The copy filmed here has been reproduced thanks to the generosity of:

Library
Agriculture Canada

The images appearing here are the best quality possible considering the condition and legibility of the original copy and in keeping with the filming contract specifications.

Original copies in printed paper covers are filmed beginning with the front cover and ending on the last page with a printed or illustrated impression, or the back cover when appropriate. All other original copies are filmed beginning on the first page with a printed or illustrated impression, and ending on the last page with a printed or illustrated impression.

The last recorded frame on each microfiche shall contain the symbol → (meaning "CONTINUED"), or the symbol ▽ (meaning "END"), whichever applies.

Maps, plates, charts, etc., may be filmed at different reduction ratios. Those too large to be entirely included in one exposure are filmed beginning in the upper left hand corner, left to right and top to bottom, as many frames as required. The following diagrams illustrate the method:

L'exemplaire filmé fut reproduit grâce à la générosité de:

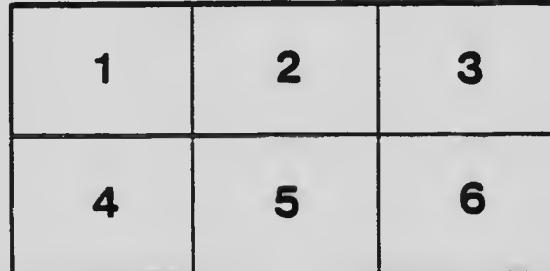

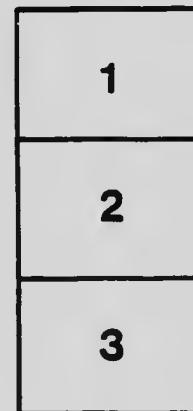

Bibliothèque
Agriculture Canada

Les images suivantes ont été reproduites avec le plus grand soin, compte tenu de la condition et de la netteté de l'exemplaire filmé, et en conformité avec les conditions du contrat de filmage.

Les exemplaires originaux dont la couverture en papier est imprimée sont filmés en commençant par le premier plat et en terminant soit par la dernière page qui comporte une empreinte d'impression ou d'illustration, soit par le second plat, selon le cas. Tous les autres exemplaires originaux sont filmés en commençant par la première page qui comporte une empreinte d'impression ou d'illustration et en terminant par la dernière page qui comporte une telle empreinte.

Un des symboles suivants apparaîtront sur la dernière image de chaque microfiche, selon le cas: le symbole → signifie "À SUIVRE", le symbole ▽ signifie "FIN".

Les cartes, planches, tableaux, etc., peuvent être filmés à des taux de réduction différents. Lorsque le document est trop grand pour être reproduit en un seul cliché, il est filmé à partir de l'angle supérieur gauche, de gauche à droite, et de haut en bas, en prenant le nombre d'images nécessaire. Les diagrammes suivants illustrent la méthode.

BULLETIN No. 35

GOVERNMENT OF THE PROVINCE OF SASKATCHEWAN

STATISTICS BRANCH

DEPARTMENT OF AGRICULTURE

FINAL REPORT

ON

GRAIN CROPS AND LIVE STOCK

OF THE

PROVINCE OF SASKATCHEWAN

FOR

1912

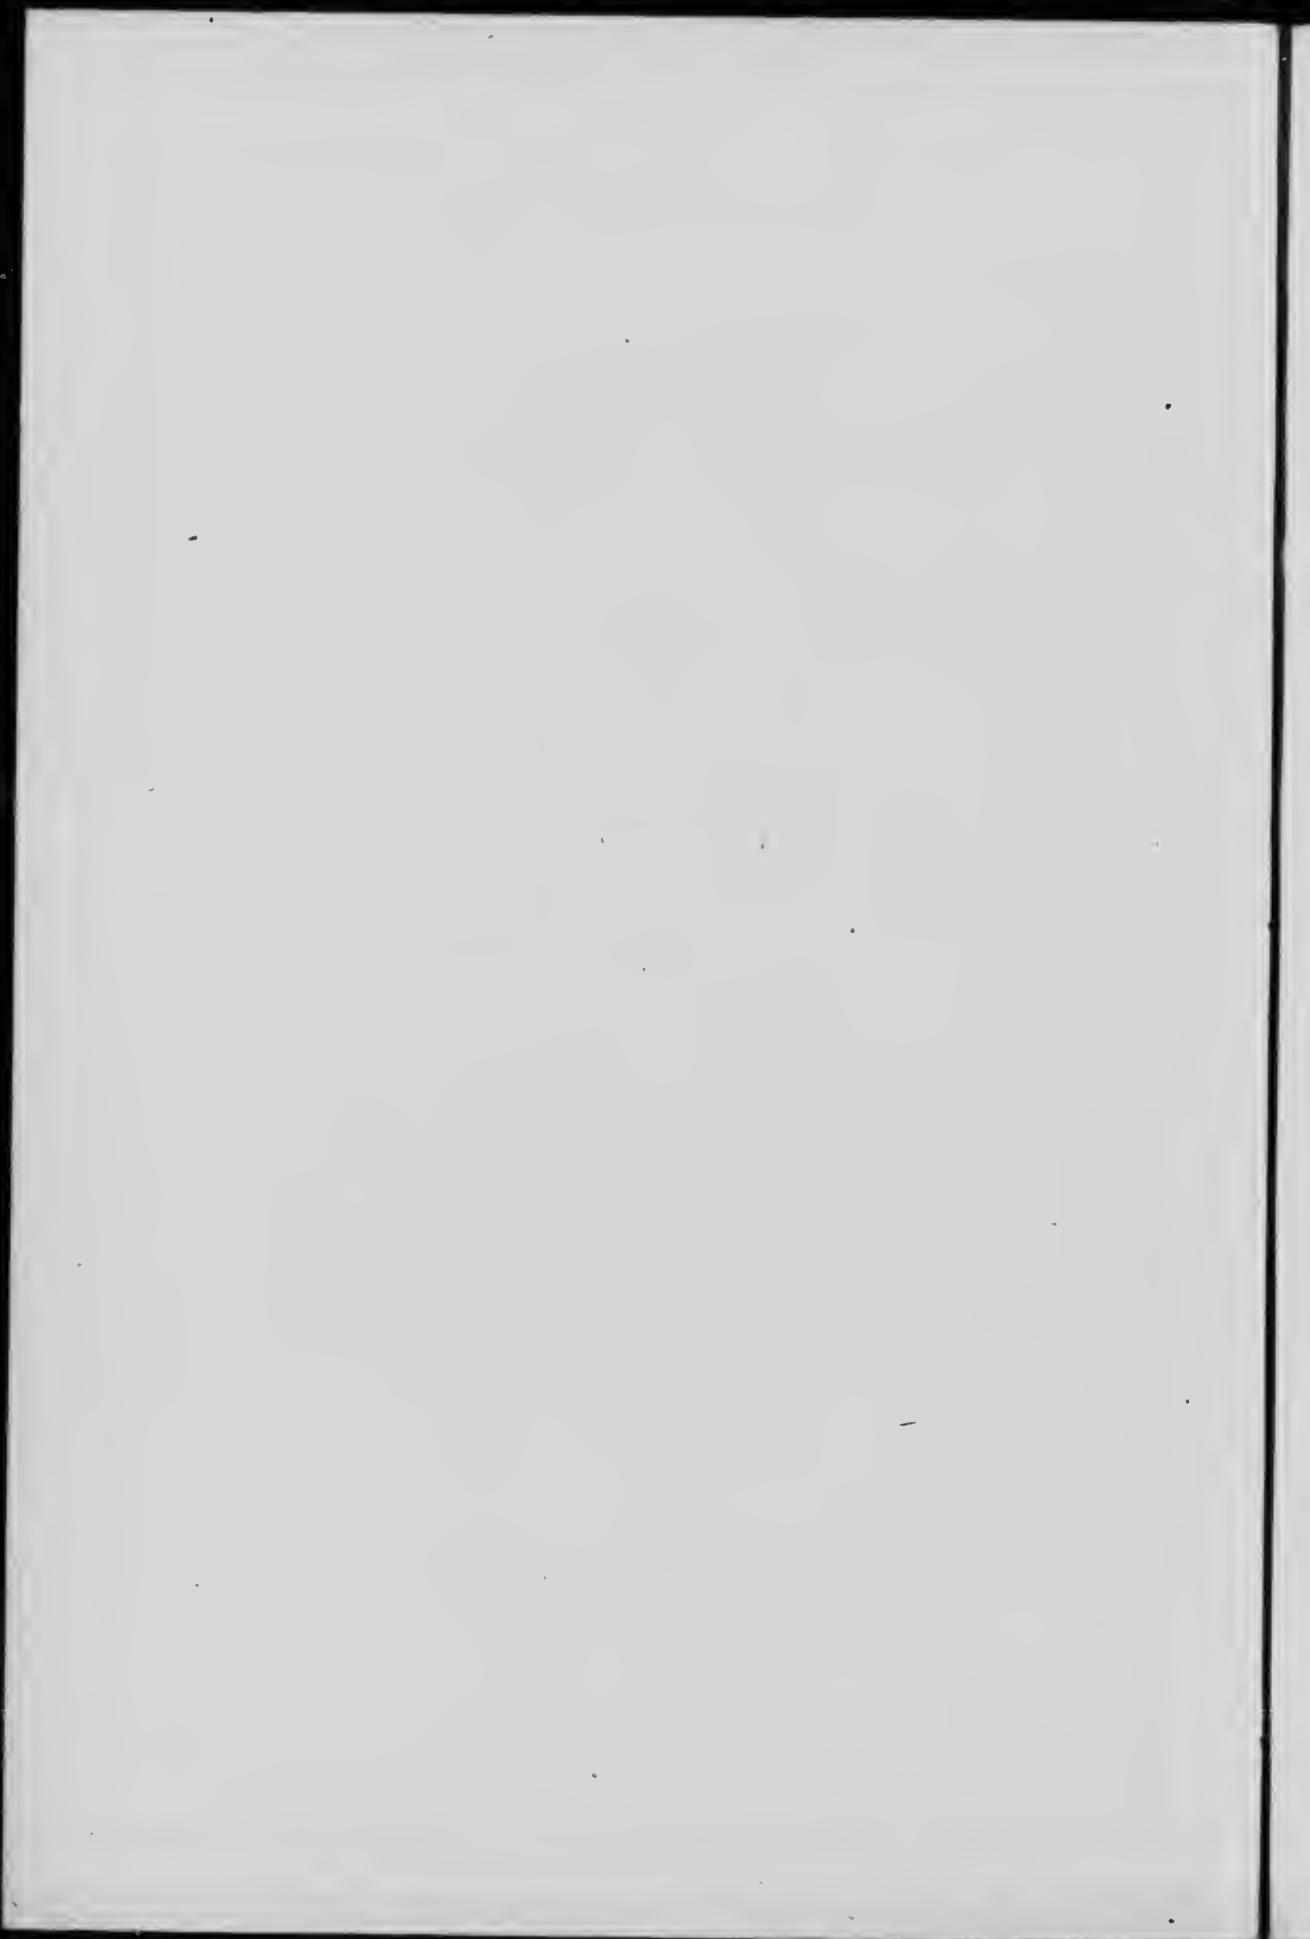

PUBLISHED BY DIRECTION OF

THE HON. W. R. MOTHERWELL, MINISTER OF AGRICULTURE

REGINA:

