The copy filmed here has been reproduced thanks
to the generosity of:

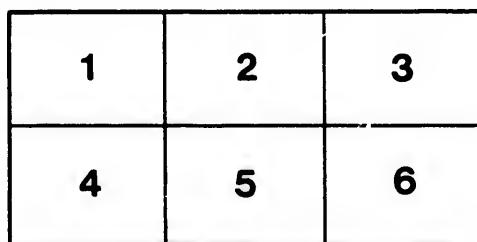

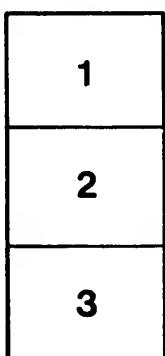

Seminary of Quebec
Library

The images appearing here are the best quality
possible considering the condition and legibility
of the original copy and in keeping with the
filming contract specifications.

Original copies in printed paper covers are filmed
beginning with the front cover and ending on
the last page with a printed or illustrated impres-
sion, or the back cover when appropriate. All
other original copies are filmed beginning on the
first page with a printed or illustrated impres-
sion, and ending on the last page with a printed
or illustrated impression.

The last recorded frame on each microfiche
shall contain the symbol → (meaning "CON-
TINUED"), or the symbol ▽ (meaning "END"),
whichever applies.

Maps, plates, charts, etc., may be filmed at
different reduction ratios. Those too large to be
entirely included in one exposure are filmed
beginning in the upper left hand corner, left to
right and top to bottom, as many frames as
required. The following diagrams illustrate the
method:

L'exemplaire filmé fut reproduit grâce à la
générosité de:

Séminaire de Québec
Bibliothèque

Les images suivantes ont été reproduites avec le
plus grand soin, compte tenu de la condition et
de la netteté de l'exemplaire filmé, et en
conformité avec les conditions du contrat de
filmage.

Les exemplaires originaux dont la couverture en
papier est imprimée sont filmés en commençant
par le premier plat et en terminant soit par la
dernière page qui comporte une empreinte
d'impression ou d'illustration, soit par le second
plat, selon le cas. Tous les autres exemplaires
originaux sont filmés en commençant par la
première page qui comporte une empreinte
d'impression ou d'illustration et en terminant par
la dernière page qui comporte une telle
empreinte.

Un des symboles suivants apparaîtra sur la
dernière image de chaque microfiche, selon le
cas: le symbole → signifie "A SUIVRE", le
symbole ▽ signifie "FIN".

Les cartes, planches, tableaux, etc., peuvent être
filmés à des taux de réduction différents.
Lorsque le document est trop grand pour être
reproduit en un seul cliché, il est filmé à partir
de l'angle supérieur gauche, de gauche à droite,
et de haut en bas, en prenant le nombre
d'images nécessaire. Les diagrammes suivants
illustrent la méthode.

INTRODUCTION.

The Toronto Magnetic and Meteorological Observatory is situated in the grounds of the University of Toronto, in latitude 43° 39'.4 N., longitude 5h. 17m. 33s. W., 108 feet above Lake Ontario, and 342 feet above the level of the sea.

Prior to the spring of 1853, the Observatory at Toronto, in common with those established at the recommendation of the Royal Society of London, at other colonial stations, was maintained by the British Government, and was under the general control of Major, now General, Sir Edward Sabine, of the Royal Artillery.

The first Director, Lieut. Riddel, R. A., arrived in Canada in the summer of 1839, accompanied by the following non-commissioned officers as assistants:

Messrs. JOHNSTON (1),
" WALKER (2),
" MENZIES (3).

(1.) Now Assistant Secretary to the Canadian Institute.

(2.) Deceased in June, 1865.

(3.) Now Senior Assistant at the Observatory.

After examining various sites, Lieut. Riddel finally gave the preference to Toronto, where a grant of 2½ acres belonging to the University of Toronto (then the University of King's College), was made by the Council of the University, with the sole condition that the building to be erected should not be appropriated to any other purpose than that of an observatory, and should revert to the University if the Observatory should be discontinued.

The first observatory building was completed in September, 1840, the observations prior to that date having been carried on in a barrack in Bathurst street.

Lieut. Riddel was succeeded early in 1841, by Lieut. Younghusband, R. A., who finally gave up his charge to Lieut. Lefroy, R. A.,* in the autumn of 1844. The latter officer continued to be Director till the spring of 1853.

* Now General Lefroy, and Governor of Bermuda.

Further details concerning the early history of the Observatory, including the circumstances which led to its establishment by the Imperial Government, are given in the introduction to the first volume of the observations, published under the superintendence of General Sabine, which, together with the second and third volumes, contain the magnetical and meteorological observations from 1840 to 1848.

From the spring of 1853, when the observatory ceased to be an Imperial establishment, it has been maintained by and under the control of the general Government of Canada.

It is intended in the present volume to give a very brief summary of the principal results derived from the magnetical and meteorological observations from the establishment of the Observatory to the end of 1871, together with tables of the daily observations from 1863 to 1871, both inclusive. Unless it is stated to the contrary, it must be understood that discussions of observations prior to 1853 have been abridged from the publications of General Sabine.

As details regarding the several instruments and their adjustments are described at length in the three first volumes (1840 to 1848), and in the three volumes, 1853-62, they are omitted here.

MAGNETICAL OBSERVATIONS.

ABSOLUTE DECLINATION.

In Table I. are given the monthly and annual values of the declination in every case in which they could be procured.

The series may be divided into three principal groups: from 1845 to 1851; from 1856 to 1864; and from 1865 to 1871.

Secular change.

According to General Sabine, the monthly determinations in the first group furnish 84 equations of the form $\psi = \psi' + ay$; in which ψ is the most probable declination at the mean epoch, July 1st, 1848; ψ' the observed declination in any other month; (a) the interval in months between the date of ψ' and July 1st, 1848, (a) being regarded as positive for dates later than the mean epoch; and (y) the monthly secular change.

From these equations were obtained $\psi = 1^\circ 34'.91$; and $y = 0'.1627$, or $12y = 1.952$, the mean annual increase of west declination.

Probable error of the monthly determinations.

From the 84 equations the following are derived:

$$\psi_1 = 1^\circ 34'.91 + 0'.1627 a_1,$$

$$\psi_2 = 1^\circ 34'.91 + 0'.1627 a_2,$$

&c., &c., &c.

$$\psi_{84} = 1^\circ 34'.91 + 0'.1627 a_{84},$$

as the most probable values of the declination in the several months in the group. From the differences between these and the observed values, the probable error of a single monthly determination was found to be $\pm 0'.75$, and the probable error of the mean determination $\pm 0'.08$. The probable errors include the effects of disturbance and of mean annual variation.

By a method similar to the one described above, the mean monthly increase of westerly declination, derived from the 108 equations furnished by the monthly determinations in 1856 to 1864, was found to be $0'.2606$; the probable error of a single monthly determination was $0'.74$; and the probable error of the mean of the group, ($2^\circ 10'.04$), corresponding to July 1st, 1860, was $0'.071$.

Again from the 84 equations, similarly deriv'd from the later group, 1865 to 1871, the mean monthly increase was found to be $0'3127$; the probable error of a single monthly determination was $0'99$; and the probable error of the mean, ($2^{\circ} 34'62$), corresponding to July 1st, 1868, was $0'109$.

Annual variation.

The process of computing the annual variation of the declination is exhibited in Tables II., III., IV.

Table II. gives the monthly means of the observed declinations derived from each of the three groups, 1845-51, 1856-64, and 1865-71, together with the corrections for secular change, needful for reducing them to their respective mean epochs, July 1st, 1848, 1860, and 1868. In Table III., the monthly means are reduced to the mean epochs; and, finally, in Table IV., are shewn the annual variations, obtained by subtracting the annual mean of each group from the several reduced monthly means.

INCLINATION.

The monthly and annual means of inclination, from 1841 to 1871, are given in Table V.

From 1841 to 1852, the annual variation was shown to be approximately expressed by a formula which, when modified so as to harmonize with the notation adopted further on, is as follows:

$$\text{Annual variation} = 1'.11 \sin(n \times 30^\circ + 122^\circ);$$

where (n) is the time measured from January 15th, the unit being the twelfth part of the year.

Making $n = 0$, $n = 1$, &c., $n = 11$, the mean annual variations for the several months are as follows:

Jan.	Feb.	Mar.	April.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.
+0.94	+0.52	-0.04	-0.59	-0.98	-1.11	-0.94	-0.52	+0.04	+0.59	+0.98	+1.11

This series shews a maximum in December and a minimum in June, with a range from one solstice to the other of $2'.22$.

* When the years 1853-54-55 were incorporated with the preceding twelve years, the conclusion arrived at respecting the annual variation of inclination was that, after the elimination of secular change, the inclination in June or July is lower than in the previous January and the succeeding December, by an amount which may be taken approximately as $1'.71$. In

* The investigation, including 1853-55, was made by Sir E. Sabine.

subsequent years the irregularities in the inclination, whether occasioned by disturbances or by other causes, are sufficient to mask the annual variations which are so distinctly marked in earlier years.

Annual variations and secular change of Inclination in the years 1858-71.

From the fourteen years we find the mean inclination to be $75^{\circ} 20' .88$, which would correspond to January 1st, 1865, if the inclination were assumed to decrease uniformly. Combining this mean and the several yearly means, fourteen equations were constructed of the form $ax = d$, where (x) is the most probable annual decrease; (a) the intervals in years or fractions of a year from the mean epoch, January 1st, 1865, (a) being positive for dates prior to the mean epoch, and (d) the excess of the corresponding yearly mean above $75^{\circ} 20' .88$. The fourteen equations give $x = 0' .704$; whence the approximate mean monthly secular decrease is $0' .059$.

Also the probable error of a single annual mean is $0' .52$, and the probable error of the mean for January 1st, 1865, is $0' .14$.

In the following Table are shewn—

- (1.) The monthly means of inclination in the fourteen years uncorrected for secular change;
- (2.) The corrections for secular change;
- (3.) The minutes of the monthly means corrected for secular change; the degrees (75°) being omitted to save space;
- (4.) The annual variations from the preceding line.

	Jan.	Feb.	Mar.	April.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.	Mean
Mon. means	75°												
14 years....	20'.00	21'.00	21'.35	21'.41	21'.24	20'.04	20'.21	20'.50	20'.76	20'.00	20'.74	20'.08	20'.20
Cor. for secular change.....	-.32	-.28	-.20	-.14	-.08	-.02	+.02	+.08	+.14	+.20	+.20	+.32	+.32
Cor'd monthly means.....	20.67	20.80	21.15	21.27	21.10	20.52	20.23	20.04	20.00	21.19	21.00	21.00	21.00
Annual varia- tions.....	-0.21	-0.08	+0.27	+0.39	+0.28	-0.38	-0.05	-0.24	+0.02	+0.31	+0.12	+0.12	+0.12

From the third and fourth lines of the Table just given, it is obvious that the annual variation cannot be expressed by one circulating term. In fact, the actual variations in the fourth line are given by the following formula, in which the coefficient of the second term is double that of the first:

$$\begin{aligned} \text{Variation} &= 0' .18 \sin (n \times 30^{\circ} + 74^{\circ}) + 0' .36 \sin (2n \times 30^{\circ} + 265^{\circ}) \\ &\quad + 0' .09 \sin (3n \times 30^{\circ} + 139^{\circ}) + 0' .04 \sin (4n \times 30^{\circ} + 284^{\circ}) \\ &\quad + 0' .07 \sin (5n \times 30^{\circ} + 188^{\circ}) \\ &\quad + 0' .02 \sin (6n \times 30^{\circ} + 270^{\circ}). \end{aligned}$$

If all the terms but the two first be omitted in the above formula, the variations of the dip in the several months will be as follows:

Jan.	Feb.	Mar.	April.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.
-0.19	-0.03	+0.28	+0.41	+0.16	-0.28	-0.53	-0.38	+0.02	+0.31	+0.25	-0.03

ABSOLUTE HORIZONTAL FORCE.

The monthly and annual means of the horizontal force are shewn in Table VI.

The methods by which they were obtained were precisely the same as those described in Vol. III. of the early series of Toronto observations; but subsequent to July, 1858, the determinations were from observations in two days in each month, two sets of vibrations with deflections at two different distances being taken in each day. The coefficient of induction (μ) was determined by experiments similar to those employed by Mr. Welsh, of Kew, and described in Vol. III.

The partial determinations, after being reduced to the mean Bifilar reading of the day, were afterwards reduced to the normal mean of the month.

Secular change.

According to Sabine, the mean annual secular change of horizontal force from 1845 to 1852 was $-0.00371 \pm .00091$. From a recent investigation it has been found that the mean *monthly* secular change, obtained from 84 equations which are furnished by the seven years, 1845-51, was -0.00022 , and the probable error of a single monthly determination $.00274$.

By examining the column of annual means, it is evident that the progressive change was converted into an increase during the latter part of the series.

From the fourteen years, 1851 to 1871, the mean annual increase was $.00148$.

Annual variation of horizontal force.

From the provisional determinations of horizontal force, from 1845 to 1851, (see p. xci. of 2nd volume,) Sabine inferred that the annual variations could be expressed by the formula :

$$\text{Variation} = .002 \sin (n \times 30^\circ + 312^\circ),$$

(n) being the months or parts of a month reckoned from January 15th ; and that the horizontal force had a maximum in June, and a minimum in December, with a total range between the solstices of $.0038$.

The annual variations have been also deduced from the monthly means of the fourteen years, 1858-1871, by the process shewn below:

	Jan.	Feb.	Mar.	April.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.	Mean
Mon. means in 14 years..	3.4397	3.4805	3.4893	3.4000	3.4945	3.4938	3.4940	3.4029	3.4914	3.4895	3.4907	3.4915	3.4915
Cor. for secular change	+ 7	+ 6	+ 5	+ 3	+ 2	+ 1	- 1	- 2	- 3	- 5	- 6	- 7	
Cor. monthly means.....	3.4904	3.4901	3.4898	3.4903	3.4947	3.4939	3.4948	3.4927	3.4911	3.4890	3.4901	3.4908	
Annual varia- tions.....	-.0011	-.0014	-.0017	-.0012	+.0032	+.0024	+.0033	+.0012	-.0004	-.0025	-.0014	-.0007	

The corrected monthly means exhibit considerable irregularity, and the variations deduced from them can only be approximately expressed by two terms of the general formula. The expression is,

$$\text{Variation} = .0022 \sin(n \times 30^\circ + 290^\circ) + .0014 \sin(2n \times 30^\circ + 127^\circ).$$

The annual variations deduced from the monthly means of General Sabine are expressed more nearly by the introduction of a second term, namely, $.001 \sin(2n \times 30^\circ + 165^\circ)$.

