern edge. The position of this rock renders it ex-

*River Philip.**Ramsheg Harbor.**Tatmagouche**River John.**Caribou Harbor.**Sunken Rock.*

remely dangerous to ships leaving Pictou Harbor for the westward, as it lies immediately in the fairway. The channel to the westward of the shoal is generally adopted, in which there are from 3½ to 4 fathoms, irregular soundings.

Pictou Island. PICTOU ISLAND, 4½ miles long east and west, and 1½ mile wide, is of clay and sandstone, rising in the central parts to the extreme height of 150 feet above the sea. It is wooded on the northern side, but there are settlements and farms along its southern shore. Low cliffs form its outline with the exception of several small bays, and Rogers Point, on the south side, which is of sand, and affords the best landing for boats.

West Point. West Point may be passed in 3 fathoms within half a mile; but on either side of the west end of the island there are rocks, nearly dry at low water, just within the 3 fathoms line, and extending to the distance of 300 fathoms off shore. The shallow water runs out occasionally to the same distance off the north shore of the island, which should not be approached nearer than 8 or 9 fathoms in the night time. The southern shore may be approached to 5 fathoms; but off the East Point a dangerous reef, in great part dry at low water, runs out half a mile to 3 fathoms, and nearly a mile to the 5 fathoms line. There are 9 fathoms not far off this reef both to the northward and eastward, it should therefore be approached with caution at all times, but especially at night, and with a flood tide. In most of the old charts a shoal is laid down about 4 miles to the eastward of Pictou Island, but we have not yet been able to discover any indication of its existence.

Pictou Harbor. Coal. PICTOU HARBOR, in every respect the finest on the southern shore of the gulf eastward of Gaspé, derives additional importance from the coal mines, valuable quarries of building stone, and finely settled country in its neighborhood. It is situated 5 miles to the southward of Caribou Point, and at the bottom of the bay, which is 1½ mile wide at its entrance, from Logan to Mackenzie Head, and 1½ mile deep. Mackenzie Head will be recognized by its sharp pointed cliff of clay and sandstone 40 feet high, and by its bearing nearly south from Logan Point.

Mackenzie Shoal. MACKENZIE SHOAL lies off the head to the N. E. by E., its outer edge being distant seven-eighths of a mile. It is a rocky bank nearly one-third of a mile in diameter, with 16 feet least water, and with 19 or 20 feet between it and the shallow water to the westward. Large vessels should not attempt to pass within or to the southward and westward of it. The marks for clearing it to the eastward at the distance of a cable, are Caribou and Doctor Points in one, bearing N. by W. ¼ W., and the lighthouse in one with the Town Point at Pictou bearing west will clear it to the northward at the distance of 200 fathoms. The shallow water extends a long half mile out to the northward from Mackenzie Head, and its edge in 3 fathoms, trends thence to the westward towards the lighthouse, the whole bay on that side being shoal, with ridges of sand drying out to a considerable distance from the shore at low water. In the bay between Mackenzie Head

Boat Harbor. and the lighthouse, and on the west side of Powell Point, is Boat Harbor, the entrance of an extensive inlet or lake, full of mud and weeds, and which boats can traverse only when the tide is in. On the opposite or northern side reefs extend off Logan Point to the east and south-east, a long half mile to the line of 3 fathoms. The lighthouse and Cole Point in one, bearing S. W. by W. ¼ W. lead over the south-eastern extreme of these reefs in 14 feet at low water, but vessels should not go nearer than 4 fathoms. Cole Point, which is of clay and sandstone cliff 30 feet high, and lies a short mile further in or to the S. W. from Logan Point, has also a reef stretching out to the S. E. one-third of a mile, and the shallow water continues from it westward to the commencement of London Beach on the north side of the entrance of the harbor.

Pictou Lighthouse. The lighthouse, of wood, painted vertically with red and white stripes, and showing a fixed light 65 feet above the sea, stands close to the water at the extremity of the sandy spit forming the south side of the entrance.

Pictou Bars. The distance across the harbor's mouth from the sandy spit to London Beach, is 220 fathoms, and 7 fathoms deep; but the channel over the inner bar is much narrower, and has besides a turn in it, which, together with the necessity of knowing exactly the set of the tides, renders a pilot indispensable in a large ship. Vessels running for the harbor must first pass the OUTER BAR, which stretches from Logan Point to Mackenzie Head, and has 21 feet at low water over a bottom of sand. After passing this bar, the depth increases to 4, 5, and 6 fathoms in the distance of about a mile, and then suddenly decreases to 19 feet on the INNER BAR, which is also of sand, and distant about 400 fathoms from the lighthouse. After passing this inner bar, which is not above a long cable wide, the water continues deep to the entrance of the harbor. There is very good anchorage between the bars although exposed to N. E. winds, and also in PICTOU ROAD which is outside of the outer bar, and where the depth is 5 fathoms, with clay and mud bottom. Vessels running or beating up to Pictou Roads at night will find the soundings in the Admiralty Chart sufficient guidance, when keeping the southern shore aboard with the prevailing S. W. winds; and on the opposite side, or with northerly winds, will have the advantage of the following excellent leading marks. Pictou light can readily be seen in a clear night from a distance of 12 or 14 miles, and when in one with Coal Point bearing S. W. by W. ¼ W. clears the reef off the east end of Pictou Island at the distance of a long half mile;

Pictou Road. and also the beating, tack behind Cole Point bearing W. edge of the W., taking care to be in safe anchorage to circumvent men, and any necessary spring able and exposed safely reckoned depth will. Having a full has been no degree or type Point, the entrance on until Logan to the north Sandy Spit in one with and run from the extreme of Mackenzie Head to the north W. extreme Sandy Spit. A pilot vessels must know is 6 feet in diameter MERIGOT entrance of timber, with the east end where you nature to enter is a depth of feet. High tides, soft mud There is a high, and bottom of refuge for to the eastward St. George is considerably elevated is said to be what rocky, ST. ARBUSI of Causo, for a number of extends out

REMARKS. the land of more than three-quarters

and also the southern extremity of the Pictou Island Bank in 5½ fathoms: therefore, if beating, tack in the board to the northward, the instant the light begins to disappear behind Cole Point; and if running keep the light just open to the southward of Cole Point, bearing W. S. W., until you strike soundings in the low water depth of 5 fathoms, on the edge of the bank off Logan Point; then follow the same depth about 1½ mile to the S. W., taking care not to bring the light to bear to the northward of west, and the vessel will be in safe anchorage in the road, where she may wait for daylight, or a pilot, according to circumstances. The branch pilots of Pictou are for the most part able and experienced men, and are always on the look out for vessels. Although 19 feet at low water, in ordinary spring tides, can be carried over the inner bar, yet the aid either of buoys, or of an able and experienced pilot, would be required to insure that depth; but 17 feet may be safely reckoned upon, if the following brief directions are strictly followed; and the greater depth will be carried in, if the endeavor to follow them exactly has been successful. Having a fair wind, and being further out than Mackenzie Shoal, the position of which has been pointed out, bring the lighthouse in one with Town Point at Pictou, bearing a degree or two to the southward of west; or, which will be the same thing, with Smith Point, the extreme of the land on the same side beyond the town. Run with those marks on until Logan and Cole Points come in one, bearing N. E., when instantly sheer a little to the northward, sufficiently to bring Town Point in one with the north extreme of the Sandy Spit. Keep the last named marks exactly in one, until the Roaring Bull comes in one with Mackenzie Head, bearing S. E. by E. ½ E., when change the course smartly and run from those marks, keeping the Roaring Bull only just in sight, until the north extreme of Moodil Point (the first point on the south side within the lighthouse) opens out to the northward of the Sandy Spit: then haul to the westward, at first towards the S. W. extreme of London Beach, and afterwards so as to pass midway between it and the Sandy Spit into the harbor.

A pilot would be indispensable in a large ship with beating winds, and even smaller vessels must know the tides and the place well to beat in or out with safety.

The lighthouse on the full and change days at 10h.; and the rise *Pictou Tides.* is 6 feet in ordinary spring tides, and 4 feet in neap tides.

MERIGOMISH, which is an excellent bar-harbor, lies 7 miles to the E. S. E. of the entrance of Pictou; the merchants of which place have ponds here, for the reception of timber, with which a number of ships are annually laden. To sail in for this place, bring the east end of Pictou Island nearly north, and keep it so until off the harbor's mouth, where you may either obtain a pilot, or anchor in 4 fathoms. A stranger should not venture to enter the harbor without a pilot, as a ledge stretches off from either side. There is a depth of 14 feet on the bar at low water, and the vertical rise of the tide is about 5 feet. High water at full and change, at 10h. 6m. The depth within is from 4 to 7 fathoms, soft mud. *Merigomish.*

There is no harbor between Merigomish and Cape St. George; but the coast is clear, high, and bold, and vessels may sail along it in safety, at the distance of a mile. As a place of refuge for small vessels in distress, there is a new pier erected on the coast, 7 leagues to the eastward of Pictou, and at the indent formed by the rock called the Barn. Cape St. George is a promontory which runs out to the north-eastward; it is bold to, and considerably elevated, forming the western point of entrance to St. George's Bay, but there is said to be good anchorage under the cape, in from 10 to 7 fathoms; the ground is somewhat rocky, but you will ride there sheltered from westerly winds. *High water.*

ST. GEORGE'S BAY, ANTIGONISH.—The entrance of the Harbor of Antigonish lies 10 miles to the S. by W. from Cape St. George. Here small vessels load with timber and gypsum, of which there is abundance in the neighborhood; but the harbor is so shoal, that even these complete their cargoes outside of the bay, although the anchorage is not so safe. *St. George's Bay, Antigonish.*

At Pomket Harbor, 6 miles eastward from Antigonish, ships of any size may load in safety. In beating in, when from the northward, you will leave the island on the starboard side, keeping close to a rock, which appears 5 or 6 feet above water. This rock is steep to, and lies off the east end of the island. Outside of it, at the distance of three-quarters of a mile, lie several sunken ledges, which are dangerous. After passing the rock a bay will open on the starboard side, which you must stand into, till you are shut in with the island, where there is anchorage in 3½ fathoms water, at about half a mile from the island.

ARBUSHEE, or AUBUSHEE, is an inlet which lies between Cape Jack and the Gut of Canso, forming a small harbor, occupied by an industrious and thriving people. Here a number of small vessels have been built, carrying from 15 to 50 tons. A rocky ledge extends outside the harbor, in a north-westerly direction. *Arbushee.*

THE GUT OF CANSO TO ISLE MADAME.

REMARKS.—The Gut of Canso is formed by the Island of Breton on one side, and by the head of Nova Scotia on the other. Its length is about 5 leagues, and breadth more than three-quarters of a mile. The east side is low, with beaches, but the west shore is

for the most part high and rocky; Cape Porcupine being remarkably so. The deepest water is on the western shore; but both shores are bold to and sound, excepting some sunken rocks, one of which lies near a cable's length from the eastern shore, and about midway between the southern entrance of the Gut and Ship Harbor; a second is between Ship Harbor, and Bear's Head, running out nearly a cable's length from the shore, and a third lies off Bear's Island, about 100 fathoms from the land. The depth of water over these rocks is about 6 or 8 feet. Mill Creek, Gypsum or Plaster Cove, Venus Creek, Ship Harbor Holland Cove or Pilot Harbor, and Eddy Cove, afford excellent anchorages, with a moderate depth, and out of the stream of the tide, which generally sets in from the southward, but is very irregular being much influenced by the winds. After strong N. W. winds, which happen daily during the fall of the year, the water in the Gulf of St. Lawrence is rendered low, which causes the current to run northward through the Gut, at the rate of 4 or 5 knots, and the contrary happens after southerly winds.

Light.

LIGHT.—On the west side of the north entrance to the Gut of Canso there is a fixed light 115 feet above the level of the sea; there is good anchorage under the light with the wind off shore.

Cape St. George.

CAPE ST. GEORGE, is a remarkable promontory, lying at the distance of 10½ leagues to the eastward of Pictou Harbor. A course of 6 leagues thence to the south-eastward, will lead to the entrance of the Gut, whence you may run along the Breton shore. It is to be observed that there is a ledge of rocks in the offing, near Arbushie, already noticed; some of these are nearly dry at low water, and nearly in the direct course for the Gut; they must, of course, be carefully avoided.

Opposite Mill Creek, at the upper end of the Gut, on the Nova Scotia side, you may stop a tide or lie wind-bound, if it does not overblow. Keep the creek open, and come to anchor in 8 or 10 fathoms, within a cable's length of the steep rocks on the south side of the creek. The best water is with the creek's mouth open. It will be necessary to carry a hawser on shore to the rocks, to steady the ship, as the tide here runs in eddies. You may obtain fresh water from the creek at low water.

Upon entering the Gut, there will be seen, on the larboard hand, a red house, on a point called Belle Ashe's Point, off which, at nearly a cable's length from shore, there is a sunken rock, which may be readily distinguished by the eddy of the tide. Within this point, on the S. E. is Gypsum or Plaster Cove, which is known by its white appearance, and where you can anchor in soft mud, in from 4 to 10 fathoms.

Sunken Rock.

SHIP HARBOR, which lies half way down the Gut, on the eastern side, is a good harbor for merchant shipping. It is, however, more particularly useful to those sailing northward, being a good outlet. It is a very proper place for ships of 16 feet draught, if bound in, from the southward, give the starboard side a berth of a cable's length, it being flat, and run in until you shut the north entrance of the Gut, and come to anchor in 4 or 5 fathoms, soft bottom, where you may wood on the Breton side, and water on the opposite shore, at Venus' Creek; the larboard side of this harbor is bolder than the starboard side, and deepest water. Without the harbor, one-third from the Breton side, you may anchor in 9, 10 to 13 fathoms, loose ground, in the strength of the tide.

Ship Harbor.

Ships bound through the Gut, from the northward, may proceed through it with safety, by keeping nearly in the mid-channel, there being no danger until they arrive off the south point, called Eddy Point; but from this point extends a long spit of sand, with large round stones, which must be left on the starboard side, at the distance of half a mile from what may be seen above water. The race of the tide will serve to guide you from it. Having passed the Spit of Eddy Point, when midway, you may steer to the south, and after you have passed Cape Argos, taking care you do not open Eddy Point with Bear Island, until you bring Green Island well open with Cape Hogan, when you may shape your course for sea from the charts.

Gut of Canso.

GUT OF CANSO.—When off Cape Canso and bound for the Gulf of St. Lawrence, the best passage is through the Gut of Canso, being shorter, and having the advantage of several anchoring places, out of the strength of the tide, in case of contrary winds or bad weather.

Cerberus Rock.

CERBERUS ROCK.—This is a dangerous rock in Chedabucto Bay, immediately in the fairway to and from the Gut of Canso; it has only 10 feet water on it, and breaks with any thing of a breeze.

The range to the eastward for this rock, is Green Island on with Point Hogan, which is the S. W. point of Isle Madame. Bound up the Gut of Canso, after getting into Chedabucto Bay, bring Eddy Point on with Bear Island, (which is a small round island off Bear Head,) and run for it until Green Island is hid behind Cape Hogan, when you may shape your course for the fairway up the Gut, as you then will have passed the Cerberus.

Inhabitant Bay.

INHABITANT BAY, &c.—Those who wish to anchor in Inhabitant Bay or Harbor, may bring the firm that is opposite to Bear Head open, the head bearing W. S. W. This mark will lead them clear, and to the southward of the Long Ledge, and in the

mid-channel, between it and the steep rocks on the east or opposite shore; at the same time take your soundings from the Long Ledge, or north shore, all the way till you arrive at Flat Point; then keep in mid-channel between Flat Point and the island opposite, from the N. E. side of which runs off a spit or ledge of rocks, at the distance of a cable and a half's length; then port your helm, and run under Island Point, and come to in 5 fathoms, muddy bottom. Up the river Trent are plenty of salmon, in the season, and there you may wood and water.

N. B. The leading mark to clear the steep rocks of Steep Point is, to bring the peninsula in a line over the point of Turbalton Head, bearing S. or S. $\frac{1}{2}$ E. until you open the island to the northward of Island Point; then haul up for the outer harbor, and come to in 10 or 12 fathoms, muddy bottom.

Those who are bound up the Gut of Canso, and meet a N. or N. W. wind, at the south end of the Gut, and who are desirous of good and safe anchorage, in 10 to 12 fathoms water, may come to on the north side of Bear Island; but should it blow hard, to a gale of wind, down the Gut, this anchorage is not altogether so secure as a careful master or pilot would wish. You must then leave the road of Bear Island, and sail round the south end of Bear Point, giving a berth to the spit that runs off it, of 3 cables' length, then haul round to the N. E. into Sea-Coal Bay, and come to anchor, in 4, 5, or 6 fathoms, sandy and muddy bottom. There is also a rock under water, said to lie about 100 fathoms to the southward of Bear Island, having only 6 or 8 feet water over it; it will be necessary to give this point a good berth, for fear of this danger.

Marks for anchoring, viz: bring Bear Head in a line over Flat Head, bearing W. S. *Anchorage.*

W. or W. by S, and Cariton Cliffs to bear N. by E. or N. in 5 or 6 fathoms, you will then have a good berth, sheltered from the W. N. W. and N. winds. Here is sufficient room to moor ten or twelve sail of any ships of war, from the sixth to the third rate.

ARACHAT HARBOR has two entrances; the north-western one being very narrow, *Arachat Harbor.* ought never to be attempted without a leading wind, as there is not room for a large ship to swing to her anchors, should she be taken aback. When going in, give the ledge, to the westward of Seymour Island a good berth, not approaching it nearer than 8 fathoms, and keep as near as possible in mid-channel; to enter by the S. Eastern passage steer for Port Marche, rounding it in 8 fathoms at about two cables' length off, and keep that shore on board at nearly the same distance and depth of water, until the church bears north; you will then see a small house (the dead house) on the top of the hill behind the church; bring that on with the east end of the church, and then steer in that direction; you will thus pass midway to the eastward of the Eleven and Five Feet Shoals, and also to the westward of the Fiddle-head Shoal; proceed with this mark on until a red house on Fiddlehead Point comes on with the dark rocky extreme of the point, bearing E. $\frac{1}{2}$ S.; you will then be to the northward of the Twelve Feet Shoal, and may haul up to the westward, where you will have excellent anchorage on fine soft mud, opposite to the low sandy beach, on the middle of Seymour Island, in 10 fathoms.

TURBALTON BAY.—Ships coming down the Gut of Canso, which may have *Turbalton Bay.* reached past Eddy Point, or as far as Cape Argos, and caught with a S. E. to a S. S. W. wind, and cannot hold their own by beating to windward, may bear up and come to anchor in Turbalton Bay, under Turbalton Head, where they may ride safely in from 5 to 7 fathoms water, muddy bottom. The marks for anchoring in Turbalton Bay are, to bring the peninsula point in a line over Turbalton Head, bearing S. or S. $\frac{1}{2}$ W. or a point of land inland, a little up in the country from Cape Argos shore, with pine trees on it, open to the eastward of the Red Head, or the said point of land with pine trees on it over the pitch or point of Turbalton Head; you are then sheltered by the rocks or spit that runs from Turbalton Head in 4 to 5 and 6 fathoms water, and will ride very safely on good holding ground. But should the wind shift to the S. W. or N. W. you must take up your anchor and beat out of the bay into Chedabucto Bay, and proceed on your passage to the southward. Should the wind overblow at S. W. so as to prevent your beating to windward into Chedabucto Bay, you may come to an anchor in Eddy Cove, bringing the lower part of Eddy Point to bear S. S. E. or S. by E. in 5, 6, or 7 fathoms water, taking care to give the ship sufficient cable, lest you drive off the bank into deep water, from 15 to 20 fathoms.

TIDES on the south side of the Gulf of St. Lawrence. The tide rushes with great *Tides.* rapidity through the Gut of Canso; and in the narrowest part of the Gut, or Cape Porcupine, it seldom runs at a slower rate than 4 or 5 miles in an hour. Here it flows, on the full and change, at 9 $\frac{1}{2}$ h.

Along shore, past Arbushe and Antipish, it sets towards Cape St. George; and rounding that cape, proceeds thence in a north-westerly direction. On the south shore of Northumberland Strait, the time of flowing, on the full and change, is from 7 to 8h. The perpendicular rise is from 3 to 7 or 8 feet.

The tides here are very materially varied by the winds; and it has been found that at times the stream of the Gut of Canso has continued to run one way for many successive days.

ST. JOHN'S, OR PRINCE EDWARD'S ISLAND.

This island is well settled, and possesses a good soil, fit for all general purposes. The climate is commonly healthy and temperate, and not subject to such frequent and heavy fogs as Newfoundland and the adjacent coasts of Breton and New Brunswick generally are, nor yet to sudden changes of weather. The first appearance of the island is like that of a forest emerging from the sea; the red cliffs, which are not very high, then appear; the lands are covered with lofty trees, and the sand-hills on the northern side of the island are covered with verdure. The country is generally level, and abounds with springs of fine water, and groves of trees, which produce great quantities of excellent timber. The greater part of the inhabitants are employed in farming and fishing.

Rifleman's Shoal is situated off the south coast of the above island, and the following remarks were taken at anchor in 7 fathoms, about 2½ or 3 cables' length S. S. W. of that part on which the British ship Rifleman grounded, viz: Point Prim, N. N. W. ¼ W. South Woody Island E. by S. ¼ S. a point (supposed Point Jennings) N. W. a merchant brig on shore on the Indian Rocks, bore S. E. about 3 or 4 miles distant.

The least water found upon the shoal was 8 feet, about half a cable's length to the northward of where the Rifleman grounded. It appears to be a rocky shoal of considerable extent.

The coast forms numerous harbors, many of which are, however, fit for small vessels only. The principal landing ports at present are on the eastern side, Cardigan Bay, or the Three Rivers, and Murray Harbor; on the S. E. Hillsborough Bay and River; Bedeque Bay on the southern side; and Richmond Bay and Holland Harbor on the north.

Cardigan Bay, or the Three Rivers.

CARDIGAN BAY, or the THREE RIVERS, lies between Boughton Island and Panmure Island; it is the common entrance to three rivers, namely: Cardigan River, Brudenell River, and Montague River. In the former there are from 7 to 3 fathoms water, and in the others from 4 to 2 fathoms. George Town stands on a peninsula between the Rivers Brudenell and Cardigan. In these places many large ships have been loaded with timber. There is anchorage without, in Cardigan Bay, in from 10 to 15 fathoms, where a pilot may be obtained.

Miray, or Murray Harbor.

MIRAY, or MURRAY HARBOR, lies close to the north-westward of Bear Cape; and the entrance is narrow and shoal, difficult of access, and not having more than 12 feet water. But small ships have frequently loaded here. Vessels coming from the eastward and bound to Murray Harbor, must avoid approaching too near to the eastern point, for a ridge of rocks stretches out a full mile from it; between the east point and Wood Island, the ground is clear, with a depth of 3 fathoms all the way, near the shore, and the anchorage good.

Hillsborough Bay.

HILLSBOROUGH BAY is the finest bay in the island, and the River Hillsborough is a large navigable river; but timber here is not plentiful. After passing the front about a quarter of a mile, keep towards the entrance of York River, for a shoal extends from the opposite shore to some distance, and anchor off the town in 6 or 8 fathoms. Vessels bound for Charlotte Town, or passing through Northumberland Strait, must be careful to avoid the Indian Rocks, which are covered at high water; and by night it will always be advisable to keep on the Nova Scotia side, particularly when passing by the Island of Pictou.

Bedeque Bay.

BEDEQUE BAY, which lies between Cape Egmont and Carleton Point, has good anchoring ground in from 6 to 8 fathoms. The harbor will admit ships of 400 tons, but the channel is narrow, crooked, and requires a pilot. It is the chief port for loading timber; but the water freezes much sooner than at Pictou, or the harbors on the Nova Scotia coast.

Between Cape Egmont and West Cape, in Halifax or Egmont Bay, there is good anchorage, with northerly and easterly winds, in 6 or 8 fathoms, but care must be taken to give a good berth to West Cape, as a shoal runs off it full 2 miles, in a S. W. direction.

From the North Cape of the island a shoal spits off nearly 2 miles, close to which there are 4 fathoms of water, and the ground is flat much further off, there being only 6 fathoms water at the distance of 8 or 9 miles from the cape. Vessels sailing through the Strait of Northumberland, with the intention of going to any port on the northern side of the island, will, after giving the north cape a wide berth, find all the other part of the coast clear from foul ground, to within the distance of a quarter of a mile of the land, and may anchor any where in not less than 3 fathoms water; and ships coming from the eastward will find an advantage in sailing along the northern shore of the island, to going through the Strait of Northumberland, for there is more sea room, and the prevailing winds are from the south-westward; they may safely run along within a mile of the shore, until they approach Richmond Bay. There is a reef extending from the east point of the island to the distance of 3 or 4 miles, and which should not be approached in the night nearer than to the depth of 17 or 18 fathoms. The only harbors on the north side of the island, for ships of large burthen, are Holland Harbor and Richmond Bay; and off these harbors, the sand-banks, which form the bars, run off more than a mile from the shore.

St. Peter's.

ST. PETER'S is the first harbor on the north side, when coming from the eastward, and is fit for small vessels only. The bar runs out about a quarter of a mile.

Savage Harbor is fit only for small craft, and has a bar before it.

TRACADIE, or BEDFORD BAY, has about 8 or 10 feet of water on the bar, which extends outward half a mile.

HARRINGTON, or LITTLE RASTICO, admits only small vessels; it communicates with Great Rastico, or Harris Bay, which is very shallow on the bar, and calculated to admit fishery schooners only. The bar stretches off nearly half a mile.

NEW LONDON, or GREENVILLE BAY, has about 8 or 10 feet of water, but the bar is very difficult, and the channel runs in west. The bar extends nearly half a mile out.

RICHMOND BAY, or MALPEC, is a spacious harbor, having about 17 or 18 feet upon the bar. The sands which form the bar extend more than a mile off the harbor. The shoals on each side are generally discernible from the swell on them, and the course in and out is nearly east and west. On a vessel's anchoring outside the bar, a pilot will come off. There are two entrances into the bay; between them is Fishery Island. The eastern is the only channel by which a vessel of burthen can enter, the western channel being very shallow and intricate. Vessels usually complete their landing at about a mile within Fishery Island, but a considerable current runs there. The anchorage is good and vessels lie in perfect safety.

HOLLAND HARBOR, or CASCUMPEC, is the westernmost harbor on the north side. Here the sands form a bar as at Richmond Bay, and run off about a mile and a half. The harbor may easily be known by the sand-hills which extend along the coast; about half way between the entrance of Richmond Bay and Holland Harbor, is one sand-hill, near Conway Inlet, much higher than the rest. Holland Bay may be known by its being at the west end of all the range of sand-hills. There is good anchorage close to the bar in from 5 to 8 fathoms.

On the bar is a depth of 18 feet of water, and it will not be difficult for a stranger to run in with a ship not drawing more than 12 feet of water. There being two leading marks, painted white, bearing W. by N. by compass, a vessel of this draft, by keeping the two marks in one, with a leading wind, may run in with perfect safety. But as these marks will carry a vessel over the south tail of the northern sand, vessels drawing more than 12 feet should not venture without a pilot. There is a buoy on the end of the south sand; between that and the tail of the north shoal there are 18 feet of water. Vessels entering the port, if drawing more than 12 feet of water, should not bring the marks in one till they are within the bay. The soundings off the harbor are regular, and the ground clear. Ships, on coming to anchor off the bar, will immediately be attended by a pilot.

There is shoal water between the outer and inner harbor on which are about 14 feet of water in common tides. Vessels generally load to 13 feet in the inner harbor, and complete their cargoes in the outer one. In the former, they lie alongside a wharf, at Hill's Town, in 4 fathoms water, where they lie without any current, as in a dock. In the outer harbor the spring tide runs strongly, but the water is smooth, the sea being broken off by the bar.

THE CURRENTS around the island are very irregular, frequently running many along the north coast, from east to west, and at other times from west to east.

THE TIDES, also, in the north side ports, are irregular excepting spring tides. They sometimes keep flowing for 48 hours, and at other times not more than 3. In common tides, the water seldom rises more than 2 feet. In spring tides, (except in strong winds from the northward and eastward,) not more than 5 feet.

GENERAL DESCRIPTION OF THE COASTS OF BRETON ISLAND &c.

The N. W. Coast of Breton Island, all along from Cape North to Cape Linzee, is, in the inland parts of the country, very high; but, in some places, it falls down gradually towards the shore. Sailing along on this side of the island, from the northward, you may safely stand in to the distance of two leagues from shore, until you arrive off Justau Corp, or Henry Island, when you may stand within one mile of the shore.

In the winter season, when the weather is mild, the S. E., N. E. and N. W. shores of Breton Island abound with all sorts of fish; and plenty of lobsters and oysters are to be found towards Prince Edward Island, especially in Hillsborough Bay.

The eastern extremity of Breton Island appears, on the sea shore, and to some distance up the country, barren and rocky; and the tops of the hills, being much alike, have nothing remarkable to distinguish them. The ruins of the lighthouse and town of Louisbourg serve, however, to point out that part of the island on which they stand. The coast continues rocky off the shore, with a few banks of red earth, which appear less barren.

The N. E. coast of Breton Island, from Cape North to Cape Ensumé, the water is deep, except very near the shore. From Cape Ensumé to Cape Dnaphin is high land, but from Cape Dauphin to Sentara Island it becomes rather low. Between port St. Anno and Sentara Island, a vessel may stand in shore to 15, 10, and 5 fathoms, in clear weather, the water gradually decreasing in depth. The following soundings were taken by Capt. Philip Aldridge, on making Cape North:

*Tracadie, or
Bedford Bay
Harrington,
or Little
Rastico.
New London.*

*Richmond
Bay.*

*Holland
Harbor, or
Cascumpec.*

*Blancherotte,
or White Cliff*

BLANCHEROTTE, or WHITE CLIFF.—On the south coast of Breton is a remarkable cliff of whitish earth. Four miles to the westward of it is a small woolly island, lying at the distance of two miles from shore, and off the little harbor called St. Esprit. Without this island, at the distance of a mile and a half, on the S. E. is a breaker.

The land hence to the Isle of Madame, or Richmond, is generally low. It presents several banks of bright red earth, with beaches between them. Albion Cliff, on the south side of Madame, is rocky, remarkably high, and precipitous. On the S. W. side of this island is the settlement called Arachat.

In the description of the Gut of Canso, already given, (page 91.) we have noticed the general appearance of its coasts. On proceeding towards this strait, it should be remarked that the Isles of Canso, on the Nova Scotia side, are surrounded with many low white rocks and breakers. The south shore of Chedabucto Bay is iron bound and steep to. Its north shore consists of red cliffs and beaches.

Off the Gut of Canso, from the southern entrance northward, the western shore, throughout, is high, rocky, and steep; the eastern shore low, with beaches. From the north end of the gut, the eastern shore to Jestico, or Port Hood, is distinguished by high, rocky, red cliffs. The opposite shore has several remarkable cliffs of gypsum, or plaster, which appear extremely white. Cape St. George is iron bound and very high, its summit being 420 feet above the level of the sea.

*Jestico, or
Port Hood.*

JESTICO, or PORT HOOD, situate on the western side of Breton Island, is a safe harbor for frigates with any wind; the anchorage is in from 4 to 5 fathoms, mud and sandy bottom. Here you may get both wood and water. The leading mark going in, is Cape Linzee on with the highest sand-hills that are on the N. N. E. side of the beach, bearing N. by E. or N. N. E. These kept in a line will lead you clear of Spithend, in 4 to 6 fathoms. On the opposite shore is a long and broad flat, stretching from the shore three-quarters of a mile, called the Dean, to which come no nearer than in 4 fathoms. From hence the shore runs nearly in a straight N. E. direction to Cape St. Laurent, whence it turns easterly to Cape North. During the whole of this distance there is no harbor of note, but several salmon rivers. To the southward of Cape North, four or five miles, is Ashpée Harbor, where there is a settlement formed for the relief of shipwrecked seamen, and to the southward of that, about 30 miles, is the entrance to St. Anne's Harbor.

*St. Anne's
Harbor.*

ST. ANNE'S HARBOR, situate on the N. E. side of the island, was called by the French, when in their possession Port Dauphin, and is a very safe and spacious harbor. It has but a narrow entrance, and carries 44 fathoms at low water, until you join the beach. When in mid channel, you will have 9 to 10 fathoms, and in the harbor from 5 to 10 fathoms, muddy bottom. On the north side the land is very high, and ships of war may lie so near to the shore, that a water hose may reach the fresh water, and a ship may be loaded in one day, from a cascade which runs from the top of the rock.

For more particular directions for St. Anne's Harbor, you will observe as follows:—After you have passed the Siboux or Herford Isles, on the east side of the entrance, keep the south shore on board, if the wind be to the S. E. and as you approach Passage Point bring Cape Esumé, or Cape Smoke, which lies to the northward, nearly on with Black Point. Steer with these marks in one, until you are nearly abreast of Passage Point, off which lies a sunken rock of 6 feet water, and opposite to which begins the spit of St. Anne's Flat, and the narrowest part of the channel. Now keep a small hummock up in the country, nearest to the shelving high land to the westward of it, which hummock is on the middle land from the water-side, in a line over the fishing-hut, or fishing-stage erected on the beach. This will lead in the best water, until you enter the elbow part of the beach. When advanced thus far in, keep the opening open, (about the size of two gun-ports,) which makes its appearance up the S. W. arm. This opening looks like two steep cliffs, with the sky appearing between them, and will lead you between the beach and the south shore, in mid channel, through 9 and 10 fathoms, and past the beach point, off which a spit stretches to the S. W. about 2 cables' length. Having passed this spit, come to anchor in either side of the harbor, in from 5 to 10 fathoms, muddy bottom, and sheltered from all winds.

La Bras d'Or

LA BRAS D'OR.—This place has hitherto remained unknown, and unfrequented, but having recently been visited by many vessels in the timber trade, some description may be acceptable. It appears, from the charts, there are two entrances to this lake or inlet, the Northern, or Great Entrance, and the Southern, or Little Entrance; they are thus described by Mr. Thomas Kelly, the only pilot of the place: but the names of the places he refers to are generally unknown, and cannot be applied to any publication extant.

SAILING DIRECTIONS FOR THE GRAND BRAS D'OR ENTRANCE.—"Ships from the southward must give Point le Conie a berth of about two miles, and steer from thence for the eastern end of the inside Bird Island, until you bring M'Kenzie Point and Cary's beach in one. Make for the Black Rock Point until you have Messrs. Duffus's store just open of Point Noir; then steer for Gooseberry Beach, until you bring a clearing on Duncan's Head over M'Kenzie's Point. It is to be observed, that ships coming in with the tide of flood must keep Point Noir well aboard, to avoid the eddy and whirlpools on the north side of the Gut, which has various settings. You must then steer for Point Jane, to keep the fair stream of tide as far as Round Cove, where there is fair anchorage in 7 or 8 fathoms, good holding ground. When abreast of the Round Cove, steer over for Duncan's Head; and when abreast of this Head, steer for Long Beach, until you bring a tall pine tree, on the Upper Seal Island, in one with a notch or valley in the mountain. You will then make for the point of the Upper Seal Island, which will carry you clear of the shoals on the islands, as also the South Shoal, or Middle Ground. The marks for this shoal are a white rock in the bank for the eastern end, and a white birch tree for the western end. When abreast the western end of this shoal you may keep the middle, there being no difficulty until you come to Red Head. If bound to Kent Harbor, after doubling the Red Head, steer for a remarkable red bank covered with small bushes until you bring Mr. Duffus's house entirely open of the beach which is on the island. There is a depth of from 4 to 5 fathoms in this harbor, and good holding ground."

DIRECTIONS FOR THAT ARM OF THE LAKE CALLED ST. PATRICK'S CHANNEL, AND UP TO WOOKAMAGH.—"From Red Head you will steer well over for the Duke of Kent's Island to avoid a mud shoal which runs off from M'Kay's Point. When abreast of the western end of the Duke of Kent's Island, sail for Wassaback Head until abreast of Stony Island. Then steer for Cranberry Head, so as to clear a shoal lying off from Wassaback Head; when abreast of Cranberry Point, sheer well over for the Bell Rock, to avoid a shoal lying on the south side of the channel. When abreast of the Bell Rock, steer for Green Beach, observing to keep Bakdock River shut in until you are well up with Green Beach. You will then steer for a beach on the south shore, until you cross the opening of the Narrows; you may then sail through the Narrows, keeping the middle until you come to the western end, when you must haul round the southern shore (beach) until abreast of the Plaster Cliffs; you are then clear of all, and in the Wookamagh Lake."

OF THE ANCHORAGE THROUGH THE BRAS D'OR.—"The first anchorage is the Round Cove, where you may ride in 7 or 8 fathoms. You may anchor in 5 or 6 fathoms, in the centre of the harbor, on a middle ground; the marks for which are to bring the Table Island a handspike's length open of Black Rock Point and Point Jane bearing N. W. On the north side of the harbor there is good anchorage as far up as the Lower Seal Islands, and to the eastward of the Upper Seal Islands, in 5 fathoms, and to the westward of the same islands, in 7 fathoms. There is no other place of anchorage from this to the Big Harbor, where you may ride in 7 or 8 fathoms; from thence you may anchor at any time."

SETTING OF THE TIDE IN GRAND BRAS D'OR.—"The first quarter flood sets from the northward, directly over the shoal. Last quarter W. S. W. being directly through the channel, and meeting with the tide coming over the shoal sets towards the Black Point, which occasions it to shoot across the Gut, making a number of whirlpools and strong eddies on each side of the channel, which shall be two or three times during the tide. The first quarter ebb sets over the shoal to the northward; last quarter directly through the channel.—N. B. The tide of ebb is the fairest setting tide. The tide runs in until half-ebb, and out until half-flood, in regular tides; but the winds make a great alteration, N. E. winds making high tides, and S. W. neaping them. Also tides running out with S. W. winds until high water, and in until low water with N. E. winds. Tides rise four feet, unless affected by winds. High water ten minutes past 8 o'clock, full and change."

SYDNEY HARBOR, the entrance to which lies 4 leagues to the S. E. of that of St. Anne, is another excellent harbor, having a safe and secure entrance, with soundings regular, from sea, in 5 fathoms. On a low point which you leave on your larboard hand going in, a lighthouse painted red and white vertically, is erected, showing a fixed light, elevated 160 feet above the level of the sea.

Entering the harbor, give the point a berth of one-third of a mile, and steer W. S. W. when you will have from 7 to 9 fathoms water. Within the point the shore is bold and perfectly safe.

In the inner part of the entrance, Beach Point and Ledge, on the south side, are steep to, but Sydney Flats, on the opposite side, are regular to 4 fathoms. When past the Beach Point, you may run up the river Dartmouth to the S. W. and come to anchor in any depth you please, to 5 and 10 fathoms, a fine muddy bottom.

The harbor of North Sydney, where the vessels are loaded with coal by lighters, lies 9 miles above the lighthouse on the north side of the river. The coal is obtained three miles above the lighthouse, on the same side of the river as the town. There is a steam engine at the coal mines, with three very tall chimneys, the smoke of which can be

Tides.

seen 8 or 9 miles at sea on a clear day. The tide in the harbor flows at 9h. and rises 6 feet.

Bridgeport Harbor.

West of Sydney Harbor are Indian Bay and Windham River, both places of anchorage, and fit for vessels to run into.

BRIDGEPORT HARBOR, formerly **LINGAN**.—The leading marks for entering the harbor are, the end of the sand-beach and Roach's Farm-house in a line. Roach's Farm may be easily distinguished, being the only one that presents a group of buildings; which are also situated on higher ground than any of the farms on the north side of the harbor.

The cliffs on the southern shore of the bay are precipitous, but not more than 30 to 50 feet high; and the land covered with wood, with the exception of a small clearing on the eastern point, and is covered with spruce and fir trees.

From Flint Island, the North Head bears N. W. $\frac{1}{2}$ W. by compass, distant 11 miles.

A pilot can always be had by making the usual signal.

There are 11 feet of water in the shallowest part of the mid-channel at high water, neap tides, and 13 feet at spring tides.

High water. Murgain, or Cow Bay.

At full moon and change it is high water in the channel at half past eight o'clock.

MURGAIN, or **COW BAY**, at the northern point of which is Flint Island. There is a passage between this island and the main, with 14 fathoms water, but this should be adopted with the greatest caution, on account of the numerous rocks under water that are scattered about: this bay is open to the north-eastward, and its further end is encumbered with an extensive shallow flat, which dries at low water.

Miray Bay is to the southward, and its entrance is bounded by Cape Murgain and the Island of Scatara; the bay is wide, and runs in three leagues, branching off at its upper part into two rivers; there is deep water within it, from 20 to 6 fathoms, and clear from dangers, but it affords no shelter for shipping.

Scatara Island.

SCATARA ISLAND lies in about the latitude of 46° north; its length E. and W. is nearly 2 leagues, and its breadth about one: it is separated from Cape Breton by a channel into Miray Bay, but this is too hazardous for strangers, and frequented only by those coasters who are well acquainted with its dangers.

Lighthouse.

On the N. E. point of this island there is a lighthouse, *white*, containing a revolving light 90 feet above the level of the sea, visible one minute, invisible half a minute.

Ships should not approach this light on any bearing between N. N. E. or S. E. by S. or run nearer than within two miles.

Louisbourg Harbor.

LOUISBOURG HARBOR is situated on the S. E. side of Cape Breton, to the westward of Scatara Island, and is very easy of access; you may be soon in, and you may likewise be soon out, if you please. In doing so, be careful to avoid the Nag's Head, a sunken rock on the starboard hand going in. The east part of the harbor is the safest. On

Lighthouse.

the east head, and on the site of the old French lighthouse, a lighthouse 15 feet high, showing a fixed light, has been erected; it is painted white with a perpendicular black stripe on each side. The inhabitants consist of a few fishermen only. Water is plenty here, but wood is scarce. The Nag's Head Rock lies nearly one-third from the lighthouse point, and has no more than 3 feet on it at low water. The larboard side going in is the boldest.

Gabarus Bay

GABARUS BAY.—From the entrance of Louisbourg to Guion Isle, called also Portland Isle, the course is S. W. by W. and the distance more than 3 leagues. Between lies the bay called Gabarus Bay, which is spacious, and has a depth of from 20 to 7 fathoms. Off the south point of this bay, called Cape Portland, lie the Cormorants, a number of islets and rocks, which are dangerous. About 4 leagues to the westward of Gabarus Bay is the Forked Harbor, a narrow winding inlet, where small vessels may run into, and lie land-locked. And five miles S. Westward of this is the remarkable white cliff, already noticed, and called Cape Blancherotte. The shore now winds to the westward, to Cape Hinchinbroke and the Isle of Madame.

Chedabucto Bay.

CHEDABUCTO BAY is wide and spacious; it is bold to on both shores, and free from danger: on its southern side, which is high and nearly straight, are Fox's Island and Crow Harbor. Fox's Island is small, and lies near the shore.

Fox Island Anchorage.

FOX ISLAND Anchorage is one of the greatest mackerel fisheries in North America, during the months of September and October. When sailing in you must pass to the westward of Fox Island, giving it a berth of a quarter of a mile, as there are rocks both above and under water, with 3 and 4 fathoms close to them. You may anchor in from 4 to 10 fathoms, with the west end of the island bearing from E. N. E. to N. N. E. keeping about midway between the island and the main. The water shoals gradually to the bar, which extends from the island to the opposite shore; it has not more than 6 or 7 feet on its deepest part, and dries in one place about one-third of the distance from the island to the main; with northerly and with westerly winds, the fishing vessels ride to the eastward of it in from two to four fathoms, and shift to the westward with easterly winds.

Crow Harbor.

CROW HARBOR is situated on the south side of Chedabucto Bay, and is capable of containing ships of war of the 6th and 5th rates, merchant ships, &c. Many schoo-

ers and sloops, herring, 7 south side of Keep, this be also clear of Island.

ers and sloops resort here in the months of July and August, to take mackerel and herrings. The passage in is to the S. W. of the island that lies in the entrance. On the south side of the beach a beacon is erected, to lead ships clear of the Corbyn Rocks. Keep this beacon in a line with a remarkable tree upon the high land, and it will lead you also clear of the Rook Island Rock, that lies 25 fathoms from the N. W. point of Rook Island.

Beacon.

MILFORD HAVEN, or the Harbor of Guysborough, at the head of the bay, is impeded by a bar, but a sloop of war may pass over it. Within the bar vessels lie in perfect security; the tide, however, sets in and out with great rapidity. The town is at present a place of little trade; but it is protected by a battery. A little to the southward of Guysborough is Salmon River, which rises a considerable way up the country, and contributes to fertilize an extensive tract of good land. From Manchester round the north shore of Chedabucto Bay, the shores are full of settlements, and wear a pleasing aspect, and on the northern side of Chedabucto Bay, you will see several red cliffs; this shore is sandy, with regular soundings in the middle of the bay; the water is deep, from 25 to 35, &c. to 50 fathoms.

Milford Haven.

At Milford Haven, it is high water full and change at 8 $\frac{1}{4}$ h., and the common spring tides rise 8 feet. At the Bay of Rocks at 8 $\frac{1}{4}$ h., rising 7 and 8 feet; and, at the Gut of Canso, at 8 $\frac{1}{4}$ h., common spring tides rising 5 $\frac{1}{2}$ feet.

Tides.

THE SOUTHERN COAST OF NOVA SCOTIA.

CHEDABUCTO BAY TO HALIFAX HARBOR.

DESCRIPTION OF THE LAND.—The eastern part of Nova Scotia is broken into the several islands and passages as represented on the charts. Of the Islands, which are low and covered with stunted fir-trees, the first on the N. E. is called Durell's Island, the second George's Island, and the third, Canso or St. Andrew's Island; outside this latter island is the smaller one, called Cranberry Island, which is now distinguished by a lighthouse, 88 feet high, painted red and white, horizontally, containing two fixed lights.

Lighthouse.

CAPE CANSO is the outer, or easternmost point of St. Andrew's Island. From this cape, westward, to Torbay, the coast makes in several white heads or points; here the country is much broken; and near the S. E. extremity many white stones appear from the offing, like sheep in the woods. During a southerly gale the sea is dreadful here. From Torbay to Liscombe Harbor there are banks of red earth and beaches; and from Liscombe Harbor to the Rugged Islands, (excepting the White Isles, which are white rocks,) the capes and outer islands are bound with black slaty rocks, generally stretching out in spits from east to west; and from the Rugged Islands to Devil's Island, at the entrance of the Harbor of Halifax, there are several remarkable steep red cliffs, linked with beach.

Cape Canso.

The fishermen of Anichat are well acquainted with the channels and inlets on this coast, and frequent them, more particularly in the spring and fall, to catch mackerel and herrings, of which large shoals commonly resort here: but the rocks are so numerous, and the passages so devious, that no stranger should attempt them.

Of the many rocks hereabout, the outer breaker, called the Bass, a rock of 3 feet water, lies more than 2 miles E. $\frac{1}{4}$ S. from the lighthouse on Cranberry Island. At seven-tenths of a mile S. E. from Cape Canso is a similar rock, called the Roaring Bull; and, at one mile to the E. S. E. of the latter, there is said to be another, discovered by a fisherman of Canso, in 1813; but its existence seems to be questionable.

CANSO HARBOR.—Sailing from the westward into this harbor, so soon as you have passed the Roaring Bull, over which the sea generally breaks, run for Pitipas, or Red Head, taking care when above the Black Rocks, to keep them open of the rocky islets off Cape Canso, until you bring Glasgow Head and the north end of Inner Island in one, which will carry you above Man-of-war Rock; then steer westerly, being careful to avoid Mackerel Rock, and make for Burying Island, the north end of which you must not approach nearer than to have a depth of five fathoms; then anchor to the north-westward of it, on a bottom of mud.

Canso Harbor.

St. Andrew's Passage, leading to Glasgow Harbor, being so thickly encumbered with rocks, can only be navigated by those who are well acquainted with its dangers.

Coming from the eastward, pass between Cape Canso and Cranberry Island, giving the latter a sufficient berth: to avoid a shoal which stretches to the southward of it, and steer for Pitipas Head, as before directed. The Northern Passage, between Durell's and George's Islands, notwithstanding its narrowness, yet having a depth of water, and a clear channel, will be found to be the best passage. In sailing in, keep mid-channel between Bald and Net Rocks, the former being above water, and the latter drying at one-quarter ebb,

High Water. when you may steer with safety by attending to the chart, and the situation of Burying Island. At Cape Canso it is high water, full and change, at 50 minutes after 8 o'clock, and the tides rise from 5 to 8 feet.

Dover Bay. DOVER BAY is a wild deep indent, with a number of islands and sunken rocks at its head; yet shelter may be found on the western shore, or during a south-east gale, by giving a berth to the rocks that lie off the south end of Big Dover Island; these are very visible in bad weather; haul up under the island, and anchor between the small islands on the eastern side; within these islands Little Dover Passage continues out south-eastward, having 5, 6, and 7 fathoms water, and quite safe.

Eastward of Little Dover is St. Andrew's Channel, for which no directions can be given, for even those who are well acquainted with the navigation, cannot keep themselves clear of the rocks. This channel leads to Glasgow Harbor, which is, in fact, a part of Canso Harbor.

These places, says Mr. Lockwood, deserve notice, as they may afford shelter in cases of emergency, and in war time are nests for privateers; while from the heights adjacent may be had an extensive view of whatever passes in the Offing.

Raspberry Harbor.

RASPBERRY HARBOR is to the westward of that of Canso, or Port Glasgow: it is small, and the shore is within quite bold. At the entrance, on the eastern side, is an island, having a ledge close to it on the S. E. By rounding this ledge, you may steer directly into the harbor, and come to an anchor under the island which lies in the middle of it, in the depth of 7 fathoms, where you will ride safely. The country here is rocky and barren, and there is a quarry of granite, much in request for millstones. The outlet between Raspberry Island and the main is a complete dock, where vessels can lash themselves to both shores, and ride in 30 feet water; but half way through it has only 10 feet.

White Haven.

WHITE HAVEN, which is two leagues to the westward of Raspberry Harbor, is a place of hideous aspect. Of its rocky islets, the larger and outer one, called White Head, from the color of its sides, is 70 feet above the level of the sea. This islet appears round and smooth, and is a useful mark, as the passage in, on either side, is in mid-channel, not difficult to navigate, and the anchorage is good throughout, in a muddy bottom. Off the head are two breakers, one S. S. E. and the other E. by S. half a mile off.

Torbay.

TORBAY.—The entrance of this bay is formed on the west by a bold headland, called Berry Head. The channel in is between this head and the islands to the eastward. E. S. E. from the head, and south of George's Island, are three very dangerous rocks, which do not break when the sea is smooth. Within the bay, under the western peninsula, there is excellent anchorage, in from 6 to 4 fathoms, muddy bottom, up to the eastern part of the bay; there is also anchorage on the western side of the bay, in from 7 to 3 fathoms, similar ground, where a vessel may lie in safety during any gale. The adjacent lands are rocky, but vessels are built here of from 40 to 120 tons, which are employed in the fisheries.

The principal dangers to be avoided in entering, are the small sunken rocks in the offing, which in smooth water do not break; they should be left to the eastward. Within the bay the anchorage is excellent, in a muddy bottom, with the exception of a few spots of rocks, sheltered from every wind.

Torbay to Country Harbor.

Torbay to Country Harbor.—From Torbay, westward, to Country Harbor, the land, in general, continues rocky and sterile, with deep water close in, but regular soundings without, and from 30 to 20 fathoms of water.

Coddle's Harbor, which is 3½ leagues to the westward of Berry Head, affords shelter to small vessels only; and these enter on the eastern side to clear the breakers. There is a deep inlet, called New Harbor, which lies about 7 miles from the islands, and connected with a chain of extensive lakes; but its navigation is obstructed by a bar across its entrance, and it is open to southerly winds.

New Harbor.

NEW HARBOR.—This place is so much exposed, that even small vessels which occasionally resort there in the fishing season, are under the necessity of leaving it the moment a southerly wind arises.

Inland Harbor lies between Harbor Island and the main, and affords excellent anchorage on a bottom of mud; it is particularly convenient for going to sea with almost any wind.

Isaac's Harbor is on the north-east side of Country Harbor, and has good holding ground, with sufficient depth of water for any vessel. Between Isaac's Harbor and Harbor Point the ground is foul and rocky.

Country Harbor.

COUNTRY HARBOR.—The fine harbor, called Country Harbor, is navigable for the largest ships, twelve miles from its entrance. It is, at present, but thinly settled, yet there are reasons for believing that, in consequence of improvements in the neighborhood, the population will speedily increase. The shores are bold; the anchorage soft mud, with a depth of 13 to 5 fathoms. Mr. Lockwood has said that, "no position in the province is more advantageous for settlers than this harbor; at its mouth the islands afford shelter to fishermen and small vessels, as well as the means of erecting their stages; and the fishing grounds, at a short distance in the offing, abound in halibut, haddock, cod, and

what they term the bait fishery; that is, mackerel, gasp reux, smelts, &c. Salmon are plentiful in their season; and, but for the improvident use of this valuable addition to the means of subsistence, would continue for ages." The ledges off the harbor generally break, and between them are deep passages. On advancing from the eastward there are two rocks to be avoided, which lie as shown on the charts; proceeding inward, you should give Green Island a small berth, and the dangers on that side will be avoided. The rocks on the west of the entrance, named Castor and Pollux, are above water and bold to. When above them give Cape Mocodame a good berth, so as to avoid the Bull, a dangerous sunken rock, that breaks in rough weather, and lies about half a mile from the extremity of the cape. The black rocks are partly dry, and from them upwards, there is no danger, and the anchorage is good. Vessels entering this harbor, must use the utmost caution in steering between the ledges and rocks which are scattered about; fortunately they commonly show themselves whenever there happens to be any sea; this will render the entrance less difficult; but having passed the Black Ledge, which is the innermost danger, the navigation will be perfectly safe for the largest fleet. The tide is scarcely to be perceived, except when in the spring the ice and snow dissolve, and heavy rains are prevalent. At the entrance of Country Harbor it is high water on full and change at 8h. 40. *High water.* Tides rise from 6 to 9 feet.

FISHERMAN'S HARBOR.—In entering this place between Cape Mocodame and the Black Ledge, great care must always be taken, in order to avoid the Bull Rock, which dries at low water, but is covered at high water, and only breaks when the weather is bad. *Fisherman's Harbor.*

HARBOR ISLAND.—The islands on the east side of the entrance, Green Island, Goose Island, and Harbor Island, or the William and Augustus Islands, of Des Barres, are low and covered with scrubby trees. Within Harbor Island is excellent anchorage. *Harbor Island.*

BICKERTON HARBOR, to the west of Fisherman's Harbor, is fit for small vessels only. At two miles to the west of it is Hollin's Harbor, a place of shelter for conifers, and resorted to by the fishermen. Indian Harbor is a shallow and unsafe creek, but has good lands, well clothed with pine, maple, birch, and spruce. The next inlet, called Wine Harbor, has a bar of sand, which is nearly dry. There are a few, and but few, settlers on these harbors. *Bickerton Harbor.*

ST. MARY'S RIVER.—The navigation of this river is impeded by a bar of 12 feet water, which extends across at the distance of a mile and three-quarters above Gunning Point, the west point of the entrance. Below the bar, towards the western side, is a middle ground, which appears uncovered in very low tides; and, above the bar nearly in mid-channel, is a small rocky islet. The passage over the bar is on the eastern side of this islet. The tide, which is very rapid, marks out the channel. The latter is devious, between mud-banks, extending from each shore, and dry at low water. The depths upward are from 24 to 18 feet. Sailing in you should proceed for 4 miles N. N. W. then 2 miles N. by W. and afterwards N. N. W. to the fork, where it divides, the western branch terminating in a brook; the eastern branch continuing navigable a quarter of a mile further up to the rapids. The town of Sherbrook is, at present, a small village at the head of the river, about three leagues from the sea. *St. Mary's River.*

WEDGE ISLE.—The islet called Wedge Isle, which lies at the distance of half a league south from the S. W. point of St. Mary's River, is remarkable, and serves as an excellent guide to the harbors in the neighborhood. The side of this islet, towards the main land, is abrupt, and its summit is 115 feet above the sea. From its S. W. end ledges stretch outward to the distance of half a mile; and some sunken rocks, extending towards it from the main, obstruct the passage nearly half way over. About 2½ miles south from the Wedge, is a fishing bank of 30 to 20 feet, the area of which is about 200 acres. *Wedge*

JEGOGAN HARBOR may be readily found, on the eastward by Wedge Island, and on the westward by the bold and high land, called Redman's Head. The passage in is easy, at the distance of a quarter of a mile from the head, and anchorage good, in muddy bottom. Three-quarters of a mile from it is a dry ledge, called the Shag. *Jegogan Harbor.*

LISCOMB HARBOR.—The entrance of this harbor, which is one of the best on the coast, is between Liscomb Island and the head-land on the west, called Smith or White Point. From the S. E. end of Liscomb Island, a ledge, with breakers, extends to the distance of three-quarters of a mile. Within and under the lee of the island is safe anchorage in from 13 to 8 fathoms. On the N. E. of the island, a vessel caught in a S. E. gale may be sheltered by Redman's Head, already described, with the head S. S. E. in 6 and 7 fathoms, on a bottom of clay. *Liscomb Harbor.*

On the west side, the ground from Smith Point is shoal to the distance of nearly a mile S. S. E. and at 2½ miles south from the point is a rock, on which the ship Black Prince was lost. It constantly breaks, and is partly uncovered. The island-side is bold. The first direction of the harbor is nearly north, then W. N. W. Opposite to the first fish-stage, at half a mile from the shore, is as good a berth as can be desired, in 7 fathoms. From this place the harbor is navigable to the distance of four miles. It is, however, to

Tides.
Bay of Islands.

be observed, that there are two sunken rocks on the north side. At Green Bay (Liscomb Harbor) spring tides rise $7\frac{1}{2}$ feet, neaps $4\frac{1}{2}$.

BAY OF ISLANDS.—The coast between Liscomb and Beaver Harbors, an extent of 6 leagues, is denominated the Bay of Islands. Within this space the islets, rocks, and ledges are innumerable. They form passages in all directions, which have, in general, a good depth of water. At the eastern part of this labyrinth, near Liscomb, is Marie-et-Joseph, an excellent harbor for the largest ships, but requires caution to enter. Nicomquirque is a small settlement in the same range, the inhabitants of which are an industrious set of people. Newton-quaddy, next east of Beaver, is scarcely fit for any but fishing and other small craft, as the channel in is rocky and narrow.

The White Islands, nearly half way between the harbors of Beaver and Liscomb, appear of a light stone-color, with green summits. The latter are about 60 feet above the level of the sea. The isles are bold on the south side; the passage between them safe, and there is good anchorage within them, in from 10 to 7 fathoms. From these the rocks and ledges extend five or six miles from E. to E. N. E. They are bold to, and mostly dry, the water within them being always smooth.

Beaver Harbor.

BEAVER HARBOR.—The Pumpkin and Beaver Islands are very remarkable to vessels sailing along the coast, particularly Pumpkin Island, which is a lofty and dark barren rock; but they afford a smooth and excellent shelter inside of them during a southerly gale. Southerland Island has, on its N. W. side, a deep and bold inlet, where a vessel may lie concealed and secure as in a dock. When in the offing, the harbor is remarkable on account of the small island which lies north of the Black Rock, having at its southern end a red cliff, being the only one on this part of the coast; having entered the harbor, you may choose your anchorage, according to the direction of the wind, the bottom being generally mud. The basin on the west side is so steep, that a small vessel may lie afloat, her side touching the beach.

Lighthouse.

LIGHT.—On the Outer Beaver or Williams Island there is a lighthouse 70 feet high, showing a revolving light, visible $1\frac{1}{2}$ minute, obscured half a minute.

The lantern is on a square building, with two black balls painted on the seaward side.

A reef extends from the east end of Beaver Island a considerable distance, so that on entering the bay you should give the light a berth of three-quarters of a mile.

The harbor is too intricate to be recommended to a stranger.

Sheet Harbor.

SHEET HARBOR.—This harbor is nearly half-way between Country Harbor and Halifax. It is dangerous for vessels to approach in thick weather. The narrow channel between Sober Island and the main, affords secure anchorage, on a bottom of mud.

Without the harbor are several ledges, which show themselves, excepting the outer one, called by the fishermen Yankee-jack, and which, when the sea is smooth, is very dangerous. It has been asserted, that a rocky shoal lies half a mile to the south of the Yankee, but its position has not been ascertained.

Within the entrance is a rock, two feet under water, which will be avoided by keeping the Sheet Rock open of the island next within it, on the eastern side. In sailing or turning up the harbor, give the sides a very moderate berth, and you will have from 11 to 8 fathoms, good holding ground.

The flood at the entrance of Sheet Harbor sets S. S. W. about one mile an hour. High water, full and change, at 2h. 50m. Tides rise 7 feet.

Tides.
Mushaboon.

MUSHABOON, to the westward of Sheet Harbor is a small bay, open to the S. E., which affords shelter at its head only, in from 7 to 5 fathoms, muddy bottom. It is connected to Sheet Harbor by a clear, deep and bold passage, between an island and the main land, not having a shoal or obstruction in it. Here you may lash your vessel to the trees, and, lying in 5 fathoms, soft bottom, with the side touching the cliff, be perfectly sheltered from all winds. This place is uninhabited, the land being incapable of cultivation. In going through the passage to Sheet Harbor you must guard against a sunken rock at its mouth, which, from the smoothness of the water, seldom shows its position. This rock lies 400 yards off Banbury Islands, and may easily be cleared by keeping the Sheet Rock open of the Island.

Spry Harbor.

SPRY HARBOR has on each side of the entrance, a high rocky, barren cape, distinguishable at a long distance. When sailing in you will perceive the land in the centre of the harbor, appearing in three distinct hills; keep the valley between the two easternmost on with the Bald Rocks, which will lead you between Mad Moll Reef and Maloney Rock. You may now steer in for the anchorage, at the western head of the harbor, where a fleet may be land-locked, in a muddy bottom.

This harbor is open to S. E. and E. S. E. winds. At the entrance, the flood tide sets in at about one mile an hour. The tide at the entrance of Spry Harbor, sets in with the velocity of about one mile an hour.

Deane, or Pope's Harbor.

DEANE, or POPE'S HARBOR, on the western side of Gerard's Isles, above mentioned, has a ledge at its entrance, forming an obtuse angle at the two points, three-fourths of a mile from each, and from which a shoal extends to the southward half a mile.

It may be perceived from the eastern end of the shoal.

TANGI which secures dries at low tide 5 to 4 fathoms. The inhabitants are of the SHOAL.

THE frigate's

It may be passed on either side; but on the west, care must be taken to avoid a shoal extending from the outer Tangier Island. The best shelter is under the smaller island on the eastern side, where there are from 8 to 6 fathoms, with bottom of blue clay, mud and sand.

TANGIER HARBOR, next to Des Barres or Pope's, is formed by craggy barren Islands, which secure vessels from all winds. At about two miles from its mouth is a ledge that dries at low water. The anchorage is under the eastern shore, above Fisher's Nose, in 5 to 4 fathoms, stiff mud. Here are some good tracts of pasture land, and the few inhabitants are occupied in the fishing and coasting trade. *Tangier*

SHOAL BAY is the Saunders Harbor of Des Barres. This bay has a good depth of water and excellent anchorage, on fine white sand and strong mud. The latter is to the northward of the island now called Charles Island, and vessels lie in it, land-locked, in 7 fathoms. Off the mouth of the harbor is a rock, that always breaks; but it is bold to, and may be passed on either side. Some parts of the harbor will admit large ships to lie afloat, alongside the shore, over a bottom of black mud. Supplies of stock, &c. may be obtained from the inhabitants of this place. *Shoal Bay.*

SHIP HARBOR is easy and safe to enter, having good anchorage in every part, the bottom being a tough clay of bluish color; it leads to Charles's River, above the narrows of which a fleet of the largest ships may lie alongside of each other, without the smallest motion. In this harbor, and on the isles about it, are near twenty families, who keep small stocks of cattle &c. The entrance, called by Des Barres Knowles' Harbor, is deep and bold: it lies between two islands, of which the eastern is Brier's Island, on the western part of which is a lighthouse. A white cliff, which may be seen for a considerable distance in the offing, is a good mark for the harbor: at first it resembles a ship under sail, but on approaching seems more like a schooner's topsail. Brier's Island, before mentioned, is a low rugged island, and ledges partly dry, extend from it three-fourths of a mile to the eastward: avoiding these when entering this way, you may range along the western island, and come to an anchor under its north point, in 6 or 7 fathoms, the bottom of mud. Ship Harbor, proper, commences about 7 miles to the N. W. of Brier's Island, at a beach in the western shore, which has 6 fathoms close to its side; its entrance is one-third of a mile broad, widening as you ascend it. Above Green Island are some shoals and ledges, but the anchorages below them are capacious and good. Spars, stock, water, and firewood may be obtained here. *Ship Harbor.*

OWL'S HEAD, or KEPPEL HARBOR, which is next to the west of the harbor last described, although smaller than many other harbors on the coast, has sufficient space for a fleet. It may be known, at a distance, by Owl's Head, on the western side, which appears round, abrupt and very remarkable. The neighboring coast and isles are rugged and barren, but the harbor has a few settlers. The entrance is of sufficient breadth to allow a large ship to turn in it; and, within the harbor, shipping lie land-locked, when in 6 and 7 fathoms, with a bottom of mud. In taking a berth, you will be guided by the direction of the wind; as, with a S. W. gale, the western anchorage is to be preferred, and the eastern with a S. E. The tide sets into this harbor from the S. W. at the rate of one mile an hour. *Lighthouse.*

LITTLE HARBOR is somewhat to the westward of Owl's Head Harbor, and is a place of safety for small vessels; but its entrance is intricate, and requires a good knowledge of the passages leading to it, in order to enable a vessel to enter. *Owl's Head, or Keppel Harbor.*

JEDORE HARBOR.—In the offing, at the distance of two leagues off the land, the body of the flood sets in S. W. by S. at the rate of half a mile an hour. From the appearance of this harbor on the charts, it might be presumed that it is spacious and commodious; but on examination, it will be found to be really different. The entrance is unsafe and intricate; a shoal of only 11 feet lies at its mouth; the channel within is narrow and winding, and there are extensive mud flats, covered at high water, and uncovered with the ebb: hence a stranger can enter with safety only at low water, the channel being then clearly in sight, and the water sufficient for large ships. The best anchorage is abreast of the sand-beach, two miles within the entrance, in from 9 to 6 fathoms, on a bottom of stiff mud. Two and a half miles above the beach the harbor divides; one branch to the larboard is navigable nearly to its extremity, and has several sunken rocks on it; while to the starboard is a large space with a clear bottom, and from 3 to 5 fathoms. On the eastern shore are Oyster Pond and Navy Pool, two deep inlets, but choked at their entrance by a bed of rocks; the river terminates with a rapid. *Little Harbor.*

The lands at the head of the harbor are stony, but tolerably good; the rest barren and deplorable. *Jedore Harbor.*

Without the entrance, on the eastern side, are two isles, called Roger and Barren Islands, between and within which the passages are good, and afford shelter in case of necessity; from these the land runs nearly E. N. E. and forms a deep inlet, called Clam or Clamb Bay.

THE BRIG ROCK.—This is a very dangerous rock of 3 feet, about the size of a frigate's long boat; it lies S. E. $\frac{1}{2}$ E. from Jedore Head, and S. W. two miles from the *The Brig Rock.*

isle, called Long Island. The weed on the top of it may frequently be seen at the surface. The marks for this rock are a house and barn in Clam Bay, just open of the east end of Long Island, bearing N. 5° E. and the house on Jedore Head open to the N. E. of Jedore Rock.

Bearings.

An account is given of a rocky shoal over which a vessel passed in 8 fathoms water, and upon which were taken the following bearings: Jedore Head N. N. W. 4 W.; west end of Long Island N. E. by N.; and Jedore Outer Ledge or Brig Rock, E. by S. This shoal may have less water upon it in other parts, but as these bearings do not agree with the chart, we apprehend there must be some error in its exact position. Mention is also made of a rock, bearing from Jedore Head S. 38° E. distant 6 miles; this has only 5 feet over it, and 22 fathoms close within and without it. This is supposed to be the Brig Rock, but if so the bearings are not correct. These two notices are inserted to show that some dangers exist hereabout, and will be sufficient to warn the mariner to search for and cautiously avoid them.

Tide.

It is high water at Jedore Head full and change at 20 minutes after 8 o'clock, and the tide rises from 6 to 9 feet. At Owl's Head, it is high water at 30 minutes after 8 o'clock, and the tide rises from 5 to 7 feet.

Polluck Shoal.

POLLUCK SHOAL.—At about nine miles south from Jedore Head is a reef, called the Polluck Shoal; its area is about one acre, having a depth of 24 feet over it; and during a swell, the sea breaks on it with great violence.

Jedore Ledges.

JEDORE LEDGES.—Those advancing between the Brig Rock and Polluck Shoal, should be cautious in approaching any of the Jedore Ledges; they are laid down on the charts, and said to extend from 5 to 9 miles from the mouth of the harbor.

Between Jedore and Halifax, there are no harbors of any consideration for shipping, but there are numerous settlements. The land in this extent is, in general, of moderate height, rising gradually from the shore. Red and precipitous cliffs, the characteristic of the eastern coast, may be seen from 7 to 9 miles off. The best harbor is that called Three Fathoms Harbor. When you are within this harbor the passage will be found to be clear, between banks of soft mud. But it is only fit for schooners and sloops, although it has occasionally been visited by large vessels. The anchorage is tough blue clay. The cliffs are composed of bright red earth, remarkable for vessels coming from the eastward. This harbor lies immediately to the east of an islet called Shut-in Island; and, with the wind on shore, is difficult and dangerous; so that it is to be attempted only in cases of real distress. The channel lies two-thirds over to the northward from Shut-in Island, and turns short round the starboard point to the westward.

In beating to windward, ships may stand to within a mile and a half of the shore, the soundings being tolerably regular, from 20 to 12 and 8 fathoms. Captain Aldridge says, "we made the land to the windward of Jedore Ledges, which bore E. S. E. and saw an island, appearing white along the bottom; between this and another island lay Jedore, a large rock, to the eastward; the island was quite white round the bottom, and had a thick green wood at top. To the westward of the westernmost of these islands, is Owl's Head, a large high bluff land; the western part of it is a darkish white, with a patch of red. A little to the eastward of this red patch are two houses, situated in Clam Bay, to the west of which is a sandy beach. In coming from the bank we had 45 fathoms, stones, then 37, 39 and 40 fathoms, mud and small pebbles."

HALIFAX TO CAPE SABLE.

GENERAL REMARKS.—Vessels coming from the eastward, and bound for the harbor of Halifax, should pay particular attention to their soundings, especially when they consider themselves in the neighborhood of Sable Island; which island and its surrounding banks we shall hereafter describe; it will therefore only be necessary at present to remark, that the island is low, and appears like small sand hillocks; that, in summer, it frequently is enveloped in a fog, but you may always discover your proximity to it by your soundings; and that on its N. E. and N. W. sides are dangerous bars; you will have except on these sides 2 fathoms, 2 cables' length off, and your depths will increase in proportion to the distance you are from it, at a general rate of about 2 fathoms for every mile, until you are more than 20 miles from it. Signals are placed on the island, and also a gun, to answer such as may be heard from vessels in distress, or in thick weather, which have already saved from shipwreck a number of vessels.

Signals.

In making land more to the south-westward, and about Cape Sable, you must be particularly careful to avoid Seal Island Rocks and the Brazil Rock. To the westward of Great Seal Island, the soundings are very irregular for upwards of 20 miles, at which distance are 45 fathoms, gravel and stones. Indeed, the soundings along Nova Scotia, from Cape Canso to Cape Sable, partake of the same irregularity, from 25 to 50 fathoms, therefore you should not come nearer the land than 35 fathoms, unless you are well assured of the exact part you are in, for otherwise endeavoring to enter Halifax, you may be driven into Mahone or Mecklenburgh Bays, and be caught by S. E. winds. The

The l other on High water at

weather is generally foggy 4 or 6 leagues off shore, both in spring and summer; but it becomes clearer as you get nearer the coast, and with the wind off the land it will be perfectly clear.

From one to three leagues out to the seaward, mackerel, halibut, rays, haddock, and cod are found in plenty; and at the entrance to the harbors and rivers, salmon are taken from April to August; the bays abound with herrings in June and July, and with tomcod all the year round.

HALIFAX HARBOR.—In approaching the harbor of Halifax, you will perceive the coast about its environs, particularly to the southward, to be rugged and rocky, with patches of withered wood scattered about, but the land is rather low in general, and not visible 20 miles off, except from the quarter deck of a 74. The high mountains of Le Have and Aspotogon excepted, which may be seen 9 leagues off. When Aspotogon Hills, which have a long level appearance, bear north, and you are 6 leagues distant, an E. N. E. course will carry you to Sambre lighthouse; this stands on Sambre Island, and is on a high tower, painted white, elevated above the sea 132 feet. There are two 24 pounders placed on the island, under the direction of a small party of artillery men; these are fired on the approach of vessels, and contribute much to the mariner's safety by warning him off the adjacent breakers. Sambre Island and lighthouse lie on the S. W. side of the entrance to the harbor. In standing in for the land you may know on which side of the harbor you are, by a remarkable difference that takes place immediately from its mouth in the color of the shores, which, if red, denotes you are to the eastward, and if white, to the westward of it. S. by E. distant 2 full miles from the lighthouse, lies the Henery Rock, with only 8 feet water over it; and E. N. E. distant one mile from the Henery, lies the Lockwood, of 12 feet; these appear to be but little known, although they are both so very dangerous.

Halifax Harbor.

Lighthouse.

THE LEDGES.—About 2 miles to the westward are the Western Ledges, these are the Bull, the Horses, and the S. W. or Outer Rock. The Bull is the westernmost; and nearest to the land; this is a rock above water, lying about two-thirds of a mile S. E. by E. from Pendant Point, the lighthouse bearing from it, E. 70° S. The Horses are about a mile to the south-eastward of the Bull, the lighthouse bearing E. by N. distant one mile and three-quarters; and the S. W. Rock or Ledge lies with the lighthouse bearing E. by N. distant one mile and a half. To avoid these, constant caution will be requisite, though they are surrounded by deep water; the channel between the Bull and the main, having 10 fathoms water, and the passage clear; between the Horses and the Bull are 16 fathoms, and no intermediate danger; and between the Horses and the S. W. Rock there are 20 fathoms.

The Ledges.

A rock with 12 feet on it has been found by Capt. Owen R. N. It bears N. E. from the light, one mile and three-quarters, nearly.

The Eastern Ledges are the Sisters, or Black Rocks; these lie nearly E. by S. from the lighthouse, distant two-thirds of a mile. There is also the Bell Rock, lying further in, and about a quarter of a mile from the land, the extremity of Chebucto Head bearing N. by E. $\frac{1}{4}$ E. distant three-quarters of a mile. In advancing up the harbor, you will meet with several other rocks, as the Rock Head which lies with Chebucto Head, S. W. by W. distant $2\frac{1}{2}$ miles, and the Devil's Island N. E. $\frac{1}{4}$ E. about the same distance; the Thrum Cap, which extends from the south end of Mc Nab's, or Cornwallis' Island; the Lichfield, on the western side of the harbor, having only 16 feet water over it; and the Mars Rock, lying also on the western side, Point Sandwich bearing N. distant half a mile, and nearly in a line with it and the west side of George's Island; all these are distinguished by buoys and flags being placed upon them. There is also a reef, called the Horse Shoe, which runs out from Manger's Beach, on the west side of Mc Nab's Island; this is dangerous and must be carefully avoided. On Manger's Beach is a tower, called Sherbrook Tower, on which is a lighthouse, elevated 58 feet above the level of the sea, erected for the purpose of guiding vessels up the harbor.

Lighthouse.

When abreast of Chebucto Head, or when Sambre Light bears W. S. W. the light on Manger's Beach should never be brought to the westward of N. By keeping the light from N. to N. by E. will lead clear of the Thrum Cap Shoal. This lighthouse bears from the Thrum Cap Buoy N. $\frac{1}{4}$ W. two miles and a half.

Vessels coming from the eastward must keep Sambre light open to the southward of Chebucto Head, until the light opens on Manger's Beach, which will then bear N. $\frac{1}{4}$ W. when they will be to the westward of Thrum Cap Shoals, and may shape a course up the harbor, always keeping the light on the beach open and on the starboard bow.

Vessels coming from the westward will see the light when they are as far to the eastward of Chebucto Head; by keeping it open and on the starboard bow, it will lead them up to the beach.

The light on Sherbrook Tower appears of a red color, which distinguishes it from any other on the coast.

High Water, Halifax Dock Yard, 8 o'clock; spring tides rise from 6 $\frac{1}{2}$ to 9 feet. High Tides. water at Sambre Isle 8h. 15m.; spring tides rise from 5 to 7 feet.

Buoy. Half way between Mauger's Beach and George's Island is a shoal, on the opposite side, extending to the S. E. from Point Pleasant nearly one-third of the channel over, and having a buoy at its extremity; the thwart mark of this buoy is a little islet at the entrance of the N. W. arm on with a remarkable stone upon the hill, appearing like a coach-box, and bearing W. S. W. Between Point Pleasant Shoal and Mauger's Beach is a middle ground of 4½ and 5 fathoms, sometimes pointed out by a buoy. This middle ground extends north and south a cable's length, and is about 30 fathoms broad. As you fall off to the eastward of it there will be found from 7 to 13 fathoms water, muddy bottom; while on the west side there are from 10 to 14 fathoms, coarse rocky soundings.

Reid's Rock. REID'S ROCK has 12 feet water over it, and lies in shore, about midway between Point Pleasant and Halifax. The thwart mark for this danger is a farm-house in the wood, over a black rock on the shore, bearing W. by S. and opposite to Reid's Rock is a buoy on a spit extending from the N. W. end of Mac Nab's Island.

Mac Nab's Island. MAC NAB'S ISLAND lies on the eastern side of the channel, and is nearly three miles in length and one in breadth; there is a small island to the eastward of it, called Carroll's Island; boats can pass this way, or between it and the Devil's Island shore, in what is commonly called the S. E. passage, but the channel is too shallow for shipping, and it is further obstructed by a bar of sand to the southward, over which are only 8 feet water. Mac Nab's Cove has good anchorage in from 9 to 4 fathoms, muddy ground. The best situation is in 7 fathoms, with Mauger's Beach and Sandwich Point locked; George's Tower touching Ives' Point.

Halifax Harbor. Dartmouth is a settlement on the eastern side of the harbor, opposite Halifax. To sail for Halifax Harbor.—Having made the lighthouse, and coming from the westward at night, with a westerly wind, the light being 7 or 8 miles off, steer E. N. E. or E. by N. until you have passed the S. W. ledges, and the lighthouse bears N. then run on N. E. or N. E. by N. until you bring it to bear N. W. which being done, take a N. N. E. or N. E. by N. course, until you bring it W. N. W.; you will then, agreeably to the wind, haul up N. or N. by E. for Chebucto Head, avoiding the Bell Rock. Chebucto Head is bold to within half a mile of the shore; run on north, along the west shore, for Sandwich Point, which also is bold: thus you will safely pass the Litchfield Rock, leaving it on your larboard side; this rock has a buoy placed on its eastern end, a mile northward of which is the Mars Rock, whose situation is pointed out by another buoy, which must also be left to the larboard. When abreast of Sandwich Point, get as near Middle Channel as you can, for on the opposite side is the Horse Shoe, a dangerous shelf, which stretches out from Mauger's Beach; steer on mid-channel between Mauger's Beach and the Horse Shoe, and having passed the latter, edge over towards Mac Nab's Island. Midway between the Island and Point Pleasant Shoals, on the extremity of which is a buoy, and rather more than half a mile further, on the same side, is Reid's Rock, whose position is also denoted by another buoy; these are all to be left on the larboard side. On the starboard, or opposite side, is a red buoy placed upon the spit which runs off Mac Nab's Island; you will sail on between these two latter buoys, and having passed the reef, steer directly north for George's Island, which you may pass on either side, and run up for, and abreast of the town of Halifax, where you will find anchorage in 9 and 10 fathoms, muddy ground, two cables' length east of the mooring buoys, or near enough to the wharfs to throw your hawser on shore. There is a middle ground between Mauger's Beach and Point Pleasant Shoal, which sometimes has a buoy upon it, but no less than 5 fathoms has yet been found upon it.

Buoy. "The great difficulty of making Halifax from the eastward, particularly in the winter season, is that the winds are generally from the W. S. W. to N. W. and blow so hard as to reduce a ship to very low canvass, if not to bare poles; but should the wind come to the eastward, it is invariably attended with such thick weather as to prevent an observation, or seeing any great distance; and consequently renders it imprudent to run on a lee shore under such circumstances, and more particularly in the winter time, when the easterly winds are attended with sleet and snow, which lodge about the masts, sails, rigging, and every part of the ship, becoming a solid body of ice so soon as the wind shifts round to the N. W. which it does suddenly from the eastward. What adds considerably to the above difficulty is, having been several days without an observation, and subject to a current, which sometimes runs strong to the southward, you may have the Bay of Fundy open, and be swept into it by the strong indraught which prevails when the wind has been any time from the southward or eastward.

"From the above circumstances, I would recommend that ships bound to Halifax in the winter, should shape a southerly course, and run down their longitude in latitude from 38° to 36°, in which parallel they will make the principal part of their passage in a temperate climate, until they approach the coast of America, when they will be met by the westerly, or even north-west winds, which will enable them (having got soundings, on St. George's Bank,) to make their course good along shore, and with a free wind and clear weather, cross the Bay of Fundy, with confidence of their situation; then, so soon as they have shut in the bay, keep the shore on board the whole way to Halifax light-house."

Observe, it must be part and to go clear the southward as best suits. With respect to George's Island stand up for Brenton Head and Shonia. The long N., or N. 4 upon it, in a gers on both George's Is. The mark main open. Over this rock The mark entrance of which clear farm-house In approx league to av by N. haul tinguishable are led clear Head and Head in sig home to Ge on the right fathoms, m is not a sin stranger wi and load ale Catch H a bar across is a fine ru oms wide o that forma feet, soft REMARK and appear togon and the rocks bald or bar and Port M being leve from thone ren places visible at a SAMB off its ent channel in ward may of M to tom, with The str only 2 fat The pa may oter the west be atten ships, bu TEN has a fair cure anc in bad w TEN

Observe, in coming from the eastward with an easterly wind, the Thrum Cap Shoals must be particularly avoided, a red buoy, as before noticed, now marks their extremity; and to go clear of them, you should bring the easternmost land in sight a ship's length to the southward of Devil's Island, bearing E. N. E. nearly, and steer in W., or W. by S., as best suits the distance you are from the island, and according to the wind and situation. With respect to the shoals, you may pursue a West, N. W., or W. N. W. course, until George's Island comes a sail's breadth open to the westward of Mac Nab's Island; then stand up for Sandwich Point, or the fort, until St. Paul's steeples, in Halifax, is open of Brenton House; keep this mark on, and you will go in the fairway, clearing Point Pleasant Shoals and Maugur's Beach; then steer on as before directed.

The long mark for Halifax Harbor, from abreast of Chebucto Head, and steering in N., or N. 4 W., is the middle of three hills, over Dartmouth village, having some trees upon it, in a line with the N. W. end of George's Island; this will lead clear of the dangers on both sides, and over the Middle Ground, in from 5 to 8 fathoms, and up to George's Island.

The marks for the Litchfield Rock are the channel between the Devil's Island and the main open, bearing E. N. E. and George's Island open to the eastward of Sandwich Point. Over this rock are only 16 feet.

The marks for the buoy at the extremity of Point Pleasant Spit, is a small island at the entrance of the N. W. arm, on with the stone on the hill, bearing W. S. W. The marks which clear Point Pleasant Shoals will also clear the Reid Rock: its thwart mark is a farm-house in the wood over a black rock on the shore, bearing W. by S.

In approaching from the westward, round the lighthouse, at the distance of a short league to avoid the sunken rocks which lie to the southward, when the light bears N. W. by N. haul in N. by W. The flag staves on the Citadel Hill above the town are distinguishable at a considerable distance; by keeping them open of Sandwich Point, you are led clear of the Bell, Litchfield, and Mars Rocks, on the west side, and the Rock Head and Thrum Cap to the east. When arrived at Sandwich Point, keep Chebucto Head in sight, by not allowing it to be shut in; this plain mark will lead in the fairway home to George's Island; leaving Point Pleasant Shoals on the left, and Mac Nab's Shoals on the right, round George's Island on either side, and anchor any where in 6, 10, or 13 fathoms, muddy ground. From George's Island to the entrance of Sackville River, there is not a single obstruction. Men-of-war commonly anchor off the naval yard, which a stranger will distinguish by the masting sheers; merchant vessels discharge their cargoes, and load alongside the wharves.

Catch Harbor, fit only for small vessels, lies to the westward of Chebucto Head; it has a bar across with breakers, and only 9 feet water; within it are 3 and 3½ fathoms. There is a fine run of fresh water at the head of the harbor. Herring Cove is about 100 fathoms wide at the entrance, and bold on both sides, with 7, 5, and 4 fathoms up to the elbow that forms the Inner Cove, within which small vessels lie perfectly sheltered in 7 and 9 feet, soft mud, the sides being one entire body of rock.

REMARKS.—Leaving Halifax, and sailing westward, you will find the shores to be steep, and appear from seaward broken and rocky, with whitish cliffs: the high lands of Apogonog and Le Have, before mentioned, are conspicuous and remarkable; to the westward the rocks about the land appear black, with reddish banks of earth. Le Have appears bald or barren at the top, with red earthy hillocks under it, and between Cape Le Have and Port Medway, or Jackson, are some hummocks inland, the coast to the seaward being level and low, and the shores marked with white rocks, with low barren points; from thence to Shelburne and Roseway it is woody. Near Port Latour are several barren places, and thence to Cape Sable the land is low, with white sandy cliffs, particularly visible at sea.

SAMBRO HARBOR is a mile and three-quarters N. N. W. from the lighthouse: Sambro Harbor off its entrance is the Bull Rock; there are also two other rocks between. The best channel into the harbor is between Pennant Point and the Bull, but vessels from the eastward may run up between Sambro Island and the inner Rock; you are to leave the Isle of Man to the leeward in entering. The anchorage is within the island, on a muddy bottom, with three fathoms water.

The strait which connects the harbor with Londy Basin is exceeding narrow, and has only 2 fathoms water. This place is generally the resort of coasters in bad weather.

The passage between the rocks and ledges that lie to the southward of Sambro Harbor, may oftentimes conduce to the safety of vessels, that make the land by mistake so far to the westward of the light as to be unable to clear the dangers southward of it, but should be attempted only in cases of emergency; the depth of water is sufficient for the largest ships, but great prudence is required.

TENNANT HARBOR is situated round the point to the westward of Port Sambro, has a fair channel leading in between Tennant Great Head and Island, with good and secure anchorage, particularly above the islands, in 6 or 8 fathoms; it is extensive and safe in bad weather, and the dangers are all visible.

TENNANT'S BAY is well sheltered above Macworth Point, and there is anchorage

Tennant Harbor.

Tennant's Bay.

in 9 fathoms a bottom of tough blue clay. The passage lies between the rocks of Point Macworth and the white rocks. There is also a safe passage between Cape Teanant and Hervey Island, with anchorage in from 5 to 8 fathoms. When entering, the land presents to the eye of a stranger the rudest features of nature, but it is extensive and safe, and in bad weather the dangers all show themselves. The tides rise 8 feet, and it is high water at three-quarters after 7.

Tides.

Prospect Harbor.

PROSPECT HARBOR lies about 3 miles to the N. W. of Cape Prospect, which forms the west side of Bristol Bay; and its entrance is encumbered with a cluster of islands which form the western side of Bristol Bay. At the back of these islands is a considerable inlet, called by Des Barres, Parker's River, but little frequented. Prospect Harbor wears, at its entrance, a rugged broken appearance, but it is safe, commodious, and extensive, and in rough weather the dangers mostly show themselves. Vessels coming from the eastward, and rounding Cape Prospect, must beware of a rock with 17 feet over it; it lies south about one-third of a mile from the cape; go not between it and the cape, but proceed on its southern side in 20 and 21 fathoms water, by keeping more than half a mile from the land, you will steer quite clear of danger, and may sail boldly up its eastern channel, between Prospect and Betsey's Islands; having passed those, the channel narrows; the western passage is between Hobson's Nose and Dorman's Rock; there is good anchorage for large ships above Pyramid Island, and also for small vessels within Betsey's Island, in 4½ fathoms, blue stiff clay. At the entrance to this harbor, depths are very irregular, and there is a rock over which the sea breaks, having 3 fathoms water over it, and lying 2 cables' length to the eastward of Dorman's Rock. There are some residents on the western side of the bay.

Leith Harbor.

LEITH HARBOR.—This lies about 2½ miles to the north-westward of Prospect Harbor, and here are situated the inlets called Shag and Blind Bays, both possessing excellent anchorages. At its entrance lies the Hog, a sunken rock, having 6 feet water over it, and bearing E. S. E. about one mile and a half from Taylor's Island. In fair weather the Hog Rock may be perceived by a constant ripple over it, and in bad weather, with an onshore wind, it will be distinguished by the breakers. There are good channels on both its sides, but the eastern one is always to be preferred on account of the ledge which extends E. S. E. about half a mile towards it from Taylor's Island.

Dover Port.

DOVER PORT lies at the western side of the entrance to Blind Bay, and is chiefly formed by Taylor's and the adjacent islands; this is the Port Durham of former charts, and affords safe and good anchorage; the eastern passage is the best, and sailing in, you must give the reef that stretches off the east end of Taylor's Island a sufficient berth, anchoring within the body of the largest island, in 7, 8, 9, or 10 fathoms, muddy bottom. The western entrance has some sunken rocks in it, and the water is in some places but shallow.

Between the harbors of Halifax and Dover the shores are craggy, broken, and barren, steep to, iron bound, and destitute of trees; but the creeks and inlets abound with fish, and great quantities of cod, herrings, and mackerel, are caught and cured here for the markets.

Margaret's Bay.

MARGARET'S BAY.—The entrance to this bay is to the westward of Taylor's Island about one league. The bay itself is full 25 miles in circumference, in length 9 miles, and in breadth, from Peggy's Point to Owl's Head, about 2 miles. Here are harbors capable of receiving ships of war, even against the sides of the shore, and sufficiently wide to turn in. In choosing a berth, it is usual to be guided by the direction of the wind, taking the western anchorage in S. W. gales, and the eastern one in S. E., where you lie land-locked, the bottom mud.

Owl's Head.

OWL'S HEAD is very remarkable, being round and abrupt. The lands and islands in the neighborhood are rugged and barren. The body of flood tide sets in from S. W. at the rate of one mile per hour.

Following the coast, which runs nearly 2 miles W. N. W. from Taylor's Island to East Point, there is a rock uncovered at low water, which lies near the land, having a passage between, with 4 and 5 fathoms water. The shore all the way is rugged and steep, against which the sea beats violently. N. N. W. from East Point, one mile, is Contact Point; and in the same direction, 1¼ mile further, is Peggy's Point; beyond which, a short mile, is Shut-in Island, 200 feet high, and covered with trees. Off the southern point of this island there is a shoal of 9 feet, with 6 and 7 fathoms between it and the island; and near to Peggy's Point there is another of 15 feet, with 6 fathoms to the northward of it. During southerly gales the water on the lee side of the islands becomes smooth, and the bottom holds well. Indian Harbor runs in here, and forms a place fit for small vessels, but affords no shelter, being entirely open to the sea. To the E. N. Eastward of Indian Harbor is Haggel's Cove, distant one mile, a cove or harbor of similar description. Luke's Island, Thrum Cap, Jolliman and Wedge Islands all lie off the eastern side of Margaret's Bay, and contribute to break off the force of the sea, so that under the lee of Luke's and Jolliman's Islands, there is good anchorage at all times for ships of every description.

FRENCH COVE is easy of access, and may be considered as a natural dock, extensive, with plenty of water, and well sheltered. There is a shoal of 10 feet water lies opposite to the entrance of this cove, at the distance of two miles; but as the islands of the eastern shore are bold to, no vessel need go so far out into the bays as to approach too near this danger.

HEAD HARBOR, or DELAWARE RIVER, lies at the further end, on the northern extremity of the bay, and is an anchorage of most excellent description, forming so complete a place of safety that a fleet of snips might be securely moored side by side, and remain undisturbed by the most violent hurricane. The surrounding lands are high and broken. Mason's Point is in itself a good farm, well stocked with cattle, and excellently cultivated; and Moser's Islands, at its entrance, are used as sheep-folds. The land on the larboard side of the entrance to the Head Harbor is 446 feet high.

INGRAM RIVER.—To the westward of Head Harbor is Ingram River, running in to the northward of Moser's Islands. At its entrance it is one-third of a mile wide, with 7, 6, and 5 fathoms water; it then gradually decreases to its head, which is shallow and sandy. To the westward is Gaspar's Indent, open, shallow, and seldom frequented. These indents or coves have rugged points projecting southward, and it is from these places small craft are employed to take limestone, building sand, &c., the former of these being of a very superior quality. Cooper and Indian Rivers are both shallow rocky nooks, but are the resorts of salmon, and in the lakes above, trout abound in great quantities, of delicate flavor, and commonly of a deeper red than the salmon.

HUBERT'S COVE is situated at the N. W. corner of Margaret's Bay. Here at the entrance is a ridge of rocks about 100 fathoms long, and covered at high water, so that when the sea is smooth it becomes invisible. In order to avoid this danger, you have only to keep towards the western or eastern side of the harbor, for both sides are bold to. The western channel is much the wider and better of the two, and by keeping the harbour shore on board, a stranger or a ship dismissed, or in distress, or without anchors, may turn in and find shelter, running aground with perfect safety.

Long Cove is $\frac{1}{2}$ miles to the south of Hubert's Cove, and affords good anchorage with a westerly wind. To the southward of Long Cove the coast is bold and rugged, without any danger, except a small rock of six feet water, which lies close in to the land.

NORTH WEST HARBOR is about one league to the southward of Long Cove; at its entrance is Horse Island, which divides it into two channels. There is a good passage with 10 fathoms water on each side of the island, and small vessels may find anchorage behind it, in from 6 to 9 fathoms, or further up, in 5, 4, or 3 fathoms. Owl's Head is an abrupt precipice, and forms the south point of entrance to North West Bay.

SOUTH WEST, or HOLDERNESS ISLAND, is a remarkable rocky island, full 50 feet high, and steep on all sides; directly to the northward of the northern part of the South West Isle is a small spot of 3 fathoms water, and to the north-westward of the island is what is commonly called the South West Harbor, formed between Owl's Head, which literally is a rocky island, separated from the main by a very narrow passage, not even navigable for boats; here are 5, 6, and 7 fathoms water, but the place is seldom frequented. To the E. N. E. of South West Island, distant nearly half a mile, is a rocky shoal of 4 fathoms; this the sea frequently breaks over, in bad weather, but it cannot be considered dangerous, unless to vessels that draw very deep water.

THE HORSE SHOE, or DOG ROCK, lies about south, distant one mile and a half from the South West Island; directly west from East Point, distant 2 miles and three-quarters, and from Taylor's Island W. by N. 4 miles and one-third; there are several small sunken rocks about it; part of it is consequently above the surface of the water, shelving on all sides, and the sea in stormy weather breaks violently over it; at a little distance from it, on the western side, are 6 fathoms, and on its eastern side, at a similar distance, are 8 fathoms; it then sinks into deep water; between the Horse Shoe and the South West Island there are 12, 14, 26, 31, and 30 fathoms water. Vessels from the eastward, bound for Margaret's Bay, commonly go in between the Horse Shoe and East Point: a northerly course will carry you midway between them right up to the head of the bay, without encountering any danger, except those already described.

To the westward of South West Island is Aspotogon Harbor, too shallow for shipping; at its entrance are Black, Saddle, and Gravelly Islands and Shoals; to the southward of these is Seal Lodge, shallow and dangerous; it lies W. $\frac{1}{2}$ N. distant $\frac{1}{2}$ miles from the Horse Shoe, and W. S. W. nearly 3 miles from the southern part of South West Island.

IRONBOUND ISLAND.—W. S. W. $\frac{1}{2}$ S. from the south point of South West Island, distant 5 miles, is Ironbound Island, about one mile long, narrow, and steep to; it lies S. S. E. $\frac{1}{2}$ S. one mile and a half from the extremity of the peninsula which divides Margaret's and Malone Bays, and is called New Harbor Point; between which is a good channel, with from 6 to 17 fathoms water, the ground being chiefly a black sand.

GREEN ISLAND.—S. $\frac{1}{2}$ E. distant one league from Ironbound Island, S. W. by S. 7 miles from South West Island, W. S. W. 3 leagues from Taylor's Island, and W. N. W. $\frac{1}{2}$ W. from abreast of Sambre lighthouse, lies Green Island; it is small. Midway between Ironbound and Green Islands there is said to be a shoal of only 2 fathoms, but its

French Cove.

North West Harbor.

South West, or Holderness Island.

Ironbound Island.

Green Island.

Mahone Bay.

exact position is not accurately known, and therefore it is omitted in the charts; the mariner, in passing through the channel between these islands, will do well to look out for and guard against the probable existence of such a danger; there is otherwise water sufficiently deep for any vessel.

MAHONE BAY is separated from Margaret's Bay by the peninsula upon which the high and conspicuous mountain of Aspotogon is situated, whose appearance, in three regular risings, is a very remarkable object to seaward, being visible more than 20 miles off; its entrance is encumbered with several islands, between all which are good passages with plenty of water, and few dangers; these lead to most excellent harbors, and places convenient and well adapted for the fisheries. We have already noticed Green and Ironbound Islands; these lie on the eastern side of the entrance to the Bay of Mahone; adjacent to these, and on the same side, are the Tancook Islands, Flat Island, and the Knohme Rock; there are also the Bull Rock, and the Outer Ledge. On the western side are the Duck and other islands.

Great Duck Island lies W. by S. from Green Island, distant $4\frac{1}{2}$ miles. Little Duck Island lies N. W. $\frac{1}{4}$ N. about one mile and two-thirds from Great Duck Island, and W. $\frac{1}{4}$ N. 5 miles and one-third from Green Island: nearly midway between Green Island and Little Duck Island lies the Outer Ledge, over which the sea always breaks; this danger bears from the east end of the Great Duck Island N. E. $\frac{3}{4}$ N. distant one mile and two-thirds; and from Green Island W. $\frac{1}{4}$ N. one league; over it are 4 feet water, and round it are $4\frac{1}{2}$, 5, and 7 fathoms.

Flat Island lies due west from Ironbound Island, distant one mile and a quarter; and in a similar direction from Flat Island, somewhere about one mile off, lies the Bull Rocks, but the exact situation of this danger is not correctly ascertained, for Mr. Des Barres places it more to the southward, and M. Lockwood to the northward of this position: it is a blind rock, uncovered at one-third ebb, with deep water all round it. The southern part of Flat Island, in a line with the southern points of Ironbound Island, will lead on the rock, as Mr. Des Barres has placed it, while the northern part of Flat Island, in a line with the northern shore of Ironbound Island, will lead to the northward of it; and Chester Church open of Great Tancook Island, will carry you clear to the westward of it, in 7 and 10 fathoms water.

Great Tancook is one mile and three-quarters long, and about a mile broad; to the eastward, between it and the main land, is the Little Tancook Island, separated by a channel a quarter of a mile broad, in which are 7, 8, and 9 fathoms; a similar passage is between Little Tancook and Indian Point, on the main, but there is a middle ground in it of 4 fathoms. Knohme Rock is above water, and shoals all round; it lies to the eastward of the south-east part of Great Tancook, and at this part of the island is anchorage in 8 or 10 fathoms water.

Westward of Great Tancook, one-third of a mile, is a rocky shoal of 6 feet, while between them the channel has 10 fathoms water: to the W. by N. of this shoal, one mile, is another, with from 6 to 12 feet over it; between these shoals the passage is good, and has from 12 to 25 fathoms water in it. Off the north-west part of Great Tancook is Star Island, and a little to the eastward of it is a rocky patch of shallow ground, so that vessels should never attempt the passage between Star and Tancook Islands. There is yet another danger, called the Coachman's Ledge; it lies 2 miles to the northward of Great Tancook, and is only visible at low water; to lead clear to the eastward of this ledge, you should bring the eastern point of Great Tancook and the east side of Flat Island in one; to clear it to the southward, bring the west end of Ironbound Island open of the west part of Little Tancook: and Frederick's Island north point bearing W. S. W. $\frac{1}{4}$ S. will carry you safe to the northward of it.

Having passed the Coachman, the head of the bay lies open; on your starboard side is the high land and small River of Aspotogon, where small vessels occasionally run in and anchor; there is a rocky shoal at its entrance, which must be avoided. To the northward is Cumberland Arm, easy of access, and affording good anchorage, with 7 and 8 fathoms, observing to give a berth to the starboard shore, which shallows some distance out. There is also good riding on the larboard shore, behind an island which lies on the eastern side of the Chester Peninsula; here vessels can ride, well sheltered, in 8 fathoms water.

Chester Town is situated at the northern part of Mahone Bay, and is surrounded by a fine and fertile country; its inhabitants are industrious people, and the adjacent islands are well clothed with sheep; wood and water are in abundance, and several vessels are built here; the anchorages between the various islands and before the town are good, well sheltered and secure, and the depth of water moderate; the only danger is a shoal, which partly dries at low water: this lies W. $\frac{1}{4}$ S. from the Town of Chester, from which it is distant one mile and three-quarters.

On the larboard side of Mahone Bay, and directly west of Tancook Islands, is a large inlet or branch of a river, named by Des Barres, Prince's Sound; the passages into it are

very safe, on channel, and, fathoms; fur

very safe, only giving a wide berth to the southern end of Edward's Island; steer mid-channel, and, when well in, anchor in 9 fathoms, or within the innermost islands, in 5 or 6 fathoms; further in it becomes flat and shallow.

To sail into Mahone Bay from the eastward, the first land visible will commonly be Green Island, which is round, bold, and moderately high; thence to Ironbound and Flat Islands, both steep to, are two miles and three-quarters; you may proceed and pass between them towards the Tancook Islands; these are inhabited; the channels between them are bold, and the anchorages under their lee good, in from 7 to 12 fathoms water; but if you are proceeding for Chester between Green and Duck Islands, you must beware of the Outer Ledge, which always shows itself by breakers; the mark to lead clear through this passage, is Chester Church well open of Great Tancook Island; this mark will also carry you safe to the westward of the Bull Rock, already described; and when you get near, or within half a mile of Tancook Island, steer out westward, and bring the same church to bear about north, and this will lead you up to the town.

LUNENBURG BAY, called also Malagunsh, is now a place of great population and considerable trade; vessels carrying wood, cattle, vegetables, &c., are constantly employed from here to Halifax; the harbor is very easy of access, and there is good anchorage to the very town. At its entrance lies Cross Island, about 30 feet high, and containing 253 acres of land, on which a lighthouse, painted red, is erected, containing two lights, one 30 feet above the other; the lower one is fixed, the upper one is flashing or darkened at intervals of one minute: the building is red. Crop Island is low and thickly covered with trees. On the N. E. side of this island is a nook, where coasters ride in safety; off this part lie the Hounds Rocks, which, in passing, must have a berth; the west and south sides of the island are bold; and two miles from its southern end is an excellent fishing bank, with from 14 to 17 fathoms water. There are good channels on either side of Cross Island.

Vessels sailing in or out, through the northern passage, should endeavor to keep about the middle of the channel, in order to avoid the shoals and rocks above mentioned, and also those adjacent to the opposite, or Colesworth Point: having passed these you should keep the northern shore on board, bringing Battery Point to bear nearly N. W. by which you will also go clear of the Sculpin or Cat Rock.

The Sculpin or Cat Rock, lies nearly in the middle of the bay, bearing N. E. distant three-quarters of a mile from Oven's Point; according to Des Barres, there are but three feet over this danger, but it will easily be discovered by the breakers over it at low water. Sailing through the western channel, which is to be preferred, you should endeavor to steer N. N. W. between Cross Island and Rose Point, where you will have 10 and 12 fathoms water; keep the Town of Lunenburg in sight over the low land to the eastward of Battery Point, and this will lead you clear of the rocky reefs about the Oven's Point; but beware lest you lessen your water below 7 fathoms, for the soundings about the point are very irregular; bring the Wagon Road at Lunenburg open to the westward of the Battery Point; and this will run you to the westward of the Sculpin, and between it and a rocky knoll of 4 fathoms water; having passed the Sculpin, haul up towards the northern shore, until you bring Moreau and Battery Points in one; this being the direct mark for the Sculpin Rock, steer on in the direction of the Battery Point, approaching it no nearer than a cable's length, then round Battery Point, and bring the road well open of the Moreau Point; this will run you clear into the harbor, and between the Long Rock and the shoals off Battery Point, when you may direct your course for the town, where you will find 12 and 13 feet water alongside the wharves, and near to them 20 and 24 feet, soft muddy ground, and perfectly secure.

Vessels having occasion to go to the southward of the Long Rock, which is the wider and safer passage, will observe there is a reef runs out from Woody Point, called the Shingles, which must be carefully avoided; to do this, when you have so far entered the bay as to be equi-distant between the Ovens, which are hollow cliffs, Battery and Woody Points, then edge off a little to the westward, until you bring a farm-house, that stands over the middle of Sandy Bay on with the end of a wood close to an opening like an avenue, bearing N. W. $\frac{1}{2}$ N.: steer with this mark on, until the west end of Lunenburg Town comes over Moreau Point, then steer north-eastward a little, approach Battery Point, and proceed as before directed.

The best anchorage in the Bay of Malagunsh or Lunenburg, is on its western side, about half a mile from the shore, and nearly midway between Oven's and Woody Points; where, with good ground tackling, you may safely ride out a south-easterly gale; but the bottom is generally rocky and uneven. It is high water, full and change, at 9 o'clock. *High water.*

DARTMOUTH BAY.—This is situated between Oven and Rose Points; there are some settlements about the shores, and on an island at the bottom of the bay. It is easy of entrance, and you may anchor abreast of this island in 3, 4, 6, or 7 fathoms. In sailing into this bay, it will be always advisable to borrow somewhat towards the Rose Point *Dartmouth Bay.*

Lunenburg Bay.

Lighthouse.

shore, because of the shoals which lie to the southward of the Oven's Point; there is otherwise no danger whatever.

From Lunenburg to the Ironbound Island, at the entrance to Le Have River, the shores are bold, and much indented with irregular inlets or bays. Ironbound Island lies about W. S. W. $\frac{1}{2}$ S. distant nearly two leagues from Cross Island. It is inhabited, and some small rocky islets surround its northern shore: S. E. $\frac{1}{2}$ E. $\frac{1}{2}$ mile from this island is a bank of 20 and 25 fathoms, and W. S. W. three-quarters of a mile from that, is a small spot of 15 fathoms. These have from 30 to 40 fathoms about them.

LE HAVE RIVER.—Vessels coming from the south-eastward for Le Have River, will not fail to discover Cape Le Have, a steep abrupt cliff, 107 feet high, bearing W. $\frac{1}{2}$ S. about 12 leagues distant from Sambre lighthouse. S. E. by S. one mile from the cape, is the Black Rock, 10 feet high, and 100 feet long, with deep water all round it, and 9 to 11 fathoms between it and the shore, except on a small knoll, lying off, and opposite to the cape, over which are only 4 fathoms. W. by S. distant $3\frac{1}{2}$ miles, is Indian Island; and to the northward of the cape lie several islands, with passages between them; but the best entrance to the River Le Have is to the northward of them all. There is also a channel to the northward of Ironbound Island, but it is narrow, and to navigate this you must give the Ironbound Island a good berth. You will then have from 12 to 4 fathoms water all through it; but the best passage is to the westward of the island, which is above one mile and a half broad, and has from 10 to 14 fathoms water within it. About 3 miles to the north-westward of Ironbound Island, is a bar which runs across, from shore to shore. Over this are 12 and 15 feet, the deepest water being one-third across from the eastern shore. The soundings from Ironbound Island towards the bar are 11, 14, 12, 9, 7, 6, 5, 4, and 3 fathoms, the latter depth being close to the edge of the bar; but when you are well over that, you drop into 4, 5, and 6 fathoms, the river continuing navigable 12 miles up, or so far as the falls. The general width of the river is half a mile, and when you are 8 miles up it, you will meet with the road from Lunenburg to Liverpool, where a ferry is established.

Within and to the westward of Cape Le Have is Palmerston Bay, at the head of this is Petit Riviere. Off the eastern entrance of this bay lies Indian Island, bearing W. by S. distant $3\frac{1}{2}$ miles from Cape Le Have.