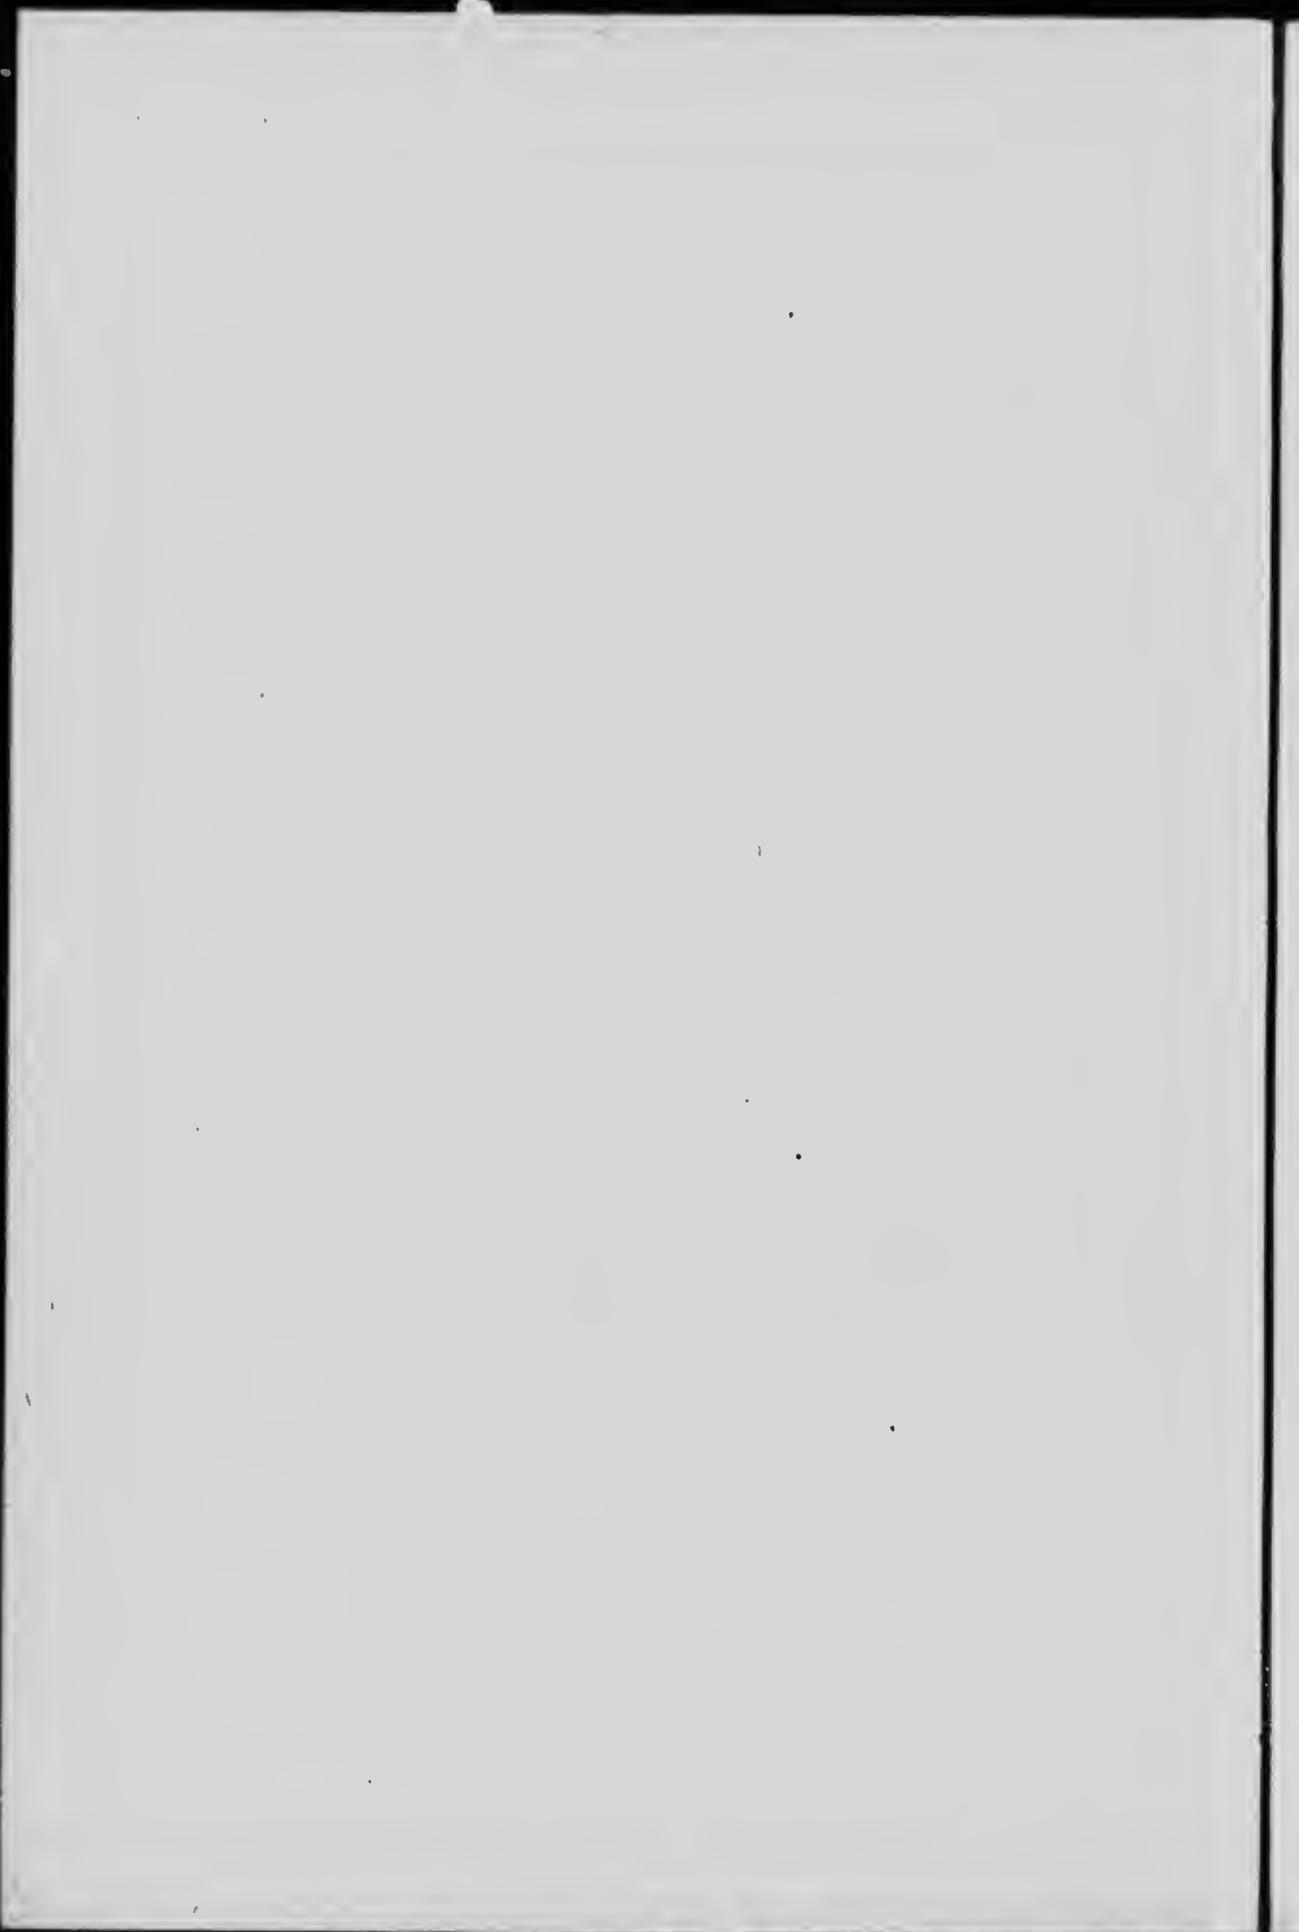

JOHN A. REID, Government Printer,
1913

PROVINCE OF SASKATCHEWAN.

Saskatchewan, which became a province on September 1, 1905, comprises the greater portion of the territorial divisions formerly known as Assiniboia, Saskatchewan and Athabasca. The province extends from the international boundary, or the forty-ninth parallel, on the south to the sixtieth parallel on the north, a distance of 760 miles. On the east it is bounded by the Province of Manitoba and the North-West Territories; and it is separated from the Province of Alberta on the west by the meridian of 110 degrees west from Greenwich. The width of the province at its southern boundary is 393 miles; in the middle 300 miles; and at the sixtieth parallel, which is its northern boundary, 277 miles. It has a land area of 242,332 square miles or 155,092,480 acres and a water area of 8,318 square miles.

South of township 64, which is practically the middle of Saskatchewan, the province has been divided for statistical purposes into nine crop districts, as nearly as possible uniform in size. The area of these districts is 86,826,240 acres and the crop area in them in 1912 was 9,276,670 acres or 10.68 per cent. of their total area. The area of arable land in the nine crop districts is estimated to be not less than 57,884,160 acres. The total area under cultivation is 14,118,780 or 16.26 per cent. of the area of the districts referred to. The acreage in readiness for the 1913 crop is estimated to be 4,715,910 acres; that is: summerfallow, 2,418,387 acres, and land newly broken, 2,297,523 acres.