TOTAL FORCE.

The mean monthly values of total force (φ) deduced from $\varphi = X \sec \theta$, (where X and θ are the corresponding values of the horizontal force and inclination,) are given in Table VII.

Secular change.

From the years 1845-51, Sabine inferred that there was an annual secular increase in the total force of .0052. A cursory examination will shew that, on the whole, the subsequent change has been a decided *decrease*.

If the whole series be divided into groups of four years each, we find the means and the changes to be as follows:

YEARS.	1845-48.	1849-52.	1850-53.	1850-53.	1864-67.	1868-71.
Means.....	13.9218	13.9356	13.8566	13.8118	13.7993	13.7303
Change.....		+.0138	-.0790	-.0453	-.0115	-.0190
Change in one year		+.00345	-.01129	-.01182	-.00287	-.00475

From the fourteen years, 1858-71, the mean annual change found by least squares was — 0.0049.

Annual variation.

Assuming the mean *monthly* change in the last fourteen years to be — 0.0004, the monthly means for this period, with the same means corrected for secular change are shewn below:

	Jan.	Feb.	Mar.	April.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.	Mean
Mon. means													
14 years	13.7978	13.7981	13.8013	13.8059	13.8209	13.8069	13.8080	13.8041	13.8010	13.7972	13.7979	13.8006	13.8092
Cor. for secular change	- 23	- 18	- 14	- 10	- 6	- 2	+ 2	+ 6	+ 10	+ 14	+ 18	+ 23	
Cor. monthly means	13.7955	13.7963	13.8004	13.8049	13.8203	13.8067	13.8068	13.8047	13.8020	13.7980	13.7907	13.8020	
Annual varia- tions	- .0077	- .0060	- .0028	+ .0017	+ .0171	+ .0035	+ .0036	+ .0015	- .0019	- .0040	- .0035	- .0003	

These monthly means shew considerable irregularity, and in fact their variations cannot be expressed with precision except by the employment of six terms of the usual formula. The variations are given approximately by the expression,

$$\text{Annual var.} = .0065 \sin(n \times 30^\circ + 302^\circ) + .0040 \sin(2n \times 30^\circ + 197^\circ).$$

SEPARATION AND DISCUSSION OF THE LARGER MAGNETIC DISTURBANCES.

In the following investigations the magnitude of a disturbance or abnormal deviation of a magnetic element is expressed by the amount by which its value differs from the normal proper to the day and hour.

A disturbance is regarded as large where it equals or exceeds a certain limit. The limits employed by Gen. Sabine in the third Toronto volume, and adopted in subsequent reductions, were 5' for the declination, 1' for the inclination, .0012 for the horizontal force (or .0012 of the whole horizontal force), .00026 for the vertical force, and .0004 for the total force.

To estimate the magnitude of a disturbance it was necessary to adopt for each instrument a series of normal readings proper to each hour, and comparable with the observations made at that hour in a group of days sufficiently near together to be inappreciably affected by annual variations or secular and instrumental changes.

The normal scale reading for each observation hour was calculated by taking the average of all the readings at like hours, in a month or more suitable group of consecutive days, omitting those days in which the readings differed from the normal *finally adopted* by an amount equivalent to the limit determined on for the element under discussion.

Before this process could be applied to the force instruments, their readings were reduced to a uniform temperature of 55° by the application of the proper corrections.

The temperature corrections applied to the scale readings were in every case derived from the observations made with the instrument, by comparing the change of scale reading with the accompanying change in the attached thermometer.

The following was the mode of obtaining the temperature corrections. Let t_1 , t_2 , t_3 be the mean temperatures of three groups of days (as shewn by the attached thermometer,) each group consisting of three or four days, and so selected that $t_1 - t_2$ and $t_3 - t_2$ may have the same signs. Also, let R_1 , R_2 , R_3 , be the corresponding mean scale readings of the instrument. Then the change in the scale reading corresponding to a change of one degree in the temperature, or $\frac{\Delta R}{\Delta t}$, will be approximately equal to

$$\frac{R_1 - 2R_2 + R_3}{t_1 - 2t_2 + t_3}.$$

The approximate scale equivalent will also be given by an expression of the same form, where t_1 , t_2 , t_3 , are the mean temperatures of three equidistant quarters, in order of time; t_1 and t_3 being the temperatures either of two quarters of the same name, or of a spring and autumn quarter, and t_2 the temperature of the quarter midway between the other two.

Applying the same process to several similar combinations, the scale value equivalent to 1° of Fahrenheit is found finally by an expression of the form $\frac{\Sigma (R_1 - 2R_2 + R_3)}{\Sigma (t_1 - 2t_2 + t_3)}$.

The disturbances of the horizontal and vertical components of the force being found, the corresponding abnormal deviations $\frac{\Delta \varphi}{\varphi}$, of the total force φ , and $\Delta \theta$, of the inclination, were calculated by the formulae

$$\frac{\Delta \varphi}{\varphi} = \cos^2 \theta \frac{\Delta X}{X} + \sin^2 \theta \frac{\Delta Y}{Y};$$

$$\text{And } \Delta \theta = \frac{1}{2} \sin 2\theta \left(\frac{\Delta Y}{Y} - \frac{\Delta X}{X} \right);$$

where $\frac{\Delta X}{X}$ and $\frac{\Delta Y}{Y}$ represent the contemporaneous abnormal deviations of the horizontal and vertical components of the force, where one or both of them were disturbed.

Of the resulting values of $\frac{\Delta \varphi}{\varphi}$ and $\Delta \theta$, those were retained as disturbances which equalled or exceeded the limits determined on for φ and θ , namely .0004 for φ , and 1' for θ .

The discussion of the disturbances of the hourly observations in the five years, 1st July, 1843, to 30th June, 1848, are abridged from the third Toronto volume, published by General Sabine.

Disturbances of Declination.

The number of disturbed observations amounted to 2,172 in the five years of hourly observations ending 30th June 1848, being about 1 in 17 of the whole.

The aggregate values in minutes of arc in the different years, are shewn in columns 1, 2, 3 of Table VIII., where (2) contains the easterly disturbances, (3) the westerly, and (1) the two combined.

Expressing the annual sums in terms of their respective means for five years, 3944.5, 2213.4, and 1731.1, we obtain the ratios given in columns 4, 5, 6.

The total aggregate of easterly disturbances in five years was 11066.9, and of westerly 8655.4; shewing that the general effect of the larger disturbances is to decrease the westerly declination, and that the easterly values preponderate in the ratio 1.28 to 1.

Table X. is computed by a process analogous to that just given. The columns 1, 2, 3 contain the aggregate sums of the disturbances, and of their easterly and westerly constituents, during the five years in each of the twelve months, and 4, 5, 6 contain these sums expressed in terms of the means of the twelve monthly sums.

From column 4 it is seen that September and April are the months of greatest disturbance of declination; and January and June the months of least disturbance, and that the progression from the maxima to the minima, and from the minima to the maxima, is continuous.

From columns 5 and 6, it is seen that the same general law prevails in both easterly and westerly disturbances, when viewed separately as when viewed conjointly; the equinoxes are the epochs of maximum, and the solstices of minimum disturbances.

The ratios which give the preponderance of easterly over westerly disturbances, shew a tendency towards a maximum at the June solstice, and a minimum at the December solstice. This is seen from the following table containing the ratios of the easterly to the westerly values :

May .. 1.29		Aug... 1.96	Nov... 0.77	Feb.. 1.27
June.. 3.82	{ 2.17	Sept... 1.29	Dec... 0.74	Mar... 1.40
July .. 1.41		Oct... 1.21	Jan... 1.29	Apr... 1.04

In Table XI. the ratios shew the aggregate sums of the disturbances in the five years in each of the twenty-four hours, expressed in terms of the means of the twenty-four hourly sums.

Referring to column (1), from 10 A.M. to 7 P.M. inclusive, the ratios are invariably below unity, and from 8 P.M. to 9 A.M. inclusive, as invariably above unity. The hour of least disturbance is 1 P.M., and of greatest 9 P.M. The progression during the days is uninterrupted to and from the minimum at 1 P.M., but is much less regular during the night.

Referring to columns (2) and (3), the easterly disturbances are below the average during the day, or from 5 A.M. to 5 P.M., and above the average from 6 P.M. to 4 A.M.; the westerly are below the average from noon to

noon to

midnight inclusive, and above the average, with a single exception (at 3 A.M.), from 1 A.M. to 11 A.M. inclusive.

The easterly have a maximum and the westerly a minimum at 9 P.M.; the westerly have a maximum at 8 A.M., and the easterly have minima nearly equal at 9 A.M. and 1, 2, 3 P.M. Excepting from noon to 5 P.M., when both easterly and westerly disturbances are small, and from 1 A.M. to 5 A.M., when they are both large, there is a systematic tendency to a diminution of easterly disturbance when westerly disturbance prevails, and *vice versa*.

In Table XII, columns (1) and (2) contain the aggregate sums of the easterly and westerly disturbances at each of the twenty-four hours, being the numbers from which columns (2) and (3) of Table XI are derived. Column (3) gives for each hour the excess of easterly disturbance over westerly, or of westerly over easterly, in the aggregate values of the five years; and column (4) the mean effect at each hour, obtained by dividing the accumulated excess in the five years in column (3) by 1552, the number of days of observation. Column (4) exhibits, therefore, the *mean diurnal variation* produced on a general average by the disturbances amounting to or exceeding 5' of arc, and which is superimposed upon the more regularly occurring diurnal variation derivable from the great body of the observations, after the disturbed observations have been separated.

It is seen from this column (4) that the general effect of the greater disturbances is to produce a maximum easterly deflection of the magnet of 0'.87 at 9 P.M., and a maximum westerly deflection of 0'.52 at 8 A.M., the intermediate progression either way being continuous, and only interrupted by a few slight irregularities in the afternoon, when the disturbances are fewest and of least amount.

Disturbances of Horizontal Force.

The number of the Bifilar observations, in which the amount of disturbance reached the limit .0012 in the five years, was 2968, being about 1 in 12 or 13 of the whole body of the observations.

From Table VIII., columns 7, 8, and 9, the numbers in which are obtained in a manner precisely similar to that employed for columns 4, 5, and 6 for the declination, we find a progressive increase in the annual value of the disturbed observations from the year ending June, 1845, to the year ending June, 1848. The aggregate value in the year ending June, 1844, was slightly greater than in the following year, in consequence of the substitution of the observations of 5 months, Oct., 1842, to Feb., 1843, for the 5 months, Oct. 1843, to Feb., 1844, when the vertical force magnet was dismounted.

Dividing the aggregate values into disturbances which increase, and those which diminish the force, it appears that the ratio of the disturbances decreasing the force to those which increase it, was on the average of 5 years, 6.4 to 1.

Comparison of the disturbances of Horizontal Force in the different months.

From the ratios in column (7) of Table X., it is seen that April and September are the months of maximum disturbance, and January and June of minimum disturbance. The amount of disturbance at the Equinoxes (April and September,) is to that at the Solstices (January and June,) in the ratio of between 3 and 4 to 1.

Comparison of the disturbances in the Horizontal Force in different hours.

From column (4) of Table XI., the amount of disturbance is seen to be systematically greater at all the hours from 10 P.M., to 10 A.M., inclusive, than at any hour from 11 A.M. to 9 P.M., inclusive. The ratios are equal to or above unity from 10 P.M. to 10 A.M., inclusive, and below unity from 11 A.M. to 9 P.M., inclusive. The maximum is at 2 A.M., and the minimum intermediate between 2 and 6 P.M., during which latter hours there is little variation in the amount. There is also a secondary maximum about 7 or 8 A.M., preceded by a secondary minimum about 5 or 6 A.M.

From columns (5) and (6) of Table XI., shewing the corresponding ratios when the disturbances at the different hours are separated into those which increase, and those which diminish, the force, we learn that, while the disturbances which increase and those which diminish the force are governed in amount by periodic laws depending on the solar hours, the laws are different in the two cases.

The disturbances which increase the force have a maximum at 4 P.M., and a minimum from 2 to 4 A.M.

From 10 A.M. to 8 P.M., inclusive, the ratios, with one exception, are above unity, and from 9 P.M. to 9 A.M., inclusive, without an exception below unity. It is in the hours of the day, consequently, that the disturbances which increase the force have their greatest prevalence: while the hours of the night are comparatively tranquil. The converse law holds in regard to the disturbances which decrease the force; from 10 P.M. to 9 A.M., the ratios exceed unity at every hour, and from 10 A.M. to 9 P.M., they are uniformly less than unity. The maximum is at 2 A.M., and the minimum at 4 P.M.

Disturbances of Vertical Force.

The number of the vertical force observations in which the amount of disturbance reached the limit, .00026, of the vertical force, was 5220, or about 1 in 7 of the whole.

From Table VIII., column (10), we find a progressive increase in the annual amount of the disturbances from the year ending June, 1845, to the year ending June, 1848; and from columns (11) and (12) it appears that this is also true with respect to the disturbances of contrary signs. Dividing the aggregate values into disturbances which increase, and those which diminish the vertical force, we find that the disturbances which diminish the vertical force are to those which increase it, in the ratio 1.4 to 1 nearly, on the average of the five years.

Disturbances of the Vertical Force in the different months.

From the ratios in column (7) of Table X it is seen that April and September are the months of maximum disturbance, and January and June the months of minimum disturbance. The progression from the maxima to the minima, and *vice versa*, is continuous, with the exception of December, caused by excessive disturbance in December, 1847.

On the whole in the disturbances of the vertical force, as in the declination and horizontal force, the maxima occur about the equinoxes, and the minima about the solstices, the former being to the latter in the ratio of nearly 3 to 1.

From columns (9) and (10) of Table X, in which the monthly values of the disturbances which increase the force, and those which diminish the force, are expressed in terms of their respective mean monthly values, we find the same general law prevailing as in column (8): the equinoxes being the epochs of maxima, and the solstices of minima.

It has been stated that on the average of the year the disturbances which diminish the vertical force preponderate over those which increase it in the ratio of 1.4 to 1 nearly. This preponderance, however, is subject to a periodic variation, and to have a maximum about the northern solstice, and a minimum at the winter solstice. The comparative preponderance is shewn by the ratios in Table X, column (11), which are the monthly values of the disturbances which decrease the vertical force, expressed in terms of those which increase it.