Port Metway. PORT METWAY lies between Cape Le Have and Liverpool Bay; and is a place now rising into considerable consequence on account of its navigable capacity, and its convenience to the fisheries. The entrance to this port bears from Indian Island W. S. W. distant 7 miles, the land to the eastward of it being remarkably broken and hilly. On the starboard point of the entrance lies Frying Pan Island, which is connected by a sandy reef to numerous islets which stretch along in a N. N. E. $\frac{1}{2}$ Northerly direction, until they join the main land. That which is next to Frying Pan Island is commonly called Glover's Island, and lies half a mile to the northward, and bears S. E. $\frac{1}{2}$ S. a good mile and a half from Metway Head. The entrance to this port may be known by the high land at Cape Metway, and the low ragged islands before mentioned. The width of the channel is about seven-eighths of a mile, and the depth of water from 5 to 14 fathoms. Directly in the way of your making for the entrance of the channel, lies the South West Ledge and the Stone Horse Rock. The former bears from the Frying Pan Island S. $\frac{1}{2}$ E. distant $\frac{1}{2}$ of a mile; there are 19 feet water upon it, and the sea, in rough weather, breaks over it. The latter, or Stone Horse Rock, lies E. by S. distant one-third of a mile from the S. W. Breaker, and dries at low water. There are 6, 7, and 8 fathoms between it and the Frying Pan Ledge, and should you pass this way, you must give the island a good berth, on account of a spit which runs out from it, in the direction of the Stone Horse Rock, a full quarter of a mile; but the best course will be half a mile outside of both these dangers, you will then pass in 12 and 14 fathoms water, and running on W. a little southerly, toward Kempenfelt Head, you will open the channel, and may steer in directly north. Or, you will avoid the S. W. Ledge and Stone Horse Rocks, in coming from the eastward, by bringing the Liverpool lighthouse, which stands on Coffin Island, open of the land to the eastward of it; and when Frying Pan Island comes N. N. E. distant $1\frac{1}{2}$ mile, steer in N. $\frac{1}{2}$ E. this will carry you past Metway Point; and when opposite to Neil's Point you may anchor in 4 or $4\frac{1}{2}$ fathoms water. From hence mud banks considerably narrow the passage, and a pilot will be found necessary; but should you proceed further without one, you will continue mid-channel from abreast of Neil's Point. N. N. W. $\frac{1}{2}$ N. until Collin's Island bears west, and until Alicia River is just opening of Point Lucy, then steer N. W. by N. and W. N. W. $\frac{1}{2}$ W. and anchor in 3 or 4 fathoms, muddy ground.

To run up Alicia River, you must sail between Grass Island and Point Lucy, keeping close to the southern and western shores, in order to avoid the flat which extends from the northward, leaving a deep but narrow channel. Barry Bay, or Branch which runs up to the westward, is shallow and full of rocky shoals; and so is Brier Bay, which is situated on the N. E. side of the port. The tide runs commonly with great strength, and it is high water at 45 minutes after seven.

LIVERPOOL BAY.—The entrance to this bay bears about W. by S. distant 17 or 18 leagues from Sambro lighthouse, Halifax; and W. S. W. $\frac{1}{2}$ W. 15 miles from Cape Le Have. Before it lies Coffin's Island, which is now distinguished by a lighthouse, painted red and white, horizontally, 75 feet above the level of the sea. The light is on the revolving principle, and appears full at intervals of 2 minutes. Between this island and the western land is the bay, affording good anchorage for large ships, especially with the wind off shore. In the bay there is sufficient room for turning to windward, and the deepest water will be found near the western coasts. The land in the vicinity of the harbor is broken, rocky, and of a barren appearance, yet the commerce of the town is very considerable. The channel to the northward of Coffin's Island is shallow, having a sandy spit running from it and joining the main land; therefore none but small vessels ever attempt it; but the passage to the southward is full one mile and a half wide, and has 15, 16, 17, and 18 fathoms water. Give the lighthouse point of the island a small berth, as a flat of 3 and 4 fathoms encompasses it, and there is no other danger. Bald Point, or Western Head, is bold to, and rendered remarkable by its having no trees upon it. Having entered this bay, and passed between Coffin's Island and Moose Head, bringing the lighthouse to bear E. by N. distant $1\frac{1}{2}$ mile, steer west. This will bring you abreast of Herring, or Schooner's Cove, situated on the N. E. side of the bay, and affording good shelter from sea-winds in 3 fathoms water, on a bottom of mud; or, proceeding further, vessels of two or three hundred tons, with high water, may pass over the bar, which stretches from Fort Point to the opposite shore; but at low water this cannot be done, for then it has not more than 9 or 10 feet over it. When within the bar you will perceive the channel winds S. Westerly, and you can anchor in not less than 2 fathoms, opposite the Town of Liverpool. Herring Bay is much exposed to the heavy S. Easterly swells of the sea, and has not room for more than two sloops of war.

It is high water in Liverpool Bay, full and change, at 50 minutes after 7, and the tide rises from 5 to 8 feet.

PORT MATOON, or MOUTON, called by Des Barres, Gambier Harbor.—This port is formed by the Island Matoon, which lies across its entrances, dividing it into two channels. In the eastern passage lies the rocky ledge, called the Portsmouth, or Black Rocks, partly dry. This is about one mile to the eastward of the island, and lies S. W. by W. distant 5 miles from Bull Point. The passage on either side of the ledge has deep water, with sufficient room to turn into the harbor. From the N. W. part of Mouton a shoal runs off a full mile, having 2 $\frac{1}{2}$ fathoms near its outer extremity. Over some parts of this shoal you will have 3, 3 $\frac{1}{2}$, and 4 fathoms. Here also is a small spot of foul ground, with 20 feet over it; this lies N. N. W. $\frac{1}{2}$ W. end of Mouton Island, and N. E. $\frac{1}{2}$ E. from the northern Spectacles Island, distant half a mile. The Spectacles lie to the W. N. Westward of Mouton Island, and are visible as you enter the port. To the northward and westward of them are 10, 11, and 12 fathoms water, inuddy and sandy ground, with good anchorage, secure from all winds. To sail into Port Mouton by the eastern channel, and with a leading wind, to the northward of the Black Rocks, you may steer in W. by N. passing at the distance of three-quarters of a mile from White Point, until you bring the Spectacles Islands to bear S. S. W. $\frac{1}{2}$ W.; this will carry you clear to the northward and westward of Mouton Island N. W. Shoal, then haul up S. W. by W. for the anchorage before mentioned. To sail in to the westward of the Black Rocks, you should steer in N. W. mid-channel, or nearly a half a mile from Mouton Island. In this passage you will find from 8 to 15 fathoms water; always giving the southern part of the island a berth, on account of a sandy flat which runs off it. In adopting this channel, mariners must look out for a small knoll of 6 feet, said to lie E. N. E. $\frac{1}{2}$ E. distant one mile and a half from the southern extremity of Mouton Island. This appears to be a modern discovery.

The western passage to Port Mouton is between the island and the main, and only frequented by coasters and vessels of a small draught of water. It is encumbered with shoals, and too intricate for strangers. The channel is narrow, and close to the main land, passing between it and the Bull Rock; having passed which, you can proceed to the anchorages, either off the N. W. shore or Mouton Island, or round the Spectacles. The land now turns S. W. $\frac{1}{2}$ W. from Point Mouton towards Port Jolie; midway is a black craggy point, with several rocks about it. S. $\frac{1}{2}$ E. distant 2 $\frac{1}{2}$ miles from Black Point, and S. W. 14 miles from Liverpool lighthouse, lies Little Hope, an island 21 feet high, and 200 fathoms long. This is a very great danger, and should have a beacon to distinguish it; round the island is a shoal ground, partly drying, and with 3 and 4 fathoms upon some parts; it lies direct E. S. E. from the eastern point of the entrance to Port Jolie, from which it is distant two good miles. Between the island and point,

Liverpool Bay, Lighthouse.

Tides. Port Matoon, or Mouton.

what nearer to the latter, there is said to lie a dangerous shoal, not hitherto noticed in the charts.

Port Jolie is an inlet more than 5 miles deep, but very shallow, and having scarce water enough for large boats; the lands adjacent appear barren and stony, yet have some families of fishermen settled there. Nearly south from the eastern point of Port Jolie, distant one mile, is a spot of three fathoms, over which the sea commonly breaks; and on the western entrance of the port are some rocky ledges, which show themselves by the breaking of the water over them. There is also a small island, lying to the S. Westward, called the Little or Lesser Hope.

Port L'Ebert.

PORT L'EBERT.—This is the third inlet west of Liverpool, and may readily be known by the steep and abrupt appearance of its western head; and also by Green Island, which lies to the S. Westward of its entrance. This island is somewhat remarkable, being destitute of trees. Port L'Ebert is divided from Port Jolie by a peninsula, which, at the head of the respective ports, is scarcely half a mile across. The channel in runs nearly north 6 or 7 miles; but, although small vessels may run a considerable way up, ships of larger size can only find anchorage at its entrance. The depth half a mile from the head, is from 9 to 12 feet; but at the mouth of the port are 6, 4, and 3 fathoms.

Sable River.

SABLE RIVER lies to the S. Westward of Port L'Ebert, distant 5 miles. At its entrance, nearly midway of the channel, is a rocky islet. This lies S. W. by W. from Green Island, distant 3½ miles; there is a passage on either side of the rock; that to the eastward has 12, 13, and 15 fathoms water, but that to the westward is somewhat shallower. The two points of the entrance of this river are distant from each other one mile and a quarter, with from 6 to 11 fathoms; but there is a bar which renders this place totally unfit for affording shelter to any but the smallest class of vessels. It is, however, not destitute of inhabitants, some of whom are settled in a small nook close to the westward of the river, which is called the Little Harbor.

*Rugged Is-
and Harbor.*

RUGGED ISLAND HARBOR lies W. by S. distant 15 miles from the Hope Island, and E. N. E. 9 miles from Shelburn Light. It seems to have been so named from its craggy and rugged appearance, and the numerous dangerous ledges and sunken rocks at its entrance. This harbor is difficult of access, and seldom resorted to, unless by the fishermen, who are familiar with its navigation; yet the anchorages are good, with 4½ and 4 fathoms. During gales of wind, the unevenness of the ground frequently causes the sea to put on a most formidable appearance, breaking violently from side to side. Off the western head, distant about a mile, is the Gull, a bed of rocks, over which the water always breaks; but between the head and the Gull are from 6 to 8 fathoms. Vessels coming from the eastward will perceive St. Thomas's or Rugged Island, lying S. W. by W. from Green Island, distant 6½ miles. This island, having high rocky cliffs on its eastern side, affords a good mark for the harbor. To the S. W. of Rugged Island are some rocky ledges. The outermost of these is called the Bear Rocks, being distant from the island three-quarters of a mile. Between Rugged Island and the Bear Rocks, are other dangers; and a little westward of the Bears is a sunken rock; these three latter, lying in a sort of triangular form. W. by N. from the Bear Rocks, distant one mile, is the Blow Breaker, a rock with only 4 feet over it. This appears to be the Tiger of Des Barres, by whose description it should bear south from Rugg Point, which is the eastern boundary of the harbor. To sail from the eastward for Rugged Harbor, you will see the eastern cliffs of Rugged Island bearing north, distant 1½ mile. Keep a good lookout for the Blow, or Tiger Rock, and pass well to the outside of the foregoing dangers; and having cleared these, haul up N. N. W. for the islands on the left, or larboard side of the harbor. In so doing you must be careful to avoid a shoal which stretches half way over from the starboard shore, narrowing the channel very considerably, so that between the shoal and Muffitt Island, the passage is not above a quarter of a mile wide. Pursuing this direction, you will readily reach the anchorage in the Northern Arm. It the best of the channel, Centre Island will be just open of Muffitt Island. Small vessels may be well sheltered within Cubb Basin, which is to the northward of Muffitt Island; and vessels coming from the southward or westward will have deep water on either side of the Gull Rocks, or between the Bear and Blow Rocks. At Cape Negro and Rugged Island Harbor, it is high water, full and change, at 8 o'clock; and the rise of the tide is about 7 feet.

High water.

*Green Har-
bor.*

GREEN HARBOR.—This port is to the westward of Rugged Island Harbor, having an island on its western side of entrance, and running in full three miles. This and the River Jordan, situated still further to the westward, appear to be places where good anchorages may be obtained, but they are at present little frequented by shipping, although they have many inhabitants. They are open to southerly winds, which cause a heavy rolling sea.

*Shelburne
Harbor.*

SHELBURNE HARBOR, or PORT ROSEWAY, is, according to Mr. Lockwood, justly esteemed the best in all Nova Scotia, from the ease of its access, and perfect security of its anchorage. At the entrance of the harbor is the Island of Rose-

 land of Rose-

north, or M'Nutt's, which is nearly 3 miles in length, and 1½ in its broadest part. On the S. E. point of this island stands an excellent lighthouse. This point is a high cliff of white rocks, the summit of which is without trees; the west side of the island is low. The lighthouse is painted black and white, vertically, and has a remarkable appearance in the day time, on account of a dark wood that is behind it; while, at night, two lights are exhibited from it. The upper light is 125 feet above the level of the sea, and the lower about one-third from the top of the building. This lighthouse bears from the lighthouse of Sambro W. S. W. distant 30 leagues; from Cape Negro N. E. ¼ N. 7 miles; from Point Beny S. W. ¼ S. 2½ miles; from the breakers south-west of Rugged Island W. N. W. ¼ W. 8 miles, and from the Jigg Rock, which has only 6 feet water over it, N. N. E. ¼ E. 1½ mile. When coming in from sea, make for the lighthouse, bringing it to bear N. W. or N. W. by N. then steer directly towards it. The dangers to be left to the eastward of you, are those adjacent to the Rugged Rocks already mentioned, the Bell Rock, which is always visible, appearing black and bold to, lying E. N. E. ¼ E. distant 2½ miles from the lighthouse. In coming from the westward, you may steer for the entrance on either side of the Jigg Rock, and if for the eastward, on either side of the Bell Rock. When you get abreast of the lighthouse, you may sail in to the northward of M'Nutt's Island about N. W. by N. keeping nearly in mid-channel; the island's side is bold to, and the anchorage is good, in 7, 8, or 10 fathoms, the bottom mud; keep the western shore on board, for there is a shallow spot somewhere about the eastern side, between George's and Sandy Points. Sandy Point is about two miles beyond the N. W. part of M'Nutt's Island; give it a berth, for a sandy spit extends from it 300 yards. With M'Nutt's Island locked to this point, the anchorage is exceedingly good, and shipping may, with good ground tackling, ride in safety during the most violent storm. In the channel, about S. by E. distant nearly one mile from Carlton Point, lies the Adamant Rock, abreast of Durfey's House. This will easily be avoided by going into no less water than 4½ or 5 fathoms, or by keeping Petit's Island open of Surf Point. The inlet which runs up to the N. W. has several shoals in it, but the eastern shore has regular soundings, from Sandy Point upwards, and is free from danger, while in the upper part of the harbor, above Carlton Point, vessels may ride in 5, 6, or 7 fathoms, the ground holding well. We have already stated, that your course from the entrance towards Sandy Point will be about N. W. by N. and having rounded Sandy Point, you can proceed N. by W. and north, according to your wind.

In coming from the eastward of this harbor, be careful to avoid, and give a good berth to, the shoals off Rugged Island; and do not haul up for the harbor until you get the lighthouse to bear W. by N. ¼ N. by which precaution you will go clear of every danger; or you may stop a tide at the entrance, in from 16 to 10 fathoms, sand and clay.

Shelburne affords excellent shelter for ships in distress, and is secure against any wind, except a violent storm at S. S. W. abreast of the town. The wind from S. to E. does no harm, although from S. by W. to S. W. by S. if blowing hard for some considerable time, it will set the smaller vessels adrift at the wharves; but in the stream, as has been observed before, with good cables and anchors, no winds can injure you. Here you may be supplied with cordage, duck, spars, provisions, and water. Carpenters, pump, block, and sail makers, can be obtained, if required; and the port charges for vessels which put in for supplies only, is no more than 4d. per ton, light money, on foreign bottoms; but should you enter the custom house, the duties become much higher. It is high water, full and change, at 8 o'clock; spring tides rise 8 feet, neaps 6, but a fresh breeze from the south-east, commonly brings on high water sooner, and causes an additional rise of 2 or 3 feet.

CAPE NEGRO HARBOR is named from Cape Negro, the eastern limit of an island which lies before its entrance; this cape is remarkably high, rocky, and barren, bearing S. W. ¼ S. distant 7 miles from Shelburne lighthouse; this island is very low mid-way, and has the appearance of being two islands. There are two passages into the harbor, one to the eastward of the island, and the other to the westward of it; the former is much the better of the two, but this is rendered dangerous, on account of two sunken rocks which lie off its entrance; these are called the Gray Rocks and the Budget: the Gray Rock lies N. N. E. from the cape, distant a full mile, and is situated nearly on the starboard side of the channel; some parts of these rocks are always visible, and serve as a mark for the harbor. The Budget is a blind rock of 6 feet, lying nearly mid-channel, and only a quarter of a mile from the island, having deep water round it. In the channel to the eastward of the Budget you will have 10, 12, and 14 fathoms, and the best direction to enter the harbor, will be to steer one-third from the rocks off the eastern point, until Shelburne lighthouse is shut in, then you will be within the danger. There is excellent anchorage off the N. E. part of Negro Island, in from 6 to 4 fathoms, on a bottom of stiff mud. The northern part of the island presents a low shingly beach, from which a bar extends quite across to the eastern shore, over which are 15 feet at low water; above this bar it is navigable full 6 miles, having a smooth clayey bottom, with 3, 4, and 5 fathoms water.

Lighthouse.

High water.

Cape Negro Harbor.

The passage to the westward of Negro Island, is somewhat intricate, encumbered with rocks and dangers, and should not be attempted except in cases of extreme emergency: in such circumstances, indecision or timidity might produce certain destruction; then the commander's post should be aloft, and if not possessing confidence himself, he should affect it. Mr. Des Barres says, "if coming from the westward, in hauling round Point Jeffery, to avoid the ledges, blind rocks, and shoals, extending easterly from the western shore, you should shape your course N. N. E. $\frac{1}{4}$ N. towards the cape, giving the Savage Rocks a berth of three cables' length, until you open Davis's Island a sail's breadth off Point William; Davis's Island is the largest, and westernmost at the head of the harbor; run up in that direction, observing to keep clear of a sunken rock which lies E. S. E. from Point William, about 300 fathoms from the shore. Fishery Beach is bold to."

To sail through the north-east passage, which is not so difficult, keep Grey's Rocks on board, and steer N. W. for Point John, until you see across the isthmus in the middle of Cape Negro Island, or until Shelburne lighthouse is shut in, and having passed the Budget; from thence haul over to the westward, keeping along the shore about 2 cables' length from the island to avoid the shoal, which extends half the distance over from Point John towards the island; and when you have opened the small islands at the head of the bay, shape your course N. N. W. to the anchoring ground, the bottom is mud and clay; along the N. E. side of Cape Negro Island, the anchorage is good stiff clay.

The River Clyde, which descends from a chain of lakes that extends E. N. E. and W. S. W. a considerable distance in the interior, falls into the head of Negro Harbor, after a run of 28 miles.

*Port Latour,
or Haldimand.*

PORT LATOUR, or HALDIMAND, is situated a little westward of Negro Harbor, being separated from it by a narrow peninsula; the extreme points which bound the entrance to the southward, are Point Jeffery, or Blanche Point, to the eastward, and Point Baccarro to the west; between and within there are several clusters of rocks, rendering the harbor unfit for any but small craft: and the tide leaves the head of the inlet dry in many places; the adjacent lands are barren, and the settlers are but few; nevertheless, as some vessels may be driven to seek shelter here, the following directions of Mr. Des Barres may prove acceptable. "To sail into this port, coming from the westward, continue your course easterly, until you have Brehem Isle a ship's length open to the eastward of North Rocks: thence you may steer northerly for Isle George, and when you come up within the distance of two cables' length from its south end, incline to the westward in a direction with the western extremity of Pond Beach, until you open Prospect House on the north side of the northernmost Mohawk Ledges, and then haul into anchorage, in 3 fathoms, muddy bottom.

"Nearly midway between Baccarro Point and the South Ledge lies the Folly, a sunken rock, within which and the western shore is a channel of 6 fathoms. The Vulture, a dangerous breaker, lies S. W. $\frac{1}{4}$ S. nearly two miles from Baccarro Point."

*Barrington
Bay.*

BARRINGTON BAY.—This is a spacious inlet, situated to the westward of Port Latour, and formed by Cape Sable Island, which lies in front of its entrance; there are two passages into it, that to the eastward is between Baccarro Point and Sable Island, being at its entrance three miles wide: that to the westward is not more than a mile broad; both are encumbered with numerous and extensive flats, narrowing the passages, and rendering the navigation dangerous; for although the channels may generally be discovered, by the waters appearing dark, yet it will require a leading wind to wind through to the anchorage, which is towards the head of the bay, and about one mile and a half below the town; here there are from 18 to 26 feet water. The passage to the northward and westward is used by small vessels only, and is not safe without a commanding breeze, as the tide of ebb is forced unnaturally through to the eastward, by the Bay of Fundy tide, at the rapidity of 3, 4, and sometimes 5 knots an hour: setting immediately upon the rocks which lie within it.

The Town of Barrington is situated at the north-eastern extremity of the bay. Vessels venturing into this bay by the eastern passage, must be very careful to avoid Baccarro Point, giving it a wide berth of full 2 miles on account of the Bantan, Shot Pouch, the Vulture, and other rocks which lie off it; the Vulture Rock is very dangerous, and lies W. S. W. from Baccarro Point, distant nearly 2 miles; the Bantan bears S. S. W. from the point about a similar distance, and from the Vulture S. E. almost one mile; they are both exceedingly dangerous.

Cape Sable.

CAPE SABLE is the south-eastern extremity of a small narrow island which is separated and distinct from Cape Sable Island; it is low and woody, but the cape itself is a broken white cliff, apparently in a state of decomposition, and visible 4 or 5 leagues off; from this island spits of sand extend outward, both to the south-east and south-westward; the Eastern Ledge is called the Horse Shoe, and runs out $2\frac{1}{2}$ miles S. E. by S.; the Western or Cape Ledge, stretches to the S. W. about 3 miles. The tides, both flood and ebb, set directly across these ledges at the rate of 3 and sometimes 4 knots an hour,

causing a strong break to a considerable distance, particularly when the wind is fresh; it will then often extend full 3 leagues out, shifting its direction with the tide, the flood carrying it to the westward and the ebb to the eastward, the former running a considerable time longer than the latter. This rippling, or breaking of the water, may be considered hazardous to pass through in a gale of wind, but there is not less than 8, 10, 12, and 20 fathoms, rocky ground.

It is high water at Cape Sable, full and change, at three-quarters after 7 o'clock, and *High water.* the spring tides rise 12 feet, neaps 6.

BONNETTA COVE.—To the north-westward of Cape Sable is a small island, called *Bonnetta Green Island*, to the north-east of which an inlet runs in to Cape Sable Island, forming *Cove*.

Bonnetta Cove, where good anchorage may be found in 3 fathoms water; the entrance to it is narrow, and runs in between a spit and the island; this will be too difficult for a stranger to discover, but is frequented by the coasters and fishermen.

FAVORITE COVE is situated in the Western Channel, and about the middle of *Favorite Cove*. Cape Sable Island; here also small vessels may run in and anchor in 2 fathoms, behind a small islet which lies mid-channel, at its entrance, affording a passage on either side, but that to the eastward is the best, and has the deeper water.

With S. W. gales there is always good anchorage off the N. E. side of Cape Sable Island; but the Shag Harbor, which lies on the opposite side of the Western Channel, and bears N. N. W. from *Bonnetta Cove*, is full of shoals, and must not be attempted, unless you are well acquainted with it. It is here high water, full and change, at 9 o'clock, spring tides 11 feet, neaps 8.

THE BRAZIL ROCK.—This is a flat rock, covering a space of 10 yards, over which are only 8 and 9 feet at low water; a tail extends 90 or 100 yards from its base, having 6 to 8 fathoms water; the tide, running strong over this, causes a ripple, and makes the rock appear larger than it really is.

Southward of the rock, at the distance of about a mile, you will have 35 and 34 fathoms, then 30 and 22 as you approach nearer to it; but towards the Cape Sable shore the soundings are regular, from 19 to 15 fathoms; you will then lessen your water to 10 and 7 fathoms, when you will be at the edge of the Race-horse Shoal; to the northward of the Brazil Rock, in the direction of the Bantun Rock, you will have 16, 19, 15, 17, 16, 15, and 10 fathoms; with this latter depth you will be near the Bantun, and must tack to the westward. The exact position of this rock has been much disputed, but the place assigned to it by Mr. Des Barres appears to be nearly correct; its latitude is 43° 24' 15" N. and longitude 65° 22' W.

THE ISLE OF SABLE AND BANKS OF NOVA SCOTIA.

ON the days of the new and full moon, it is high water along the south shore of the *High water.* island at half an hour after 8 o'clock, and it flows till half an hour past 10 o'clock on the north side, and till near 11 o'clock in the pond. Common spring tides rise seven feet perpendicular, and neap tides four. The flood sets in from the S. S. W at the rate of half a mile an hour, but it alters its course and increases its velocity, near the ends of the island.

At half flood it streams north, and south at half ebb, with great swiftness, across the north-east and north-west bars; it is therefore dangerous to approach without a commanding breeze. The north-east bar runs out E. N. E. about six leagues from the eastern extremity of the island, all which is very shoal, having in a few places no more than 2, 3, or 4 fathoms water, whence it continues E. and E. by S. deepening gradually to 12, 15, and 18 fathoms water, at the distance of 8 or 10 leagues, and shaping to the S. and S. E. sloping gently to 60 and 70 fathoms water. To the northward and eastward it is very

*This course cannot be sailed, upon account of the intervention of the land.

steep, and, in a run of 3 miles, the water will deepen to 130 fathoms. Abreast of the body of the island, the soundings are more gradual. The shoal ground of the north-west bar extends 5 leagues to the westward, and deepens gradually to 70 fathoms water, at the distance of 20 or 25 leagues from the isle, and winds easterly and southerly, until it meets the soundings off the north-east bar. The quality of the bottom in general is very fine sand, with a few small transparent stones; to the northward, and close to the north-east bar, the sand is mixed with many black specks; but near the north-west bar, the sand has a greenish color. The north-east bar breaks, in bad weather, at the distance of 8 and 10 leagues from the island. The north-west bar breaks, in bad weather, sometimes 20 miles from the island.

Extract of a Letter from Capt. Joseph Darby, Superintendent of Sable Island, to the Editors.

"I have known the island for the last twenty-eight years, in which time the west end has decreased in length about 7 miles, although the outer breakers of the N. W. bar have the same bearing from the west end of the island that they then had, about N. W. by compass, distant about 8 miles, which clearly shows that the whole of the bank and the bar travels to the eastward. The ground is high and the water shoal outside of the breakers 7 or 8 miles in a N. W. direction. The flood tide sets across the bar to the northward and eastward very strong, and the ebb tide to the opposite point, chugging alternately at half flood and half ebb. The ground to the southward and westward of the bar is very regular, deepening very slowly to a considerable distance; but to the northward and eastward the ground is very steep, and from the breakers, or from very shoal ground outside of the breakers, you fall into deep water all at once. The bank to the N. W. is very uneven, and curves round to the northward in a steep ridge, and at the distance of about 35 miles from the island, in a N. W. direction, are 10 fathoms water, and W. N. W. and E. S. E. from that the ground falls very suddenly into deep water. This ridge joins the middle ground, and extends in an easterly and a N. E. direction to a considerable distance, with shoal water; the bottom in small ridges, with 11, 12, 11, 13 fathoms of water, and so on, over it; and between this bank and the bar, or the island, the water is very deep, 80 or 90 fathoms. The bank extends to the eastward abreast of the island, the southern edge of the bank, from 20 to 25 miles to the northward of the island.

"The east end has altered very little since my knowledge of it, except in height, which is much greater than it was, and the whole island seems to increase in height every year, but grows narrower. There is a low bar of dry sand running from the high land of the east end, in a N. E. direction, about three miles, from whence shoal water, that always breaks, extends about two miles further, in an E. N. E. direction, outside of which, for a distance of about six miles, is a passage across the bar, with from 24 to 3 fathoms of water in it. Outside of that, again, is a piece of high ground that always breaks, and is sometimes dry, and extends in an E. N. E. direction between 2 and 3 miles, from which the shoal ground continues in the same direction some miles further. The flood tide across this bar sets very strong to the northward, and the ebb tide in the opposite direction, but not so strong. The soundings to the southward and eastward of the bar are flat and regular for a considerable distance, but to the northward and westward the ground is very steep—close to the breakers 10 fathoms, and goes down suddenly into 70 or 80 fathoms to 100 or upwards. I believe, in general, there is a very strong current setting to the W. S. W. between the Sable Bank and the Gulf of Mexico stream; and there is a strong current sets down the western side of the Gulf of St. Lawrence stream, in a S. S. W. direction. The current along the south side of the island is very shoal water, runs both east and west, and is principally influenced by the winds. The most of the wrecks that happen here are in error of their longitude; for instance, vessels bound to the eastward think themselves past the island when they get on shore upon it, and vessels bound to the westward (say from Europe) do not think themselves so far to the westward when they get on shore upon it. I have known several cases of vessels from Europe that have not made an error in their longitude exceeding half a degree, until they came to the Banks of Newfoundland, and from that here, in moderate weather and light winds, have made errors of from sixty to a hundred miles, which, I think, goes so far to prove the existence of a westerly and southerly current between the Grand Banks and here, and also of the existence of a westerly current between the Sable Bank and Gulf of Mexico stream, which will be stronger or weaker according to the distance between the stream and the banks.

"When a casualty has occurred, and you find that you are on the body of the island, I would recommend that nothing of masts or rigging be cut away, without the vessel should be very tender, and then you may do it to ease her a little; but a vessel of ordinary strength will bear her spars until she heaves up on the beach, or settles in the surf and lays quiet, as lives and property have often been saved by a vessel having her spars standing, as from the heads of which you may often send a line on shore when it is not possible

to work a boat; and by sending a good hawser after it and securing it well on shore, a chair or other more efficient article may be rigged for conveying passengers, or others, or valuable property, over the breakers in safety; as from the nature of the soft sandy bottom, a vessel will not go to pieces as soon as if she was on rocks, and by the rigging being left standing, it may afterwards be saved, whereas, if the masts are cut away, the whole of the rigging goes with them, and all get tangled and buried in the sand, and are generally totally lost. But if you are on either of the bars, the first consideration should be to secure the boats and lighten the ship, and leave her as soon as ever you have to abandon the hope of getting her off; endeavor to get to the leeward of the breakers, and land on the island, according to circumstances, endeavoring to land on the north side if possible, as vessels that get on the bars very soon disappear altogether, either by going to pieces in the irregular sea and strong currents, or by rolling over the steep bank to the northward, and sinking in deep water. When property can be saved on the island, it is proper for the master and his crew to do the utmost in their power to save it; they can get the assistance of the people of the island, with a boat and teams of horses, not for hire, for they are employed by government, and the island draws a salvage of whatever may be saved on it, which is apportioned by the magistrates at Halifax: the more there is saved by the master and crew the less salvage will be taken; but it is very often the case that the crews will not assist to save property, and whatever is saved is done exclusively by the establishment, in which case the salvage is pretty high. There are buildings on the island for the shelter of persons cast away on it, with provisions for those who save none; also some buildings for the reception of perishable goods. These buildings, and whatever is put into them, are under the charge of the superintendent. All property saved must be sent to Halifax by the first opportunity: the master can keep inventories and continue with the goods if he likes, but has no control over their destination; but I believe, by petitioning the governor at Halifax, he might get permission to take them where he pleases, on paying the duty and salvage. When any property is saved on the island it is sent to Halifax, where it is advertised and sold by order of the commissioners, and the proceeds paid into their hands, out of which they pay the king's dues, the salvage apportioned by the magistrates, the expenses of freight, and other small charges, and the residue is paid over to the master, or other authorized agent, for the benefit of the underwriters and all concerned. The superintendent is under the control of the governor and the commissioners, and can take no new step without orders from them. The above and before mentioned custom is an old and long established rule, and supported by many acts of the Provincial Legislature, and more particularly by an act passed the 4th day of April, 1836, and in the sixth year of his Majesty's reign, which does more fully explain and set forth the rules for the guidance of the establishment.

"The north side is very safe, as a vessel may approach any part of it within a mile, and vessels in distress might, by standing in on the north side and near the west end, where the principal establishment is, get a supply of fresh water or fuel, or a partial supply of provisions and fresh meat, except in cases of a strong breeze and in heavy sea on shore. There is no difficulty in working boats on this side of the island. The south side is also very safe to approach in clear weather, but from the heavy sea that constantly breaks on it, the communication with a vessel by boats, is extremely difficult, except after a spell of northwesterly winds for three or four days, when the sea becomes smooth, and boats may work."

As when a vessel is on shore in a fog, it is of the utmost importance to ascertain her true position, in order to save the ship or the lives of those on board, the following directions should be attended to.

If breakers are seen to extend in a direction N. W. and S. E. you are on the N. W. bar. *Directions*

If breakers are seen to extend W. S. W. and E. N. E. you are on the N. E. bar.

If breakers are seen to the northward ahead, and extending from east to west, you are on the south side of the island.

If breakers are seen to the southward ahead, and extending from east to west, you are on the north side of the island.

The eastern end of this island is in $43^{\circ} 59' N.$ lat., long. $59^{\circ} 48' W.$: the western end is in $43^{\circ} 57' N.$ lat., long. $60^{\circ} 14' W.$

Ice.—H. M. packet brig Express fell in with two islands of ice on Sable Island Bank, *Ice* the 7th July, 1836, in 45 fathoms water, estimated heights 180 and 150 feet. Latitude $43^{\circ} 13' N.$, long. $25^{\circ} 17' W.$ Air 46° , water 42° .

The Nova Scotia Banks extend nearly 70 leagues in a westerly direction. From the Isle of Sable, they are from 20 to 25 leagues wide, and their inner edges are from 14 to 18 leagues off shore. They are intersected by narrow winding channels, (the bottom of which is mud.) running N. W. and S. E. Between these banks and the shore are several small inner banks, with deep water and muddy bottom. The water deepens regularly from the Isle of Sable to the distance of 22 leagues, in 50 fathoms, fine gravel; thence proceeding westward, the gravel becomes coarser; continuing westward to the western ex-

Soundings. tremity of the banks, the soundings are rocky, and shoalen to 18 and 15 fathoms water, Cape Sable bearing N. by W. distant 15 leagues.

The south-west extremity of Banquereau, lies seventeen leagues E. N. E. one half E. from the east end of the Isle of Sable. This bank extends E. by N. 35 leagues, and is near 8 leagues in width; its shallowest part is about 5 leagues from its eastern extremity, in 16 and 18 fathoms water, slimy sand and clams: whence it deepens regularly every way to 60 and 70 fathoms, towards the edges of the bank.

This bank is steep to; and from its soundings on the north side, you fall immediately into 90 or 100 fathoms water, black mud; and on the south side, into 120 fathoms.

Soundings.

REMARKS.—It may be observed, generally, that the soundings all along the Nova Scotian Coast, between Cape Canso on the E. N. E. and Cape Sable to the W. S. W. are very irregular; from 25 to 40 and 50 fathoms; therefore, in foggy weather, do not stand nearer in shore than 35 fathoms, lest you fall upon some of the ledges. By no means make too bold with the shore in such weather, unless you are sure of the part of the coast you are on; for you may, otherwise, when bound for Halifax, fall unexpectedly into Mahone and Meckleburgh Bays, and thus be caught and endangered by a S. E. wind.

The weather on the coast is frequently foggy in the spring and some part of the summer; in particular at the distance of 4 or 5 leagues from the shores; but on approaching nearer, the weather is found more clear; and with the wind from the land, it is perfectly clear and pleasant.

THE WEST AND NORTHERN COASTS OF NOVA SCOTIA, AND THE COAST OF NEW BRUNSWICK, INCLUDING THE BAY OF FUNDY, WITH MANAN ISLANDS, &c.

REMARKS.—Whoever examines and well considers the situation of the south-western coast of Nova Scotia, the Bay of Fundy, and Manan Islands, will readily perceive the dangers attendant upon the navigation of its harbors, its natural exposure to the Atlantic Ocean, the variableness of its tides and winds, and the many rocks with which it is environed. These, therefore, must be expected to involve the mariner in occasional difficulties, which will call forth his utmost energies, and require no common share of attention to surmount; yet, although the loss of vessels in these parts fully justifies a perilous apprehension, there are few obstacles which a moderate exercise of skill and resolution would not have been able to overcome; and we fear it is more to the want of these qualifications in the navigators, than to the dangers of the navigation, that such losses have ever occurred.

"It is essential," says Mr. Lockwood, "to the safety of those who are navigating the Bay of Fundy that it should be clearly understood;" and in cases of necessity, many are the places of safety to which vessels might resort, even without the advantage of a pilot, although no man would attempt to justify the economy of saving the expense of pilotage, on a coast like this, where currents, fogs, and changes of weather may confound the best judgment.

In order to lessen these accidents, if not totally to prevent such fatal occurrences in future, let the mariner be fully convinced of the necessity of frequently sounding with the deepsen lead, and see the expediency of having his anchors and cables fit for immediate use; this cannot be too strongly impressed upon his mind, for vessels well equipped and perfect in gear, with their anchors stowed, as in the middle of the Atlantic Ocean, have been here wrecked, in moderate weather, and so frequently, that such gross neglect cannot be too much reprobated; such serious losses will, we trust, be hereafter prevented, more especially as it is so dependant upon the mariner himself, and may be, in most cases, remedied by only sounding in time, and keeping the lead in continual action.

Tides.

TIDES.—Another subject most particularly essential to the mariner, is a knowledge of the tides: this we recommend seriously to his attention.

CAPE SABLE TO BRIER'S ISLAND, ON WHICH IS A LIGHTHOUSE.

THE COASTS, ISLANDS, &c.—Before we give a description of the main land, from Cape Sable to the entrance of the Bay of Fundy, it may be proper to notice the islands and rocks which lie adjacent and to the westward of Cape Sable; these are the Blonde Rock, the Seal, (on which is a lighthouse painted white, containing a fixed light,) and Mud Isl-

Lighthouse.

ands, the Tusket Islands, the Gannet Rock, and Green Island, &c. The Seal Islands' southernmost point bears from Cape Sable nearly W. N. W. $\frac{1}{2}$ W. distant 16 miles, being somewhat more than two miles in length from north to south. Its southern part is covered with scrubby trees, elevated about thirty feet above the sea; to the southward of this part, distant two miles and seven-tenths, is a rock uncovered at low water, called the Blonde, from a vessel that in 1777 was wrecked upon it; round this rock are 7, 9, and 10 fathoms water. About a mile to the westward of the Blonde, are very heavy and dangerous overfalls, having a very alarming appearance. The ship Waterloo, in passing between the Blonde Rock and Seal Island, struck twice upon a rocky shoal, with only 18 feet water over it, and thereby knocked off her rudder; this was supposed to be a part of the ledge which runs off to the southward of the Seal Island. The Blonde Rock is particularly dangerous, as the ebb tide sets so strongly towards it, and from the lowness of the Seal Islands you are so likely to be deceived, even in fine weather. The tide also runs with great rapidity past the Seal and Mud Islands, which occasions the sea to break over the shoals in their vicinity, making them appear more extensive than perhaps they really are. In sailing, therefore, between the Seal Island and the Mud Islands, large vessels should always keep one mile off the latter, by which they will avoid the overfalls, in 3 fathoms. Off the western part of the Seal Island, distant one mile, lie two small rocky islets, called the Devil's Limb, and the Limb's Limb; the Devil's Limb is visible at all times, and the Limb's Limb is only seen at half tide. The smoothest anchorage is midway between these and Seal Island, in $3\frac{1}{2}$ or 4 fathoms, clear sand; wild fowl and fish are here in abundance. The fishermen resort to this island for wood and water; the former they obtain from wrecks, the latter from a pond near the centre of the island.

The Mud Islands, called also the North Seals, are 5 or 6 low ragged islands, the largest of which lies N. E. by N. $3\frac{1}{4}$ miles from the southern Seal Island; it is one mile and a quarter long, and off its southern point lies the Noddy, a little low islet, to the southward of which are overfalls of 18 feet; large vessels, in passing between Seal and Mud Islands, should be careful to borrow within a mile of Seal Island, for these overfalls extend full three-quarters of a mile from Noddy Islet. To this islet the petrels, or Mother Cary's chickens, annually resort in great quantities to hatch their young, sitting about in astonishing numbers. Nearly N. W. by N. distant two miles from the largest Mud Island, is a ridge of rocks, called the Soldier's Ledge; it is commonly uncovered at half ebb. The course from abreast of Cape Sable, to pass between Seal and Mud Islands, is N. W. by W.: you will meet with some overfalls in this direction, but no danger.

Tusket Bald Islands are a cluster of islands lying to the northward of the Mud Islands, and to the south-westward of the entrance of the Tusket River; some of them are of considerable dimensions, and there are many shoals and dangers among them, so that although there may be navigable channels between, no stranger should attempt these passages. In the channel which separates the Tusket and Mud Islands is a rocky shoal, called by Des Barres, the Acteon; it lies N. N. W. distant 4 miles from the largest Mud Island, but Mr. Lockwood places it one mile and a half further off; nevertheless, these are generally supposed to be the same dangerous shoal, although its position does not seem to have been exactly determined; it appears to have from 2 to 4 fathoms over it, and therefore must be carefully watched for and guarded against by those who should venture through this channel.

TUSKET RIVER runs in to the north-eastward of the Tusket Islands, and is one of several inlets that are navigable on this part of the coast; it has several settlements on its banks, but at present is little known or frequented.

PUBNICO HARBOR is, according to Mr. Lockwood's account, "an excellent ship harbor, easy of access, and well situated for vessels bound for the Bay of Fundy, and distressed for either shelter or supplies. Its entrance is distant from the south end of Seal Island 12 or 13 miles, from which it bears N. E. $\frac{1}{2}$ E. the depths of water between them being from 16 to 20 fathoms, and from thence to 12 and 7 fathoms up so far as the beach, which is the proper place for strangers to anchor. Above this beach, on the western side, is a ledge, which becomes partly dry at low water. About 2 or 3 miles, on the starboard shore, before you arrive at the entrance of Pubnico, is St. John's Island, under the northern side of which is good shelter in south easterly gales; and small vessels frequently lie round the beach which forms its eastern part; but coasters commonly pass through the inner channel, within St. John's, Mutton, and Bonne Portage Islands, by Cockewit, and thence towards Burrington Bay by Shig Harbor; but these places are partly shoal, and totally unfitted for large vessels.

From the entrance to Pubnico a W. N. W. $\frac{1}{2}$ W. course for 4 leagues, will lead clear to the southward of the Tusket Islands, but in this route you must be very careful to avoid the Soldier's Ledge and the Acteon, both of which have been already described. Having passed to the westward of the Mud and Tusket Islands, you will encounter, in your passage to the northward, the Gannet Rock, which lies N. W. by W. nearly 6 miles distant from the Southern Bald Island, and S. $\frac{1}{2}$ W. 10 miles from Cape Fourchu; it is

36 feet above the surface of the water, and always appears whitened by the dung of birds; about two miles to the south-westward of the Gannet is the Opossum's Ledge, which is visible at half tide, and appears to have endangered the lives of many, having been formerly represented to lie 4 miles W. by N. from the Gannet; Des Barres has placed this danger in latitude $43^{\circ} 40' 40''$, and longitude $66^{\circ} 9'$.

GREEN ISLAND lies N. N. E. $\frac{1}{2}$ N. distant $3\frac{1}{2}$ miles from the Gannet Rock light; there is a reef runs out from this island to the south-westward almost $\frac{1}{2}$ of a mile; round this reef are 6 and 5 fathoms water, and between it and the Gannet Rock from 12 to 17 fathoms. West of Green Island, about $1\frac{1}{2}$ mile, is also a sunken ledge; it lies directly in the fairway of the channel to the Little Harbor of Jeboque, which is shoal and intricate, being the common resort of fishermen and coasters; the lands adjacent are moderately high, and are both well cultivated and settled. Should a stranger venture for this harbor, he must not only avoid the dangers already described, but also a rocky shoal, called the Dragon, which is situated S. W. Southerly a full mile from Jeboque Head, and N. N. E. one mile and three-quarters from Green Island; there are 8, 10, and 12 fathoms between the Dragon and Green Island; and 5, 6, and 7 fathoms between it and Jeboque Head; there is also a knoll of 3 fathoms at the entrance of the harbor, and shoal water off its eastern side.

Green Island.

Cape Fourchu.

CAPE FOURCHU, or the Forked Cape, on which there is a lighthouse, containing a revolving light, visible one and a quarter minute, and invisible half a minute. The building is red and white, vertically, 135 feet above the level of the sea, so called from the island which forms it, having two narrow prongs running out to the southward, but the inlet formed between these must not be mistaken for Yarmouth Harbor, which lies to the eastward of them both. This cape forms a remarkable object in these parts, being rocky, high, and barren; it bears from Jeboque Head N. N. W. $\frac{1}{2}$ N. distant $4\frac{1}{2}$ miles.

Yarmouth.

YARMOUTH.—Vessels intending to run for Fourchu or Yarmouth Harbor, will find it the safest way to proceed to the westward of Seal Island, the Gannet Rock, and Green Island, giving the Gannet a berth of about two miles; they will then have no danger to encounter, but from 20 to 30 fathoms water all the way. Having passed Green Island their course towards Yarmouth Harbor will be about N. N. E. $\frac{1}{2}$ N. In this passage they will meet with the Bangshot Rock, which dries at low water, and is dangerous, running out shoal full half a mile to the southward; it bears from Cape Jeboque nearly N. W. from which it is distant almost $2\frac{1}{2}$ miles, and from Cape Fourchu S. by W. almost $2\frac{1}{2}$ miles; you may pass on either side of this rock, and run on N. by E. $\frac{1}{2}$ E. for the harbor's mouth; this is considered a safe but small harbor; the fairway is to follow the eastern shore until you reach the eastern point; this you are to give a berth, and proceed mid-channel; you will readily perceive the isthmus, with a battery upon it, and under its lee, to the northward, is the anchorage; the ground is good, and the depth of water from 5 to 6 fathoms. About a mile above the anchorage is the town of Yarmouth, which is numerous peopled, the houses large, though straggling, the grounds adjacent well cultivated, and the circumstances of the inhabitants generally good.

From Cape Fourchu to Cape Mary the main land extends N. by W. and from Cape Mary to the lighthouse on Brier's Island is N. N. W. 13 miles. Almost opposite to Cape Fourchu is the Lurcher's Rocky Shoal, and between that and Cape St. Mary is the Trinity Ledge, and these are the only dangers in the passage.

Lurcher Rock.

The LURCHER ROCK lies nearly W. N. W. from Cape Fourchu, distant 13 miles; it covers a spot of about 3 acres of shoal ground, the least water over which is 12 feet; around the edge of the shallow water are 10, 11, and 12 fathoms, and a little further off from 20 to 30 fathoms.

Trinity Ledge.

THE TRINITY LEDGE comprehends a smaller space than the Lurcher, about three-fourths of an acre, having the tops of three small rocks showing themselves at low tides; this danger bears from Cape Fourchu N. by W. distant 14 miles, and from Cape St. Mary S. W. $\frac{1}{2}$ W. $6\frac{1}{2}$ miles; the depth of water to a mile round it is from 12 to 15 fathoms. The stream runs very strongly over these two dangers, but the anchorages in their vicinity are tolerably good for a tide.

Vessels coming round Cape Sable, and intending to take the Tusket Passages, may steer N. W. by N. and proceed through either of the channels which have been described before, as best suits their convenience, or else proceed to the southward of Seal Island for about 35 miles, passing at the distance of 20 miles to the westward of Seal Island; thus the Bay of Fundy will be open and their course up N. N. W. This will carry them outside of the Lurcher, but the tide will make one point difference in this course, and it sets S. E. and N. W. through the channels of Mud and Tusket Islands, and near the Munnan Ledges, the ebb running W. S. W. and the flood E. N. E. at the rate of four knots an hour.

From the Seal Islands up to Cape St. Mary, the soundings extend full 20 and 30 leagues off the land westward of Brier's Island light, and near the Munnan Ledges are 60, 80, and 100 fathoms at 3 and 4 miles distance; therefore the lead should always be kept going.

BRIER'S ISLAND, AT THE ENTRANCE TO THE BAY OF FUNDY,
TO CHIGNECTO BAY.

BRIER'S ISLAND lies at the S. W. entrance of St. Mary's Bay; it is 4 miles long and 1½ mile broad; on its western side stands a lighthouse, painted white, 90 feet, containing a fixed light. In advancing from the westward towards the island, the tide ripples strongly, even in 33 and 45 fathoms, when you are at the distance of 8 or 10 miles off the island. There is a long and narrow reef runs out S. W. from the south-eastern part of the island, full two miles, some parts of which are visible, and called the Black Rock; in the same direction to the S. W. is a small spot of 3 fathoms; this lies about 1½ mile from the extremity of the reefs; between the knoll and reef, and also around the knoll, there are from 15 to 34 fathoms; vessels, therefore, going round to the southward of Brier's Island must always give it a wide berth. About 3 miles N. W. ¼ W. from the northern end of the island, lies the N. W. Ledge of 10 feet; it is small and dangerous; nearly S. W. three-quarters of a mile from this, is Botson's Ledge, and between these two ledges and the island are two others, said also to be dangerous, with deep channels between them, but the exact situations of these are not clearly known: it will therefore be particularly dangerous for the mariner to approach nearer to the northern side of this island than 4 or 5 miles.

LONG ISLAND is separated from Brier's Island by a narrow channel, called the Grand Passage, in which are from 5 to 15 fathoms water; the island runs in a N. E. and S. W. direction, being nearly 10 miles long, and about 1½ mile broad; its coasts are almost straight, and at its farther end is the Petit Passage, dividing it from a narrow neck of land which continues so far as the Gut of Annapolis; thus Brier's Island, Long Island, and this peninsula, form the northern shores of

ST. MARY'S BAY—while from Cape St. Mary, upwards into the bay, the southern shore is low, and runs out with sandy flats, in some places almost so far as three-quarters of a mile; the opposite or northern shore, is constituted of high cliffs, having deep water close under them. Nearly mid-channel, and full two-thirds up the bay, is a rocky bank, with 4, 5, and 6 fathoms over it, whilst on each side of it are channels of 12 and 15 fathoms, muddy ground. Far up the bay, on the southern shores, is the River Sisibou, the entrance to which is shoal, with a depth of only 2 fathoms water. At the further end of St. Mary's Bay, is an extensive sandy beach, on entering which you will lessen your depth from 4, 5, and 6 fathoms, to 12 feet, and should you advance, it will become more shallow. On the north side, and nearly opposite to Sisibou River, is Sandy Cove, where vessels, when it comes on to blow hard, may run aground on a bottom of soft mud, and lie sheltered from all winds.

GRAND PASSAGE.—We have already stated that this channel runs in between Brier's and Long Islands; its southern entrance bearing north, distant 29 miles from Cape Fouchu, and N. by W. 12 miles from Cape St. Mary: in running for it, from abreast of Cape St. Mary, you will have no impediment whatever, but a depth of from 14 to 30 fathoms; at the entrance of the passage are 18 fathoms mid-channel, and having advanced within you will perceive Billy Islet; this may be left on either side, although Mr. Des Barres says the western channel is the best and widest; here, a little to the northward of the island, is one of the safest and best harbors in the vicinity; from hence to the northward are 4, 5, 6, and 7 fathoms; following the shore of Brier's Island, opposite its northern point, the water deepens to 13 and 14 fathoms; you are then clear of the Grand Passage, and may borrow towards Long Island, steering north-easterly, or N. by N. into the Bay of Fundy.

PETIT PASSAGE lies at the further extremity of Long Island, and is the channel which separates that island from the main. It is situated about 3 leagues to the north-eastward of the Grand Passage, and is 240 fathoms wide in its narrowest part; its shores are bold to, and there are from 20 to 30 fathoms water within it: a N. N. E. ¼ Northerly course from abreast of Cape St. Mary, will carry you right through it. Near its northern entrance, on the western side, is Edly Cove, a very convenient place for vessels to anchor in, for here they may ride out of the stream of tide, which commonly runs so rapidly, that without a fresh landing wind, no ship could possibly stem it.

ANNAPOLIS GUT.—Pursuing the coast along shore from Brier's Island to Annapolis Gut, it has very few curvatures; the shore is bound with high rocky cliffs, above which a range of hills rises gradually to a considerable height; their summits appear unbroken, except at the Grand and Petit Passages, at Sandy Cove, and Gulliver's Hole, where they sink down in valleys, and near the gut, where they terminate by an abrupt and steep declivity. The mariner, in navigating this coast, will, by keeping about a mile or a mile and a half from the land, have 50, 40, and not less than 30 fathoms water all the way; and when at the entrance of the gut, one and a half mile distant from the lighthouse on Point Prim, he will find the latter depth. The shore on both sides of the gut is iron bound for several leagues; the stream of ebb and flood sets through the gut with the velo-

Gut.*

Lighthouse. city of 5 knots an hour, causing various eddies and whirlpools, but the truest tide will be found off the eastern side, which is so bold to approach that a ship may rub her bowsprit against the cliffs, and yet be in 10 fathoms water. There is a lighthouse upon Point Prim, the light from which is exhibited from a window 120 feet above the sea, and is an object of pitiful and useless economy; but it may perhaps serve to prevent the fatal error of mistaking the real entrance of the gut from Gulliver's Hole, which the land much resembles, but which the latter has no such distinguishing building upon. Point Prim runs off about 30 fathoms, and off the eastern entrance is the Man-of-war Rock; it lies about a cable's length from the land, and has no channel within it. The entrance to the gut is very narrow, but keep mid-channel, and after you get within it the harbor widens, and ships can anchor on the east or west side of the basin, or run up to Goat's Island; if the latter, they should observe that when they get within half a mile of the island, they must stretch two-thirds of the way towards the larboard shore, until they are past the island, which is about all round, and from thence they can steer up mid-channel towards the town.

In addition to the above, Mr. Lockwood observes, "That the abrupt precipices of the highlands which form the gut, cause those gusts of wind which rush down so suddenly and so violently from the mountains. The tide also hurries your vessel through with great force. At the entrance there is no anchorage except close in shore, near the outer western point; in some places the depth is from 40 to 80 fathoms."

Black Rock Point. Lighthouse.

BLACK ROCK POINT.—On this point there is a lighthouse, 45 feet above sea level, at high water, (rise and fall about 50 feet.) three-quarters of a mile east of it, and at Givan's Breakwater, 2½ miles westerly. It will be a guide light for vessels in clear weather, making Spencer's Island anchorage and the channel leading into the Basin of Mines. The following are bearings of the prominent head lands within view from the light:—

Bearings.

Long Point, south shore.....	S. 86½ degrees west.

Isle of Haute.....	N. 19 " "
Cape Chignecto.....	N. 21 " "
Cape D'Or.....	N. 134 " east.
Spencer's Island.....	N. 35 " "
Cape Split.....	N. 66½ " "
Range of shore towards Hall's Harbor.....	N. 89 " "

Annapolis to the Basin of Mines.

ANNAPOLIS TO THE BASIN OF MINES.—From the Gut of Annapolis up the bay to Cape Split, the coast continues straight, and nearly in the same direction, with a few rocky cliffs near the gut or narrows, and many banks of red earth under high lands, which appear very even. In the channel or narrows leading into the Basin of Mines, from Cape Split to Cape Blow-me-down, and from Cape D'Or on the north side, to Partridge Island, the land rises almost perpendicularly from the shore to a very great height. Between Cape Blow-me-down and Partridge Island, there is a great depth of water, and the stream of the current, even at the time of neap tides, does not run less than 5 or 6 knots. Having passed Cape Blow-me-down, a wide space opens to the southward, leading to the settlements of Cornwallis, Horton, Falmouth, and Windsor, &c.; these are now rising into great mercantile consequence, and abound in mines of coal, plaster, limestone, and other valuable minerals; while to the eastward the river extends to Cobequid Bay, having on its banks the towns of Londonderry, Truro, and Onslow, this latter place forming a direct communication with the Bay of Turmagouche, in the Gulf of St. Lawrence. Off Cape Split there are considerable whirlpools, which, with spring tides, are very dangerous and frequently run 9 knots an hour. Should a vessel be at anchor between Cape Sharpe and Partridge Island, and you should be desirous of proceeding to Windsor River, it will be necessary to get under way two hours before low water, in order to get into the stream of the Windsor tide on the southern shore; otherwise, without a commanding breeze, a vessel would run the hazard of being carried up with the Cobequid tide, which is the main stream, and runs very strong both with flood and ebb; while the Windsor tide turns off round Cape Blow-me-down to the southward, and is then divided again, one part continuing its course up to Windsor, and the other forming the Cornwallis tide, running up the river of that name.

In sailing up Windsor River, the house on Horton Bluff should be kept in a south bearing, and the gap in the Parsborough River north; this will carry you through the channel between the flats, which cannot be passed at low water by a vessel drawing 15 feet much before half tide. Off Horton Bluff the ground is loose and slaty, and a ship will be likely to drag her anchors, with a strong breeze, particularly at full and change; therefore, it might, perhaps, be better for men-of-war to moor across the stream, and full one-third from the bluff.

Haute Island.

HAUTE ISLAND.—This island is situated at the entrance of the Mine's Channel, and is not ¼ mile in length, and about half a mile broad; it bears from Cape Chignecto S. W. distant 4 miles; the channel on either side is good; that between it and the cape

has 14, 20, and 22 fathoms water in it, and that between Haute and Jolyffe Head from 20 to 40 fathoms; it forms a prominent and very remarkable object, from the height and steepness of its rocky cliffs, which, in a most singular manner, seem to overhung its western side; there is, however, a fair landing at its eastern end, and anchorage half a mile off in 18 fathoms, with the low point bearing about N. E. by N.; here also is a stream of fresh water running into the sea. Cape D'Or and Cape Chignecto are high lands, with very steep cliffs of rocks and red earth, and deep water close under them. You have nearly the same kind of shore to the head of Chignecto Bay, where very extensive flats of mud and quicksand are left dry at low water. The tides come in a bore, rushing in with great rapidity, and are known to rise, at the equinoxes, from 60 to 70 feet perpendicular.

CHIGNECTO BAY runs up E. N. E. and may be considered to be the north-eastern branch of the Bay of Fundy; it is divided from the Mine's Channel by the peninsula, of which Cape Chignecto is the western extremity: having advanced about 12 or 13 miles within it, you will see a point on the larboard or northern shore running out to seaward; this is called Cape Enragé, on which there is a lighthouse containing a fixed light; 11 miles beyond which it divides into two branches, the one leading to Cumberland Basin, and by the River Missequash to Verte Bay, in the Gulf of St. Lawrence, and now becoming a place of very considerable commerce; the other running northerly, and taking the name of the Petucdiac River; these parts, like the Basin of Mines, are fast rising into consequence, and becoming the seat of numerous settlements. The Cumberland Branch is navigable to within 13 miles of Verte Bay; and it is remarkable that when the rise of the tide in Cumberland Basin is 60 feet, that in Verte Bay will only rise 8 feet. The River of Missequash, which runs across the isthmus, is the present boundary between the provinces of Nova Scotia and New Brunswick.

CAPE CAPSTAN.—On this Cape there is a lighthouse which shows two lights horizontally, when approaching it from the westward or seaward side. The lights are about 40 feet above high water (rise and fall about 55 feet). The building is square and painted white, and is a conspicuous beacon in the day time to mark the entrance of Apple River, a place of resort for vessels of 100 tons and under. The following bearings are given from the Light:—

To the Sisters outermost head.....	S. 61 degrees west.
Salmon River.....	N. 9 " "
Cape Enragé Light.....	N. 41 " east.
Grindstone Light.....	N. 51 " "

Cape Capstan. Lighthouse.

Bearings.

CHIGNECTO BAY TO THE MANAN ISLANDS, AND PASSAMAQUODDY BAY.

THE NORTH COAST OF THE BAY OF FUNDY, from Cape Enragé, towards Quaco, in the township of St. Martin's, is, at present, but thinly inhabited, and it continues to be so as far as St. John's: the land is good, but much broken with steep valleys; the weather is generally humid, the winds boisterous and changeable, and the intervals of sunshine limited and evanescent; but from Quaco to St. John's the interior hills rise in easy inequalities; the ravines of the cliffs are deep and gloomy, and the indentations frequently have beaches: at Black River, which is about 12 miles west of Quaco, is a safe inlet for a small vessel, although it is dry from half tide.

QUACO LIGHT, white and red, horizontal, is on a small rock off Quaco Head, W. $\frac{1}{4}$ S. from St. Martin's Head; it is a revolving light, time of revolution 30 seconds.

QUACO LEDGE.—This is a dangerous gravelly shoal, situated about 12 miles S. E. $\frac{1}{4}$ E. from Quaco, and W. by N. distant 11 miles from Haute Island; it extends N. W. by N. and S. E. by S. about $3\frac{1}{2}$ miles, and is half a mile broad; vessels have frequently grounded upon this bank; there are several irregular patches of rocks lying off its N. E. side; the ledge shows itself at half tide, and dries for about 100 yards, having but 12 feet water over it with common tides; half a mile to the N. E. the eddies with the flood tides are strong and numerous, the ship's head going nearly round the compass in the space of half an hour; the ebb is a true tide, and sets in a W. S. W. direction towards the ledge; the soundings are from 7 to 14 fathoms, at about two cables' length all the way round, but they shoal more gradually from the N. E.

At low water, spring tides, the highest rock is 12 or 14 feet above water, and as much under at high water. In light winds and smooth water, it is not visible, and therefore dangerous.

The night tides here, and generally throughout the bay, are highest; at St. John's they are so during the summer, but the contrary during the winter months, or between the equinoxes. The mark to go clear to the southward of the Quaco Ledge is Cape D'Or on with the south side of the Island Haute.

ST. JOHN'S HARBOR.—The entrance to this harbor bears from the Gut of Anna-

St. Jo Harbor.

polis about N. $\frac{1}{2}$ W. distant 11 leagues: it is distinguished by a lighthouse which stands on Partridge Island, after mentioned. Vessels coming from seaward, and making for this harbor, should, so soon as ever they can well discern the lighthouse, make their signal for a pilot; but if unable to succeed in reaching the harbor that tide, then endeavor to run in between Meogenes Island and the main, going either on the south or on the north side of this island, in doing which you will have no where less than 4, 5 and 6 fathoms water, with a bottom of sand and mud. Here you will obtain the best anchorage, by bringing the three hills in the country to the N. E. in a line over Rocky Point Island, and the house on Meogenes Island S. E. by S. High water, 11h. 44m. rise 21 to 25 feet.

High water.
City of St.
John.

Lighthouse.

Beacon.

THE CITY OF ST. JOHN stands on an irregular descent, having a southern aspect, and on entering the river, has an imposing appearance. Partridge Island is about two miles to the southward of the city, answering the double purpose of protecting the harbor and, by its lighthouse, pointed white and red, vertical, guiding and directing the mariner to its entrance; the lantern is 166 feet above the level of the sea, and the light is good and well attended. The ground for several miles to the southward of Partridge Island is muddy, the depth gradual from 7 to 20 fathoms, affording excellent anchorage; the passage westward of this island has in it 10 feet, that to the eastward has 16 feet, and abreast of the city are from 7 to 22 fathoms. Three-fourths of a mile to the northward of the lighthouse is a beacon, black and white, vertical, fixed on the edge of a rocky ledge, forming the west side of the channel, and having deep water close to it. A breakwater is erected further on at the eastern side of the channel and below the town; this greatly intercepts the violence of the waves, which southerly gales usually occasion. Every possible assistance is here given to ships wanting repair, they lie upon blocks, and undergo a thorough examination, without incurring the expense, injury, and loss of time occasioned by heaving them down.

Vessels having made the harbor, and finding themselves able to enter, may, when they have passed Meogenes Island, edge in shore towards Rocky Point, until they perceive Meogenes Point is in a line with, or over the N. W. corner of Meogenes Island; then, sailing in between Rocky Point and Partridge Island, with these marks on, will lead them in the deepest water, over the bar, until they open Point Musquet to the northward of the low point of Partridge Island; when putting the helm starboard, they should edge over towards Thompson's Point, until they get the red store at the south end of St. John's in a line over the beacon; keep them in one until they have passed the beacon at the distance of a ship's breadth; then haul up N. N. W. for the harbor, keeping the blockhouse, at the upper part of the harbor, open to the westward of the king's store, situated by the water side; which mark will lead them, mid-channel, up to the wharves, where they may lie aground, dry at half tide, and clean the ship's bottom; or ride afloat in the stream at single anchor, with a hawser fastened to the posts of the wharves on shore. The flood tide is weak here, but the ebb runs down rapidly past Meogenes Island into the Bay of Fundy.

Tide.

Should the tide of ebb have taken place at the beacon, then it would be highly improper to attempt gaining the harbor that tide; but wait for the next half flood to go over the bar; as both sides of the entrance to the harbor are composed of sharp rocks, which dry at low water; and the tide of ebb, especially in the spring of the year, when the ice and snow are dissolving, is so exceedingly rapid and strong, that all the anchors you possess will not be sufficient to prevent the ship from driving.

Tide.

"The River St. John," says Mr. Des Barres, "has sufficient depth off water for large ships to the falls; whence it continues navigable eighty miles up the country, for vessels of 100 tons. At Fort Frederick the rise of the tide is 18 feet, and at equinoctial spring tides 25 feet; above the falls it seldom rises more than 4 feet. When the tide has risen 12 feet at the fort, the falls become smooth, after which, during the space of 20 minutes, they are passable. At times of great freshets, which generally happen between the beginning of April and the end of May, from the melting of the snow, the falls are absolutely impassable for vessels going up the river, for then the tide does not rise to their level."

The falls are situated nearly 2 miles beyond the city of St. John; it is a narrow channel 80 yards wide, and 400 long; this channel is straight, and has a ridge of rocks stretching in such a manner across it as to hold and retain the river water from running out into the sea. After passing the falls, you enter a gullet, which is a quarter of a mile wide, and two miles long, winding in different courses, and having 16 fathoms in the channel.—Next to this gullet is a fine and extensive basin, a mile and a half wide, and eight miles long, which enters the main river. The river branches some hundreds of miles up in a serpentine manner; and runs through a country which abounds with timber, coal, limestone, and many other minerals; and the surrounding lands are now becoming highly cultivated. There is water sufficient to navigate vessels of 50 tons, as high as Fredericton, and in all the branches to the lakes adjacent, except in dry seasons.

In the middle of May, or earlier in favorable seasons, the snow and ice in the country, dissolving, occasions a general overflow in the river, which in some years rises so high as to inundate all the low lands.

In autumn the beginning of the season, the water runs out to seaward without a fall, their level.

The body of the water has risen to the tide level, the water fills the river only 14 feet.

To the north is a small bay, hence the point of view, it being deep water, has deep water.

MUSQUASH trace is in the water, small vessels when past ward.

BEAVER a mile wide channel, bear east, ground, for the tail to the place

ing into ETAN the north traces in the distance low

In autumn, the river St. John is swollen by rains, and between the middle of *April* and the beginning of *May*, by the melting of the ice and the great quantities of snow that accumulates on the banks of this vast navigable river. From those causes, the water streams out to seaward continually; therefore vessels, at that time, seldom enter the harbor without a fresh leading wind. The falls are then impassable, as the tides do not rise to their level.

The body of the river is 174 feet above low water mark, consequently after the tide has risen to that height, the water descends, or literally falls up into the river. When the tide has flowed 12 feet, the falls are smooth and passable for 20 minutes. Above the falls the water rises 4 feet, and at Majorfield, which is 60 miles in the interior, it rises only 14 foot.

To the W. S. Westward of Meogenes Island is Flat Bay, called also Visarinkum; it is a small harbor, with 5 and 4 fathoms water, used sometimes by the coasters. From hence the land runs nearly W. S. W. passing Negro Head to Cape Musquash; off the point of which is Split Rock; it lies close to the cape, and has 8 fathoms water very near it, being distant from Partridge Island 8½ miles; the shore is iron bound all the way, and has deep water close into the land.

MUSQUASH HARBOR lies about a mile to the westward of the Split Rock; its entrance is about half a mile wide, and there is good anchorage a little way in, with 4 fathoms water, but further on a bar runs across the harbor, over which is only 1½ fathom; small vessels sometimes pass to the westward of the islands, and run up the river, which, when past the bar, has 2, 2½ and 3 fathoms water; but this harbor is open to the southward.

Musquash Harbor.

POINT LEPREAU.—From the entrance to Musquash the coast runs W. S. W. westerly nearly 10 miles to Point Lepreau, on which there is a tower, red and white, horizontal, with two fixed lights, one elevated 18 feet above the other. In this space are 4 or 5 inlets, but only calculated for small craft; the first of these is about 1½ mile to the westward of Musquash western point, and is of no note whatever; in your way to it a berth must be given to the shore, particularly about Musquash Point, on account of some rocks lying off that part; there are channels between these rocks, but few vessels will venture through them. About a mile further is Chance Harbor, which is a mere shallow cove of 2 fathoms water. Little Dipper is more westerly still, and situated 3¼ miles from Musquash Point; this also has only 12 feet water in it, and scarce fit for any thing but boats. Great Dipper is divided from Little Dipper by a flat point of land, round which are several scattered rocks; this harbor can accommodate small craft, which sometimes run in there for shelter; but it is by no means to be recommended, unless in cases of necessity; there is a creek of fresh water runs into it, called Moose Creek. Further westward, and about 1½ mile from Point Lepreau, is Carringe Harbor; this is open to the eastward, and affords anchorage at its entrance in from 7 to 3 fathoms. The land all the way from Musquash to Point Lepreau is high, broken, and many scattered rocks lie off it; therefore, vessels, in passing, should carefully give it a good berth.

Point Lepreau.

MACES, or MASON'S BAY, is formed to the westward of Point Lepreau, between it and Red Head; these bear from each other N. W. 4 N. and S. E. 4 S. distant full 5 miles. There are numerous rocks, shoals, and small islets within it, but its navigation seems insecure, for Mr. Lockwood emphatically observes, "this point ought to be classed as one of the dangers of the Bay of Fundy; for many serious accidents have lately happened in the neighborhood of this promontory." Maces Bay he calls a deep and ugly indent; so much so, that ships bound to the River St. John, dreading to pass its entrance, get frequently embayed there, and some valuable vessels have thus been lost. "Yet, at the head of this bay," he observes, "is a place called Pok Logan, where there is good shelter. Several rivers appear to fall into this bay; and, perhaps, a better knowledge would tend much to strip it of its fancied dangers."

Maces, or Mason's Bay

W. by S. from Point Lepreau, distant 3½ or 4 miles, there is supposed to be a dangerous shoal, but its actual situation is not known; if such should exist, it must be surrounded with very deep water, for a small distance from this imagined situation, are 26, 28, and 31 fathoms, mud, mud and sand, and gravel.

BEAVER HARBOR lies about 4 miles to the eastward of Bliss Island, and is above a mile wide at its entrance, with 10 fathoms water on each side, and 20 fathoms mid-channel. In entering keep the western shore on board, until you bring the Goal Rock to bear east, distant about half a mile, when you may anchor in 4 or 5 fathoms, good holding ground. There are no regular pilots, but the fishermen on the coast are well qualified for the task, although in clear weather they are not absolutely necessary, yet strangers to the place will most probably require their assistance. There are several rivulets running into various parts of the harbor, but there is no convenient watering place.

Beaver Harbor.

ETANG HARBOR is situated to the southward of the Magaguawo, and runs in to the north-eastward of Campo Bello; before it lie many islands. There are three entrances into this harbor, so that vessels may go in or out at any time. The western entrance leads to La Tete Harbor, where anchorage may be obtained in from 10 to 5 fathoms.

Etang Harbor.

oms, but there is no passage for ships round the northern end of Payne's Island. The channels between Payne's and Bliss Islands are considered to be the best, as they will admit of vessels working through them; but the eastern passage requires a leading wind. A pilot will be necessary on account of the intricacies of the channel, but one can easily be obtained any where on the coast; water can be procured in various places. The bay is extensive, secure, and well sheltered, having good anchorage throughout. High water 11h. 10m. rise 21 to 25 feet.

High water.**St. Andrew's Harbor. Dangers.**

ST. ANDREW'S HARBOR lies on the eastern side of the entrance of the River Scoodic, and has two entrances; the eastern one is narrow and intricate, but is the deeper, having 4 or 5 feet at low water; the dangers in entering through this passage are a reef of rocks with a beacon on it, extending nearly three-quarters of a mile from Navy Island, and a reef of sand and large stones with a pole on it, extending nearly two miles from the block-house on the main land; the narrowest part of the channel is not more than a cable's length; the mark for entering is to keep the town of St. Andrews open, and steer directly in for the harbor. In the bay, in general, there are from 17 to 25 fathoms water.

Reef.

The western entrance is not so difficult, but has less water than the eastern, the bar being dry at the last quarter ebb. A dangerous reef of stones, with a floating beacon on it, lies off the west end of Navy Island. In steering you must keep close to the northward of the two poles on the bar, where at high water you will have from 18 to 20 feet water.

High Water. Tides. Wolf Islands.

There is a harbor master and branch pilots belonging to St. Andrews, and large vessels should never attempt to enter without having one of them on board. High water 10h. 50m. Common tides rise 20 feet; spring tides 26 feet.

WOLF ISLANDS.—The Wolves may be passed on either side, having deep water close to them; but they afford no sheltered anchorage, except for small fishing vessels in summer time; they are from 60 to 100 feet high. With light winds, a lee tide, or thick weather, you may let go an anchor any where between the Wolves and Beaver Harbor, in good holding ground, with a depth of 20 or 25 fathoms.

The Manan Islands.

THE MANAN ISLANDS.—Grand Manan is an island situated at the north western entrance of the Bay of Fundy; it is in the province of New Brunswick, and forms a part of Charlotte County; being 14½ miles in length, and 7 in breadth. According to the chart, the N. Western part of this island is distant from Passamaquoddy Head about 7 miles; its N. Eastern point, or Bishop's Head, bears from Cape Maspeck W. S. W. nearly 10 leagues, and W. N. W. from the entrance to the Gut of Annapolis, about 14 leagues; and from Petit Passage, N. W. by N. 32 miles. Its S. W. end, or head, bears from the lighthouse on Brier's Island N. W. by N. nearly, from which it is distant 28 miles; and N. W. by W. from the northern entrance to Petit Passage, distant 30 miles. Thus situated it commands an uninterrupted view of every vessel that passes to or from the Bay of Fundy. It is naturally strong, and possesses harbors where the largest ships may ride in perfect security. Its fisheries are in great estimation.

On its western side the cliffs are nearly perpendicular, rising 600 feet above the level of the sea; but on this side there is only one little inlet along the whole range, that can shelter even boats. It is commonly called Dark Cove, being situated about 4 miles from the northern part of the island; there is indeed a place called Bradford's Cove, about 5 or 6 miles more to the southward, but this is of no note whatever. There are soundings all along the shore, from Bishop's Head to the S. W. Head, 3, 4, 5, and 6 fathoms close to the land, deepening to 13, 20, 21, and 22, half a mile off, to 30, 40, and 50 fathoms at a mile distance, and still deeper as you increase your distance from the island.

The Northern or Bishop's Head, is abrupt and bold; but on its eastern side there is anchorage in a place called Whale Cove. This is situated between Swallow's Tail and the North Point; here vessels frequently ride during southerly winds, to wait the turn of tide. The soundings are from 15 to 25 fathoms; but it must not be resorted to in northerly gales.

Long Island Bay.

LONG ISLAND BAY.—This lies to the S. Eastward of Whale Cove, and is formed by the Swallow's Tail, which is a bold, high, ragged, and barren looking point, and Long Island, which bears nearly south from it, distant 1½ mile. This bay is easy of access, and possesses all the advantages of a harbor. The bottom of the bay is generally mud, excepting a ridge of rocks and gravel, which extends from the ledge that shows itself within the Swallow's Tail, and the cluster of sunken rocks that lie half a mile N. N. E. from Long Island Point, and these are five feet under water at low spring tides. In the northern part of the bay the bottom is a stiff clay, and vessels ill provided with gear have often rode out the severest gale there; and under Long Island opposite the beach is good anchorage, even locking in the northern end of Long Island with Swallow's Tail. The ground here is a strong mud, and you will ride safe and unaffected by sea or wind from any quarter.

Further to the southward, and on the eastern coast of Great Manan, are the Duck Islands. Here a pilot will be necessary, for though the ground is good about Great Duck

Island, yet the To the south which is scarce are connected to the Diamond resides an able resort for vessels. At the shallow mudvenience some outer ledges. bottom; the oward of the low and ledgy be seen; and dries at low wge may be o

SEAL I On the we

Island, yet there are dangers which, when the tide becomes high, are completely hidden. To the south-westward of Duck Islands are the Islands of Ross, the northern point of which is scarcely separated from Manan, Cheney's Island, and White Head Island; these are connected together by a sandy and rocky reef of foul ground, which extends S. $\frac{1}{2}$ W. to the Diamond Rocks, of which we shall speak hereafter. On White Head Island resides an able and active pilot, and the cove opposite to his house is commonly a great resort for vessels employed in the fisheries; but with easterly winds this is no desirable place. At the western side of Ross Island is part of what is called Grand Harbor. It is a shallow muddy basin; but vessels may enter and lie securely in it, on the mud; a convenience somewhat desirable, should you have lost your anchors and cables on any of the outer ledges. The entrance to this place has 4, 5, 6, and 7 fathoms water, with a clayey bottom; the channel is narrow, but secure from the sea.

A little to the westward of White Head Island are the Green Islands, and to the southward of the Green Islands, about one mile, are the three Kent's Islands; these latter are low and ledgy; the eastern, or largest one, is bold to the rocks, which are at all times to be seen; and to the N. Westward of these rocks is a ledge called the Constable, which dries at low water. Under the lee of these and the Green Islands, occasional anchorage may be obtained in from 14 to 7 fathoms.

WOOD ISLAND lies off the southern part of Grand Manan, and is one mile and three-quarters long; it runs parallel to the south-west head of Manan, and forms an excellent harbor between. The upper part of this inlet, and the head of it, afford most secure anchorage; and the inhabitants about Seal Cove and Red Head, will furnish you with all necessary supplies you may stand in need of, for these places are all well settled.

THE MANAN LEDGES are those more distant islets, rocks, and dangers, which lie to the southward of Grand Manan. The outer and most dangerous of these is the Old Proprietor, covering a space of half an acre at low water, and drying at half ebb; but when covered the tide sets directly over it, at the rate of 4 miles an hour. It lies S. $\frac{1}{2}$ E. distant $9\frac{1}{2}$ miles from Great Duck Island; S. by E. nearly 7 miles from the north eastern part of White Head Island; E. $\frac{1}{2}$ S. $6\frac{1}{2}$ miles from the Gannet Rock; S. E. by E. 4 leagues from the south-west head of Manan; N. N. W. $\frac{1}{2}$ N. $18\frac{1}{2}$ miles from Brier Island lighthouse; N. N. W. $\frac{1}{2}$ W. 18 miles from the northern entrance to the Grand Passage; N. W. $\frac{1}{2}$ W. $18\frac{1}{2}$ miles from the Petit Passage; west 35 miles from the Gut of Annapolis; and S. W. 15 leagues from the lighthouse on Partridge Island.

About $2\frac{1}{2}$ miles N. E. $\frac{1}{2}$ N. from the Old Proprietor is the Clerk's Ground; a rocky shoal of $4\frac{1}{2}$ fathoms. N. W. by N. one mile and two-thirds from the Old Proprietor, is Crawley's Shoal, of 7 feet only; and west of the Crewley, one mile and a half, is the Rans, of 5 feet. The Roaring Bull bears N. $\frac{1}{2}$ E. from the Old Proprietor, distant 4 miles; and, although it has 6 fathoms over it, it usually has a heavy dangerous ripple. The marks to go clear to the eastward of all these dangers, is the north easternmost highland of Manan well open of the Long and Duck Islands; the mark to lead to the southward of them is the south-west head of Manan open to Kent's Three Islands. In easterly winds the tide-rips are impassable.

There are also other rocks within these, a range of which lies south of the south-west point of White Head Island; some of these have deep water between them, and occasion a continual ripple three miles from the shore, quite home to the long point: these are called the Tinker, Three Diamonds, Rans, and many others without names; some of these show themselves, others have only 3 and 4 feet water over them.

S. S. E. $\frac{1}{2}$ S. about three-quarters of a mile from the southern point of the Three Islands is a knoll called the Kent, it is dangerous and has only 7 feet water over it; it bears about W. N. W. $\frac{1}{2}$ W. from the Rans, and is not included within the confines of the mark given to avoid the dangers to the southward, viz. the S. W. head open of all the islands. There is also a danger said to lie S. E. $\frac{1}{2}$ S. from the Kent Knoll, distant 2 miles, and W. S. W. $\frac{1}{2}$ S. one mile and a quarter from the Rans, but this is doubtful.

THE GANNET ROCK, on which there is a lighthouse, painted black and white, vertical, containing a flashing light, twenty seconds dark and forty seconds light each minute, 90 feet above water, and lies S. W. by S. distant $3\frac{1}{2}$ miles from the southern point of the Three Islands, and S. S. E. $6\frac{1}{2}$ miles from the S. W. head of the Grand Manan; it has a number of small ledges and sunken rocks about it, which are always breaking; this stands conspicuous, being in the immediate vicinity of all the sunken rocks and dangers. Nearly W. S. W. from the Gannet, distant one mile and a half, is St. Mary's Ledge: part of which is always above water; and to the northward of St. Mary's Ledge, one mile, is the Long Ledge, equally visible; between and around these are numerous rocky shoals, with deep water between them, rendering this part particularly dangerous. Other reefs are supposed to exist to the westward, and between the Gannet Ledges and the Machias Seal Islands; their imaginary situations are marked on the chart, but no further particulars of them are known.

SEAL ISLANDS.—W. by S. $\frac{1}{2}$ S. from Grand Manan lie the Western Seal Islands. *Seal Islands.* On the western island two lighthouses are erected, showing fixed lights, distant from *Lighthouses.*

each other about 140 feet, in the direction of E. S. E. and W. N. W. by which they are distinguished from all other lights upon the coast; they are elevated about 50 feet above high water mark. From the westernmost of these lighthouses the following bearings were taken:

Bearings.

- To the southernmost of the Murr Ledges E. S. E.
- To Gannet Rock lighthouse, E. by S. $\frac{1}{4}$ S. about 12 miles.
- To N. E. Rock, N. E. by N. about $1\frac{1}{2}$ mile.
- To the southern head of Grand Manan, E. by N. $\frac{1}{4}$ N.
- To West Quoddy lighthouse, N. N. E.
- To Little River Head, N. by W.
- To Libby Island lighthouse, N. W. by W.
- To south point of Kent Island, (on the chart three isles,) East.

**GENERAL DIRECTIONS AND REMARKS FOR SAILING TO AND
WITHIN THE BAY OF FUNDY.**

Ships navigating the Bay of Fundy have to encounter an atmosphere almost constantly enveloped in dense fogs, the tides setting with great rapidity over the rocks and shoals with which it abounds, and a difficulty of obtaining anchorage on account of the depth; so that, under these circumstances, the most unremitting attention is requisite to prevent the disastrous consequences which must necessarily attend a want of knowledge and caution.

When you are off Cape Sable with a westerly wind, and destined for the Bay of Fundy, it will be advisable to make for the coast of the United States, somewhere about the Shuttock Hills, or Petit Manan lighthouse, as you can pass with greater safety to the westward of Grand Manan than to the eastward, having also, if necessary, shelter in Petit River, Machias, Passamaquoddy, Etang, or Beaver Harbor, &c.

Between Grand Manan and the State of Maine the passage is free from danger; vessels beating through generally stand from side to side, particularly during fogs, the depth being from 12 to 70 fathoms, with a bold shore on each side, and the tide through strong and regular.

When steering between Grand Manan and Brier's Islands the utmost caution is requisite during thick weather, as vessels are frequently drawn in among the islands and ledges to the southward of Manan, by the flood setting directly upon them. The most dangerous of these is the Old Proprietor, which, at low water, dries for the space of half an acre. When the wind, therefore, veers at all to the southward, make the best of your way to St. John's Harbor, or you may secure an anchorage in Grand Passage or St. Mary's Bay, as it seldom blows in that direction above 18 hours without bringing on a fog.

There is no difficulty in going through Annapolis Gut, if you have but a commanding breeze, although the tide is very rapid, the flood and ebb running 5 knots an hour, and the eddies strong; about one-third through lies the Man-of-war Rock, about a cable's length from the eastern shore; therefore if you keep mid-channel, you will be sure to clear it.

The prevailing winds here, and throughout the whole coast of Nova Scotia, are from W. S. W. to S. W. nearly as steady as trade winds, except during the summer months, when they become rather more southerly, accompanied with but little intermission of fog, which requires a N. Westerly wind to disperse. It is therefore recommended not to leave an anchorage, without making proper arrangements for reaching another before dark, or the appearance of a fog coming on, which with a S. W. wind is so sudden that you become enveloped within it unawares; neither should you keep the sea at night, if you can avoid it. But you will observe that, whenever the wind blows directly off the land, the fog will soon disperse.

Tides.

TIDES.—The tides at the entrance and within the Bay of Fundy are very rapid, but regular, and although the wind against them alters the direction of the rippings, and sometimes makes them dangerous, yet it has little or no effect upon their courses. The flood tide sets from Cape Sable to the N. Westward, through the Seal, Mud, and Tusket Bald Islands, at the rate of 2 or 3 miles an hour; and in the channels among the islands, it increases to 4 and 5 miles; from thence taking the direction of the main land, it flows past Cape St. Mary, and then N. N. W. towards Brier's Island; it runs up St. Mary's Bay but slowly, which adds to its strength along the eastern shore; then increasing its rapidity as the bay contracts, it rushes in a bore into the Basin of Mines, and up Chignecto Bay; so that here the water sometimes rises to the extraordinary height of 75 feet.

To the above may be added the additional observations: "The great volume of fresh water which constantly flows down the harbor of St. John, in April and May, causes a continual ebb tide, during that period, sometimes to the depth of nearly 5 fathoms, under which the flood and ebb tides flow regularly; the maximum of its velocity was found to

be four knots in the fresh much to estimate. The fact is maintained by a current on the tion.

"Between bay to the east extremely dangerous part of the allowance for Captain Nap miles and a

rapidity, a fall when that direc so that the which the

be four knots and a half, and the minimum at two knots; but as the log floated very deep in the fresh water, and ultimately sunk into the salt water, underneath, it will not be too much to estimate the maximum at five knots, and the minimum at two knots and a quarter. The fact of the under tide beginning at the depth of nearly 5 fathoms was ascertained by sinking a lead down to that depth, when it was carried the same way as the current on the surface; but when lowered below that, it was drifted in a contrary direction.

"Between Brier's Island and the opposite northern coast, and for some distance up the bay to the eastward, the first of the flood sets strongly, nearly north, so that it will be extremely dangerous for a vessel to run in the night, or during thick weather, from any part of the southern towards any part of the northern coast, without making a large allowance for the set of the tides, and keeping the lead constantly going. The Jaseur, Captain Napier, was nearly run on shore, having being drifted by this tide in a fog, eight miles and a half in three hours and ten minutes."

THE COAST OF THE UNITED STATES.

FROM PASSAMAQUODDY TO CAPE COD.

BANKS.—There are four banks on this part of the coast: Jeffrey's Bank, Jeffrey's *Banks* Ledge, on both of which there are from 30 to 50 fathoms water, Cashe's Ledge, which is dangerous, and George's Bank and Shoals, also dangerous. We have no particular information, excepting of the two latter.

CASHE'S LEDGE.—The position of this shoal has been accurately determined *Cashe's Ledge*. by Lt. Charles H. Davis, U. S. Coast Survey. It is in latitude $42^{\circ} 56'$, longitude $68^{\circ} 51'$, and has on it 26 feet.

East by the compass 17 to 18 leagues from Thacher's Island you get soundings upon the Fippanies, a bank of 8 or 10 leagues in extent from North to South, about six miles wide in the centre and the northern end; on the southern end it is two to two and half miles wide. The depth varies from 27 to 46 fathoms, shelly and pebbles.

From the eastern edge of the Fippanies east 4 to 5 leagues, will bring you upon Cashe's, on the shoal ground, which is on the eastern edge of the Bank: and is a flat white rock of from 200 to 300 feet in extent.

South of the flat rock there is a gully, 90 fathoms water, which runs in upon the Bank in a S. Westerly direction. Upon the south side of this gully, three miles south of the flat rock, there is a shoal of 7 fathoms, from which the soundings run suddenly to 15 and 30 fathoms on all sides except the east, where it deepens suddenly to 80 fathoms.

N. by W. 9 miles from the flat rock there is another shoal of 14 fathoms; between this and the flat rock there are from 10 to 35 fathoms, rocky bottom: on the rocky bottom, there is kelp of 45 feet in length; on the flat rock there is none.

GEORGE'S SHOAL.

A Report relative to the survey of George's Shoal, made in Sloop Orbit, by direction and at the expense of E. M. Blunt, assisted by the United States Schooner Science, under authority of Capt. Isaac Hull, at his request, in 1821.

There are properly, four shoals on George's Bank; the whole of them included between latitudes $41^{\circ} 34'$ N. and $41^{\circ} 53' 30''$ N. and longitudes $67^{\circ} 18'$ W. and $67^{\circ} 59'$ W. Between them there are from 15 to 35 fathoms water.

The largest, and on which is the chief danger, is the most southerly and westerly. It is somewhat triangular, with a long and narrow spit making out from the S. E. angle. The S. E. point is in latitude $41^{\circ} 34'$ N. and longitude $67^{\circ} 40'$ W. The west point is in lat. $41^{\circ} 43'$ N. and longitude $67^{\circ} 59'$ W. The N. E. point is in latitude $41^{\circ} 48'$ N. and longitude $67^{\circ} 47'$ W. The eastern side of this shoal, although somewhat irregular, runs nearly S. S. E. and N. N. W. having on it from three feet to nine fathoms at common low water. It is composed of a great number of sand spits, very narrow, so that the width of a narrow vessel will make several fathoms difference in the depth of water. The general range of the spits is from S. E. to N. W. As there are no rocks, they are consequently liable to change, in some measure, their positions and ranges. On the eastern edge, even in calm weather, unless it be high or low water, the tides run with great rapidity, and form considerable breakers when setting to the westward, and a large waterfall when setting to the eastward. This is accounted for, by a knowledge of the fact, that directly on the edge of this shoal, there are from twelve to sixteen fathoms of water, so that the edge forms a species of dam, stopping the force of the flood tide, and over which the ebb falls.

When there was considerable wind, we observed that the breakers were higher within the edge, to the westward, than on the edge; and I have no doubt that the water there was still shoaler, and that we should have seen the sand had it not been for the heavy sea. The breakers were such, unless it were entirely calm, that it was impossible to go among them with boats: nor was it considered safe to attempt it with the vessels. For, besides the danger of striking on the hard sand pits, the vessels would have been liable to be filled by the breakers. Even on the eastern edge, and at nearly slack water, the vessels were at times nearly covered with them. And it was not thought necessary to attempt it, as the objects of survey, to ascertain if there was danger on the shoals, and the situations and extent of them, could be accomplished without the risk.

Had not the sea been very smooth, and at high water, we should not have been able to have gotten on where we found three feet, reducing it to low water. The prevailing wind was to the eastward; and I have no doubt but that this place would have been bare with any continuance of an off-shore wind.

I think there are no rocks about the shoals. We had one cast on the S. W. side, which indicated rocky bottom in 15 fathoms: but I believe it to have been some sharp stone that the lead struck on, although I have marked it according to the appearance, on the chart. (This chart is published by E. & G. W. Blunt.)

The centre of the northern shoal is in latitude $41^{\circ} 53' 30''$ N. and longitude $67^{\circ} 43' W.$ It extends east and west about four miles. The shoalest part, having six fathoms is very narrow, and composed of hard sand. But there are not more than twelve fathoms of water for three miles south of the above latitude. On the north side, at two cables' length from the shoal, the sloop dropped into 33 fathoms. The breakers on this shoal are very heavy, and when there should be a sufficient sea to endanger a vessel, they may be seen some miles, and heard at a very considerable distance; and as the shoalest part is not more than a cable's length inside, and no danger near it, a vessel might avoid it.

To the eastward of the last mentioned shoal, in latitude $41^{\circ} 51' N.$ and longitude $67^{\circ} 26' W.$ is another small shoal, with eight fathoms water, having, however, considerable breakers. There are but 17 fathoms for three miles north of it; but very near to the east of it, are 31 fathoms, and from 20 to 30 fathoms to the south and west.

The centre of the east shoal is in latitude $41^{\circ} 47' N.$ and longitude $67^{\circ} 19' W.$ It is about two miles long from east to west, and has several fathoms water. To the south, there are but 17 fathoms for two miles. In other directions there are from twenty to thirty fathoms.

The above described shoals, I am confident, are all which are on George's Bank. Their positions and sizes may be relied on, as well as the places of the soundings which I have laid down on the chart. They were ascertained by a vast number of celestial observations, taken with good and well adjusted instruments on board the two vessels, and very carefully and faithfully calculated. The rates of the chronometers were found by a transit instrument previously to sailing from Boston, and after our return, and all the observations re-calculated for the small variation which appeared.

At anchor, different places, and on different days, we determined the set and strength of the tides, and as nearly as possible their rise and fall. The rise of them is from one to one and a half fathom. They set round the compass every tide, setting S. E. nearly, at full moon, and running from one to four knots per hour, at a mile's distance from the breakers. The mean rate, however, is materially varied by the winds; they set strongest at W. S. W. and E. N. E. and which is undoubtedly the strength of the flood and ebb. From these causes and variety in the tides, arises a principal danger in approaching the shoals. When under way about the shoals, in a few hours time we found ourselves drifted far out of our reckonings, and to ascertain our situation, when both vessels were under way, we took continued observations for the longitude by the chronometers, and at the same time double altitudes for the latitudes; which latter were calculated by Brossier's new and certain method. By allowing for the sets of tides, as ascertained at anchor, the observations and reckoning agreed very nearly, so that the latitude and longitude of every sounding place on the chart may be considered as certain. Should any vessel fall in with the shoals, a knowledge of the course and strength of the tides would be of the greatest importance. And they can be calculated for any day and hour by the preceding facts.

In going from Cape Cod to the shoals, at 5 leagues from the light, there are 86 fathoms, muddy bottom. The water gradually deepens to 133 fathoms; and then gradually decreases towards the shoals. In lat. $41^{\circ} 51' N.$ and long. $68^{\circ} 11' W.$ there are 90 fathoms. In lat. $41^{\circ} 50' N.$ and long. $68^{\circ} 3' W.$ there are 49 fathoms, sand and gravel, on the western edge of the bank. The water then shoals fast. To the northward of the shoal, in lat. $41^{\circ} 59' N.$ and long. $67^{\circ} 52' W.$ on the south side of the north channel, there are 60 fathoms, soft mud. In lat. $42^{\circ} 12' N.$ and long. $67^{\circ} 51' W.$ there are 102 fathoms. In lat. $42^{\circ} 10' N.$ and long. $67^{\circ} 18' W.$ there is no bottom at 175 fathoms. To the eastward we did not ascertain the extent of the Bank. In two miles southward of the S. E.

Great Sh
NOTE.
lat. 40° 4

point of the shoals, there are from 20 to 26 fathoms of water, which soundings continue for at least 20 miles to the southward and westward.

The bottom of the Bank, so far as we ascertained it, is of such a narrow character, that it is difficult for a vessel to ascertain her situation by it. We often found a great variety of soundings in a very short distance; such as sands of various colors, and differently mixed, coarse and fine, gravel pebbles of various colors, stones, sponge, and shells. Of all these, except sand, I saved a number of specimens, with marks to note the places from which they were taken.

It may be worthy of remark, that at one cast of the lead, on examining the arming, I found one-third black sand, one-third white, and one-third green shells, in as distinct dimensions as they could have been drawn.

Notwithstanding this variety, some general character of the soundings may be useful. To the westward of the shoals, and at some distance from them, the bottom is coarse sand and gravel of all colors; to the N. W. a mixture of white, black, and yellow sand; to the N. black and white sand; to the N. E. chiefly gravel and pebbles; to the E. fine white and yellow sand; and in lat. $41^{\circ} 57' N.$ and long. $68^{\circ} 40' W.$ some white moss; to the S. E. fine white and yellow sand.

As the shoals are approached, in whatever direction, the soundings become coarse, and are frequently mixed with shells of different kinds. Near the shoal much of the bottom is pebbles; and to the east of the largest and most dangerous shoal, there are stones of the size of hens' eggs, with moss and sponge on some of them. Near the S. E. point are from 15 to 20 fathoms; a prevailing character of the soundings is green shells, and chiefly of the species usually called sea eggs. If a vessel be far enough south to avoid danger, she will have no shells. The quality of the soundings, as far as we were able to survey the bank, will be best understood from the chart, where they have been carefully rated.

The time and weather prevented making a complete survey of all parts of the bank; and although we ascertained the boundaries of it to the westward and northward, I have not delineated it on the chart, being unwilling to borrow anything from charts which disagree so essentially, and which we found very incorrect in the material points. Of the shoals themselves, I do not believe a more perfect survey can be made; unless in a calm time, the main shoal could be penetrated. This, however, does not seem to be an object, as no vessel would be safe in attempting to pass over it.

The reports that rocks have been seen on the shoals are undoubtedly incorrect. Had there been any there, we could not have failed of discovering them. At the west part of the bank, in strong tide rips, we saw large quantities of kelp and sea weed, which, at a distance, had the appearance of rocks. But on sounding we found good water, and regular and clear bottom.

It will be seen by the bottom that the holding ground is not good. But the vessels employed in the survey, by having a long scope of cable, rode out a considerable gale of wind for 22 hours, on the east side of the main shoal and to windward of it. At this time the sea broke very high in 10 fathoms water.

Since this survey, in 1821, the shoal has been re-surveyed by Lt. Charles Wilkes, and others, in the U. S. brig Porpoise, in the year 1837, and from his report the following is taken:

"The shoalest water found on any part of the Bank was $2\frac{1}{2}$ fathoms, or 15 feet, reduced to low water; and this is only to be found in two small places, viz,

Lat. $41^{\circ} 40' 13''$ Long. $67^{\circ} 44' 10''$
 Lat. $41^{\circ} 40' 33''$ Long. $67^{\circ} 44' 30''$

"The whole of the shoal is composed of hard sand spits—fine sand on the shoalest places, and coarser as the water deepens, until it becomes large pebbles without sand."

"The rise and fall of tides is 7 feet, extremely regular, the first part of the flood setting N. N. W. the latter part N. by E. and ebb S. S. E. and S. by W. The flood runs $4\frac{1}{2}$ hours, ebb $5\frac{1}{2}$ hours; greatest velocity two and six-tenths of a mile from half an hour to two hours in changing, going round with the sun on from north by way of east. The wind has but little effect on the velocity. High water, at full and change, at 10 o'clock 30 minutes. Variation of the compass $8^{\circ} 15''$."

GEORGE'S BANKS.—A bank, which is called upon the chart "Clark's Bank," has been discovered inside of George's Shoal. Ten fathoms water have been found upon it, in lat. $41^{\circ} 34'$, long. $69^{\circ} 15'$.

LITTLE GEORGE'S BANK, having only 5 fathoms, and which breaks in heavy weather. It is in lat. $41^{\circ} 11'$, and about long. 68° , being about S. W. by S. from the Great Shoal of George's Bank. The fishermen have given it the above name.

NOTE.—In coming from the southward for George's Bank, you will get soundings in lat. $40^{\circ} 4' N.$ if on the S. S. W. part of the Bank. Should you not get soundings in the

High water.

George's Banks.

Little George's Bank.

Soundings.

lat. of 40° 30' N. you may be certain you are to the eastward of the shoal, when you must direct your course accordingly to clear it, when your first soundings will be in 75 to 80 fathoms. When steering to the northward, you will shoalen your water gradually to 20 fathoms, when you will be in latitude 41° 20' N. which depth of water you will have 10 or 12 leagues distant, either east or west.

Soundings from George's Bank continue W. by S. until you are nearly abreast of the east of Long Island, then southward to Cape Hatteras.

The Bay of Passamaquoddy.

THE BAY OF PASSAMAQUODDY abounds in good anchoring places, well sheltered from all winds, and divides the United States from that of the British territory.

There are three passages into Passamaquoddy Bay, namely, the Western Passage, the Ship Channel or Middle Passage, and the Eastern Passage. The first is that between the Isle of Campo Bello and the main land to the west. Middle Passage lies between Campo Bello and Deer Island, and the Eastern Passage is to the eastward and northward of both islands, which is preferred, being of easy access, with good depth of water.

Western Passage.

WESTERN PASSAGE.—Vessels bound to West Quoddy Bay, and being to the westward of the lighthouse, should give the shore a berth of $\frac{1}{2}$ of a mile, and steer N. E. by E. which will carry you clear of Sail Rock; and when the light, or sound of the bell bears W. N. W. you may steer N. W. $\frac{1}{4}$ mile, which course and distance will bring you up with the Spar Buoy on the Middle Ground, and if low water, here you may anchor and wait for the tide to go over the bar, which you cannot cross until 2 $\frac{1}{2}$ hours flood; but if high water, and you wish to continue through the Narrows—

Bearings.

Bring the Red Buoy to bear N. by W. $\frac{1}{4}$ W. and steer direct for it. You may go on either side, by keeping it close on board, and after passing it one cable's length, steer N. E. by N. for the Black Buoy, which you leave on your larboard hand; and after passing it half a cable's length, steer N. by W. for Delesdernier's Point, which you must keep close on board.

Tide.

After passing this point you must keep in the middle of the Narrows, due regard being had to the tide, as it runs upon the flood and ebb from 3 to 5 knots.

West Quoddy Head light may be seen at sea, in clear weather, 6 leagues.

Lighthouse.

It is situated on the S. E. side of Quoddy Head, and contains a fixed light, elevated ninety feet above the level of the sea. It bears from the Southern Head of Grand Manan N. $\frac{1}{4}$ E. distant about 16 miles; and from the Northern Head of said island, W. N. W. distant about nine miles.

Sail Rock bears from the light S. S. E. about $\frac{3}{4}$ of a mile: it is not covered at high water, and at some distance has the appearance of a sail, from which it derives its name. There is a passage between it and the main shore, at low water, but which had better not be attempted, unless forced by the currents, and light winds. Near the above mentioned lighthouse is an alarm bell, weighing 28 cwt. 2 qrs. (twenty-eight hundred weight and two quarters,) which is at present rung by hand, and may be heard at sea, from 3 to 6 miles, in thick weather.

Alarm Bell.

Liberty Point bears from the light E. N. E. about one and a half mile, this being the southernmost point of Campo Bello Island, and forming the eastern side of West Quoddy Bay.

West from said point, about $\frac{3}{4}$ of a mile distant, lies a rock, called Black Rock, which is not covered at high water, and is bold all around.

Buoy.

The middle ground is a shoal, near the middle of West Quoddy Bay, about $\frac{1}{4}$ of a mile in circumference, with a good channel on either side of it. The shoalest part is often dry. On the western part of the shoal is a Spar Buoy, moored in 5 feet at low water, and which bears from West Quoddy Head N. N. W. distant about one mile.

From the above mentioned buoy, N. W. by N. $\frac{1}{4}$ N. about $\frac{1}{4}$ mile distant, is a Nun Buoy, painted red, and moored in two fathoms at low water. To the southward of this buoy is a rocky bar, extending from Campo Bello Island to the main shore of West Quoddy Bay, and which is nearly dry at low water. N. N. E. distant half a mile from the above Red Nun Buoy, is a similar buoy painted black, moored in 4 feet at low water, on the eastern part of the Muscle Bank, so called, which is bare at half tide.

From the Black Buoy to Delesdernier's Point, it is N. $\frac{1}{4}$ W. distant about $\frac{3}{4}$ of a mile. This point is very bold, and may be known by a number of fish houses upon it, which may be seen on the larboard hand, in running through the narrows.

Pilot.

The entrance of West Quoddy Bay is wide, and the shores are bold, and may be neared until up with the Spar Buoy. If in want of a pilot, by displaying a signal, one can be obtained at the lighthouse.

Middle Passage. Lighthouse.

MIDDLE PASSAGE.—If bound into Passamaquoddy in a large vessel, your best way is to go to the eastward of Campo Bello Island, on the north-east point of which is a lighthouse, 60 feet above high water mark, containing a fixed light; it is placed between the main ship channel and the northern entrance into Head Harbor, and within 250 feet of the extreme point. Ships in entering into the main channel, or vessels bound to Head Harbor, may safely pass at a cable's length from the lighthouse. In sailing up the main

channel, care should be taken not to keep fi from the shores of Campo Bello, as the flood tide sets directly over from the point at the lighthouse, to the islands and ledges on the north side of the channel, which is here upwards of a mile in width, and at two hours flood the tide sets directly towards the Black Rock, which is a very dangerous ledge between Spruce and Casco Bay Islands, upon which several vessels have been wrecked; after passing up and leaving the light about a mile to the eastward, the tide becomes more regular, and sets along the direction of Campo Bello shore.

Common tides rise here 25 feet. At full and change it is high water at half past 11 o'clock at Moose Island, and runs, when strongest, between Moose Island and Marble Island, and between Deer Island and Campo Bello, nearly 5 miles an hour. In the western passage, common tides rise from 20 to 25 feet, and within Passamaquoddy Bay the stream of tide is scarcely perceptible.

Vessels from the southward, when bound up for this bay, should make for the western coast, or that of the United States, as it is the most clear and the flood most favorable, being from 7 to 8 miles wide: both shores bold, the depth quickly increasing, on each side, from 12 to 70 and 75 fathoms; the greatest depths near Grand Manan, where you haul quickly from 10 to 75 fathoms.

With the light bearing S. S. E. or S. E. there is a depth of 19 and 20 fathoms, where ships may anchor securely from all winds.

Off the N. E. end of Campo Bello, is a remarkable large rock, called the White Horse Rock.

CAMPO BELLO LIGHTHOUSE.—The following bearings were taken from the top of it:

To the east point of Grand Manan, (Fish Head,) S. 18° E. or S. by E. $\frac{1}{2}$ E.

To the southernmost of the Wolves, S. 66° 30' E. or E. S. E.

To the northernmost do. S. 87° E. or E. $\frac{1}{2}$ S.

To Point Lepreau, N. 84° E. or E. $\frac{1}{2}$ N.

To entrance of Beaver Harbor, N. 70° E. or E. N. E. $\frac{1}{2}$ E.

To the White Horse Island, the top of the rock, which is white, N. 45° E. or N. E. This you leave on the starboard hand.

Spruce Island bearing from N. 6° E. to N. 15° W.

To Black Rock, very dangerous, N. 61° 30' W. or N. W. by W. $\frac{1}{2}$ W.

To Casco Bay Island, N. 33° W. or W. $\frac{1}{2}$ N.

HEAD HARBOR, at the N. E. point of Campo Bello Island, is a secure and safe place, small, but of easy access, and with 6, 7, and 8 fathoms water, muddy bottom.

HARBOR DELUTE lies on the western side of Campo Bello, and at its S. W. end is Soug Cove, a good harbor. Moose Island is on the opposite side of the channel, and belongs to the United States. The entrance to Passamaquoddy comprehends a space of nearly twelve miles.

If bound for Moose Island up the River Scodic, as you pass Todd's Head, (which is half a mile N. E. from the town landing on Eastport,) give it a berth of half a mile, as a ledge of rocks lies off it. Having passed this head, the course and distance to Onk Point or Devil's Head, will be N. by W. 8 leagues; in going which distance, (24 miles,) you pass Froese's Ledge on your larboard hand, six miles from Todd's Head, and three-quarters of a mile from the land; when continuing your N. by W. course 5 leagues, you will come to Robinstown, two miles above which, off a small island, from which it bears N. E. is a shoal on your larboard hand, and to avoid it you must keep your starboard hand best on board, till you come up with Neutral Island, which you leave on your larboard hand, one-fourth of a mile distant; and your course from this to the Devil's Head, (before mentioned,) which you leave on your larboard hand, is N. N. W. 3 miles. When you have passed the Devil's Head, your course is W. N. W. one league, when you will come to a large ledge of rocks that you must leave on your larboard hand, which is bare at two hours ebb, and extends half way across the river. Keep your starboard hand on board, and when you pass this ledge, your course is W. S. W. distant one mile, to Turner's Point, and from said point to the harbor, your course is N. W. by N. distant three miles, and the next reach to the falls is W. N. W. distant one mile; the tide flows here 25 feet, and there are only 6 or 7 feet in the channel at low water, with long flats of mud on both sides. The Devil's Head may be seen at the distance of 10 or 12 miles.

