MORNING AND EVENING STARS.

VENUS will be visible in the morning, in the South east, or East, before sunrise until 24th July, the day of her superior conjunction with the Sun, and afterwards in the Evening after sunset, in the west, or south west. The remainder of the year Mars will be visible in the West after sunset until 1st May, the day of his conjunction with the Sun, afterwards in the Morning in the East, the remainder of the year. During the whole of 1840 this planet will be very remote from the Earth and will shine with little of the splendor of its appearance, when in opposition. His next opposition takes place April 17, 1841, the last took place March 11, 1839. JUPITER will be in opposition to the Sun on 4th May, and in conjunction on 21st Nov. SATURN will be in opposition to the Sun on 8th June, and in conjunction on Decr. 15. HERSCHEL, or URANUS will be in conjunction with the Sun on 6th March, and in opposition on 10th Sept. MER-CURY, the least of the old planets, is but seldom seen by the aked eye, or it is never visible more than about two hours beore the rising or after the setting, of the Sun. The following will be the most favorable times in Charlotte-Town for viewing it in 1840. It generally appears like a reddish star of the first magnitude. Jan. 1st to 10th, in the morning before sunrise, bearing E.S.E. March 13 to 25, in the evening after sunset West. July 1 to 7, in the evening after sunset W. by N Augt. 25 to Sept. 7, in the morning before sunrise E. by N.

ECLIPSES IN 1840.

There will this year be Four Eclipses-two of the Sun, two of he Moon; of which only one, that of the Moon, on the 13th lugust, will be visible in Charlotte-Town.

I. Monday Morning, Feb. 17th. a partial eclipses of the moon, isible in the Western part of North America, but not in Prince dward Island.

II. Tuesday and Wednesday, March 3rd. and 4th. an annular Eclipse of the Sun, visible throughout Asia, Borneo and Sumatra, in a part of the Indian Ocean, and in the North Eastern part of Africa and Europe, but central only in Asia-The path of the central eclipse first touches the Earth, in the Arabian Sea near the Arabian Coast, thence passes across Hindostan, the northern part of Burmah and of China, the eastern part of Tartary to the north eastern part of Siberia when it leaves the Earth. Eclipse will be very large in Goa, Calcutta and Pekin; in Bombay it will probably be annular. No part of the eclipse will be visible in America, Australia, the Western part of Africa, or of

III. A partial Eclipse of the Moon, visible in Charlotte-Town, on Thursday morning, August 13th, as follows, viz :-

Dim nedantisma ni si	1		h. m.	H I . I TONIN
Beginning of the Eclipse	-	- 1	431)	in no mid self

End of the Eclipse -		- 4	331	0.010103
Digits eclipsed 7° 17' on	the	northern	limb of	the Moon.

This eclipse will be visible throughout America, but in no other continent.

IV. August 26th and 27th a total Eclipse of the Sun visible to the greater part of Africa, to the South eastern part of Arabia, the South eastern part of Australia, in the Island of Madagascar, and in a large part of the Indian Ocean, but wholly invisible throughout America and Europe. The path of the central Eclipse first touches the Earth near the Western Coast of Africa, about 1400 miles north of the Cape of Good Hope; it thence passes in an easterly direction across that continent and the northern part of the Island of Madagascar to the Indian Ocean, thence in a South easterly direction, over said Ocean about 5000 miles to lat. 64° South lon. 129° East where it leaves the Earth At the Cape of Good Hope about one half of the Sun will be eclipsed.

OCCULTATIONS.

The most important occultations probably visible in 1840 are those of part of the Pleiades in the evenings of Jan 14, Feb. 10, July 23, Octr. 13, the morning of Nov. 10, and in the evening of Dec. 7; those of Regulus, (a star of the firs magnitude) in the evening of Jan. 20 and March 15; those of "tau m" (a star of the third magnitude) in the morning of Apri 20, and in the evening of July 10; and that of Mercury on the evening of June 30.

EXPLANATION OF THE CALENDAR PAGES.

LEFT HAND PAGE.

Column 1. Days of the month.

