WITHOUT THE USE OF WIRES
NIKOLA TESLA CAN TELEGRAPH ONE HUNDRED MILES

A Wonderful Invention for Sending Messages Through the Air—A Powerful Vibratory Machine—The Theory of Many Years Now Crystallized Into Practice and Confirmed by Experiments.

(Special Correspondence.)
New York.—(Special.)—Nikola Tesla has made an instrument for telegraphing without wires by which a vessel a hundred miles from the coast will be able to send messages to the shore.

Mr. Tesla tells me that he is ready to offer the invention to the United States Government for use in war. Its advantages are easy to understand. There has been much talk of telegraphing to moving ships, and some discussion of the feasibility of sending out a cable repair ship to pick up one of our great ocean cables and send us messages telling of the approach of an enemy.

The telephonograph would be over a short range and the cable ship would be out of the way.

He said that he had been thinking of this for some time, and that he had been working on it for some time. He said that he had been thinking of this for some time, and that he had been working on it for some time.

Mr. Tesla is not prepared to make public the details of his invention. He always gives his conclusions in a scientific periodical. But he said to me: "You may say that I have succeeded in making a machine a thousand times more powerful than any ever made before. With it I expect to send messages without wires over long distances—probably 100 miles.

"I think so," he said. "If it can be used I have no desire for compensation. It is not for sale. But I will freely offer it to the Government. One reason I can not tell you just what my machine is, is that it is so secret that I shall be proud to have been of so much use to the country.

"Of this invention I can tell you that it is the result of more than five years of hard work. The experiments which have been carried out in my laboratory, which have attracted so much comment follow the lines that I laid down some years ago. For a long time I have been working on this, and I have been successful. Signals could be sent in for only short distances. When they returned to my system they found that they could send messages to a much greater distance. The idea of transmitting intelligence without wires is the natural outcome of the most recent results of electrical investigations. Some enthusiasts have expressed their belief that telephony at any distance by induction through the air is possible. I cannot stroke my imagination so far, but I do firmly believe that it is practicable to disturb by means of powerful machines the electrostatic condition of the earth and thus transmit intelligible signals and perhaps power. In fact, what is there against the carrying out of such a scheme? We now know that electric vibrations may be transmitted through a single conductor. Why then not try to avail ourselves of the earth for this purpose? We need not be frightened by the idea of distance. To the weary wanderer counting the miles most the earth is a vast plain. To the astronomer, who gazes at the heavens and by their standard judges the magnitude of our globe, it appears very small. And so I think it must seem to the electrician, when he contemplates the electricity which an electric disturbance is propagated through the earth, all his ideas of distance must completely vanish.

"I have been working on that problem ever since. For a long time I experimented with delicately adjusted instruments, but I found them unreliable. I would send signals for a few blocks and then a strong current of electricity would somewhere in the neighborhood or some atmospheric condition would interrupt them. After a time I decided to work on a different line. I must have something reliable.

Telephone in this neighborhood." With a sweep of his arm the inventor suggested that the building in a flower street, where the laboratory is.

"But could not some one else destroy the effect of these powerful signals with counter currents?" asked I.
"Of course," he replied. "But I have had to be a devil of a fellow." Which ingenious statement I interpreted as meaning that he had a "counter-fellow" as he says as strong a machine as that of Mr. Tesla.

Mr. Tesla told me very little about the new machine. He said that it was "no larger than this plate," he said, indicating a very small one which stood against the wall, covered with scientific magazines.

"It could be put on board a ship without any loss of power," he said.
"Of course," he said. "And how about the current to operate it?"
"Of course," he said. "It could be had from a small dynamo such as they have aboard all the ships of the navy."