There are several good harbors on the west side of this river, and all the difficulty is the great depth of water, which is, in general, from 18 to 24 fathoms. There is also a good harbor on your starboard hand going into Deer Island, which lies to the southward of St. Andrews, 2 leagues distant. It may be easily known, as there is a large bay between the two islands, which lies N. E. from the River St. Croix, 3 leagues distant.

LITTLE RIVER.—This harbor bears due west from the middle of Grand Manan Island, and is called Little River, but you cannot see it except you are near the north shore. You must not run in for it before it bears N. W. or N. N. W. There is a bluff point of rocks on the starboard hand, as you go in, and an island in the middle of the harbor. As you pass in, leave the island on your larboard hand, and when you have passed

High water.

Campo Bello Lighthouse.

Head Harbor.

Harbor Delute.

Little River.

it half a mile, you may anchor in 4 or 5 fathoms, muddy bottom, and remain safe from all winds. Your course from this harbor to West Passamaquoddy light, is N. E. by E. $\frac{1}{2}$ E. distant 4 $\frac{1}{2}$ leagues. On the western side of the entrance there is a fixed light, 23 feet 6 inches high.

Light.**Machias.**

MACHIAS.—If you are bound to Machias or Passamaquoddy, your course from Mount Desert is E. 10 leagues, which will carry you up with Moosenpeck light, which you leave on your larboard hand; then steer N. E. by E. 2 $\frac{1}{2}$ leagues, for Machias light, a fixed light, 65 feet high, on Libby Island. After you have passed the light, and have the passage well open, steer north, until you pass Cross Island, which you leave on your starboard hand; but in passing Cross Island, you must be careful of some dangerous ledges lying off it $\frac{1}{4}$ mile, in a S. W. direction, on which course you will leave a large white rock on your larboard hand; keep on this north course until you pass a round high island on your larboard hand, when you may shape your course W. N. W. or N. W. by W. for a point that is covered with young birch trees, and a house on it, for on the starboard hand there is nothing but flats and shoals. You may keep your larboard hand after you pass this house, until the river opens to the northward, when you may run up to Cross River, where you may anchor in 4 fathoms; but if you are bound up to the S. W. mills, you must haul away to the westward. When you get up with Mr. Parker's house and barn, which are on the starboard hand, you must leave the barn open to the south-westward of the Pott-Head. This Pott-Head is a large hill that you leave on your starboard hand.

Jones Harbor.

JONES HARBOR.—After passing the above large white rock in your north course, haul to the westward for one-half mile; bring a high round island that is covered with trees to bear N. when you may anchor in 4 or 5 fathoms, muddy bottom.

Moose a Beck Head Light.

MOOSE A BECK HEAD LIGHT is on Mistake Island; it is 54 feet above the level of the sea, and contains a revolving light; time of revolution 4 minutes, showing in that time two bright faces.

Moose a Beck Reach.

MOOSE A BECK REACH.—When you come from the westward, and pass Ladle Island on your larboard hand, steer N. E. by E. for Tibbet's Island, which you leave on your larboard hand. When you come to the east end of this island, give it a good berth, for at low water there is a ledge of rocks that lies a cable's length to the S. E. of said island. When you pass it, and bring Moose a Beck Reach open, you may steer east for Mr. Beal's house; but you must keep the starboard hand best on board, for there is a rock that lies about the middle of the sound, which has not above two feet of water on it at low water. You may anchor to the westward of Mr. Beal's house.

When bound to the eastward over Moose a Beck Bar, which you must not cross before two hours flood, you steer for Kelley's Coffee House, which lies on the larboard hand, as you go to the eastward, on the N. E. point of Moose a Beck Reach. When you are entering on the bar, you will bring a bushy tree right against Kelly's House, which stands on the point. Your course over the bar is east. You leave the Virgin's Breasts, one on your starboard and one on your larboard hand; but if you are bound to Chandler's River, you will leave the Virgin's Breasts on your starboard hand, and Rogue's Island on the same hand. There is a muddy bar that lies between Rogue's Island and the main land, but water enough on it at two hours flood. Rogue's Island has a good harbor at the N. W. of it, safe from all easterly winds, and a small distance from Chandler's River.

When you go over Moose a Beck Bar, bound to Machias, you leave the Virgin's Breasts as before mentioned, keeping your course east, and a bare rock, called Pulpit Rock, on your starboard hand; you must keep Libby's Island light open to the southward of this bare rock. [N. B. This bare rock, which you leave on your starboard, may also be left on your larboard, and steer E. S. E. for Libby's Island light.]

Moose a Beck Head to Machias.

MOOSE A BECK HEAD TO MACHIAS.—Give the light a berth of one mile leaving it on the larboard hand, and steer N. E. by E. 2 $\frac{1}{2}$ leagues, when you will be up with Libby's Island light on your starboard hand; then run N. N. E. 2 leagues, which will bring you up with Stone's Island, on your larboard hand, having a rock lying E. one-third of a mile from the centre of the island; from this steer N. for Round Island, from which follow the eastern directions for Machias.

Cape Split Harbor.

CAPE SPLIT HARBOR.—When you pass Petit Manan light, bring it to bear S. W. $\frac{1}{2}$ S. and steer N. E. $\frac{1}{2}$ N. for Cape Split, distant 5 leagues, which course will carry you safe into the harbor. In steering said course, you will make a black rock, which you leave on your starboard hand, distant one mile from Cape Split. This harbor is safe from all winds but S. W. which blows right in; but if you anchor in a cove on the starboard side and moor N. W. and S. E. you will lie safe from all winds.

Nash's Island Light.

NASH'S ISLAND, at the entrance of Pleasant River. There is a lighthouse, 47 feet above the level of the sea, on this island, containing a fixed light of a deep red color, which you leave on your starboard hand going in.

Coming from the westward, you must leave Petit Manan light on your larboard hand, giving it a berth of half a mile; then steer N. E. ten miles, which will carry you up with Nash's Island light, leaving it on your starboard hand, one-fourth of a mile, when you

...steer N. E. 10 leagues, which will carry you up with Moosenpeck light, which you leave on your larboard hand; then steer N. E. by E. 2 $\frac{1}{2}$ leagues, for Machias light, a fixed light, 65 feet high, on Libby Island. After you have passed the light, and have the passage well open, steer north, until you pass Cross Island, which you leave on your starboard hand; but in passing Cross Island, you must be careful of some dangerous ledges lying off it $\frac{1}{4}$ mile, in a S. W. direction, on which course you will leave a large white rock on your larboard hand; keep on this north course until you pass a round high island on your larboard hand, when you may shape your course W. N. W. or N. W. by W. for a point that is covered with young birch trees, and a house on it, for on the starboard hand there is nothing but flats and shoals. You may keep your larboard hand after you pass this house, until the river opens to the northward, when you may run up to Cross River, where you may anchor in 4 fathoms; but if you are bound up to the S. W. mills, you must haul away to the westward. When you get up with Mr. Parker's house and barn, which are on the starboard hand, you must leave the barn open to the south-westward of the Pott-Head. This Pott-Head is a large hill that you leave on your starboard hand.

These narrow S. E.; this pass steer N. E. $\frac{1}{2}$ E. your starboard in from 5 to 6 miles. Coming in fringed, bring N. approach the sou fully one-third. Vessels may from easterly 1 mile from the from the light on your larbo name of the " one mile above course: the ne fore described. the main land On the righ but they lie a Any ship, n following the The followi light, which n rections: Black Rock Jourdan's a PETIT M south end of the light. Jackson's I 4 miles. South East A ledge w Moulton's There are three miles d PLEASA ant River, i N. 3 leagues Waase's hou low water. ward of it) isle, which y house and a except you Narrow C rided, as th way for a st in going int BOWBE Bowbear H one-fourth leave the E giving it a b Dyer's hou DYER'S light three- to bear N. into the m of this ledg where you GOLDS leagues dis your larbo will bring in 3 or 4 fa

steer N. E. by E. two and a half miles, which will take you into Tibbet's Narrows. These narrows are formed by Tibbet's Island on the N. W. side, and Ram Island on the S. E.; this passage is a quarter of a mile wide; from the middle of which you must steer N. E. $\frac{1}{2}$ E. one mile, which will bring you up with Shabby Island, leaving it on your starboard hand one-eighth of a mile, and when half a mile above it, you may anchor in from 5 to 6 fathoms, good holding ground, Shabby Island bearing S. W. by S.

Coming in from sea, and to the eastward of all the shoals and ledges hereinafter mentioned, bring Nash's Island light to bear N. by W. and run for it, taking care not to approach the southern end of the island nearer than half a mile, as there is a sunken ledge fully one-third of a mile from the shore.

Vessels may anchor on the N. W. side of Nash's Island, and find a tolerable shelter from easterly and S. E. winds, one-fourth of a mile above the light, and one-eighth of a mile from the island, in 10 fathoms, soft bottom, being but a little out of the regular track from the light to Tibbet's Narrows. In coming from the light to the narrows, you leave on your larboard hand, about half a mile, a large black rock, generally known by the name of the "Pot;" the next is Ladle Island, formed very much like a ladle, and about one mile above the light; this you pass within a quarter of a mile in steering the regular course: the next land on the left is Tibbet's Island, the entrance of the narrows, as before described. It may be proper to observe that Tibbet's Island appears to be a part of the main land until you get above the narrows.

On the right hand, between the light and said narrows, are several islands and ledges, but they lie a good distance from the regular track.

Any ship, no matter how great her draft of water, may enter Moose a Beck Reach by following the above directions.

The following are the bearings and distances of rocks and ledges from Nash's Island *Bearings.* Light, which must be borne in mind when you are compelled to deviate from the given directions:

Black Rock, (always above water), S. E. by S. $\frac{1}{2}$ S. $3\frac{1}{2}$ miles.

Jourdan's Outer Ledge, which is covered at high water, S. W. by W. $\frac{1}{2}$ W. 4 miles.

PETIT MANAN LIGHT is a fixed light, 53 feet above the level of the sea, on the south end of Petit Manan Island, and there are several dangerous ledges bearing from the light. *Petit Manan Light.*

Jackson's Ledge or Eastern Rock, on which there are 12 feet at low water, bears east 4 miles.

South East Rock, on which there are 7 feet, bears S. E. by S. 4 miles.

A ledge with 16 feet, S. S. E. 2 miles.

Moulton's Ledge, W. by N. 4 miles, nearly bare.

There are also several shoal spots bearing from the light, from S. to S. S. W. about three miles distant.

PLEASANT RIVER.—When you come from the westward, and bound for Pleasant River, in passing Petit Manan light, bring it to bear S. W. by S. and steer N. E. by N. 3 leagues distant. In steering said course, if it is clear weather, you will see Captain Wasse's house open between the island and main land; but this passage will not do at low water. You must leave this island (and a high dry ledge of rocks that lie to the westward of it) on your starboard hand: when you pass the bare ledge, you will see a bare isle, which you leave on your starboard hand; then you may haul up for Capt. Wasse's house and anchor, and take a pilot for Pleasant River, as it is not safe going without one, except you are well acquainted. *Pleasant River.*

Narrow Gauges is one mile to the westward of Pleasant River, too difficult to be described, as there are sundry small islands at the mouth of the harbor or bay. The best way for a stranger is to go into Cape Split Harbor and get a pilot, as there is no difficulty in going into Cape Split in the day time, keeping the larboard hand best on board.

BOWBEAR HARBOR.—In coming from the westward, bound to Pigeon Hill, or Bowbear Harbor, bring Petit Manan light to bear N. E. and run for it, giving it a berth of one-fourth of a mile, and then steer N. $\frac{1}{2}$ W. 4 miles: in steering this course, you will leave the Egg Rock on your starboard hand, when you will make the westerly shore, giving it a berth of half a mile; then steer N. N. E. one mile, when you will be opposite Dyer's house, where you may anchor safe from all winds in 3 fathoms water. *Bowbear Harbor.*

DYER'S BAY.—In coming from the eastward, bound to Dyer's Bay, give Petit Manan light three-fourths of a mile berth, leaving it on your starboard hand; bring the light to bear N. E. three-fourths of a mile distant, then steer N. by W. which will carry you into the mouth of the bay, leaving a large dry ledge on your larboard hand: when abreast of this ledge, which is bold to, give it a berth of 5 or 6 rods, then steer N. $\frac{1}{2}$ E. 4 or 5 miles, where you may anchor safe from all winds, in 4 or 5 fathoms, muddy bottom. *Dyer's Bay.*

GOLDSBOROUGH HARBOR lies N. N. W. from Petit Manan lighthouse, two leagues distant, leaving one island, covered with trees, on your starboard hand, and two on your larboard hand; then your course is N. N. W. $1\frac{1}{2}$ mile, then N. $\frac{1}{2}$ E. 4 miles, which will bring you up with Goldsborough Point, where you may anchor safe from all winds, in 3 or 4 fathoms, muddy bottom. *Goldsborough Harbor.*

Prospect Harbor.

PROSPECT HARBOR has a fixed light, on the east point of entrance. From Petit Manan, it bears N. W. $\frac{1}{2}$ W. distant 6 miles, but is not visible from that point: from Schepdick Island it bears N. N. E. distant 4 miles—and in sailing along the coast, is visible only between the bearing N. by E. $\frac{1}{2}$ E. and N. W. by N.

Light.

Clark's Ledge (the old point of entrance to the harbor) lies S. W. by S. distant third of a mile from the light; Big Ledge S. by E. distant $2\frac{1}{2}$ miles; Little Black Ledge S. by E. $\frac{1}{2}$ mile. Little Black Ledge is nearly covered at high tide and bears S. $\frac{1}{2}$ E. 1 mile from Cranburg Point and E. $\frac{1}{2}$ S. from Big Ledge, which is high above water. There is a good passage between the two ledges.

Bring the light to bear N. W. by N. $\frac{1}{2}$ N. and steer for it—leaving Little Black Ledge on the larboard, and Cranberry Point on the starboard hand—when up with the light give it a berth of 200 fathoms—leaving it on the starboard, and Clark's Ledge on the larboard hand, sailing W. N. W. for the middle of the harbor—anchor with the light bearing E. $\frac{1}{2}$ N.

MOUNT DESERT TO GOLDSBOROUGH AND MACHIAS.

In going from Mount Desert to Goldsborough, you must steer E. $\frac{1}{2}$ N. for Scuttock Point, four leagues, where there is an island which you may pass either side of, but it is best to leave it on your larboard hand, and then steer N. E. about $3\frac{1}{2}$ leagues, which will carry you up with Goldsborough Harbor. You will see three islands which lie in the mouth of the harbor; you must leave them on your larboard hand, and go in the eastern passage. In standing in for this place, you will see Petit Manan lighthouse, which you leave on your starboard hand. North from Petit Manan, one-eight of a mile distant, lies a ledge, bare at half tide, which you keep within half a cable's length of when going over the bar, which you pass on your starboard hand, when bound eastward, at which, as you pass the bar, Scuttock Island will be a handspike's length open to the southward of Scuttock Point, but to go over this bar requires a pilot. When near the bar, and up with Petit Manan Island, keep E. S. E. one half a mile distant, which will clear a ledge having 9 feet water at low water, that lies E. of the channel going over the bar, one-fourth of a mile distant. There is a bar that runs from the shore to this little island, which is about one league from the land. This bar has $3\frac{1}{2}$ fathoms, at high water, and 9 feet at low water.

Mount Desert Rock. Lighthouse.

MOUNT DESERT ROCK.—This Rock is 15 miles S. 12 W. from Baker's Island light; on it there is a lighthouse, 56 $\frac{1}{2}$ feet above the level of the sea, containing a fixed light. S. W. by S. 3614 feet from the rock there is a ledge of 3 fathoms, inside there are 22 fathoms, outside, close to the rock, there are 17, 18, 20, 25, 30, and 35 fathoms water; it has been called Columbia Ledge by Capt. Owen, R. N., who surveyed it.

Mount Desert Island.

MOUNT DESERT ISLAND forms the northern side of the passage to Bear Island, and may be known by several high hills upon it. This island is about 15 miles long, from north to south, and 12 broad; it is nearly divided by a stream of water, called Soames Sound, at the head of which is Eden; at the entrance of Soames Sound are two good harbors, N. E. and S. W. Harbors.

Light.

Bear Island lies near the centre of the passage between Sutton's Island and Mount Desert: it is a small island, covered with spruce trees. The light stands upon its western end, elevated 65 feet above the level of the sea, exhibiting a fixed light, and may be seen in clear weather a distance of 12 or 15 miles.

Mount Desert, Eastern Pass.

MOUNT DESERT, EASTERN PASS.—In coming from the westward, and intend going into Mount Desert, bring Baker's Island light to bear north, and run for it, leaving it on your larboard hand. After passing it, steer N. N. W. until the light on Bear Island bears W. N. W. and run direct for it. In running this course, you will leave Sutton's Island on your larboard hand. The shores around this island are very bold, and you may near it within one cable's length.

Bunker's Ledge.

BUNKER'S LEDGE, on which is built a stone beacon, with a cask placed upon a staff in its centre, bears from the eastern end of Sutton's Island E. $\frac{1}{2}$ N. distant about one mile, which you leave on your starboard hand. You may near the ledge within two cables' length. When the light on Baker's Island is entirely obscured behind the eastern point of Cranberry Island, you are then the westward of Bunker's Ledge; and should you have a head wind, you may stand to the northward until the light on Bear Island bears W. by N. In running for Bear Island light, you may near Bunker's Ledge within one cable's length, leaving it on your starboard hand. After passing the light one-quarter of a mile, you may anchor, with the light bearing from E. to E. N. E. in 12 fathoms water, good holding ground; or you can run for N. E. Harbor, about one mile to the northward of the light.

Buoy.

N. W. by W. distant $\frac{1}{2}$ a mile from Bear Island light, lies a ledge, bare at low water, having on the western edge a spar buoy painted black, which you leave on your starboard hand. Said ledge bears from the centre of N. E. Harbor S. $\frac{1}{2}$ W.

Sutton's Island lies near the centre of the passage, but the best water is to the north-

ward of it. Cranberry Island can then anchor. W. N. W. Bunker's Bear Island The middle mile.

ward of it. If you wish to go to the westward of it, when between Bunker's Ledge and Cranberry Island, steer W. by S. until Sutton's Island eastern point bears N. E. You can then anchor, or run further in, into Hadlock's Harbor, to the south of you; or steer W. N. W. distant about three miles, for S. W. Harbor.

Bunker's Ledge bears from Baker's Island light N. by W. distant about four miles. Bear Island light bears from Bunker's Ledge W. by N. $\frac{1}{2}$ N. distant about three miles. The middle part of Cranberry Island bears from Bunker's Ledge S. S. W. distant $1\frac{1}{2}$ mile.

Bunker's Island and Cranberry Island form the western side of the entrance of the passage to Bear Island, and are covered with spruce trees. The light on Baker's Island is located near the centre of the island, elevated 100 feet above the level of the sea, exhibiting a fixed light, and may be seen a distance of fifteen miles, in clear weather.

A bar extends from Baker's to Cranberry Islands covered at high water, which is often mistaken by strangers for the passage going into Cranberry Island Harbor.

You must always recollect that, before entering Cranberry Island Harbor, the light on Baker's Island will be entirely obscured behind the eastern point of Cranberry Island.

You may go in on either side of Bunker's Ledge; but strangers should leave it on the starboard hand. Between Herring Cove and Bear Island light, near the north shore, there are several rocks and ledges covered at high water.

S. W. HARBOR.—This is one of the best harbors on that coast; as many as 400 vessels have been at anchor at one time here; to run in, if coming from the westward, when up with Long Island, steer N. N. E. 6 miles, (leaving the two Duck Islands on your starboard and the three Calf Islands on your larboard hand.) This will bring you up midway between the Great Cranberry Island and Mount Desert; steer up midway, until you open S. W. Harbor, when you may haul in, (keeping nearest to the starboard hand, on account of a ledge on the larboard hand, which runs off half a mile) N. W. or W. N. W. and anchor in 5 or 6 fathoms muddy bottom, safe from all winds. High water at 12 o'clock; rise of tides 12 feet.

Off the S. W. point of Cranberry Island there is a rock, bearing west, distant three-quarters of a mile.

The eastern passage into S. W. Harbor is between Bear Island (on which there is a fixed light) and Sutton's Island; after you have passed these run until you get the harbor open, then follow the above directions.

HULL'S COVE, MOUNT DESERT.—Bring the light on Baker's Island to bear S. W. by S. and steer N. E. by N. for the Great Porcupine Island; when up with it haul to the westward of Hull's Cove, leaving a dry ledge on your starboard hand, where you may anchor in 3 fathoms. $\frac{1}{4}$ of a mile from the shore.

BASS HARBOR.—When you leave this harbor, bound to the eastward, steer out S. W. till you bring Bass Harbor Bar to bear S. S. E. then run S. S. E. keeping the larboard hand best on board. This bar has not water enough for a loaded vessel before half tide, having 8 $\frac{1}{2}$ feet only at low water; but a light vessel may go over at low water, keeping the larboard hand best on board. When you get over this bar, you steer E. by S. till you bring the S. W. entrance of Mount Desert to bear N. E. then you may run N. E. leaving Cranberry Island on your starboard hand. But this passage is shoal at low water, and not fit for loaded vessels to go through; but at full tide there is water enough, keeping the middle of the passage. Continue your course to the N. E. till you pass Cranberry Island; then you may steer E. S. E. and anchor between the two Cranberry Islands, where you will be safe from easterly or S. W. winds. You may lie in from 4 to 7 fathoms, good holding ground.

When you leave this port bound to the eastward, you steer E. by S. till you get up with Baker's Island light, which lies to the eastward of the Cranberry Islands; then you steer E. by N. 4 leagues to Scuttock Island. When you pass said island, and are bound to Goldsborough, you must steer N. E. about 5 leagues, and keep that course till you bring Goldsborough Harbor to bear N. N. W. then you must leave three islands on your larboard and one on your starboard hand, and run into the harbor, where you may lie safe from all winds, and anchor in 5 or 6 fathoms.

CRANBERRY ISLANDS are three island lying south of N. E. Harbor, Mount Desert, making a good roadstead for all winds but easterly.

BAKER'S ISLAND.—On this island, which is the south-eastern of the Cranberry Islands, there is a lighthouse, containing a fixed light, 70 feet above the level of the sea. It bears W. S. W. 22 miles distant from Petit Manan light.

BLUE HILL BAY.—If you are bound to Blue Hill Bay, or Union River, as soon as you pass Long Island, you will open a large sound to the N. N. W. which course you are to steer seven leagues, when you will be up with Robertson's Island, leaving the Ship and Barge on your larboard hand. Robertson's Island is the only island near that place that has a house on it. The south part of the island is clear of trees, on which the house stands. When you come near the south part of the island give it a berth of three-quarters of a mile, as there are several sunken rocks off said point. When you bring

Blue Hill Bay.

this island to bear from S. W. to N. W. you may anchor in 6 or 7 fathoms water, muddy bottom; but if you are bound to Blue Hill Bay, you may stand to the northward direct for the Blue Hills, which you may see 10 or 15 leagues off. If you are bound for Union River, you had better take a pilot at Robertson's Island, for it is not fit for a stranger to go without one.

Isle-au-haut. ISLE-AU-HAUT.—The Isle-au-haut is remarkable land, composed of high steep cliffs, and makes with a large bay on each side of it; has good landing on its eastern end, and anchorage half a mile off, in 18 fathoms, with the low point bearing about N. E. by N. there is also a stream of water running into the sea. The highest part of the island is in the middle, and represents a saddle.

Saddle Back Ledge. Light. SADDLE BACK LEDGE is a high black rock, formed somewhat like a saddle, on the S. E. end of which is erected a lighthouse, built of hewn granite, and of that color; it is elevated 40 feet above the level of the sea, exhibiting a fixed light, and may be seen in clear weather a distance of 15 miles. You may near it on all sides within one cable's length.

About two miles N. W. by W. from the light lies a small sunken ledge, which breaks at low tides, with a little motion of the sea.

The southern head of Isle-au-haut bears from Saddle Back light S. E. by E. $\frac{1}{2}$ E. $\frac{3}{4}$ miles distant; Seal Island, S. by W. about 15 miles; Wooden Ball Island, S. W. by S.; Matinicus Island, S. W. $\frac{1}{2}$ W. 18 miles; Brimstone Island, W. $\frac{1}{2}$ N. 2 miles; Little Isle-au-haut Harbor, N. E. by E. $\frac{1}{2}$ E. 6 miles distant; Eagle Island light, N. distant about 20 miles; Fox Island Thoroughfare, N. by W. distant about 15 miles.

Isle-au-haut and Deer Islands form the eastern side of Isle-au-haut Bay; Brimstone and the Fox Islands the western side. The bay is about 5 miles in width, and Saddle Back lies near its centre.

In making Saddle Back light coming from sea, bring it to bear from N. W. by N. to N. by W. and run it close aboard, leaving it on your larboard hand. If you are bound up the bay, bring the light to bear S. and steer N. for Eagle Island light, which you may near within one cable's length by leaving it on your larboard hand. After passing Eagle Island light, steer N. N. W. about 8 miles, which course and distance will bring you up with Channel Rock, which you leave on your starboard hand. Give it a berth of one eighth of a mile, and steer N. by E. about 10 miles for Dice's Head light. In running this course you will pass Cape Rosier, a high bluff, which you leave on your starboard hand. When up with Dice's Head light, if you wish to go into Castine or up the Penobscot, follow the directions given. (See pages 142, 143.)

Channel Rock may be known by its being a small rock of a yellowish cast, lying to the westward of a small group of islands, and may be seen at all times above water.

N. B. In coming from sea and bound for the Isle-au-haut Bay, you leave the Wooden Ball and Seal Islands on your larboard hand. The Seal Island is the easternmost island, and you may near it within $\frac{1}{4}$ of a mile.

In coming from the westward and intend going to the northward of Matinicus Island, and are bound for Saddle Back light, bring it to bear E. N. E. and run for it: follow the directions before given.

Wooden Ball Island bears from Seal Island E. N. E. $\frac{3}{4}$ miles distant; Wooden Ball from Matinicus Rock light, N. N. E. 7 miles distant; Seal Island from Matinicus Rock light, N. E. by N. about 4 miles; from Matinicus Island, N. $\frac{3}{4}$ miles distant.

MATINICUS ISLAND, at the mouth of Penobscot Bay. On the rock south of this island there are two fixed lights 82 feet above the level of the sea, attached to a dwelling house, 40 feet apart, bearing N. N. W. and S. S. E. from one another.

PENOBSCOT BAY AND RIVER.—This extensive bay is included between Sedgwick Point on the east, and white Head on the west; the distance between these points is about 11 leagues; and it therefore includes the Isle-au-haut, Deer Island, the Fox Island, Long Island, and a number of small isles, rocks, and ledges. Through the bay to the mouth of the river of its name, the western channel is by the headland on the west, called Owl's Head, on which there is a lighthouse containing a fixed light, 147 feet above the level of the sea; thence, by Camden on the west, and Cape Rosarie on the east to Bagaduce Point or Castine River. The eastern channel is between Isle-au-haut on the west, and the smaller isles on the east, through a channel called Long Reach, formed by the shore of Sedgwick on one side, and Deer Island on the other, until it unites with the main channel between Cape Rosarie and Long Island. Above this, on the east, stands Fort Castine, near to which is the town of Castine, opposite to Penobscot. Castine is the port of entry. This noble river, which empties its waters into the bay, and which is now decorated with numerous townships, is the most considerable in the State of Maine, and has its sources about 130 miles above the inlet of Castine. The head of tide and navigation is, however, at Bangor, about 30 miles from the same; but vessels of 30 tons may approach within a mile of this place. At the entrance of the river is a depth of 10 fathoms.

PENOBSCOT RIVER.—From Segune to Manheigen, the course is east; but you must not bring Segune to bear W. until you have passed Bantan Ledge, as it bears E. about 4 miles from Segune. Manheigen is good land to run for, being bold. There are several high rocks on the N. W. side, but they are also bold. From thence to White Head, the course is N. E. leaving George's and Mosquito Islands on the larboard, and Mitinick on your starboard hand. The latter is foul. There are two rocks off George's Island, called the Old Man and Old Woman, with a passage between them. The first lies more than a mile off. When you can see Mosquito Island to the eastward of George's you are clear of them. There is a ledge between George's Island and Mosquito Island, called Scilly; and also another about one-third of the way from Mitinick to Manheigen, called the Roaring Bull, which latter bears about N. E. $\frac{1}{4}$ E. from Manheigen; but you have a clear bay until you come near White Head. There is a ledge S. by E. $\frac{1}{4}$ a mile from the head, and several near the land to the westward. The head is very bold. When a little inside the head, haul up nearly for the N. E. point of a large white island, with trees on it, on the larboard hand, to avoid a ledge called the Gangway Ledge. It lies directly off the mouth of Seal Harbor, and about N. E. from the light. The course from White Head to the point of Ash Island is N. E. The point of Ash Island is bold at low water, but at high water some of the rocks are covered. There is a sunken ledge off this point, the kelps on which are seen at low water, called also Gangway Ledge, which you leave on the starboard hand. Thence to Owl's Head about N. N. E. The course from Owl's Head to Castine is N. E. by N. passing close to Mark Island, which is the first you come to, and leaving several small islands and ledges on the starboard hand; Mark Island on the larboard. The passage is here rather narrow, but with a fair wind there is no danger. The bay, however, is not so clear to the eastward as to the westward of Long Island. From Owl's Head to Camden the course is N. by E. $\frac{1}{2}$ miles, leaving a high rock called the Graves on your starboard, and Negro Island, on which there is a lighthouse, on your larboard hand. There are some sunken rocks between the Graves and the northern point of the harbor, nearest the latter, which are on the starboard hand. From Owl's Head up the bay the course is N. N. E. easterly, to Spruce Head, in Northport, 7 leagues. You pass a good harbor on Long Island side, called Gilkey Harbor. It is easy of access, but is bad to find in the night, the land back being higher than that in front of the harbor. Here a lighthouse is much needed, as it is the best harbor in the whole bay. It lies directly opposite Ducktrap. From Spruce Head to Old Fort Point the course is N. E. 5 leagues, leaving Belfast and Cape Jellison Harbors on the larboard hand. If you wish to harbor in Cape Jellison, you enter with Brigadier Island on the larboard hand, keeping it nearest aboard, as there is a long ledge makes off from Squaw Point on the starboard hand, which is covered at high water. There is a ledge off Fort Point in a southerly direction, called Fort Point Ledge, a half a mile or more. It lies S. S. E. and N. N. W. and is bare at half tide. There are two buoys, one off each end of it. There is a lighthouse on the point, near which it is so bold that there is a good channel between that and the ledge for beating. The extreme point, however, to the eastward of the light is shoal, and you must give it a good berth. When you have turned this point, you have an excellent harbor on the larboard hand, called Fort Point Cove. There is one small rock near Sandy Point, on which there are about 7 feet at low water, near which there is a log buoy placed. From Fort Point to Bucksport Narrows, the course is north 5 miles. Above Sandy Point lies Odom's Ledge, which is nearly covered at high water. You may go either side of it, but the eastern is the best channel. When you open Bucksport village, your course is N. E. $\frac{1}{4}$ of a mile, when you will open Marsh Bay N. W. at the head of which is Frankfort village, 5 miles. Run up midway till you come near Marsh River, on the larboard hand. The point on the opposite side of the bay is called Drachin Point, from which a flat extends $\frac{2}{3}$ the distance across to Marsh River, on the end of which a buoy is placed. Should you not see the buoy near Picard's Point on McKenzie's Point a handspike's length, and run until you find the reach to Oak Point. Picard's Point is the land on the S. E. side of Marsh River, and McKenzie's Point is the first point on the starboard hand above Bucksport village. From Marsh River to Oak Point, the course is N. E. 5 miles, good anchorage all the way. Thence to Hinckley's E. by N. $\frac{1}{4}$ of a mile. Thence to Mill Creek, N. by E. 1 mile, leaving Buck's Ledge, on which there is a spire and ball, on the starboard hand, Thence to Bald Hill, N. W. by W. $\frac{1}{4}$ mile. Thence to Higgins', N. N. E. $\frac{1}{4}$ mile. Thence to Brugdor's Castle, N. E. $\frac{1}{4}$ of a mile. Thence to Crosby's N. N. E. 2 miles. Thence through Crosby's Narrows, N. E. $\frac{1}{4}$ mile. Thence to Crosby's Old Wharf, N. N. E. $\frac{1}{4}$ mile. Thence to Brewer village, E. N. E. 2 miles. Thence to Mitchell's Steam Mill, N. E. by N. $\frac{1}{4}$ mile. Thence to High Head, N. E. $\frac{1}{4}$ mile. Thence to Bangor, N. E. by N. $\frac{1}{4}$ of a mile.

Or, bound up Penobscot Bay, leave Manheigen on the larboard hand from 1 to 2 miles distant, and steer E. N. E. for Green Island: when up with the easternmost island, giving a berth of one mile, steer north for Owl's Head, then N. N. E. for Castine, as before directed.

Penobscot River.

Lighthouse.

Lighthouse.

Log buoy.

Buoy.

Fox Island Passage.

FOX ISLAND PASSAGE.—On Brown's Head, at the western entrance of Fox Island thoroughfare, a light, showing a fixed light, is erected on the Southern Fox Island, it stands two rods from the shore, and is 42 feet high.

Fiddler's Ledge bears from the light W. $\frac{1}{4}$ S. distant about 3 miles; Fiddler's Ledge from Crabtree's Point, W. S. W. distant about half a mile. Fiddler's Ledge is above the surface of the water at two hours ebb.

Crabtree's Ledge bears from the light W. by S. distant about $1\frac{1}{2}$ mile; Crabtree's Ledge bears from Crabtree's Point S. W. by S. distant about half a mile. This ledge may be seen breaking at high water with a little motion.

Inner Dog Fish Ledge bears from the light S. W. distant about 3 miles; Inner Dog Fish Ledge bears from Crabtree's Ledge S. S. E. distant about $1\frac{1}{2}$ mile.

In running from Owl's Head light for Fox Island thoroughfare, bring the light to bear W. and steer E. $\frac{1}{4}$ S. until you bring the light on Brown's Head to bear E. N. E. and then steer for it until you are within one cable's length from the light. In running this course, you pass between Crabtree's Ledge and Dog Fish Ledge, leaving Crabtree's Ledge on the larboard hand, and Dog Fish Ledge on the starboard, which is separated by a channel $1\frac{1}{2}$ mile broad; you may then run half a cable's length of either of them. When abreast of the light, and between the light and Sugar Loaves, steer N. E. $\frac{1}{4}$ E. for Young's Narrows. The Sugar Loaves are two high rocks, formed somewhat like sugar loaves, and are located nearly in the centre of the passage. There is good anchorage between the Sugar Loaves and light, in $7\frac{1}{2}$ fathoms, at low water.

The entrance to Young's Point is narrow at low water, off which lies a ledge of rocks, which are covered at high water. There is also a quantity of sunken rocks at the larboard hand, near a mile to the W. N. W. which lie off the Dumplings. These Dumplings are three islands, which you leave on your larboard hand. Your course in this passage is E. S. E. and W. N. W. keeping your starboard hand on board. When you pass this point on your starboard hand, you must keep your starboard hand on board, and steer E. S. E. about two miles, when you will make Deep Cove on your starboard hand, which lies to the eastward of a very high bluff of rocks. If you have neither cables nor anchors, you may run into said cove to secure your vessel with the main or fore sheet, or come to anchor in 7 fathoms water in the said cove. There the flood meets, one from the W. N. W. the other from the E. N. E. which makes an eddy against this cove and highland; here you may ride safe with any wind. When you leave this place, and are bound to the eastward, you steer E. S. E. and keep your starboard hand on board till you come up to a clear spot of land, where the trees have been cut off. As soon as said spot bears W. S. W. you steer E. N. E. for the middle narrows. When you draw near the narrows, you will see two large white rocks in the middle of the passage, unless at high water, at which time they are covered about one hour, but may be seen at all other times of tide. You may go on either side, but the deepest water is at the southward of them. Continue your course E. N. E. about one league, when you must keep your starboard hand on board, as there are several sunken rocks and ledges on your larboard hand, which are covered at high water. You will make the eastern narrows on your starboard hand, and as soon as you bring it to bear S. S. E. you may run through, where you will have a fine harbor, which is safe to ride in with all winds, except at E. N. E.; but you may remain in the west passage with the wind at E. N. E. or anchor at the northward of a bare island, that you will see on your starboard hand as you go back to the westward. When you pass the eastern passage of Fox Island, you must steer E. N. E. about 4 miles, which course will carry you into a large bay that lies between Fox Island and the Isle-au-haut. This bay lies N. and S. and about 4 leagues E. and W. When you get into this bay from the above mentioned passage, and are bound to the eastward of the Isle-au-haut, you may steer E. S. E. 6 leagues, which course will carry you to the southward of the Isle-au-haut.

Camden Harbor.

CAMDEN HARBOR.—North-east Ledges bear from the light on Negro Island, at the mouth of Camden Harbor, N. E. $\frac{1}{4}$ N. distant about three-eighths of a mile. North-east Ledges to Morse's Point, N. by W. distant about half a mile; these ledges are covered at high water, but are above the surface of the water at two hours ebb. Barrit's Point forms the western side of Camden Harbor, and bears from the light S. W. by S. $\frac{1}{4}$ S. distant about three-eighths of a mile. Morse's Point lies opposite the lighthouse, and forms the eastern side of the harbor. Barrit's Point to the Graves, S. E. $\frac{1}{4}$ S. distant about $1\frac{1}{2}$ mile. From the light to the Graves, S. by E. $\frac{1}{4}$ E. distant about 2 miles. Owl's Head light bears from Camden light S. $\frac{1}{4}$ W. distant about 12 miles. From the Graves to the Owl's Head light S. by W. $\frac{1}{4}$ W. distant about 10 miles.

Lighthouse.

Camden lighthouse is situated on the S. E. part of Negro Island, and contains a fixed light, elevated 49 feet above the level of the sea.

In coming from the westward, and bound to Camden Harbor, bring Owl's Head light to bear south, and steer N. $\frac{1}{4}$ E. for Camden light, leaving the Graves and North-east Rocks on the starboard hand; the Grave is a small black rock, and is above the surface of the water at all times, and you may near it within a cable's length, on all sides. up with the lighthouse leave it on the larboard hand one cable's length, and steer N. W. by N. $\frac{1}{2}$ N. or N. N. W. distance nearly half a mile, and anchor near the north shore, in from four to five fathoms water, good holding ground. If you are to the eastward and bound for Camden Harbor, bring the light to bear W. S. W. or S. W. by W. to clear the North-east Ledges, then follow the above directions.

CASTINE LIGHTHOUSE is on Dice's Head, at the entrance of Castine Harbor. *Castine Lighthouse.* It is a fixed light, 116 feet above the level of the sea, N. W. $\frac{1}{4}$ W. from Fort Point Ledges, and from the eastern end of Long Island, S. E. by E. $\frac{1}{2}$ E. The shore near the lighthouse is bold.

CASTINE.—The beacon on Otter Rock bears from the lighthouse on Dice's Head, at the entrance of Castine Harbor, S. E. $\frac{1}{2}$ E. distant half a mile; Noddle's Island Point, S. E. $\frac{1}{4}$ S. distant about $1\frac{1}{2}$ mile; Bull Head, on Holbrook's Island, south, distant about 2 miles; Turtle Head, W. N. W. distant about $4\frac{1}{2}$ miles; Belfast, N. W. by W. distant about 11 miles. From the Beacon on Otter Rock to Noddle's Island Point, S. E. by S. $\frac{1}{4}$ S. distant about three-eighths of a mile; from Noddle's Island Point to the beacon on Hosmar's Ledge, E. N. E. distant about three-quarters of a mile; from Otter Rock Beacon to the Beacon on Hosmar's Ledge, E. distant about three-quarters of a mile; Hosmar's Ledge Beacon to the town of Castine, N. N. E. distant about half a mile. *Castine.*

Otter Rock is a small round rock, and lies about 2 cables' length from the northern shore, and has on it an iron beacon, with a cask placed upon a staff at its centre, and is about 12 feet above the level of the sea at high water. Noddle's Island Point is a low black rock, and very bold. Bull Head is a high bluff of rocks, and of a yellowish cast, and lies on the south side, without the entrance of the harbor.

Hosmar's Rock lies about one-eighth of a mile from the southern shore of Castine Harbor, and has on it an iron beacon, as described on Otter Rock. Turtle Head is the northern head of Long Island. Stubb's Point Ledge lies opposite the town, but is not in the way of vessels going into Castine Harbor, on which there is a beacon erected.

If you are bound up Penobscot Bay, and are to the eastward of Long Island, and intend going into Castine Harbor, bring the light on Dice's Head to bear N. E. by N. and run for it until you are within half a mile of it, then steer E. by N. for the beacon on Hosmar's Ledge, leaving Otter Rock Beacon on the larboard hand, one cable's length distant, and Bull Head, Noddle's Point, and the beacon on Hosmar's Ledge on the starboard hand. You may near the starboard shore off the entrance of Castine Harbor within one cable's length, and steer E. N. E. which will carry you in ship channel way. You may anchor off the town, near the wharves, in from 8 to 10 fathoms water.

This harbor is easy of access, and vessels may approach it with safety by following the above directions.

WHITE HEAD—Vessels bound from the southward, and intending to fall in with White Head lighthouse, should endeavor to take their departure from the high land of Cape Cod, from which to Manheigen light, the course is N. N. E. $\frac{1}{2}$ E. distant thirty-five and a half leagues. The shore near Manheigen is bold, with good water on all sides, having no shoals or sunken rocks about it; there are some dry islands and ledges on the north side, but they are bold, and good water all among them. From Manheigen light to White Head light, the course is N. E. distant about seven leagues, with a fair open sound. There is a small ledge lies about half a mile from White Head light, bearing S. by E. which is just out of water at common tides; at low water you pass between this ledge and the light to go in the Muscle Ridge Channel, or into the harbor. You continue your course N. E. by the light about three-quarters of a mile, when you will open the harbor on your larboard hand, between a small ledgy island near the light, and a high white island with some spruce trees on it. When you open the harbor N. W. you steer N. W. and sail on till you pass all the ledges on your larboard hand, and anchor in about 5 or 6 fathoms, good holding ground. *White Head Lighthouse.*

White Head light is built on White Head Island, remarkable for the many white rocks on the Head. It is 7 leagues from Manheigen, bearing N. E.; is a fixed white light, 58 feet above the level of the sea. Attached to this light is a bell, weighing 1000 lbs., striking in foggy weather, three times a minute. The light is small but of great importance, as all vessels bound to Penobscot bay, going in shore, are obliged to pass by the light through the Muscle Ridges. A stranger wishing to pass this light must, if coming from the westward, run in for the land east of Manheigen, until the light bears S. W.; then steer N. E. and you can pass within half a cable's length of the head.

Vessels of 60 or 70 tons may double close around the head of the light, soon as it bears N. E. and anchor right abreast of the store. This is called Sail Harbor. Vessels taken with calm and ebb tide, may anchor any where off the light, in from 12 to 20 fathoms water. If the wind takes you at N. E. and ebb tide, that you cannot get into Sail Harbor, you may run into Tarrant Harbor, which bears W. by S. about 4 miles distant. You will continue your W. by S. course till the first house on the starboard hand bears N. N. W. when you may anchor in about 4 or 5 fathoms water, good ground.

Sail Harbor. SAIL HARBOR lies to the northward and eastward of White Head, about three-fourths of a mile. If you wish to go into this harbor, haul up round the Head, within about a cable and a half's length, run until the light bears S. W. then steer N. by W. run in and anchor in 8 fathoms, sticky bottom. This is a good harbor in winter.

Tarrent Harbor, Muscle Ridge and Penobscot Bay.

TARRENT HARBOR, MUSCLE RIDGE AND PENOBSCOT BAY.—In sailing from this harbor, you may steer east one league, to White Head light, but be careful not to haul in for it till it bears N. E. as there is a large ledge of rocks bearing about W. N. W. from said Head, one mile distant, but within it, a pistol shot from the shore, is safe, navigation. In going in, you must give the larboard hand a berth, as there is a sunken ledge, which extends about two-thirds across the mouth of the harbor, that breaks when there is any sea, unless at high water.

Your course from White Head light is N. E. to Ash Point or Island, one league distant, which has a large rock to the S. W. of it, about half a mile distant, which you must leave on your larboard hand. It is not in the way except you are obliged to go about. When you haul round this island, give it a small berth, and steer N. N. E. or N. E. by N. for the Owl's Head, leaving two islands on your starboard hand; but when you draw near the larboard shore, you steer about E. N. E. for the Owl's Head, which has a good harbor on the larboard hand as you go to the eastward. This harbor makes with a deep cove. You may bring a rocky point that lies on your starboard hand to bear N. E. and a ledge of rocks that lies without said point to bear E. N. E. and anchor in 4 fathoms, muddy bottom.

This harbor is open to the wind at E. by N. and E. N. E. but in all other winds you are safe. The tide of flood sets to the eastward, and the tide of ebb S. W. through the Muscle Ridges.

If it is night when you come to White Head light, you had better not attempt going through the Muscle Ridges. Your best way is to go by Two Bush Island, which you must leave on your larboard hand, keeping the course E. N. E. or N. E. by E. [Two Bush Island is round and barren, but has only one bush on it. Formerly it had two bushes.]

If you are in a large vessel, your best way is to go in this passage, as it is the most safe. You must follow your course, as above directed, about two leagues, when you will have Penobscot Bay open, and then you may direct your course to either side of Long Island. If you go to the westward, your course is N. N. E. to Great Spruce Head, which having passed seven leagues, your course is N. E. by N. 5 leagues, to Old Fort Point. In steering said course, you will leave Belfast Bay and Brigadier's Island on your larboard hand, which island has a good harbor, and if you mean to go into it, you must leave it on your larboard hand, and steer in about N. or N. by W.

You may run up above this island, and anchor on the starboard hand, if the wind is to the eastward; but if to the westward, or S. W. you must not. There is a bar that lies from this island to the main land, which is covered at high water. There is also a good harbor to the westward of this island, called Long Cove. If you turn into either of these harbors, you must be careful of some rocks that lie to the southward of this island, more than half a mile from the main land. But in going to Penobscot, proceed as above, and keep your larboard hand on board. When you pass this island for the Old Fort Point, which has no trees on it, you must observe before you come to it, that a large ledge of rocks lies about three-quarters of a mile to the E. S. E. of it, which is covered at high water, but bare at half tide. You may go within a cable's length of Old Fort Point, in smooth water. These rocks may be discovered when the wind blows.

If you are bound up Penobscot, from Old Fort Point, with the tide of ebb, and the wind ahead, you may make a good harbor in the east river, which lies about E. N. E. from Old Fort Point, about one league. This river lies to the south-westward of Orphan Island, in which place you will lie safe from all winds, and anchor in six or seven fathoms, good holding ground.

Lighthouse.

On Old Fort Point, above Castine, there is a lighthouse, to indicate the direction to Prospect Harbor.

Orphan Island is a large island, which you are to leave on your starboard hand, and sundry rocks on your larboard hand, which are above water. When you pass Orphan Island, you may anchor to the N. W. of it on the starboard hand, as you go through; but if the wind and tide are in favor you may proceed up to Marsh Bay, keeping the larboard hand best on board. Marsh Bay is about two leagues from Orphan Island. When you pass Marsh Bay, you may keep in the middle of the river, and you have neither rocks nor shoals till you get up to the falls. You have no particular course in going up this river, but may sometimes go to the westward of N. and sometimes to the eastward of N.

When you enter Penobscot Bay, and are bound to the eastward of Long Island, you must steer N. E. by N. leaving Long Island on your larboard hand, which course will carry you up to Castine. If you intend going into this harbor, as soon as it bears E. N. E. you may run in it, steering E. N. E. keeping the middle of the channel until you pass

the first island, giving it a berth of half a mile; then haul to the southward until the island bears W. S. W. when you may anchor in 8 or 10 fathoms, muddy bottom, and lie safe from all winds.

In going into the harbor of Castine, you leave three islands on your starboard hand; but if you are bound up Penobscot River, you must steer north, leaving the ledge of rocks off the Old Fort Point on your larboard hand; then follow the same direction you have for running into the Penobscot River, which will carry you up to the falls. The tide ebbs and flows, at full and change, about 10 or 11 feet. *Tide.*

MANHEIGEN LIGHT.—On Manheigen Island, south of the entrance to George's River, is a revolving light, alternately red and white; time of revolution 2' 15", elevation 170 feet above the level of the sea. You can run close to the island on either side, taking care to go between some dry ledges on the northern side of it. In the island there is a small harbor, open to the S. W.; it bears E. N. E. from Seguin light. *Manheigen light.*

FRANKLIN ISLAND LIGHT, is on the north end of Franklin Island, which is on the eastern side of the entrance to George's River, is a fixed light, 50 feet above the level of the sea. *Franklin Island light.*

PENNEQUID POINT LIGHT, on the western side of the entrance to George's River. A lighthouse, containing a fixed light, is erected on this point, 30 feet high, and 75 feet above the level of the sea. It is a light to Bristol and Waldborough Rivers; bears N. W. $\frac{1}{4}$ W. from Manheigen light, distant 12 miles. *Pennequid Point light.*

GEORGE'S RIVER.—Bring the North Damiscope Island, which is called White Island, (from its being white,) to bear W. S. W. and steer E. N. E. for Franklin lighthouse, that you leave on your starboard hand, and which you may pass within a cable's length of. When abreast of Franklin Island light, (which is on your starboard hand,) steer N. E. for Otter Island, 4 miles distant, and continue until within one-quarter of a mile of it, leaving it on your larboard hand; then steer E. N. E. for Cauldwell's Island, at the S. W. end of which is a high round rock, called Goose Rock. When abreast of said rock, which you may pass within one cable's length of, leaving it on your starboard hand, steer N. E. by E. and N. E. keeping Cauldwell's Island best on board, to avoid a ledge in the middle of the river. *George's River.*

In beating into George's River, you must be careful of a sunken ledge which bears E. N. E. from Franklin Island light, 6 miles distant; also of a ledge off the S. E. end of Gay's Island, which extends one-third of the way across to Goose Rock. *Ledges.*

Should you fall in with Manheigen Island light, and bound to George's River, you may steer N. N. W. leaving Manheigen Island on your starboard hand, until Franklin Island light bears N. E. by E. when you may run for it, and steer as above directed. Franklin light may with safety be run for when bearing from N. E. by N. to E. N. E.

In running from White Islands for George's River, be careful of New Harbor Ledges, which bear E. N. E. from Pennequid Point light, one league distant, on which are 5 feet water at low water. After passing these ledges, you will see a large dry rock, called the Western Egg Rock, which bears E. N. E. from Pennequid Point, two leagues distant, and W. by S. from Franklin light, one league, which you leave on your larboard hand; you will also see the Eastern Egg Rock, which bears south from Franklin light, one league distant, which you leave on your starboard hand. These Egg Rocks bear E. S. E. and W. N. W. from each other, one league distant, and their appearance much alike, which you pass between, with a clear and open channel. You may distinguish one from the other by their bearings from the light.

Should you have the wind ahead, and be obliged to turn to windward, you may stand to the northward until Franklin Island light bears E. N. E. and to the south-eastward until it bears N. N. E. without danger.

To the northward of the range of Pennequid Point and the Western Egg Rock, and M'Cobb's Island, the ground is foul and rocky, and also to the eastward of the range of Franklin Island light, and the Eastern Egg Rock, [NOTE.—M'Cobb's Island is the western entrance of George's River, and bears N. W. $1\frac{1}{4}$ mile distant from Franklin Island light.]

JOHN'S BAY HARBOR.—John's Island bears from Thrum Cap Island N. N. E. distant about three miles. Thrum Cap Island is a small bare island, and forms the western side of the entrance of John's Bay, bearing from Pennequid Point W. S. W. distant about two and a half miles. Pennequid Point forms the eastern side of the bay, and is a low bare point; but the shores are bold on all sides. The lighthouse is situated on the S. E. side of Pennequid, and bears from the western point E. N. E. distant about half a mile; from John's Island to Butford's Island, west, distant about one mile; Stuart's Island, N. W. by W. distant about one mile; High Island Head, N. $\frac{1}{4}$ W. distant about two miles; McFarling's Point, N. W. by N. distant about one and a half mile—one-eighth of a mile from McFarling's Point there are several ledges, covered at high water, but are not in the way of vessels running into this bay, as they lie so near the western shore they may be seen at all times, with a little motion of sea;—McCown's Point from John's Island, north, distant about one and a quarter mile; Pennequid Point, *John's Bay Harbor.*

S. by E. distant about three miles; Penmequid Harbor, N. E. distant about half a mile. Thrum Cap Island bears from White Island N. E. distant about two miles. High Island Head is a high bluff covered with trees, and you may near it within 200 feet of the shore.

John's island is small and high, covered with spruce trees, located near the centre of the bay, and has a house on the N. W. part of it, which cannot be seen until you are up with the island; if you wish to run into Penmequid Harbor, you may go to the eastward of John's Island, leaving two dry rocks on the starboard hand, keeping them close on board; or you may leave them on your larboard hand, and after passing them you will see the entrance of the harbor, bearing about N. E. half a mile distant, where you may run in, and lie safe from all winds.

Vessels westward bound, and falling in with Manheigen Island, and wish to make a harbor in a strong S. W. wind, must observe the following directions:—Bring Manheigen light to bear S. E. and steer N. W. distant about 11 miles, for Penmequid Point; and when the light on said point bears E. N. E. distant half a mile, you are then up with the western point of Penmequid; leave it on your starboard hand, and give it a berth of one-eighth of a mile, then steer north for John's Bay Harbor, leaving John's Island, McCoun's Point, on your starboard hand; Butford's Island, Stuart's Island, and McFarling's Point, on the larboard hand. If you are from the westward and bound into this harbor, you may bring John's Island to bear N. by E. and run until you are within one cable's length of it; then steer north for High Island Head, which you leave on your larboard hand, and when abreast of said head steer N. $\frac{1}{2}$ E. about three-eighths of a mile, and anchor in from 4 to 5 fathoms water, good holding ground. John's Bay lies about 5 miles to the eastward of Townsend Harbor, and is a fair open bay, having no rocks or shoals at its entrance, and vessels may run in without fear, by following the above directions.

Damariscotta River.

DAMARISCOTTA RIVER.—The buoy at the mouth of Damariscotta River, and the bearings of different objects about it, and directions for the river:—Hern Island, S. W. part, bears from the buoy, E. by N. distant about a quarter of a mile; White Island, S. $\frac{1}{2}$ W. distant 2 $\frac{1}{2}$ miles; Varnum's Point, north, distant about 3 $\frac{1}{2}$ miles; Foster's Point, N. by E. distant about 2 $\frac{1}{2}$ miles; from Hern Island to White Island, S. S. W. distant about 3 miles. Hern Island forms the eastern side of the entrance of Damariscotta River, and is high, covered with spruce trees. Varnum's Point is a high bluff point, and is on the western side of the river, and is also covered with trees. The shores on both sides of the river are bold.

In coming from the westward, and bound to Damariscotta River, bring White Island to bear S. $\frac{1}{2}$ W. and steer north, leaving the buoy, Hern Island, and Foster's Point on the starboard hand; give the buoy a berth of a cable's length, and steer N. by E. keeping in the middle of the river, and when up with Varnum's Point, which you leave on your larboard hand, you will see Hodgden's mills on the western side of the river, about $\frac{1}{2}$ mile. Hodgden's house and mills are painted red; you may anchor abreast of them, near the middle of the river, in 5 fathoms water, good holding ground, where you may lie safe from all winds. The above mentioned buoy is a spar buoy, painted red, elevated about 12 feet above the surface of the water, and is moored about 100 feet to the westward of the ledge, in 6 fathoms, at low water.

Should you fall in to the eastward of Seguino, and wishing to go outside of Damariscotta Islands, bring Seguine light to bear E. $\frac{1}{2}$ N. and steer E. $\frac{1}{2}$ S. 5 leagues distant, to clear Bantam ledge, which lies east from Seguine 3 $\frac{1}{2}$ leagues distant, and S. S. W. from Pumpkin Rock one league; you then steer N. E. until you make Franklin light, and then steer as above directed, and at the same time your E. $\frac{1}{2}$ S. course until Pumpkin Rock bears north, then steer N. E. for Franklin light. Your course from Pumpkin Rock to Franklin light is N. E. by E. 5 leagues distant. In hazy weather you will do well to get a departure from this rock, as you cannot see Franklin light more than 4 miles distant. You may anchor in Gay's Cove, taking care to avoid a sunken ledge which lies E. from Gay's Cove, near the middle of the channel, and has 4 feet at low water. This ledge must be left on your larboard hand, keeping Caldwell's Island close on board. Gay's Cove lies on your larboard hand about 8 miles to the E. N. E. of Franklin's Island light. You may know this Cove, as Gay's house and barn lie to the N. W. of it. But if you are bound through Herring Gut, bring Capt. Henderson's house to bear N. N. W. and steer S. S. E. for Herring Gut. This Herring Gut has a bar from side to side, but you may go over it at two hours flood, keeping your larboard hand best on board. As you come on the bar, you will see a large rock on your starboard hand, and the deepest water is within a cable's length of the rock; your course over the bar is S. S. E. You may anchor to the N. W. of the bar in 4 or 5 fathoms, muddy bottom, and wait for the tide. The tide of flood sets to the northward, and the ebb to the southward.

Buoy.

A spar buoy, painted white, has been moored N. W. about 400 feet from Bantam Ledge, in six fathoms water, bearing from Burnt Island light, in Townsend Harbor, S. by W. distant about eight miles

SEGUINE LIGHTHOUSE is situated on an island near the mouth of Kennebeck River, 200 feet above the level of the sea, and contains a fixed light. Cape small Point bears N. W. from it, and Wood Island N. N. W. 1½ miles distant. There are several rocky ledges near Seguine, which bear from the light as follows: Five Fathoms Ledge S. W. distant three quarters of a mile; Ellingwood's Rock north, one quarter of a mile; Seguine Ledges N. N. E. half a mile, always dry; Jack-knife Ledge N. W. 1½ mile, 8 feet water; Wood Island Reef N. N. W. 1¼ miles, 4 feet water; Whale's Back N. N. E. 1¼ mile; and White's Ledge, with 8 feet on it, bears N. E. one mile.

MARSHALL'S POINT.—On Marshall's Point, at the eastern entrance of Herring Gut, there is a fixed light, elevated 30 feet above the level of the sea. *Marshall's Point light.*

HERRING GUT HARBOR.—Old Cilly bears from the light on Marshall's Point, at the entrance of Herring Gut Harbor, S. distant about 3 miles; Black Rock, S. ½ W. distant about 1½ mile; Henderson Island, S. S. W. distant 1 mile; Bradford's Island, W. by S. distant half a mile; Gunning Rock, S. E. by S. ¼ S. distant about 1 mile; Two Brothers, S. E. distant about 2½ miles; Henderson Island from Gunning Rock, W. distant about half a mile; Gunning Rock to Black Rock, S. W. ¼ S. distant about half a mile. S. E. by S. ¼ S. from Gunning Rock, distant a quarter of a mile, lies a sunken ledge, which can be seen breaking at low water in a heavy sea. From Old Cilly to the light on Manheigen Island S. W. by S. distant about 9 miles; Mosquito Island from Old Cilly, N. E. by E. distant about 4 miles; Green Island from the Brother's S. E. ¼ S. distant about a quarter of a mile. Old Cilly is a low black rock, and can always be seen above the surface of the water. A reef extends off east, distant nearly a quarter of a mile, which must be avoided. Black Rock is a small round rock, and is also above the surface of the water. Henderson Island is a small low island, with no bushes or trees on it. Bradford Island is high, and covered with spruce trees, and forms the western side of Herring Gut Harbor. Green Island is also a small bare island. The two islands called the Brothers, are small, and covered with spruce trees. Gunning Rock is high and bare, with a yellowish color; this ledge is very bold, and you may near it within 100 feet.

In running from Manheigen for Herring Gut Harbor, bring the light on Manheigen to bear S. W. and steer N. E. by N. and when the light on Marshall's Point bears N. by W. ¼ W. then run for it: in running for the light you will leave the Old Cilly, Black Rock, and Henderson Island on the larboard hand; Mosquito Island, Green Island, Two Brothers, and Gunning Rock, on your starboard hand. Give the light a berth of two cables' length, and when it bears east of you, steer N. N. E. distant about one mile, and anchor in from 4 to 5 fathoms, where you lie safe from all winds. You will find good anchorage any where between Marshall's Point and Bradford's Island.

You may run into this harbor by bringing the light on Marshall's Point to bear W. N. W. leaving the Green Island, Two Brothers, and Gunning Rock on the larboard hand; Mosquito Island on the starboard. This passage is full of shoals, and had better not be attempted unless well acquainted.

This harbor is easy of access, and vessels may approach it with safety by following the above directions.

When you go out of this harbor, and bound to the eastward, be careful and give the larboard hand a good berth, for there are two ledges of rocks on the same hand of the eastern point, which are under water, and lie off about a cable's length. When you are clear of these ledges, you may steer E. by S. or E. S. E. one mile to the barren island, which you leave on the larboard hand, and 3 or 4 islands and ledges on the starboard hand.

When you pass those ledges and Mosquito Islands, if bound to White Head, you may steer N. E. by E. 2 leagues, and when you bring the light to bear N. E. run for it, but when you pass the S. W. White Head, leave it on your larboard hand, and be careful of a sunken rock that lies S. E. from the eastern White Head, about one cable's length distant. Your course through to the eastward is N. E., and to the westward S. W., keeping near the middle of the passage. Before you come up with Ash Point, you must be careful of a sunken rock, which lies off the point about one-third of the passage, which has not more than 8 feet at low water. But if you should go through this passage in the night, keep Potatoe Island, which is right against Ash Island, about S. S. W. from it, and bare of trees, which you leave on your starboard hand, best on board. When you pass Potatoe Island, and are bound into Owl's Head, your course is N. N. E. about 2 miles, which will leave two islands on the starboard hand. When you open the passage to Owl's Head, and bound to Edgemavoggun Reach, your course is N. E. by N. till you pass the Lime Islands, which you leave on your larboard hand. Continue said course till you make a large bare rock on your starboard hand, and a little round island to the eastward on the same hand, which is covered with trees. Continue your course to the N. E., and you will make a large island on your starboard hand; when you pass this island, you have the passage open to Buck's Harbor; continue your course N. E. till you pass by all the islands, to the southward and northward. In the day time you may see Blue Hills, bearing E. N. E. over all the land. This passage is safe to go through with a first *Sunken rock.*

from Bantam
and Harbor, S.

rate man-of-war. When you come within two miles of the reach, you will make a small island on your starboard hand, which has a sunken rock to the northward of it. Your safest way is to keep the middle of the passage, as there is a sunken rock (or ledge) on the larboard hand, that lies E. by S. from an island which you leave on your larboard hand, about half a mile distant. If you want to make a harbor, you may go into Buck's Harbor, by a N. E. or N. E. by N. course. When you come into this harbor, (which is 12 leagues from Owl's head), you must leave an island covered with young birch trees, on your starboard hand, steering N. N. W. and when you get to the northward of said island, you steer E. S. E. till you bring it to bear S. S. W., where you will be land-locked from all winds, in 4 and 5 fathoms, soft bottom. When you leave Buck's Harbor, and bound to the eastward, you steer S. E. till you come to a large rock and four islands, which you leave on your larboard hand, keeping the said rock and islands best on board, for there is a sunken ledge that lies S. S. W. from them. You will make a black island on your starboard hand with burnt trees on it. This ledge lies N. N. E. from said island near the middle of the passage, but keeping the eastern shore best on board, you will go clear of it. When you have passed this ledge, you leave two islands on your starboard and two or three on your larboard hand. Continue your course to the S. E. till you make two islands, between which and Buck's Harbor the course is S. E. and N. W. 6 leagues. To the eastward you may go between both islands, steering E. by S. 1 league, which course will carry you up with Thrum Cap, which island has a bar of rocks, that lie near half a mile to the northward; but if you have a head wind, and are obliged to run through, you will observe the channel is two miles wide at Channel Rock, which is always above water.

When you leave this Thrum Cap, steer E. by S. which will carry you between the Ship and Barge, and three islands which you leave on your larboard hand, which are covered with large rock-maple trees. The Barge is a bare rock, which you leave on your starboard hand; but there is a rock about a cable's length to the northward of the Barge. Continue your course E. by S. for Bass Harbor, distant from Thrum Cap 5 leagues; but you must have some regard to the tide of ebb, which sets very strong to the S. S. E. and the tide of flood to the N. N. W. If you are bound into Bass Harbor, you keep Rich's Point within a cable's length, which you leave on your larboard hand, for there is a large ledge of rocks, which lies off about half a mile, which is bare at half tide, and bears S. E. from Rich's Barn, and S. by W. from the entrance of Bass Harbor. You give the larboard hand a good berth in going into Bass Harbor; in entering which you must give both sides a berth, for at low water it is shoal. When you get into this harbor, anchor on the larboard hand, with a cove to the westward of you, in 3 or 4 fathoms, muddy bottom.

*Townsend to
Manheigen
Harbor.*

TOWNSEND TO MANHEIGEN HARBOR.—When you take your departure from Squirrel Island, you steer E. S. E. for Manheigen light, on the north side of which are some small dry islands and ledges, but good water between them and the other sides of the island, keeping that course until the passage between George's Island and Manheigen bears N. E. You may then steer N. E. about seven leagues, through a fair open sound, for White Head light, leaving George's Islands, (which are three in number,) on your larboard hand. The eastern island has no trees on it. There are two dangerous rocks, bearing due south from the middle of the middle island, called the Old Man and the Old Woman, which are bare before low water. They lie about one mile from the shore; and at high water, when the wind blows off the land, they do not appear. If you are bound to the eastward, and the wind should take you ahead, when you are between Manheigen and George's Islands, bring the middle of Manheigen to bear S. and run in N., which course will carry you between the eastern George's Island and the middle island. You may run as near as you wish to the eastern island, but the middle island has a ledge of rocks that lies to the eastward of it, which are always dry, that you are to leave on your larboard hand. When you get to the northward of this island, you must haul to the westward and run up between it and the western island, so as to bring the body of the middle island to bear N. E. of you. Here you moor your vessel, if you stay any time.

If you are bound to the eastward from this island, you may go to the northward of the eastern island, but you must be careful of a ledge that lies to the eastward of said island, which you must leave on your starboard hand; and when you bring Manheigen light to bear S. W. you may go N. E. If night should come on, or the wind ahead, you may haul up about N. E. by N. for Tarrent Harbor, which lies about 8 leagues from George's Islands. You cannot miss this harbor in the day time. You will make Mosquito Harbor, which lies between two islands, covered with spruce trees. The entrance of the harbor is north. Having passed this harbor, you will run about two miles, keeping your course N. E. by N., when you will pass an island with burnt trees on it, which you leave on your larboard hand, and two islands on your starboard hand, which also have burnt trees on them; then you must bring the harbor to bear W. N. W. before you enter. This is a good harbor, provided you have neither cables nor anchors, as you may see

your ve
water.

your vessel by running up to the head of it, on muddy bottom, which will be dry at low water.

TOWNSEND HARBOR.—The entrance of Townsend is wide. From the Cuckolds *Townsend Harbor.* to the Damiscove Islands is about three miles; and Squirrel Island lies N. E. by N. about 2½ miles; and from Squirrel Island to the western shore is about 1½ mile; and Burnt Island, on which there is a fixed light, 56 feet above the level of the sea, bears N. distant about two miles from the westerly point of Squirrel Island. Banting Ledge lies south a little westerly, from Burnt Island light. If you are outside of Damiscove Islands, be careful to stand so far to the westward as to bring Burnt Island light to bear N. by E.; then you may run for it without fear.

If the wind should be ahead, and you have to beat into the harbor, you may stand from shore to shore without fear, and beat up either to the eastward or westward of Squirrel Island; you may find good anchorage under the lee of Squirrel Island, and go round the island with any vessel.

In coming from the westward, leave Seguine Island on your larboard hand, giving it a berth of about half a mile; then steer N. E. by E. 3 leagues, when you will, if clear weather, open Townsend light, on Burnt Island, bearing about N. N. E. but still continue your N. E. by E. course until Burnt Island light bears N. by E., then stand for it, continuing N. by E., leaving it on the larboard hand till up the harbor. About three-quarters of a mile N. N. E. from the light, there is a small island, called Mouse Island, which you leave on your starboard hand, which is bold; after passing it, you haul up N. E. for the eastern harbor, or continue your course N. by E. till you get the western harbor to bear W. N. W.; then you may run in till you shut Burnt Island light in by the land; or you may anchor any where inside of Mouse Island, as there are neither rocks nor shoals lying off from the land.

In coming from the eastward, get Manheigen light to bear E. S. E. and steer W. N. W. about 5 leagues, which course and distance will carry you into the passage between all the outer islands and the main; and in steering amid course, you will make Burnt Island light, bearing about N. W. by W.; then steer W. by N. till you get Burnt Island light to bear N. W., then haul up for it, keeping it on your larboard bow, till you get up with it, then steer N. by E. and follow the directions before given in coming from the westward.

KENNEBECK.—If coming into Kennebeck River from the westward, keep about one-fourth of a mile from Seguine Island light; in doing which you will avoid Jack-knife Ledge, which bears from Seguine light N. W. distant 1½ mile, and Ellingwood's Rock, lying N. one-fourth of a mile from Seguine. After passing Ellingwood's Rock, bring Seguine light to bear S. and steer N. for Pond Island light, which is a fixed light, 52 feet above the level of the sea, and bearing N. ½ W. from Seguine light, distant 2½ miles. Leaving Pond Island a cable's length on the larboard hand, care should be taken on the flood tide to haul quickly round Pond Island Point, to avoid the Sugar Loaves, (two small islands N. ½ mile from Pond Island,) upon which the tide sets very strongly. The course after passing Pond Island is about N. W. to the fort on Hunnewell's Point, (which you will give a berth of a cable's length,) and steer north for Cuxe's Head, (on which also is a fort,) one mile. The course is then N. E. to Perkin's Island, which you will leave on the starboard hand, about one mile, and you will give it a berth of a cable's length, to shun two sunken ledges that lie nearly abreast of Perkin's Island, and about in the middle of the river; then steering about north, one mile, you will have fine anchorage at Perkin's Flats, in 4, 5, and 6 fathoms. This is as far as it would be prudent for a stranger to attempt with a heavy vessel.

There is good anchorage in moderate weather any where between Seguine and Pond Island, within half a mile of the latter, in from 5 to 8 fathoms. Should the wind blow violently, or in case of stress of weather, and if far enough to windward to weather Ellingwood's Rock and Seguine Ledges, it might sometimes be advisable to run to Townsend Harbor.

If bound into Kennebeck, and falling to the eastward of Seguine, bring the light on Pond Island to bear N. W. by W., and run for it till within a cable's length, then follow the preceding directions.

There is safe anchorage, with an off-shore wind, any where between Small Point and Seguine, avoiding Jack-knife Ledge, before mentioned.

Safe anchorage may be had from Cuxe's Head to Perkin's Island, nearest the eastern shore. The usual rapidity of the tide, between Seguine and the mouth of the river, is 3 and 4 knots.

There is also a passage into Kennebeck River, leaving Pond Island on the starboard hand; but only 16 feet can be carried at high water, and it is not recommended.

You have deep water to the eastward of Seguine. At the westward the tide of flood sets strong to the northward into New Meadows, and W. N. W. into Broad Sound, and up to Portland, and the ebb tide the reverse. Your soundings between Seguine and Cape Elizabeth, are various; at times you have 18 or 20 fathoms, rocky bottom, and within a cable's length you will find 30 or 35 fathoms, muddy bottom.

*Hendrick's
Head light.
Sheepscut
River*

HENDRICK'S HEAD LIGHT is a fixed light, 30 feet above the level of the sea, on the starboard hand going in, near the mouth of Sheepscut River.

SHEEPS CUT RIVER.—If you are bound to Sheepscut River from the westward, and make Seguire light, you may leave it on your starboard hand, giving it a berth of half a mile; when you pass it to the eastward you must bring it to bear S. W. by S. and steer N. E. by N., which course will carry you to Ebenicook Harbor, distant three leagues, leaving three dry ledges on your starboard hand, and one on your larboard. This harbor is very narrow at the entrance, but makes a large basin when you get into it; in the entrance it lies E. N. E. You cannot get in here with a N. E. or easterly wind, but must have the wind south or westerly; after you get into this harbor, you must haul up N. E., or N. E. by N., for there are several sunken rocks on the starboard hand as you go in, which you are to avoid. The best anchorage is against Capt. Smith's wharf, where there are 4 fathoms, muddy bottom, and you will lie safe from all winds. But if you are bound up Sheepscut River, in a large vessel, and come from the westward, pass Seguire light to the southward, steer N. E. until you bring Hendrick's Head to bear N. a little westerly, then run for it, keeping the starboard shore close aboard. There are many rocks and ledges, some of them above and some under water, which are all to the eastward of Seguire. When you get up as high as Ebenicook, you leave the two Mark Islands on your larboard hand, keeping your course north a little easterly; but if you only come here to make a harbor, when you get up to Capt. Hodgson's you will see a bare ledge on your larboard hand, if it is low water, which is covered at high water; you may anchor at 8 fathoms, to the northward of it.

*Little Mark
Island.*

LITTLE MARK ISLAND.—On Little Mark Island a stone column is erected as a land-mark for vessels running into or passing either Harpawell or Broad Sound. It is also a conspicuous mark for the mariner, standing in from sea, in any direction between Cape Elizabeth and Cape Small Point. This island, at the entrance of Harpawell Sound, (half way between Portland and the entrance of the River Kennebeck,) is one-fourth of a mile in length, without trees, its elevation 40 feet above the level of the sea; the column is placed near the centre of the island, 50 feet high, painted perpendicularly in black and white stripes, except near the top, which is black on each side. Course up Harpswell Sound N. E. $\frac{1}{4}$ N.

Bearing by compass, and distance in statute miles from the column.

If you want to go up to Wiscasset Point, you must keep your starboard hand best aboard, north-easterly, till you come to Cross River, which you leave on your starboard hand. You will not attempt to go up to Wiscasset Point with a head wind and the tide of ebb, for it is 1 $\frac{1}{2}$ league from Cross River; but when you have a fair wind and tide, you may proceed without fear. This river is narrow, and lies more to the westward. When you are about a mile or a mile and a half up, you must keep your larboard hand best on board, for there is a ledge of rocks which reaches near half way across the river, which is on your starboard hand, and the rock near the middle is covered at high water, but may be seen two hours before. The river runs straight to Decker's Narrows, then turns round to the westward: when you enter these narrows, you may see the town. In case you should go up in the night, you must be careful of two large rocks that lie W. S. W. of these narrows; the tide of flood sets very strong for them, and they are covered at half tide; you may go on either side of them, and may anchor in 10 or 12 fathoms water, muddy bottom.

Tide.

It is high water here, at full and change of the moon, about 10h. 45m.

*New Mea-
dows.*

NEW MEADOWS.—This river bears N. E. 8 leagues distant from the pyramid on Cape Elizabeth, and about one league W. from Cape Small Point. If you should fall into this bay with the wind at S. E. or S. S. E. and bound to the eastward, you may make a good harbor in the above river. In standing to the northward, you will have a large round island on your starboard hand, covered with spruce trees, together with two

large rocks, one called the Brown Cow, and the other the White Bull, which are some distance from each other. You must leave the Brown Cow on your starboard, and the White Bull on your larboard hand, the latter of which you may go within a cable's length of, and when you have passed it, must stand over for Horse Island, that lies on the starboard, which has a house on it, that you may go within a quarter of a mile of. To the westward of the island lies a large rock, which is covered at high water, but bare at half tide; you may go on either side of it when it is in sight, but the widest passage is to the eastward. When you have passed this rock, steer N. by W. or N. N. W., which course will carry you up with a large island, called Bear Island, which is covered with spruce and birch trees. When you have passed this island about one-quarter of a mile, you may haul in for the starboard shore, and anchor in 5 or 6 fathoms water. This is the best place to anchor, with the wind at S. S. E. or E.; but be careful of a ledge of rocks that runs to the northward of this island, about half a mile off. You may anchor in this bay according as the wind may be; if it should be at the eastward, anchor on the east side. If you have lost your cables and anchors, there is a large cove on the starboard hand, about two miles from Bear Island, bearing about N., which is sufficient to hold 30 or 40 sail of vessels. It is land-locked all round, so that no wind can damage a vessel after she gets into it.

HUSSEY'S SOUND.—If you come from the eastward, and make Seguin light, bring it to bear E. and steer W. for Hussey's Sound, if you have a fair wind and daylight, as you have nothing but islands on your starboard hand. The tide of flood sets very strong in between these islands: when you get within two miles of Hussey's Sound, you will make two islands which have no trees on them, called Green Islands. You continue your course till you make Hussey's Sound, bearing N. N. E.; then you may steer in with your course N. N. E.

Hussey's Sound.

When you pass the two islands, after entering Hussey's Sound, you leave three islands on your larboard, and two islands on your starboard hand; the northern island on your starboard, is called Smith's Island; when you pass said island, about three-quarters of a mile, you may haul away E. N. E. till you shut in said island, to the S. E.; then you may anchor in 8 or 9 fathoms, muddy bottom; Hog Island to the S. W., Basket Island to the N. W., Great Gabegie Island to the N. E., and Smith's Island to the S. E. Here you may moor 200 sail of ships, safe from all winds, and when wind and tide serve, you may be out to sea in one hour.

HALF WAY ROCK is high and black, about 600 feet in diameter, elevated 16 feet above the level of the sea, at high water. At the distance of 600 feet from the rock, on the N. W., North, N. E., E., and S. E. sides, there are from 5 to 6, and gradually deepens to 25 fathoms, within three-quarters of a mile of it. A reef extends off W. by S. distant about an eighth of a mile. Within one cable's length of said reef you will find from 10 to 12 fathoms water. You may near this rock on all sides within a quarter of a mile, and find from 15 to 25 fathoms water. Seguin lighthouse bears from the rock E. $\frac{1}{2}$ N. distant about 15 miles; Drunken Ledges, N. N. E. distant about 2 $\frac{1}{4}$ miles; Mark Island, N. by E. $\frac{1}{2}$ E. distant about 4 $\frac{1}{2}$ miles; the lighthouse on Cape Elizabeth, S. W. by W. $\frac{1}{2}$ W. distant about 9 miles; Cod Rock, (shoalest part.) S. W. by S. distant about 6 miles; Portland lighthouse, W. $\frac{1}{2}$ S. distant about 11 $\frac{1}{4}$ miles; Green Islands, W. $\frac{1}{2}$ N. distant about 5 miles; Jewill's Island, N. W. by N. distant about 3 miles; Eagle Island, N. about 4 $\frac{1}{2}$ miles. Drunken Ledges may be seen at all times, breaking with a little motion of the sea. Mark Island is a small bare island, and has a stone monument erected on it as a guide for vessels running into Broad Sound. Eagle Island is a small high island, covered with trees, at the entrance of said sound. Mark Island and Eagle Island form the eastern side of the entrance to Broad Sound. Brown Cow and Jewill's Islands form the western side. Green Islands are two in number, and bear from Jewill's Island S. W. distant about one and a half mile.

Half Way Rock.

Lighthouse.

Cod Ledge is about half a mile in circumference, and has on the shoalest part of it two and a half fathoms, at low water, and gradually deepens to 3, 5, 7, 8, and 12 fathoms, and bears from Portland lighthouse, E. S. E. distant about 7 miles, and from Cape Elizabeth lighthouse E. by N. $\frac{1}{2}$ N. distant about 5 miles; Green Island S. S. E. distant about 3 miles. This ledge often breaks in a heavy south-east gale.

Lighthouse.

PORTLAND HARBOR.—Cape Elizabeth lights are situated on Cape Elizabeth, south of the entrance to Portland Harbor, about 140 feet above the level of the sea, and 300 yards apart, bearing from each other S. W. $\frac{1}{2}$ W. and N. E. $\frac{1}{2}$ E. The western light revolves once in two minutes, the eastern is a fixed light.

Portland Harbor Lights.

E. S. E. from these lights, 2 $\frac{1}{2}$ miles distant, is a dangerous ledge, called Alden's Rock, with four feet water on it at low tide. Also a reef, called Taylor's Reef, bearing S. E. by S. 1 $\frac{1}{2}$ mile distant, having 2 $\frac{1}{2}$ fathoms at low water. E. by N. $\frac{1}{2}$ N. from the lights, 5 $\frac{1}{2}$ miles distant, lies Bulwark Ledge, having 2 $\frac{1}{2}$ fathoms on it at low water.

The following are the bearings and distances, from the north-easterly light, of the shoals and reefs, and of other lighthouses in sight of, and near the cape, viz.:

- Alden's Rock, S. E. by E. 2 $\frac{1}{2}$ miles.
- Hue and Cry, S. W. $\frac{1}{2}$ S. 3 $\frac{1}{2}$ do.

Bearings.

Portland lighthouse is on a point of land called Portland Head, at the western entrance of the harbor. It is a stone edifice, 72 feet high, exclusive of the lantern, which is 13 feet, and contains a fixed light.

A red spar buoy is placed on Alden's Rock, with a staff of about 12 feet long, to which is attached a red flag. There are also two watch buoys within 15 or 20 feet of this buoy on the following bearings:

Lights;

- Hussey's Sound, viz., from the buoy N. about 8 $\frac{1}{2}$ miles distant.
- Northern lighthouse on Cape Elizabeth, N. W. by W. $\frac{1}{2}$ W.
- Southern lighthouse on the same, N. W. by W. $\frac{1}{2}$ W. distant 3 miles.
- The barn on Richmond's Island, W. distant 4 $\frac{1}{2}$ miles.
- Portland lighthouse, N. N. W. $\frac{1}{2}$ W. distant 6 $\frac{1}{2}$ miles.
- Wood Island lighthouse, S. W. by W. $\frac{1}{2}$ W. distant 13 miles.

The most dangerous parts of this ledge are two rocks bearing from each other E. S. E. and W. N. W. The distance between these rocks is 420 feet.

The western rock is about 12 feet in diameter, and has 5 $\frac{1}{2}$ feet on it at low water. The eastern rock is about 30 feet in diameter, and has but 7 $\frac{1}{2}$ feet at low water. Between these rocks are 3, 4, and 5 fathoms. The western rock bears from the buoy S. by W. distant 240 feet. The eastern rock bears S. E. $\frac{1}{2}$ S. distant 520 feet. At the distance of 600 feet from the eastern rock, on the S. E., E. and N. E. sides, are 4, 5, and 6 fathoms water. At the distance of 300 feet from the western rock, on the S. W., W. and N. W. sides, are 6, 7, and 8 fathoms.

Light.

Vessels bound to Portland, falling in to the westward, and making Wood Island light, must bring it to bear S. W. by W. $\frac{1}{2}$ W., and steer N. E. by E. $\frac{1}{2}$ E. 13 miles, which will bring them up with the buoy on Alden's Ledge

Light.

Should they fall in to the eastward, and make Seguine' light, they must bring it to bear E. by N. $\frac{1}{2}$ N. and run W. by S. $\frac{1}{2}$ S. 9 leagues, which will bring them up with the buoy.

In passing the buoy to the E. give it a berth of one-quarter of a mile. If to the west, you may near it within a cable's length.

If running for Portland Harbor, bring the buoy to bear S. S. E. and steer N. N. W. 6 $\frac{1}{2}$ miles, which will bring you up with Portland light. Continue this course until you are half a mile within the lighthouse, then bring it to bear S., and steer N. by W. for House Island, which is two miles N. by W. from Portland light. Should you wish to go further up the harbor, follow the directions given here.

The course from the buoy to Hussey's Sound is North.

N. B. Vessels of large draft will find the best water by bringing Portland light to bear N. W. by N., and running directly for it.

Buoy.

Coming from the south-westward, when within half a mile of Cape Elizabeth, the red buoy on Broad Cove Rock may be seen; it bears N. N. E. from the pitch of the cape, distant one and a half mile, and lies in 24 feet water. When up with this buoy, leave it on the larboard hand, half a cable's length distant, and steer N. by E. $\frac{1}{2}$ E. 1 mile, which will carry you up with the white buoy on Trundy's Reef, which lies in 16 feet water. Giving it the same berth as the other, you may then run N. by W. $\frac{1}{2}$ W. for Portland lighthouse, 3 miles distant. When up with the head on which the lighthouse stands, give it a small berth, and steer N. by W., leaving Bang's Island on the starboard hand, till you come to House Island, the S. W. point of which bears N. from the lighthouse, distant almost 2 miles. Before you are up with this island, the black buoy on Spring Point Ledge may be seen; it bears N. W. by W. from the S. W. part of House Island, distant half a mile, and lies in 14 feet water. When up with this buoy, you open the town, giving the black buoy a small berth, you may haul up N. W. for the white buoy on Stanford's Ledge; this buoy lies also in 14 feet water, and one mile distant from Spring Point Ledge buoy. Giving the white buoy a small berth, you may keep up midway the river, and anchor opposite the town, where you please, in safety.

Vessels coming from sea, and bound into Portland, may, by giving the lights on Cape Elizabeth a berth of 4 miles, run to the northward and eastward until Portland light bears N. W., and then stand directly for it, which will clear all the ledges.

There are also two small buoys on two ledges in White Head Passage, at the N. E. part of Bang's Island. This passage is narrow, and but seldom used with large vessels. By keeping midway between the two buoys, the red on the starboard and the white on the larboard hand, in coming in, you will have not less than 5 fathoms water. After passing the buoys, keep midway the passage, and run 1 mile distance, which will carry you into ship channel, the same as if you had passed the lighthouse.

[N. B. All the above mentioned buoys are to be left on the larboard hand, in coming in, and the depth of water put down is at low water.]

NOTE.—If by accident either of the buoys should be removed, the following directions for sailing into Portland Harbor will be found useful.

When you come from the south-westward, and intend to go into Portland, give Cape Elizabeth a berth of half a mile, and steer N. N. E. until you bring Portland lighthouse to bear N. N. W., when you must haul up N. N. W. if the wind will permit; but if you are in a large ship, and the wind N. W. or W. N. W., your safest way is to continue your course N. N. E., which will carry you safe into Hussey's Sound, allowing it to be tide of flood, as Portland Sound is narrow, but bold between the lighthouse and Bang's Island, the latter of which is on your starboard hand. If you should turn into Portland in the night, in standing to the south-westward, you must go about as soon as the light bears N. N. W.; and in standing to the eastward, you must go about as soon as the light bears W. N. W., for there is a ledge of rocks that bears S. by E. from Portland lighthouse, and also a low island, called Ram Island, east northerly, one mile distant from the lighthouse; but if you have a leading wind you may go in without fear, keeping about middle of the channel way, and when abreast of the light, steer about N. by W. for House Island, which you leave on your starboard hand: when you pass House Island, bring it to bear S. E. by E. and steer N. W. by W., or W. N. W. with the tide of flood. In steering the above course, you will see a round bushy tree to the north of the town, and a house with a red roof, and one chimney; bring the tree to the west of the house, which course will carry you up the channel way, in 6 or 7 fathoms water; but when you come abreast of the fort which stands on a hill, haul away W. S. W., as there is a shoal bank on your starboard hand that has not more than 10 or 12 feet on it at high water, which you are to avoid. Here you will be careful of two ledges of rocks, one called Spring Point Ledge, two miles N. by W. $\frac{1}{2}$ W. from the lighthouse, and the other three miles, bearing N. by W. $\frac{1}{2}$ W., called Stanford's Ledge, which has a buoy on it, and stretches off from your larboard hand near half a mile in length. They lie to the S. W. of House Island, and are all bare at low water. If you are obliged to turn in here, they are much in the way, and when you are standing to the southward, be careful of them. The marks will do in the day-time, but are of no service in the night. There is a pilot who generally attends here. This harbor is open to the wind at N. E. and E. N. E. If you should come in a dark night, your best way is to go into Hog Island Road, which may be done by steering as follows:—when you pass the lighthouse, steer N. by W. until you pass Bang's Island, which you will leave on your starboard hand; in steering this course, you will make House Island, which you will leave on your larboard hand; when you are between both of these islands, you steer N. E. by E. till you come to the second island on your starboard hand. If it is day-time, you will see a large house on said island; and may anchor as soon as abreast of it, in 10 or 12 fathoms, muddy bottom.

If you should fall in to the eastward of Portland, and make Segune light, bring it to bear E. and steer W., which course you are to continue till you make Portland light to bear from N. W. to W. N. W., when you may run for it without fear.

You must have some regard to the tide of flood, which sets very strong between the islands to the eastward of Portland.

MASTERS who sail from Portland, or ports adjacent, are informed, that from the OBSERVATORY on Fort Hill, by means of the telescope placed there, vessels approaching the coast may be discovered at 15 leagues distance; and their colors or private signals can be distinguished 8 leagues, if the weather should be clear and the colors hoisted, or suspended in such a manner to present them fair to the Observatory. Should any need assistance, they will set their ensign over their private signals; and may be assured if they can be discerned, that their situation will be made known to their owners.

The Observatory bears N. N. W. $\frac{1}{2}$ W. from Portland lighthouse, 4 miles distant; and these, in range, are a good mark to clear Alden's Rock; which, keeping the above in range, you will be nearly three quarters of a mile to the eastward of.

The Observatory is on an eminence 141 feet above high water mark; and the building 32 feet high, painted red, and the telescope placed near the top.

Vessels falling in with Cape Elizabeth, and wishing to make a harbor in a strong N. W. wind, must observe the following directions:

Give this cape a berth of one-quarter of a mile, and steer N. E. nine miles, leaving the Green Island on the starboard hand, which will carry you up with the S. W. point of Crotch Island. Give this point a berth of half a mile, and steer N. N. E. $\frac{1}{2}$ E., which will carry you between Hope Island on the north and Crotch Island on the south. You may anchor midway between the two islands, in about 13 fathoms water. The shores on each side are very bold.

BOON ISLAND.—This island is very low, about one-quarter of a mile in length. A lighthouse is built on the west part of the island, a little to the westward of the former light. It is 50 feet above the surface, shows a fixed light, elevated about 70 feet above the level of the sea.

Light.

Ledges

Directions.

Light.

There is a passage between the island and the main, half a mile within the former, between 4 and 5 miles wide, in from 12 to 20 fathoms, nearly up with York Ledge. There is a ledge off the north part of Boon Island, one-fourth of a mile distant, which shows at low water.

Boon Island Ledge.

BOON ISLAND LEDGE is about 200 feet long, and about the same in width; is bare at low tides, and may be seen breaking at all times in a heavy ground swell.

The Ledge bears from the island E. $\frac{1}{4}$ S. two and three-quarters of a mile distant. There is a passage between the ledge and the island, but it will not do for strangers, as there is a reef extends $\frac{3}{4}$ of a mile, from the S. E. point of the island.

The following are the soundings around Boon Island.

Soundings.

From Agamenticus Hill, Boon Island bears S. E. distant 5 or 6 leagues, and when you come in from sea, and make Agamenticus Hill, being N. W. by N., you are then to the westward of Boon Island Ledge, but when said hill bears N. W. by W. you are to the eastward of it. From Boon Island to Cape Elizabeth the course is N. E. distant about 29 miles.

I would recommend to all mariners, in coming from the eastward, not to go to the northward of lat. 43° N. in thick weather, unless they are well acquainted, and judge themselves to be to the westward of Boon Island Ledge, as this has proved fatal to many who were unacquainted.

We have been informed there is a ledge of rocks due north from Boon Island, one mile distant; the gentleman who gave the information, since deceased, and whose veracity and experience could be relied on, said, "I have passed this place several times, but never discovered the ledge till the year 1783, when, being bound to the eastward, the wind took me from the westward, but the vessel having no more than steerage way, I hove over a line to catch fish, and found I had 24 fathoms water, sandy bottom, and in a few minutes I had but 10 feet of water, and my vessel drawing 9. All that saved me from striking was, that the water being entirely smooth, the current set me to the eastward, and I got into 24 fathoms within the length of the vessel from where I sounded, and had 10 feet."

York Ledge.

YORK LEDGE.—This rock is bare at three-quarters tide, extending E. N. E. and W. S. W. about 400 feet. It is about 300 feet wide.

N. E. from the main rock there is a shoal runs off a quarter of a mile, having upon it only two fathoms at low water.

The soundings are gradual, from 5 to 20 fathoms half a mile from the rock.

An iron beacon has been placed upon this rock; it is 33 $\frac{1}{2}$ feet high, and about 25 feet above the level of the water.

Upon the pillars rests an iron tabular column, supporting an iron base of 3 $\frac{1}{2}$ feet diameter, upon which is inscribed "York Ledge. 1841."

The Triangles, which break in a heavy sea, and which have 4 fathoms at low water, bear S. W. 2 miles distant from this beacon.

gths.

Boon Island light bears from this beacon E. $\frac{3}{4}$ N. 5 $\frac{1}{2}$ miles; Whale's Back light, W. by S. $\frac{1}{4}$ S. 5 miles; White Island light, S. by W. $\frac{1}{4}$ W. 8 $\frac{1}{2}$ miles; York Nubble, N. by E. 4 $\frac{1}{2}$ miles.

York Harbor.

YORK HARBOR.—This is a small harbor, but once entered is safe; twelve feet can be carried in at low water; rise of tide 9 feet.

White Hills.

WHITE HILLS.—These hills lie N. W. from Portland, and N. N. W. from Wood Island lighthouse. You may see them in clear weather when no other part of the land is in sight. At the first sight they appear like a cloud, and are always white. They have been seen when in latitude 43 degrees 10 minutes North, twenty-three miles South from the lighthouse on Cape Elizabeth. The depth of water in the above latitude is eighty fathoms, muddy bottom. When you steer N. W. or N. N. W. from this latitude, you will make Agamenticus Hills, and when bearing W. by N. six or seven leagues, they appear like three hills, the smallest of them to the eastward. At the same time you will make Well's Hills, bearing W. N. W., and when you are on the northern part of

Jeffery's Ledge, in 45 fathoms water, you will see the hills of Agamenticus bearing W. by N. or W. N. W.

Between Jeffery's and the Isles of Shoals you will have 70 and 75 fathoms water, muddy bottom, and a strong current setting to the S. W. You may see the Isles of Shoals 5 or 6 leagues, when you are to the eastward of them; but will first see the lighthouse, which is on White Island, and the meeting-house on Star Island, bearing N. E. and S. W. from each other, distance seven-eighths of a mile.

CAPE PORPOISE TO WOOD ISLAND LIGHT.—Wood Island light is situated near the entrance of Saco River, on the east side of the island. The lantern is elevated 45 feet above the level of the sea, and contains a revolving light. Wood Island is high woody land, and very even, and lies N. E. 3 leagues distant from Cape Porpoise. In running for the light, bring it to bear N. N. W. or N. W., and run till within a cable's length with safety. You may go into this harbor either at the eastward or westward of the island. There are several rocks to the westward of the island, and also a long bar which lies to the S. W., about three-quarters of a mile distant, together with two ledges, one of which bears S. E. by S. from the light, distant half a mile, having 10 feet water on it at low tide, and the other is a dangerous ledge called Dauceberry, bearing S. by E. from the light, distant about three-fourths of a mile, and breaks at all times. When you have the wind to the southward, you may lay your course in, and anchor near Stage Island, on which is a monument: this is called Winter Harbor. You may go in the eastern way, and have room to turn your vessel, which is an advantage you cannot have in going in to the westward; but here you are exposed to the wind at N. E. and E. N. E., but if your cables and anchors are not good, you may run into the Pool, and lie safe from all winds.

Cape Porpoise to Wood Island light.

In running in the eastern passage, you open a small channel for boats only, between Wood and Negro Islands, but no man of experience would mistake it. Negro Island is small, with two stores on it, and is left on the larboard hand

Saco lies about a league to the north-west, but is a barred place, and has not above 10 feet at high water, which makes it not fit for a stranger to go in; there is, however, considerable navigation owned here, and the inhabitants are enterprising.

Saco.

RICHMOND'S ISLAND.—The next place to Wood Island is Richmond's Island, which lies about N. E. northerly, 4 leagues. This place is only fit for small vessels, such as coasters, and but few vessels put in here, it being only one league to the westward of Portland, which is the principal port in the State.

Richmond's Island.

In sailing by Richmond's Island, you must be careful of a sunken ledge, called Watch Ledge, that lies off about S. E., near half a mile from the N. E. end of the island: it does not show itself except the wind blows fresh, but you need not go so near the island, unless you have a scant wind, or turning to windward.

CAPE NEDDOCK TO CAPE PORPOISE.—Your course from Cape Neddock to Cape Porpoise is N. E., distant 4½ leagues. Cape Porpoise is a bad harbor, and not to be attempted, unless you are well acquainted or in distress. In going in you must leave 2 small islands on your larboard hand, and three on your starboard. It may be known by the high land of Kennebunk, which lies to the north-west of it. When the harbor bears N. W. you must haul in, but be careful of the point on your larboard hand, and not go too near it, as it is very rocky. As soon as you are in the harbor, and clear of the point of rocks on your starboard hand, your course must be N. W. about two cables' length, when you must come to, and moor N. E. and S. W. or run direct for the wharf. A vessel that draws 10 feet will be aground at low water. The harbor is so narrow that a vessel cannot turn round; is within 100 yards of the sea, and secure from all winds, whether you have anchors or not.

Cape Neddock to Cape Porpoise.

CAPE PORPOISE HARBOR.—The lighthouse stands on the south-west part of Gout Island, and contains a fixed light, elevated thirty-three feet above the level of the sea. The following are the directions for the harbor:—If you are to the eastward, and make Wood Island light, and bound to Cape Porpoise Harbor, bring Wood Island light to bear N. E. by N. and run S. W. until you bring Cape Porpoise light to bear N. by W.; then steer direct for the light until you shut Wood Island in by the eastern head of Cape Porpoise Harbor: then you are abreast of a breaking ledge called the Old Prince, which bears from Cape Porpoise lighthouse S. E. by S. half a mile distant; then steer N. N. W. until Cape Porpoise light bears E. N. E.: you are then up with the entrance of the harbor. Then, if low water, keep midway between the two points; but if high water, keep the larboard shore best aboard. When up with the points, steer N. W. a quarter of a mile, and anchor in three fathoms water, at low water. By following these directions you will find from 3 to 6 fathoms water. In coming in from sea, and making Cape Porpoise, and intending to go into the harbor, bring the light to bear N. by W. and follow the above directions. This harbor is not so safe for large vessels, and must not be attempted, unless with a fair wind. Wood Island lies about 10 miles to the N. E. of Cape Porpoise, and has on it a repeating light. Folly Island lies opposite the lighthouse, and forms the western side of Cape Porpoise Harbor. The S. S. E. part of Folly Island point bears

Cape Porpoise light. Directions.

from the light S. $\frac{1}{2}$ W. distant about $1\frac{1}{2}$ mile. The shoal runs off nearly three-quarters of a mile.

Buoys.

NOTE.—A spar buoy, painted red, elevated 9 feet above the surface of the water, has been moored near the Old Prince, in 8 fathoms water, at low water, and bears from Cape Porpoise lighthouse S. S. E. distant about five-eighths of a mile; Old Prince bears from the buoy N. N. E. distant about one-eighth of a mile; Folly Island Point, west, distant about one-quarter of a mile. In running for Cape Porpoise Harbor, you may go on either side of the buoy, by keeping it close on board, and after passing it bring it to bear S. E. by S., and steer N. W. by N. for the entrance of the harbor, and follow the above directions.

Kennebunk.

KENNEBUNK.—A buoy has been moored near the Fishing Rocks, at the mouth of this harbor. The Fishing Rocks extend E. N. E. and W. S. W. nearly half a mile distant. The shoalest parts of the rocks are bare at 2 hours' ebb, and may be seen breaking, at all times, with a little motion of the sea. On this shoal there is a spindle erected, with a small cask upon its end; the buoy bears from the spindle, N. E. by E. $\frac{1}{2}$ E. distant about a quarter of a mile; from the spindle to the piers at the entrance of the harbor N. E. by N. $\frac{1}{2}$ N. distant about 1 mile; Flying Point, E. by N. distant about three-quarters of a mile; Fox Point, N. E. distant about three-quarters of a mile; Boothby Point, N. by W. distant about three-quarters of a mile; Harding's Rock, W. N. W. distant about three-eighths of a mile. This is a barred harbor, and cannot be entered except at high water. If bound to Kennebunk, you must leave the spindle and buoy on Fishing Rocks on the larboard hand, about a cable's length distant, and Flying Point and Fox Point on the starboard hand, and after passing them steer north or N. by W. a quarter of a mile, and anchor in from 3 to 4 fathoms water, sticky bottom, where you may lie safe, with the wind from N. E., N. or N. W. Flying Point and Fox Point are bold, and you may near them to within an eighth of a mile. The above mentioned buoy is a spar, painted red, elevated 10 feet above the surface of the water, and is moored in 4 fathoms at low water. Kennebunk is not frequented as a harbor, but vessels may, in stress of weather, run in and lie safe, with the winds above mentioned.

At the mouth of Kennebunk Harbor are two piers, one on the eastern and one on the western side of the channel, running from the shore about 3 or 400 feet towards the bar, extending a little beyond low water mark, with a flag-staff and beacon on the top, which may be seen about one mile distant. A ledge of rocks lies off the harbor, called the Fishing Rocks, distant about three-quarters of a mile from the head of the piers, between, which is the anchoring ground. The ledge bears due south from the head of the piers and is all covered at high water. Vessels approaching the harbor should keep well to the eastward of the ledge; though there is a tolerable passage to the westward, but it ought not be attempted by a large vessel without a good pilot.

Depth of water on Kennebunk Bar, at low water, from 2 to 3 feet: rise and fall of common tides from 8 to 9 feet, increasing sometimes to 10 and 12 on full and change. Time of high water, full and change, 11h. 15m.

Tides.**Portsmouth Lighthouse.**

PORTSMOUTH LIGHTHOUSE is near the mouth of the harbor, on the west side, on the N. E. point of Great Island, near Fort Constitution. It is 90 feet above the level of the sea, and shows a fixed light.

The following are the bearings and distances of places to be observed and avoided approaching the harbor.

Kitt's Rocks buoy bears S. 25° 30' E. 1 mile 2420 feet from Portsmouth light.

Odiorne's Point, S. 14° 17' 45" W. 1 mile 5120 feet from Portsmouth light.

Gun Boat Shoal.

GUN-BOAT SHOAL.—Four miles from Portsmouth lighthouse, bearing S. 4° W. lies Gun-boat Shoal, having not less than $3\frac{1}{2}$ fathoms on it, and that only on its shoalest part, which is small; it runs E. N. E. and W. S. W. about 2 cables' length, and bears from Whale's Back light S. by W. $\frac{1}{2}$ W.: from Odiorne's Point, S. $\frac{1}{2}$ E.

Lighthouse.

Whale's Back lighthouse is situated on the east side of Portsmouth Harbor. Its height is 68 feet from low water mark. It has two fixed lights, one ten feet below the other.

The following are the bearings and distances of places from Whale's Back light.

Western Sister, N. 89° 41' E. 1 mile 1310 feet.

Eastern Sister, N. 75° 53' 30" E. 1 mile 3480 feet.

Odiorne's Point, S. 44° 30' W. 1 mile 1920 feet.

Phillip's Rocks (12 feet) S. 83° 30' E. 1 mile 300 feet.

Kitt's Rock buoy S. 23° 50' E. 2130 feet. High water 11 10. Springs 12 feet.

Lighthouse.

If you fall in to the eastward, and make Cape Neddock, and are bound to Portsmouth, when within half a mile of said cape your course is S. S. W. four leagues; which course you will continue till you bring Portsmouth lighthouse to bear N. and the lights on Whale's Back to bear N. N. E., then steer N. $\frac{1}{2}$ E. (leaving Whale's Back light on the starboard hand,) having four fathoms water, until you are abreast of Portsmouth light, which you may round within one-quarter of a mile, when you must steer N. W. until it bears S. S. E., and anchor in nine fathoms, good bottom.

A black spar buoy has been placed on Cod Rock, near Fort Point, at the entrance of the harbor, in 13 feet of water. Vessels passing into the harbor, by leaving this buoy on the larboard hand thirty feet distant will have six fathoms of water. *Buoys.*

A black spar buoy has also been placed at the ledge, at the N. E. of Amazon's or Goat Island, in ten feet water. Vessels passing up the harbor, by leaving this buoy on the larboard hand thirty feet distant, will have seven fathoms water.

A black spar buoy has also been placed on the eastern edge of sunken rocks, in ten feet of water, bearing about east from the monument on said rocks. Vessels passing up the harbor, by leaving this buoy on the larboard hand forty feet distant will have seven fathoms water.

Two spar buoys have also been placed as guides, in entering Spruce Creek Harbor, viz: a white buoy on the S. W. point of Hick's Rock, in thirteen feet water, and a black buoy on Jamaica Point, (Trifethen's Island) in ten feet water. Vessels entering Spruce Creek Harbor, by leaving the white buoy on the starboard hand one hundred feet distant, will have five fathoms water, and by leaving the black buoy on the larboard hand one hundred feet distant, will have three and a half fathoms of water.

After passing the two last mentioned buoys about one hundred feet, vessels may anchor in five fathoms of water, in good muddy bottom; and by keeping in mid-channel, and running about north, may anchor in the creek in five or six fathoms of water.

N. B. Hick's Rocks are under water mostly at about two-thirds tide; and the depths of water named in the preceding directions were taken at low water. If coming from the eastward of the Isles of Shoals in the night, bring Portsmouth light to bear N. W. by W. $\frac{1}{2}$ W., which course will carry you clear of Duck Island. Continue this course until White Island light bears S. S. W., when haul up W. by N., and continue that course until Portsmouth light bears N., when you may run for it with safety.

You may also, if coming from sea, and make the Isles of Shoals, and are to the eastward of them, run for them until within one mile of the eastern island, then steer W. N. W. until Portsmouth light bears N., then follow your directions, passing Whale's Back light on the starboard hand. Berthing into Portsmouth Harbor, it is not prudent to stand to the eastward further than to bring the light to bear N. by W. $\frac{1}{2}$ W., or to the westward further than to bring it to bear N. If you are to the westward of the Isles of Shoals, give White Island light a berth of one mile and a half, bring it to bear E., and then run N. by W. for Portsmouth light, 9 miles distant.

On the east side of the entrance of the harbor lies Kitt's Rock, on which is a buoy, and S. $\frac{1}{2}$ W., one-quarter of a mile from the lighthouse. lie Steilman's Rocks, over which is a black buoy; both rocks are under water. Give both buoys a good berth, Kitt's buoy 200 yards, and Steilman's 100 yards, and there is no danger, as you will have full five fathoms water.

Between Kitt's Rocks and the Western Sister, lie Phillip's Rock's, occupying an area of about 500 feet by 900 feet, with 11, 12, and 13 feet water on them.

When you come from the S. W. and make Cape Ann, and to the eastward of the Dry Salvages, bring them to bear S. by E., and steer N. by W. or N. $\frac{1}{2}$ W. In entering this course, you will make the Isles of Shoals, from whence you may take a new departure, by bringing the lighthouse to bear E. distant one and a half mile, and run N. by W. for Portsmouth light.

If you are bound to the eastward from Portsmouth Harbor, you steer S. by E. one league from the lighthouse, then steer N. N. E. for Old York or Cape Neddock, which is four leagues from Portsmouth; but if the wind should come from the northward, you must be careful of York Ledge.

ISLES OF SHOALS.—By the benevolence of the Massachusetts Missionary Society, aided by subscriptions of several gentlemen in Newburyport and the neighboring towns, a meeting-house has been erected on Star Island (one of the above islands.) *Isles of Shoals.*

White Island lighthouse is built on the westernmost island of the Isles of Shoals; it is 87 feet above the level of the sea, and it revolves in 3 minutes 15 seconds, showing in that time a red and white light.

The following is the description and relative situation of the islands: White Island (the south-westernmost island) is a rocky island, three-quarters of a mile in length, from S. E. to N. W., and about one mile and three-quarters distant from the meeting-house. There is a reef that extends about one-third of a mile from the N. W. end, which, in passing, you must give a good berth. The S. E. end bears from the meeting-house, S. W. $\frac{1}{2}$ S., the N. W. end S. W. by W. $\frac{3}{4}$ W.

In running in for this light there is nothing in the way when coming from the southward or eastward, except Cedar Island Ledge, Anderson's Rock and White Island Ledge.