- 2. Days of the week.
- 3. Rising of the Sun.
- 4. Setting of the Sun.
- 5. Days length in hours and minutes.
- 6. Equation of time in minutes and seconds.
- 7. Sun's Declination taken from the Nautical Almanack, in hours and minutes, at mean noon. It denotes the apparent position of the true Sun with reference to the equator, and the true equinox, at the instant the Greenwich mean time clock, or chronometer, indicates 0h. 0m. 0s., or when the hour angle of the true sun is equal to the equation of time.
- 8 Rising and Setting of the Moon.
- The Moon's place in the signs, for explanation of these signs, see page 2.
- 10. Moon's Southing—when the moon comes to the Meridian of any place, or twelve o'clock hour-line, she is then due south with respect to that place, and this is termed the moon's southing.
- 11. Days increase in hours and minutes.

RIGHT HAND PAGE.

- 1. Days of the month.
- 2. Sundays, Anniversaries, Weather, &c.
- 3. High Water at Halifax, Nova-Scotia.
- 4. Annapolis, N. S.
- 5. Charlotte Town, Prince Edward Island.
- 6. Windsor, N. S. and at St. John, N. B.

The top of the columns of each month shows the moon's phases, or the times of new and full moon, and of the first and last quarters, or two quadratures with the sun.

The Farmer's Calendar is placed at the foot of the columns of each onth.

The time of High Water at the following places may be found y adding or subtracting the hours opposite each respectively, o, or from, the time of High Water at Halifax.

All the calculations in this Almanack (with the exception) of the Equation of time, and the Sun's declination) have been adapted to mean solar time-since (on account of the inequality of the solar days, arising from the unequal motion of the earth and the obliquity of the ecliptic to the equator) a clock regulated to apparent solar time must be frequently adjusted. Mean time has of late came into very general use and has almost entirely superseded the old mode of reckoning. To those however who still prefer, to keep apparent time, the calculations in this almanack will be equally useful, as mean time is easily converted into apparent, by subtracting the quantity in the sixth column of the left hand calendar pages, when the sun is slow of clock, and adding it when fast of clock. Thus on 1st Feby. the Sun's upper limb rises in mean time at 7h. 19m, and sets at 5h. 8m., and the sun on the same day of 14 minutes slow of the clock; this quantity must therefore be subtracted, and we have 7h. 5m. and 4h. 54m. for the apparent times of rising and set-The Equation of time (see slow or fast of clock) and the Sun's declination are computed for apparent noon at Greenwich or for a quarter before 8 in the morning at Halifax, N.S. The rising and setting of the sun, are given, not of his centre as heretofore, but, of his highest point, and are corrected for refraction, a correction hitherto, almost always, very improperly neglected. The setting of the moon is given from new to full moon, and her rising from full to her change. The time of high water, of that tide which arrives immediately before the southing of the moon is given for Halifax, and Annapolis, in N.S. Charlotte Town, P. E. I., Windsor, N.S. and St. John N. B. The time of high water at the new and full moon being, according to the best authorities as follows, viz:-at Halifax 7h. 15m. at Annapolis 10h. 45m. at Charlotte Town, 10h. 15m. and at Windsor and St. John, N. B. 11h. 45m. The highest spring tides will this year be moderate—the highest of all, unaffected by wind, will be those of March 4, April 3, May 2, Augt. 27, and Octr. 11, and the lowest spring tides those of Jany. 4, April 16, May 16, June 14, July 14, Nov. 23, and Decr. 23.

EXPLANATION OF TERMS.

APHELION, is that part of a planet's orbit furthest from the sun Apogee, the moon is said to be in Apogee when furthest from the Earth.

DECLINATION, is the distance of a heavenly body from the equi-

ECLIPTIC, is the plane of the Earth's orbit extended to the starr, sphere; or the annual path which the sun apparently describes among the stars.

ELONGATION of a planet, is its distance from the Sun, as seen from the Earth.

Equinoxial, or Equinoxial Line, is an imaginary line, or circle of the heavens corresponding with the Equator of the Earth.

Equinox. (See Right Ascension.)

Nodes are those points in the orbits of the moon or planets which intersect the plane of the ecliptic.

Perihetion is that part of a planets orbit nearest the Sun. PERIGEE. The moon is said to be in perigee when nearest the Earth.