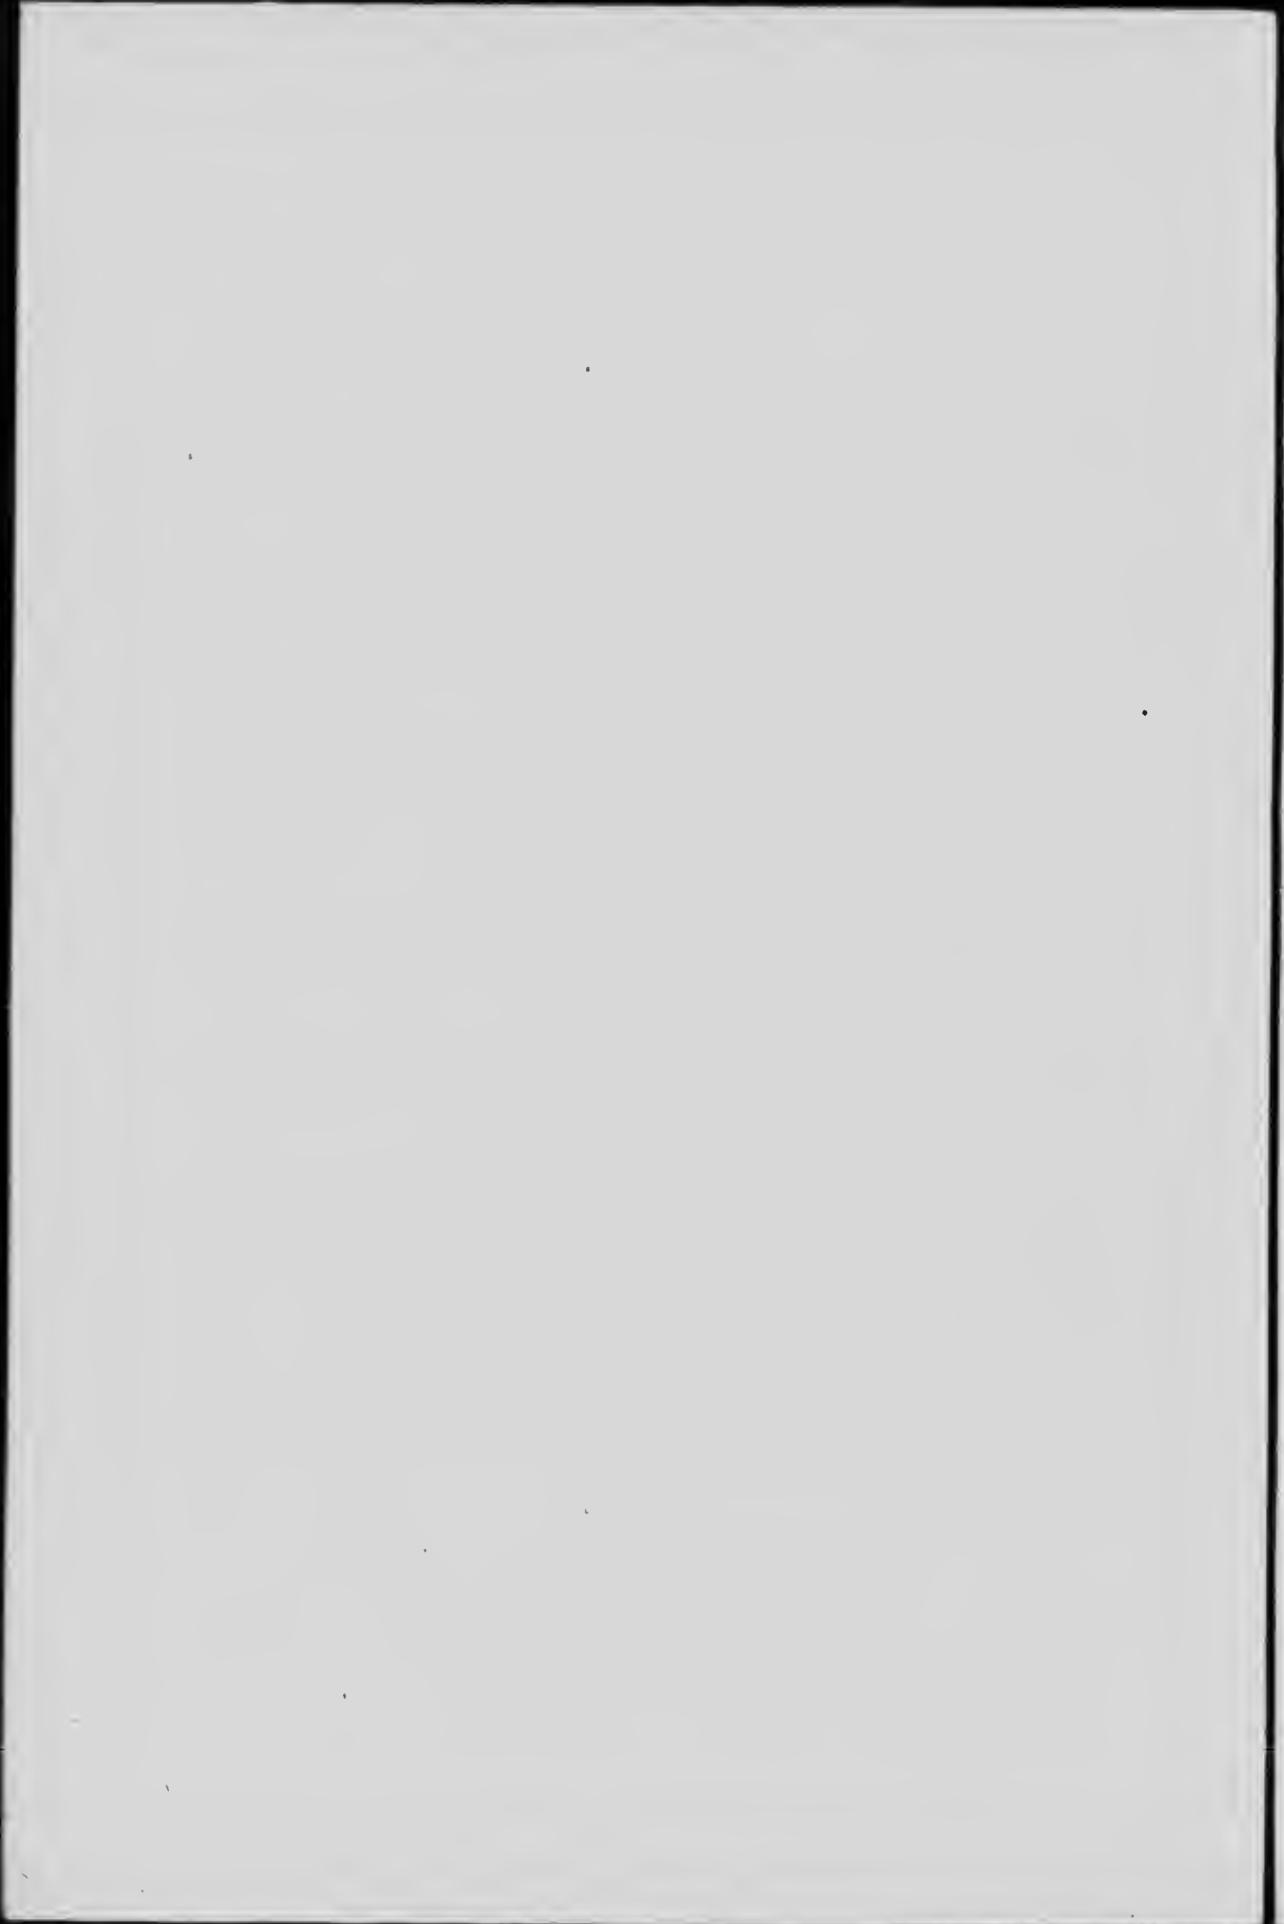

STATISTICS BRANCH DEPARTMENT OF AGRICULTURE

This bulletin contains a final report on the principal grain crops and live stock of the province for the year ending December 31, 1912, compiled from returns made to the Department by individual farmers and the regular staff of crop correspondents.

THOMAS CROMIE,
Secretary.

Regina, Saskatchewan,
February, 1913.

THE WEATHER AND ITS EFFECT ON CROPS.

The spring of 1912 opened early but seeding was delayed by the excessively wet and cold weather, which continued up till the end of April. The average temperature for March was 8.17 compared with 8.32 for January. As a consequence, seeding was not so rapid as in previous years. It commenced in some districts on March 28 and was general by April 17.

On the disappearance of the snow, farmers commenced to thresh the balance of the previous year's crop. In many districts seeding and threshing operations were carried on simultaneously. The spring threshed grain had lost much of its vitality, and in some fields where it was sown the seed did not germinate so that these fields had to be resown. Owing to the small amount of fall ploughing and the unusually large amount of work to be done in the spring, much of the crop was put in on stubble.

The last two weeks of June were hot with prevailing dry winds and local thunderstorms. This hot spell had an adverse effect, particularly on the early varieties of wheat just heading out and tended to shorten the straw. Because of its advanced state of maturity Marquis wheat received most damage from this cause.

The adverse effect of the hot winds was offset to a degree by the rain which fell in plenty throughout the province during the following weeks. Wheat was fully headed out by July 20, and in such shape that harvest was expected to be two weeks earlier than the previous year. Cool, showery and dull weather prevailed during the latter part of July and all through August. The rainfall was very much heavier than is usual at this period of the year. Leaf rust made its appearance owing to so much wet weather, but black rust was not reported. The areas affected by hail were very much smaller and more scattered than in the previous year.

Unsettled and changeable weather prevailed throughout the province during September, and the precipitation was much above the average of former years. Fine and rainy weather followed in alternate spells of two or three days duration. When threshing was in full swing work had to be suspended owing to the heavy rains. The ground was so wet as to make it impossible to move the outfits. The worst storms occurred between the 20th and 26th. The eastern part of the province suffered most severely from bad weather. Strong winds on the 5th and 6th of October did good service in drying the stooks, but also did damage by shelling out a fairly large percentage of the riper grain still standing. A few late fields of wheat and some oats and barley were caught by frost—flax, as usual, suffered most from this cause—but generally speaking frost damage did not amount to much on the year's crop. One effect of the rains was that a good deal of grain sprouted in the stack. Another undesirable feature was the formation of the second growth as a result of the rains following the heat of June and July. This made harvesting difficult. The quality of the grain was, however, very satisfactory, and fully two-thirds came within the contract grades.

REVIEW OF HARVESTING CONDITIONS.

Harvesting was commenced under adverse conditions. The wet weather experienced during the latter part of August and the first week

of September was general throughout the province. There was an entire absence of severe early frosts, but damage was done by the rains and by high winds which occurred both after and during the wet spell. This had the effect of shelling out much of the grain, thereby reducing the yield. Many farmers were compelled to cut wheat on the green side. The grain was also somewhat later in reaching the cutting stage on account of a second growth that came with the wet weather after the drought and cyclonic conditions which existed at the end of June. This poor start was offset by ideal conditions which were general during the first two weeks of October. Fine weather with gentle drying winds prevailed and enabled harvesting to be carried on without interruption.

MARQUIS VS. RED FIFE.

The season was not favourable to early sown grain, the hot weather in June scorching it during the heading out stage. The yield of Marquis wheat was less than in the previous year, but it ripened fully a week earlier than Red Fife, and quite as early as Preston, one of the other early maturing varieties. The average yield was from 20 to 30 bushels per acre, while some farmers reported over 40 bushels to the acre on new land. The straw of the Marquis is shorter by from four to nine inches than that of Red Fife, is slightly more resilient and a better stand. Its growth last year was from three and a half to four feet high. The majority of those who have tried Marquis speak very highly of it, yet it is not likely to supplant Red Fife in the popular favour for some time to come, especially when good selected registered Red Fife seed is used.

HARVEST HELP.

The labour question, as usual, caused anxiety. In spite of the high wages paid many of the threshing outfits were run short handed. The average wage paid to harvesters was \$3.75 per day.

THE HAY CROP.

The hay crop was not nearly so good or plentiful as the early part of the season gave promise of. Although the yield is about the same as in former years, the quality is poorer. A large amount that was cut could not be saved on account of the extremely wet weather which was widely prevalent during the hay harvesting season. In many districts the sloughs were so full as to prevent the cutting of a great quantity of hay which is available in normal years. This cause alone explains the material reduction of what should have been a bumper crop.

The area of cultivated hay raised in the province is limited, but the average yield has slightly increased, the figures being: 1.72 tons to the acre as against 1.50 tons the previous year. The average price also rose from \$9.73 to \$10.35 per ton this year.

The total tonnage of hay, domestic and natural, for the year 1912, is estimated to be 1,600,000, of which 2,100 tons were of alfalfa and 37,000 tons of other kinds of hay, such as timothy, rye and brome grass.

ACREAGE AND PRODUCTION OF GRAIN CROPS.

The total production of the four principal grain crops in 1912 was 237,278,446 bushels, or 24,568,088 more than in 1911. The percentage of increase is 11.5, as against a percentage of increase in 1911 of 31.88.

The total production of wheat includes 107,167,700 bushels or 10,371,-112 over 1911. This is an increased percentage over the previous year of 10.7. Wheat shows a substantial increase both in acreage and in average yield, although the crop lost somewhat in favour owing to the nonpreparation of the soil in the previous fall, and also owing to the interference with wheat seeding by rain at the end of April. The acreage under this crop was 5,384,092, an increase of 151,844 acres or 2.90 per cent. over 1911. The average yield per acre is 19.9, or an advance of 1.4 over the previous year. Wheat has increased largely in the north-western or Battleford district, owing to the increase in the acreage brought under cultivation by new settlers. The Kindersley district also shows a larger area sown to wheat.

Fall wheat has been tried in several places, mostly in the east central district, but has not met with complete success. Farmers have put in trial plots of a few acres, but it has, in most instances, failed to come through the winter months, being killed by the severe frosts even under a covering of snow.