Bearings from White Island Lighthouse.—Portsmouth lighthouse bears N. N. W. distant $7\frac{1}{2}$ miles. Square Rock lies directly in the range, distant from White Island five-eighths of a mile. Boon Island light, N. E. by N. distant 12 miles. Cape Ann Island lights, S. $\frac{3}{4}$ W. distant $19\frac{1}{2}$ miles. Rye meeting-house, N. W. by W. $\frac{1}{2}$ W. distant lighthouse

9 miles. Star Island meeting-house, N. E. distant seven-eighths of a mile. North-west point of Hog Island, N. by E. $\frac{3}{4}$ E. Cedar Island Ledge E. by N. $\frac{1}{2}$ N. distant 1 mile. Anderson's Ledge S. E. by E. $\frac{1}{2}$ E. distant $1\frac{1}{2}$ mile. White Island Ledge, W. S. W. distant one-third of a mile.

Louder's (or Lounging) Island lies about $1\frac{1}{2}$ mile to the northward of White Island, is about five-eighths of a mile in length, from S. to N., and is high at each end: in high tides the middle is sometimes covered; a number of rocks lie close about the island, in almost every direction, some of which are always bare. The south end bears W. from the meeting-house; the north end W. N. W. $\frac{1}{2}$ W., about half a mile distant. About half way between this island and Star Island, lies a rock, which is bare at low water; it bears from the meeting-house N. W. by W. $\frac{1}{2}$ W. one-third of a mile distant.

Star Island (on which the meeting-house stands) is about three-fourths of a mile in length from S. E. to N. W., and about half a mile in breadth; it is covered with buildings on the north side. The meeting-house stands on an eminence a little to the northward of the middle of the island; is 12 feet high from the foundation to the roof; to the top of the steeple is 30 feet more; the whole height from the surface of the water is about 65 feet; it is painted white, and the steeple is placed in the middle of the building; it stands fronting the west, and may be seen at a distance of 8 or 9 leagues, in almost any direction at sea; it bears from Thatcher's Island lights (Cape Ann) N. E. 6 leagues distant; from Pigeon Hill N. by E. 6 leagues distant; from Newburyport lighthouses, N. E. $\frac{1}{2}$ E. 6 leagues distant; from Portsmouth lighthouse, S. S. E. $\frac{1}{2}$ E., three leagues distant; from the western Agamenticus mountain, S. $\frac{1}{2}$ E.; from the eastern do., S. $\frac{1}{2}$ E. from Boon Island lighthouse, S. W. $\frac{1}{2}$ S., $4\frac{1}{2}$ leagues distant; from Boon Island Ledge, (which lies one league E. from Boon Island,) S. W. by W. $4\frac{3}{4}$ leagues distant. Off the south end of this island, about three-quarters of a mile from the shore, lies Anderson's Rock, which is bare at half tide; in passing give it a good berth; it lies from the meeting-house S. S. E.

Cedar Island is small, and about one-third of a mile in length from east to west, situated between Star and Smutty-nose Islands. The east end of Cedar Island bears from the meeting-house E. $\frac{1}{2}$ N., and the west end E. N. E. $\frac{1}{2}$ E., three-eighths of a mile distant. A rock lies off the S. E. end of this island, half a mile distant, bare at half tide, bearing from the meeting-house E. by S.

Between Cedar and Smutty-nose Islands, the government, a few years since, erected a sea wall, to afford a shelter to vessels from easterly gales, and to make the roadstead off the northerly side of Star Island more secure; the violence of the sea in a short time greatly injured the wall, so that the object of its erection has been but partially effected.

Smutty-nose Island is about one mile in length from east to west, and about half a mile in breadth; at the west end is a harbor, called Haley's Cove, where 15 or 20 small vessels may lie safe from all winds. There are several buildings near this harbor. There is a fine channel between this island and Hog Island, which has water sufficient for any vessel, keeping near the middle of the passage. The west end of Smutty-nose Island bears from the meeting-house N. by E. $\frac{1}{2}$ E., and the east end E. N. E. about five-eighths of a mile distant.

Hog Island is a high island lying to the northward of Smutty-nose Island; is about one mile in length from E. to W., and five-eighths of a mile from N. to S. The west end lies from the meeting-house N. by W. $\frac{1}{2}$ W.; east end of do., N. N. E. seven-eighths of a mile distant.

Duck Island (the northernmost island) is a long, low, rocky island; some parts of it are covered, at high water, with rocks projecting in every direction, especially at the N. W. end, where a ledge runs off half a mile. It is the most dangerous of any of the Isles of Shoals, and ought carefully to be avoided; it is about seven-eighths of a mile in length from N. W. to S. E. The east end bears from the meeting-house N. N. E. $\frac{1}{2}$ E. The west end N. by W. $\frac{3}{4}$ W., about $3\frac{1}{2}$ miles distant. [See the Plate.]

Newburyport lights.

Lighthouses.

NEWBURYPORT LIGHTS, on Plum Island, so called, is situated between the mouth of Merrimack River on the north, and Ipswich Bay on the south, and is separated from the main land by a narrow sound. Its length is about $8\frac{1}{2}$ miles, and its width, from the sea to the main, not more than 500 paces. On the north end of the island are two lighthouses, containing fixed lights, which are constantly lighted at night, and so constructed as to be easily moved, a circumstance requisite from the frequent shifting of the bar at the mouth of Newburyport Harbor.

Badger's Rocks bear N. W. $\frac{1}{2}$ N. from the lighthouse, distant half a mile and are covered at two-thirds flood, which you leave on your starboard hand. Black Rocks bear N. W. from the lighthouses, three-quarters of a mile distant, and are always dry, which you also leave on your starboard hand. Half-tide Rocks (on which is placed a pier) bear W. by S. $\frac{1}{2}$ S. from Black Rocks, distant $1\frac{1}{2}$ mile, and bare at half tide, which you leave on your larboard hand. North Rocks (which also have a pier on them) bear W. by S. from Black Rocks, distant $1\frac{1}{2}$ mile, and are seen only at very low tides, which you leave on your starboard hand, between which and Half-tide Rocks is the channel.

To facilitate the means of conveying immediate assistance to those unfortunate mariners who may be wrecked on this island, a number of gentlemen were incorporated for the purpose, and have completed a bridge and turnpike road from Newburyport to Plumb Island. This road leads in a south-easterly direction from Newburyport, and the bridge across Plumb Island near about one-quarter of a mile to the S. W. of Seal Island. A hotel has been erected at the east end of the bridge, within 100 rods of the sea shore, one mile south from the lights. The hotel is painted white, has three white chimneys, and may serve as a landmark to the seaman.

If a vessel, by stress of weather, should be obliged to run ashore on this island, and the master can make any choice of place, it is most eligible to run on as nearly opposite this house as possible, as assistance and shelter can be more promptly afforded, and the communication more direct with Newburyport.

It rarely happens that any life is lost on this beach in attempting to escape from the wreck, when the crew remain on board till low tide. Unless the vessel is in imminent danger of going to pieces immediately, the seamen should never take to their boat.

In a course nearly N. from the lighthouses on Plumb Island, and about half a mile distant, across the mouth of Merrimack River, is the southern extremity of Salisbury Beach, called Salisbury Point. From this point a sand beach extends on the verge of the ocean, without an inlet or interruption of any consequence, until it reaches Hampton River. This beach is connected with the main land by a salt marsh of considerable extent, intersected by a variety of small rivulets and creeks, which render it impossible for a shipwrecked mariner to reach the inhabited parts of Salisbury. Here, too, the hapless seaman is sometimes destined to suffer the misfortunes of shipwreck, and to reach a desolate and inhospitable shore, only to aggravate the horrors of his death. If he can attain the first and wished for object, in evading the jaws of the angry ocean, yet he finds himself a solitary wanderer on the coast, without shelter and without sustenance; and in his fruitless search for them, must inevitably perish. As the N. E. storms are generally most fatal to vessels on this part of the coast, Salisbury beach is not so often a place of shipwreck as Plumb Island.

NEWBURYPORT.—When you come round Cape Ann, and are two miles to the northward of the Dry Salvage Rock, bring said rock to bear S. E., and steer N. W. by W. $3\frac{1}{2}$ leagues, which course and distance will carry you up with Newburyport Bar. In running for the bar from the eastward, strangers should not approach too near Hampton Harbor, as off the mouth of it lie several sunken rocks. Hampton Harbor lies about 5 miles north from the southern extremity of Salisbury Point, between which and Hampton Harbor, N. by E. $\frac{1}{2}$ E. from the lights on Plumb Island, 3 miles distant, lies another dangerous rock, having only $3\frac{1}{2}$ feet water on it. If you go no further to the westward than for the lights on Plumb Island to bear S. W., there is no danger from either of the above mentioned rocks, but that course to the bar would run you on the north breakers; therefore you must bring the lights to bear W. by S., and anchor in 11 or 12 fathoms water, if the tide will not permit your coming in. No vessel, in coming in, ought to go nearer the south breaker than 7 fathoms water, nor nearer the north breaker, in coming from the eastward, than 9 fathoms. There are several pilots belonging to this harbor, who will, if possible, be outside the bar, to take command of any vessel wanting their assistance. If they cannot, you must keep the lights in range, and run for them till within a cable's length of the eastern light, when you must haul to the westward, and anchor between the two lights, in 4 fathoms water. A vessel that draws 10 feet water may come in at two-thirds flood. They should always keep to the windward of the bar, unless the wind should be fair. If the sea is so great as to prevent the pilot's getting over, a signal will be made by him, when you must run direct for his boat, keeping the lights in range, which will carry you safe over. *This bar is constantly shifting, and should not be attempted without a pilot, unless in a case of great necessity.* If your cables and anchors are not good, you may bring the western lighthouse to bear S. E. by S., and run N. W. by N. for Salisbury Point; but as soon as you make said point, you must haul up N. W., which course will carry you clear of Badger's Rocks, Black Rocks, and the Hump Sands. Across the chunnel, from the Hump Sands to Black Rock Creek, lie 7 or 8 piers, on which are from 7 to $2\frac{1}{2}$ feet water, at low water, which were sunk in the year 1776, and have not since been removed; the mark to pass between them is to bring the beacon, at the west end of the town of Newburyport, (which may be distinctly seen in clear weather,) over the south corner of the north meeting-house. The Hump Sands lie S. W. from Salisbury Point, which makes the channel very narrow and difficult for strangers. When you pass the Black Rocks, you must haul up W. by S. $\frac{1}{2}$ S., which will bring you in channel way, and good anchorage. And if it be in the night, or dark weather, when you judge yourself about half a mile from Black Rock, you may come to with safety. I would recommend to all masters, whether they belong to Newburyport or not, to avoid attempting that port in a gale of easterly wind, except they are well acquainted, and have a good prospect of getting in, as no pilot can get over the bar when it blows a gale from the eastward. And if you should make Cape Ann lights, and

bring them or the Dry Salvages to bear S. by E.; you may run with safety N. by W., or N. $\frac{1}{2}$ W. distant 8 leagues from Cape Ann to Portsmouth. In running the above course, you will make the Isles of Shoals, if it is any way clear, from which you take a new departure; when you pass the said islands, you bring Star Island, (on which the meeting-house stands,) to bear S. S. E., and then steer N. N. W. distant from said island 3 leagues to Portsmouth; or give White Island light a berth of a mile and a half, bringing it to bear east, and then run N. by W. for Portsmouth light. White Island is the south-westernmost island. There is a very good harbor, in the Isles of Shoals, from the wind, from north-easterly round to southerly, and you may lie land-locked with any of them; but if the wind hauls to the S. W., or W. N. W., you may run in between Smutty-nose Island, which has a wind-mill on it, and Hog Island, where there is water enough for a first rate man-of-war, and where you anchor, have 12 fathoms, muddy bottom.

When you come from the eastward, with the wind E., or E. S. E., with which wind you cannot weather Cape Ann, and you are to the northward of the Isles of Shoals, your only shift is to Portsmouth, and you are obliged to run so far to the westward as to bring said port to bear N. N. W., as, generally, the wind at E., at sea, hauls two or three points to the northward, which makes it a head wind. [See the PLATE.]

Signals for Vessels.

SIGNALS FOR VESSELS, when in sight, supposed to be bound to Newburyport, and the sea is so large on the bar that pilots cannot get out to their assistance.

When a vessel comes into the bay, and cannot come over the bar at high water, owing to insufficiency of the tide, a Red Square Flag will be hoisted, and a pendant under it, and as soon as those signals are seen from the vessel in the bay, she must keep off, and try some other port.

When the usual signals for vessels are kept up, the vessel must lay off and on at the bar, keeping to windward, until signals be made for her to come in; and when it is a suitable time to come over the bar, a Red Square Flag will be hoisted at half mast; she may then come in, keeping the lights in range.

When a Pendant is hoisted half mast, the vessel may come in, keeping the lights a little open to the northward.

When a Blue Burgee is hoisted half mast, the vessel may come in, keeping the lights a little open to the southward.

When a vessel is seen in the bay, and does not come in before night comes on, the following lights will be made, viz:

For a vessel to keep off, and not attempt to come in over the bar during the night, a Lantern will be hoisted to the top of the flag-staff.

When there is a proper time for a vessel to come in over the bar during the night, two Lanterns will be hoisted, one at the top of the flag-staff, and the other half mast high. The vessel must then lay off and on at the bar, until a light is made in the eastern light-house, at a window about eight feet below the lantern. The vessel may then come over the bar, keeping the lights in range, and when she gets abreast of the upper light, there is good anchorage.

The signal for a vessel in distress, is a White Square Flag, with a large black ball in the centre, hoisted half mast high.

Ipswich.

IPSWICH.—There are two lighthouses on Ipswich Beach; they bear from each other W. $\frac{1}{2}$ N., and E. $\frac{1}{2}$ S. Keeping the two lights in one will lead over the bar, in the best water, a little to the south of the buoy. Run in close to the beach and follow it close up to, to avoid the northern spit on the starboard hand; run up round the first high bluff head, where will be found safe anchorage. There are 8 feet water on the bar at low water.

Light.

The western light at the entrance of Ipswich Harbor is a revolving one, the eastern one fixed.

A canal connects this harbor with that of Gloucester. It is about 120 rods in length, 30 feet wide, and has for its depth about the whole flow of the tide, which is about 12 feet in spring tides, and 8 feet in neap.

Annis Squam Lighthouse.

ANNIS SQUAM LIGHTHOUSE is a wooden building, of octagonal form, about 40 feet high, containing a fixed light, elevated about 50 feet above the surface of the water at common high tides. It is painted white, and may be known by being lower than any other lighthouse on the coast of Massachusetts, and its inland situation. It bears from Portsmouth lighthouse about S. by W., distant 8 leagues, and from Newburyport Bar S. S. E. 3 $\frac{1}{2}$ leagues.

Annis Squam Harbor, in Ipswich Bay.

ANNIS SQUAM HARBOR, IN IPSWICH BAY.—The masters of vessels out of Newburyport should generally be acquainted with the harbor of Squam; and for their benefit a plan of the harbor has been taken from actual survey, which will be of the greatest importance, when obliged to make a harbor from Ipswich Bay, through stress of weather. When a vessel at anchor off Newburyport Bar, cannot get into port, or parts a cable, with the wind at N. E., or E. N. E., if she can carry double-reefed sails, she may run S. S. E., 3 $\frac{1}{2}$ leagues, which course, if made good, will carry her a little to the

eastward of Squam Bar; and if the weather is so clear as to see half a mile when you make the land to the eastward of Squam, you may run within a cable's length of the shore; your course is S. S. W.

Squam Bar bears from Halibut Point, (the N. E. Point of Cape Ann,) from W. S. W. to S. W. distant about $3\frac{1}{2}$ miles. In running from Halibut Point, you must be careful of Plumbe Cove Ledge, which shows until near high water, and bears from Squam light N. N. E. distant $1\frac{1}{2}$ mile. When you have passed this ledge, you leave a deep cove called Hodgkin's Cove, and a long point or neck of land, called Davis' Neck, on your larboard hand. When up with this neck, haul S. W., or S. W. by W., for Squam Bar.

Having made Halibut Point, or Folly Cove Point, bring either of them to bear south from a quarter to a half a mile distant from them. Then run W. S. W. until you bring the light to bear S. If you judge there is sufficient water on the bar, you will then run for the light: you will pass between the two buoys. The white one is on Harraden's Rock, which you will leave on the larboard hand. The black one is on the north spit of the bar, which you will leave on the starboard hand. You may pass close to either of the buoys; when you have passed the black buoy 20 or 30 rods, you may run S. by W. half W. which will carry you close along by the monument on the Lobster Rocks, which you must leave on your larboard hand, and pass on until abreast of Babson's Point; then a S. S. E. course will bring you into the harbor. If it is so dark that the buoy cannot be seen, continue your south course until within 60 yards of the light, then your course must be S. S. W., which will carry you abreast of Babson's Point, on your larboard hand, and opposite the Dry Bar Rocks, on your starboard hand, then S. S. E., as before directed. The bar has 6 feet of water at low tide. If you should judge there is not water enough on the bar to carry your vessel over safe, you will come to outside of the bar, and hoist a signal for assistance, which will come off if possible; if not, a flag will be hoisted near the lighthouse, when there is water enough on the bar for a vessel to run in safety.

On the Lobster Rocks is a monument, 12 feet at the base, 17 feet high, built of stone, and is 7 feet out at high water. The lighthouse on Wigwam Point bears from the monument N. E. by N. $\frac{1}{2}$ N. distant one-quarter mile; the black buoy placed outside the bar bears N. $\frac{1}{2}$ E. distant $1\frac{1}{4}$ mile; the White buoy near the Harraden Rocks bears N. by E. $\frac{1}{2}$ E. distant $1\frac{1}{4}$ mile; leaving the White Buoy on the larboard hand, you may steer direct for the Monument, course S. by W. $\frac{1}{2}$ W. The channel abreast of the Monument is about 45 fathoms wide; the Monument, going in, is left on the larboard hand, and may be approached at three fathoms distant, and then have two fathoms at low water; the Black Buoy, just without the harbor, lies in 10 feet at low water, and bears from the lighthouse N. $\frac{1}{2}$ W., and is to be left on the starboard hand; the White Buoy lies in 10 feet water off the N. W. side of Harraden's Rocks, bearing from the lighthouse N. by E. $\frac{1}{2}$ E. distant about one mile, which is to be left on the larboard hand. A Red Buoy is placed off the Plum Rock Ledges, in three fathoms water, and bears from Squam light N. N. E. distant $1\frac{1}{2}$ mile. On Squam Bar, at low water, there are about 6 feet. High water, full and change of the moon, at 11 o'clock.

SANDY BAY PIER.—If from the southward, in passing outside Streightsmouth Island, be careful of Avery's Rock, which bears north from the eastern part of Streightsmouth Island, about one-third of a mile distant. Run W. by N. until you bring the meeting house to bear S. W. by S., then run in for the Pier Head, in approaching which keep away a little, and run in until you can see into the Pier Pool; then luff and run in. Those constantly in the habit of entering said Pool when the wind is eastwardly, make up the houndsails and keep up the mainsail, which enables them to have command of the vessels and avoid falling against the wharf built out from the beach. If from the northward, after having passed Andrew's Point, bring the meeting-house to bear S. S. W. and run for it. This course will carry you clear of Dodge's Ledge, which you will leave on the starboard hand.

The passage through Streightsmouth Gap is not safe, except at nearly high water, as there are but three feet water at low tide, and rocky bottom.

CAPE ANN LIGHTHOUSES are built on Thatcher's Island, which lies about two miles east of the south-east point of Cape Ann, and forms the northern limits of Massachusetts Bay. The lanterns are elevated about 90 feet above the level of the sea, and contain fixed lights. The lights range when bearing N. by E. $\frac{1}{2}$ E., or S. by W. $\frac{1}{2}$ W., and are about one-third of a mile apart.

Thatcher's Island Ledge bears from the body of the island from E. S. E. to S. S. E., extending about two miles from the island. After getting the west light to bear N. $\frac{1}{2}$ W., you are to the westward of the ledge; then haul to the N. W. to bring the lights to bear N. E. by E., and steer S. W. by W. for the eastern point, which is about $7\frac{1}{2}$ miles distant from Thatcher's Island. Then your course is W. by S., distant $7\frac{1}{2}$ miles, for the lights on Baker's Island.

Seven to ten miles E. S. E. from Thatcher's Island there are 3 to 4 small stony spots, with 10 to 18 fathoms. There are 25 and 30 fathoms inside.

Cape Ann.

CAPE ANN.—When you come from the eastward, and make Cape Ann lights, in the night, bring them to bear S. W., and run direct for them, which course will carry you within the Londoner; and when you pass the said rocks bring the two lights in one, at which time they will bear N. by E. $\frac{1}{2}$ E., and then steer S. S. W. $\frac{1}{4}$ W., keeping said course about one mile, which will carry you clear of Milk Island, which is very low, and cannot be seen in a dark night. When you judge yourself to the westward of said island, you haul to the westward until you bring the lights to bear E. N. E., when you must steer W. S. W., about 5 miles, which course will carry you to Eastern Point. When you pass said point, keep your course W. S. W. until you bring Norman's Woe, which is the highest land on the north side of the harbor, to bear N. N. W., then run N. N. W. till you shut the lights in, then N. N. E. will carry you safe in.

If you want to go inside the Salvages, keep close aboard Halibut Point, which has a tree on the eastern part of it, and steer S. S. E. for Streightsmouth Island; but be careful to avoid Avery's Rock, by keeping the lights on the dry point of Streightsmouth Island till you get up close aboard, then haul round the point, and S. S. E. will carry you to the lights. To avoid the Londoner, you must keep the lights close aboard the body of the island on which they stand. The Londoner lies half a mile off, breaks at all times of tide, is quite dry at low water, and bears E. S. E. from the middle of Thatcher's Island. A long shoal runs off N. E. half a mile distant from the Londoner. Between the Londoner and Thatcher's Island there are 3 fathoms at low water. From the Salvages to Halibut Point and Sandy Bay, there lies a large spot of flat ground, which at low water will take up a small vessel. Outside the Salvages is very bold. Halibut Point bears from the Salvages W. N. W. $2\frac{1}{2}$ miles distant; and the Salvages bear from the lights N. N. E. 3 miles distant.

In sailing from Cape Ann lights to Cape Ann Harbor, you will first open Bruce's Cove before you come up with the harbor; which will, when open, bear N. N. W., which you must avoid. Cape Ann Harbor lies one mile farther to the westward, and when open, bears N. N. E.

*Ten Pound
Island
Lighthouse.
Cape Ann
Harbor.*

Ten Pound Island lies in the harbor of Cape Ann. There is a lighthouse on it, containing a fixed light, 45 feet above the level of the sea.

CAPE ANN HARBOR.—Vessels bound for Cape Ann Harbor, and falling in to the eastward of the eastern point, on which a lighthouse, is erected, containing a fixed light, must give the point a berth of about one mile, and when the light on Ten Pound Island bears N. N. E., are then to the westward of the ledge that extends off from the point, on which is a spar buoy, the head painted red, in 10 feet water at low water, bearing from Ten Pound Rock E. $\frac{1}{2}$ S., and may steer direct for the light. This ledge bears from the light on Ten Pound Island S. by W. $\frac{1}{4}$ W., and is about half or three-quarters of a mile from the shore. Running this N. N. E. course, will carry them between Ten Pound Island and Ten Pound Ledge, which bears from the light S. W. $\frac{1}{4}$ W., about two-thirds of a mile distant, has but 6 feet water at low spring tides, and is about 10 fathoms diameter. Passing between the island and the ledge, you will have 13 to 15 feet water at low spring tides. The east end of Ten Pound Island is foul ground, and no safe passage. The south, west, and north sides are bold, and may be approached within 40 to 60 fathoms at low water. Give the west end of the island a berth of 50 to 70 fathoms, and steer in for the inner harbor N. E. You may anchor at any distance, from 100 fathoms to three-quarters of a mile from the island. The light will then bear from S. to S. W. Anchor in 6, 5, 4, or 3 fathoms, spring low tides, muddy bottom. This inner harbor is safe against all winds that blow.

Bound for Cape Ann Harbor, and falling into the westward, as far as Half-way Rock, take care not to bring the light on Ten Pound Island to bear to the eastward of N. E. by N., until you are a mile or a mile and a half to the eastward of Half-way Rock, to avoid the S. E. breakers that extend from Baker's Island, and which bear from the lights on Baker's Island S. E. $\frac{1}{4}$ S. to S. S. E. $\frac{1}{2}$ E., and about $2\frac{1}{2}$ miles distant. On the S. E. part of these breakers is placed a spur buoy, painted black, bearing from Half-way Rock N. E. by E. about one mile distant, and from the lights on Baker's Island S. S. E. $\frac{1}{4}$ E. $2\frac{1}{2}$ miles. When passed to the eastward of these breakers, you may then bring the light on Ten Pound Island to bear N. E., and run for it. On this course you will leave Ten Pound Ledge on your starboard hand, and the ledges off Norman's Woe Rock and Fresh Water Cove on your larboard hand. When up with Ten Pound Island, anchor as above directed.

Baker's Island lights bear from the monument W. by S. $\frac{1}{2}$ S. distant 7 miles; south point of Kettle Island, W. $\frac{1}{2}$ S. distant 4 miles; Half-way Rock, S. W. by W. $7\frac{1}{2}$ miles; lighthouse on Ten Pound Island, N. $\frac{1}{4}$ E. distant $1\frac{1}{2}$ mile; the white buoy on the west end of Dog Bar, W. N. W. half a mile.

The outer harbor of Cape Ann is safe and good anchorage against a northerly or east wind, where you may anchor in $7\frac{1}{2}$ to $6\frac{1}{2}$ fathoms, low tides, muddy bottom, the lighthouse bearing about S. E. by E. distant about one mile, or a mile and a half.

The S. E. Harbor is also safe and good anchorage against a northerly, east, and to the

south-east winds. Bring the light to bear from N. by E. to N. N. W.; anchor in 9, 8, 7, or 6 fathoms, at low spring tides, muddy bottom, distant from the light one-eighth to half a mile.

Gloucester Canal, which connects the harbor with Squam River, passes immediately by the west part of the town, or what is called the Harbor Parish. It is about 120 rods in length, 30 feet wide, and has for its depth about the whole flow of the tide. It was excavated at low water mark, spring tides; say in spring tides 12 feet, neap tides 8 feet.

LEDGES OFF TEN POUND ISLAND, Bearings, &c., viz.—The ledge that makes off from the eastern point, bears from the light S. by W. $\frac{1}{2}$ W. about 2 miles distant, and has from 6 to 10 feet water at low tides; this ledge lies off from the eastern point about half a mile.

*Ledges off
Ten Pound
Island,
Bearings, &c.*

There is a single rock that lies about midway between the eastern point and Norman's Woe, called the Round Rock, on which is a spar buoy, in $2\frac{1}{4}$ fathoms, low water. The head of this buoy is painted black, and bears from the lighthouse on Ten Pound Island S. W. $\frac{1}{4}$ S. distant $1\frac{1}{2}$ mile. Round Rock and Ten Pound Ledge bear from each other S. S. W. $\frac{1}{4}$ W., and N. N. E. $\frac{1}{4}$ E. Ten Pound Rock and Cove Ledge bear W. $\frac{1}{2}$ N. and E. $\frac{1}{2}$ S. from each other. Round Rock and Cove Ledge bear S. by W. and N. by E. from each other.

A spar buoy is placed on Cove Ledge, or Old Field Rocks, in two fathoms, at low water. The top is painted black, and it bears from the lighthouse W. by S. half a mile distant.

A spar buoy is placed on the west end of Dog Bar Ledge, with the top painted white, in two fathoms, at low water, common tides, bearing from the lighthouse on Ten Pound Island S. by W. $\frac{1}{2}$ W. distant $1\frac{1}{2}$ mile; Dog Bar and Ten Pound Ledge Buoy bear N. $\frac{1}{2}$ E., and S. $\frac{1}{2}$ W.; Dog Bar and Round Rock N. W. by W. $\frac{1}{4}$ W., and S. E. by E. $\frac{1}{2}$ E.; Dog Bar and Cove Ledge S. by E. $\frac{1}{2}$ E., and N. by W. $\frac{1}{2}$ W.

The shoal called Round Rock, is a shoal formed by large and small popple stones, and always the same uniform depth of water on it, as before mentioned. Dog Bar consists of large rocks.

About 30 fathoms off from Norman Woe Point is a large high rock, called Norman's Woe Rock, of 20 to 30 fathoms diameter; and about 100 fathoms off this rock, in a southerly direction, is a ledge that has 7 or 8 feet water on it at low tides. About one-quarter of a mile off from Fresh Water Cove lies a ledge with only 3 feet water, low spring tides, bearing from the light W. $\frac{1}{2}$ N. distant 2 miles.

Half-way Rock, and the rock on Ten Pound Island, bears S. W. $\frac{1}{2}$ W., and N. E. $\frac{1}{2}$ E. of each other, distant about 8 or 9 miles.

HALF-WAY ROCK.—This is a high rock of about 30 fathoms diameter, lying S. $\frac{1}{4}$ E. two miles distant from Baker's Island lights. It is bold all round, and 40 feet high. A monument is erected upon it, the stone work of which is 15 feet high; above the stone work is a spindle 15 feet high, on which is a copper ball 2 feet in diameter.

*Half-way
Rock.*

SATAN'S, OR BLACK ROCK, is above water, steep to, and bears S. W. by S. from Baker's Island, distant $1\frac{1}{2}$ mile, and from Half-way Rock N. W. by W. $\frac{1}{2}$ W. a mile and one-sixth.

*Satan's, or
Black Rock.*

SALEM HARBOR.—Vessels inward bound, and falling in with Cape Ann, must observe the following directions, viz.: When abreast of Cape Ann lights, bearing N. N. W. about two miles distant, steer W. S. W. about three leagues, which will carry them up with the eastern point of Cape Ann, then steer W. by S. $\frac{1}{2}$ S., $7\frac{1}{2}$ miles, which will carry them up with the lights on Baker's Island.

*Salem
Harbor.*

Ships bound to Salem, falling to the southward, and running for the lights, must, when they have made them, keep the northern or lower light open to the eastward of the southern light, and run for them, which will carry them to the eastward, and clear of the southern breaker of Baker's Island, which bears from the lights S. E. by S., $2\frac{1}{4}$ miles distant, and is very dangerous.

BAKER'S ISLAND lies on the south side of the principal entrance of Salem Harbor, is about a third of a mile in length, from north to south, bearing E. from Fort Pickering, distant about 5 miles east from the town of Salem. There are now two separate lighthouses on Baker's Island, the bases of which are about 45 feet above the level of the sea. One is 72 feet, and the other 81 $\frac{1}{2}$ feet high, and bear from each other N. W. $\frac{1}{4}$ W., and S. E. $\frac{1}{2}$ E. The southern light is the highest. The water is deep near the island, but there is no convenient landing-place. The north and east sides are high and rocky. There is a small channel between the south rocks and the dry breakers, but it is safe only to those who are acquainted with it.

*Baker's
Island.*

MISERY ISLAND lies from Baker's Island about one mile, is joined by a bar to Little Misery, which makes the north side of the channel opposite Baker's Island. Misery Ledge has 8 feet water at low spring tides, and bears from the lighthouse N. W. by W. $\frac{1}{2}$ W., $1\frac{1}{2}$ mile distant. Misery Island, or Great Misery, is 174 rods in length, from north to south, and 96 rods in breadth. Little Misery is 40 rods in length, with its most western point projecting into the channel. South part of Little Misery Island bears from the lights N. W. $\frac{1}{4}$ N., three-quarters of a mile distant.

*Misery
Island.*

The Haste Rock is a broken rock above water, lying near the channel, bearing from Baker's Island lights W. $\frac{1}{2}$ N. distant $2\frac{1}{2}$ miles, and $1\frac{1}{2}$ mile from Salem Rock.

Beacon.

Hardy's Rocks (on which a beacon is erected) bear W. $\frac{3}{4}$ N. from Baker's Island lights, distant five-eighths of a mile. They are covered at high water and are dangerous. At half tide they are visible. Rising States Ledge bears W. $\frac{1}{4}$ N. from them, 150 fathoms distant.

Bowditch's Ledge, on the east end of which a triangular monument of granite, 32 feet high, is placed, in $2\frac{1}{2}$ fathoms, bears from Baker's Island lighthouse W. N. W., 14 mile distant, and is seen at low spring tides.

Cat Island is situated about S. W. by W. from Baker's Island two miles distant, and about $1\frac{1}{4}$ mile from Marblehead Neck, and ranges from Baker's Island just clear of Marblehead Neck. On the N. W. end is a high beach, directly opposite the point of Marblehead, called Peach's Point. The shore is irregular and rocky. Beyond, and in a line with the island, are two other heads, of nearly the same projection; and on the southern side are three high rocks, but not so large as the former. Two of them are connected with the island by bars of sand, out of water at the ebb; the other stands boldly up within these two, but more southerly. The Marblehead Marine Society has erected on Cat Island Rock a spar, 40 feet high, to the top of which is annexed a cask of about 130 gallons measure, which is seen at sea 20 to 30 feet above the land. A black spar buoy lies off the S. E. end, bearing from the lights S. E. $\frac{1}{2}$ S. to S. S. E. $\frac{1}{2}$ E. $2\frac{1}{2}$ miles distant.

Spar buoy.

Eagle Island is about $1\frac{1}{2}$ mile from Peach's Point, and bears from the lighthouses W. by S. $\frac{1}{2}$ S. distant $2\frac{1}{2}$ mile. A bar runs off from the western point of this island in a N. W. direction, half a mile distant, and has a red spar buoy on the end of it. It may be avoided by keeping Gray's Rocks to the southward of Marblehead Fort.

Winter Island lies on the north side of the entrance of Salem Harbor, about half a mile in length; the highest part is on the south of the island, opposite a point of rocks on the neck, (which is a point of land running north-easterly from the town, about one mile.) It has a store and a wharf on the southern end, at the entrance of Cat Cove. On the eastern point stands Fort Pickering.

The Brimbles bear S. W. by W. from the lighthouse, distant $1\frac{1}{2}$ mile, S. S. E. from Eagle Island, nearly half a mile distant. They are sunken rocks, bare at low water: near to it is a spar buoy, painted red. It comes out of water at half ebb.

Spar buoy.

Coney Island is a small island that lies near the mouth of Salem Harbor; it bears from Marblehead Point N. E., one mile distant; from Fort Pickering, on Winter Island, E. $\frac{1}{2}$ S., two miles distant; and from Baker's Island light W. $\frac{1}{2}$ S., $2\frac{1}{2}$ miles distant.

Marblehead Rock bears S. W. from the western part of Cat Island, distant three-fourths of a mile. It is above water, and may be approached on either side, very near, with safety.

Gray's Rock bears N. W. from Cat Island, distant three-quarters of a mile, W. by S. $\frac{1}{2}$ S. from the lighthouse, distant $2\frac{1}{2}$ miles, is high out of water, and may be approached with safety.

Vessels bound to Salem, having made the lights with a westerly wind, in beating up, must not stand to the southward or westward, farther than to shut one light in with the other, on account of the south breaker, nor to the northward, further than to bring the lights to bear W. by S. $\frac{1}{2}$ S. on account of Gale's Ledge, which bears from the lights N. E. by E. $\frac{1}{2}$ E., $1\frac{1}{2}$ mile distant, having but 4 feet water at low tides.

In going into Salem by the common or ship channel, between Baker's Island and Misery Island, being up with Baker's Island, you may pass within 100 fathoms of it, and steer W. by N. for the Haste; this course will carry you clear of Hardy's Rocks, leaving them to the southward, and will leave Bowditch's Ledge to the northward. If you are in the mid-passage, between Baker's Island and the Misery, you may steer W. N. W. till you have passed Bowditch's Ledge, or till you get Cat Island open to the westward of Eagle Island, then haul up for the Haste. Any stranger may there anchor in safety, in about 5 fathoms of water, good anchorage; but if you choose to proceed into Salem Harbor, you must steer about west for the Haste, which you will leave on your larboard hand, about half a mile distant, then steer S. W. by W., which will carry you into Salem Harbor; but you must observe, that there is a ledge runs off from the N. E. end of Winter Island, and that Abbot's Rock lies abreast of it; to avoid which you must keep above a quarter of a mile from the shore. Abbot's Rock is found by bringing Castle Hill and house into the cove north of Fort Pickering, and Beverly Meeting-house well in with Juniper Point (or S. E. point of Salem Neck). Abbot's Rock has seven feet at common ebb. The mean of common tides is 12 feet. In keeping off shore to avoid Abbot's Rock, you must not go too far off, for fear of the Aqua Vita, which are sunken rocks, lying E. S. E. from Fort Pickering, distant nearly half a mile.

When coming from the southward, if you are near Cat Island, you may pass to the eastward or westward of it; if you are to the eastward, you must give a berth of a quarter of a mile, and steer N. by W. $\frac{1}{2}$ W. or N. N. W. leaving the Brimbles and Eagle

Island to you clear Haste, and get under

may pass to the
berth of a quar-

mbles and Eagle

Island to the starboard, and Coney Island Ledge to the larboard—that course will carry you clear of Eagle Island Bar; continue upon the same course till you have passed the Haste, and get into common ship channel, or you may continue the same course till you get under the north shore, where there is good anchorage.

If you are to the westward of Cat Island, you may pass in the middle channel between that island and Marblehead Rock, and steer over north for the ship channel, leaving Gray's Rock and Coney Island to the westward. After passing the Haste and entering the ship channel, you may proceed as before directed.

If in coming from the southward and eastward, you should find yourself near Half-way Rock, you may bring it to bear S. E. and steer N. W. for the Haste, passing near to Satan or Black Rock, leaving it on the larboard hand, and the Brimbles and Eagle Island on the starboard; continue this course, and you will leave the Haste on the larboard hand, enter the common ship channel, and proceed as above.

There are several other channels for entering Salem Harbor, but they ought not to be attempted without a pilot.

BEVERLY AND MANCHESTER.—To enter Beverly Harbor, follow the directions for Salem Harbor, till you bring the Haste to bear E. S. E. and run W. N. W. about two miles and you reach Beverly Bar, which is a spot of sand running out from the southern or Salem side of the entrance, and has commonly a beacon upon the head of it, above a quarter of a mile from the shore. The bar has very shoal water on the eastern or outward side near it, but good anchorage within. There is good water at the head of the bar. Having passed the bar, there is a sandy point from Beverly, on the northern side of the entrance, and beyond this point are the Lobster Rocks, which bear from the head of the bar W. a little S., and not half a mile distant, and they are above water at half tide. To avoid this point, after having well cleared the bar, you will steer towards Ram-horn Rock, which has also commonly a beacon, and is to be seen at half tide, bearing S. W. by S. from the head of the bar, one-eighth of a mile distant. There are several fathoms of water within a vessel's length of Ram-horn Rock. Giving this a good berth, you then clear the sandy point, and steer for the Lobster Rock Beacon, bearing from Ram-horn Beacon N. W. by W., distant about one-quarter of a mile. Giving this a good berth, you are then opposite to the wharves, and may anchor in deep water, in a very safe and excellent harbor.

To enter Manchester Harbor, you must bring the southern light on Baker's Island to bear S. ½ E., and run N., one mile distant, where you may anchor on good bottom.

Eastern point bears from Baker's Island lights E. by N. ¼ N., 7¼ miles distant. Half-way Rock bears from the lights S. ¼ E., 2 miles distant. Hardy's Rocks bear from the lights W. ¼ N., distant five-eighths of a mile.

MARBLEHEAD.—Vessels bound to Marblehead, and falling to the southward and running for the lights, after making them must keep the north and lower one open to the eastward of the southern light, and run for them, which will carry them to the eastward and clear of the south breakers off Baker's Island, which bear from the lights from S. E. ½ S. to S. S. E. ¼ E. distant two miles and one-quarter.

Having made the lights with a westerly wind, and beating, when within two and a half miles of them, you must not stand to the southward and westward so far as to shut the north light up with the south light, on account of the south breakers, nor to the northward further than to bring the lights to bear W. by S. ½ S., on account of Gale's Ledge, which bears from the lights N. E. by E. ¼ E., distant 1¼ mile. Drawing near to the lights, take care of a ledge, called the Whale's Back, which bears from the lights N. by E., distant four-fifths of a mile, and comes out of water at quarter ebb.

In going into Marblehead, and being up with the lights, give the north point of Baker's Island a berth of one-quarter of a mile or less. Having the lights one in with the other, you are up with the point. When the south light is open with the north light, you have then passed the point, (leaving the Misery Island on your starboard hand, which bears from the lights N. W. ½ N., three-fourths of a mile.) Then steer S. W. by S. or S. S. W. until you bring the south light to bear N. E. by E. ¼ E.; then steer S. W. by W. ¼ W., distant 3 miles, for Marblehead Harbor. You will leave Hardy's Rocks, Eagle Island, and Gray's Rock, on the starboard hand; Pope's Head, (which is a large high rock, bearing S. W. by W. from the lights, two-thirds of a mile distant,) Brimbles, and north point of Cat Island, on the larboard hand. The Brimbles bear from Eagle Island S. S. E. ¼ E., distant half a mile; and Gray's Rock from the north point of Cat Island, N. W. by W. seven-eighths of a mile.

Falling in with the south point of Baker's Island, and it blowing hard from the eastward, if you cannot avoid it, you may pass the point by keeping it well on board, say at the distance of from 20 to 50 fathoms from the shore, where you will have from 4 to 5 fathoms water. When up with the S. W. point, steer W. S. W., which will carry you between the north Gooseberry Island (which bears S. W. ¼ S. from the lights, distant two-thirds of a mile) and Pope's Head, leaving the former on your larboard hand, and Pope's Head on your starboard hand, between which you will have from 3¼ to 5 fathoms

*Beverly and
Manchester.*

Marblehead.

of water. As soon as you have passed Pope's Head, haul to the northward, until the south light bears N. E. by E. $\frac{1}{2}$ E., then steer S. W. by W. $\frac{1}{2}$ W. for Marblehead Harbor.

The south entrance of the Harbor of Marblehead is bold, and may be approached with safety with the light on the point of the neck at the S. E. side of the harbor, bearing from N. N. W. to W. by N. until you are within half a mile of it; then bring the light to bear W. by S., and run for it till within two cables' length; then steer N. W. by W. until the lighthouse bears S. S. W.; then steer S. W., and anchor with the light bearing from E. by S. to N. E. by E. from a quarter to a half a mile distant, in 6 fathoms, good holding ground and clear bottom, secure from all but easterly gales. The following are the bearings from the lighthouse:

Marblehead Rock	S. E. by E. $\frac{1}{2}$ E.	distant $\frac{1}{2}$ mile.
Half-way Rock	E. by S.	" $2\frac{1}{2}$ do.
Cut Island Rock	E. $\frac{1}{2}$ N.	" $\frac{3}{4}$ do.
Baker's Island Light	N. E. by E.	" 3 do.
Hardy's Rocks	N. E.	" $2\frac{1}{2}$ do.
Eagle Island	N. E. $\frac{1}{2}$ N.	" $\frac{1}{2}$ do.
Gray's Rock	N. E. by E. $\frac{1}{2}$ E.	" 1 do.
Pench's Point	N. by W. $\frac{1}{2}$ W.	" 1 do.
Fort Head	N.	" $\frac{1}{2}$ do.

Vessels coming from the eastward, and running for Half-way Rock, (described in page 163.) must not bring the rock to bear to the southward of W. S. W., to avoid the south breaker, which bears from Half-way Rock N. E. $\frac{1}{2}$ E. distant one mile. Being up with Half-way Rock, and bound into Marblehead, bring the rock to bear E. by S. $\frac{1}{2}$ S., and steer W. by N. $\frac{1}{2}$ N. for Fort Head, distant 3 miles, leaving Cut Island on the starboard hand, which bears from Half-way Rock W. N. W. distant $1\frac{1}{2}$ mile, and Marblehead Rock on the larboard hand, which bears from Half-way Rock W. $\frac{3}{4}$ N. distant 2 miles. Black Rock bears from Half-way Rock N. W. by W. distant $1\frac{1}{2}$ mile. Cut Island Rock and Point Neck bear east and west of each other, distant about one mile.

Vessels being up in Boston Bay, may, by bringing Boston light to bear S. S. W. run N. N. E. for Marblehead Rock; they are distant from each other about 12 miles. Half-way Rock and Boston light bear from each other S. W. and N. E., distant 15 miles.

Hardy's Rocks are covered at high water, and may be seen at quarter ebb. Whale's Back is covered at high water, and may be seen at quarter ebb. Gale's Rocks have but 4 feet water at low tides, and bear N. E. by E. $\frac{1}{2}$ E. from the light, distant $1\frac{1}{2}$ mile. The south breakers, off Baker's Island, are always covered. The Brimbles are covered at high water, and are seen at half tide. Black Rock is always out of water, but low; Cut Island Rock, Half-way Rock, Marblehead Rock, Gray's Rock, and Pope's Head, are large, and high above water. Half-way Rock is very bold all round it. Eagle Island is bold only on the south and east; from the N. E. part of it, quite to Hardy's Rocks, is very shoal water, and no passage for ships.

Bearings and distances of the principal Islands, Rocks, &c., in the vicinity of Salem, from Baker's Island Light.

The lights bear from each other N. W. $\frac{1}{2}$ W. and S. E. $\frac{1}{2}$ E., 40 feet distant.

Eastern point of Cape Ann bears.....E. by N. $\frac{1}{2}$ N.,..... $7\frac{1}{2}$ miles distant.

Outer breakers, known generally by the name of Outer, Middle, and Inner Breakers; this is a very extensive and dangerous shoal, extending from Searl's Rocks in a S. E. direction, about two miles, and in a westerly direction about three-quarters of a mile, bearing from the lights S. E. $\frac{1}{4}$ S. to S. S. E. $\frac{1}{4}$ E. two and a quarter miles; to pass to the eastward of this dangerous shoal, have the northern or low light a little open to the eastward of the high light.

Searl's Rocks, a small part comes out of water at low spring tides, and bears from the south light, S. E. three-eighths of a mile distant, and from the S. E. points of Baker's Island, S. E., distant a small one-fourth of a mile. There is a good channel between the island and Searl's Rocks, by keeping the island best on board, say at a distance of 30 to 40 fathoms; in this channel are 3 to 5 fathoms water, at low common tides.

BOSTON LIGHTHOUSE is situated on the Little Brewster Island, on the north side of the entrance to the harbor. The light is a revolving one, and is 82 feet above the level of the sea. Boston Lighthouse.

E. by S. nearly, and not quite three miles from Boston light, there is a spot 4 $\frac{1}{2}$ fathoms, called Thieve's Ledge.

LONG ISLAND LIGHT, on the N. E. point of Long Island, is on a tower of 20 feet, with a lantern 7 feet high, bearing from Boston light W. $\frac{1}{4}$ N. Long Island Light.

BOSTON HARBOR.—From Cape Ann to Boston lighthouse, the course is S. W. $\frac{1}{4}$ S., distant 8 $\frac{1}{2}$ leagues. After making the light, with the wind fair, you will bring it to bear W. by N. or W. N. W., and then run for it, till you come within 2 cables' length of it. If the weather is bad, and you cannot get a pilot from the lighthouse, after running abreast of it, so as to bring it to bear N. by E. you may run W. by S. two miles, until the light on Long Island Head bears N. W. by N.; then steer N. W. about one mile, or until the old light is hid by George's Island, where you may anchor in from 7 to 5 fathoms, in safety, in Nantasket Road. Boston Harbor.

The main entrance into Boston Harbor lies between Lighthouse Island, on the north side, and Point Alderton on the south, (off which lies a shoal, as described in the PLATE, to which the reader is referred.)

To work into Boston Bay, you may stand to the southward till you bring the light to bear W. N. W., and to the northward till you bring it to bear W. S. W., till you come within one league of the light; then you must not stand to the northward any further than to bring it to bear W. by N., and to the southward to bring it to bear W. N. W. You may anchor in the bay with safety if the wind is off shore. If you fall to the southward of Boston Harbor look out for Cohasset Rocks, on which there is a light, which lie above water, distant from the land 3 miles; the outer part of which, called Minot's Rock, has a black buoy on it, that lies in 5 fathoms water, which you leave on your larboard hand. This rock comes out of water at low common tides, and bears from Boston lighthouse S. E. $\frac{1}{4}$ E. 9 miles. Your course from this buoy to the lighthouse is N. W. by W., distant 3 leagues. N. N. E. from Minot's, four miles distant, lies a ledge of rocks, which is small and bold; near it you have 20 fathoms. In running the above course and distance, you will pass a white buoy which lies in 4 fathoms water, that is on the N. E. part of Harden's Rocks, and bears S. E. $\frac{1}{2}$ S. from the lighthouse, distant 1 $\frac{1}{2}$ league; which rocks may be seen two hours before low water, that you also leave on your larboard hand. There is another buoy on your larboard hand, which is red, that lies in 3 fathoms water, on Point Alderton. When in the middle of the lighthouse channel, steer W. by N. one mile distant, to the beacon on the spit, which you may run within one-quarter of a cable's length of, leaving it on your starboard hand; opposite to which

*THE SINGLE ROCK OFF THE NORTH PART OF POINT ALDERTON.—The rock on which the first fence that runs over the east side of Strawberry Hill; Newcomb's Barn (on Gallop's Island) half way between the lighthouse on Long Island and the beacon on the spit. When Newcomb's Barn is on with the beacon, you pass just to the north of this rock, on the north of which the buoy is placed, and near it

MARKS FOR A SHOAL IN LIGHTHOUSE CHANNEL.—The east low point of Gallop's Island, just seen clear of the N. E. of George's Island; the buoy on the Centurion just clear to the north of the Great Brewster. This is something of a shoal. On it, at low water, are 12 to 13 feet. Mr. Wilson, pilot for Boston Harbor, struck on this shoal in a ship drawing 14 feet 9 inches water. Then the tide had flowed about three-quarters of an hour.

Lighthouse. lies a black buoy in 2 fathoms water, on George's Island Rocks. Between the lighthouse and George's Island lies a rock, having a black buoy on it, called the Centurion, in mid-channel, with 14 feet water on it, bearing from the lighthouse W. S. W. Your course from this to Gallop's Island Point is N. W. by N. half a mile distant. From thence through the Narrows, by Nick's Mate, your course is N. N. W. half a mile distant. Nick's Mate has a monument on it, and must be left on your larboard hand, one cable's length distant, and then steer W. by N. for Castle Island, distant 4 miles. In running W. by N. from Nick's Mate, you will first leave a white spar buoy on the Lower Middle, on your starboard hand, distant 3 miles from Nick's Mate; then, three-quarters of a mile distant, you will see a white buoy, which is on the Castle Rocks, in two fathoms, which you leave on your larboard hand. When abreast of the Castle, steer N. N. W. one-quarter of a mile, to clear the Upper Middle Ground, which has a black buoy on it in 2 fathoms water, that you leave on your larboard hand; if the buoy should be removed, run N. N. W. till you bring the two northernmost steeples in Boston a hand-spike's length open, then steer N. W. by W. $2\frac{1}{2}$ miles, which will carry you opposite the town.

Broad Sound, which is the north entrance of Boston Harbor, is not a proper channel for large vessels; but those who frequent it, will follow the directions here given: when up with the Graves, which are a parcel of dry rocks that appear white, you must leave them on your larboard hand, two cables' length distant, then bring them to bear S. E., and run S. W. by W. 4 miles, when you will be up with Long Island light. You leave it on your larboard hand.

Light.

Light.

In passing from the Graves to Long Island light, you will see two buoys on your larboard hand, one of which is on a reef called the Devil's Back, is painted red, and lies in 4 fathoms water; the other is on Ram's Head Bar, painted black, and lies in 15 feet water on the N. E. end, bearing from Long Island light E. N. E. You will also pass a white buoy on your starboard hand, which lies on the N. E. point of Fann Bar, in $2\frac{1}{2}$ fathoms, (at which time Long Island Head light will bear S. W.,) when you must follow the directions above for the town.

A black buoy with a white vane, has been placed near to the Barrel Rock, which lies in the Broad Sound channel, at the entrance of Boston Harbor. The buoy is moored about 7 fathoms N. E. from the rock, in $3\frac{1}{2}$ fathoms water, about $\frac{1}{2}$ mile W. by S. from the body of the Graves, one half mile N. W. from the Devil's Back, W. N. W. from the house on Green Island, and N. E. $\frac{1}{2}$ E. from the tree on Long Island Head. This rock is 10 or 12 feet long, and 5 or 6 feet wide, ranging N. N. W. and S. S. E., having 4 or 5 feet of water upon it at low tide, and 34 fathoms round it. Vessels may pass with safety either side of the buoy, giving it a berth of 12 or 15 fathoms, but the eastern passage is said to be preferable for strangers.

The Lower Middle Ground lying in the way, the directions are as follows, viz.

The Lower Middle Ground, which lies on the north side of the channel, a little above Spectacle Island, is in part dry at low water. On the eastern part is a red buoy, and on the western part is a black buoy, in two fathoms water, both which you leave on your starboard hand, at which time you may see the white buoy on the Castle Rocks, before mentioned.

Putding Point, or Shirley Gut Entrance, is between Fann Bar and Winship's Bar. You must bring it to bear S. W. and run for it, leaving Shirley Point on the starboard and Doer Island on the larboard hand. The channel from this gut to Boston is so crooked and narrow, that no person should attempt to go in with a large vessel, unless acquainted, without a pilot.

In consequence of part of Doer Island's washing away, a shoal has made off from the S. or S. W. point, in about a W. S. W. direction, called the Handkerchief, about 40 or 50 fathoms long, ranging about E. N. E. and W. S. W. It is covered at high water, but dry at very low tides, which makes it dangerous for vessels coming in and going out through Broad Sound. A black buoy is now placed near the point, which must, in passing, be left to the northward, when passing through Broad Sound.

High water.

Hypocrite Passage.

HYPOCRITE PASSAGE.—In coming from sea, you leave the Graves, Roaring Bull, (which lies between the west end of the Graves and the east end of Green Island,) Green Island, and Half-tide Rocks, on your starboard, and the Outer Brewster, Little and Great Calf Island, on your larboard hand. [NOTE.—Half-tide Rocks lie to the west of Green Island, one-third of a mile, and opposite Little Calf Island, distant about half a mile, and come out at half ebb.]

Giving the Graves a berth of one-quarter of a mile, the course up for Little Calf Island's N. E. point is about W. by S. distant $\frac{1}{2}$ mile from the Graves. As you pass up, give the south side of Green Island a berth of one-quarter of a mile to avoid a ledge of rocks that runs off from the south side of the island, about one-eighth of a mile. When nearly up with the N. E. point of the Little Calf, give it a berth of about 40 or 50 fathoms, and after passing it, steer for the north point of the Great Calf Island, from the west end of which the course is S. W., or run up by it, keeping the S. W. head of Pettick's Is-

and open to the west of the beacon on the spit. In passing between Lovell's Island and the beacon on the spit, keep nearest the island, as a ledge of rocks extends from the spit from 60 to 80 fathoms, and comes out of water at half ebb, lying about one-third of a mile N. E. from the beacon. There is also a ledge (or rock) lying about midway between the beacon and the S. E. point of Lovell's Island, having 6 feet on it at low spring tides. After passing the beacon, you enter the Narrows. Lovell's Island makes the east side of the entrance to the Narrows.

BROAD SOUND BUOYS.

BARREL ROCK. DEVIL'S BACK. FAWN BAR. LITTLE ALDRICH'S FAWN. RAM'S HEAD. LOWER MIDDLE. CASTLE ROCK.

Lighthouse. Vessels outward bound, from Boston lighthouse, who would wish to fall in with Cape Cod, the course is S. E. by E. $\frac{1}{2}$ E. distant 11 leagues, thence 3 leagues to the lighthouse. When up with the lighthouse, and it bears S. W. 2 leagues distant, you may then steer S. S. E., which will carry you out of the south channel.

Lighthouse. Vessels in Boston Bay, who put away for Cape Cod Harbor, must endeavour to fall in with Race Point lighthouse, which contains a revolving light, and run for it until within half a mile; when it bears E. N. E. haul up E. S. E., or as near as the wind will permit, and anchor in from 10 to 4 fathoms, in Herring Cove, where is a good lee, with the wind from N. N. E. to S. E. by E. Should the wind shift to the N. W. Provincetown Harbor is under the lee, to which we refer. Should you first make Cape Cod light, bring it to bear E. by N., and run for it until you have soundings in 14 or 15 fathoms water; then steer N. E. until the light bears E. by S.; then run in N. W. for the harbor. The course from Boston lighthouse to Sandwich is first S. E. by E. 3 leagues, to Cohnasset Rocks, thence to Sandwich S. S. E. 11 leagues.

Lighthouse. Between Cape Ann and Cape Cod you will have from 50 to 17 fathoms, the latter $\frac{1}{2}$ miles N. by E. from the Race light, with 35 fathoms inside. S. E. by E. $\frac{1}{2}$ E. from Boston light to the Race light, there is a ridge of rocks and sand of from 7 to 23 fathoms water, with a small gully of 37 fathoms, 20 miles from Boston light. To the north of this ridge the bottom is generally muddy, and the depth from 40 to 50 fathoms.

High water. At full and change, it is high water off Race Point at 10 o'clock and 45 minutes. Vessels in leaving Cape Cod, bound to Boston, should calculate the tide, as the flood sets strong to the S. W. off Cape Cod, from the Race to Chatham; flood sets to the south, ebb to the north; southern tide, 9 hours; northern tide, 3 hours.

The upper buoys in Boston Harbor will be taken up during the winter season; but those in the vicinity, including Salem and Cape Ann, are not taken up during the winter.

Boston Lighthouse to Cape Elizabeth Lights. BOSTON LIGHTHOUSE TO CAPE ELIZABETH LIGHTS.—From Boston lighthouse to Thatcher's Island lights, which lie two miles east from Cape Ann, the course is N. E. $\frac{1}{2}$ N., and the distance 8 leagues; but to clear the Londoner, which you leave on your harbour land when bound to Cape Elizabeth, the course is N. E. by E. About halfway, and near the north shore, is a high bold rock, called Half-way Rock, of about 30 fathoms diameter, (on which is a monument) bearing S. W. by W. distant $7\frac{2}{3}$ miles from the eastern point of Cape Ann, before described.

From Thatcher's Island E. S. E. one half of a mile, lies a ledge of rocks, called the Londoner, which show themselves at half tide, and extend E. N. E. and W. S. W. distant two miles from the island. If you should be forced to the northward of Cape Ann, there is a very clean bay, called Ipswich Bay, and north-east from it lies the harbor of Portsmouth, the entrance to which is formed by Great Island on the west, and Gerrish's Island on the east, on the former of which the town of Newcastle is built.

From Cape Ann lights to the Isles of Shoals light, the course is N. $\frac{1}{2}$ E. distant 5 $\frac{1}{2}$ leagues.

Cohnasset Rocks, or Minot's Ledge. COHNASSET ROCKS, or MINOT'S LEDGE, is eight miles S. E. $\frac{1}{2}$ E. from Boston light, and six miles N. $\frac{1}{2}$ W. from Scituate light, and consists of 15 large rocks out of water, and ledges all round these rocks. The nearest land is Scituate, 3 miles distant. These rocks extend north and south from $3\frac{1}{2}$ to 4 miles. Small vessels pass between the rocks. The depth of water round the rocks is 5 and 6 fathoms.

* This called S Head, main land of the lighthouse and reliable shipping

On Minot's Ledge there is a fixed light, 66 feet above high water.

There is a passage within Cohasset Rocks, used by coasters.

SCITUATE.—The lighthouse at the entrance of Scituate Harbor is discontinued.

From the northerly part of Cedar Point, a ledge, called Long Ledge, extends N. N. W. nearly one mile; so that vessels filling in a little more than one mile northward of the point, may bring the point to bear south; and if they make good their course north, they will clear the outer ledges of Cohasset Rocks: half a mile east of the body of the point will clear Cedar Point, Long Ledge, and the first Cliff Ledge.

[NOTE.—There are ledges extending from all the four cliffs, but none between them; and half a mile from the shore, will clear all, except frigates and large vessels.]

From the point running S. S. E. will clear Brandt's Point, consequently, giving the point half a mile berth, there will be no danger in running S. S. E.

There is a meeting-house about two miles W. by N. from the point; and a farm-house near the north-west side of the harbor, with two large barns a little north. To go into the harbor (the mouth of which is about one-third of a mile wide) bring the meeting-house or farm-house to bear about W. by N. from the middle of the entrance of the harbor, and run in W. by N. for the farm-house, until you have passed the bar, which is a hard bed of stones and gravel that does not shift; and after passing the bar, and coming on sandy bottom, haul up and anchor near the beach on the south side of the harbor.

A ledge off Brandt Point has been determined by Lt. C. H. Davis, U. S. Coast Survey. It has eight feet water on it, and the following bearings:

Gurnet light bearing S. $\frac{1}{4}$ E. $4\frac{1}{2}$ miles distant; Brandt Point $1\frac{1}{2}$ mile distant; and due west from the shore, $1\frac{1}{2}$ mile, there is a buoy on Philip's Ledge, $\frac{1}{2}$ of a mile in-shore of it, bearing W. N. W. $\frac{1}{4}$ W. Buoy.

GURNET LIGHTS.—On Gurnet Point, the northern side of the entrance to Plymouth Harbor, there are two lighthouses, 86 feet above the level of the sea, 11 feet 6 inches apart, and containing fixed lights, and should not be brought in range when to the northward of them; but to the southward, you may bring them in one, which is a good mark to clear Brown's Island or sand bank. Gurnet lights.

PLYMOUTH HARBOR.*—The high land of Manomet bears from the lights S. $\frac{1}{4}$ W. $5\frac{1}{2}$ miles; Manomet Point S. S. E. 6 miles; and Brandt's Point N. $\frac{1}{4}$ W. about 6 miles; Squash Head W. $\frac{1}{4}$ S. 3 miles; the easternmost part of Brown's Islands or shoals that dries, S. S. W. one and a quarter mile, and the Gurnet Rock from the body of the lighthouse E. by S. $\frac{1}{4}$ S. one-third part of a mile; on this rock you have but 3 feet at low water, at which time all the soundings were taken, and $3\frac{1}{2}$ fathoms along side at the same time. A white buoy is placed near this rock, bearing E. S. E. from the lighthouse, distant about one-third of a mile. When you have shut in the Sandy Hill with the Gurnet Head, you are clear of the rock; after which you must mind not to haul in too close to the Head, as there are many sunken rocks some distance from the shore. When you bring Squash Head to bear W. by N. you may steer up W. by S., and if you are bound for Plymouth you must keep that course for a large red cliff on the main, which is a very good mark to carry you clear of Dick's Flat; then you must steer more southerly for Beach Point, or run up until you are abreast of Squash Head, giving it one quarter of a mile distance; then steer W. by S. $\frac{1}{4}$ S., which will clear you of Dick's Flat, and carry you directly for Beach Point, keeping within 15 or 20 yards of the Sandy Point, steering away for the southward, keeping that distance until you have shut in the lights, where you may anchor in 3 and 4 fathoms, but the channel is very narrow, having nothing but a flat all the way to Plymouth, except this small channel, which runs close by this neck of land; you will have 4 and 5 fathoms close to this point. If you are bound into the Cowyard you must steer as before directed, which will clear you of the stone monument on Dick's Flat; and that on the Muscle Bank, both of which, you leave on your starboard hand, when you may anchor in 7 or 8 fathoms water. If bound to Kingston, you will keep the house on Gurnet Head just open with Squash Head, until you have opened the high pines with Clerk's Island; then you are clear of the Muscle Bank, when you may steer N. W. until you have three fathoms at low water, not running into less.

In coming from the northward, bound into Plymouth, you must not bring the lights more southerly than S. by W. to avoid High Pine Ledge, which lies north from the Gurnet Head, about $2\frac{1}{2}$ or 3 miles. When you are on the shoalest part of this ledge, some

* This harbor is capacious, but shallow, and is formed by a long and narrow neck of land, called Salthouse Beach, extending southerly from Marshfield, and terminating at the Gurnet Head, and by a smaller beach within, running in an opposite direction, and connected with the main land near Eel River, about three miles from the town. On Salthouse Beach is placed one of the huts erected and maintained by the Humane Society of Massachusetts for the reception and relief of shipwrecked mariners. There is a breach in the inner beach, which exposes the shipping, even at the wharves, during an easterly storm.

piss between the

part of which appears at low ebb, you will have the high pines in range with Captain's Hill, which will then bear W. by S. This ledge of rocks lies $1\frac{1}{2}$ mile from the shore, extending about N. N. E. for near a mile, and close to this ledge you will have 4 and 5 fathoms, which deepens gradually as you run from it to the eastward: within one mile, you will have 10 and 12 fathoms.

In coming from the southward, bound into Plymouth, you must not open the northern light to the westward, but keep them in one, which will carry you in 5 fathoms by the easternmost part of Brown's Islands or Shoal, keeping that course until you are within half a mile of Gurnet Head or higher, where you will have but 4 fathoms; then Squash Head will bear W. by N. a little northerly, and the two outermost trees on the head in one; then you may steer directly for them, until you bring the lights to bear E. N. E. and the house on Squash Head to bear N. W., just open with the first sandy beach, where you may anchor in 4 fathoms in Squash Road, good clear bottom; but if you are bound for Plymouth or the Cow-yards, you must steer as before directed. If in the night it is best to anchor here, as it is difficult to make Beach Point (as it is mostly covered at high water) if dark, or go into the Cowyard.

In turning into Plymouth, you must stand to the northward into not less than 3 fathoms, as it runs a flat a long way from the Gurnet Head to Squash; and from both the heads lies off a point of rocks a good way from the shore, many of them but just under water at low ebbs. And all the way from Squash to Muscle Bank, you have shoal water; so that you must not stand in less than before mentioned. And in standing over for the sands to the southward, you must go about as soon as you shoalen your water to 4 fathoms, as it is bold to, and you may observe the rips, unless it is very smooth. This sand extends from abreast of the lights to Beach Point, most of which is dry at low ebbs. From the easternmost part of this sand to Dick's Flat, it rounds with a considerable sweep; you have but 5 fathoms water from the easternmost part of Brown's Island to the Gurnet Head, and not more than 7 or 8 until you are abreast of Dick's Flat, where you will have 13 or 14 fathoms in a deep hole, and then shoalen to 5 fathoms abreast of Beach Point.

If you should fall in to the southward of Brown's Islands or Shoal, between them and Manomet Hill, where you have 20 fathoms in some places, you must not attempt to run for the lights, until you have them shut in one with the other, when they will bear N. N. W. $\frac{1}{2}$ W.; if you do, you may depend on being on Brown's Islands or shoals, as there is no passage for even a boat at low water.

In coming in from the northward in the night, you must not bring the light to bear more southerly than S. by W. to avoid High Pine Ledge, and keep that course until you have them to bear N. W., or N. W. by W., when you will be clear of the rock, and may steer up W. by S. until you have lights to bear E. N. E. where you had best anchor in the night. Here the tide runs strong channel course from the Gurnet to the Race Point of Cape Cod; the course is E. $\frac{1}{2}$ N. about 6 leagues distant; and from the Gurnet to the point going into Cape Cod Harbor, is E. by S. 7 leagues.

If you should make the lights in hard northerly or N. W. winds, and cannot get into Plymouth, you may then run for Cape Cod Harbor, bringing the lights to bear W. by N. and steer directly for Race Point light, following the directions given for entering Provincetown Harbor, by the fixed light on Long Point, and come to anchor. If it should blow so hard that you cannot turn up the harbor, you may anchor off the point, clear bottom; you have 8 and 9 fathoms very nigh the shore, so that there is no danger of being on it, unless very dark.

At the Gurnet and Plymouth the tides are much the same as at Boston; that is, a S. E. moon makes full sea.

CAPE COD LIGHT.—A lighthouse containing a fixed light 200 foot above high water mark, is erected on the Clay Pounds, high lands of Cape Cod.

RACE POINT.—(Cape Cod.) On this point is a revolving light, 155 feet above the level of the sea. It cannot be seen by vessels toward bound, until it bears S. S. W. $\frac{1}{2}$ S.

LONG POINT.—On Long Point, at the entrance of Provincetown Harbor, is a lighthouse containing a fixed light, and elevated 25 feet above the level of the sea.

CAPE COD HARBOR.—(Provincetown.) This is one of the best harbors on this coast. If bound into this harbor from the northward, you may run within half a mile of the lighthouse on Race Point; after passing it, and it bears east, steer S. S. E. $\frac{1}{2}$ S. miles, when the light on the Highlands will bear E. by N.; then run for it $1\frac{1}{2}$ mile, which will put you in the fairway of the harbor; then haul up N. N. W. westerly, a good mile, when you may anchor in 5 or 7 fathoms, with the light on Long Point bearing S. W. by S.

Large ships should bring the light on Race Point to bear N. by W. and steer S. by E. to pass Wood End Bar in 10 fathoms; as soon as the light on Long Point bears N. E. by N., steer N. E. until in 8 fathoms water, when anchor, the light on the Highlands of Cape Cod bearing from E. $\frac{1}{2}$ N. to E. $\frac{1}{2}$ S.

Good anchorage may be found in a N. E. gale, by running for Race Point light, giving

one-third of a mile distance as you pass it, as soon as it bears E. N. E., when you will be safe with the wind from N. N. E. to S. E. by E.; haul up E. S. E. and anchor in from 10 to 4 fathoms.

Vessels inward bound, who fall in with the back of Cape Cod, may bring the light to bear S. W. 2 leagues distant, and then steer W. N. W. for Boston lighthouse, which contains a revolving light.

When up with Race Point, you will find it very bold about one mile to the westward of the lighthouse, and it may be known by a number of fish-houses on it. About one mile to the southward of Race Point is what is called Herring Cove, where you may have good anchorage half a mile from the shore, the wind from E. to N. N. E., in 4, or even in 3 fathoms water.

In passing Race Point to the southward, you must give it a berth of one mile, as there is a long flat of sand that lies to the southward of said point. You must not haul to the eastward until you come near Herring Cove.

In running from Race Point to Wood End, after you pass the Black Land or Hummocks, you will come up with a low sandy beach which forms the harbor, extending between two and three miles to Wood End, which is difficult to be distinguished in the night; it is very bold, and you will have 25 fathoms water within one-quarter of a mile of the shore.

In beating into Cape Cod Harbor, you must keep the eastern shore aboard until you get into 5 fathoms water. Stand no farther to the westward than to bring the light to bear E. by S., as there is a long spit of sand runs off from the western shore, which being very bold, you will have 11 fathoms water within a stone's throw of the shore.

If it blows so hard that you cannot beat into the harbor, you will have good anchoring without, in from 10 to 15 fathoms water. Or if it blows hard at N. E., bring Race Point light to bear N. W. by N., and steer S. E. by S. 6 leagues, which course will carry you into Wellfleet. In steering this course, you will make Harwich right ahead; when you open the bay, you will bring Billingsgate Island light on your larboard hand, when you may haul to the eastward, and anchor safe from all winds.

BILLINGSGATE ISLAND LIGHTHOUSE is on Billingsgate Island, at the entrance of Wellfleet Bay, five leagues S. E. by S. from Race Point light, and contains a fixed light. It is 40 feet above high water, and is situated so far up Barnstable Bay that it cannot be mistaken for any other. *Billingsgate Island Lighthouse.*

Billingsgate Island is about 13 feet above the level of the sea at high water. It is high water in this bay, at the full and change of the moon, at 11 o'clock; the rise of the spring tides is from 12 to 14 feet; common tides from 9 to 11 feet. From the west end of Billingsgate Island extends a long shoal of hard sand 10 or 11 miles, in a W. by S. $\frac{1}{4}$ S. to W. by N. from the lighthouse, and in a N. W. to N. N. W. direction, 5 or 6 miles; at the distance of $1\frac{1}{2}$ to 2 miles from the light, are about 8 feet at low water, common tides; and the meeting-house with a steeple in Brewster, S. by E., at a distance of 5 miles from the lighthouse, 10 to 12 feet, the meeting-house bearing S. S. E., at the distance of 7 miles, 24 fathoms of water, the meeting-house bearing S. E. by S.; at these depths of water the lighthouse bore from E. by N. to E. by N. $\frac{1}{4}$ N. Crossing this shoal point of flats, you drop into 4 to 5 fathoms at the distance of 40 fathoms from the edge of this shoal, when the lighthouse will then bear E. N. E.

In coming around the shoal approach no nearer than $2\frac{1}{2}$ fathoms. Soon as you deepen to 4 fathoms, haul up for the light and anchor.

Vessels drawing 12 feet of water, or upwards, should bring the lighthouse to bear E. N. E. to N. E. by E., and steer in E. by S. to E. S. E., until the lighthouse bears N. by W., when they will have good anchorage in 3 to 4 fathoms, low water, common tides, soft muddy bottom, and distance from the lighthouse $1\frac{1}{2}$ to $1\frac{3}{4}$ mile; Brewster meeting-house on with a wind-mill that stands not far from it, when they will bear S. by W. $\frac{3}{4}$ W.; also the north meeting-house, that stands on a hill in Eastham, and no other building near to it, bore at the same time E. $\frac{1}{4}$ N.

The following bearings and distances are taken from the lighthouse:—The high land of the north point of Manomet W. by N. $\frac{1}{4}$ N., distance about eight leagues; entrance of Barnstable, the Black Land, called by some Scargo Hill, in Dennis, S. W., distant 16 miles, S. W. $\frac{1}{4}$ S. about 11 miles, Brewster meeting-house with a steeple to it, S. by W. to S. 9 miles; entrance of Orleans, S. E. $\frac{3}{4}$ S. 6 miles; Eastham, north meeting-house, S. E. by E. $\frac{3}{4}$ E. 4 miles; Silver Spring Harbor of Eastham, E. by N. $\frac{3}{4}$ N. 4 miles. The above places are all barred harbors, and flats extend off shore from one to two miles, with little water over them.

There is a rock in the passage-way up to Wellfleet, that is about 12 feet long and 8 feet broad, called Bay Rock, on which there are one or two feet water at low tide, and round this rock are nine to eleven feet water at low tide, bearing from the lighthouse E. by S. $\frac{1}{4}$ S., distant one and a quarter mile. When on this rock, Chipman's wind-mill, which is the south mill in Wellfleet, a little open to the north of a large rock called Blue Rock, by some, and stands near the shore of Wellfleet, when it will bear N. N. E. $\frac{1}{4}$ E.; this rock

is covered at high water; and a wind-mill on a hill in Eastham, over salt mills, which is near the shore at Eastham, these bearing E. by S. from Bay Rock. The east point of the Horse-shoe bears from the lighthouse E. N. E., distant about one-third of a mile. On the south side of Billingsgate Island, the flats extend off the distance of one half to three-quarters of a mile, lying on them at low water, common tides, 6 to 9 feet water.

There is no meeting-house with a steeples to be seen to the eastward of Barnstable but the one in Brewster; and this meeting-house is a good mark to pass over the long shoal point that extends off from the lighthouse.

From the lighthouse on the Race Point of Cape Cod, when bearing E. N. E., the course to Billingsgate point of flats is S. by E., distant 18 miles. Vessels drawing 12 feet water or upwards should steer from the Race lighthouse S., when distant from the Race one or two miles.

Barnstable Bay.

BARNSTABLE BAY.—From Centre Hill Point to Sausett Inlet is about 4 miles, bearing S. $\frac{1}{2}$ E. This is a clean and bold shore, and may be approached at the distance of one-third to half a mile, carrying $3\frac{1}{2}$ to 4 fathoms, sandy bottom. There is a bar of sand that lies parallel with the shore, near Centre Hill Point, extending to the southward, and terminating about three-quarters of a mile to the northward of Sausett. From the shore over this bar to 3 fathoms water, the distance is 240 to 250 fathoms, and the bar is from 100 to 140 fathoms wide, having on it from 9 to 11 feet water, and between that and the shore from 3 to $3\frac{1}{2}$ fathoms. From the south end of this bar along shore to the entrance of Sandwich are 3 fathoms, and distant 70 to 90 fathoms, sandy bottom, and regular soundings as you approach the shore.

On the south side of Sausett Inlet is a low rocky point of 90 fathoms. Three-fourths of a mile off shore are 3 fathoms, and at the distance of $1\frac{1}{2}$ or 2 miles are 9 to 10 fathoms, muddy bottom.

Passing from Sandwich towards Barnstable, the flats run off shore 100 to 180 fathoms. Tides.—The neap tides rise 8 feet; common tides 9 to 10 feet; spring tides 12 to 13.

*Tides.
High water.
Barnstable Light.
Barnstable Harbor.
Lighthouse.*

BARNSTABLE LIGHT is a fixed light erected on a dwelling-house, over which it is elevated 16 feet.

BARNSTABLE HARBOR.—When coming from the northward, the bar must not be approached in less than 5 fathoms water, until the lighthouse on Sandy Neck bears S. W. $\frac{1}{2}$ W. which will bring you up with the buoy on the bar; haul close round it, leaving it on your starboard hnd, run two cables' length S. S. W., then steer S. W. by W. $\frac{1}{2}$ W. $1\frac{1}{2}$ mile, which will bring you up with the tongue of Yarmouth Flats, or until the light bears S. W. by S., then steer for the light. Be careful to make the above course good, as the flood sets strong over Yarmouth Flats, and the ebb strong to the northward over the bar. Continue to run for the light until within a cable's length of the beach, and follow the shore round the point. There is safe anchorage inside, abreast of the light, against all winds, it bearing from S. W. to N. E., in 5 to $2\frac{1}{2}$ fathoms water.

High water.

Vessels drawing 8 feet water may, at high water, bring the light to bear S. W. $\frac{1}{2}$ W., and run directly for it. Full sea at full and change at 11 o'clock. Tide rises 10 feet, and there are 7 feet water on the bar at low water.

At a meeting of the Trustees of the MASSACHUSETTS HUMANE SOCIETY, on the 13th instant, it was VOTED, that a statement of the locations of the Life Boats and Rockets of the Society be distributed, in the form of a circular, for the information of navigators.

Wherefore, the undersigned give notice that the old Boats of the Society are stationed as follows.

Swampscut, Lynn, No. 3,	one " —
Ipswich, near the Light, No. 3,	one " 5.
Marblehead Neck, No. 3,	one " —
Seituate Harbor, No. 3,	one " —
Cutthunk, near the other Boat, No. 3,	one " —
Duxbury, at Powder Point, No. 3,	one " 5.

Rockets for throwing a line to wrecks, so as to establish a communication whereby a boat may be more safely hauled through the surf, are stationed at Boston Light—at Point Alderton—Seituate Neck, south of Minot's Lodge—Ipswich Light, Highland Light, Cape Cod—and at Chatham.

Three other Boats are being built, under an appropriation by the State, for Plum Island—one to be under the care of the Merrimac Humane Society; one at Race Point, Cape Cod, and one at Wellfleet, near to Newcomb's Hollow, for the Massachusetts Humane Society. Life preservers for all the crews are to be furnished from the same appropriation, so as to insure safety, when boarding wrecks, from the exposed beaches.

The undersigned applied to the Secretary of the Treasury to give orders to the Revenue Cutters to protect the property of the Humane Societies, and to afford facilities for inspecting their boats and houses on the coast, and to make experiments, &c. In answer, the Secretary writes;

"In so far as the aid of the Revenue vessels, when employed in the duties specially assigned to them by the ninety-ninth section of the Act of March second, 1799, may be useful in promoting the objects of the Society, the department cheerfully assents to your request. Of this the Collectors at Boston and Newport have been informed."

The Committee earnestly recommend those who may be cast on the exposed beaches, not to attempt to leave the ship until low water—as many lives have been sacrificed by too hastily attempting to land on a rising tide.

R. B. FORBES,
DAVID SEARS,
SAMUEL AUSTIN,

BOSTON, APRIL 24, 1849. Committee Mass. Humane Society.

CAPE COD TO CHATHAM.—From the Highland light to Nausett lights, the *Cape Cod to* course is S. by E. 12 miles; thence to Chatham lights S. $\frac{3}{4}$ West 11 $\frac{1}{2}$ miles; the shore is *Chatham.* sandy.

NAUSETT BEACH LIGHTS.—On Nausett Beach three lighthouses, one hundred *Nausett* and fifty feet apart, have been erected. *Beach Light.*

CHATHAM LIGHTS are two fixed lights on James' Head, 70 feet above the level *Chatham* of the sea; they are only of use in running over the shoals, as the beach has made out 2 *lights.* or 3 miles to the south since they were erected.

E. by S. 10 or 11 miles from Chatham lights, there is a rocky ground, called Crab Ledge with 10 to 15 fathoms on it. It runs N. by E. and S. by W. about 15 miles, and is 5 miles in width from east to west.

CHATHAM HARBOR.—Chatham is situated on the exterior extreme of Cape Cod, *Chatham* bounded E. by the ocean, S. by Vineyard Sound, W. by Harwich, and N. by Pleasant *Harbor.* Bay. Its harbor is convenient for the fishery, in which they have usually 40 vessels employed, and contains 20 feet at low water.

While passing Chatham in thick weather, approach no nearer than 5 fathoms to cross the Pollock Rip; edge off and on from 5 to 7 fathoms, which will carry you over the Pollock Rip in 3 fathoms.

Monomoy Point Light. MONOMOY POINT LIGHT is a fixed light, 25 feet above the level of the sea, on the extreme southern point of the peninsula of Cape Cod; to the north the sea has made an inlet deep enough for small craft, making it an island.

Butler's Hole. BUTLER'S HOLE.—To run through Butler's Hole, after passing Chatham lights, get them in range; they will then be $3\frac{1}{2}$ miles distant, and bear north; steer south, and pass through the slue, or until Monomoy light bears W. N. W.; then run W. by N., and pass the point from one to two miles distant. After passing the point, steer S. W., until past the Handkerchief, when you steer W. by S. for the light-ship on Cross Rip. On these courses you will not have less than $3\frac{1}{2}$ fathoms.

The south part of the Handkerchief bears S. W. from Monomoy light, and N. $\frac{1}{2}$ E. from Nantucket light.

The S. E. point of the Horse-shoe bears E. by N. $\frac{1}{2}$ N. from the light-ship.

SHOALS TO THE NORTH-EASTWARD OF NANTUCKET.

Pollock Rip. POLLOCK RIP.—This rip, on which there are but 5 feet water, extends E. $\frac{1}{2}$ N., 6 miles from Monomoy Point light; on it, in 14 feet water, there is a red buoy, bearing from Monomoy light E. $\frac{1}{2}$ N., 7 miles, and from the Little Round Shoal buoy N. E. by N., 4 miles.

Light Boat. On the east end of the Rip there is a fixed Light Boat, which bears from Chatham lights south; and from Monomoy Point light E. by S. $\frac{1}{2}$ S.; from Great Point light, Nantucket, N. E. $\frac{1}{2}$ N. It is a miserable light, and is often out of its place.

Little Round Shoal. LITTLE ROUND SHOAL.—This shoal, on which there are only 7 feet water, bears from Chatham lights S. by W., $4\frac{1}{2}$ leagues; from Nantucket light N. E., 3 leagues; on the S. S. E. part there is a white buoy in 14 feet water, with a small pole on the end of it.

Great Round Shoal. GREAT ROUND SHOAL.—This shoal is partly dry at low water; it bears E. N. E., 8 miles from Nantucket light; on the northern part of the shoal there is a black buoy in 14 feet water. The white buoy of the Little Round Shoal bears from it N. W. by N. $2\frac{1}{2}$ miles.

The channel between the Great and Little Round Shoals should not be attempted by vessels drawing over 11 feet.

Tides. TIDES.—The flood tide sets north about 3 hours, then E. S. E., when the ebb commences at south, and continues till low water. At Sankaty Head the flood sets N. E. and the ebb S. W. In the middle (or E. N. E. channel) the flood sets N. E. by E. and ebb S. W. by W.

In Butler's Hole the ebb sets west, and flood east. From Chatham to Pollock Rip the flood sets S. S. W. and ebb N. N. E.

From Butler's Hole to the Horse-shoe, ebb W. S. W.; then W. by N. to Holmes' Hole.

At Pollock Rip, Great Rip, Little Round Shoal, Point Rip and the Handkerchief, the tide rises and falls 5 to 6 feet. At the Horse shoe, Cross Rip, Hedge Fence, Squash Meadow and Middle Ground, the tide rises and falls 3 to 4 feet. S. $\frac{1}{2}$ E. moon makes full sea in the sound.

Chatham to Holmes' Hole. CHATHAM TO HOLMES' HOLE.—Bring Chatham lights to bear N. N. W., then, by steering S. S. E., $3\frac{1}{2}$ leagues, you will pass the Pollock Rip, in 3 or 4 fathoms water; and if the weather is clear you will make the lighthouse on Sandy or Great Point, (Nantucket Island,) $5\frac{1}{2}$ leagues distant, which bring to bear S. W. $\frac{1}{2}$ W.; then steer for the lighthouse, keeping it in this direction, and you will pass between the Great and Little Round Shoals, on the former of which is a black buoy, and on the latter a white buoy, with a small pole in the end of it, bearing N. W. by N. and S. E. by S. from each other, distant $2\frac{1}{2}$ miles.

Buoys. When you are within about 3 miles of the lighthouse, steer W. $\frac{1}{2}$ S. until you are past the Point Rip, on the N. E. end of which is a red buoy in 14 feet water, bearing from Sankaty Head N. by W. 4 leagues; from Nantucket light N. E. by E. $\frac{1}{2}$ E., 2 miles, and from the black buoy on the Horse-shoe E. S. E. 6 leagues. Shonlest water on Point Rip, 8 feet; or you may bring the lighthouse to bear E. by S. $\frac{1}{2}$ S., and steer W. by N. $\frac{1}{2}$ N., taking care to make your course good for Holmes' Hole light, 11 leagues distant, observing, while running from Nantucket light to Holmes' Hole, you leave on your larboard hand Cape Poge light, which must bear W. $\frac{1}{2}$ S., to clear the Cross Rip, on the N. E. part of which is a white buoy, in 15 feet water, bearing from Cape Poge light E. by S. 5 leagues; from Tuckanuck Island N. by W., 2 leagues, and from the red buoy on Squash Meadow E. by S. $\frac{1}{2}$ S., 5 leagues. Shonlest water on this rip, 12 feet.

To go through the north Ship Channel, bring Chatham lights to bear N. N. W. and steer S. S. E. $3\frac{1}{2}$ leagues, when you will pass the Pollock Rip in 3 or 4 fathoms water,

when you will see must run the west 3 fathoms red buoy Cross run W. when you As you Poge light water.

There Chatham of Monomoy fathoms, and count board round; the light, or HOLE

Chop of west of light, eleven shoals, there have been the Group S. W. $\frac{1}{2}$ by E., 3 Cape Poge the N flats.

The Ha distant. East from buoy is a small c

when you must steer W. $\frac{1}{2}$ S. 5 miles for Butler's Hole, in 15 fathoms water, when you will see a white buoy to the north of you, which lies in the S. S. W. passage, when you must run W. S. W. for the south part of the Handkerchief, which has a white buoy on the west end of it, bearing from Monomoy Point light S. W. 2 miles, when you will be in 3 fathoms water, fine sand; from Nantucket light N. by E. $\frac{1}{2}$ E. 4 leagues, and from the red buoy on Pollock Rip W. by S. $\frac{1}{2}$ S. 3 leagues.

Crossing the Handkerchief, on a W. S. W. course, in 3 or 4 fathoms water, you will run W. for the black buoy on the Horse-shoe, $11\frac{1}{2}$ miles, leaving it on the starboard hand. When you will continue your course W. for Holmes' Hole light, 4 $\frac{1}{2}$ leagues distant.—As you enter the Swash, in the Horse-shoe, Hyannis light will bear N. N. E., Cape Poge light W. S. W., Holmes' Hole light W. Part of the Handkerchief dry at low water.

There is a channel of 9 feet, still north of the above, which may be found by bringing Chatham lights to bear N. W. when in 7 fathoms, and running S. S. W. for Sandy Point of Monomoy light, till the light bears S. W., then run for it till you cross from 3 to 7 fathoms, when you will be within three cables' length of the light, where you may anchor and continue till 2 $\frac{1}{2}$ hours flood, when, if bound to the westward, continue the shore on board round the point, crossing a spit between Egg Island and Monomoy Point, in 2 fathoms; then steer N. W. till the light bears E., when you must run W. N. W. for Hyannis light, or haul into Stage Harbor Bay and anchor.

HOLMES' HOLE.—A lighthouse, showing a fixed light, is erected on the West Chop of Holmes' Hole, on the starboard hand as you enter the harbor. Four miles west of Falmouth is Nobsque Point, on which a lighthouse is erected, showing a fixed light, elevated 80 feet above the sea. It is intended to guide vessels passing over the shoals, through the north channel into the Vineyard Sound. The following bearings have been taken:—West Chop lighthouse, S. E. $\frac{1}{2}$ S. distant 4 miles; east end of Middle Ground, S. E. $\frac{1}{2}$ S. $3\frac{1}{2}$; west end of do. S. W. by S. 4; Gay Head lighthouse, S. W. $\frac{1}{2}$ W., 15; Tarpaulin Cove lighthouse, W. S. W., 6; Falmouth Wharf, N. E. by E., 3; Seconset Point, E. $\frac{1}{2}$ N. 7; S. W. part of the Hedge Fence, E. S. E., 4; Cape Poge lighthouse, S. E. $\frac{1}{2}$ E., 14; East Chop Holmes' Hole, S. E. 6. By keeping the Nobsque light open by the East Chop of Holmes' Hole, will clear the Old Town flats.

OLD STAGE HARBOR.—If you intend, when passing Monomoy Point, to make a harbor, when about 100 yards west from the point, steer N. N. W. from 5 to 6 miles, to avoid the common flat which makes off from the beach, then steer E. N. E. two miles, which will bring you to anchorage, in from 3 to 5 fathoms, good holding ground. This harbor is exposed to winds from South to West by North.

Monomoy Point bears from the anchorage south, distant about eight miles.

To go through the S. S. W. channel, get Monomoy Point light to bear N. by E. $\frac{1}{2}$ E., and run S. S. W. $1\frac{1}{2}$ mile, into Butler's Hole, in 7 fathoms, and a S. S. W. course continued will carry you to the westward of Nantucket Point light, 5 leagues. In the S. S. W. channel, are two fathoms at full tide.

Bring Chatham lights to bear N. by W., on which bearing keep them till you cross the Pollock Rip in 3 fathoms water, and deepen into 7 fathoms; then steer S. W. by S., which carries you across Butler's Hole, to 5 or 4 fathoms; then steer W. S. W. which will carry you to the northward of the Little Round Shoal, up to Tuckeruck Channel, when you will be up with the S. E. end of the Horse-shoe, where you have 9 fathoms, then steer W. by N. for Cape Poge light. From the Stone-horse to the S. E. end of the Horse-shoe, the distance is ten miles. To go through the Muskeket Channel, bring the light on Cape Poge to bear N. by W., and steer S. by E., which will carry you to the eastward of Skiff's Island, which you may go within half a mile of.

To go through the Swash of the Horse-shoe, bound to the westward, after passing the Stone-horse, and you deepen your water to 6 fathoms, steer W. till you bring Cape Poge light to bear W. S. W.; then steer directly for it through the Swash of the Horse-shoe, till you deepen twelve fathoms, then steer for the East Chop of Holmes' Hole.

To the northward of the Horse-shoe, bring Point Gammon light to bear E. N. E.; Seconset Point to bear W. N. W., when you will see the northernmost dry shoal of the Horse-shoe. Bring Cape Poge light to bear S. S. W., and run for it. In beating to windward, come no nearer the north shore than 3 fathoms; when past the dry spot of the Horse-shoe, steer S. W. by S. till you bring the East Chop to bear W.

HYANNIS LIGHT is situated on Point Gammon, at the entrance of the harbor south side of Cape Cod. The lantern is elevated 70 feet above the level of the sea, and contains a fixed light.

The Harbor light of Hyannis, bears from Point Gammon light, N. 22 30 W. 2 $\frac{1}{2}$ miles distant.

East from Hyannis lies Bass River, near which are the towns of Dennis and Yarmouth, a buoy is placed on Dog-fish bar. A beacon, (or rather a large stick,) on the top of which a small cask, is also stuck up on the Bishop and Clerks.

Holmes' Hole lighthouse.

Old Stage Harbor.

Hyannis light.

Hyannis Harbor.

HYANNIS HARBOR.—Vessels coming from the eastward, bound through the North Channel, must leave the Bishop and Clerks on the larboard hand, and not go nearer them than 4 fathoms. They are a dangerous ledge of rocks, bearing S. by E. from the lighthouse, 2½ miles distant, and are always dry.

When coming from the eastward, bring Point Gammon light to bear N. N. E. in 3½ fathoms water, and steer N. W.; on which course you will have from 3½ fathoms to quarter less 3. When the Harbor light bears N. ½ E., run for it; which course will carry you two cables' length from the east end of the breakwater. Give it a good berth towards the shore, and round to in 2½ or 3 fathoms water.

When coming from the westward, bring Point Gammon light to bear E. by N., or E. by N. ½ N., run for it until the Harbor light bears N. by E. ½ E., and run for it, as above.

Vessels bound to the westward from Hyannis, must run to the southward till the light bears E. by N.; then steer W. by S., which course will carry them clear of the south-west rock, which bears west from the light, 4 miles distant, with several sunken rocks near it; said rock is dry at low water. W. ½ S., 4½ miles distant from the light, is a dangerous ledge, called Collier's Ledge, 3 miles from the shore. There are 3 fathoms water round it, and the ledge is part dry at low water. In running this W. by S. course, (the light bearing E. by N.,) you will have from 3 to 4 fathoms, and sometimes 5, as it is ridgy. If further towards the Horse-shoe, to the southward, you will have 4, 5, 6, 7, 10, and close to the Horse-shoe, 13 fathoms; northern part of the Horse-shoe dry at low water. On the S. E. part of the Horse-shoe is a black buoy placed, in 16 feet water, bearing from Great Point light N. W. by W., 4½ leagues, and from Tuckanuck Island, N. by E. ½ E. 5 leagues. Tide rises about 5 feet; high water, at full and change, at 12 o'clock; and runs from 2 to 3 knots east and west, in the following manner, viz: it begins to run to the westward at half flood, and continues to half ebb, then runs to the eastward, the three last hours of ebb and three first of flood.

Cross Rip Light Ship.

CROSS RIP LIGHT SHIP is on the north point of the Rip, in 7 fathoms water. 200 fathoms south of the light there are eleven feet water. From the light vessel Point Gammon lighthouse bears N.; Chatham light N. E.; Sandy Point light, N. E. by E.; Nantucket Great Point light, E. S. E.; Nantucket Brandt Point light, E. S. E. ½ E.; Nantucket Beacon light, S. S. E.; Cape Poge light, W.; centre of Tuckanuck Island, S. S. W. ½ W., distant 7 miles.

Running from the Horse-shoe towards Holmes' Hole, observe the following directions, viz: When to the northward of the Horse-shoe, in 12 fathoms' water, one mile distant from the dry spots, at low water, steer S. W. for Holmes' Hole, 3½ leagues distant. If bound to the northward of the Hedge Fence, between that and the L'Honnuedieu Shoal, get the point on which the wind-mill stands, which is east of Wood's Hole, to bear W. by N., and run for it till within half a mile; then W. S. W. will carry you through the Vineyard Sound, leaving Tarpaulin Cove and Cutterhunk lights on your starboard hand, and Gay Head light on your larboard hand. You will not see Cutterhunk light till 4 leagues to the westward of Tarpaulin Cove light, when it will open on the starboard hand; when it bears N. E. by E., distant 3½ miles, you may run west for Point Judith light, (if bound up the sound,) 10 leagues distant.

Nantucket, or Great Point Light Lighthouse.

NANTUCKET, or GREAT POINT LIGHT, is on the N. E. point of Nantucket Island, is a fixed light, and is elevated 70 feet above the level of the sea.

Nantucket Harbor lighthouse is on the south side, of the harbor, on high ground, some distance from the shore, is a small pyramidal building, and contains a fixed light. Its only use is to assist vessels entering the harbor, to pass the bar.

Nantucket Harbor.

NANTUCKET HARBOR.—If the lighthouse on the south side of the harbor cannot be seen, bring the light on Brandt Point, (which lies on the starboard hand and shows a fixed light,) to bear S. by E., (none to the south of that,) and run for it till within about a cable's length; then run to the eastward for the end of the point, and pass it as near as you please; or

Lights.

Bring the south light and the light on Brandt Point in one, at the outer buoy; and the south light should be opened to the westward on this range, one handpike's length, to run the channel from the bar or outer buoy, to the shoaling of the water on Brandt Point.

From then N. From 17 or 18 Diced Bar, the house, p may set three mi land. unt iog W. t Great R too near Shoal, to passed th State of Old Cha After three mi N. From Brandt Point N. N. W. $\frac{1}{2}$ W. 300 fathoms; then N. by W. $\frac{1}{2}$ W. 100 fathoms; then N. 350 fathoms over the bar.

From the bar N. by W. $\frac{1}{2}$ W. eight and one-half miles will cross Tuckanuck Shoal in 17 or 18 feet water.

Directions for ships bound over the Shoals of Nantucket, from the bar.—From Nantucket Bar, the course is about N. N. E. to the Great Point; if a west tide, run for the light-house, pass the Great Point, keeping it about two miles distant from you; an east tide may set you on the Point Rip. Keep the town open, clear of Great Point, until you are three miles to the N. N. E. of the point; then run S. E., keeping three miles from the land, until the light is W. by N. from you; then run East, keeping the lighthouse bearing W. by N. will carry you to sea. When you are in 25 fathoms, you are without the Great Rip. If a light wind, and a southerly tide, there is danger of being set by the tide too near the Rip; therefore it is best, after being sure that you are without the Round Shoal, to run E. by N. or E. N. E., according to the wind and tide. When you have passed the Round Shoal, there is nothing to fear, from N. to E., until you come to the State of Maine on the one hand, or the shoal of George's on the other. The above is the Old Channel-way.

Directions,

After you are three miles N. N. E. from the Great Point light, run S. E., keeping three miles from the land, until Sankaty Head bears S. W. by W.; you may then run N. E. by E., which will carry you channel-way. The Round Shoal bears from the Great Point light E. N. E., eight miles off.

When you are three miles to the N. N. E. of the Great Point light, with the town open clear of the Point, run S. E., keeping three miles from the land, until the town is over the middle of the head of the harbor; keeping it so, will carry you out channel-way.

When the town is shut in by the high land of Pocomo or Squam, you are in danger of the north end of the Bass Rip, also the north end of the Great Rip.

At the full and change of the moon, it is full sea at Nantucket at 12h. 18m.; rise, springs 4 feet 9 inches.

SANKATY HEAD LIGHT is 150 feet above the level of the sea, the tower is 70 feet high, painted with two white and one red rings, horizontally, the red being in the centre; it is a fixed light when seen at the distance of 12 miles or less, beyond that it is a flashing light, two flashes at intervals of one and a half minute, the third an interval of three minutes. It bears S. by E. nine miles from Long Point light, and from the centre of the New South South Shoal N. $\frac{1}{2}$ W. 19 $\frac{1}{2}$ miles.

Sankaty Head light.

CAPE POGE LIGHT is on the N. E. Point of Martha's Vineyard; is a fixed light, and 55 feet above the level of the sea.

Cape Poge light.

A fixed light is erected at the entrance of Edgartown Harbor, on a pier running from the west side, 1000 feet from the beach. It is elevated 50 feet above the level of the sea.

EDGARTOWN HARBOR.—Vessels bound eastward, and wishing to enter Edgartown Harbor, from the east end of Squash Meadow Shoal, will bring the harbor light to bear S. W. by S., and Cape Poge light to bear S. E., then steer S. S. W., (they then will have 6 and 6 $\frac{1}{2}$ fathoms water,) until the harbor light bears W., then steer W. by S., and pass the light about a cable's length to the right hand, which course will carry them up to the wharves.

Edgartown Harbor.

Vessels bound westward, and wishing to enter Edgartown Harbor, after passing near Cape Poge, in 4 or 5 fathoms water, bring the harbor light to bear S. W. by S., and steer S. S. W. until the harbor light bears W., then steer W. by S., and pass the light about a cable's length to the right hand, which course will carry them up to the wharves.

If vessels wish to anchor in the outer harbor, they will follow the above directions until the harbor light bears W. by S., and Cape Poge light bears N. E. $\frac{1}{2}$ E., when they may anchor in 4 $\frac{1}{2}$ or 5 fathoms water, and very good holding ground. High water, 12 17, rises 2 feet.

In leaving Holmes' Hole to pass over the shoals, keep the West Chop open to the northward of the East Chop, until you have passed Squash Meadow Shoal, on the N. W. end of which is a red buoy, with a small pole in the end of it, placed in 16 feet water, bearing from Cape Poge light N. W. $\frac{1}{2}$ W., 6 miles; from West Chop light, S. E. by E. $\frac{1}{2}$ E., 6 miles; and from the black buoy or Hedge Fence, S. by E., 2 miles. Shoalest water 5 feet. The buoy lies about 2 $\frac{1}{2}$ miles from the East Chop, must be left on the starboard hand, when your course will be E. by S., in 10 or 12 fathoms water, which course you must continue till you pass Cape Poge light. If it should be tide of flood, you must steer E. by S. $\frac{1}{2}$ S., as the tide of flood sets very strong to the northward, between Cape Poge and Tuckanuck Island, and the tide of ebb to the southward, so that you must govern your course by the tide. In clear weather you may see Nantucket lighthouse 18 miles, which you must bring to bear E. by S. $\frac{1}{2}$ S. which course you are to steer, passing it at the distance of one league, when you must bring it to bear west and steer east, taking care to make this course good, which will carry you over the shoals in ship channel; the ground is very uneven, and you will have from 4 to 8 fathoms water.

When you have passed over the shoals, you will have from 10 to 14 fathoms water, and then by steering north, you will make Cape Cod lighthouse, (which contains a fixed light,) distant 18 leagues.

To go to the northward of the Great Round Shoal, on the northerly part of which is a buoy, which you leave on your starboard hand, placed in 14 feet water, bearing from Sankaty Head, N. by E. $\frac{1}{2}$ E., 5 leagues; from Nantucket light E. N. E. $\frac{1}{2}$ N., 10 miles, and from the red buoy on Point Rip, E. N. E., 3 leagues; shoalest water 5 feet; you must proceed according to the foregoing directions, until you pass the lighthouse, and bring it to bear S. W. $\frac{1}{2}$ W., then, by making a N. E. $\frac{1}{2}$ E. course good, you will go between the Great and Little Round Shoals, on the south part of which is a buoy, with a small pole in the end of it, placed in 14 feet water, bearing from Chatham lights S. by W., $4\frac{1}{2}$ leagues; from Nantucket light, N. E., 3 leagues; and from the black buoy on the Great Round Shoal, N. W. by N., $2\frac{1}{2}$ miles; shoalest water 7 feet, in $2\frac{1}{2}$, 3, 4 and 5 fathoms water, until you have crossed the Pollock Rip, where you will have about 3 or 4 fathoms water, on which is a red buoy which you leave on your harbour hand. The Little Round Shoal bears N. W. from the Great one, distant about $2\frac{1}{2}$ miles. Continue your N. E. $\frac{1}{2}$ E. course, until you deepen your water to 12 or 13 fathoms, and then steer north for Cape Cod lighthouse, before mentioned.

NANTUCKET* OLD AND NEW SOUTH SHOALS, &c.

OLD SHOAL.—This dangerous shoal, which lies in lat. $41^{\circ} 04' N.$, long $69^{\circ} 51' W.$, bears S. by E. from Sankaty Head light $13\frac{1}{2}$ miles. It is composed of hard white sand, over which the sea breaks in the most tremendous manner, having on it in many parts, only 3 feet water, and the tide meeting it obliquely, passes over it in different directions. The course of the tide is, N. E. and S. W., beginning to run S. W. at 10 o'clock on the day of full moon, and continues in that direction about 7 hours. It extends from east to west one mile, and is in breadth two cables' length. It often breaks in 5 fathoms, on the east and west of the shoal. The rip which extends from the western end, has about 7 fathoms water on it.

South from the old South Shoal, half a mile distant, the bottom is uneven, from 3 to 5 fathoms. There is a rip puts off from the west end of the shoal to the south and west, and sweeps round so that the south end of the rip bears nearly south from the shoal, on which it sometimes breaks in 7 or 8 fathoms water, at the distance of five miles from the shoal: between the outer part of the rip and the shoal is uneven bottom and full of rips.

The tides run round the compass in $12\frac{1}{2}$ hours, but the southern tide has the greatest duration, and runs the strongest.

All who pass near the South Shoals should, for their own safety, pay particular attention to the tides, sometimes a current sweeping them over the bottom with a velocity as great, and even much greater in some instances, than the vessel moves through the water.

Extract from the surveying sloop Orbit's Journal.

" Sankaty Head bearing N. W.	}	Came to a large swash through the Bass Rip with 5 fathoms. Standing on the rip, had from 9 feet to 2 fathoms, hard sand.
Siasconset town N. W. $\frac{1}{2}$ N.

" Sankaty Head bearing N. by W.	}	On the south breaker of Bass Rip, in 9 and 8 feet and less.
Siasconset N. N. W.		
Tom Never's Head N. W. by N.		
Southernmost land W. N. W.		

" Kept standing on to the southward in a channel of from 6, 7, and 8 fathoms. Sankaty Head bearing N. by W., 8 miles, crossed a dangerous rip in $2\frac{1}{2}$ fathoms, lying S. W. by S. From this rip E. S. E., 3 miles distant, is another rip, between which are 9, 15, 17, 14, 6, and 4 fathoms, which is the shoalest water on the rip: then standing east, had 7 and 8 fathoms; three cables' length from this rip, came to another, with 4 fathoms water; from this, at equal distance, came to a third, then a fourth, all of which were within the limits of 3 miles, and lay N. and S. Although they have the appearance of danger, there are not less than 4 fathoms on the shoalest part. After crossing the fourth rip, came into deep water within one mile, viz: 12, 17, 22, and 25 fathoms, sand and red gravel. When over, had smooth water with 3 fathoms, and made a south course, having 4, 11, 18, and then 11 fathoms, and crossed the east end of the South Shoal in 2 fathoms, running down the south side in 13 fathoms, 80 fathoms distant, when we anchored in 10 fathoms. Got under way and stood to the westward; had 7, 4, 6, 5, and 7 fathoms; doubled round the west end in 3 fathoms, fine sand; when over, had 7 fathoms, the tide setting N. N. W. Kept along the north side in $2\frac{1}{2}$, $2\frac{3}{4}$, and 2 fathoms, one cable's length from the breakers. When about midway the shoal, perceived a swash, through which we crossed between the breakers, in a S. S. E. direction, had $2\frac{1}{2}$ and 2 fathoms, and one east 9 feet, at which time it was about half tide. In a few moments, deepened to 4, 5, 6, and 7 fathoms, 2 cables' length from the shoal, hard white sand. From this, steered S. $\frac{1}{4}$ W., to make a south course good, kept the lead going, and increased the soundings gradually to 10 fathoms, fine black and white sand, then one mile from the shoal. From this sounded every three miles, depth increasing about one fathom per mile, till at the distance of 7 leagues from the south shoal, where we found 28 fathoms, fine black and white sand.

*This Shoal, together with Georgo's Bank, have been surveyed at the expense of E. M. Blunt, and published on a large scale, by E. & G. W. BLUNT, 179 Water street, corner of Burling Slip.

This was in lat. $40^{\circ} 42' N.$ long. $69^{\circ} 56' W.$ The same quality of soundings continue till you get in lat. $40^{\circ} 31' N.$, when you will have 40 fathoms, soft mud, from which it continues muddy bottom till off soundings, and $40^{\circ} 00' N.$ no bottom, with 120 fathoms."

NOTE.—The Orbit, (Capt. J. Colesworthy,) was sent by the author of this work to ascertain the exact situation of the South Shoal, which differing so much in latitude from what it had ever been laid down, induced several gentlemen in Nantucket, again to engage in the enterprise, who confirm the surveys made in that vessel, and make the following report:—Observed in lat. $41^{\circ} 4' 11'' N.$, abreast of the shoal, as laid down by Capt. Colesworthy; steered off S. by W., 22 miles, and regularly deepened the water to 35 fathoms; steered E. N. E., twelve miles, to 30 fathoms; N. W., twenty miles, to 18 fathoms; S. S. W., ten miles, to 30 fathoms; and N. N. W., fourteen miles, regularly shoaling until 6 A. M., made the mills, and came in at one P. M. These several courses formed a track over where Paul Pinkham has laid the South Shoal of Nantucket, and on which there are 28 fathoms."

New South Shoal.

NEW SOUTH SHOAL.—This dangerous shoal was discovered and surveyed by Lieut. Charles H. Davis, U. S. Coast Survey. It has on it only 8 feet in places, and bears from the middle of the Old Shoal from S. $3^{\circ} 28' W.$ to S. $16^{\circ} 42' E.$, by compass, distance $6\frac{3}{8}$ miles. It is $2\frac{3}{8}$ miles long from east to west; and its greatest breadth, from north to south, nine-tenths of a mile.