From the comparison of easterly and westerly disturbances of declination made in page xxvii of Vol. II of Toronto Observations, evidence is shewn of an analogous periodic variation. In the north solstitial months, easterly disturbances preponderate, and in the south solstitial months westerly disturbances preponderate.

Disturbances of Vertical Force in the different hours.

From Table XI, column (7), the aggregate disturbance in the five years has a maximum at 3 a.m. and a minimum at 11 a.m., with a secondary maximum at 5 p.m. and a secondary minimum at 9 p.m. There is therefore a double progression; and between the successive maxima and minima,

the progression is continuous. From 8 a.m. to 11 p.m., except from 4 to 7 p.m. inclusive, the ratios are less than unity; and from midnight to 7 a.m. the ratios exceed unity.

From columns (8) and (9) of the same Table, wherein the ratios are derived respectively from the disturbances which increase, and those which diminish the vertical force, we find that in the disturbances which increase the vertical force the values are highest from noon to 10 p.m.; they exceed unity or the mean hourly value from 1 to 9 p.m., and exceed twice that value from 4 to 7 p.m. The hours of maximum and minimum are approximately 5 p.m. and 5 a.m. In the disturbances which diminish the force the values are least from 10 a.m. to 9 p.m. inclusive; the ratios are below unity from 9 a.m. to 10 p.m. inclusive, and above unity from 11 p.m. to 8 a.m. The maximum is well marked at 3 a.m.; and the minimum, which is not so well marked, occurs in the afternoon. When the ratios are highest in the disturbances increasing the force, they are generally lowest in those which decrease the force, and *vice versa*: but the periodic laws in the two cases are not strictly the converse of each other.

Disturbances of the Total Force.

The aggregate values of the disturbances in the different years, each ending 30th June, together with the aggregate values respectively of those which increase and those which diminish the force, are given in columns 1, 2 and 3, of Table IX. Expressing these in terms of the means of the five years given at the foot of the respective columns, we have the ratios in columns 4, 5 and 6.

The general effect of the disturbances is to decrease the total force, the ratios of the disturbances decreasing the force to those which increase it being on the average 1.94 to 1.

The values of these ratios in the several years are given in column (7) of Table IX.

Distribution of Disturbances of Total Force in the different months.

The aggregate values of the disturbances of total force in the several months, expressed in terms of the mean value for the twelve months, are shewn in column (12) of Table X, in which columns (13) and (14) contain the corresponding ratios when the disturbances are separated into those which increase and those which diminish the force.

The ratios in columns (12) and (13) shew an exception to the law observed with reference to the annual distribution of the disturbance of declination, namely, that the maxima and minima occur respectively at or near the equinoxes and solstices.

This exception is due to the anomalous character of December, 1847; for if the year ending 30th June, 1848, be omitted, the ratio for December

becomes less than unity for the disturbances which increase the total force, as well as for the disturbances considered without regard to sign. As the excessive disturbances in December, 1847, were chiefly those which *increase* the total force, the progression in the disturbances which diminish the force from a maximum to a minimum, and the converse, is continuous and uninterrupted.

Distribution of the Disturbances of the Total Force at the different hours.

The ratios which express this distribution are contained in columns (10), (11), and (12) of Table XI.

In the case of the disturbances, without regard to sign, shewn in column (10), it is seen that from 8 a.m. to 11 p.m. inclusive, the disturbance at every hour is less than at every hour from midnight to 7 a.m. inclusive. It is a minimum at 11 a.m. and a maximum at 3 a.m. From the maximum at 3 a.m. to the minimum at 11 a.m. the progression is continuous and uninterrupted; from the minimum at 11 a.m. to the maximum at 3 a.m. the progression suffers a slight interruption from 5 p.m. to 9 p.m.; but from the latter hour to the principal maximum at 3 a.m. the progression is continuous.

In columns (11) and (12) it is seen that the disturbances which increase the force, and those which diminish it, are so related that, for the most part, at the hours when the one augments in value, the other diminishes in value, and *vice versa*.

To determine the mean effect produced in the total force by the disturbances at the different hours, the aggregate amount in five years of the forces of opposite signs are collected in columns (5) and (6) of Table XII. In column (7) are shewn for each hour the preponderance of the disturbances of either sign, or the *whole* effect in the five years. Finally, in column (8) we have the mean daily effect.

From this column we learn that the law of that part of the diurnal variation, which is due to disturbances, is as follows:—

From 11 a.m. to 9 p.m. inclusive, the disturbances augment the force.

From 10 p.m. to 10 a.m. inclusive, they diminish it.

The hour of greatest augmentation is 5 p.m.

The hour of greatest diminution is 3 a.m.

The greatest diminution is nearly twice as great as the greatest augmentation.

The hours of most rapid change are from 7 to 8 a.m. and from 11 p.m. to midnight.

From the greatest diminution at 3 A.M. to the greatest increase at 5 P.M., the progression is continuous; and from 5 P.M. to 3 A.M., it is also continuous, with the exception of a small interruption at 7 P.M.

Disturbances of Inclination.

The aggregate values of the disturbances of Inclination in the five years, each ending 30th June, when taken together, and when separated into those which increase and those which diminish the inclination, are shewn in columns (8), (9), and (10), of Table IX.

Dividing the several values in (8) by the mean, 1318.1, at the foot of the column, we have the ratios in column (11). The ratios in columns (12) and (13) are found in a similar manner from (9) and (10).

The general effect of the larger disturbances is evidently to increase the inclination, the ratio of those which increase the inclination to those which diminish it, being as 5.6 to 1, on the average of the five years. The analogous ratios in the separate years, which shew the relative preponderance of the disturbances, which increase the inclination, are given in column (14) of Table IX.

Disturbance of Inclination in the different months.

The ratios shewing the aggregate amount in each month, compared with the mean of the twelve monthly amounts, are given in Table X., column (15). December is the only exception to a periodical variation, which has its maximum at the Equinoxes and its minimum at the Solstices; this apparent anomaly being occasioned by unusual disturbances in December, 1847.

Disturbances of Inclination at the different hours.

The ratios of the aggregates at each hour to the mean hourly value, or average of all hours, are given in column (3), Table XI. The hourly disturbances of the inclination exhibit a double progression. From 7 A.M. to noon, and again from 7 P.M. to 2 A.M., inclusive, the values exceed the mean hourly value: and from 1 P.M. to 6 P.M., and again from 3 A.M. to 6 A.M., inclusive, they fall short of the mean hourly value.

In columns (14) and (15), of Table XI., are shewn the disturbances which increase the inclination, and those which diminish it, expressed in the usual manner.

The disturbances which increase the inclination have two epochs of maxima and two of minima; the principal maximum is at 1 A.M., and the secondary maximum at 7 A.M. The principal minimum is at 4 P.M., and the secondary at 5 A.M.

The disturbances which decrease the inclination are comparatively small at all the hours: they exhibit, however, a systematic tendency to be greater during the day than during the night: their maximum is at 2 P.M., and their minimum at 2 A.M.

The disturbances which increase the inclination preponderate greatly at all hours. The inclination differs in this respect from the declination and

total force, for both of which elements there are certain hours in which disturbances of one sign preponderate, while at other hours the preponderance is of an opposite character.

Effect of the Larger Disturbances on the Diurnal Variation of Inclination.

To ascertain this effect, the aggregate values, at the several hours and of contrary signs, are collected in columns (9) and (10), of Table XII. The differences shewing the preponderance in five years of the disturbances which increased the inclination over those which diminished it, are given in column (11); and finally, by dividing the numbers in column (11) by the total number of days of observation in the five years, are obtained the mean daily effects at each hour, as shown in column (12).

SOLAR DIURNAL VARIATIONS OF THE MAGNETIC ELEMENTS.

The solar diurnal variations obtained directly from the observations consist of two parts, of which one is that due to the disturbances. In column (4) of Table XII, the mean effect of the disturbances on the diurnal variations of declination is given at each hour, those disturbances only being taken into account which equal or exceed $5'$.

When the diurnal variations are derived from the whole of the observations, the march of the north end of the magnet towards the east, which is continuous from the extreme westerly position between 1 and 2 p.m. to the extreme easterly position between 7 and 8 a.m., is interrupted by a small westerly retrogression between 9 p.m. and 4 a.m.; but if the effect of the larger disturbances be deducted, this westerly retrogression is considerably diminished both in amount and continuance.

Again: if it be assumed that the aggregate effect of the *smaller* disturbances be equal and similar to those already separated, and if these effects be also deducted, we have the residual diurnal variation as follows, in which the westerly retrogression is almost wholly obliterated:

Toronto Astron. Time.	0	1	2	3	4	5	6	7	8	9	10	11
Diurnal Variation.	3.91 W	5.04 W	4.78 W	3.75 W	2.39 W	1.25 W	0.66 W	0.46 W	0.34 W	0.35 W	0.09 E	0.18 E
Toronto Astron. Time.	12	13	14	15	16	17	18	19	20	21	22	23
Diurnal Variation.	0.30 E	0.28 E	0.35 E	0.56 E	0.97 E	1.95 E	3.27 E	4.40 E	4.96 E	4.09 E	1.54 F	1.58 W

The mean Solar diurnal Variation of Declination will thus be approximately as follows:

The chief variations are when the sun is above the horizon. The motion of the north end of the magnet towards the east, which during the night was slow, quickens between 4 and 5 A.M., and reaches its eastern extreme a little before 8 A.M. It then returns rapidly towards the west, and attains its westerly extreme about 20 minutes after 1 P.M., the amplitude being about 10'. After reaching its western extreme, the north end of the magnet returns again towards the east at a nearly uniform rate of about 1' per hour, until about 6 P.M., when the slower motion proper to the night begins; a motion which, on the average of the ten hours from 6 P.M. to 4 A.M., is about 0.16' per hour.

In Table XIII are shewn the solar diurnal Variations of Declination for every month, for the two half-years, from April to September, and from October to March, inclusive, and for the year, the larger disturbances, namely, those which equal or exceed 5', having been eliminated.

In Tables XIV and XV are given the corresponding Variations of Horizontal Force, and of Vertical Force.

In Table XVI are shewn the annual and semi-annual means of the solar diurnal variations of Total Force and of Inclination.

In Table XVII are given the semi-annual inequalities of the Declination and Inclination for each hour, with the signs proper to the half-year when the sun is mostly north of the equator. For the other half-year, the signs must of course be changed.

The numbers in the table are taken from Tables XIII to XVI, by subtracting the annual from the semi-annual means of the diurnal variation proper to the half-year, April to September inclusive.

LUNAR-DIURNAL VARIATION.

The existence of a lunar-diurnal variation in one of the magnetic elements, namely, the declination, was discovered in Austria by M. Kreil, from observations taken at Milan and Prague; but Toronto was the first station at which the numerical values, at every lunar hour, of the lunar-diurnal variations of the three elements were published.

The lunar-diurnal variation of each of the elements is a double progression in the 24 lunar hours, having epochs of maximum and minimum symmetrically disposed. In character, therefore, it differs from what might be expected to take place if the Moon were a magnet, *per se*, and accords with the phenomena which might be expected to follow, if she were magnetic only by induction from the Earth. On the other hand, it is believed that the amount of the variation very far exceeds what can be imagined to proceed from the Earth's inductive action reflected from the Moon.

The observations employed in the investigation were the six years of hourly observations of the declination, from 1st July, 1842, to 30th June, 1848, and the five years of hourly observations of the horizontal and vertical forces, commencing 1st July, 1843, and ending 30th June, 1848, but having in the first year of the horizontal and vertical forces, the months of October, November, December, 1842, and January and February, 1843, substituted for the corresponding months in the following year, during which the observations of the vertical force were suspended.

The larger disturbances of each element having been marked for omission, and the hourly normals (excluding the observations so marked) computed, the retained observations were characterized in reference to their lunar relation by small figures signifying the lunar hour to which each observation most nearly corresponded.

In preparing the lunar tables, instead of the scale readings, the *differences* at each hour between these readings and the normals at the same hour, were employed; by which process the diurnal and other variations, depending on the period of the year and the hour of the solar day, were in great part at least eliminated. The means were then taken in every month, at every lunar hour, the signs being regarded: the monthly means were then collected into yearly means: and finally, the means of the yearly means were expressed by the usual formula of sines and cosines.

In this way the variation in the declination was found to be very nearly represented by the formula.

$$\Delta X = 1''\ 05 \sin(a + 168^\circ 52') + 19''\ 186 \sin(2a + 271^\circ 21')$$

a (+) sign indicating an easterly deflection of the north end of the magnet.

The following is the table of the deflections at the several lunar hours calculated from this formula.

Lunar Hours.	Deflections.	Lunar Hours.	Deflections.	Lunar Hours.	Deflections.	Lunar Hours.	Deflections.

2	9'64 "	8	8'20 "	14	8.86 "	20	10'19 "
3	0.14 "	9	0'42 to the west	15	1'04 to the east	21	0'42 "

Comparing these values with the actual deflections, the probable error at each observation hour was found to be $\pm 1''.37$.

In addition to the foregoing formula, three other formulæ were calculated from the means taken for three periods, each of two years, namely,

July 1842 to June 1844, July 1844 to June 1846, and July 1846 to June 1848. These formulæ agree very nearly with one another, and with that obtained from the six years. The number of observations employed in the investigation was 40,543.

Horizontal Force.—The lunar-diurnal variation in the horizontal force may be represented in parts of the whole force by the formula.

$$\Delta X = .0000187 \sin(a + 353^\circ.6) + .0000289 \sin(2a + 13^\circ.5).$$

The number of observations employed was 34,303.

Vertical Force.—The lunar-diurnal variation in the vertical force may be approximately represented by the formula.

$$\Delta Y = .0000377 \sin(a + 182^\circ) + .0000312 \sin(2a + 330^\circ).$$

The number of observations employed was 31,773.

Formulae were also constructed for the variation in both the horizontal and vertical forces, from the means taken over shorter periods; and in each case the results agreed very nearly with the above formulæ.

Inclination and Total Force.—If from the variations of the horizontal and vertical forces, the lunar-diurnal variations of the inclination and total force are calculated, it is found that they follow the same general law as those in the horizontal and vertical forces.

General Conclusions.—The three magnetic elements concur in shewing that the moon exercises a sensible magnetic influence at the surface of the earth, producing in every lunar day a variation in each of the three elements. The westerly maxima of the horizontal deflection of the north end of the magnet synchronize with the moon's superior and inferior passages of the meridian, the easterly maxima with the lunar hours of 6 and 18. The maxima of the increased magnetic force due to the moon's action occur about the lunar hours of 3 and 16; and the minima about the hours of 9 and 20. The maxima of the inclination occur about the lunar hours of 3 and 14, and the minima about 9 and 20. The extent of the variation in the lunar day, or the range between the extremes that are widest apart, is in the declination $38''.33$, in the inclination $4''.4$, and in the total force $.000012$ parts of the whole terrestrial magnetic force at Toronto.