Many farmers have reported success in growing Marquis wheat. This variety makes a good early showing and is quicker coming to maturity and earlier harvested than any of the other varieties.

Oats have increased again in all districts, which is principally due to the demand for feed, and also because of the land being too wet for wheat. This crop is also less susceptible to early frosts. The total acreage under oats is 2,421,932 or 229,126 more than in 1911, showing an advance of 10.45 per cent. On an average yield of 44.4 bushels to the acre the total production is 107,619,948 or 8,943,678 over 1911. This is an increase of 9.06 per cent. over the previous year. The average yield, however, shows a slight decrease of .6 per cent. compared with 1911.

Compared with 1911 barley shows a considerable advance. The acreage in 1912 was 267,139 or 22,146 acres more than in the previous year. The district with the largest acreage under barley is the south-eastern, possibly owing to the proximity to the United States markets. The total production of barley for 1912 was 8,319,584, or 1,459,780 bushels over 1911. This is an advance of 21.2 per cent. The average yield is 31.1, or 3.1 per cent. above last year's yield.

The flax crop shows a larger percentage of increase both in acreage and yield than any of the other grain crops. Although a considerable percentage of the flax crop of the previous year was not saved, this crop continues to increase especially in newly opened districts. The total acreage in 1912 under this crop was 1,111,651, as against 932,408 in the previous year, while the yield was 14,171,214 bushels. This is 3,793,513 bushels or 36.5 per cent. increase over 1911. The average yield is 12.7 or 1.4 per cent. increase. The increase in flax acreage is greatest in those districts which have the least railway facilities, as the farmer with a long haul can obtain more money for his load of flax than for any other kind of grain. He can also get quicker returns, as flax is the most suitable crop for new broken land.

The crop acreages and yields are set out in full detail in the following tables:

A very satisfactory condition is indicated by a number between 100 and 125; a fair condition inferior to the average is indicated by a number between 75 and 100; a poor condition by a number between 50 and 75.

Commencement of Harvesting.

Although the date when harvesting commenced was a week or more earlier this year than last, conditions were such that by the time wheat cutting was general harvest was three days later than in 1911. District No. 3 (the south-western portion of the province) was in every case earlier than any of the other districts. The full figures are given below:

District	Wheat	Oats	Barley	Flax

Damage to Crop Areas.

There have been many conjectures as to the actual amount of damage suffered by the crops from various causes during the past season. The following tables are therefore interesting. It should be borne in mind that the figures do not show the percentage of crop damaged but refer merely to the areas affected in the different districts.

Percentage of Areas affected by

District	Frost				Rust				Hail				Wet and Wind

* This statement is not compiled by Provinces.

According to the figures supplied by the Board of Grain Commissioners two hundred and forty-three new grain elevators were erected in the province during 1912, giving an increased capacity of 7,064,000 bushels. This number includes those built by the Saskatchewan Co-operative Elevator Company. It will also be seen from the accompanying tables that Saskatchewan has an elevator capacity of over two million bushels more than Manitoba, Alberta and British Columbia combined.

The following table gives the number and total capacity of elevators and grain storage warehouses in Saskatchewan in each of the years 1912-1907:

Year	Number	Total capacity
1912.....	1,252	36,503,000
1911.....	1,009	29,439,000
1910.....	909	26,440,000
1909.....	842	24,279,000
1908.....	638	18,138,500
1907.....	516	14,621,500

Summary by provinces of country elevators and warehouses, terminal elevators and eastern public elevators.

Season 1912-1913

Province	Stations	Elevators	Warehouses	Capacity
Manitoba.....	338	698	10	22,253,150
Saskatchewan.....	513	1,246	6	36,503,000
Alberta.....	168	321	19	11,565,500

MARKET ON RYE.

In view of the market offering and the value of rye as a rotation crop the farmers of Saskatchewan may find it to their advantage to plant some of their acreage under this grain. At present only a few cars are shipped from the west.

This season we made some inquiries into the market obtaining for this grain, and the following extracts from letters received from Messrs. Randall, Lee & Mitchell, grain commission merchants, Winnipeg and Minneapolis, may be of interest.

Winnipeg.—“Last season there was a limited demand here in Winnipeg for rye, but the supply was so uncertain that the parties have discontinued its use. At present, about the only outlet we know of is for shipment to points in Ontario where the rye is purchased by the distillers. I have heard of none of this rye going into the American markets. We have referred the matter to our Minneapolis office, and have requested them to write you direct, giving you any information they may have on the subject.”

Minneapolis.—“We are glad to state there is a very active market prevailing on rye in this territory, and a considerable volume of business is worked all the time. Our Minneapolis market is in condition to take care of any volume offered, receipts having run as high as seventy-five to ninety cars daily for quite a time during the fall. At the present time choice No. 2 rye, free from any mixture of foreign grain or foul seed, commands a price of 60c per bushel. Poorer samples of No. 2 carrying light mixtures of wild oats or foul seed sell from that figure down to 56c. Samples which are tough or very dirty, grading no grade, sell from 56c to 50c, according to quality. We lack information as to the market value of your Canadian rye in the eastern provinces so are unable to state whether it would be profitable to ship rye to Minneapolis, paying a 10c per bushel duty. Freight rates have been adjusted so that they are about equivalent from your western provinces to Minneapolis or Port Arthur and Fort William. As regards the comparative value for distilling purposes of spring rye and fall rye, our buyers here apparently do not differentiate, though preferring large plump berried white rye against the smaller berry of darker sample.”

With regard to the market value of Canadian rye in the eastern provinces it may be stated that it was quoted at 71c per bushel on the Montreal market. Taking the average freight rate from Saskatchewan to Fort William as 20c per 100 pounds and 20c Fort William to Montreal, or a through rate to Montreal of about 22c per bushel of 56 pounds, would give to the farmer a return of \$17.15 per acre on a yield of 55 bushels per acre.

The following letter under date of January 30, 1913 was received from the Albert Dickinson Company, seed merchants, Chicago, on this subject:

“In reference to the spring rye, can only say that there is usually a moderate demand for this from year to year for crop that can be put in in spring for harvesting in fall. The quantity obtainable the last few years has been comparatively small, so that it has brought sharp premium over the winter rye, but this is the exception. Ordinarily, when good crop is secured, it sells on about parity or possibly few cents a bushel premium over the regular winter rye. We do not know how extensive demand for it is on your side, as it was our impression that it was easily produced in sufficient quantities to take care of the home requirements, and on this side of the line supplies have been about ample from year to year to satisfy the demand, so that it would probably not afford you any outlet in the States on account of the duty, etc.

“The winter rye, we understand, is a regular crop with you and presume you have no difficulty in marketing same with the milling trade on your side, or for export. We do not know what the experiments of seeding rye on your side might develop, but it is doubtful whether it would bring sufficient premium to seed it on any extensive scale.”

REPORT OF THE CONFERENCE ON WHOLESALE SEED TRADE WITH REFERENCE TO RED CLOVER, ALSIKE AND ALFALFA.

(By Geo. H. Clark, Dominion Seed Commissioner.)

“In November a conference was held with representatives of the wholesale seed trade at which samples were prepared and agreed upon to represent the minimum standard general quality, apart from weed seed

content, that would be recognised in official grading for Nos. 1 and 2 timothy, red clover, alsike and alfalfa seed during the season of 1912-13.

"On the whole the standards are somewhat lower than last season with more spread between Nos. 1 and 2.

"The grade No. 1 American standard for timothy seed, which was recognised last season owing to the unusual circumstances, has been eliminated and the standard for No. 1 lowered to allow a larger proportion of hulled seed than last year; while grade No. 2 has been raised to prevent too wide a spread. With the clovers the standards for No. 1 are nearly as high as last season, but the No. 2 standards are considerably lower, especially for red clover. Samples of the standard grades have been distributed to the leading seed merchants.

"Owing to the very light crop of red clover, alsike and alfalfa seed in Canada and the United States and its low average quality, it is exceedingly difficult for seed merchants to secure sufficient good Canadian and United States grown seed to meet their requirements. Canadian grown alsike and clover seed that will grade No. 1 is extremely scarce, while No. 1 Canadian alfalfa seed is almost nonexistent and there is very little of the lower grades available. American grown Mammoth clover seed that will grade No. 1 is practically impossible to obtain in quantity and the supply of No. 2 is extremely limited. The fact that there is such a small amount of Canadian and United States grown clover seed has produced some unusual features of the trade that farmers and retail dealers would do well to consider. During the last few years the demand for No. 1 seed has greatly increased, and now, when locally grown supplies cannot be had, the wholesale seedsmen are forced to depend largely on foreign seed for their No. 1 stocks. Red clover seed is being brought in from Chili and Europe to make up the No. 1 grade. The same applies to alfalfa seed in even a more marked degree, as practically all that grades No. 1 is being imported from the United States or Europe.

"The preponderance of foreign seed in the No. 1 grade this year is sufficient reason for the farmers and retail dealers to look more favourably on the lower grades, provided the seed is not graded down for weed seed content.

"It is well known that foreign grown seed is not so suitable for Canada as home grown acclimatised seed; and it is quite possible that No. 2 Canadian grown seed would be really more valuable than No. 1 seed of foreign origin, provided that the weed seed content is the same.

"When pure Canadian grown seed can be secured although it grades No. 2 or even No. 3 on account of general quality, it would be advisable to use it, applying more to the acre to make up for the poor seed that will not grow.

"This is especially true of alfalfa, as with it the origin of the seed is of even greater importance than with red clover or alsike."

Tame Hay.

District	Average yield per acre	Average price per ton
1.....	1.71 tons	\$7.94
2.....	2.05 "	10.72
3.....	1.37 "	11.00
4.....	2.50 "	8.77
5.....	1.63 "	8.90
6.....	1.37 "	10.00
7.....	1.75 "	12.00
8.....	2.20 "	7.75
Province.....	1.82 tons	\$9.63

Potatoes and roots yielded well and were of a very good quality. The average yield of potatoes was 200 bushels to the acre. Wherever they were put into ground properly prepared and given some attention during early part of growth good results were obtained. Some of the swede turnips and mangolds weighed as much as 12 and 15 pounds each. The average yield of roots was 300 bushels to the acre. As cleaning crops there are nothing better than potatoes and roots. Yet there were only 9,930 acres of roots and 31,927 acres of potatoes grown in Saskatchewan in 1912.

POTATOES AND ROOTS.

The following table gives the estimated acreage and production of potatoes and feed crops in 1912:

	Acres	Average yield per acre	Total Production
Other grains.....	4,098	44 bus.	180,312 bus.

MARKETING OF CROPS.

It was the last week in September before the western wheat crop of 1912 began to be shipped out in any volume. The scarcity of spot wheat was the means of keeping the price high for this class and for cars that had passed Winnipeg. During October wheat began to arrive at Winnipeg from the prairies at the rate of 500 cars daily. A considerable proportion of it was tough and damp, although the wheat, in this condition, was mostly No. 1 or No. 2 Northern, and was perfectly good for milling. From this on, the wheat receipts increased in volume. From the 4th to the 9th of October 4,342 cars of wheat were inspected at Winnipeg, as against 2,770 cars inspected during the same period the previous year. The effort to cover short sales was given as one of the causes of the maintenance of the prices. The following week the receipts of wheat increased to 1,100 and 1,200 cars per day. The war scare, which had accounted for a slight rise in prices, owing to the rush to cover short sales, subsided, and this, together with the advent of the big receipts, caused prices to drop from 3c to $3\frac{1}{2}$ c in two days. Towards the end of October the prices declined in line with outside markets. There was, however, a big demand to provide for the vessels loading at the lake fronts.