Between it and the Old Shoal there are from 4 to 18 fathoms water; but to the north and east there are ridges of only 20 to 24 feet water, to the extent of about three miles from the New Shoals. Lt. Davis states that deep water intervenes between these ridges, and the soundings on the ridges were very irregular.

The tide rips showed that two, and perhaps three, lines of shoal ground are near each other, in parallel directions. The latitude of the centre of the New Shoals is $40^{\circ} 57' 50'' N.$, longitude $69^{\circ} 51' 40'' W.$, and bears from Sankaty Head, S. $\frac{1}{2} E.$, $19\frac{1}{2}$ miles.

Tides.

The tides set regularly round the compass, the main body of the flood running to the eastward and the ebb to the westward, varying north and south of east and west.

But the flood begins to turn to the southward, passing round to the west, and ebb to the northward, passing round to the east, about $1\frac{1}{2}$ hour before the principal set and strength are attained.

Upon the shoals the tides always run across their line of direction, and are much more rapid, which makes an approach on the side to which the tide is setting very dangerous.

The tide is never still; at even slack water its velocity is seldom less than half a mile, and on the second quarter of the flood and ebb it sets at a rate of 2 knots.

Seven leagues to the westward of the South Shoal, in 25 or 30 fathoms, you will have black mud of a shining smooth nature, when you will be in Tuckanuck Channel.

To the westward of the South Shoal of Nantucket, you have no shoals, rips, nor tides to hurt you, until you come near the land; but clear sea, good navigation, and regular soundings. To the eastward and northward of the South Shoal, you will have a rapid tide.

Pochick Rip.

POCHICK RIP lies off the South-east part of Nantucket Island. It commences a few rods south of Siasconset town, and then runs E. S. E., one mile, when you come to a corner on which are 6 feet at low water; between this corner and the island there are a few swashes, from $2\frac{1}{2}$ to 3 fathoms, through which vessels may pass. From the corner the rip runs south, $1\frac{1}{2}$ mile, when you come to another swash, half a mile wide, with 7 fathoms. W. S. W., one-quarter of a mile from this channel, is a very shoal spot, with 6 feet, which runs S. W. by W., one-quarter of a mile, when you fall into a swash 40 rods wide, Tom Never's Head bearing N. N. W., 3 miles distant. You then come to the east end of the Old Man, which runs W. S. W., about 4 miles, on which are from 9 feet to 3 fathoms; when over the Old Man, you will drop into 7 fathoms, fine sand, with black specks.

Between the Old Man, Tom Never's Head, and Pochick Rip, there is a very good roadstead, or anchorage; and with the wind at N. W., N. N. E., E. S. E., and furthest south or S. S. W., preferable to any harbor in the Vineyard Sound for vessels bound to the northward or eastward, particularly in the winter season, provided your cables and anchors are good. Tom Never's Head bearing E. N. E. $\frac{1}{2} N.$, the southernmost land W. by N., you will have 5 fathoms, coarse sand; from which, to the Old Man, you will have 5, 6, $6\frac{1}{2}$, 7, 8, 9, 10 to 14 fathoms, red sand, then half-way between the two; from this you shoalen to 13, 11, 8, 7, 5, 4, and 3 fathoms, fine sand, with black specks.

Bass Rip.

BASS RIP on which there are from 4 to 18 feet water, is 4 miles long in a N. N. E. and S. S. W. direction, the N. E. Point bears E. 10 S. from Sankaty Head Light, 3 miles distant.

From Sankaty Head light, north by the way of east, to the south, a sweep of 19 miles the ground is broken and full of dangerous shoals, from 9 feet upwards. Vessels of 9 feet or over, should not attempt to navigate within this extent without a pilot.

The following are from the U. S. Coast Survey:

direction, having on it 4, 5, and 6 fathoms, and deepening very rapidly outside to 20 and 25 fathoms, and inside to 13 fathoms, on which the sea breaks in bad weather.

The following bearings are taken from the centre of this ridge: centre of New South Shoal, W. by S., distant 4 miles; the middle of the Old South Shoal, N. $\frac{3}{4}$ W., distant 6 miles.

2. A shoal spot with 16 feet of water on it in the channel-way to the eastward of Bass Rip, from which Sankaty Head bears W. N. W. $\frac{3}{4}$ W., distant $4\frac{1}{2}$ miles; and Great Point light, N. W. $\frac{1}{4}$ N., distant $10\frac{1}{2}$ miles.

3. A shoal having 14 feet of water on it to the southward and eastward of Great Point light, and north of Bass Rip, from which Sankaty Head bears S. S. W. $\frac{1}{2}$ W., distant $4\frac{1}{2}$ miles; and Great Point light, N. W. by W. $\frac{1}{4}$ W., distant $5\frac{3}{4}$ miles.

Four shoals having on them from 9 to 15 feet, bearing from Great Point light E. $\frac{1}{2}$ S. from $10\frac{7}{10}$ miles to $9\frac{1}{2}$ miles distant. From Sankaty Head light they bear N. E. $\frac{3}{4}$ E. from $9\frac{6}{10}$ miles to $9\frac{9}{10}$ miles distant.

These shoals can readily be discovered by the rip (or ripples) formed on them by the tides at all stages, except during slack water, when they can no longer be detected by this means; but, in daylight, they exhibit the usual discoloration of water.

Two small spots of 18 feet water, one bears from Great Point light E. $\frac{1}{2}$ S. $9\frac{8}{10}$ miles distant from Sankaty Head light, N. E. $\frac{1}{2}$ E. $9\frac{4}{10}$ miles distant.

The other from Great Point light E. $\frac{1}{2}$ S. $11\frac{7}{10}$ miles distant from Sankaty Head light, N. E. $\frac{1}{2}$ E. $10\frac{1}{2}$ miles distant.

THE GREAT RIP is about 4 leagues from Sankaty Head. On this rip, about E. S. *Great Rip.* E. from Sankaty Head, there are 4 feet water, and east from Squam there are 5; but on many other parts of it, there are $2\frac{1}{2}$, 3, and 4 fathoms water.

FISHING RIP is about 8 leagues from Sankaty Head, and has from 5 to 7 fathoms *Fishing Rip.* water on it. Between this and the Great Rip the ground is uneven, there are 12, 22, and 15 fathoms water. These two rips stretch nearly north and south, and are about 12 miles in length.

Around the coast of Nantucket and the shoals, you will have sandy bottom, and in moderate weather had better anchor than be driven about by the tide, which is very rapid. The course of the tides at and over Nantucket Shoals, is nearly N. E. and S. W., and regular. The N. E. tide makes flood. S. S. E. moon makes high water. South moon makes full sea at Nantucket Harbor.

S. S. E. and W. N. W. moon makes high water on the shoals. The tide of flood sets N. E. by E., and ebbs S. W. by W., from 2 to 3 knots an hour. It ebbs and flows about 5 or 6 feet.

BLOCK ISLAND CHANNEL, &c.,—Directions for those running for Block Island *Block Island* Channel, to the southward of Martha's Vineyard, Vineyard Sound, Nantucket Island, Channel. and such as are bound into the Vineyard Sound, and intend going over the shoals to the eastward.

In approaching the south end of Block Island (on the N. W. point of which two light-houses are erected, as after described) from the southward, the water shoals gradually. When the island bears from N. W. to N. by W., the bottom is mud; this is commonly called Block Island Channel. This Island, if you come from the southward, appears round and high; and if you approach it from the S. E., it appears like a saddle, being high at both ends, but highest to the southward. Your course from the S. E. head of Block Island to Gay Head lighthouse is E. by N., 15 leagues. The current in Block Island Channel, is N. N. E. and S. S. W., two knots. If you run to the southward of Martha's Vineyard, and can see Noman's Land Island, and intend going over the shoal to the eastward, bring Noman's Land Island to bear W., and steer E. by S., 8 leagues, which will bring you up with Nantucket Island, to which you must give a distance of two miles, until you have passed Miconic Reef, which extends one mile from the shore, has two fathoms water, and bears from the South Tower of Nantucket S. by W. When you got to the eastward of this rip, you may nigh the shore to within one-quarter of a mile, until up with Tom Never's Head, which lies $1\frac{1}{2}$ of a mile to the southward and westward of a small village, called Siasconset, where you may anchor, if necessary, in 4 or 5 fathoms.

If you wish to continue through the channel, which lies between Nantucket Island and the Old Man, you may run within three cables' length of the shore, which will carry you over Pochick Rip, on which there are but two fathoms, and of course only fit for small vessels. When on this rip, haul to within one cable's length of the shore, and continue in 5 fathoms till up with Sankaty Head, which is the highest eastern land of Nantucket. Bring Sankaty Head to bear S. W. when in 5 fathoms water, and run N. E. till you deepen to 15 fathoms, when the Round Shoal Buoy will bear N. W.; after which you shoal into 7 and 8 fathoms, fine ridges, which buoy passed, and come into 10 fathoms, a north course will carry you to the high land of Capo Cod, 17 leagues dis-

tant. If in a large ship, and you make the south side of Nantucket, bound over the shoals, you may proceed either within or without the Old Man, but the latter is preferable.

If you wish to go between the Old Man and Pochick Rip, bring Tom Never's Head to bear N. W. by W., and run S. E. by E. till Sankaty Head bears N. N. W. $\frac{1}{2}$ W., where you will have 9 fathoms water, when you will run direct for Sankaty Head, till in 5 fathoms, which will be close on board; then continue your course N. E., as before mentioned, for the Round Shoal. In running the S. E. by E. course, you go through a swash half a mile wide, having 7 fathoms.

If you are coming from sea, and make the Island of Nantucket to the northward of you, it may be known by two towers, and four wind-mills, which stand near each other, upon an eminence. You may then steer directly for the land, until you are within half a mile, and may, if bound to the eastward, run along the shore in 4, 5, and 6 fathoms water, to the S. E. part of the island, where there are shoals and rips, on which you will have only $2\frac{1}{2}$ or 3 fathoms water. Sankaty Head is the easternmost headland of Nantucket.

If, when you make the New South Shoal, you are bound to Boston Bay, and choose to go to the eastward of all the shoals and rips, pass a mile or two to the southward of the shoal; then steer N. E. by E., about 7 leagues, when you will be up with the Fishing Rip. In running this N. E. by E. course you will deepen to 25 fathoms, which is about midway of South Shoal and Fishing Rip. From the Fishing Rip, in 17 or 18 fathoms, steer N. N. W. for the high land of Cape Cod, 18 leagues, on which is a lighthouse containing a fixed light.

If you come from the eastward, and are bound for New York, you should be careful not to go to the northward of $40^{\circ} 54'$ N. latitude, until you pass the shoals of Nantucket. If by stress of weather, you should be driven so far to the northward as to be near the Vineyard, you may pass through the channel to the westward of Nantucket Island, by bringing Cape Poge lighthouse to bear N. by W., and steering right for it, will lead you through, in from 3 to 4 fathoms, clear of all shoals, leaving Skiff's Island, which is a dangerous shoal, on your larboard hand. Martha's Vineyard Island lies in much the same latitude as Nantucket Island, and may be known by a small round island which lies at the southward of Gay Head light, called Noman's Land Island, before mentioned, 8 miles distant. You may go between this island and Martha's Vineyard; but you must take care to avoid a ledge of rocks which bears from Gay Head light S. by E., $5\frac{1}{2}$ miles distant, called the Old Man.

In bad weather, coming from the eastward, and you wish for a harbor, and the wind admitting, you may bring Nantucket light to bear E. S. E., and run W. N. W., making your course good, until Cape Poge lighthouse bears W. by S.; if bound into Edgartown Harbor, then steer for the light until you get in 3 fathoms water, then run W. N. W.; if it shoals, haul to the northward; if not, keep on until the light bears south, then run W. S. W.; you will have 3 and 4 fathoms, hard bottom. As soon as you get in $5\frac{1}{2}$ or 6 fathoms, sucky bottom, then run S. S. W. until the light bears N. E. $\frac{1}{2}$ E.; then you may anchor in about 5 or 6 fathoms water with safety, in case your cables and anchors are seaworthy; otherwise, if you wish to go into the harbor, when the light bears N. E. $\frac{1}{2}$ E., you may run S. W. by W. until you get $3\frac{1}{2}$ fathoms, hard bottom, then run west about half a mile, and you will be within the flats, which you leave on your starboard hand, coming in; you will find it smooth, and about 3 or 4 fathoms water, where you may anchor with safety, though your ground tackling is poor.

MUSKOKET CHANNEL.—Several buoys have recently been placed in this channel, which is situated between Martha's Vineyard and the Island of Nantucket.

Vessels bound westward over Nantucket Shoals, and when about 3 miles from Cape Poge light, will be near a black buoy on the north end of Haws' Shoal, which lies moored in 3 fathoms water, Cape Poge Light bearing W. $\frac{1}{2}$ N., the tall steeple in Edgartown W. $\frac{1}{2}$ S., and Sampson's Hill S. W. by W. Leave this buoy on your larboard hand and steer south-westerly, until Cape Poge light bears N. by W., and then steer S. by E. You should be careful to keep the light on these bearings, as the tide runs strong through this channel. A south by E. course will carry you near a red buoy, which lies moored in 3 fathoms water on the outer end of Tom's Shoal, two-thirds of a mile from the shore, and bears from Cape Poge light S. $\frac{1}{2}$ E. When up with this buoy, which you leave on your starboard hand, and bearing about east, one mile distant, is a black buoy, which lies moored in 3 fathoms water, on the S. W. end of Haws' Shoal, which bears from Cape Poge light S. E. by S. $\frac{1}{2}$ S. Leave this buoy on your larboard hand, and continue on your S. by E. course, which will carry you out to sea, having not less than 3 fathoms water, leaving Skiff's Island* on your starboard hand, and Mutton Shoal on your larboard hand,

* Skiff's Island may, perhaps, more properly be termed a shoal; formerly it was an island containing two or three acres of land, now it alters somewhat during a heavy gale, but some portion of it is visible at all times.

upon the west end of which is a black buoy, which lies moored in 3 fathoms water, bearing from Cape Poge light S. by E. $\frac{1}{4}$ E., and from Skiff's Island S. E. by E., three-fourths of a mile distant.

When abreast of Skiff's Island you will have 25 fathoms of water, and as you go to the southward you will gradually shoalen the water to three fathoms, which is all you can carry out of the channel to sea.

Come no nearer the Vineyard shore than three-quarters of a mile, and you can carry 2 fathoms of water from Cape Poge to Washqua Hill.

In beating through this channel, when Cape Poge light bears N. N. W., go about. Should the weather be thick, and the light obscure, when you are stretching over toward Hawes' Shoal, as soon as you commence deepening your water go about; you are near the Shoal.

Should the buoys be out of place, by bringing Cape Poge light to bear N. by W., you can go through the channel in the best water.

S. E. by E. from Cape Poge light, on Hawes' Shoal, lies the wreck of an English brig, which is awash of the water at low tide.

Vessels falling in to the southward and eastward of Gay Head, may keep within three-fourths of a mile from the shore, and can carry 2 fathoms of water around the island to Cape Poge. Be particular and give Washqua Point a berth of three-fourths of a mile, to clear a ledge of rocks that lies off the Point. Keeping this distance from the shore will carry you inside of the shoal at the south of the Vineyard; or you may run down outside, until Cape Poge light bears N. by W., when you may steer directly for it, passing the buoys as before mentioned.

You should not attempt to run in for the Vineyard shore from sea, in order to go down inside the bar, unless you are two miles to the westward of Catama Woods, (a clump of trees at the south part of Edgartown Harbor,) which will carry you clear of the west end of the bar, upon which the sea breaks at all times, and can be distinctly seen.

GAY HEAD LIGHTHOUSE stands at the southwest end of Martha's Vineyard, *Gay Head* on a remarkable promontory, called *Gay Head*, elevated above high water 134 feet, elevated *lighthouse*. tion of light above the sea, 150 feet.

The cliff, which rises about 134 feet above the water, is very conspicuous from the different colors of the earth, which have been exposed by the action of the elements.

The lights revolve once in about four minutes, and are observed twice in each revolution. At the distance of 12 miles they are obscured about three-fourths of the time; at 3 miles distance they may always be seen, though dimly, through parts of each revolution. Cape Poge light at the N. E. point of the Vineyard, may be seen over the land from sea, is a fixed light, to distinguish it from *Gay Head*; also *Cutterhunk light*, at the N. W. part of *Cutterhunk Island*, south entrance of *Buzzard's Bay*, which is also a fixed light. *The Devil's Bridge*, a rocky shoal, makes off about N. W. from the light, one and a half mile distant.

Bearings and distances from the light: West part of *Nomnan's Land Island* bears S. 8° W. from *Gay Head*, $\frac{1}{2}$ miles distant. The island is about three miles long and one broad. *Old Man S.* by E. This is a ledge of rocks which lies two-thirds of the distance from the Vineyard to *Nomnan's Land Island*, which has a passage on both sides, that is but little used. Those who go through must keep near *Nomnan's Land Island* till the light bears north. You will have 7 fathoms water in this passage. *Sow and Pigs*, N. W. by W., $\frac{1}{2}$ leagues. This is a ledge of rocks which is very dangerous. *Newport (Rhode Island) lighthouse*, W. by N. $\frac{1}{4}$ N., distant 11 leagues.

To enter the Vineyard Sound, bring *Gay Head light* to bear S. E. 4 miles distant, and steer E. N. E.

To enter *Buzzard's Bay* through *Quick's Hole*, bring *Gay Head light* to bear S. $\frac{1}{4}$ W., and steer N. $\frac{1}{4}$ E. to the entrance of *Quick's Hole*, which is six miles from *Gay Head*. *Menemsha Bite*, which lies on the north side of *Gay Head*, affords good anchorage $\frac{1}{2}$ to 3 miles east from the light, with the wind from E. to S. W., but being much exposed to the influence of northerly winds, it should be resorted to only in the summer, or at other times from necessity.

From *Gay Head lighthouse*, the south part of *Cutterhunk Island* bears N. 45° W., distant $\frac{1}{2}$ miles.

A lighthouse showing a fixed light, is on the West Chop of *Holmes' Hole*, elevated 60 *Light*. feet above the sea.

If you wish to go to *Holmes' Hole*, or through the sound, bring *Cape Poge light* to bear S. E. by E. $\frac{1}{4}$ E., and run N. W. by W. $\frac{1}{4}$ W.; you will run for the East Chop, and leave *Squash Meadow Shoal* on your starboard hand; get 3 fathoms water on the Chop, then haul to the N. N. W. until you deepen to 7, 8, or 9 fathoms; then run S. W. by W. for *Holmes' Hole Roundstead*, in 4 or 3 $\frac{1}{2}$ fathoms, or N. W. for the sound, to clear the West Chop and Middle Ground.

Gay Head is the westernmost land of *Martha's Vineyard*. When you come by *Gay Head* with a southerly wind, the south channel is best. From *Gay Head* to *Nantucket*

Point, the tide sets directly through the Vineyard Sound with a little variation, after passing Cape Pogo to the eastward, which is caused by a strong tide setting through Tuckanuck Channel. The land of Gay Head is high, and of divers colors, namely, red, yellow, and white, in streaks. In steering from Block Island for Gay Head, you must be careful to avoid the Sow and Pigs; they make a ledge of rocks, some of which are above, and others under water. These rocks lie $2\frac{1}{2}$ miles S. W. by W. from the westernmost of Elizabeth Isles, and W. N. W. from Gay Head $2\frac{1}{2}$ leagues distant; the first of the flood tide sets strong to the northward over them into Buzzard's Bay. Your course along Elizabeth Isles is E. N. E. in 15, 14, 12, 8, 15, 16, and 17 fathoms water; give the isles a berth of about three-quarters of a mile. In running from Gay Head light into Vineyard Sound, if you wish to make a harbor on the north side, bring Gay Head light to bear S. W., and run N. E. 3 leagues, which will carry you up with Tarpaun Cove light, where you may anchor in from 4 to 18 fathoms, on fine sand, the light bearing from W. by N. to S. W., affording safe anchorage with northerly winds. You can anchor in this harbor in from 4 to $2\frac{1}{2}$ fathoms, taking care to avoid two rocks, one on the north the other on the south side of the harbor. To avoid the northern one, of 14 feet, do not bring the light to bear to the south of S. S. W.; and to avoid the other, of 13 feet, do not bring the light to bear south of S. $\frac{1}{2}$ W.

*Tarpaun
Cove light.*

TARPAULIN COVE LIGHT lies on the larboard hand as you enter that harbor, and shows a fixed light, elevated 80 feet above the sea. It bears about N. E. by N. from Gay Head light, which is a revolving light, $3\frac{1}{2}$ leagues distant.

A shoal of 13 feet, $2\frac{1}{2}$ miles S. by E. $\frac{1}{2}$ E. from Tarpaun Cove, has been found by Lt. C. H. Davis, U. S. Coast Survey. One-third of a mile N. E. from the lighthouse, there is a rock of 7 feet water, on which there is a black buoy. High water full and change 11 45.

When coming from sea, you may run for Gay Head light when it bears from N. N. E. to E. S. E., giving it a berth of 2 miles, to clear the Devil's Bridge, which bears from the light N. W., $1\frac{1}{2}$ mile distant. As measuring the distance in the night would be uncertain, you must keep your lead going, and if you should have 7 or 8 fathoms when the light bears S. E. by E., or S. E., haul up north till you have 10 or 12 fathoms; then with flood steer N. E., and with ebb N. E. by E. 3 leagues; then E. N. E. will be the course of the sound, which will carry you to the northward of the Middle Ground, which has a black buoy on the east end, in 16 feet water, bearing from Tarpaun Cove light E. 4 leagues; from West Chop light N. W. by W. half a mile; and from the black buoy on Hedge Fence W. $\frac{1}{2}$ N. 3 leagues, (shoalest water on Middle Ground two feet,) when you will see the West Chop of Holmes' Hole light, which you may run for; keep one mile from shore till you open the East Chop one cable's length, and with a flood tide steer direct for it, and with ebb keep it one point open, till you open a wind-mill on the west side of the harbor about one cable's length, then run up in the middle of the river, till you come to 4 or 3 fathoms, where you may anchor on good ground. The usual mark for anchoring is the West Chop, bearing from N. N. W. to N. W. by N.; but if you lie any time here, the best anchoring is well up the harbor, and close to the shore, mooring S. E. and N. W., in 4 or 5 fathoms water. In this harbor which is about two miles deep, you will lie secure from all winds except a northerly one.

Buoy.

You must not keep further than two miles from the West Chop, as there is a shoal called Hedge Fence, on the east end of which is a black buoy, in 16 feet water, bearing from West Chop east, 6 miles, and from the black buoy on Middle Ground, E. $\frac{1}{2}$ S. 3 leagues. The Hedge Fence lies about $3\frac{1}{2}$ miles N. E. by N. from Holmes' Hole light, and extends W. N. W. and E. S. E. 6 miles, is about half a mile broad, and has 4 feet water on the shoalest part. Between this shoal and Holmes' Hole there are from 8 to 12 fathoms water.

If you make the Chop in the night, when it bears S. E. you are clear of the Middle Ground; steer for the east side of it till you strike in 4 or 3 fathoms on the flat ground near the Chop, then steer S. E. by E., observing not to go nearer the land than 3 fathoms. If, in running S. E. by E., you fall into 6 or 7 fathoms, haul up S. by W., or S. S. W., and run into 4 or 3 fathoms, as before directed.

If bound into Vineyard Sound, with the wind at the eastward, and you are near the south side of Martha's Vineyard, to go between Squibnocket and the Old Man, run round Squibnocket in $3\frac{1}{2}$ and 4 fathoms water, continuing N. N. W. along the beach till you come to Gay Head light, and if ebb tide, anchor in 5 fathoms, the light bearing from N. to N. E.

Vessels entering the Vineyard Sound should leave Cutterhunk light on the larboard hand, giving it a berth of 3 miles, to avoid the Sow and Pigs, the western part of which bears S. 56° W. from the light, $2\frac{1}{2}$ miles distant. Cutterhunk is one of the Elizabeth Islands.

*Cutterhunk
light.*

Sow and Pigs to those entering the bay and Vineyard Sound. It is a fixed light, elevated 48 feet above the sea at high water.

SOW AND PIGS.—The floating light off Sow and Pigs, is moored in 9 feet water. *Sow* and *Pigs*, 2 3/4 miles from Cutterhunk lighthouse, at the distance of 2/3 of a mile north-easterly from the light vessel, there are 3 1/2 fathoms water on the Sow and Pigs, between which point and the light vessel there is a safe channel. One mile N. easterly from light vessel the rocks dry at half ebb.

West Point Pune Island,.....	N. 34° E.....	3 do.
Gay Head lighthouse,.....	N. 42° E.....	7 do.

In entering Buzzard's Bay, bring Cutterhunk light to bear east, 3 miles distant, and steer N. E. by N., which course will carry a vessel to good anchorage, in 6 1/2 and 7 fathoms, about one mile from the Dumplin Rock light, with it bearing from N. N. E. to N. E. by N. This is as far as a stranger should venture without a pilot, who can always be had on setting a signal.

VINEYARD SOUND.—In coming into the sound in the night, with a strong north-westerly wind, haul to the northward till you have smooth water under the Elizabeth Islands, where you may anchor in 14 or 10 fathoms. Should you have the wind to the southward, it will be best to run down through the South Channel or Vineyard side. When Gay Head light bears S. S. E. your course is N. E. by E. 1/2 E. or E. N. E., observing not to come nearer the land than into 7 fathoms water, till you are abreast of Lambert's Cove, in which is good anchorage, with southerly or easterly winds, and may be known by a high sand-bank, called Necunkey Cliff, on the east side of it, about midway the cove, opposite which you may come to in 5 or 3 fathoms, sandy bottom, where is the best anchoring. The Middle Ground lies about two miles without the cove, and has 12 feet water on it. If you intend running down for Holmes' Hole, your course, when opposite Necunkey Point, is E. by N., keeping near the land to clear the Middle Ground, the east end of which bears east from Turpaulin Cove light 4 leagues distant. You may track the shore by the lead in from 7 to 4 fathoms, till you come near the light; but come no nearer than 3 fathoms; and you may track the Chop around, the same as running down to the northward of the Middle Ground, which bears from the West Chop light N. W. by W. half a mile, and from the east end of the Hedge Fence, W. 1/2 N. 3 leagues. There is a good anchoring along this shore, in 6 or 4 fathoms, after you are to the eastward of Necunkey Point, till you come near the West Chop. If you wish to make a harbor after entering the Vineyard Sound, bring Gay Head light to bear W. distant 8 miles, and run S. E. till you come into 7 fathoms water, which will be on the east side of the bay in Nimshobite, near Clark's Spring, where the best water may be had in great abundance, and lie in good anchorage. Gay Head light bearing W. by N. The tide flows, at change and full days of the moon, at 9 o'clock, but in the channel between Elizabeth Islands and Martha's Vineyard, the flood runs till 11 o'clock. In this channel there is a Middle Ground, which is a narrow shoal of sand, the eastern end of which bears N. W. by N. from the light. There are not more than 3 or 4 feet on the eastern end. N. W. from Necunkey Cliff are 3 and 4 fathoms across the ground. Opposite Lambert's Cove are 12 feet, and to the westward of that, are 3 or 4 fathoms. The shoal lies W. by S. and E. by N., is about 4 leagues in length, and has several swashes on it. When the East Chop of Holmes' Hole comes open of the West Chop, you are to the eastward of the Middle Ground. Your course from Turpaulin Cove light to Holmes' Hole light is E. 1/2 N., distant 3 leagues. In steering this course, you must have regard to the tide, as the ebb may set you too far to the southward, and the flood too far to the northward, and stand in for the harbor, when you have opened the East Chop, as before directed. From Holmes' Hole light to Cape Poge light, the course is E. S. E., and the distance about 3 leagues. In the channel between them there are 12 and 11 fathoms water. In going over the

Vineyard Sound.

Tide.

shoals through this channel, you must be careful to keep your lead going, in order to avoid a dangerous sand which lies on the north side of it, called the Horse-shoe, distant from Cape Poge 3 leagues. The channel between this sand and Cape Poge, and also between the former and * Tuckanuck Shoal, is narrow; in it there are from 12 to 4½ fathoms water, the latter of which is between the east end of the Horse-shoe and Tuckanuck Shoal. When Tuckanuck Island bears S. S. W. you are to the eastward of the Horse-shoe. On the south side of the channel, also, there are several spots of shoals, to avoid which you must keep your lead going.

New Bedford, through Quick's Hole. Lighthouse.

NEW BEDFORD, THROUGH QUICK'S HOLE.—Bring Gay Head lighthouse which contains a revolving light, to bear S ¼ W. and run N. ¼ E. till you come to the passage through the Islands, which forms Quick's Hole, which you must enter as near the middle as possible; but if you deviate, keep the starboard hand best on board, to avoid a spit or flat which runs off from the S. E. point of Nashawina, on the larboard hand, when you will have from 5 to 6 fathoms, then haul square into the Hole, keeping the larboard hand best on board, following somewhat the bend of the shore. You will keep Gay Head light open about a ship's length by the S. E. point of Nashawina, till you are at least one mile north of the Hole, which will carry you to the eastward of a ledge and rock that lie that distance from it, with only 5 to 12 feet water on them, to the westward of which is a good channel, and 5 fathoms all round. Then steer N. ¼ W. till you strike hard bottom in 5 fathoms water, on the S. E. corner of the Great Ledge, which is on the western side of the channel; then N. E. by N. about three-fourths of a mile, till in 5½ or 6 fathoms, sucky bottom, when the light will bear N. N. W.; then steer N. by W. and run into the river. † After passing ‡ Clark's Point light, you will see a small island called Outer Egg Island, just above water, which you will leave on your starboard hand, giving it some berth, as there are rocks which lie south-westerly from it, say one-third of a mile distant, but still keeping nearer to it than to the main land, to avoid Butler's Flat, which makes off from the west shore. To steer clear of this flat, keep the lighthouse open a ship's length to the westward of the Round Hills. As soon as you open the north line of the woods with the clear land, about a mile north of the lighthouse, you are to the northward of the flat, and may steer direct, either for the hollow or the high part of Palmer's Island, hauling a little to the eastward as you approach it. The passage between this island and Fort Point, on the starboard hand, is narrow. A flat which extends out S. W. from the point, makes it necessary to keep nearest the island. As you draw towards the north end of the island, give it a berth of two ships' length, as a small flat makes off east from its N. E. point. As soon as you have passed the island one cable's length, the town will appear open on your larboard hand, when you may run for the end of the wharf which projects out farthest into the channel (Rotch's Wharf); or, to anchor in the deepest water, bring Clark's Point light without Palmer's Island.

Palmer's Island Light.

PALMER'S ISLAND LIGHT is on the N. E. point of Palmer's Island. It is 37 feet high, and a fixed light. With it in range with Clark's Point light, you clear all the ledges outside.

In the river Palmer's Island light on with the most Northern Mill Chimney, leads out of the river clear of danger.

Other directions from Quick's Hole to New Bedford are, to make a north course good till you strike hard bottom in 5 fathoms, on the eastern side of the channel, and then haul up N. N. W., but the former directions the pilots consider safest.

In coming into New Bedford from the westward, the eastern channel is safest for strangers. Give the Sow and Pigs a berth of one mile, and run N. E. by N. till Penikese Island bears S. E.; then E. N. E. till Gny Head light bears S., and then N. ½ W., as before directed.

A rock lies off N. W. from the north end of Penikese Island about one mile distant, on which there are only 8 feet at low water. Between this and Wilke's Ledge (on which there is a black buoy) is an open ship channel, free from danger, and courses may be varied as circumstances require. By those who are acquainted with the bay, the western

* Tuckanuck Shoal lies between Cape Poge and Tuckanuck Island. On the shoal a floating light is moored.

† When running from Quick's Hole for the N. Ledge, as soon as you find yourself in 7 fathoms water, you may be sure that you are abreast of the Great Ledge, or have passed it.

‡ Clark's Point lighthouse stands on the south end of Clark's Neck, containing a fixed light, elevated 52 feet above the level of the sea, at high water, and is intended to guide vessels into the harbors of New Bedford and Fairhaven. The light bears from Outerhunk light, N. 20° E. 11½ miles distant.

From the light to Dumplin Rock light,	S. 24° W. 3½ miles.
“ “ Centre Quick's Hole,	S. 10° E. 9 do.
“ “ Black Rock,	S. 54° E. 2¼ do.

channel is a berth, the d about five-si Mishaun H not more th the Dumpli bla's length to avoid the direct cours a mile, and You may al it and the 1 DUMPLI 3½ miles S centre of a oa Middle 2½ miles; K Quick's H Penikese I and Pige S. Moshe latter with t Packet R upwards, W Bedford up The soun

channel is most commonly used. Giving the Old Cock, Hen and Chickens a sufficient berth, the only danger to be avoided in approaching Mishauam Point, is a rock which lies about five-sixths of a mile S. W. from it, on which there are only 6 feet water. Having passed Mishauam Point, S. W. of which, $\frac{3}{4}$ of a mile distant, there is a ledge, on which there are not more than 3 fathoms at low water, and sometimes less, you may steer directly for the Dumplin Rock light, off the Round Hills, and which may be passed within two cables' length to the eastward. Hence to Clark's Point light the course is N. N. E.; but to avoid the Middle Ledge, (on which there is a red buoy,) and which lies very near in a direct course from the outer Dumplin to the light, it is better to steer N. E. by N. about a mile, and then haul up N. N. E.; when you will leave the ledge on your larboard hand. You may also carry in 4 fathoms to the westward of the ledge, but the channel between it and the Lone Rock, which lies N. W. from it, is narrow.

DUMPLIN ROCK LIGHT, is on one of the Dumplin Rocks in Buzzard's Bay, *Dumplin Rock Light. Lighthouse.* 34 miles S. S. W. from Clark's Point lighthouse. The lantern is on a tower on the centre of a dwelling-house, showing a fixed light, forty-three feet above the sea. Buoy on Middle Ledge, N. E. by N. $\frac{1}{2}$ N. 1 $\frac{1}{2}$ mile; Buoy on North Ledge, N. E. $\frac{1}{2}$ E. 2 $\frac{1}{2}$ miles; Buoy on Great Ledge, E. $\frac{1}{2}$ S. 1 mile; Wood's Hole, E. by S. 11 miles; Quick's Hole, S. by E. $\frac{1}{2}$ E. 6 miles; Buoy on Wilke's Ledge, S. by E. $\frac{1}{2}$ E. 1 $\frac{1}{2}$ mile; Penikese Island, S. by W. 6 miles; Cutterhunk lighthouse, S. S. W. 7 $\frac{1}{2}$ miles; Sow and Pigs S. S. W. $\frac{1}{2}$ W. 9 miles, Mishauam Point, S. W. $\frac{1}{2}$ W. 2 miles; White Rock, N. $\frac{1}{2}$ E. $\frac{1}{2}$ of a mile.

When bound to sea, a S. W. by S. course from the Dumplin Rock light will carry you just without the ledge south of Mishauam Point, and in a fair channel way between the Sow and Pigs, and Hen and Chickens.

From Seaconnet Rocks (giving them a berth of one mile) to the entrance of Buzzard's Bay, the course is E. $\frac{1}{2}$ S. By this course made good, all the dangers of the Hen and Chickens will be avoided. Soundings generally, from 9 to 7 fathoms, and mostly hard bottom, till it deepens to 16 fathoms, sucky bottom. when Cutterhunk Island light will be upwards of a mile distant, and Clark's Point light will bear N. N. E., and you may run directly for the light till up with the Dumplin Rocks, to which a sufficient berth must be given. Or you may stand on this N. N. E. course till in 7 fathoms, sucky bottom, which will be between Mishauam Point and the Round Hills, and come to anchor, or otherwise, steer N. N. E. till Pune Island bears S. E., and then E. N. E. for Quick's Hole channel, as before directed. It may be well to observe, that if, when you have stood in from Seaconnet Point towards Cutterhunk Island light, and the light on Clark's Point is not to be seen, but you can see Gay Head light, you may stand on your course E. $\frac{1}{2}$ S. till you shut it in behind the west end of Cutterhunk, but must then immediately change your course to N. N. E. If neither light is to be seen, the soundings are the only dependence, and must be very carefully attended to. In light winds you must take care the flood tide does not carry you into Buzzard's Bay, or on the Sow and Pigs.

ADDITIONAL REMARKS.—To the S. E. of the Dumplin Rock light, one-half to three-quarters of a mile distant, is a sand-spit with only 7 feet of water on it. Between this spit and the rocks, there are 5 fathoms water.

Lone Rock, on which a black buoy lies, about 35 feet S. by E. from the rock; from which Clark's Point lighthouse bears N. N. E.; Outer Dumplin Rock, S. by W. $\frac{1}{2}$ W.; Round Hill S. W. $\frac{3}{4}$ S.; White Buoy at Hussey's Rocks S. W. by W., distance by estimation, one mile. The entrance of Apponeganset River N. W., and N. W. of the Middle Ledge, nearly half a mile distant, is nearly or quite dry at low water, when there are 2 $\frac{1}{2}$ fathoms around it. Between this rock and the Hussey Rock is the entrance to Apponeganset River; depth of water in the channel 3 $\frac{1}{2}$ fathoms. There is also a channel between the Hussey Rock and White Rock. Course from Quick's Hole to entrance of Apponeganset River, N. N. W.

The White Rock, on which a white buoy lies, about 40 feet S. S. E. from the Hussey's Rocks, from which Round Hills bear S. S. W.; white Rock south, and distant by estimation, one mile; Clark's Point lighthouse N. E. by N.; Buoy at the Lone Rock N. E. by E. and the entrance of Apponeganset River, N. N. W. appears considerably high above water, and the two rocks to the westward of it, called the Rugged Rocks, are always to be seen.

A small rock to the S. W. of the North Ledge, (about one mile distant from the buoy,) with only 7 feet water on it, and another small rock to the N. E. of the same ledge, (about half a mile distant from the buoy,) with 10 feet water on it, were recently discovered by Capt. Mosner. On the former he struck with the brig Commodore Decatur, and on the latter with the brig Elizabeth.

Packet Rock, a small sunken rock, on which there are 4 feet water, lies half a mile, or upwards, W. by N. from Black Rock. The passage for coasting vessels bound from New Bedford up the bay, is between Packet and Black Rocks.

The soundings across the western entrance of Buzzard's Bay, between the Sow and

Pigs, and Hen and Chickens, and some distance within them, are very irregular, varying from 5 to 10 and 15 fathoms, and bottom generally hard.
 A south-east moon makes high water in the bay, and the average set of tide is 1½ knot.

Buzzard's Bay.

BUZZARD'S BAY.—The entrance of Buzzard's Bay lies between Bird Island on the N. W., and Wing's Neck on the S. E. Sailing for Monument River, the best water is near to Wing's Neck, and from the point of Wing's Neck, nearly up to the southernmost of Tobus Islands, are from 4 to 6 fathoms water. Near to the Island, (Tobus,) commences a ridge of flats, extending over to the N. W. shore, on which are 7 to 9 feet water. Having passed over this ridge, you will have from 15 to 20 feet water, which depth you may carry until abreast of a large single rock, called the Old Cow, which lies about one-quarter of a mile from the shore, when you will come up with a ridge of hard sand, from 100 to 120 fathoms wide, on which are from 7 to 9 feet water, which, after passing, you will have from 18 to 22 feet water, quite up to Buck River Harbor. The soundings are reduced to low water. Rise from 3 to 6 feet. High water at full and change of the moon at 8 o'clock.

Bird Island is on the north shore of Buzzard's Bay, near the east side of Sippican Harbor, in the town of Rochester, about 12 miles E. N. E. from New Bedford lighthouse. It is small, not containing more than three acres of land, and is about five feet above the level of the sea. The light and dwelling-houses are built of stone, and are whitewashed.

The tower of the former is 25 feet high, on which is a lantern 7 feet high. It is a revolving light; time of revolution $3\frac{1}{2}$ minutes.

There are three of the Tobus Islands, but at low water they are all connected.

BUOYS IN BUZZARD'S BAY.—There are 5 buoys placed in Buzzard's Bay, viz: *Buoys in Buzzard's Bay.*
 A yellow buoy on the S. E. part of the North Ledge, in 2½ fathoms water; a red buoy, lying in very shoal water, on the centre of the middle, which is a small ledge; a white buoy on the S. E. part of the Great Ledge, in 3 fathoms water; a black buoy on the S. W. part of Wilke's Ledge in 2½ fathoms water—all on the western side of the bay; and a white buoy in 2 fathoms water, on West's Island Ledge, on the eastern side.

All these buoys, except the one on West's Island Ledge, are taken up in the winter.

Bearings and distances from Bird Island lighthouse.

The south point of West's Island, S. W. $\frac{3}{4}$ W. 8 miles.
 West's Island Ledge, S. W. $\frac{1}{2}$ W. 9½ miles.
 The north entrance of Quick's Hole, S. W. by S., 15 miles.
 Wood's Hole, due, S. 9 miles.
 The entrance of Monument River, E. N. E. $\frac{1}{2}$ N. 7½ miles.

Bearings and distances of sundry places in the vicinity of Buzzard's Bay.

From Wing's Neck to the lighthouse on Bird Island, W. by S., 2½ miles.
 Minister's Neck, S. by E. $\frac{3}{4}$ of a mile.
 From Great Rocky Point to the south end of Mishaum Island, S. W. $\frac{1}{4}$ W., $\frac{5}{8}$ of a mile.
 Hog Island, W. by S., $\frac{1}{2}$ of a mile.
 Wing Neck, S. W., 3 miles.
 Tobus Island, S. S. W., $\frac{7}{8}$ of a mile.
 Old Cow Rock, S. by E. $\frac{1}{2}$ E., $\frac{1}{2}$ of a mile.
 From the south end of Mishaum Island to Bird Island, S. W. by W. $\frac{1}{2}$ W. 4½ miles.
 Wing's Neck, S. W. $\frac{1}{2}$ S., 2½ miles.

WEST ISLAND LEDGE BUOY.—West Island Ledge lies in Buzzard's Bay, between 3½ miles S. E. by E. from Clark's Point lighthouse, in from 4 to 4½ fathoms water. *West Island Ledge Buoy.*
 A large white buoy has been placed over the ledge.

WAREHAM HARBOR, IN BUZZARD'S BAY.—This harbor can only be attempted in the day time; and the only safety is to keep in between the buoys, of which there are 9 in number, leaving in going in, the black buoys on the starboard hand, and the white on the larboard. *Wareham Harbor, in Buzzard's Bay.*

NED'S POINT LIGHTHOUSE is situated on the north side of Buzzard's Bay, and on the east side of Mattapoisett Harbor, about one mile S. E. from the village, and contains a fixed light. The tower is built of stone, and whitewashed, standing 45 feet from the sea to the S. W., and 250 feet from the sea to the S. E. The lantern is elevated 40 feet above the level of the sea. *Ned's Point Lighthouse.*

Bearings and distances from Ned's Point lighthouse.

A buoy on Nye's Ledge, S. 20° E., distant two and a half miles.
 A buoy on S. E. point of Mattapoisett Ledges, 10½° E., distant one and seven-eighths of a mile.

A buoy on Snow's Rock, S. 10° E. distant three and one-quarter miles.
 A buoy on N. W. part of Mattapoisett Ledge, S. 3½ W., distant one and a half mile.
 Cormorant Rocks, S. 4° E., distant three and a half miles.
 Angoloco Point, S. 55° E. distant one and three-quarter miles.
 Wood's Hole, S. 22° E., distant nine miles.

Before coming up with West Island, bring Bird Island light to bear N. E. by N., and run for it until Ned's Point light bears N. N. W., half W., when you may haul up N. W. half W. In running this course, you will pass a buoy, painted white, with two black stripes around it, which stands on the middle of Nye's Ledge, in two and one-half fathoms water; this ledge is about a quarter of a mile over, either way, and not more than eight feet water on some parts of it. Continuing this course, you will pass a buoy on your larboard hand, painted white, with three black stripes around it, which stands on the S. E. part of Mattapoisett Ledge, in two and one-half fathoms of water. Continue the above course and you will pass two buoys, one on your starboard, and the other on your larboard hand; the latter stands on the east side of the Sinking Ledge, in three fathoms of water; the former stands by the side of the Snow Rock, in two and one-half fathoms of water. This rock has eight and one-half feet water on it. Keep midway until you pass them, when you may steer N. W. by W., until Ned's Point light bears east, when you may anchor in three fathoms water, good bottom.

BLUNT'S AMERICAN COAST PILOT.

There are two other buoys not named above; the one stands about N. E. from Snow Rock, in three fathoms of water, by the side of the Barstow Rock; the other on the extreme point of Ned's Point, in two fathoms of water.

Matapoisett has a fine harbor, and easy of access.

Block Island.

BLOCK ISLAND.—Two lighthouses are erected on the N. W. Point of Block Island, showing fixed lights, bearing N. and S., distant 25 feet from each other, and elevated 58 feet above the level of the sea. From the point extending into the sea, in nearly a N. $\frac{3}{4}$ E. course, is a shoal, making it dangerous for a vessel to pass within two miles of the light. From this shoal, Montock Point lighthouse bears S. W. by W. $\frac{1}{4}$ W.; Point Judith Point lighthouse, N. E. by N.; Watch Hill lighthouse, W. N. W.; Clay Head, (Block Island,) S. E. by E.; rocks off Clay Head, S. E. by E. $\frac{1}{2}$ E.; and the S. W. part of Block Island, S. S. W. $\frac{1}{4}$ W.

The two lights cannot be made separate when to the northward, unless in a position to make Point Judith light N. E., when they appear like the lights of a steamboat.

Vessels coming from the southward, or south and westward, will make Block Island. Give it a berth of about one mile, on the east and west sides. The two lights situated on the N. W. point of this island, are so near together, they appear as one light until you are within two or three miles of them. Off the N. W. Point, a shoal makes out N. $\frac{3}{4}$ E., which renders it dangerous for large ships to pass within two miles of the lights. Point Judith light bears from these lights N. E. $\frac{1}{4}$ N., distant 11 miles. After passing Point Judith, follow the directions for sailing into Newport.

Lighthouse.

From the S. E. part of Block Island to Rhode Island lighthouse, the course is N. by E. $\frac{1}{4}$ E., and the distance 19 miles; about midway between them there are 24 fathoms water. If you are on the west side of Block Island, with the body of the island bearing E. N. E., in 8 or 10 fathoms water, your course to Point Judith light is N. E. by E., about 6 leagues. This point appears like a nag's head, and is pretty bold; between Block Island and the point there are from 30 to 6 fathoms water, except a small shoal ground, which, in thick weather, is often a good departure, say 4 to 5 fathoms, bearing about W. by S. from Point Judith light, distant 3 miles. From Point Judith, when not more than a quarter of a mile from the point to Rhode Island Harbor, your course is N. E., and the distance is about 8 miles. When in 13 fathoms water, Point Judith light bearing W., or W. by N., the course to Rhode Island Harbor is N. E. by N. $\frac{1}{4}$ N., and the distance to the lighthouse 2 leagues. The lighthouse, together with the Dump-lins, must be left on your larboard head; it stands on the south part of Conanicut Island. This point is called the Beaver's Tail, and is about 2 leagues distant from Point Judith.

Point Judith Lighthouse.

POINT JUDITH.—The lighthouse on Point Judith is a stone edifice, 40 feet high. The lamps are 60 feet above the level of the sea, and contain a revolving light, to distinguish it from Newport light, which stands on Conanicut Island, and is a fixed light. The distance from the lighthouse to high-water mark, is as follows: E. from the lighthouse to high-water mark, 16 rods; S. E., 14 rods; S. 18 rods; S. S. W., 23 rods; which is the extreme part of the point, to which a good berth should be given. The light on Point Judith bears S. W. $\frac{1}{4}$ S., 2 leagues distant from Newport, (Rhode Island) lighthouse. Point Judith light may be distinguished from Watch Hill light, by the light not wholly disappearing when within 3 leagues of it.

Newport Harbor.

NEWPORT HARBOR.—Conanicut Island lies about 3 miles west of Newport, the south end of which (called the Beaver's Tail, on which Newport lighthouse stands) extends about as far south as the south end of Rhode Island. The lighthouse on Goat Island bears N. 60° E. from the light on Conanicut Island, and Kettle-bottom Rock N. E. The east shore forms the west part of Newport Harbor. The ground the lighthouse stands upon is about 12 feet above the surface of the sea at high water. From the ground to the top of the cornice are 50 feet, round which is a gallery, and within that stands the lantern, which is about 11 feet high, and 8 feet in diameter. It contains a fixed light.

A sunken rock lies south of Beaver Tail, called Newton Rock, on which it breaks if there be any sea, distant 200 yards from Rhode Island lighthouse.

The following are the bearings by Compass, from Beaver Tail lighthouse, of several remarkable places, together with the distances, viz:

- Block Island, (S. E. point,).....S. W. by S. $\frac{1}{4}$ S.
- Point Judith light,.....S. W. $\frac{1}{4}$ S., distant 2 leagues.
- Block Island, (S. E. point,).....S. W. $\frac{1}{4}$ S., or S. W. by S., nearly.
- Block Island, (middle,).....S. W. $\frac{1}{4}$ S., distant 6 leagues.
- Block Island, (S. E. end,).....S. W. by S. $\frac{1}{4}$ S.
- Whale Rock,.....W. $\frac{1}{4}$ S.
- Brenton's Reef,.....E. S. E. $\frac{1}{4}$ E.
- South Point of Rhode Island,.....E. $\frac{1}{4}$ S.
- Highest part of Castle Hill,.....E. N. E. $\frac{1}{4}$ E.

N. B. The anchoring place between the town of Rhode Island and Coster's Harbor, N. E. by E.

BRENTON'S REEF—Brenton's Reef extends about one mile S. by W. from the main shore, on the eastern side of the entrance; some portions of it are bare at low tide, and may at all times be seen breaking, with a little motion of the sea. A buoy has been moored on the extreme S. W. part of the reef, in five and a half fathoms at low spring tides; it is a spar painted red, the top of which is 25 feet above the level of the sea, and may be seen in clear weather from three to four miles. Point Judith lighthouse bears from the buoy S. W. by W., distant 9 miles; Beaver Tail lighthouse, W. by N. $\frac{1}{2}$ N., two miles; Seaconnet Rocks, E. by S. 8 miles; Castle Hill, N. $\frac{1}{2}$ E., one mile. The buoy may be neared on all sides, within a cable's length, but vessels should not pass to the northward of it, unless well acquainted. After passing to the southward of this buoy, and bound to Newport, or up Providence river, follow the directions.

Brenton's Reef.

A little within the lighthouse, and near to the shore, on the west side, there is a cove called Mackerel Cove, the entrance to which is shoal and dangerous. As both ends of these islands are pretty bold, you may pass into the anchoring at either end, and ride nearer to Goat Island side than to that of Rhode Island, as the other parts of the harbor are grassy, and would be apt to choke your anchors. Rhode Island is navigable all round, by keeping in the middle of the channel.

Lighthouses.

GOAT ISLAND lies before the town of Newport, about 5 miles N. E. from Newport light, and has a lighthouse on the north end, containing a fixed light, from which the following bearings have been taken:—Newport lighthouse bears S. 60 W. equal to S. W. by W. $\frac{1}{2}$ W., distant 5 miles; west shore of Castle Hill, S. 54 W., or S. W. $\frac{3}{4}$ W., 3 $\frac{1}{2}$; Brenton's Point S. 51 W., or S. W. $\frac{1}{2}$ W., 1; South Dumplin Rock, S. 70 W., or W. S. W. $\frac{1}{2}$ W., 1 $\frac{1}{2}$; Conanicut Ferry, N. 71 W., or W. N. W. $\frac{1}{2}$ W., 2 $\frac{1}{2}$; south point of Rose Island, N. 58 $\frac{1}{2}$ W., or N. W. by W. $\frac{1}{2}$ W. $\frac{1}{2}$; Gull Rock, N. 11 $\frac{1}{2}$ W., or N. by W., $\frac{1}{2}$; west shore of Coster's Harbor Island, N., 1 $\frac{1}{2}$; buoy on the north point of Goat Island, N. 50 E., or N. $\frac{1}{2}$ E. $\frac{1}{2}$. Large vessels go south of the buoy.

Goat Island. Lighthouse.

Narragansett Bay lies between Conanicut Island and the main. Your course is in about north, taking care to avoid Whale Rock; you may pass in on either side, and anchor where you please. From the lighthouse on Conanicut Island, to Gay Head, on Martha's Vineyard Island, the course is E. by S. $\frac{1}{2}$ S., and the distance 9 leagues.

You must take care to avoid the rocks which lie off south from Castle Hill, some of which are above water. Castle Hill is on the east side of Rhode Island Harbor, N. E. from which is Fort Adams, from the north end of which a reef extends.

Vessels coming from the eastward, to clear Brenton's Reef, bring Newport light to bear W. N. W., and steer for it until they see Goat Island light from the deck, which will then bear N. E. $\frac{3}{4}$ E.; then run for Goat Island light until it bears E., (or continue your course until it bears E. S. E.) at the same time keeping Newport light bearing S. W. by W., and anchor in 7 to 9 fathoms, good bottom. In coming from the west, after passing Point Judith, (the lighthouse whereon has a revolving light,) steer N. E. by N., until you draw up with Newport light, to which giving a berth, run for Goat Island light, and anchor as above directed. Goat Island lies before the town of Newport, extends about north and south, and has a fort on it; off the N. E. point lies a buoy in 16 feet water.

A large white buoy is also placed at the end of the shoal, which makes out from the south end of the island, in 10 feet water. The shore on the north and south ends is rocky, and you must not attempt going between the buoys and the island.

Vessels coming from the westward through Long Island Sound, bound to Rhode Island, will leave Fisher's Island on the larboard hand, and steer E. by N., which will carry them to Point Judith, keeping in not less than 10 fathoms water, giving the point a berth of one mile, when you will see Newport light bearing N. E. $\frac{1}{2}$ N., distant 6 miles; steer for it, leaving it on your larboard hand; you will then steer for Goat Island light, which bears from Newport light N. E., distant about 5 miles; keeping the latter bearing S. W. by W. until you bring Goat Island light to bear E., or E. S. E., and anchor in from 7 to 9 fathoms water, good holding ground. Between Newport light and the North Dumplin, you will have from 18 to 28 fathoms water.

If, after passing Point Judith, as before directed, you wish to proceed toward Providence through the West Passage, your course is N. E., leaving Newport light (on Conanicut Island) on your starboard hand, half a mile distant, when your course will be N. by W., 1 $\frac{1}{2}$ league, to Dutch Island light, (erected on the south part of the island, show-

ing a fixed light,) which you also leave on your starboard hand, one-quarter of a mile distant, from which you steer N. $\frac{1}{2}$ E., 14 miles, for the light on Warwick Neck, leaving it on the larboard hand, one-quarter of a mile, where you may anchor in 3 fathoms water, as it is not safe to proceed further without a pilot, unless you choose to depend on finding the channel, which is marked out by stakes.

In entering this passage, keep nearest Conanicut Island, to avoid the Whale Rock, which bears from Newport light S. 82° 30' W., distant about three-fourths of a mile, with some scattering rocks north and south of it.

Lighthouse.

Warwick Neck lighthouse is erected on the south part of Warwick Neck, and shows a fixed light. A spar buoy is placed on Long Island Point, off Warwick Harbor, $1\frac{1}{2}$ mile distant, which must be left on the larboard hand going into East Greenwich.

Buoys and Spindles.

BUOYS AND SPINDLES PLACED AT NEWPORT HARBOR.—A spindle on Saddle Rock, eastward of Rose Island, on either side of which there is a passage.

A spindle with a ball, on a rock at the south end of the island, which you leave to the northward.

One red buoy, with a cross, on Dyer's Reef, south part of Coster's Harbor, which you leave on the starboard hand.

One on the ledge off the Bishop's Rock called the Triangle Rock, on either side of which you may pass, giving the buoy a berth.

One red spar buoy at the south, and one at the north end of Gull Rocks, both of which you pass to the eastward.

One spar buoy on Providence Point, which is the north end of Prudence Island, to the northward of which is the main channel.

At Plum Beach a spar buoy painted red and moored on the extreme N. E. part of Plum Beach point, in 14 feet at low tide, bears from Dutch Island light N. $\frac{1}{2}$ E. distant 2 miles. Vessels bound up the Bay must leave it on the larboard hand and give a berth of one cable's length, and continue the course up the Bay.

Flat Rocks off Wickford, a spar buoy painted red, in 15 feet at low water.

Manna Rock, a spar buoy painted red. The above buoy bears from Poplar Point Lighthouse E. by N. $\frac{1}{2}$ N. These buoys are in a range and the channel varying; no proper directions can be given.

A Dolphin has been placed on Long Bed in Providence River, in lieu of the buoy formerly placed there.

Newport to Providence.

NEWPORT TO PROVIDENCE.—Pass Half-way Rock, which lies nearly in middle of the river, about $5\frac{1}{2}$ miles from Newport, and $1\frac{1}{2}$ mile from the south end of Prudence Island, there is a passage on both sides of the rock. West from Prudence Island lies Hope Island, having a passage all round, giving the N. E. end a small berth.

From the Triangle Rock, which lies off the Bishop Rocks, on which is a buoy that may be passed on either side, to Warwick Neck light, the course is N. $\frac{3}{4}$ W. After leaving Prudence Island, 3 miles N. E. by N. from Warwick Neck light, you pass on your larboard hand a spar buoy, which you may go very close to. E. $\frac{1}{2}$ S. from Warwick Neck light lies a spar buoy, which you leave on the starboard hand. When Warwick Neck light bears W., steer N. N. E. for Nyatt Point light, leaving the spar buoy on Providence Point on the starboard hand, and running so far to the eastward as to bring Prudence Island to bear south, by which you leave the Middle Ground, which has a buoy on it, on the larboard hand. Nyatt Point light is on the starboard hand, and 9 miles from Providence. Soon after passing the light you come up with a pyramid, directly opposite the village of Petuxent, the base of which is painted black, with a white top, erected on a ledge of rocks, which you may approach very near, leaving it to the larboard hand. At a short distance you come to another pyramid, and a stake, both which you leave on your larboard hand. One-fourth of a mile from the last pyramid lie Lovett's Rocks, having a spar buoy on them, which must be left on the starboard hand, going very near to them.

Bristol Harbor.

BRISTOL HARBOR.—Bristol Harbor lies 9 miles from Newport, and east of Warwick light. At the mouth of the harbor lies Castle Island, having a pyramid on it, which is left on the starboard hand, and a red buoy on the larboard, steering N. E. when entering.

Rhode Island light and through the Sound.

RHODE ISLAND LIGHT AND THROUGH THE SOUND.—The first course from Rhode Island lighthouse, on Beaver Tail Point, is S. W. $\frac{1}{4}$ S., distant 2 leagues to Point Judith light; thence from Point Judith light through the Race to Little Gull light, the course is W. by S., 11 leagues distant, leaving Watch Hill Point light, Stonington light, and Fisher's Island on your starboard hand, and Little Gull light on your larboard hand.

Watch Hill light is situated on Watch Hill, at the entrance of Fisher's Island Sound. The lantern is elevated 50 feet above the level of the sea, and contains a revolving light.

Stonington Lighthouse.

STONINGTON LIGHTHOUSE shows a fixed light on the extreme point of land at Stonington, and bears from Watch Hill Point lighthouse N. W. $\frac{1}{2}$ W., 2 miles distant; from Napertree Point, N. N. W. $\frac{1}{2}$ W., $1\frac{1}{2}$ mile; from Catumbest Rock spire

dle, N., 2½ miles; Wicopesset, N. by E., 2 miles; Latimer's Reef, N. E. ¼ E. 2 miles; Wamphagett Shoal, E. ¼ N., half a mile; North Dumplin, E. by N. ¼ N., 5¼ miles distant. High water 9h. 5m. rise 3 feet.

STONINGTON HARBOR AND FISHER'S ISLAND.—If off the south-east part of Fisher's Island, bring the highest steeple in the town of Stonington open to the east of Stonington lighthouse, and steer for it N. 6° E., until Watch Hill bears east, when you will have passed through Lord's Channel, which is between the spindle on Wicopesset Island Ledge and the spindle on Catumb Ledge, you will then be in 12 to 13 fathoms water, then steer north-westerly to clear the shoal water extending from Bartlett's Reef, until the light bears N. by E., when you may steer directly for the lighthouse, or the breakwater, into the harbor.

If you should be to the eastward of Watch Hill light, and bound through Fisher's Island Sound, give the light a berth of one-third of a mile, and steer W. ¼ N., until the light on Stonington Point ranges with the highest steeple in the town, when you may steer as above directed into Stonington; or, if bound west, you may continue your course on, passing the spindle on Latimer's Reef, on your starboard hand, about 150 yards, until Stonington light bears E. N. E., and the house on Ram Island N. W., when you may steer W. S. W., and pass directly between the North and South Dumplins, which are two small islets of moderate height. The North Dumplin is bold to, except on the east side. On steering the last course, you will leave Ellis' Reef, on which is a spindle, on your starboard hand, and East Rock, Middle and West Clumps, on your larboard; the three last are reefs of rocks trending W. by S. and E. by N., between the South Dumplin and Latimer's Reef. There is a fixed light on the North Dumplin—elevation of tower 26 feet.

In this harbor, Lieut. Blake, of the U. S. Coast Survey, has found the two following rocks:—Young's Rock, which just washes, lies south of Latimer's Reef. Blake's Rock, 4 feet water, a short distance east from Latimer's Reef Spindle.

Should you go to the southern channel, you will, on passing Latimer's Reef, keep over towards Fisher's Island, and steer about W. ¼ S., to avoid East Rock, and the Middle and West Clumps, which are nearly covered at high water, until the centre of what is called Flat Hummock, which is a barren sandy island, of a few acres in extent, bears N., distant three-fourths of a mile, and the west point of Fisher's Island in sight, bearing W.; New London lighthouse will then be open between the South Dumplin and Fisher's Island, when you may steer for it N. W. ¼ W., keeping in mid-channel, to avoid the shoal water off the west point of West Harbor, and the shoal which puts off between the South Dumplin and the Flat Hummock, in the form of a horse-shoe, until you have passed the Dumplins, when you are clear of all danger. South of the Dumplins and Flat Hummock, in the west harbor of Fisher's Island, where there is good anchorage in 2½ fathoms, soft bottom, Flat Hummock bearing N., and the west point of the Harbor W. N. W. Ellis' Reef, on which is a spindle, lies south of the house on Ram Island, distant about one-third of a mile, between which there is a very narrow passage of 5 fathoms water. Potter's Reef lies N. W. ¼ W. from the North Dumplin, distant one mile, between which there is a fine passage, free from all danger; this reef is of small extent, and has a spindle on it, which may be passed on either side. W. ¼ S. from Ram Island, and half way to Potter's Reef, is the extreme point of Groton Long Reef. This is a conspicuous point on Fisher's Island Sound, and may be known by being cleared of trees at the south part: it is not to be approached from the south nearer than half a mile. A shoal, called the Horse-shoe, lies west of Groton Long Point, and N. E. from Potter's Reef; as there is no spindle on the Horse-shoe, vessels should avoid going much to the north of Potter's Reef.

There is good anchorage to the east of Groton Long Point, in 2½ fathoms, soft bottom, distant from the shore one-third of a mile.

After you have passed Fisher's Island Sound, you should be careful to keep the South Dumplin in range with the N. E. point of Fisher's Island, to clear the Triangle Rocks, which form the south point of Bartlett's Reef, on which there is a buoy. When Two-tree Island bears N. by W., or Little Gull N. by E., you are past this danger, and may follow the general directions up the sound.

If bound through from the westward, you should on no account go to the southward of the South Dumplin, but should, after passing either between the Dumplins, or to the north of them, bring Stonington light to bear E. N. E., and run for it until the Breakwater bears N., when you may steer for the anchorage.

If you wish to pass through the sound, when Stonington light bears E. N. E., and the house and Ram Island N. W., steer E. ¼ S. for Watch Hill light, leaving Latimer's Reef on your larboard hand, and giving Napertree Point and Watch Hill Point a berth of about one-third of a mile, leaving Watch Hill Reef, on the east end of which is a spindle, on your starboard hand. This spindle bears from Watch Hill light S. S. W. ¼ W., distant about two-thirds of a mile. A rock, with 6 feet water on it, lies south from Watch Hill Point, distant about one-eighth of a mile.

High water 9h. 5m., rise 3 feet.

Stonington Harbor and Fisher's Island. Lighthouse.

Light.

Lighthouse.

High water.

Fisher's Island Sound is perfectly safe with the foregoing directions, and to be preferred if bound east on the flood, or west with an ebb tide, to going through the race; but it should not be attempted without a leading wind, by strangers, and great attention should be paid to the lead.

The Eel-grass Shoals lie between Ram Island and Stonington light, and extend in spots for some distance; the largest of these shoals lies south of the White Rock, which is E. N. E. from Ram Island, half way to the lighthouse on Stonington Point, and is always conspicuous; but you are clear of them when Stonington light bears E. N. E.

Spar buoy.

A spar buoy, painted black, moored on the middle ground of the harbor of Stonington, in 12 feet water at low tide; and Stonington lighthouse S. by W. 1 mile distant; vessels bound into Stonington harbor, and of a larger draft than 12 feet, must give the buoy a berth of $\frac{1}{2}$ mile on the starboard hand, and steer N. by E. for the lighthouse. East end of Fisher's Island from the buoy S. W. by S. $\frac{1}{4}$ S. distant 2 miles, Napertree Point S. E. by S. 1 mile.

At Bartlet's Reef is also a spar buoy, painted black, and moored in 9 feet of water, Stonington lighthouse S. by E. distant $\frac{1}{4}$ of a mile—vessels bound into Pawcatuck River must leave this buoy on the starboard hand.

At Folly Rocks (mouth of Pawcatuck River) an iron spindle, with a keg upon the top, it bears from Stonington lighthouse E. by S.

Race Rock buoy is a spar painted black, with a red top, the top of which is 15 feet above the level of the sea. It is moored in 2 $\frac{1}{2}$ fathoms at low tides, and bears from the lighthouse on Watch Hill south one-quarter of a mile.

Watch Hill Reef buoy is a spar, painted red and white, with a black ball on the top, moored E. from the reef about one cable's length, in twenty-two feet of water at low tides, the top of which is elevated twenty feet above the level of the sea, and may be seen in clear weather three miles. This buoy bears from the Watch Hill lighthouse S. W. by S. $\frac{1}{4}$ S. one and one quarter mile.

Napertree Point buoy is a spar painted red, with a white top which is elevated twelve feet above the sea, moored in fourteen feet of water at low tides, and bears from Watch Hill lighthouse W. by N., two and a half miles. Napertree Point bears from the buoy N. one-quarter of a mile. Watch Hill Reef buoy bears E. S. E., about two miles distant; depth of water between Race Rock buoy and Watch Hill Reef buoy, six, five, four, and three fathoms may be found within one cable's length of either buoy. Vessels from the eastward who intend going through Fisher's Sound should leave Race Rock buoy on the starboard hand, and Watch Hill Reef buoy on the larboard hand; after passing them follow the directions.

Little Gull Light.

LONG ISLAND SOUND.—Little Gull light is situated on Little Gull Island, at the entrance of Long Island Sound, through the race. This light may be considered as the key to the sound. The lantern is elevated 50 feet above the level of the sea, and contains a fixed light. High water 9h. 38m., rise 2 feet 9 inches.

You must be careful to avoid a reef which runs off from the west of Fisher's Island, W. S. W. towards Race Rock, on which is a spindle, distant one mile from the point of the island, and which you must leave on your starboard hand, and continue your course until the Little Gull is south of you, if the tide should be flood, about one mile; if the tide should be ebb, you should, as soon as the Little Gull bears west, and New London light in range with the highest steeple in the town (N. 2° W.), steer north-westerly, until it is south of you 2 miles, when you may steer W. $\frac{1}{4}$ N. for Falkner's Island light, elevated 75 feet above the level of the sea, and exhibits a fixed light, distant 8 leagues, on which course you should be careful to avoid the Long Island Sand Shoal, off Cornfield Point, and which extends east and west 5 miles. Should you make the above courses good, you will, when off Cornfield Point, be $\frac{1}{2}$ mile south of the shoalest part. This shoal is very narrow, and as you approach it, you will shoalen your water from 12 to 2 fathoms very suddenly. You should in the night time come no nearer to Falkner's Island, when north of you, than 14 fathoms, (three-fourths of a mile distant), when you may steer S. W. by W. $\frac{1}{4}$ W. for Old Field Point light, 8 leagues, which carries you to the south of the Middle Ground.

Old Field Point Light.

The lighthouse on Old Field Point shows a fixed light, elevated 67 feet above the sea, and 27 feet from the base. It bears from Eaton's Neck light N. 89° 6' E., 12 $\frac{1}{2}$ miles distant. From Stratford light S. 9° W., 10 $\frac{1}{2}$ miles distant. From Black Rock light S. 19° 4' E., 11 miles distant. From New Haven light S. 34° 28' W., 18 $\frac{1}{2}$ miles distant.

You should come no nearer Old Field Point than 8 fathoms, (distant half a mile), in the night; and when it bears south of you, steer W. $\frac{1}{4}$ N. 17 miles, which will take you to the north of Lloyd's Neck, in 13 fathoms water, leaving Norwalk light, which is revolving, on your starboard hand, and Huntington light (on Eaton's Neck) on your larboard hand, from whence you may steer S. 66° W., which will take you between Sands' Point and Execution Rocks, on the latter of which, on the east end, is a buoy, bearing N. by W. from the light, distant seven-eighths of a mile. If, when up with Falkner's Island, you should prefer going to the north of the Middle Ground, steer W. $\frac{1}{4}$ S. for Stratford

shoal on the eas

light, 20 miles, and giving it a berth of half a mile, in $3\frac{1}{2}$ fathoms water, steer S. 66° W. for Sands' Point lighthouse.

Eaton's Neck lighthouse, fronting from the east round north to the south-west, is elevated 134 feet above the level of the sea, and 49 feet 8 inches from its base, and shows a fixed light. It bears S. $5^\circ 15'$ E. from Norwalk light, distant 5 miles and nine-tenths. A reef extends from the light N. N. E. half a mile, on which are a number of rocks. High water 11h. 1m., rise 9 feet 2 inches.

Eaton's Neck Light.

Vessels should not come nearer the shore than three-fourths of a mile, when the light bears between west and south. On the west side the shore is sandy and pretty bold.

Sands' Point lighthouse is N. $42^\circ 30'$ E. from Throg's Point light, distant 4 miles and six-tenths. The rocks extend from the shore opposite the light, N. W. one-eighth of a mile. High water 11h. 12m., rise 8 feet 7 inches.

Sands' Point Light.

Stratford lighthouse contains a revolving light. The revolution is such as to exhibit the light once in 90 seconds. From it Old Field Point light, on Long Island, bears S. 9° W.; New Haven light N. 63° E., 10 miles distant; Middle Ground S. 3° W., $5\frac{1}{2}$ miles distant; Black Rock light S. 88° W.

Stratford Light.

In case of flood tide and southerly wind, when you come through the Race, your course should be W. $\frac{1}{2}$ S. until you come up with Old Field Point light, distant 16 leagues, taking care to allow for the tide, which runs very strong, and flows on the full and change days of the moon until 11 o'clock. In coming up with Old Field Point light, you should not bring it to bear to the west of W. by S. $\frac{1}{2}$ S., on account of a shoal off Mount Misery, or if in the day-time, keep Crane Neck, which is a bluff, two miles to the west of the light, open clear of the light, and pass the point in 8 fathoms as above directed.

If a ship could have a fair departure from the middle of the Race, and is compelled to run in a dark night, or in thick weather, the best course would be west 15 leagues toward Stratford light, as it would afford the largest run on any one course, and if made good will carry you $1\frac{1}{2}$ mile south of Stratford Point light in 6 fathoms water, and 4 miles to the north of the Middle Ground; on this course you will leave Saybrook, Falkner's Island and New Haven lights on your starboard hand, Plumb Island light on your larboard hand, and will pass three miles south of Falkner's Islands, in 17 fathoms water. When up with Stratford light, and it bears north $1\frac{1}{2}$ mile distant, your course to Sands' Point light is W. S. W. 11 leagues. West of Stratford light $\frac{1}{2}$ mile is Point-no-Point, which is shoal for some distance from the shore, but you are clear of it when Black Rock light bears W. $\frac{1}{2}$ N.

Plumb Island light is a revolving light, 63 feet above the level of the sea, on the S. W. point of the island.

Plumb Island Light.

Falkner's Island light is fixed, 93 feet above high water mark.

KIMBERLY'S REEF, on which there are 13 feet water, bears E. $\frac{1}{2}$ N. from Falkner's Island light, distant one $\frac{1}{4}$ mile.

Kimberly's Reef.

Should you wish to anchor under Falkner's Island, there is good holding ground on the east and west side in $2\frac{1}{2}$ and 3 fathoms water, but the best place with the wind from the west, is close to the N. E. point of the Island, the lighthouse bearing S. W. by S., in $2\frac{1}{2}$ fathoms. North from the Island a narrow shoal puts off one-quarter of a mile, and is bold to, but you are to the north of it, when the centre of Goose Island bears S. W. by W., and when the light bears S. E. by E. you may run for it and anchor.

The passage inside of Falkner's Island is perfectly safe, but you should not, in standing over towards the Connecticut shore, bring Hammonasset Point to the south of east. This point may be known by having two small bluffs at the extremity, and it bears E. N. E. from Falkner's Island, distant $5\frac{1}{2}$ miles. When standing to the south towards Goose Island, you should be careful of the shoal extending to the north of it, and when you are just clear of it when Falkner's Island light bears E. S. E. and Goose Island S. by W., in $2\frac{1}{2}$ fathoms, rocky bottom; after you have passed Goose Island you should keep more to the southward, to avoid Whetton's and Brown's Reef lying off the Thimble Islands, and Branford Reef, which is dry at very low tides: on this reef is a buoy bearing from Falkner's Island light W. $\frac{1}{2}$ N., distant 6 $\frac{1}{2}$ miles, and from New Haven light, S. E. by E. $\frac{1}{2}$ E., distant 5 miles. To the north of Branford Reef there is a good passage, but it should not be attempted by strangers without a favorable opportunity; but in case you should be compelled to navigate, as during the late war, you may, after passing Goose Island, bring the lighthouse to bear E. S. E. and steer W. N. W. for the Outer Thimble, giving it a berth of 30 or 40 yards, then steer W. $\frac{1}{2}$ S., on which course, if made good, you will keep the outer Rock of the Thimble in range with the large Hotel on Sachem's Head, astern of you. Vessels of any draft of water may go through this passage, and you will leave Whetton's Reef, which is one-fourth of a mile S. S. W. from the Outer Thimble, and Brown's Reef, on which there is a buoy, on your larboard hand, and Thimble Buoy to the west of the Thimble, half a mile, and the buoy on the Nigger Heads, on your starboard hand; this range takes you within 100 yards of the Nigger Head Buoy, and about seven-eighths of a mile north of Branford Reef, when you may steer W. by S. $\frac{1}{2}$ S. for Stratford Point. Goose Island is W. S. W. from Falkner's Island, one mile distant; it is shoal on the east and north sides, and a resting place for gulls, which are purposely left

undisturbed, as their noise serves to give notice of your approach to the island in thick weather.

S. $\frac{1}{2}$ W. from Stratford light, distant $5\frac{1}{2}$ miles, is the Middle Ground, the entrance of which bears from Eaton's Neck light E. by N. $\frac{1}{4}$ N., 15 miles; from Black Rock light S. E. $\frac{1}{4}$ S., $7\frac{1}{2}$ miles; and from Old Field Point light N. by E. $\frac{1}{4}$ E., distant 5 miles. On this shoal are two feet water at low tide; on the south side is a white spar buoy, and on the north side a black spar buoy, both in 19 feet water, bearing nearly N. by E. and S. by W. from each other, half a mile distant. You may go on either side of the shoal you please: on the north are from 3 to 11 fathoms, and on the south side from 8 to 24 fathoms water; a mile either to the east or west of this shoal you will have 12 fathoms.

A ledge lies off the N. E. point of Eaton's Neck, three-fourths of a mile from the shore, but after the light bears S. E., the shore is bold to all the way up on the east side of Huntington Bay, where you may anchor in easterly winds.

Black Rock light is on Fairweather's Island, at the entrance of Black Rock Harbor, 45 feet above high water mark. High water 11 hours 1 minute, rises 9 feet 1 inch.

In beating up sound, when Eaton's Neck light bears S. W. by S., you should not stand over to the north shore nearer than to bring Norwalk light to bear W. by S. $\frac{1}{2}$ S., on account of the reef which puts off from Caukeen Island E. by S. $1\frac{1}{4}$ mile, and on which there is a buoy. When Goose Island, which is the first island S. W. from Caukeen, is west from you, you are south of the reef. There is a passage for small vessels between these islands, but to the west of Goose Island there is no passage, as the reefs extend to the buoy on Green Ledge, one mile W. by S. $\frac{1}{4}$ S. from Norwalk light. W. by S. from Norwalk light, 3 miles distant, is Long Neck Point; there is good anchorage to the eastward of it when the light bears E. from you, but when you are to the west of Long Neck Point, you should be careful of Smith's reef, which lies S. W. one mile from it, and also of a reef called the Cows, which is also S. W. from Long Neck Point, $2\frac{1}{4}$ miles, and south from Shippan Point, three-fourths of a mile, on both which there are buoys, and they are bold to until you are close on the rocks. After you pass the Cows, the first point is Greenwich Point, which is bare of trees, and is the S. E. point of a neck of land running into the sound, the S. W. point of which is called Flat Neck Point, and covered with trees; the water off both these points is shoal. The easternmost of the Captain's Isles lies S. W. by W. from Flat Neck Point, $1\frac{1}{4}$ mile distant, between which is a fair passage; but in going in, you must keep half way between Flat Neck Point and the island, on account of the rocks extending N. E. from the island, and S. E. from the point, and steer north, and when Flat Neck bears east you may anchor. The passage between Captain's Islands and the main should not be attempted by a stranger. Captain's Islands are three in number, the largest of which is the westernmost one, which has a lighthouse on its east end, showing a fixed light, bearing from Norwalk light W. by S. $\frac{1}{4}$ S., distant $10\frac{1}{2}$ miles; from Eaton's Neck light W. by N. $\frac{1}{4}$ N., 11 miles, and from Sands' Point light N. E. $\frac{1}{4}$ N., 9 miles. You may approach near these islands, but after you have passed them to the west, you should keep at least half a mile from the shore, on account of several rocks and reefs between those islands and Rye Point. High water 11 hours 1 minute, rises 8 feet 2 inches.

On the south shore of the Sound, after passing Eaton's Point to the westward, is Loyd's Neck, the north point of which is low, and sandy. E. by N. from which is a reef on which there is a buoy, lying off the highest bluff, half a mile from the shore: the reef is very small, and has 3 fathoms close to it. To clear this reef and the Sandy Point, you should not bring Eaton's Neck light to the N. of E. $\frac{1}{4}$ S. in passing it. To the west of Loyd's Neck is Oyster Bay, in standing in towards which you should be careful of the shoal which puts off from the north point of Hog Island, in a N. N. W. direction, nearly a mile; you are to the north of it when Oak Point is open of a hill on Matinecock Point (S. W. by W.) and Cooper's Bluff, which is the highest up the bay, is open clear of the east point of Hog Island, (S. S. E.) when you may steer S. E. for the eastern side of the bay, to clear the Middle Ground, and make a harbor either in Cold Spring or Oyster Bay, keeping but a short distance from the shore.

One mile east of Sands' Point light is the Pulpit, a large rock on the shore; when this rock is between S. S. W. and S. E. from you, you should not bring Sands' Point light to bear W. of S. W., on account of a reef of rocks off it, and in standing to the north, you should, when the light is S. by E. from you, make but short tacks, on account of the Execution Rocks, which lie N. N. W. seven-eighths of a mile from the light, and also on account of some scattering rocks, one-eighth of a mile from the point. After you pass the point, your course is S. W. for the south point of Hart Island, on which course you pass Success and Gangway Rocks, on both which are buoys, left on the larboard hand on the above course, although you may go on either side of them. Success Rock is bare at low water, and is S. W. from the lighthouse on Sands' Point, about one mile. Gangway Rock has 6 feet of water on it, and is one-sixth of a mile W. N. W. from Success Rock, lying (as its name imports) in mid-channel. The south point of Hart Island has two single trees on it, and is bold to. The course from this to Throg's

Point lighthouse, (which stands on the south-east point of Throg's Neck, and contains a fixed light) is S. S. W. $\frac{1}{2}$ W., on which course you will leave the buoy on the Stepping Stones on your larboard hand, and you may stand over to the westward, guiding by your lead; but as you come up with the Stepping Stones, which is about half way, do not bring the trees on Hart Island to bear to the N. of N. N. W., and give Throg's Point a berth of one-eighth of a mile. You may, after passing Throg's Point light, steer west towards Whitestone Point, which is the first point on your larboard hand, and Old Ferry Point, which is beyond it, on your starboard hand, between which and Throg's Point there is good anchorage. Other bays that put in, to the west of Old Ferry Point, are shoal until you are beyond Waddington's Point, which is opposite Riker's Island. Between Old Ferry and Waddington's Point are Clauson's and Hunt's Points, the former of which has a buoy off it, and both are shoal for a short distance. South of Clauson's Point, and nearly two-thirds over to the Long Island shore, is a reef of rocks, on which there is a buoy, which must be left on the larboard hand; you open Flushing Bay when you come up with it, and from mid-channel may continue your course on west from the north point of Riker's Island, which is bold to; you can anchor to the westward of it in such water as you think proper, with the north point bearing east.

EXECUTION ROCKS LIGHT is a red fixed light 42 $\frac{1}{2}$ feet above high water.

It bears from Sands' Point light, N. N. W., distant $\frac{1}{2}$ of a mile; from Throg's Point light, N. E. by N. 5 miles.

The rocks extend one mile in a N. N. E. and S. S. W. direction, and are $\frac{1}{2}$ of a mile wide in the broadest part, where the lighthouse is placed, near the middle of the reef.

There is a black spar buoy with one white horizontal stripe on the N. E. point of the reef, in 4 $\frac{1}{2}$ fathoms water, distant 800 feet from the light. High water 11h. 12m., rise 8 $\frac{1}{2}$ feet.

THROG'S POINT.—At Throg's Point it is high water, full and change, at 10h. 59m., *Throg's Point.*

rise 7 $\frac{1}{2}$ feet.

HELL GATE.—It is high water, full and change, at 10h. 04m.

HART ISLAND affords good anchorage either in easterly or westerly winds. To anchor on the east side you may stand towards a barn which is in the bend towards the south part of the island, and anchor in 3 fathoms, the trees bearing S. S. W., distant half a mile. Should you wish to anchor on the west side, between that and City Island, you may haul close round the south part of Hart Island, and anchor west of the trees, in such water as you think proper.

HUNTINGTON BAY has a fair entrance and sound ground. There is good anchorage in Lloyd's Harbor, in 2 fathoms water, secure from all winds. To enter it, steer S. W. $\frac{1}{2}$ S. from the light, when it bears N. E. $\frac{1}{2}$ N., until the north point of Lloyd's Harbor, which is a low sand point, is W. from you, when you may steer directly into the harbor, leaving Sandy Point 20 yards on your starboard hand. High water 11h. 1m. rises 9 $\frac{1}{2}$ feet.

In going in or coming out of Lloyd's Harbor, you should be careful of the shoal water, which is to the east of the Sandy Point, and on the west side of Huntington Bay.

SHOALS IN THE SOUND.—We will now notice more particularly the shoals in Long Island Sound.

Hatchett's Reef, to the east of Connecticut River; it bears E. $\frac{1}{2}$ S. from Snybrook lighthouse, and S. S. W. from Hatchett's Point, and is dangerous. Between this reef and the shore is Barrows' Rock, lying W. N. W. from it. Strangers should not approach the north shore on account of these reefs, the bar off Connecticut River, and the shoal off Cornfield Point.

Should you want a pilot to enter Connecticut River, by making a signal off the bar, they will come on board. The bar extends 1 $\frac{1}{4}$ of a mile from the shore.

To the S. W. of Norton's Point, which is on the Long Island side, and S. E. from Falkner's light, the water is shoal for the distance of 3 miles, but from thence the shore is bold until you come up with Ronnoke Point, a distance of 10 miles; after passing this point, you should not come nearer to the shore than one mile, until you are west of Wading River, on account of a shoal off the Friar's Head, and Herrod's Point; after passing Wading River, you may come within half a mile of the shore, till nearly up with Mount Misery, when you should not bring Old Field Point light to bear W. of W. by S. $\frac{1}{2}$ S., on account of a shoal already described.

The Friar's Head is a remarkable sand-hill to the east of the Horse and Lion, which resembles the bald head of a friar, it being bare of trees on the top, and the soil white. The Horse and Lion are two small spots in the bank, bare of bushes, which some years ago resembled those animals.

SECOND DIRECTIONS FOR BLACK ROCK HARBOR.—Bring the light on Fairweather Island to bear N. $\frac{1}{2}$ W., and run for it, if it should be in the day time, when on that bearing it will range with a single hill, situated in the interior several miles, which you must keep in range, until you are distant half a mile from the lighthouse; you will then have passed the spindle on the Cows, and will be in 4 fathoms water, when you may steer N. N. W. until the light bears E. by S., leaving a rock S. by W. from the light, on which is

*Execution
Rocks Light.*

*Hell Gate.
Hart Island.*

*Huntington
Bay.*

*Shoals in the
Sound.*

a buoy, on your starboard hand, when you may anchor. In steering the above course you will have 5 fathoms, when up with the spindle on the Cows, and it shoalens gradually. High water 11h. 2m. rises 6 feet 6 inches.

*Montock
Point light.*

MONTOCK POINT LIGHT is on the east end of Long Island, bearing W. by S. from the S. W. point of Block Island, 4 leagues distant. From Montock lighthouse to the west point of Fisher's Island, N. W. by N., $13\frac{1}{4}$ miles distant. The lighthouse contains a fixed light, elevated 100 feet above the level of the sea. High water $\frac{1}{2}$ h. 15m., rise $2\frac{1}{2}$ ft.

*Block Island
to Gardner's
Bay*

BLOCK ISLAND TO GARDNER'S BAY.—Montock Point, the easternmost part of Long Island, is 4 leagues W. by S. from the S. W. point of Block Island, on the N. W. point of which are two lighthouses: between the island and the point there are 16 and 18 fathoms water. As you approach the point, you will quickly come into 9, 7, and 5 fathoms water. A flat runs off from the above point, on the outer part of which there are 5 fathoms water, rocky bottom, and S. by W. from the light, 9 miles distant, lies Frisby's Ledge, extending N. W. and S. E. 4 miles, with from 8 to 15 fathoms on it, hard rocky bottom, and deep water very near.

Between Montock Point and Block Island there is a shoal with only $4\frac{1}{2}$ fathoms on its shoalest part, on which the sea breaks in moderate gales from the southward. It lies nearly half way between the Point of Montock and the south-west part of the Island, W. by S. from the latter, and about E. $\frac{1}{2}$ N. from the lighthouse on Montock, distant $8\frac{1}{2}$ miles. You suddenly shoal your water from 13 to 6 fathoms on the N. W. side of the shoal, and before you get a second cast of the lead you are over the shoalest part, into 7, 8, 10, and 12, and then into 14 fathoms. The rippling of the tide is very conspicuous when approaching the shoal in fine weather, and the sea breaks on it so in bad weather, that even in small vessels, it is recommended to avoid coming near it, especially in southerly, or S. W. gales. You will suddenly shoal from 13 to 9 fathoms, and Montock light bearing W. $\frac{1}{4}$ S., 8 miles distant, you will have $5\frac{1}{2}$ fathoms. The soundings from the shoal towards Montock are 6, 9, 14, 13, 11, 10, and 9 fathoms. Towards the lighthouse, when it bears from W. to S. W. by W., the bottom is strong; towards the shoal the bottom is coarse sand, and a very strong tide. A shoal runs off from the north side of Block Island, 2 miles.

In rounding Montock, come no nearer than 9 fathoms, or keep the two bluffs, or high parts of the land, (to the westward of Montock,) open one of the other, until Willis' Point comes open of Montock False Point. These marks will carry you clear of all the shoals in $3\frac{1}{2}$ and 9 fathoms, and a N. by W. course will then carry you clear of the Shagawanock Reef, which lies N. W. $\frac{1}{4}$ N., $3\frac{1}{4}$ miles from Montock lighthouse, and has 6 feet on its shoalest part, 6 fathoms on the N. E. and N. W. sides, 3 and 4 fathoms on the S. E. and S. W. sides, and 3, 4, and 5 fathoms between the shoal and Montock False Point. The tide sets strong round Montock Point; the flood N. E., and ebb to the contrary. At the Shagawanock the flood sets W. by S., and ebbs to the contrary. When on the Shagawanock in 6 feet, anchored a boat, and took the following marks:

1. Willis' Point in a line with the westernmost point of Fort Pond Bay, or the bay closed by the points being brought in a line S. W. by W. $\frac{1}{4}$ W.
2. Montock False Point S. about $1\frac{1}{2}$ mile.
3. The White Cliff, or high sand-hills, on the west end of Fisher's Island, called Mount Prospect, N. by W. $\frac{3}{4}$ W.
4. The Gull Islands N. W., and the bluff sand cliff of Gardner's Island, W. Montock False Point is 2 miles N. W. from the lighthouse. Willis' Point is the easternmost point of Fort Pond Bay.

In rounding Montock in the night (when the land or light can be seen) with westerly gales, you may anchor when the lighthouse bears S. W. by S. in 8 or 9 fathoms, coarse sand. Having brought Montock to the southward of west, the weather thick, you cannot clearly ascertain the distance you are from the point, the lead must be your guide. Steer as high as W. N. W., until you have got into 9 fathoms. Steer off again into 13, and if you suddenly shoal from 10 to 6, steer off E. by N. until you are in 11 or 12, which suddenly deepens. (as a bank of not more than $5\frac{1}{2}$ fathoms extends from the N. E. Reef to the Shagawanock,) and a good lead kept going will prevent you going too near these shoals, by steering off in 12 or 13 fathoms, before you attempt to steer to the westward, after having sounded in 6 or 7 fathoms. In the day time, having rounded Montock, and bound to Gardner's Bay, steer N. by W. until you clearly discover that Fort Pond Bay, and the red cliff on the western point, are open of Willis' Point; you may then steer W. by S. for the bluff point of Gardner's Island, and you will pass between the Shagawanock and Middle Ground, or Cerberus Shoals.

The Middle Ground (or Cerberus) is a rocky shoal, having from $2\frac{1}{2}$ to 5 fathoms on the shoalest part; the north and east sides are steep, having 10 and 15 fathoms within half a cable's length of the shoalest part. It extends N. by E. and S. by W. three-quarters of a mile. The south and west sides shoalens gradually from 13, 10, 9, 8, 7, to 5 fathoms, sandy bottom. It lies N. W. $\frac{1}{4}$ N., $7\frac{1}{2}$ miles, from Montock lighthouse; E. S. E. 7 miles from the Gull light; S. W. by S. $9\frac{1}{2}$ miles from the lighthouse on Watch Hill

Point; $5\frac{1}{2}$ miles S. by E. $\frac{1}{2}$ E. from Mount Prospect, or the high sand-hills on the west end of Fisher's Island. The tide in general makes a great rippling over the shoalest part. To avoid these rocks in the day time, observe a conspicuous hill, with a notch in its centre, at the back of New London, called Pole's Hill. This kept a ship's length open, either to the eastward or westward of Mount Prospect, (or the sand-hills of Fisher's Island,) will keep clear of the rocky shoal in 10 or 15 fathoms to the eastward, and in 8 or 9 fathoms to the westward. The tide sets strong over the shoal. In calm or little winds, ships should anchor before any of the marks or bearings are too near.

Being bound for New London, and having brought the Gull light W. by N., and the light on Watch Hill N. E., steer so as to open New London lighthouse of Fisher's Island; and when the spire of New London church is in one with a gap on Pole's Hill, steering with it in that direction will carry you between the Race Rock (on which is a spindle, or beacon) and the Middle Race Rock, on which are 17 feet at half flood, and lies about half way from the Race beacon and the Gull light: or you may bring New London lighthouse a sail's breadth to the eastward of the church spire, bearing N. 5° E., which will carry you to the westward of the Middle Race Rock, or between that and the Gull lighthouse. You may then steer direct for New London lighthouse.

About 3 miles within Montock Point, $1\frac{1}{2}$ mile from the shore, lies a reef, bearing N. W. $\frac{1}{2}$ N. from the point, on which there are 6 feet water, which is very dangerous.

S. by W., about 9 miles from Montock light, is a small fishing-bank, having 8, 10, 11, and 15 fathoms on it, before mentioned.

In the offing, between Montock and Block Island, it is high water at half past 9, full and change.

Montock False Point is about 2 miles W. N. W. from the true point. The Shagawonock, or Six Feet Rocky Shoal, lies N. $1\frac{1}{2}$ mile from it, and has been previously described. Willis' Point is on the east side of the entrance of Fort Pond Bay. This bay is very convenient for wooding and watering: the ground is clear and good, and you may anchor in any depth you please. In a large ship you may bring Willis' Point to bear N. E., and even N. E. by N., and then have in the middle about 7 fathoms water. Near the shore, at the bottom of the bay, there is a pond of fresh water.

The N. E. part of Gardner's Island is $5\frac{1}{2}$ leagues W. N. W. from Montock Point. With westerly winds you may anchor off this part of the island, which is sandy; the marks for anchoring are the lighthouse of Plum Island N. W. and the south part of Gardner's Island in sight, bearing S. by W. or S.; you will have 12 or 10 fathoms water. The bottom is sand and mud.

The entrance of Gardner's bay is formed by the north end of Gardner's Island, and the south end of Plum Island. If you are bound through the sound towards New York, your passage from Gardner's Bay is between the west end of Plum Island and Oyster Pond, through which channel you will have from 4 to 20 fathoms water. When going into the bay, you may go within a cable's length of Gardner's Island, where you will have 10 fathoms water. You should be careful not to go too near Gull Rock, which is a single black rock between Plum Island and Great Gull, and called Old Silas, "as there is a rocky spot one and a half mile from it, on which there are 3 fathoms at low water. This shoal lies with the following marks and bearings, viz:—A house on Plum Island (standing about one-third of the way between the middle and the north-east end) on with the northernmost of the two trees which appear beyond the house; the north end of Plum Island to bear N. N. W., or N. by W. $\frac{1}{2}$ W., and the southernmost end of Plum Island on with the northernmost point of Long Island. In order to avoid this rock, when going into, or coming out of Gardner's Bay, you must be sure to keep the south point of Plum Island open of the north-west point of Long Island, whilst the house on Plum Island is on with the northernmost of the two trees, as before mentioned. There are several trees, but they appear, when viewed at a distance, to be only two trees. This shoal is called by some the Bedford Rock, because the English ship Bedford grounded on it, August 15, 1780. E. by N. one league from Plum Island, lies a dangerous reef, which extends to the Gull Islands, and the passage between is not fit to be attempted, as there are several rocks, some of which may be seen. In Gardner's Bay you may anchor in what depth of water you please, from 5 to 8 fathoms.

On the S. W. side of Gardner's Island there is very good riding. If you are to the eastward of this island, with an easterly wind, and wish to take shelter under the south-west side, you must give the north-west end of the island a large berth, as above directed, and as you open the west side of the island, you may haul round the north-west point, and anchor where you please. The soundings are regular.

Ships, in turning up into Gardner's Bay, and standing to the southward, will observe a single conspicuous tree on the south-east part of Plum Island, and tacking before it is brought to touch the south end of the wood on Plum Island, will avoid the Superb's Reef, which lies E. by N. $\frac{1}{2}$ N. from the low point on Gardner's Island, one-third of a mile distant. It then extends S. E. by E. about two-thirds of a mile, and is about 200 yards broad: three fathoms on the middle, 6 fathoms close to the north-west end, 4, 4 $\frac{1}{2}$, and 5 fathoms close to the south-east end, 5 and 6 fathoms close to the east side, lying

parallel with the low point of the island. To avoid this shoal, the leading mark into Gardner's Bay is to keep Plumb Gut a ship's breadth open. Stand to the northward until Plumb Gut is nearly closing on the north-east bluff of Long Island, nearly touching the south-east point of Plumb Island, and until New London lighthouse is brought to the north and west of Gull lighthouse, but tack before the points close, or stand into no less than 7 fathoms water, otherwise you may shoot over on the Bedford Reef, which is a bed of rocks, about 30 yards wide and 400 long, lying S. E. and N. W., with 16 or 17 feet on its shallowest part. You may anchor in Gardner's Bay in 5 or 6 fathoms. New London lighthouse kept a ship's breadth open to the eastward of Plumb Island will run you up into the middle of the bay, into the deepest water, and out of the tide. Ships going in through the Race, or going out of New London, in order to avoid the middle Race Rock, (which has only 17 feet on it at half flood, and lies about half way from the Race beacon and the Gull lighthouse,) having from 30 to 32 fathoms on the north side, and from 10 to 30 on its south side, should observe the following marks:—Going out of the roads, and to the westward of the rock, which is the best channel, bring the spire of New London church a sail's breadth open to the westward of the lighthouse; keep this mark until a grove of trees standing on a high hill on Fisher's Island, comes on with the east side of Mount Prospect, or the white sand-hills on the S. W. side of Fisher's Island, N. 60° E., or the Gull light W. S. W. The tide flows at the Gull 11 h. 30 m., full and change.

To go to the northward of this rock, and to the southward of Race Rock beacon, bring New London church spire in one with the middle of the gap on Pole's Hill, at the back of New London (N. 8° W. :) keep this mark until Watch Hill lighthouse comes a little open of the south side of Fisher's Island, N. 70° E., and when the Gull lighthouse is in one with the middle or Great Gull Island, S. 73° W., you are then to the eastward of the rock. Coming up the sound through the Race, bring Watch Hill lighthouse just open of the south side of Fisher's Island, until the South Dumplin comes open to the northward of the north part of Fisher's Island, or until New London lighthouse bears north; you are then to the westward of the Race Rock, and may steer for the lighthouse of New London, and anchor in the roads, with Montock lighthouse S. E. by S., then just open of the west point of Fisher's Island, Gull lighthouse S. W. by S., and New London lighthouse N. by W., and the gap and spire of the church in one. You will have 12 fathoms, stiff clay bottom.

Going to the westward through the race, and to the southward of the Race Rock, steer for the Gull lighthouse, keeping it to the northward of west until New London lighthouse bears N. 4 E., then steer for it, leaving the Gull lighthouse half a mile on the larboard hand.

The first half flood sets N. W., the last half about W. N. W., and the ebb E. S. E. The above is to be observed in case the weather should be thick, and New London church spire not to be seen, or when Gull lighthouse bears S. by W. You may then steer N. N. E. for the roads, making allowances for tides, which are very strong in the race. Flood runs to the westward till 9 h. 38 m. full and change days of the moon; but in New London roads only 9 h. 30 m. It rises 2½ feet, spring tides. The flood sets through the roads, first half flood W. N. W., last half W. S. W. Ebb, first quarter, sets S. S. E., the last three-quarters S. E., for the S. W. point of Fisher's island.

Vessels bound eastward through the Race, in the night, when abreast of Gull Island light, with the tide of flood and a leading wind, should steer E. by S., or E. S. E., until Gull Island light bears S. by W.; preserve that bearing until you see Stonington light over the low land of Fisher's Island; they are then clear of Race Point and Race Rock. The spring tides in the Race run about five knots per hour; neap tides about four knots. High water, full and change, at 9h. 38m. The first half flood sets N. W., the last half about W. N. W.; consequently, upon steering E., or E. by N., which is the sound course, they have a strong tide upon the starboard bow, which forces them over to the northward, and instead of making, as they suppose, an E., or E. by N. course, often carries them on Race Point, from which runs out far off a reef of rocks under water.

To go through Plumb Gut to the westward, give Pine Point, which is steep, a berth of 2½ cables' length, and steer so as to bring the north bluff of Plumb Island N. by W. ½ W. Keep it in that bearing until you have brought the poplar tree clear of the east end of Mr. Jerome's house, or until you have got Pine Point to the southward of east; you will then observe a wood close inland of the high bluff of Long Island, which, when bearing W. ½ S., will be in one with the rocky point, which is the next point to the Oyster Pond Point. Steering with the wood and this point in one, will carry you clear of the reef, which lies off the north bluff.

In running through to the eastward, keep the point over the middle of the wood before mentioned, until the poplar tree is to the west end of the house; then steer to the southward, giving Pine Point a berth as before. Pine Point E. ½ S. will lead clear of the shoals coming to the eastward.

The tide runs 4 or 5 knots in the gut. The flood sets about N. N. W., and the ebb S. S. E. It is high water at 9h. 38m., full and change.

Mount house, N Island, b which ex have from quarters good wnt From island.

Marks for the Valiants or Middle Race Rock, which has only 17 feet on it at half flood, and is about half way from the Race beacon, and the Gull lighthouse.

1. New London lighthouse in one with two conspicuous trees, which stand on the declivity of a hill, at the back of New London, being remarkable for a gap on its summit, N. 4° W.
2. The west side of the South Dumplin just touching with the north hill or point of Fisher's Island, N. 41° E.
3. The east bluff point of the Great Gull Island in one with the west lower extreme of Little Gull Island, or the Gull lighthouse, a small sail's breadth open to the eastward of the east part of Great Gull Island, S. 64° W.
4. The north end of Long Island just shut in with the N. W. point of Plumb Island, S. 76° W.; Gull lighthouse S. 63° W., and Mount Prospect, or high white sand-hills on Fisher's Island, N. 60° E.

Marks for the New Bedford Reef, a bed of rocks about 30 yards broad, and 400 yards long, lying S. E. and N. W., with 16 or 17 feet on its shoalest part.

1. The N. E. end of the northernmost grove of trees on Plumb Island touching the south declining end of the southernmost of the white sand-hills on Plumb Island. These sand-hills are the two next south of the houses in the bay.
2. A large notch or gap in the wood on the main land, to the westward of Black Point, a sail's breadth open to the northward of a single black rock, which is between the south end of Great Gull Island and the N. E. end of Plumb Island, N. W. by N.

Thus appears the rock called Old Silas.

Marks for a bed of rocks, about 40 yards square, lying three-quarters of a mile off shore, on the S. E. side of Plumb Island. At low water the shoalest part has not more than three feet on them, and about the size of a small boat's bottom. It may be seen at low water; three fathoms all round, not more than 8 feet from the rock. Other parts of the reef, 8 fathoms are around the shoal.

1. The largest house with two chimneys, in the bay, east side of Plumb Island, in one with a large stone or rock on a hill behind the house, N. 33° W.
2. The Gull lighthouse touching the east end of Great Gull Island, N. 65° E.
3. The white sand-hills on the south side of Fisher's Island, or Mount Prospect, half way open to the westward of Great Gull Island. S. E. part of Plumb Island, S. 74° W., and the N. E. end of same, N. 45° E.

Marks for a shoal in the middle of Plumb Gut, which is a compound of rocks and large stones, with only 16 feet on it, having 16 and 17 fathoms on the N. E. side, 26 on the N. W., and 6 and 7 on the south side. When on the shoal, took the following marks.

1. A small poplar tree in one with Mr. Jeroin's door, N. N. E.
2. A single conspicuous tree in one with the east side of a grey cliff on Gardner's Island, S. E. by E.
3. Oyster Pond Point W. $\frac{1}{2}$ N. and the S. E. (or Pine Point) of Plumb Island, E. by N., and the rocky point or bluff point of Plumb Island, north. The passage through Plumb Gut is to the northward of this rock.

There is another rock, with only 24 feet upon it, about 400 yards from the rocky or bluff point on Plumb Island, on the latter of which is a revolving light.

Marks for anchoring in Plumb Island Roads.

Mount Prospect, or the white sand-hills of Fisher's Island, touching the Gull lighthouse, N. E., and the N. E. part of Long Island in one with the S. E. end of Plumb Island, bearing W., or the east bluff points of Gardner's Island in one with the low beach which extends from the north side of the island, S. 45° E. With these marks you will have from 7 to 8 fathoms, soft mud, and quite out of the tide, and not more than three-quarters of a mile from the shore of Plumb Island, where there is very convenient and good water.

From Block Island a reef of rocks lies one mile distant from the north end of the island.

South-west Ledge lies W. S. W. from Block Island, 4 miles distant, having 4½ fathoms at low water, and breaks a heavy sea. As you open the passage between Montock and Block Island, you will deepen your water, and have soft bottom on an E. N. E. course, and when abreast of Block Island, you will shoalen your water to sandy bottom; when past it, you will again deepen to soft bottom.

Bearings and distances of sundry places from the lighthouse on Montock Point.

The S. part of Block Island bears E. by N. from the lighthouse on Montock Point, 20 miles distant.

The eastern rips lie E. by N. 1¼ mile from the lighthouse. The northern rips lie N. E. ¼ E. 3 miles from the lighthouse. These rips although they may appear to the mariner dangerous, may be crossed with any draft, in 6, 7, 8, and 9 fathoms.

Shagawannock Reef, on which a spear is placed, bears N. W. ½ N. from the lighthouse on Montock Point, 3¼ miles distant; the reef ranges N. by E. and S. by W. about one-quarter of a mile in length. There is a good channel-way between the reef and Long Island, about 1½ mile wide, in 3, 4, and 5 fathoms water.

Frisbie's Ledge is only a place of hard rocky bottom before you approach the lighthouse, to the westward, from 8 to 15 fathoms, and no ways dangerous to any vessel. You may keep the shore on board from the Highlands (say three-quarters of a mile) and haul round Montock.

The east end of Fisher's Island bears N. ¾ W. from the lighthouse on Montock Point 13¼ miles.

Watch Hill Point lighthouse (which contains a repeating light) bears nearly N. from Montock Point lighthouse, distant 14 miles: there is a reef extending from Fisher's Island to Watch Hill Point, leaving a passage between the E. end of the reef and Watch Hill Point, half a mile.

The Race Rock, where there is an iron spear placed, bearing S. W. by W. three-quarters of a mile from the W. point of Fisher's Island, bears from Montock lighthouse, W. by N., 13¼ miles distant.

The Gull Islands bear S. W. by W. from the Race Rock, 4 miles distant. The light-house standing on the West Chop of New London Harbor, bears N. by W. ½ W. 5 miles from the spear on the Race Rock. On the little Gull Island there is a lighthouse containing a fixed light, bearing S. W. by W. from the west point of Fisher's Island, 4 miles distant.

Bartlett's Reef, on which a buoy and light vessel, with one mast and a bell, are placed, bears N. W. by W. ½ W. 4 miles distant from the Race Rock.

Little Goshen Reef, where a buoy is placed, bears N. E. ¾ E., about 2 miles distant from the buoy on Bartlett's Reef.

The lighthouse at New London Harbor, bears from the buoy on Little Goshen Reef, N. N. E. ¼ E., about 1½ mile distant, and contains a fixed light.

The S. W. ledge, where a buoy is placed, bears N. by W. from the Race Rock, 4½ miles distant.

The East Chop of New London Harbor, bears N. by E. ¼ E. from the S. W. ledge, ½ mile distant.

The lighthouse bears from the buoy on S. W. ledge N. W. by N. ¾ mile distant.

 anchor,

London lighthouse. Light. New London.

NEW LONDON LIGHTHOUSE stands at the entrance of the harbor, on the western side. The lantern is elevated 80 feet above the level of the sea, contains a fixed light, and bears N. by E. from Little Gull light, about 6½ miles. High water 9h. 30m., rise 2½ ft.

NEW LONDON.—If you are bound into New London, after getting to the northward of the S. W. part of Fisher's Island, keep New London light bearing from N. N. W. to N. N. E., if you are beating to windward, but if the wind is fair, bring the light to bear N. when at the distance of 2 leagues, and run directly for it; leave it on your larboard hand in running in; when in, you may have good anchoring in 4 or 5 fathoms water, clayey bottom. In coming out of New London, and bound west, when you have left the harbor, bring the light to bear N. N. E. and steer directly S. S. W. till you come into 15 fathoms water, in order to clear a reef that lies on your starboard hand, when the north part of Fisher's Island will bear E., distant 2 leagues.

New London or westward.