ON THE LARGER DISTURBANCES AND THE SOLAR DIURNAL VARIATIONS IN 1854 AND THE YEARS FOLLOWING.

The observations which form the groundwork of the previous remarks relating to the magnetic disturbances and the solar diurnal variations, were taken at every hour (Sundays excepted) during the five years ending 30th June, 1848.

The observations have been discussed in a very complete manner by General Sir E. Sabine, in the third volume, containing the Toronto observations for the years 1846 to 1848, and published under his superintendence in 1857. Persons interested in such discussions should, if possible, consult that valuable work; but as it is probable that there are many who cannot obtain access to it, the principal facts brought out in the discussions of General Sabine have been reproduced in a condensed form; the arrangement of the tables having been altered for the sake of brevity.

The disturbances in the years from 1854-'62 were discussed in a manner similar to that employed by General Sabine, and were given in a volume published in the year 1863. The results, as far as they went, were generally confirmatory of the conclusions previously arrived at; but as they were based on observations made only six times in each day, the distribution of the disturbances in the different months was of a less distinct character than in the earlier series. The epochs of maxima and minima were slightly changed and the range diminished in amount.

As the observations in and after 1854 were made *six* times only in each day; in order to compare different years it was necessary to separate the aggregate of disturbances at the same six hours from the general aggregate in the early series. The results are given in the volume published in 1863, and are also printed in Table XVIII of this volume.

For the years 1863 to 1871, the annual sums of the disturbances of Declination only, and without reference to direction, have been separated and are given in the following table, together with the annual sums derived from the same six hours in previous years.

TABLE, shewing the aggregate values of the disturbances of Declination, without reference to direction, in the years 1844 to 1871, inclusive; the disturbances being limited to those which were separated from observations made at the hours 6 A.M., 8 A.M., 2 P.M., 4 P.M., 10 P.M. and midnight.*

Years	1844	1845	1846	1847	1848	1849 to 1853	1854	1855	1856	1857	1858	1859
Sums	614'	702'	771'	1373'	1582'	*	1494'	*	366'	423'	961'	1200'
Years	1860	1861	1862	1863	1864	1865	1866	1867	1868	1869	1870	1871
Sums	1695'	1465'	1118'	1760'	1672'	1614'	1988'	1200'	1046'	1941'	1364'	1750'

* In 1849 to 1853 the disturbances were not separated, and in 1855 the observations were partially suspended.

The aggregate sums in this Table for later years certainly do not support the doctrine of a secular periodicity.

The solar diurnal variations of the magnetic elements in the six observation hours from 1856 to 1871 were computed as follows:—

- (1.) For each instrument monthly normals were found in the usual way for each of the six hours.
- (2.) Corrections deduced from Tables on pp. 90-92 of Vol. III, Toronto Observations, were applied to the means of the six normal in each month, whereby approximate values of the mean normals proper to twenty-four hours were obtained.
- (3.) These twenty-four hourly normals being then subtracted from the monthly normals for each observation hour, the remainders reduced by the scale co-efficients, were taken as the diurnal variations at each hour.

In Tables XIX to XXIII are given the means of the monthly diurnal variations deduced from several years, collected into groups; those from the earlier years being taken from pp. 90-92 of Vol. III, Toronto Observations.

In Table XXIV is given for each element, a comparative view of the half-yearly and yearly means of the solar diurnal variations as derived from the observations in three groups of years; namely from 1844-1848, 1856-1862, and 1863-1871; the winter half-year being understood to extend from October to March, and the summer from April to September. By subtracting the annual means from those of the half-year, April to September, we obtain also the semi-annual inequalities for each of the three groups of years.

Table XXV contains a synopsis of those instances of extraordinary disturbance of declination, when the reading at the *ordinary hours* of observation differed from the normals proper to those hours by at least 15'.

Table XXVI contains some examples of continued disturbance. The numbers in the column headed $\Delta \phi$ are the differences of the actual declination from approximate values of the normals proper to the instant of observation.

The analogous differences of the horizontal and vertical forces, being obtained in a similar manner, the corresponding deviations of the inclination and total force were computed from them in the ordinary way, and are entered in the columns headed $\Delta \theta$ and $\frac{\Delta \varphi}{\varphi}$.

TORONTO MAGNETICAL OBSERVATIONS.

TABLE XXV.

DATES (ASTRONOMICAL TIME) AT WHICH UNUSUALLY LARGE DISTURBANCES OF DECLINATION OCCURRED AT THE ORDINARY OBSERVATION HOURS, WITH THE AMOUNT OF ABNORMAL VARIATION OF EACH SUCH DISTURBANCE.

Declination, Abnormal Variation not less than 15'. The (+) sign indicates an Easterly Disturbance, and (-) a Westerly Disturbance.

CONTENTS.

TABLE.

PAGE.

Introduction	
I.—Correction for every fifth day in the year, to be applied to the Temperature observed at Toronto at any of the hours of mean Astronomical time, in order to give the mean temperature of the day.....	1-4
II.—Normal daily means of Temperature, derived from the monthly means of the twelve years, 1841 to 1852.....	5
III.—Normal daily means of Temperature from six daily observations in the ten years 1859 to 1868 inclusive	6
IV.—Monthly and annual means of the Temperature of the Air in each of the thirty-one years from 1841 to 1871, with the monthly and annual means for the whole period, and for three groups of twelve, nine, and ten years respectively. Also, the corresponding approximate means, from observations by the late Rev. Charles Dade, prior to the establishment of the Observatory, and embracing the greater portion of the years 1831 to 1841	7
V.—Monthly means of the daily maxima of Temperature from 1841 to 1871, excluding 1849 to 1852, together with the averages derived from the twenty-seven years, and also from groups of eight, nine, and ten years	8
VI.—Monthly means of daily minima of Temperature from 1841 to 1871, excluding 1849 to 1852, together with the averages derived from the twenty-seven years, and also from groups of eight, nine, and ten years.	9
VII.—Monthly means of the daily ranges of Temperature from 1841 to 1871, together with the averages derived from the twenty-seven years, and also from groups of eight, nine, and ten years. (The years 1849 to 1852 are excluded from the general averages for the sake of uniformity with the two previous Tables).....	10
VIII.—Greatest daily ranges of Temperature in each month from 1841 to 1871, together with the averages derived from the thirty-one years, and also from groups of twelve, nine, and ten years. (NOTE.—The highest daily range in each year is indicated by an asterisk).....	11
IX.—Table containing the absolutely highest Temperature in each month and year, from 1841 to 1871, together with the averages derived from thirty-one years, and also from groups of twelve, nine, and ten years..	12
X.—Table containing the absolutely lowest Temperature in each month and year, from 1841 to 1871, together with the averages derived from thirty-one years, and also from groups of twelve, nine, and ten years..	13
XI.—Monthly and yearly ranges of Temperature from 1841 to 1871, or the difference between the highest and lowest temperatures in each month, and the differences between the highest and lowest temperatures in each year ; also, averages from thirty-one years, and from groups of twelve, nine, and ten years	14
XII.—Averages of the Daily Mean Temperatures in every day in the year, derived from groups of twelve and nineteen years, and the number of days included in each average.....	15-18
XIII.—Mean abnormal variations of Temperature with their proper signs, arranged according to the direction of the wind at the time of observation, in each month, in each quarter, and in the year, from the eight years, 1860 to 1867	19

CONTENTS.

TABLE.	PAGE.
XIV.—Monthly and yearly means of the Diurnal Change of Temperature (exclusive of that due to annual variation), from 6 a.m. to 6 a.m., for the periods 1854-59 inclusive, and 1860-62 inclusive, arranged according to the daily resultant direction of the wind	20
XV.—Monthly and annual means of the Barometric Pressure for each of the twenty-four hours of Toronto Astronomical time, and for the twenty-four hours collectively, from hourly observations in the six years from 1st July, 1842, to 30th June, 1848. (Barometer at $32^{\circ} = 29$ inches + the numbers in the Table)	21
XVI.—Monthly and annual means of the Barometric Pressure in each of the thirty-one years from 1841 to 1871, with the monthly and annual means for the whole period, and for three groups of twelve, nine, and ten years respectively; also the probable variability of the monthly and annual means in a single year. (Barometer at $32^{\circ} = 27$ inches + the numbers in the Table)	22
XVII.—Highest readings of the Barometer observed in each month, and in the year, from 1841 to 1871, together with the averages derived from thirty-one years, and from groups of twelve, nine, and ten years. The month in which the highest reading of each year occurs is indicated by an asterisk. (Barometer at $32^{\circ} = 27$ inches + the numbers in the Table)	23
XVIII.—Lowest readings of the Barometer observed in each month and in the year, from 1841 to 1871, together with the averages derived from thirty-one years, and from groups of twelve, nine and ten years. (The month in which the lowest reading of each year occurs is indicated by an asterisk. Barometer at $32^{\circ} = 27$ inches + the numbers in the Table)	24
XIX.—Range of the Barometer, expressed in inches, in each month and in the year, from 1841 to 1871, together with the averages derived from the thirty-one years, and from groups of twelve, nine, and ten years	25
XX.—Normal daily means of the Barometric Pressure and the Pressure of Vapour, on every 5th or 6th day in the year, from observations in the years 1859-68 inclusive	26
XXI.—Changes in Barometric Pressure, Pressure of Dry Air, and Pressure of Vapor, which take place in two hours, during winds from each of the thirty-two points of the compass	27
XXII.—Monthly and annual means of the Pressure of Dry Air, for each of the twenty-four hours of Toronto Astronomical time, and for the twenty-four hours collectively, from hourly observations in the six years, 1st July, 1842, to 30th June, 1848	28
XXIII.—Monthly and annual means of the Pressure of Dry Air from 1841 to 1871 (omitting 1847), with the monthly and annual means for the whole period, and for three groups of eleven, nine, and ten years.. .	29
XXIV.—Monthly means of Temperature, Barometric Pressure, and Pressure of Dry Air, at the hours 2, 4, 10, 12, 18, 20, Toronto mean time, from the years 1841 to 1871 inclusive	30
XXV.—Monthly and annual means of the Pressure of Vapor for each of the twenty-four hours Toronto Astronomical time, and for the twenty-four hours collectively, from hourly observations in the six years, 1st July, 1842, to 30th June, 1848.....	31
XXVI.—Monthly and annual means of the Pressure of Vapor from 1841 to 1871, with the monthly and annual means for the whole period, and for three groups of eleven, nine, and ten years, 1847 being omitted from the combinations	32
XXVII.—Monthly and annual means of the Relative Humidity for each of the twenty-four hours, Toronto Astronomical time, and for the twenty-four hours collectively, from hourly observations in the six years, 1st July, 1842, to 30th June, 1848	33

	XXVIII.—Monthly and annual means of the Relative Humidity from 1841 to 1871, both inclusive, with the averages derived from the whole series, omitting the year 1847.....	34
	XXIX.—Monthly means of the extent of Sky Clouded, derived from six daily observations in each of the years from 1853 to 1871 inclusive, the hemisphere being expressed by 100	35
	XXX.—Monthly means of the extent of Sky Clouded at each of the six ordinary observation hours, derived from the nineteen years, 1853 to 1871 inclusive	36
	XXXI.—Depth of Rain in inches in each month and in the year, from 1840 to 1871 inclusive, months belonging to incomplete years being excluded from the general means	36
	XXXII.—Depth of Snow in inches in each month and in the year, from 1843 to 1871 inclusive	37
	XXXIII.—Aggregate of Rain and Melted Snow in inches, for each month and for the year, from 1843 to 1871 inclusive. (The months belonging to incomplete years are not included in general means)	38
	XXXIV.—Number of days on which Rain fell in each month and in the year, from 1840 to 1871 inclusive.....	39
	XXXV.—Number of days on which Snow fell in each month and in the year, from 1840 to 1871 inclusive.....	40
	XXXVI.—The greatest depth of Rain which fell on a single day, in each month from 1840 to 1871. (The month which includes the day of heaviest rain is marked with an asterisk).....	41
	XXXVII.—Comparative duration of the several Winds on days in any part of which Rain or Snow fell, from observations in the two periods, 1853-57 and 1858-62. Rain and Snow are considered separately, and are grouped in classes, distinguished as Light, Moderate, and Heavy	42
	XXXVIII.—Resultant direction of the Wind for each month and year, from 1848 to 1871, and also the monthly and annual resultants for the whole period. (The direction in every case is measured from the North)	43
	XXXIX.—Resultant velocity of the Wind for each month and year, from 1848 to 1871, and also the monthly and annual resultants for the whole period	44
	XL.—Mean velocity of the Wind for each month and year, from 1848 to 1871, and also the monthly and annual mean velocities for the whole period	45
	XLI.—Resultant direction of the Wind in each hour, Astronomical time, for each month and for the year, from observations in the six years, 1854 to 1859 inclusive. (The direction in every case is measured from the North)	46
	XLII.—Resultant velocity of the Wind in each hour, for each month and for the year, from observations in the six years, 1854 to 1859 inclusive. (Velocities in miles per hour).....	47
	XLIII.—Mean velocity of the Wind in each of the twenty-four hours, Astronomical time, for the four quarters and for the year, derived from two groups of years, including the six years, 1848-53, and the seventeen years, 1855-71	48
	XLIV.—Mean velocity of the Wind in each of the twenty-four hours, for the four quarters and for the year, expressed in terms of the mean velocity of the twenty-four hours for the corresponding quarter; being the quotients obtained by dividing the numbers in the preceding Table by the respective averages for twenty-four hours	49

INTRODUCTION TO ABSTRACTS

OR

METEOROLOGICAL OBSERVATIONS.

The Tables collected in this volume are of the following classes:—

- (1.) Tables of daily means, &c., from 1863 to 1871 inclusive.
- (2.) Tables of sundry data as far back as they could be procured, and continued to the end of 1871.
- (3.) Tables exhibiting various meteorological relations based on combinations of several years, including several which have been taken or abridged from volumes or articles already published.

The discussion of the temperature observations for 1841-52, as far as concerns the computation of the Tables of diurnal variation, the normal daily means, 1841-52, and the probable variability of the actual daily means in the same years, is extracted or abridged from a paper of Sir E. Sabine, as stated further on. All other deductions that have appeared before are from the Toronto volumes, 1854-59, 1860-62, and from articles in the *Canadian Journal*.