The arrangement whereby the freight rate on grain shipped from the west to Duluth was made the same as the rate to Fort William and Port Arthur—not only for grain shipped in bond for export but also for grain shipped for local consumption—helped the movement of the grain during the winter months.

Seldom, if ever before, have there been more universally good crops throughout the world. The large exporting countries—Russia, the United States and Canada—have had largely increased yields, and with every prospect of excellent crops in the Argentine, Australia and India it is certain that the world's surplus of wheat will be very much larger than it has been for some years past. The effect of this surplus of supply over requirements brought about a heavy decline in price.

At the beginning of November there was a slight decline in the grain movement from the west, but there was a ready sale for all wheat that had passed Winnipeg on the declining prices. In the third week of November the Winnipeg markets closed with slight advances as the result of a rise in Liverpool prices. With less apprehension over the political situation prices went up, but heavy selling on the Chicago markets forced the prices down again. On the week there was a decline of from 3c to $3\frac{1}{8}$ c in the Winnipeg market. In fact the prices in the markets of the North American continent were during this period lower than they have been since 1907.

Owing to the heavy movement from the west and the slower movement eastward from Fort William, congestion at the terminals took place to such an extent that the Canadian Pacific Railway tried to check the western movement by temporarily refusing to supply cars at certain country points. Outlying points in this province suffered most from this action on the part of the railway company. As a matter of fact, however, there was little reduction in the volume of receipts at Winnipeg until the advent of colder weather in December, when receipts fell off to about two-thirds of the previous movement.

Lake navigation closed on December 17. The available storage capacity at the lake terminals was increased by the large number of vessels lying at the docks until spring. Towards the end of December the receipts had gone down to below what they had been at the same time in the previous year, and there was a slight rise in prices.

Statement of receipts and shipments of grain at country elevators for Manitoba, Saskatchewan and Alberta for 12 months
ended August 31, 1912.

1911	621,338,000	(79,689,000)	215,918,000
1912	730,267,000	(Preliminary) • 30,160,000	190,236,000
		• 30,160,000	• 64,466,000

* This figure does not include exports of Flour.

Wheat flour at the rate of four and a half bushels per barrel is included with unmilled wheat.
 It may be observed that the production in the United States has varied very little since 1891, while it has not exceeded the 748,000,000 bushels recorded in 1901, nor have the exports exceeded those recorded in 1901 and 1902.

The following tables showing the exports from Canada of Canadian wheat, oats, barley and flaxseed for the past two fiscal years ending March 31, have been supplied by the Federal Department of Trade and Commerce.

SMALL FRUIT GROWING IN SASKATCHEWAN.

Inquiry was made during the year into the possibilities of fruit growing in the province. It has been felt that for some time this branch of horticulture is being very much neglected by our busy farmers, and it is probable that if the excellent results, which many have secured with comparatively little trouble, were more generally known, a widespread effort might be made by our farmers, not only to supply their own tables, but also the local market with fresh or preserved fruit. It seems an anomaly that such high prices as are obtained for small fruits should go into the pockets of the growers of British Columbia or elsewhere, when these fruits can be raised with equal success by our own farmers.

The further the inquiry is pushed the more obvious it becomes that, while fruit growing in Saskatchewan is only in an experimental stage, those who have experimented have almost invariably been perfectly successful. The letters of about 350 correspondents tend to show that the growing of the larger fruits, such as peaches, plums, apples or pears have hitherto been unsuccessful, although some crab apples and Manitoba plums have been grown. But raspberries, black, red and white currants and gooseberries all do splendidly and many have had very good success with strawberries also. It is curious to note that in spite of the great demand for these fruits, out of all these correspondents mention is made of only one farmer who grows fruit for sale, and strawberries are the bulk of his crop.

In many cases a farmer will transplant wild stock, putting them into a corner of his vegetable garden, and either because he has no time or lacks interest, will leave them to bear or not as circumstances may dictate. This seems a pity, as those who bestow even the most ordinary care and attention on their fruit bushes are certain to be well repaid.

In starting to grow fruit it is, of course, advisable to buy cuttings from a reliable nurseryman, but when this is impossible the wild stock is generally easy to procure, and after being transplanted to a well manured and well-worked garden, the fruit, especially the currants, will rapidly improve both in quality and quantity.

There is no doubt that small fruit growing in Saskatchewan presents an attractive opportunity for the man with small capital. Every market gardener, at all events, should devote a portion of his ground to fruit growing, as he will not only secure good returns in cash, but the shelter obtained will be valuable to his other crops. There is nothing either in our soil or climate which is adverse to a high rate of production, while the market is all that could be desired.

Extracts from a few of the more interesting letters are appended:

Patience Lake.—“I have a garden 50 by 7 yards, which was planted in 1906. The currants started bearing in the following year and gooseberries and raspberries the year after. We have more fruit than we can manage to pick, and a great deal falls to the ground. We have been using raspberries and red currants for a month for a family of six and have made eighty pounds of jam. Black currants and gooseberries are ready to pick and I expect about the same quantity of fruit from them. Half of the bushes are in full bearing, while the other half, taken from cuttings and suckers, are not so far advanced, but have borne fruit.”

Estevan.—“I got twenty-two quarts of fruit from 35 strawberry plants, and also had a fine crop of currants of all colours.”

Quill Lake.—"More farmers in this district would grow fruit if they could get trees and bushes."

Oakshela.—"Small fruit, such as black, red and white currants, gooseberries and raspberries are grown by most of the farmers in the township. A few are trying wild plums, but the fruit does not mature, though the trees are thrifty. The fruit drops off when about half grown."

Broadview.—"I grow red, white and black currants, raspberries, plums and crab apples, all with good success."

Whitewood.—"Not many farmers grow fruit, but I have had fair success. Red and white currants do well and black currants grow much larger when cultivated than when in a wild state. My crab apples grow well in sheltered places and are at present covered with fruit. Last year I had a good quantity of ripe fruit of good quality. I intend planting some more trees, such as crabs, plums and cherries."

The following statement shows the value on the farm of the products of the farms of Saskatchewan during the years 1911 and 1912:

	1912 Average			1911 Average		
	Bushels	Price	Total Value	Bushels	Price	Total Value
Wheat.....	107,167,700	\$0.67	\$71,802,359.00	96,796,588	\$0.67	\$64,853,713.96
Oats.....	107,619,948	.25	26,904,987.00	98,676,270	.21½	21,215,398.05
Barley.....	8,319,584	.35	2,911,854.40	6,859,804	.43	2,949,715.72
Flax.....	14,171,214	1.00	14,171,214.00	10,377,701	1.80¾	18,757,694.56
Other grains.....				180,312	.50	90,156.00
Potatoes.....	6,385,400	.39½	2,582,233.00	5,108,368	.50	90,153.00
Field Roots.....	2,979,000	.43	1,280,970.00	2,836,988	.51	2,605,267.88
Hay.....	Tons			Tons		
Natural and domestic, (estimated)	1,650,000	5.00	8,250,000.00	1,594,713	4.50	7,176,208.50
Forage crops.....	63,525	5.50	349,387.50	60,502	5.00	302,510.00
			\$128,343,160.90			
						\$119,170,523.31

The above average prices of grain are calculated on the basis of cash prices, in store at Fort William or Port Arthur; minus—freight, 20c per 100 pounds; spread between street and track, 6c per bushel on 25 per cent. of the crop or 1½c per bushel on the full crop; handling charges on 50 per cent. of the crop at 1½c per bushel or 7-8c per bushel on entire crop and commission of 1c per bushel.

HEALTH OF LIVE STOCK.

Horses and cattle came through the winter in good shape, although many had fallen off in flesh from want of substantial feed. Many farmers fed their unthreshed flax and barley to stock. Abortion was prevalent among mares and influenza caused much loss and also kept many in poor condition. Distemper was common for a while but was well over before seeding started. Several cases of lung fever, pink eye and ringworm were reported, and in districts 3 to 5 principally glanders was the cause of many horses having to be killed.

Cattle and sheep on the whole were free from any infection. Many sows lost their litters, chiefly due to poor feeding and lack of exercise. Many farmers have been feeding frozen grain to their swine, and some attributed to this fact the high mortality among young pigs.

Weddel & Co.'s 1912 review of the frozen meat trade contains this statement with reference to Canada:

"The import trade into the western provinces from Australia *via* Vancouver, increased during 1912, when Australia shipped 30,600 carcasses of mutton to that market."

CONDITION OF LIVE STOCK.

Owing to the liberal rainfall this summer the pasturage throughout the province has been exceptionally good and abundant and partially accounts for the high average condition of stock.

The figure 100 indicates a condition of normal health, thriftiness and flesh. A number below 100 indicates a condition not so good.

June 1, 1912.

Poultry.....	4,759,954	.50	2,379,977.00

The tables given below show the receipts and average prices of cattle, sheep and hogs at Winnipeg stock yards in the past three years. The 1912 increase in cattle receipts is accounted for by the number shipped to British Columbia. The average price for butchers' cattle was 62c per hundredweight higher than the previous year.

Shipments of sheep from the United States are on the increase. Except in 1910, the average price of hogs was the highest in six years.

There were 13,820 horses shipped to the west from Eastern Canada and 4,097 from the United States.

PUBLICITY.

The growing interest in Saskatchewan as a field for investment and the increasing demand for information as to the splendid opportunities which she offers to the man of little capital who desires to start farming for himself is to a degree evidenced by the enormous increase in the number of inquiries received by this branch from every part of the world. The gradual extension of our permanent mailing list, and the distribution of pamphlets, maps, bulletins and lately the Public Service Monthly, has added materially to the clerical work of the branch.

In addition to the usual publicity literature five thousand copies of a special calendar were printed and distributed in Great Britain and Ireland, and ten thousand maps of the province were printed, chiefly in the interests of prospective homesteaders. These maps were brought up to date, showing railway developments, both present and projected, and indicating lines under provincial bond guarantee.

A new handbook compiled and bound in rather more attractive form than usual is now ready for distribution and should be of much value to those interested in this province. It deals with every phase of the country's agricultural and industrial development, at the same time presenting a short sketch of the province's history, in order that a better idea might be gained of the wonderful strides made during the last two decades.

Visitors' registers were sent out with the provincial exhibits to Eastern Canada, the United States and the Dry Farming Congress at Lethbridge. In this way thousands of names were secured to whom literature was afterwards mailed.

Another innovation was the effort which was made to arouse interest in Saskatchewan by sending moving picture films to the old country and to the United States. Last year 1,000 feet of films were obtained, and it is

hoped that in the coming year one or more films of this length will be sent to those countries sending the largest number of immigrants to the province. These pictures will include views of actual agricultural operations from the commencement of seeding up to the marketing of the grain, and also views of some of our industries, which are attracting so large an amount of capital year after year that Eastern and American manufacturers find it profitable to establish branches here.

The usual number of exhibits were prepared and sent, in charge of a government official, to exhibitions at Toronto, Sioux City, Milwaukee and Lethbridge. The exhibit was a good deal more elaborate than in former years, and was very successful in attracting attention to Saskatchewan's resources. Besides the very fine display of grains and grasses, the chief attraction was the mechanical device entitled "The Niagara of Saskatchewan," which was a continuous cascade of grain instead of water. The effect of the exhibit on immigration is bound to be great, as the demand for literature and information was very heavy. Although the display was not quite so large in the States, the people there showed great interest in the products of our soil, and particularly in Sioux City the spirit of emigration to Canada seemed to be very much alive.

THE DRY FARMING CONGRESS.

