# Technical and Bibliographic Notes/Notes techniques et bibliographiques

The Institute has attempted to obtain the best original copy available for filming. Features of this copy which may be bibliographically unique, which may alter any of the images in the reproduction, or which may significantly change the usual method of filming, are checked below.

L'Institut a microfilmé le meilleur exemplaire qu'il lui a été possible de se procurer. Les détails de cet exemplaire qui sont peut-être uniques du point de vue bibliographique, qui peuvent modifier une image reproduite, ou qui peuvent exiger une modification dans la méthode normale de filmage sont indiqués ci-dessous.

☐ Coloured covers/  
Couverture de couleur

☐ Covers damaged/  
Couverture endommagée

The copy filmed here has been reproduced thanks to the generosity of:

New Brunswick Museum  
Saint John

The images appearing here are the best quality possible considering the condition and legibility of the original copy and in keeping with the filming contract specifications.

Original copies in printed paper covers are filmed beginning with the front cover and ending on the last page with a printed or illustrated impression, or the back cover when appropriate. All other original copies are filmed beginning on the first page with a printed or illustrated impression, and ending on the last page with a printed or illustrated impression.

The last recorded frame on each microfiche shall contain the symbol → (meaning "CONTINUED"), or the symbol ▼ (meaning "END"), whichever applies.

Maps, plates, charts, etc., may be filmed at different reduction ratios. Those too large to be entirely included in one exposure are filmed beginning in the upper left hand corner, left to right and top to bottom, as many frames as required. The following diagrams illustrate the method:

L'exemplaire filmé fut reproduit grâce à la générosité de:

New Brunswick Museum  
Saint John

Les images suivantes ont été reproduites avec le plus grand soin, compte tenu de la condition et de la netteté de l'exemplaire filmé, et en conformité avec les conditions du contrat de filmage.

Les exemplaires originaux dont la couverture en papier est imprimée sont filmés en commençant par le premier plat et en terminant soit par la dernière page qui comporte une empreinte d'impression ou d'illustration, soit par le second plat, selon le cas. Tous les autres exemplaires originaux sont filmés en commençant par la première page qui comporte une empreinte d'impression ou d'illustration et en terminant par la dernière page qui comporte une telle empreinte.

Un des symboles suivants apparaîtra sur la dernière image de chaque microfiche, selon le cas: le symbole → signifie "A SUIVRE", le symbole ▼ signifie "FIN".

Les cartes, planches, tableaux, etc., peuvent être filmés à des taux de réduction différents. Lorsque le document est trop grand pour être reproduit en un seul cliché, il est filmé à partir de l'angle supérieur gauche, de gauche à droite, et de haut en bas, en prenant le nombre d'images nécessaire. Les diagrammes suivants illustrent la méthode.

## NOTICE.

GENTLEMEN making Nautical Communications to the Subscriber, will please address them to the care of EDMUND & GEORGE W. BLUNT, No. 154 Water street, corner of Maiden Lane, New York; by whom, in future, all his works will be published. E. & G. W. BLUNT will, with pleasure, communicate every information in Nautical Improvements.

EDMUND M. BLUNT.

N.B. As some improvements have been made since this work commenced, the reader is referred to the APPENDIX:

CHRONOMETERS rated, sold, and repaired by E. & G. W. BLUNT.—See their advertisement in this work.

## PREFACE

### TO THE TWELFTH EDITION

OF

### THE AMERICAN COAST PILOT.

NEARLY *forty years* have elapsed since the subscriber commenced this work. To it he has devoted the largest portion of his life, unwearied labor, and great expense; and the reception it has met with from that respectable class of society by whom it is used, may be inferred from the fact, that ELEVEN EDITIONS, comprising *thirty-seven thousand* copies, have been sold, previous to the publication of the present edition.

The difficulties of procuring all the improvements incident to a work of this character, not only intended to enable the mariner to recognize the coast at a distance; but to direct him into a port when pilots cannot be obtained, render it a work of great labor and responsibility. The life of the most experienced is more endangered when he approaches the coast, than when exposed to the tempests which agitate the mid-ocean. Pilots, who are not always to be found in the discharge of their duty, are often prevented by storms and violent winds from offering their services to vessels endeavoring to make a harbor. In such cases, unless the masters are acquainted with the port, the safety of the vessel depends upon the accuracy of the Sailing Directions. Charts are intended rather to give a general idea of the coast, than minute and accurate descriptions of particular harbors. It is, therefore, to their printed directions that they must resort, to procure information which at such moments is vitally important. Their instruments and charts, by which they have been enabled to shape their course through a trackless ocean, are rendered useless from their ignorance of the channel by which they are to enter the harbor; and mariners, who have escaped all former dangers of the voyage, are often shipwrecked upon some sunken rock or shoal, at the entrance of their destined port. The knowledge of such dangers, important as it is to seamen generally, is particularly so to those of the United States. Navigating waters filled with shifting sand banks and bars, which are formed by the Gulf Stream, and by the mighty rivers which discharge themselves from the coast of the North American continent, they require no ordinary skill and knowledge to avoid those extensive and intricate shoals that line our shores. This coast is rendered still more dangerous by rapid tides and eddies peculiar to the American seas, and by a strong current running counter to the Gulf Stream, from the Banks of Newfoundland to Cape Florida. The boisterous and variable weather, so common in this climate, also tends to increase the difficulties and dangers of our coasting trade.

The Charts of the American Coast of foreign publication, were drawn from information obtained previous to the revolution, from the imperfect sketches of such ports as the policy of the British government caused to be surveyed at the time it held us as colonies. These were few in number, and, since the publication of American charts, the English charts have fallen entirely into disuse. In general the mariners were left to acquire their knowledge from the shipwrecks of others. Those we now publish, are from

# PREFACE.

authentic sources; and from the surveys of our own government, the observation of ship-masters, and our own exertions, we derive that information which is here published concerning the coast of the United States.

In preparing the *American Coast Pilot* for press, recourse has been had to every Nautical work of merit; and with the assurance that neither pains nor expense have been spared, it is presented to the world as perfect as the nature of the work will admit. Every source of marine intelligence which our country affords has been successively resorted to. Letters have been addressed to the Collectors and Pilots in the several ports of the United States, requesting nautical information, which they have given with commendable promptitude.

Surveys, in pursuance of various acts of Congress, have been made of Savannah River, Capes Fear, Hatteras, and Look-out, of the entrance of the Chesapeake, the river Darien, Isles of Shoals, Portsmouth, Boston, and Newport Harbors; copies of which the author has been permitted to take, and which are inserted in this edition of the Pilot. These, however, are but part of the improvements. The Bahama Bank, and the adjacent keys, which lie directly in the course of all vessels bound to New Orleans and Havana, and which have long been the dread of our West India mariners, were surveyed in 1820, at the expense of the subscriber. The next year, the sloop *Orbit*, a surveying vessel in his employ, was sent to examine the South Shoal of Nantucket, the extent and situation of which he had long suspected to be incorrectly described. It was then ascertained that this Shoal, which had been laid down in all the English charts, as extending to the south as far as lat. 40° 42' N. in fact terminated in lat. 41° 4' N. The importance of this discovery to the navigation of the United States, may be easily conceived. Heretofore, mariners bound from Europe, or from the eastern ports to New York, Philadelphia, or any of the southern ports, in their desire to avoid this dangerous shoal, kept so far to the south-east as often to run into the Gulf Stream, and were thereby retarded from 60 to 70 miles per day. By this survey, a clear and perfectly safe channel, twenty-two miles wide, is added to the space, supposed to be between the stream and the shoal, which will enable them to keep more to the north-west, and to take advantage of the south-west current on the inner edge of the Gulf. An average gain of twenty-four hours may be thus made in the home passage of most European traders.

The accuracy of this survey, which was at first disputed, has been fully proved, by two different expeditions subsequently sent from Nantucket to ascertain the extent of the shoal.

The surveying sloop *Orbit*, also accompanied a vessel sent by Capt. *Isaac Hull*, at the request of the subscriber, to examine St. George's Bank, and the result is published in this edition of the *American Coast Pilot*.

Since the publication of the eleventh edition, Messrs *E. & G. W. Blunt* have made a minute survey of Long Island Sound, and also completed their survey of New York Harbor. Great improvements have been made in the directions for the coasts of Newfoundland and Nova Scotia, for which the author is indebted to the surveys of Messrs. *Bullock, Lane, & Lockwood*, under the direction of the British Admiralty. He has also availed himself of the labors of Baron *Roussin*, who since the publication of the last edition of the Pilot, surveyed the coast of Brazil from St. Catharine to Maranham, by order of the French Government, and of the continuation of that survey from St. Catharine's to the River La Plata, by Lt. *Barrel*. and ability of Capt. *King* of the British navy, who has completed the survey of the Straits of Magellan, he is indebted for the directions for those straits in the following work.

To Capt. *Beauregard*, hydrographer to the British Admiralty, Capt. *R. Owen* of the British navy, Don *Martin F. de Navarrete*, hydrographer to the Spanish government, Lt. Col. *Abert* of the U. S. topographical engineers, and to the officers in the British, French, Danish, and Dutch service, his thanks are particularly due for the new and valuable information which they have voluntarily furnished of the coasts that have fallen under their observation, and in a manner which indicates, that in their opinion the advancement of the science of hydrography is the common interest of all nations.

Many improvements are made in this, which have increased its contents one-third over the last edition, by sailing directions for every harbor in the West Indies, Spanish Main, &c. &c. with a full description of the many Beacons, Buoys, and the new Lighthouses, which have been erected on the coast of the U. S.; together with the alterations that have been made in some of the Lighthouses, and a complete revision of the Latitudes and Longitudes, adapted to recent observations.

These are part of the improvements of the present edition; though some material corrections have been made, whenever the author was satisfied, by the testimony of mariners, or by surveys, that his former directions were inaccurate. Alterations have not, however, been made, unless upon stronger evidence than what prompted him to insert the original directions.

In presenting the *TWELFTH EDITION* of the American Coast Pilot to the public, the author does not flatter himself that it will prove entirely free from errors. The shifting nature of certain parts of the coast, which occasionally present deviations from the present directions. Imperfection too is the lot of man, and in attempting to give directions for the navigation of a coast 6000 miles in length, and which was discovered long after the European coast had been fully explored, he is sensible that he has undertaken a duty, the performance of which belonged RATHER TO THE GOVERNMENT THAN TO AN INDIVIDUAL. Of such a momentous task, it is matter of astonishment that so much has been done; and not that so much remains to be performed. During the many years devoted to its execution, his zeal has not been excited, nor his industry quickened by the consciousness that he was engaged in a brilliant undertaking, which would attract the attention of mankind; neither was there opportunity or place in a work addressed to a class using a peculiar dialect, and who required only perspicuity and accuracy, for the beauties of style and language. His pecuniary reward has hitherto been nothing, the profits of the work having been wholly absorbed in the expense of improvements.

It is, however, no small satisfaction to reflect, that the average rate of insurance, since the first publication of the Pilot, has been diminished more than one half upon coasting vessels, and four-fifths upon vessels bound to New Orleans, and that, among other causes, the improvements in hydrography must have contributed to effect this great reduction. Still more satisfactory is the consciousness derived from many public and private acknowledgments, that, in no small number of instances, by following his directions, both vessels and crews have been saved from the rage of a merciless element, when the pilots were unable to come to their assistance,

This conviction of the utility of his labors has encouraged him to continue them even when the embarrassments of our commerce had extinguished all expectation of any adequate recompense. For the greater part of his life he has devoted himself to the improvement of American hydrography; and with a constitution broken by exposure and fatigue, and a fortune literally "cast upon the waters," he now retires from the superintendence of a work which his increasing infirmities will not permit him any longer to continue, with an expression of gratitude to that class of our citizens

"Whose march is on the mountain wave,"

for the encouragement given him in their uniform preference of his publications, and parts from them with a wish, that the *American Coast Pilot* may long prove a safe and unerring guide in their journeys through the trackless ocean.

JULY, 1833.

EDMUND M. BLUNT.

## P R E F A C E

TO THE

### THIRTEENTH EDITION.

In preparing this edition for the press, every care has been taken, many additions have been made, and such errors as existed in the twelfth edition, and have been discovered, have been corrected.

The Editors feel indebted for many communications to this work: more especially to Capt. BEAUFORT, hydrographer to the Admiralty, for the continuation of his valuable favors; to Lieut. BEECHY, R. N., and to the invaluable work, the English Nautical Magazine, he edits; to Capt. OWEN, R. N., for his surveys of the Mosquito Shore and Bahama Bank; to Lieut. GREEN WALDEN, of the U. S. Revenue Service, for his description of part of the Coast and Harbors of the State of Maine. WILLIAM C. REDFIELD, Esq. of this city, has contributed the articles on Storms and Currents.

Much yet remains to be done, to make this work as perfect as the editors desire. This only is to be attained by continued industry, by collecting and carefully collating the various descriptions of places, sailing directions, surveys of harbors, coasts, &c. The important survey of the coasts of the United States, now in progress, under charge of Professor HASSLER, aided by a corps of scientific assistants, will at a future day afford materials for further corrections and improvements. To this survey of the American coast, and to the surveys of the English and French hydrographers, of the coasts, harbors, &c. embraced in this work, to communications and sailing directions from intelligent ship masters, and to an extensive correspondence, the attention of the editors is constantly directed.

Large appropriations were made, at the last session of Congress, for new Lighthouses, Buoys, Beacons, &c. Notice of these appropriations will be found in the Appendix. On the completion of any of these works due notice will be given.

JUNE 1, 1837.

## COAST OF LABRADOR,

### FROM YORK POINT TO SANDWICH HARBOR.

*Variation allowed from York Point to Sandwich Harbor  $2\frac{1}{2}$  and 3 Points.*

YORK, or CHATEAUX BAY, lies about 16 miles N. W.  $\frac{3}{4}$  N. from the south-western point of Belle Isle, and 8 leagues N.  $\frac{3}{4}$  W. from the Harbor of Quirpon; it may easily be known by two very remarkable hills, situated on Castle and Henley Islands, which lie at the entrance of the bay; these rocky hills appear flat at the tops, and the steep hills around them have the appearance of castle walls; the islands form the eastern side of the entrance to the bay, while the Capes York and Temple are to the westward; but as the mariner may not be able to discover the above hills at a distance, because of the high land behind, the better marks will be, to observe that all the land to the westward is of a high and uniform figure, terminating at the west side of the bay with a conspicuous knob or hillock, while the land to the eastward of Chateaux Bay is lilly and broken, having many islands near the shore; while to the westward there are none.

To sail into Chateaux Bay, you must leave Castle and Henley Islands on your starboard side, and endeavor to keep Point Grenville, which has a beacon upon it, on with the western point of Henley Island; this point is a smooth black rock, having a little dark rock just appearing above water off its point; keep this mark on until you get abreast of Whale Island; then, to avoid the middle rock, over which are only 9 feet water, and which lies nearly midway between the east point of Whale Island and the black point of Henley Island; haul over close to Henley Black Rock, or borrow towards, but not too near, to Whale Island, for here it runs off shallow and flat; and when you are so far advanced as to open the narrow channel into Temple Bay, with the view of sailing up into Pitt's Harbor, then haul to the westward, until you bring the outer point of Castle Island, a little open of Whale Island; this mark will lead you up into Pitt's Harbor, which is spacious, clear from danger, and well sheltered from all winds; here you may ride in 10 or 14 fathoms, with plenty of timber ready for your use, and every convenience for carrying on your fishery. There is also a narrow passage into Pitt's Harbor, to the northward of Henley Island, through which you will have 3 fathoms water.

One mile to the eastward of Henley Island, lies Seal Island, and  $3\frac{1}{2}$  miles further is Duck Island; between these is Goose and Bad Bay, full of rocks both above and below the water, and also open to the easterly winds. To the eastward of Seal Island, distant 6 miles, is St. Peter's Islands, a cluster of barren rocks, within which is St. Peter's Bay, a good place of anchorage, but too much exposed to the south and south-easterly winds to be much frequented.

CAPE CHARLES.—To the north-eastward of St. Peter's Island is Cape Charles making with a high hill, steep to seaward, and sloping down inland, so that when you are to the westward of Chateaux Bay, it has the appearance of an island. Cape Charles Island lies S. E. by E.  $\frac{1}{4}$  E. distant about one and a half mile from Cape Charles; it is of moderate height, and has several small rocks both to the eastward and to the westward of it. From St. Peter's Islands to Charles Island the course is E. N. E.  $\frac{1}{4}$  E. distant 14 miles; between them lies Niger Sound, an inlet about two leagues deep, and having several small islands before it; to enter Niger Sound you may pass either to the southward or northward of these islands, and obtain anchorage on the northern side of the sound in 9 fathoms water: the course in will be nearly N. by W.

CAPE CHARLES HARBOR.—From the north point of Cape Charles Island into Cape Charles Harbor, the course is N. W.  $\frac{3}{4}$  N. distant 4 miles; this harbor is formed by Eyre and Little Caribou Islands, on the eastern sides, and by the main on the west; there is very good anchorage in from 17 to 22 fathoms water in it, on a muddy bottom, and you may sail in on either side of the centre island; but the best passage is between it and Little Caribou.

From Cape Charles Island to the Battle Islands the course is E. N. E.  $\frac{1}{4}$  N. and the distance  $4\frac{1}{2}$  miles; this course will carry you clear to the eastward of the rocks which lie a large mile to the eastward of northernmost Battle Island, which will appear high and round at the top.

From the northernmost Battle Island to the River Islands, your course will be N. W.  $\frac{1}{4}$  W. distant 2 leagues; here, to the westward of Pocklington, which is one of the River Islands, you will find anchorage in 30 and 35 fathoms water, with a bottom of mud; and vessels may pass to the southward of these islands up the river St. Lewis,

**CUTTER HARBOR.**—From the south point of Pecklington Island to Cutter Harbor, the course is W.  $\frac{1}{4}$  S. distant one mile: in this harbor there is good anchorage for small vessels.

**ST. LEWIS RIVER.**—From the northernmost Battle Island, to the entrance of the River St. Lewis, the course is N. N. W.  $\frac{1}{4}$  W. distant 7 miles; steer in N. W.  $\frac{1}{4}$  W. for 5 miles, then N. N. W.  $\frac{1}{4}$  W. 8 miles, to Woody Island. When you are about 4 miles up this river from its entrance, you will find good anchorage, and this will continue until you arrive at Woody Island; but above that the river becomes intricate and has many shoals. The north point of the river is low for about 2 miles up, then both sides become rather high and woody; at the head of the river are different kinds of very fine wood, birch, fir, juniper, and spruce; and the river is plentifully stored with salmon.

**ST. LEWIS'S SOUND.**—One mile to the northward of the north point of St. Lewis River lies the entrance to St. Lewis's Sound, which runs up nearly N. W. about 3 miles, having very good anchorage at its upper part, but care should be taken, lest a shoal, which stretches off from a sandy beach on the larboard side, about 2 miles within the entrance, should do you any injury; you will therefore be sure to give this a good berth in passing.

**DEER HARBOR.**—From the northernmost Battle Island, to the entrance of Deer Harbor, the course is N. N. W.  $\frac{1}{4}$  N. distant  $2\frac{1}{2}$  leagues. This is considered to be a very good harbor, secure from all winds, and in which vessels will find anchorage in from 10 to 18 fathoms; there is no danger in entering, and the best anchorage is at the back of Deer Island, called also Maridam Island. Port Maridam is formed by the east end of Maridam Island, and the main to the north and eastward of it.

**CAPE ST. LEWIS.**—From the northernmost Battle Island, to Cape St. Lewis, the course is N.  $\frac{1}{4}$  W. distant 5 miles; this cape is high ragged land; a quarter of a mile from the point, there are two flat rocky islets, and several sunken rocks about the point of the cape; round the point is the entrance of a small cove running in S. W.  $\frac{1}{4}$  W. half a mile, it is commonly called Deep Water Creek, being very narrow, and having from 20 to 40 fathoms within it. About  $1\frac{1}{2}$  mile N. N. W.  $\frac{1}{4}$  N. from the Cape, is Fox Harbor, which is small and fit for shallops, but appears to be a convenient place for the fisheries.

**PETTY HARBOR.**—From the northern part of Cape St. Lewis, to the south head of Petty Harbor Bay, the course is about N. N. E.  $\frac{1}{4}$  E. distant  $1\frac{1}{2}$  mile; the shores are bold and lofty; the entrance is a mile and a half wide, and the north point bears from the southern point N. E. by N.; the bay runs up nearly N. W. by N. full 1 mile, having from 20 to 40 fathoms water in it. At the bottom of the bay you will perceive Petty Harbor; the entrance is to the northward of a low point of land, which shuts the harbor in from the sea, so as to render it very difficult to distinguish its situation; it is not above 50 fathoms broad at the entrance, with 5 fathoms mid-channel, and 3 towards the sides; but this narrow passage continues only a short way, for having passed through it, the harbor opens wide, and vessels will have plenty of room, and may anchor in any part, in from 7 to 12 fathoms, lying land-locked.

From the north head of Petty Harbor Bay to Point Spear, the course is N. E.  $\frac{1}{4}$  N. distant  $2\frac{1}{2}$  miles; and from Cape Lewis to Cape Spear, in nearly the same direction,  $6\frac{1}{2}$  miles; between are Barren Bay and Spear Harbor; Barren Bay is a little to the northward of the northern part of Petty Harbor Bay, and affords no shelter; but Spear Harbor, which lies to the southward of Point Spear, is a very excellent harbor; in coming from the northward, and making Point Spear, you will open two islands, in the bottom of a small bay; the best passage into Spear Harbor is between these islands; keep the northern islands close on board, there being 4 fathoms along side of it, and after you get about a cable's length within the islands, steer for the middle of the harbor, and anchor in 7 or 8 fathoms; there is good room to moor. Small vessels may go on either side of the islands, the least water being two fathoms; but you ought to observe that, in coming from the southward, you will only be able to distinguish one island, for the northernmost islands will be shut in with the land so as not to be seen until you get within the heads.

**SOPHIA, CHARLOTTE, AND MECKLENBURGH HARBORS.**—From Point Spear to the entrance of these three harbors, the course is N. W. by N. about 3 miles; between are several small but high islands, lying within half a mile of the shore; these are commonly called Spear Islands, they are bold to, and there are channels between them with 20 fathoms water. N. E. by E.  $\frac{1}{4}$  E. from the southern head of the entrance to the three harbors lie two small islands, close together, and therefore named the Double Island; these appear to be as high as they are broad; about a cable's length to the eastward of these islands are two sunken rocks, over which the sea, in bad weather, constantly breaks. Nearly in the middle of the entrance also lie two other islands, being so close to each other as to seem one island; these are steep to, and ships may pass on either side of them in 12, 13, and 14 fathoms, anchoring within them, in Queen's Road, in 16 fathoms; but to the southward of these islands you will find the widest passage, and most room for ships to work out.

**Sophia Harbor.**—The first and southernmost of these three harbors is Sophia Har-

bor, running away, round the point, and fit only for small vessels.

**Port Charlotte.**—The starboard side of the entrance is close to the shore, and a reef that lies across the entrance.

**Mecklenburgh Harbor.**—W.  $\frac{1}{4}$  N. and N.  $\frac{1}{4}$  W. about 12 fathoms, but the larboard side is about 30 fathoms, and above the harbor.

**ST. FRANCIS.**

distance is not more than 12 fathoms, but the westward side is though small, fisheries being one being to the westward, lying directly in the inlet, called as you enter, you have 5 at you should be reef off it; give two points of no nearer to the nearer the station westerly, to the cove at the Cape St. F.

bor, running in S. S. W. about  $1\frac{1}{2}$  mile, with from 10 to 15 fathoms water; it then trends away, round a low point to the eastward, and becomes a mile broad, it is thence shoal water, and fit only for small vessels.

*Port Charlotte* is the middle harbor, and fit for any ships; there is a low flat island on the starboard side of its entrance, from which runs a reef of rocks one third of the channel over; to avoid this, keep the southern side on board, you will then have 9 fathoms close to the shore, until you get a quarter of a mile up within the harbor, you may then anchor in any part in from 12 to 17 fathoms, only giving the starboard side a berth to avoid a reef that lies on that side.

*Mecklenburgh Harbor* is the northernmost of the three harbors, and turns in N. N. W.  $\frac{1}{2}$  N. and N. W. by N. about two miles; in the lower part of this harbor there are 20 fathoms, but as you advance the water lessens, and in the upper part there are no more than 12 fathoms for ships to moor in. To sail up to the head of the bay, you must keep the larboard side nearest, in order to avoid the ledge of rocks that lies on the starboard, about 30 fathoms from the shore. These rocks lie within the narrowest part of the harbor, and above the low point on the starboard side; the best anchorage is at the head of the harbor.

**ST. FRANCIS HARBOR.**—From Point Spear to Cape St. Francis, the course and distance is nearly north, 6 miles, and from the islands at the entrance of the three harbors to Cape St. Francis N. E.  $\frac{1}{4}$  N. about 5 miles; between them, and nearly half a mile to the westward of the Cape, is St. Francis Harbor. This is a snug and secure harbor, though small, and generally filled with vessels, during the fishing season, considerable fisheries being carried on in its vicinity. To enter this harbor there are two entrances, one being to the northward, the other to the south-westward of Pigeon Island, this island lying directly before its entrance; the south-eastern channel leads to a small but narrow inlet, called Round Harbor; every where clean ground, with 10 fathoms in the channel as you enter, and the depth gradually decreasing as you advance towards its head, where you have 5 and 3 fathoms. In entering to the south-westward for St. Francis Harbor, you should beware of and give a berth to the western side of Pigeon Island, for a rocky reef off it; give this a berth, proceed on N. N. E.  $\frac{1}{4}$  N. and having got fairly between the two points of the harbor, you will perceive on your starboard side a small white rock; go no nearer to it than 7 fathoms, steer up north, and having passed mid-channel, or rather nearer the starboard shore, the rocks above water, which you will see on each side of you, turn westerly, and anchor in 4 or 5 fathoms. Small vessels go to Birrell's Beach, or up to the cove at the northern extremity of the harbor.

*Cape St. Francis* is the eastern point of an island, between which and Granby Island, is a very narrow passage for boats, with 4 fathoms water within it. From this cape, in a N. N. W. westerly direction, about  $\frac{3}{4}$  of a mile, is Indian Point, between which and Jasper Island's south-eastern point, is an opening leading into Indian Bight and Shoal Tickle, two narrow coves, the latter being shallow, and with only 2 and  $1\frac{1}{2}$  fathoms water in it. To the northward of Indian Point are Hare and Fox Islands, having a narrow passage running northward between them; on crossing from Indian Bight to the channel, you will have deep water, but when you enter the passage it will shallow to 5, 4, 3, and 2 fathoms; this flat will continue for a quarter of a mile, you then deepen your water again to 5, 7, 10, and 12 fathoms; vessels frequently anchor in this place, on the western side of Hare Island, or rounding the northern end of Fox Island, run through Pearce's Tickle into Sealing Bight.

**SEALING BIGHT** is a very commodious and convenient place for the fisheries; the best anchorage is on the southern part of the bay, to the westward of Jasper Island; here you may safely ride in 8, 10, or 11 fathoms, or further in with less water. There are several coves, situated along shore, to the northward of this anchorage, where small vessels may anchor; fresh water can easily be obtained, but wood is scarce; the southern entrance to this place is between Indian Point and Jasper Island, on one side, and Hare and Fox Island on the other; the water is deep, and there is no danger, except a reef which stretches out to the south-westward from Gull Island, over which the sea breaks very high in stormy weather; it will, therefore, to avoid this reef, be always prudent to borrow close towards Indian Point, in either sailing in or out of Sealing Bight. Merchantman Harbor is about 2 miles W.  $\frac{1}{2}$  S. from St. Francis Island; it is small, but has from 7 to 15 fathoms water.

**FISHING SHIP HARBOR.**—From St. Francis Island, to the northernmost Fishing Island, the course is N. N. E.  $\frac{3}{4}$  N. distant three miles. The Fishing Islands are 3 in number; the two northern ones are connected by a beach, which, with the main, forms Fishing Ship Harbor, where vessels may ride land-locked, and secure from all winds, in from 5 to 14 fathoms water, the entrance being to the southward of the southern Fishing Island; the best passage will be between the two western islands, that entrance bearing from Hare Island N. by W.; there is no danger in this channel, and vessels may sail right through it, in nearly a N. by W. direction, up to the very head of the harbor, and anchor

in 12 fathoms, leaving good room for ships to moor; there are two other passages into this place, one to the westward from the entrance of Gilbert's River, the other to the northward of all the Fishing Islands; the latter has 7 fathoms throughout, but is so narrow that you will have some difficulty in discovering the opening.

**GILBERT'S RIVER.**—Between Fishing Islands and Granby Island, is the northern entrance to Gilbert's River; the southern entrance is between Denbigh Island and the main, and this is much the wider of the two; there is also a channel between Denbigh and Granby Islands. The passage in has deep water every where; the course of the river is nearly N. W. by N. for about 6 miles, it then divides into two branches, one running N. W. by N. 7 or 8 miles, the other S. W. by W. about 6 miles: both these branches are full of rocks, small islands, and shoals; but in the middle the anchorage is good all the way up from 20 to 10 fathoms; this river has also a passage out to sea, between Hare and the Fishing Islands.

**CAPE ST. MICHAEL.**—Six miles N. N. E.  $\frac{1}{2}$  N. from the northernmost Fishing Island, and 16 miles N. N. E.  $\frac{3}{4}$  N. from Point Spear, is Cape St. Michael, high and steep, and easily known by a large bay to the northward of it.

**OCCASIONAL HARBOR.**—About 2  $\frac{1}{2}$  miles to the southward of Cape St. Michael, is Occasional Harbor, easily known by the twins, two large rocks lying two-thirds of a mile outside of the entrance; they are very near each other, and vessels may pass on either side of them; the entrance to the harbor is between two high lands, and runs in W. by N. for 2 miles, then N. W. by N.; both sides are steep to, without any dangers, and having good anchorage in from 10 to 7 fathoms, about 2 miles from the entrance: the wind between the high land always sets right into or out of the harbor.

**ST. MICHAEL'S BAY.**—From Cape St. Michael to Cape Bluff, the course is nearly N. N. E. about 7  $\frac{1}{2}$  miles, and these two Capes form the points of entrance to the Bay of St. Michael, which contains a vast number of islands, inlets, and rivers; the largest island is named Square Island, lying at the mouth of the bay, and being 3  $\frac{1}{2}$  miles long and very high; its N. E. point forms a lofty round hill, and makes, in coming from the southward, like a separate island, being only joined by a narrow neck of land; the best anchorage for small vessels, is on the southern side of St. Michael's Bay; to go there you should keep Cape St. Michael's shore on board, then run along the south side of the first island you meet with, which is called Long Island, till you get nearly to its western end, there you may anchor in from 12 to 20 fathoms, land-locked, and can work out to sea again on either side of the island. From Cape St. Michael to the entrance of Square Island Harbor, the course is N. N. W. 3  $\frac{1}{2}$  miles; at the entrance lies a small island of moderate height, to the westward of which is the best passage into the harbor, there being only 2 fathoms in that to the eastward of it. About a league N. N. W. from Square Island Round Hill is the entrance to Deadman's Harbor, which is formed by a number of little islands, and fit only for vessels of small dimensions. There is a passage between these islands and Cape Bluff, by which vessels may put out to sea.

Cape Bluff is very high land, rugged at top and steep toward the sea; it may be seen 15 or 16 leagues; Cape Bluff Harbor is a small place, and unfit for large vessels; to sail into it you should keep the Cape on board until you reach a small island, which you should pass to the eastward, and then anchor. The several bays and inlets in St. Michael's Bay are well stored with wood.

From Cape Bluff to Barren Island, the course is N. Eastward about 1 league; and from the south point of Barren Island to Snug Harbor, N. W. by W. 1  $\frac{1}{2}$  mile. Snug is a small harbor, but in it is very good anchorage in 26 fathoms; and no danger to be apprehended either in sailing in or out of it. About one mile to the northward of Barren, is Stony Island, and within these islands on the main, are Martin and Otter Bays; in the northernmost is good anchorage and no invisible danger in entering; wood and water are plentiful.

**DUCK HARBOR** lies on the western side of Stony Island, and is a very convenient place for small vessels; large ships may also anchor between the west point of Stony and Double Islands, in from 20 to 24 fathoms, sailing from thence to seaward on either side of Stony Island in great safety.

**HAWKE BAY.**—About 1 mile to the northward of Stony Island, lies Hawke Island, within which is Hawke Bay, running in westerly 2 leagues; it then divides into two branches, one going W. by S. 6 miles, the other N. W. by W. 5 miles: the shores of these are well supplied with wood. After you get within Pigeon Island, the anchorage is good up to the very head of both branches.

**EAGLE COVE** lies on the south side of Hawke Island; this place affords good riding for large ships in 30 and 40 fathoms water, and also for smaller vessels in 7 and 8 fathoms at the upper end of the bay.

**CAPLIN BAY.**—On the main, within Hawke Island, and nearly 5 miles E. by N. from Hawke Bay is Caplin Bay, having good anchorage and plenty of wood.

**PATRIDGE BAY** lies 4  $\frac{1}{2}$  miles to the northward of Hawke Island; the anchorage is good, but the bay is difficult of access, unless to those who are well acquainted with the place, on account of the numerous small islands which encumber its entrance; but the land

hereabout may be very easily known, for the southern point of the bay is a remarkable high table hill of very barren appearance, and all the land between it and St. Michael's Cape is high, while that to the northward is low.

**SEAL ISLANDS.**—From Cape St. Michael to the southernmost Seal Island, the course is N. E.  $\frac{1}{2}$  N. distant 9 leagues, and from thence to Round Hill Island, N. E.  $11\frac{1}{2}$  miles; this latter island is the easternmost land on this part of the coast, and may also be recognized by a remarkable high round hill on the western part of it.

**SHALLOW BAY.**—From Round Hill Island to Spotted Island, the course is N. N. W.  $\frac{1}{2}$  N. distant  $4\frac{1}{2}$  miles; and from Spotted Island, the land turns N. N. Westerly and is fronted with numerous islands. From the southernmost Seal Island to White Rock, the course is N. N. E.  $\frac{1}{2}$  E. about 5 miles; and from this rock to enter Shallow Bay, you must steer W.  $\frac{1}{2}$  S. nearly 4 miles; there is very fair anchorage within this bay, and no danger; excepting a small rock which lies on a cove on the larboard hand, about one-third over the bay; this rock is visible at low water, and at other times the sea breaks over it; there is little wood visible on the shores of this bay.

From White Rock to Porcupine Island, the course is N. N. W. distant 2 leagues; this island is high, barren, and steep to; vessels may pass on either side of it to Porcupine Bay, where the riding is good, but little or no wood.

**SANDY BAY** lies on the southern part of the Island of Ponds, and N.  $\frac{1}{2}$  W. from White Rock, from which it is distant 5 miles; there is good anchorage in this bay, with 10 fathoms water, on a bottom of sand, and would be a very convenient resort for the fishing ships, but for the total absence of wood. Between this Bay and Spotted Island, are numerous islands and rocks, both above and under water, rendering this part of the coast extremely dangerous.

**SPOTTED ISLAND** is high barren land, and may be recognized by several white spots on its eastern side: it is about 3 miles long and of nearly a similar breadth; the northern part lying in latitude  $53^{\circ} 30' N.$  To the westward, and within side this island, is Rocky Bay; to sail into this bay, you should run in to the northward of Spotted Island, and go between either of the islands that lie before the entrance of the bay; but there is no good anchorage in it, the bottom being so rocky, until you get between Level Point and Eagle Island, where you may ride in 8 or 10 fathoms, the ground good and clean, only taking care to give Level Point a free berth; the best anchorage will be on the western side of Eagle Island in 8 or 9 fathoms, mud. In passing between Eagle Rocks and the Duck Rocks you may borrow on either side to within two-thirds of the length of a cable, or you may run up and anchor on the southern side of Narrow Island in Narrow Harbor, and be handy for both wooding and watering.