TEMPERATURE OF THE AIR.

The thermometers, throughout the series, were exposed on the north wall of the Observatory, in a shed formed of Venetian slats which extended to a distance from the ground of three to four feet.

From January, 1845, to December, 1852, the shed had a second roof, and a second enclosure of Venetian slats eighteen inches exterior to the first.

In no case was any screen interposed between the thermometers and the ground, or between the thermometers and the wall of the Observatory; this mode of exposure, though to some extent faulty, being retained to avoid a breach of continuity in the series.

The thermometers were attached to two slips of wood extending east and west from end to end of the shed, at such a height as to allow the bulbs to be $4\frac{1}{2}$ feet from the scil.

Reduction of the Temperature Observations.

In effecting the reduction of these observations, the first process was to determine the corrections for diurnal variation.

The details are given by General Sir E. Sabine, in a paper read before the Royal Society, February 10, 1853, "On the periodic and non-periodic variations of the temperature at Toronto, from 1841-52 inclusive." The following were the chief steps in the investigation :—

- (1.) From hourly observations, July 1, 1842, to June 30, 1848, a Table was formed, giving the six-year averages of the monthly and annual means of temperature.
- (2.) From the twelve monthly and annual means was constructed separately for each hour an interpolating formula, which may be thus written :—

$$t_n = a_0 + t_1 \sin(n \times 30^\circ + C_1) + t_2 \sin(2n \times 30^\circ + C_2) + \&c., \\ + t_5 \sin(5n + 30^\circ + C_5) \times t_6 \sin(6n \times 30^\circ + C_6).$$

where t_n is the *provisional* normal temperature at the time (n), measured from January 15, the unit of time being the twelfth part of a year.

- (3.) From the twenty-four formulæ corresponding to each of the separate hours were computed provisional normals for every hour, and for every fifth day in the year.
- (4.) The corrections for diurnal variation for every fifth day were then obtained by subtracting the normals at every hour from the corresponding daily mean normals.

The results are given in Table I of this volume.

From January, 1841, to June, 1842, and from September, 1850, to April, 1851, the observations were at every second hour; and from January to April, 1850, and from July to August, 1850, at every hour.

In these cases, as well as in the six years of continuous hourly observations, the means of the observations without correction were taken as the means of the day; but in all other parts of the twelve years which extend from January, 1841, to December, 1852, corrections for diurnal variation were applied individually to the several observations; and the mean temperatures of the several days were then computed from the means of the observations so corrected.

The mean daily temperatures during the broken periods, including in all six complete years, were then grouped into monthly means, which were again combined with the monthly means from the six years, July, 1842, to June, 1848, yielding the following monthly means from the observations of twelve years :—

January...24.97	April...41.14	July.....66.41	October....44.93
February..23.40	May...51.18	August....66.16	November..35.51
March ...30.23	June...61.05	September..58.02	December..26.75

Year....44.23

From an interpolating formula derived from the foregoing twelve monthly means, the normal daily means of temperature were computed for every day in the year. They are given in Table IV of Sir E. Sabine's paper, and in Table II of this volume.

Finally, by applying to the normal daily means in Table II the corrections from Table I, with their signs changed, the normal temperatures may be found for every hour and for every day in the year.

Normals thus computed were employed as standards of reference in the Toronto Tables published in the *Canadian Journal* to the end of 1868.

During and prior to the time when the observations were made, on which General Sabine based his conclusions (1841-52), the mean temperature of January exceeded very decidedly the mean of February in other parts of North America, as well as at Toronto. Testimony to this effect is given by Dove, who describes the isothermal lines as moving southwards from January to February. Observations of subsequent years, however, at other places, even more than at Toronto, show a preponderance in the temperature of February, thus:—

At Isle Jesus (near Montreal) . . .	1853-62,	February was warmer than January by	$\frac{3}{4}$
Quebec	1860-67,	"	"
St. John, New Brunswick	1861-68,	"	"
Halifax	1867-69,	"	"
Stratford, Ontario	1861-69,	"	"
Toronto	1859-68,	"	"

That the change in the time when the greatest cold occurs in Toronto has been a progressive change, is shown by comparing the means of January and February in groups of five years:

1841-45, Jan. warmer than Feb. by	$\frac{2}{6}$	1856-60, Jan. colder than Feb. by	$\frac{0}{3}$
1846-50, "	"	"	"
1851-55, "	"	"	"

As it is manifest from the foregoing facts that the old normals were not suitable as standards wherewith to compare the observations of more recent years, new normals were computed from the ten years 1859 to 1868, for each day in the year, and for each of the six ordinary hours of observation, namely:—

- 6 a.m., 8 a.m.
- 2 p.m., 4 p.m., 10 p.m., and midnight.

Taking each hour separately, and adopting in the first instance the erroneous hypothesis that monthly means represent the temperatures proper to the middle days of the respective months, six interpolating formulæ were constructed of the annexed form:—

$$t_n = t_0 + t_1 \sin(n \times 30^\circ + C_1) + t_2 \sin(2n \times 30^\circ + C_2) + \text{&c.}$$

TORONTO METEOROLOGICAL OBSERVATIONS.

The coefficients t_1 , t_2 , &c., were then modified by multiplying them respectively by

$$\frac{\frac{1}{12}}{\sin \frac{1}{12}}, \quad ; \quad \frac{\frac{2}{12}}{\sin \frac{2}{12}}, \quad ; \quad \frac{\frac{3}{12}}{\sin \frac{3}{12}} \quad \text{etc.}$$

The normal daily means of temperature from six daily observations in the ten years 1859-68, or the means of the six normals proper to each day, are given in Table III.

The normals computed separately for each of the six observation hours are given in Table L, for every fifth or sixth day through the year.

The following are the formulæ for the different hours employed in the computation of Table L :—

2h.

$$T_2 = 48^\circ.99 + 24^\circ.98 \sin(x + 261^\circ 57') + 0^\circ.50 \sin(2x + 27^\circ 18') \\ + 0^\circ.73 \sin(3x + 262^\circ 17') + 0^\circ.75 \sin(4x + 10^\circ 10') \\ + 0^\circ.69 \sin(5x + 36^\circ) + 0^\circ.22 \sin(6x + 90^\circ).$$

4h.

$$T_4 = 48^\circ.57 + 25^\circ.04 \sin(x + 262^\circ 54') + 0^\circ.72 \sin(2x + 27^\circ 10') \\ + 0^\circ.71 \sin(3x + 265^\circ 59') + 0^\circ.70 \sin(4x + 11^\circ 36') \\ + 0^\circ.66 \sin(5x + 34^\circ 40') + 0^\circ.22 \sin(6x + 90^\circ).$$

10h.

$$T_{10} = 42^\circ.63 + 21^\circ.68 \sin(x + 261^\circ 7') + 0^\circ.35 \sin(2x + 35^\circ 33') \\ + 0^\circ.89 \sin(3x + 267^\circ 59') + 0^\circ.80 \sin(4x + 35^\circ 8') \\ + 0^\circ.70 \sin(5x + 26^\circ 13') + 0^\circ.20 \sin(6x + 90^\circ).$$

Midnight.

$$T_{12} = 41^\circ.55 + 21^\circ.19 \sin(x + 260^\circ 40') + 0^\circ.31 \sin(2x + 38^\circ 39') \\ + 0^\circ.97 \sin(3x + 269^\circ 28') + 0^\circ.80 \sin(4x + 5^\circ 25') \\ + 0^\circ.79 \sin(5x + 21^\circ 9') + 0^\circ.20 \sin(6x + 90^\circ).$$

18h.

$$T_{18} = 40^\circ.34 + 21^\circ.61 \sin(x + 260^\circ 38') + 0^\circ.03 \sin(2x + 128^\circ 31') \\ + 0^\circ.94 \sin(3x + 276^\circ 35') + 0^\circ.81 \sin(4x + 359^\circ 9') \\ + 0^\circ.76 \sin(5x + 22^\circ 56') + 0^\circ.27 \sin(6x + 90^\circ).$$

20h.

$$T_{20} = 43^\circ.08 + 24^\circ.31 \sin(x + 262^\circ 4') + 0^\circ.50 \sin(2x + 104^\circ 11') \\ + 0^\circ.71 \sin(3x + 260^\circ 16') + 0^\circ.80 \sin(4x + 0^\circ) \\ + 0^\circ.79 \sin(5x + 26^\circ 34') + 0^\circ.28 \sin(6x + 90^\circ).$$

The days when the temperature attains its extreme and mean values for each hour, and the values of the maxima and minima are shown in the following Table :—

1859-68.	MINIMA.		SPRING MEAN.	MAXIMA.		AUTUMN MEAN.
	Day.	Temp.		Day.	Temp.	
2 P. M.	January 7	24.3	April 23	July 25	75.0	October 23
4 P. M.	" 5	23.7	" 22	" 24	74.8	" 22
10 P. M.	" 6	20.8	" 24	" 23	65.4	" 26
Midnight	" 5	20.1	" 24	" 22	63.9	" 26
6 A. M.	" 8	19.2	" 26	" 18	63.3	" 25
8 A. M.	" 7	19.2	" 23	" 21	68.4	" 22
Six hours	" 6	21.2	" 24	" 22	68.5	" 23

To exhibit in a more distinct manner the changes which the positions of the epochs of maximum and minimum temperatures in the annual period have undergone, from the series 1841-52 to 1859-68, the dates and temperatures are placed below in juxtaposition, together with the corresponding numbers in the years 1861-69, forwarded by Mr. C. J. Macgregor, M.A., meteorological observer at Stratford, Ontario.

	MINIMA.		SPRING MEAN.	MAXIMA.		AUTUMN MEAN.
	Day.	Temp.		Day.	Temp.	
Toronto, 1841-52	February 12	23.4	April 25	July 28	66.9	October 17
" 1859-68	January 6	21.2	" 24	" 22	68.5	" 23
Stratford, 1861-69	" 15	19.9	" 19	" 15	67.1	" 20

On the probable variability of Daily Means of Temperature at different seasons.

(1.) Taking the difference between the normal daily means of temperature derived from the period of twelve years, and the means of the corresponding day in each of the twelve years, the non-periodic variations of each day are obtained.

(2.) Grouping together the non-periodic variation in periods of five days, and taking the difference (Δ) between the mean of each group, and its several members, the *probable daily non-periodic variation* is then computed from the formula :—

$$\text{Variability} = .6745 \sqrt{\frac{\sum \Delta^2}{(n-1)}}$$

(3.) Finally, collecting the latter into monthly and seasonal averages, there is found for the twelve years, what has been termed the probable variability of the *daily* temperature in the several months and seasons, as shown below :—

TORONTO METEOROLOGICAL OBSERVATIONS.

1841-52.			
Winter.	Spring.	Summer.	Autumn.
December .. 6.6	March .. 5.0	June 4.0	September .. 4.1
January ... 6.6	April 4.3	July 3.5	October ... 4.0
February .. 6.5	May 4.2	August 3.0	November .. 4.0
Means .. 6.2	4.5	3.5	4.2

From the above it is inferred that in the winter the temperature of a day is as likely to differ from its normal state, $6^{\circ}.2$ or *more*, as it is to differ *less* than that amount.

By a process precisely similar to that employed by General Sir E. Sabine, in the production of the preceding Table, the following numbers are found for the years 1859-68 :—

Winter.	Spring.	Summer.	Autumn.
December .. 6.8	March 5.1	June 4.0	September .. 4.2
January ... 6.5	April 4.1	July 3.8	October ... 4.6
February .. 6.4	May 4.0	August 3.4	November .. 4.3
Means .. 6.6	4.4	3.4	4.4

*Monthly and Annual Means of the Temperature of the Air at Toronto,
from 1841 to 1871—Table IV.*

To this Table have been added approximate monthly means obtained from observations by Rev. C. Dade, prior to the establishment of the Observatory, during portions of the years extending from January, 1831, to April, 1841.

In consequence of the absence of Mr. Dade, observations were suspended in August and September, 1831 and 1833; also for a few days in August, 1835, and again from October, 1838, to June, 1839, both inclusive. Excepting in the breaks above named, and occasionally in the early part of 1831, when the readings were at 7 a.m., the thermometer was read daily, Sunday included, at 8 a.m. on every day *but one*. Readings were also made at noon and at 5 p.m., but with large and numerous breaks, sometimes one hour and sometimes both having been omitted. To combine these materials so as to form monthly means, the method adopted was to reduce each reading to the mean of the day, by applying to it the corrections given in Table I of this volume, and, dividing the sum of all the corrected readings in like months of different years by the number of the readings, to regard the quotients thus found as the approximate monthly means.

*Formulae for computing Normal Daily Means from the Monthly Means
at the foot of Table IV.*

If, in the first instance, the erroneous assumption be admitted that the mean temperatures of the several months are the means proper to their

middle days, the mean temperature t_n at a time (n), reckoned from January 15 (the unit being the twelfth part of a year), will be given by an expression of the following form, from which, by making $n=0, n=1, \&c., n=11$, the means of the several months would be reproduced.

$$t_n = T_0 + t_1 \sin(n \times 30^\circ + C_1) + t_2 \sin(2n \times 30^\circ + C_2) + \&c., \\ + t_r \sin(rn \times 30^\circ + C_r) + \&c.$$

The error introduced by the assumption stated above is removed by multiplying the several coefficients respectively by the factors :—

$$\frac{\frac{11}{12}}{\sin \frac{11}{12}} ; \quad \frac{2\frac{11}{12}}{\sin 2\frac{11}{12}} \quad \&c.; \quad \frac{r\frac{11}{12}}{\sin r\frac{11}{12}} ;$$

whence a more correct formula is obtained, as follows :

$$T_n = T_0 + T_1 \sin(n \times 30^\circ + C_1) + T_2 \sin(2n \times 30^\circ + C_2) \\ + T_3 \sin(3n \times 30^\circ + C_3) + T_4 \sin(4n \times 30^\circ + C_4) \\ + T_5 \sin(5n \times 30^\circ + C_5) + T_6 \sin(6n \times 30^\circ + C_6).$$

Corresponding to the five groups of means at the foot of Table IV, the values of the constants are as follows :—

	T ₀	T ₁	C ₁	T ₂	C ₂	T ₃	C ₃	T ₄	C ₄	T ₅	C ₅	T ₆	C ₆
1831-41	49.26	22.71	264 7	1.22	118 30	0.73	210 32	0.90	111 11	1.38	89 9	0.80	90
1841-52	44.23	22.06	261 29	1.11	71 32	0.88	167 41	0.20	37 25	1.10	50 33	0.51	90
1853-61	44.06	23.21	260 51	0.36	82 2	0.57	232 58	0.25	48 10	0.93	49 9	0.47	90
1862-71	44.21	23.55	261 43	0.53	78 11	0.21	207 31	0.78	41 16	0.81	5 5	0.10	90
1841-71	44.17	22.89	261 22	0.70	74 27	0.50	190 11	0.42	41 52	0.94	38 44	0.86	90

From the final column of Table IV, showing the differences between the mean temperature of each year and the general annual mean from 31 years, it is found that the average deviation without regard to sign is only 0.6°. The warmest year in the series was 1846, with a difference from the average of + 2°.19, and the coldest, 1856—difference (- 1°.99), giving a total range of 4°.18.