The Seventh International Dry Farming Congress at Lethbridge was brought to a successful conclusion on October 26. This movement had a small beginning several years ago, but at this congress representatives were present from every country in which dry farming is practised. Many delegates attended from Western Canada and the dozen or more western states in which the production of cereals has been greatly increased through the adoption of dry farming methods. The Government of Saskatchewan was represented by Hon. Mr. Motherwell, Deputy Minister Mantle and several other officials of the Department of Agriculture and of the College of Agriculture. The total registered attendance was over 2,500, which is 100 per cent. increase over any previous year.

During the week conferences on soils, tillage methods and machinery, crops and crop breedings, agricultural education, farm management, scientific research, agricultural colleges and experiment stations were held, while an interesting feature was a special section whose discussions were devoted to the interests and problems of farm women.

VICTORY FOR SASKATCHEWAN.

Saskatchewan has every reason to be proud of the success achieved by her exhibitors. In addition to a long list of prizes won by individuals the Saskatchewan composite display was successful in gaining the much coveted prize for the best collection of farm products from any state or province. It was of even greater importance that she took the first prize for the largest number of delegates from any state or province, as this shows the great interest which was taken in the congress by our farmers.

The Hon. Mr. Motherwell was elected president for the coming year, and, Mr. Mantle, corresponding secretary for the Province of Saskatchewan.

Dry farming methods are those which have been shown to tend to the reduction of evaporation and the production of a storage reservoir in the soil. A system which will conserve moisture and promote fertility is known to be necessary for at least 63 per cent. of the agricultural acreage of the world. Dry farming is the term applied to these newer methods, suitable to those climates where the precipitation is not great, as contrasted with those older methods used in humid or irrigation districts.

The work of the congress was divided into nine distinct conferences. Eight of these were on agricultural subjects, and were in charge of noted agricultural experts, while the ninth was for women, and dealt with the work and life of the rural home.

To make the trip to this important and inspiring event still more pleasant for those attending from Saskatchewan points, the Provincial Department of Agriculture chartered a special train of standard sleeping cars for the round trip to Lethbridge. A large number of farmers, business men and others secured accommodation for themselves and their wives and daughters. The cars were available for use throughout the Congress, so that the party had no concern regarding hotel accommodation while at Lethbridge.

It is recognised to be perfectly fair and natural that the Congress should be held alternately in the United States and Canada, and in 1913 it will accordingly be held in Oklahoma City. It is, however, more than probable that the 1914 convention will be held in the capital city of Saskatchewan.

THE PUBLIC SERVICE MONTHLY.

The Public Service Monthly, which commenced its career in August, differs so materially from all previous publicity work that it is deserving of special mention. In former years the energies of this branch, with regard to publicity work, were directed towards securing for Saskatchewan new settlers or new industries, while the Public Service Monthly exists chiefly in order to convey to our own citizens information as to the varied activities of the Government. Hitherto the Government has been dependent to a great extent on the public press for the insertion of notices articles and data on subjects concerning the public service and welfare,

and as a vehicle for conveying information of this sort was becoming more and more necessary, the Public Service Monthly was started. In filling this want it has met with greater success than was ever anticipated. Letters of appreciation are being daily received, and the demand for it is so great that the circulation has risen from four to eight thousand in the eight months of its existence. Setting forth as it does the operation of the different departments and the administration of our laws, its educational value cannot be over estimated. Instead of the government being regarded as a mere machine for grinding out laws and swallowing taxes, through this medium it will be recognised as having more important duties, and all must benefit by a closer acquaintance with the numerous works undertaken to meet the new and growing conditions in the province where progress and settlement have been so rapid.

UTILISATION OF FLAX STRAW.

Investigations have been made from time to time with regard to the utilisation of flax straw, and we are pleased to note that a factory for the conversion of the flax straw into high grade paper pulp has already been established at Rosetown, and a ready market is being found for this product in the old country. A point of interest in connection with this industry is that the refuse of the straw can be used for fuel, so that at a cost of from \$2 to \$3 per ton the town can be supplied with electrical energy at a low rate.

STATISTICAL WORK.

The collection and compiling of statistics, which may be regarded as the chief work of the branch has necessarily increased with the increase in settlement. The year's work entailed the compilation of some 220,000 replies from the staff of crop correspondents to questions asked. During the coming year the collection and compilation of agricultural statistics will be much heavier, as an effort is being made to secure with the assistance of the municipal authorities crop figures from every farmer in the province.

HOMESTEAD ENTRIES.

The following statement shows the number of homestead entries recorded at each Dominion Lands Office in Saskatchewan during each month of 1912, in comparison with 1911.

Month	Battle-ford	Este-van	Hum-boldt	Medicine Hat	Moose Jaw	Prince Albert	Re-gina	Saska-toon	Swift Current	York-ton	Total by months	1911

The province, 1909.....	16.11- 24.04	12.16- 17.97

THE COST OF FARM LABOUR.

Some interesting statistics have been compiled by the Bureau of Statistics relative to the cost of production of grain crops in our province, and in this connection a statement has been compiled showing the average wage paid for farm labour in Saskatchewan at different periods of each of the past six years.

Undoubtedly the question of the high cost of living is just as much a matter of deep concern and interest to the farmer as to the city dweller. When the rise in the price of commodities is accompanied by a rise in wages in the same proportion, the increased cost of living, which is thereby brought about, is not felt by the wage earner so much as by the employer, and the table which is given below clearly indicates that the increase in the cost of labour on the farm is keeping pace with the increased cost of labour in

other branches of industrial life. The increase has been most marked since 1910, while in 1912 harvest labour by the day has reached its maximum.

In considering the figures it will be noticed that the wages for the eight months period are higher than for the yearly engagement. This is of course natural, as the most active seasons of the year are included, namely seeding and harvest.

In the year 1907 as high as \$420.00 and as low as \$150.00 was paid for the year's work, but it is improbable that either figure was very often paid to agricultural labourers of average ability.

In 1908 the wages offered differed from those which were obtained in 1907, but rose slightly during threshing time, until from \$35.00 to \$45.00 per month was paid to good men.

The total grain crop for 1908 was about one hundred million bushels, and about fourteen thousand harvesters were secured for Saskatchewan, but in 1909 with a crop almost twice as heavy the supply of harvest labourers was only twelve thousand. This was a serious shortage of men and wages accordingly rose, varying according to the supply and demand in different parts of the province until as much as \$50 per month was being paid.

On and after the commencement of the year 1910 the steady rise in wages became more pronounced, and during the harvest of that year the lowest wage was \$2.50 per day with board, while some secured as much as \$3.75 per day with board.

In 1911 conditions were much the same and wages steadily rose for all kinds of farm labour, except perhaps for domestic help, which remained about the same. Farmers complained of the increasing difficulty they found in getting experienced men.

During 1912 farmers found it harder than ever to obtain adequate help throughout the whole year, while at harvest time the shortage was very serious. Owing partly to the action of the railway companies, who this year issued harvest excursion tickets good only as far as Winnipeg, and charged a further half cent a mile to destination point, only about 15,000 harvesters were secured instead of the 25,000 who could easily have found employment. Farmers were forced into keen competition with one another and harvest wages rose to the highest point in our history.

Year	Yearly Engagement		Summer Engagement	
	Per annum		Per month	Seeding to Harvest
1907.....	\$250-\$278	Average \$264	\$22-\$25	\$25-\$30
1908.....	250- 290	" 270	22- 28	27- 30
1909.....	250- 300	" 275	22- 30	29- 35
1910.....	255- 320	" 287	25- 30	30- 37
1911.....	259- 333	" 296	25- 33	30- 39
1912.....	278- 350	" 314	25- 35	31- 45

Year	Harvesting and Threshing				Domestics	
	Per month		Per day		Per month	
	\$32-\$36	Avg. \$34	\$1.50-\$2.50	Avg. \$2.00	\$10-\$15	Avg. \$12.50
1907....	35- 45	" 40	2.00- 3.25	" 2.60	10- 16	" 13.00
1908....	40- 50	" 45	2.50- 3.50	" 3.00	12- 16	" 14.00
1909....	45- 55	" 50	2.50- 3.75	" 3.12	12- 18	" 15.00
1910....	45- 55	" 50	2.75- 3.75	" 3.25	12- 18	" 15.00
1911....	45- 65	" 55	3.00- 4.00	" 3.50	15- 20	" 17.50
1912....						

In order to illustrate just what these figures mean, we will take a farm of three quarter sections, and figure out what the farmer's labour would have cost during these six years. On a farm of this size the staff would probably be:

- (a) One man on yearly engagement,
- (b) One man for eight months, seeding to harvest inclusive;
- (c) Two harvesters for two months;
- (d) One domestic.

On this basis the following figures will show the yearly expenditure:

	1907	1908	1909	1910	1911	1912
(A).....	\$264.00	\$270.00	\$275.00	\$287.00	\$296.00	\$314.00
(B).....	220.00	228.00	256.00	268.00	276.00	304.00
(C).....	136.00	160.00	180.00	200.00	200.00	220.00

Province, 1911.....	259- 333	29.95- 39.40	12.60- 18.70

The average wages of farm labour in the United States, as reported by the Department of Agriculture, was \$28.77 per month without board and \$20.18 with board. During harvest the average daily wage with board was \$1.49 and without board \$1.85, and for other days than harvest the rate was \$1.09 and \$1.42 respectively. The highest wage in preceding years was in 1866 when the monthly rate was \$26.87 without board. The lowest rate between those years was in 1895 when \$17.69 was the average monthly wage without board and \$12.02 with board.

Wages of general farm labour including board in 1912.

POPULATION.

On June 1, 1911, the fifth census of the Dominion of Canada was taken, and on April 30, 1912, the first volume of the completed report was issued. This volume bears eloquent testimony to the wonderful progress which has been made not only by the Dominion in general but also by the Province of Saskatchewan in particular. In the census taken both in 1891 and 1901 the population of the unorganised portions was estimated, but the census under consideration is an enumeration by person and name taken for the whole province by 604 enumerators with 13 schedules and 549 questions.

We find the total population of Saskatchewan in 1906 was 257,763. In 1911 it was 492,432, an increase of 234,669, or 91.03 per cent. This increase is a good deal greater both in numbers and percentage than in any other province in the Dominion, our nearest competitor being the province of Alberta.

We now have 120,751 families as against 66,009 in 1906 an increase of 54,742. In 1911 there were 291,730 males and 200,702 females, as against 152,791 males and 104,972 females in 1906. The increase of males was 90.93 and of females 91.19. So that the number of the sexes now bear about the same relation to one another as in 1906, or in other words have increased at almost the same rate.

The following table of population by conjugal condition shows the figures in 1911 and the increase during the five years:

	Single	Married	Widowers	Divorced	Legally separated	Not given	Total
Males, 1906.....	103,376	46,702	2,262	51			
Males, 1911.....	192,352	90,765	4,291	85	82	4,155	152,791 291,730
Females, 1906....	59,559	42,173	3,205	35			
Females, 1911....	112,387	82,180	5,556	34	55	481	104,972 200,702

Increase							
Males.....	88,976	44,063	2,029	34	82	4,155	138,939
Females.....	52,828	40,016	2,351	1	55	481	95,730

The males exceeded the females by 47,819 and the ratio was as 1.45 to 1 in 1906, and in 1911 the males exceeded the females by 91,028 but the ratio of the sexes was maintained at 1.45 to 1.