RIGHT ASCENSION is the distance, eastward, reckoned on the equinoxial from the first point of Aries; and is generally estimated in time; fifteen degrees of the arc, being equal to one minute of time, and so on. The Zero point, or first of Aries is called the Equinox.

The world may be compared to a mill, which is perpetually grinding its grist; the grain that is put into the hopper soon disappears, and more is required to fill its place. The earth's revolution for 1839 has been made; its catalogue of wars, earthquakes, fires, famines, freshets, crimes, births, marriages and deaths, is finished. Its grist is ground. The world has entered upon a new course; a new grist is in the hopper-the great machinery is at work, and this too will soon be finished. In this vast movement, an individual may seem but a single kernel of grain;-but, small as he is compared to the whole, each one seems of considerable importance to himself. Accordingly he looks out for number one—and thus each kernel of the grist is taken care of. And how can one get along without one of Haszard's Calendars? Not at all! Every body must have an almanack at hand to regulate his affairs by, or he may get into some trouble. Without Almanacks, then, not only individual kernels in the great hopper of the year may be badly ground, but the whole grist may shew more bran than meal.

LOOKING-GLASS FOR A DRUNKARD .- A drunkard is the annoyance of modesty; the trouble of civility; the spoil of wealth; the destruction of reason. He is the brewer's agent; the alehouse benefactor; the beggar's companion; the constable's trouble. He is his wife's wo; his children's sorrow; his neighbors scoff; his own shame. In sum, a tub of swill; a spirit of sleep; a picture of a beast; a monster of a man.

Many by drinking health to others, leave none to themselves. Drunkenness is a flattering devil, a sweet poison, a delightsome sin, which whose hath in himself, hath not himself; and he that useth it, is not himself in the concrete, but sinfulness itself in the abstract; being a voluntary devil, the common shame of nature, and the prodigious disgrace of mankind.

Farmer's Calendar.—The compliments of the Season to all our patrons, and they are very many, and on the increase every year—may peace, prosperity, and contentment be with them all, throughout the year. Farmers have plenty of leisure this month for forming plans and adopting measures to be pursued throughout the year, and also for the education of their children—teach the boys the importance of knowing how to earn their own livelihood by the sweat of their brow, and the benefits of strict economy. Teach young ladies how to sew, knit, spin, mend and to make their own garments, and cultivating kind dispositions, and the plesant duty of knowing how to superintend the cooking depart-

ment, appearing always neat and in a dress of home manufacture. You will save half your materials for fodder, by cutting your hay, straw, cornstalks, &c. with Willis' or some other straw cutter, then mix your cut fodder with Indian meal, bran, soaked or boiled corn, sliced potatoes, or other roots, cut so fine that there will be no danger of the animals' thoking themselves. Cattle well wintered are half summered. Agriculture of late has, like many other arts and sciences, undergone a great change, within a few years, the farming interest has been most asonishingly redeemed from the unjust humiliation into which it had sunk. When we reflect upon the entire dependance of every other profession, rade, or employment, on agriculture, we cannot but be sensible of its mportance, and of the respect and esteem to which its votaries are entiled.

Farmer's Calendar.—A short month this, at best, and rather short days too; well, then, let us be the more delighted to improve them! How go matters and things at the barn? Will the hay hold out? Finish threshing and secure your grain from vermin. Have a watchful eye, also, to prevent the ravages of rats and mice in your cellars and panteries. This is a good season to feed to your cattle the poorest fodder; they will eat it better now than in the spring or fall. Visit your barn early in the morning; feed your cattle often but with little at a time. Keep your forward cows and ewes in good heart, a little corn now and then, or a few potatoes or other roots, will not hurt them. Let your cattle be as comfortable as yourself, if you wish them to thrive. See that the pigs have warm food three times a day. Cut scions for grafting.

ncrease your wood pile. The pleasures and gratifications which flow rom the fire side, may be considered as almost peculiar to our region. In warmer climates the aid of fire is demanded for little else than culintry purposes—to the enlivening blaze, and the clean swept hearth, and all the numerous comforts, which, in this country, so usually wait upnature, under the warmth, and splendor of a summer sun, most perpose look forward with pleasure to those seasons, when the falling affor drifting snow draws closer the family circle, and ushers in that interaction and intellectual intercourse which constitutes the dearest charm, and next to religion, the highest privilege of human existence. When I without is wrapped in darkness, and the freezing blast howls eager for trance round your dwelling, with what enjoyment do its inmates crowd the cheerful hearth, and, as the flame grows brighter on their cheeks, ten, with a sensation of self gratulating security, to the storm that shakes eir solid roof.