Probable Variability of the several Monthly Means of Temperature.

For the years 1841 to 1852, the numbers expressing the probable variability for the several months, computed by General Sabine, were as follows :—

January ..	± 2.7	April	± 1.9	July	± 1.1	October	± 1.4
February ..	± 2.6	May	± 1.8	August	± 1.2	November ..	± 2.1
March ...	± 2.8	June	± 2.0	September ..	± 1.8	December ..	± 2.5

And for the year, ± 0°.63.

The following are the analogous numbers for the period 1841-71, from the formula, variability = $.6745 \sqrt{\frac{\sum \Delta^2}{n-1}}$, where Δ is the difference between the mean of a month in a single year and the general mean from similar months in the whole series of (n) years :—

January .. ± 3.0	April ± 1.6	July ± 1.7	October .. ± 1.7
February .. ± 2.6	May ± 1.9	August.... ± 1.3	November.. ± 1.8
March ... ± 2.6	June ± 1.9	September.. ± 1.8	December.. ± 2.5
And for the year, ± 0°.60.			

or the mean temperature of a single year is as likely to differ from the average of 31 years by 0°.6 or *more*, as it is to differ *less* than that amount.

In Tables V, VI, VII, are given the *monthly means* of the daily maxima, daily minima, and daily ranges of temperature in each year, with combinations of like monthly means in averages of several years; and in Table VIII are the greatest daily ranges in each month, with analogous combinations. To compare the different groups, the averages for each month have been collected into averages for the year, as follows :—

Maximum.	Minimum.	Daily Range.	Greatest Daily Range.
1841-48..... 52.62	36.14	16.48	1841-52.... 26.88
1853-61..... 51.69	35.50	16.19	1853-61.... 27.34
1862-71..... 52.12	36.95	15.17	1862-71.... 26.22
The whole.. 52.12	36.22	15.90	1841-71.... 26.80

Tables IX, X, XI, show the absolutely highest temperatures in each month, the absolutely lowest, and the monthly ranges, with combinations of like monthly means in averages of several years. The following are the averages for the year, found from the monthly averages in the several groups :—

Highest Maximum.	Lowest Minimum.	Monthly Ranges.
1841-52	66.21	19.82
1853-61	66.78	19.13
1862.71	66.86	20.52
1841-71	66.58	19.84

Connection of Temperature with the Direction of the Wind.

In order to judge whether the observed value of any element is abnormally high or low, it has been the practice, as soon as the entry has been made in the daily register, to enter in a column adjacent to that in which the element is recorded, the difference between the observed value and the normal (or what is taken as such) for the day and hour; the difference being marked + or -, according as the observed is greater or less than the standard value.

Normals obviously cannot be derived from a series in which the current observations are included; yet, provided that they have been computed

from a series of sufficient length, the differences recorded from day to day, will serve to indicate in a general way the relative values of the element : if, however, it be desired to obtain accurate measures of the mean abnormal variations during any period of years, or of their connection with the direction of the wind, or any coexistent phenomena whatever, the standards ought to be derived from the observations of *all* the years in that period, and from those years *alone*; and hence, the differences recorded, as above stated, in the daily register are not, in strictness, suitable materials for such enquiries. Nevertheless, as the results of certain computations based on the abnormal differences between current observations and normals obtained from older series, although not strictly accurate, are not without some value, it has been thought best, either to print the results after the application of approximate corrections, or to print them as they stand, explaining in each case the method of correction applied.

Table X of the volume of Toronto Meteorological Abstracts for 1854-59, contains the mean abnormal variations of temperature, with their proper signs, arranged according to the direction of the wind to the nearest of the sixteen points, with the number of times which the wind blew from each point, and the partial results of each year, as well as the general results.

The normals to which the observed temperatures are referred in this Table, having been computed from the twelve years, 1841-52, and being therefore not necessarily applicable to 1853-59, some modifications in the results will be required. This has been effected by applying to the general means of the variations corresponding to different winds in the seven years, as an approximate correction, a constant $+0^{\circ}.26$, that being the difference by which the mean temperature of 1841-52 exceeded that of 1853-59. The general results thus modified are given below :—

N.	-2.54	E.	+1.99	S.	+3.15	W.	-1.92
N.N.E.	-2.92	E.S.E.	+1.44	S.S.W.	+3.87	W.N.W.	-2.01
N.E.	-1.55	S.E.	+2.05	S.W.	+3.71	N.W.	-3.28
E.N.E.	+1.63	S.S.E.	+2.54	W.S.W.	-0.47	N.N.W.	-3.32
Calms.....						+1.59	

From this Table it appears that the temperature was above or below the normal, according as the wind blew from a point lying to the south or north of a line stretching from about N.E.^bE. to S.W.^bW.; the greatest depression, $-3^{\circ}.32$, being with a wind from N.N.W., and the greatest elevation, $+3^{\circ}.87$, with a wind from S.S.W.

Although modified by the application of the constant, $+0^{\circ}.26$, these numbers are liable to other errors, namely, those which may arise from massing together abnormal variations for all parts of the year, whereby

opposite effects, that may be proper to different seasons, may in some degree neutralize each other.

Table XIII was formed from the observations of the eight following years, 1860-67, by a process similar to that employed for 1853-59, excepting that the months were dealt with separately, the aggregate algebraical sum of the abnormal deviation for the eight years for each month and wind, being divided by the number of times when the wind under consideration, was blowing in the month of the same name at the time of observation.

The means for the quarter and year are deduced from the aggregate sums and numbers for the quarters and year.

This Table, as well as that for 1853-59, is affected by the circumstance that the normals to which the observed temperatures were referred, (the normals deduced from 1841-52) were not strictly applicable to the years 1860-67.

The anomalies that may be noticed in Table XIII, are due in some degree to the cause just stated, as well as to the insufficient number of times when the wind, in certain months, blew from some of the points. Thus, while the number of times for each month and wind is about 146 in the eight years, on the average of all months and winds; the average number of times when the wind from the S.E. occurred was only about 58 on the average of the twelve months.

The errors in Table XIII, occasioned by referring the temperature observed in 1860-67 to normals deduced from 1841-52, may be lessened, although not entirely removed, by applying to the results of each month, as an approximate correction, the differences between the mean temperatures of the several months deduced from the two series, 1841-52 and 1860-67, the corrections being + or -, according as the mean from the older series is greater or less than that from 1860-67.

The following are the corrections for the months, quarters, and year.

Jan.	Feb.	Mar.	April.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.
+°.48	-°.59	+°.12	-°.17	-°.25	-°.09	-°.71	+°.31	+°.04	-°.40	-°.08	+°.80
Winter.		Spring.		Summer.		Autumn.		Year.			
+°.13		+°.23		-°.50		-°.16		-°.07			

The results obtained by applying the above corrections to the several numbers in Table XIII, are shewn in Table LI.

The preceding enquiries relate to the comparison of the temperatures that accompany different winds at the instant of observation. The effects

on the temperature produced by a given wind will be found from the change which has occurred in a given time, while that wind has been blowing. To ascertain the effects completely, would require simultaneous and continuous records of wind and temperature; but in the absence of these, an approximate knowledge of the effect may be obtained from the changes in twenty-four hours, which accompany different resultant winds, computed for the same twenty-four hours.

The changes corresponding to resultants to the nearest of the eight points, are shown in Table XIV, for the two groups of years, 1854-59 and 1860-62.

In examining Table XIV it will be seen that, for 1854-59, in every month, with a resultant wind from N., N.W., and W., the temperature was lowered; in every month, with a resultant wind from S.W., S., S.E., and E., the temperature was raised; and that with a resultant from N.E., the temperature was raised in some months and lowered in others, the total effect in the whole year being a rise with a N.E. resultant.

These remarks are also applicable for the most part to 1860-62, but there are exceptions in the latter group, in consequence of the small number of resultants from some points of the compass; thus, while the average divisor for all the months and winds is 11 nearly, a resultant from the S.E. does not occur at all in January, only twice in February, once in March, and once in April.

BAROMETRIC TABLES.

The barometer in use throughout the series is one by Newman, with a tube of internal diameter of .506 of an inch. The correction for capillarity has not been applied. The readings of the barometer have been corrected for temperature, but not for gravitation; nor have they been reduced to sea level.

In Table XV are given the monthly and annual means for each of the twenty-four hours, derived from hourly observations in the six years—1st July, 1842, to 30th June, 1848. The monthly means in this Table, which correspond to the six ordinary hours of observations, were employed to the close of 1859, as normals or standards with which to compare the actual readings; after which, until the close of 1868, the means at the same hours from eighteen years ending December, 1859, were similarly employed, the same standard for any given hour being used throughout the month.

The standards employed, subsequently to 1868, were derived from the observations of the ten years, 1859 to 1868, in the following manner: The corrected readings of the barometer at the six observation hours during the ten years, being first combined in monthly means, for each of the six hours separately, and for the six hours collectively, the latter, or general means

8 " "	+.017	+.029	+.021	+.019	+.022	+.021	+.022	+.022	+.020	+.021	+.024	+.011

The mean pressures in each month, from observations at the six hours combined, are shown in the following Table, where pressure = 29 inches + number in the Table.

Jan.	Feb.	Mar.	April.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.	Year.
.6405	.6511	.5706	.5986	.5617	.5888	.5942	.6117	.6087	.6457	.6006	.6606	.6162

Assuming that the means of each month are the pressures proper to their middle days, the mean pressure (b_s) proper to any day in the year will be given by the formula:—

$$\begin{aligned} b_s = & .6162 + .0371 \sin (x + 146^\circ 36') + .0174 \sin (2x + 24^\circ 32') \\ & + .0147 \sin (3x + 78^\circ 27') + .0127 \sin (4x + 160^\circ 18') \\ & + .0147 \sin (5x + 307^\circ 13') + .0135 \sin (6x + 270^\circ) \end{aligned}$$

where x is proportional to the time reckoned from 15th January, the whole year being expressed by 360°.

The normal mean pressures computed from this formula are given in Table XX, at intervals of five or six days through the year.

For finding the daily normal pressures for each of the six observation hours, the approximate method was adopted of applying to the normal daily means the monthly means of the diurnal inequalities given above.

The application of the same diurnal inequalities to the normal daily means throughout the month, occasions a slight breach of continuity in the series of normals for the separate hours in passing from month to month; but the transitions are much less abrupt than where the monthly means of the several hours were adopted for normals, as was the practice prior to 1869.

The normals obtained in the manner above stated, are useful for standards in comparing current observations, and in any investigations relating to the whole of the series, 1859-68. No deductions from them are contained in this volume.

In Table XVI are shewn the monthly means of barometric pressure in each of the thirty-one years, 1841-71, with the monthly means for the three groups of years, and for the whole period.

For computing the daily mean pressures, formulæ were constructed for each of the groups of monthly means, at the foot of Table XVI. The general form is as follows :—

$$b_x = m_0 + m_1 \sin(x + C_1) + m_2 \sin(2x + C_2) \\ + \text{ &c., &c., } + m_6 \sin(6x + C_6)$$

where b_x expresses the mean pressure of any day corresponding to (x), x being proportional to the time reckoned from 15th January. The values of the constants for the different groups of years are shewn below :—

Year.	m_0	m_1	C_1	m_2	C_2	m_3	C_3	m_4	C_4	m_5	C_5	m_6	C_6
1841-52	0.6206	0.0246	152 28	0.0166	347 42	0.0108	163 14	0.0081	193 57	0.0056	180 23	0.0014	270
1853-61	0.6128	0.0484	150 26	0.0137	71 22	0.0280	97 32	0.0122	97 47	0.0177	259 42	0.0005	90
1862-71	0.6164	0.0375	148 32	0.0277	0	0.0144	241 58	0.0107	185 40	0.0120	348 38	0.0018	270
1841-71	0.6166	0.0386	150 23	0.0167	8 31	0.0136	102 11	0.0101	167 14	0.0062	270 9	0.0011	270

These constants, as well as those for the formulæ which relate to barometer reduced to sea level, and to other elements, are given in full, that the reader may judge as to the degree of significance of the higher terms.

Normal Mean Daily Pressures at Sea Level.

As elsewhere stated, the separate barometric readings of the ordinary observations have not been reduced to sea level; hence, to obtain the general form of the annual curve of barometric pressure at sea level, the monthly means at the foot of Table XVI, were reduced to sea level by an approximate method, in which the following formula was employed :—

$$\text{reduction} = \frac{342}{890.6} \left\{ 1 - .002t \right\} = .3840 - .00077t$$

where 342 is the height of the cistern of barometer above sea level,

" 890.6 the height of a column of air at temperature of 40° , whose weight is equal to that of a column of mercury of the same transverse section, and one inch in height,

TORONTO METEOROLOGICAL OBSERVATIONS.

t the excess above 40° of the mean temperature of the air, for the same month, and same group of years, is given at the foot of Table IV.

The mean pressures, reduced, are shown in the following Table, where barometer at 32° reduced to sea level = $29 +$ numbers given.

	Jan.	Feb.	Mar.	April.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.	Year.
1841-52	1.0250	1.0090	1.0233	0.9901	0.9584	0.9190	0.9000	1.0070	1.0234	1.0207	1.0054	1.0403	1.0014
1853-61	1.0703	1.0225	0.9390	0.0533	0.0017	0.9154	0.0671	0.9006	1.0341	1.0310	0.0068	1.0070	0.9030
1862-71	1.0395	1.0490	1.0063	0.9710	0.9145	0.9550	0.0441	0.0735	1.0075	1.0211	0.0943	1.0201	0.0962
1841-71	1.0430	1.0225	0.9935	0.9733	0.9458	0.9118	0.0573	0.0857	1.0408	1.0241	0.0076	1.0466	0.0974

The same notation being adopted as in the case of the unreduced barometric readings, the constants in the interpolating formulae for expressing, for any day, the mean pressure reduced to sea level, are as follows:—

	m_0	m_1	C_1	m_2	C_2	m_3	C_3	m_4	C_4	m_5	C_5	m_6	C_6
1841-52	1.0014	0.0340	123 36	0.0105	344 50	0.0102	103 4	0.0083	104 30	0.0059	100 33	0.0010	270
1853-61	0.9030	0.0570	133 20	0.0135	71 6	0.0234	90 59	0.0122	98 16	0.0182	253 47	0.0002	90
1862-71	0.0062	0.0475	128 15	0.0270	360 23	0.0145	01 40	0.0204	180 34	0.0116	348 1	0.0010	270
1841-71	0.0074	0.0452	120 3	0.0102	7 27	0.0138	102 3	0.0105	168 57	0.0057	272 24	0.0016	270

In Tables XVII, XVIII, and XIX, are shewn the highest and lowest barometric readings, and the difference between them, or range of the barometer, in each month from 1841-71 inclusive, with the averages derived from thirty-one years, and groups of twelve, nine, and ten years.