From Spotted Island to Wolf Rock, the course is N. N. E.  $\frac{1}{2}$  N. about 18 miles; this rock is above water, and lies 14 miles from the main; there are some sunken rocks about it, and several islands between it and the coast. About two miles to the northward of the entrance to Rocky Bay, is Indian Island; this is remarkable high land, particularly at the western end; between the island and the main is tolerably good shelter for small vessels, and it appears to be a fit place for a seal fishery.

**SAND HILL COVE.**—This place is so called from several sand hills lying on the southern side of its entrance; it is situated 4 good leagues to the westward of Indian Island; here the anchorage is good about half a mile up from its entrance, in 4 or 3 fathoms water, sandy ground. When you are sailing into this cove, you should take care to give the north point a good berth, because of a ledge of rocks which stretch off about a cable's length from the point, and run westward along shore, the length of two cables.

**TABLE BAY.**—The southern head of this bay lies about 2 leagues N. by W. from Sand Hill Cove, and may be known by a remarkable table hill on the north side of the bay, about 8 miles within the entrance; this hill may be seen from the Wolf Rock, which lies N. W.  $\frac{1}{2}$  N.  $7\frac{1}{2}$  leagues from the entrance of the bay. In this bay, about 4 miles from its entrance, lies Ledge Island, so called from a ledge of rocks stretching westerly from the island up the bay for 2 miles. On the southern side of this island is anchorage, in 12 or 14 fathoms, in what is called South Harbor; or you can run further up, and anchor in Table Harbor. On the north side of the bay, just within Ledge Island, lies North Harbor, having very good anchorage in it. In sailing up to Table Harbor, you should take care to keep the main land close on board, in order to avoid a rock that lies half way between the ledge that runs off Ledge Island and the main.

The **GANNETS** are a cluster of islands, lying from 7 to 11 miles off the main land; the outermost island bears from the Wolf Rock N. N. W.  $\frac{3}{4}$  W. distant 10 leagues.

**CURLEW HARBOR** lies nearly S. W. of the Gannet Islands, on the main, and may be distinguished by a green round island, lying before its entrance; the channel into the harbor is between this island and a low point to the southward, having a small rock above water close to the point; there is no danger in sailing into this place; the best anchorage will be about one mile within its entrance; here large ships may ride in safety, bringing the small rock off the entrance point, on with the northern point of Long Island; they will then ride

in 14 or 15 fathoms water, good holding ground. Long Island lies about  $1\frac{1}{2}$  mile N. by W. from Green Island. Small vessels run higher up the bay, and generally anchor in from 10 to 7 fathoms. On the southern side of the harbor is a shoal, lying at a small distance from the shore; wood is scarce in this bay, but water plentiful.

**ISTHMUS BAY.**—This bay lies round the western point of Curlew Harbor, sailing from whence you should endeavor to keep Great Island on board, in order that you may go clear of a shoal that stretches off the point towards the island; there is also another passage into Isthmus Bay, between the western point and a small bare rock of moderate height, that lies off the south point of the Great Island; this channel is narrow, and has a depth of three fathoms within it; both wood and water may be obtained here.

**HARE HARBOR.**—One league to the westward is Hare Harbor, fit only for small craft, the bottom being foul, except towards the head, where you may anchor in  $3\frac{1}{2}$  fathoms water, the ground tolerably good. Hare Island, which lies before the entrance to the harbor, is high land; the eastern point of Huntingdon Island lies about 2 miles to the northward of Hare Island, and W. S. W.  $\frac{3}{4}$  W. about 13 miles from Gannet Island; it is moderately high, and in length, from east to west, 7 miles; off its eastern point are some small islets, named Sadler's and Leveret's Islands, and a little to the northward of the latter is a rocky flat; these lie  $1\frac{1}{2}$  mile off the extreme point of Huntingdon Island. There is a safe passage above a mile wide, along the southern side of Huntingdon Island; this leads into Huntingdon Harbor, opposite which you may ride safely in from 5 to 13 fathoms water; further in towards the island it shallows, but the best anchorage is behind Egg Island, in 6 fathoms, near that island; here you will be secure from all winds, and ride very convenient for both wooding and watering, there being abundance of both on the island.

**SANDWICH BAY,** called by the natives Netsbuctoke.—On the south-western side of Huntingdon Island is Earl and Diver Islands, on either side of which is a passage into Sandwich Bay; but the channel between Diver Island and Earl Island, called Diver's Tickle, is very narrow, and has in some places not more than 6 feet water, while that between Diver and Huntingdon's Islands, is over a sandy flat of 9, 12, and 18 feet water, and consequently not to be attempted by large vessels. To the eastward is Cartwright's Harbor, leading to the Favorite's Tickle, and thence to Sandwich Bay; this has deeper water, and by keeping the southern land well open of Earl's Island you will go through it until you reach the Narrows, when the two points forming the Narrows must be brought on with each other, and this will lead between the eastern small island and the main in 4, 7, and 9 fathoms; between the Narrows is 18 fathoms. Sandwich Bay is a very fine harbor, 6 or 8 miles broad, and 6 leagues deep, with plenty of wood and water, and 4 rivers running into it, abounding with salmon. There is very good riding in a cove on the eastern side of the bay, and also on the northern side under a mountain; from the shore, at the foot of the mountain, and five miles to the westward, the soundings stretch gradually off the shore, from 5 to 25 fathoms, muddy ground, and extend full three miles from the land. The passage into the bay, on the western side of Huntingdon and Earl Islands is the widest and best channel, for that to the southward we have just shown to be narrow, shallow and inconvenient; to enter to the northward of Huntingdon Island you must beware of the flats which lie a little to the northward of Leveret's Island; there is deep water at the entrance, and you will see the Island of Plantation to the northward, a little to westward of which is Henrietta's Island; between these two is Independent Harbor, a snug retreat running in north, and having every convenience for the fisheries. Directly before this harbor, and in the fairway of the channel to Sandwich, are the Double Islands; in entering you will leave Wedge Island and Bellows Rock to the northward and Gull Island to the southward, and pass on either side of the Double Islands; your course then will be N. W. by W.  $4\frac{1}{2}$  miles; and having got beyond the N. W. point of Huntingdon Island, you will perceive Entrance Island lying midway between the point and the opposite shore; the channel now bends to the S. Westward, and is bounded to the northward by the North River Flats, and to the southward by Huntingdon Flats, the deep water passage being about a mile broad: you may sail in on either side of Entrance Island; proceed W. by S. towards Main Tickle Point; from off this point a spit extends E. N. E.  $1\frac{1}{2}$  mile, contracting the channel and making the navigable passage very narrow for large ships to enter: on the starboard side are the two Brenton Islands, situated in Table Hill Cove: when you get these open of each other, a line passing directly between them, or when the North Brenton opens its own length to the eastward of the southern one, you will clear the spit in  $4\frac{1}{2}$  fathoms; when these islands come on with each other, you will pass over the spit in 2 fathoms water: the cross mark is Green and Leading Mark Island in one; these lead on to the centre of the pit, and are two islands situated on Huntingdon Flats; the leading mark to go through the Main Tickle Passage is Leading Mark Island on Old Man's Head; this will carry you clear of the shoals on both sides in from 6 to 14 fathoms, right into Sandwich Bay; to sail out of the bay bring the hollow part of Leading Mark Island in one with the gap of Old Man's Head, until you are within three cables' lengths of the former, then give the island a berth of equal distance in passing, and steer direct for Entrance Island.

# FROM CHATEAUX BAY TO THE ESQUIMAUX ISLANDS. AT THE ENTRANCE OF THE RIVER ST. LAWRENCE.

*Variation allowed 2 Points.*

From York Point, the southern entrance of Chateaux Bay, to Barge Point, the course and distance is W. by S.  $5\frac{1}{2}$  leagues; from Barge Point to Saddle Island is nearly west, 10 miles; between these is Green Bay, a place where small vessels may anchor in 12 fathoms water, but open to the S. Easterly winds.

RED BAY.—This is an excellent harbor, and may always be known by Saddle Island, which lies at its entrance; this island rises up at each end, and sinks down in the middle, somewhat similar to a saddle; there is also a remarkable round hill on the western side of the bay, and opposite to the west end of Saddle Island, which will tend to point out the harbor; the land on the west side of the bay is high, the eastern side rather low, and the head of the bay is high and woody: in sailing into this place, there is little danger, the passage is to the westward of Saddle Island, only taking care to give a berth to the rock, which at a quarter ebb is above water, and lies off the western point of the main land, and also not to come too near to the inner part of Saddle Island, as a shoal stretches off it about the length of a cable. The western bay lies in to the northward of the western point, and has very good anchorage with westerly winds, but somewhat open to the eastward; there is no passage except for boats, to the eastward of Saddle Island; vessels coming from the eastward, must be careful to go clear of a small rock which lies about a mile from the two black rocky islets, which are at the east end of Saddle Island, and near a mile off the shore: the high round hill at the west side of the bay on with the saddle of Saddle Island, will lead you directly upon the rock, and the sea commonly breaks over it.

BLACK BAY lies to the W. S. Westward, distant 10 miles from Saddle Island; the anchorage here is tolerably good, but too much exposed to the S. E. winds. S. W. by S. from Ship Head, which is the western point of entrance to Black Bay, distant  $1\frac{1}{2}$  mile, is St. Modeste Island; it is small and low, but vessels frequently run in to a place within the island, called St. Modeste Bay, and anchor, but this, though occasionally used, cannot be recommended.

WOLF'S COVE, OR L'ANCE DE LOUP.—S. W. by W. from St. Modeste Island, distant  $4\frac{1}{2}$  miles, begin some remarkable red cliffs, which continue full 2 miles, and form the eastern point of Wolf's Cove; this is high table land, terminating with steep cliffs towards the sea. The entrance to Wolf's Cove is about 2 miles wide, the two points of the cove bearing from each other S. W. and N. E.; there is good anchorage at the head of this cove in 12 fathoms water, and also on the western side, in Schooner's Cove, where small vessels may lie safely in 7 fathoms, on a bottom of sand.

FORTEAU BAY lies 5 or 6 miles to the westward of Wolf's Cove, the shore between them is rather low; Forteau Bay is about 3 miles broad, and runs in nearly the same distance; on the western side, near the head of the bay, is good riding, in from 10 to 16 fathoms, but exposed to the southward. Off the east point of the bay is a rock, which appears like a shallop under sail; and on the western side of the bay is a fall of water, which, on coming from the eastward will easily be perceptible. West 7 miles from the western point of Forteau Bay is Island au Bois, and 2 miles westward of that is Green Island; the former of these is of moderate height, and has a good passage round it; it lies in front of Blanc Sablon Bay, where a vessel may occasionally find anchorage: but the ground is loose sand, and will not hold. The channel between Bois and Green Islands is good, and has 11 fathoms water in it; there is a cove on the eastern side of Green Island, where a fishery is sometimes carried on; there is also a passage between Green Island and the main, which leads to Brador Bay and Harbor; but you should be careful to give Grand Point a good berth in passing, as some sunken rocks lie directly off the point.

LABRADOR HARBOR.—From Green Island to Island of Ledges, the course is nearly north, distant 5 miles; the Harbor of Brador may readily be known by the land between it and Point Belle's Amour: the point itself is low and green, but about a mile inland, it rises up to high table land; and further inland are three remarkable hills, called our Lady's Bubbies; these are round and may be seen all along the coast, lying to the N. Eastward about 2 leagues distant from the Island of Ledges; this island is of moderate height, having a great many islets and rocks about it; on its eastern side is Blubber Cove, where small vessels may anchor in 2 and  $2\frac{1}{2}$  fathoms. There are two passages into Brador Harbor, but that to the northward of the Island of Ledges is by no means safe, on account of the number of rocks scattered about it. To enter the eastern passage, you must take care to avoid a small rock, which lies about S. W. by W. a quarter of a mile from the low point

on the main, where the houses stand; on this rock the sea commonly breaks and shows itself at a quarter ebb: on the eastern side, within this rock, is Shallop Cove; from the point above the cove, a shoal stretches off about a cable's length from the shore, and continues nearly the same distance, quite to the head of the harbor.

**ESQUIMAUX RIVER AND BAY.**—From *Point Belle's Amour* to the outer *Esquimaux Island*, the course and distance is W. by S. 10 or 11 miles; N. N. E. about 4 miles from which there is good anchorage, between two high islands, for small vessels; and within these lies the River Esquimaux. From hence to Dog Island, is a chain or cluster of small islands and rocks, the easternmost of which are commonly called the Esquimaux Islands; the middle ones, the Old Fort Islands; and the western ones, the Dog Islands; within these, and on the main land, are various good bays and places of shelter; but the entrances to them are so intricate, narrow, and dangerous, that no person, unless well acquainted, should attempt to navigate a vessel through them. These islands extend from the outer Esquimaux Island nearly 4 leagues, and some of them are full 4 miles from the land.

**LITTLE BAY.**—W. N. W. about 5 miles from the Dog Islands, is Little Bay, in which small vessels may find very good anchorage; nearly a mile to the westward of Little Bay, is the Bay D'Omar; this bay runs up N. E. by N. nearly 3 miles, the land on both sides being very high, but the western shore is the highest; its width is about 2 cables' lengths, but off the coves it is broader; outside of the eastern point of the bay, are 2 small islets, a cable's length from land. This bay has good anchorage, the best place being 2 miles within the entrance, opposite a woody cove on the west side, where you will lie secure in 14 and 16 fathoms water, with abundance of wood and water. On the west side also, a mile within the entrance, is a remarkable green cove, but this becomes shoal a short distance from the shore. From the entrance of the Bay D'Omar to Bowl Island, the course and distance is W. S. W.  $\frac{1}{2}$  S. 2 miles. This is a remarkable round island, of moderate height, and lies a mile from the main land; about it, and between Bowl Island and Shecatia, are a great number of islets and rocks, the coast being thereby rendered dangerous to navigate unless you have a fresh wind; the rocks will then show themselves by the sea breaking over them.

From Bowl Island to Shecatia, the course is W. by N. about two leagues; and 3 miles E. N. E. from Shecatia Island is the Bay of Petit Pene, running in N. N. E. about 5 miles; but this place is scarcely fit for vessels to go into, because the water is too deep, the entrance too narrow, the ground bad, and the whole bay open to the southerly winds.

**MISTANOGUE BAY** lies about 2 miles to the westward of Petit Pene; there is a good channel between the Island Shecatia and the main, and many seals are frequently caught there. Before the entrance to the Bay of Mistanogue, lies an island of the same name; here, between the island and the river, the anchorage is good, with from 15 to 20 fathoms water; the ground holds well, and there is room enough to moor. To go into this road, you should pass round the western end of the island, which is bold to, or else round its eastern end, and between it and Shecatia; but this latter passage is fit only for small vessels. In the Bay of Mistanogue the anchorage is good up to the very head, the channel is both long and narrow; the island and the main land, at the entrance, has a barren appearance, and is high, but both wood and water may be obtained in the bay.

**SHECATICA BAY** runs close in to the westward of Mistanogue Island, and extends many miles up the country, its course bending to the northward, and having various branches and turnings, with numerous islands, capable of giving shelter to vessels of all descriptions; but these are little frequented, and consequently not well known, besides the passages are too narrow for strangers to attempt the navigation of.

**SHAG ISLAND AND ROCKS.**—Nearly S. W. by W. distant above 2 leagues from the Island of Mistanogue, is the Shag Island and Rocks; the island is small, high, and has a round peaked hill in the middle; to the eastward of it are a number of rocks above water, the outermost lying E. S. E.  $\frac{1}{2}$  E. one mile and one-third from the island.

**CUMBERLAND HARBOR** lies N. N. E.  $\frac{3}{4}$  N. about three miles from the outer Shag Rocks; and may readily be distinguished by a remarkable high hill on the main land, appearing like a castle at its summit, being a steep cliff, looking like walls; this hill lies N. by W. nearly  $3\frac{1}{2}$  leagues from the entrance to the harbor. The outer islands which form the harbor, are called the Duke and Cumberland Islands; these are moderately high, the eastern one making in two round hills. To enter this harbor there is no danger but what appears above water, except one small rock, which lies south about half a mile from the western head; the entrance to the harbor is a quarter of a mile wide, and the inlet half a mile long; from the eastern head you must steer for the inner point on the western side, and after you reach that point, haul over to the eastward, and anchor in from 20 to 7 fathoms, excellent ground, and room enough for any ships; this is by far the most commodious and best harbor on the coast, and also the easiest of access; fresh water is plentiful, but for wood you must go to Shecatia Bay.

**SANDY ISLAND BAY.**—N. W. by N. about  $2\frac{1}{2}$  miles from Shag Island, is the bay and harbor of Sandy Island; to sail into this, you should pass to the eastward of the Murr Rocks, keeping the starboard point of the bay on board, you will then perceive a small rock

above water to on either side danger; here ground and sa

**PORT AN**

above water to the N. N. Westward; this lies off the entrance of the harbor; you may pass on either side of this rock, and then steer in N. N. E.  $\frac{1}{2}$  N. for the harbor; there is no other danger; here you will have room enough to moor in 5 and 6 fathoms water, with good ground and safe riding; there is no wood here, but water in plenty.

**PORT AND RIVER ST. AUGUSTINE.**—The entrance to the Port and River St. Augustine, is between Shag Island and St. Augustine Square; the West Island, which is moderately high, the western part being the highest, and quite low in the middle, but not easily to be distinguished at a distance, on account of the islands within it being much higher; a-third of a mile to the eastward of this is the East Island, somewhat larger, not quite so high, but even at the summit; between these islands, after passing the Chain and Square Islands, is a safe passage for small vessels to enter this port; and they can anchor between the West and Round Islands; or run to the northward, past Round Island, and stop in 6 or 7 fathoms, with plenty of room to moor S. W. by W. about half a league from west part of St. Augustine's Island, is a string of small islands, commonly called St. Augustine's Chain, the outermost of which is a remarkable smooth round rock, and to the westward of this one quarter of a mile, are several rocks under water, over which the sea is constantly breaking, some of these are visible at one-third ebb: half a mile W. S. W. from these is a high black rock above water, and between these two is the best passage for large vessels into the Port of St. Augustine; you should steer from this black rock, towards a remarkable low point, which will bear N. N. E.  $\frac{3}{4}$  N. until you open the port; then haul in and anchor as before directed; or you may steer up the passage between this point and Round Island, and anchor.

**THE RIVER ST. AUGUSTINE** is  $4\frac{1}{2}$  leagues from the entrance of the port, and lies to the N. N. W. having several islands lying in the passage; but the river is shallow, and only fit for boats to enter; there is a sandy bar across, which dries at low water. Two miles up, it divides into two branches, both running to the N. N. Westward for 14 or 15 leagues; wood and water are plentiful.

From St. Augustine's Chain to the bluff head of Great Mecatina Island, the course and distance is W. S. W. 8 leagues and one mile: the coast is lined with islands, within and about which are many harbors; the main land in sailing along this part, from Shecatia to Ha Ha Bay, cannot be seen, and the adjacent islands are so high, so numerous, and so near each other, that although there are navigable passages between them, yet you cannot discover their entrances, nor perceive them to be islands, until you get near and entangled among them.

**EAGLE HARBOR.**—This lies at the western end of Long Island, to the eastward of Ha Ha Bay, and is formed by a cluster of islands, being capable of holding a great number of vessels in security; in it are from 20 to 10 fathoms water, the ground holding well. In order to find out this anchorage, it will be advisable to make for the Great Island of Mecatina, from whence you should shape your course for the Fox Islands, which lie S. S. E.  $\frac{1}{4}$  S. one large mile from the westernmost entrance of the harbor; it may also be known by a deep bay to the eastward, without any islands in it, while to the westward there are a great many. But if you intend sailing in to the eastward, you should steer from the Fox Islands N. N. E.  $\frac{1}{4}$  E.  $2\frac{1}{2}$  miles, into the bay, when you will observe to the N. N. Westward of you, a remarkable high island, round which, to the northward, is a safe passage of three fathoms into the harbor, where you will ride in safety, well sheltered from all winds. In the western passage to this harbor, there are  $2\frac{1}{2}$  fathoms; this is, however, a narrow channel, fit only for small vessels, and running in between many small islands.

This part of the coast is very dangerous for any vessels to fall in with, in dark and foggy weather, on account of the infinite number of small low islets and rocks about it, many of the latter being under water, and to avoid which no practical mark can be given; it will, therefore, always be advisable and prudent to keep off the coast to a considerable distance.

**HA HA BAY** lies on the main, to the westward of Eagle Harbor, and has several small islands at its entrance, forming separate entrances; the best of these is that which lies between Seal Point and Round Island, leaving all the islands on the starboard side; this is a wide and safe passage, having no danger but what is visible. Ha Ha Bay runs in to the northward about 7 miles, and has many islands at its head, on the starboard side; within these islands, to the eastward, are numerous anchorages, with from 9 to 20 fathoms water; vessels may also occasionally anchor all along the eastern side of the bay in 12 and 14 fathoms, muddy bottom, but on the western side the water is too deep. N. N. W.  $\frac{1}{2}$  N. about two miles from the entrance on the west side, is a high bluff head; round this head N. W. by W. half a mile, is a small, but safe harbor for small vessels, in which you will have 12 fathoms, good ground; this harbor is formed by an island, on either side of which there is a narrow but safe passage.

**LITTLE FISH HARBOR** is to the southward of Ha Ha Bay, and runs in westerly; it is small, and formed by an island covered with wood; you may sail in on either side of the island; but the northern passage is considered to be the better of the two; in the bay to the southward of the island, is a ledge of rocks, partly visible at all times. S. E. by E. from the Woody Island lies a rock, on which are only two fathoms at low water. You may anchor in the harbor at the back of this island in 7 or 8 fathoms, and have plenty of room to

moor. Off the northern point of the entrance to this harbor, called Seal Point, are two little islands, and a small sandy cove, where a seal fishery is carried on.

Between Fish Harbor and Ha Ha Bay there is a very remarkable round high hill, making in a peak, which may serve as a landmark to point out either of these places of anchorage.

GREAT MECATINA ISLAND lies 3 miles off the main land, it is  $3\frac{1}{2}$  miles long, and about 3 miles broad, being the most remarkable land at this part of the coast; it rises up in the middle, which is much higher than either of the ends; its E. N. E. point makes like a bluff head, and round this head to the northward, within a cluster of small islands, there is a cove running in about one mile and a half; in this cove vessels can safely anchor, in from 14 to 20 fathoms, good ground, and may obtain both wood and water.

MECATINA HARBOR.—This harbor is formed behind Mecatina Island on the main; it is safe but small, yet will admit vessels of burthen, there being not less than 3 fathoms at low water, in either passage to it; but they must moor head and stern, there being no room to moor otherwise. To sail in through the western passage there is no danger, but to sail in through the eastern channel you must observe the following directions. From the eastern point of Mecatina Island steer North towards the main land, keep that close on board until you get the western point of the island on with the point of Dead Cove; this is a small cove on the main, which lies open to the eastward; the land which forms it is very low, with some brushwood upon it; then sail on in that direction until you get above a stony point, which is to the north side of the said cove; or until you bring the north point of Gull Island, which is a small island lying E. by N. distant one mile from Mecatina Island, on with the E. N. E. point of Mecatina Island, you will then be within a spit of rocks which stretches off the island, and must haul over for Mecatina island, in order to avoid a ledge which runs off from the point of Dead Cove; and when you bring the western passage open, you may anchor in 6 or 7 fathoms water. Vessels coming from the eastward, and bound for the Harbor of Mecatina, in passing to the northward of Gull Island, should be careful either to keep Gull Island or the main land close on board, in order to avoid a sunken rock that lies near half way between Gull Island and the main, on one part of which there is not above 3 feet water. The highest part of the land between Grand Point and Ha Ha Bay is directly over the Harbor of Mecatina.

THE GRAND POINT OF MECATINA is the extremity of a promontory, which runs out from the main land, it is low at the point, but rises inland, sloping gradually up until it becomes of considerable height; it may easily be recognized by the adjacent islands and rocks which are about it; the nearest is a small low rock, not far from the point; two of these islands are much larger, and rise much higher than the others; and the outermost are small, low, rocky islands, lying  $2\frac{1}{2}$  miles off the point, S. E. by E. five miles and a half from the Grand Point are the Murr Islands and Rocks, and these are the most southerly islands on all the coast. The northernmost Murr Island bears from the other north a little westerly, distant one mile; they are remarkable objects, being two barren rocks, of moderate height and steep all round. About half a mile E. S. E. from the southern Murr Island, are the two Murr Rocks, both appearing above water, and E.  $\frac{1}{2}$  S. from the same island lies a ledge of rocks, under water, on which the sea generally breaks.

BAY DE PORTAGE.—N. W. by N. from the Murr Islands, distant two leagues, is the Bay de Portage, the land over which makes in a valley, each side being high; at its entrance lies an island of moderate height, which forms the harbor; you may enter on either side of this island, but the eastern passage is fit only for small vessels, there being only 2 fathoms, in some parts of it, at low water. The western channel is sufficiently large and safe for any vessel to turn, there being from 6 to 8 fathoms in it; but they must be careful to avoid two sunken rocks, on which are only  $2\frac{1}{2}$  fathoms at low water. The northernmost of these lies from Mutton Island S. by W. distant one mile and a half; the southernmost rock bears from the Seal Rocks N. E.  $\frac{3}{4}$  N. distant half a mile; they are both bold to, and vessels may borrow within a cable's length of Mutton Island or the Seal Rocks.

**COURSES and DISTANCES from Island to Island along the Coast, between Grand Point and Shecataga, which courses will carry you outside of all the other Islands and Rocks.**

The *Great Island of Mecatina* being the most remarkable point of land about this part of the coast, from whence vessels frequently take their departure, and shape their courses to other places, the following table may be useful in showing the bearings and distances of the most remarkable points, rocks, headlands and harbors from it, allowing the variation to be 2 points westerly, which is sufficiently near the truth for any purpose of navigation.

To the westward of the Grand Point of Mecatina, until you reach the Island of St. Genevieve, which is the easternmost of the Esquimaux Islands, there appears to have been no survey yet made of the coast; the land from the Grand Point of Mecatina runs about W. S. W. 15 leagues to Cape Whittle, and is skirted by many islands and rocks, some of which lie 7 miles off shore; therefore, in coasting along, the land must always have a wide berth given to it; vessels entering the Strait of Belle Isle, and being abreast of Chatmaux Point, distant 7 or 8 miles, or having brought the Red Cliffs to bear west, distant 5 or 6 miles, may steer a W. S. W.  $\frac{1}{2}$  W. course, and they will go clear of all dangers; when having passed the Southmaker's ledge; which is the outermost reef, distant 7 miles from Cape Whittle, and brought that cape to bear N. by W. or North, distant 8 or more miles, they may steer W. by N. past Wolf Island, until they see Mount Joli, a high mountain on the main land; bring that to bear N. W. by N. and a N. W.  $\frac{1}{2}$  W. course will take them to St. Genevieve Island.

REMARKS.—All the islands along the coast of Labrador have a barren appearance, the outer ones being, for the most part, small low rocky islets, and the inner ones large and high, covered with a sort of green moss. There is no wood to be obtained, except at those places where we have mentioned.

TIDES.—The course and flowing of the tides along the whole coast are irregular and uncertain, depending much upon the prevailing winds; and when the weather has been settled, it was high water at Shecatia, full and change, about 11 o'clock, and at Mecatina at half after two. The rise of the tides being about 7 feet.

At Red Bay, the tide flows full and change at half-past nine o'clock; at Forteau Bay at eleven; and at Labrador at half after 11; and at all these places, spring tides rise 7 feet, neaps 4 feet.

## GENERAL DESCRIPTION OF THE ISLAND AND \*BANKS OF NEWFOUNDLAND.

THE ISLAND OF NEWFOUNDLAND is situated on the eastern side, and directly in front of the Gulf and River St. Lawrence, its northern part being separated from the coast of Labrador by the Straits of Belle Isle; and its south-western extremity from Breton Island and Nova Scotia, by the great entrance into the Gulf. Its length from Cape Race to Cape Norman, is nearly five degrees and a half, and its breadth, from Cape Spear to Cape Anguille, about 5 degrees 13 miles; being very narrow at the northward, but becoming wide as you approach southerly; its extremes lie between the latitudes of  $46^{\circ} 40'$  and  $51^{\circ} 40'$ , and the longitudes of  $52^{\circ} 25'$  and  $59^{\circ} 23'$  west. The whole circuit of the island is indented with inlets and bays, many of which are extensive, commodious and well sheltered, where vessels ride in perfect security; into these bays and harbors numerous rivulets continually run, which, besides the fine purity of their water, afford abundance of trout and other fish.—Most of the harbors have complete anchorages, with clear and good channels into them, so that they can be navigated at all times without the assistance of a pilot; they are frequently situated so near to one another, that in many places they form a succession of harbors, but they are not all inhabited; the towns and villages are in general to be found in the larger branches only, where the situation and soil are most convenient; the inhabitants therefore are not numerous, and the settlements but small.

The *Great Bank of Newfoundland* is to the eastward of the island, and extends from about the latitude of  $42^{\circ}$  North to  $50^{\circ}$  or upwards, but recent observations seem to prove that its southern extent does not exceed the parallel of  $42^{\circ} 50'$  N.; its form, like those of the other banks, is irregular and not easily ascertained or defined; but about the latitude of  $45^{\circ}$ , its breadth, including the Jaquet and Whale Banks, is nearly 4 degrees; to the northward and southward it narrows almost to a point, and seems insensibly to drop into fathomless water. The Jaquet and Whale Banks may be fairly considered parts of the Great Bank, being only divided from it by channels of somewhat deeper water. The Jaquet lies to the eastward, and has 55 fathoms upon it; its edge is very steep; between it and the edge of the Great Bank are 112, 120, and 160 fathoms. The mariner, when entering upon the Great Bank, will change his soundings from 60 to 30, 37, 44, 45, and 60 fathoms; and as he advances towards the Whale Banks, he will have 55 and 60 fathoms; between the Great Bank and the Whale Bank are 72, 75, and 80 fathoms, and upon the Whale Bank 50, 45, 55, and 60 fathoms, being over which, you again drop into 100 and 200 fathoms, no ground. On the western side of the Great Bank, and to the southward of the Island of Newfoundland and Nova Scotia, a chain of banks extends almost two degrees from the land; these are called Green Bank, Banquereau, Sable Island Bank, &c.; all these have soundings over them of various depths, from 20 to 70 fathoms, admirably situated, in dark weather, to warn the mariner of his approach towards the land.

The Outer or False Bank, called also the Flemish Cap. This is a patch of rising ground lying two degrees to the eastward of the edge of the Great Bank, in latitude  $46^{\circ} 50'$ , and longitude  $45^{\circ}$ ; its length is supposed to be about 90 miles, and breadth 50 miles; on it are from 100 to 158 fathoms; between it and the eastern edge of the Great Bank is much deeper water, the bottom being very fine sand and ooze, which will hardly stick to the lead; as you enter upon the Great Bank you will have fine whitish sand, speckled black. Should you make the bank in this latitude, between  $46^{\circ}$  and  $47^{\circ}$ , you must be very careful to avoid being drifted upon the Cape Race or Virgin Rocks. These banks are frequently enveloped in most horrid fogs, which, from the middle of spring to December, have been known to last 8 and 10 days successively: at such times they are often so thick that you will not be able to see any object at ten fathoms distance; a continual drizzling rain is dropping from your sails and rigging, a general calm prevails, and sometimes attended with a considerable swell of the sea, so that you are constantly in fear of running foul of some vessel, or being drifted by the currents upon some danger, which, from a total inability of discovering, you will have great difficulty to avoid. Added to this, the currents which surround the Island of Newfoundland are frequently so violent and so irregular, sometimes driving towards the shores, and sometimes toward the sea, that the greatest caution will always be found necessary, while the known current coming from the northern regions, sweeps along the shores of Labrador, and in the spring detaches immense icebergs, which float to the southward, and become exceedingly dangerous, especially in foggy weather. Some of these masses will frequently be grounded in 40 and 50 fathoms water, and others will be met with further

out to seaward, at the distance of 125 or 130 leagues from the land; fortunately these formidable objects may generally be discovered, even in dark weather, by a white and bright appearance on the sky above them, and also by the roar of the waters breaking against them; they also may be apprehended by the intense coldness they diffuse to a great distance around them; they continue and are usually met with as late as June, July and August. Your approach towards the banks may be known by the numerous sea fowls which will attend you, as roches, malinauks and divers; these latter are seldom found more than 30 leagues off the banks, but malinauks and others are occasionally seen all across the Atlantic, but in the vicinity of the banks they become numerous.

THE VIRGIN or CAPE RACE ROCKS are extremely dangerous; they extend in an irregular chain or cluster S. W. by W. and N. E. by E. 800 yards; the breadth varying from 200 to 300 yards; the least water on a white rock is  $4\frac{1}{2}$  fathoms, with from 5 to  $6\frac{1}{2}$  fathoms, about one hundred yards all around it—the bottom distinctly visible. Towards the extremities of the shoal, the soundings are from 7 to 9 fathoms on detached rocks, with deep water between them, the current setting a mile an hour to the W. S. W. with a confused cross swell to the S. E.—South, S. W.—West, and W. N. W. of the shoal, the water deepens gradually to 30 fathoms, half a mile distant, to the N. W. North, and N. E. one third of a mile, and to E. N. E.—East, and E. S. E. a mile.

The bank upon which the shoal is situated, extends E. by N. and W. by S. 4 miles and a quarter; and  $2\frac{3}{4}$  miles across its broadest part, with regular soundings of from 28 to 30 fathoms, until they suddenly deepen on its outer edge to 39 and 43 fathoms.

The bottom is seen, and large patches of sea-weed on the sand around them. Over them the sea breaks so violent, as to make it unsafe to pass in a gale. Lat.  $46^{\circ} 26' 15'' 3$  N. Long.  $50^{\circ} 56' 35''$  W.

## EAST COAST OF NEWFOUNDLAND,

### FROM CAPE\* RACE TO ST. JOHN'S HARBOR.

*Variation 2 Points West.*

CAPE RACE, is the S. E. point of Newfoundland, and lies in  $46^{\circ} 39' 44''$  North latitude, and in  $52^{\circ} 59'$  longitude West from Greenwich; it is table land, moderately high; near it is a black rock, and several smaller ones around it.

E. S. E. from Cape Race is a fishing bank, over which are from 17 to 25 fathoms water; it is named the New Bank, and is about 5 miles long and 2 miles broad.

From Cape Race to Cape Ballard the course is N. E. by E. distance  $8\frac{1}{2}$  miles. About one mile southward of Cape Ballard is Chain Cove Head, appearing high and dark; between the points is a Cove, and to the westward of Chain Cove Head is Chain Cove, having a black rock above water lying before it.

RENEWES.—About three quarters of a league N. E. from Cape Ballard lie some small rocks, off Small Point, and  $3\frac{1}{2}$  miles beyond Small Point are the Renowes Rocks; they are moderately high and bold to, being distant from the land about one mile;  $1\frac{1}{2}$  mile to the northward of these lies Renowes Island, situated near the main land; and about one mile to the southward of the entrance to Renowes Harbor, which is but an indifferent place of shelter, with a depth of water of 15 feet; to sail into it you must keep the north shore on board, for several rocks lie scattered about its entrance, and S. E. winds commonly send in a very rough sea.

FERMOSE.—Near 3 miles further north is Fermose or Fermowes Harbor, and between them is Bears Cove, off which a sunken rock lies a cable's length from the shore. There is no danger in sailing into Fermose Harbor, though the entrance is narrow; just within it, on the northern side, is a small Cove, where a fishery is carried on, but the anchorage is indifferent; further in is Admiral's Cove, where merchant vessels ride land-locked in 7 and 8 fathoms; and one mile within that is Vice Admiral's Cove; large ships anchor on its south side in 12 and 15 fathoms, muddy ground, and very convenient for both wood and water. On the same side, further in, is Sheeps Head Cove, directly off which, near the middle of the channel, is a bank with only 9 feet, constituting the only known danger within this harbor.