NEW LONDON OR WESTWARD.—Keep Gull Island light to bear W. N. W. until you judge yourself within about two miles of the light; your course then to New London light (after you pass Race Rock, which lies W. S. W. from the point of Fisher's Island, distant ½ of a mile) is N. ½ W. In coming in, or going out of New London (when opposite the Gull light) bring the Gull light to bear S. S. W. and New London light N. N. E., leave the light on your larboard hand in going into the harbor; keep well to the W. if it be winter season, and wind at N. E. and stormy—your course to break off a N. E. gale in good anchorage, is W. N. W. from the Gull, distance 5 miles, then haul up, if the wind be N. E. and steer N. W. until you get into 10 fathoms of water, muddy bottom; anchor as soon as possible—you will be between Hatchett's Reef and Black Point; this is the best place you can ride in, if you have a N. E. gale, and thick weather, and cannot get into New London. Saybrook light will then bear W. by N. or W. N. W.

Saybrook Point light.

SAYBROOK POINT LIGHT is a fixed light, at the mouth of the Connecticut River, on the west end of the entrance to that river; it stands on a low sandy point, projecting into the sea, has on its west side a considerable tract of salt marsh, containing a pond of brackish water, which by its evaporation, creates a mist, at times, which very much impedes the light, the weather at the same time clear off shore. Height of the lighthouse from the sea 44 feet.

Saybrook is not a good harbor to enter, but if you must attempt it, bring the lighthouse to bear N. N. W. and steer for it until within one mile, then steer N. E. till the light bears N. W. by W., and then run for it until within half a mile distant, from which a N. N. W. course will carry a vessel up to good anchorage near the town.

When bound up Sound, and off Saybrook light in clear weather, give it a berth of three or four miles; your sound course then is W. S. W. ½ W., 50 miles distant, which will carry you up with Eaton's Neck light, leaving Stratford Shoal on the starboard hand. This shoal, which has a white spar buoy on the south, and black spar buoy on the north, between which you cannot go, bears north from Satauket (Long Island) and S. 3° W. from Stratford Point light. The buoys are placed in 19 feet water. In leaving Falkner's Island light north two miles, steer W. (until you get into 5 or 7 fathoms water) distance 20 miles to Stratford Point light, hard bottom, which leaves Stratford Shoal, that bears S. by W. from the light, on the larboard hand; then your course is W. S. W. to Matinicoek Point.

From Plumb Gut to Greenport.

FROM PLUMB GUT TO GREENPORT.—Vessels bound to Greenport may make their course S. W. and run 3 miles, which will carry you up to Bon's Point, on Long Beach. This beach is 3½ miles long, and covered with low cedar trees, which you leave on your starboard hand going up to Greenport. You will have, from Plumb Gut to Bon's Point, from 4 to 4½ fathoms water, and then your course is W. S. W. 3¼ miles. In running this course you will shoal your water to 3 fathoms, and if you get any less water, haul to the southward, and as soon as you get 3 fathoms, keep your course, and run until you, by heaving your lead, from one heave will have from 3 to 7 fathoms water. As soon as you get 7 or 8 fathoms water, your course is W. N. W. one mile, which will carry you to Hay Beach Point, on Shelter Island, which you leave on your larboard hand; haul close round Hay Beach Point, and your course is W. S. W. 1¼ mile to Greenport; then you may come to anchor in a good harbor.

From Gardner's Point to Greenport.

FROM GARDNER'S POINT TO GREENPORT the distance is 12 miles, and your course is W. by S. Running this course you will shoal your water from 6 fathoms, gradually, to 3 fathoms, on Long Beach side; and then you follow the above directions to Greenport. Five fathoms of water can be carried into Greenport, but large vessels should take a pilot—one is always to be had.

Oyster Pond Point and Plumb Island.

OYSTER POND POINT AND PLUMB ISLAND.—In sailing through this passage, (called Plumb Gut,) you leave the light on your larboard hand, running boldly for the cliff on which it stands, then steering S. E. by E. till the Gull light bears N. E. by E., when you may shape your course for Point Judith, or wherever you may wish.

When passing the light, you will open Gardner's Bay, which is the passage to Sag Harbor, and also leave Oyster Pond Point on your starboard hand, off the eastern part of which a shoal extends one-third over toward the south end of Plumb Island.

The bearings of the lighthouse have been taken from the following places:—From Oyster Pond Point and the reef, N. E. by E., distant from the outer part of the reef $1\frac{1}{2}$ mile; from Saybrook light S. E. $\frac{1}{2}$ S., distant $8\frac{1}{4}$ miles; from Pine Point (the S. W. part of Plumb Island) N. W. by N., distant three-quarters of a mile; from Cherry Harbor Point (the S. W. part of Gardner's Island) N. 30° W., distant 6 miles; from Gardner's Point N. W. $\frac{3}{4}$ W., distant $3\frac{1}{2}$ miles; from New London light S. W. $\frac{1}{4}$ S., distant 10 miles; from Cedar Island (at the entrance of Sag Harbor) N. N. E. $\frac{1}{4}$ E. distant 8 miles.

Bearings.

On Cedar Island is a fixed light; it is elevated 32 feet above high water, and as it may be seen from a high decked vessel, over the sandy point of Gardner's Island, vessels should not run for it when passing that point, until it bears S. of S. W.

Lighthouse.

The bearings and distances, by compass, of this light from the following places, are, Eam Head S. $\frac{1}{2}$ E., distant 24 miles; Plumb Island lighthouse, S. S. W. $\frac{1}{4}$ W., $8\frac{1}{2}$ miles; Gull Island lighthouse, S. W. $\frac{1}{4}$ S., $12\frac{1}{2}$ miles; sandy point of Gardner's Island, S. W. $\frac{1}{4}$ W., 8 miles.

NEW HAVEN LIGHTHOUSE is situated on Five Mile Point, at the entrance of the harbor, and lies on the starboard hand. The lantern is elevated 35 feet above the sea, and contains a fixed light. From New Haven light the following bearings and distances are taken, viz:—Stratford Point light, S. 63° W., 10 $\frac{1}{2}$ miles; Middle Ground S. 42° W., 14 miles; buoy on Adam's Falls S. 50° W.; buoy on S. W. Ledge S. 30° W.; beacon on Quick's Ledge S. 1° E.; Falkner's Island light S. 74° E., 12 miles.

New Haven Lighthouse.

If bound into New Haven, give Falkner's Island a berth of one mile, and steer W. by N., until New Haven light is north of you, in $6\frac{1}{2}$ fathoms water, when you may steer N. W., giving the light a berth of $1\frac{1}{4}$ mile, to avoid the S. W. Ledge, on which there is a black buoy, bearing from the lighthouse S. W. by S. $\frac{1}{4}$ S., distant 1 mile, which you leave on your starboard hand, and when the light bears N. E. you may steer up N. E. by N. for the Fort, to the north of the Pallisades, leaving the white buoy on Adams' Falls on your starboard hand. When you are nearly abreast of the Fort give it a berth of one-fourth of a mile, and steer up N. $\frac{3}{4}$ W. for the end of the Long Wharf, leaving Black Ledge, which is one-fourth of a mile N. W. of the Fort, on your starboard hand.

The buoy on Adams' Falls bears from the light S. W. half a mile, and from the S. W. Ledge N. by E., half a mile.

There is a spindle on Quick's Rock, which bears from the light S. $\frac{1}{4}$ E., distant three-quarters of a mile. The buoy on Adams' Falls bears from the spindle N. W., distant half a mile. The buoy on S. W. Ledge bears from the spindle W. S. W., distant half a mile.

Vessels bound in from the eastward, may pass between the buoy on the South-west Ledge and the spindle, as there are 3 fathoms water in this channel, keeping about midway between them, and leaving the white buoy on Adams' Falls 20 rods to the eastward of them, and then steer for the end of the wharf. On this shore, in channel-way you will have 3, 4, and 5 fathoms water, muddy bottom. Bringing the light to bear S. E. you may anchor in Mcris's Cove, near the east shore, in two fathoms water, muddy bottom. Your course from this up the harbor with a fair wind, is north. Give the Fort Rock, in running for the pier, a small berth.

Vessels bound in from the westward will leave both buoys on the starboard hand, and they may pass with safety within 20 rods of either of them. If beating in, your soundings will be from 2 to 3 and 4 fathoms. Stand in no further than 2 fathoms upon the west shore, on which you will have hard bottom. In beating up, after getting in muddy bottom, (which is channel soundings,) it is best to keep the lead a going often, on account of bordering on the west shore, where you will have hard bottom, and soon aground. High water 11h. 16m., rise 6 feet 6 inches.

BRIDGEPORT.—Vessels bound into Bridgeport must leave the outer buoy on the starboard hand, and steer direct for the beacon on Wells' Point, which bears N. E. from the outer beacon that is on the west flat, about 350 yards distant, leaving the buoy on Stony Bar on the starboard hand, and Allen's Flats on the larboard.

Bridgeport.

In the Harbor of Bridgeport are three buoys, placed as follows, viz: One on Marchand Flats, which lies a mile S. $\frac{1}{2}$ W. from the outer beacon; one on Stony Bar, bearing S. E. from the beacon, 150 yards distant; one on Allen's Flats, being inside the harbor. High water 11h. 11m., rise 8 feet 8 inches.

FAIRWEATHER ISLAND, OFF BLACK ROCK HARBOR.—The harbor of Black Rock, although safe and easy of access, is so situated, that no direct course can be given to steer for the light, that will carry you direct into the harbor, as that depends wholly on the distance you are from the light at the time you make for it; therefore, judgment is to be used in varying the bearing of the light as you draw near in, which is easily done by observing the following rules:—In coming from the westward, if you mean to harbor, to avoid the reef called the Cows, you bring the light to bear N. by W., and run directly for it, until within three-quarters or half a mile distant, when, if occasion requires, you may stretch in to the westward, in a fine beating channel, having from 5 to

Fairweather Island.

3 fathoms water, and good ground. As you approach the light which stands on the east side of the harbor, the water gradually shoals to about two fathoms. The mouth of the harbor, although not very wide, is not difficult; the light bearing east brings you completely into the harbor. The island on which the lighthouse stands, and the reef called the Cows, on the south and west sides, form the harbor of Black Rock. On the easternmost rock of this reef stands a spindle, distant from the light half a league, and from which the light bears north. The light stands 44 rods from the south point of said island at low water. From this point puts off a single rock, 30 rods distant, on which are 8 feet at high water, making in all about 74 rods distance. The light bears from this rock N. by E. $\frac{1}{2}$ E. As soon as you pass this point or rock, the harbor is fairly opened to the northward, in any point from N. to W. N. W. You can run for the light with safety, observing, as you draw nearly in, the above directions, and due attention to the lead. The bottom, for some distance from this rock, southerly, is hard, but you may continue your course, and it will soon deepen. It is safe and good anchorage to the eastward of the light for all winds from W. S. W. to N. N. E., quite down to the mouth of Bridgeport Harbor, which is distant about two miles. The shore on the eastern side of the light is bold to, in 3 fathoms, close aboard the light, and so continues until you are quite down to the south point of the island. This bay, to the leeward of the light, between that and Bridgeport, is one of the best bays for anchorage on the north shore in Long Island Sound, and affords from 4 to 3 fathoms water, the light bearing west. In coming from the eastward, crossing Stratford Point light close aboard, your course to Black Rock light is W. by N., and you keep sounding on the starboard hand, not less than 4 fathoms, nor more than 8 fathoms, to the north of Bridgeport Harbor, which is distant about two miles. The shore on the eastern side of the light is bold to, in 3 fathoms close aboard the light, and so continues until you are quite down to the south point of the island.

Between Fairweather Island and the entrance of Bridgeport Harbor there is good anchorage, in from 2 $\frac{1}{2}$ to 4 fathoms, sticky bottom, with the wind from E. N. E. to S. W., by way of North; bring the woods on the west of the harbor to bear N. E., and anchor in such depth of water as you wish.

Long Island.

* **LONG ISLAND.**—Long Island, from Montock Point to Red Hook, extends W. by S. about 102 miles, and is at the broadest part about 25 miles across. The land is generally pretty low and level, excepting a few hills, which lie about forty miles to the westward of Montock Point, and Hempstead Hill, which is 319 feet above the level of the sea. Along the south side of the island a flat extends about half a mile from the shore. The east end of the flat is sand; the middle and west parts are sand and stones. Your course, Montock Point light bearing north, 7 miles distant, along Long Island shore, is W. S. W., 22 leagues, and W., 12 leagues. About 4 leagues distant from the island there are from 15 to 18 fathoms water, and from that distance to 20 leagues, the water deepens to 80 fathoms; in the latter depth you will have oozy ground, and sand with blue specks on it. About four leagues off the east end of the island, you will have coarse sand and small stones; and at the same distance from the middle and west end, there is small white sand and gravel, with black specks. From the S. W. end, off Coney Island Point, a shoal extends about 6 miles towards Sandy Hook, which forms the east bank.

There are a few inlets on the south side of the island. The first one of any importance is Fire Island, on which bar there are 7 feet at low water. It is a dangerous bar, and only to be attempted by the aid of a pilot, who can be found on board of the coasters plying from the place. The remaining inlets are shallow, with the exception of Rockaway, to which bar the remarks on Fire Island above will apply.

Block Island to New York.

BLOCK ISLAND TO NEW YORK.—Bound into New York, if you fall into Block Island Channel, you will have soundings in lat. 40° N., 100 fathoms, mud and ooze, which quality of soundings continue decreasing gradually till you get into 40 fathoms. In 38 fathoms, Block Island bearing N. by W., 4 $\frac{1}{2}$ leagues distant, you will have fine red and black sand; two and one-half leagues distant, same bearing, you will have 28 fathoms, coarse sand. When Block Island bears N., distant 4 or 5 leagues, you cannot see any land to the northward or eastward; but as you approach the island, you see Montock Point to the westward, making a long low point to the eastward, on which is a lighthouse. In sailing W. S. W., you will make no remarkable land on Long Island. From the eastward of said island to the westward, its broken land appearing at a distance like islands; but may discover Fire Island lighthouse, which shows a revolving light, containing 18 lamps, elevated 89 feet 3 inches above the level of the sea, and 70 feet 10 inches from the base, bearing N. 77° 35' E. from Sandy Hook light, 12 leagues distant. From Fire Island light, a shoal extends south three-fourths of a mile, and joins the bar,

Lighthouse.

* Long Island Sound is a kind of inland sea, commencing at Sands' Point, where is a lighthouse, and extending to Gull Island light. It is from 3 to 17 miles broad, and affords a safe and convenient inland navigation, having good anchoring places, and several fine lighthouses to guide the mariner throughout its whole length.

which is very dangerous, as it shoals suddenly from 8 to 6 fathoms, then directly on the shoal, on which the flood tide sets very strong. It is not safe to approach the shore nearer than two miles when the light bears to the E. of N. To the eastward of the light the shore is bold; the bar is subject to change, and has 7 feet water on it. When Fire Island light bears N., in 10 fathoms water, you may steer W. by S., which will carry you up with Sandy Hook light. The quality of the bottom is various, viz.: yellow, red, brown, blue, and grey sand, within short distances. About south from Fire Island, 33 miles distant, and 40 miles S. E. by E. from the Highlands, lies a bank, extending from N. E. by E. to S. W. by W., having on it from 10 to 14 fathoms, pebbles. On the bank is plenty of fish. Within this, a short distance, you will get 20 fathoms, when it shoals into 16 fathoms, grey sand, which depth you will carry till you get into what is called the Mud Hole, where are from 20 to 36 fathoms water, marl or green ooze, and sometimes pebbles, the deepest part of which bears east from the northernmost part of the woodland, 10 miles; and S. E. $\frac{1}{4}$ S., 15 miles from Sandy Hook light. From the Mud Hole to the bar of Sandy Hook the water shoals gradually, as laid down on the chart.

You will have 20 or 22 fathoms water out of sight of the land, sandy bottom in some, and clay in other places. Before you come in sight of Sandy Hook lighthouse, you see the Highlands of Neversink, which lie W. S. W. from Sandy Hook, and is the most remarkable land on that shore. On the Highlands two lighthouses are erected.

NEW YORK.—If you fall in to the southward, and make Cape May, on which is a lighthouse exhibiting a revolving light, it would be prudent to keep about three leagues off, to avoid Herreford Bar, which lies from four to six leagues from the cape to the northward, and 8 miles from the inlet of that name. This inlet is frequented by the Delaware pilots, having no other harbor to the northward until they reach Egg Harbor. After passing Herreford Bar, you may steer N. E. when in 10 fathoms water, taking care that the flood tide, which sets very strong into the inlet, does not draw you too close; this course continued will carry you up with Egg Harbor; you will then have fine white and black sand, intermixed with small broken shells; by continuing the same course, you will deepen your water, and so continue till you draw near Barnegat Inlet. [In running along the shore, do not steer to the northward of N. E., if in 10 fathoms water or less, as you will be apt to get on Absecon Shoals, or Egg Harbor Bar.] On the south side of Barnegat Inlet, a lighthouse, containing a fixed light, is erected, off which you will get bright coarse yellow gravel. The shoal off Barnegat does not extend beyond two miles from the beach, and is steep to; you may turn this shoal in six fathoms water, within pistol shot of the outer breaker. It would always be prudent to keep in 9 or 10 fathoms water during the night, and not steer to the north of north-east, unless certain of being to the north of the shoal. The soundings are so much to be depended on, that the moment you lose the above soundings you are past the shoal, when you will have fine black and white sand, and very hard bottom; you may then haul in for the land N. by E., which course will bring you along shore in from 15 to 17 fathoms water, but if the wind and weather permit, I would recommend hauling in N. N. W., which will bring you in with the southernmost part of the Woodlands, which is very remarkable, having no other such land in the distance from Cape May up to the Highlands, and can be distinguished by its being very near the beach, and extending to Long Branch.

In passing from Barnegat to Sandy Hook, when to the southward of the lights on the Highlands, you must not open the northern light (which is a fixed light) to the westward of the southern light, (which shows a revolving light) as that will bring you too near the Jersey shore.

The south part of the WOODLANDS.

By passing Barnegat in the day time, it may easily be known; should you be so far off as not to see the breakers, you may perhaps see a grove of woods back in the country, apparently 3 or 4 miles long, known to the coasters by the name of Little Swamp, and lies directly in the rear of the inlet of Barnegat, so that, by sailing to the northward, your having the north end of this land directly abreast, you are certainly to the northward of Barnegat; there is also another grove directly in the rear of Egg Harbor, known by the name of the Great Swamp, which has the same references as respects Egg Harbor; but that the one may not be taken for the other, it must be observed, the Great Swamp of Egg Harbor will appear much higher, and in length 8 or 10 miles; neither can they be seen at the same time, as Barnegat and Egg Harbor are 15 miles apart. Barnegat bears due S. by W. 41 miles from Sandy Hook. In hauling in for the Woodlands before mentioned, you may, if the wind is off the shore, keep within a cable's length of it all the way, until nearly up with the highlands.

New York

Light.

As a number of vessels have been lost, bound into New York, from heaving to with their head on shore, we cannot too strongly urge on the ship-master the necessity, if he is in doubt of his position, of heaving to with the head off shore.

The bottom on the New Jersey shore is of uncertain depth, not at all dependent on the distance, there being ridges parallel to the shore, with 7 and 8 fathoms, and 9 and 10 fathoms inside.

HIGHLANDS, N. 63° W.

Light-ship. LIGHT-SHIP.—A light-ship, of about 350 tons burthen, and showing two lights, is anchored off Sandy Hook, near the place of the old light-ship in 1827. The forward light is 30 feet above the deck, and the after one 40 feet. She is also provided with a bell of 800 pounds weight, which will be rung in thick weather. She is placed in 13 fathoms water. Sandy Hook lighthouse bears from the light-ship W. by N., distant 6 1/2 miles, Highland lighthouse, W. S. W., distant 7 miles.

Highlands of Neversink. HIGHLANDS OF NEVERSINK.—Neversink Hills, on which two lighthouses are built, extend N. W. and S. E., about S. W. from Sandy Hook, on the Atlantic Ocean, to Raritan Bay. The correct altitudes of the following places, which present themselves to mariners as they approach them, are—

- Mount Mitchell, the highest point of Neversink, Monmouth co., (N. J.) 282 feet.
- Tompkins' Hill, on Staten Island,307 do.
- Hempstead Hill, Queen's county, Long Island,319 do.

Highland lights. HIGHLAND LIGHTS.—On the Highlands of Neversink there are two lighthouses bearing N. 23° W. and S. 23° E. from each other, distant 100 yards. The southern light is a revolving one, on the Fresnel plan, and is without doubt the best light on the coast of the United States. It is 248 feet above the level of the sea. The northern light is a fixed light, 246 feet 7 inches above the sea.

Sandy Hook light. SANDY HOOK LIGHT is on the northern point of Sandy Hook, and is a fixed light, 90 feet above the level of the sea.

Two beacons are erected on the Hook; the easternmost one ranges for the buoy of the Upper Middle, and the westernmost one ranges for the buoy of the S. W. spit; they are both lit at night.

Ledge off Sandy Hook. LEDGE OFF SANDY HOOK.—On this reef there are but 9 feet water. The northern light on the Highlands, a little open to the eastward of the southern one, leads right on the reef.

This Ledge is S. 1/2 E. from Sandy Hook light, 7 miles distant, and about one and a quarter mile from the shore, and on which the ship William Thompson struck.

Oil Spot. OIL SPOT.—E. S. E. 1 1/2 mile from Sandy Hook light, is the Oil Spot, having only 10 feet water in one spot, at low water; it is of a triangular shape, and about half a mile on each side in extent; the Along-shore Channel is inside of it.

False Hook. FALSE HOOK.—C... d a quarter mile E., a little northerly, from Sandy Hook light, there is a small shoal spot, with only 12 feet water upon it at low water; it is the remains of the old False Hook.

New York Harbor. NEW YORK HARBOR.—There are three channels over New York Bar; the first is that along and parallel to the Jersey shore, inside of the Outer Middle; the second is the main ship channel between the buoys of the bar; the third is a slue of deep water to the northward of the black buoy of the bar, over which you can carry 24 feet at low water; this channel runs in nearly W. by S.; it was first discovered by Lieut. Godney, of the U. S. Coast Survey, and is used by our largest class ships of war.

Along Shore Channel. ALONG-SHORE CHANNEL.—If bound into New York from the southward, and close in with the Jersey shore, and you do not draw over 10 feet water, you may continue on until you get Sandy Hook light to bear W., or W. by N., when you may steer N. by E. to avoid the point of the False Hook, until you get deep water, say 7 fathoms, Sandy Hook light bearing S. W., then steer W. N. W. until the light bears S. by E., then with the flood tide, steer N., or with an ebb steer N. N. W., (the true course is N. by W.) which will carry you over the East Bank, and up to the black buoy of the Middle.

In going over the East Bank, be careful you do not get set by the ebb tide on Romer; the mark to keep clear of Romer is, to keep Sandy Hook light open with the east end of the Highlands.

Beacon on Romer. BEACON ON ROMER.—A granite beacon, 25 feet high, has been placed on the north-western point of Romer, 9 feet above water.

It bears
15° E.

It bears from the light on Sandy Hook N. 10° W.; from the light at the narrows, S. 15° E.

This beacon was intended to mark out the Swash Channel. It is on the wrong end of the shoal.

Vessels bound in will infallibly get on shore if they run for it.

There is another passage over the east bank between Romer and Long Island. This passage has been buoyed off, and the following are the directions:

The buoys to mark out this channel to the northward and eastward of Romer, are ten in number, and with the following distinguishing marks. Those on the larboard hand coming in, are black and white, in horizontal stripes; those on the starboard hand, red and black.

The first buoy on the larboard hand coming in, is in 25 feet water.

The first buoy on the starboard hand coming in, is in 19 "

" second buoy	"	"	"	"	"	"	"	19	"	"
" third	"	"	"	"	"	"	"	24	"	"
" fourth	"	"	"	"	"	"	"	24	"	"
" fifth	"	"	"	"	"	"	"	24	"	"

The above named buoys are placed in the shallowest water in the channel, and on the edge of the banks which form the channel; and in no one case must a vessel stretch beyond the buoys on either side.

There is a true tide setting through the channel, the time of high water the same as at the Hook, viz. full and change 7h. 29m.

The course in after entering the channel, is W. N. W. by compass, until the Hook and Highland lights are in range. Keep these in range, and run up for the Narrows, which will carry you clear of every thing.

To the northward of the black buoy of the Bar, the following spar buoys have been placed. Those on the larboard hand coming in are black, with white tops; and those on the starboard hand white, with black tops.

The 1st buoy on the larboard hand is in 31 feet water.

" 2d	"	"	"	"	"	"	"	24	"	"
" 1st	"	"	starboard	"	"	"	"	30	"	"
" 2d	"	"	"	"	"	"	"	24	"	"

The flood tide sets, first half, N. W., last half, S. W. All the above depths are at low water.

The spar buoys at the entrance will be changed in the spring, and can buoys, with the same marks will be put down.

SANDY HOOK CHANNEL-WAY.—In running into New York, if intending to go ship-channel-way, give the Jersey shore a berth of 3 miles, until the light on Sandy Hook bears W., which will bring you midway between the buoys of the bar; then steer in for the point of the Hook, keeping the lighthouse well open on the larboard bow, (taking care, if it is flood, not to be set too far to the northward, and if ebb, to the southward,) when abreast of the Hook, so that the lighthouse and east beacon range; keep within half a mile of the shore, to avoid Flynn's Knoll, which has on it only 7 feet water, and lies N. by W. 1½ mile from the light, and seven-eighths of a mile from the point of the Hook. After you have passed the beacon, if you mean to anchor, you may haul into the bay, S. W., giving the Hook a berth of a mile, until you bring the lighthouse to bear E. by N., or E. N. E., where you may anchor in from 5 to 7 fathoms water, soft muddy bottom. But should you wish to proceed to New York, when you have come in as before directed, and got abreast of the beacon, or the point of Sandy Hook, steer up W. by N. until you get the lighthouse on Sandy Hook to bear S. E., when the light and west beacon will be in range; keep them in range, and run directly for the black buoy of the S. W. Spit, which you leave on the starboard hand, giving it a berth of 200 yards.

After you have passed the buoy of the S. W. Spit, steer N. by E. ¼ E. for the black buoy of the Upper Middle, which is 2½ miles distant from the S. W. Spit buoy: on this course you will leave the white buoy of the Knoll on your larboard hand; after you get up with the black buoy of the Upper Middle, steer N. by E. until you pass the white buoy of the West Bank, when you open two hummocks in New Jersey; the westernmost one is called Snake Hill; keep this hummock open with the bluff of Staten Isl., and steer N. by W., which course will carry you through the Narrows. Between the can

Sandy Hook Channel-way.

buoy of the West Bank and the bluff of Staten Island, are 4 white spar buoys,* which you leave on your starboard hand. When thus far, you must, to pass Fort Diamond, keep Staten Island shore aboard. The mark to pass Fort Diamond is to keep Bedlow's Island open with the point of Long Island; for if you can see Bedlow's Island in coming through the Narrows, there is no danger from the narrows to come up to New York; you will steer up for Bellow's Island to avoid the Mud Flat, on which four black buoys are placed, which you leave on your starboard hand. This Flat is a kind of oyster bed, or bank of mud and shells, and has not more than 11 feet on it at low water; but to avoid this flat do not stand too far to the westward, on account of Robbin's Reef, on which there is a lighthouse, between which and Bedlow's Island are three white spar buoys, which, to avoid running on the west side of the channel, the mark is to keep the point of land up the North River (on which Fort Lee stands) open with the east side of Bedlow's Island, after which there is nothing material to obstruct the navigation to New York, it being very steep near the point of Governor's Island, and the rocks near the Battery do not extend 100 yards from the shore. There are three reefs of rocks in the East River, viz: one off the north side of Governor's Island, with 15 feet water on it; one off the Battery, having 9 feet over it, and one off Corlier's Hook, which is very dangerous; they may generally be distinguished at all times by the rip of tide going over them, both flood and ebb.

Lighthouse.

These directions are for slack water; those following them should remember that the flood tide below the Narrows sets to the westward, and the ebb to the eastward.

Between the buoy of the West Bank and Staten Island there is a shoal, dry at low water; the mark to avoid this, is to keep Snake Hill open with the bluff of Staten Island.

Other Directions.—Or you may, after making the Highlands of Neversink, run in boldly within three miles of the beach, and in steering along to the northward, observe to keep in about 8 fathoms water, until you get the lighthouse to bear W. 4 N., then if you have a round hill, called Mount Pleasant, some distance in Jersey, in one view with the land about one-quarter of a mile to the southward of the lighthouse, you are in a situation to pass the bar; steer in W. by N. until you are over it; you will have on it at low water, 3 fathoms; when over, you will be in 4½ fathoms. Pass the Hook and lighthouse about half a mile, at which distance you will have 5 and 6 fathoms. When you have the point of the Hook on which the beacon stands bearing S. S. E. you may then haul to the southward, and round the Hook and come to, from one to two miles distant, the Hook bearing from E. to N. E., in good holding ground, 5 fathoms water. When you make Long Island, it is necessary to keep somewhat in the offing, on account of the East Bank, and observe the same marks running in as before mentioned.

If sailing up in the night, when abreast of the S. W. Spit, the two lights on the Highlands will range, when you may steer N. by E. ¼ E. until you make the buoy of the Upper Middle, when the East Beacon and Sandy Hook light will range in one. After passing the Upper Middle, you will deepen your water to 6 fathoms, when you may steer N. up through the Narrows, and you will deepen your water to 7, 8, 10, 12, and 16 fathoms.

High water.

High water at full and change of moon on the bar and Sandy Hook, 7h. 29m. A. M. Average rise and fall of tide on the Bar, 5½ feet.

*Bearings.**Bearings from Prince's Bay lighthouse.*

Point of the Neversink Hills, S. 54° E.
Sandy Hook lighthouse, S. 71° E., distant 10 miles.
Spr Buoy, on the north side of the Round or Middle Shoal, at the entrance of Prince's Bay, S. 86° E.
At Prince's Bay, where the lighthouse is erected, the level of the hill is 77 feet above tide-water. The elevation is 30 feet from its base.

Directions for sailing in by Sandy Hook, corresponding with the Chart published by E. & G. W. BLUNT.

In coming up with the bar, when midway between the buoys, steer W. by N. till the light on Sandy Hook ranges with the easternmost of five trees on the Highlands; you may then steer W. until you get the West Beacon on the point and the lighthouse in range, and so keep them till you make the black buoy of the S. W. Spit; after hauling round the spit, steer N. by E. $\frac{1}{2}$ E., until you make the buoy of the Upper Middle, but be careful of the flood tide, which sets directly over to the West Bank; after you have passed the buoy of the West Bank (which is the upper buoy) you should not bring Staten Island light north of N. by W., as the edge of this bank is very shoal, and extends to the point of the island.

If you wish to run for Prince's Bay, bring the light to bear W. N. W. and run for it, anchoring as near the shore as you please; E. S. E. $\frac{1}{2}$ S. from the light will take you on the N. point of the shoal, on which a buoy is placed; this buoy is left on the larboard hand in going in, but as it is liable to be carried away by the ice, the light should never be brought to bear north of W. N. W.

Prince's Bay lighthouse stands on a bluff on the west side of the bay, bearing N. 71° W. from Sandy Hook light, distant 10 miles, and W. from the Knoll Buoy. It shows a fixed light, facing E. S. E., having eleven lamps, elevated 106 feet 11 inches above the level of the sea, and 29 feet 11 inches from its base.

GEDNEY'S CHANNEL.—There are three can buoys, painted with black and white vertical stripes, in Godney's Channel. They are in mid-channel, so that vessels can pass on either side of them by following these directions.

Godney's Channel.

Lowest water 23 feet. Bring the light-house on Sandy Hook to range with the black buoy, and the beacon on Romer to bear W. N. W. Steer W. N. W. with the ebb, and W. by N. on the flood, until you drop into 6 fathoms water, when the lighthouse will range with a clump of trees on the Highlands with the eastern side cut down square. You then steer for the E. beacon on the Hook, keeping it a little open on the larboard bow, until you get mid-channel way, when you steer for the buoy of the S. W. Spit.

The following are the bearings, courses, and distances of the buoys placed in the Harbor of New York.

CAN BUOYS.—The black buoy on the bar, bearing E. by N. from the lighthouse, distant 3 $\frac{1}{2}$ miles, ranges with the lighthouse and Mount Pleasant, in New Jersey.

Can Buoys.

The white buoy on the bar, bearing E. $\frac{1}{2}$ S. from the lighthouse, 1 $\frac{3}{4}$ mile distant, and S. from the black buoy 1 $\frac{1}{4}$ mile distant; between these buoys is the channel. This buoy ranges with the West Beacon and Block House.

The black buoy on S. W. Spit, 2 $\frac{3}{4}$ miles from the lighthouse, bearing N. W. by W., ranges with the West Beacon and lighthouse.

The white buoy on the Knoll, bearing N. W. $\frac{1}{2}$ N. from the lighthouse, distant 4 miles and one-tenth.

The black buoy of the Middle, distant 5 miles from the lighthouse, bearing N. 15° W., ranges with the East Beacon and lighthouse.

The white buoy of the West Bank, N. 15° W. from the lighthouse, 6 $\frac{1}{2}$ miles distant, ranges with Snake Hill, in New Jersey, and the bluff of Staten Island, where the light-house is erected, as before mentioned, and where the telegraph now stands.

SPAR BUOYS,

Between the Ocean and the City of New York, in conformity to Act of Congress.

Five spar buoys between the outer bar and the black can buoy of the Spit.

Four black spar buoys between the can buoy of the Spit and the can buoy of the Middle.

Three black spar buoys between the can buoy of the Middle and Coney Island.

Four black spar buoys on the shoal opposite Gowanus Bay.

On the S. E. part of the ruins of Flinn's Knoll, in 3 fathoms water, is a black spar buoy bearing N. from Sandy Hook lighthouse.

Vessels from sea, going up Ship Channel, must leave it on the starboard hand, and those bound through the Swash Channel on the larboard hand.

On the west side of the Main Channel.

One black spar buoy on the north side of the Round, or Middle Shoal, opposite Prince's Bay.

Four white spar buoys between the white can buoy of the bar and the point of Sandy Hook.

Six white spar buoys between the can buoy of the Knoll and the can buoy of the West Bank.

Four white spar buoys between the can buoy of the West Bank and Staten Island.

Three white spar buoys between the point of Robbin's Reef and Bedlow's Island.

In the East River and Long Island Sound.

One white spar buoy on the Middle Ground, opposite Bushwick Creek, where the Dry Dock is located.

One black spar buoy on the Governor's Table, Blackwell's Island.

One black spar buoy on Lawrence's Reef, south from Westchester Creek, near Long Island.

[NOTE.—In sailing Ship Channel, the white buoys are to be left on the larboard, and the black buoys on the starboard hand. None of the buoys are in less than 19 feet water.]

THE LIFE SAVING BENEVOLENT ASSOCIATION OF NEW-YORK, chartered by the Legislature on the 29th of March, 1849. Its object is to furnish means to save lives from shipwrecked vessels, and by donations, to reward meritorious conduct and acts of courage in the preservation of human life. Its means are derived from voluntary contributions. By the aid of an appropriation from the United States Government, the association has erected the following houses, and placed in the Superior Metallic Life Boats and other facilities for communicating with wrecked vessels, and for taking persons from them to the beach. Houses have been built under the superintendance of Mr. Watts, United States Engineer, between Coney Island and Montock Point.

On the South side of Long Island, the

There are six Boat Houses erected by the United States government, under the superintendance of Lieutenant John McGowan, acting under the advice of the Philadelphia Board of Underwriters, between Little Egg Harbor and Cape May, viz :

- 1. Brigantine Beach,
- 2. Absecom do.
- 3. Pock's do.
- 4. Ludlum's do.
- 5. Five Mile do.
- 6. Cape May, near the lighthouse.

These houses are under the supervision of the Philadelphia Board of Underwriters. Each house under the charge of the Life Saving Benevolent Association, when complete, is to be furnished with the following articles :

- One metal surf-boat with air chambers and cork fenders, seven oars, and two India rubber bailing buckets.
- One metal life-car, with cork or India rubber floats and fenders, and rings and chains for each end.
- One manilla hawser, 4½ inch, 180 fathoms.
- One hauling line, 2½ inch, 310 fathoms.
- Two rocket lines, ⁹/₁₀ of an ounce per yard, 300 yds. each.
- One coiling frame for rocket line and box.
- One crotch and range for throwing rockets.
- One sand anchor, strop and bulls-eye.
- One tackle with 20 fathoms fall, of 2½ inch Manilla.
- One heaver and strop.
- One mortar of iron, and 10 shot fitted with spiral wire.
- One copper powder canister and 4 lbs. powder for same.
- Twelve blue lights and box, containing 50 quick matches.
- Five rockets and rocket box of tin.
- Eight pieces of match-rope and 12 pieces of port-fire.
- Two lanterns and oil can, and oil for same.
- One lamp feeder and wick.
- One stove and pipe.
- One cord of wood.
- Two shovels.
- One priming wire.

WALTER R. JONES, President.
 BACHE McEVERS, Vice President.
 ROBERT C. GOODHUE, Treasurer.
 JOHN D. JONES, Secretary.

South side of Long Island.

MONTOCK SHOAL lies S. by E. from the lighthouse, distant 2½ miles, is of hard sand, extending N. W. and S. E. about one mile, having four fathoms on it, shoaling suddenly, and breaks in heavy weather. It has 12 fathoms on the inside.

FRISBIE'S LEDGE.—See page 201.

The soundings are in general very regular, shoaling gradually as you approach the shore; there is, however, deeper water to the east of Fire Island lighthouse, when opposite Raccoon Woods, near the shore, than in other parts of the coast; as 10 fathoms are found about a mile distant. The shoal off Fire Islands lighthouse, composing part of the bar, extends about a mile from the shore, and one mile from where the lighthouse stands. It is bold to on the eastern side, having six fathoms close to it; to the west of the lighthouse it shoals more gradually.

Fire Islands Inlet is navigable for vessels drawing nine feet water. It is subject to change, and those who are acquainted with its entrance are guided by the breakers in entering as much as by any thing else.

Oak Island, Gligo, Crow and Hog Island Inlets are all barred harbors, having very little water; they do not extend out more than half a mile from the general line of the shore.

Rockaway Inlet.

ROCKAWAY INLET lies N. E. from Sandy Hook, distant nine miles. The bar is subject to change; 12 feet may be about the average depth at low water, and the bar extends about two miles from the shore.

Barnegat to Sandy Hook.

BARNEGAT TO SANDY HOOK.—Barnegat lighthouse is 40 feet above the level of the sea, and contains a fixed light; it is on the southern side of the entrance.

The shore, from Barnegat to the north end of Long Branch, is nearly straight, running N. 33 miles. It then bends gradually to the N. N. W., to the latitude of Sandy Hook lighthouse, distant nine miles from the northern part of Long Branch.

The beach north of Barnegat is bare of timber, until nearly up with Squam Inlet; (19 miles;) but the pines, which are on the main land from two to three miles inside, show plainly over the sand-hills.

The Woodlands, which commence about one mile south of Squam, are close to the shore, and extend to Long Branch, eight miles.

Long Branch is that part of this shore where low table land shows itself close to the beach; numerous houses are built on it, and they are generally known to the seamen as "the Tavern houses." It is about five miles in length.

North of Long Branch the beach is low, and nothing remarkable until up with the entrance to Shrewsbury River, opposite the lighthouses on the Highlands of Neversink, where it is free from sand-hills, and when the entrance is closed, which is sometimes the case, it appears perfectly level. After passing this flat part, distant about six miles from Long Branch, the cedars on Sandy Hook commence, and extend up to the lighthouse.

Squam Inlet is navigable for small vessels; and as they are frequently detained at anchor on the inside of the bar, strangers, not knowing their latitude, have supposed themselves opposite Barnegat from seeing them at anchor. At Barnegat the pines show as remote from the shore, while at Squam they are near.

The shore between Barnegat and the Highlands may be approached within one-third of a mile by all classes of shipping, in clear weather, in the day time; and there is nothing to fear, save a spot to the north of Long Beach, about one mile from the beach, on which there is but 14 feet. The ship William Thompson struck on this shoal. It lies S. S. E. from the lighthouse on the Highlands, distant 3 miles, as described in page 210.

Although vessels, in clear weather, may venture with safety near this part of the Jersey shore, in the day time, they cannot be too careful in thick weather and at night; and when in less than 13 fathoms water, should keep the lead constantly going, as there are many places on this coast where 10 and 12 fathoms depth may be found within one or two miles of the shore, where the bottom is irregular, and where your approach to the beach can only be known by the rapid change in depths. Not many years since one of our packets was lost on this shore, and the Captain assured me that he had 20 fathoms about 10 minutes before the ship struck. On examining the chart, I found his rate would place him in about 13 fathoms, and he did not heave to, when sounding, although going at the rate of 10 knots.

Soundings between Cape May and Montock Point.

The average extent off the coast of New Jersey is 60 miles; this will take you to the Forty Fathoms Line, from which it shortly afterwards deepens to 50 and 100 fathoms. The Forty Fathoms Line extends itself parallel with the coast until up with Barnegat, when it begins to widen, and from thence extends over towards Montock Point; S. S. E. from which, 40 miles, you have 40 fathoms; 65 miles, 50 fathoms; and 80 miles, 100 fathoms.

When you get soundings on the edge of this bank, and are uncertain as to your position, never rely on sounding *once or twice* to determine it; but sound frequently, projecting your course, distance, and depth of water, the same scale as your chart, on a clean sheet of paper. After you have continued the same for sufficient time to get a profile of the ground sailed over, compare the depth and changes by cutting out such parts of your projection where there are no soundings, so as to enable you to slide it over the chart to such place as it will correspond; or, what is better, make your own projection and soundings on transparent paper, and slide it over such parts near which you suppose yourself to be, until the profile of depth corresponds with it, preserving the meridians on both parallels.

NOTE.—The chart of approach to New York is now engraving in the office of the U. S. Coast Survey, Washington City, and by attention to the above one may navigate with the greatest safety with it, bearing in mind that a single depth of water will no more give you your location at sea, than your altitude above the sea would give your position on the land. If you wish to navigate with the lead, in addition to having a good chart, you must watch the changes as you would the aspect of a country over which you are travelling.

Coast southward of Sandy Hook.

COAST SOUTHWARD OF SANDY HOOK.—If you come in near Cape Hatteras, be careful of its shoals, and make your way to the N. N. E., which will carry you on the soundings of the Jersey shore. When you get 20 fathoms water, in lat. 40° N., then haul in to make the land, by which you will avoid the difficulties of the coast, and the shoals nearer in shore; but if you cannot, see the following:

When you are up with Chincoteague Shoals, in 16 fathoms water, it is near enough to approach them; from this station, if bound into the Delaware, steer N. N. E. $\frac{1}{2}$ E., which is the course parallel to the land, until Cape Henlopen light bears W. You may then run in for it; or, if bound to New York, keep on that course, until you have passed the pitch of Long Beach, taking care, as remarked before, not to run into less than 10 fathoms water, if night. You can then steer for the Hook. If, in running up, you deepen your water suddenly, from 14, 18 to 25 and 30, or 35 fathoms, oozy bottom, you are in what is called the Mud Hole, the centre of which is 13 miles from the taverns, at Long Branch, and S. E., 16 miles, from Sandy Hook lighthouse.

SANDY HOOK, CAPE MAY, AND CAPE HENLOPEN.—When sailing from Sandy Hook lighthouse, as soon as to the eastward of the bar, steer south, if night, till you pass Barnegat; if day-time when passing, you may go nigh the breaker, say $5\frac{1}{2}$ fathoms. In sailing between the Highlands and Barnegat in the day-time, you may go within one-quarter of a mile of the land, if the wind is off shore. When you have passed Barnegat, steer S. W. by S., 10 or 11 leagues, which will carry you up with Great Egg Harbor, which has a shoal bank one league from the shore, that has not more than 6 feet water on it.

In the day-time you may go within 2 leagues of the shore, but in the night it will be prudent to keep further off. When you have passed Great Egg Harbor, steer S. W. by W. 10 leagues, which will bring you up with Cape May light.

Between Barnegat and Cape May there are three inlets, one of which is fit, at high water, for vessels drawing 15 feet, viz: Little Egg Harbor, as below. Great Egg Harbor may be run for in time of danger, and will give 12 feet at high water. The navigation is not so safe as other places.

In running for Cape May, while steering your S. W. by W. course, you will pass five inlets before you come up with Cape May Light, viz: Coston's, Townsend's, Herreford, Turtle Gut, and Cold Spring, all of which have bars lying off their entrances; when abreast of Herreford inlet, you may, if bound to Cape May, steer W. by S., but if bound to Cape Henlopen, steer S. S. W. till the lighthouse bears W., when you may run for it till within 2 miles.

E. by S. from Cape May light, $15\frac{1}{2}$ miles distant, lies Five Fathom Bank, with 12 feet water on it. The south point bears E. S. E. from Cape May, and from Cape Henlopen it bears E. $\frac{1}{2}$ N., 21 miles distant, and ranges N. and S. It is dangerous for vessels with over 10 feet water.

LITTLE EGG HARBOR lighthouse is a fixed red light; the tower is red, 45 feet high, and is about 220 yards in a southerly direction from the old boarding-house, which is burned down.

The light is about 18 miles in a S. W. by W. direction from Barnegat light. Vessels making it should not steer to the N. of N. E. until they make Barnegat light.

This notice is deemed necessary, as the land at Barnegat runs nearly in a N. by E. direction, and to one not acquainted, both lights being of the same character, the Tucker's Besch light would be apt to make him haul to the northward too soon.

Sailing directions, by the late Lieut. Geo. M. Bache, Asst. U. S. Coast Survey.

SOD CHANNEL.—Coasters bound to the northward will generally make this harbor, when caught by a north-easter, after having passed to the northward of it, and before being able to make Sandy Hook. In running down within sight of the land, pass the house near the point of Long Beach, giving the breakers off the Old Inlet a berth of half a mile, and keeping in 24 feet water until the lighthouse on Tucker's Island bears N. W. by W. High water 7h. 10m., rise 4 feet.

Being in 24 feet water, fine black sand, with the lighthouse on Tucker's Island bearing N. W. by W., steer W. by S. for the outer buoy, near the middle of the entrance of Sod Channel.

While abreast of Tucker's Island, and before reaching the outer buoy, there will not be much tide, and the least water will be 10 feet at low water. When up with the outer buoy, the S. W. point of Tucker's Island being 900 feet distant to the westward, steer S. W. $\frac{1}{2}$ S. for the middle buoy, keeping on the outside. Strong tide will here be met. The flood setting over the shoal off the point of Sods, and the ebb setting over towards the Round Shoal, for which allowance must be made. Turn the middle buoy in 19 feet water and steer for the inner buoy. With a scant wind and an ebb tide, vessels will be obliged to anchor here, or even before reaching this point. With a change of tide a better anchorage will be found further up, between Anchoring Island and the marsh to the northward. This part of the harbor, from the N. W. extremity of Anchoring Island to Hatfield's store, is $1\frac{1}{2}$ mile long, and $\frac{1}{2}$ of a mile wide.

Vessels coming from the southward and wishing to enter by the Sod Channel, will bring the lighthouse on Tucker's Island to bear N. $\frac{1}{2}$ W., and steer for it, giving the Round Shoal a berth. When the hillock on the south end of the island bears W. $\frac{1}{2}$ N., haul up W. by S. for the outer buoy, and afterwards follow the directions given above.

*Sandy Hook,
Cape May &
Cape Henlo-
pen.*

*Little Egg
Harbor.*

Sod Channel.

South Channel.

SOUTH CHANNEL.—Vessels from the southward will give the Brigantine Shoals a good berth, keeping in 4 fathoms water until the northernmost house on Brigantine Beach bears N. W. by N., then steer N. by W. $\frac{1}{4}$ W., if the weather be clear. Hatfield's store on the marsh, will be seen ahead, $4\frac{1}{2}$ miles distant. Keep on this course until the northern house on the Brigantine Beach bears N. W. by W. $\frac{1}{4}$ W., when they will be between the breakers on the south point of the Round Shoal and those on the beach; then haul up to the N. E. $\frac{1}{4}$ N., and continue on that course $\frac{1}{4}$ of a mile, until the northern house on Brigantine Beach bears west, and the S. E. point of the sand hillock on the south end of Tucker's Island bears N. $\frac{1}{4}$ W., haul in then N. $\frac{1}{4}$ W., and steer for this hillock until nearly up with the middle buoy, after which proceed as before directed.

Absecum Inlet.

ABSECUM INLET.—Absecum lies $5\frac{1}{2}$ miles S. W. from Little Egg Harbor. Off Absecum, from E. to E. by S., 3 miles, lies a shoal, having on it several lumps, on which there are only 10 feet water. The ground is broken, having between the lumps 4 and 5 fathoms. On this shoal the ship *Citizen* was lost in 1822.

To enter the Harbor.—Bring the house which is on the starboard hand point to bear N. W., and steer directly for it, until within one-fourth of a mile from the house, when you must steer north until you get to the marsh, where you may anchor in from 3 to 6 fathoms. Depth of water on the bar at low water, 9 feet; common rise of the tide, 5 feet.

Five Fathom Bank.

FIVE FATHOM BANK.—Vessels bound into the Delaware, coming from the northward, or having fallen to the northward of Cape Henlopen, should be careful not to approach nearer than 12 fathoms water, until they have got into the latitude of said Cape, to avoid the shoal called the Five Fathom Bank; on which a light-vessel, having two masts, with a lantern on each, is moored in 7 $\frac{1}{2}$ fathom's water, Cape May lighthouse bearing W. 20° $30'$ N., distant $15\frac{1}{2}$ miles; the centre of the shoalest ground, on which is found 12 feet water, bears N. 28° E. from the light-ship, distant $2\frac{1}{2}$ miles. It extends N. by E. $\frac{1}{2}$ E., and S. by W. $\frac{1}{2}$ W., three-fourths of a mile, and is half a mile in breadth, and bold on its eastern edge, as there are 7 fathoms half a mile to the eastward of the shoal water.

The Bank, having on it 4 and 5 fathoms, is 9 miles long, in a N. and S. direction, and has an average breadth of $1\frac{1}{2}$ mile, in an E. and W. direction.

Vessels coming from the northward should not run for the light-ship, while bearing from it between N. 14° E. and N. 41° E. S. E., three-fourths of a mile from the light-ship, there are 5 fathoms water.

There is a passage inside of this shoal, by taking your soundings from the land, in 6 or 7 fathoms, but strangers in large vessels should not attempt it.

McCrie's Shoal, off Cape May Lighthouse.

MCCRIE'S SHOAL, OFF CAPE MAY—This shoal bears $7\frac{1}{2}$ miles south-east from Cape May lighthouse, and has 17 feet water upon it. W. by N., one and one-eighth of a mile from McCrie's Shoal, there are 18 feet water on a small spot. Another shoal, 15 miles E. S. E. from Cape Henlopen lighthouse, with $4\frac{1}{2}$ fathoms water upon it. The above were examined by Lt. Buche, U. S. N., Assistant U. S. Coast Survey, in 1844.

South-east, $1\frac{1}{2}$ mile from Congress Hall, there is a shoal one mile in extent, on which there are only 6 feet water. There are $3\frac{1}{2}$ fathoms inside of it. It is called Old Eph.

Cape May Lighthouse.

CAPE MAY LIGHTHOUSE is on the extreme south-west point of the Cape, at the entrance of Delaware Bay; its elevation from the sea is 80 feet, contains a revolving light, and makes a revolution in three minutes. It bears N. E. by N. $\frac{1}{4}$ N. from Cape Henlopen light, distant about $10\frac{1}{2}$ miles.

South-west from Cape May light, half a mile distant, there is a shoal of one-fourth of a mile in extent, having on it 10 feet water.

The south point of Crow Shoal bears W. 22° N. from the light, distant $1\frac{1}{2}$ mile. The shoal is four miles in extent, in a N. direction, having on it only seven feet in places.

There is good anchorage and harbor under Cape May light, with the wind at N. or N. N. E.; and after passing the light and keeping the land on board, in 3 to 5 fathoms water, vessels will find safe anchorage, and a good harbor, with the wind at the eastward.

Cape May.

CAPE MAY.—Vessels approaching the Delaware by Cape May, will get the light to bear W. N. W., in 4 or 5 fathoms, then run for it, and make a safe entrance into the Delaware, clear of all shoals, with vessels drawing 10 feet water.

Running for the light, keep about two miles to the northward and eastward of it, until about three-quarters of a mile from the shore. From this you must keep the shore close on board, when you will be in 5 fathoms water, till you double round the Cape; when you will leave the Great Shoal on your larboard hand, over which it continually breaks, when covered, bearing S. E. by E. from the light, distant $1\frac{1}{2}$ mile, bare at low water.—After you have doubled the Cape, steer N. till the light bears S. E. $\frac{1}{2}$ S., when you must steer N. W. until you deepen into 7 and 8 fathoms. In running the above course, you will have from 5 to $1\frac{1}{2}$ fathoms at low water on Crow Shoal, before you come into eight fathoms, which is 5 miles distant from the light. After you have got into 8 fathoms, you will immediately come into 3 fathoms, when you must steer N. W. by W., 3 leagues, which will carry you into the main channel, between the Bradywine light-boat on your larboard, and Cross Ledge on your starboard hand, bearing N. N. W. $\frac{1}{4}$ W. and S. S. E. $\frac{1}{2}$ E. from each other, distant $11\frac{1}{2}$ miles.

Cross Ledge has a beacon boat with one mast, moored on it in summer: and in winter a buoy.

On the first of the flood, the tide sets to the westward, and in light winds should be guarded against, by steering from one to two points more to the eastward, and on the ebb the contrary.

In running the above course, you will have 3, 3½, and 2½ fathoms, till you come near the main channel, when you will deepen into 5 fathoms, which is a swash that runs up to the eastward of the Cross Ledge; still keep your N. W. by W. course till you have crossed this swash, when you will shoal your soundings into 2½ fathoms, and then deepen into 7 fathoms, which is the main ship channel, when you must steer N. W. till you have only 5 fathoms, which is on the Fourteen Feet Bank, (which has a buoy on the S. S. E. end,) and then alter your course to N. N. W. for Cross Ledge. High water, 8 19, rise 6 ft.

CAPE HENLOPEN LIGHT is 160 feet above the level of the sea, containing a fixed light. S. E. by S. of the lighthouse is the Hen and Chickens Shoal, after described. The nearest part of the Overfalls, which has on it from 2 to 5 fathoms, bears N. E. by N. from the land, distant 4½ miles; the outer point N. E. by E. ½ E., distant 7 miles. Brandywine Shoal bears N. ½ W., distant 11¼ miles.

The Beacon stands on the extreme north end of Cape Henlopen, very near the beach. It bears N. 5° W., three-fourths of a mile from the lighthouse. Ships running in for Old Kiln Roads, may, when the beacon light and the lighthouse are in one, approach the beacon light within a cable's length; then steer W. N. W. until the lighthouse bears S. E., and anchor in 4 fathoms, good holding ground.

E. ½ S. from Cape Henlopen, 25 miles, is a shoal, with 4 fathoms on it, gray sand. Bring Cape Henlopen light to bear W., and run for it till within two miles; when abreast of it, you will have 15 or 16 fathoms water. After you have passed it, steer W. N. W. till you bring it to bear E. S. E., when you may anchor, in 3 or 4 fathoms, near the breakwater.

There is no difficulty, with common attention, in running into the anchorage to the southward of the Breakwater, even in a gale of wind, either between the two works, or by the passage to the S. E. of both. There is a red fixed light, 56 feet high, on the N. W. end of the Breakwater.

In approaching from sea and going in by the south passage, give the beacon light on the pitch of the Cape a berth of from four to five hundred yards, and when you bring the west end of the Breakwater to bear N. W., steer for it, and anchor as close on the works as you can with safety, the light on the west end bearing about N., or N. by W.

Brandywine light-boat is on the west side of the shoal, bearing N. ½ W. 12½ miles from Cape Henlopen light; the light-boat is nearly three-fourths of a mile from the south point of the shoal.

One and three-fourths of a mile, on a N. by W. course from the light-boat, there is a buoy on the northern point of the shoal.

Cape May light bears E. S. E., 7½ miles, from the light-boat.

DELAWARE BAY AND RIVER.—In running up the Bay, the light bearing S. 4 E., steer north, a little west, for the buoy of the Brown, which bears N. 4° W. from the light, 9½ miles distant, which you leave to the westward; keep on that course until up with the Brandywine light-boat, (No. 1,) then steer from light-boat N. 1 to light-boat No. 2, near Cross Ledge. Your course, on the flood tide, is N. W. by N. ½ N., and on the ebb, N. N. W., the distance 11¼ miles. Soundings from 4½ to 8 fathoms. You leave the buoy on the north end of the Brandywine Shoal to the eastward, and the one on the 14 feet bank to the westward: the former being 1½, and the latter five miles from the light-boat.

The tides are influenced very much, in direction and strength, by the winds; but as the channel is well defined by the two light-boats, (which are moored in line with it,) in connexion with the buoys, there can be no difficulty in clear weather.

You make Egg Island light bearing about north, soon after leaving the Brandywine: it is upon a dwelling-house, elevated about 40 feet, visible 12 miles. N. W. by W., 1½ mile from the buoy on the 14 feet bank, is the southern extremity of Joe Flogger, or Folger Shoal, a narrow ridge running N. N. W. 15 miles, nearly dry in places, and forming for that distance the west side of the main channel. In beating up, do not stand to the westward into less than four fathoms. In thick weather Joe Flogger may be safely tracked along the whole extent, hauling on to four fathoms, hard, and deepening off to 5 and 6 fathoms, soft.

The ledge, or No. 2 light-boat, shows a single light, elevated 45 feet, visible 7 miles, and is in a cove about mid-channel between Joe Flogger and the buoy on the lower end of Cross Ledge, which is a narrow ridge of hard sand on the east side of the channel, 4½ miles in length, and nearly dry in places. Leave the light-boat to the westward, close aboard, and the course then to the Middle is N. W. by N. ½ N., on the flood, and N. N. W. on the ebb tide, distance 5 miles, soundings from 7½ to 5 fathoms. These courses carry you about mid-channel between Joe Flogger and Cross Ledge. From the buoy of the Middle unto Bombay Hook Bar, the Thrum Cap (the lower of two insulated clumps

Cape Henlopen Light.

Delaware Bay and River

of trees on the western shore, bearing S. W.,) the course is N. W. $\frac{1}{2}$ W., on the flood and N. W. by N. on the ebb, distance $7\frac{1}{2}$ miles. Soundings from 5 to $6\frac{1}{2}$ fathoms.—Bombay Hook Bar is very bold; the soundings in the channel off it are from 6 to $6\frac{1}{2}$ fathoms. It should not be approached nearer than 5 fathoms.

Cohansey light.

Cohansey light, on the Jersey shore, is in sight from the Buoy of the Middle, bearing N. N. W.; it is upon a dwelling-house, elevated 40 feet, and visible 12 miles. Mahon light is also upon a dwelling-house, elevated 30 feet, visible 10 miles, and is in sight, bearing W. by S. $\frac{1}{4}$ S. Egg Island light bears E. by S. $\frac{1}{4}$ S.

When nearly up with the northern end of Joe Flogger, Bombay Hook light will be made just open with Bombay Hook Point, and bearing N. W. It is elevated 40 feet, and is visible 12 miles. When up with Bombay Hook Point, Reedy light will be made, bearing N. W. by N., elevated 55 feet, and visible 14 miles.

The channel westward of Joe Flogger cannot be considered available until it is buoyed. The following directions are given, because it has sometimes been entered by mistake, and considerable embarrassment experienced in working back, to get into the main channel again. This channel is as direct as the main channel, though not so wide. The southern extremity of Joe Flogger Shoal, as already observed, bears N. W. by N. $1\frac{1}{2}$ mile from the buoy on the 14 feet bank. Entering with that buoy bearing east $1\frac{1}{2}$ mile, steer N. W. by N. $\frac{1}{4}$ N., which course will carry you along the western side of the shoal, in not less than four fathoms, until Mahon light bears W. by N., when you strike a middle ground $1\frac{1}{2}$ mile long, least water 13 feet; having passed it, you drop into four fathoms again.

When the buoy of the Middle (main channel) bears E. by N. $\frac{1}{4}$ N., and Mahon light W. by S. $\frac{1}{4}$ S., steer N. W. by N. $\frac{1}{4}$ N., and you pass through into the main channel, a little below the Thrum Cap, and in not less than $3\frac{1}{2}$ fathoms.

The following directions will also serve for this channel, and, with a head tide, more safely than the foregoing:—Entering as before directed, track the west side of the channel along, shoaling to $3\frac{1}{2}$ and deepening to 4 and 5 fathoms, until Mahon light bears W. N. W., when you take your soundings from Joe Flogger cautiously, (not shoaling to less than three fathoms, for the shoal is very bold,) and carry $3\frac{1}{2}$ to $4\frac{1}{2}$ fathoms through, between it and the Middle Ground. When past the Middle Ground track the west of the channel along as before.

Note.

NOTE.—Courses and bearings magnetic, and distances are in nautical miles.

The name of Blake's Channel has been given to the channel west of Joe Flogger, which was made known in the progress of the U. S. Coast Survey.

From Bombay Hook Bar to Liston's, (the tree bearing south,) the course is N. W. $\frac{1}{2}$ N., distance 13 miles; soundings, as far as Bombay Hook light, 6 to $4\frac{1}{2}$ fathoms, and between the light and Liston's 3; to $3\frac{1}{2}$ fathoms being the least water in any part of the channel between Cape Henlopen and the Pea-Patch.

From Liston's, (the tree bearing south,) to give Stony Point bar a berth, steer for Port Penn Piers, a little to the westward of Reedy Island light, $1\frac{1}{2}$ mile, or until Burney's house, on the Delaware shore, (yellow, with two single poplars near it,) bears S. W. by W., soundings 4 fathoms; then your course is N. by E. $\frac{1}{4}$ E 4 miles, to Salem, or Elsingborough Point, on the Jersey shore; soundings, up to the middle of Reedy Island, 4 to 5 fathoms, then deepening to 7 and 8 fathoms. There are two channels to pass the Pea-patch: for the eastern, or Goose Island Channel, track the Salem flats along, which commence at Elsingborough Point, hauling on and off, shoaling to $3\frac{1}{2}$, and deepening to 5 and 6 fathoms.

When up with the north end of the Pea-patch, take your soundings from the New Jersey shore, hauling on to the flat to 3, and deepening to 4 fathoms, tracking the flat along until New Castle spire bears N. by W., when you are clear of the north-eastern end of Bulkhead Shoal, and may haul out into the middle of the river.

The channel westward of the Pea-patch is divided by a middle ground, commencing about midway between the Pea-patch and Delaware shore, and following the bend of the river about $1\frac{1}{2}$ mile; least water upon it 10 feet.

The channel westward of this Middle is narrow; least water 20 feet. To take it, run from Elsingborough Point for the Pea-patch, until up with Reedy Point, from which the shore trends suddenly to the N. W.; then track the flats on the Delaware shore along, passing between the E. and W. buoys, and near the W. buoy, up to the Hamburg buoy.

The channel east of the middle is not so difficult; least water 13 feet. When up with Reedy Point, take your soundings from the Pea-patch side, and track the flats up to the E. buoy, and then the Middle to the Hamburg buoy.

From New Castle to Marcus Hook the general course of the river is N. E. by N. $11\frac{1}{2}$ miles. The best water off the eastern shore, until past Cherry Island flats, a middle ground off Christiana Creek about $2\frac{1}{2}$ miles long; least water 11 feet. Having passed the flats, the best water is off the western shore; keeping it pretty well aboard, you clear Marcus Hook Bar, which lies off that place.

From Marcus Hook to Chester, the course is about N. E. by E. $3\frac{1}{2}$ miles; best water off the western shore. When one mile above Chester, you are up with the buoy on the spit which makes down the river, from Tinicum Island, which you leave to the westward.

mud. Th
of the buoy

It marks
sand with v
to the west

The trend of the river is then nearly east of the bar, below Fort Mifflin, upon which there are two buoys.

Cross the bar between the two buoys, and steer for Fort Mifflin, passing to the northward of the Old Pier, which lies off that work. The river then trends eastward again up to the Horse-shoe, upon which there is a buoy, which is to be left to the northward.

Having passed the Horse-shoe, the trend of the river is nearly north up to Kaighn's Point, the best water on the eastern shore, until the Canal Basin, on the Pennsylvania side, bears W. by N., steer across the river, and keep the western shore aboard up to the city.

REMARKS.—The Harbor of Reedy Island is much used, particularly in winter, while ice is running. A small spit makes south from the lower end of the island a $\frac{1}{2}$ mile; being clear of this, your course is north. Anchor off the Piers, in 4 to 6 fathoms, mud.

Bombay Hook Roads is an anchorage much used by vessels waiting wind or tide. Bring Bombay Hook Point to bear S. by E., the light W. by N., and anchor in from 3 to 4 fathoms, sticky bottom.

The above directions are by Lt. George S. Blake, U. S. Coast Survey, excepting the Goose Island channel, which was re-surveyed in 1845—6, by Lt. Arthur, the change in the channel having made it necessary.

DELAWARE BAY.—The following spar buoys have been placed at the entrance of Delaware Bay.

No 1 is painted red.

It marks the point of shoal (Priest Vicks) off Cape May lighthouse. It stands in 18 feet water, bottom coarse gray sand and gravel; the shoal to northeast has 10 feet on it.

No. 2 is painted red.

Has letters B W in black on a square white board. It marks the southern end of the round or E. N. E. shoal. It stands in 18 feet water, bottom fine grey sand and blue mud. The E. N. E. or Round shoal has 3 feet water on it, and the shoal to S. and E., of the buoy has 7 feet; the channel way is close to the buoy.

No. 3—Crossed-striped red and black.

It marks the S. E. spit of Mummy Shoal, and stands in 17 feet water; bottom fine grey sand with white specks. The Mummy Shoal has 6 feet water on it. Blunt's channel is to the westward of this buoy (not yet buoyed out,) and Rickard's channel to the N. and E.

No. 4—*Crossed-striped red and black.*

With one fluke of anchor on top of buoy; it marks the southern spit of Crow shoal, and stands in 15 feet water, bottom coarse gray sand and gravel. Crow shoal has 7 feet water on it. The Rickard's channel is to the westward, and the ordinary coaster's channel to the eastward of this buoy.

No. 5—*Perpendicular white and black stripes.*

It marks the centre of Rickard's channel, and stands in 18 feet water; bottom blue mud. Crow shoal to the eastward, and Mummy shoal to the westward.

No. 6—*Perpendicular white and black stripes.*

It marks the western entrance to Rickard's channel; stands in 19 feet water; bottom fine gray sand and blue mud.

General Directions.—Vessels entering keep to port of red buoys, starboard of black; either side of red and black striped. Black and white perpendicular stripes mark a channel buoy.

Compass bearings of buoys from Cape May and light.

The following sailing directions for entering Delaware Bay, are given by Lieutenant R. Brche, in connexion with these buoys:

RICKARD'S CHANNEL.—Vessels drawing 15 feet water can pass through this channel at ordinary low water—smooth sea.

BLUNT'S CHANNEL.—Not yet buoyed.

THROUGH CHANNEL TO BREAKWATER.—Vessels drawing 16 feet can pass through this channel at ordinary low water—smooth sea.

The rise of the tide may be estimated at 5 feet. Strong tides running, an allowance of two points must be made on the course steered, crossing the direction of the tides. The lead is a guide. The shoals, although pretty steep to, can be avoided by constant and true soundings.

When off the boarding-houses on Cape Island, in the Coasters' or Cape May channel, buoy N. 1 will be seen bearing W. by N. $\frac{1}{4}$ N. per compass—steer for it, leaving it close on board on starboard hand in passing—when up with buoy No. 1, buoys Nos. 2, 3, 4, 5, and 6 in clear weather will be in sight.

TO PASS THROUGH THE "THROUGH CHANNEL" TO BREAKWATER.—This channel is narrow; on the S. E. is a shoal with 7 feet water upon it, and the Round or E. N. E. shoal is to the northward, and has 4 feet water on it, and the breakers show plainly in any breeze. When abreast of N. 1, stand W. $\frac{3}{4}$ N. towards buoy N. 3, keeping it open on the port-bow a point, and gradually hauling up for it. When up with No. 3, leave it on the starboard hand, and steer S. W. by S. for No. 2, which leave close on board on starboard hand, and continue on S. W. by S. for Breakwater.

TO PASS THROUGH RICKARD'S CHANNEL.—This channel lies between Crow and the Mummy shoals; the Crow shoal having on it 7 feet water, and the Mummy shoal 6 feet water. After passing buoy N. 4, it is a good beating channel.

From buoy No. 1, steer N. W. $\frac{3}{4}$ W. for No. 4, which leaves 1 on the starboard hand at a short distance, and steer N. N. W. westerly for No. 5, which pass on either hand, and haul up N. W. $\frac{1}{4}$ W. westerly for No. 6, which pass on either hand, and shape your course W. $\frac{1}{4}$ N., which brings you between the buoy and the Brown and light-boat on the Brandywine shoal, in the main ship channel.

NOTE.—All soundings are given at *low water*.

THE HEN AND CHICKENS.—On this shoal there are 5 feet water, in places. The southern point, on which there are 13 feet water, bears S. E. by S., $2\frac{1}{2}$ miles from Cape Henlopen light. The beacon in range with the light on the Breakwater puts you on the edge of the shoal. *The Hen and Chickens.*

Inside of the shoal, and parallel to the shore, there is a channel of $4\frac{1}{2}$ to 5 fathoms.

CAPE HENLOPEN TO CAPE HENRY.—The coast is studded with shoals, lying at a distance off, from 3 to 6 miles from the nearest point of land. The Cap, on which there are 3 fathoms, lies S. E., easterly, six and a half miles. *Cape Henlopen to Cape Henry.*

Indian River Shoal of 3 fathoms, bears S. S. E. $\frac{1}{4}$ E. 11 miles from Cape Henlopen light. Lt. Lee, U. S. Coast Survey, has discovered two new shoals, Fenwick's Island Shoal, of 15 feet, lat. $38^{\circ} 27'$, long. $74^{\circ} 59'$, being $5\frac{1}{2}$ miles from the nearest land, and 11 miles S. $\frac{1}{4}$ W. from Indian River Shoal. Isle of Wight Shoal, of $3\frac{1}{2}$ fathoms, lat. $38^{\circ} 23\frac{1}{2}'$, long. $78^{\circ} 58'$; being S. nearly of Fenwick's Island Shoal $3\frac{1}{2}$ miles.

S. W. by S. from the Isle of Wight Shoal, 10 miles, is the Little Gull Bank, of 2 fathoms.

Gull Bank, of 5 fathoms, is 15 miles S. W. by S. from the Isle of Wight Shoal.

The Sinepuxent Shoals are between the Gull Bank and the Sinepuxent Inlet.

CHINCOTEAGUE LIGHT is a fixed light, 50 feet above the level of the sea, and is on the S. E. point of Assateague Island, lat. $37^{\circ} 55'$, long. $75^{\circ} 21'$. When you are within half a mile of Fenwick and Chincoteague Shoals, you will have 12 fathoms water. The land from Chincoteague to Cape Charles makes broken land, with islands and several small inlets. There is a good harbor within Chincoteague Shoals, which goes by the same name. *Chincoteague light.*

The Winter Quarter Shoal, of 2 fathoms, bears E. $\frac{1}{4}$ N., 7 miles from the light; there are several shoal spots, with channels for small vessels inside this shoal.

The next shoals are those generally known by the name of Chincoteague Shoals, and are clustered around the southern end of Assateague Island, on which there is a lighthouse, containing a fixed light. These shoals have deep channels between them, but they are only attempted by the coasters. From Chincoteague to Cape Charles the land trends S. S. W. $\frac{1}{4}$ W., with several barred inlets. The land is low, sandy, and marshy.

REHOBOTH BAY lies 9 miles to the southward of Cape Henlopen lighthouse. This bay is only for small vessels that draw not more than 6 feet water. *Rehoboth Bay.*

The north end of Fenwick's Island lies 10 miles to the southward of the lighthouse, and separates Delaware from Maryland. It has a grove of trees on it, and you will have 6 or 7 fathoms of water within a league of the land, and a strong current setting to the southward.

MATOMKIN HARBOR has 12 feet water on the bar at spring tides. In running in for the bar, you will have gradual soundings from 7 fathoms. One cable's length from the bar you will have $2\frac{1}{2}$ to 2 fathoms. *Matomkin Harbor.*

In running over the bar, keep the north shore on board, and steer S. W. On the larboard hand, one mile from the bar, give the point a small berth, and round in to the N. W., and anchor in 4 fathoms water.

To the northward of the bar, one-quarter of a mile lies the wreck of a vessel. From the bar up the inlet, the navigation is very dangerous, being filled with oyster beds.

These are very dangerous harbors in a gale of wind, but you may ride along shore with the wind from N. W. to S. W. When the wind blows hard at N. E., or E. N. E., and you are in sight of Chincoteague Shoals, your only chance for safety is to stand to the southward; for you cannot clear the land to the northward, or go into the harbor of Chincoteague. When the wind is to the eastward, it is generally thick weather on the coast. After you pass to the southward of Chincoteague, steer S. S. W. for the lighthouse on Cape Henry, for the northern part of Machipungo Shoals lies 4 or 5 leagues to the northward of Smith's Island, and the southern part of them comes near abreast of said island. In steering to the S. W. westward, 5 or 6 leagues S. E. of Smith's Island, you will have 12 or 13 fathoms, and in some places 3 or 4 fathoms. When you are 20 leagues from the land, in the latitude of $37^{\circ} 30'$, you will have from 30 to 35 fathoms; but when to the southward of Cape Henry, you will have from 7 to 8 fathoms, within a league of the land, and a strong southerly current, which in general runs from 2 to $2\frac{1}{2}$ knots an hour.

CAPE OF VIRGINIA.—In coming from sea, and falling in to the northward, you may make an island, called Hog Island, which has a shoal on the N. E. side, 5 miles from the island, and also Machipungo Island; the latter is a smaller island. Hog Island and Smith's Island are about 6 or 7 leagues from each other, and the latter has a lighthouse on it. Hog Island is longer than Smith's; the trees stand more open, and are not so thick as on Smith's Island; and in going on to the southward from off Hog Island, you will make sand-hills which lie between Hog Island and Smith's Island, being a sure mark you have not passed Smith's Island. Be careful not to come nearer than 7 fathoms when off the sand-hills, as nearer than that depth the ground is broken. *Capes of Virginia.*

Cape Charles Lighthouse. A lighthouse has been erected on the north end of Smith's Island, N. E. from Cape Charles; it shows a revolving light, about 65 feet above the level of the sea.

Smith's Island is the first island after passing the sand-hills above mentioned. On the northern end of it there are some struggling trees, which appear like a grove, but which join on to the island. As you draw up with Smith's Island, you may haul into 6 and 5 fathoms, till you get near abreast of it.

Smith's Island is a good place to anchor under, with the winds from N. N. W. to W. N. W., and vessels often come to there if the wind is coming out from N. and westward.

If you intend to anchor there, bring the light to bear W. S. W. and run for it, and you may go in as near as your draught of water will admit, into 3 fathoms, or less, if you choose. You will have blue mud and sand; and when you get under way from there, steer S. by W. till you cross the north channel in 7½ fathoms; keep on till you raise your ground into 5 fathoms on the Middle Ground, then steer S. W., which will cross the Middle in 4 fathoms; keep on S. W. until you deepen into 6 or 7 fathoms, ship channel; then with a strong breeze steer W. by N, which will carry you across in deep water until you raise your ground on the Horse-shoe. When at anchor under Smith's Island, Cape Henry light bears about S. S. W.

In coming in from the southward, bound to Cape Henry, keep in 7 fathoms until you begin to draw up with False Cape, which lies about 7 leagues from Cape Henry towards Currituck; then 9 to 10 fathoms is full near enough to False Cape. After you have got to the northward of False Cape, you may then keep again in 7, 8, and 9 fathoms (ship channel) till you get up with Cape Henry. From off Roanoke the soundings along shore are hard sand all along until nearly up with Cape Henry, when it is sticky bottom, and you will be in channel way.

The shore between False Cape and Cape Henry makes in like a bay, something like Lynhaven Bay, and in thick weather a stranger might mistake it for Lynhaven Bay, and False Cape for Cape Henry, if it is so thick that the lighthouse on the latter cannot be seen; but in round False Cape it is all hard bottom, and in Lynhaven Bay it is soft or sticky bottom, and in some places very tough bottom.

The passage between Cape Charles and Outer Middle is little known, and not frequented by large vessels. It is only used by small vessels of 8 or 10 foot water.

Cape Henry Lighthouse.

CAPE HENRY lies 12 miles S. by W. from Cape Charles, both of which form the entrance to Chesapeake Bay. On it is a lighthouse, the lantern of which is elevated 120 feet above the level of the sea, showing a fixed light.

When coming in from sea in the latitude of Cape Henry, you meet with soundings about 25 leagues off, which you may observe by the color of the water. In the south edge of the bank you will have 40 fathoms water, which will shoal to 20, and still decrease as you approach the shore, generally sandy bottom. In clear weather, you may see the land when in about 10 or 11 fathoms, regular soundings, at which time you will be about 5 leagues to the southward of it. To the northward of the land, in 6 fathoms, the soundings are irregular, and the ground coarser. In coming in with the wind northwardly, you must be careful of the outer part of the Middle Ground, which lies 9 miles E. N. E. from Cape Henry, and 7 miles S. E. by E. from Cape Charles. You may go so near it as to bring Cape Henry to bear W. ¼ S., which will carry you round the tail of it, in 4½ or 5 fathoms water, when you will deepen into 11, 12, or 13 fathoms, and then haul away for the bay, the Cape being steep to. The channel between the Cape and Middle Ground is about 4 miles wide, and 5 and 6 fathoms water close to the latter. When Cape Henry lighthouse bears W. N. W. ¼ W., distant about 3 leagues, it appears thus:

With a fair wind you may bring the lighthouse to bear W.; but if you have the wind ahead, and are obliged to turn in, you may stand to the southward till the lighthouse bears N. W. by N., and to the northward till it bears W. by S. You will have 9 or 10 fathoms within a mile of the lighthouse, and from 6 to 5 fathoms close to the Middle Ground.

Hampton Roads.

FOR HAMPTON ROADS.—When abreast of Cape Henry, and the lighthouse bears S. S. W., distant about 2¼ miles, steer W. by N. till you get on the Horse Shoe, in 5 fathoms, sandy bottom. There are no soundings at 5 fathoms on that course between Cape Henry and the Horse Shoe. The first soundings as you approach the Shoe, on

this course, are 6 and 7 fathoms, a sticky or tough bottom, at about 4 miles from the lighthouse on Cape Henry; and a mile further on, (say about 5 miles from the lighthouse) you will have the 5 fathoms, sandy, on the tail of the shoe, where vessels can anchor. Then steer W. until you get on the south side of the channel for an ebb tide; but tide aboat, steer W. $\frac{1}{2}$ N. or W. by N. Those courses will carry you into 5 fathoms on the smooth side; then you may steer W. N. W., which will carry you into 6 or 7 fathoms, sticky bottom, until nearly up with Willoughby's Point, and when you deepen your water to 9 or 10 fathoms on your W. N. W. course, you have passed the bank off Willoughby's Point, where there is a light vessel; then bring the light on Old Point Comfort, W. or W. by S., and steer for it until nearly up with it, say within half a mile; then haul up S. W. by W. till you bring the light on Old Point Comfort to bear N. W., when you steer S. W., passing between Fort Calhoun and Old Point, for the Roads, 5, 6, or 7 fathoms, good anchoring.

The centre of the Castle (Fort Calhoun) is S. 17° E. from the lighthouse at Old Point Comfort, distant about one mile.

Old Point Comfort lighthouse bears from Cape Henry light, N. 18° W. distance 15 miles. It shows a fixed light elevated about 50 feet above the level of the sea, and is a guide for vessels bound into Norfolk or Hampton Roads. High water 8h. 22m., rise 3 ft. *Light.*

A floating light-vessel has been stationed off Willoughby's Bank in 3 $\frac{1}{2}$ fathoms water. *Light-ship.*

Old Point Comfort lighthouse, bearing W. $\frac{1}{2}$ N. 2 miles.

Back River Point, " " N. $\frac{1}{2}$ W. 5 "

Cape Henry, " " E. S. E. 13 "

Vessels going out or coming into Hampton Roads, should not pass to the southward of this vessel. She may be distinguished in the night from the light on Old Point Comfort, by having two lanterns, the forward one elevated 41 feet, and the after one 32 feet. A bell will be rung in foggy weather.

Should you, after passing Willoughby's Point, fall into 14 or 15 fathoms, Old Point Comfort lighthouse bearing W. N. W., steer up S. W. by W., but go no nearer to Hampton Bar, on the N. side, than 10 fathoms, it being steep to, until you pass Sowell's Point, when Old Point Comfort bearing N. E., you will fall into 7, 8, and 9 fathoms, good anchoring. After passing Fort Calhoun, be careful of the shoal which extends from it W. S. W., and hending to the south connects with the bar off Sowell's Point.

From Hampton Roads to Norfolk the channel is intricate to strangers, and we should recommend anchoring in the Roads, but the following directions, strictly followed, will carry them to Norfolk:

As you approach Old Point Comfort, you will discover a low tree standing to the westward of the lighthouse; steer S. W. until you bring this tree over the house occupied by the Colonel, which is the first house to the westward, and painted white; continue this course till up with Sowell's Point, when you may haul to the southward till the light-boat off Craney Island bears S. by E., observing at the same time not to shut Old Point light in with Sowell's Point, and continue steering S. by E. till you pass the light-boat, leaving her on your starboard hand; then take your soundings off Lambert's Point, on the larboard hand, in 4 fathoms, and steer S. S. E., till you get into 5 fathoms; then S. E. $\frac{1}{2}$ E. till you get up to the fort, 3 miles distant, having from 5 to 6 fathoms.

A light-vessel, having one light at her mast-head, has been placed at the extremity of Craney Island Flats, in Elizabeth River, in 4 $\frac{1}{2}$ fathoms.

LYN-HAVEN BAY.—If requisite, when entering the Capes, and it is advisable to anchor in Lyn-Haven Bay, you may run in clear of the Middle Ground, when the lighthouse on Cape Henry bears W. by S., as this course will lead to the channel-way, in from 7 to 10 fathoms, sticky bottom. It is then proper to take soundings towards the southern shore, and in order to do this, steer west until you have advanced to within a short distance of the lighthouse, (say half a mile;) then rounding the point you may haul into the bay and drop anchor, as most convenient, in from 7 to 4 fathoms. *Lyn-Haven Bay.*

REMARKS.—If in going along the southern side of the channel bound to Hampton Roads, you shoalen your water to less than 5 fathoms, haul off to the northward, and keep in about 6 or 7 fathoms, until you judge yourself nearly up with Willoughby's Point. By hauling to the northward you will deepen your water. On the Horse Shoe side of the channel the bottom is hard sand, and on the south side it is soft bottom, until drawing on towards Willoughby's Point, when it becomes hard; therefore, being on the south side, where the ground is soft, you may always know your drawing up with Willoughby's Point as soon as you get hard bottom. Go no nearer Willoughby's Point than 7 fathoms.

Of the *Thimble*.—It is a small lump, E. 15° N. from Old Point Comfort lighthouse, distant 3 $\frac{1}{2}$ miles, and on the north side of the channel, with about 9 feet water on it. It is steep to, say 7 fathoms, but being small, is quickly passed. It lies a little below the shoal off Willoughby's Point, (where the channel is about one mile wide), to avoid which is the reason why it is necessary to get soundings first on the Horse-shoe. Near the *Thimble* you will have sticky bottom, and on the Horse Shoe hard sand. The *Thimble* may be considered as on the edge of the Horse Shoe, and when Back River Point light, which is a revolving one, bears N. N. W., you are abreast of it. *The Thimble.*

Horse-shoe.

THE HORSE-SHOE.—The tail of the Horse-shoe lies about 5 miles N. W. from Cape Henry lighthouse, and 12 miles east from the lighthouse on Old Point Comfort; the least water in that place is 4 fathoms, hard sand, broken ground. The southern edge of this shoal runs W. $\frac{1}{2}$ N., until it connects with the main shore, a little to the north of Old Point Comfort, forming the northern side of the channel into Hampton Roads. The N. E. side extends in a N. W. direction, until it connects with the Pocosin Flats, nearly up to the entrance to York River, and forms the western side of the Bay Channel. There is good anchorage on the Horse-shoe, from the tail to within $\frac{3}{4}$ or 4 miles of the shore, and the smaller class of vessels may go nearer in.

Tide.

TIDE.—The flood tide runs in round Cape Henry and Lyn-Haven Bay until 8 o'clock, on the full and change, in the mid-channel; and out of the way of the Chesapeake stream it flows at 8; in Hampton Roads at 8h. 22m., rise 3 feet. As the tide varies considerably in its direction according to the time from ebb to flood, and is influenced by the wind, attention should be paid to the bearings of the lights, as well as to the soundings, when running either up to Willoughby's Point or towards New Point Comfort, for fear you cross the channel. The ebb from James' and York River sets over the Middle Ground to the eastward, which renders the navigation there dangerous in the night or in thick weather.

Cape Henry, or Lyn-haven Bay, to York River.

CAPE HENRY, OR LYN-HAVEN BAY, TO YORK RIVER.—As Cape Henry S. S. E. would lead you near the tail of the Middle Ground, and as the proceeding with it at S. E. would carry you on the tail and north edge of the Horse-shoe, your keeping the cape on any bearing between S. S. E. and S. E. will carry you through between the two shoals. On the tail, and along the north side of the Horse-shoe, the soundings are gradual. With Cape Henry bearing S. S. E., or S. E. by S, steer N. N. W., or N. W. by N., until you bring Cape Charles to bear E. by N.; you are then to the northward of the Horse-shoe, and may steer N. W., or N. W. by W., according as you have the wind and tide. As the ebb sets strong out of the Chesapeake over the Horse shoe, you must not, with a northerly wind and ebb tide, approach any nearer to the shoal than 5 or 6 fathoms water. When you have brought New Point Comfort to bear N. N. W., and Back River light to bear S. by W., you are then on the tail of York Spit, in 3 fathoms water. When you are a little above Long Isle, you must not come any nearer to the shore than 5 fathoms, until you enter the river above the marsh; then keep in 9 or 10 fathoms, and run up and anchor between York and Gloucester in what depth you please.

With a contrary wind stand towards the Horse-shoe in $4\frac{1}{2}$ or 5 fathoms, and from it into $6\frac{1}{2}$ or $7\frac{1}{2}$ fathoms, until you are abreast of the entrance of Pocosin, where there is a gut of 7 fathoms, which runs close to the entrance; you should therefore be careful to avoid going too far in, and thereby getting on the tail that extends from Toes' Marsh. When you have got thus far up, you should go no nearer to the shore on this side than 7 or $6\frac{1}{2}$ fathoms, all the way up to York Town. On the other side you should not stand any nearer to the small isles on York Spit than 10 or 11 fathoms. Close to the tail of this spit there are 6 fathoms; close to the middle of it there are 10 fathoms; and close to it, abreast of the islands, you will have 13 fathoms, and before you can get another cast of the lead, you will be ashore. When you have entered the river, you must not come any nearer to the flat than 8 or 9 fathoms water. This flat extends from the north shore almost one-third over the river.

Light.

The lighthouse on Back River Point contains a revolving light, elevated 40 feet, and serves as a guide for vessels bound into the river, as well as assists vessels bound up the bay.

New Point Comfort, Mobjack Bay and Severn River

NEW POINT COMFORT, MOBJACK BAY AND SEVERN RIVER.—When you bring Cape Henry to bear S. S. E., you may steer N. N. W., 8 leagues, which course and distance will carry you up to New Point Comfort. If you wish to anchor at New Point Comfort, which bears from the Cape about N. W. by N., distant 8 leagues, you must take care of the spit that runs off the point about S. E., 2 miles. Keep to the westward of this point of sand, and you may run in under the point, and anchor in 4 or 5 fathoms water, fine bottom, in Mobjack Bay, where you will be secure from northerly or N. E. winds.

Light.

On New Point Comfort, which forms the eastern side of Mobjack Bay, is a lighthouse containing a fixed light, elevated 60 feet above the level of the water.

Vessels at anchor in Mobjack Bay, are exposed to the wind from E. S. E. to S. E., and I would therefore recommend in that case to go into Severn River, where they will be safe from all winds. Your directions for this port are to bring the south point of New Point Comfort to bear E. by S., and steer W. by N., 2 leagues, which course you will continue till Severn River bears W. S. W., when you must steer into the river W. S. W., or S. W. by W., which will carry you safe, where you may lie land-locked from all winds. In running for this river, you will make two bunches of trees on your larboard hand, which at a distance appear like two islands; but, as you approach them, you will find they are on the main land. In going into this river, you must keep your lead going; keep in the middle, and go between two points of marsh, and you will have no more than 3 fathoms between New Point Comfort and Severn River, muddy bottom. You may go to sea from this river, with the wind from S. W. to N. W.

CAPE HENRY UP THE BAY TO THE POTOMAC RIVER &c.—When you come in from sea, and are bound up the Bay, bring Cape Henry light to bear S. S. E., and steer N. N. W., about 4 leagues, which will carry you to the northward and westward of the Middle Ground, that lies between the two capes, and when you have Smith's Island, (off Cape Charles,) to bear E. by S., or Back River Point lighthouse W. S. W., you will be to the northward of the shoal part.

If you have the wind ahead, and are obliged to turn to windward, you must not stand further to the eastward after the lighthouse (or the Cape,) bears S. S. E., as the western part of the Middle Ground is steep to. In standing to the westward, you may go in $3\frac{1}{2}$ or 4 fathoms without danger; but in standing to the eastward do not go in less than 8 fathoms, as you will be near the Middle Ground.

Back River Point light is a revolving light, and bears from

Cape Henry	N. W. $\frac{1}{2}$ W.	16 miles.
Old Point Comfort	N. N. E.	$5\frac{1}{2}$ "
New Point Comfort	S.	$13\frac{1}{4}$ "

Light.

After you are clear of the Middle Ground, as before directed, (Cape Henry bearing S. S. E.,) and having a fair wind, you may steer up the Bay north, 6 leagues. Come not to the westward of north until you have Gwinn's Island, (which is about 3 leagues north of New Point Comfort) bearing W. N. W. from you, to avoid a dangerous shoal called the Wolf Trap, which lies N. N. E. 2 leagues from New Point Comfort lighthouse, and S. E. from Gwinn's Island, which is small.

A light vessel, showing 2 lights, is anchored near the Wolf Trap. The forward light is elevated 30 feet, the after one 38 feet.

When past the Wolf Trap steer north about 11 leagues, which will carry you up the mouth of the Potomac River. In running the above course you will have from 10 to 4 fathoms before you come up with the Tangier Islands. If, as you approach these Islands, you shoalen your water to 3 fathoms, hard bottom, you must haul a little to the westward, when you will deepen your soundings. You will pass the light vessel off the mouth of the Rappahannock on the larboard hand. This light vessel is anchored on the end of the shoal off Windmill Point, and shows one light.

If the wind should be ahead, be careful as you approach Lower Tangier Island that you do not get hooked in behind the spit, which extends off from the southern point S. W. about 4 miles; and do not, until you pass it, bring the lighthouse on Smith's Point to bear to the west of N. W. (See Tangier Islands.)

When Little Watts Island, which lies E. by S. from the south end of Lower Tangier, 4 miles distant, and on which is a fixed light, ranges with the trees on Lower Tangier, you will begin to deepen your water from 5 to 10 and 12 fathoms, muddy bottom, continuing your course north until Smith's Point lighthouse, which is on the southernmost point of Potomac River bears W. and keeping rather on the Tangier side, you will be in 10 or 12 fathoms water. Should you deepen your water to 15 or 20 fathoms, you will be very near the spit, which extends off from Smith's Point into the bay E. S. E., about 4 miles and on the end of which is a light vessel showing two lights. (See directions from Rappahannock to Smith's Point.)

The lighthouse on Smith's Point shows a fixed light, at an elevation of 85 feet. It is a leading light, and wants some improvement. *Light.*

When Smith's Point light bears nearly N. by W. $\frac{3}{4}$ W., 9 miles, and appears as represented in the annexed figure, with a house on its west side open, it leads in a fair way up the channel, equally clear of the shoals to the east and west.

SMITH'S POINT LIGHTHOUSE.

When Smith's Point lighthouse bears west of you, and soundings in 10 or 12 fathoms on the Tangier's side, as before directed; you may haul up N. W. by N. for Point Lookout, which is the northern point of Potomac River, and come to within one mile of the point, the western side of the bay, and have 4 or 5 fathoms, muddy bottom. Or if you wish to harbor, having the wind down the bay, you may run in round Point Lookout, giving it a small berth, and anchor in Cornfield Harbor, so called, where you will be sheltered from all northerly winds.

On Point Lookout there is a lighthouse containing a fixed light in a lantern on the keeper's dwelling, of service to those bound into the Potomac, or up the bay, with the *Lighthouse.*

*New Point
Comfort to
Rappahannock River.*

wind to the westward. Off the point a bar extends half a mile S. $\frac{1}{2}$ W. The light bearing W., three-quarters of a mile distant, you will have $3\frac{1}{2}$ fathoms, sticky bottom.

NEW POINT COMFORT TO RAPPAHANNOCK RIVER.—From this point a spit extends S. E. 2 miles, which you will avoid by not going into less than 4 fathoms water. The Wolf Trap lies about 5 miles N. N. E. from the light on New Point Comfort: on it there are 12 feet at common tides, and between it and New Point Comfort there are 8 or 9 fathoms, and near it, 7 fathoms water. A light-ship is anchored near this shoal showing two lights. The shore from New Point Comfort up to Cherry Point, the N. point of Gwinn's Island, is not bold to, but you can feel your way, keeping in not less than 4 fathoms. A spit extends off north from this point some distance, and, should you wish to harbor in the Piaukatank, after turning it haul over towards Stingray Point, from which a spit puts off E. about 2 miles, and keeping your soundings on the starboard side of the river, you may haul up S. W. choosing your anchorage in 3 fathoms water, secure from all winds.

If you wish to go into Rappahannock River, off which lies a light-vessel, showing the end of the spit extending from Wind Mill Point, and which you leave on your starboard hand, keep your soundings on the larboard hand, in from 3 to 7 fathoms, and do not deepen your water more than 7 fathoms to the northward, to avoid the sand spit which runs off from the northern point of the river, (Windmill Point) which is very steep, but keep the southern side in the above depth of water, when you may anchor in 7 or 8 fathoms, good bottom; or you may anchor on the northern side of the river, about one mile above Windmill Point, within a short distance of the shore, in 3 fathoms water, good bottom, secure from all winds.

View of Windmill Point at the North Entrance of the Rappahannock.

This point is just half way between New Point Comfort and Smith's Point. The Windmill Reef now extends about 3 miles from the point to the S. E. by E., and forms a broad shelf of $2\frac{1}{2}$, 2, and $1\frac{1}{2}$ fathoms, thence shoaling to the dry shore, on the end of which is a floating light, bearing S. E. by E. from Windmill Point, two miles distant, and showing one light.

*Rappahan-
nock to
Smith's
Point.*

RAPPAHANNOCK TO SMITH'S POINT.—From the light-vessel off Windmill Point to the end of the flat off Smith's Point light, which is the south side of the Potomac River, the course is N. $\frac{1}{2}$ E. and the distance $5\frac{1}{2}$ leagues; you may run this in 6 or 7 fathoms water. After passing Windmill Point be careful, in standing to the westward, to keep the light on Smith's Point open, to avoid a spit which puts off from Daumeron's Marsh, about 9 miles north of Windmill Point. When you draw near the shoal which runs off from Smith's Point, you should not go into less than 7 fathoms. This shoal extends about 4 miles E. S. E. from the point: on its extremity there are only 2 fathoms water, and very near to it, eastward, there are from 10 to 20 fathoms. The mark for the shoalest part of this spit is a house with a white chimney, standing among the trees on the shore within Smith's Island, (Smith's Point is sometimes called Smith's Island. It is separated from the main land by a creek. We mention this, as there are two other Smith's Islands, one at the mouth of the bay, and the other opposite the mouth of the Potomac, on both of which are lighthouses.) open to the northward of the island, and bearing west. When this house bears W. by N. you are to the southward of the extremity of the shoal, and when it bears W. by S. you are to the northward of it.

That which adds considerably to the danger of this shoal, in going either up or down the Chesapeake, is the broken islands which lie on the eastern side of the channel, and the flats which extend to the westward from them.

Light-ship.

A light-vessel has been stationed off this spit in $4\frac{1}{2}$ fathoms water, showing two lights; the foremost one $34\frac{1}{2}$ feet elevation, the after one 39 feet. Vessels passing either up or down the bay, should avoid going between it and Smith's Point.

*Tangier Isl-
ands.*

TANGIER ISLANDS.—Lower Tangier lies S. E. from the mouth of the Potomac River: it is about 4 miles in length, being mostly marsh, with small hummocks of firm soil, on which the inhabitants have built their houses. A cluster of pine trees on the southern part of the island is the only timber now standing, and a collection of wooden buildings close to them, whitewashed, used during camp meeting, serves to point out the southern point of a chain of islands, which extend on the eastern side of the channel of the bay, as far as Kedge's Straits.

Upper Tangier lies N. a little westerly of Lower Tangier, separated by an opening, which is very shallow, of 3 miles in width: It is called generally Smith's Island, is about 4 miles in length, being directly opposite the Potomac River, and resembles Lower Tangier, save that it is wooded in several parts, towards the centre and north end. A light-house showing a fixed light has been erected on Fog Point, the N. W. point of the island; the tower is on the keeper's house. Point Lookout bears from it W. 13 miles distant. This light serves as a guide to Kedge's Straits, and also to warn you of the bar which puts off S. W. from Holland's Island.

These islands are intersected by creeks, navigable only by canoes: the shores are not to be approached except by vessels of light draft of water. The flat extending off on the western side, narrows the channel of the bay, and the spit off the S. end of Lower Tangier extends S. W. about 4 miles from the cluster of trees spoken of; but you may edge off and on in what water you please, keeping your lead constantly going. The inhabitants are a hardy, honest and industrious set of men, accustomed to the navigation of the bay, and on making a signal, should assistance be wanted, it will be rendered promptly.

TANGIER SOUND.—If you wish to go into Tangier Sound, bring Windmill Point to bear S. W. by W.; steer N. E. by E., and you will get soundings on the Tangier Bar, in 5 fathoms; the cluster of pine trees and buildings on the south part of Lower Tangier will then be seen bearing N. E. of you, and you may edge off and on the southern side of the bar in what water you please, from 3 to 15 fathoms, bottom hard and sandy; but it is not advisable to come nearer the Tangier Bar than 6 fathoms, as it shoalsens from 6 to 2 fathoms in 200 yards; should you wish to anchor, when the cluster of trees bears W. of you, haul up to the northward and westward, where there is good anchorage for small vessels, secure from westerly winds, in a bay called Crocket's Bay, about S. E. from the houses in the middle of the island, and N. E. of the cluster of trees. If you proceed up the sound, it is proper to get soundings on the Watts' Island side, as it is rather more gradual, steering parallel with the islands on your starboard hand, N. and keeping in mid-channel; when Great Fox Island bears E. of you, which has a few pines on it, you will see a tall poplar on Jane's Island bearing N. E. by N.; haul towards it, steering N. N. E. and keeping your soundings on the starboard side of the channel, to avoid the flat which puts off from Horse Hummock, on which are some houses and apple trees; keep this course until the poplar bears S. E. of you, when you will steer N. N. W., getting soundings on your larboard hand on Terrapin Bar; you will then see a house with a clump of cedars on the N. point of Upper Tangier, called Kedge Island, which you will steer for when it bears W. N. W. keeping in not less than 2 fathoms water, and giving it a berth of about 100 yards. Continue this course until the light-house on Fog Point bears S. when you may steer S. W. to clear the point of the spit which puts off from the S. point of Holland's Island. This spit is about 4 or 5 miles in length, of hard sand and irregular bottom. Should you wish to go to the Nanticoke, Manokin, or Annemesix Rivers, you can obtain a pilot soon after entering Tangier Sound by hoisting a signal.

LITTLE WATTS' ISLAND AND POCOMOKE BAY.—There is a lighthouse on this island exhibiting a fixed light, in a tower 40 feet high. The island is small, and forms the western point of Pocomoke Bay. A long spit extends off from it S. W. about 5 miles; you can keep on the edge of it in from 3 to 5 fathoms water, if bound up this bay, and anchor either under the east side of Great Watts' Island, or on the opposite side, when you must take a pilot if bound to either Apes' Hole or Pocomoke River.

Little and Great Watts' Island with the Fox Islands, divide Tangier Sound from this bay; there is a narrow passage for vessels drawing 5 feet water, at the north of Great Watts' Island into Tangier Sound, and save that, there is no other passage between these islands.

POTOMAC RIVER separates Virginia from Maryland. Its entrance is between Smith's Point on the south side, and Point Lookout on the north; on both of these points there are lighthouses; the distance between them is 10 miles.

To enter the Potomac, when up with Smith's Point lighthouse, bring it to bear S. W. about 3 miles distant, and steer N. W. 5 leagues, in from 9 to 10 and 11 fathoms, which will carry you to the mouth of St. Mary's River, lying on the starboard hand, at the mouth of which lies St. George's Island, making a bluff. From St. George's Island, if bound up the Potomac, steer N. W. 4 W. 6 miles, leaving the lighthouse on Piney Point on your starboard hand, which will carry you abreast of Ragged Point, lying on the larboard hand, off which you must not go into less than 8 fathoms, and continue N. W. 4 W. till you drop into quarter less 5 fathoms, when you haul up W. by N. 8 miles, which will carry you above Blackstone's Island, lying on the starboard hand, then W. N. W. till you come in sight of the light-boat off Cedar Point, then N. W. till the boat bears N. 4 E., and keep soundings on the larboard hand, in 4 and 5 fathoms. When up to Cedar Point, steer for Mathias Watkins' Point, giving it a small berth; then steer up for Cedar Point, giving it a small berth; from thence the courses to Georgetown are about midway the river, the flats showing on each side in most places.

Light.

Tangier Sound.

Lighthouse.

Little Watts' Island and Pocomoke Bay.

Potomac River.

Lighthouse.

By a letter addressed to the Mayor of Washington, we learn that the bar at the mouth of the East Branch of the Potomac is so much deepened, that there is now a depth of 21 feet at common tide, sufficient for the largest frigate with her guns on board.

The lighthouse on Piney Point is a tower 25 feet in height, showing a fixed light. It is about a mile above George's Island.

If you are bound to St. Mary's River, you must give the shoal off Point Lookout a good berth; and when you approach St. George's Island, you must keep nearer to the main than to the shoal which extends from the island. Your course into the river is N. W., and as it is all open to your view, you may anchor when you please, in 5 or 6 fathoms water.

If you are bound to Wicomack, in Potomac River, your course from the east end of St. George's Island to Ragged Point is N. W. $\frac{1}{2}$ W., and the distance 2 leagues. On the south, or larboard side, there are flats lying off from the shore, which in some places extend one mile; come no nearer to them than 7 fathoms. In the middle of the channel you will have 11, 10, 13, 10, and 8 fathoms. You must give Ragged Point a good berth, to avoid the shoal which extends from it nearly one mile. From Ragged Point to Clement's Island, your course is W. $\frac{1}{2}$ N., and the distance 2 leagues. In the middle of the channel you will have 6, 5, 4 $\frac{1}{2}$, and 7 fathoms water. On the south side, a little below Clement's Island, is Nonine Bay. From abreast of Clement's Island steer W. N. W., in 6, 5, and 4 fathoms water, until you have Wicomack River open; then pass pretty near to the island, which is on the east side of the entrance, in order to avoid the shoal which runs off from the point on the west side. Steer about N. into the river, and anchor on the south side of Newton's Point, in 5, or 4 $\frac{1}{2}$ fathoms water.

*Smith's
Point to
Cove Point.
Main
channel.*

SMITH'S POINT TO COVE POINT.—From the light vessel at the end of the shoal off Smith's Point to Cove Point the course is N. by W. $\frac{1}{2}$ W., distant 32 miles, which course will carry you in mid channel until nearly up with the lighthouse on Cove Point, which you will make on your larboard bow; your soundings will decrease to 6 and 7 fathoms, and as you approach Cove Point they will deepen. Should you shoalen your water in steering as above, when you approach Barren Island Bar, you must haul to the westward.

When you are up as far as Point Lookout, and have the wind ahead, you have a good channel to bent in, up as far as Patuxent River. You may stand on each tack to 4 or 5 fathoms, but in standing to the eastward, when you have 9 or 10 fathoms, it is best to tack, as the ground rises suddenly to 4 or 5 fathoms, and then lessens into two, hard sand; the western side is more regular. Your course from Point Lookout west, three miles distant, to Patuxent River, with a fair wind, is N. by W. $\frac{1}{2}$ W., and the distance 5 leagues, in 6, 7, and 10 fathoms water, which will carry you up with Cedar Point, which is pretty bold, and makes the first point south of Patuxent River. If the wind is to the northward, and you cannot get into Patuxent (which is often the case) you may run in under Cedar Point, and anchor in 3 or 4 fathoms, good bottom, and secure from the wind down the bay.

Should you be nearer in with Point Lookout than 3 miles, and the wind from the west, you may steer N. 2 leagues, which will carry you parallel with the shore, past Point No-Point; then steer N. by W. $\frac{1}{2}$ W., for Cedar Point, 3 leagues, which will bring you up with it, and if you continue on up the bay a N. course, 5 miles distant, will bring you up to Cove Point. (See Holland's Island and Barren Island.)

If you should stand in towards the "Red Cliffs," between Cedar Point and Cove Point, do not shoalen your water to less than 4 fathoms, as a spit puts off there some distance.

Light.

The lighthouse on Cove Point contains a fixed light, elevation 50 feet. It is a leading light, and should be seen soon after passing Point Lookout, coming up the bay, and from abreast of Sharp's Island going down.

*Holland's
Islands.*

HOLLAND'S ISLANDS.—On the north side of Kedge's Straits are several islands, extending to Hooper's Straits, called under the above name. The southernmost one is properly Holland's Island, and has two poplars on its southern extremity. The next in order on the bay is Long Island, on the northern end of which are some cedars; it stands out to the west more than any of the others. Bloodworth's is the largest and most northerly of these islands; it forms the south side of Hooper's Straits, and is mostly marsh, with some hammocks of trees on it. On the east of these are several other small islands, which, with the Tangier Islands, make the western boundary of Tangier Sound. A sand spit or bar puts off from the S. W. of Holland's Island, which vessels drawing only 4 feet water, would clear on a N. W. course from Fog Point light. It is hard sand bottom, irregular, but you can avoid it by sounding. (See Kedge's Straits.) There are no passages through these islands, and the flats extend out from them on all sides.

*Hooper's
Straits.*

HOOPER'S STRAITS.—A light vessel has been moored in Hooper's Straits, in 2 $\frac{1}{2}$ fathoms water. It is necessary to lead vessels clear of the flat off Hooper's Island on the N., and those extending from off Bloodworth's Island on the S. side of the passage. It is of service to vessels bound either to Nanticoke River or to Tangier Sound. In thick

r's Island on the
the passage. It
ound. In thick

weather, by night or day, a bell will be rung on board at short intervals, and if it is thick and blowing, it is ordered to be constantly kept ringing.

If from up the bay, and bound through the straits, bring the light vessel to bear E. by N., and run for it, which course will carry you across Hooper's Island bar, in about 4 fathoms water; continue your course until you deepen your water into 7 fathoms, then steer E. N. E. until the light bears E., and run for it; or you may bring the vessel to E. N. E., and run directly for it; pass on your starboard hand, which will carry you into channel way; continue your course after you pass the light vessel E. and E. by S., towards Bishop's Head, keeping rather on the northern side of the passage, and by showing a signal you can obtain a pilot to take you through Fishing Bay, Nanticoke River, or into Tangier Sound. The flats are steep to on both sides, and you can anchor opposite Todd's house, on Bishop's Head, in 3 fathoms water, about half a mile from the shore, the extreme S. point bearing S. E. by E., distant about $\frac{1}{2}$ of a mile.

If from down the bay, bring the light vessel to bear N. E., and steer for it, when you will gradually shoalen your water on the S. side; you may, with safety, course round the light in 3 fathoms until you bring the light to bear E., when you may steer as above.

BARREN ISLAND BAR.—N. by W. 25 miles from the light vessels off Smith's Point, will carry you to the S. W. edge of this bar, which is very shoal, and extends off from the south end of the island about S. S. E., 4 miles. There is anchorage for small vessels on the eastern side of it, but there is no passage between it and Hooper's Island. Barren Island may be known from the other islands by its being heavily timbered, and standing out more in the bay than either Hooper's or Taylor's Island. The bar is somewhat bold to, but serves well as a guide, bound up the bay, when you get soundings on that side, which is rather to be preferred, unless the wind is from the westward.