The quarterly averages of the several groups are as follows:—

MAXIMA.

Years.	Winter.	Spring.	Summer.	Autumn.
1841-52	30.2311	30.0783	29.0251	30.0954
1853-61	30.2249	30.0585	29.8795	30.0813
1862-71	30.2320	30.0123	29.9107	30.1096
1841-71	30.2331	30.0513	29.9073	30.0959

1853-61	1.2808	1.0604	0.6082	1.0551
1862-71	1.3140	0.9839	0.7014	0.9994
1841-71	1.3100	1.0398	0.6882	1.0206

In Table XXIII are given the monthly means of the pressure of dry air in each of the years, 1841-71 (omitting 1847), with the monthly and annual means for the whole period, and for three groups of eleven, nine, and ten years.

For computing daily mean pressures, formulæ of the usual form—

$$D_x = m_0 + m_1 \sin(x + C_1) + m_2 \sin(2x + C_2) + \&c.$$

were constructed for each of the groups of means at the foot of Table XXIII.

The values of the constants for the different groups are as follows :—

Years.	m_0	m_1	C_1	m_2	C_2	m_3	C_3	m_4	C_4	m_5	C_5	m_6	C_6
1841-52	0.3510	0.1000	84 17	0.0442	268 15	0.0105	123 41	0.0103	159 24	0.0104	208 49	0.0007	270 00

1841-71	0.3531	0.2016	87 18	0.0361	286 50	0.0103	91 20	0.0103	157 41	0.0092	250 23	0.0014	270 00

The following are the mean differences, without regard to sign, between the pressures of dry air at 6 a.m. on consecutive days in each month, derived from 1860-62 :—

Jan.	Feb.	Mar.	April.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.	Year.
.310	.321	.258	.224	.201	.219	.209	.194	.234	.237	.240	.275	.243

Table XXIV contains the means of temperature, barometric pressure, and pressure of dry air, at each of the six observation hours, from 1841 to 1871, certain broken months being omitted. The discrepancy between the means from the six hours in this Table, and the general means at the foot of Tables IV, XVI, and XXIII, are due, partly to the fact that *six* hours only are included in Table XXIV, and more so, to the omissions as stated above, which were rendered necessary by the absence of observations at one or more of the six hours in these months. The months omitted from the above cause, were January to April, in 1849, May and June, in 1849 and 1850, and July to December, in 1848 and 1849.

PRESSURE OF VAPOUR.

The normal daily means of the pressure of vapour given in Table XX, are computed from the following Table of monthly means, from observations in the ten years, 1859-68.

Jan.	Feb.	Mar.	April.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.	Year.
.1066	.1126	.1365	.1846	.2775	.3009	.4860	.4715	.3745	.2586	.1840	.1210	.2586

The following is the formula for computation :—

$$V_z = .2585 + .1864 \sin(z + 257^\circ 25') + .0392 \sin(2z + 63^\circ 18') \\ + .0085 \sin(3z + 252^\circ 48') + .0033 \sin(4z + 3^\circ 38') \\ + .0011 \sin(5z + 348^\circ 18') + .0020 \sin(6z + 90').$$

The normals used as standards of reference for the different hours of observation, since 1st January, 1869, were obtained from the daily normals by applying to them the mean diurnal inequalities for the month, in the manner already explained in the case of the barometric pressures.

In Table XXVI are shewn the monthly and annual means of the pressure of vapour in each of the years 1841-71, omitting 1847, and for four combinations of years. The constants in the formulae for computing the daily mean pressure of vapour, V_z , corresponding to the different groups of years, are as follows :—

Years.	m_0	m_1	C_1	m_2	C_2	m_3	C_3	m_4	C_4	m_5	C_5	m_6	C_6
1841-52	0.2684	0.1906	257 31	0.0455	62 16	0.0060	193 29	0.0050	271 9	0.0094	58 31	0.0007	270 06
1853-61	0.2601	0.1888	268 14	0.0404	68 12	0.0059	261 11	0.0034	202 45	0.0071	28 44	0.0010	90 00
1862-71	0.2587	0.1904	257 30	0.0411	63 45	0.0054	248 12	0.0024	123 2	0.0043	345 18	0.0014	90 30
1841-71	0.2627	0.1899	257 45	0.0426	64 13	0.0053	234 18	0.0019	235 29	0.0063	35 58	0.0006	90 00

The following are the mean differences, without regard to sign, between the pressure of vapour at 6 a.m. on consecutive days in each month, from the three years, 1860-62 :—

Jan.	Feb.	Mar.	April.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.	Year.
.038	.043	.039	.041	.051	.091	.144	.088	.093	.065	.044	.044	.060

Connection between the Direction of the Wind and the Barometric Pressure, the Pressure of Dry Air, and the Pressure of Vapour.

The annual means of the changes in twenty-four hours, which accompany different resultant winds from 6 a.m. to 6 a.m., are shewn in the following Table, where the changes for the barometer have been deduced from the six years, 1854-59, and from the three years, 1860-62, and the changes for dry air and vapour from the three years, 1860-62 :—

	N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.
Barometer.....1854-59	+.097	-.102	-.179	-.197	-.009	-.036	+.144	+.170
Barometer.....1860-62	+.076	-.137	-.196	-.178	-.130	-.089	+.142	+.183
Dry Air1860-62	+.096	-.152	-.240	-.264	-.189	-.109	+.180	+.227
Vapour.....1860-62	-.020	+.015	+.043	+.085	+.057	+.021	-.036	-.044

In the earlier series for the barometer, the signs continue the same through the year, excepting that in April, May, August, and December, the barometer rises with a S.W. resultant.

In 1860-62, owing to the small number of resultants from some of the directions, the exceptions to uniformity of sign through the year are more numerous.

In the following investigation, the changes are those which accompany the different *actual*, as distinct from the *resultant*, winds :—

On the Changes of Barometric Pressures, Pressures of Dry Air, and Vapour, that accompany different Winds, from observations in the Seven Years, 1860-66.

The changes considered are limited to those in which the wind did not vary, between two consecutive observations, by more than $22\frac{1}{2}^{\circ}$ on each side of one of the principal eight points ; and as this constancy of direction more frequently occurs when the interval is short, those differences only have been considered which took place from 6 a.m. to 8 a.m., from 2 p.m. to 4 p.m., and from 10 p.m. to midnight.

The changes between two consecutive observations being first diminished by that due to diurnal variation, the residual changes were classed according to the direction of the wind in the interval, and their averages in each class were then taken, for the year as well as for the two half years.

The average changes of barometric pressure which take place in two hours, and found in the manner just described, are given below for each of the principal eight points of the wind's direction :—

APRIL TO SEPTEMBER.

N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.
+ .0085	-.0043	-.0113	-.0057	-.0084	-.0041	+.0132	+.0150

OCTOBER TO MARCH

N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.
+ .0087	-.0160	-.0334	-.0313	-.0222	-.0037	+.0168	+.0209

THE YEAR.

N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.
+ .0086	-.0103	-.0215	-.0164	-.0129	-.0039	+.0156	+.0180

The most probable values of the changes corresponding to intermediate directions of the wind, are given by the following formulæ, where Ψ_1 , Ψ_2 , Ψ_3 , represent the changes for the two half years and year, and θ the angular distance of the point from which the wind blew, measured from north to east, and expressed in degrees :—

APRIL TO SEPTEMBER.

$$\begin{aligned}\Psi_1 = & + .0004 + .0125 \sin (\theta + 141^\circ 29') + .0044 \sin (2\theta + 180^\circ 29') \\ & + .0025 \sin (3\theta + 14^\circ 2')\end{aligned}$$

OCTOBER TO MARCH.

$$\begin{aligned}\Psi_2 = & -.0075 + .0281 \sin (\theta + 148^\circ 14') + .0024 \sin (2\theta + 160^\circ 49') \\ & + .0014 \sin (3\theta + 30^\circ 15')\end{aligned}$$

THE YEAR.

$$\begin{aligned}\Psi_3 = & -.0028 + .0195 \sin (\theta + 148^\circ 2') + .0040 \sin (2\theta + 174^\circ 17') \\ & + .0021 \sin (3\theta + 10^\circ 47')\end{aligned}$$

Pressure of Dry Air.

The average changes in the pressure of dry air in two hours with different winds, and the corresponding formulæ of interpolation, are as follows :—

APRIL TO SEPTEMBER.

N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.
+ .0146	-.0009	-.0128	-.0088	-.0122	-.0046	+.0195	+.0219

OCTOBER TO MARCH.

N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.

+ .0128	-.0091	-.0243	-.0194	-.0100	-.0034	+.0195	+.0229

APRIL TO SEPTEMBER.

$$\Psi_1 = +.0021 + .0182 \sin(\theta + 135^\circ 13') + .0048 \sin(2\theta + 193^\circ 10') \\ + .0034 \sin(3\theta + 10^\circ 18')$$

OCTOBER TO MARCH.

$$\Psi_2 = -.0077 + .0317 \sin(\theta + 149^\circ 4') + .0030 \sin(2\theta + 156^\circ 2') \\ + .0016 \sin(3\theta + 47^\circ 29')$$

THE YEAR.

$$\Psi_3 = -.0021 + .0237 \sin(\theta + 144^\circ 46') + .0040 \sin(2\theta + 174^\circ 17') \\ + .0026 \sin(3\theta + 15^\circ 39')$$

Pressure of Vapour.

The average changes in the pressure of vapour in two hours, that accompany winds from the eight principal points, and the formulæ for finding the most probable change, with the wind blowing from any intermediate point, are given below:—

APRIL TO SEPTEMBER.

N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.
-.0057	-.0034	+.0020	+.0035	+.0042	+.0001	-.0073	-.0069

OCTOBER TO MARCH.

N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.
-.0025	+.0009	+.0037	+.0031	+.0017	-.0013	-.0032	-.0039

THE YEAR.

N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.
-.0041	-.0012	+.0025	+.0034	+.0034	-.0007	-.0046	-.0054

APRIL TO SEPTEMBER.

$$\Psi_1 = -.00169 + .00607 \sin(\theta + 305^\circ 49') + .00096 \sin(2\theta + 88^\circ 48') \\ + .00110 \sin(3\theta + 181^\circ 2')$$

OCTOBER TO MARCH.

$$\Psi_2 = -.00018 + .00385 \sin(\theta + 330^\circ 26') + .00034 \sin(2\theta + 287^\circ 6') \\ + .00022 \sin(3\theta + 243^\circ 26')$$

THE YEAR.

$$\Psi_3 = -.00084 + .00479 \sin(\theta + 312^\circ 45') + .00035 \sin(2\theta + 86^\circ 44') \\ + .00037 \sin(3\theta + 216^\circ 15')$$

If, in the nine foregoing formulæ, the variable angle, θ , be made equal in succession to $0^\circ, 11^\circ 15' (11^\circ 15') \times 2, (11^\circ 15') \times 3, \&c. \dots \dots \dots$ $(11^\circ 15') \times 31$, the changes of pressure will be found which would most probably occur if the wind were to blow steadily for two hours from each of the thirty-two points of the compass.

The results are given in Table XXI. By examining this Table, it will be seen that on the average of the year, the barometer rises with a wind from any point between S.W.^bW. (measured from left to right) to N.^bE., and that it falls with winds from N.N.E. to S.W. The same rule also

holds (within a point) in summer and winter separately, and is true also with respect to the changes in the pressure of dry air. The pressure of vapour increases with a wind between E.N.E. to S.W.^bS., and diminishes with a wind between S.W. and N.E.

On the average of the year, and during the winter half year, both the rise and fall have an uninterrupted progression; and the same is true in every case where the change is an increase; but in the summer half year, besides the maximum rate of barometric fall which occurs with a wind from E., there is a second inferior maximum fall when the wind is from S.^bW. There are also two minima in the rate with which the pressure of dry air diminishes during the summer. They are of equal magnitude, —.0131, and also occur with winds from E. and S.^bW.

The most rapid changes, together with the winds that accompany them, are shewn in the following Table:—

Barometric Pressure.

	SUMMER.		WINTER.		YEAR.	
	Change in 2 hours.	Wind.	Change in 2 hours.	Wind.	Change in 2 hours.	Wind.

EXTENT OF SKY CLOUDED.

From the final column in Table XXIX, shewing the mean extent of sky clouded in the different months and years, from 1853-71, it appears that the mean of the year on the average of nineteen years is 61 (the whole sky clouded being expressed by 100), and that in the different years it varied from 66 to 57. The monthly means shew an uninterrupted progression from a maximum 75, in December, to a minimum 48, in August.

For the different seasons the means are as follows:—

WINTER.	SPRING.	SUMMER.	AUTUMN.
December-February.	March-May.	June-August.	September-November.
73	60	50	62.

From the final column of Table XXX, which shews for every month and for the year the extent of sky clouded at each of the six hours of observation, it appears that of these hours, 2 p.m., on the average of the year, is the most, and 10 p.m. the least, cloudy hour.

From the following Table, shewing for the four seasons the extent of cloud at the several observation hours, it appears that the maximum is at 2 p.m. in every season but the winter, when it is transferred to 8 a.m. In autumn, the minimum lies between 10 p.m. and midnight:—

Hours.	Winter.	Spring.	Summer.	Autumn.
2	76.7	65.3	58.0	66.0
4	75.3	64.3	55.3	63.7
10	67.7	50.7	43.3	57.0
12	68.7	51.7	44.7	57.0
18	74.7	61.3	51.7	62.3
20	77.7	62.0	53.0	63.7

Connection between the Direction of the Wind and the Extent of Sky Clouded.