Farmer's Calendar.—"The borrower is the servant of the lender." Every one who is master of his business has his farming Tools in readiness, and is not obliged to borrow, Farmers awake—the spring is upon you—are your plans for the season all matured? Keep the cattle from the fruit trees that they may not injure them by browsing. House you sleds, sleighs, &c. as soon as you have done with them. Attend to you fences—drive your business before you, and it will go on easily; suffer it to lag behind, and it soon becomes a burden too ponderous to bear The season for tilling the earth has now arrived, but "the sluggard will not plough by reason of the cold; he shall therefore beg in harvest

ad have nothing." You may sow grass seed either as soon as the ow is off the ground, or, as some say, in Augt. or Sept. You may e the time for this purpose discussed in "Fessenden's Complete Farm-," pages 22, 24. Be sure to use seed enough, say about 12lbs of over and one peck of herd's (timothy) grass to the acre. Have your ood cut up and piled away for summer use, it is very had economy to obliged to leave your work in haying or harvesting, to draw and cut every now and then, a little green wood to cook with. In this month e sheep will begin to bring forth their lambs-the utmost care and atntion are requisite to preserve the lambs. It is said that more than If the human race die before they are two years old; and it is very proble that half the lambs die before they see two weeks-this mortality is obably produced by inattention to the dictates and requirements of ture, rather than as the results of physical laws.

Farmer's Calendar.—The Farmer's work commences in earnest, sethat every thing is in proper order—to prevent vexation, and to say what you raise, look well to your fences, and put them in thorough a pair, look sharp after the bars, rails and gates, trim up the whole as see that the farm is in prime order, ready to receive the plough. Procuse good seeds for all the crops you intend to raise and let them be put in the ground early; pay what attention to the moon you think properties an extra lot of land ploughed up this year. Agriculture is an exployment in which too many persons cannot be engaged—the literal professions may be crowded; trade and commerce may be overdood too great a number engaged in these, starve each other. But in a new

d fertile country like this, every one who industriously and skilfully ls the ground, while he adds to the public good, secures his own indendence. If the income of the Farmer is not so abundant as that of the ofessional man, or the merchant, it is also not so precarious; if greatbodily exertion and fatigue attaches to his employment, he has far less xiety and perplexity of mind; if he has not an equal access to the luxus and superfluities of life, he is more certain of its necessaries and mforts. Industry and economy combined, form the true philosopher's one, which turns all into gold-they generally exist together; and are th so indispensably necessary to success in any pursuit of life, that here one is wanting, the other, for all practical purposes, may be abnt. Without industry, economy will be of no avail; and without ecomy, the fruits of industry will soon be wasted. It is the want of these at prevents the success of so many in the various situations of life. He ho has it should draw the strings as frugality directs, and he will be sure ways to find a useful penny at the bottom of it.

Farmers Calendar.—If a man means to make anything by farming he must attend to it personally, and not trust to others—he must engage in it through thick and thin, and not be afraid of getting dirty hands, a a smuty face. Now is the time to let the cattle step into the field an plough up that fine piece of soil. Plant potatoes, corn, peas, and beams sow all the wheat and oats you can, for these bring the ready money Be particular to have the butter made nice and clean, don't let any slu or slovens go near the churn. Give the cows small potatoes night an morning; only treat them well, and they will smile at you every tin

you go to the barn. A good cow is almost as profitable as a good wife; you cannot have a good wife without she is economical and good natured when her husband goes into the house—a smile, a look, a word, an act of tenderness and esteem from a wife may add more to the real happiness of the weary husband when he returns from his toil, that all the wealth the world can bestow. Gardening is too much neglected in our country, if half the time was employed in cultivating a kitchen garden, that is spent doing nothing, or what is worse, our farmers would live much cheaper than they now do, and far more to their comfort. Put your corn ground in readiness; there will be no danger of ploughing it too much. If your spring grain is not all sown, lose no time in getting it into the ground. Continue to plant potatoes, peas, beans, raddishes, &c. Plant cucumbers for early use. Caterpillars should be seen too, otherwise they may do much mischief.