POTOMAC RIVER TO PATUXENT RIVER.—From Point Lookout, which is the northern point of the Potomac River, a flat runs off a considerable way, which you must be careful to avoid by not coming any nearer to it than 7 or 8 fathoms water. There is a lighthouse (the lantern being on the top of the dwelling house,) on this point, showing a fixed light.

Opposite to this point the flat of Upper Tangier or Smith's Island, extends so far to the westward as to narrow the channel of the Chesapeake to about 6 miles. This part of the flat is steep, and has 10 fathoms close to it. About 2 leagues to the northward of Point Lookout is Point No-Point, off which, $1\frac{1}{2}$ mile from the shore, lies a shoal, on which there are 18 feet water. It is steep to, having from 5 to 7 fathoms close to it. It is about 50 feet square.

Cedar Point is 3 leagues north-westerly from Point No-Point. It is low and sandy, with some bushes and scattering trees on it; the water is so bold to on the southern side, that you cannot be too careful in approaching it in the night. It extends out into the bay, the shore line making a bend to the westward, between that and Point No-Point, and if it is sufficiently clear to see the white beach at the distance of 100 yards, you can run with safety. You may keep in 7 or 8 fathoms between these points. On the north side of Cedar Point it is shoal, so that after passing it, if bound into the Patuxent, keep no nearer the shore than 5 fathoms.

Cove Point lies about 5 miles to the northward of Cedar Point. A lighthouse is erected on it, showing a fixed light, 50 feet above the surface of the water; the point is low and sandy, extending out into the bay, so as to make this the narrowest part of the Chesapeake. Vessels of light draft of water can anchor close under the south side of Cove Point, secure from the northerly winds, in 3 fathoms water; or you may anchor under the yellow cliffs secure from N. W. winds, in case you cannot get up the bay, in 4 or 5 fathoms.

PATUXENT RIVER discharges itself into the bay between Cedar Point and Cove Point; it is easy of access, and Drum Point, which is its northern point, lies N. W. 3 miles from Cedar Point. The first high land met in going up the bay, is the "Red Cliffs," commencing on the northern side of the entrance to this river. If you go into this river give Cedar Point a small berth, and stand to the northward until you have the river open, when you may stand for Drum Point, which is on your starboard hand. This is a low, sandy, bold point. After passing this point you can anchor opposite the first bank or bluff in 24 or 3 fathoms, secure from all winds. In beating into this river, you may stand on the north side for the high red cliffs to 3 fathoms water, and to the south to 5 fathoms; in the channel you will have 7 fathoms. When standing to the south side of the river, you will see some buildings on the north side of the river, above Drum Point; as soon as the buildings come on with Drum Point, you must tack to avoid a spit that runs off from the south side of the mouth of the river.

This is one of the most frequented harbors on the Chesapeake, and it is common with those who seek shelter here, waiting for a fair wind, to remain at anchor until daylight before getting under weigh, even when the flood makes early in the morning, and the wind is from the eastward. You should always keep in mind the time lost in beating out into the bay; and if bound up the bay, by leaving on the latter part of the ebb tide, you

*Barren
Island Bar.*

*Potomac
River to
Patuxent
River.*

Lighthouse.

*Patuxent
River.*

will have the whole flood to help you in passing between Cove Point and Taylor's Island. Half an hour's start has enabled me, frequently, to pass Cove Point, and beat up, when a whole fleet has returned to Drum Point.

If you should harbor in the Patuxent, when you come out, bound up the bay, give the high land on the northern side of the river something of a berth, going into not less than 5 fathoms water, and do not haul to the northward until you have got into 9 or 10 fathoms water, as a large spit runs off from the Patuxent Cliffs, about S. E., extending from Drum Point nearly to Cove Point, which should be avoided.

Cove Point.

FROM COVE POINT BOUND UP THE BAY.—That part of the bay opposite Cove Point, is about 5 miles in width; the flood and ebb sets strong here; a fast sailing vessel may beat through it.

When up with Cove Point, you may give it a berth of not less than $\frac{1}{4}$ of a mile, and steer up mid channel N. by W., which will carry you up with the north end of Poplar Island; the distance is about 8 leagues. In running this course, you will have from 10 to 15 fathoms, and you pass Sharp's Island on your starboard hand; when it bears E. you may have 18 fathoms, muddy bottom.

Lighthouse.

On the north end of Sharp's Island is a lighthouse, the lantern on the keeper's dwelling, showing a fixed light. The island is about 2 miles long, and well wooded on its north end. A spit puts off from the south point, and the shore is not bold to.

If, after leaving Patuxent River, you intend going into Great Choptank River, steer N. by E. 5 leagues, for James' Island or Point, which you must leave on your starboard, and Sharp's Island on your larboard hand, giving both a good berth, as there are long spits off from both these places. After you have passed James' Point, steer away about N. N. E. in seven and eight fathoms, which will carry you in under Sharp's Island, where you may anchor within half a mile of the island, and lie secure from northerly and N. W. winds, and, if you wish it, take a pilot at this place.

NOTE.—The land on the western side of the bay, from Patuxent to Annapolis river, is something high, with several bays, such as Herring and West River Bays, where the soundings are gradual on both sides, near which there are shoals which should be avoided.

Poplar Island.

POPLAR ISLAND is about two miles in length, having timber on the northern and S. E. parts; a spit puts off on the southern part, and vessels may anchor S. W. from the island, secure from northerly winds. The passage on the eastern side is only for vessels drawing about 8 feet water.

After you are up with Poplar Island, and it bears E., you may then steer away about N., distant 5 $\frac{1}{2}$ leagues, which will carry you up to Annapolis Roads, which afford a fine anchorage, and protection from N. and N. W. winds. The channel into Annapolis is difficult and narrow; few vessels ever attempt it. The State House at Annapolis is remarkable for having a large steeple, by which it may be known, and may be seen when abreast of the head of Poplar Island.

In running N. and N. W. from Poplar Island, for Annapolis Roads, you pass Thomas Point lighthouse; and in a S. E. direction lies a shoal, which should be avoided, as it is bold to, making it more dangerous. The dwelling-house of the keeper stands between two large walnut trees, near the lighthouse; you will also pass in this distance, on your larboard hand, three small islands, called the Sisters, lying below South river.

Lighthouse.

Thomas' Point lighthouse contains a fixed light, in a tower, 30 feet high; it is important to the navigation of Chesapeake Bay, and those bound for Annapolis Road. The buoys off Talley's Point bear from the light N. N. E.

North of Poplar Island, 4 miles distant, is the south point of Kent Island; you may anchor under it, secure from all winds but the S. W.

Annapolis.

You also have, in running from Poplar Island to Annapolis or Talley's Point, (and which is the southern point of Annapolis River, off which a buoy is placed in 6 fathoms water, bearing E. S. E., one mile distant, and N. N. E. from Thomas Point light) from 7 to 15 fathoms. If you go into Annapolis River, give Talley's Point a good berth, and haul in to the westward of the mouth of the river, taking your soundings off the south side in 3 and 4 fathoms water, and pass in between Talley's and Greenberry Points, the latter of which has a buoy off it in 3 $\frac{1}{2}$ fathoms, bearing from the buoy off Hackett's Point W. by S. $\frac{1}{4}$ mile, and from Talley's Point buoy N. W. $\frac{1}{4}$ N., 2 miles distant, giving said points a berth of an equal width, and run just above them, where you may anchor in 3 or 4 fathoms, and lie secure from all winds. High water 4h. 43 m., rise 2 feet 6 inches.

Buoys.

Buoys, beside those above named, have been placed at Annapolis, viz:

Buoy off Hackett's Point in 4 $\frac{1}{2}$ fathoms, bearing from Talley's Point buoy N. $\frac{1}{4}$ E., distance between the two buoys, two miles.

Buoy off Horn Point in 4 fathoms, bearing from Greenberry Point buoy N. $\frac{1}{2}$ W. westerly.

Buoy in 15 feet water, in the harbor, Fort Madison bearing N. E., Horn Point S. W., and Horn Point buoy S. E.

Fort Madison is an old fort, on a high red bank, bearing from Horn Point buoy N. by W.

ltimore, when in

the middle of the channel, your course is N. by E. ½ E., which will give the best water, until you get the Bodkin lighthouse to bear W. N. W., then due N. till the Bodkin lighthouse bears W. ½ S., and the two lighthouses at North Point in one, or nearly so, keeping the east a little open with each other, until the Bodkin lighthouse bears S. W. by W., when you will steer W. by N., until you get the eastern lighthouse at North Point to bear N., wieu, if at night, you can anchor in the best water: if in the day-time, when you get the Bodkin lighthouse to bear W. ½ S. and the two lighthouses on North Point in one, or the bluff of woods on North Point on with a large walnut tree on Sparrow's Point, steer for either N. 60° W. until you get the white rocks to range with the centre of a red bank on the west side of the river; then N. 88½° W., continuing the said course until you get the end of Sparrow's Point to range with a gap in the woods, on Suller's Point, and a white house inland, for which you will steer N. 36° W., until you get Leading Point a sail's breadth open with Hawkins' Point (a dusky wood beyond) then N. 64½° W., with these marks on until North Point bears N. 85° E., then steer S. 85° W., till Hawkins' Point ranges with Leading Point; then N. 61° W.; with these marks on until you get the flag-staff on Fort M'Henry to range with the Washington Monument, which differs from the Shot Towers, from its being white, and stands to the westward of them; steer for this N. 41° W., until you are up with the Narrows between Fort M'Henry and Lazaretto Point, taking care to avoid the Lazaretto bar on the larboard hand, and a heap of ballast stones and Fort M'Henry bar on the opposite hand; then steer for Fell's Point, not forgetting a Middle Ground or Shoal just abreast of Easton on the starboard hand, with which you must not interfere.

You may anchor at Fell's Point, or continue up to the town, as the track is plain. Other directions are, after sailing as before described until you get the eastern lighthouse at North Point to bear N., you may bring the two lights a little open with a gap of woods on Sparrow Point, which will carry you in 3 fathoms water, soft bottom, being most you will have in this channel, common tides; keep these marks till Bodkin Point light bears S. S. W.; then steer W., or W. by N., into the river, giving North Point lights a berth of about one mile, by which you avoid a shoal off the point, of 12 feet, hard bottom, near which, in 18 feet, soft bottom, is a black Spar Buoy, which you leave on your starboard hand. When abreast of North Point light, steer away for the White Rocks, which you will see on the south side of the river, until you are abreast of them, when you must haul to the southward till you bring Leading Point, (which is high bluff woods) within two sail's breadth of Hawkins' Point, and keep it till you are almost abreast of the rocks, when you must again haul to the southward till you bring the snail point within a small sail's breadth of each other, which must lead you up to Hawkins' Point, to which give a berth of one-quarter of a mile. When up with Hawkins' Point, you may steer away for the Narrows (on which the fort stands) about N. W. by N., which course has nothing to obstruct you, where you will have from 2½ to 5 fathoms. When you are up with the Narrows, pass between the two points, and give the larboard side a good berth, to keep clear of a shoal just above the Narrows; then haul to the S. W. up for the wharves, or the point which is on the starboard hand, and there anchor, or proceed to Baltimore. If you leave the point, keep your larboard hand on board, when you will find good bottom, from which you may proceed to the wharves, or come to with safety.

There are several small shoals of about two fathoms, on each side of the channel, which are steep, and the channel between them not more than a quarter of a mile wide.

The Bodkin is a fixed light, requisite for vessels bound to Baltimore. The North Point light serves to show vessels the direction through the Ship Channel, also through the Swash. There are twenty buoys off the Patapsco and in the river, some on bars and others on knolls. As they are now all of one color, it is impossible for a stranger to designate them. They were formerly painted white, black, and the knoll buoys black and white alternately. They are now without paint, and a person unacquainted, is as likely to pass them on the wrong as on the right side.

There are two lighthouses on North Point, which exhibit white lights, bearing N. by W. ½ W. from the Bodkin. Lighthouses.

For vessels of small draft of water.—Give Sandy Point a good berth, on account of its bar, that runs out considerably, but you may safely pass it in 8 fathoms. This point is easily known from its having a few small detached round-topped pine and cedar trees on it, near its outer extremity, and a brick two-story house with wings, a little inland.

When abreast of the point, and pretty near the bar, with a leading wind, steer N. 12½° W., which will lead you to the Swash Channel, and the course through it: but it will be well to observe the natural inland marks for this channel, which are a small house standing a little to the westward of a large house having a steeple or dome to it; to the east of

North Point, up the bay, well on with a tree, as in the margin, farther inland until you are abreast of the Bodkin lighthouse. You will not have less than 19 feet, common tide, and afterwards not less than 13 feet. Steer with the above marks on until you open a house at the head of Bodkin Creek, or until you open Leading Point a little with Hawkins' Point, when you can

cross Bodkin Bar and stand up the river for Hawkins' Point, when, giving a fair berth to Hawkins' Point Bar, you may run for the channel between Fort M'Henry and the Lazzaretto Bar on the larboard hand, when you will follow the directions previously given for vessels of heavy draught of water. (See Chart of Chesapeake.)

Navigators who frequent the Swash Channel leading into the Patapsco River, will recollect that a hard knoll or oyster bank lies about two miles above the mouth of Magothy River, having less than 7 feet water on it, with 4 fathoms soft around it, from which the Bodkin lighthouse bears N. 41° W.; bluff off Sandy Point, S. 9° W.; and two very light green trees, appearing as one to the naked eye, standing over the Red Bank to the northward of Magothy, S. 84° W. to the Red Bank, two miles. A small mast buoy, painted black and white alternately, with an O upon it, both in the black and white, is placed on the northern edge of it.

Rates of Pilotage.

American vessels pay \$3 00 down, and \$4 00 up, per foot.
Foreign do. do. 4 00 do 4 33 up, do.

Buoys in Ship Channel.

BUOYS IN SHIP CHANNEL.—No. 1, a mast buoy, painted white, to the westward of which you should not go. Another white buoy, No. 2, to range with it and No. 4, which last will be red, and placed exactly on the Ship Channel range, so that by observing it, you will, without farther notice, know when to run in for the river, as it will range precisely with the two lighthouses on North Point. No. 3, a white buoy, upon or near a small knoll of 16 feet hard, on the larboard side of the Ship Channel. No. 5, a black and white buoy on a hard knoll of 15 feet, which lies in the Ship Channel, with the marks nearly on. It is best to leave it on the starboard hand going up. Nos. 9 and 10, two black mast buoys, mark the southern extremity of the Man-of-war Shoals; vessels beating through must not pass this range. No. 6, and No. 7, two white buoys, designate the southern or larboard side of the Ship Channel, and will range with No. 3, before mentioned. No. 8, a white buoy, on the end of the Bodkin Bar.

These buoys, when first put down, were painted as described, but the person employed by the government to keep them in order, receives a salary, whether he neglects his duty or not.

Directions for coming out of the Susquehanna River with small draft of water only.

Keep the eastern ferry-house opposite Havre de Grace (a stone building) astern, and passing near Point Concord lighthouse, run for a large tree near the thoroughfare island of Specutia Island, until you just shut in two Lombardy poplars, or till you get Turkey Point and a gap in the Highlands, south side of Elk River, to range; nor for the last marks until you open a single tree on the Highlands, south side of Susquehanna River, with the easternmost point of Specutia Island; then run for a red bank east side of the bay, having Langsdale's house, which is a large brick one above Havre de Grace, right astern, until you open a single tree, east end of a long ridge of black woods south side of Elk River with Turkey Point, then N. W. westerly, for Poole Island: a short distance below, and on the starboard hand, after leaving Point Concord, lies a shoal called Devil's Island, which at low tide is nearly out of water, and on the opposite side of the channel is a very extensive flat or shoal, which also must be avoided by making short tacks when beating in or out of the river.

Lighthouse.

Concord light, at Havre de Grace, is a fixed light, the navigation to which, in passing, together with the port, is fit only for vessels drawing not over 8 feet; the channel is narrow and crooked; on the shoals are only 3 feet water. It is impossible to give a stronger course and distances, who must be guided altogether by the lead, and it should not be run in the night.

Lighthouse.

On Poole Island is a lighthouse, containing a fixed light; it shows the way through the western channel, in which there are only 7 feet water. Few vessels take this channel, as the eastern is the safest, having from 3 to 7 fathoms water. A bell is tolled in thick weather.

NAVIGATION OF THE PATAPSCO.

Directions for Mariners, Bay Craftsmen, &c., for sailing up or down the Patapsco, and for passing through the Swash Channel.

The can and log buoys heretofore used to buoy off the Swash Channel and River Patapsco having been removed, and spar or mast buoys adopted in lieu thereof, as being more conspicuous from their erect position, and showing a mast of from 9 to 20 feet above the water, it is conceived necessary to give due notice of the changes, viz.:

The buoys now moored are numbers 5, and from 11 to 20, and are painted, some of them entirely white, others entirely black, and others again black at the surface of the

water and at the head, with white between. The white buoys designate the south or larboard side of the channel, coming up; the black buoys the north or starboard side; and the white and black buoys denote the knolls that lie in the channel-way, or elsewhere, and to be avoided. Their particular positions are as follows:

No. 5.—A buoy painted black and white alternately, on the edge of a hard knoll of 15 feet, immediately on the Ship Channel range, abreast of the easternmost Man-of-war Shoal, in 3 fathoms, sticky bottom.

No. 12.—A white buoy is placed on the larboard side of the channel, to mark the south-east burr.

No. 13.—Shows the starboard side of the channel, and is placed just at the edge of the 7 feet knoll.

No. 11.—A white buoy in 18 feet, soft, on the outer edge of the Rock Point Shoal.

No. 14.—A white and black striped buoy, in 18 feet, soft, on the edge of a hard knoll of 14 feet, between North Point and Rock Point.

No. 15.—A black buoy in 18 feet, soft, denotes the Shoal off North Point.

No. 16.—A white and black striped buoy in 18 feet, just outside of the Rock Knolls.

No. 17.—A black buoy in 18 feet, soft, on the outer edge of the Sparrow's Point Knolls, of 12 feet, hard.

No. 18.—A white buoy in 4 fathoms, soft, on the outer edge of the shoal, extending from Hawkins' Point Bar.

No. 19.—A black buoy in 20 feet, soft, on the outer edge of a shoal of 14 feet, hard, extending from Soller's Point Bar.

No. 20.—A black buoy in 18 feet, soft, on the eastern extremity of the shoal, extending from the Lazaretto.

No. 22.—There is a buoy, painted black and white alternately, on the sunken rock between North Point and Sparrow's Point.

NOTE.—No. 5 shows 12 feet above the surface of the water; all the others show from 12 to 14 feet, except No. 19, which does not show as high.

A good berth should be given to the stripe buoys, as they are expressly placed to mark the shoals.

The black buoys indicate the northern extremity of the channel.

The white buoys indicate the southern extremity of the channel, so that it is dangerous to attempt to pass to the northward of the first, or to the southward of the latter.

Besides the above enumerated buoys, there will be placed a black and white buoy at the old wharf, abreast of Fort M'Henry, which will be No. 21.

Spur or mast buoys will also be placed, as soon as they can be completed, to buoy off the ship channel leading from the Chesapeake Bay into the River Patapsco, of which due notice will be given.

CAPE HENRY TO CAPE HATTERAS.

BODDY'S ISLAND LIGHT is a revolving light, 56½ feet above the sea, in lat. 35° 47' 30", 32 miles north of Cape Hatteras.

CAPE HATTERAS.—This cape lies about S. S. E., 37 leagues, from Cape Henry; between them lie the inlets of Currituck, which are shoal, and New Inlet, on which are 5 feet water. About 6 leagues N. by E. from the cape lie the Wimble Shoals, on which are 3 and 4½ fathoms water, extending N. by W. and S. by E. about 3 miles, and is about 3 miles wide. The inner edge of this shoal is about three miles from the shore, and the soundings between them 8, 10, and 7 fathoms. About 5 miles N. by W. from the north end of this shoal, and 3 miles S. E. from the north end of Hatteras Island, there lie some small knolls, on which are only 9 feet at low water.

Cape Hatteras Shoals extend 8 miles in a south-easterly direction, with 5 and 6 fathoms on the extreme parts. The most dangerous shoal lies in latitude 35° 10' N., the middle of which is 4 miles distant from the cape, and has barely 9 feet water. This is called the Diamond Shoal, between which and the cape there is a good passage for small vessels, in moderate weather, or when the wind is off the land; but it would be always safest to go round the shoal in 10, 12, and 15 fathoms.

CAPE HATTERAS LIGHT is 1½ mile from the point of the cape; the lighthouse is white, 95 feet above the level of the sea, containing a fixed light. There is a good channel, three miles from the light, keeping the land on board. The light bears from the S. W. part of the outer shoals N. by W. ½ W., and from the S. E. part N. W., distant 3 leagues; from the S. W. part of the middle shoals, within which vessels bound along the coast generally pass, the light bears N. N. W.

The light at Cape Hatteras will be seen from a considerable distance without the outer shoals, and to a vessel steering from Ocracock, W. by N., W. N. W., or even N. W. by W., the light on the cape will first show, and will continue to be seen till the light appears within the bar.

The lighthouse at Cape Hatteras exhibits a fine light when in order, and can be seen very plainly in 9 and 10 fathoms water on the outer part of the shoals, when only 10 feet

*Boddy's Is
and Light.
Cape Hatteras.*

Cape Hatteras Light.

above the level of the sea; but when on board a large vessel, it might be seen in 20 or 25 fathoms. The soundings from the cape are 2, 3, 4, 4½, 5, 6, and 7 fathoms, and then deepen to 9 on the S. S. E. part. There is a current with a south wind which runs N. N. E. two miles per hour, and with a north wind S. S. W. two miles per hour.

W. S. W. from Cape Hatteras, 8 leagues distant, is Ocracoke Inlet, on the bar of which are 9 feet water; this bar is subject to change, and should not be entered without a pilot.

From Cape Hatteras to Cape Henry the ground is fine sand, and to the northward of Cape Henry, coarse sand, with some shells among it.

High water.

It is high water at Cape Hatteras Shoals, on full and change of the moon, at about 9 o'clock, and the tide flows from 4 to 5 feet, being governed by the winds in the offing; in easterly gales it runs several feet higher.

Hatteras Cove and Inlet.

HATTERAS COVE AND INLET, both of which have been discovered and examined by Lieuts. Alden and Maffit, U. S. Coast Survey, are good harbors of refuge for our small coasters.

HATTERAS COVE.—This anchorage affords protection from all winds except those from the southward and westward, being exposed from S. to W. N. W.

To enter from the southward and westward bring Hatteras light to bear N. E. by N. ¾ N. and run for it. Anchor when in from 5 to 4½ fathoms water, muddy bottom, with the breakers on the S. W. spit bearing south.

To enter from the northward and eastward, giving Hatteras Point (which lies 2 miles S. S. W. of the light) a berth of half a mile, will carry you across the shoals in 3½ fathoms water. Bring the light to bear N. E. by N. ¾ N. and run for it. Anchor when in from 5 to 4½ fathoms water, muddy bottom, with the breakers on the S. W. spit bearing S.

To go outside the shoals keep in 12 fathoms water until the light bears N. N. W., then steer N. W. until the light bears N. E. by N. ¾ N., and steer in for the anchorage as before directed.

To beat in. Vessels beating in, should go about, on approaching the western shore, or in standing towards the spit, or getting into less than four fathoms.

HATTERAS INLET bears S. 70° W., (W. by S. ¾ S.) 12 miles distant from Cape Hatteras lighthouse. It is easily known by a remarkable round hummock, covered with trees, on the east side of the entrance.

The breakers seldom extend entirely across the entrance, but at nearly all times make an each side, and between them lies the channel.

The bar should be approached from the northward and eastward. Keep in from 4 to 5 fathoms water, along the breakers, until up with the opening. The course in is N. W. by W., ½ a mile, keeping the eastern breakers aboard, until the house on the East Point of the entrance is on with the south edge of the trees on the hummock, when the course is N. W. ½ W. ¾ of a mile, bringing the house on the East Point just open to the northward of the trees on the hummock; then the course up is N. W. by N. ¾ N., ¾ of a mile to the anchorage just inside of the sand-spits, which are bare at low water, and show at all times distinctly.

The best anchorage for vessels drawing not over 10 feet is marked on the sketch.

The least water on the bar is 14 feet at mean low water, to which the soundings are reduced. The mean rise and fall of tides is 2 feet.

The tides and currents are much influenced by the winds: the ordinary velocity in the channel is 3 knots.

The bottom is hard sand, except a few sticky spots about the anchorage at the head of the channel.

Ocracoke Lighthouse.

OCRACOCK LIGHTHOUSE.—On Ocracoke Island is a lighthouse exhibiting a revolving light, which you leave on your starboard hand entering the inlet. The time of each revolution is two minutes. It is elevated 75 feet above the water.

A floating light is stationed within the point of the 9 feet shoal, near Pench's Hole Swash. She is moored in 2 fathoms water, with the light on Ocracoke bearing S. E., distant 2¼ miles; Shell Castle bearing S. W. ½ W. 4½ miles, and the light-bout at the S. W. Straddle W. by S., 9 miles. A bell will be tolled at intervals in thick and foggy weather.

Vessels bound to Washington, from the S. W. end of Royal Shoal, on which is a light-bout, will make their course good N. W. by N., which will bring them up the main channel of Pamlico River, and will be within a quarter of a mile of the light.

A light-vessel is on the S. E. end of Brandt Island Shoal.

Lighthouse.

On a point of land on the south side of Pamlico River, 35 miles below Washington, running into Pamlico Sound, stands a lighthouse, 30 feet above the level of the sea, with a fixed light.

A floating light is also moored at the mouth of Neuse River. She is moored in 4½ fathoms water, sticky bottom, near the upper edge, or western side of the shoal, extending out from the point of marsh, with the point bearing due south, distant about three miles; Gum Thicket bearing S. W. ½ W.; Brand Island due N.; Swan Island S. E., and

of Croton Sound.

Wade's Point floating-light on the north side of Pastoquash River.

Roanoke River floating-light off Walnut Point.

CAPE LOOKOUT.—Cape Lookout lighthouse is painted with red and white stripes horizontally, and can be seen 16 or 18 miles, and resembles a ship under sail. It contains a fixed light, elevated 100 feet above the level of the sea. The house is surrounded by a small growth of trees, from which a bold sand-beach extends in a S. E. direction, about 3 miles, in the centre of which are small hillocks of sand. This light, although seen clearly all night, until near the approach of day, cannot then be discerned, owing, it is thought, to a mist that rises between the vessel and lamps. It is judged imprudent to approach the shoals of Lookout in the night nearer than 7 fathoms on the east, or 10 on the west side.

The shoals extend from the cape 10 miles, in a S. S. E. direction, being broken ground as far as lat. $34^{\circ} 28' N.$ In that latitude there are 14 fathoms water, and from thence to the Gulf Stream the soundings are gradual, 95 fathoms. The tracks are faithfully laid down in the chart, (published by E. & G. W. BLUNT,) together with all the soundings from the outer part of the shoal to the edge of the Gulf Stream.

The outer part of Cape Lookout Shoals lies S. W. $\frac{1}{2}$ W., 22 leagues from Cape Hatteras, and 22 leagues S. W. $\frac{3}{4}$ W. from the outer part of Cape Hatteras Shoals. Seven miles from Cape Lookout light lies a shoal which is dry at low water, bearing S. $\frac{1}{2}$ E. from the light; the sea breaks constantly S. E. from this shoal for the distance of 2 miles, which is the S. E. point of breakers. Between this shoal and the shore there are numerous spots, on which are 13 and 14 fathoms; south of this shoal the least water is 24 fathoms. On the eastern part of Cape Lookout Shoals there are 24 fathoms; near them, on the northern and southern sides, are 4, 5, and 9 fathoms. On the N. and E. of Cape Lookout Shoals you will have 7 and 8 fathoms, dead, dark, broken shells, with sand.

BEAUFORT.—Old Topsail Inlet, or entrance to Beaufort, lies about 3 leagues W. N. W. from Cape Lookout. It has 24 fathoms water, but the eastern side of the entrance is formed by a long spit extending westward. The channel lies first N. W. by N., and then alters gradually round the flat, which extends from the harbour or western side to the N. N. W. In proceeding up to Beaufort, you will have 3, 4, and 3 fathoms in the channel, and may anchor in 3 fathoms at low water. *Beaufort.*

If you wish to come within the shoals of Cape Lookout, after making Beaufort, keep along the shore at the distance of 2 miles, until you come up with the point of sand, forming a pretty good harbor, with the wind from the N. W. to E., for small vessels. If bound to the northward, keep, as near as you can judge, the same distance, or a little less, from the beach, until you bring the lighthouse to bear N. W. by N.; you will at that distance have not less than quarter less three; then, keep N. E., and you will deepen to 5 and 6 fathoms in a few minutes. High water 7h. 46m., rise 3 feet.

West, 10 leagues from Cape Lookout, lies Bougue Inlet, on which are 8 feet water; W. by S. $\frac{1}{2}$ S., 44 leagues from Bougue Inlet, lies New River, on which you have 8 feet water; S. W. $\frac{3}{4}$ W., 6 leagues from New River light, lies New Topsail Inlet, on which are 10 feet water; S. W. $\frac{1}{2}$ W. from New Topsail Inlet, 3 leagues distant, you make Deep Inlet, on which are 7 feet water; S. S. W. from Deep Inlet, 6 leagues, lies New Inlet, on which are 7 feet water. This inlet is between the sea coast and N. E. end of Smith's Island. It will admit vessels drawing 6 feet, and is about 2 miles wide at its entrance, having 7 feet water, at low tide, over the bar. It continues its breadth to the flat, and is navigable for large vessels 21 miles from its mouth, and 20 miles to Wilmington, to which town vessels drawing 10 or 12 feet can reach without any risk. S. by E., 8 leagues from New Inlet, will carry you into 15 fathoms, south from the Fryingspan Shoals.

CAPE FEAR, or BALD HEAD LIGHTHOUSE.—On the S. W. end of Smith's Island, Bald Head lighthouse is erected. It stands one mile from the sea, is 90 feet high, and contains a fixed light. The lamps are 110 feet above the level of the sea, and 50 feet above the tops of the trees which stand on the hills between the light and the sea. Smith and Oak Islands form the main entrance into the river. *Lighthouse.*

To go over the main bar, bring the lighthouse to bears N. $\frac{1}{2}$ E. The buoy is within the bar, close to it, and on the western side of the channel. From the buoy the lighthouse bears about N. N. E., distant one and a half mile. On the bar, at high tide, you have 144 feet, and its rise is 5 feet. From the point of the cape the lighthouse bears N. W., distant 4 miles, and from the extremity of the Fryingspan Shoal, N. W. by N. $\frac{1}{2}$ N., 5 leagues.

The general direction of the land from Bald Head lighthouse to Little River, (30 miles from the bar,) is W $\frac{1}{2}$ S. From the western projection of Fryingspan Shoals to

the mouth of Little River, the soundings are from 9 to 10 fathoms, sometimes sand, and sometimes rock.

It may be necessary to observe to strangers, that, in passing the shoals, especially in a dark night, it is most prudent to steer W. in lat. $33^{\circ} 20'$, or 25 at most, until they shall find their water to 7 or 8 fathoms; by doing this they may be sure of being to the westward of the bar.

Your course from Cape Fear Bar, when in 9 fathoms water, to clear Cape Roman Shoal, is S. W., and distance 72 miles. When sailing towards these coasts it is prudent to keep nearly a degree to the southward of the latitude of the place you intend to make, until you reckon yourself on the edge of the Gulf Stream, when you must be directed by judgment, according to circumstances. Do not, if possible to avoid it, sail to the northward of $33^{\circ} 20'$, or at highest, $33^{\circ} 25'$, until you obtain 10 fathoms water. In this depth you will be within the south or outer end of the Fryingpan Shoal, which lies in lat. $33^{\circ} 36'$. In approaching the coast, in $33^{\circ} 20'$, your first soundings will be from 30 to 35 fathoms; in this depth you will be very near to the edge of the Gulf Stream. You will have fine grey sand, with black spots, when you will get into 17 fathoms: there is a long flat in this depth of water. In steering west you will, for the first 5 or 6 leagues, shoalen the water very little. When you come in 14 fathoms, you shoalen your water quicker, but gradually. You will see the land from 10 fathoms water, if the weather be clear, and may then be sure that you are within the Fryingpan, from the outside of this shoal. To the westward of N. W. no land can be seen, when without the shoals.

The currents on the coast of North Carolina are governed mostly by the wind: during the summer months, the prevailing winds are south-westerly, and the currents then set the direction of the coast to the eastward, and when the southerly winds cease blowing, it changes suddenly to the contrary direction, which is a sure precursor of a N. E. wind.

Lighthouse.

The lighthouse on Federal Point bears N. E. by N. from Bald Head light, distant about $8\frac{1}{2}$ miles. It is elevated 48 feet above the level of the sea, painted white, and stands on the main land, north side of the entrance of Cape Fear River, where formerly stood a beacon. The bar bears from the light E. S. E., distant one mile.

North Bar New Inlet.

NORTH BAR NEW INLET.—To enter, the marks are, to bring the west end of Buzzard's Bay point of sand on H. Helly's large white house, in Smithville, and the bearings will be S. W. by W., keeping the point of Smithville with these bearings until over the bar; then keep the spit of sand or beach that makes off from Federal Point light close on board, which will carry you into the river channel, where there is good anchorage all along the sand, in 3 and 4 fathoms water. On this bar there are 10 feet at low, and 12 at high water.

The land on Cape Lookout is very low, and cannot be seen more than a league in the clearest weather, from on board a small vessel.

[We decline giving directions for sailing into many ports in North Carolina, as all the harbors are barred, and always subject to alteration by every gale, particularly in the equinoctial storms; but the bars create only a part of the danger in sailing into those ports; it is the vast bed of shoals that lies within the bars, with their innumerable small channels, which give to tide so many different directions that even the pilots who live on the spot, find it difficult to carry a vessel in without some accident.]

Old Bar at New Inlet.

OLD BAR AT NEW INLET, or, as now called, **THE SOUTH BAR.**—In running in, when the lighthouse on Federal Point bears W., or W. by S., you will make a thick and high hummock of woods, called Merryck's Wood Bluff, before you make the light; but should it bear to the N. of W., you will make the lighthouse and bluff at the same time, the former of which may be seen in clear weather about 15 miles, from a ship's deck, in about 10 or 11 fathoms water, and when first discovered, has the appearance of a distant sail. As you approach the light, the water becomes gradually shoal. In 4 fathoms water, one mile and a half from the lighthouse, bearing W. S. W. to W., there is good anchorage, soft bottom.

In running in bring the lighthouse on with the south end of the barracks, which you will continue till over the bar, and near the beach, and so along the beach until you are in the river. On the bar at high water, 11 to 12 feet; at low water 6 feet only. The depth of water, and channel, however, are subject to variation, so that it is not advisable for strangers, except in cases of necessity, to run in without a pilot.

The Main Bar of Cape Fear River.

THE MAIN BAR OF CAPE FEAR RIVER.—Vessels running down from the westward, should not approach nearer the Middle Ground, than to bring the cape (which is the most eastern part of the Bald Head Woods) to bear E. by N. When you bring the lighthouse to bear N. & E., in about 4 fathoms water, steer immediately for it, which will be a little open to the eastward of a pole beacon, with a cask on the top painted black. A continuation of this course will carry you clear of the Fingers, when you will see a buoy ahead, or a little on the larboard bow, which you will pass, leaving it on the larboard hand; as soon as you leave the buoy, steer N. W., or keep the breakers close on board the larboard side, when you will fall, or bear away, as the water may deepen, or

Vessels a
ward, conve

become more shoal, to be ascertained by heaving the lead. This will carry you clear of a long sand shoal that makes off the point of Bald Head, which is dangerous to ground upon, as the flood tide sets directly over, and breaks upon it with the wind from the S. W. In approaching Bald Head, caution is necessary, as the shoals on both sides are very steep, frequently from 6 to 3 fathoms at one cast of the lead. Keep close to this shoal by sounding as above directed, until you reach Oak Island, when you may steer direct for Smithville. Outside of the bar, in 5 or 6 fathoms water, the lighthouse bearing N. there is good anchorage, in soft bottom. There are on the bar, at low water, 10 feet, and at high water, 14½ feet; and the sea is scarcely ever so rough as to prevent a pilot's boarding a vessel at the buoy.

OAK ISLAND CHANNEL.—Vessels drawing not more than 9 feet water, running into Wilmington through Oak Island Channel, may bring the easternmost part of the lump of trees on the east end of Oak Island to bear N. E. by E., and run for it, which will carry them over in the best of the water, 7½ feet at low water, and 11 feet at high water; as soon as you deepen your water over the bar, steer for the end of the sandy point of Oak Island, till close up with it, then steer E. S. E. for opening Cape Creek, till you deepen into 4 fathoms, then haul up N., or N. N. W., along the beach, till you get up with Fort Johnson, where you may anchor.

GEORGETOWN.—Georgetown entrance is 72 miles S. W. ¼ W. from Cape Fear.

In sailing to Little River Inlet, which divides North from South Carolina, you pass Lockwood's Folly Inlet, which lies west from Cape Fear light, 3½ leagues distant. The land appears broken, and contains no safe harbor.

On your course towards Georgetown, several other inlets may be seen, and you pass North Inlet, about 3 leagues from Georgetown lighthouse; this inlet is the northern boundary of North Island. The entrance into this inlet is from the northward; the south breaker, forming nearly a crescent, runs apparently across the mouth of the inlet; there are generally not less than 6 feet water on the bar at low water, but the depth varies with the direction and violence of the prevailing winds. The direction of this channel has been within a few years considerably, though gradually, changed by the elongation and curve of the south breaker throwing the channel more to the northward. In entering it, Georgetown lighthouse will bear about S. by W., distant 3 leagues: a small but distinct sand-hill, (the most northern on the north end of the North Island,) S. W. ¼ S.; the most southern building on the south end of the opposite islands W. by S.; you may then run in between the heads of the two breakers, rounding along the edge of the south breaker, and thus passing between the breakers into the harbor. The flood tide comes in from the S. E., and sets across the south breaker towards the north breaker. On the north end of North Island, about 3 leagues from the light, there is a village of about 20 or 30 dwelling-houses, (a summer residence,) which is distinctly seen from sea, and often mistaken for Sullivan's Island, near Charleston: there are several houses on the north point of the opposite island. To small vessels, this inlet affords a safe harbor; there are two passages leading from it up to Georgetown, but from the shoalness of the water, they cannot be conveniently navigated, except by boats; in case of necessity, however, vessels of 6 or 7 feet draught may be navigated with some delay through the most southern, which is the deepest passage into the bay, or river, leading to the town.

GEORGETOWN HARBOR.—Georgetown lighthouse is a white tower, erected on North Island, which is on the northern and eastern sides of the harbor, at the entrance of Winyaw Bay, on a low sandy spot, and exhibits a fixed light, 90 feet above the level of the sea at high water, bearing N. ¼ W. from the entrance of the bar, 6 miles distant. From the south-easternmost part of Cape Roman Shoals, to the entrance of the bar, the course is N. N. E., and the distance 17½ miles.

In approaching Georgetown Bar from the northward, the harbor is shut out from view by North Island, and the lighthouse appears to be situated in a low wood.

In passing the light, either northerly or southerly; vessels will find 5 fathoms water, within 5 miles of the land. S. S. E., 5½ miles from Georgetown light, there is a shoal bank with 7½ feet water.

There are several spur buoys placed in the best water on the bar, and in the channel, in sailing by which, the following directions must be observed, viz.: The first buoy on the bar lies directly in the channel, which, of course, may be passed on either side, close to; from this to the second (channel) buoy, the course is about N. W., one mile distant, and when up with it, immediately steer N. E. ¼ mile distant, which is also in the channel, to the third buoy, when you will immediately steer N. by W. for the lighthouse, 4 miles distant, keeping that course until within 100 fathoms of the light, leaving it on the starboard hand, when you will be in good anchorage.

The north inlet channel into Georgetown, cannot be recommended, under any circumstances.

Vessels at sea will find deep water, and when the wind is to the southward and westward, convenient and safe anchorage near the land, about 1¼ or 2 miles to the northward

Oak Island Channel.

Georgetown.

Georgetown Harbor. Light.

Buoys.

High water. of the lighthouse. A common flood tide rises nearly 4 feet; it is high water on the bar at the full and change of the moon, about 7 o'clock.

Cape Roman light. CAPE ROMAN LIGHT is a fixed light, 87½ feet above the sea; the lighthouse is painted alternately black and white, beginning with white at the base, it is on the east end of the Great Racoon Key, and bears W. by S. from Cape Roman.

Cape Roman. CAPE ROMAN.—Cape Roman is very low land; it has neither tree nor bush, and appears, when seen at a distance, to be a sand left dry by the tide.

The Shoal off Cape Roman runs off S. E., about 6 miles from the light; the outer point has only 4 feet water, with a swash channel of 2½ fathoms, between that and the light; off the point of the Shoal, the water shoals from 7 to 5 fathoms, then directly on the breakers.

From the south entrance of Santee River, to 6 miles S. E. of Cape Roman, the shoal extends to a considerable distance from the land; the S. E. point of it lies 17½ miles S. S. W. from Georgetown lighthouse. Close to this shoal there are 4 and 3 fathoms, and the land is so low that you cannot see it from the deck of a ship, at the extremity of the shoal.

In steering W. N. W. from the S. W. part of Cape Roman Shoal, you will soon see Racoon Key light, then steer W. S. W., or S. W. by W., in about 5 fathoms water. As there is a shoal runs off about 5 miles S. E. by E. from the N. E. end of Bull's Island, you should take care to avoid it in passing. Senee Bay, or Bull's Harbor, lies between Racoon Keys and Bull's Island. There are shoals lying off the west end of Racoon Keys, and you should anchor near to Bull's Island, in 6 fathoms water.

From the shoal off the N. E. end of Bull's Island to Charleston Bar, the course to go clear of the Rattle Snake, is S. W. by W., and the distance 7 leagues. There are four islands between Senee Bay and Charleston Bar, viz: Bull's, Cooper's, Davies', and Long Island. Flats extend from all the islands, along which the soundings are regular. With Charleston churches northward of Sullivan's Island, you will be in 5½ fathoms water, on the edge of the Rattle Snake; and when the churches are open to the southward of Sullivan's Island, you are clear of that shoal. You should approach no nearer to this bank than 5 fathoms water.

Georgetown, (S. C.) to Charleston, (S. C.) GEORGETOWN, (S. C.) TO CHARLESTON, (S. C.)—From Georgetown Bar, outside of Roman Shoal, steer S. by W., distance 15 miles.—From thence to Charleston Bar, S. W. by W., distant 39 miles. If, after passing Roman Shoal, you wish to go to Bull's Harbor, steer W. by S., until you bring Bull's Island to bear W. N. W. or N. W. by W. In steering for Bull's Island you will pass Racoon Keys.

Bull's Bay. BULL'S BAY is about 23 miles North-east of Charleston light, on the coast of South Carolina. Thirteen feet can be carried across the bar at low water spring tides, the rise and fall of which is six and three-quarters feet. To enter, "bring the N. E. bluff or point of Bull's Island to bear N. W. by W. (by compass) and run for it. When within three-quarters of a mile of the point, steer N. three-quarters W. until it is passed. Then follow round the shore, and anchor at pleasure in soft bottom." "In leaving the bay, keep away until the outer spit is cleared, which bears S. E. by S. from the bluff point of Bull's Island, distant three and a quarter miles."

Lighthouse. Charleston lighthouse, which is 125½ feet high, is built on Lighthouse Island, and contains a revolving light. On Morris Island there are two beacons, intended as the marks for the Overall Channel.

Buoy. The south breaker has a buoy on the east end, in 12 feet water, and in the middle of this channel is a buoy with a small white flag upon it, in 18 feet water, low tide—on either side of which you may go when running in.

High water. There are also two beacons on Sullivan's Island, as a range for the Ship Channel. High water, 7h. 15m., rise 6 feet.

Lawford Channel Beacon.

Revolving.

Ship Channel Beacon.
Fixed Light.

Charleston, (S. C.)—Ship Channel. CHARLESTON, (S. C.)—SHIP CHANNEL.—Standing in for the Bar, having the Beacon to appear as above, a handspike's length to the N. of the lighthouse, and you will soon make the Bar Buoy lying in 3 fathoms water, and which may be passed on either side. Nearly in the same range lie two other Buoys; the first on the south point of the North Breaker, and the other on the inner south point (or S. W. point) of the same breaker. These buoys are to be left on the starboard hand, at the distance of a ship's length. Af-

passing the inner buoy, steer N. or N. $\frac{1}{2}$ W. (according as the tide is flood or ebb) for Sullivan's Island, keeping the two beacons on Sullivan's Island in range until you are up with the buoy off Cummin's Point, which you leave on your larboard hand. From Cummin's Point Buoy the course is N. W. by N. to the anchorage in Rebellion Roads. When midway between Sullivan's Island and Cummin's Point Buoy, you will clear the "Middle Ground" by steering for Fort Pinckney, keeping it a little on the larboard bow. Give the island a berth of about 100 yards as you approach it, and anchor off the city.

LAWFORD CHANNEL has one buoy at its entrance, which you will find by keeping the South Beacon open to the northward of the lighthouse about three handspikes' length. Leave the buoy on the starboard hand at the distance of 50 yards, and then steer N. N. E. to clear shoals on the larboard hand, until the lighthouse bears W. N. W., when the course should be directed to Sullivan's Island. The South Beacon is not lighted.

On Morris' Island are two white beacons, which, kept in range, will bring you to a buoy lying at the entrance of the *Overall Channel*. Keep the beacons directly on with each other, and steer for them until you strike 5 fathoms water, and then shape your course for Sullivan's Island. They are both lighted. At low water 7 feet can be carried through this channel,—at high water, 13.

There are three buoys in the NORTH CHANNEL. Run for the outer buoy, leaving it on the larboard hand,—thence for the middle buoy, which leave on the starboard, and the inner on the larboard hand. Nearly the same water may be found in the north as in the Overall Channel, but the latter is to be preferred.

STONO INLET is about two leagues from the south channel of Charleston; between them lie two islands, viz.: Morris Island, on which the lighthouse stands, and the island called the Coffin Island. With the lighthouse open of the Coffin Island, you will go clear of the Stono Shoals, in 6 fathoms water; but if you shut the lighthouse in with Coffin Island, you will not have more than $5\frac{1}{2}$ fathoms off Stono Shoals; you will pass close to the breakers, and consequently be in danger: the breakers, unless the sea be smooth, show where the shoal is. In Stono Inlet there are 9 or 10 feet water at low water, but it was not much frequented until Charleston was blockaded in the year 1775.

From 3 fathoms water, south of Charleston Bar to North Eddisto inlet, the course is S. W. by W. $\frac{1}{2}$ W., and the distance 5 leagues; this course will carry you clear of shoals which lie off Stono Inlet, which lie further off than any that are in your way to Eddisto.

ST. HELENA SOUND.—The entrance of this sound lies between South Eddisto Island and the northernmost Hunting Island; it is about 2 leagues wide. This place is navigable by vessels of 7 or 8 feet water only; it is full of sand-banks, many of which are dry at low water. Six rivers empty themselves into this Sound, viz: South Eddisto, Ashappo, Cumbahaw, Chehaw, True Blue, and Corsaw. These rivers are all navigable; some of them come 200 miles down the country, but few of them can be navigated by vessels of 6 feet water, for more than 30 or 40 miles from the sound. From the entrance of St. Helena Sound, along the Hunting Islands, to the entrance of Port Roynl, the course is S. W. $\frac{1}{2}$ S., and the distance about $5\frac{1}{2}$ leagues. The soundings are regular: you will have 5 or 6 fathoms water.

SAINT HELENA SOUND.—This is a good place for shelter for vessels not drawing over 13 feet water. There are two channels, the Ship channel, which has 14 feet, and the Slew channel, which has 9 feet at low water. Time of high water, at full and change, excepting during a freshet, 7h. 40m.—rise of tide about 7 feet.

A light-ship is moored inside the bar, excepting during 6 weeks in the summer, with the following bearings: north point of Hunting Island, W. $\frac{1}{2}$ S.; the two Slew buoys, E. $\frac{1}{2}$ N.; Ship bar buoy, S. E. by S.

To go in Slew channel, get the light-ship on with the north end of Hunting Island—will then bear W. $\frac{1}{2}$ S.; run in until you are in 4 fathoms water, when you can haul up for Otter Island. On this bar there are two buoys, the outer one is white, in $2\frac{1}{2}$ fathoms, the inner one is black, on the inside edge of the bar. They range with the light-ship as above mentioned. The best water is close to the north breaker, but the flood sets in strong.

To go in by the Ship channel, get a gap in the southernmost Hunting Island to bear N. S. W., when you will have a bunch of woods that looks like an island over the centre of it—run for it until you get the said point of the northernmost Hunting Island to bear W. N. W., then run for the point until the light-ship or the S. point of Otter Island bears N. W. by N., when you will be in fair channel way. You can then run for the point of Otter Island, inside of which there is a good harbor of 4 fathoms, muddy bottom; on the south end of the north breaker there is a black buoy, which bears S. E. by S., $2\frac{1}{2}$ miles distant from the light-ship.

NORTH EDDISTO.—From Stono Inlet to North Eddisto Inlet, the course is W. N. W., and the distance 11 miles; between them the soundings are regular, and the shoalings, when you are coming from the offing towards the shore, are very gradual; the bar of North Eddisto, and the shoals which are contiguous to it, lie off about 4 or 5 miles from the land. Close to the bar and shoals there are 3 and 4 fathoms water. South Ed-

Lawford Channel.

Stono Inlet.

Saint Helena Sound.

High water.

North Eddisto.

disto is 3 leagues W. S. W. from North Eddisto. The shore of the islands which lie between them may be approached with your lead without danger. The shoalings towards it are gradual.

If bound to the southward or northward, and obliged, through stress of weather, to make a harbor in North Eddisto, you must, when within about 5 miles of the land, open a tree (which resembles an umbrella,) with the south point of the harbor, and then steer in N. W. without any danger, and anchor in 6 fathoms water, on the northern side of the harbor. [The tide here is very rapid.] In the harbor, 4 miles west from anchorage, you may get good water.

Port Royal.

PORT ROYAL is 5 leagues N. E. $\frac{1}{4}$ E. from Tybee lighthouse, at the entrance of Savannah River.

Light ship.

A LIGHT SHIP, showing one light 22 feet above the sea, in 6 $\frac{1}{2}$ fathoms at half ebb, has been moored between the S. E. point of Martin's Industry and the north bank of Port Royal entrance.

Tybee light bears from it W. S. W. about 18 miles, the north point of Trench's Island N. W. $\frac{1}{4}$ N.

When you are coming from sea, for Port Royal Harbor, you should get into the latitude of St. Michael's Head, which is 32° 6' N., then steer W. for the Head, and when you come within 15 leagues of it, you will have from 20 to 25 fathoms water. Continue your west course until you make the land, which you will do, if the weather be clear, at a distance of 6 leagues, in 12 fathoms water. The land hereabouts is generally low, but the trees are high. Port Royal entrance is known by a small grove of trees, which stand on the west side of it, and tower above all the other trees, like a high-crowned hat; hence this grove is called the Hat of Port Royal. Continue to steer as before, keeping your lead going until you get into 8 fathoms water, when you will be about 3 leagues from St. Michael's Head. You may then steer a point to the southward of west, until you get into 5 fathoms water; then steer more southerly, taking care not to bring St. Michael's Head to the northward of N. W. by N. until you see the great north breaker, called Coles' Care, close to which there are 4 fathoms water: this shoal must be left on the starboard side. As you approach this breaker from the northward, you will see another breaker to the southward, called Martin's Industry; between these two breakers lies the entrance of the channel into Port Royal Harbor, which is about a mile wide. The mark to go clear the north breaker is a parcel of high trees, which stand near the mouth of the River May, and appear like an island, kept just open of Elizabeth Point. Your course through between the two shoals, is W. $\frac{1}{4}$ N., or W. by N. In this channel there are not less than 3 $\frac{1}{2}$ or 4 fathoms, at low water. Continue to steer as aforesaid between the two breakers, until you bring Philip's Point to bear N. N. W., then steer directly for it, and you will have as you proceed, 9, 8, and 7 fathoms water. When you are abreast of Philip's Point, give it a small berth, and steer up N. by W. $\frac{1}{4}$ W., in 6 and 5 fathoms; in the latter depth you may anchor, very safe harbor.

There is also a channel between Martin's Industry and Gaskin Bank, called the South Channel, in which there are not less than 12 feet at low water. In order to go in through this channel you must when in 7 fathoms water, bring Hilton's Head to bear N. W. by N., and then steer, with an ebb tide, N. W., and with a flood tide, N. W. by N., until Philip's Point bears N. by W. $\frac{1}{4}$ W. You may then steer for the point, and proceed as before directed.

About 3 $\frac{1}{2}$ miles S. E. from Hilton's Head, and 4 miles S. by E. from Philip's Point, lies the east end of the Joiner's Bank; it thence extends W. N. W. about 2 $\frac{1}{2}$ miles, and has 3 $\frac{1}{2}$ fathoms on it at low water. Hilton's Head is on the south side of the harbor, and is a higher bluff point of land than any thereabouts.

Tybee Inlet lies 5 leagues S. W. $\frac{1}{4}$ W. from the entrance of Port Royal south channel; between them is Hilton's Head Island; it is large, fertile and well inhabited. From this island the Gaskin Bank extends about 8 miles on the broadest part. You may proceed along this bank, in 5 fathoms water. Some, when bound to Port Royal, reckon it best to make the land about Tybee, because the lighthouse makes that part of the coast distinguishable from any other part. Tybee Inlet is the entrance of Savannah River. Ships which draw 14 or 15 feet water, may go in at Tybee, and proceed through land to Beaufort, in Port Royal Islands, and from Beaufort, vessels of 8 or 9 feet water, may go through land to Charleston. From Charleston, vessels drawing 7 or 8 feet water may go through land to the River Medway, in Georgia, which lies 30 miles south of Savannah.

Tides

On this coast it is observed, that N. E., easterly and S. E. winds, cause higher tides than other winds, and also somewhat alter their course. At Port Royal entrance the tide flows, on the change and full days of the moon, $\frac{1}{4}$ past 7 o'clock. About 6 leagues from the land, in 12 fathoms water, the flood sets strongly to the southward, and the ebb to the northward; further off from the shore there is no tide at all. Near to the entrance of the harbor there is a strong indraught during the flood tide, and an outset with an ebb tide.

SOUTH CAROLINA.—When the wind blows hard, in the N. E. quarter, without rain, it commonly continues to blow violent for some time, perhaps 3 or 4 days; but if such winds are attended with rain, they generally shift to the E., E. S. E. and S. E.

*South
Carolina.*

S. E. winds blow right in on the coast, but they seldom blow dry, or continue long; in 6, 8, or 10 hours after their commencement, the sky begins to look dirty, which soon produces rain. When it comes to blow and rain very hard you may be sure that the wind will fly round to the N. W. quarter, and blow very hard for 20 or 30 hours, with a clear sky.

N. W. winds are always attended with clear weather. They sometimes blow very hard, but seldom do so longer than 30 hours.

Gales on the coast of South Carolina frequently increase much in violence toward their conclusion, and then break off at once, leaving a cross sea, with almost no wind.

The most lasting winds are those which blow from the S. S. W. and W. N. W., and from the N. to the E. N. E. When the wind is in any of these quarters, the weather is the most settled.

Thunder-gusts are very common on this coast in the summer time; they always come from the N. W. quarter, and are sometimes so heavy that no canvass can withstand their fury; they come on so suddenly, that the greatest precautions are necessary to guard against the effects of their violence.

CHARLESTON BAR TO TYBEE.—When over the bar, in 8 fathoms water, the course is S. W., distant 20 leagues. As you come near the latitude of Port Royal anchorage, which is $32^{\circ} 8' N.$, be careful to avoid a very dangerous shoal, called Martin's Industry; it lies 4 leagues from the S. side of the entrance of Port Royal, which is the north side of Hilton Head, the highest land in sight: come no nearer than 7 fathoms, keeping your lead going; and in the night, or thick weather, do not approach nearer than 10 fathoms: the tide of flood sets boldly in. Shoal ground, with 6 or 7 fathoms, coarse shells, lies S. E., 14 or 15 miles from Tybee light. When you get to the southward of Hilton Head, you will see the lighthouse, which stands on the Island of Tybee.

*Charleston
Bar to Tybee.*

Tybee Island lies at the mouth of the Savannah River, to the southward of the bar. It is very pleasant, with a beautiful creek to the west of it, where a ship of any burthen may lie in safety at anchor. Warsaw Sound is formed by the southern end of this Island.

SAVANNAH.—If in the night, and you are to the northward of Tybee, be careful of going nearer the Gaskin Bank than 5 fathoms. In fresh winds you take a pilot abreast of the lighthouse—in moderate weather without the bar. In clear weather you may see Tybee light at the distance of 12 miles.

Savannah.

Near the Gaskin Bank and Martin's Industry, the flood runs strong into Port Royal, to which may be attributed the loss of so many vessels on these banks.

TYBEE LIGHT is a fixed light, 80 feet high, on the north end of Tybee Island.

Tybee light.

Off Tybee there are two large coppered buoys, one on the tail of the knoll, in 2 fathoms water, bearing from the lighthouse N. N. W., the other in 4½, bearing N. E. by N. from the lighthouse, in mid-channel, where large vessels may anchor with safety, when wind and tide will not permit to proceed higher up.

A beacon is erected on Tybee Island, which is lighted, and bears E. ¼ S. from the lighthouse, 600 yards distant. It is 10½ feet high.

The beacon light open a handspike's length to the northward of Tybee light, is the direct course over the bar. The best anchoring-ground is with Tybee light bearing from S. S. W. to S., the former to be preferred, and distant about one cable's length from the beach. On the bar is a buoy with a white top, in 4½ fathoms water, distant 4½ miles from the lighthouse. The deepest water is between the buoy and the south breaker head.

On Savannah Bar there are 18 and 19 feet at low water. On the south breaker there are not more than 7 or 8 feet water; and 1¼ mile from the light, it is bare at low tide.—On the north breaker there are not less than 12 feet for the distance of a mile. The head of Stone Horse Shoal commences at the north breaker, and extends from the land about 6 or 7 miles. [The brig Pocahontas, Capt. Walford, was totally lost on this shoal, the 7th Sept., 1829, at flood tide; Tybee light then bearing about N. N. E., distant about 8 miles, very bold near the shore.]

After getting into 4 fathoms water, you will be over the bar, when you must haul up W. N. W. until the lighthouse bears S. S. W., then anchor.

The point of shoal which runs down from Cockspar Island, and separates that channel from the ship-channel, bears N. ¼ W. from the light, and has not more than 5 feet on it at low tide. When to the northward of this point, the light bearing S. S. E., you may anchor in 4 or 5 fathoms.

Vessels drawing not more than 8 or 9 feet may keep the light or island side on board, and run into Cockspar and anchor, as they cannot pass the upper end of the island until half flood, there being only 7 or 8 feet at low tide.

There are three bars, having from two to three fathoms, on the back of Tybee and Cabbage Islands; but they are never to be attempted but in absolute necessity.

Buoys.

NOTE.—Sailing into Savannah, you will observe the following marks and buoys, viz: a large buoy lies on the outer edge of the bar, in the deepest water, having all the leading marks on the beacon and lighthouse in one, bearing W. $\frac{1}{4}$ N., distant 4 miles. Another buoy lies in the same direction, one mile within the bar; a third buoy lies one mile farther W. by N. from the second, a fourth buoy lies N. W. by W. from the third; after passing which, there is safe anchorage for a large fleet, in 4 or 5 fathoms, at low water, the lighthouse bearing S. S. W.

The buoys lie and lead in the deepest water, having a channel half a mile to the northward, and one-quarter of a mile to the southward of them, (the narrowest place) nearly the same depth of water; and there are 20 feet on the bar at lowest tides; you may sail either side of the buoys.

Tybee Creek has 11 feet through it, at low water. Forty miles south of Savannah lies Sunbury, a port of entry, at the head of St. Catharine's Sound, between Medway and New, or Rivers, about 15 miles south of Ogeechee River. There is a bar here, but the harbor is capacious and safe, and has water sufficient for ships of great burthen.

Ogeechee River

Warsaw has 10 feet on the bar, but it is too intricate for strangers.
OGEECHEE RIVER.—Ossabaw Bar, at the mouth of the river Ogeechee, has 18 feet water on it, to cross which, bring Green Island to bear N. W. by W., steer in W. by N. till you deepen your water, then haul up N. W. by N., and you will soon get in 8 or 9 fathoms, when your eye and lead will be your best directions; at the extremity of the channel you will keep Ossabaw nearest on board, until nearly up with the lower part of Buzzard's Island, when the channel will be close under the starboard shore.

Green Island is much higher land, has taller timber than the surrounding forests, containing several hundred acres, covered with pine, which generally has a greenish appearance.

St. Catharine's Bar.

ST. CATHARINE'S BAR, which is difficult for strangers, lies one mile south of the north point of the island, has but 8 $\frac{1}{2}$ feet at low tide; channel not more than 200 yards wide, the shoals generally dry at each side of the bar. It is better for vessels bound to Newport, Sunbury, or up these streams, to enter at Sapelo or Ossabaw, and go the inland passage, which is not difficult.

*Darien or**Doboy Light.*

DARIEN OR DOBOY LIGHT, is erected on the south point of Sapelo Island, 74 feet above the level of the sea, and contains a revolving light, revolving once in five minutes. To distinguish it from any other lighthouse on the neighboring coasts in the day, the tower is painted red and white, in horizontal stripes.

Two beacons have been erected on the east side, and nearly on the north end of Wolf Island, in a S. S. E. direction from the lighthouse, on the south point of Sapelo Island.

To designate these beacons, the tower of the western, or highest beacon, is painted white. The lantern is 25 feet above the surface.

Darien.

The eastern beacon is painted black, and is 15 feet above the surface.

DARIEN.—Vessels making the land, when in 5 or 6 fathoms water, will, during clear weather, see the beacons on Wolf Island, which must be brought to bear W. $\frac{1}{4}$ S., and run this course till the buoy on the outer edge of the bar is made, which may be passed on either side. Continue this W. $\frac{1}{4}$ S. course till near the inner buoy, opposite the north breaker, by which you will pass the 8 feet knoll on your starboard hand. In passing them the north breaker is to be kept on the starboard, and the buoy on the larboard hand, taking care at the same time that the flood tide does not set the vessel on the north breaker. In running this course, the bar is crossed with not less than 12 feet at low water. When abreast of the inner buoy, run from it $\frac{1}{2}$ mile in a direction exactly N. W. by W., where the anchorage is excellent, in 4 fathoms, at low water, which will bring the vessel in the vicinity of the lighthouse.

Or you may, after making the light on Sapelo Island, and steering directly for the beacon on Wolf Island, bringing them in a line, and keeping the lead constantly going, the lighthouse bearing W. $\frac{1}{4}$ N., (true course,) cross the bar in 13 feet water. Neap tide ebbs 7 feet.

The following are the depths of water, bearings, and distances of the two buoys, placed in Doboy Inlet, leading to Darien, Georgia:—

Buoys.

Buoy No. 1, sunk in 18 feet water, at low water, on the outer edge of the bar, bearing E. $\frac{1}{4}$ N. from the beacon on Wolf Island, 3 $\frac{1}{2}$ miles distant, and $\frac{1}{4}$ miles from the south point of Sapelo, in an E. S. E. direction.

Buoy No. 2, sunk in 21 feet water, at low water, off the north breaker head, bearing E. $\frac{1}{4}$ N. from the beacon aforesaid, about 2 $\frac{1}{2}$ miles, and in a S. E. by E. direction, 3 $\frac{1}{2}$ miles from the south point of Sapelo. This buoy is S. E. by E. $\frac{1}{4}$ E., 5 $\frac{1}{2}$ miles from Doboy Island, and from the most southern part of the north breaker, one third of a mile W. by S. $\frac{1}{4}$ S.

TYBEE TO ST. SIMONS.—Bring Tybee lighthouse to bear N. W. when in 10 fathoms water, and steer S. W. by S., distant 21 leagues, to go clear of the shoal of St. Simons, which lies off St. Simon E. S. E., 2 leagues. There are 4 and 5 fathoms close to this shoal, to avoid which, come no nearer than 8 or 9 fathoms. The Island of St. Simons is on the north side of the sound or harbor of the same name, which lies in latitude 31° 7' N., and may be known by four trees standing thus † † † †. On the south side of that harbor lies Jekyl Island, on which are remarkable trees, appearing like umbrellas, and thence called the umbrella trees. St. Simons and Jekyl Island beaches are remarkably white. The bar at the entrance of St. Simons' Sound lies 6 miles from the light.

Tybee to St. Simons.

ST. SIMONS.—St. Simons' light is on the south point of St. Simons' Island; it is 75 feet in height, and contains a fixed light.

St. Simons.

On St. Simons' Bar there are two buoys; the northernmost is a black buoy, and is in 24 fathoms at low water; it bears from the light S. E. by E. 4 E., six miles distant.

Buoys.

The southernmost buoy is white, and is on the N. E. point of the south breaker, in 3 fathoms water; it bears S. S. E., 14 mile from the black buoy; 34 fathoms is the least water between the buoys.

Inside of the bar there is a shoal ground, called the Middle Ground; on the northern side there is a black buoy, which bears from the lighthouse S. E. by E. 4 E., 4 miles distant.

Vessels approaching the bar, should endeavor to get the black buoy on the north breaker to bear W. S. W., and run for it, passing at two cables' length, leaving it on the starboard hand. When abreast of it, haul up W. N. W., the channel course, to pass the middle ground, leaving the buoy on the middle ground on the larboard hand, giving it a good berth. Then steer W. by N., to pass the light; upon passing which, the vessel is in safety, in ten fathoms water. The shoalest soundings in the channel are three and one-quarter fathoms, at low water. By these directions, any vessel drawing less than 17 feet can come into port at dead low water. The tide rises on the bar six feet, common tides.

Tides. Light.

LIGHT.—On the north end of Little Cumberland Island, and on the southern side of the entrance to St. Andrews Sound, there is a fixed light, 53 feet high.

ST. ANDREWS.—The entrance to St. Andrews is between Jekyl and Cumberland Islands; and on the bar there are 11 feet at low water. There are three buoys at the entrance; one large buoy inside the bar, in 3 fathoms, at low water; one spar buoy on the spit off the north end of Little Cumberland Island; and one spar buoy on a shoal at the mouth of the Great Satilla River.

St. Andrews.

Bring the lighthouse on Little Cumberland Island to bear W. by N., when the outer buoy will be in a range with the lighthouse; and run for it till over the bar, and up with the outer buoy; the south point of Jekyl will then be N. W. 4 W.; alter the course N. W. by W., until between the points of Cumberland and Jekyl Islands, and abreast of the spar buoy off Cumberland Point, leaving it to the south, where will be found good soundings from 3 to 5 fathoms, near the shore.

Lighthouse.

Satilla River empties into St. Andrew's Sound. Crow Harbor lies up Satilla River, about 30 miles, and is a great timber depot; about 15 miles above Crow Harbor is the town of Jefferson, where vessels drawing 12 feet can go.

ST. MARY'S AND AMELIA BAR.—Vessels from the northward, after passing Jekyl Island, which lies in latitude 31°, ought to keep in 7, 6, or 5 fathoms water, as weather and size of the vessel may permit. As you proceed towards the southern part of Cumberland, you will open Dungeness House, which is about 1½ mile distant from the south point of said island, and is the only conspicuous large building on this coast, and is hid by the trees when you are to the northward. Southward of this house there is a space of about two miles, with no trees on it, which makes the south point of the island appear, at a distance, like an island of about two miles in length.

St. Mary's and Amelia Bar.

ST. MARY'S.—On the north point of Amelia Island there is a lighthouse containing a revolving light, 50 feet high. In running for the Bar, which is about 3 miles in an E. by N. direction from the north end of Amelia Island, and has on it 12 feet at low water, bring the lighthouse on Amelia Island to bear S. W. by S., southerly, to enable you to find the outer buoy, near which are 4 fathoms water, which you leave on the larboard hand, your course on the flood tide is S. W. by S. to the next buoy, which you leave on the starboard hand. After passing this buoy, your course is W. by N., to pass the buoy on the Spit off the north end of Amelia Island, which you leave on the larboard hand, and give a good berth to.

St. Mary's.

The channel is now shown by the north breakers and dry sand-banks on the eastern side. After passing the buoy off Amelia Island, your course is about west. From Tiger Island, there is an extensive sand-flat as far as Jolly River.

The buoys are wood, coppered, and of that color, with iron-tops painted black.

The lighthouse on Amelia Island is too far south for use, excepting to find the outer buoys of the Bar.

Full sea at St. Mary's Bar, on full and change, at half past 7 o'clock; Average tide 7 feet.

Tide.

ST. JOHN'S LIGHT is a fixed light, 65 feet high, on the south side of the entrance to the river.

St. John's Light.

St. Mary's to St. John's.

ST. MARY'S TO ST. JOHN'S.—The course is S. by E., distant 7 leagues to St. John's; in making this place, when bound into St. Augustine, there is a round high bluff, at the south side of the river, known by the name of the General's Mount; the small craft running in from Amelia to St. Augustine generally make it, and take their departure. On the north side of the harbor is Talbot's Island, full of trees, lying north and south, and about the same height with the General's Mount: there are 11 feet water on the bar at high water. In running into St. John's bring the lighthouse to bear S. W. $\frac{1}{2}$ W. and open the top of the chimney in the west end of the dwelling-house, about 3 feet to the S. and E. of the light; then run in until within the South Breaker Head; then steer S. S. W. for the General's Mount, within a cable's length of the shore; then haul up to the westward, keeping the shore about the same distance from you, to clear the Middle or North Breakers, which show plain if there is any wind. When nearly opposite the swash, incline towards the north shore, or Fort George Island, to clear a flat that makes off from the shore a considerable distance. Spring tides rise 12 or 13 feet; neap tides not more than 10 feet. The currents run out until quarter flood, and sometimes half flood. High water, at full and change of the moon, about 20 minutes past 7. The tides are very much influenced by the winds.

Tides.

The outer buoy is a large coppered can buoy, in 16 feet at low water, N. N. E. from the light; at about 3 miles distant, S. by W. $\frac{1}{4}$ W., a half mile distant, is a coppered spar buoy, in 10 feet water. There is another spar buoy, S. by W., half a mile distant, in 8 feet water; another spar buoy, S. E. by $\frac{1}{2}$ E., one-fourth of a mile off; one other small spar buoy, S. by E., one-eighth of a mile off, in 10 feet water. The buoys are all well anchored, with heavy anchors, in the middle of the channel.

The St. John's is a long and broad bay, which receives the impressions of the tide at more than 150 miles from its mouth, running parallel with the ocean.

Lake George is a little sea of nearly 60 miles in circumference, at the extremity of which is found a bank of shells, on which you have only about 5 feet water; but at two or three miles above this, the branches of the St. John's reunite, and a broad and deep channel conducts you to a lake.

St. Augustine light-house.

ST. AUGUSTINE LIGHTHOUSE is built on the north end of St. Anastasi Island, and shows a fixed light. It is a square tower, painted white, 70 feet high from the ground, exclusive of the lantern, which is 7 feet.

St. Augustine is situated on the main, about 2 miles within the bar, immediately opposite the inlet. When in 9 fathoms water, off the bar of St. John's, the course is S. S. E., distant 10 leagues. The northernmost land of the bay is called Point Cartel. When you are as far to the southward as this point, you will see the Island of Anastasia, in length 15 miles, and on the south side of the bay, on the north end of which is a light-house, showing a fixed light.

The bar at the entrance of this harbor has opened in a new place, rendering the passage much more direct and easy. In crossing the bar with the lighthouse bearing W. by S., steer W. S. W., which secures 14 feet water at high tide.

Depth on the bar, at high water,.....	12 feet.
" " " half tide,.....	9 do.
" " " low water,.....	6 $\frac{1}{2}$ do.

Vessels coming from the northward will run down till the lighthouse bears W. by S., keeping in 3 fathoms water.

The pilots in good weather, board vessels outside the bar. They will be on the bar with a flag, and a wave to the right or left will indicate whether the vessel is to proceed either larboard or starboard. When the staff is erect, the vessel will bear down for the pilot-boat.

If the wind be to the south, bring the light to bear W.; if moderate, come to, and anchor in from 7 to 9 fathoms water, muddy bottom.

All vessels bound to this port will show, when off the bar, how much water they draw by signal, hauling down the flag and hoisting it again equal to the number of feet they draw.

The tide flows, at full and change, S. E. by S. and N. W. by N., 6h. 4m.; variation off St. Augustine, 7° E., 1819.

Tide.

Mosquito Inlet.

MOSQUITO INLET.—Sixty-five miles to the southward of St. Augustine light-house is Mosquito Inlet. On the bar there are 5 feet at low water. Rise of tide, 3 $\frac{1}{2}$ feet. On the south side of the inlet there was a *lighthouse intended for a fixed light. The town of Smyrna is within this inlet.

* This lighthouse was never lighted: a few months after being built [by contract] it fell to the ground. It is uncertain when a new lighthouse will be lighted to indicate the entrance to this inlet.

REMARKS OFF St. Augustine.—From the first of November to the last of February, the hardest gales prevail that blow on this coast, and in general from N. N. E. to S. S. E. The wind any way easterly comes on very suddenly to a gale during the season above mentioned; and these gales give but very little warning. An experienced navigator says: "I was at anchor in St. Augustine Bay, when it came on to blow at E. N. E., and in fifteen minutes I was obliged to slip, and had we not carried sail to the utmost, we should not have cleared the land to the southward." When the wind backs against the sun, with a small rain, you will perceive the sea to rise before the wind comes; then prepare for a gale, which in general will last 50 or 60 hours. If you should be obliged to cut or slip, carry all the sail you possibly can, to get an offing before it increases so as to put you past carrying any sail, which is always the case: and observe, that the flood tide setting to the southward will be of no service to you further out than 12 fathoms water, when you will be in the southern current until you get into 46 fathoms, which is about 15 leagues from the land, and in the Gulf Stream, where the current runs strong N. N. E. as far to the northward as latitude 35° 15' N., when it sets more easterly, or about N. E. by N., as far as latitude 37° N.; from thence, as far as the Capes of Delaware, its direction is about E. N. E., and from latitude 38° 57' N. it sets nearly E.

To keep in the best current of the Gulf Stream, when in long. 79° 30', lat. 29° 30', steer north until in lat. 30° 30'; thence N. N. E., easterly, until up with Hatteras.

Note.—Along the southern coast of America, you will find no tide farther out from the shore than 10 or 12 fathoms water; from that depth until the edge of soundings, you will have a current setting to the southward, at the rate of one mile per hour: when out of soundings, you will have the Gulf Stream setting to the N. E. quarter, and the further you get to the northward, it sets more easterly, but not so strong as before mentioned; when you get to the northward of 39°, it sets about E.

GENERAL REMARKS.

When over the Bank, and bound for New Orleans, you may shorten your distance very much by running down the Florida Reef, keeping in colored water in day time, and off into the stream by night, as a strong eddy, or counter current, sets westwardly along the outside of the reef, between it and the regular set of the Gulf. To do this with advantage, you must calculate to fall in with the Florida coast as early in the forenoon as possible, that you may take advantage of the eddy through the remainder of the day. Your best way, therefore, will be, on leaving the Bank in lat. 24° 40', with a good breeze, to steer W. S. W., 25 leagues, and if at daylight Florida Reef is not in sight, steer West by N., or W. N. W., and make them at once; you will fall in with them between Key Largo and Old Matcumbe, which has high trees on its north end, the tops of which are quite level, and at first sight appear like table land; keep down in colored water by daylight, and at night haul out at a respectful distance, until fairly daylight again, when you may haul in to the northward, and again make the land. Or, should you be so far to the westward as between the Marques Keys and the Tortugas light, where you cannot see the land, unless within 4 leagues of the one or the other, you must keep a lookout for colored water, and when fairly into it, keep down to the westward, and make the Tortugas, which you may pass at a respectful distance either to windward or leeward, as best suits your fancy, and as the winds will admit of. Between Sombrero Key and Sand Key light, you may see the beacon on Looe Key, which is 30 feet high, and on which is a large ball painted red; 4 or 5 miles E. of Looe Key is a white buoy on a reef, in 3½ feet of water, and between Looe Key and the west end of Florida Reef, you may make the lighthouse on Sand Key.

Should the wind be far southerly or light, it would be most advisable, on leaving the Bank, to keep to the southward, and get under Double-headed Shot Bank, and out of the

Buoy.

force of the stream; and with light and westerly winds, (which sometimes continue for several days during the summer,) it is usual to get on the Double-headed Shot Bank, and lay on its western edge for a breeze, or cross over into St. Nicholas Channel, and take advantage of the land breeze from the Island of Cuba, to get to the westward.

Lighthouse.

A lighthouse, showing a fixed light, elevated 70 feet above the level of the sea, 400 yards from the bench, and about 7 miles from the Gulf Stream, is built on the south point of Key Biscayne [Cape Florida.] Vessels drawing 10 feet may approach it till within 2½ miles. It is about 7 miles from the Gulf Stream, lat. 25° 40', N., long. 80° 5' W., a little south of Cape Florida.

On the Reef off Key Largo is a floating light-vessel, showing two fixed lights, one about 50 feet high, the other 40 feet, bearing from the highest land on Key Largo E. by S., 7 miles distant; from the elbow on Carysfort Reef, N. ½ E., distant 3 or 4 miles; the outer reef [say 14 fathoms water] bearing E., 2½ miles distant, lat. 25° 12' N., long. 80° 16' W. It may generally be seen 6 miles, and its object is to warn vessels from the dangerous rocks and shoals near which she is moored. In hazy weather, a bell will be struck frequently to warn vessels to keep off.

Tortugas light. Buoy.

TORTUGAS LIGHT. Stationary, on one of the Dry Tortugas Islands, near the western extremity of the reef

A spur buoy, painted white, in 15 or 18 feet water, showing 3 feet above the water, is placed at the west end of the quicksands, [Dry Tortugas,] 15 miles E. ½ S. from East Key, which is the most easternmost key, and where there is a shoal of not more than 7 or 8 feet water.

Sand Key light is not rebuilt. [1850.]

For these lights, see Appendix.

DESCRIPTION OF THE BAHAMA BANKS, ISLANDS, AND CHANNELS.

THE following directions are confined to that part of the Bahamas which American vessels navigate in their route from the Atlantic ports to those in the Gulf of Mexico.

Bahamas.

BAHAMAS.—Under this general denomination are included all those groups which appear on the banks between the Matanilla Bank on the N. W. and Square Handkerchief on the S. E. The principal islands are situated on those remarkable flats, called the GREAT and LITTLE BANKS OF BAHAMAS, which are divided by the channel of Providence, and of so much importance did we consider a correct description of its navigation, being the passage for vessels from the ports of the United States to those of the Mexican Sea, as to induce the author, in 1820, to send the sloop Orbit, under the direction of E. C. Wurd, U. S. Navy, to make surveys.

The banks are generally of sand, with coral. The islands are low, flat, and interspersed with porous rocks, of fresh water; but the supply is, however, scanty, it being obtainable only from pools, formed during the rains, or from wells dug in the sand, into which the sea water filters. In the woods are found the wild hog and the agouti.

Within the jurisdiction of the Bahamas are, therefore, included the Great Bahamas and Abaco Isles, New Providence, Andros, the Berry Isles, Eleuthera, or Erihera, Guanahama, otherwise St. Salvador or Cat Island, Watland's Island, Exuma, Yuma, or Long Islands, the Crooked Islands, Maynana, the Caycos, the Inaugues, and many smaller groups hereafter described under the head of West Indies.

Little Bahama Banks, with its islands.

LITTLE BAHAMA BANKS, WITH ITS ISLANDS.—The Hole-in-the-wall, which is the southernmost extreme of the island Abaco, bears N. N. W. from Egg Island, and 7½ leagues distant, and the two form the mouth of what is called the North-east Channel of Providence; and the Hole-in-the-wall, with Stirrup's Key, forms the eastern mouth of what is called the North-west Channel of Providence; and this North-west Channel's mouth is formed by the Great Isaac, and the western extremity of the Island of Great or Grand Bahama. About one mile west of the N. E. point of Abaco is a fine bay, called Hurricane Bay, with water enough for small vessels.

After passing the Hole-in-the-wall, the land is indented, both on its surface and bench, and trends nearly east and west, forming a slope; the highest land to the eastward. Two miles W. by S. from it lies the southernmost point of the Island of Abaco, and Little Bahama Bank.

From the south point of Great Abaco to Rock Point, the bearing and distance are N. W. by W., 16 miles; the latitude of the latter is exactly 26°; from Rock Point to Key Gorda, on which fresh water may be found, is N. W. by W. ¾ W., 10 miles. Along

the edge of the Bank, N. W. $\frac{1}{2}$ N. from Key Gorda, in an extent of 6 leagues, is a continued series of keys and reefs, and within these on the bank is Moose Island. In this distance you will have a dangerous rocky shore, on the west end of the bank. About half way between Moose Island and the S. E. end of Great Bahama Islands, are Burrows Keys.

The Island of Abaco is divided into two parts by a small shoal channel, and when it is seen to the eastward, it forms two pretty high lumps. There are commodious anchorages on the western and southern edges, well sheltered from the sea, one of which is on the western part of Abaco, which from the Hole-in-the-wall bears N. W., and terminates in a bay, 9 miles from the point.

This bay, with winds at N. W., N. N. E., E., and even S. E., affords a good shelter, with a depth of 7 $\frac{1}{2}$, 8, and 9 fathoms water, and although the wind at S. E. is along shore, it makes no sea, and it is excellent holding ground.

In the bottom of this bay is the channel which divides the Island of Abaco into two parts; a number of houses are erected there by people from New Providence, who come to cut wood. This anchorage is safer in winter than in summer, as during the latter you have constant squalls from the southward, from which the lightning often does harm, and earthquakes are frequent, which drive off the people, who retire to Providence and Eleuthera.

From the west part of this bay a chain of keys extends 20 miles W. by N., after which you will see the east end of the Island of Great Bahama, which continues on nearly the same direction for 19 leagues, and the whole of these two spaces of the bank are foul, with reefs and rocks, as far as the middle of Great Bahama, from whence it is clean and has a smooth bottom.

The south-east side of GREAT BAHAMA ISLAND, which is wholly bordered with a reef, forms a bight, which is 14 leagues in length, and very dangerous with strong S. W. winds. Within the S. E., or more properly the south point, there is fresh water; and at this point, in lat. 26° 28', long 78° 40', is a narrow spot of good anchoring ground, having 10 or 11 fathoms. Towards this coast there is generally an outset from the Florida Stream on the west, which, however, varies according to the wind, &c., and at all times it is necessary to give the west end of Great Bahama a good berth, not only on account of its shoals, for if the wind should hang to the southward, you would be embayed.

On the western edge of LITTLE BAHAMA BANK are several keys and dangerous reefs. Off the N. W. point of Great Bahama Island are the Wood and Indian Keys, at a league to the northward of which is Sandy Key, and at three leagues to the N. W. of Sandy Key, is Memory Rock, which stands about half a league within the edge of the bank, and appears when tearing N. N. E. as represented in the margin.

Memory Rocks, N. N. E., three miles.

From Memory Rock the edge of the bank trends to the N. N. W., and at 4 miles from the rock is the south end of a reef which is even with the water's edge. It is succeeded by others to the entire N. W. point of the Bank in lat. 27° 19', long. 79° 05'. The westernmost edge of the Bank, and which is dangerous, is in lat. 27° 06', long. 79° 12', bearing N. 29° W., 10 miles distant from Memory Rock.

Inside the reefs the Bank is clear to some extent, with from 3 $\frac{1}{2}$ to 4 fathoms water. When there is a sea from the N. E. on the N. W. point of this bank, it makes at flood tide a race, and whirlpools, produced by its encountering with the Gulf current, so as to cause it to break heavy, and makes it appear like shoals. The bottom is sand, gravel, and some stones, upon which you may occasionally anchor. On this bank the water is green, and you cannot see the bottom until in 2 $\frac{1}{2}$ and 3 fathoms, upon which, or in the green water, there never has been any current experienced; therefore the Gulf Stream does no more than touch along the edge of soundings.

MATANILLA REEF.—This reef, which is a succession of shoal patches, was surveyed by Capt. E. Barnett, R. N., in 1846; his object being to find a suitable place for the location of a lighthouse. The reef appears to be a succession of very shoal spots with narrow channels between, of 5 and 6 fathoms water, commencing to the north and west of Walker's Key, running W., northerly, from the latitude of 27° 19', longitude 78° 40', to longitude 79° 05', latitude 27° 24'.

The extensive chain of keys which borders the north-eastern side of the Little Bahama Bank, extends from the Elbow Reef 34 leagues W. N. W., and the late delineations prove how very inaccurately they have ever before been represented. The bank which supports these keys is generally shoal, but there is a passage between them and the Abaco Isles, having from 4 to 2 fathoms, which leads to the centre of the bank. The entrance to this passage is close to the west of Great Gunna Key and the Whale Key Rocks, in lat. 26° 45', long. 77° 6'. To small vessels it affords excellent shelter between the keys and Abaco.

But it is to be noted, generally, that a very heavy swell commonly sets upon this coast; and it is never visible for a stranger to advance nearer than two leagues, as the wind is mostly from the eastward. This is the case along the whole of the north-eastern keys,

Great Bahama Island.

Little Bahama Bank.

Matanilla Reef.

and therefore, when sailing in this part, whether beating up or running down, a too near approach is both unnecessary and dangerous.

Abaco, or the Hole-in-the-wall.

ABACO, OR THE HOLE-IN-THE-WALL.—The N. E. point of the Island of Abaco lies in latitude 26° 17' N., longitude 76° 57' W. When in its latitude, distant nine miles, steer S. by W. $\frac{1}{4}$ W., 12 miles, which will carry you on the bank off the Hole-in-the-wall, in about 14 fathoms water. The first island to the northward of the N. E. point, is Little Harbor Key. North of this, Linnyard's Key, and still farther north, Little Guana Key. Linnyard and Pelican Keys run S. by W. $\frac{1}{4}$ W., and N. by E. $\frac{1}{4}$ E. The distance between Linnyard's Key and Abaco is about two miles, fine sandy bottom, clear of rocks, and good anchorage, and bears north from the N. E. point of Abaco.

On the N. E. side of the Island of Abaco, in a direction N. N. W. from said point, N. W. from the south, and S. W. by S. from the north end of Linnyard's Key, is a good watering place, called Wertherford's Well. To enter the channel leading to the watering place, which lies between Linnyard's Key and Little Guana Key, you must keep a small island which forms the north side of the channel, (about 300 yards from Linnyard's Key,) well on board on your starboard hand, and you will pass the bar in 3 fathoms, and find good anchorage in 4 or 5 fathoms water, within about two miles west from the north point of Linnyard's Key. This channel is far preferable to the one at the N. E. point of Abaco, independent of its safety and facility in getting water, as you may approach within a mile and a half of the watering place with three fathoms, or come immediately abreast in two fathoms, within 300 yards of the shore. Wood may be had in abundance among the keys, together with scale and shell fish.

The water breaks where there is danger, with the wind to the eastward, and it is advisable to have a lookout aloft while going in.

The eastern part of the coast is completely iron-bound, and fragments of wrecks are found on all its shores and keys.

The first point, south of the N. E. point of Abaco, is called Rocky Point. S. S. W. $\frac{1}{4}$ W. from this point, 6 miles distant, is a reef of rocks 9 miles in length, and $1\frac{1}{2}$ in breadth, running in the same direction as the shore, inside of which is Cheeric Sound, which makes a channel between the two.

After passing the reef which lies off Rocky Point, the water is bold to within half a mile of the shore, till up with the Hole-in-the-wall.

The land between Rocky Point and the Hole-in-the-wall forms a deep bay, in which you must be careful not to be caught with a south-easterly wind.

PROVIDENCE CHANNEL, BAHAMA BANK, with its islands, Gulf Passage, and the **FLORIDA COAST.**—In preference to running down for Rocky Point, (which lies about 2 miles S. S. W. from the N. E. point of the Island of Abaco,) where, if you get embayed, you must lie up S. S. E. and S. E. by E., to run along the land, it is more prudent to run into the latitude of the Hole-in-the-wall, and with the wind any way to the southward of east, it is presumed every man would do it.

Providence Channel.

Abaco light.

ABACO LIGHT.—At one-third of a mile from the Hole-in-the-wall, this lighthouse has been erected, in 25° 51' 30" N. lat., and 77° 10' 45" W. long. Its base is 80 feet above high water, and the tower is 80 feet high. The light revolves once in every minute, and may be seen in all directions, except where the high parts of the island intervene; and being 160 feet above the level of the sea, it will be visible in clear weather at the distance of 15 miles to an eye elevated 10 feet.

17 do.	do	20 do.
19 do.	do.	40 do.
21 do.	do.	80 do.

High water.

There is good anchorage, [during the ordinary winds,] in 10 and 11 fathoms, with the lighthouse bearing E. by N., about half a mile from the shore. The time of high water, at full and change, is at 8h., and the tide rises 3 feet.

HOLE-IN-THE-WALL.—The Hole-in-the-Wall lies in latitude 25° 51' north, longitude 77° 10' west, and is the south-east point of Abaco. By making Rocky Point in the day time you may have a safe run on your S. by W. $\frac{1}{4}$ W. course, 12 leagues, and then, if you do not choose to run, lay by, should it be in the night. The generality of the vessels make the land too far north, in the latitude of 26° 10', or 26° 20', because an opinion prevails that the land thereabouts is soonest seen, and are not aware of its forming a bay to the south and west. If, at night, they make the land in the parallel of 26° 10', with a strong breeze from the N. E., they are so close in shore, before they can discover the land, that it is almost impossible to clear it, for the land, in that latitude, trends a little to the westward, forming a bay, a few miles north of the Hole-in-the-wall, with a reef of rocks outside, in one part, half a mile from the shore; and should they make the land farther north, the danger, with a scant wind, is still greater, as there is constantly a heavy swell setting on the shore.

* The Hole-in-the-wall is seldom seen when to the eastward of it, as it is not open until very near the shore, or when you are S. W. of it.

Vessels should run down their longitude in the parallel of 25° 50', or from that to 26°, and not farther north. By keeping in this latitude they cannot miss the Hole-in-the-wall, and they will likewise avoid the land on the south or Harbor Island side. Off the Hole-in-the-wall lies a bank, in a S. E. direction, 7 or 8 miles in length, and about 4 miles broad in the middle, ending at a point on the S. E. extremity.

Soundings taken on the Bank.

“ N. W. ¼ N., 2½ miles.....	15 do.
“ N. W. by N., 3 miles, off the bank.	

Beyond 15 fathoms there were no soundings with 80 fathoms. You may know when on this bank, as the water changes at once from a dark sea blue to a beautiful vivid green, is more agitated by a ground swell, and discovered the moment you are off, particularly with a S. E. wind, at which time the above soundings were taken.

The Hole-in-the-wall, (or Hole-in-the-rock,) is an arch through the land, about 10 feet wide, and 4 or 5 feet high, the bottom nearly one foot above the water, which breaks through the Hole, and may be seen when bearing S. S. W. to W. S. W., and N. N. E. to E. N. E., and at first sight appears like a sand-bluff, but at 3 or 4 miles distance may be plainly distinguished to be an arch-way through the land.

South from the Hole-in-the-wall, 100 yards distant, is a rock, 60 or 70 yards long, hollowed out all round at its base by the water, which may be doubled within half a mile.

On the south point of the main land is another corresponding projection, both which appear to have been caused by some convulsion of nature, of which the whole coast bears evident marks. It is covered with fragments of vessels, spars, &c., and the western side has a complete barrier of stones, formed on the beach, above the tide mark, both by nature and the S. W. gales, which at times blow very hard.

Five miles to the westward of the Hole-in-the wall, and about 300 yards from shore, the soundings are regular, 2½ and 3 fathoms, and deepening rapidly as you leave it.

One-quarter of a mile off the S. W. part of the island, you will have 2 fathoms, fine level sandy bottom. The land here is low, and covered with brushwood. Here the ebb sets N. E., and tide rises 3 feet.

Tide.

Vessels of any draught ought not to approach the land nearer than about 400 yards, where they will lie in about 4 fathoms water. Inside this the water shoals suddenly to two fathoms.

Vessels in the night, or in foggy weather, may run to the westward, when in latitude 25° 46' N., and sound till they get in 14 or 15 fathoms, and be then sure to clear the Hole-in-the-wall by a west course, six miles, when it will bear north, and then run W. ¼ N., sixteen leagues, when Stirrup Key will bear south, six miles distant. Vessels running down in the latitude of the Hole-in-the-wall, will not get soundings till up with it.

In taking your departure from the Hole-in-the-wall for the Great Bahama Bank, steer west twelve leagues, and if the land be not in sight, haul W. S. W., or S. W. by W., and make the Berry Islands; keep down past these islands, and keep a good lookout for the westernmost key, called Stirrup Key, before mentioned, which lies in latitude 25° 49' N., and longitude 77° 53' W.

Off Stirrup Key there is good anchorage in 7 fathoms. To get shelter from strong easterly winds, in order to repair any damage or to obtain water, you may anchor to the west of the westernmost island, in 7½ or 8 fathoms, on good holding ground. W. S. W. from Stirrup Key, 4 miles distant, the Brig Dromo struck in 9½ feet, hard coral bottom, having 2½ fathoms to the S. and W. on each side, and 5 fathoms to the northward. On Stirrup Key there is a settlement, and a Custom House established; the place is called Williamstown. Here refreshments of every kind can be obtained.

The Berry Islands consist of about thirty large keys, with innumerable smaller ones; they lie to the N. E. of Andros Island, the south-easternmost of which is Frozen Key, and the northernmost Stirrup Key. There are soundings all round the group; and 20 fathoms may be found at two miles from any of the keys. The surface of the bottom is sand, and below that, a kind of limestone. The isles form several small harbors, where water and other refreshments may be had, but are seldom frequented by any other than the people of New Providence. At the Berry Islands the tide rises two feet more when the sun is to the northward of the equator, than it does when to the southward of it. In the anchorage, or little harbor of these islands, the tide runs with strength among the rocks, in a N. W. direction.

Tides.

Extract from the log-book of the surveying sloop Orbit.

"In approaching the Berry Islands, the water is bold close in; two and a half miles from the shore, 11 fathoms; two miles, 9 fathoms; one mile, 8 fathoms; the northernmost part of Stirrup Key bearing W. by N., three and a half miles, 7 fathoms; W. N. W. two and a half miles, 8 fathoms, rocky bottom; west, one mile, 7 fathoms; W. S. W., three quarters of a mile, 9 fathoms; and all along to the westernmost key, 8, 9, and 10 fathoms, generally fine sandy bottom. The moment you get on soundings, in approaching the Berry Islands, the water changes color.

"Sailed around the Berry Islands till they bore N. N. E., two miles, and had 5, 4, 3, and 3½ fathoms; and far as five miles, 4, 3, 4, 3½, 4, 3½, and 3½ fathoms; N. by E., six miles, 2½ fathoms. West Berry bearing N. N. E., and Blackwood's Bush S. S. E., course W. N. W., the soundings were 2, 4, and 5 fathoms; at 2½h. steered W., 4 fathoms; at 3h., S. S. W., 7 fathoms; at 3½h., S. S. W., 7 fathoms; 3½h., 6½ fathoms; at 4h., 6 fathoms; at 4½h., 5½ fathoms; at 4¾h., 4½ fathoms; at 4¾h., 3½ fathoms; at 5h., 3 fathoms; at 5½h., 3 fathoms; at 5½h., 2½ fathoms; at 5¾h., 2½ fathoms; at 6, 2½ fathoms; at 6½h., 2½ fathoms; at 6¾h., 2½ fathoms; at 7h., only 11 feet, and came to anchor among black patches, which we sounded and found to be flat rocks, about one foot high, covered with weeds. The water was shoal far to the westward of this. Vessels should not go among these black patches; the regular channel is quite free from them, and the water is muddy, having a milky appearance, which prevents the bottom being easily seen."

Sheep Keys.

SHEEP KEYS bear S. S. W. ¼ W. 7 or 8 leagues from Stirrup Key, and lie off the N. N. W. part of Andros Islands; from these keys it is, as before observed, very foul to the westward, and the shoal extends quite round to Stirrup Key; the bottom covered with spots of sponge and rocks, the size of a barrel or the head of a hoghead; and any object on the bottom may as plainly be seen as if no water intervened. Here the tide rises four feet.

The best courses for crossing the Bahama Bank are the following, viz.: when Stirrup Key bears S., 8 miles distant, (at which time it can be just seen from deck,) steer W. S. W., 6 leagues, then haul to S. W. by S., 10 leagues; thence S. S. W., or between that and S. W. by S., to latitude 24° 55', when you may keep away W., and make Orange Keys, or continue on your course to latitude 24° 45', when you may keep down west, and leave the Bank without danger. In case you should prefer to haul to sooner than directed, in crossing the Bank, and find your water shoaling, you may, by keeping off W. 3 leagues or more, find the deep water of the channel, which is 5 leagues in breadth; bear up as soon as you get but 2½ fathoms, as it shoals suddenly and irregularly from that depth.

You may even run 7 leagues on your W. S. W. course, after leaving Stirrup Key, without danger; be careful to allow for the tide. On the north side, the flood sets S. S. E., and ebb N. W., and as you draw on the Bank, the force of the tide decreases, for when you have got 4 or 5 leagues on the Bank, the tide is but a slight set. Or when Stirrup Key bears south, 5 miles distant, you may steer S. W. by W. 44 miles, and thence S. S. W. until off the Bank. The water in the regular channel is milky white; to the eastward you have it clear with black spots on the bottom, and to the westward with clear, hard white bottom.

Or you may follow the courses as given on the large chart of the Great Bahama Bank, from the Admiralty Surveys, republished by E. & G. W. BLUNT.

Centre of Great Stirrup Key, bearing south three miles distant, steer W. S. W., 23 miles, then S. W. by S. southerly, 70 miles. Or S. W. ¼ W., 26½ miles, then S. W. by S. 66 miles.

Either of the above courses will place you about 10½ miles from Orange Key, and in a proper place to run off the Bank.

The straight course is S. W. 95 miles: this has the best water, but it is necessary to be very accurate in steering, to prevent running on the Sheep Key Shoals.

All the courses are by Compass.

Every attention should be paid to the steering and log, as it will be seen that the courses laid down border closely on the edge of the channel.

By crossing the Bank as above directed, you will see few or no spots of sponge, and the bottom is with difficulty discerned, and may be sure of 3 fathoms all the way, at high water.

Be careful of Orange Keys in the night time, as they are very low, and cannot be seen until on board of them, and the soundings are deepened regular, until very near them on their east side.

Orange Keys.

ORANGE KEYS is a cluster of shoals and keys, lying near the west edge of the Great Bahama Bank, extending from lat. 24° 52', to 24° 58' N., and long. 79° 9' 30" W. The main rock is about three-quarters of a mile in length, and the broadest part

about 120 yards, highest part 20 feet, and narrowest 8 yards. It is a barren rock, the eastern side quite straight, and runs S. S. W. and N. N. E. S. by W. of the main island, distant three-quarters of a mile, are two rocks, 6 feet out of water, about 15 feet in length; and one half a mile S. by W. of these, lie two smaller rocks. It is dangerous to pass between either of these rocks and the principal island, as reefs run out and connect them, 30 or 40 yards broad, and soon as over 4 fathoms. Three miles south of these rocks you may sail with safety. They are a mass of solid rock, and may be approached at the westward to their very edge, on 11 feet water. N. W. of them is good anchorage in 8½ fathoms, foul; there is, also, good anchorage S. E. of Orange Keys, in 6 fathoms, without other danger than the eye announces. To the northward it is not safe to approach within three miles, as the water breaks, and has a ridge, projecting to a very considerable extent. There is no sign of verdure on these keys, but round them plenty of fish.

Many persons mistake Orange Keys for the Riding Rocks, north of which you cannot go; but north from Orange Keys, 3 miles distant, you will find a passage, although it is not safe for strangers to go this way, neither should it be attempted by any one, as you are obliged to pick your way through black patches, which are shoal. Var. 4° 26' E. 1820.

S. W. from Orange Keys, 5 or 6 miles distant, is good anchorage in 20 fathoms water. When up with these keys, a passage is seen through the Gulf, for then you may make sail either in the morning or at midnight, steering S. W. 10 or 11 leagues; that will enable you to fall in with Salt Key Bank, which for 10 leagues on the north side stretches E. and W., and consequently the current sets stronger as you come to the westward. In coming over you have good soundings all along by it. There is anchorage by spots all the way in, but the soundings are narrow at the Double-headed Shot, the N. W. point of which lies in latitude 23° 52' N. This route, however, demands the most zealous care, in order to avoid any shoal which may exist, although unknown. North 4° W., four miles distant from Orange Keys, is the Galeon Shoal, having only twelve feet, and from thence to the Riding Rocks is a number of shoal patches, one mile and a quarter to the eastward of the edge of the bank.

RIDING ROCKS lie 6 leagues north of Orange Keys, consisting of one rock or key, about half a mile long, and 12 yards wide in the broadest part, which is nearly divided one-third from its south point by a bay. This key is very irregular in its height, and more uneven than Orange Keys; about 2½ miles to the northward of this rock, is a small island about 2½ miles long, and 250 or 300 yards broad in the broadest part. To the northward of the southernmost key lie three small rocks, about 10 or 12 yards long, each running N. W. by N. The southern key runs N. by W.; the one next to this key is 50 yards from it; this, 100 yards from the third, and the third 100 yards from the second. These rocks are about 3 or 4 feet high. South of this key are two haycock rocks, just out of water, 6 or 8 yards from the land. There are also two rocks which lie half a mile east of the southernmost key, the largest 80 feet long, and the smallest 50 feet long, about one hundred feet asunder, and 12 feet high. These two rocks lie N. and S. There is a rock as big as a small boat about half a mile to the northward of these two rocks. A reef extends all along between these rocks, with the southernmost of the Riding Rocks bearing N. N. W., distant 1½ mile, 5 fathoms. Eastern Rock and the northern key, in a line bearing N. by W. 2½ miles, 4½ fathoms fine level sandy bottom; 2½ fathoms immediately, and 3 miles distant 3 fathoms. Northern Riding Rocks bearing W. 5 miles, 3½ fathoms. Southern Key, bearing S. W. by W. 2 miles, 3½ fathoms. Main or Northern Key bearing W. N. W. 2½ miles, 3 fathoms. There is a shoal runs out from this key in a N. N. E. direction, on which are 6 feet water. You will not have a passage to the northward of the Riding Rocks for vessels drawing 6 feet water. Ebb sets N. E. 1½ mile per hour. S. by E. 1½ mile from the east lump of the Riding Rocks, there is a sizeable isle, with various small keys in its vicinity, called Rock Key; there is good anchorage on the west part in 7½ and 8 fathoms, sand; and the edge of soundings lies 1½ mile off.

In steering from the Orange Keys to the Riding Rocks, the deepest soundings are 8½ and the shallowest 4½ fathoms. The western edge of the bank is an iron bound shore, being connected by one grand chin of rocks, extending under water from key to key.

Extract from the Orbis's Log Book.—"Laying at anchor, among these shoals, at low water had 12 feet, and at high water 13 feet; had a light wind at W. S. W., and could see the edge of soundings off deck, not more than three-quarters of a mile distant: got under way at first ebb, and in making a tack crossed over some shoals with only 13 feet water on them, on which there could not be more than 7 or 8 feet at low water; and I have no doubt, but, at times, after heavy gales, these shoals may be above the water's edge.

"High water, at full and change, on the edges of the bank, at 8h. 50. On the north side the rise is 2 feet; on the west, to the northward of Orange Keys, 3 feet; to the southward of Orange Keys, 4 feet, and in lat. 24° 10', 5 and 6 feet. The flood and ebb set from three-quarters of a mile to two miles, on and off the bank."

*Riding
Rocks.*

High water

The edge of soundings, between the Riding Rocks and Orange Keys, is clean; you may enter on it without other care than that of the lead. From Orange Keys, which are the southernmost keys on this side of the bank, the edge of soundings runs about S. by E. very clean to $24^{\circ} 10'$, and more or less deep; it forms, with the keys on Salt Key Bank, a channel, which is bottomless, and called Santaren. The above observation, in entering on the Bank between Orange Keys and Riding Rocks, means only the very edge; as you get further on, you find the soundings obstructed in their regularity by many coral shoals, but by day, and with a free wind, you can pick your way.

In star-light nights the bank reflects a bright light into the air, which may be seen at 4 or 5 leagues. You may observe this reflection all over both the Bahama Banks, but not on Salt Key Bank; neither can you see it while on the bank; but when in the Gulf you can plainly distinguish the Providence Channel, having none of this reflection between the two reflections of the Great and Little Bahama Banks.

It is not presumed the same depth of water can always be carried over the bank, even in the same track, as it must occur to the mind of every person that a strong easterly wind will drive the water off the Bank, as well as a strong northerly increase its quantity. In all parts of the channel the bottom is of a sticky quality; whereas to windward the bottom is hard, and spots thicken as you shoal your water. Almost every regular trader has a different course to run across the Bank, but the principal object is to clear Sheep Key Shoals; with the wind scant, and not drawing a heavy draught of water, you should haul to a little sooner, but not without a leadman constantly in the chains, and should bear up as soon as you shoalen your water to 24 fathoms. With the wind steady and free, so that you could lay to windward of south, you should always make sure of westing to clear the shoals to windward, taking care not to run so far as to get among the shoals which stretch off from the east side of the keys which border the bank on its western edge.

When you anchor on any part of the edge of the Bank, in order to pass the night, or for a favorable tide, you ought to have every thing ready to make sail the moment it may be necessary; and also, if the sky looks ill, you should have the topsails reefed. From any one of these anchorages you may make sail with any wind; and, generally speaking, every one in these parts, who requires to anchor, may find a proper place to do so, and in which he may be sheltered from the winds that molest him, or which he foresees coming; and without eddy winds to leeward, which cause trouble in case of fouling the anchor, though they only require vigilance and a seaman-like dexterity.

On leaving the bank, you must be careful not to fall in with the Florida Shore, or Double-headed Shot Keys, in the night time; but with day-light and a breeze, there is no danger in making either.

High water.

High water, at full and change, on the edges of the Bank, at 8h. and 50m.; on the north side it rises 2 feet; on the west, to the northward of Orange Keys, three feet; to the southward of Orange Keys, four feet; and in lat. $24^{\circ} 10'$, it rises five and six feet. The flood and ebb set from three-quarters to two knots on and off the bank.

There were scarcely two men who crossed the Bahama Bank that agreed as to the latitude of the Orange Keys, and many doubted their existence; this difference of opinion induced sending the sloop Orbit: the subject is now at rest, as marine and land surveys have been made by her officers, of the Orange Keys, Riding Rocks, Cat Keys, Great and Little Isaacs, with the rocks, &c. adjoining, all which are previously described.

On the Bahama Bank, in latitude $24^{\circ} 10'$ to latitude $24^{\circ} 32'$, it is shoal near the edge. The tide rises 6 feet, and there are many spots in this space with less than 10 feet at low water. The shoals lie within one mile of the edge of the Bank; they are of quicksand, and of course, the depth of water on them must alter with every gale.

Should you prefer running down the Cuba shore, you may steer S. W. after leaving the Bank, in latitude $24^{\circ} 40'$, and when sure of having passed the Double-headed Shot, haul a little more southerly, say S. W. by S., and make the Island of Cuba; this is called the route by the Santaren Channel, and is at all times preferable. Keep down in shore as far as the table land of Mariel, which cannot be mistaken, when you may run over N. W., and if not more than 24 hours in the Gulf, you will clear the Tortugas; but if you are a longer time in crossing, it will be prudent to keep a look out for colored water and the Tortugas. The Pan of Matanzas bearing S. S. W. to S. appears like one round hill, but at any other bearing you will see another each side of it not so high, and adjoining to it. If you are near in shore, on passing the Havana, you will see the shipping in the harbor, and the Moro Castle light may be seen 8 leagues off. The table of Mariel is 9 leagues from Havana.

PROVIDENCE N. W. CHANNEL, AND N. W. EDGE OF THE GREAT BAHAMA BANK.—As vessels drawing over 13 feet water cannot cross the Great Bahama Bank, from the Berry Islands to the Orange Keys, it is necessary to navigate along the edge to the north of the Isaacs, and, doubling them, go as far south as the Orange Keys; the best course is, when up with the Hole-in-the-wall, to steer $W. \frac{1}{4} N.$ 95 miles, which will carry you to the west edge of the Bank, and about 4 miles from

which brings

the Little Isaac, taking care to keep in 12 or 16 fathoms, in which you ought to pass 2 miles from the Great Isaac; then shape your course through the Gulf, exercising the utmost care so as not to get far out from the edge of soundings, because the moment you leave the edge, and get into blue water, you will be in the general current, or Gulf Stream, which sets strongly to the northward; therefore, if the wind does not permit steering along the edge of the Bank, you ought to anchor on it, and wait till the wind be favorable. He who has no experience in this place, ought not to pass beyond the Great Isaac by night, but may anchor to the N. E. of the centre of the island, in from 7 to 10 fathoms, on sand, and wait for daylight.