From Fermowes Harbor, about one mile N. E. by E. is Bald Head, N. by E. from which one mile further is Black Head.

AQUAFORT.—From Black Head to the entrance of Aquafort Harbor the course is N. by W. distant one mile, at the mouth of which is a rock above water; to the northward of this rock is the passage in, having 15 fathoms water; the harbor runs in W. N. W. about 3 miles, becoming narrow as you advance; here you have 4 fathoms water; within the narrows,

\* CAPE RACE ROCKS.—A large plan, from actual survey, by direction of Admiral Sir CHARLES COLE, is published on the new Chart of the Western Ocean, by E. & G. W. BLUNT.

on the northern shore, is a little Cove, where vessels may heave down, the shore being steep. To sail up, give the stony beach on the north shore a berth, it being shoal, except at the point of the narrows, where it is bold to.

**FERRYLAND HARBOR**, is to the northward, and its entrance is between Ferryland Head and Bois Island, being little more than half a cable's length wide. Ferryland Head has 2 rocks near it, called the Hare's Ears; when you have passed these and are within Bois Island, it becomes wider, having good anchorage with 8 and 10 fathoms, but north east winds send in a heavy sea over the lower rocks, which run from Bois Island to the main.

From Bois Island to Goose Island the course is N. N. E.  $\frac{3}{4}$  E. distant half a mile, and from Goose to Stone Island the course is N. N. E.  $\frac{1}{2}$  N. distant half a mile.

**CAPLIN BAY**.—Two and a half miles from Goose Island is Caplin Bay running in N. W. by N.; there is a passage into it, on either side of Goose Island; to the northward of Goose, and between it and Stone Island there is no danger, the islands being bold to; but in passing between it and the Island of Bois take care to keep the point of Ferryland Head open to the eastward of Bois, by which means you will avoid a sunken rock having only 2 fathoms water over it; this rock lies nearly midway between Goose Island and Cold East Point, and having passed this rock no other danger will be found in sailing up the Bay to the best anchorage, which is abreast of a Cove on the larboard shore, and half a mile within Scogin's Head, with 16 fathom's water.

From Ferryland Head to Cape Broyle, the course is nearly N. N. E. distant 2 $\frac{3}{4}$  miles. Cape Broyle is high land, making somewhat in the form of a saddle. South of the north part of the Cape  $\frac{3}{4}$  of a mile, lies the Old Harry Rock, over which are only 3 fathoms water, though between the main and it are 20 fathoms. E. N. E. of the Cape, distant  $\frac{3}{4}$  of a mile, are the Horse Rocks, having from 7 to 14 fathoms over them: the mark for these rocks is a white house on Ferryland Downs, open with Stone Islands; and the head of Cape Broyle Harbor open, will lead directly upon them. In stormy weather the sea breaks very high over them.

**CAPE BROYLE HARBOR** runs in about 4 miles, between Cape Broyle and Brigs Head, their distance from each other being 1 $\frac{1}{2}$  mile. Within the entrance on the north side, is Admiral's Cove, where you may anchor in 12 fathoms water, good ground, but exposed to the S. E. The best anchorage will be found above the Narrows, in 7 fathoms; the only danger in the way is the Saturday's Ledge, which lies about 1 $\frac{1}{2}$  cable's length outside of the Narrows, on the north shore: bring the saddle of Briggs Head open of the point of Admiral's Cove, and you will clear it; and after you get beyond the Narrows anchor in 7 fathoms, good ground, very convenient for both wood and water.

**BRIGUS**.—This is a small cove, or harbor, a little to the northward of Briggs Head; but it is only fit for boats.

Four and a half miles from Cape Broyle is Cape Neddick, a kind of table land moderately elevated, and steep to. From Cape Neddick to Baline Head is 1 $\frac{1}{2}$  mile; one quarter of a mile to the northward of this is a Baline Cove, fit only for boats. The outer part of Great Island is about 2 $\frac{1}{2}$  miles N. E. by E.  $\frac{1}{2}$  E. from Cape Neddick; and from Baline Head to Spear Island, the course is N. N. E.  $\frac{1}{2}$  E. distant one mile. Within this island is a fishery, but the anchorage is unsafe, and the bottom rocky. One mile to the northward is Toad's Cove, fit only for boats; half a mile from which is Tinker's Point, the southern boundary of Momables Bay; this place is nearly one mile deep; it is open, and its northern point forms the southern part of Witless Bay; about three quarters of a mile from which is Green Island; and the same distance to the northward of Green Island, is Gull Island, about a mile in length, and a quarter of a mile in breadth, the land appearing high.

**WITLESS BAY** extends inwards full two miles from Gull Island, but lies open to the sea; the ground is tolerably good, and the depth of water moderate; but half way up is a ledge of rocks off the northern shore, part of which are seen at half tide.

**BAY OF BULLS**.—One mile and a quarter to the northward of Gull Island, is the southern point of the Bay of Bulls, and from hence to the northern point, called Bull Head, the course is E. N. E.  $\frac{1}{2}$  E. distant one mile and a quarter; between these points the Bay runs up N. W. by W. nearly two miles, and then N. W. by N. one mile further to the river head. Within this bay the riding is good, in from 20 to 16 fathoms; and after you have passed Bread and Cheese Point there is a cove; off this latter point lies a sunken rock, at the distance of about half a cable's length, having passed which, the bay is free from danger, and the shores bold; run up and anchor over against John Clay's Hill, bringing it to bear N. E. by N. having 12, 13, and 14 fathoms; the merchant vessels run further in to 10 and 7 fathoms.

From Cape Broyle to the Bay of Bulls, the course is N. E. by N. distance 4 $\frac{1}{2}$  leagues. From Bull's Head to the south point of Little or Petty Harbor, from which a reef of rocks stretches out about a quarter of a mile, the course is N. E. distance 8 $\frac{1}{2}$  miles. The south point of Petty Harbor is distant from the north point 2 $\frac{1}{2}$  miles, between which lies the bay, running in two miles; at the bottom of this is a cove and fishery. About midway between the Bay of Bulls and Little Bay, is a cavern, having an opening at its summit, through which, whenever the sea runs high, the water spouts through, forming a remark-

able appearance.

From the miles; it has and lies in the ward, upon Between the Bay, and lies between

able appearance, which may be seen far off, it is therefore significantly enough named the Spout.

From the north, or Lady Point of Little Harbor, Cape Spear bears N. E. distant 2½ miles; it has a low and ragged appearance, and is the easternmost part of Newfoundland, and lies in latitude 47° 30' 53" N. and in longitude 52° 33' 27" W. Vessels from the eastward, upon getting into soundings, and bound for St. John's, generally steer for this point. Between the Cape and the entrance to St. John's, are three bays; the first is called Cape Bay, and lies between Cape Spear and Black Head; the second is called Deadman's Bay, and lies between Black head and Small point; and the third is called Freshwater Bay, and lies between Small Point and Fort Amherst.

ST. JOHN'S HARBOR is one of the principal places in Newfoundland, being the seat of Government: and although its entrance is narrow, its harbor is excellent, and its situation readily known, both by the Blockhouse built on Signal Hill, at the north side, and Fort Amherst on its south head, or point of entrance. The channel, from point to point, is only 360 fathoms wide; but it gets wider just within the points than between them, decreasing again as you approach the Chain Rock, for from the latter to the Pancake Rock, the distance is only 95 fathoms, these are rocks, both being above water, and steep to; Chain is the northern rock, and Pancake Rock lies on the south side of the channel.

In approaching the Harbor of St. John's with a large ship, care must be taken to avoid the Vestal Rock, which lies about 50 fathoms off the southern, or Fort Amherst Point; over this rock are 25 feet water; the marks for it are Fort William, or the Old Garrison, just open of the south head; and the outer Wash Ball Rock open to the eastward of the Cuckold's Head; these latter rocks lie close to the northern point of the harbor, and are always above water, being steep to, and therefore not dangerous. The course in is N. W. by W. the shores continuing bold until you get near the Pancake, then give the south side a small berth, continue the same course, or rather more inclined to the westward, keeping Fort Amherst Flagstaff open to the northward of Frederick's Battery Flagstaff; you will by these means avoid the Prosser, a rock on the larboard side, running off the end of another rock, formed like a saddle, with 18 feet water in the hollow, and only 5 feet on its outside; yet it is steep to, having not less than 5 fathoms close to it; so soon as you are within, and have passed the Prosser Rocks, you may steer up as you please, both shores being clear of dangers, and anchor in from 4 to 10 fathoms water, on a bottom of mud, and lying quite land-locked.

The winds from the S. W. to the southward, as far as N. E. by E. blow in, all other directions of the wind either baffle or blow out of the Narrows; with the latter winds you must warp in, for the convenience of doing which, rings are fixed in the rocks on each side: the anchorage within the Narrows has from 10 to 16 fathoms, and a little before you enter the Narrows there are 20 fathoms.

The tides rise 6, 7, and 8 feet, but very irregular, being much influenced by the winds; and the variation is about two points west.

#### FROM ST. JOHN'S HARBOR TO BACCALOU ISLAND.

We recommend the mariner to be careful, lest, if a stranger to the coast, he should mistake Kitty Vitty, a small place fit only for boats, lying about one mile to the northward of St. John's, for St. John's itself; at a distance it has the appearance of a good harbor; he will therefore observe, that at Kitty Vitty's south side is a round hill, shaped like a haystack, standing upon Cuckold's Head; while St. John's Harbor may be distinguished by Fort Amherst, which appears white; and by the flag-staves on the hill, over the north point of entrance; these will sufficiently denote the right entrance.

About one mile from Cuckold's Point, is a small point or projection of the land; and two miles further is Sugar Loaf Point, tapering upward, and much resembling a sugar loaf. One league further is Red Head; between Sugar Loaf Point and which is Logy Bay.

TORBAY.—One mile and a half from Red Head is the south point of Torbay, which is somewhat lower than the others. From this point to Green Cove, the customary place where vessels anchor, the course is W. N. W. about two miles, where you may ride in 14 and 12 fathoms, but it is much exposed to seaward. This bay is large, being full a league in extent; from off its northern point is a flat rock, where the sea breaks; a heavy swell sets from the eastward into the bay, so that it is not a good place to lie in.

From Flat Rock Point, which is low dark land, the coast runs northerly to Red Head, a distance of two miles; and from thence to Black Head, N. E. by E. two miles more; the latter bearing north, distant 6½ miles from Torbay South Point.

CAPE ST. FRANCIS.—From Black Head to Cape St. Francis the course is N. N. W. distant one league. Cape St. Francis has a white appearance, and is itself low, but above it the land rises high. A little south of the Cape is Shoe Cove, a place used in bad weather for splitting and salting fish. Off the Cove there is good fishing, and with northerly, westerly, and southerly winds you will lie safe within the cove.

About one mile and a half east of the Cape lie the Brandy Rocks, in a triangular position,

the outermost being distant from the Cape  $1\frac{1}{2}$  mile: the sea breaks over them: and there is a channel between them and the Cape, but too dangerous to be attempted; these rocks considerably add to the safety of Shoe Cove.

There is also another small Cove, fit for boats, to the northward of the Cape, which may be used with the wind off shore.

**CONCEPTION BAY.**—Cape St. Francis, which we have already described, is the southern point of Conception Bay. From Cape St. Francis to the southern point of Bacelon Island, which may be considered the other point or boundary of Conception Bay, the course and distance is N. N. E.  $\frac{1}{2}$  N.  $5\frac{1}{2}$  leagues; this is an extensive and deep Bay, running to the south-westward, and comprehending many lesser Bays and Inlets.

**BELLE ISLE.**—Four leagues S. W. by W. from Cape St. Francis is Belle Isle, in length  $5\frac{1}{2}$  miles, in breadth about two; this island is lofty, and its eastern side is near three miles off the main; there is on this side, a bench, to the southward of which is good anchorage, in 30 fathoms, sandy ground; and a league further, near the south part of the island, is also tolerable anchorage in from 15 to 30 fathoms. At the south end of the island is a small Cove, called Lance Cove, which fishing vessels sometimes resort to, and find good shelter for five or six vessels. One mile from the south part of the island lies a rock, over which are  $2\frac{1}{2}$  fathoms water. Two miles S. by W. from Lance Cove, lies a small low island, called Little Belle Isle, W. S. W. of which, distant  $1\frac{1}{2}$  mile, is Kelley's Island, of middling height, and about three quarters of a mile in length.

Within Belle Isle, on the main, is Portugal Cove, the anchorage within which is not considered safe. To the southward is Broad Cove, and at the bottom of the Bay is Hollyrood Harbor, in depth about  $3\frac{1}{2}$  miles; in a Cove, on the west side of which, is good anchorage in 8, 9, 10 or 12 fathoms water, and room enough to moor.

Following the coast, about  $1\frac{1}{2}$  mile from Hollyrood entrance, is Harbor Main, about  $1\frac{1}{2}$  mile in depth, and half a mile wide; it is an open place, but near the upper part you may anchor in from 7 to 10 fathoms water.

**SALMON COVE.**—One mile further is Salmon Cove, the entrance to which is a mile wide; the course in is W. S. W. about  $2\frac{1}{2}$  miles, it then divides into two branches, one to the westward about one mile, the other southward one mile and a half; in either of these branches the anchorage is good, but the southern river is considered the better one, there being no danger in entering. In the western branch a rock lies at a small distance from the starboard shore, having on either side a passage, but the southern one is the wider of the two.

**COLLIER'S BAY.**—To the northward near one league, lies Collier's Bay, running inward south-westerly full two leagues; one mile and a half from the entrance of which lies a sunken rock, nearly mid-channel, on both sides of which the channel is good; this rock is visible at three quarters ebb. Two and a half miles up the bay is good anchorage in 10 fathoms water, on the eastern side, and opposite a small Cove; into this Cove vessels may go, and ride in 3 and 4 fathoms water. Higher up the Bay is another Cove, at the further distance of  $1\frac{1}{2}$  mile, but it is both foul and shallow. Near the head of the Bay the anchorage is good in 8, 9, and 10 fathoms.

**BRIGUS BAY** is two miles to the northward of Collier's Bay, and seldom frequented but by small vessels, it being open, and too far up Conception Bay: it runs in from Brigus Head about  $1\frac{1}{2}$  mile, and has anchorage in from 10 to 15 fathoms; or at the head of the Bay, behind a small island, on the south side, small craft may lie secure from all winds, with 3 and 4 fathoms water, and moor to the shores. The south point of Brigus Bay may be known by its peculiar ragged appearance.

**PORTGRAVE, or PORT DE GRAVE, BAY** lies to the northward of Brigus, and has within it Sheep's and Cupid's Coves; the latter is on the south side of the Bay, and is a good place for 2 or 3 ships to ride in, with 4, 5, and 6 fathoms water, almost land-locked, and having not above one point open; its north side is bold, and you may lie alongside the rocks, and take in your cargoes; the shore on the northern side is remarkably high, and called Spectacle Head. Sheep's, or Ship Cove, will accommodate small vessels in 4 and 5 fathoms water, mooring head and stern, having their S. W. anchor in 22 fathoms, about a cable and a quarter's length from the ship.

Portgrave is about three quarters of a mile to the westward of Ship Cove; the water within the islands is shallow, but without them the anchorage is 20 and 25 fathoms deep, where you will be quite exposed to south-easterly winds. Burnt Head is the south point of Portgrave Bay; from whence  $2\frac{1}{2}$  miles N. E.  $\frac{1}{4}$  N. lies Bay Roberts Point, the southern point of the entrance to Robert's Bay, which is  $1\frac{1}{2}$  mile broad, and runs in to the south-westward 5 miles. One mile above Bay Roberts Point is Blommedown Head, which is higher than any land near it; half a mile within this is a Cove.

**BAY ROBERT'S** has no invisible danger at its entrance; you may borrow on either side or go close to the island, which lies further in on your starboard side; having passed which, you may run on about a mile, and lie land-locked in 9 or 10 fathoms; between the island and main vessels can anchor, but the ground is foul and bad; and there are two sunken rocks, one being near the inner part of the island, the other above the island and near the main.

Two miles at Bay, on mud water lie near.

**SPANIAR** Bay is deep at nearly all over.

Two league tant from Cap ant's Cove, a you may sail in The ground w HARBOR.

Two miles behind which way of the ch

**GREEN** further is Gre Broad Cove, age in 15 and open to the e

Two miles above the island is excellent anchorage, in the N. W. arm or branch of the Bay, on muddy ground; give the south point a good berth in sailing in, as some rocks under water lie near it, and the starboard shore shoals near half a cable's length.

SPANIARDS BAY is divided from Bay Roberts by an isthmus, or neck of land; this Bay is deep and extensive, but open to the S. Easterly winds; there is anchorage within it, nearly all over, especially at its head, in 7 and 8 fathoms water.

Two leagues N. E. from Spaniard's Bay are the islands of Harbor Grace, they are distant from Cape St. Francis about 6 leagues, bearing E.  $\frac{1}{4}$  South. To the southward is Bryant's Cove, a good place for fish, but not for shipping; there is a rock midway of the entrance; you may sail in on either side of this rock, and find good anchorage in 4 and 5 fathoms water. The ground within the rock is clean.

HARBOR GRACE.—The entrance to the harbor is to the northward of the islands, for to the southward, and between them and the shore, the channel is narrow and the ground is foul; the course in will be nearly west: almost mid-channel is the Salvage Rock, no danger is outside of this rock; there is also another rock, called the Long Harry, lying near the north shore; both these rocks are above water, and always visible. When you are within the Salvage, go no nearer the west shore than just to open a passage on the west side of the Long Harry, the leading mark for sailing in being the high point of the main, called Mosquito Point, just open to the eastward of Long Harry Rock; this will carry you in with not less than 22 fathoms, quite up to the harbor, clear of all danger: but toward the eastern shore, you may stand over until you bring the Western Landmark on with the Cupola of the Chapel; you will then be up to the north side of the bar, and must take care not to open these marks, especially if the mark in the Cove at Ship's Head is open with the mark on the point of Admiral's Beach; but if you can bring the Western Landmark at the back of the Chapel on with the Cupola, before the mark at the Cove at Ship's Head comes on with the mark at the point of Admiral's Beach, then you will be in the narrows, and must not stand further over to the eastward than to bring those marks in one, and continue turning with these marks to the east and west, until you bring the Eastern Landmark at the back of the Chapel on with the Cupola, then you will be within the bar, and should stand well over to the eastward. About half way down this harbor a broad spit of sand runs off from the southern shore, extending full two thirds over towards the Chapel; this appears to be what Mr. Lane has called the bar, it has  $1\frac{1}{2}$ , 2, 3, and  $3\frac{1}{2}$  fathoms in some places over it; but there is a channel between it and the northern shore, with 4 and 5 fathoms water: to sail through which bring Otterbury Head on with the point of the beach at Ship's Head, this will also lead to the northward of the island of the Harbor Grace. A white rock on the beach at the west end of Father Ewer's House, near the Catholic Chapel, will clear the east end of the spit; the western post of the said Father's Ewer's Gate on with the opening between the Spire and the west end of the Catholic Chapel, will clear the west end of the spit; and the outer edge of the Long Harry on with the extreme point of the northern shore, will clear the shoal on its northern side. This is a very good and convenient anchorage, with room enough for a vessel to turn in or out of the narrows; and the marks here given are very easily to be distinguished, and will clear all dangers. The Middle Mark at the back of the Chapel on with the Cupola, and the mark at Ship's Head on with that at Admiral's Beach, leads on to the shoalest part of the bar. To the northward of Harbor Grace is Carbonierre Island and Harbor; before you reach which is Mosquito Cove, a place between Harbor Grace and Carbonierre, little frequented, although the anchorage is good, it not being convenient for the fisheries.

CARBONIERRE ISLAND lies about 18 miles from Cape St. Francis, its southern end is low land, but upon it stands a small fort, built for the defence of the fishermen. The island is bold to, so are the shores of the harbor, but off the S. W. end of the island are several rocks under water: the passage therefore, between the island and the main, should not be attempted. On the north side, opposite Carbonierre Island, are two small Coves, where the planters live, who keep fishing boats; the northern of these is called Clown's Cove, fit only for boats; the other is called Crocker's Cove, and is separated only from Carbonierre Bay by a small point of land, named Crocker's Point. Off these Coves are several rocks, both above and under water; therefore, in sailing either in or out of the Bay of Carbonierre, these must have a berth; and after you reach Otterbury Point you may stand in to either shore, both being bold to, until you near the head of the harbor: this is a good place for riding in. It is wide, and with water of various depths for anchoring every where.

Two miles N. E. by N. from Carbonierre Island is Salmon Cove Head, high and steep; behind which is a Cove, where abundance of salmon are caught; an island lies in the mid-way of the channel, but the cove is only fit for boats.

GREEN BAY.—Four or five miles further north is Broad Cove Head; and  $3\frac{1}{2}$  miles further is Green or Western Bay Point; off the shore, and about a mile to the northward of Broad Cove, is anchorage in from 10 to 15 fathoms. At the entrance to Green Bay, is anchorage in 15 and 16 fathoms, but it would be dangerous to go far into the Bay, which is quite open to the eastward.

Five miles to the north-eastward of Green Bay is Devil's Point Cove, a place of little note, and further on is Flamborough Head, black and steep to; there is no good place of shelter hereabout, nor from Carbonierre to the Island Bacalien, except with the wind off shore.

BAY VERDE is about half a mile to the westward of the head, and up to the Cove is three quarters of a mile; the entrance is not above a cable's length across, and vessels lie about half a cable's length from the head of the bay, in 5 fathoms water, having a cable fastened to the shore, and an anchor out astern; six or seven ships can lie in this manner, but S. W. winds blowing right in, would make that a dangerous situation; it is also a bad place for either wood or water, but the great quantities of fish which resort here, occasion it to be much frequented. It is a place easily known by Bacalien and the projecting land, called Split Point; Bay Verde Head itself will serve to point out its position, for these three heads, Bay Verde Head, Split Point and Bacalien Island, appear prominent bluff land, very similar to one another, as you come from the southward; and there is no hidden danger in entering the Bay. The Island Bacalien is high land, nearly 4 miles long and  $1\frac{1}{2}$  broad, it is distant  $1\frac{1}{2}$  mile from the main, and between is a good channel; nearly midway between its southern point and Split Point is a sunken rock, over which, in blowing weather, the sea generally breaks, although it is six fathoms under water, and steep to all round.

From Split Point about  $4\frac{1}{2}$  miles is the Point of Grates, having rounded which, you will open Trinity Bay.

#### FROM BACALIEU, OR BACCALOU, ISLAND TO CAPE BONAVIDA.

TRINITY BAY is, like Conception Bay, wide, extensive, and forms itself south-westward; like that also, it contains many lesser bays and harbors within it; these will be regularly described in rotation. Point Grates is the S. Eastern point of the Bay; from which, distant about 2 miles, is Break-heart Point, and between them is a kind of Bay, where boats, with an off-shore wind, ride in safety; within this Bay is a ledge of rocks above water. To the southward of Break-heart Point is Scurvy Island, and between this island and Sherwick Point is a bay running in S. S. E. about three quarters of a mile; the course from Break-heart Point to Sherwick Point is S. W. by W. 3 miles. Off the latter is a rock above water; this forms the northern point of Old Perlican; vessels cannot go between the island and point, although the passage appears good and open, because the ground is altogether foul and rocky, always therefore run in to the southward of the island, and when you have passed it, anchor in 4 or 5 fathoms; this cannot be considered a good harbor, as the ground is bad for holding, and with the wind at N. W. you will then be obliged to buoy your cables.

From Old Perlican to Salvage Point the course is W.  $\frac{1}{2}$  N. distant 5 miles; Salvage Point requires a good berth, having a reef of rocks running out from it, the point itself is low.

From Salvage Point to Hants Head the course is W. by S. distant 7 miles; and one mile to the eastward of the Head is Hants Harbor, fit for small craft only; two miles off which is Hants Harbor Rock, over which the sea generally breaks; bring King's Head open of the Sugar Loaf, and you will clear it to the northward. Two miles further is King's Head, and from King's Head to the Sugar Loaf the course and distance is S. W.  $\frac{1}{2}$  W. about 3 miles.

Eastward of the Sugar Loaf is Sillee Cove, fit only for boats, and unsafe for vessels.

NEW PERLICAN.—From the Sugar Loaf to the north point of the entrance of New Perlican, the bearing is S. W.  $\frac{1}{2}$  W. distance 2 miles; and one mile further is the Harbor, small, but tolerably good, within which you may ride land-locked in from 5 to 10 fathoms; the shores are bold to, and free from danger; the entrance is nearly two miles wide, being bounded by Smutty Nose Point on the east, and Gorlob Point on the west; but as you advance the harbor becomes narrower, so that at the anchorage it will scarcely be half a mile broad.

HEART'S CONTENT.—Three miles from New Perlican is Heart's Content, a good harbor, fit for any ship, with excellent anchorage towards the north shore, in from 8 to 12 fathoms water. One league further is Heart's Desire, fit for boats only; and  $3\frac{1}{2}$  miles beyond that is Heart's Delight, another cove, adapted for small craft only. From Heart's Delight, about three miles, is Long Point, projecting considerably into the Bay, and a league further is Witless Bay, by no means a place of safety, being too much exposed, and the bottom rocky; between Long Point and Witless Bay are two small islands, which you leave on your larboard side.

One mile from Witless Bay is Green Harbor, where vessels may anchor in from 7 to 10 fathoms; three miles further is Hope-all-a-head; two miles beyond which is New Harbor, a place of shoal water, and only fit for boats.

DILDO HARBOR.—Two and a half miles from New Harbor is Dildo Harbor, within which is very good anchorage, in a cove, at the northern side of the entrance, in from 10 to 20 fathoms water, good clean ground. Three miles from thence is Chapel Bay, the mouth of which is a mile broad, and the bay about three miles deep; here, behind a small island, about two miles in, is good anchorage in from 8 to 12 fathoms. About 5 miles to the northward is Collier's Bay, very similar, and running nearly in the same direction to Chapel Bay;

seven miles further in the same direction, full anchorage is safe.

BAY OF 1 direction to w in various parts of the Cove, about 10 to the N. E. is the shore; we no with many sho 6 fathoms on t ther in, is a ba of Shallop Co is also another fathoms, this on the main, ch on good the north point

PORT BC on either side and when you uly winds he a point behin even with bac

seven miles further is the Point of Tickle Harbor Bay, which runs inward, in a southerly direction, full 8 miles; there is no danger in the way, and though little frequented, the anchorage is safe.

**BAY OF BULLS.**—To the northward is the Bay of Bulls, running in a N. N. Westerly direction to within 2 miles of Chance River in Placentia Bay; there is very good anchorage in various parts of this Bay, in 12 and 10 fathoms water, particularly on the western side in a Cove, about one mile and a half from the entrance, with from 10 to 15 fathoms, sandy ground; to the N. E. is Bull Island, and 5 miles further Copper Island; both these lie very near the shore: we now open Deer Harbor, a place extensive, and good for anchorage, but barred with many shoals; the first shoal lies midway between Tickle Point and Deer Island, having 6 fathoms on its shallowest part, and therefore not dangerous; but one third of a mile further in, is a bank with only 2 and  $2\frac{1}{2}$  fathoms water; bring the point of the N. E. Cove open of Shallop Cove Point, and you will go clear to the westward in 7 fathoms water. There is also another shoal lying off the point on the outside of Shallop Cove, on which are  $2\frac{1}{2}$  fathoms, this will be avoided by just opening the point of Deer Island with the first point on the main, within Deer Island; and after you have passed Harbor Island, you may anchor on good ground, in from 10 to 26 fathoms. The entrance of Deer Harbor bears from the north point of Bacalin Island, W.  $\frac{1}{2}$  S. distant about 13 leagues.

Full  $2\frac{1}{2}$  miles N. E. from the entrance to Deer Harbor is Jones's Harbor, the mouth of which is not above a quarter of a mile wide, and the channel in is, in several parts, still less; it runs in  $2\frac{1}{2}$  or 3 miles, and has good anchorage in from 5 to 24 fathoms water. To the southward is a high and steep island, called Jones Island; about 4 miles from which is Bald Head; and 2 miles further Ganny Cove; its entrance is confined, being not more than a quarter of a mile wide; there is, nevertheless, good riding within it in 10, 12, and 15 fathoms; about a cable's length off the north shore, just at the entrance, lies a sunken rock, and about a mile S. S. E. from the south point of Long Island, is another rock, by some called White Island, just appearing above water; this rock bears S. W. from Random South Head.

Random North Head lies W. by N. distant  $9\frac{1}{2}$  leagues from the north end of Bacalin Island, and about  $4\frac{1}{2}$  leagues N. by W. from New Pelican.

**RANDOM SOUND** lies to the westward, and comprehends several arms and harbors: thus Random and Smith's Sounds unite and form Random Island, the channels being narrow, long, and circuitous; at the junction of the two sounds is a small island with a bar of only two fathoms water, the passage being not a mile broad. About 3 leagues from Random North Head, lies Hickman's Harbor, where you will find good anchorage in 15 fathoms. Random North Head bears from Random South Head N. E.  $\frac{1}{2}$  E. distant 3 miles. When you are within the entrance of Random Sound there is a branch runs in toward the south west, about 1 mile within which is Fox Cove, fit for boats, and 2 miles further Little Heart's Ease, a similar Cove running in a quarter of a mile, then dividing into 2 branches, the western one has 4 and 5 fathoms within it, but the eastern branch is shallow and adapted for boats only. There is also an anchorage 2 miles further, on the same side in a cove with an Island before it, with 8 fathoms, and not far from this is another Cove on the northern side, where a vessel may ride in 7 fathoms.

**SMITH SOUND** has generally deep water, and is in most places one mile wide until you get near the head. Shut-in Harbor is on the starboard side, it is nearly at the entrance, and has no safe anchorage, the ground being rocky; 3 miles further up is Pope's Harbor, this also is encumbered with rocks, a shoal lying near the middle of it. The direction of the channel is westward about  $7\frac{1}{2}$  leagues. To the eastward of Random Island are Duck and Green Islands, both lying a considerable distance from the main; the latter is high, and may be seen as far as Trinity Harbor, it bears from Bonaventure Head S. W.  $\frac{1}{4}$  S. distant about 6 miles; and Bonaventure Head bears from the entrance of Smith's Sound E. N. E.  $\frac{1}{2}$  E. distant 5 miles. To the north-westward of Green Island is Anthony Island and Ireland's Eye; the latter is  $3\frac{1}{2}$  miles in length, and lies in a S. W. and N. E. direction, making the larboard side of the entrance to Smith's Sound. The northern point of Ireland's Eye bears from Bonaventure Head nearly S. W. distant  $5\frac{1}{2}$  miles.

There is a small place of anchorage called Ryder's Harbor, formed by a little island near the main, and bearing from Green Island S. E.  $\frac{1}{4}$  E. distant 4 miles, the passage to it is round the west end of the point, off which are some scattered rocks both above and under water; within this harbor are 3 fathoms water, and about a quarter of a mile from Ryder's Island the N. W. arm branches off, running westward one mile, and being about a quarter of a mile wide; here are 7 fathoms and good anchorage. From Bonaventure Head to Port Bonaventure is 2 miles, but when you are a mile off, and to the southward of the Head, the Harbor to the Admiral's Stage will lie about N. by W.

**PORT BONAVENTURE'S** best entrance is between 2 small islands, but you may go on either side of them in 3 and 4 fathoms water, with a leading wind there will be little danger, and when you are within, and have passed these Islands, anchor in 4 and 5 fathoms; southerly winds here send in a very heavy sea: there is however a secure place for boats within a point behind the Admiral's Stage, appearing like a great pond, where 100 boats may lie, even with bad weather, in safety.

From Bacalieu North Point to Bonaventure Head the course and distance is N. W.  $\frac{1}{2}$  W. 22 $\frac{1}{2}$  miles. Bonaventure Head is remarkably high and steep.

From Bonaventure Head to the entrance of Trinity Harbor, the course and distance is N. E.  $\frac{1}{4}$  N. 4 $\frac{1}{2}$  miles, and from Bonaventure Head to the Horsechops E. N. E.  $\frac{1}{4}$  E. 8 miles.

TRINITY HARBOR is considered one of the best and largest harbors in all Newfoundland, having several arms and coves, where some hundred ships may ride land-locked. It is a place which you may safely turn in or out, being bold-to on each side, and having no danger but what is visible; except when going into the S. W. arm, where the Admiral's Stage usually is, there is a shoal, called the Muscle Bank, from which shoots off the point within the small island on the larboard side going in, and extends over N. N. W. about a third of the breadth of that arm. Being within that bank, which will discover itself by the color of the water, you may edge over close to the south shore, or keep your lead going to avoid the Muscle Bank, giving it a little distance; the mark for avoiding it is the house, standing over the steep perpendicular rock, situated between Tavernor's Point and Ship Cove, open of the Neddick; keep this mark on, until you are half way over to the Neddick, then haul toward the S. W. branch, taking care to avoid the south shore, till you shut in Tavernor's Point with the Neddick; you will then go within the Muscle Bank. You may anchor in from 14 to 10 fathoms, and approach near to the stage on shore, so as to make a stage with topmasts to your stage on shore, to load or unload your ship. This will be found a most excellent harbor; for, after you are in the S. W. arm, you will perceive another branch running up to the N. W. which is continued by another to the S. W. but there is a bar or ledge, at the entrance of the S. W. arm. The N. W. arm is also a large place, having good anchorage for 500 sail of ships. Besides the fore-mentioned arms, the main harbor turns up to the north.

Ships, being within the harbor's mouth, may safely ride in a large cove, on the starboard or east side, land-locked, on good ground; here the planters live. Over against that cove, on the larboard or west side, are two other coves; the southernmost of them is called the Vice Admiral's Cove, very convenient for curing fish; and above, or to the northward of that, is a large cove, or arm, called Got's Cove, where there is room enough for 300 or 400 sail of ships to ride, all on clear ground; there neither winds nor sea nor tide can hurt you, and in this place ships may lie undiscovered until the weather becomes clear and open.

There are several other anchoring places in this harbor with good clean ground. The bottom every where is tough clay, with 4 and 5 fathoms water, within two boats' lengths of the shore; and 6, 7, 8, 9, 10, 12, and 14 fathoms, and in some places more, in the middle of the arms and channels. You may turn in or out readily, observing your tide, which rises about 4 feet, and sometimes more.

ROBINHOOD'S BAY.—Sherwick Head, which is the eastern point of Trinity Harbor, forms also the S. Western boundary of Robinhood's Bay, the entrance to which is a mile wide, and the bay extends northward nearly two miles; here vessels frequently ride and fish, in from 7 to 17 fathoms water; at the further or upper end of this bay there are some spots of shallow water, but at its entrance, and between Sherwick and Fox Island Points there is no danger whatever.

SALMON COVE and ENGLISH HARBOR lie to the eastward of Robinhood's Bay, being only divided from it by a narrow neck of land, called Fox's Island. The former of these runs in northerly, and is considered a good fishing place; it is clear of dangers, and has a good depth of water, from 17 to 10 and 8 fathoms; the eastern shore is bold to, and at the further end of the cove there is a small run of water, which extends about two miles to the northward.

ENGLISH HARBOR is situated at the S. Eastern entrance of Salmon Cove; it is a clean bay, where you may ride in 4 and 5 fathoms water. From hence the coast rounds to the eastward to the Horsechops, a distance of more than three miles; it is all high land, steep to and without danger. To the N. Eastward of Horsechops is Green Bay, open and entirely exposed to the southward; at the eastern part of this Bay is a small sandy beach with a rivulet of water; this place is little frequented, and is neither convenient for ships to fish or ride in. When you have passed this Bay, there is no sheltering cove or place until you reach Ragged and Catalina Harbors.