Farmer's Calendar.—You must not expect many leisure days this month: the industrious farmer will so employ the rainy weather of June to "make hay while the sun shines" in July, plant more cucumbers, set out cabbage plants, keep the hoe in motion to destroy weeds in your garden. See that all your seeds are in the ground before the first of June. Clear out the cellars, and throw away every thing in and around, or about the premises that is not useful or necessary. The trees being now in full blossom, you may expect many visiters, who cannot but acknowledge that the country is the very place for comfort and contentment, being surrounded with pure air and good water—birds singing at your windows by sunrise—the little chickens singing sweat meal and water, surrounded with fowls saying good morning, and the pigs calling out,

> 0 come, come, hurry along my breakfast, and the fine cows asking the girls to take the milk and let them go to grass; and even the horse says I will take a little fresh hay, but none of your driving me quite so hard to day. Hoeing is a business by no means to be neglected; and unless attended to, no one must expect a crop, Some, however, after taking much pains to deposit their seed, leave the rest to providence. and brambles of course come up and choke the tender plants; and the field once so fair and promising, becomes a stigma and a disgrace to the idle possessor. Hoe deep and hoe often, and your land will retain more Your crops of course will find more nourishment and moisture for it. better bear the drought. Set cabbages, and be sure they are hoed about every other morning. You must likewise attend to the bugs and destroy them early in the morning, if you would not have your labour lost. Half hill your corn. Keep your temper both in doors and out. Let peace be within thy dwelling.

Farmer's Calendar.—It is a matter of much importance that the farmer should take time by the forelock during the season of hay-making—he must drive his business instead of being drive by it. Indolence or improper management in hay-time will soon give a sorry complexion to a farmer's affairs—a day or two lost or misemployed while the sun shines, and your grass suffers for lack of the scythe and the rake, or your grain is going back into the ground while the sickle is rusting on a peg behind the door, and its owner is asleep or gone on a journey, may be the means of introducing Mr. Deputy Sheriff on your premises, who will do more harm than a crop of thistles or a host of hessian flies. Look into yonder

ield; see how the mowers sweep along; men, women, boys, and girls, all busily engaged, the sun is hardly two hours high, and yet each has early completed their half day's work—this is the true way to manage, but your grass while the dew is on, if you would have your scythe go moothly. Cut your grain early, the flour is better, the straw is better, and there is less waste—be sure to finish hoeing your corn before it beins to silk or tassel; nature should then be left to herself or your cropyill be injured. You will also be a gainer by finishing your hoeing beore the hurry of haying commences. Pay your hands well. "The abourer is worthy of his hire." On the 5th of July commence the Dog days, which are a number of days preceding and following the rising of Sirius, or the dog star. There were formerly many superstitions conterning the dog star. The heat of the weather during the dog days is fery great.

Farmer's Calendar.—The farmer who has it in his power to drive his business instead of being driven by it, will do well to sow his winter rye some time between the middle of Augt. and the middle of Septr. If it be sowed so early, it will be less apt to winter-kill, will require less seed, the growth will be stouter, and the produce greater, other things being equal, than if the sowing was deferred till late in Autumn. Rye is capable of being cultivated on most kinds of land, but the light sandy soils, where wheat will not thrive, are the sorts of soil on which it will, generally speaking, be found most profitable to raise this kind of produce. When rye is sown upon light land it ripens much earlier than on a cold, stiff ground, and it is said by some writers that, by continuing to

sow on such a soil for 2 or 3 years, it will be forwarded so much as to ripen a month earlier than that which has been raised upon strong cold ground-those who sow their rye late will do well to provide themselves with this early seed. It is asserted as a general rule, that the proper time to reap wheat or rye is when the straw begins to shrink and become white about half an inch below the ear-this appearance is a sure indication that the grain has ceased to receive nourishment from the roots of the plant. By cutting early it will yield more and whiter flour; the harvesting will be expedited, so as to prevent waste in shelling, by having the last cuttings become too ripe, and the straw will be more valuable by its retaining a part of the natural juices. Improve every opportunity for collecting into your barn yards and hog pens materials for making manure. At this dry season, see that the cattle have enough water to drink—See that they are changed into a fresh pasture have any leisure it will be a good time to white wash.