Mr. Tesla says his original theory concerning the transmission of signals and possibly of power without wires has been confirmed by his experiments. At another place Mr. Tesla said that if the distance between the stations is not too great, the wireless telegraph first, but he first suggested the means by which all other means of telegraphing are superseded. The most that is claimed for Marconi's system is that it can be used for a greater distance than any other wireless telegraph. But Mr. Tesla's new machine is more important in its superiority to the influence of others. A recent writer in the London Standard says that the wireless telegraph would become impossible as soon as a wireless telegraph generator should be placed in the hands of the "character."

At the Hamilton Police Court Magistrate Jelfs allowed Hannah Lister, the young girl who pleaded guilty to the charge of concealing of birth, to go on deferred sentence. He did so on the understanding that she should have nothing to do with Sidney Bull, her betrayer, for two years. Mrs. Lister, the girl's mother, has refused to allow her daughter to marry Bull.

In the Old Bailey Police Court at London, Eng., William Rucelman was sentenced to five years penal servitude for burglary. Rucelman, who had passed himself off as a baronet, under the name of Sir Granville Temple, had married an actress, Agnes Ingilby, while his first wife, Kate Wessel, whom he had married at Birmingham, N.Y., was still living.

There is an agitation at Ottawa for Sunday street cars. The Toronto standard weight of bread has been fixed at 1 1/2 and 3 pounds per loaf.

An English syndicate is said to have closed a deal for all the coal mines in the Jellio district of Kentucky. The coronation of the Queen of Brunei of Sarawak was held at Walkerton with attractive military ceremonies.

The Klondike district and Indian River output of gold is estimated as anywhere from \$10,000,000 to \$20,000,000. The latest data show every reason to believe that the output of the district will be very near the true mark.

Editor Demers of Quebec Le Evesque, a member of the Provincial Government and will give his views and criticisms of his having transferred the printing of Le Gazette Officiel from him to Le Soleil.

A Lima, Peru, dispatch says the news that the United States Senate had given its approval to the project for an international bank, involving Peru and other South American countries, has been received here with great interest.

The Provincial Board of Health has received a communication from Honeywood Post-Office, Mulmurry Township, stating that the epidemic of a virulent form of influenza is infesting the district. A number of families are at present affected, and two deaths have occurred.

A One-Legged Tramp Killed Officer Twohey at London.
London, June 28.—Policeman Michael Twohey was murdered by a tramp who had only previously assaulted G.T.R. Watchman Ross, and whose description gives him the appearance of a dark-skinned and stout man. Chief of Police Williams is hourly in receipt of telegrams from various places as to the progress of the search for the tramp in such and such a locality. Detectives W. Rider and Thomas Nickle, who were with the search for the murderer as far as the Province of Ontario, have been successful. Word was received here from Streetsville that a one-legged tramp had been arrested on suspicion, but his description did not in any respect resemble that of the murderer, and he was allowed to go.

SURVEYING BY PHOTOGRAPHY

IT HAS REACHED ITS HIGHEST PERFECTION IN THE DOMINION.
Canada, and His Majesty's Work in This Direction. The New Method Greatly Improves the Accuracy of the Survey. The One-Color Surveying Camera.

Photography, as the application of photography to surveying, is far from being a novel application of camera work. It is an old method, and has been used for many years. It is a method which has reached its highest perfection in the Dominion.

One of the most extensive uses of this process is Mr. D. Deville, the Surveyor-General of Canada, who writes in his book on the subject has very ably advanced the use of photography, and has shown that the use of a photographic camera in place of the usual theodolite is a method which has reached its highest perfection in the Dominion.

It is a common habit with English acrobats to distinguish their transients from the permanent residents of the middle initial. Mr. Moore, I note, calls his American millionaire friend P. Norton. All the details which would be needed when dealing with the picture for measurement and plotting. To prevent any possibility of error, the camera is mounted on a tripod, and the lens is adjusted to position by the instrument maker, and is, of course, provided with no means of focusing.

It is a common habit with English acrobats to distinguish their transients from the permanent residents of the middle initial. Mr. Moore, I note, calls his American millionaire friend P. Norton. All the details which would be needed when dealing with the picture for measurement and plotting.