RAGGED HARBOR is so named from the rough and craggy appearance of the surrounding rocks, which render it unsafe for either boats or ships to enter; but for those who intend going there, we shall observe, they must go to the northward of the reef of rocks at its entrance, running on north, until the Harbor comes quite open, then you may steer in between the Round Island near the main, and a large black rock, being the outermost of the ragged ones before mentioned; sail on until you are to the westward of them all, or until you get the south head of Catalina to appear between the westernmost rock and the main, then anchor. A river of good water is at the head of the Harbor.

CATALINA HARBOR is nearly two miles to the northward of Ragged Harbor, and is in the latitude of 48° 31' 15" N. bearing from the north point of Bacalieu Island nearly north, distant 24 miles. It is a good harbor for small vessels, and may be known by a sin-

foundland, near

gular green island at the south points of its entrance; near half a mile to the north of this island, is the Brandy Rocks, a ledge over which the sea frequently breaks; you may go on either side of these rocks, giving the little island a berth, or with a leading wind between the island and the main, though this passage is exceeding narrow, in 4 and 5 fathoms. Just within the entrance of the Harbor is Charlton Rock or shoal, lying nearly mid channel, over which are only 8 feet water; you must avoid bringing the north point of Green Island on with Burnt Head, the south point of the harbor, for that will carry you right upon the rock; there is a passage between the island and rock, and also between the rock and the north shore, only steering nearer the main about two thirds over.

LITTLE CATALINA BAY lies inwards on the northern side; from Catalina Harbor to Little Catalina the course is about N. E.  $1\frac{1}{2}$  mile; and thence to the north head of the Bay E. N. E. a little easterly  $4\frac{1}{2}$  miles; when within the Harbor you may anchor close to the shore in 4 and 5 fathoms land-locked; or to the southward of the Little Green Island in  $3\frac{1}{2}$  fathoms, or by running up two miles further obtain fresh water. In the S. W. arm or branch of the river, where there is anchorage in 5 fathoms, the harbor runs westerly. Sometimes the water in this harbor will suddenly rise 3 or 4 feet, then fall again, and in certain seasons it will often do so 2 or 3 times in 3 or 4 hours. It abounds with salmon, and the herb Alexander grows luxuriantly on the Little Island; near a small Cove, at the N. W. is a sort of mineral, of a glittering nature, generally called Fire Stone; excellent willicks may be found on the rocks.

From the south to the north head of Catalina the course is N. E.  $\frac{3}{4}$  E. distant  $5\frac{1}{2}$  miles, and between them are from 13 to 5 fathoms water; the whole way is a kind of broken ground, and in blowing weather the sea frequently breaks high over it.

From the north head of Catalina to Flower's Point, the course is N. N. E.  $\frac{1}{4}$  E. distant  $2\frac{1}{2}$  miles; and one mile to the eastward of the Point lie some sunken rocks; you may go between Flower's Point and these rocks, in 6 fathoms water, but it is more advisable to pass on the outside of them; this you will readily do by bringing Gull Island open of Spiller's Point, or by keeping the south head of Catalina open of the north head.

From Flower's Point to Bird's Island is 2 miles; within Bird's Island is a small bay where ships can occasionally ride, in one branch which runs up towards the west, and in the other, amidst some rocks, which are above water. Bird's Island Bay extends so far as Cape L'Argent.

From Flower's Point to Cape L'Argent is  $3\frac{1}{2}$  miles, it is rather a low rocky point, having also a large rock above water lying off it.

From Cape L'Argent to Spiller's Point, is  $1\frac{1}{2}$  mile; between these points, the lead falls into very deep water. Spiller's Point is steep and bold to, but not very high, with a rock above water near it; over the point, you may discern the high land of Port Bonavista a great way off at sea.

From Spiller's Point to Cape Bonavista the course is north, distant almost one league; between them is a deep bay, which might be mistaken for the Harbor of Bonavista, from the head of which it is only divided by a neck of land, two miles over, and from Red Head Bay it is not above a musket shot.

Hitherto the allowance made for the variation of the compass has been two points west, which it is presumed will be found sufficiently near to the truth, for all the purposes of navigation; but from hence to the northward it appears to have generally increased. At the Capes which form Bonavista Bay, the variation in 1820 was  $30^{\circ} 28' W.$  at Barrow Harbor  $28^{\circ} 30' W.$  and at Happy Adventure only  $28^{\circ}$ .

#### FROM CAPE BONAVISTA TO CAPE FREELS (NORTH.\*)

CAPE BONAVISTA is in latitude  $48^{\circ} 42' N.$  and longitude  $52^{\circ} 59' 20'' W.$  The Cape appears from a distance of a bluish color, and is a steep rocky point, having 4 fathoms close to the shore. Somewhat less than three quarters of a mile N. N. E. from the extremity of the Cape lies Gull Island, which, though small, may easily be recognized, by being of moderate height, and elevated in the middle, making something like a round hat with broad green brims, and visible 4 or 5 leagues off, when the weather is clear; N. N. E.  $\frac{1}{2}$  E. distant  $3\frac{1}{2}$  miles from Gull Island is the Old Harry Rock, having only 15 feet water over it; from this a reef or bank extends to the N. E. nearly three miles, having several dangerous spots upon it, of only 18 feet and 3 or 4 fathoms; the outer edge of this danger is called the Young Harry, and lies in latitude  $48^{\circ} 10' N.$ , and longitude  $52^{\circ} 58' 15'' W.$ ; at its northern extremity is 10 fathoms water, and a little farther off 45 fathoms; between the Young Harry, and the middle ground of 18 feet, are 12, 20, and 50 fathoms; to the northward of the middle ground are 60 and 40 fathoms; to the eastward 19 and 20 fathoms, to the southward, and between it and the Old Harry, 26 and 31 fathoms; at the north part of the Old Harry is 11

\* So called to distinguish it from a Cape of the same name situated on the southern part of Newfoundland, near St. Mary's Bay.

fathoms, to the westward 30 fathoms, to the S. W. 9 fathoms, and a little further S. W. 57 fathoms; abundance of fish are caught by the boats which frequent this bank, but it is very dangerous for shipping. The sea commonly breaks over Old Harry, unless in fine weather, and the water be very smooth, but the other part of the shoals show themselves only in, or immediately after, heavy gales on the shore.

In order to avoid the Old Harry, you should bring Gull Island on with the Green Ridge, which lies considerably inland; but you must beware, for this mark will carry you too close to the Young Harry. Vessels running along shore, to avoid these rocks, must be careful in keeping Cape Bonavista open with the westernmost extremity of a high range of land to the southward, called the Inner Ridge; these dangers, together with the long ledge, called the Flowers, already noticed, render it very imprudent for a mariner to attempt making land hereabout in thick or boisterous weather; indeed at any time, the Island of Bacalien is the best and safest land-fall for the stranger that is bound to any part of Bonavista Bay.

**BONAVISTA BAY.**—This extensive Bay is formed on the South by Cape Bonavista, and on the north by Cape Freels; these Capes lie N.  $\frac{3}{4}$  E. and S.  $\frac{3}{4}$  W. from each other, and comprehend a distance of 40 miles, between which the coast is much indented with bays and inlets of the sea, most of which are navigable, but difficult, rocky, and dangerous. The land, on the south, is generally high and mountainous, and the shores steep and iron-bound; the north side is low and marshy, from which the water runs off shoal to a considerable distance; the whole Bay abounds with small islands, and is on every side encompassed with dangers. The harbors, sounds, and inlets, are deep, extensive, numerous, well sheltered, and safe, but they are generally so deeply embayed, the passages into them so intricate, and the surrounding land so similar in appearance, that few, except those to whom the navigation is familiar, ever attempt to enter them. Of those which seem to offer the best refuge to strangers, who from necessity should be compelled to seek a place of shelter, the following appear best calculated to suit his circumstances: Barrow Harbor, or Great Chance Harbor, on the south; and New Harbor, or Cat Cove, on the north side of the Bay; but the extreme narrowness of the entrance to New Harbor is a great impediment, and renders Cat Cove the most to be preferred.

**PORT BONAVISTA**, or Bonavista Harbor, lies within and about  $3\frac{1}{2}$  miles to the south-eastward of Cape Bonavista, and vessels intending to rendezvous there, may either pass to it, between Gull Island and the cape, or between Gull Island and the Old Harry Rock, or to the northward of the Young Harry altogether; if the former, between Gull Island and Bonavista, the passage is about three quarters of a mile wide, and both the Cape and Island steep to, having 4 fathoms water close to each side, and 16 or 18 fathoms mid-channel; but it will be advisable not to go too near to the Gull Island, on account of a rock under water, which lies about 300 yards off the S. E. part of the Island. Having passed through this channel, and finding yourself to the westward of the Cape, you will see Green Island distant about half a mile from the Cape; large vessels commonly leave this island on their larboard side, in their passage to Port Bonavista, going between Green and Stone Islands; the channel is full one mile and a quarter wide, and with 12, 16, and 18 fathoms water in it, and no danger whatever, except a sunk rock of 3 fathoms water, which lies about 200 yards to the N. E. of Green Island; or they may go to the westward of Stone Island, and run on southerly until they open the points of the Harbor, and having passed Moses Point, sail to the southward of the Swerry's Rocks; these are always visible, and have no passage between them and the Point; here they may anchor in 10 or 8 fathoms.

The Inner passage, between Cape Bonavista and Green Island, is frequently attempted by small vessels; the channel is in some parts narrow, and the ground foul; about a mile to the S. Eastward of the Green Island is the ledge of red rocks; you may go between these and the land into Red Cove; there are 6 fathoms water, and in the Cove 4, 4, and 3 fathoms; but the ground is all foul; there is a passage also to the southward of these rocks, and between them and Western Head, in which are 6 fathoms. A little to the eastward of Western Head there is a small rock under water, it lies about a cable's length from the shore, and the sea commonly breaks over it, but boats can go between it and the shore. To the southward is Red Head or Point, and further on is Moses Point; between these is another opening, called Bayley's Cove; you may, in case of extreme necessity, run in here and anchor, but the ground is foul and rocky throughout; there was on the north side of this Cove a stage for fishing. Moses Point is the northern point of Bonavista Bay; this place is a very eligible situation for carrying on the fishery, but it is so open to the weather, that with N. Westerly gales, following a continuance of strong winds from seaward, the waves break right athwart the harbor's mouth, and sometimes the whole of the fishing boats founder at their anchors, and not unfrequently many of their stages are destroyed. Vessels during the summer months commonly moor under Swerry Head in 8 or 10 fathoms; but even here, and in every other part of this Harbor, the ground is so rocky and uneven, that you will be obliged to buoy up your cable.

**BLACK HEAD BAY.**—This is a wide and deep bay, comprehended between Black Head to the eastward, and Southern Head to the westward. Black Head bears from Cape

Bonavista W. S. W.  $\frac{1}{2}$  S. distant  $5\frac{1}{2}$  miles; Southern Head bears from Cape Bonavista W.  $\frac{3}{4}$  N. distant 12 miles; and Black Head and Southern Head bear from each other E. S. E.  $\frac{3}{4}$  S. and W. N. W.  $\frac{3}{4}$  N. being nearly 8 miles apart: on the western side of Black Head Bay is KING'S COVE, distant about 4 miles from Southern Head; this also is a fishing establishment, but still more objectionable, as a place of shelter, than Bonavista, for this is directly open to seaward, and the ground is all foul.

KEELS.—This is another establishment for the fisheries, and situated in one of the coves about midway between Southern and Western Heads; between these two heads are four other coves, but neither Keels nor any of these coves, are fit or good places for anchorage, especially with ships of burthen.

From Western Head the land bends W. S. W.  $\frac{1}{2}$  S. and leads to numerous coves, bays, and arms of the sea, most of which have deep water, and places of anchorage; we shall here enumerate the principal of these, with their respective situations, but, as many of them are too deeply embayed for general navigation, we shall not extend our directions to a minute or particular description of them all, but confine ourselves to such only as are situated in prominent parts of the Bay, and are mostly fitted for general use, and commonly frequented.

We have already stated, that from Western Head the land turns W. S. Westward, and leads to Plate Cove, Indian Arm, and Southward Bay.

PLATE COVE is situated on the coast about  $7\frac{1}{2}$  miles distant from Western Head; its entrance between Arrow Point and Plate Cove Head is three quarters of a mile wide, from whence it bends in more than a mile to the southward; at its Eastern extremity, is a run of fresh water, but the bottom is foul and rocky, it is therefore not much frequented.

INDIAN ARM lies about S. W. by W. from Plate Cove head, distant 3 miles; it is a narrow inlet running in nearly S. W. about two miles, and terminates in a rivulet of fresh water.

SOUTHWARD BAY is separated from Indian Arm only by a narrow neck of land; this is an extensive branch of the sea, its entrance between Red Head and Kate's Harbor Head, is a full mile wide, with 50, 50, 80 and 90 fathoms water, mid-channel; from hence it bends to the S. Westward  $7\frac{1}{2}$  miles, becoming narrower as you advance, but with deep water and no danger. On the western side there is an opening called Hayes Cove, it lies about 2 miles from Kate Harbor Head.

BACON-BONE ROCK.—It will be proper here to remark, that vessels intending to seek either of these places, must beware of the Bacon-bone Rock, a danger of only 18 feet water over it; this lies W.  $\frac{1}{2}$  N. distant one mile from Western Head, and directly in the fair way of the navigation. To avoid this danger, do not shut in Southern Head until Little Denier comes on with the outer Shag Island.

KATE HARBOR lies to the westward of Plate Cove; its entrance is three quarters of a mile wide, and the Harbor runs in about one mile and a quarter; the depth of water is 36, 29, and 27 fathoms mid-channel, decreasing as you advance to the further end: there is a rock under water off its entrance with 7, 8, and 9 fathoms round it; this lies nearer to Kate's Head, but there is a passage between them, and also a still wider channel on the western side of the rock.

SWEET BAY.—This is another extensive inlet, lying to the westward of Kate Harbor; its entrance is between Cutler's Head and Chance Point; and leads also to Maidenhair Cove, and Little and Great Chance Harbors. Sweet Bay is the easternmost inlet; which having entered, and passed Cutler's Head, which is rocky and steep to, you will see Turfpook Island, it is small and narrow; about half a mile to the S. W. of this is Woody Island, and between them a rock under water; there is a passage on either side of these, and when you get beyond Woody Island, the bay becomes about three quarters of a mile wide, with 60 fathoms water, mid-way; advancing still further you will observe several islands in your passage; there is also a rock under water on your starboard side, three quarters of a mile beyond Woody Island; it lies abreast of a little island which is mid-channel; further on is Wolf Island, between which and the main there is no passage; off this lies Gooseberry Island, between which and Wolf Island there is 30 fathoms water, but the channel is narrow, and that on the eastern side of Gooseberry Island is much wider; Sweet Bay here divides into two branches, that to the eastward is called the S. W. arm, and has directly before its entrance Hunt's Island, the channel to the eastward of which has 10, 12, and 14 fathoms water, and that to the westward 7 and 9 fathoms, you will then see on your starboard side a small island, you may pass it on either side, and having so done, will drop into 24, 22, and 20 fathoms water; the head of the arm is foul and rocky. The N. W. arm is divided from the S. W. arm a little below Hunt's Island, and at the further end of Wolf's Island is nearly a mile wide, from whence it runs S. Westward  $3\frac{1}{2}$  miles, with good depth of water, and clear of dangers; at the bottom is a sandy beach and a small rivulet.

GREAT CHANCE HARBOR.—This is an excellent and convenient place of anchorage, the entrance to which lies W.  $\frac{3}{4}$  S. distant  $10\frac{1}{2}$  miles from Western Head. Vessels sailing from this place, should recollect the mark already given to avoid the Bacon-bone Rock; having passed this danger, you may sail on directly for the harbor, the course will be W.

$\frac{1}{2}$  North, until you get abreast of Chance Point; you will now guard against a sunken rock at the southern part of the entrance, which has only 16 feet water over it; to avoid and go clear of this danger, be careful not to shut in the westward Mustard-bowl Island with the eastern one; these are situated at the larboard side of the channel: having passed the eastern island, stand boldly in, approaching each side as nearly as you like, and anchor where above the narrows in from 11 to 5 fathoms, the ground is good and holds well; you will lie sheltered from all weather, and may procure wood and water with great facility. Chance Point and Cutler's Head are both steep to; off the former, and directly in a line between the southern part of Long Islands, there is a spot of ground with only 7 fathoms water; during heavy gales from the seaward this will show itself by the sea breaking over it, but in fine weather it is not dangerous. N. E. a little Northerly, distant almost one mile, is the Chance Gull Rock, steep to, and always visible: to the westward is Deer Island, one mile and a quarter long but narrow; there is a good channel between it and the main to Chandler's Reach.

CHANDLER'S REACH is the channel leading to Goose Bay and Clode Sound; the course through which is W.  $\frac{1}{2}$  S. which, from the N. W. point of Deer Island, will take you to Connecting Point; this is the point of the peninsula that divides the former from the latter.

GOOSE BAY runs in S. Westerly, about  $7\frac{1}{2}$  miles, and by keeping in mid-channel you will meet with no danger, but have 47, 40, and 36 fathoms water, until, having passed Lubbers Hole, the depth decreases to 12, 13, 10, and 8 fathoms, when you will see a small island, situated to the westward of Goose Head; behind and to the westward of this, you may anchor in from 4 to 7 fathoms, or further to the southward in  $5\frac{1}{2}$  fathoms; in most of these inlets you will lie perfectly safe, and entirely land-locked; fresh water and wood are plentiful, and easily obtained.

CLODE SOUND is a fine branch of the sea, running in from Chandler's Reach full 20 miles; it has many places of very good anchorage, and without any danger; vessels may find perfect safety on the northern shore, at Brown's Cove, or further in at Long Cove, or Platter Cove; or on the southern shore, at Bunyan's and Love Coves; or, passing the Platter Rocks, and steering westward, at Freshwater Cove; the mid-channel has all the way deep water, and there are no rocks except near the shores.

LION'S DEN.—This is an opening lying at the N. W. end of Chandler's Reach; to enter which you must sail to the northward of the Deer and Cluster Islands, and pass the narrows, which is about one third of a mile wide, and has 24 fathoms water in it; having passed the entrance about one mile, there is a sunken rock, round which are 4, 5, and 6 fathoms; you may then perceive the inlet to branch off into two divisions, that to the N. W. is very narrow, and has a rocky islet at its entrance; but that which runs to the S. W. is broader, and has 11, 14, and 10 fathoms water in it; it runs in from the sunken rock about  $1\frac{1}{2}$  mile, and at its further end becomes shoal, narrow, and rocky.

THE LONG ISLANDS are 4 in number, having narrow channels between them, some of which are encumbered with rocks, and dangerous; the eastern island is the largest and broadest, the next to it is the longest, the two western ones are smaller and narrower; they form the northern boundary of the passage from Western Head to Chandler's Reach; and also the southern boundary to Swale Tickle and Newman's Sound. Off the N. Eastern point of the largest Long Island, lies a sunken rock; it is close to the land, and therefore may easily be avoided; this point bears from Western Head nearly W. by N. distant 6 miles.

NEWMAN'S SOUND.—This is a large arm of the sea, running in W. by N. having at its entrance Swale Island, which is nearly  $4\frac{1}{2}$  miles long, and not one broad in the widest part. This divides the entrance into two channels; the southern passage is called the Swale Tickle, and the northern one goes by the general name of Newman's Sound. To sail from abreast of the Western Head into the Swale Tickle, you must steer W. N. W.  $\frac{1}{2}$  W. To sail from abreast of the Bonavista Gull Island, steer W. N. W.  $\frac{3}{4}$  W. 29 miles, and it will carry you a little to the southward of Little Swale Island, and in the fairway of the passage: but in advancing through this channel there are several obstructions, and the passages from thence into Newman's Sound are so narrow, that it will always be advisable to go to the northward of the Great Swale Island. To do this, having rounded the Gull Island, steer W. N. W.  $\frac{1}{2}$  W. 27 or 28 miles; you will then have the sound open, and can proceed accordingly. It is full  $1\frac{1}{2}$  mile wide, and extends in nearly a N. by W. direction from the N. E. point of Swale Island 11 miles, having several places of good anchorage. Those on the southern shore are South Broad Cove, Minchin's Cove, and Stanford Cove.

SOUTH BROAD COVE is situated two miles and a half beyond the western point of Swale Island, and is a place of great safety; the passage in is to the S. Westward, and you will ride well sheltered in 10 fathoms, free from any danger: there is a small island at the entrance, which you will leave on your larboard side.

MINCHIN'S COVE is to the westward; to go to this place, there is a long narrow point of land running out to the northward, which you will round, and turning southerly, the Cove will appear open: here you will lie in 5 fathoms, opposite a sandy beach. To the westward is Mount Stanford, off the point of which lies a small island, reaching half way over the passage, making the channel in this part very narrow; the best course through, is to the eastward of

this island, it fit for small 26, and 27 fathoms. The shores. approach to

The anchor Adventure Cove is a convenient harbor for the peninsula large islands, and the main is a full mile completely landlocked. Gull Island, from the north, will be seen. The course they will take S.  $\frac{1}{2}$  W. distant less than 4 fathoms. In sailing on month, you will find three quarters of a mile against, and so go on its north reef of rocks, almost half way channels of 7 pilot. To clearward of Smolbrook bring Broom without obstruction. A sunken rock, shut in from the anchoring in about Barrow the more ready.

SANDY COVE is readily be known. In sailing to the Sandy Cove, it has 4 fathoms keep outside.

GREAT A LYING about the Sound; but between these coves 80 yards from lies Sydney Island and Harlow.

NORTH ISLANDS from Harlow anchorage, and named Black. Until you make a side; after which is a dangerous passage to 25 fathoms.

In advancing off the northern mile beyond under water, close to them. Sailing up Newman's Sound nearly half a

this island, in 9 fathoms; here an opening appears to the eastward, called Buckley's Cove, fit for small vessels: the coast now winding to the westward, forms a broad bay, with 20, 26, and 27 fathoms water in it, free from any danger, and shallowing on each side towards the shores. At the S. Western part of this is Stanford Cove, having a sandy beach, the approach towards which shallows gradually.

The anchorages on the northern shore are, North Broad Cove, Great and Little Happy Adventure Coves, and Barrow Harbors; Barrow Harbor is tolerably safe, and the most convenient harbor on the south side of Bonavista Bay; it is situated on the southern side of the peninsula which divides Newman's Sound from Salvage Bay, and is formed by three large islands, Keat's, Goodwin's, and Richard's Islands; that part between Goodwin's Island and the main is the entrance, about 500 yards wide, and not difficult of access. The harbor is a full mile in length, the outer part is rocky and not well sheltered, but the inner part is completely land-locked, and has good holding ground. Vessels taking their departure from Gull Island, Bonavista, should steer N. W. by W.  $\frac{3}{4}$  W. about 22 miles. But if coming from the northward, their course from the Eastern Gooseberry Rock, towards Barrow Harbor, will be S. W.  $\frac{1}{4}$  W. 18 miles; Gooseberry Rock appears just above water. In this course they will have to avoid the Malone Rock and Ledge, the latter being a shoal, lying S.  $\frac{3}{4}$  W. distant one mile from the rock, which is always above water: this shoal has never less than 4 fathoms over it, so that, in fine weather, no danger whatever is to be apprehended. In sailing on, and approaching Little Denier Island, which is almost opposite the harbor's mouth, you must be particularly careful of the Outer Rock, lying N.  $\frac{3}{4}$  W. of Denier, distant three quarters of a mile; this has only 4 and 6 feet upon it, but fortunately the sea constantly breaks over it, thereby pointing out its situation, and enabling the mariner to guard against, and steer clear of the danger. Having reached the Little Denier, it will be better to go on its northern side, for between Little Denier and Richard's Island there lies a dangerous reef of rocks, called the Brandishes; these extend nearly in a line, but at various distances, almost half way over the channel; upon these rocks are from 12 to 17 feet, with narrow channels of 7 and 8 fathoms between them; to navigate this passage, therefore, requires a pilot. To clear the Brandishes, you should keep Wedge Point a little open to the southward of Smoky Ridge, which is a range of high lands at the top of the harbor, until you bring Broom Head on with the Middle Shag Island; the passage then will be open, and without obstruction, until you get near to Wedge Point; off which only 70 yards, lies a sunken rock, with 8 feet water: you may then sail up Pudner's Cove, until you are entirely shut in from the sea, then you can anchor in from 10 to 18 fathoms. Some vessels prefer anchoring in Garland's Creek, but without running well up, the ground is foul. The land about Barrow Harbors is higher than the neighboring shores, and, consequently, may be the more readily recognized by its projection.

**SANDY COVE** lies further up Newman's Sound, and has good anchorage; it may readily be known, having the only sandy beach on the north side of the sound; there is no danger in entering, and it is perfectly safe, the depth of water being from 10 to 20 fathoms. In sailing to this place, and keeping along the northern shore, between Barrow Harbor and Sandy Cove, you will meet with a rocky islet, called the Half-way Rock; it is steep to, and has 4 fathoms close to it; there is also a deep water channel between it and the main, but keep outside, and pass to the southward of it, and there will be no danger.

**GREAT AND LITTLE ADVENTURE COVES.**—These are two snug little coves, lying about three quarters of a mile above Sandy Cove, and on the same side of Newman's Sound; but from the narrowness of their entrances they are fit only for small vessels. Between these coves, and off a point of land which separates them, lies a sunken rock, about 80 yards from the shore, with only 4 feet over it. Off the entrance to Great Adventure Cove, lies Sydney Island; the passage in is to the northward of this island, for between the island and Harbor Head, there is no thoroughfare.

**NORTH BROAD COVE.**—The entrance to this place lies one mile and three quarters from Harbor Head, and is on the northern shore; it is a convenient and well sheltered anchorage, and may be easily known by a round island lying at its western side; this is named Black Duck Island. Sailing into the Cove you should keep the island on board until you make a tickle\* between it and the western shore, to avoid a sunken rock at its eastern side; after which, it is advisable to keep as close as possible to the eastern shore, for there is a dangerous rock lying mid-channel; being inside this rock, you may anchor in from 10 to 25 fathoms, muddy ground.

In advancing further up Newman's Sound, there are some other dangerous rocks, lying off the northern shore; one of these is called the Shag Rock, and lies three quarters of a mile beyond Black Duck Islet; and one mile further on is Hall's Rock; both these are under water, and distant about a cable's length from the land; they have 4 and 5 fathoms close to them, and a passage between them and the shore of 6 and 7 fathoms: therefore, in sailing up Newman's Sound, the northern shore should always have a good berth. Keep nearly half a mile off, and you will avoid them all.

\* "Tickle," a narrow passage between islands and rocks.

**SALVAGE BAY** lies on the northern side of the promontory which divides it from Newnan's Sound; it has several runs of fresh water within it, but no place of good shelter.

**DAMNABLE HARBOR** lies to the northward of Salvage Bay; between them are several small islands and rocks, the largest of these is named the Baker's Loaf, and is a narrow island, about three quarters of a mile long. To go to this place from Gull Island, Bonavista, you should steer W. N. W.  $\frac{1}{2}$  N. about 7 leagues, and round the Shag Islands; proceed thence to the northward of the Baker's Loaf, or steer N. W. by W. from the Gull towards the Ship Island, which may readily be known by a remarkable bald point, like a sugar loaf; then W.  $\frac{1}{2}$  S. from Ship Island,  $5\frac{1}{2}$  miles, will bring you to the entrance of Damnable Harbor; this place is well adapted for the reception of small vessels, but its very narrow entrance disqualifies it for ships of burthen. There is a rock off the southern part of the entrance, and another off the northern side of the island, which lies in the middle of the harbor; there is good anchorage all round the island in 4 and 5 fathoms, sandy bottom.

**MORRIS'S COVE.**—This lies on the north side of Morris's Island, and is considered to be a safe anchorage. In sailing for this place, keep Ship Island well on board, on account of a dangerous reef, which extends from Flat Island nearly two thirds of the way towards Ship Island, on some parts of which there are not above 17 or 18 feet; proceed therefore to the northward of Ship Island, passing at not more than half a mile distance; and when you have gotten well inside, avoid shutting in Lackington Rock with Varket Island; this latter will be known by its appearing like two singular hummocks, on account of there being several clusters of rocks between Ship and Horsechop Islands; steer for Varket until you get abreast of Lackington Rock, then keep Lackington Rock on the northern extremity of Ship Island, until the Varket bears north, in order to clear the two sunken rocks off the end of Morris Island; you may then steer directly for the Cove, which you can enter without fearing obstruction, and anchor in any part thereof, in 25 to 5 fathoms; but the western side of the Cove is to be preferred.

**BAY OF FAIR AND FALSE.**—This place may contain several good anchorages, but it is so filled with small islands and rocks, that no description we could give would be of any use to the mariner. A cluster of large islands extends off the frontage of this bay, full 20 miles, or so far as Offer Gooseberry Island; between these are passages innumerable, with deep water; there is also a wide channel, running from Fair and False Bay, and Morris Island, to the northward; this leads to Bloody Bay, which then turns westward, and is divided into various branches, forming the N. W. arm, the middle arm, and the north east arm; this latter being a peculiar and extensive channel, running in one direction, southward, almost to Newman's Sound; and in another, almost to Damnable Harbor; all these are navigable, and afford places of good anchorage, and plenty of both wood and water. There is also an open strait from Bloody Bay to the eastward; through Bloody and Cattel's Reaches and out to the northward of Offer Gooseberry Island. Other channels branch off to the northward from Bloody and Cattel's Reaches, and between the Lakeman's Islands, running into Pit's Sound, Locker's and Content Reaches, and thence to Freshwater Bay: within these, and on the northern shore, are Hare, Locker's, Trinity, Indian, and many other lesser bays, coves, and inlets, abounding with good anchorages, and calculated to afford shelter for shipping of all descriptions, in cases of necessity: these are, at present, but little known, and frequented only by the constant traders; we shall, therefore, proceed to those which are the usual places of resort, and are better situated for the purpose of fishing.

Vessels coming from the south-eastward, and bound to the northward, for New Harbor, Greenspond Tickle, Cat Cove, or anchorages adjacent, frequently take their departure from Cape Bonavista: in which case, their course will be N. by W. to clear the Eastern Rock, which lies E. S. E. distant one mile and a quarter from Offer Gooseberry Island. From thence they should steer N.  $\frac{3}{4}$  E. to Copper Island, at the mouth of Greenspond Tickle; here pilots may frequently be obtained to conduct you to this, or any of the adjoining anchorages; there is good holding ground between Greenspond Island and the main; but the water is generally so deep, that a vessel is liable to be drifted on shore in the act of weighing; nor is there sufficient room to veer out a lengthened cable, in heavy gales from the S. W. to which quarter it is much exposed.

Ships coming from the eastward, or round Cape Freels, must be careful to go clear of the Charge Rock, which lies S. E.  $\frac{3}{4}$  S. two and a half miles from Gull Island off Cape Freels; this has only 6 feet water over it, and is circumscribed by a large spot of rough fishing ground, with from 8 to 30 fathoms upon it. From the Gull Island of Cape Freels, you may run immediately for the Stinking Islands, taking care not to open Cape Freels to the eastward of the former; this will carry you inside the danger. You should keep a good look-out for the mid-rocks, which appear just above water, and lie two miles N. E. by E.  $\frac{1}{4}$  E. from the Stinking Islands, but vessels not bound up the bay, are strictly recommended to keep outside of them all; for should the weather become suddenly thick and foggy, a circumstance by no means unusual, more especially with an easterly wind, you will run great hazard of getting bewildered among the innumerable rocks, which are scattered so profusely about this part of the

## BLUNT'S AMERICAN COAST PILOT.

coast, and from which neither compass nor chart can extricate you. In the winter months, when the north-easterly gales are generally heavy and continuous, the sea breaks exceedingly high over several spots of the Stinking Banks, which lie E. by N.  $\frac{1}{2}$  N. from the islands, distant about  $2\frac{1}{2}$  miles; in two places there are only 7 fathoms over these banks; and in such weather, although a ship would not strike, she would be in great danger of foundering in the tremendous sea which would then frequently break over her; but when the weather is settled, and the sea smooth, they are by no means dangerous.

Having rounded the Stinking Islands, and wishing to sail into New Harbor, or Cat Cove, you may, with propriety, steer S. W. by W.  $\frac{1}{4}$  W. directly for the Offer Gooseberry Island, until you bring Pouch and Flower Islands to touch each other; you will then be two miles outside of the three rocks, which lie  $1\frac{1}{2}$  mile to the southward of Flower Island: the outer rock has 3 fathoms over it, the middle rock 14 feet, and the inner rock only 11 feet. You will now alter your course to W.  $\frac{1}{4}$  S. keeping the white face of Chalky Hills a little on the starboard bow, which will take you clear of Copper Island dangers; then, should the inclemency of the weather prevent your getting a pilot on board, you can continue this course until you bring Shoe Cove Point, which may be distinguished by its semblance to white marble, to bear N. W.  $\frac{1}{2}$  W. then shape your course W. N. W. for Indian Bay.

**NEW HARBOR** is situated on the eastern side of Indian Bay, about two miles from the Shoe Cove Point; this place, during easterly winds, will be quite inaccessible, on account of its narrow entrance; in this case, you must proceed onward, about four miles, for Cat Cove.

**CAT COVE.**—In order to reach this place, you will proceed between Silver Hair and Brown Fox Islands and the main; and as you approach the latter, the channel narrows, and you will have a narrow island on your starboard side; this is Cat Island, behind which is Cat Cove; you will have no difficulty in distinguishing this island, it being the only part that is covered with LIVE WOODS, for the surrounding forests have all been destroyed by some general conflagration. Off the upper part of Cat Island lie two high green rocks; you must go round these, for the water is too shoal to go between them: having done so, you may run on, until you get some distance inside the upper point of the island, when you may anchor in from 5 to 13 fathoms, with a hawse open to the N. W. the winds from that quarter being most heavy and squally. In working in, you may stand close to either shore, except off the point of the island, as there is a sunken rock within 100 yards of it, with not more than 10 feet water over it.

**NORTH WEST ARM.**—This is situated on the main, and is the place of safety nearest to Cape Freels; but its entrance is very difficult, on account of the number of islands that surround it, and these islands are almost undistinguishable one from the other, from their similarity of appearance. In coming from the southward for the North West Arm, the greatest danger you will have to encounter, is the Northern Rock, which never has less than 22 feet over it; this lies N. E. distant one mile and three quarters from the Copper Island; this island you will easily recognize by its having no wood upon it, and by its height. In fine weather, and a smooth sea, vessels pass over it in perfect safety; but in hard gales, the waves beat over it incredibly high. To avoid it, be careful to open Fool's Island, which is somewhat higher, and more prominent than the rest, and which is covered with trees, except about the summit, to the westward of the Western Pond Rock, until you get Butterfly Island to touch the inner part of Flower Island, or until Puffin and Copper Islands touch each other; then, leaving the Pond Rocks on your starboard side, steer in for Fool's Island; it is advisable to keep this island well on board, for there is a sunken rock, lying mid-channel, exactly between it and Partridge Island Rocks: this danger has only 18 feet water over it; but no mark can be given to avoid this rock. The course then up the arm will be N. W.  $\frac{1}{4}$  W. and so soon as you get inside of Odd Island, you may anchor on muddy ground, in from 7 to 9 fathoms, Fool's Island Hill bearing S. E. to S. E. by S.

**GREENSPOND TICKLE.**—Greenspond is a square island, about a mile in breadth each way. A reef of rocky islets runs off its southern part all the way to Puffin Island. Greenspond Tickle lies on the south-eastern part of the island, and is of very little importance, being incapable of receiving any vessel whose draught of water exceeds 14 feet: the dangers in going to this place, are the Northern Rock, the Cook-room and Harbor Rocks; but it will be almost impossible to get into this harbor with an adverse wind, or even with a fair one, without the assistance of a pilot.

Ships sometimes run in, and anchor between Greenspond Island and the main, but the channel is narrow, the water is very deep, and it lies too open to the S. W. winds to be considered a place of safety. In order to sail into it you must get to the westward of the Copper Islands; in so doing, be careful of the Midsummer Rock, which lies nearly W. by S.  $\frac{1}{4}$  S. distant one mile from Copper Island, and has only 5 and 6 feet over it, observe, when you shut in Silver Hare Island by Shoe Cove Point, you will be within side of the danger; it is also necessary to give Nowat's and Ship Island a wide berth, as the water shoals off them to a considerable distance.