Farmer's Calendar.—This is the month to dig ditches, and drain the meadow, some of the finest lands have laid waste for the want of draining—look to it, it will be a legacy to the boys, provided you learn them to work while young. Before you attempt to drain a piece of land, it will be well not only to calculate the cost, but to ascertain the nature of the soil which it is proposed to render fit for cultivation. If the subsoil or under layer be clay, the swamp may be worth draining, though there should be no more than six inches of blacksoil or mud over it, for the clay and the mud mixed will make a fertile soil—but if the subsoil or under stratum be gravel or white sand, it will not, in common cases, be best to undertake draining, unless the depth of black mud be as much as from 15 to 18 inches deep; for the soil will settle after draining, and be

s damp than it was before. The mud and other materials which are g out of a ditch or drain should not be suffered to lie in heaps or banks the side of the ditch, but should be spread as equally as possible over surface of the drained land-in this way matter taken from the ditchwill tend to level the surface, will, perhaps, serve in some measure for nure, and will not present any impediment to the passage of the wato the ditches. There is nothing which so much lightens, economises, d renders efficient the labors of the farmer, as good implements to use his farm. The farmer who is obliged to work with bad tools, is in poor predicament-laboring with such things is dull, discouraging adgery, and the little work which can be performed with awkward and fficient implements, is generally done in such a slovenly and imperfect nner that it might better have been omitted. You cannot make good ork with a poor plough. It leaves the land worse than it was before use was attempted, and makes its owner poorer for possessing such

Farmer's Calendar.—Winter Apples should be gathered after they a fully ripe, in a clear day; they should then be spread on a floor in a dairy place, and remain till in danger of frost, then removed in tight cas or boxes to the cellar, and they will keep much better than if managed the common way. To make good Cider, the first requisite is suital fruit; it is equally necessary that the fruit should be not merely mellout thoroughly mature, rotten apples being excluded; and ripe if post blefat the suitable period, or about the 1st of November, or from the fit to the middle, after the excessive heat of the season is past, and whisufficient warmth yet remains to enable the fermentation to progress slo

y as it ought. Newark in New Jersey is reputed one of the most famous places in America for its cider—the cider apple most celebrated here is the Harrison apple, a native fruit; and cider made from this fruit, when fined and fit for bottling, frequently brings Ten Dollars per barrel. Mr. Bellamy, a gentleman of Herefordshire, England, has by skill produced cider from an apple called Haglae Crab, which, for richness, flavor, and price on the spot, exceeds perhaps every other liquor which nature or art has produced. He has been offered sixty guineas for a hogshead of 10 gallons of this liquor. Why can't our farmers produce the same kinds of cider? When a man gets a good farm, and is able to carry it on, let him think himself well off. Should he have a little cash on hand, it will be convenient enough; but it is unfortunate if he gives heed to every speculation story that is told, and is willing to be flattered into a belief hat he is to be enriched by every stone that is turned, and by every new project and plan.

Farmer's Calendar .- Bank up your cellars and have every square of glass mended in the house. Make haste while the day lasts, and have coded it, there w every thing ready for winter-that chilly intruder Jack Frost, now up between the f begins to poke his nose through the cracks and broken panes of glass, perpendicularly, some endeavour to prevent his entrance by stuffing in old rags; when such things are seen, you may conclude that matters do not go exactly lines putrescent right either in or out of the house. Ploughing previous to winter setting in is of great use to clays, or stiff lands, exposing the surface to the frost and be laid and k which mellows and reduces it in a manner infinitely superior to what excelves and our could be accomplished by all the operations of man—exposing the sur-took out for ther face of stiff soils to the frost is of great advantage, the more surface there wins to instruct

exposed the greater the advantage; and if the furrow slices are set rtly or entirely on their edges there will be more surface exposed than ere would be if they were laid perfectly flat. And if they were turned such a manner as to form an angle of forty-five degrees, the outer edge the furrow resting on the inner edge of that which immediately pre nd have goded it, there would be but little chance for the weeds or grass to grow ost, now between the furrows, which may be the case when the slices are set of glass, perpendicularly, or nearly so, on their edges. There will likewise be a wity under the edges of the furrow slices, containing stagnant and someexactly times putrescent air, which will enrich the soil. Dry sandy soils, such ought not to be ploughed in ridges, should be turned over completely, the frost and be laid and kept level as possible. A competency is all we want for to what to what the sur- look out for themselves—they will do well enough, if we take proper ce there pains to instruct them.