The area of the province is now 251,700 square miles and the number of people per square mile is 1.95. The following table showing the population per square mile in the different provinces is interesting:

Alberta.....	1.93
British Columbia.....	1.09
Manitoba.....	6.18
New Brunswick.....	12.61
Nova Scotia.....	22.98
Ontario.....	9.67
Prince Edward Island.....	42.91
Quebec.....	5.69
Saskatchewan.....	1.95
Yukon.....	.041
Northwest Territories.....	.009

The following shows the division of the population into rural and urban in 1906 and 1911. The provinces of Alberta and Manitoba are given for the sake of comparison:

Province	Rural			Urban		
	1906	1911	Increase	1906	1911	Increase
Saskatchewan.....	209,301	361,067	151,766	48,462	131,365	82,903
Alberta.....	127,379	232,726	105,347	58,033	141,937	83,904
Manitoba.....	227,598	255,249	27,651	138,090	200,365	62,275

Ratio of Rural and Urban Population to total.

	1906		1911	
	Rural	Urban	Rural	Urban
Saskatchewan.....	69.77	30.23	73.32	26.68
Alberta.....	62.26	37.76	62.12	37.88
Manitoba.....	68.71	31.29	55.02	44.98

The following table illustrates the great progress made by our urban population. Only those cities or towns with 1,000 or more of population are shown:

Cities	Population		Increase in Decade	
	1901	1911	Total	Per cent.

	1901.....	885
	1891.....	4,376

The following table shows net increase of population in Saskatchewan in the ten years 1901-11 as divided among the principal denominations.

The minus sign (-) denotes a decrease.

PROPORTION OF NET INCREASE.

	Actual	Percent.
Adventists.....	656	0.16
Anglicans.....	59,346	14.78
Baptists.....	15,955	3.97
Christians.....	1,921	0.48
Congregationalists.....	2,004	0.50
Disciples.....	331	0.08
Eastern Religions.....	573	0.14
Evangelicals.....	616	0.15
Greek Church.....	22,231	5.54
Jews.....	1,764	0.44
Lutherans.....	49,975	12.44
Mennonites.....	10,649	2.65
Methodists.....	66,297	16.51
Mormons.....	641	0.16
No Religion.....	2,406	0.60
Pagans.....	-655	-0.16
Presbyterians.....	80,332	20.00
Protestants.....	3,361	0.84
Roman Catholic.....	72,441	18.04
Salvation Army.....	425	0.11
All others.....	4,144	1.04
Unspecified.....	5,740	1.43
Net increase.....	401,153	

Presbyterians head the list with 80,332 while Roman Catholics come next with a total population of 72,441.

Methodists.....	66,297
Anglican.....	59,346
Lutheran.....	49,975
Greek Church.....	22,231
Baptists.....	15,955
Mennonites.....	10,649

The Presbyterians show the largest percentage of increase, being 20 per cent., Roman Catholic, 18.04, Methodists, 16.51, Anglican, 14.78 and Lutheran 12.44 per cent. increase.

FLAX CANKER.

Samples of diseased flax were sent to the authorities of the Saskatchewan College of Agriculture and to Professor Bolley, dean and botanist of the North Dakota Agricultural College. Professor Bolley is admittedly one of the foremost authorities in North America on flax. In his reply he stated:

"I have examined the flax which you forwarded and find that the trouble is characteristic of a disease which I have described as flax canker. I think the description given in Press Bulletin No. 52 enclosed will make the matter quite plain to you."

In this bulletin it is stated that canker is caused by a parasitic fungus closely related to the wilt fungus and the trouble is particularly evident under dry conditions. The parasite does its most noticeable damage by the formation of cankers near the ground line, preventing the stem from enlarging at the point of formation and producing a girdled condition. Flax canker may be recognised by the breaking over of the plants as if whipped off by the winds or gnawed by insects. It can be detected in the shrunken or concave seeds and many of the bolls will be almost empty. When the hulls are removed from diseased seeds purplish sores or spots are found on the seed leaves or root tips. The sound and healthy seeds get dusted over with the spores of the disease. Wherever a diseased plant falls it infects the land, which next year would produce cankered plants.

No one should sow flax twice in succession. The rotation recommended as best adapted to escape the flax and wheat root diseases is, beginning with the new breaking: flax, wheat, hay, other cereals, flax, etc.

The first breaking should be deep, as wherever sufficient moisture is maintained in the soil to give the flax plant a normal growth, canker is not liable to do much damage. This condition is reversed when wilt is in the seed or soil. Save seed from a healthy field, threshed when dry. Avoid a sample which shows many seeds with concave spots.

CUTWORMS.

From year to year these insects, which are the larvae or caterpillars of Noctuid moths, are constantly reported as inflicting damage varying in magnitude in different field and garden crops. Such common species as the glassy cutworm (*Hadena devastatrix Brace*), the red backed cutworm (*paragrotis ochrogaster Gn.*) and the variegated cutworm (*peridroma saucia Hub.*) are the more destructive and were sent in from different parts of the Dominion. The methods which were used in preventing cutworm injuries are (1) the placing of small metal cylinders round the plants; (2) surround the bases of the plants with poisoned bran, prepared by mixing half a pound of Paris green with fifty pounds of slightly moistened bran, and to each gallon of water used in moistening the bran, half a pound of sugar is added; (3) when the cutworms are attacking a crop they can be destroyed by the use of poisoned bait in the following manner: a small patch of clover is well sprayed with an arsenical poison (1 pound of Paris green to 150 gallons of water, or six pounds of lead arsenate to 100 gallons of water), it is then cut and the poisoned vegetation is distributed in small heaps around the infested crop, a small board or shingle being placed on the top of each heap to conserve the moisture.

WIREWORMS.

As in the case of white grubs, these insects are found frequently to attack crops of cereal or roots which have been sown in permanent grass land newly turned under cultivation, owing to the fact that their normal habitat is grass land where they live feeding on the roots. Potatoes are often sown as the first crop, and, in consequence the majority of complaints that are received are of injuries to potatoes in the different provinces from Nova Scotia to British Columbia. In Ontario it was the chief insect of which complaints were received as destroying new fall wheat, and in Nova Scotia it destroyed corn which had grown about two feet in height.

Many remedies have been suggested for wireworms and much disappointment has resulted from their trial, with no little loss of time, money and faith. The wireworm is the larva of a beetle known as the "click-beetle," of which there are a number of species. The beetle is rather long compared with its breadth, brown in colour and has the habit, when laid on its back, of jumping into the air with a click and righting itself. The wireworms are about an inch or an inch and a quarter long when full grown, of a light brown or brownish yellow colour and have three pair of legs at the anterior end. These characters distinguish them from the millipedes mentioned later, which are often mistakenly called wireworms. Their life history, like that of the white grub, is a lengthy one and the "worm" or larval stage may last two, three or four seasons according to the species of wireworm and also according to conditions of climate and soil. After its lengthy life the "worm" changes into the pupa at the end of the summer and in two or four weeks the pupa changes into the adult beetle which hibernates until the following spring when it emerges to lay its eggs. At Ottawa adults were seen flying on sunny mornings of the last week in April. It is customary, therefore, to find wireworms of different ages in the soil and these pass the winter in this situation. Consequently the best method of treatment, as in the case of the white grub, is one of cultivation, and the greatest benefit can be obtained by adopting the same measures, namely, deep ploughing in the fall to expose the larvae and pupae. Clover or buckwheat may be sown on grass land which has been turned down to cultivation if it is not desired to leave the land under summerfallow, which is the procedure to be most recommended; but a clean fallow is not always successful. On account of the hard and resistant nature of the wireworm and its position during life it is almost impossible to treat it with insecticidal substances and these are not to be recommended. Penning sheep on grass land intended for cultivation is sometimes attended with good results as the sheep tread the soil down firmly and prevent the movement of the wireworms, and by heavily manuring the land make it unattractive to the beetles. It has been frequently recommended to dip the seeds or grain in certain preparations or chemical before planting in order to prevent the attacks of wireworms. Careful investigations into these methods and remedies have shown that as a rule, they are useless, and to adopt such methods is a waste of time and money. It is evident that the fact of the grain being coated with a poisonous substance will not prevent the wireworms from eating the young roots, which are of course not poisoned, as is its custom, and thus killing the young plant.

WHITE GRUB.

Every year complaints are made concerning the injuries to field and root crops caused chiefly by two species of insects, namely, white grubs and wireworms. In many cases these injuries might have been prevented or reduced had the farmers and others been in possession of the following facts. White grubs and wireworms generally occur in old pasture or grass land. Their presence is not usually noticed unless their injuries are severe, as in the cases mentioned later. This is doubtless owing to the fact that grass land does not receive so careful scrutiny as a crop. When such land is turned down and put under cultivation, the subsequent crop is usually sown at once; not infrequently potatoes are planted,

with the result that these insects, supplied with new food very much to their liking, cause considerable damage. It is necessary, therefore, for farmers to bear these facts in mind and, on putting old grass or pasture land under cultivation, to adopt such means of cultivation as are recommended in order to avoid the possibility of serious injuries to their crops by these insects, which, owing to their peculiar life histories and habits cannot be controlled on a large scale by other means. It will be found that where a regular rotation of crops is practised and land is not left under grass for more than two or three years, white grubs and wireworms will be considerably less injurious, and from the point of view of crop production such rotations are to be recommended.

The white grub is the larva of a fairly large and robust brown beetle which, as it appears in these regions in June, is called the June bug; further south they appear earlier and are known as May beetles. These beetles, usually species of *Lachnostenus*, feed on the foliage of certain trees such as oak, maple, poplar, chestnut, etc., and are sometimes the cause of no little injury to such hardwoods. They deposit their eggs singly in the ground at a depth of one to several inches, and the young white grubs or larvae on hatching out feed on the young roots of the grass or crop upon which they are attacking. The approach of winter causes them to work their way deeper into the soil where they hibernate. They usually remain three seasons in the grub stage, hibernating each winter except the last, before which the grubs usually change into the pupal stage, and from this into beetles, and the mature beetles hibernate to emerge the following year. The greatest damage is done by the grubs in the second and third years of their growth when they feed on the larger roots. It should be pointed out, however, that our knowledge of these insects and their life histories is comparatively meagre. The remedial treatment is still as a rule in the unsatisfactory state of being suggestive.

As the white grub passes all its life underground it is almost impossible to control it by ordinary measures. In cases where small areas of grass are attacked, drenching the affected area with kerosene emulsion is sometimes effective. Where larger areas are attacked, methods of cultivation only can be relied upon. Deep ploughing in the fall will bring up large numbers of the hibernating grubs and expose them to climatic influences, such as frost, etc. If possible, this should be repeated a second year and cross ploughing is to be recommended if the infestation is severe. Hogs or poultry turned on the ploughed land will destroy large numbers of the grubs. Such crops as cereals and roots should not be sown on infested land, but clover, which appears to be more immune, may be sown on the land and then ploughed under in the following fall. Two fall ploughings with an intermediate crop of clover will expose and destroy very many of the white grubs in their different stages. It is impossible on account of the prolonged life history, extending as it does over several years, to rid infested land of these insects by measures carried out for one year only; repetition is necessary to destroy those larvae which have escaped the previous year's treatment. In Europe, the destruction of the adult beetles, which can be effected by collecting them or by spraying the infested trees with an arsenical spray has been found to be of great service in reducing the infestations.

REPORT OF THE DEPARTMENTAL COMMISSION ON THE OFFICIAL STATISTICS OF CANADA

The commissioners appointed by the Dominion government "to inquire into the statistical work now being carried on in the various departments, as to its scope, method, reliability, whether and to what extent duplication occurs and to report a comprehensive system of general statistics adequate to the necessities of the country and in keeping with the demands of the time" have made the following recommendations affecting agriculture:

- (1) That arrangements should be entered into by the Dominion and provincial authorities to secure by co-operation:
 - (a) The collection at a given date of annual statistics of areas under the principal field crops and the numbers of farm live stock;
 - (b) The adoption throughout Canada of uniform methods for the classification, collection and compilation of agricultural statistical data;
 - (c) That for special crops such as fruit and tobacco the co-operation should be obtained of the fruit and tobacco divisions of the department of agriculture, both with regard to statistics and monthly crop reports;
- (2) That the collection from reliable sources of the market prices of agricultural produce be undertaken with a view to the regular publication of records of prices on a comparative basis.