## CAPE FREELS TO THE STRAIT OF BELLE ISLE.

CAPE FREELS is formed of three points, the South Bill, the North Bill, and the Middle, or Cape Freels: there are many shoals and rocky dangers about them all, therefore a wide berth should be given them at all times. Over these points is some high land, commonly called the Cape Ridge, which is visible at a considerable distance.

**FUNK ISLAND.**—N.  $54^{\circ}$  E. from Cape Freels, distant 27 miles, lies the Funk Island. This is little more than a sterile rock, and cannot be seen further than at the distance of 10 or 12 miles; but it will always be distinguished by the great number of birds which continually hover over it. About 200 yards north of Funk Island is a large rock above water, and N. W. by W. 180 yards from this are still larger rocks; they are all barren, and only the resort of sea birds, that inhabit and breed there; between these rocks are 18, 37, and 42 fathoms water, with a clear passage, but between the eastern rock and Funk Island there is a dangerous sunken rock, of only 10 feet water, over which the sea generally breaks; near this sunken rock are 14 and 16 fathoms, and between it and Funk Island 30, 25, 56, 38, 24, and 17 fathoms; off the western point of Funk Island are some rocks, and at its eastern part a sort of creek with 5 fathoms in it. It is also reported that a ledge of rocks lies S. W. from Funk Island, distant about 7 miles.

**DUREL'S LEDGE.**—This is a dangerous reef, and said to lie about 7 leagues N. W. by N. from Funk Island; the sea breaks over it continually; and nearly N. W. by W. distant 3 leagues from Durel's Ledge, is another danger named Cromwell's Ledge, it is supposed to bear E. S. E.  $\frac{3}{4}$  E. distant 10 or 16 miles from Little Fogo Islands.

N. N. W.  $\frac{1}{2}$  W. from Cape Freels, distant  $6\frac{1}{2}$  miles, is the Outer Cat Island; it is connected to the main by a sandy reef, which is impassable for shipping, and forms the southern point of Deadman's Bay; a little before you come to the Outer Cat, you will see a remarkable hill called the Windmill Hill, and near it the Little Cat Island. In sailing to or from Cape Freels the shore should have a good berth, although there are soundings all the way, and they decrease gradually towards the shore. Deadman's Bay is formed by the Outer Cat Island to the southward, and Deadman's Point to the northward; the soundings within it are regular, and the bay without rocks, unless close to the shore, but it is totally unsheltered and open to all easterly winds.

Having passed Deadman's Point you will approach the Penguin Islands; these are 2 in number and bear from Cape Freels N. N. W.  $\frac{1}{4}$  W. distant 14 and 15 miles; between them the passage is clear, with from  $5\frac{1}{2}$  to 7 fathoms water, but vessels should not go within them and the shore, for there are several rocky reefs which render it particularly dangerous.

**RAGGED HARBOR** lies to the N. westward of the Penguins, distant  $6\frac{1}{2}$  miles; the main land hereabout is low and sandy, and the passage from the eastward rocky and dangerous; it should therefore not be attempted by a stranger, or without a pilot. To the north-westward is Ladle Cove Island, and 7 miles beyond that is Rocky Bay. At its entrance, which is wide, lie 3 islands, Noggin Island, Green Island, and further south is White Island; you may pass between each of these in 7 fathoms; between Rocky Point and Green Island in 7, 8, 13, or 10 fathoms; and between Green and White Islands in 13 and 14 fathoms; between Noggin Island and the western point of the Bay there are  $3\frac{1}{2}$ , 7, 12, 9, and 4 fathoms; the bottom of these bays, for there are 3 openings, is rocky, and vessels cannot go far into them.

**THE WADHAM ISLANDS.**—These are a cluster of islands lying to the N. westward of Cape Freels. They consist of 8 or 10 scattered islands, separated from each other by channels more than 1 and 2 miles wide; the largest of these is called Peckford's Island, which is almost a mile long, lies in the direction of north and south, and bears from Cape Freels nearly N. by W. distant 20 miles; from its southern part towards the land about Ragged Harbor, there are a number of rocky islets and reefs, with channels between them, rendering the navigation of this part extremely hazardous. N. N. W.  $\frac{1}{2}$  N.  $\frac{1}{2}$  mile from Peckford's Island is White Island, but a passage between them should not be attempted, for there are several small rocks lying off the north and north-western part of Peckford's Island, some of which stretch out almost as far as White Island. N. W. by W. from Peckford's Island, about  $4\frac{1}{2}$  miles, is Copper Island; Green Island lies W. N. W.  $\frac{1}{4}$  N.  $2\frac{1}{2}$  miles from Peckford's Island, and about a similar distance S. S. E.  $\frac{1}{4}$  E. from Copper Island; there are also some small rocks lying off the N. W. end of Green Island, which, being visible, can always be avoided with ease.

**S. W. ROCK.**—This is a small detached rock above water, bearing from Peckford's Island S. S. E.  $\frac{1}{4}$  E. distant  $3\frac{1}{2}$  miles; near it are 13, 17, and 21 fathoms; about N. N. E. distant 2 miles from the S. W. Rock, is a small flat island; and a little more to the eastward is Offer Island; this is the most easterly of all the Wadham Islands. There is yet a rock to describe, which lies E. S. E.  $\frac{1}{4}$  E. from Offer Island, distant about one mile and a half; this is dangerous, and must have a berth in passing either north or south of it.

**THE FOGO ISLANDS** lie to the N. westward of the Wadham Islands; Great Fogo is a large island, 4 leagues long and 9 miles broad; off its S. western point lie the Indian

Islands; and N. E. by N.  $3\frac{1}{2}$  miles from the body of Great Fogo are the Little Fogo Islands; numerous other rocks and small islands are scattered about.

This harbor is very secure, with good anchorage in any part, above the Harbor Rock; it has two Ticks, so called, in Newfoundland, and intended to describe narrow passages between islands and rocks; these may be entered with any wind except from the South to the S. W. which wind blows out of both. To enter the Eastern Tickle, you should borrow on Rags Island, keeping the extreme of Fogo Island nearly open of Lane's Island, until Gappy's Island comes open of Simon's Island, you will then clear the shoals of Filly's Point. To avoid the Harbor Rock, bring Slade and Cox's Flagstaff on with the eastern chimney of their dwelling house; it will be necessary to get this mark on before Boatswain's Island closes Bullock's Point. In coming from the westward it is advisable to make free with Fogo Island, in order that you may distinguish the small islands that form the Tickle, which if passed with westerly winds can never be regained, owing to the constant set there is to the eastward. Having passed Little Motion, keep the extreme point of the head over the Narrows Point, until you get past Bullock's Point, when the above directions will clear all the harbor's dangers.

**FORTUNE HARBOR.**—This Harbor lies between the Bay of Exploits and New Bay; it is good when attained; but the entrance, which is the Western Tickle, is extremely narrow and dangerous, on account of the high land around it; from which all winds baffle, except those blowing directly in.

**TRITON HARBOR.**—The entrance to this harbor is between the great and little Dunier Islands; in entering you will see Francis Island, which has a reef running to the S. Westward; give this a berth, but both the Dunier Islands are bold to and free from danger. Little Dunier Island lies S. W. three miles and a quarter from Saulpin Rocks, on approaching which, the harbor opens off the high land of Great Dunier; its shores are exceedingly bold, and therefore it is always to be preferred to Cutwell Harbor; its great depth of water will be avoided by running into Inspector's or Scrub Cove, where vessels may moor with hawsers to the trees, in perfect security.

The tides here, and also upon all the eastern coast of Newfoundland, have nearly the same rising, the springs being about 6 feet, neaps 4 feet, but these are much influenced by the winds.

**CUTWELL HARBOR.**—This harbor has a spacious entrance, sufficient for the largest ship to beat in to secure anchorage, in from 10 to 5 fathoms, sand and mud; the best anchorage is about W. by N. distant three miles from the Southern head. The arm runs in full one mile and a half above the Narrows, in which is abundance of wood and water, and well adapted for heaving down and refitting vessels. At the entrance is the Fool's Cap Rock, the marks for which are Copper Island, seen through Indian Tickle, and Mark Island on with the White Point. To clear the Fool's Cap Rock, keep the extremity of Southern Head, touching the north end of Hardrix Island, until Green Bay Gull Island opens to the westward of the Hag Rock. The only danger within the heads, is the rocks on the eastern shore, and most of these are visible at half tide.

Coming from the eastward, and bound to Fogo Harbor, you must be careful to avoid the Dean's Rock; which is a sunken rock, and lies between Joe Batt's Point and the harbor; steer W. N. W. until Brimstone Hill, a remarkable round mountain, appears in the centre of the harbor; then steer for the East Tickle, which may be known by the lantern on the top of Sim's Island, make the west side of the Tickle. Give a good berth to the point on the starboard side, and run right up the harbor, keeping near the south side, and you will carry from 5 to 3 fathoms through; immediately you get round the point, steer S. W. to avoid the Harbor Rock, and follow the directions given above for anchoring. The middle Tickle appears the widest, but it is fit only for boats; the other two must be adopted as best suits the wind.

Little Fogo Islands lie nearly N. E. distant  $4\frac{1}{2}$  miles from Joe Batt's Point; there are numerous rocks about them, both above and under water, making this part of the coast exceedingly dangerous; a little to the eastward of Little Fogo is a small rock just above water, called the N. Eastern Rock, and somewhat in this direction, distant 10 or 11 miles, is said to lie Cronwell's Ledge, whose exact position is not well determined, although it is considered to be extremely dangerous. Northward of Little Fogo are the Turr Rocks, and from hence in the direction of the western side of Great Fogo Island, and the Storehouse Rocks, the Seals Nests, Gappy and Stone Islands, the Jigger and Black Rocks, and various other dangers, all having deep water round them, and tending to increase the difficulty of the navigation.

The Island of Toulouquet lies to the westward of Fogo, and has several small islands about it; here is situated what is called Toulouquet Bay, and to the S. Westward of Toulouquet Island is the Harbor of Herring Neck; this is said to be a spacious, fine harbor, and fit for any vessels.

**CHANGE ISLAND TICKLE.**—This harbor is accessible when Fogo Harbor is not; it is very secure, and has good anchorage with 6 or 7 fathoms, muddy bottom. In general

the islands about it are low and marshy, but there is abundance of fire-wood, though water is scarce. The passage in from the eastward is between Ruth's Rock and the Tobacco Islands, the mark being Brimstone Head kept between both; this will clear all the dangers on the Northern Shore, and also off Skinner's Harbor; or you may bring the "Tackle" to the westward between the points of the land, and steer directly through in great safety.

**TOULINQUET HARBOR.**—This harbor is sheltered from all winds but those which blow from the North and North East, when, in heavy gales, it becomes dangerous. In entering, either by the East or Western channel, you must take the greatest care to avoid the White Ground, to clear which, you must bring Messrs. Slade's Dwelling House open of Simms' Island, and keep it so, until French Head opens through the Eastern Passage. This is very commonly called Burnt Island Tickle; and should not be attempted without you are thoroughly acquainted with the navigation, or in cases of great emergency. The anchorage is mostly foul, but the best and most secure is about 5 or 6 fathoms off Colburn's Stores; both water and wood is scarce. If the mariner should be here either early or late in the year, Back Harbor, which lies off the western side of the Table Land, will be found a preferable place for shelter, and a few small vessels may ride there with much safety; you may proceed in on either side of Gull Island, lying with the Western Head open of Batrix Island, and the Bluff Head, or with the Eastern Stage open of Batrix Island. The islands about the harbor of Toulouquet are moderately high, and bounded by dark colored slate cliffs: it may readily be known by the Gull Island or Table Land.

From Toulouquet Bay to Cape St. John the course is N. W. by N. distant 12 or 13 leagues; this is a high and rugged point of land, and may readily be known by the small high round Island to the S. Eastward, distant from the northern pitch of the Cape about  $2\frac{1}{2}$  or 3 miles; this is called the Gull Island, and is the third of that name on this side of Newfoundland; perhaps it will be better we should hereafter distinguish this as the Northern or St. John's Gull; that near Cape Freels as the middle or Cape Freels Gull, and the one lying off Cape Bonavista, as the Bonavista or South Gull.

Between the Fogo Islands and Cape St. John the charts commonly represent various deep bays and inlets, but their particulars are very little known, although there can be little doubt the Great Bay, and River Exploits, and the Bay of Notre Dame, afford many places of good anchorage, and of easy access, which, when fully explored, may become hereafter frequented, better understood, and prove highly beneficial.

**LA CEY.**—About 5 miles to the westward of Cape St. John is the Little Harbor or Cove of La Cey, to sail into which there is no danger whatever, and you may anchor anywhere in from 3 to 8 fathoms; it is easy of access, and open to the N. N.W. winds, which throw in a heavy sea; the best holding ground is just within a little cove on the starboard side, in 15 fathoms, muddy bottom; but further in the ground is not good.

**GREAT AND LITTLE ROUND HARBORS.**—The former of these is a good and convenient place for vessels engaged in the fishing trade; there is no danger in sailing in or out of it, both shores being bold to: the anchorage lies within the two inner points, where vessels may ride in 4 or 5 fathoms water, secure from the weather and entirely land-locked; but Little Round Harbor, which lies round a point to the N. Eastward about one mile and a half distance, is merely a Cove, and totally unfit for shipping.

**NIPPER'S HARBOR.**—This harbor lies to the N. Eastward of Green Bay Island about  $4\frac{1}{2}$  miles, and is fronted by several small islands, between which are several channels; but the best and safest is between them and the Northern Shore, in which the water is very deep and the shores bold. The harbor is rather confined and small, and therefore only fit to accommodate small vessels; but it is the most safe and secure on the shores of Cape St. John, and has excellent anchorage with from 7 to 14 fathoms water; the land about it is high and barren, but it is well supplied with water, and may be easily distinguished by the islands which lie off it.

**PAQUET HARBOR.**—About 5 miles N. W. by N. from Great Round Harbor lies Paquet Harbor; its entrance bears from the channel between the Horse Islands, nearly S.W. by S.; it may be known by its Southern Head, which is a high and rocky mountain; the Northern Head is somewhat lower, and there are 3 rocky islets lying directly off its point; both points are bold to, but a little to the southward of the 3 rocky islets, is a small shoal with  $2\frac{1}{2}$ , 3, and 4 fathoms upon it; the channel between it and these three rocks has 7, 8 and 9 fathoms, and the water across the entrance is from 8 and 9, to 19 and 20 fathoms; a similar depth continues more than a quarter of a mile in, where the Harbor divides into two channels, the one running northward, the other West and S. West. The northern arm is about one quarter of a mile long, and has 20, 18, and 19 fathoms at its entrance, becoming shallower as you advance; vessels running in here should keep the starboard shore on board, for about two thirds up the channel on the larboard side, there is a rocky shoal, a small part of which occasionally appears above water; on the other part of this shoal are from 3 feet to 4 fathoms; having passed this shoal steer up mid channel and anchor in 5, 7, or 8 fathoms; the northern part near the land becomes shallow, and a rivulet here falls into the bay, which is said to issue from some extensive lakes about two miles inland. The south-western chan-

nel is somewhat on both sides a mile in; it then running southward, occasion may require Hill, common

western chan-

nel is somewhat narrower than the northern one, but is quite free from danger; the shores on both sides are steep to, and bold, and you will have 12, 10, 9, 8, and 7 fathoms for half a mile in; it then shallows to the head of the bay, where there is a sandy beach and a river running southward. This is a snug and secure place for vessels to run into whenever occasion may require. To the northward of the Northern Point is a mountain called Signal Hill, commonly having a signal-post upon it, and serving to point out its situation.

THE HORSE ISLANDS are situated nearly equi-distant between Partridge Point and Cape St. John, bearing from the latter N. by W. and N. N. W. distant about five leagues; these are two islands, and form a circuit of nearly two leagues, appearing moderately high; there are three rocks above water lying to the northward of the easternmost; and on the east side of the same island there are some sunken rocks, which stretch out in some places near a mile from the shore; at the S. E. part of this island there is also a little cove, fit only for boats; there is probably a safe channel between these islands, but it is seldom attempted; the eastern island is the largest.

Following the shore of Newfoundland, to the N. Westward of Cape St. John there are two bays, called Pine Bay and Bay Verte, but although these may be places of good anchorage, they are little frequented by shipping.

FLEUR DE LIS HARBOR.—This harbor lies to the south-eastward of Partridge Point, from which it is distant one league, and derives its very appropriate name from three remarkable hillocks just over it. It is small but safe, and secure from all winds, having excellent anchorage in its N. E. arm, in 4 fathoms water. To avoid a rocky shoal that lies about 100 yards off the island, borrow towards the eastern shore, until you get Bluff Head open to the eastward of the island. There is plenty of wood, but in a dry season water becomes scarce. It is, however, very conveniently situated for the fishery, and commonly is frequented by 8 or 10 French vessels.

WHITE BAY.—This is a large and extensive arm of the sea, being at its entrance, from Cape Partridge to Cat Head, full 4 leagues wide, and running in a S. westerly direction, about 14 leagues, to its head; where it is contracted to a river's mouth  $1\frac{1}{2}$  mile wide. In this Bay or Gulf are several islands, coves, and inlets, affording both anchorage and shelter; these are Lobster Harbor, Southward Arm, Middle Arm, Pigeon Islands, Westward Arm, Purwick Cove, Granby's Island, Gold Cove, or River's Head, Goat and Sop Islands, Sop's Arm, Jackson's Arm, French Cove, Great and Little Coney Arms, and Great and Little Cat Arms.

LOBSTER HARBOR.—This is a small round harbor, with a shallow narrow entrance, having, at low water, in some places, not above 8 or 9 feet water; but when you are once entered, you will have 12 and 13 fathoms all over the harbor. Small vessels, therefore, sail in, commonly, at the flood tides.

THE SOUTHWARD ARM lies about 8 miles from Lobster Harbor, and further up the bay; here a ship may anchor with great safety, in 17 fathoms water, about 3 miles within the heads; but there is also good anchorage in any part below this, and before you are advanced so far up, in 20 and 25 fathoms; a little above the inner point, on the northern side, is a muscle bank, which stretches quite across the Arm, and nearly dries at low water; and when you have passed this, you will have 11 and 12 fathoms water, and the channel continues deep until you approach the River's Head. This is the first great inlet on this side of the gulf, and may, therefore, be readily recognized.

MIDDLE ARM.—This inlet lies about  $1\frac{1}{2}$  mile S. W. from the Southward Arm; at its entrance is a rocky island, which is joined to the shore by a shoal, over which are 1, 2, and, in some places, 3 fathoms water. This inlet runs in to the southward, about 3 or 4 miles. To enter it, you will do well in keeping the larboard shore on board; it is fitted only for small vessels. Two leagues W. by S. from Middle Arm, is Hawling Point; and between them lie the Pigeon Islands, about which the ground is good for fishing.

WESTWARD ARM.—This lies E. S. E.  $\frac{1}{2}$  S. of Hawling Point, and runs up nearly 4 miles; here large vessels may anchor in 18 fathoms water: there is a cove on each side of its entrance; that to the N. Eastward is named Bear Cove, where smaller vessels may moor securely, and ride safe from all winds, in about 12 fathoms water; the other is called Wild Cove, a very indifferent anchorage, open to the N. Westerly winds, and the bottom rocky and foul.

PURWICK COVE.—About 5 leagues down from the River's Head, and near the S. E. side of the bay, lies Granby's, or Mid Bay Island, without either cove or place of shelter; on the S. Eastern part of this island is a shoal running off the length of two cables, with not more than 9 feet water over it; and nearly abreast of this island, on the S. E. side of White Bay, is Purwick Cove, where shipping may find safe anchorage, and lie with good conveniences for the fisheries.

Having passed to the southward of Granby's Island, the bay narrows and runs up about 5 leagues towards Gold Cove, where the river branches out into several streams; and is commonly called the River's Head.

On returning up the western side of White Bay, you will perceive Sop's Island, about 3 miles in length, and 11 miles in circuit; near its southern end is Goat's Island; these form a

long passage, or arm, called Sop's Arm; at the north part of which a vessel may safely anchor, just inside the north side of Sop's Island; this will be the best side of the channel, or passage, into the arm; but there is anchorage in deep water between Sop's Island and the main, before you reach so far up as Goat's Island: there is also a small cove at the north end of the island, called Sop's Cove, and two other coves opposite the main, called Hart's Coves, in all which the fisheries are carried on, although ships generally anchor in the upper part of the arm, and withinside of Goat's Island.

**JACKSON'S ARM.**—About 4 or 5 miles to the northward of Sop's Island is Jackson's Arm, to enter which you will pass a ragged point, low and round; the water here is deep, except in a small Cove on the starboard side, where a vessel should moor head and stern: this place affords the largest timber in White's Bay. Frenchman's, or French Cove, is about a league to the northward of Jackson's Arm, and offers good and safe anchorage.

**LITTLE AND GREAT CONEY ARMS.**—Nearly 4 miles to the N. Eastward of Frenchman's Cove, is Coney Arm Head, the most remarkable land on the western side of White Bay, and bears W. N. W.  $\frac{3}{4}$  W. distant 6 leagues from Cape Partridge; the land here projects out one mile and a half, forming a deep bight, called Great Coney Arm. In this place there is no good shelter for shipping; but in Little Coney Arm, which lies to the westward of the head, is convenient anchorage for small vessels, although its entrance is too shallow for large ships; here fishing craft frequently rendezvous.

**GREAT AND LITTLE CAT ARMS.**—To the north-eastward of Coney Arm Head, distant 3 miles, lies the Great Cat Arm, and 5 miles further is Little Cat Arm; this latter inlet runs up to the westward full two miles; off its northern point are some rocks above water; to avoid which, keep nearer to the southern shore; you will find the water deep, and no good shelter, unless you approach the head or further end of the arm, where you will lie secure and land-locked.

**LITTLE HARBOR DEEP.**—You will now be to the northward of White Bay, and following the shore, will perceive the entrance to Little Harbor Deep, called by the French La Vache; this place is much exposed to south-easterly winds, and by no means a good harbor; off its northern point are some rocks, which are always above water; they lie half a mile from the shore, and afford good fishing about their environs; the water is not very deep in any part of this inlet, and when you get up half way from the entrance to the head, or further end, it becomes quite shoal.

**GRANDFATHER'S COVE, or L'ANCE L'UNION,** is an inlet about two miles deep, lying one mile and a half from Little Harbor Deep; this is also open to the southerly winds; and may be known, when near the shore, by the northern point appearing like an island, and bearing N. N. W.  $\frac{1}{2}$  N. from Cape Partridge: it is but an indifferent place for shipping, and seldom frequented.

**ORANGE BAY, or GREAT HARBOR DEEP.**—This may be known from any other inlet, by the land at its entrance being much lower than any land on the north side of White's Bay, and by its bearing north, distant 5 leagues from Cape Partridge; it forms a large harbor, and when you get about three miles within its entrance, divides into three branches, in the northern arm the water is too deep for vessels to anchor, until they have run up near the head; but the middle arm has a good bottom, and safe anchorage in 6 and 7 fathoms water. A little within the entrance of Orange Bay there is a Cove on each side frequented by the fishing vessels; but these are very dangerous for a ship to lie in, for although they moor head and stern, yet should a gale come on from the eastward, there is little safety to be depended upon.

**FOUCHEE.**—This place is little frequented, and there is no anchorage until you approach its further end, where you will find a cove on the northern side; this cove is 2 or 3 miles above the entrance, and very small vessels may anchor there in 16 fathoms, mooring head and stern. The land on both sides is extremely high and steep to the shore; there is also another arm running in above two miles further than the cove, but it is so narrow, and has such a depth of water, that it is almost useless to shipping.

**HOOPING HARBOR.**—About eight miles to the north-eastward of Fouchée, and a little to the S. Westward of Canada Head, lies the entrance to Hooping Harbor, or Sans Fond. This place has two arms, or bays, one running up northward, the other westerly; like many of the adjacent inlets, there is deep water all the way until you get near to the head of the northern branch; there the bottom is a kind of loose sand, open to the southerly winds, and by no means a safe place to lie in; but in the western arm a vessel may anchor in a moderate depth with safety.

**CANADA HEAD** lies about three miles to the south-westward of Canada Point, or Bide's Head; it is elevated land, and very easily to be distinguished either from the northward or southward, but when you are directly to the eastward of it, it becomes hidden by the high land up the country, commonly called the Clouds.

**CANADA BAY.**—This is an inlet of considerable size and extent: at its southern entrance is Canada Head; from whence it runs N. N. Easterly full 5 leagues; here vessels caught in easterly gales may seek shelter, and anchor in safety: in entering, when you get above the two rocky islets which lie near Bide's Head, and called the Cross Islands, you will

see a low white cables' length will find no da the narrows; and you will narrows, the 20 fathoms, frequented, at

Great St. Jul

see a low white point, and another low black one a little beyond it; off this latter, distant two cables' lengths, lies a sunken rock; keep therefore towards the middle of the bay, and you will find no danger, except a rock above water, which lies about a mile below the point of the narrows; this you will endeavor to leave on your larboard hand, keeping mid-channel, and you will have 18 fathoms through the narrowest part. Soon after you have passed the narrows, the bay widens, and is above a mile across, and you may then anchor in from 18 to 20 fathoms, good holding ground, and secure from all winds. But this bay is not much frequented, and only occasionally resorted to in case of necessity.

ENGLE'E HARBOR is situated on the north side of Canada Bay; to sail into this place you must pass a low point, appearing white, and forming the northern point of entrance to Canada Bay; then keep near the shore, until you get abreast of the next point, which makes the Harbor: haul round it to the S. E. taking care not to come too near the point, for it shoals a full cables' length off; having so far advanced, you can anchor in from 15 to 17 fathoms, good holding ground; but this is well up the Cove, which is too small to lie in, unless you moor head and stern. In Bide's Arm, which runs up N. N. E. from Engle'e, almost 2 leagues, there is no good anchorage, the water being too deep; but within the south end of Engle'e Island, is a good harbor for shallops, although from thence to where the ships lie, there is no channel, even for boats, unless at high water, or beyond half tide.

CONCH HARBOR bears nearly E. N. E.  $\frac{1}{2}$  E. distant 7 or 8 miles from the entrance of Canada Bay; it lies very open to the winds from the south, but has good anchorage well up to the head, in 11 fathoms water, good holding ground. S. by W. from Conch, distant 2 leagues, is Hilliard's Harbor, called by the French Botitot; this is a bad place for shipping, but very convenient for the fishing craft.

CAPE ROUGE HARBOR.—This harbor lies to the westward of Groais and Belle Isle Islands, which contribute to shelter it from the heavy swells of the Atlantic; the southern part of its entrance is shallow and rocky, and in the S. W. Arm is the Harbor shoal. The best anchorage is in the Northern Arm, in any depth of water. Ships may beat in or out, but the centre of the harbor is too deep for anchorage. Directly opposite to its entrance is a small island, which is named after the harbor, Rouge Island; its northern end requires a berth in passing.

BELLE ISLE AND GROAIS ISLAND.—These are high islands lying off the N. E. coast of Newfoundland, from which they are separated 9 or 10 miles. Belle Isle is the southernmost, and the larger island, being 8 miles in length and 3 broad; there is a little harbor at its south part, where fishing craft occasionally resort, but not calculated for shipping; other coves may be found about the shores of the island, where shallops sometimes take shelter. Off its south-eastern side lies Green Island, a small rocky islet, and to the southward a bank of soundings extends with 12, 20, 25, and 30 fathoms; there are some rocks, both above and under water, at the S. point of Belle Isle, but these lie close in to the land.

GROAIS ISLAND lies to the north-eastward of Belle Isle; and is about 8 miles in length and 2½ miles broad, its northern point lying in latitude 51°. Off this end, and also off the N. W. part of the Island, are several rocks above water; otherwise this Island is bold all round, and between it and the main are from 20 to 70 fathoms water: there are also two islets midway; the southern one is commonly called Red Island, they are both steep to, and without any known danger.

CROQUE HARBOR.—The entrance to this harbor is half a mile wide, and somewhat difficult to discover, it bears N. W. from Groais, distant 3 leagues. When the north point of Belle Isle is clear of the southern part of Groais, you will be a little to the southward of Croque; and this mark will not fail pointing out to those unacquainted with this navigation the fair way to its entrance; especially as the headland forming the southern shore is bare of trees and has a round appearance, with some rocks, which are always visible, and lie about 40 yards to the S. E. of it. The shores of the harbor are bold to, and even a frigate may easily work into it; the anchorage is excellent, being good holding ground, of dark slate colored mud. Having opened the Harbor's mouth, steer in N. W. by N. proceed mid-channel, and when you have advanced up about a mile, you will see the river divide into two branches, anchor hereabout. There is a little Cove at the southern entrance, called Irish Bay, in which are 13, 10, 8, and 5 fathoms, and two rocks above water at the head of the Bay, near which is a little rivulet of fresh water.

GREAT AND LITTLE ST. JULIEN.—To the north-eastward of the Harbor of Croque lie Negro and St. Julien's Islands; near which are the Harbors of Great and Little St. Julien, and also that of Grandway; these are all adjacent to the Island of St. Julien, and bear to the north-westward of the northern part of the Island of Groais. The S. W. end of the Island of St. Julien is but little separated from the main, and cannot be distinguished to be an Island, until you arrive very near it; there is at this end no passage, except for boats; therefore to sail into either of these harbors you may keep close to the north east end of the island; and in passing that, the Harbors will open to your view.

Great St. Julien's is the easternmost harbor, to which there is no danger until you get with-

in the entrance; then you will find the starboard shore to be shoal, nearly one third over; but when you have passed the first stages, you may anchor in from 8 to 4 fathoms water.

*To Sail into Little St. Julien's* you will first steer for Great St. Julien's Harbor, in order to clear a sunken rock, which lies directly before the Harbor's mouth; and having arrived opposite the entrance of Grandsway, steer into the harbor and anchor in 5 or 4 fathoms water. It will be requisite for all ships which go into either of these Harbors, to moor both head and stern; but Grandsway is not a harbor for shipping, although it is extremely convenient for fishing craft.

**CREMALLIRE and GOOSE COVES.**—These places lie on the northern shores of Hare Bay; Cremallire has spacious and good anchorage in 7 or 8 fathoms, and is supplied with abundance of wood and water. Trois Montagnes is merely a small creek, in which a few French vessels moor during the winter season. It is situated to the S. Westward of Cremallire, and has a rivulet which extends eastward to Goose Cove.

Goose Cove is situated on the western side of Goose Cape; it is small but very secure, and has most excellent anchorage in 4 or 5 fathoms. Vessels can sail into it with a westerly wind, or into Cremallire with an easterly one.

**ST. ANTHONY'S HARBORS.**—This lies a little to the north-eastward of Cremallire Bay, and is a very safe place, having good anchorage with 6 and 7 fathoms water, on a bottom of blue clay; its entrance lies West, distant one mile and a half from Cape St. Anthony. It cannot be easily mistaken, from the remarkable high land on its southern shore. It is well supplied with wood and water, and is commonly frequented by some French fishing vessels.

**BRAHA HARBOR.**—This harbor is small but safe, having good anchorage within it; the bottom is sandy, and the shores are bold and steep to. The Braha Shoal, lies S. 74° E. (true) distant  $1\frac{1}{2}$  mile from the Needle Rocks: it is reported to have not more than 6 feet water over it, but Capt. Bullock says, he never found less than 16 feet; with a little sea it occasions breakers, but the common current will always create a constant ripple.

**HOW HARBOR** lies on the northern shore of Hare Bay. The entrance to this place bears N. 48° W. distant 12 miles from Fishot's Northern Island, and is by far the best harbor in Hare Bay, having safe anchorage over every part; the surrounding hills are barren; but small stunted wood may be found in the valleys. To the northward a range of marshes and ponds extend as far as Pistolet Bay. The harbor is about half a mile wide, and a full mile and a half long; a small rock lies off the western point, but it is very near the land, and the upper part of the harbor shoals gradually.

**ST. LUNAIRE BAY.**—This excellent harbor will contain 100 vessels in perfect security, is remarkably easy of access, and may always be recognized by the appearance of the White Cape; the best and most convenient anchorage will be found at Amelia Cove, in from 5 to 7 fathoms. The approach and entrance are bold and steep to, only observing to give the point of the Southern Islands a good berth. Both wood and water are to be obtained without difficulty, and it affords in every respect a good and secure anchorage.

**GRIGUET BAY and CAMELS' ISLANDS HARBOR.**—The North Bay is insecure in spring and fall, on account of its being exposed to the southerly gales; the S. West Bay is therefore recommended, where there is good anchorage in five or six fathoms water. Camels' Islands Harbor will always be found too intricate for a stranger, and should never be attempted without the assistance of a pilot.

**THE NORTH HARBOR** runs in with Stormy Cape; and has, at its entrance, a rock above water; which is bold to all round, and vessels may sail on either side of it, and anchor in 6 fathoms water. In the passage which leads to the N. W. and S. W. Harbors, there is an island which contracts the channel, rendering the passages narrow; the best and safest entrance is to the northward of this island, giving the outer point of the N. W. Harbor a little berth, and so soon as you get within the island you will open both harbors; that which runs in N. Westward is the larger of the two, and is two miles deep; you should sail up on its western side, having 14, 16, and 18 fathoms, until you get inside the point, a little within which is a bank of 7 or 8 fathoms, but when you have passed over this, you will again drop into 16 and 17 fathoms; and as you approach the head of the Bay you will lessen your water to 7, 6, and 5 fathoms, every where good anchorage, and well sheltered from all winds. The two Islands of Griguet lie outside of Camel's Island, and, together, form between them several small but snug harbors for fishing vessels.

**WHITE ISLANDS.**—You will now perceive the White Islands, lying to the north-eastward of Stormy Cape, from which they are distant one league and about  $2\frac{1}{2}$  miles from the shore opposite; they are small, of moderate height, and have several rocks inside, both above and under water, but these are not considered to be dangerous, as they are easily discoverable even in fine weather, and the passage between them and the main is very safe.

**QUIRPON ISLAND.**—This lies off the north-eastern part of Newfoundland, and forms the S. E. point of entrance to the Strait of Belle Isle; it is large, high, and barren; and Cape Degrat is visible in clear weather, full 12 leagues to seaward.

**LITTLE QUIRPON.**—There is a narrow channel which runs into the southward of Quirpon and divides it from the main; here lies Little Quirpon Harbor, to enter which

there is no danger, stern, and lie to the

DEGRAT A Island, and to the and rocks above water, and good Quirpon Island, and steep to, and you will perceive

COOK'S HAR about two miles a ward of the north open of the outer and if going in, so in for the harbor,

there is no danger but what you will easily perceive; vessels commonly moor head and stern, and lie there perfectly secure.

**DEGRAT AND PIGEON COVES.**—These coves lie on the eastern side of Quirpon Island, and to the northward of Cape Degrat; at their entrance are several small rocky islets and rocks above water, affording behind them very fair security for shipping, in 4 fathoms water, and good conveniences for fishing. Bauld Cape, which is the northern extremity of Quirpon Island, lies in latitude  $51^{\circ} 39' 45''$  N., and in longitude  $55^{\circ} 27' 50''$  W.; it is rocky and steep to, and may be approached very near, with great safety; having rounded this Cape you will perceive a rocky point to the southward leading to the Harbor of Quirpon.

**GREAT QUIRPON HARBOR**, lies on the N. W. side of the island, and its entrance is between it and Grave's Island; in your approach towards it from the northward you may borrow as close as you please to Bauld Head, there being no invisible danger until you arrive at the entrance to the harbor, where there are some shoals which must be left on your larboard side: to do this keep Black Head on Quirpon Island open of all the other land, until Raven Point comes over Noddy Point, then haul in for the harbor, going not nearer than the distance of half a cable's length from the point of Grave's Island; the anchorage within the island is every where good, with room and depth enough for any ship, and the ground holds well; but the best place to ride in will be towards the upper end of Grave's Island, abreast of Green Island, in 9 fathoms water; the passage to the Inner Harbor, on either side of Green Island, is very good for ships of moderate water, through which you will have 3 fathoms, and above Green Island you have excellent riding in 7 fathoms. There is also a passage to this harbor through Little Quirpon Harbor, but it is too narrow and intricate for any one to attempt, unless they are perfectly acquainted with the navigation.