0 1001 ? Do we act in all things according to this rule ? Let us think deep-0 y of these matters, and if we have erred, let us try to err no more: and, 0 man is feeble in all his efforts, to overcome the force of bad habits, and O secome wise, when he has been wedded to folly, let us ask the aid of one o who has strength sufficient to overcome our weakness. If you cut wood outh a wish that the stumps should sprout, let it be after the fall of the and before the buds swell in the spring. When bushy ground, full of the twesterong roots is to be ditched, begin the ditch in winter when the ground nd gray has frozen two or three inches deep. The surface may be chopped into s of memoraces by a broad axe with a long helve, and the ditch completed in warm ir minds weather. The farmer may, probably, hit on a good time for this work gan? Area December, when there happens to be no snow, and when it will not to the fasterfere with other farming business,

Sailing Instructions for Charlottetown Harbour.

A BLACK BUOY, with a ball and staff, has been placed on the South side of the Fitz Roy Rock, lying off Governor's Island, in $4\frac{1}{2}$ fathoms low water, with the following Marks and Bearings, viz:—A remarkable gap or notch in the trees on the distant land on with the Blockhouse, bearing N. 4° E., and the North Point of Governor's Island, on with Pownal Point E. by N. $\frac{1}{4}$ N. The least water on this rock is 21 ft. and the proper deep water channel is on its larboard side going in, but it may be passed on its East side at the distance of a cable's length, if required.

A Red Buoy has been placed on the eibow of St. Peter's Bar, in 23 feet low water, with the following marks and bearings, viz:—The remarkable gap open a ship's length to the eastward of the Blockhouse; the Presbyterian Church tower open to the left of the trees on Battery Point; the North Point of St. Peter's Island W. ½ S., and the S. W. point of Governor's Island S. E. ½ S. This Buoy must be left on the larboard hand going in, and after rounding it from the westward, do not haul up for the Blockhouse until Government House comes on with Battery Point, which is the starboard inner point of the entrance, unless in a vessel of easy draft, as a direct course from the Buoy N. ½ E. leads over the eastern edge of the shoal ground in 15 feet low water; you may, however, with a scant wind, choose your water from 2½ to 14 fathoms, which latter depth will be found in mid-channel and carried up to the entrance, with Government House just seen left of the trees on Battery Point, bearing N. ½ E. nearly. Beating in with a heavy vessel, tack on each side of the channel in 4 fathoms—the Fitz Roy Buoy bears from the Elbow Buoy nearly S. by W. 1 10 miles.

A BLACK BUOY has been placed off the extremity of the spit stretching out from Battery Point, in 5 fathoms low water, with the following marks and bearings, viz:—The east end of Governor's Island shut in with "Sea-Trout Point," which forms the outer point of entrance, and "Rosebank Point," a ship's length open to the left of Battery Point, bearing N. E. by E. This Buoy must be left on the starboard hand going in, and after passing it, steer N. N. E. with the red Beacon on with the tower of the Presbyterian Church, until the white Beacon comes on with M'Kinnon's log house, bearing S. W. ½ W. with which mark proceed up towards the pier, where you may choose your berth at pleasure in 9 or 10 fathoms. The best berth for men of war is with the Government House N. W. by N., the Blockhouse on with Battery Point, and M'Kinnon's log house open twice its breadth to the northward of the white Beacon in 9 or 10 fathoms—capital holding ground.

N. B.—The Presbyterian Church tower is white and of a square form, without a spire.

Proceeding outwards, reverse the above directions; and do not open the Government House of Battery Point until the red Euoy comes on with the South Point of St. Peter's Island; then you may haul to the westward as close to the Buoy as you please, choosing your water by the lead. On rounding Point Prim, do not steer for the channel until the entrance of the Harbour bears N. by E., or the Presbyterian Church tower kept midway between the points of entrance will lead up to the Buoy of the Fitz Roy.