To run along the edge of these banks, you have to attend to the lead, and keep an unusually strict lookout, as the Gingerbread Ground, in the neighborhood of the Little Isaac, makes up at once from deep water, with which guide, and the notice we have given, you will have sufficient information to enable you to avoid all danger. On the edge of soundings, although you do not feel the general current, yet there is a set of the tide, which may either run a vessel off the edge, or upon the keys; but this cannot happen if the lead, which ought to be kept constantly going, is properly attended to, as it will warn whether to keep to starboard or larboard, in order to preserve the proper depth. In passing you will pass Little Isaac, Great Isaac, Bemini Isles, and Gun Key light.

THE GINGERBREAD GROUND is a shoal of ten miles in extent, in an E. S. E. and W. N. W. direction, and varying in width from one to four miles. It is full of rocky heads, with as little as 6 feet water. The S. E. point is in lat. $26^{\circ} 50'$, long. $78^{\circ} 34'$, and bears W. 4° S., 78 miles, from the Hole-in-the-wall. The N. W. point is in lat. $26^{\circ} 56'$, long. $78^{\circ} 44'$, and bears E. 13° S., 74 miles, from the Eastern Little Isaac. Between it and the Little Isaac is broken ground; the shoal is about one and a quarter mile within the edge of the Bank.

The Little Isaacs are three small rocky keys, running in an E. S. E. direction; the Eastern one, which is 11 feet high, is in lat. $28^{\circ} 58' 30''$, long. $78^{\circ} 51' 30''$. The N. W. Key bears from the Eastern one, W. 27° N., 3 miles, E. 7° S., one and a half mile. There is a rock a-wash at high water. There is anchorage on the Bank, to the southward of the Isaacs, but which you must have daylight and the Chart before you to run for.

THE BROTHERS, which are two small rocky keys, bear W. 28° N., 7 miles, from the Little Isaacs. The bank is clear, and good navigation between them and the Isaacs.

THE GREAT ISAAC, which is 40 feet high, is in lat. $26^{\circ} 02' N.$, long. $79^{\circ} 6' 30''$. N. E. of it, $1\frac{1}{2}$ mile, is a rock 12 feet high; and in a N. N. E. direction, one mile from the rock, there are 3 fathoms. To the south of the Great Isaac, for some distance, there is good anchorage, much better than to the northward; as the only thing to be dreaded in anchoring is a sudden change of wind to the northward; and in that case you have plenty of room to drift or get under way, which is not the case to the north of the Great Isaac.

THE HEN AND CHICKENS bear W. 53° S., $3\frac{1}{2}$ miles, from the Great Isaac, and are three small Keys, on a bank of one mile in extent in that direction: from these to the Bemini Island, the bank is clear, with the exception of the Moselle Shoal.

THE MOSELLE SHOAL, of 6 feet, bears from the north point of the North Bemini, N. 24° W., distance $2\frac{1}{2}$ miles. It is about one mile in length, in a N. N. E. direction. It bears W. 57° S., 13 miles distant, from the Hen and Chickens.

The flood here sets at the rate of about $1\frac{1}{2}$, and the ebb 3 miles an hour.

THE BEMINIS run S. 20° W., $6\frac{1}{2}$ miles. They are low sandy keys, two in number. On the southern one there is a well. The south point of the South Bemini is in lat. $25^{\circ} 44' 30''$, long. $79^{\circ} 20'$. The edge of the Bank is very narrow here, not being over a mile from the keys.

The Bemini Isles are low, with some small trees, or rather bushes, on them, particularly on the S. E. part of the South Isle. They are the westernmost isles of the Great Bank. Under the south point there is a bay, with some low keys lying S. S. E. and S. E. of it, in which you can anchor and have shelter from winds at N. round to S. E., with 4, 5, and 6 fathoms, or you can pass the night here when bound southward. On these keys and islands there is some wood and water.

The inlet, or harbor, between the Beminis, has throughout from 12 and 11 to 10 and 9 feet at low water.

From the S. W. point of the Southern Bemini, a chain of low keys and rocks, called the Turtle Rocks, extends about 3 miles to the south. Some of them do not rise to the level of the water. Here the bank is very steep, as, at the distance of a pistol shot, no bottom is to be found, and at the half length of a ship, are 14 and 15 fathoms, on sand. Barnett's Harbor, a hole in the bank, of 24 fathoms, divides this from a succeeding group of keys, called the Cat Keys, which extend to the south nearly to $25^{\circ} 30' N.$

From the South Point of the South Bemini, the bank runs S. 4° E., some $6\frac{1}{2}$ miles, which brings you nearly up with Gun Key light.

The Beminis.

Gun Key Lighthouse.

GUN KEY LIGHT.—At 250 yards from the southern extreme of Gun Key (a narrow ridge of coral, which stands on the western edge of the Great Bahama Bank) a light-house has been erected, in 25° 34' 30" north latitude, and 79° 18' 24" west longitude. Its base is 25 feet above high water, and the height of the tower is 55 feet. The light revolves once in every minute, and may seen in all directions, except between the bearings of S. by W. $\frac{1}{4}$ W., and S. $\frac{3}{4}$ E., (magnetic,) where, at the distance of about 8 miles, it will be intercepted by the Bemini Islands.

When within 5 miles distance, vessels should not bring the light to the southward of the S. E., as the chin of keys and reefs projects in a curve to the westward, and as they lie within a mile of the outer edge of the bank, there might be scarcely time to obtain soundings. The flood tide also sets strongly to the eastward through the intervals of the keys, where it is high water, at full and change, at 7h. 30m., and the tide rises three feet.

High water.

The light being 80 feet above the level of the sea, it will be visible in clear weather at the distance of 12 miles to an eye elevated 10 feet.

13.....	20 do.
15.....	40 do.
27.....	80 do.

From Gun Key light, the bank runs S. 27° E., 23 miles, which is up with the South Riding Rock. From here the edge of the Bank runs again to S. 4° E., 19 miles, to Orange Keys.

From Orange Keys you may leave the bank and enter the Gulf, without dread of the current, steering as before directed for the Double-headed Shot Keys. Or you may from the Riding Rocks steer for the Salt Key Bank, navigating along its edge, and, as it were having doubled the western angle, steer for the coast of Cuba; but to do this it is necessary to steer from the Riding Rocks S. S. W., and sail more than 4 miles the hour, and as one is not master of the winds, if it should be calm, you will be in danger of drifting to the north, a thing you should by all means guard against, on which account we consider the navigation by the Sauteren Channel as preferable.

This navigation, which we have just described, is not in common practised by those bound from Europe to Havana, or to the Gulf of Mexico, as it offers no advantage over that of the old channel, or that to the south of Cuba, which is more direct; but it may be well for vessels from the United States, and for those who, driven out of the Bahama Channel, by calms or accident, wish to avoid the long circuit of gaining sufficient east longitude to make Point Maysi and return to Havana by the old channel.

From the south, say 5 or 6 miles, of the Orange Keys, steer S. W. $\frac{1}{4}$ W., 80 miles, which will bring you up with the light on the Double-headed Shot Keys, and from thence, if bound into the Gulf of Mexico, steer W. by S., which puts the current on your larboard bow, steering a little more south, if night, that you may make the FLO-RIDA REEF in the daylight. After making the reef you steer the following courses, as shown on the Chart published by E. & G. W. Blunt, of the Florida Reef.

The floating light, bearing W. $\frac{1}{2}$ S. 4 $\frac{1}{2}$ to 5 miles distant, steer S. W. by S., 19 miles, thence S. W. $\frac{1}{4}$ W. 29 $\frac{1}{2}$ miles, then W. S. W. 47 $\frac{1}{2}$ miles, when the West Samboes Key will be north of you, 2 $\frac{1}{2}$ miles distant; from thence W. $\frac{1}{4}$ S. will carry you up with the west end of the reef.

N. B. The greatest attention must be paid to the steering, and the log, in running these courses and distances.

West of the meridian of Key West there is often a westerly current 12 miles in width, south from the reef.

Southern Border of Great Bahama Bank.

SOUTHERN BORDER OF GREAT BAHAMA BANK.—Key Verde is the south-easternmost key of the Great Bahama Bank, in lat. 22°. It is only a mile and a half in length, and about two cables' length broad, extending E. S. E. and W. N. W., and is destitute of fresh water. From this key the edge of the bank extends W. S. W., 11 leagues, to the Key of St. Domingo, in the mouth of the Bahama Channel. The ground between Key Verde and St. Domingo's Key is generally clean; but there are two shoals: one at 13 miles from Key Verde, on the edge of the bank, is called St. Vincent's, and does not exceed a cable's length in extent from N. N. W. to S. S. E., by half a cable at its greatest breadth, with only 3 feet over it; the second shoal is also on the edge of the bank, 9 miles from St. Vincent's, and 22 from Key Verde: it is formed of rocks, is not so large as the former, and has one fathom over it.

The Key of St. Domingo is arid: it is a cable's length long, and half a one broad, and its middle forms a small hill, covered with the Indian fish-bush, which looks like an upset vessel, and may be seen at the distance of three leagues. A breaker extends from the S. S. W. side to the distance of three leagues; and W. by S. from its middle, at the distance of two or three cables, there is a bank of 6 and 7 fathoms, with very clear water, where shelter from the breezes may be found.

On the southern part of the bank, to the westward of the Key of St. Domingo, there is no particular object which is not sufficiently described. The only spots above water are

the two keys and Ginger to south, so Both may be seen, which bottom, and colored as in fore, be app in daylight. other shoals are, likewise required.

the two keys called Lobos, on which there is a beacon 20 feet high, and Gulncho, or Wolf and Ginger Keys, both of which have foul ground about them, from north round by east to south, so that, in these directions, they should not be approached nearer than a mile. Both may be seen at the distance of 6 or 8 miles. The shoal grounds named the Mucaenas, which are about 20 miles to the south-eastward of Lobos, have weeds or grass at the bottom, and it is, therefore, requisite to notice that the water on them remains as dark colored as in the mid-channel. Without them are no soundings, and they should, therefore, be approached with great caution, for without this a vessel may easily be lost, even in daylight. On the very edge of the bank, between Lobos and Guincho, there are some other shoal spots; and vessels of great draught should not venture upon the bank. There are, likewise, some rocky spots to the westward of Guincho, so that caution here is also required.

ANGUILA, OR SALT KEY BANK.—This bank lies opposite the western end of the Old Channel of Bahama, between the Great Bank of Bahama and the Island of Cuba, and forms the channels of Santaren and St. Nicholas, the former on its N. E., and the latter on its south side. *Anguila.*

At the north-western extremity of the Salt Key Bank, on the elbow, or north-western-most and highest of the narrow ridge of detached barren rocks, commonly known as the Double-headed Shot Keys, a lighthouse has been erected in $25^{\circ} 56' 23''$ N. latitude, and $80^{\circ} 27' 38''$ W. longitude. *Lighthouse.*

Its base is 46 feet above high water, and the height of the tower is 54 feet.

The light is fixed, and may be seen in all directions, except on the bearing of S. W. by W. $\frac{1}{2}$ W., (magnetic), when, at the distance of about 9 miles, it will be interrupted by Water Key.

From the lighthouse, the south-westernmost of the Double-headed Shot Keys bears S. S. W. $\frac{1}{2}$ W., (magnetic), distant $3\frac{1}{4}$ miles.

The Florida Stream is generally found to set strongly to the N. E., within a mile and a half of these rocks, but through the intervals of the keys, the ebb and flood tides run rapidly off and on the bank. It is high water, at full and change, at 9 o'clock; the tide rises from 2 to 3 feet. *High water.*

The light being 100 feet above the level of the sea, it will be visible in clear weather at the distance of 14 miles to an eye elevated 10 feet.

15 $\frac{1}{2}$ "	"	"	"	20 "
17 $\frac{1}{2}$ "	"	"	"	40 "
29 "	"	"	"	80 "

The following description of this bank is by Mr. De Mayne, who surveyed it in 1825:

"Its greatest extent is from N. W. to S. E., about $20\frac{1}{2}$ leagues, and the broadest part is about 12 leagues. Its western edge is bounded by a chain of barren rocks, called the Double-headed Shot Keys, the north-westernmost of which, called Elbow Key, lies in latitude $23^{\circ} 55' N.$, and longitude $80^{\circ} 25' 30'' W.$ From this point they extend to the N. E. by E., in rather a circular direction, 9 miles to Water Key, which is the largest of this chain, being nearly 2 miles in length, and about half a mile broad. Near the centre of this key, and close to a good boat landing-place, on the south side, is a natural well of fresh water, formed by a hole in the rock.

"Opposite Water Key, as well as all these chains of rocks, on the south, or bank side, there is good anchorage, in 5 or 6 fathoms water, at any distance from them, and good holding ground; and from these rocks being so closely connected, they form a complete breakwater against the winds from the W., N. W., N., and N. E. quarters, which sometimes blow with great violence, particularly in the months of February and March. The wind from any other quarter seldom blows stronger than what may be termed a brisk gale.

"From abreast of Water Key, the bank trends to E. N. E. about 8 or 9 leagues, and thence S. E. by S. to the Anguila Islands, a distance of about $13\frac{1}{2}$ leagues. In this space there are several clusters of rocks, rugged and barren, some of which are very little above the sea, situated at about 4 miles within the edge of the bank, forming channels or passages to the bank, which appear safe to sail through. They are distant from each other from 1 to 10 miles. On examining the four westernmost of these passages, there was not found less than 5 fathoms water; the bottom very rocky, until you get well on the bank. Ships should be cautious not to approach too near these clusters of rocks; the deepest water will be found by keeping as near mid-channel as possible.

"The S. E. extremity of the Anguila Islands is in latitude $23^{\circ} 29' 40'' N.$, and longitude $79^{\circ} 27' 40'' W.$ The north-westernmost of the Dog Rocks, in latitude $24^{\circ} 4' 10''$, and longitude $79^{\circ} 50' W.$ A dangerous shoal is represented near the eastern edge of the bank, in latitude $23^{\circ} 46' \frac{1}{2}''$; but this, with the various keys near the edge, and rocky heads in the interior of the bank, will be best understood by inspecting the chart.

"Key Sal is situated near the S. W. extremity of the bank, and distant from the Elbow Key of the Double-headed Shots about $4\frac{1}{4}$ leagues. This island is of a triangular shape, and about $1\frac{1}{2}$ mile in length, having an excellent salt pond in its centre, the pro-

duce of which is of the finest quality. The centre of this key is in latitude $23^{\circ} 42'$ N. and longitude $80^{\circ} 20\frac{1}{2}'$ W. Nearly east from Key Sal, distant $2\frac{1}{2}$ miles, is a small shoal even with the water's edge, called Lavanderas; and in a north-west direction from the same key, about 4 miles, is another small shoal, also even with the water's edge. Both those dangers can be seen at all times, in the day, at a sufficient distance to avoid them.

"The general depths on the interior of the bank, those on the rocky heads excepted, are from 4 to 5, 6, and 7 fathoms.

Tides.

"The tides on the west part of the bank, being much influenced by the Gulf Stream, run in various directions. The flood sets strong through all the openings, or between the rocks, towards the centre of the bank, and the ebb contrary. It is high water, on full and change days, at Anguila Island, at three-quarters after 8, and at Water Island at 9 o'clock. Spring tides generally rise 3 feet 4 inches, neaps 2 feet 3 inches; but much depends on the wind."

The Derrotero says, Key Sal may be discovered at the distance of 10 miles, and fresh water may be procured on it with facility, although there is not any on Anguila, or the other keys in its vicinity. This bank has three rocky shoals upon it, as shown in the charts; but vessels may navigate upon it without danger in 7 $\frac{1}{2}$, 8, and 9 fathoms water in all the months from October to May. Whenever the appearance of the sky indicates a hard north, it is advisable to enter on the bank, and anchor under the shelter of the keys; or you may lie to there, being careful only to make use of the lead, until the wind changes, so as to enable you to proceed.

The current does not always set through Nicholas Channel to the westward, but a regular tide of ebb and flood prevails throughout; the flood setting eastward, and the ebb westward, at the rate of about one mile in an hour.

In the Santareu Channel, between the Great Bank of Bahama and the Salt Key Bank, there is said to be rarely any current, unless after heavy gales, when it runs with great violence up and down. If it predominates in one direction more than another, it is to the N. N. W., and about one mile an hour.

Description of the Southern and Eastern Coasts of East Florida.

Tortugas Islands.

TORTUGAS ISLANDS.—On the southern edge of soundings, which extend along the western coast of the promontory or peninsula of East Florida, are 10 or 11 keys or small islands, called the Tortugas Islands, which is the westernmost land, and which announces the proximity of the General Florida Reef, which terminates the southern edge of soundings, and which continues to the east, doubling the above mentioned promontory, and extends to Cape Florida.

The Tortugas (often called the Dry Tortugas) are generally looked upon to be very dangerous, and to a person unacquainted with them, they undoubtedly are so, especially in the night time; yet, when they are known, on many occasions, they may be found both useful and convenient. They extend east and west 9 miles, and north and south 3 miles, and, although very low, can be seen at the distance of 12 miles, being covered with bushes; you should not come nearer them than 6 miles, as they have some rocky spots which extend that distance from them.

To the west there is a large bank of coral rocks, intermixed with white patches of sand, on which the soundings are irregular; but as the bottom shows itself very plainly there is no danger. This bank is of an oblong form, and between it and the Tortugas Islands there is a clear channel of three miles wide, with soundings from 13 to 17 fathoms water.

The Tortugas are situated N. 14° W., true, about 30 leagues from the nearest part of Cuba, the table land of Mariel, and 14 leagues from the westernmost of the Florida Keys. The S. W. key, which, though one of the smallest, is the most material to be known, is in lat. $24^{\circ} 36'$. A reef of coral rocks runs off it S. W. a quarter of a mile, on which the water is discolored.

If you are bound to the eastward, and meet with a strong easterly gale, which is frequent there in the summer season, you may safely come to an anchor in 5 or 6 fathoms about a quarter of a mile off shore, under the lee of the long sandy island to the westward of the South-west Key. There is a good anchorage, also, in several other places, particularly in a small but snug harbor, near Bush Key, which is entirely sheltered from the sea by a large reef of rocks, and a flat shoal within them, about half a mile broad, the bottom is soft clay and mud. This harbor is quite smooth, even in a gale of wind, and in case of necessity a vessel might easily be hove down there, as there are 3 fathoms water close to the bank. There is no drinkable water to be got on any of the Tortugas, except on the northernmost island; nor is there any fire-wood, except a few bushes, which it were a pity to cut down, as they serve to distinguish the keys at a distance; but the Tortugas abound with a variety of sea birds, turtle, and excellent fish.

There is a channel of 17 miles in width between the eastern key and the west end of the Florida Reef. Thirteen and a quarter miles from the Eastern Key, in an E. 6° S.

direction, there is a shoal of 12 feet, of about $\frac{1}{4}$ of a mile in extent. Bush Key light bears west from the shoal, $17\frac{1}{4}$ miles distant. This is the only danger; with care, and seeing the light, it is a channel which should be taken by daylight in preference to going round the Tortugas: the chart makes it perfectly safe.

Cayo Marquese is a very dangerous and extensive bank of quicksand, on every part of which you have no more than 4 or 5 feet water. It is of a remarkable white color, especially all along the north edge, and may easily be seen and avoided in the day time.

The tide between the Tortugas and Cayo Marquese sets variously through the northward, and ebbs to the E. S. E., about 3 or $3\frac{1}{2}$ feet, by the shore.

The proximity of the Florida Reef is shown clearly in the day time by the whiteness of the water, so that there can be no danger in drawing in with it; but if safe by day, it is not so by night, nor in bad weather, when you should carefully avoid it, and be sure to keep the lead going, by which means you can avoid danger at the distance of two miles from the edges of the keys or reefs.

In passing the promontory of Florida it is not this reef alone which you see, but an innumerable quantity of keys and islands, raised upon a bank north of it.

On Bush Key (Garden Key) one of the Dry Tortugas, is a lighthouse, elevated 70 feet above the level of the sea, showing a fixed light, and can be seen when a vessel is on shore, and is without doubt the worst kept light on the coast. It can be approached within 3 miles on the west and east sides, but on the S. W. you should keep at the distance of 6 miles, as there is a shoal of 11 feet, of about 300 feet in length, in a N. by E. and S. by W. direction, bearing W. by S. $\frac{1}{4}$ S., $7\frac{1}{2}$ miles from the light.

BANKS AND COAST OF FLORIDA.—Seventeen and a half miles to the eastward of the easternmost Tortugas, is placed the west edge of the bank, called the Marquese Bank; and 15 miles farther east are placed, on this bank, the key called Marquese Key, which is the westernmost of a group, of which the northernmost is called Boca Grande Key; this key is the largest of the group, and is near six miles east and west. About one mile to the eastward of this key the first bank ends, whose eastern edge runs about north and south. The first bank is separated from the following by a channel of two miles wide, with 10 or 12 feet water, sandy bottom. This channel is called Boca Grande, but no man who is not well acquainted, should ever attempt to take the channel, as there are some shoals in it.

The second bank, called the Mangrove Islands, is like the first, upon which is raised a portion of islands, of which the three southernmost have white sandy benches. This second bank may be viewed as distinct from the following, although they are united on their northern part by an isthmus of half a mile wide: otherwise they are separated by a channel of 1 mile in breadth, which contains from 10 feet to 12 fathoms water, low tide.

The third bank is that of Key West and the Pine Islands, at the western part of which it is called by the former, and at the eastern by the latter name.

A lighthouse is built on Key West, containing a fixed light, and a number of buoys are placed, viz:

A white buoy, showing 3 feet above the water, and on the reef, in 26 feet water, bearing from the lighthouse on Whitehead Point S. S. E., and from the lighthouse on Sand Key, E. by N. $\frac{1}{4}$ N.

A white buoy, showing 3 feet above water, moored in 27 or 28 feet, and bearing S. S. W. $\frac{1}{4}$ W. from the lighthouse on Whitehead Point, [Key West,] near the dry rocks which lie to the west of Sand Key, to show the west channel into Key West.

The first island on its western edge, is Key West, which lies E. by N. and W. by S., 6 miles in length, N. and S. 2 miles in breadth, and about 56 miles from the main land of Florida, and its southern coast is very sandy. This island is covered with trees, especially on its western part, in which there is a secure anchorage, with a channel of $4\frac{1}{2}$ fathoms to enter it, and 2 $\frac{1}{2}$ fathoms within, well sheltered. To enter this channel you must observe the following directions, viz:—In running along the Gulf Stream you must not attempt to pass the reef, which is about six miles from the island, until you bring Whitehead Point lighthouse, which is on the S. W. point of the island, and which exhibits a fixed light, to bear N. N. W.; then steer for the harbor, which lies at the N. W. point, leaving Sand Key lighthouse, which exhibits a revolving light, on your larboard hand, as you cross the reef, and taking care to give Whitehead Point a berth of one mile on account of a reef that makes off from it. The lighthouse on Sand Key bears from Key West lighthouse, S. S. W., nine miles distant. After you pass the reef (at the inner edge of which a buoy has been placed, as before mentioned,) haul up for the flag-staff. You will have 3 $\frac{1}{2}$ to 4 fathoms water crossing the reef, and then from 6 to 7 fathoms until you enter the harbor, where you may anchor with perfect safety. There is a powerful tide here, rising and falling about 4 to 5 feet; and setting alternately N. E. and S. W.

Sand Key lighthouse was blown down in 1846—not yet rebuilt.—July, 1850.

There is a passage through Key West from Florida Stream, into the Bay of Mexico, for vessels drawing 12 feet, at low water. This passage is about 6 miles in extent, and

Lighthouse.

Banks and Coast of Florida.

Lighthouse.

vessels by passing through it, save the danger and delay of going round the Dry Tortugas, which are a group of ten distinct islands or keys, lying off the west coast of East Florida, low, some covered with mangroves, surrounded with reefs and sand-banks, extending N. E. and S. W. 10 or 11 miles, and from east to west 8 miles, and may be seen at the distance of 4 leagues. Good pilots can be obtained at Key West to carry vessels through. The harbor is large and commodious, admitting vessels of the largest class, where they are protected from all winds within 200 yards of the N. W. point of the island, and several ponds of fresh water, which for nine months in the year produce excellent water.

From Key West eastward for 24 miles, there are nothing but low mangrove islands in whose channels nothing but canoes can pass. This third bank terminates at Bahia Honda, and the islands to the eastward are somewhat larger, and covered with pine trees, but are low and drowned like the others, and their channels are navigable only for boats. Of the whole of these islands there is but one, which is 13 miles from Key West, which although small, is of tolerable height, is rough and covered with trees, and in whatever direction you see it, appears in the form of a saddle.

Off Bahia Honda a buoy is placed, in 27 feet water, bearing north, when Looe Key Beacon will bear W. S. W. $\frac{1}{2}$ W.

The next bank is called Bahia Honda, separated from the last by a channel of half a mile wide, which channel is called Bahia Honda, and in which there is anchorage in 3 and 3 fathoms. This channel is easily known, because on its western part, and on the very eastern part of the last bank of Key West and Pine Islands, there are three small islands, and on its eastern part, upon this fourth bank of Bahia Honda, there is one called Palm Island, which is large, and has a sandy beach, and is remarkable by the many high palm trees with which it is covered, and are the first you see coming from the westward. This bank of Bahia Honda has but few keys, and extends E., about four leagues.

From the fourth the fifth follows, called Key Vacas, or Cow Keys, extending to the eastward about 5 leagues, upon which bank a group called by the same name is raised, the easternmost of which is called Dutch Key, or Cuyo Holmdes; between this key and Key Bivoras is one league. This key is remarkable by its white sandy beach, and by its tolerable high hill covered with trees, which is on its western part.

Concerning the whole of the channel to the westward of the Cow Keys, it may be necessary to state the following remarks, namely, that you will have two fathoms water all the way within a mile of the keys, and will always find the deepest water nearest to the reef. That the usual method navigating between the reef and the keys, is, to proceed in the day time, and lie at anchor in the night; and that should you be obliged to anchor where there is any coral, it will sometimes be necessary to buoy up your cable to prevent its being rubbed.

From the eastern extreme of Key Bivoras to the westernmost part of Old Matecumbe is 3 $\frac{1}{2}$ miles. Old Matecumbe is 4 miles long in the direction of N. E. and S. W., and its N. E. point is covered by some very high trees, appearing like table-land. On the north end of Old Matecumbe is a natural well, in a rock, containing excellent water.

One mile east of Old Matecumbe, lies Indian Key, to the eastward of which there is a channel running to the northward, with 10 and 12 feet water, where by doubling the N. E. point of Old Matecumbe, you may anchor, sheltered from all winds. This channel is easily discovered by the white shoals of only 2 or 3 feet, bordering both sides of it, which serve us an excellent beacon.

Two miles N. E. of Old Matecumbe you will find Little Matecumbe, which in the same direction has 4 miles in length: this key is covered with high trees. Off its N. E. part there is a small mangrove island, separated by a channel of half a mile wide, and N. E. of the last there is another, of tolerable size, separated by another channel of the same breadth. This is also separated by another channel, like the others, from Long Island.

N. E. from Long Island lies Key Largo, separated like the others by a small narrow channel. Nearly east from this channel, $\frac{1}{4}$ mile, lies Key Tavernier, to the northward of which there is excellent anchorage for vessels drawing not over 8 feet water, and is one of the nurseries much frequented by the fishermen. About N. E. by N. from Key Tavernier lies the Key Melchor Rodrigues, which is an island of tolerable extension, and the land so spongy that the roots of the trees are discovered.

A floating light is placed off Key Largo, bearing from the highest land on the key E. by S., distant 7 miles; from the elbow of Carysfort Reef, N. $\frac{1}{2}$ E., distant 3 to 4 miles. The outer reef (say 14 fathoms water) bears E., distant 2 $\frac{1}{2}$ miles. Lat. 25° 12' N., Long. 80° 16' 20" W.

The coast runs from Melchor Rodrigues to Key Largo N. N. E., N. by E., and N. W., which last course there are various keys for some distance, of which the last is called Key Biscayno; and the eastern point of which is called Cape Florida.

From Key Biscayno to Hillsborough Inlet there is a narrow reef, running parallel to the shore, about five miles distant, having on it, off New River, 12 feet.

The shores of this coast are lined with a bank of regular soundings, which run off a good distance; this regularity of soundings extends from Cape Florida to lat. $27^{\circ} 17'$, where there is a shoal of 15 feet three miles from the land; from thence to Cape Canaveral the coast is clean. The soundings off Cape Canaveral, that cape bearing W. by S. are 55, 75, and 90 fathoms, at 32, 36, and 39 miles distance.

Key Biscayne lies a little to the southward of Cape Florida. On it is a lighthouse, the lantern elevated 70 feet above the level of the sea, and exhibits a fixed light.

A white buoy, showing 3 feet above water, is placed on a reef near Cuppo Florida; Soldier's Key bears from it W. by W. and Saunders' Hut bears S. S. W.

CAPE CANAVERAL light is a revolving light, 55 feet height of tower.

Off this cape in an E. by S. direction, $8\frac{1}{2}$ miles distant, there are $4\frac{1}{2}$ fathoms, inside $2\frac{1}{2}$. The shoals off this cape is not yet surveyed; a good berth had better be given to them.

From Cape Canaveral the coast runs N. W. by N., 26 leagues, to the entrance of New Smyrna, which is barred, and only fit for boats and launches; the coast is very clean, and you may, without danger, keep within two miles of it.

Seven leagues N. 25° W. from New Smyrna, is the entrance to Matanzas, but only vessels of very light draft can enter it: this bar has 8 feet, at high water. From this entrance there is an inland navigation to St. Augustine, formed by the island of St. Anastasia and the main. The tide rises 4 feet at spring tides, and it is high water at full and changes at 7h. 15m. The whole of this piece of coast is equally clean with the anterior. You have 8 fathoms one league from the land.

From Matanzas to St. Augustine is 12 miles, and the Island of St. Anastasia extends the whole length; you may keep along it at two miles distant, in 5 and 6 fathoms. You can see this island from 15 fathoms, as it is pretty high, and also distinguished by the lighthouse, showing a fixed light: the coast to the northward is very low, and you can see it but a short distance, so that it makes a good mark to know if you are north or south of St. Augustine.

SOUNDINGS OFF FLORIDA.

The whole of the coast from Cape St. Blas. as after mentioned, sends off a bank of soundings which stretches a long distance from the land, and these soundings are generally known by the name of Tortugas soundings, and are so clean that other danger is not known in the whole of it, than a spot or knoll of sand in lat. $28^{\circ} 35'$, and lies about 12 miles east of the meridian of St. Blas.* This knoll has but 3 feet on it, and so steep that from 100 fathoms you will be upon it, and is probably what was called in ancient charts Providence Island. The whole of these soundings are very equal, diminishing gradually towards the shore.

When you enter on these soundings, without a sure knowledge of the latitude, and in parallels near the Tortugas, it is necessary to run carefully to get soundings on its edge, and not get into less than 40 or 35 fathoms, which is a depth to keep clear of the Tortugas, which lie in 30 fathoms; that is, if they did not exist the regular soundings of the bank would be 30 fathoms where they are placed; on the western part of these keys the soundings are steep.

You should take the same precaution when entering on soundings in parallels north of the Tortugas. You should take this same precaution when navigating to the southward, that you may leave soundings with safety off its southern edge, so that what is said is sufficient to liberate you from all danger offered by the Tortugas.

On the edges of this bank the waters run lively to the southward, so that when navigating from the westward, with intention of sounding on its edge, the ship will be retarded by the wind, which fixes itself at E. N. E. or E.; but when for two days you experience a difference of latitude to the southward of 20 miles more than account, you may be sure that you are in the vicinity of soundings, in which case you may suppose yourself in the meridian of the edge, and calculate an error, if not exceeding 30 miles, and thence take your route with security.

FLORIDA REEF.—To the eastward of the Tortugas, and at the distance of 17 miles, the Florida Reef commences. Its breadth is about 3 miles, and it preserves the same, or nearly the same breadth, as far as the eastern meridian of Boen Grande, and thus far has at least 3 fathoms water over it. You can cross this portion of the reef with any ship of 16 feet draft; but you should ever remember, that over White Shoals you always endanger the ship if she is large, especially if the weather is thick, when the bottom does not show itself clearly. You may in such weather soon encounter a coral shoal of only one fathom, or even less; so that when we say, that the least water is 3 fathoms on this portion of the reef, it is because it is so generally, and that the inequalities found on the other parts of the same reef to the eastward, are not found here on this portion of it.

From the eastern meridian of Boen Grande the navigation is safe, till within $4\frac{1}{2}$ miles of Sand Key, on which is a lighthouse, showing a revolving light, bearing S. S. W.

* It is extremely doubtful whether this knoll exists.

from Key West light, distant 9 miles: 4 miles from Sand Key, W. $\frac{1}{4}$ S., on the outer edge of the reef, lies a group of dry rocks, and N. E. by E. from these rocks is another group of dry rocks, bearing N. from Sand Key, and between them, in the same direction, are two or three shoals with only 9 feet on them. One and a half mile east from Sand Key is another group of dry rocks, on a bank which extends 4 miles east from the Sand Key, on which there are from two to three and a half fathoms water. Six miles E. by N. $\frac{1}{4}$ N. from Sand Key is a coral shoal, with 3 fathoms on it, between which and Sand Key lies the eastern channel into Key West. From this shoal the reef leads E. N. E., and is very dangerous, being full of coral rocks, on which there is as little as 10 feet water, till you come up with Looe Key, on which is a beacon with a red ball on the top. Off Looe Key the bank is very steep. Sixteen miles from Looe Key lies Sombrera, which is the easternmost key on the reef. To the eastward of this key is very dangerous, being cut up by coral rocks, with channels which should only be attempted through, necessarily, and in daylight, as nothing is so useful in the navigation of this reef as a good lookout. S. S. W. to S. by W., $5\frac{1}{2}$ miles distant from Dutch Key, (the easternmost of Cow Keys,) are two groups of dry rocks. S., $4\frac{1}{2}$ miles, from the west end of Old Matecumbe, is a coral bank, with only 8 feet on it. S. E. by E., $4\frac{1}{2}$ miles from the eastern end of Old Matecumbe, is another shoal, with only 2 feet, called Alligator Shoal, from the circumstance of the U. S. schooner Alligator being lost on it, and on which the ship Spermo was also lost. North of Key Tavernier, which is in lat. $24^{\circ} 59'$, lies the great inlet of the Florida Reef. From this inlet the reef takes a sudden bend, and makes what is called Carysfort Reef, on which the current sets very strong. From this the reef trends N. N. E. till up with Cape Florida, passing Key Biscayno, on which is a lighthouse showing a fixed light.

Lighthouse.

Carysfort Reef.

CARYSFORT REEF.—This dangerous reef has been surveyed, and the position of the light-ship determined. It is moored inside the reef, in lat. $25^{\circ} 12'$, longitude $80^{\circ} 16' 20''$.

We advise shipmasters not to place much reliance on this, or any of the Florida lights, as they are all bad.

Carysfort Reef, inside of which there is a light-ship stationed, as described before, is the most dangerous reef on the whole coast, the south extremity of which is in latitude $24^{\circ} 59' N.$, and lies immediately off Sound Point.

In latitude $25^{\circ} 35' N.$, according to Mr. Bishop, his Majesty's ship Fowey, after losing all her anchors, beat over the reef in 3 fathoms water, and when within it, drifted five leagues to the northward in 5 or 6 fathoms water; and was afraid of drifting out in the Florida Stream.

The Fowey Rocks.

The FOWEY ROCKS, lie at the north end of the reef, and are partly dry. The eastern edge of these rocks lies about 6 miles to the eastward of Key Biscayno; they have many bad bars within them. Key Biscayno hath also a bank lying off from its east side.

There are several openings, or in and outlets, over this reef; all of which are safe communications between the Hawke Channel and Florida Streams, having a depth of no less than 18 feet water. By placing a boat on the reef at those entrances, it will always point them out in such a manner, that you may be able to enter, safely, any one of them, in moderate weather, when want of fresh water, contrary wind, or any other cause, renders this shelter necessary. Two of these inlets, however, require a little more to be said of them; those are Great Inlet and Spencer's Inlet.

Great Inlet, in $25^{\circ} 04'$ latitude, has a knoll of dry rocks on the south-east point of the reef, directly on the edge of the channel, whereby it is easily known. Here your eye must be your guide; the land may also help a little, as the two small mangrove keys, Tavernier and Rodrigues, show themselves plainly enough in the west.

The soundings in both are as marked in the chart; and to any person who knows that in a gale, by reason of a reverting current, anchorage is full as safe under a reef as under land, we need not enlarge much about the utility and knowledge of these channels; much less to a man who is either in want of water, or who, upon falling in with the shoals, and thinks himself in danger, has courage enough not to despair. At the outer inlets, the land appears so much alike, that it requires years of experience to know it.

The following, although not intended to be permanent, will be found useful to those navigating the Florida Reef. They are signals for the U. S. coast survey.

Signal poles.

1. A signal pole on *Turtle Reef*, bearing S. E. from Caesar's Creek, 12 feet above the water, with braces 6 feet from the base; on the top a tin cone—the upper half painted red, the lower white.

2. A signal on the *Pacific Reef*, E. S. E. from Caesar's Creek, of the same dimensions—the upper part of the cone painted white, the lower part red.

3. On *Ajax Reef*, commonly called the *Hay Jack Reef*, bearing E. by N. from Caesar's Creek, of the same dimensions—the upper part of the cone painted red, the lower white.

4. On *Long Reef*, bearing E. of Elliott's Key, also of the same dimensions—the upper part of the cone painted white, the lower part red.

Two beacons of similar dimensions were also put up on the *Triumph Reef*, and on the *Fowey Rocks*, but by some accident or design they were lately removed. Arrangements, however, have been made to have them replaced during the first calm weather, and their bearings and character will be as follows:

Triumph Reef—E. of Ragged Keys, painted red above, white below.

Fowey Rocks—S. $\frac{1}{4}$ W. from Soldier's Key, white above, and red below.

It was attempted to place a signal or beacon on *Ledbury Reef*, but it was found impracticable.

The following large signals and beacons were put up last year and recently:

Sombrero Key—36 feet high, barrel, braces 25 feet long.

Lone Key—38 feet high, barrel, braces 22 feet long; leans somewhat to the east.

West Saubo—35 feet high, barrel, braces 25 feet long.

Sand Key—(Astronomical station)—23 feet high, barrel, braces 26 feet long; the sides recently boarded up by Lieutenant Rodgers.

Eastern Dry Rocks—near Sand Key; triangle, 18 feet poles.

Western Dry Rocks—near Sand Key; 18 feet poles.

Middle Ground—also near Sand Key; triangle, 22 feet poles; the E. and W. sides boarded up.—May, 1850.

A. D. BACHE.

Directions for sailing from the Eastward through the Hawke Channel.

Key Biscayno, on which there is a lighthouse containing a fixed light, lies within, and forms the west side of the northern entrance of the channel or passage between the Florida Keys, or Martyrs, on the west and north side, and the Florida reefs on the east and south side, called Hawke Channel. The coast for 4 or 5 leagues to the northward of the key, has foul ground, and the sea breaking upon it has a frightful appearance, but there is no where less than 3 fathoms; but, by keeping off 5 or 6 miles from shore, you will find generally 5 or 6 fathoms, fine sandy bottom; and when you approach the end of the reef, you may haul in towards Key Biscayno, observing to give the reef a good berth without you, on account of several bad sand-bars on its inner edge. You will not find less than 3 fathoms any where within, till you come abreast of the south end of the key, where there is a small bank of eleven feet only; but be careful to give the key a good berth, as a large flat stretches from it.

You then steer to the eastward of south, and pass to the eastward of the shallow bank that surrounds Oswald Keys, when the course will be more westerly, by the edge of the bank. The general rule to sail along through the channel, from the Soldier's Keys to the southward, is, to have a careful man at the mast-head, to look out; he will see all the heads and other shoals, in a clear day, at least a mile off. Thus, making the eye your pilot, come no nearer to the Soldier's Keys than 12 feet, and no farther off to the eastward of them than 18 feet.

About a mile E. S. E. from Saunders' Cut lies a small round bank with only 9 feet water on it; from this black spot to Caesar's Creek, there are several sunken heads, and the bar of that creek reaches a great way out. Right abreast of this spot, and northward of the bar, is a very fine anchorage of 22 feet water, close to the back of the reef, which makes the inlet.

From Saunders' Cut to Saunders' Point there are only 11 feet of water to be depended on; that is, if you keep in that part of the channel which is clearest of rocks; you may find deeper water, by going out farther towards the reef; but the care necessary to be taken in order to avoid the heads is inconceivable.

When you are clear to the southward of Angel Fish Creek, the same rule of keeping between 18 and 12 feet in the channel is to be observed; but after all that can be said, a careful inspection of the chart, together with a comparison of it with the course of the land you sail by, and especially a good lookout, will constitute you a better pilot than any direction that can be given for this navigation. The course from Angel Fish Creek to the north part of Sound Point, is S. by W. $\frac{1}{4}$ W., and the distance is 5 leagues.

Sound Point is the only spot that may be said to form a true promontory, from the spring in the rock.

From the north end of Sound Point to Rodrigues Key, the course and distance are S. W. $\frac{1}{4}$ S. $\frac{1}{2}$ miles. There is a good harbor for small craft off the N. W. part of the key, formed by a reef running off its N. E. point; and another good place for shelter to the S. W. of it; but neither has a greater depth than 9 feet at low water. Tavernier's Key, or Tabano, is only a large thicket of mangroves, without any dry soil on it, and affords only some aquatic birds and their eggs.

From abreast of Sound Point to abreast of Tabano, the course is S. W. $\frac{1}{4}$ S., and the distance is 3 leagues. From Tabano, the direction of the coast alters to S. W., and to the east end of New Matacumbe, the distance is 7 miles. New Matacumbe has nothing remarkable, except a well of good fresh water on its east end; but that being known to few, the island is little frequented. Off its S. W. end lies a small drowned mangrove island,

called **Umbrella Key**; a channel 10 feet deep runs in to the south-westward of it, and extends up to the larger island; but there being nothing worthy of notice on this key, it is very seldom visited. In coming this way from Tabano, the channel is in general deeper than before; but the same rule for keeping without 12 and within 18 feet, still holds good; but observe that directly abreast of New Matabumbe, within a mile and a half to the eastward of the land, are several dangerous sunken heads, called the Hen and Chickens, which require particular attention.

The next to the south-westward, is the Island of Old Matabumbe, remarkable for being the most convenient, and best watering place on all this coast. On its east end are five wells in the solid rock, which appear to be natural chasms, yielding excellent water in abundance; and some ponds near them likewise afford some; insomuch, that in a wet season, all the east end of the key is overflowed, and water enough may be had to supply a whole fleet. There are likewise some ponds and wells at the west end, but the water is of a much inferior quality. This island was one of the last habitations of the indians of the Coloosa nation. About a mile from its N. E. end, on the extremity of a reef, lies the small bushy, gravelly key, called Indian Key, which is the leading mark for finding the watering-place on Old Matabumbe. Run to about a cable's length off the east side of the key, and the channel will be easily distinguished by your eye, as before said. Observe that the tides being very rapid, require particular attention, in going in or out; and that the channel is very narrow, having only just room enough for a small vessel to turn to windward.

From the south-west end of Old Matabumbe to the west end of Cayo Bivoras, or Viper Key, the course and distance are S. W. by W. $\frac{1}{4}$ W., 7 miles; the depth of water is from 16 to 18 feet, sandy bottom; but you must be careful to give the Bivoras a berth of at least a mile and a half. From abreast of the west end of Bivoras, S. W. by W. $\frac{1}{4}$ W., 11 or 12 miles, brings you to a contraction of Hawke Channel, between the Outer Reef and Cayos de Vacas; your depth is generally 18 feet, the bottom is sandy, and a broad bank runs off from the Vacas Islands. At this contraction of the channel the course must be altered W. S. W. $\frac{1}{4}$ W., going through the like depth of water for 5 miles. In running this last distance, care must be taken to avoid the shoals lying off the S. W. part of Cayos de Vacas, heretofore described.

From the west end of Cayos de Vacas to Cabbage Tree Island, or Bahia Honda, the course and distance are W. S. W. $\frac{1}{4}$ W., 10 miles. In this run you will find 3 fathoms water all along within a mile of the keys, the deepest water being nearest to the reef. Hence to the west end of Cayo Hueso, or Key West, the course and distance are W. S. W., 31 miles, the depth of water from 17 to 23 feet. Key West is about $5\frac{1}{2}$ miles in length, having a shallow bank before it, which extends close round its west end, as has already been said, and near which end is a well of ordinary water. All these keys have plenty of venison, and in some of them honey is found. From abreast of Key West, a W. by S. course, 5 leagues, and W. S. W. $\frac{1}{4}$ W. $8\frac{1}{2}$ leagues, will carry you to the west end of the channel, abreast of the west end of the Quicksands, which extend westward from Cayo Marquese. This bank of quicksand may be always seen in the day time, it being very white, and therefore may be easily avoided.

Directions for Key Biscayno.—Bound into Key Biscayno from the north, you can run close in with the beach until within one or half a mile of *Bare Cut**; you must then give the shore a berth of not less than one mile; (be careful not to get in less than three fathoms water;) your course will be S. by E., made good.

When *Soldier Key*† bears W. by N., steer for it until the lighthouse on Key Biscayno bears N. by W.; then steer for the lighthouse until *Little Soldier Key*‡ is on with *Soldier Key*; your course will be thence from N. by W. to N. by E., according to the tide, ebb or flood; but the points of the two *Soldier Keys* must be kept just on, or very nearly so, (the little one to the east of the large one) until the sand point of the beach (south end of Key Biscayno) is opened out to the westward, pass the high point of mangroves, (N. W. and inner point of same) from thirty to fifty yards; this will bring you close to the northern sand-bar, thence off for the lighthouse, about N. W., keeping the sand-bars (on your

* *BARE CUT* is the first opening north of Key Biscayno light, and is distant from same about 3 miles.

NARROW CUT is north of *Bare Cut* about 3 miles, and is immediately abreast of Miami River, at the entrance of which there are settlers, whose houses show very plain while passing.

† *SOLDIER KEY* is a small key with high growth, bearing from Key Biscayno lighthouse S. 42° W., distant about 6 miles, and is from 5 to 700 yards in circumference.

‡ *LITTLE SOLDIER KEY* bears about S. from *Soldier Key*, and is very small, with a lower growth than the large one; it is about 600 yards distant from the other.

The tide here sets about E. S. E. ebb, and W. N. W. flood, and runs very swift on the full and change of the moon.

right) close aboard, which at all times show themselves very plain. As you draw up with the point of the island, keep a little further off of the sand-bars, pass the point from 100 to 200 yards distant, and when the lighthouse bears N. 30° E., anchor. Here the channel is bold up to the beach, and over to the south bank, which forms the harbor, and in which you will have from 2½ to 3 fathoms water.

Directions for crossing the Reef at Cape Florida.—Get the lighthouse to bear W. N. W., and steer for it until you get into three fathoms water, and then keep S. W. by S. When Soldier Key bears W. by N., distance one or two miles, then you will have good anchorage under Fowey's Rocks. The reef will then bear E. by N. ½ N. Depth of water 3 fathoms.

Directions for running down inside of the reef from Cape Florida to Key West.—The course from Cape Florida to Soldier Key is S. by W.

From Soldier Key to Bolles' Bank, S. ½ E., depth of water 2 fathoms.

From Bolles' Bank to Caesar's Creek, S. by W., distant 25 miles.

From Caesar's Creek to Old Roads, S. by W.

From Old Roads to Basin Hill is S. W. by S. ½ S., depth of water 2½ fathoms.

From Basin Hill to Upper Sound Point, is S. S. W., depth of water from 10 to 12 feet.

From Upper Sound Point to Lower Sound Point there are 15 feet water, soft bottom.

From half way between these two points to Tavernier the course is S. W. by S., with from 10 to 12 feet water.

From Tavernier to Snake Creek, S. W. by S., with three fathoms water.

From Snake Creek to Indian Key, S. W., with 14 feet water.

Get Mutacumbe Cut just open, and then steer S. W., hard bottom, with from 12 to 14 feet water.

Get Indinn Key to bear N. N. W., and steer for it until within a ¼ of a mile, then the anchorage is good. Water from 10 to 12 feet.

From Indinn Key to the east point of Viper Key the course is S. W. ½ W., depth of water from 15 to 18 feet.

From the east point of Viper Key to the east point of Duck Key the course is S. W. by W. ½ W., and then W. S. W. to Crane Cut, and then S. W. to Jacob's Harbor, and W. by S. to Sister Keys, with from 18 to 24 feet water.

From Sister Keys to Loggerhead Key is W. by S. ½ S.

From Loggerhead to Saddle Hills is W. by S.

From Saddle Hills to Boca Chica, W. S. W., with from 4 to 5 fathoms water.

From Boca Chica to Key West the course is W. by S. ½ S.

THE TIDES.—The tide ebbs and flows here regularly, and the time of high water, on full and change of the moon, at Key West harbor, is 20 minutes after 8 o'clock, Spring tides rise 4 feet 5 inches, and it is nearly the same every where, from the Dry Tortugas to the Cayos de Vacas. The tides from Cayos de Vacas, north-eastward, rise not quite so high, and the time of high water is earlier. Within the northern entrance of Hawke Channel, opposite Soldier's Keys, it is high water at half an hour after 5 o'clock, and spring tides rise only 2 feet 6 inches. To the northward of Key Biscuyno, the stream on soundings is much influenced by the wind when it blows fresh; but with moderate breezes the ebb sets northward, and the flood southward; a due attention to this will contribute to shorten a passage over soundings to the reef. Tides.

Having observed, in the course of long experience, that several masters of vessels, who had the misfortune to be cast away on the Martyrs, and the coast of Florida, ignorant of the existence of any settlement at Cape Florida, have attempted to proceed to the northward in their boats, deprived of every assistance, I feel it incumbent upon me to inform such as may hereafter experience a like misfortune, that if they pass to the north side of Key Biscuyno, on which a lighthouse is erected, as before mentioned, they will find the entrance of Boen Ratonos, through which they can safely go with their bounts, and they will see the houses in front, on the main land.

In case of shipwreck to the northward of Boca Ratonos, at the distance of 2 miles therefrom, they will perceive mangroves thinly scattered, from whence the houses may be seen, and in that situation, on making a signal with fire, or otherwise, they will obtain assistance.

If it should happen to the southward of New River, they may proceed southwardly along the beach, where they will meet, every 4 miles, with posts fixed in the ground, on which is an inscription, in English, French, and Spanish, informing where wells of fresh water have been purposely dug for relief.

Channel of Florida, between the Reef and Keys.

The western part of this channel begins with a breadth of 3½ or 4 miles, and you will find in it from 6½ to 10 fathoms water, sand and mud, or ooze, as far as Boca Grande, from which to Key West light it is generally about 3 miles wide, and its depth

6 and 10 fathoms, fine sand and mud. In this last piece of the channel there are two shoals; the one nearly north and south with the easternmost part of Key Boca Grande, and the other S. S. W. from the westernmost part of Key West, and both in the middle of the channel.

From these shoals the channel continues with a breadth of 4 miles as far as Samboes Keys, from which to the eastward its breadth diminishes, and the reef increases in the same proportion, so that the channel is only $1\frac{1}{2}$ mile wide at the distance of 5 miles west of Looe Key beacon, and this is the narrowest part of the channel, but drawing up with Looe Key beacon, the channel begins to widen, so that north and south of Bahin Honda it is 3 miles wide. The depth in these narrows is 3 fathoms, and continuing to the eastward, you augment your depth to 6 fathoms.

There is a beacon on Looe Key 30 feet high, on which is a large ball, painted red.

From Looe Key the channel continues to its end with a breadth of 2 or 3 miles, but its depth varies remarkably, so that as far as Cow Keys, you have 4 to 6 fathoms, and from thence to the eastward it goes on diminishing, and when abreast of Old Matcumbe you have but 3 fathoms, and abreast of Key Tabano only 2 and $2\frac{1}{2}$; besides which, from Looe Key, the channel has many coral shoals, which, although by day they offer no risk, (as the dark color shows their place,) yet by night they are very dangerous; and it is absolutely necessary to anchor, and lie by for the night, throughout all parts of this channel.

In Bahin Honda you get excellent water by digging wells, and on the south side of Cow Keys, about 8 miles from its western end, you again have a fine spring.

These are the only places among the keys where you can find water from natural springs; but there are many natural tanks, where rain water is preserved till evaporated.

On the north side of Cow Keys, and about 6 miles east of the west end, you will find a natural pond, that never wants water, which is in a valley, distant from the beach about 100 yards, and the landing is something to the westward of three small mangrove islands, called Stirrup Keys. You may also, at times, find water on the western extreme of Key Vacas (Cow Keys); also in some of the keys in its vicinity, and on Dutch Key, and generally in all those places where the earth is rocky, you will find water, especially after rains.

A lighthouse is erected on Whitehead's Point, which is the S. W. point of the Island of Key West. The light is elevated 23 feet 6 inches above the level of the sea, and shows a fixed light.

KEY WEST.—A white spar buoy with a flag, is stationed on the reef, about nine miles from the lighthouse, on Whitehead's Point, from which it bears S. S. E. It is anchored in 27 feet of water, at low tide, and vessels crossing the reef by this channel, will find the best water close to the buoy on the west side.

The proper course to pursue, to bring into the harbor the greatest draught of water from this buoy, will be to run for the lighthouse, passing at the distance of about a quarter of a mile, a tub buoy, with a staff and imitation ball painted black—marking the situation of three coral heads, on one of which there are only fourteen feet of water at low tide. You leave this buoy on the larboard hand, and when two miles distant from the lighthouse, steer N. W. by W. until you pass a second tub buoy, painted black, stationed off the lighthouse point in 6 fathoms water; you then steer N. by E. $\frac{1}{2}$ E. until you open Freeman's Key, a small mangrove island in the northern part of the harbor, for which you then run.

N. W. PASSAGE.—Vessels bound through the North-West Passage, will run, from the last named buoy, N. W., and they will then enter the passage, which is staked out for about 6 miles. The stakes on the north and south sides are painted white, and have keys on their summits also painted white; those on the large middle ground are painted white with black crosses, and those on the small middle ground are all black.

The stakes are all in about two feet of water at low tide, and a vessel drawing 9 feet of water can approach generally within 40 yards of any one of them; but $3\frac{1}{2}$ fathoms, at least, can be carried between either of the middle grounds and the north or south sides of the passage, or about 9 feet between the two middle grounds.

After passing the stakes, vessels will shape their course for a tub buoy, painted black, having an imitation ball, which is anchored in $3\frac{1}{2}$ fathoms water about half way from the last stake to the bar. Passing this buoy on either side, you will at present run N. W. $\frac{1}{2}$ W., about two miles, which will bring you to the bar, and on hauling up north you will cross it in ten or eleven feet water at low tide.

The light-vessel for the north-west bar of this harbor, lies about 8 miles from Key West at the junction of the north-west channels, so as to serve as a guide to vessels entering either.

Vessels from the westward, coming in by the North Channel, will bring the light vessel to bear due south, and run directly for her; and on reaching her station, will then run for the lighthouse on Key West, unless the tide should be extraordinarily low. There are not ten feet in this channel at low water, and twelve feet at high water.

Vessels coming east half east, considered the

Key West.

N. W. Passage.

Vessels coming in by the North-west Channel, will bring the light vessel to bear south-east half east, run for her, and then steer for the lighthouse as before. This channel is considered the best, having from one to two feet more water than the other.

The light-vessel shows one light at an elevation of about 60 feet, which may be seen, in clear weather, nine or ten miles.

Directions for Key West—South Channel.—Get Key West light to bear N. E. by N., and run for it. Leave Sand Key light $\frac{1}{2}$ a mile on the starboard hand; depth of water, 24 fathoms. Run for the light until you get Mangrove Key to bear N. by E., then steer N. N. E.

Directions for the Ship Channel.—Get Key West light to bear N. N. W., and run direct for it, until within two miles of the light, and then give the lighthouse point a berth of one mile, until you open Mangrove Key from the wharfs of Key West, about a hand-spike's length. Keep these bearings on, and they will take you up in the best water.

Directions for the North Bar.—Get the light-ship to bear south, and steer direct for it. Cross the bar in 11 or 12 feet of water. When you deepen the water to 3 $\frac{1}{2}$ fathoms, steer S. E. by S. This course made good will carry you clear of every thing.

Directions for the N. W. Channel.—Get the light-boat to bear S. S. E., and steer N. N. W. Keep the bearings of the light-boat on, and you will have from 11 to 12 feet at high tide.

Directions for crossing the reef at Loggerhead Key.—Get this key to bear N. N. W., and steer for it. You will cross the reef in 3 $\frac{1}{2}$ or 4 fathoms water.

Directions for crossing the reef at Bahia Honda.—Get Bahia Honda to bear from W. to N. W., and you will have from 2 $\frac{1}{2}$ to 3 and 4 fathoms.

Directions for crossing the reef at Knight's Key.—Get Knight's Key to bear N. N. E., and steer for it, and you will cross the reef in 3 $\frac{1}{2}$ or 4 fathoms water.

Directions for crossing the reef at Duck Key.—Get Duck Key to bear W. by S., and steer for the east point, having from 3 to 4 fathoms.

Directions for crossing the reef at Indian Key.—Get Indian Key to bear N. by E., and steer for it, and cross the reef in 3 and 3 $\frac{1}{2}$ fathoms.

Directions for crossing the reef at Tavernier.—Get Tavernier to bear W. by N. $\frac{1}{2}$ N., and steer for it. You will cross the reef in 9 and 10 feet water.

CAPE ROMANO is a long low point with mangrove trees on it. Off this point lies a sand-bank, which extends off 9 miles S. W. from the point, and has about three feet water on it. The shoal is regular as you approach it. Thirty miles to the N. W. lies the Island of Sanibel. If you are running for this island, keep in 4 $\frac{1}{2}$ and 5 fathoms water. At the S. W. end of this island there is a good harbor with 12 feet water in it, which, if you wish to enter, give Sanibel Point a berth of 5 miles, as there is a long bank making off from it; run in for the land in 2 $\frac{1}{2}$ fathoms, and then steer up N. W. until you shut in the point of the islands, where you can anchor in 12 feet water.

There is a large Spanish establishment for fishing, and you can obtain provisions, wood, and water.

General Description of the Coast from Cape St. Blas to Point Tancha.

CAPE ST. BLAS.—Cape St. Blas is a low point, which runs to the southward two miles. From that part where trees end on this point, a shoal of sand runs S. S. E., 4 miles, bearing from S. S. E. to S. S. W. from the point. Various shoals and small spots of sand having less than 3 fathoms water on them, also lie off the same point, the southernmost of which is 17 miles distant; between these shoals there are 7, 8, and 9 fathoms water.

S. 77° E., 16 miles from Cape St. Blas, lies the south point of St. George's Island, called Cape St. George, between which is the main entrance to St. George's Sound and Apalachicola Bay; the bay is distant about 12 miles from the entrance into the sound between St. Vincent's and St. George's Islands in a straight line, but owing to the obstructions in this part of the sound, vessels are obliged to bend their course to the east to reach Apalachicola River, which increases the distance to 18 miles.

Vessels drawing 10 feet water can anchor in the bay, but only 7 $\frac{1}{2}$ feet can be carried to the town.

From Cape St. George's (which is shoal to the south) for 5 miles the coast doubles round to E. N. E., and at the distance of 24 miles from the cape is the east end of this island, and the middle entrance into the sound; this entrance is formed by the east end of St. George's and the west end of Dog Islands; the distance between the two is 3 miles. The channel is contracted between by shoals, which make out from the two islands; the depth of water on the bar is about 14 feet, and the width one-third of a mile. The channel is near Dog Island.

Dog Island is 6 miles long, and trends nearly the same as St. George's; at the east end is the eastern entrance into St. George's Sound; this entrance offers a depth of 14 feet on the bar, which is above $\frac{1}{2}$ of a mile wide, and is within that distance of the island.

Cape Romano.

Cape St. Blas.

St. George's Sound, from the eastern to the middle pass, affords from 2½ to 3 fathoms water; but to the westward, towards the main entrance, the sound is much obstructed by oyster-banks, through which vessels drawing more than 6 feet water cannot shape their course. The mean rise of tide, 2½ feet.

Tide.

N. 50° E. from the east end of Dog Island, 7 miles distant, is the S. W. Cape; this distance is shoal, if we except the channel above mentioned, and to the south of the cape the shoal extends to the distance of 3 miles.

From the S. W. Cape the coast bends to the northward, and after to the eastward, and forms a large bay, into which the river Apache is emptied.

Tide.

This river is shoal, and obstructed at its entrance, and for a long distance off, by many oyster-banks, which are dry at low water. The tide rises 2½ feet.

About 8 miles up the river from the bar, is the Fort of St. Mark's, situated on a point which forms the confluence of the river, of which the east branch is called St. Mark's, and the other Warellar. The shoal water which is found in this river, is also found all over this large bay, and 8 feet is the best water in the channels.

St. Mark's River affords 8 feet water at its mouth at high water, and 8 miles lower down, good anchorage for vessels drawing 10 feet. Here are two bars, one 3 miles below Fort St. Mark's, called the Devil's Elbow, with a depth over it of 8 feet at high water; the other called the Outer Bar, 8 miles from the Fort. From this bar to the Devil's Elbow the average depth is 10 feet; the channel takes a sudden turn at the Devil's Elbow, and the width is reduced to about 40 feet for a quarter of a mile. From the Devil's Elbow to Fort St. Mark's, 8 feet can be carried through at high water. The place called the Spanish Hole, 3 miles within the outer bar, is the best place to anchor; the depth is 12 feet at high water. The outer bar is in some way connected with the extensive shallow banks, which to the east end and west obstruct this part of the coast, and serve to protect the anchorage within the outer bar, which is the only shelter for vessels drawing 10 feet water from the S. W. Cape to Espiritu Santo.

From Apache Bay the coast bends off to the southward and eastward to the River Suwannee in Vassalousa Bay, which is 23 leagues distant from the River of Apache. Oyster-banks obstruct this bay, and the Suwannee cannot be entered at high tide by vessels drawing more than 5 feet.

Cedar Keys.

CEDAR KEYS.—South, a little east, 10 miles from the mouth of the Suwannee, are Cedar Keys. The Sea-horse shoal bears off 7 miles, in a S. W. direction, from Bird Keys. The channel is buoyed off, and pilots can be obtained. The latitude of Sea-horse Key is 29° 7' N., long. 82° 56' W.

Fifty-five miles south of Cedar Keys, lies the Key Anclote, or Anchor Island, and before you come to it you may discover the coast. The whole of the coast from S. W. Cape to this key, is so shoal, that at ten leagues from the land you have but 5 and 6 fathoms, and two leagues you will have from 6 or 7 feet. Key Anclote is distant across from the main land four miles, and in length about eight miles north and south; it is divided into three parts, and its south part has good anchorage in 3 fathoms water.

From Key Anclote the coast runs S. E. by E. 30 miles to the entrance to Tampa Bay, or Bahia del Espiritu Santo. The coast between is clear and deeper than the anterior. At 3 leagues from the land you will have 6 fathoms water, and no impediment to your keeping in with it by the lead. Off this coast there are various keys, which lie, at most, only four miles from the main.

From Tampa the coast continues S. E. by S. 22 leagues, to the Bay of St. Carlos; all this piece of coast is bordered with keys which lie about 4 miles off from the main land; the whole is clear with the exception of a sand-bar, which runs off from what is called Boca Quarazote, which is an opening formed by two of the above mentioned keys, and is distant from Tampa 21 miles. On this bar there are 2 fathoms water, and all along the coast you will have 4 fathoms at 5 or 6 miles from it, so that there is no danger in keeping in with it by the lead.

Curlos Bay is a large entrance made in the coast, in which are emptied various rivers, whose mouths are covered by many keys and shoals, which leave between them channels more or less wide: the northernmost is called Friar Gaspar, and has 6 feet water; the next, called Boca Grande, is the deepest, having 14 feet water. This bay is only good for vessels of 8 feet draught, by the little shelter which it affords in gales in winter; and although the holding ground is good, you are obliged to look for the bends of the bay to shelter you from the wind which blows. The tide rises two feet, and when the wind is off shore, it runs with great velocity.

Tide.

The key, whose north extreme forms what is called Boca Cautivo, is the same whose southern extreme forms Boca Ciega, which is the opening which said key forms to the northward, and Sanibel to the southward. This opening extends to Shoal Lagoon, which communicates by various shoal channels with Bay St. Carlos.

Key Sanibel has good anchorage on its south part in 2 fathoms, sheltered from all winds. This anchorage of Sanibel is known by a palm-tree, two leagues to the southward of it, and is the only one you see on the whole coast. To anchor in Sanibel, it is necessary to

run with care, and the lead in hand, that you may avoid the shoal bottoms which run off four miles from Sanibel, and the keys S. E. of it.

From Sanibel the coast runs S. E. by E. eleven leagues to Point Largo, or Key Roman. This piece of coast is clean, having 3 fathoms at 2 miles from the land. Point Largo extends out S. and S. W. of it a shoal, which runs from it seven miles, and the coast bending to the eastward forms a bay of 12 feet water, in which vessels of light draft may enter and find shelter from winds any way on the northern board.

The coast from hence runs S. S. E. twenty-five leagues to Cape Sable, which is the southernmost promontory of the peninsula of East Florida.

The whole of the coast has regular and clean soundings, whence the lead is the best guide.

BOCA GRANDE, or CHARLOTTE HARBOR.—The course into Charlotte Harbor is E. N. E. Charlotte Harbor forms a large bay of 8 or 10 miles in width, but very shoal, having only from 10 to 12 feet water.

In entering this harbor you pass between Boca Grande Key and Casperillo Key, bearing N. N. E. and S. S. W. from each other, distant three-quarters of a mile, having six fathoms water between them. When Casperillo Point bears N. E. by E., distant four miles, you are then up with the outer bar, which is three-quarters of a mile in width, having three fathoms water at low tide. The current sets in and out of the harbor at the rate of 2½ knots, running in 7 and out 5 hours. The entrance of the harbor may be known by a bunch of trees at the northward and westward of the entrance.

N. B. This harbor produces the finest oysters, and the greatest variety of fish, wild fowl and deer, of any other upon the whole coast.

TAMPA BAY.—The next harbor to the N. W. is Tampa Bay, or Spiritu Santo. In entering the Ship Channel, bring Mullet Key to bear E. by N. and Egmont Key E. by S.; the N. E. point of Egmont Key is bold. Keep midway between the two keys, leaving Egmont Key on the starboard, and Mullet Key on the larboard hand, having from 3 to 5 fathoms water. The bar extends off from Egmont two miles. At high water on the bar, 2½ fathoms.

On Egmont Key there is a fixed light, 40 feet high.

Directions for the W. S. Passage to Tampa Bay.—Bring the S. W. end of Egmont to bear N. E. by N., and run for it, in 2½ and 3 fathoms water, at low tide.

One high tide in 12 hours; runs in six and out six hours.

This bay has sufficient depth of water for frigates; for there are within it 5 and 6 fathoms water, and although there is a bar at its entrance, the least depth on it is 3½ fathoms.

The entrance is obstructed by several sand-banks, upon which rise some inlets; between these banks there are three channels, named the West, the South-west, and the South east. The two first have plenty of water on their bars; for the first has 3½ fathoms, and the second has 2½ fathoms. The channels are clear, and to take them there is no necessity for instructions, as the shoals are distinctly seen at high water, and at low water they are dry.

A few miles to the N. W. of Tampa Bay is Prince Edward's Islands, the western one of which is a small, round, high island; the course of these islands from this to St. Mark's forms a deep shallow bay; the shoal ground runs 7 miles from the land, and the bank is nearly up and down, with 3 fathoms along the edge of it.

A lighthouse, 73 feet high, containing a fixed light, is on the eastern side of the entrance to St. Mark's.

ST. MARK'S.—If you are bound to St. Mark's and fall in to the S. E. of it, work along this bank, which will bring you up to the mouth of the river; and if you wish to run into Port St. Mark's Harbor, the entrance affords 12 feet water, and you will see on the N. E. bank, which is nearly dry at low water, a large stake sticking on it, and the one on the other side has three stakes on it. You will see a small house, on an island four miles from the mouth of the river, which bring to bear N. by W., leaving the lighthouse on your starboard hand, and that course will carry you up between the two stakes; when you are between the banks, half way up, you have good anchorage. From this up to Fort St. Mark's you can have but 9 feet of water. A pilot can be obtained here at any time. S. S. W. from St. Mark's lighthouse, 15 miles distant, lies the south point of James' Island, called the S. W. Cape; a bay makes in between St. Mark's entrance and this cape, into which the River Okonofrisky discharges itself; this river is shoal at the entrance, and the shore from the cape to the light should not be approached nearer than two miles.

A shoal having three feet water on it, lies E. by N. from the cape; and the easternmost end bears from the lighthouse south.

The coast trends from S. W. Cape, S. W. ½ W., 37 miles, to Cape St. George, which is the southernmost point of George's Island; this island is 24 miles long, and forms, with Dog Island, the south side of George's Sound. The east end of Dog Island is S. W. ¾ W., 7 miles from the S. W. Cape, between which is the eastern entrance to St. George's Sound. Dog Island is about 6 miles in length.

Boca Grande, or Charlotte Harbor.

Tampa Bay.

High water.

Light.

Lighthouse.

St. Mark's.

Dog Island light.

DOG ISLAND LIGHT is a revolving light on the west end of Dog Island, and 50 feet high. It revolves in three minutes, and bears from the bar N. $\frac{1}{4}$ E., distant 2 miles. To distinguish it in the day time from the lighthouses of St. Mark's and St. George's, it has a black horizontal strip near the top.

Middle Entrance into St. George's Sound.

MIDDLE ENTRANCE INTO ST. GEORGE'S SOUND.—For vessels drawing 12 feet of water this entrance is to be taken, as you cannot carry into the main entrance so called, which is between the N. W. end of St. George's Island and St. Vincent's Island, over 11 feet at high water. The middle entrance or passage into St. George's Sound is between the west end of Dog Island and the east end of St. George's Island and is about 3 miles wide; it is rather difficult to find for strangers, as the west end of Dog Island and the east end of St. George's Island are both low sand-beaches, and there is a sand-beach on the main directly in front of the passage, so that it looks, at 3 or 4 miles distant, like one continued beach.

After making the passage, steer for it, keeping most towards Dog Island, as the channel is altogether on Dog Island side. You will soon see a large green buoy, which lies in the best water on the buoy; pass close to this buoy on either side, and stand in N. N. W. along Dog Island Reef, which can be plainly seen, until the eastern point of George's Island bears S. W., or S. W. $\frac{1}{4}$ W., then haul up the sound for the shipping, say about W. S. W.; continue on this course until the eastern point of St. George's Island bears about E., 2 miles distant, and a black buoy on shore, well under St. George's Island, bears about S. E. $\frac{1}{2}$ S., half a mile distant, when you may anchor in from 2 to 2 $\frac{1}{2}$ fathoms.

There is a barrel buoy a short distance outside the green buoy, a black buoy on Dog Island Reef, and a white buoy on the eastern extreme of St. George's Island Reef; these buoys are not to be relied on, as they shift their position with every strong breeze; they are placed there by the pilots; the channel being perfectly plain and the reefs visible they would in any case be of little use.

Light.

On the south point of George's Island there is a lighthouse 65 feet high, with a fixed light.

Apalachicola Bay.

APALACHICOLA BAY.—When the south point of St. George's Island, (which lies to the southward of Apalachicola Bay,) bears north, two leagues distant, you will be in 2 $\frac{1}{2}$ fathoms. From these bearings and depth of water, steer N. N. W., or N. by W., until you make the large black buoy,* which can be seen at the distance of 4 miles; by keeping the buoy close on board, you have the best water; the course from the buoy is due north, until you bring the three tall trees on St. Vincent's Island to bear N. E., then run for them. The entrance then being fairly open, steer for the point of St. George's Island, or between the point of that island and St. Vincent, you will have three fathoms when over the bar, deepening gradually; and between the Islands of St. George's and St. Vincent, you will have 8 fathoms when fairly in. When past the point of St. George's haul to the eastward, and keep from one-half to three-quarters of a mile distant from St. George's Island. The water will shoal in this course to 2 fathoms, soft bottom, when you had better come to anchor and wait for a pilot, which you will obtain by hoisting the usual signal.

When off the entrance, in 6 fathoms, no inlet can be discovered between the two islands, but the place may be known by the bearings of the land. It is a low sand-beach, having a hummock of bushes about one mile from the west point of St. George's Island, to the westward of, which are four umbrella trees, the two easternmost standing 6 or 8 feet apart, at top connected, and at a distance having the appearance of one tree. To the west of these trees is a hummock of palmetto trees, which stand nearly on the extreme west end of St. George's, which are considerably larger than the hummock of bushes before mentioned; and these, when distant so far that you cannot see the beach, that bearing N. E., appears as separated from the other land, and to form an island by itself, but when bearing N. W., appears connected with the Island of St. Vincent, which is thickly wooded on the eastern end. This hummock is, however, on St. George's.

The south point of the Island of St. George's is thickly wooded, and can be discerned when in 10 fathoms, bearing N. E.

Should you have a foul wind, and be obliged to turn to the windward, keep the Island of St. George's on board; when fairly to the westward of the south point, the water is good near the beach, and soundings regular.

Directly off the south point of St. George's, there is a dangerous shoal of 2 or 3 leagues extent.

The Shoal of Cape St. George makes off at least 6 miles from the south part of the island, and has not more than 5 or 6 feet of water, perhaps less. The soundings near the shoal, on the W. edge, are irregular, from 3 to 4 and 2 fathoms.

* An Island, called Flag Island, formerly existed at the entrance of this port, but it was washed away in 1835; the buoy alluded to was placed on a rock.

Description of the Coast from Cape St. Blas, Westward.

A revolving light, 65 feet high, has been erected on Cape St. Blas, about two miles north of the south point of the cape. St. Joseph's light has been discontinued. *Light.*

From Cape St. Blas a narrow peninsula or tongue of land extends N. by W. 17 miles, forming the Bay of St. Joseph. This bay is nearly land-locked, and has a width at its mouth of about 3 miles, and is about 14 miles in length. The bar lies west of the north point of the peninsula about one mile. Within the bar the bay affords from 25 to 33 feet of water for about 8 miles up the bay, and it is sheltered from all winds. The tide rises about one foot. This is the next best harbor to Pensacola on this coast, the depth on the bar at low tide being 17 feet. The tongue of land that forms this bay is so narrow, that in some places it is only two cables' length in width. There are various breaches in it in time of rains, by which the water of the bay unites with the ocean.

To enter this bay, you must coast along the tongue of land in 4 or 5 fathoms, until you pass a tongue of sand, a little before you come to the mouth, from whence you steer N. E. and E. N. E. till within, always coasting the tongue, which is the deepest water.

N. W. by N., 10 miles from St. Joseph's Bar, is the entrance to the Bay of St. Andrew's; in this distance the coast should not be approached nearer than 5 miles, on account of a shoal that extends the whole distance, called the Middle Ground, which may be easily discovered by the whiteness of the water. The S. E. extreme of this shoal and the above tongue, form the entrance to the Bay of St. Joseph.

BAY OF ST. ANDREW'S is covered by Crooked and St. Andrew's Islands, which comprehend between them and the Main St. Andrew's Sound, which leads into the bay. *Bay of St. Andrew's.*

There are three entrances into this bay; the eastern is through the opening between Crooked and St. Andrew's Islands, the depth 3 fathoms on the bar, and the channel, which is one-sixth of a mile wide, close by the latter island; the distance between the islands is above two-thirds of a mile. The middle or main entrance is near the western end of St. Andrew's Island; the depth 21 feet, and the channel 200 yards wide. The western entrance is about two miles N. W. of the latter; the depth on the bar 10 feet. This bay is very large, but as yet there can be no motive for ships to call here; but should you do it for shelter in bad weather, the bay is said to be shoal, but from the main to the eastern entrance you have 3 fathoms in the sound, and good shelter under St. Andrew's Island.

N. W. by W. from St. Andrew's Bay, distant 50 miles, is the entrance to St. Rosa's Sound; in the whole of this distance the shore is bold, and you will have 4 fathoms close to the land. On this coast the trees are very thick, and close to the shore, where there are also some red bluffs, and white sand hummocks.

ST. ROSA'S BAY.—The east point of this bay is known by some bright reddish colored bluffs, which are upon it. The channel, or mouth of the bay, is very narrow, and a bar of only 5 or 6 feet impedes its entrance. To enter, steer N. till you pass the east extreme of the island, whence steer N. W., and anchor as soon as you have shelter. This bay is of extraordinary length, extending 24 miles to the eastward, with a breadth of 4 to 6 miles. The best water in it is 3 fathoms, which is only found when you are E. and W., with the red cliffs at the entrance, about two miles from the bar. The other part of the bay is full of shoals and palisades, navigable only for boats. *St. Rosa's Bay.*

From St. Rosa Bar to the western end of St. Rosa Island, the distance is 44 miles. This long and narrow island lies about W. by S. and E. by N., parallel to the main, and covers a sound of the same name; its greatest breadth is not more than half a mile: on it there are many sand-bluffs and some scattering trees. The sound affords a navigation for vessels of less draught of water than 4 feet to Pensacola.

PENSACOLA LIGHTHOUSE is on an eminence, about 40 feet high, and directly N. by W. from the bar; the lantern is about 40 feet from its foundation, making an aggregate height of 80 feet above the level of the sea, and is about half a mile north-westerly from the west point of St. Rosa Island. The light is revolving, each revolution one minute ten seconds. *Pensacola lighthouse.*

PENSACOLA.—The Bay of Pensacola affords a good harbor, having, at low water, on the bar, 21 feet. The eastern point of its entrance is called Point Siguenza, and is the western point of the Island of St. Rosa, on which fortifications are erected, making it very conspicuous from the sea. St. Rosa Island extends E. by N. and W. by S., 14 leagues, and completely fronts the whole Bay of Pensacola; it is so low that the seas, in gales, wash its tops, and is no where more than one-fourth or one-third of a mile wide. There are some red bluffs on the main coast, which are higher than the rest of it, and one of which, and the largest of all, is on the eastern side of Pensacola Bay; and in or near the front of the entrance, are three red bluffs adjoining each other, and called the Barnaces. *Pensacola.*

The channel entering Pensacola Bay is from the south-east, and turns round a middle ground which projects nearly one mile to the S. W. of Point Siguenza; it then bends to the eastward towards the bay. A bar, projecting about two miles to the south, and ex-

tending from the western end of St. Rosa Island to the main opposite, has at low tide 21 feet on it. The width of the bar taken in the direction of the channel is about one mile. The entrance between St. Rosa's and Foster's Islands, is about a mile and a quarter wide. After passing the bar the entrance to the bay is between the Barancas and Point Signenza. This port would be difficult to recognize, were it not for the lighthouse and bluffs, which, consisting of 3 adjoining each other, cannot be easily mistaken.

The interior of the bay affords great depth of water and good bottom for anchoring. However, a considerable extent of its shores are shallow, but at some points a good depth is found within a short distance of the land, viz: at the Careening Ground, 18 feet are to be found at about 50 yards from the shore; at Tartar's Point, where the Navy Yard is, 30 feet are found within a few yards of the point, and 12 feet west of it; at the English Careening Ground 18 feet can be carried close to the shore.

The bar is not the only difficulty entering Pensacola, since you meet, when within it, the Middle Ground, as previously stated; and although it is decidedly the best harbor in the Gulf of Mexico, you must observe the directions, and frequently have recourse to your plan of the port, which will give a correct idea of its configuration.

Vessels coming from the eastward, should keep in 7 fathoms water until the lighthouse bears by compass N. by W., when they can stand in for the bar, until in 34 fathoms, which is the shallowest water on the bar at low water, with the light bearing N. by W.

Vessels of large draught of water should not attempt to enter in the night, as there is a Middle Ground on the east side of the main channel, one mile inside the bar, on which there are not more than 7 feet water, and the course around it is very circuitous.

Vessels making the land, should keep off four or five miles, until they make the lighthouse, which cannot be seen until nearly opposite, as the trees on St. Rosa Island to the east, and on the main land to the west, obscure it from the river.

To come in over the bar, on which generally there are 4 fathoms, bring the light to bear N. by W., and run directly for it, until over; the bar is about 600 yards across, on which is a buoy; soon as over, the water deepens to 5 and 6 fathoms, when run N. W. until the lighthouse bears N., in order to avoid the Middle Ground, when run for it until within the point of St. Rosa Island; then haul up east until the west end of St. Rosa Island bears S. W., when you may anchor in 4 or 5 fathoms water, safe from all winds.

Small vessels drawing not more than 14 feet, can bring the light to bear N. $\frac{3}{4}$ W., and steer for it in the night until within half a mile, where they can anchor with the wind off shore; but if they have a fair wind, they can steer E. by N. until sheltered by St. Rosa Island, where they can anchor in a good harbor until daylight, as it is everywhere excellent.

Vessels coming in or going out on ebb tide, should (preserving the necessary depth of water) keep near the eastern edge of the channel, as the tide runs to the south-west across the Caucus Shoal, and the flood sets directly over the Middle Ground.

Vessels drawing not more than 10 feet water, can pass through a small channel between the Middle Ground and the Point of St. Rosa Island.

Other Directions for Pensacola.—Run along the coast in from 6 to 7 fathoms water, until the light bears N. by W.; then steer direct for it. In crossing the bar you will have from 3 to 34 fathoms in the best water. After you cross the bar and deepen the water, you must haul more to the westward, and keep the larboard shore best on board to avoid the *Middle Ground*, on which are not more than 7 feet water at low ebb; this you leave on your starboard hand. After passing the Middle Ground, steer N. by E. $\frac{1}{2}$ E., and anchor within half a mile of the north shore, in 3 fathoms water.

The course from Mobile to Pensacola is E. N. E., distant about 38 miles.

From Pensacola to St. Joseph's the course is E. $\frac{1}{2}$ S., distant 95 miles.

The coast from Pensacola to St. Andrew's is very bold, and you may keep within half a mile from the shore.

From Pensacola Bay the coast trends W. by S. to Perúdo Bay, distant 11 miles; this bar is subject to change, and affords but about 4 feet water, and 28 miles to the westward is the bar and entrance to Mobile Bay.

MOBILE BAY.—A lighthouse is erected on Mobile Point; the lantern is 55 feet above the ocean level, and shows a revolving light of one minute in duration. S. 5° E. from the light, 5 miles distant, you have 3 fathoms on the bar. The east end of Dauphin Island will then bear N. N. W. $\frac{1}{4}$ W., and Sand Island (just above water) will be on the middle of Dauphin Island. On Sand Island there is a lighthouse containing a fixed light 50 feet high.

The entrance to Mobile Bay is between Mobile Point and the eastern point of Dauphin Island; the distance between them is 34 miles. To the south of Dauphin, about one mile, is Big Pelican Island, which is barren and of small extent, and E. S. E. from the latter island, distant 34 miles, is Little Pelican or Sand Island, which is of but few yards in extent, and nearly even with the water's edge. A bank, projecting to the south of Dauphin Island and Mobile Point, on which are the above islands, obstructs the en-

entrance to the bay; but, however, affords through it various channels, the main one having 15 feet on the bar at the lowest tide. The interior of this bay has water enough for any vessel that can pass over the bar; but on account of a shoal formed opposite the mouth of Dog River, 11 miles south of the town, vessels drawing more than 8 or 9 feet cannot, at low tide, ascend the bay further up.

By following close to the south shore of Dauphin Island, and having Big Pelican Island on the starboard hand, coming from the westward, vessels drawing 7 feet water can enter the bay at low water; but to do this, you must, when the east point of Dauphin Island is north of you, steer to the southward, to avoid a narrow sand-spit which projects off from the point $1\frac{1}{4}$ mile S. S. E.; haul close round this spit, and steer up the bay.

There is good anchorage between Big Pelican and Dauphin Islands, and close to the latter, for vessels drawing 12 feet; this anchorage can be entered either from the westward, by steering close to Dauphin Island, or from the main channel, leaving it when Big Pelican Island bears W. by N., (about 2 miles S. W. from Mobile Point.) During the prevalence of northerly winds, when vessels from sea are prevented from entering the bay, this anchorage affords good shelter.

Those off Mobile should recollect the necessity of getting an offing as soon as there are appearances of a gale on shore, either to weather the Balize, or which is better, to take in time the Road of Naso, as destruction is inevitable, if you come to anchor outside Mobile Bar during the gale.

Strangers approaching Mobile Point in the night, should keep in 10 fathoms water till the light bears north, to avoid the dangerous sands lying to the eastward, and the shoals off Pelican and Sand Islands, on which is a beacon, to the westward of the bar.

In running in for the land, should you make it to the westward of the bar, it will appear broken, as it consists of small islands, which occasion several openings. More to the westward the land is very level. Dauphin Island, on the western point of the bay, appears high and bluff; Mobile Point, low and sandy, with a single tree on the extremity.

Vessels approaching the entrance to Mobile Bay in the day, should not run for the bar until the light on Sand Island ranges between the east and west ends of the woods on Dauphin Island.

Vessels not drawing over 10 or 11 feet, and with easterly winds, may haul in for the bar as soon as the beacon comes on within the west end of the woods, and keep it on thus until they get 7 or 8 fathoms water, when they will gradually haul more northerly; at this time all the dangers will be visible. Heavy ships must bring the beacon on with the centre of the woods, and cross the bar with it thus, in about 18 feet water, steering up N. N. W. until abreast or past the beacon and island on the larboard, from which an extensive shoal makes in every direction. Within the bar are two buoys, the first to be left on the starboard, and the second on your larboard hand. The channel up thence is deep and plain. Mobile Point lighthouse bearing between N. and N. E. Tides rises 24 feet.

Other Directions for Mobile.—Bring Sand Island light to bear N. W., and run direct for it, until one-quarter of a mile of the light; then bring Mobile Point light (which is a revolving light) to bear N. by E. and run for it, leaving it on your starboard hand about $\frac{1}{4}$ of a mile distant; you may then steer N. $\frac{1}{4}$ W. up the bay about 25 miles; you will then obtain a pilot over Dog River Bar, and up to the city.

In running in for Sand Island light, you will cross the bar in from 24 to 3 fathoms water. After crossing the bar, should you have the wind ahead, you must not stand further to the westward than into 6 fathoms water, or to the eastward in less than 94 fathoms.

From Mobile Bay to the Bay of St. Louis, the distance is 65 miles west; on this extent of coast there is a chain of islands parallel to the main, forming a sound, which affords a partial inland navigation, and is about 7 miles wide. This coast is marshy, but at two or three miles from the shore it is covered with pines and oaks. The islands are sandy.

The sound enters Mobile Bay between the main and Dauphin Island. At this place the bottom, formed by oyster-beds, presents three shallow passes, viz.: Pass Aux Huiters, with a depth of three feet at high water; Pass Guillori, 2 feet at common high tides, and the Pass au Heron, with nearly 5 feet.

Dauphin Island is 7 miles in length, and the next succeeding is Pettit Bois Island. The entrance between these two is one mile wide, and the depth of water 5 feet. Pettit Bois Island is narrow, but it is very easily known, since it has a wood in the middle of it: it is about 9 miles in length.

The passage between Pettit Bois and Horn Islands is two miles wide, and vessels drawing 9 feet water can enter it. The length of Horn Island is about 15 miles. There are some groves on it, but at the eastern part it is entirely barren. There is no lighthouse on this island.

The next of the chain is Dog Island, a small island lying midway between Horn and Ship Islands. To the east of Dog Island there is a passage close to Horn Island, of 18

Beacon.

Tides

Other Directions.

feet; but to the west there is no passage, as the shoal which extends off from Ship Island and extends beyond Dog Island, having a channel of only one-third of a mile wide. The distance from Horn to Ship Island is about 5 miles. Ship Island is 7 miles long, and wider than the rest of the chain: in its middle it is covered with herbs and some pines, but the rest is entirely bare. There is a well of very good water on it, on the north side, about the middle.

West from Ship Island is Cat Island, between which the distance is 5 miles. There is a bank which puts off from Cat Island, towards the west end of Ship Island, having a channel of only a mile wide, which turns round the west end of Ship Island, and in which there are 18 feet.

Lighthouses.

Cat Island is the last of the chain extending to the westward, and forming the Sound. On its western point there is a lighthouse, with a fixed light, 45 feet high, and on the main land, bearing nearly N. W. from the former, there is another lighthouse, 30 feet high, with a fixed light. These two lighthouses indicate the passage through Pass Christian and Pass Mary Ann. To the S. W. of Cat Island are several keys, distant about 3 miles: (which are near the coast, and called St. Michael's Keys): this channel is no where less than 15 feet; but within this part of the sound, vessels drawing more than 8 feet, cannot reach the Aux Malheureux Island, or steer to the eastward between Cat Island and St. Mary's Key, or enter the Bay of St. Louis; thus, between the Island Aux Malheureux and this bay, the sound becomes shallow and obstructed.

The impeded part of the sound, in the direction of Cat Island and the entrance of the Bay of St. Louis, is called Pass Christian; and does not admit of vessels drawing more than 8 feet at medium tide. This draft of water can be carried through Lake Borgne. From Pass Christian to Pass au Heron, 12 feet can be carried through the sound by keeping on the island side; but vessels drawing 8 feet must have the sound between Petit Bois and Horn Islands, and shape their course for the main entrance of Mobile Bay. Lake Ponchartrain is separated from Lake Borgne by Pine Island, to the north of which is the entrance called Rigoletts, and to the south called the Chief Mentour; these entrances and outlets afford, on their respective bars, in Lake Borgne, a depth of 9 fathoms at high water, and 8 feet at medium tide. This depth can be carried through the Sound within a short distance of the shore, to Madisonville, to the mouth of the Manchac, and to the mouth of Bayou St. Jean, which connects the city of New Orleans with the lake.

Bayou St. Jean, on Lake Ponchartrain, Lighthouse.

BAYOU ST. JEAN, on LAKE PONCHARTRAIN.—To enter the Bayou, bring the light to bear S. E. $\frac{1}{2}$ S. The entrance is on the west side of the light, and usual depth of water in the channel, 6 feet.

The lighthouse is at the mouth of Bayou St. Jean, has one small fixed light, elevated 48 feet above the ordinary surface of the lake, and can be seen in a clear night about eight miles. It is 25 miles S. E. by E. $\frac{1}{2}$ E. from the mouth of Cheninata River, 25 miles S. W. from the Rigoletts, 15 miles S. W. from Point Resence, and 5 miles north from the city of New Orleans.

Light. Chandeleur Islands.

South, 15 miles from Dog Island, is the north point of the Chandeleur Islands, which run to the southward, and with Grand Grosier and Isle au Breton, which bend to the S. W., nearly join the mouth of the Mississippi River. They will be described hereafter.

On the north end of the North Chandeleur Island, there is a fixed light, 55 feet high. **CHANDELEUR ISLANDS.**—From Passe a l'Ouvre, (one of the entrances of the Mississippi,) the coast doubles to the westward, and soon to the northward, to the parallel of $29^{\circ} 27'$, in which latitude lies Isle au Breton, which is a group of small keys, whose western limits are 5 miles distant from the coast, so that it forms a bay, called Pouza Bay, in which there are 4 or 5 fathoms, with some shoals of less water. East of Isle au Breton, is the Isle of Grand Grosier, from which a ledge runs N. N. E., and breaks to the Isle of Palos, which is the southernmost of the Chandeleurs. There is a good passage inside the Chandeleurs, with 8 to 11 feet water, but a good pilot is requisite. From Isle au Breton a shoal stretches two miles S. W., bold at the very point. Shelter can be had from a N. E. wind inside this island, but the navigation is difficult for strangers, and requires much survey to describe it properly.

The whole of the Chandeleur Islands are very low, with some myrtle bushes upon them, and form a chain of coast very injurious, and to be dreaded by navigators, not only that you cannot see them at a regular distance, but because the winds at S. E. (which blow hard in winter,) are right on the coast: nevertheless, there is a good shelter for all ships to the westward of the north extreme of the Chandeleurs, called the Road of Nasa, where the heavy English men-of-war lay during the siege of New Orleans. This is the only good shelter for large men-of-war on the whole coast of Florida, (Tampa Bay and Pensacola for small sized frigates excepted,) not only because it is defended from winds on shore, but because there is no bar, breakers, nor impediment whatever, to your entering it in all weathers. To enter the road of Nasa, you have only to run so as to double the north point in 5 or 6 fathoms water, which will be one mile from the land, and then navigate from west round to south, keeping in 4, 5, or 6 fathoms, according to the draft

the ship, and 2 miles; but the north point of the whole coast, but there is a bench. I deduced.

North-west Island: west called St. Michael's. Cat Island is a very little water; the anchorage in 4 and 5 fathoms, which in 1819 cut a small of good water, Island, 5 miles

leaves a channel drop into Island, which is

But, as navigating wholly or foggy in the night, the so navigating to the mixed at times w parallel of the Bay

of sounding with very l and St. Michael's Key, and if course de laurs; and if you in front of the Channel: so that the signal that they are

the ship, and you may anchor in 4 fathoms, when the north point bears N. N. E., distant 2 miles; but if you wish deeper water, you must not run so far south, but anchor when the north point bears E. N. E., in 5 to 6 fathoms water. In the Chandeleurs, and almost the whole coast of the Mexican Gulf, you can get water by digging wells in the beach, but there is no other wood on the Chandeleurs than the drift logs left in abundance on the beach. Its lands produce nothing but the myrtle, from which the green wax is produced.

North-westerly of the north extremity of the Chandeleurs, 14 miles distant, is Ship Island: west of which, 8 miles, is Cat Island, and to the southward of this, various keys, called St. Miguel, run and extend out from the coast of the islands: between these and Cat Island is the pass into Blind Lake and Lake Ponchartrain, in both of which there is very little water, especially in Blind Lake. Between Cat and Ship Islands there is a large shoal running out from the east point of the first, which leaves a channel of less than half a mile wide, to enter to the northward of them; this channel has good 12 feet water; the anchorage is N. and S., with the west end of Ship Island $\frac{1}{2}$ of a mile distant, in 4 and 5 fathoms. Ship Island is long, E. and W., and very narrow, and widest in the middle, which is partly covered with pines, but barren at both ends. The hurricane of 1819 cut a small channel through Ship Island, $\frac{1}{4}$ mile from its west end: in it is a well of good water, which is on its north coast, and about midway the island. East from Ship Island, 5 miles distant, lies the west end of Horn Island, and between the two lies Dog Island; from the first a shoal runs out to the east, which not only embraces the Dogs, but leaves a channel of only 150 fathoms wide; the bar has $2\frac{1}{2}$ fathoms, when you immediately drop into 5 fathoms. East of Horn Island lies Pettit Bois Island, then Dauphin Island, which is on the W. side of the entrance into Mobile.

GENERAL OBSERVATIONS.—The whole coast, from Mississippi to Cape St. Blas, sends off a bank of soundings to a great distance from the shore, whose edge runs out to latitude $28^{\circ} 50'$, but the depth is very unequal; this inequality is very clean. If you except the sand-bank that lies in the vicinity of Cape St. Blas, you will find no danger in the whole of it that cannot be prevented by care and the use of the lead; and as the whole of the coast is very low, having few visible marks to distinguish it in its whole extension, and besides is often cloudy and foggy, exposed by the continuation of winds from S. to W., and from W. to N., which blow with great force in winter, and by hurricanes in August and September, all which create the necessity of saying something on the method of making the land, and navigating its coast.

New Orleans, Mobile, and Pensacola, are the three important points of destination on this part of the Gulf of Mexico; to go to either of which it is best to make well to the eastward of them respectively, when coming from any place S. E. of them; that is, when you have the winds easterly, which is the wind that predominates here; but if you come from the westward of them, you have no other resource but to beat to windward from that point of the coast which you have made, and the greater or less distance of it, according as you are best accommodated, with respect to the season, the quality and size of your ship, &c.

The making to the eastward of your destination is necessary to be more or less distant according to the confidence and security you have in the situation of the ship, so that bound into the Balize, you will look for soundings in the meridian of $29^{\circ} 30'$, or thereabouts; and if bound to Pensacola or Mobile in the meridian of Cape St. Blas.

Should you strike soundings in latitude 29° , steer N. W. by W. awhile, so as to make it E. northerly of it: that is to make its bearing W. southerly, to prevent falling into the southern part of the parallels, especially in winter, when it is best to run heading for the middle of the Chandeleurs: in this route you find no regularity in soundings, as whatever the parallel may be you will as often get more water as less; nevertheless, from 20 fathoms down, the soundings are very regular; and from the meridian of Pensacola westward, to the southern limits of the Chandeleurs, you will get 10 fathoms 10 miles from the coast; from Pensacola eastward, you have 10 fathoms at 4 miles from the coast, and 25 fathoms at ten or twelve miles.

But, as navigating for the Balize, you may want an observed latitude, and have it so cloudy or foggy as to impede making the land: in such circumstances, or to run for it in the night, the soundings will serve as a secure guide, for which you must recollect that navigating to the westward, if you find 40 to 50 fathoms, loose mud, sticking to the touch, mixed at times with small black and white sand, it is a certain signal that you are in the parallel of the Balize, and from that depth to less water, you will always find the same quantity of soundings: but if from 40 to 50 fathoms to less water, you get bottom of fine sand, with very little mud or without it, you will be in the parallel of between the Balize and Cotton Key or Island: if you get small white sand, you are in the parallel of said key; and if coarse sand and snail shells, you will be in a parallel between said key and Chandeleurs; and if you get coarse sand, with gravel, small stones, and large shells, you will be in front of the Chandeleurs. From the Balize to the westward, the bottom is of sand alone: so that those from the southward who look for the Balize, sand alone will be a signal that they are west of it.

When navigating N. W. and N., from the getting 40 or 50 fathoms, sand, and in diminishing the bottom or depth, if the quality of soundings does not vary till in 10 or 12 fathoms, you are to the southward of the Balize: but if in this N., or N. W. route, you have crossed mud, or ooze, and entered in 10 fathoms, you find sand, then it is a signal that you have crossed the mouth of the Balize, and drawing in with Breton Island and the Chandeleurs. The better to explain these soundings, we shall place them in form of a table.

In the parallel of the Balize, Crossing these soundings, you cross this parallel. }	Loose mud, sticky to the touch, mixed at times with small fine black and white sand.
In the parallel of between the Balize and Breton Island or Key. }	Fine sand with very little mud or sand alone.
In the parallel of Breton Island. }	Fine white sand.
In the parallel of between Breton Island and the Chandeleurs. }	Coarse sand and small shells.
In the parallel of the Chandeleurs. }	Coarse sand, with gravel, small stones, and large shells.
West of the Balize, the bottom is sand alone.	

When you come in looking for the Balize, either in its parallel or that of the Chandeleurs, you must take care not to get foul of the land at night, but maintain your position, in 15 or 20 fathoms, at anchor or under way; but if you do not wish to delay, for more safety, you may stretch in towards the Balize, to anchor in 10 or 12 fathoms, outside the bar.

If the running in for the land has been in the parallel of the Chandeleurs, as soon as you get 10 or 12 fathoms, you will steer S. S. W., trying to maintain this depth, without danger of running aground, or among shoals, as is shown by the following breakage in the soundings:—

In this S. S. W. route there is, in the middle of the soundings, a good mark to know the place of the ship, which is, as soon as you arrive in a parallel with the S. end of the Chandeleurs, which is as far up as Alcatrazes, the depth begins to augment to 12, 14, and 18 fathoms; which is athwart with the Poza. This augmentation ceases as soon as you arrive abreast of Passé l'Outre, where you find anew the 10 fathoms; this knowledge is of importance in looking for the Balize with security, so as not to pass to the southward of it.

In running as above, be careful not to get into less than 10 fathoms, when stretching from E., or from S. to W., because, from this depth to less, you cannot weather the Balize with the wind at E., and you have no opportunity for running for the road of Naso, as follows:—

Placed in 10 fathoms water, in a S. E. gale, (and no appearance of the wind's ceasing) and getting into less water, you have the resource of navigating to the northward, sounding continually to maintain 8 or 10 fathoms, so as to coast the Chandeleurs, and you will know you have passed the northernmost point; if you lose the oozy soundings, sometimes mixed with white shells, which is found off the Chandeleurs, and finding fine white and black sand, you may steer W., and run in 10, 8, and 6 fathoms to anchor, under shelter, in the road of Naso, as the atmosphere is cloudy; in such weather you can discover nothing, and to get to this anchorage, there is no other guide than the lead; but if you can see the land, you will easier get to the anchorage, as you have only to double the spit of sand which runs off the N. E. end of the Chandeleurs, on which the sea breaks with easterly or south-easterly winds.

This convenient resource will be better if embraced as soon as you consider the passing or weathering the Balize doubtful, as here you have your choice of water from 3 to 7 fathoms, sheltered from winds, in 3 fathoms, from N. E., and in 7 fathoms from winds from E. round on the southern board to S. W. It is also necessary to advise, that as soon as the winds haul round to between W. and N., you should lose no time in getting out of this roadstead, as the water will fall from 4 to 6 feet.

It is a good rule, in running for the Balize, to get soundings in any parallel between 29° 10' and 29° 30' or 35', to get in 25 fathoms, from whence the Balize will bear S. W.; from 25 fathoms, in any parallel between 29° 10' and 29° 35', the Balize bears S. W.; and by steering that course you will hit the Balize about the N. E. Pass.

If your destination is Mobile or Pensacola, you should run in for the land, the eastward of them respectively, not only to avoid passing the port, but because landmarks are so wanting, and the coast so low, that a stranger has nothing to guide himself by, except the lighthouses, the former of which shows two lights, one fixed, the other revolving, and the latter a revolving light, which may be some guide to the navigator: nevertheless, the soundings indicate sufficiently well the meridian in which the ship is found; a little more or less, if you attend to the quality of course sand and coral found outside of land, which is a sure indication that you are off the east end of Santa Rosa Island, where you find the same quality of soundings as off Tampa Bay and the other parts of East Florida, but can cause no equivocation, because the points are so distant from the one now treated of.

Directions for the Mississippi, and to prevent falling to the Westward

Should you take your departure from the Tortugas, on one of which is a lighthouse, on leaving them make a N. W. course good, and you will fall into the latitude of the Balize, 20 leagues to the eastward; keep on to latitude $29^{\circ} 20'$, when you may steer W., or W. $\frac{1}{4}$ S., to 25 fathoms, then haul to S. W. for the Balize, taking care not to pass its latitude in the night time, and you may make sure of seeing Frank's Island light. Should the weather be thick, keep in 16 fathoms, and you will fall in on Passe a l'Outre, where pilots are always stationed: but should you see the land, or vessels at anchor, if the wind will permit, haul to S. S. W., or more southwardly, and lead along in 12 fathoms.

Lighthouse.

On Frank's Island the lighthouse at the entrance of the River Mississippi is built. It contains a fixed light, elevated 78 feet above the ordinary surface of the sea, and can be seen, in clear weather, 6 leagues distant; your best course, running for the light, is due W., and vessels may safely anchor in 10 fathoms water.

Lighthouse.

The following bearings from Frank's Island lighthouse are the mean of a number of experiments by compass:

Passe a l'Outre, N. N. W., distant 2 leagues: S. E. Pass, S. S. W., one and a half league.

S. W. Pass, S. W., distant 22 miles, but from it the light cannot be seen, on account of the cypress growth lining the sides of the pass itself, as well as the intervening mudbanks, which are generally covered with bushes.

Should it be very foggy, as it sometimes is in summer and fall, either anchor in 12 or 15 fathoms water; or stretch to the northward, as the currents to the southward of the bar set strong along the land to the southward, and by keeping to the southward you will be liable to be driven to the southward of the south point, in the latitude of which you will have 35 fathoms, within three miles of the land. A large bell has been provided, which will be kept tolling by night and by day, whenever from fog, or any other cause, the light or lighthouse cannot be seen at least four miles, at which distance it is calculated the bell may be heard in moderate weather.

In coming from the sea, the S. W. Pass is said to have advantages, there being but few shoals. The water is very deep close to the bar, and the softness of the mud such as to do little harm to a vessel, even should she ground. Vessels, after making the light, are often blown to the southward of the Balize, where they have been known to lie embayed for days and weeks together. Ships drawing 16 feet have been taken over this bar without touching, whereas ships drawing $14\frac{1}{2}$ feet water often lie on the S. E. bar for days. The N. E. and S. E. Passes are subject to changes, although much frequented by vessels of the largest class. From the S. W. Pass, 22 miles distant, the light on Frank's Island cannot be seen. Profiting of this pass, these delays may, in a great measure, be avoided.

The S. W. Pass light is 65 feet high, painted white and black in perpendicular stripes, showing two fixed lights, one elevated 30 feet above the other. It is on an island on the south side of the Nine Feet Channel, about three miles inside the bar, and left on the larboard hand on entering the river.

Lighthouse.

A lighthouse is also built on a shoal or island, near the south point of South Pass, showing a revolving light, which is left on the starboard hand going into the river. The building is painted black and white, in horizontal stripes, 65 feet high.

Lighthouse.

The principal entrances to the Mississippi are the N. E. Pass, lat. $29^{\circ} 07' 25''$, between 3 and 4 miles S. E. of the light; that of the S. E. Pass, lat. $29^{\circ} 08'$, 4 or 5 miles S. S. E. from the light; and the S. W. Pass, 22 miles from the light on Frank's Island; but approaching the Balize, you should keep 2 or three leagues to the northward, by which you will have good soundings to guide you. When you have struck soundings, you may run in the parallel above directed into 18 or even 16 fathoms, and you will then see the lighthouse on Frank's Island, and have the Block House or Balize bearing south-westerly: the anchorage is good every where, and should it fall calm, a light kedge will prevent being drifted by the current, which is sometimes pretty strong on the coast, but

it is much stronger in the latitude of the river's mouth than elsewhere, and no soundings until you come close in with the land. In running from Passe a l'Outre for the main bar at the S. E. Pass, in the night, it is not safe to keep in less than 15 fathoms water; in the day time vessels may approach within 8 or 10 fathoms, observing to keep the lead going. Being off Passe a l'Outre in 15 fathoms, in order to go round the N. E. Pass in 10 fathoms, the course is S. S. E., distant 2 leagues; from thence to the anchorage off the bar, S. S. W., 1½ league. The Block House at the Balize bears from the best anchorage to wait for a fair wind to come over the bar, W. by N. ¼ N., distant 2 leagues, where will be found 8 to 11 fathoms. At the entrance of the S. E. channel on the bar, the Block House bears N. W. by W., distant 5 miles.

Common error of Strangers.

COMMON ERROR OF STRANGERS.—Captains not acquainted on the coast, are frequently alarmed when they come near the river, by the appearance of the water, particularly during the first summer months, when the river is high, for at that time the fresh water of the river rushes out with great force, and being lighter than the ocean water, floats on the top, making an appearance altogether singular and alarming; for where the fresh water has not entirely covered the salt water, but leaving spots, it has the appearance of rocks, the river water being of a milky color, while the other is quite dark, and changes suddenly. When the river is low, the white muddy water extends about 3 leagues off, and when high about 5. On coming into it, it ripples like shoal breakers, but your soundings are regular.

On the setting of the current.

ON THE SETTING OF THE CURRENT.—The current sets, with very little variation, to the east; and when any variation is experienced, it is either to the north or south of the river's mouth. It is very evident to every man of reflection, that so large a column of water, rushing into the ocean, must spread, when it is no longer confined, and produce different currents, until it has found its level, and will be found to vary from the original course, in proportion as you approach the edges: allowing the current to set due east. I have known two ships to come into the river at the same time, and the one complain of a southerly, and the other of a northerly current, and that because the one had been to the south, and the other to the north of the river's mouth; however, as every stranger should get into a proper latitude before he comes within the influence of its current, I do not think it necessary to say any more on that subject.

Entrance of the River.

ENTRANCE OF THE RIVER.—The land at the entrance of the Mississippi River is nothing more than mud-banks, continually increasing, with reeds and rushes growing upon it, at the height of 10 or 12 feet above the water. The lighthouse on Frank's Island, or vessels at anchor, are generally the first you discover. The general winds are from the N. E., and you should avoid getting to the southward. The winds make a difference over the bar, at the entrance of the Mississippi, and the general depth of water is from 11 feet 6 inches to 14 feet.