**NODDY HARBOR.**—This place lies a little to the westward of Quirpon Harbor, and runs in between Noddy Point and Cape Raven; there is no danger in entering, and you will pass to the starboard of the little island that lies about a mile within the entrance, and anchor above it in 5 fathoms water; or you may with a small vessel run further up into the basin, and anchor in  $2\frac{1}{2}$  or 3 fathoms; here is a stage within the island, and on the eastern side of the harbor, with convenient room for many vessels.

**GULL ROCK and MARIA'S LEDGE.**—The Gull Rock lies W. N. W. from Bauld Cape in the island of Quirpon, distant  $2\frac{1}{2}$  miles; and N. N. E.  $\frac{2}{3}$  E. nearly 3 miles from Cape Raven; it is always above water. Maria's Ledge lies nearly S. W. from the Gull Rock, distant 2 miles, and N. by E.  $1\frac{1}{2}$  mile from Cape Raven, being distant about a mile from Maria's Head. In standing in from the northward for either QUIRPON or NODDY HARBORS, you need be under no apprehension of danger from the Gull or Maria's Rocks, for both are above water, the passage between them is half a league wide, and very safe; but it will be prudent to pass nearer the Gull Rock because of the N. W. Ledge, which never appears but in bad weather; this N. W. Ledge bears W. a little south, distant  $1\frac{1}{2}$  of a mile from the Gull Rock, and you should not attempt the passage between it and the main, on account of other rocks that are said to lie about, and places of shallow water.

To the westward are the Sacred Islands; Great Sacred Island lies about N. W. by W.  $\frac{1}{4}$  W. from Bauld Cape, distant  $5\frac{1}{2}$  miles, and S. E. by E.  $\frac{1}{3}$  E. from Cape Norman nearly 13 miles. Little Sacred Island is one mile to the southward of the great island; the passage between them is safe, and you may sail round both, for they are high and bold; within them, on the main and to the W. S. Westward, is Sacred Bay, tolerably large, with numerous rocky islets within it: the shores of this place abound with wood, and therefore it is much resorted to for the use of the fisheries at Quirpon and Griguet, &c. Cape Onion forms the north point of Sacred Bay, being high and steep; near it is a remarkable rock, called the Mewstone, and much resembling that in Plymouth Sound. There is a little cove to the southward of this rock, where a vessel may occasionally resort to with safety.

**HA-HA BAY.**—From Cape Onion to Burnt Cape the course is W.  $\frac{1}{3}$  N. about 6 miles; it has a white appearance, and rises from the seaward to a considerable height. On the eastern side of Burnt Cape is Ha-ha Bay, which runs in southerly about 2 miles; it lies open to northerly winds, but when you are within the cape you will find anchorage in 6 or 7 fathoms; or you can go further up and ride well sheltered in 3 or  $2\frac{1}{2}$  fathoms. This is a convenient place for the fisheries, and has plenty of wood.

**PISTOLET BAY.**—This bay lies between Burnt Cape and the Norman Ledges, which bear from each other N. W. by N. and S. E. by S. distant 8 miles; the bay is extensive, and reaches several miles each way, having good anchoring ground in most parts, particularly on the western side, a little above the islands, in about 5 fathoms water; the shore is tolerably well furnished with wood, and contributes to supply those places which are destitute of that article.

**COOK'S HARBOR**, lies in the N. W. part of Pistolet Bay, and within the islands, about two miles above Norman Ledge Point. These ledges are about one mile to the eastward of the north point: to clear these dangers as you enter, be sure to keep Burnt Cape well open of the outer rocks, that lie off the islands at the western entrance to Pistolet Harbor, and if going in, so soon as you consider yourself to be to the southward of these ledges, steer in for the harbor, leaving the islands and rocks, on your larboard side; keep the southern

shore on board, for fear of a ledge of rocks that juts out from a little rocky island on the other side; and so soon as you get within the island haul over for the northern shore, and anchor in 4 or 5 fathoms water. This harbor is capable of being made very convenient, and several fishing rooms and proper stages for the boats to resort to, and cure their fish, might be erected in all the coves between it and Cape Norman.

**CAPE NORMAN**, is the northernmost point of Newfoundland, being of a moderate even height, and very barren appearance, which continues far inland; it is about a league to the N. Westward, of the ledges; from Cape Norman the shores of Newfoundland turn S. Westward, and will be described hereafter.

**BELLE ISLE.**—This island, which lies at the entrance of the strait to which it communicates its name, should be called the Northern Belle Isle, to distinguish it from those we have already described, lying to the southward; it is about 8 miles long and 3 broad, or 7 leagues in circumference, being distant from Bauld Head in Quirpon Island, about 14 miles, and from the coast of Labrador 12 miles; it is moderately high, and wears a uniform sterile appearance. On its N. Western shore there is a small harbor called Lark Cove, or Harbor, lying within an island almost close to the land, and fit only for small craft; and at the eastern side of this island is another cove called Batteaux Creek, frequented occasionally by shallops. About two miles to the north-eastward of this island lies a ledge of rocks, part of which appear above water, and over these the sea breaks very high; this is called the N. E. Ledge, you will have 15 and 20 fathoms close to it, and 55 between it and the north part of the island. The soundings about this Belle Isle are very irregular; near the island you will seldom find less than 20 fathoms, except on a small bank said to lie to the northward, distant 4 miles from its N. Eastern part, whereon is only 5 fathoms. The northern part of this island is said to lie in about the latitude of  $51^{\circ} 57' N$ .

*Soundings in the Strait of Belle Isle.*—In crossing the Strait of Belle Isle from Quirpon to Chateaux Bay, your soundings will be irregular; from 20 to 30 fathoms on the Newfoundland side, and in some places from 30 to 38 fathoms; in the stream or middle of the Strait, you will find 25 and 35 fathoms, coarse sand and broken shells; and towards Chateaux Bay, 45 to 80 fathoms, and within a mile of the coast of Labrador 35, 30, and 25 fathoms. To the northward between Belle Isle and St. Peter's Bay there are 59, 87, 96, 63, and 20 fathoms.

## THE SOUTHERN COAST OF NEWFOUNDLAND,

### FROM CAPE RACE TO CAPE CHAPEAU ROUGE.

**PRELIMINARY REMARKS.**—Vessels bound towards the Gulf of Newfoundland should take the greatest care to notice and make a proper allowance for the currents, which set from the eastward, all along the southern coast of Newfoundland, with frequently fatal velocity; causing an impetuous indrught into the various Bays, and occasioning the much to be deplored loss of many lives, and the wreck of numerous vessels; these local currents chiefly prevail on that part between Cape Race and Cape Ray; more vessels have been cast away on the small point of land which divides the two bays of Trepassey and St. Mary, than on any other part of the island; that these accidents were occasioned by the currents there can be little doubt.

An able navigator, who has been 20 years employed in the fisheries, and who is a native of Newfoundland, observes, it is well understood by all the boat masters, that there is in general a strong current setting in from the eastward, along the Western Coast of Newfoundland, which, after passing Cape Pine, runs more towards St. Mary's and Placentia Bays; this current will be felt at least 20 leagues to the S. W. of Cape Pine, and becomes more rapid as you approach the land; its velocity increasing as the winds favor its direction; but at all times of sufficient magnitude to endanger the safety of any vessel approaching from the south or west in foggy weather, and being ignorant of its existence.

In order to avoid the danger arising from this current, the fishermen in foggy weather, when returning from the western coast to their homes on the eastern shore, invariably use the lead, depending more upon the depth of water than their compass, and always keeping a sufficient distance from the land to insure the safety of the vessel. On passing to the eastward of Cape Race they never approach nearer to the land than 35 fathoms water; the ground being more of an inclined plane on the west than on the east coast, you will find that depth of water at a considerable distance; the ground becomes more broken, and the depth of water increases so fast, that in your course from Cape St. Mary's to avoid Cape Race

you will, when to short distance fur be clear of any lar navigation, the m

you will, when to the eastward of it, find yourself in 50 fathoms, and when advanced a very short distance further, you will drop into 60 and 70 fathoms; consequently, you will then be clear of any land, and may safely pursue what course you think proper; but, in all this navigation, the mariner's safety may be insured by a due attention to the lead.

**CAPE RACE** is situated on the southernmost part of Newfoundland, and lies S. W.  $\frac{1}{2}$  W. distant 3 leagues from Cape Ballard: before it lie 2 or 3 rocks above water, these are close to the land, and have 10 fathoms water very near them. Between 6 and 7 miles E. S. E. from Cape Race is the New Bank, being 4 miles long and  $1\frac{1}{2}$  broad, and lying N. E. by N. and S. W. by W.: on it are 17, 20, and 25 fathoms with very deep water on its outside, and 30 fathoms just within it. Vessels making this part of the coast may know their approach toward the land, by suddenly lessening their water to the above depths.

The Virgin Rocks, which are dangerous, lie in the direct track to Cape Race, Newfoundland, the point which vessels bound to Quebec generally endeavor to make. (See page 13.)

Near Cape Race is a small inlet named Cripple Cove; the land then turns westerly towards Mistaken Point a distance of  $4\frac{1}{2}$  miles; the shores are bold, and off Mistaken Point is a rock above water. N. W. by W. about 2 miles is the French Mistaken Point, this also has a rock off its extremity; from hence the shore winds N. by W. into Trepassey Bay, at the northern part of which lies Biscay and Mutton Bays, and Trepassey Harbor. The two former of these are seldom frequented, and it is considered dangerous to get embayed there, for the sea commonly drives in, and there is hardly any current to help you out again. Mutton Bay is formed to the eastward by Cape Mutton, and to the westward by Cape Powles; this last is the extreme point of a narrow neck of land that divides Mutton Bay from Trepassey Harbor; it is a long, low, sandy, and stony beach, over which the ships lying in Trepassey Harbor can be distinctly seen. Mutton Bay is about 2 miles deep, and has from 12 to 3 fathoms water in it: but the bottom is foul and rocky.

**TREPASSEY HARBOR.**—The entrance to this harbor is to the westward of Cape Powles, and the direct course in will be N. E.  $\frac{1}{2}$  E. Cape Powles lies from French Mistaken Point N. W. about 8 miles; from Cape Mutton W. S. W.  $\frac{3}{4}$  W. one mile, and from Cape Pine N. E. by E. 5 miles. The entrance to Trepassey Harbor is three quarters of a mile wide, and continues of that breadth full  $2\frac{1}{2}$  miles up; it then narrows to less than half a mile, and opens again to its former width, and there vessels commonly ride. To enter this harbor ships commonly steer over from Mistaken Point towards Cape Pine, until you fairly open the harbor; you may then safely run along the shore, for it is bold; in sailing into the harbor, you will meet with a rock on the S. Eastern shore, lying about a mile from Powles Head, and one third of a cable's length off the shore; there is also, on the northern side, a shoal which runs along up the harbor, so far as a low green point; to clear this shoal, bring Baker's Point on with a low rocky point at the entrance of the harbor; and when you get so far up as the low green point, you may steer more westerly, and anchor either in the N. W. or N. E. arm, in 5 or 6 fathoms water; both wood and water can be obtained with ease.

From Mistaken Point to Cape Pine the course and distance are W. N. W.  $\frac{1}{2}$  W. 4 leagues and a half; and from Cape Pine to Cape Freels, west, one mile. The land about Cape Pine is barren and moderately high; from Cape Freels, the shores extend W. N. W. one mile to Black Head, and thence N. W.  $\frac{3}{4}$  W. to the eastern reef, and head of St. Shot's Bay.

**ST. SHOT'S BAY.**—This is the fatal spot where so many vessels have been recently wrecked; the bay is about a mile deep, and from the eastern to the western head, the bearing is N. by W.  $\frac{3}{4}$  W. distant two miles, it lies entirely open and exposed to the sea.

**ST. MARY'S BAY.**—This is an extensive bay, or gulf, commencing on the eastern side at St. Shot's, and on the western side at Point Lance; the course from the eastern head of St. Shot's to Point Lance being N. W.  $\frac{1}{2}$  W. about 20 miles; from thence the land runs up E. N. E. 9 leagues and a quarter; the land on each side being moderately high, and having several good harbors in it. In proceeding from St. Shot's along the eastern shore you will pass two little coves, and reach Gull Island, this lies close in to the land, and bears from the western head of St. Shot's N.  $\frac{1}{2}$  E. distant 4 miles.

From Gull Island to Cape English the bearing and distance are N. by E.  $\frac{3}{4}$  E. two leagues; Cape English is high table-land, terminating in a low rocky point, and forming a bay, about a mile deep, to the southward of it; at the bottom of this bay is a stony beach, within which is Holyrood Pond, running E. N. E. nearly six leagues, and from half a mile to 3 miles in breadth; this occasions the Cape to appear like an island, when you are to the southward of it. One mile and three quarters N. E.  $\frac{1}{2}$  N. from Cape English is False Cape; six and a half miles E. N. E. from Cape English is Point la Haye, this is low, and has a ledge of rocks running from it about a quarter of a mile into the sea, and above a mile along the shore, on which the waves break furiously in bad weather; this is the only danger you will meet with in St. Mary's Harbor.

**ST. MARY'S HARBOR.**—From Point La Haye to Double Road Point, which is the

southern extreme of St. Mary's Harbor, the course and distance are E. N. E. one mile and a half; the land between is low and wears a barren appearance. Within Double Road Point is Ellis's Point, distant half a mile; these two form the starboard points of entrance to the harbor, which is here nearly a mile wide. You will now perceive the river to be divided into two branches, the one running E. N. E. into what is called Mal Bay, the other S. Easterly into St. Mary's Harbor. When you are within Ellis's Point, in St. Mary's Harbor, you can haul to the southward, and anchor abreast of the fishing-stages and houses upon a flat, in 4 or 5 fathoms water, where you will ride land-locked; this flat runs off shore about half a mile, and between it and the opposite shore is from 15 to 30 fathoms water. The best anchorage is about two miles above the town, opposite to Brown's Pond, where it is above half a mile wide; here also you will lie land-locked in 12 fathoms, and have excellent ground to the further end of the bay.

**MAL BAY** on the E. N. E. branch, is about one mile wide, and runs up  $2\frac{1}{2}$  miles; but the anchorage is not good; a heavy sea frequently sets into it, and unless you run up to its very head, in 5 or 6 fathoms, you can have no place even for occasional security; it therefore is seldom resorted to. The entrance to these harbors bears from Point Lance nearly East distant 19 miles. From Trapeau Point, the coast runs N. N. E.  $\frac{1}{2}$  N. above two miles to Shoal Bay, and opposite to the northern point of this Shoal Bay lies Great Colinet Island; this is about a league in length and one mile broad; the southern end of which bears from Cape English N. by E. distant three leagues; there is a safe channel on either side of this island, only taking care to give Shoal Bay Point a good berth of a quarter of a mile, in order to avoid some rocks which lie off it. On the northern side of the Great Colinet is a stony beach, off which runs a bank with from 7 to 17 fathoms water, rocky ground. One mile and a half N. Eastward from Great Colinet is Little Colinet Island, above a mile in length and half a mile in breadth; there is deep water all round it.

**GREAT SALMON RIVER**.—E. N. E. five miles and a half from the northern part of Little Colinet Island is the entrance to Great Salmon River, which is nearly three quarters of a mile wide, and runs E. N. E. 7 or 8 miles. About 3 miles up this river, and on its southern shore, is an opening called Little Harbor; opposite this, in a small cove, is the best anchorage in the river, although it is generally good throughout; here you may ride safely in 5 or 6 fathoms water; the river narrows as you advance up it, and towards its furthest end becomes very shallow.

**COLINET BAY**.—N. W. by N. from the entrance of Great Salmon River, distant  $2\frac{1}{2}$  miles, and N. E.  $\frac{1}{2}$  E.  $5\frac{1}{2}$  miles from Little Colinet Island, is the mouth of Colinet Bay; between Salmon River and Colinet Bay, is a cove a good mile and a half deep, with from 13 to 4 fathoms in it, but it is exposed to the S. W. and therefore not much resorted to. Colinet Bay runs in N. E. by N. about 2 miles, where the point of an island on the starboard side narrows the passage, having passed which the channel opens wider again, and the top of the bay is a sandy shallow beach; throughout the whole of Colinet Bay the anchorage is good; you will have from 12 to 6 fathoms water up to the narrows; in passing the narrows there are 7 and 8 fathoms, and above it 6, 5, and 4 fathoms; all good ground.

**NORTH HARBOR**.—To the W. S. W. of Colinet Bay, 4 miles, and N. by E. about 2 miles from the northern end of Little Colinet Island, is the entrance to North Harbor, which is three quarters of a mile wide, and runs up to the northward 3 miles; the anchorage is very good about two miles up the river, where it is half a mile wide in 5 or 6 fathoms; or vessels may run further up, where two sandy points stretch out, being half a cable's length asunder; keep the starboard point on board, and anchor close within the starboard shore. In entering North Harbor always keep mid-channel, for the eastern land is somewhat shallow.

The land now trends W. S. W.  $\frac{1}{2}$  S. towards Point Lance; there are one or two coves in the way, but no place fit for the reception of shipping.

**POINT LANCE** lies in lat  $46^{\circ} 48'$ , and is a low ragged point, although the land in the interior rises up and becomes highly elevated. We have already stated that the course and distance from the eastern head of St. Sho's to Point Lance, is N. W.  $\frac{1}{2}$  W. about 22 miles; from Point Lance to Cape St. Mary is N. W.  $\frac{1}{2}$  W. about  $6\frac{1}{2}$  miles.

**CAPE ST. MARY** is a high bluff point of land making like Cape St. Vincent's on the coast of Portugal; the land to the northward along shore, to a considerable distance, has an even appearance, and is nearly of equal height with the cape itself. W. by S. from Cape Lance, distant full two miles, lie the Bull and Cow Rocks; these are two flat rocks lying very near each other, and having many small rocks about them; about a similar distance, but nearer to the main, is another rock appearing at half tide; there are 10 fathoms between it and the shore, and 15 fathoms between it and the Bull and Cow Rocks. In a similar direction to the Bull and Cow Rocks from Cape Lance, but at 3 leagues distance, and nearly S. S. W. distance  $7\frac{3}{4}$  miles from Cape St. Mary's, are two other little rocks appearing just above the surface of the water, and having the sea constantly breaking over them; they lie S. S. E. and N. N. W. from each other, distant 3 cables' lengths, and have 15 fathoms between them; the same depth of water is all round them excepting towards the S. S. E. where only 6 fathoms will be found 2 cables' lengths off. Between these rocks and Cape St. Mary are 32, 25,

and 19 fathoms w

and 19 fathoms water; and near the Cape are 13, 14, and 15 fathoms. Vessels therefore may proceed between them, and also between the Bull and Cow Rocks and the main, if necessary, for there is no hidden danger; but perhaps it will always be more prudent to go to the southward of both.

**PLACENTIA BAY.**—The entrance to Placentia Bay is formed by Cape St. Mary on the east, and Cape Chapeau Rouge, or Mountain of the Red Hat, on the west; the former lying in latitude  $46^{\circ} 49'$  N. the latter in  $46^{\circ} 53'$  N. bearing from each other W. N. W. and E. S. E. distant 17 leagues. Cape Chapeau Rouge is the most remarkable land on all the coast, appearing higher than the surrounding shore, and somewhat like the crown of a hat, from which singularity it obtains its name; it is visible 11 or 12 leagues to seaward, in clear weather.

From Cape St. Mary to Cape Breme your course will be N. by E. about 9 miles, and from Point Breme to the Virgin Rocks N. E. by E. 13 miles; these rocks lie  $1\frac{1}{2}$  mile from the main, and always appear above water; a little to the southward of the Virgin Rocks are some whitish cliffs in the land, by which it may be known if falling in with the land hereabouts in thick weather.

From the Virgin Rocks to Point Verde, the southernmost point of Placentia Harbor, the course and distance are N. E. by E.  $\frac{1}{2}$  E. 5 miles; from St. Mary's Cape to Verde Point there is no harbor or place of shelter for ships of any size.

**PLACENTIA HARBOR.**—Point Verde or Green Point is low and level, and forms the southern point of the road; it has a pebbly beach on each side, and several fishing stages within it; at the end of this beach, is a high rocky cliff, extending to the S. E. corner of the bay, where it again terminates in a pebbly beach; this beach then runs E. N. E. one mile to the Fort Point, and on the inside, which faces the S. E. arm of the harbor, stands the town of Placentia. A little southward of the town is a high hill, with a remarkable cliff on the middle of the beach. The outer side of the north point is level, with a clay cliff on its outer part, bearing nearly N. E. by N. distant from Point Verde  $1\frac{1}{2}$  mile; from this point the land forms a small bay, with a stony beach round it, to the corner of the cliff under Signal Hill; this cliff continues to Freshwater Bay, which is formed in a valley between Signal Hill and Castle Hill, having a pebbly beach around it; here a small rivulet runs down the valley, at which vessels may obtain water; to sail into this road, if coming from the southward, you should keep a league off the land, in order to avoid the Gibraltar Rock, which lies about two miles to the westward of Green Point, and has only 8 feet water over it; the mark to go to the northward of which is the castle, standing on a hill at the northern side of the harbor, and very conspicuous to seaward, open of Point Verde; when you have this castle on with the point, you will pass a little to the northward of the rock, but when you have the castle well open of the point, you will give the rock a wide berth; run in with this mark, keep your lead going, for there are regular soundings on both sides, and give Green Point a good berth of 2 cables' length, passing it in 4 fathoms water; then proceed to the anchorage in Freshwater Bay, and under Castle Hill, at three quarters of the distance over from that side, where you will lie in 6 or 7 fathoms water, good ground. At the bottom of the road is a long beach, which terminates in a point to the northward, on which stand some houses and an old fortress; there is also a fort on the opposite point; the entrance to the harbor is between these; it is very narrow, not above 60 fathoms across, and has  $3\frac{1}{2}$  fathoms water in it; when you get within these points the harbor opens, becomes one third of a mile wide, and extends E. N. E. above  $1\frac{1}{2}$  mile, where ships may lie in perfect security with 6 and 7 fathoms water; in going in keep nearer to the starboard side; the stream runs into the harbor more than 4 knots an hour. The tide rises 6 or 7 feet; and it is high water, full and change, at 15 minutes after 9 A. M.

N. E.  $\frac{1}{2}$  E. from Point Verde, distant two miles, and N. N. W. from Moll Point, about  $\frac{3}{4}$  of a mile, is the Moll Rock, over which are only 12 feet water, with 8 and 10 fathoms near it. N. E. by N.  $\frac{1}{2}$  miles from Point Verde is Point Latina; S. W. from Point Latina, distant one mile, is the Wolf Rock, these lie about half a mile from the main, and between Placentia Harbor and Point Latina, and therefore must have a good berth in passing; the shore all the way is low near the sea, but high and ragged inland; a large mile to the eastward of Point Latina is Point Roche, which has a shoal off it extending one quarter of a mile out.

**LITTLE PLACENTIA HARBOR** runs in to the southward from Point Roche, and S. E. by E.  $\frac{1}{2}$  E. from Point Roche, distant 2 miles, is the opposite, or Fox's Point, which may be considered to be the eastern entrance to Placentia Sound; on the western side of this Sound is the harbor of Little Placentia, which extends W. by S. above  $1\frac{1}{2}$  mile, and is nearly half a mile broad; there is good anchorage in a cove on the northern shore, which you may know by the western side of it being woody; off the east point of the cove lies a shoal, stretching nearly one third across the channel; in this cove are 7 and 8 fathoms water. To the eastward an arm also runs in almost a league with deep water, but little frequented; it is called Placentia Sound. Fox's Harbor is a small sandy cove, fit for boats only.

**SHIP HARBOR.**—From Point Latina to Ship Harbor the course and distance is east nearly 7 miles; this inlet runs up northerly two miles and three quarters, and is  $\frac{1}{2}$  a mile

wide; the best anchorage is in a cove on the west side, in 10 fathoms water, about one mile from the entrance.

**FOX ISLAND** is small and round, and lies N. E.  $\frac{3}{4}$  N. distant 3 miles from Point Latina, and N. W. by W. full 3 miles from Ship Harbor Point; this latter is a low stony point, lying a mile and a quarter from the entrance of the harbor; between Fox's Island and Ship Harbor Point, is a ledge of rocks, which, in bad weather, will show breakers quite across; between the rocks are  $2\frac{1}{2}$ , 5, 7, and 10 fathoms water. N. N. W. one mile and a half from Fox's Island is the Fishing Rock, a steep rock always above water; and N. N. E. one mile and a half from the Fishing Rock is Rowland's Sunken Rock, over which the sea most commonly breaks.

**THE RAM ISLANDS.**—This is a cluster of high islands, lying nearly N. E.  $\frac{1}{2}$  E. from Fox Island, distant 3 miles; on the eastern side of these islands is Long Harbor; there is no danger in entering this place, but the best anchorage will be on the northern side, to the eastward of Harbor Island, between it and the main, in 6 or 7 fathoms water, where you will ride secure from all winds.

From Long Harbor the shore runs N. N. E., N. by E. and North full 15 miles, having no harbor or place fit for the reception of vessels, until you reach Little Harbor, Little South Harbor, and Great South Harbor; within this space are said to be several low islands and rocks; one of which, called the White Rock, from being covered with the dung of birds, lies N. E. by N. from Point Latina, distant 13 miles, and direct midway between Fox Island and Little Harbor; it is abreast of a small place, called Tinny Cove, and full 2 miles off the land: vessels pass on either side.

**LITTLE HARBOR** has very bad anchorage, and is much exposed to S. Westerly winds, therefore not much frequented.

**LITTLE SOUTH HARBOR** lies one mile to the N. Westward of Little Harbor, and has several rocky islands at its entrance, which, in sailing in, must be left on your starboard side, excepting one, on either side of which there is a good passage, with 15 fathoms water: on the southern shore within these islands is a sunken rock, over which the sea commonly breaks; it lies about a cable's length from the land. Nearly opposite are also some rocks, half a cable's length from the shore, which appear at half ebb; this harbor is one mile and a half long, half a mile wide, and has 7, 8, 10, and 12 fathoms water in it; and the ground, except where these rocks are situated, tolerably good.

**GREAT SOUTH HARBOR** lies one mile to the northward of Little South Harbor; its entrance is between the middle point and the Isle au Bordeaux, one mile and a quarter wide, with from 20 to 30 fathoms water; there is no danger in going in, and the anchorage one mile and a half up, or near the head of the harbor, is very good in 6 and 7 fathoms water.

**CHANCE HARBOR.**—The Isle au Bordeaux is a high round island, from which the coast runs N. Easterly 4 miles, to the entrance of an inlet, called Come-by-Chance; this runs up full three miles, and has from 20 to 3 fathoms water, gradually decreasing in depth unto the further end; vessels may anchor here on a sandy bottom, but they will be quite exposed to S. Westerly winds.

**NORTH HARBOR.**—About N. N. W. 3 miles from the entrance of Come-by-Chance, is that of North Harbor; it is above a mile wide, and there is no danger in sailing into it, but like the former, it is too open to be trusted to; there is, however, fair anchorage about 2 miles up, in 7 fathoms water.

**PIPER'S HOLE.**—N. W. by N. distant  $2\frac{1}{4}$  miles from the entrance to North Harbor, is that which leads to Piper's Hole; the channel in it is between Sound Island and the main; in the passage you will have 19, 15, and 12 fathoms, and when to the northward of the island 8, 7, and 6 fathoms; from hence Piper's Hole runs up to the northward full five miles; but the water is shallow and unfit for shipping. From Piper's Hole, in a S. W. direction, lie Sound, Woody and Barren Islands, having a channel between them and the N. Western shore half a mile wide, in which are from 7 to 20 fathoms, and good anchorage all the way; between Woody and Sound Island is a passage with from 7 to 16 fathoms water in it; that between Woody and Barren Island is much wider and deeper, having 40 and 50 fathoms. Opposite the northern part of Barren Island is a small cove, called La Plant, fit only for boats: Barren Island is  $3\frac{1}{2}$  miles in length, and one in breadth, it is high land, and at its S. Eastern part is a small cove, in which is tolerable anchorage in from 8 to 16 fathoms. N. W. by W. from the southern part of Barren Island is Gulsh, an inlet of very little importance; further S. W. are Great and Little Sandy Harbors.

**GREAT SANDY HARBOR** lies W.  $\frac{1}{2}$  S. distant 4 miles from the south end of Barren Island; to this place there is a passage between Ship Island and the main, with 7, 9, and 17 fathoms water; but the entrance to the harbor is very narrow, and much encumbered with rocks; these are all above water, and have channels between them, but when you get within the harbor there are 6 and 7 fathoms, and good shelter.

**LITTLE SANDY HARBOR** is a quarter of a mile to the southward of the Great Harbor; in it you will have 6 and 7 fathoms water, good ground; in sailing in, you should pass to the northward of a low rock, which lies at the entrance. You may readily know this har-

bor by the Bell Island, which lies S. E.  $\frac{1}{2}$  E. one mile and a half from the mouth of it, and N. E. by N. 13 miles from the western point of Merasheen Island; this island has a remarkable appearance, resembling a bell with the bottom upwards.

CLATISE HARBOR, &c.—S. W. by S. from Bell Island, lie the Burgoe Islands, and farther south, the White Islands. S. W. by W. from the Burgoe Islands, nearly 5 miles, is the entrance to Clatise Harbor, between the great Isle of Valen and the main; the shore all along from the Sandy Harbors is steep to, and the passage to Clatise three quarters of a mile wide, with 40 and 50 fathoms water; but the cove itself is very narrow; the best anchorage is in the western branch, which is a mile long, in from 10 to 17 fathoms, good ground; there is also a good channel from the southward, between Great and Little Valen Islands and the main, with 20, 30, and 50 fathoms in it.

GRAMMER'S ROCKS.—These are a cluster of low rocks, just appearing above water; and lying E. by N.  $\frac{1}{2}$  N. 1 mile from the northern end of Valen Island; there is a passage between Great and Little Valen Islands, but it is encumbered with several rocks.

MERASHEEN ISLAND.—This is a long narrow island, running nearly in the direction of the coast full 6 leagues; off its northern shores are a larger cluster of rocks and islands denominated the Ragged Islands. At its south-western part is a small, but good harbor, with from 6 to 10 fathoms water in it; to sail into this place you should keep the starboard shore on board, in order to avoid a sunken rock that lies a cable's length off a ragged rocky point on the larboard side when going in. There is also a small cluster of rocks lying off the S. Eastern part of Merasheen, three quarters of a mile from shore; these lie between it and Red Island.

RED ISLAND is high, being visible 11 or 12 leagues, and wears a barren appearance, about  $4\frac{1}{2}$  miles long, and  $2\frac{1}{2}$  broad; its southern point bears N. N. W. distant 11 miles from Placentia Road, and E. by N. 16 leagues from Mortier Head. On the eastern side of the island, and near its northern end, is a small cove or bay, fit only for small craft.

LONG ISLAND.—Directly N. E. from Red Island, distant 7 miles, lies the main body of Long Island, and midway between them, is Woody Island, off the S. W. of which are two small rocks above water; the passage between Red and Woody Islands is otherwise clear from dangers, and nearly three miles wide; that between Woody and Long Island is two miles across; both have deep water. Long Island is irregularly shaped, and indented with inlets, its length is full eight miles, its breadth no where much above one; off its southern end is Iron Island, and a small rock above water; the southern point being formed of high and steep rocks. From Point Latina to this end of Long Island, the course and distance are N.  $\frac{1}{2}$  E.  $4\frac{1}{2}$  leagues, and from thence to Indian Harbor, which is situated on the eastern side of Merasheen Island, N. W. by W. 4 miles; to enter this place, you may go on either side of a small island at the entrance; the passage is safe, but the only anchorage is to the westward of the island, between it and Merasheen, and here the ground is uncertain.

HARBOR BUFFET.—On the eastern side of Long Island, about a league from Iron Island is Harbor Buffet, a tolerably good harbor, the entrance to which is narrow, but has 13 fathoms water in it; this place may be known by the islands that lie in the mouth and to the southward of it, and by Harbor Buffet Island, which lies E.  $\frac{1}{2}$  S. 1 mile from the entrance; to sail into this harbor you must steer to the northward of the islands at its mouth, and being within them, you will perceive the harbor divide into two branches; one running westward, the other northward. The best anchorage is in the northern arm, in 15 fathoms water.

MUSCLE HARBOR.—On the western side of Long Island, and about 4 miles from its southern end, is Muscle Harbor, the entrance to which is between a low green point on the starboard side, and a small island on your larboard; the harbor is nearly 2 miles long, and 1 broad, and has from 10 to 20 fathoms water within it. Vessels bound to this place may run in between Woody and Iron Islands from the southward, or between Long and Merasheen Islands from the northward; but in the latter track there are some rocks to be guarded against, which lie nearly mid-channel between the northern ends of both islands; there are also some rocks above water, to the north-eastward of Long Island, called the Bread and Butter Islands, but these are always visible, and steep to.

PRESQUE.—W. N. W.  $\frac{3}{4}$  N. distant 4 miles from the south-western point of Merasheen Island, lies the little harbor of Presque; the water here is sufficiently deep, but there are so many rocks about its entrance, that it is rendered thereby difficult of access. S. W.  $\frac{1}{2}$  W. two miles from Presque, is the Black Rock, and a quarter of a mile within this is a sunken rock. West from the Black Rock, distant 2 miles, is the Island of Marticot, about one mile in length, and half a mile broad; within the Black Rock and Marticot Island lie the Harbors of La Perche, and Little and Great Paradise.

LA PERCHE runs in to the northward of the Black Rock; its entrance is difficult; and there is no good anchorage. Little Paradise lies to the westward of La Perche, and to the northward of the east point of Marticot Island; the only safe anchorage is in a cove, at the head of the harbor, on the larboard side; there you may moor to the shore, and lie land-locked. Great Paradise is fit only for boats; it lies to the westward of Little Paradise. Between the north-western point of Marticot and the main, is Fox Island; between these

islands is a safe passage into Paradise Sound, with 9 fathoms, but vessels must never attempt going between Fox Island and the main.

**PARADISE SOUND.**—To the westward of Fox Island about 1 mile is the entrance to Paradise Sound, extending N. E. by E. 4 leagues, and being about a mile broad; having very deep water throughout, and no safe anchorage except at its head. Just within the sound, on its eastern side is a cove, with 10 fathoms water; but there are several rocks above water in it, and the bottom is rocky, so that you cannot well anchor there. In passing to the N. Westward of Fox Island there is a sunken rock which must be avoided. To the S. Westward of Paradise Sound lies Long Island, running W. S. W.  $\frac{1}{2}$  S. about 3 $\frac{1}{2}$  miles; it is principally high land, making in several peaks.

**PETIT FORT HARBOR.**—One mile to the westward of Paradise Sound lies Petit Fort Harbor, a very good inlet, having in it from 14 to 7 fathoms water, good ground. The entrance is more than a quarter of a mile wide, and lies N. E. distant 5 miles from the south point of Long Island, and N. by E. 2 $\frac{1}{2}$  miles from the north point of the same. There is no danger in going in; and the best anchorage is on the starboard or eastern side, for S. E. winds heave in a great swell on the western shore, when it blows hard. Nonsuch Harbor has no good anchorage.

**CAPE ROGER HARBOR** lies close to the westward of Cape Roger, which is a high round barren head, lying N.  $\frac{1}{2}$  E. 3 $\frac{1}{2}$  miles from the south point of Long Island. There are several low rocks and islands lying off the eastern point of the entrance. In the harbor, at a quarter of a mile within, on the western side, lies a small island to the northward of which, between it and the main, is a very good anchorage in 7 or 8 fathoms water, or farther up in 6 or 7 fathoms.