In the following Table is shewn the amount of cloud that accompanies winds from each of the sixteen points, in the years 1853-59, both inclusive, the hemisphere being expressed by 100, with the amount, Δ , by which the several numbers differ from 59, the general average for the seven years:—

Cloud.	Δ	Cloud.	Δ	Cloud.	Δ	Cloud.	Δ
50 N..... - 9		70 E.... +11		48 S.... -11		57 W.... - 2	
65 N.N.E. + 6		64 E.S.E. + 5		58 S.S.W. - 1		53 W.N.W. - 6	
74 N.E.... +15		57 S.E... - 2		67 S.W... + 8		53 N.W ... - 6	
80 E.N.E. +21		49 S.S.E. -10		64 W.S.W + 5		48 N.N.W. -11	
Cloud. Δ							
Calms..... 55 -4							

The corresponding numbers to the nearest eight points, from 1860-62, are as follows. General mean for the three years, 62:—

Cloud.	Δ	Cloud.	Δ	Cloud.	Δ	Cloud.	Δ
54 N..... - 8		77 E.... +15		56 S.... - 6		63 W.... + 1	
76 N.E.... +14		63 S.E... + 1		68 S.W... + 6		49 N.W... -13	
Cloud. Δ							
Calms..... 55 -7							

RAIN AND SNOW.

On examining the yearly totals in Tables XXXI, XXXII, and XXXIII, very considerable irregularities may be noticed in the amount of rain and snow that fell in different years.

If the years prior to 1845 be left out of consideration, it will be found that the average difference between the rain in different years, and the mean of the twenty-six years, is 3.55 nearly; that in 1866 there was a maximum, with an excess of 6.11 inches nearly; and that in 1867 there

was a minimum, the difference in defect being 9.05 inches nearly. Taking the same years, 1846-71, the average deviation from the mean, in the amount of snow in different years, was 17.9; there was a maximum excess of 53 inches in 1870, and a minimum in 1851, with a deficiency of 31 inches.

In Table XXXIII are given the total amounts of precipitation of rain, and the water equivalent of snow, on the supposition that one inch of snow is equivalent to one-tenth of an inch of water.

Taking the same twenty-six years, it is found that the actual precipitation in different years differs from the average by quantities whose average value, without regard to sign, is 3.98 inches nearly.

The maximum of precipitation occurred in 1870, with an excess of 11.13 inches; and the minimum in 1848, with a deficiency of 8.25 inches nearly.

If the mean annual fall of rain and snow in two equal groups, 1846-58 and 1859-71, be compared, it is seen that while there has been a diminution in the rain, the snow has increased, and also that the precipitation on the whole has increased:—

Years.	Rain.	Snow.	Total.
1846-58	28.552	60.82	34.634
1859-71	27.639	78.46	35.485
Change.... Decrease..	0.913	Increase.. 17.64	Increase.. 0.851

Again, on comparing the *number of days* in the two groups, from Tables XXXIV and XXXV, a decided increase is found in the days both of rain and snow:—

Years.	Rain.	Snow.
1846-58	106.4 days.	53.6 days.
1859-71	120.3 days.	76.0 days.
Change..... Increase ..	13.9 days.	Increase.. 22.4 days.

From Table XXXVI, where the heaviest falls in a single day in each month are recorded, it appears that the average of the heaviest falls in the year

in 1846-58 was 2 106 inches,
and in 1859-71 was 1.906 inches,

shewing, according to the testimony of these twenty-six years, that the heaviest rain in a single day, as well as the aggregate of rain in the year, had undergone a diminution. From comparing the monthly means at the foot of Table XXXVI, it appears that the heaviest falls in a *single day* in September considerably exceed those of any other month; that the heaviest falls of the year occurred nine times in September (the month of the largest average rain fall in the year); and that the heaviest fall on record on one day (3.455 inches) was in September, 1843.

The following Table gives the heaviest fall of snow in the year, on a single day, from 1853-71:—

Years.	Inches.	Years.	Inches.	Years.	Inches.	Years.	Inches.
1853	6.5	1868	6.0	1863	16.0	1869	12.0
1854	5.5	1869	6.0	1864	10.0	1870	9.0
1855	15.0	1870	9.0	1865	7.0	1871	16.0
1856	5.8	1871	8.0	1866	6.0	1872	12.0
1857	5.5	1872	9.0	1867	15.0		

The average of the nineteen years, from the above Table, is 8.91 inches, and for the last thirteen years, 10.38 inches, shewing an increase in the average amount of the heaviest fall of snow in the year, as well as in the total annual amount.

On the whole, then, it appears that while there has been a diminution in the average annual amount of rain, and in the average amount of the heaviest fall of rain in the year, the snow has increased in both these respects; the total annual precipitation of rain and melted snow has also increased, as well as the number of days of rain and the number of days of snow.

On the Relative Frequency of the different Winds during Days of Rain or Snow, from the Hourly Records of Ten Years. (Table XXXVII.)

The object of this Table is to compare the different winds with reference to the number of hours that they blow during days in any part of which a fall of rain or snow takes place. If all winds continued for an equal number of hours through the year, or through the particular season under consideration, it would be sufficient to compare the *absolute* durations of the several winds on days of precipitation; but as there is a very great inequality in the frequency of winds from different points of the compass, (winds from N.W., for example, being more than three times as numerous as those from S.E.) an undue prominence would be given to the winds of greater general frequency, if the comparisons were to be made between the absolute durations. Hence it becomes requisite that the absolute durations of each wind, during the days of rain, included within a given period of time, should be divided by the whole duration of the same wind within the same period. The quotients form what may be termed the *relative* durations of the several winds, and constitute the proper quantities for intercomparison.

As winds of comparative rare occurrence on days of heavy rain, were found to blow very frequently on days of light rain, the adoption of some classification of the rainy days became necessary. In this Table the days of rain have been arranged in three classes, as well as collectively in one

group. Class I includes days of light rain, in which the whole amount in the day did not exceed one-tenth of an inch. Class II includes days of moderate rain, or over one-tenth and less than half an inch; while Class III comprises days of heavy rain, wherein the fall in the day amounted to half an inch and upwards. The days in which snow fell are classified in a similar manner, and with the same limits, one inch of snow being regarded as equivalent to one-tenth of an inch of rain. With a view of learning whether the relative duration or frequency of a wind, during rain, is affected by the season, the computations have been made separately for the winter half year (October to March), for the summer half year (April to September), and for the year as a whole. As the falls of snow after March are not sufficiently numerous to furnish materials for a separate discussion, no separation of the seasons has been made in the case of snow.

Again, for the purpose of comparing the corresponding results in different years, the observations of the ten years, 1853-62, have been discussed in two separate equal groups.

For every Class, the numbers in the Table are the relative durations, expressed in terms of the average relative duration for all winds in that Class.

TABLES RELATIVE TO THE WIND.

Resultant Direction of the Wind in different Months. (Table XXXVIII.)

A comparison of the monthly resultants from the period 1848-71, given in this Table, shews that the general direction of the atmospheric current is considerably more from the westward in the winter than in the summer months, the monthly resultants oscillating about N. 48° W., from April to September inclusive, and about N. 69° W. during the remaining six months. It is also evident that there is a greater uniformity of direction in the different years for some months than for others, and that in the cold months the resultant direction of the wind is more steady than in the warm.

The resultants for the year in different years are deflected from the general resultant for twenty-four years (N. 61° W.), through an angle whose mean value is $9^{\circ} 30'$ nearly, the greatest deflection from the general direction to the north being 23° in 1849 and 1853, and the greatest deflection to the west 15° in 1864.

Resultant Velocities and Mean Velocities in different Months and Years. (Tables XXXIX and XL.)

The inferiority of the velocities recorded from 1848-54, was due to the less advantageous exposure of the anemometer. Prior to 26th June, 1854, the cups had an elevation of only 20 feet above the floor of the Observatory. On that day it was moved to the top of a conical tower, where the cups

had an elevation of 30 feet nearly ; and on 11th June, 1855, it was mounted in the position which it has since occupied, on the tower of the Observatory (then rebuilt), where the cups revolve in a plane $4\frac{1}{2}$ feet above the balustrade, and at a height above the ground of 45 feet nearly. The resultant velocity and mean velocity both have a maximum in December and March, and a well marked minimum in July.

Resultant Direction of the Wind in the different Hours. (Table XLI.)

From the column of annual resultants it is found that on the mean of the year the direction of the wind attains its extreme westerly deflection (N. 103° W.) during the hour commencing noon. From this point, at which it continues nearly steady for three hours, it draws towards north continuously till 5 a.m., when it makes its nearest approach to the north (N. 39° W.). About this point it varies little from midnight to 7 a.m., after which it recedes again rapidly to the westward.

*Mean Velocity of the Wind in each of the Twenty-four Hours.
(Tables XLIII and XLIV.)*

The first of these Tables contains the velocity in miles for two series of years included in 1848-71. The whole period is divided into two groups, 1848-53 and 1855-71, in consequence of the changes in the position of the anemometer in June, 1854, and June, 1855. As part only of 1854 is comparable with 1853, and none of it with the year following, 1855, it has been omitted from both sets of means.

In Table XLIV, the velocity in each hour is expressed in terms of the average velocity in the same group for the twenty-four hours. A comparison of the two series will show a very fair similarity, column with column; but in the early series, when the instrument occupied a lower position, the diurnal ranges are greater than in the later series, as shewn by the following numbers :—

Years.	Winter.	Spring.	Summer.	Autumn.	Year.
1848-53....	0.36	0.71	1.15	0.76	0.69
1855-71....	0.32	0.55	0.92	0.66	0.57

In both series the maximum velocity occurs in one of the three hours commencing 1 p.m., and the minimum near to 4 a.m.

Velocity of the Wind in different Directions.

The following Table gives the mean velocity, on the average of the year for each of the sixteen points, from the seven years, 1853-59.

N	7.31	E	8.40	S	6.53	W	10.72
N.N.E...	6.03	E.S.E....	6.05	S.S.W....	7.46	W.N.W...	10.89
N.E....	6.92	S.E....	5.22	S.W....	8.05	N.W....	10.90
E.N.E...	8.77	S.S.E....	5.73	W.S.W...	9.85	N.N.W...	9.63

AURORAS.

In Table XLVI are given, as far as they could be procured, the number of Auroras recorded in every month from 1841-71.

By aid of the sums on the right and at the foot of the Table, the absolute numbers in the different years and in the different months may be compared. In Tables XLVII and XLVIII, the *relative* frequency are given in each year from 1853-71, and for each month, derived from the same years, or the ratios of the numbers of nights when Auroras were observed, to the number of nights when the sky was sufficiently clear to insure the visibility of Aurora if it were present.

The *absolute* monthly numbers in Table XLVI, and the relative numbers in Table XLVII—

- both show a principal maximum in September,
- a principal minimum in January or December,
- a second maximum in March or April,
- a second minimum in June.

Table XLIX contains the dates of certain periodic events, as far as they could be obtained. In the column, "Navigation closed," it must be understood that the year given refers to the winter commencing with December of that year, and that if the date of closing be in January, it refers to January of the next year.

The following are the dates of opening and closing of navigation for a few years prior to 1840.

	Navigation opened.	Navigation closed.
1833.....	April 4.	
1834.....	March 14.	
1835.....	March 30.	December 1.
1836.....	April 25.	December 1.
1837.....	April 16.	December 14.
1838.....	April 2.	December 14.
1839.....	April 2.	December 14.

TORONTO METEOROLOGICAL OBSERVATIONS.

TABLE IV.

MONTHLY AND ANNUAL MEANS OF THE TEMPERATURE OF THE AIR IN EACH OF THE THIRTY-ONE YEARS FROM 1841 TO 1871, WITH THE MONTHLY AND ANNUAL MEANS FOR THE WHOLE PERIOD, AND FOR THREE GROUPS OF TWELVE, NINE AND TEN YEARS RESPECTIVELY. ALSO, THE CORRESPONDING APPROXIMATE MEANS, FROM OBSERVATIONS BY THE LATE REV. CHARLES DADE, PRIOR TO THE ESTABLISHMENT OF THE OBSERVATORY, AND EMBRACING THE GREATER PORTION OF THE YEARS 1831 TO 1841.

Years.	Jan.	Feb.	Mar.	April	May.	June.	July.	Aug.	Sept.	Oct.	Nev.	Dec.	Mean Annual Temp.	Differ. from Average.

TORONTO METEOROLOGICAL OBSERVATIONS.

TABLE VIII.

GREATEST DAILY RANGE OF TEMPERATURE IN EACH MONTH FROM 1841 TO 1871,
TOGETHER WITH THE AVERAGES DERIVED FROM THE THIRTY-ONE YEARS, AND
ALSO FROM GROUPS OF TWELVE, NINE AND TEN YEARS.

[NOTE.—The highest Daily Range in each year is indicated by an asterisk.]

Dec.	Year.	Jan.	Feb.	Mar.	April.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.

TORONTO METEOROLOGICAL OBSERVATIONS.

TABLE XVII.

HIGHEST READINGS OF THE BAROMETER OBSERVED IN EACH MONTH AND IN THE
YEAR, FROM 1841 TO 1871, TOGETHER WITH THE AVERAGES DERIVED FROM
THIRTY-ONE YEARS, AND FROM GROUPS OF TWELVE, NINE, AND TEN YEARS.

The month in which the Highest Reading of each year occurs is indicated by an asterisk.

Barometer at $32^{\circ} = 27$ inches + the numbers in the Table.

TORONTO METEOROLOGICAL OBSERVATIONS.

TABLE XVIII.

LOWEST READINGS OF THE BAROMETER OBSERVED IN EACH MONTH AND IN THE
YEAR, FROM 1841 TO 1871, TOGETHER WITH THE AVERAGES DERIVED FROM
THIRTY-ONE YEARS, AND FROM GROUPS OF TWELVE, NINE, AND TEN YEARS.

*The month in which the Lowest Reading of each year occurs is indicated by an asterisk,
Barometer at 32° = 27 inches + the numbers in the Table.*

TORONTO METEOROLOGICAL OBSERVATIONS.

TABLE XXIII.

MONTHLY AND ANNUAL MEANS OF THE PRESSURE OF DRY AIR FROM 1841 TO 1871, OMITTING 1847, WITH THE MONTHLY AND ANNUAL MEANS FOR THE WHOLE PERIOD, AND FOR THREE GROUPS OF ELEVEN, NINE, AND TEN YEARS.

Pressure = 27 inches + the numbers in the Table.

Years.	Jan.	Feb.	Mar.	April.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.	Year.
1841	2.529	2.382	2.527	2.447	2.287	2.090	2.170	2.215	2.152	2.433	2.306	2.444	2.339