A summary of the recommendations of the commission is given at the end of the report as follows:

SUMMARY OF RECOMMENDATIONS

1. The organisation of a central statistical office for the co-ordination, unification, extension and general improvement of statistics, involving:
 - (1) The creation of a Dominion Interdepartmental Statistical Committee;
 - (2) The creation of an Interprovincial Conference on Statistics.
2. The following reforms in existing statistics:

(1)—DOMINION

(a) *The Census.*—The taking of a quinquennial census and the limitation of the field of the census proper to the enumeration of population and property, with a thorough re-examination of the methods at present in use in collecting and compiling data and in publishing results.

(b) *Production.*—The institution of an annual census of production, embracing the chief products of agriculture, forestry, fisheries, mining and manufactures.

(c) *Trade.*—The co-ordination of the work of the statistical branches of the departments of customs and trade and commerce, with improvement in the classification scheme and in other details.

(d) *Transportation.*—The re-organisation of canal statistics. The creation of statistics of coastal trade.

(e) *Labour.*—The creation of wages and consumption statistics.

(f) *Emigration.*—The perfecting of methods of recording departures.

(g) *Miscellaneous.*—Improvements in statistics of insurance and the development o' price statistics.

(h) *Publications.*—The enlargement of the Canada Year Book. The co-ordination of other publications.

(2)—PROVINCIAL

The co-ordination of statistics on the following subjects in the light of matter set forth in the report: births, marriages and deaths; public health; education; agriculture; local and municipal governments; industrial accidents; various phases of production; finance; public lands; public works, and hospitals and charities.

(3) The appointment of all officials engaged in statistical work on grounds of character and capacity.

METEOROLOGICAL DATA.

JANUARY.

Extremely cold weather was general for the greater part o' January, and during the first fortnight the temperature was never above zero and the range of difference from average was 5 degrees below to 13 below. Almost everywhere in this province the temperature was below zero on the first day of the month and remained below continuously for 15 days. During the remainder of the month day temperature generally exceeded 10 degrees, but night temperatures which were below zero were of frequent occurrence. The lowest temperature of the month occurred on the 10th or 11th and was 50 degrees below. The highest temperature of the month occurred on the 30th, but did not exceed 43 degrees at any place, nor 36 degrees in the majority of instances. Highest temperatures.—42.2 degrees at Maple Creek on the 15th; lowest, 55 degrees at several points. Prince Albert.—No precipitation recorded during the month. The Pas.—Cold month. Moose Jaw.—Sixty-eight hours of bright sunshine.

FEBRUARY.

A deficient precipitation prevailed during this month and although the minimum temperatures were fairly low, they were offset by corresponding high maximum readings giving a mean temperature wel above the normal. The mean temperature exceeded the norma by from 6 degrees to 9 degrees. For the first ten days, however, the min mum temperatures were very low, ranging as far as 38 degrees below zero on the 8th. From the 10th to the 25th much milder conditions obtained, 40 degrees being exceeded on the 15th, 17th and 18th in a few localities. The last two days of the month were very cold.

In some districts there was only a flurry of snow during the month, while generally the fall was large enough to measure on three days only. The average depth was five inches, but in north-eastern Saskatchewan it ranged from fourteen to twenty-four inches. Moose Jaw.—One hundred and sixteen hours of bright sunshine. The Pas.—A month of favourable weather.

MARCH.

There was comparatively little snow on the ground, the depth in east ern Saskatchewan being from two to four inches, while elsewhere the ground is practically bare.

The greatest difference from normal temperature in the western provinces occurred in southern Saskatchewan and amounted to from 5 to 9 degrees. During the first three weeks temperatures well below zero were of daily occurrence, but during the last week the weather was much milder in all districts.

In almost every instance the total precipitation was less than a half of an inch, and in some cases was nil. The largest amount was recorded near the confluence of the two branches of the Saskatchewan river, where the average of five stations was in excess of three-quarters of an inch, which closely approaches the normal for that district. *Moose Jaw*.—One hundred and seventy-six hours of bright sunshine. Snow on level gone.

APRIL

The weather of April was characterised by high temperatures and a deficiency of precipitation.

In all districts of Saskatchewan the temperatures decreased to 20 degrees or lower on the 15th and 26th, and locally on the 12th, 27th and 28th also. The warmest days of the month were generally the 9th and 10th when many stations recorded 70 degrees. At some places lying between the south branch of the Saskatchewan river and the international boundary temperatures exceeding 70 degrees occurred on the 29th. The difference from normal was from 3 degrees to 5 degrees over the greater portion of the province.

There was a general deficiency in precipitation which was in some cases relatively large. Many districts reported no precipitation during the month, while at many others it was recorded on but one or two days. *Battleford*.—Wheat seeding is now almost completed and weather conditions have been suitable for rapid progress. There will be a 25 per cent. increase in the wheat acreage in this district. *The Pas*.—Warm month; no snow on the ground. *Moose Jaw*.—Seeding well advanced, ground in fine condition with plenty of moisture. Two hundred and thirty-six hours of bright sunshine.

MAY.

The weather during May approximated the normal except that in southern Saskatchewan the precipitation was rather excessive.

Over the greater part of the province the mean temperature was less than average, by one degree in the north and two degrees in the south; but in the extreme north-west the average was exceeded by from one to two degrees. The highest temperatures occurred on the 15th and 16th, in many places exceeding 80 degrees. Frost occurred as late as the 19th and 20th and was severe in some localities.

Rain was in excess of average along the north Saskatchewan only, while in other districts it was considerably less. In the province there was an excess of from 20 to 40 per cent. of the normal. *Battleford*.—Wheat seeding completed on the 18th; oats and barley finished by the 31st. Wheat is from eight to ten inches high and prospects are extremely favourable. *The Pas*.—Vegetation progressed favourably during the latter part of the month. *Swift Current*.—Changeable weather during May, but very satisfactory to the farmers. There is plenty of moisture in the ground and all grains are coming up nicely. *Moose Jaw*.—Grain looks well.

JUNE.

Excessive heat with a generally deficient precipitation marked the weather of June. Over the basin of the north and south branches of the Saskatchewan river the mean daily temperature was from 4 degrees to 7 degrees higher than normal. In the extreme south-eastern portion of Saskatchewan the average was exceeded by barely one degree. The most noteworthy feature of the month was the period of very warm weather which began about the 18th and lasted till the 28th, during which the temperature attained maxima between 80 and 100 degrees. At points near the 55th parallel light frost was recorded on three nights during the first week, but in the southern districts there were few places which recorded temperatures lower than 34 degrees.

There was very much less than average precipitation. The normal rainfall for June varies according to locality, between three and four inches, but the amount recorded lacked from one to three inches of these figures. *Prince Albert*.—Weather conditions were excellent for farmers. Vegetation is well advanced. *Battleford*.—Grains suffered during the latter part of the month owing to the lack of rain, but the fall of the last day of the month has saved the situation. *Swift Current*.—The latter part of the month was very warm, but the heavy rain during the last two days of the month has made the prospects for a good crop almost assured. *Moose Jaw*.—Three hundred and thirty hours of bright sunshine. Wheat headed out. Flax in bloom. More moisture required. *Regina*.—A tornado passed over a part of the city on the 30th, causing considerable damage and loss of life.

JULY.

Cool weather with an excessive precipitation was very general during July, but in some parts of south-western Saskatchewan the rainfall was deficient and crops somewhat suffered. The reports regarding crops situation are for the most part optimistic and a better than average yield is expected.

Throughout Saskatchewan the mean temperature was from three to five degrees below the normal. On the 15th, 16th and 17th, minima were recorded lower than 40 degrees.

There were instances of heavy precipitation, as at Battleford and Prince Albert, where double the usual amount was recorded, but large excesses were not of general occurrence in Saskatchewan, while there were local deficiencies near the international boundary. The rainfall was, however, in all cases well distributed throughout the month. *Battleford*.—Wheat will be an average crop and it is expected to grade high and flax exceptionally good. Oats are about average. *Prince Albert*.—The heavy rains during the month have made the roads almost impassable. No damage to crops. River continues abnormally high for this season of the year. *The Pas*.—Plenty of rain, weather favourable for vegetation. *Moose Jaw*.—Crops appear to be in good condition; two hundred and sixteen hours of bright sunshine.

AUGUST.

During August the weather was generally cool with frequent rainfalls and much clouded skies. In eastern Saskatchewan the mean temperature was about three degrees below the average, while in other parts the normal was closely approached or slightly exceeded. Precipitation was generally heavy. Notwithstanding the somewhat adverse conditions,

reports seem to indicate that, except the delay that has been occasioned, the crops are in good order and heavy yields anticipated.

In parts of Saskatchewan, mainly near the confluence of the northern and southern branches of the Saskatchewan river, the mean temperature of the month was either normal or about one degree higher. This would appear to be due to warm waves which occurred about the 7th, 8th and 9th, 20th, 21st and 22nd. The general departure from normal was however negative and ranged between 1 degree and 3 degrees. *Battleford*.—Although wheat cutting was general towards the close of the month, not much has been done owing to the frequent rains. *Prince Albert*.—Heavy rains are destroying roads and hindering harvest. *The Pas*.—Crops rather light. Stock in good condition. *Moose Jaw*.—One hundred and ninety-two hours of bright sunshine. Although wet weather has retarded harvesting, about 40 per cent. of the grain has been cut, and there has been no damage from this cause. The yield will be large.

SEPTEMBER.

Cool showers weather was the dominant feature of September. The mean temperature was considerably below normal in all districts except southern Saskatchewan where the negative departure was as much as 8 degrees. Heavy rainfalls were very general and some light snowfalls occurred. Severe thunderstorms were frequent. Reports regarding the crop situation indicate that comparatively little damage has occurred and the outlook is favourable. *Moose Jaw*.—One hundred and thirty-eight hours of bright sunshine. *Battleford*.—Harvesting completed and crop much better than last year. *Prince Albert*.—Successful harvesting reported from all parts of this district; no damage from the excessive rains.

OCTOBER.

Precipitation was quite light, only a few localities reporting a total fall for the month exceeding much over half an inch. A few light falls of snow or snow flurries were locally experienced. *Moose Jaw*.—Total precipitation 0.3 of an inch; Sunshine one hundred and forty-four hours. *Battleford*.—Threshing will be completed throughout the country in about two weeks; weather very favourable.

NOVEMBER.

Unusually mild weather prevailed with a resultant mean temperature from 5 degrees to 10 degrees above the normal. There was no important disturbance and the precipitation was scant and in the form of occasional light snowfalls.

In the southern districts the ground was nearly bare of snow, a trace being reported from most localities. *Moose Jaw*.—Ice formed on the creek on the 12th.

DECEMBER.

The mean temperature was above the average. The departure ranged between 8 degrees and 2 degrees, the largest excess being in north-western Saskatchewan. Mild weather prevailed during December. Precipitation was deficient in southern Saskatchewan. Low barometer readings were frequent throughout the month and some severe storms occurred. Very little snow is on the ground except in northern parts of Saskatchewan. *Moose Jaw*.—Eighty-three hours of bright sunshine. *The Pas*.—Very little precipitation.