**GREAT GALLOW'S HARBOR.**—N. N. W. 2 miles from the south point of Long Island, lies a small Green Island, which has a shoal all round to nearly a cable's length. From Green Island, N. N. W. 2 $\frac{1}{2}$  miles, lies Great Gallows Harbor Island, which is high. Vessels may pass on either side of this island into Great Gallows Harbor, which lies one mile to the E. N. E. of the island. In this harbor is exceedingly good anchorage in 7 fathoms water, on the starboard side, just within a low stony point, taking care to give the point a small berth, in order to avoid a rock which is alternately covered and uncovered with the tide.

**LITTLE GALLOW'S HARBOR** lies close round to the eastward of Great Gallows Harbor, and is only fit for small vessels, which must be moored to the shore; a rock above water lies at the entrance; and the two harbors are only divided by a narrow neck of land. To the north-westward of Great Gallows Harbor are Little Harbor, Bay de L'Eau, and Boat Harbor; the first of these is only fit for boats; Bay de L'Eau runs in a full league, and has deep water all the way up, except at its head, where there appears a sandy beach. Here vessels may ride in 3 fathoms.

**BOAT HARBOR** lies round the western point of Bay de L'Eau, off which is a rock above water; this harbor runs up N. E. 3 miles, with deep water, until you get near its further end. The land from hence runs S. Westward to Bane Harbor; this lies on the main land, and is fronted by several islands, the largest of which is called Cross Island, being two miles in length, and one in breadth; the other islands are named Gooseberry, Petticoat, Gull, and Jerseyman's Islands, and are situated between Cross Island and the main.

**BANE HARBOR** is a good place for small vessels its entrance is narrow, but when you are within it, there is sufficient room to moor with 3 fathoms water. There are good channels between all these islands, through which vessels may pass to the harbors at the northward. One mile and three quarters S. W. from Bane Harbor is Rashoon; too shallow for any vessels; and about the same distance from Rashoon is Broad Cove; here the anchorage is exceedingly good, with 8 and 9 fathoms water; it lies to the north-eastward of a point of land, which juts out, and is named Broad Cove Head.

**RED HARBOR** lies three miles from Broad Cove Head, and is a good harbor, but too open to the southward; in it are 17, 13, and 9 fathoms; S. W. from hence, distant 3 $\frac{1}{2}$  miles, and situated on the main, is John le Bay; in your passage to which, and nearly mid-channel, between Flat Islands and the shore, is a cluster of small islands with deep water all round them; and further on, near the land, is a rock above water; you may sail on either side of this; the channel between it and the land is narrow, and has 17 fathoms; that on the eastern, or outside, has 15, 25, and 26 fathoms, and leads directly out to Placentia Bay.

**AUDIERNE ISLAND** lies half a mile to the northward of Cape Jude or Middle Island, on the west side of which there is a tolerably good harbor. At about a cable's length from Audierne Island, to the southward of the harbor, is a sunken rock; the mark for avoiding which, in coming in from the southward, is not to haul in for the harbor till you open a remarkable green point on the southern side of the harbor. The best anchorage is on the north shore, just within a small island. A spit of rocks stretches just off the Green Point on the south shore, which is covered at high water.

Vessels bound for Audierne Harbor may pass between Cape Jude or Middle Island and Audierne Island; and between Crow and Patrick's Island, which are two small islands lying off the S. W. point of Audierne Island. Off the eastern point of Audierne is Ford's Island, to the west of which is a sunken rock, about a cable's length from the island, and another on the eastern side, which almost always breaks. **GALLOPIN** white marks in t dy's Island, and fathoms water of

The White H Iron Island.

1½ mile from Ford's Island is Green Island, having a little rocky islet off its eastern, and another off its western ends; there is deep water all round it, 11 fathoms close to the rocky islets, 70 fathoms between it and Ford's Island, 73 and 60 fathoms between it and Long Island, and still deeper water towards the Gallows Harbors.

THE SADDLE BACK is an islet lying E. N. E. 8½ leagues from Corbin Head; E. by N. from Mortier West Point, and E. ¾ S. 3 leagues from John the Bay Point. Between it and the main are a great number of rocks and little islands, which render this part of the coast very dangerous. A chain of rocks extends N. E. by E. 2 miles from the Saddle Back.

CAPE JUDE, or MIDDLE ISLAND, is about 2½ miles in length, 2 in breadth, and lies 1½ mile north of the Saddle Back; on the south end of it is a round hill, which is called the Cape. Between this island and the main are a cluster of islands and low rocks with a great number of sunken rocks about them, called the Flat Islands, the innermost of which lies about one mile from the main.

West 3¼ miles from the S. Eastern Flat Island, and two miles to the N. N. W. of John the Bay Point, lies John the Bay; in which there is tolerable good anchorage, with about 8 fathoms water, sandy bottom.

ROCK HARBOR.—From John the Bay Point to Mortier East Head, the bearing and distance are S. W. ½ W. 8 miles. Two miles S. W. by W. from John the Bay Point lies Rock Harbor, not fit for shipping. Between lie two sunken rocks, nearly half a mile from the shore.

MORTIER BAY.—Two miles W. S. W. from Rock Harbor is the opening into Mortier Bay, at the western entrance of which is a small harbor, called Boboy, of only 9 feet water. The course into Mortier Bay is N. N. E. for about two miles; and in it there are from 50 to 70 fathoms water, the land on each side being high; it then extends westward about two miles, and is nearly two miles wide. On the eastern side, at about three miles from the entrance, is an exceedingly good harbor, called Spanish Room, in which vessels may anchor, in from 4 to 6 fathoms water, good ground, and secure from all winds. There is not the least danger in going into this harbor, only giving the low rocks above water, on the larboard hand at the entrance, a berth of one cable's length.

LITTLE MORTIER BAY.—Two miles and a half from the entrance of Mortier Bay lies Croncy Point and Islands; about two miles further southward, and nearly a mile westward of Mortier East Point, is Little Mortier Bay, at the entrance of which is a round island, called Mortier Island, lying one third of the distance from the west side; it is bold to all round, and may be passed on either side. Close to the first point beyond the island, on the larboard side, going in, is another little island, close under the land; and two cables' length from it in a direct line towards the outer island, is a sunken rock, on which the sea breaks in bad weather, which is the only danger in the bay. At the bottom of it, 1½ mile from Mortier Island, on the east side, is a cove, called Fox Cove, where there is fair anchorage, and room for one ship to moor in 9 fathoms, good holding ground, two points open to the sea, from S. S. E. to S. E. On the west side of the bay is the harbor, which is small and narrow; but a very good one for small ships, where they lie moored to the shore. Off the starboard point, going in, is a rock, which is always covered at high water.

One mile and a half S. W. by W. from Mortier East Point lies Mortier West Head, one mile beyond which is Iron Island; and S. E. ¼ E. 2 leagues from Iron Island, and S. W. ¼ W. 5 leagues from Cape Jude, lies the Mortier Bank, the shoal part of which is about one league over, and on which there are said to be only 4 fathoms. The sea breaks heavily on it in blowing weather.

IRON ISLAND is small and high; off its S. W. point is a rock under water; three quarters of a mile to the southward of it is Gregory's Rock, S. ½ W. ¼ of a mile from which is Galloping Andrews; and S. E. by E. from Iron Island is the White Horse of 8 fathoms; a W. S. W. course from Marticot's Island will clear all these dangers.

GREAT AND LITTLE BURIN HARBORS.—S. W. ¼ W. from Iron Island, distant one league is the S. E. point of Great Burin Island; and W. N. W. 1½ mile from it is the north part of Parady's Island. On the main, within these islands, lie the harbors of Great and Little Burin. Vessels bound for Burin may pass on either side of Iron Island; the only danger in passing to the northward is the ledge called the Brandys, which almost always breaks; they lie near a quarter of a mile to the southward of a low rock, above water, close under the land of Mortier West Head. By keeping Mortier West Head open to the westward of Iron Island, you will avoid Gregory's Rock, on which is only 2 fathoms water, and which almost always breaks. Vessels may pass with safety between this rock and Iron Island, by giving the latter a berth of above a cable's length.

GALLOPING ANDREWS.—On the main, within Parady's Island, are two remarkable white marks in the rocks; the northernmost of these brought on with the north part of Parady's Island, and Iron Island N. E. ¾ N. will lead on the Galloping Andrews, a shoal with 5 fathoms water on it.

The White Horse is a shoal with 8 fathoms on it, which bears S. E. by E. one mile from Iron Island.

The Dodding Rock lies about a quarter of a mile from the easternmost part of Great Burin's Island.

Great Burin Island is about  $2\frac{1}{2}$  miles in length, lying N. N. E. and S. S. W. being high land; near its south end is Cat Island, high and round, lying E. N. E. nearly 4 miles from Corbin Head.

From Corbin Head to Shalloway Point the bearing and distance are N. E.  $\frac{1}{2}$  N.  $4\frac{1}{2}$  miles. Between them, and nearly in the same direction, lie Corbin and Little Burin Islands, both high and round, not more than a cable's length from the shore.

SHALLOWAY ISLAND lies N. N. W.  $\frac{1}{2}$  W. one mile from Cat Island, and N. E. by E. a quarter of a mile from Little Burin Island: the passage into Burin Harbors, from the southward, is to the westward of Shalloway Island.

In sailing in, take care to give Poor Island a berth on your larboard hand; and when within Shalloway Island, you may anchor in safety between it and Great Burin Island, in from 12 to 18 fathoms. The best anchorage in Great Burin Harbor is in Ship Cove. The course up to it, after you are within Neck Point, which is to the westward of the Shalloway Island, is N. N. E. about 1 mile. It is nearly a quarter of a mile wide: in sailing up, keep the west shore on board, in order to avoid a sunken rock on the east shore, at about half way up, and near a cable's length from the shore. Directly off this is a remarkable hole in the rock, on the same side, and a gully in the land from top to bottom, on the western shore. Another rock, with 2 fathoms on it, lies above a cable's length to the S. W. of Harbor Point, which is round and green, and of a moderate height, joined to Great Burin Island by a low narrow, sandy neck.

BURIN BAY is about one mile N. N. E. of Little Burin Island; it is clear, and about a mile wide every way: here ships may occasionally anchor, and lie almost land-locked. In this bay are two islands, one called Poor Island, low and barren; the other lies to the northward, before the entrance of Burin Inlet, and is high and woody.

BURIN INLET may be entered on either side of the island; it extends up 5 miles; a little within the entrance on the east side, half a cable's length from the shore, is a rock covered at three-quarter's flood; and  $1\frac{3}{4}$  mile from the entrance, near the middle, is another rock, to the westward of which is good room and fair anchorage, in from 7 to 12 fathoms. There are 15 fathoms in the entrance; and, in the middle, 2 miles up, 15 to 23 fathoms; and thence up to the head are from 10 to 5 fathoms.

The east passage is in between Parly's Island and Iron Island; but is not safe without a commanding gale, and that between the N. N. E. and S. E.

CORBIN HARBOR is about a mile to the northward of Corbin Head, and is a good harbor for small vessels. A quarter of a mile eastward from this harbor, and 2 cables' length from the shore, is a sunken rock, of 5 or 6 feet water, on which the sea breaks in bad weather. Vessels bound for this harbor must also avoid a shoal of 2 fathoms water, which lies E. S. E. from the south point of the entrance, distant half a mile; the best anchorage is in the north arm, about half a mile within the entrance, opposite a cove on the starboard side.

From Corbin Head, which is high, bluff land, to Small Point, the lowest hereabout, the course and distance are W. S. W.  $2\frac{1}{2}$  miles; and from Small Point to Sauker Head W.  $\frac{1}{2}$  S. 2 miles: there are many head-lands between, which form coves, but afford no shelter. The coast is clear of rocks; and there are 30 fathoms water close to the shore; but a little to the S. Westward of Sauker Head there is a small rock under water; it lies close in with the land.

From Sauker Head, which is a high hill in the shape of a sugar loaf, to Cape Chapeau Rouge, the bearing and distance are West, 3 miles; between lie the harbors of Great and Little St. Lawrence.

LITTLE ST. LAWRENCE.—The harbor of Little St. Lawrence is the first to the westward of Sauker Head. To sail in, you must keep the west shore on board, to avoid a sunken rock, which lies a little without the point of the peninsula, which stretches off from the east side of the harbor. The anchorage is above the peninsula, (which shelters it from the sea-winds,) in 3 or 4 fathoms water, a fine sandy bottom. Ships may anchor without the peninsula in 12 fathoms, good ground, but this place is open to S. S. E. winds.

GREAT ST. LAWRENCE.—The harbor of Great St. Lawrence, which is the westernmost, is close to the eastward of Cape Chapeau Rouge. To sail in you should be careful with westerly, particularly with S. W. winds, not to approach too near the Hat Mountain, in order to avoid the flaws and eddy winds under the high land. There is no danger but what is very near the shore. The course is, first, N. N. W. till you open the upper part of the harbor, then N.  $\frac{1}{2}$  W. The best anchorage for large ships is before a cove, on the east side of the harbor, in 13 fathoms water. A little above Blue Beach Point, which is the first on the west side, you may lie, only having two points open: and may anchor any where between this point and the point of Low Beach, on the same side, near the head of the harbor, observing that, close to the west shore, the ground is not so good as on the other side. Fishing vessels commonly lie at the head of the harbor above the beach, sheltered from all winds.

Garden Bank, whereon are from 7 to 16 fathoms water, lies about half a mile off Little St. Lawrence, with Blue Beach Point on with the east point of Great St. Lawrence.

## FROM CHAPEAU ROUGE TO CAPE RAY.

**FERRYLAND HEAD** lies W. S. W. one mile from Cape Chapeau Rouge; it is a high rocky island, just separated from the main, and with Chapeau Rouge, are infallible objects to point out the harbors of St. Lawrence.

**LAUN BAY.**—W. N. W. 8 miles from Ferryland Head, lies the Point of Laun, from whence the land turns to the northward, and forms the Bays of Laun; here are two small inlets, called Great and Little Laun. Little Laun is the easternmost, lies open to the S. W. winds, and therefore is no place to anchor in. Great Laun runs in N. E. by N. 2 miles; is near half a mile wide, and has from 14 to 3 fathoms water. In sailing in be careful to avoid a sunken rock, which lies about a quarter of a mile off the east point. The best anchorage is on the east side, about half a mile from the head, in 6 and 5 fathoms, tolerably good bottom, and open only to the South and S. by W. winds, which cause a great swell, as the head of this place is a bar harbor, where boats can ascend at half tide, and find conveniences for fishing, with both wood and water.

**LAUN ISLANDS** lie off the west point of Laun Bay, not far from the shore; the westernmost and outermost of which lies W. N. W. westerly 14 miles from Ferryland Head. Nearly a quarter of a mile to the southward of this island is a rock, whereon the sea breaks in very bad weather; there are other sunken rocks about these islands, but not dangerous, being very near the shore.

**TAYLOR'S BAY** lies open to the sea, about four miles to the westward of Laun Islands. Off the east point are some rocks, near a quarter of a mile from the shore.

**POINT AUX GAUL** is a low, narrow point of land, which stretches out a little to the westward of Taylor's Bay; a rock lies off it above water, half a mile from the shore, called Gaul Shag Rock, which bears from Ferryland Head W. N. W.  $\frac{3}{4}$  W.  $6\frac{1}{2}$  leagues; there are 14 fathoms close to the off-side of it, but some rocks on its inside. From Point Aux Gaul Shag Rock to the Lamelin Islands, the bearing and distance are N. W. by W. one league; between is the Bay of Lamelin, which is unfit for shipping, being shallow, and having several islands and rocks about it; the river at the bottom of the bay abounds with salmon.

Near the south point of the westernmost Lamelin Island is a rock high above water, called Lamelin Shag Rock. From Lamelin Shag Rock to Point May, the distance is 9 miles; between lie the Lamelin Ledges, which are very dangerous, some of them being 3 miles from the land. To avoid them, in the day time, you should not bring the Lamelin Islands to the southward of E. S. E. until Point May bears N. E. by N. from you; you may then steer northward between Point May and Green Island with safety. By night, approach no nearer than in 30 fathoms water.

**REMARK.**—Mariners who navigate this part of the coast, will do well by observing the appearance of the land, for all that part of Chapeau Rouge and Laun is very high and hilly close to the sea; from Laun Islands to Lamelin, it is only moderately high; and from Lamelin to Point May, the land, near the shore, is low, with beaches of sand, while inland it becomes mountainous.

**ST. PIERRE, or ST. PETER'S ISLAND.**—The island of St. Pierre lies 13 leagues W. by N. from Cape Chapeau Rouge; it is about 4 leagues in circumference, and pretty high, with a craggy, broken, uneven surface. On coming from the westward, Point Cronier, which is the S. E. point of the island, makes in a round hummock, like a small island, separated from St. Pierre. A little to the N. E. of Point Cronier lie three small islands, the innermost of which is the largest, and called Dog Island; within it are the road and harbor of St. Pierre. The harbor is small, and has from 20 to 12 feet water; but there is a bar across the entrance, with only six feet at low water, and 12 or 14 at high water. The road lies on the W. side of Dog Island, and will admit ships of any burthen in 8, 10, or 12 fathoms water. The best anchorage is on the north side; but in general it is rocky, and exposed to the N. E. winds. Be cautious, in going in or out, of some sunken rocks, which lie about a mile E. S. E. from Boar Island, which is the easternmost of the three islands above mentioned: this is the only danger about St. Peter's, but what lies very near the shore. This harbor has lately been improved by the erection of a lighthouse.

**THE ISLAND OF COLOMBIER** lies very near to the N. E. point of St. Pierre, it is rather high; between them is a passage one-third of a mile wide, with 12 fathoms water. On the north side of the island is a rock, called Little Colombyer; and about one-quarter of a mile E. N. E. from it is a sunken rock, with 2 fathoms on it.

**GREEN ISLAND** is about three quarters of a mile in circuit, and low; it lies E. N. E. about 5 miles from St. Pierre, and nearly in the middle of the channel, between it and Point

May, in Newfoundland; on its south side are several rocks above and under water, extending  $1\frac{1}{2}$  mile to the W. S. W.

**LANGLEY, or LITTLE MIQUELON.**—Langley Island lies to the N. W. of St. Pierre, with a passage of about  $2\frac{1}{2}$  miles wide between, free from danger. It is about 8 leagues in circuit, of a moderate and equal height, excepting at the north end, which is a low point, with sand hills; off which, on both sides, it is a flat little way; but every other part of the island is bold to. There is anchorage on the N. E. side of the island, near Seal Cove, in 5 or 6 fathoms, a little to the southward of the sand hills, on a fine sandy bottom.

**GREAT MIQUELON.**—From the north point of Langley to the south point of Miquelon, the distance is scarcely one mile, and the depth of water between is 2 fathoms. Miquelon is 4 leagues in length from north to south, and is about 5 miles in breadth at the widest part: the middle of the island is high land, called the High Lands of Dunne; but down by the shore it is low, excepting Cape Miquelon, which is a lofty promontory at the northern extremity of the island.

On the S. E. side of the island is the little Harbor of Dunne; it is a bar harbor, admitting fishing shallops at half flood, but no way calculated for shipping.

Miqueon Rocks stretch off from the eastern point of the island, under the high land,  $1\frac{1}{2}$  mile to the eastward; some are above, and some under water; the outermost are above water, and there are 12 fathoms water close to them, with 18 and 20 a mile off. N. E.  $\frac{1}{2}$  E. about  $4\frac{1}{2}$  miles from these rocks, lies Miquelon Bank, on which are 6 fathoms water.

Miquelon Road, which is large and spacious, lies towards the north end, and on the east side of the island, between Cape Miquelon and Chapeau, which is a very remarkable round mountain near the shore, off which are some sunken rocks, at the distance of about a quarter of a mile; but every where else it is clear of danger. The best anchorage is in 6 or 7 fathoms, near the bottom of the road, on fine sandy bottom; but there you lie exposed to easterly winds.

The Seal Rocks, two in number, are above water, and lie about  $1\frac{1}{2}$  league off from the north-west side of Miquelon; the passage between them and the island is very safe, and there are 14 or 15 fathoms water within a cable's length, all round them.

Point May has a rocky islet at its point, and from thence the land turns N. N. E. towards Dantzic Cove and Point, and thence E. N. E. towards Fortune Head.

**FORTUNE BAY, &c.**—From Point May to Pass Island, the bearing and distance are N.  $\frac{1}{2}$  E. 12 leagues; between them is the entrance to Fortune Bay, which is about 22 or 23 leagues deep; and in which are numerous bays, harbors, and islands.

**BRUNET ISLAND.**—The Island of Brunet lies nearly in the middle of the entrance into Fortune Bay; it is above 5 miles in length, two in breadth, and of moderate height; the eastern part appears, in some points of view, like islands; on its E. side is a bay, wherein there is tolerable anchorage for ships, in 14 or 16 fathoms water, sheltered from southerly and westerly winds. In the bottom of the bay, at about a quarter of a mile from the shore, are some rocks, which must be avoided. Opposite to this bay, on the south-west side of the island, is a small cove, with 6 fathoms water. The islands lying off the west end of Brunet, to the southward, are called the little Brunets, which, with Brunet, may be approached within a quarter of a mile all round.

The Plate Islands are three rocky islets, of a moderate height, the nearest of which lies W. S. W. one league from the west end of Great Brunet. The southernmost is about 2 miles farther off, and bears from Cape Miquelon E.  $\frac{1}{2}$  S.  $3\frac{1}{2}$  leagues; and in a direct line between Point May and Pass Island, 17 miles from the former, and 19 miles from the latter. E. S. E. a quarter of a mile from the Great Plate, (which is the northernmost,) is a sunken rock, whereon the sea breaks, and this is the only danger about them. There are several strong and irregular settings of the tides or currents about the Plate and Brunet Islands, which seem to have no dependency on the moon and the course of the tides on the coast.

**SAGONA ISLAND,** which lies N. E. 2 leagues from the east end of Brunet, is about a mile across each way, of a moderate height, and bold to all round; on its western side there is a small creek admitting fishing shallops; in the middle of the entrance to this, is a sunken rock, which occasions it to be difficult of access, except in very fine weather; a sand bank surrounds this island, running westerly full 7 miles, upon which are 14, 17, and 20 fathoms water.

**POINT MAY** is the southern extremity of Fortune Bay, and the S. W. extremity of this part of Newfoundland; it may be known by a great black rock, nearly joining to the pitch of the point, and something higher than the land, which makes it look like a black hummock on the point. At about a quarter of a mile directly off from this black rock are three sunken rocks, on which the sea always breaks.

**DANTZIC COVES.**—N. by E.  $1\frac{1}{2}$  of a mile from Point May, is Little Dantzic Cove; and 2 miles farther is Great Dantzic Cove. From Dantzic Point (which is the north point of the Coves) to Fortune Head, the bearing and distance are E. N. E. 2 $\frac{1}{2}$  leagues; and thence to the town of Fortune,  $1\frac{1}{2}$  mile S. E. by E. This is a fishing village, and the

lage, and the

road where the ships lie has from 6 to 10 fathoms water, quite exposed to nearly half the compass. It lies S. by W. from the east end of Brunet. To the N. N. Westward of Dantzic Point is the long narrow bank of Jerseyman's, with 24 and 25 fathoms over it, extending from abreast of the point in the direction of the Plate Islands.

**SHIP COVE.**—The Cape of Grand Bank is high, and lies one league E. N. E. from Fortune. To the eastward of this cape is Ship Cove, where there is good anchorage for shipping in 8 or 10 fathoms water, sheltered from south, west, and N. Westerly winds. Grand Bank lies S. E. half a league from the Cape, and is a fishing village, where there is no security for shipping, and the entrance is barred.

From the Cape of the Grand Bank to the Point Enragée, the course is E. N. E. ¼ E. distance 8 leagues; the coast between forms a circular bay, in which the shore generally is low, with several sandy beaches, behind which are bar-harbors, fit only for boats, of which the principal is Great Garnish, lying 4½ leagues from the Cape of Grand Bank; it may be known by several rocks above water lying before it at two miles distance from the shore, the outermost of these is steep to; but between them and the shore are several dangerous sunken rocks. To the eastward, and within these rocks, is Frenchman's Cove, where small vessels sometimes run in and anchor in 4 or 5 fathoms water, tolerably well sheltered from the sea winds; this is a convenient place for the cod fishery; the passage in is to the eastward of the rocks that appear the highest above water; between them and some other lower rocks lying off to the eastward of the east point of the Cove, there is a sunken rock nearly in the middle of the passage, which you must be aware of. The shore is bold all the way from Point May to Cape of Grand Bank, there being 10 or 12 fathoms within 2 cables' length, and 30 or 40 at a mile off; between the latter and Great Garnish the water is not so deep, and ships may anchor any where in 8 or 10 fathoms water, sheltered only from the land winds.

From Point Enragée to the head of the bay, the course is, first, E. N. E. ¼ E. 3 leagues to Grand Jervey; then E. ¾ N. 7½ leagues to the head of the bay; the land in general along the south side is high, bold to, and of uneven appearance, with hills and valleys of various extent, the latter mostly covered with wood, and having many fresh water rivulets.

**BAY L'ARGENT.**—Seven leagues of the eastward of Point Enragée is the Bay L'Argent, where there is anchorage in 30 or 40 fathoms water, sheltered from all winds.

**HARBOR MILLÉ.**—The entrance to Harbor Millé lies to the eastward of the east point of L'Argent. Before this harbor, and the Bay L'Argent, is a remarkable rock, which, at a distance, appears like a shallop under sail. Harbor Millé branches into two arms, one lying to the S. E. the other to the east; at the upper part of both are good anchorages. Between this harbor and Point Enragée are several bar-harbors, or small bays, with sandy beaches; but the water all along the coast is very deep; you may safely anchor any where, but it must be very near the shore.

Cape Millé lies N. E. ¼ E. one league from the Shallow Rock above mentioned, and near 3 leagues from the head of Fortune Bay; it is a high reddish barren rocky point. The width of Fortune Bay at Cape Millé does not much exceed half a league; but, immediately below, it becomes twice as wide, by which the Cape may readily be known; and above this cape the land on both sides is high, with steep craggy cliffs. The head of the bay is terminated by a low beach, behind which is a large pond, or bar-harbor, fit only for boats. In this, and in all the bar-harbors between this and the Grand Bank, are convenient places for building stages, and good beaches for drying fish, fitted to accommodate numerous boats.

**GRAND LE PIERRE** is a good harbor, situated on the north side of the bay, half a league from the head. The entrance cannot be seen until you are abreast of it; there is no danger in going in, and you may anchor in any depth from 8 to 4 fathoms, sheltered from all winds.

**ENGLISH HARBOR** lies a little to the westward of Grand Pierre; and to the westward of English Harbor is the Little Bay de L'Eau, both of which are small, and only fit for boats.

**NEW HARBOR** is situated opposite to Cape Millé, and to the westward of the Bay de L'Eau; it is a small inlet, and has good anchorage on the west side, in from 8 to 5 fathoms, sheltered from S. W. winds.

**THE HARBOR FEMME** lies half a league to the westward of New Harbor, it is narrow, and has in it 20 and 23 fathoms; before its entrance is an islet, near to which are some rocks above water; one league to the westward of Harbor Femme is Brewer's Hole, fit only for boats; before this cove is also a small island near the shore, and some rocks above water.

**HARBOR LA CONTE** is situated one mile to the westward of Brewer's Hole; before this are some islands, the outer one is called the Petticoat Island, the inner Smock Island, there are also two smaller ones between these, and a sunken rock or two; the best passage in is on the west side of the outer island, and between the two larger ones; so soon as you begin to open the harbor, keep the inner island close on board, to avoid some sunken rocks

that lie near a small island, which you will discover between the N. E. point of the outer island, and the opposite point on the main: there is also another rock which appears at low water, and lies higher up on the side of the main; and when you get beyond these dangers, you may keep in the middle of the channel, and will soon open a fine spacious harbor, wherein you may anchor in any depth, from 6 to 16 fathoms water, on a bottom of sand and mud, shut in from all winds. To the eastward of the outer island there is a small cove fit for small vessels and boats, and otherwise convenient for the fisheries.

**LONG HARBOR** lies 4 miles to the westward of Harbor La Conte, and N. E. by E. distant 5 leagues from Point Enragée. It may be known by Gull Island, which lies at its mouth, and a small rock, which lies half a mile without the island, and has the appearance of a small boat; there is a passage into this harbor on each side of this island, the western one is the broader of the two; nearly in the middle of this channel, a little outside of the island, is a ledge of rocks, whereon is two fathoms water; and a little within the island, on the eastern side, are others, 2 cables' length from the shore, they lie off two sandy coves, and are visible at low water. Long Harbor runs 5 leagues up into the country, but the only anchoring place is in Morgan's Cove, on the N. W. side of the harbor, about 2 miles within Gull Island, in 15 fathoms water, unless you run above the Narrows; there is a salmon fishery at the head of the bay.

A little to the westward of Long Harbor, is Hare Harbor, fit for small vessels only. Two miles to the northward of Hare Harbor, is Mal Bay, having very deep water, extending N. Easterly about 5 miles, and having no anchorage except at its furthest end; to the westward of Mal Bay, near the shore, lie the Rencontre Islands, the westernmost of which is the largest, has a communication with the main at low water. In and about this island is shelter for small vessels and boats.

**BELLE HARBOR** lies 4 miles N. W. by N. from the westernmost Rencontre Island; the passage into it is on the western side of the island, and so soon as you have passed the islands you will open a small cove, on the east side, where small vessels can anchor, but large vessels must run up to the head of the harbor and anchor in 20 fathoms, where there is most room; it is but an indifferent harbor. About  $1\frac{3}{4}$  of a mile westward of Belle Harbor is Lally Cove, behind an island, fit for small vessels only; the west point of this cove is high and bluff, and is called Lally Head; to the northward of this head is Lally Back Cove, where ships may anchor in 14 or 16 fathoms water.

Two miles to the northward of Lally Cove Head, are East Bay and North Bay, in both of these there is deep water, but no anchorage near the shore; at the head of North Bay is the largest river in Fortune Bay, and appears to be a good place for the salmon fishery, from which circumstance it is named Salmon River.

**CINQ ISLES BAY.**—The Bay of Cinq Isles lies to the southward of the North Bay, and opposite to Lally Cove Head; there is tolerably good anchorage for large ships on the S. W. side of the islands, in the bottom of the bay. The north arm is a very snug place for small vessels, and salmon may be caught at its head.

**CORBEN BAY.**—A little to the southward of the Bay of Cinq Isles is Corben Bay, where there is good anchorage for any ships in 22 or 24 fathoms water. About 2 miles south-eastward from Lally Cove Head are 2 islands, about a mile distant from each other; the north-easternmost is called Belle Island, and the other Dog Island; they are bold to all round. Between Dog Island and Lord and Lady Island, which lies off the south point of Corben Bay, something nearer to the latter, is a sunken rock, with deep water all round it; and, about a quarter of a mile to the northward of Lord and Lady Island, is a rock which appears at low water.

**BANDE DE L'ARIER BAY** lies on the west point of Belle Bay, and N.  $\frac{1}{2}$  W. 3 leagues from Point Enragée; it may be known by a very high mountain over the bay, which rises almost perpendicular from the sea, called Iron Head. Chapel Island, which forms the east side of the bay, is high land also; the harbor lies on the west side of the bay, just within the point formed by a narrow low beach, and is a snug place; between the harbor and Iron Head there is tolerably good anchorage in 18 or 20 fathoms.

Bande de L'Arier Bank has 7 fathoms water on it, and lies with the beach of Bande de L'Arier Harbor just open of the west point of the bay, and Boxy Point on with the north end of St. Jacques Island.

**ST. JACQUES.**—Two miles to the westward of Bande de L'Arier is the harbor of St. Jacques, which may be readily known by the island before it being high at each end, and low in the middle. The passage into the harbor is on the west side of the island, free from danger, as is the harbor, where you may anchor in from 17 to 4 fathoms.

**BLUE PINION.**—About one and a half mile to the westward of St. Jacques, is the harbor of Blue Pinion; and a little to the westward of that is English Cove.

**BOXY HARBOR.**—Boxy Point lies W.  $\frac{3}{4}$  S. 6 miles from St. Jacques Island, and E. N. E.  $\frac{1}{2}$  E. 12 miles from the east end of Brunet Island; it is of moderate height, and the most advanced to the southward of any land on the coast. Boxy Harbor lies N. E. 3 miles from Boxy Point, in which there is anchorage in 4 or 5 fathoms water, fine sandy ground; to

ndy ground; to

ail in, bring Boxy Point open of a little black head just within the point, called Friars Head, in this direction you will keep the middle of the channel, and between the shoals which lie off each point of the harbor where the stages are.

W. N. W. one mile from Boxy Point is the Island of St. John, and N. N. W. half a league from St. John's Island is St. John's Head, high, steep, and craggy. Between St. John's Head and Boxy Point is St. John's Bay, quite exposed; in the bottom of this is John's Harbor, fit for boats only. On the north side of St. John's Head are two rocky islets, called the Gull and Shag; at the west end of which there are several sunken rocks.

GREAT BAY DE L'EAU is about  $1\frac{1}{2}$  league to the northward of St. John's Head. In this bay there is good anchorage in various depths, sheltered from all winds. The passage in is on the east side of the island, which lies in its entrance; for only very small vessels can enter to the westward.

BARRYSWAY BAY.—To the westward of Bay de L'Eau, about 3 miles north from St. John's Head, is Little Bay Barrysway, on the west side of which there is good anchorage for large ships in 7, 8, or 10 fathoms; and both wood and water to be obtained with ease.

HARBOR BRITON lies to the westward of Little Barrysway, and N. N. E.  $\frac{1}{2}$  E. 2 leagues from the Island of Sagona. The heads which form the entrance are high, and lie from each other S. E. and N. W. distant about 2 miles. Near the east head is a rock above water. The only danger in going in is a ledge of rocks, which stretches 2 cables' length from the south point of the S. W. arm, which is more than a mile within the west head. The only place for ships of war to anchor in is above this ledge, before the entrance of the S. W. arm, in 16 or 18 fathoms, mooring nearly east and west; the bottom is very good, and plenty of wood and water is to be obtained here. Opposite to the S. W. arm is the N. E. arm, or Jerseyman's Harbor, which is capable of holding a great number of ships, secure from all winds, in 6, 7, and 8 fathoms water: it has a bar at the entrance, on which there are 3 fathoms. The mark to sail over the bar is, the point of Thompson's Beach, which is the south point at the entrance into the S. W. arm, open of Jerseyman's Head, which is high and bluff, on the north side of the entrance into Jerseyman's Harbor; so soon as you open the harbor, haul up to the northward, and anchor.

From the West end of Harbor Briton to Connaigre Head the bearing and distance are West 5 miles; between are Gull Island and Deadman's Bay, off which there is a bank stretching from the shore between 2 and 3 miles, whereon the depths vary from 34 to 4 fathoms. The sea, during storms, will sometimes break for a considerable way out from Gull Island.

CONNAIGRE BAY.—From Connaigre Head, which is high and craggy, to Basseterre Point, the bearing and distance are N. W.  $\frac{3}{4}$  W. 7 miles; between is Connaigre Bay, which extends about 4 leagues inland. In the mouth of the bay lie the Connaigre Rocks, above water, which may be approached very near, there being no danger but what shows itself: the channel between them and Connaigre Head is the safest, as a ledge of rocks extends a mile from the north shore, which renders the other channel rather dangerous.

Connaigre Harbor is near 5 miles above the head, within a point on the south side of the bay; it is very small, and the depth of water is 7 fathoms; the passage in is on the S. E. side of the island, which lies before it. Abreast of this harbor, nearly in the middle of the bay, are two islands; and on the south side of the westernmost, are some rocks above water.

Dawson's Cove is on the N. W. side of the bay, and bears N. N. E. about 4 miles from Connaigre Head, and W. N. W. 2 miles from the west end of the westernmost (and the greatest) island: the anchorage is in 6 or 5 fathoms, quite exposed to southerly winds. Basseterre Point, which forms the west point of Connaigre Bay, is of moderate height, clear of wood, and from thence to Pass Island, hold to; Pass Island lies nearly W. by N. distant 3 miles from Basseterre Point.

PASS ISLAND, which is the N. Western extremity of Fortune Bay, is a full mile in length and narrow, it bears from the N. point of \*Miquelon N. E. by N. 7 leagues, and from Point May N.  $\frac{1}{2}$  E. 12 leagues. It lies near the shore and is rather lofty; on its S. Western side there are several rocks above water, which extend a full mile from the island; and to the N. W. is a sunken rock about a quarter of a mile from the island; there is a passage between this island and the main, about the length of two cables wide, it frequently is traversed by small vessels, who sometimes anchor there on a fine sandy bottom in 6 fathoms water. The cod-fishery about this part is generally considered good and productive.

REMARKS ON FORTUNE BAY.—The general appearance of the land on the northern side of Fortune Bay, is hilly, rising directly from the sea, with craggy, barren hills, extending 4 or 5 leagues inland, having many rivulets and ponds, while that on the southern side of Fortune Bay has a very different appearance, having less of these rugged hills, and being better clothed with wood of a short brushy kind, giving to the country an air of greenness and fertility.

SOUNDINGS.—In the night time, or in dark foggy weather, the mariner should not place much dependance on the soundings in Fortune Bay, for therein they might be great-

\* On Miquelon Island a lighthouse is built, showing a light from 1st May to 15th November.

ly and fatally deceived, inasmuch as, in many places, the water near the shores and in its creeks and harbors is often deeper than in the middle of the bay itself.

**HERMITAGE BAY.**—This extensive bay is bounded on the S. W. by Pass Island, and to the northward by the islands that form the Bay of Bonne and Great Jarvis Harbor, the width being more than 2 leagues: and by the southern shores of Long Island, where it begins to narrow; in sailing along the southern coast from Pass Island, you will discover the Fox Islands, which are distant from Pass Island 10 or 11 miles; these islands are situated opposite to the entrance to Hermitage Cove about  $\frac{3}{4}$  of a mile from the land, and are said to have good fishing about them; off the Northern Fox Island are several rocks above water, and a sunken rock lies also off the south side of this island. To enter Hermitage Cove you should keep between the islands and the shore, borrowing somewhat towards the main land, where you will find 30, 32, and 37 fathoms water; here you will see the cove open, and may turn in south, having deep water and without the least danger; the anchorage is good, with every convenience for fishing, and plenty of both wood and water. From hence Hermitage Bay runs in nearly west for 12 miles, with very deep water, until you get near the head, where it gradually lessens to 25 and 22 fathoms, and further in to 9 fathoms; there is a small islet or two on the southern side, but no danger whatever.

**LONG ISLAND,** which separates the Bay of Despair from Hermitage Bay, is of a square form, about 8 miles long and nearly 8 leagues in circuit. The eastern passage is very good, but narrow, and is between the east end of Long Island and the main, called the Passage of Long Island. The west entrance into the Bay of Despair from Hermitage Bay is by the west end of Long Island. About half a mile from its S. W. point are two rocks above water, with deep water all round them.

**GALTAUS HARBOR.**—There are four harbors on the south side of Long Island, the easternmost of which is called Galtaus; this is but small, and lies near the south-east point of the island: the best channel into the harbor is on the west side of several rocky islands, which lie at the entrance, wherein are 4 fathoms, but in the harbor there are from 15 to 24 fathoms.

**PICARRE HARBOR.**—The next is Picarre, which lies N. by E. half a league from the easternmost Fox Island; in going in here, keep near the west point, in order to avoid some sunken rocks off the other: the anchorage is in the first cove on the east side, in 9 or 10 fathoms, sheltered from all winds.

**ROUND HARBOR.**—The next harbor, called Round Harbor, is about 2 miles to the westward of Picarre, and fit only for small vessels, the channel in being so narrow.

**LONG ISLAND HARBOR** is the fourth, and lies about  $2\frac{1}{2}$  miles from the west end of Long Island. This harbor has two arms, one running in to the north, the other to the eastward; they are both very narrow, and have from 40 to 7 fathoms water; the eastern arm is the deepest, and affords the best anchorage. The passage in is on either side of an island which lies off the entrance, and has several rocks above water about it.

**BAY OF DESPAIR.**—The entrance of the Bay of Despair lies between the west end of Long Island and Great Jarvis Island (which lies in the mouth of the harbor of that name); the distance between is one mile and a quarter, and midway no bottom is found with a line of 280 fathoms. The Bay of Despair forms two capacious arms, one extending full 8 leagues to the north-eastward, the other about 13 miles northward: in the N. E. arm are several arms and islands, and tolerably good anchorage in several places; in the north arm there is very deep water, and no anchorage excepting in the small bays and coves which lie on each side of it, but in an arm of this bay, which runs easterly, there is a fine salmon fishery, and wood in plenty. In the N. E. arm also there are good salmon fisheries at Little River and Connie River; all the country about this part is mountainous and barren, but about the head of the bay it becomes level, and has abundance of wood, such as fir, pine, birch, witch hazel, spruce, &c.

**GREAT JARVIS HARBOR** is situated at the west entrance into the Bay of Despair; it is a safe harbor, with good anchorage in every part of it, in from 16 to 20 fathoms, secure from all winds, and plenty of wood and water. The passage in is on either side of the Great Jarvis Island; but the southernmost channel is the safest, there being no danger in it but the shore itself. In the northern channel are several sunken rocks. To sail in you should bring the north point between the two rocks above water, on the starboard side, and then steer directly in; this will carry you clear of some sunken rocks which lie on the west point of the island; these rocks appear at low water: the entrance to this harbor may be known by the east end of Great Jarvis Island, which is a high, steep, craggy point, called Great Jarvis Head, and is the northern point of the south entrance to the harbor.

**BONNE BAY** lies about a league to the westward of Great Jarvis Head, and nearly N. by E. distant 7 miles from Pass Island; it has several islands at its entrance, the westernmost of which is the largest and highest. The best passage in is to the eastward of the largest island, between it and the two easternmost islands. The bay runs in north 4 miles, and there is no danger but what shows itself; you may go on either side of Drake Island, which is small, and nearly in the middle of the bay; between which, and two small islands

ead, and nearly rance, the west-eastward of the north 4 miles, Drake Island, o small islands

on the west side of the bay, within Great Island, there is anchorage in 20 or 30 fathoms; but the best place for large ships is near the head of the bay, in 12 or 14 fathoms, clear ground, and convenient for wood and water. On the N. W. side of Great island, within the two small islands, is very good anchorage, in from 16 to 24 fathoms, secure from all winds. The entrance from this bay is to the northward of the two small islands. In sailing in or out of the bay, approach not too near the south point of Great Island, as there are some sunken rocks lying at one quarter of a mile from the shore. A little to the westward of Bonne Bay is Muskita Cove, a small inlet of from 30 to 47 fathoms water.

W. N. W. 4 miles from Bonne Bay is the entrance to the Bays of Facheux and Dragon; this entrance being very conspicuous at sea, the coast may here be readily known.

FACHEUX, which is the easternmost branch, is very easily seen to seaward, it runs in N. N. E. 2 leagues, and is one-third of a mile wide at the entrance, with deep water in most parts of it. On the west side of the bay are three coves, where ships may anchor in from 10 to 20 fathoms. Dragon Bay lies in N. W. one league, and is near half a mile wide, with 60 or 70 fathoms water, and no anchorage excepting near the head; and then you must lie very near the shore. One mile to the westward of Facheux is Little Hole, with shelter for small craft; and one league to the westward of Facheux is Richard's Harbor, a place fit only for small vessels and fishing shallops, with 23 fathoms water in it.

HARE BAY.—N. W. by W. one league from Richard's Harbor, is Hare Bay, which runs in N. N. E. about 5 miles, and is about one-third of a mile wide, with deep water close home to both shores on all parts of it, except about one league up on the west side, where there is good anchorage, in from 8 to 15 fathoms, with plenty of wood and water, and a small cove about one mile up on the east side, where there are 30 fathoms, with gradual soundings to the shore.

DEVIL'S BAY.—N. W. about  $4\frac{1}{2}$  miles from Hare Bay, and one league N. E. from Hare's Ears Point, is Devil's Bay, a narrow inlet, extending a league to the northward, with deep water, and no anchorage until you come close to the head.

The Bay of Rencontre lies to the northward of Hare's Ears Point, and runs in N. W. by W. 2 leagues; it has deep water in most parts of it, and is near half a mile wide at the narrowest part. The anchorage is in 30 fathoms, above a low woody point on the south shore, quite land-locked. Hare's Ears Point is large, with a ragged rock upon it, which, from some points of view, looks like the ears of a hare. It lies W. by N.  $\frac{1}{4}$  N. distant 10 miles from Richard's Harbor, divides the Bays of Rencontre and Chaleur, and bears N. W.  $\frac{1}{4}$  W. 6 leagues from Pass Island. Off this point is a fishing bank, extending a full mile from the shore, having from 20 to 36 fathoms over it.

CHALEUR BAY.—Two miles to the westward of Hare's Ears Point is the Bay of Chaleur, which runs in about 2 leagues N. N. W. It is very narrow, and has deep water in most parts. At the north entrance into the bay, and close to the land, is a small island of moderate height, and half a league within the island, on the N. E. side of the bay, is a rock above water; a little within this rock, on the same side, is a small cove, with a sandy beach, off which you can anchor in 28 fathoms, a cable's length from the shore.

FRANÇOIS BAY.—West, near half a league from the Bay of Chaleur, is the Bay of François, a small inlet running in N. W.  $\frac{1}{4}$  W. one mile, being at the entrance about a quarter of a mile broad, and 17 fathoms deep, but just within is 50 and 60 fathoms; at the head is from 30 to 20 fathoms, good anchorage, and very convenient for carrying on the fishing business.

OAR BAY.—Westward, 4 miles from the Bay François, on the east side of Cape la Hune, lies Oar Bay; off the east point of its entrance is a low rocky islet, and, in the entrance of the bay is another, with a passage on each side of it. The bay runs in N. N. E. about 4 miles, and is one-third of a mile wide, with deep water close to both shores all the way up; at the head is a harbor for small vessels, with only 5 fathoms water. At the west side of the entrance into the bay is Cul de Sac, a little cove, with 3 and 4 fathoms water, and good shelter for small vessels.

CAPE LA HUNE is the southernmost point of land on this part of the coast, and lies in lat.  $47^{\circ} 31' N.$  bearing W. N. W.  $\frac{1}{4}$  N. 8 leagues from Pass Island, and N. N. W.  $\frac{1}{4}$  N. 10 leagues from Cape Miquelon; its figure much resembles a sugar-loaf: this cape may also be known by the high land of La Hune, which lies one league to the westward of it, appearing flat at the top, and may be seen from a distance of 16 leagues.

THE PENGUIN ISLANDS lie W. S. W.  $\frac{1}{4}$  S.  $10\frac{1}{2}$  miles from Cape La Hune, and N. W.  $\frac{1}{4}$  N. 10 leagues from Cape Miquelon: they are an assemblage of barren rocks lying near to each other, and altogether about 2 leagues in circuit; and may be approached in the day-time to the distance of half a league all round. On the W. S. W. side of the large island, which is the highest, is a small cove, fit for shallops, and convenient for the fisheries, and the ground about it is considered to be good for fishing.

WHALE ROCK.—E. S. E. 8 miles from the Penguin Islands, and S. by W. 3 leagues from Cape La Hune, lies the Whale Rock, on which the sea generally breaks; it is about 100 fathoms in circuit, with 10, 12, and 14 fathoms water close to all round it. From this

rock a narrow bank extends one league to the westward, and half a league to the eastward, with from 24 to 58 fathoms water on it, rocky and gravelly bottom. In the channel between the shore and this rock, and also between the shore and the Penguin Islands, are 120 and 130 fathoms of water, muddy bottom, and there is the same depth of water at one league without them.

**LA HUNE BAY** lies close to the westward of Cape La Hune; it is about two leagues deep, and one third of a mile wide, with deep water in most parts of it; but there is a sunken rock, which lies off the west point of the entrance, nearly one third of the channel over. In sailing in or out of this bay, you should keep the eastern shore on board, in order to avoid a sunken rock which lies off the west point of the entrance into the bay, nearly one third over. Two miles up the bay is Lance Cove, having anchorage in 14 and 16 fathoms water, good clean ground. A cable's length off the southern point of this cove is a small shoal with 9 feet water, and between it and the point there are 5 fathoms. To sail into this place, keep the east point of the bay open of a red cliff point, off which is a rock above water, until the round hill you will see over the valley of the cove, is brought on with the north side of the valley; you will then be above the shoal, and may haul into the cove with safety. There is a narrow bank which stretches quite across the bay, from the south point of the cove to the opposite shore, whereon are from 27 to 45 fathoms.

**LA HUNE HARBOR** lies half a league to the westward of Cape La Hune; it has an island before its entrance, and is fit only for small vessels, and open to westerly winds: before it lies an island near the shore. The channel into the harbor is on the N. W. side of the island. There is no danger in going in, and you must anchor close up to the head, in 10 fathoms water. This harbor is well adapted for the fishery, there being good fishing ground about it, and a large beach quite across from the head of the harbor to La Hune Bay: a space of 800 feet, exposed to the open air, and well calculated for drying fish.

Four leagues N. W.  $\frac{3}{4}$  W. from Cape La Hune, is the entrance of Little River, which is about 100 fathoms wide at the entrance, and 10 fathoms deep: a little way up there is anchorage in 10, 8, and 7 fathoms water, good ground. Between Cape La Hune and Little River, the land is tolerably high, and forms a bay, where there are several small islands and rocks above water, the outermost of which lie N. N. E.  $\frac{1}{2}$  E. 3 leagues from the Penguin Islands, and are called the Magnetic Rocks.

S. by W.  $\frac{1}{2}$  W. 7 miles from the entrance of Little River, and N. by W.  $\frac{1}{2}$  W. from the Penguin Islands, lie the Little River Rocks, which are just above water, with very deep water around them.

**THE ISLES OF RAMEA**, which are of various extent, both in height and circuit, lie N. W.  $\frac{1}{2}$  N.  $5\frac{1}{2}$  leagues from the Penguin Islands, and one league from the main: they extend east and west 5 miles, and north and south 3 miles, and have several rocks and breakers about them; but more on the south side than on the north. The easternmost island is the largest, and is very high and hilly: the westernmost, called Columbe, is a remarkably high round island, of small circuit, with some rocky islands and sunken rocks near it.

**RAMEA HARBOR.**—There is a harbor for small vessels, formed by the islands which lie near Great Ramea and the Columbe, called Ramea Harbor, where they may lie sheltered from all winds. To enter this from the westward, you should give the southern point a berth on account of some rocks that lie off the starboard island, these are all above water; steer E. N. E. towards the harbor, keeping as nearly mid-channel as you can, the passage is above a cable's length broad, and run for the anchorage in Ship Cove; this is the second inlet on the N. Western shore; you will here ride safely, on clean ground, in 5 fathoms water. To enter from the eastward, you must keep the northern side of Great Ramea on board, until you are up to the west end thereof, then steer S. W. into the harbor, keeping in the middle of the channel, in about three fathoms, and anchor as before directed. This harbor is very convenient for fishing vessels; in it, and also about the islands, are several places fit for erecting stages and drying fish, which seem to be well calculated for that purpose.

The Ramea Rocks are two in number, close to each other; they lie about south, distant 4 miles from the east end of Great Ramea. W. S. W. one league from these rocks is a small bank with only 6 fathoms water on it; and, nearly in the middle, between Ramea and the Penguin Islands, is the New Bank, with from 14 to 50 fathoms water; to run upon the shoalest part of this bank, bring the two Ramea Rocks on with the S. Western part of Ramea Islands, and between them and Columbe, and the entrance to Little River N. E.  $\frac{3}{4}$  E.

**OLD MAN'S BAY.**—Four miles to the westward of Little River is Old Man's Bay, which runs in N. N. E. about 7 miles, and is nearly a mile wide; the water throughout the bay is very deep. About one mile and a half up the bay, on the eastern side, is a small island, called Adam's Island, behind which vessels can ride, if necessary, in 30 and 40 fathoms; but the best anchorage is at the head, in 14 or 16 fathoms.

**MOSQUITO HARBOR** lies about half a league to the westward of Old Man's Bay; it is a snug and safe harbor, and will hold a great number of vessels in perfect security; but the entrance is so narrow, being only 48 fathoms in breadth, that it is difficult to get in or out; the land on both sides is high, and off the southern point of entrance is a large white rock, about a cable's length from which is a black rock, above water, on the southern side of which

is a sunk rock the course is a should give the anchor, be as a harbor you will of both wood a south and east it is common

the south, distant from the rocks is a small island named Ramea and the shoalest part of Ramea is N. E.  $\frac{3}{4}$  E.

Old Man's Bay, the harbor throughout the side, is a small inlet 30 and 40 fathoms deep.

Old Man's Bay; the security; but to get in or out; the large white rock, on the side of which

is a sunk rock, whereon the sea breaks; from this black rock to the entrance of the harbor, the course is about N. N. W. distant one-third of a mile. In sailing either in or out, you should give the black rock a small berth, keeping the western shore on board, and if obliged to anchor, be as quick as possible in getting a rope on shore, lest you drift on the rocks. In this harbor you will have from 18 to 30 fathoms water, with good riding every where, and plenty of both wood and water; in the narrows you will find 12 fathoms, the shores being bold to the south and easterly winds blow right in, northerly winds right out; and with westerly winds it is commonly either quite calm, or descends in irregular puffs.

Fox Island Harbor is formed by an island of the same name; it lies about half a league to the westward of Mosquito Harbor; between are several rocky islands and sunken rocks. This is a commodious harbor for small vessels, which may anchor in 8, 9, and 10 fathoms water. You may go in on either side of the island, and there is no danger but what shows itself.

WHITE BEAR BAY lies about 2 miles to the westward of Fox Island Harbor, and N. N. E. one league from Great Ramea Island; it has several islands at its entrance. It runs in N. E.  $\frac{3}{4}$  N. about 4 leagues, is near half a mile wide in the narrowest part, and has deep water close to both shores in most parts, to the distance of 6 miles up; then the ground rises at once to 9 fathoms, whence it shoals gradually to the head with good anchorage. The best passage into the bay is to the eastward of all the islands. On the S. W. side of Bear Island, which is the easternmost and largest in the mouth of the bay, is a small harbor, running in about east half a mile, with from 10 to 22 fathoms of water, but there are several sunken rocks before its mouth, rendering it difficult of access. At the western entrance is a high round white island, and S. W. half a mile from this island is a black rock above water. The best passage into the bay, from the westward, will be to the westward of this black rock, and between White and Bear Islands; some of the rocks are above a mile off the land.

RED ISLAND HARBORS.—Five or six miles to the westward of White Bear Bay, and nearly north from Ramea Columbe, are two small harbors, called Red Island Harbors, formed by Red Island, which lies close under the land. The westernmost is the largest and best, and has from 6 to 8 fathoms water, good anchorage. In going in, keep the island close on board, the outer part of which is composed of steep red cliffs.

The BURGEON ISLES are a cluster of islands extending about 5 miles along shore, and forming several snug and commodious harbors. They lie about 3 leagues N. W. by N. from Ramea Columbe. To sail into Burgeo from the eastward, the best passage is on the N. E. side of Boar Island, which is the northernmost, and lies N. N. W. from Ramea Columbe. S. E. by S. from this island half a league, is a rock, uncovered at low water, on which the sea generally breaks; you may go on any side of this rock, the water being deep all round it: so soon as you are to the N. W. of it, keep the north side of Boar Island on board, and steer W.  $\frac{1}{2}$  N. for Grandy's Cove, the north point of which is the first low point on your starboard bow; haul round that point, and anchor in the cove in 14 fathoms, and moor with a fast on shore. The best place for large ships to anchor in is, betwixt Grandy's Cove and a small island, lying near the west point of Boar Island, in 20 or 24 fathoms, good ground, and sheltered from all winds. To sail into Grandy's Cove from the westward is dangerous, unless well acquainted: there are several safe passages in from the southward and eastward, between the islands, and good anchorage; and in bad weather all the sunken rocks discover themselves, and you may run in without any fear; but the islands do not afford either wood or water.

WOLF BAY extends inwards N. E. by E. one league: the entrance is E. N. E. 2 miles from Boar Island, and two miles to the westward of Red Island Harbor; the east point of the entrance is composed of low rugged rocks, off which is a sunken rock, at the distance of a quarter of a mile from shore, over which the sea breaks in bad weather. Near the head of the bay is tolerably good anchorage, and plenty of wood and water.

King's Harbor lies round the west point of Wolf Bay, and runs in N. E. by E. three quarters of a mile; before its mouth is a cluster of little islands. To sail in, keep the east point of these islands on board, and steer N. by W. and north for the entrance of the harbor, anchoring under the east shore in 9 fathoms.

HA-HA.—On the south side of the islands before King's Harbor, and nearly north one mile from Boar Island, is the entrance into the Ha-Ha, which runs in W. N. W. one mile, and is about a quarter of a mile broad, with from 20 to 10 fathoms water, and good ground all over. Over the south point of the entrance into this harbor is a high green hill; and a cable's length and a half from the point is a sunken rock that always shows itself. Over the head of the Ha-Ha, is Richard's Head, a mark for running upon Ramea Shoal.

GREAT BARRYSWAY.—About four miles to the westward of the Burgeo Isles is the Great Barrysway point, which is low, white, and rocky; and E. N. E.  $\frac{1}{2}$  E. half a league from this point is the west entrance into the Great Barrysway, wherein is room and depth of water for small vessels. Between the Burgeo Isles and the Great Barrysway Point, are several sunken rocks, some of which are half a league from the shore.

**CONNOIRE BAY.**—N. W.  $\frac{1}{2}$  N. 4 leagues from the Burgeo Isles, is the east point of the Bay of Connoire: this point is so far remarkable that it rises with an easy ascent to a moderate height, and much higher than the land within it; the west point of the bay is low and flat, and to the westward of this are several small islands. The bay runs in N. E. by N. about a league from the east point to the middle head, which lies between the two arms, and is half a league wide, with 14, 12, 10, and 8 fathoms, close to both shores, good anchorage, and clear ground, but open to S. W. winds. The N. E. arm affords shelter for small vessels from all winds. To sail in, keep nearest the starboard shore, and anchor before a small cove on that side, near the head of the arm, in  $3\frac{1}{2}$  fathoms; towards the head of the arm on the north-western side, is a bank of mud and sand, upon which a vessel may run, if necessary, and receive no damage.

**THE BAY OF CUTTEAU** lies about 2 leagues to the westward of Connoire: its depth will admit small vessels only. Round the west point of Cutteau is Cinq Serf, wherein are a number of islands, which form several small snug harbors. Right off Cinq Serf, about half a league from the shore, is a low rocky island, westward of which is the safest passage into the largest harbor; keep near this rock, steering E. N. E.  $\frac{1}{2}$  E. towards the south-eastern shore, until you get abreast of a small woody island; this is the easternmost except one, and lies about a quarter of a mile E. N. E. from a white rock in the middle of the channel; haul short round this island, and anchor behind it, in 7 fathoms water, here you will lie safely sheltered from all winds, or you may go further up, and anchor at its head in 4 fathoms.

**GRAND BRUIT.**—Four miles to the westward of the rocky island of Cinq Serf, is the harbor of Grand Bruit, which is small but commodious; and may be known by a very high remarkable mountain over it, half a league inland, which is the highest land on all the coast: down this mountain runs a considerable brook, emptying itself by a cascade into the harbor. Before the mouth of the harbor are several little islands, the largest of which is of middling height, with three green hillocks on it. A little outside of this island is a round rock, rather high above water, called the Columbe of Grand Bruit; and a quarter of a mile to the southward of this rock, is a low rock: in a direct line between the low rock and the rocky isles of Cinq Serf; half a league from the former, is a sunken rock, whereon the sea does not break in fine weather. The safest passage into Grand Bruit is to the north eastward of this rock, and of the islands lying before the harbor, between them and the three islands (which are low, and lay under the shore;) and, after you are to the northward of the sunken rock above mentioned, there is no danger but what shows itself. The harbor extends N. N. E. half a mile, and is but a quarter of a mile wide in the broadest part; but it is bold to on both sides, and has a depth of from 4 to 7 fathoms.

**BAY OF ROTTE.**—To the westward of Grand Bruit, between it and La Poile Bay, lies the Bay of Rotte, wherein are a great many islands and sunken rocks. The southernmost is a remarkable high round rock, called the Columbe of Rotte, which lies N. W. by W.  $8\frac{1}{2}$  leagues from the southernmost of the Burgeoes. Between this island and Grand Bruit is a reef of rocks, some above, and some under water, but they do not lie to the southward of the direct line between the islands. Within the islands of Rotte there is shelter for shipping; the safest passage in is to the westward of the islands between them and Little Ireland, which lies off the east point of La Poile Bay.

**LA POILE BAY** is large and spacious, and has several commodious harbors. It may be known by the high land of Grand Bruit, which is only five miles to the eastward of it; and likewise by the land on the east side of the bay, which rises in remarkably high craggy hills. About 11 mile S. W. from its east point lies Little Ireland, a small low island, environed with sunken rocks, some of which are one-third of a mile off: north, about half a mile from Little Ireland, is a sunken rock that shows itself at low water: this is the only danger in going into the bay, excepting such as lie very near the shore.

**GREAT AND LITTLE HARBORS.**—Two miles within the west point of the bay, and N.  $\frac{1}{2}$  W. 2 miles from Little Ireland, is Tweeds, or Great Harbor; its south point is low, and it extends inwards W. N. W. one mile; it is about  $1\frac{1}{2}$  cable's length wide in the narrowest part: and the anchorage is near the head of the harbor, in 18 or 20 fathoms, clear ground, and sheltered from all winds. Half a mile to the northward of Great Harbor is Little Harbor, the north point of which, called Tooth's Head, is the first high bluff head on the west side of the bay; the harbor extends inwards W. N. W. about a mile. In sailing in, give the south point a small berth. You may anchor about half way up the harbor, in 10 fathoms water, before the stage which is on its northern side.

**GALLY BOY'S HARBOR** lies on the east side of the bay, opposite Tooth's Head; it is small, snug, and convenient for ships bound to the westward. The north point is high and steep, with a white spot in the cliff, and near its southern point are some hillocks close to the shore. To sail in or out, keep the north side on board. You must anchor so soon as you are within the inner south point, in 9 or 10 fathoms, good ground; and sheltered from all winds. One mile to the northward of Gally Boy's Harbor, between two sandy

coves on the rock, that join Broad Cove the bay. In NORTH E. arm, which sandy point of fathoms water and water.

Tooth's Head; h point is high e hillocks close anchor so soon and sheltered een two sandy

coves on the east side of the bay, and nearly two cable's length from the shore, is a sunken rock, that just uncovers at low water.

Broad Cove is about two miles to the northward of Tooth's Head, on the same side of the bay. In this there is good anchorage in 12 or 14 fathoms.

**NORTH EAST ARM**—About two leagues up the bay, on the eastern side, is the N. E. arm, which is a spacious, safe, and commodious harbor. In sailing in, give the low sandy point on the S. E. side a small berth, and anchor above it where convenient, in 10 fathoms water, good holding ground, sheltered from all winds, and very convenient for wood and water.

Indian Harbor and De Plate lie just within the outer west point of La Poile Bay; these are two small coves, conveniently situated for the fishery, but fit only for small vessels, who may get in at high water.

Little Ireland bears from the southernmost of the Burgeons N. W. by W.  $\frac{1}{2}$  W.  $9\frac{1}{2}$  leagues; and lies nearly 11 leagues to the eastward of Cape Ray.

**GARIA BAY**—From Little Ireland to Harbor la Coue, and La Moine Bay, the course is W. N. W.  $\frac{3}{4}$  W. 9 or 10 miles; between lies the bay of Garia, and several coves, fit only for small vessels; before these there are several islands, and sunken rocks scattered along the shore, but none of them lie without the above course. In bad weather, all the sunken rocks discover themselves. To sail into Garia Bay, you will, in coasting along shore, discover a white head, this is the south point of an island, lying under the land, off the eastern point of the bay, and a little to the westward of two green hillocks on the main; bring this white point N. N. E. and steer directly towards it; keep between it and the several islands that lie to the W. S. westward; from the white point, the course into the bay is N. by W. bor- row toward the eastern point, which is low. The bay of Garia affords plenty of timber, large enough for building of ships.

**LA MOINE AND LA COUE HARBORS.**—The S. W. point of the entrance into Harbor la Coue, called Rose Blanche Point, (near to which are some rocks above water,) is tolerably high, and the land near the shore over Harbor la Coue and La Moine Bay is much higher than any other land in the vicinity: by this they may be known. La Moine Bay extends inwards N. E.  $\frac{3}{4}$  E. about 4 miles, and is one quarter of a mile broad in the narrowest part. Off the east point are some small islands, and rocks above water. In sailing in, keep the west point on board, until you have entered the bay; then edge over to- wards the east shore, and run up to the head of the bay, where you may anchor in 10 or 11 fathoms, good ground: here is plenty of wood and water. To sail into Harbor la Coue, which lies at the west entrance into La Moine Bay, steer N. N. W. between a rock above water, in the mouth of the harbor, and the west shore; so soon as you are within the rock, haul to the westward, into the harbor, and anchor in 6 or 8 fathoms water, moor- ing with a hawser on shore; or you may steer into the arm, which runs in N. E. by E. from the harbor, and anchor in 20 fathoms, sheltered from all winds. This has been the resort of the small fishing vessels for many years.

**ROSE BLANCHE.**—To the westward of Rose Blanche Point, is the harbor of the same name; it is small and snug, and the anchorage is in 9 fathoms water. The channel into the harbor is between the island lying off its western point, and Rose Blanche Point; give the island a good berth, on account of some sunken rocks which lie on its eastern side, and keep the west side of the small island which lies close to the point, on board, anchor- ing within the N. E. point of this island in 9 fathoms. To enter into the N. W. part of the harbor would be dangerous, if a stranger, because of its numerous islands and rocks.

Mull Race is a small cove 2 miles to the westward of Rose Blanche Point, wherein is anchorage for small vessels in 4 fathoms. Off the west point of the cove are two small islands, and several sunken rocks; the passage in is to the eastward of these.

Seven miles to the westward of Rose Blanche Point are the Burnt Islands, which lie close under the shore, and are not easily to be distinguished from it; behind these is a shelter for small vessels. Off these islands are sunken rocks, some of which are half a mile from the shore.

**CONNEY AND OTTER BAYS.**—Six miles to the westward of Rose Blanche Point, is Conney Bay and Otter Bay, both of which are rendered difficult of access by several sunken rocks outside the passage; which do not show themselves in fine weather; but when once you are safe within Otter Bay, there is good riding in 7, 8, and 9 fathoms water.

**DEAD ISLANDS HARBOR.**—W. N. W.  $\frac{3}{4}$  W. nearly 4 leagues from Rose Blanche Point, are the Dead Islands, which lie close under the shore; in the passage to Dead Islands Harbor, between the islands and the main, is good anchorage for shipping in 6 or 8 fathoms, sheltered from all winds; but it is very dangerous of access to strangers, as there are several sunken rocks in both the east and west entrances. The eastern entrance can be known by a remarkable white spot on one of the islands; bring this spot to bear N. by W. and steer in for it, keeping the starboard rocks on board, and leave the white spotted island on your larboard side. The western entrance may be recognized by a high point on

the main, a little to the westward of the islands, on the western part of which point is a green hillock; keep this point close on board, until you get within a little round rock, near to the westernmost island, at the eastern point of entrance; then haul over to the eastward for the great island, distinguished by a high hill, and steer E.  $\frac{1}{4}$  N. keeping the before mentioned little rock in sight.

**PORT AUX BASQUE.**—From the Dead Isles to Port aux Basque, the course and distance are W. N. W. about 4 miles; between lie several small islands close under the shore, and there are sunken rocks, some of which are half a mile from the shore. Port aux Basque is a small commodious harbor, which lies about 2 $\frac{1}{2}$  leagues to the eastward of Cape Ray. To fall in with it, bring the Sugar-Loaf Hill over Cape Ray, to bear N. N. W.  $\frac{1}{2}$  W. or the west end of the Table Mountain N. N. W. Steer in for the land with either of these marks, and you will fall directly in with the harbor: the S. W. point, called Point Blanche, is of a moderate height, and of white appearance; but the N. E. point is low and flat, and has, close to it, a black rock above water. In order to avoid the outer shoal, on which are three fathoms, and which lies E. S. E. three quarters of a mile from Point Blanche, keep the said point on board, and bring the flag-staff which is on the hill over the west side of the head of the harbor, on with the S. W. point of Road Island; that direction will lead you in the middle of the channel, between the east and west rocks, the former of which always show themselves, and these you leave on your starboard hand: continue this course up to Road Island, and keep the west point on board, in order to avoid the Frying-pan Rock, which stretches out from a cove on the west shore, opposite the island; and, so soon as you are above the island, haul to the E. N. E. and anchor between it and Harbor Island wherever you please, in 9 or 10 fathoms, good ground, and sheltered from all winds: this is called the Road or Outer Harbor, and is the only anchoring place for men of war, or ships drawing a great depth of water, but small vessels always lie up in the Inner Harbor. To sail into it, run in between the west shore and the S. W. end of Harbor Island, and anchor behind the said island, in 3 or 4 fathoms. In some parts of this harbor ships can lay their broadside so near to the shore as to reach it with a plank. This place has been frequented by fishermen for many years, it is well situated for their purposes, and is capable of most excellent accommodations; one mile to the eastward of Basque is Little Bay.

**GRAND BAY** lies about two miles to the westward of Port aux Basque; there are several small islands and rocks in and before it, the outermost of which are not above a quarter of a mile from the shore, on these the sea generally breaks: it is only fit for small vessels.

From Port aux Basque to Point Enragée, the bearing and distance are W. N. W. about a league, and thence to Cape Ray N. N. W. nearly 1 $\frac{1}{2}$  league. Point Enragée, is low; off it and to the eastward of it, are some sunken rocks a mile from the shore, on which the sea breaks.

**CAPE RAY** is the S. W. extremity of Newfoundland, situated in lat. 47 deg. 37 min. north, and longitude 59 deg. 17 min. west from Greenwich: the land of the cape is very remarkable; near the shore it is low, but three miles inland is a very high table mountain, which rises almost perpendicular from the low land, and appears to be quite flat at the top, excepting a small hillock on the S. W. point of it. This land may be seen, in clear weather, from the distance of 16 or 18 leagues. Close to the foot of the Table mountain, between it and the point of the cape, is a high round hill, resembling a sugar-loaf, (called the Sugar-Loaf of Cape Ray,) whose summit is a little lower than that of the table mountain; and to the northward of this hill, under the table mountain, are two other conical hills, resembling sugar-loaves, which are not so high as the former; one or other of these sugar-loaf hills are, from all points of view, seen detached from the table mountain.

There is a sandy bay between Cape Ray and Point Enragée, wherein ships may anchor with the winds from N. N. W. to East, but they should be cautious not to be surprised there with S. W. winds, which blow directly in, and cause a great sea. The ground is not the best for holding, being fine sand. Towards the east side of this bay is a small ledge of rocks, one mile from shore, on which the sea does not break, in fine weather. The best place for large ships to anchor in is, to bring the point of the cape N. W. and the high white sand-hill in the bottom of the bay N. E. in 10 fathoms water. Small vessels may lie farther in. Be careful not to run so far to the eastward as to bring the end of the table mountain on with the sand-hill, in the bottom of the bay, by which means the ledge of rocks before mentioned will be avoided.

N. W.  $\frac{1}{2}$  W. nearly one mile from the point of the cape, is a small ledge of rocks, called the Cape Rocks, whereon the sea always breaks; and, one mile to the northward of the cape, close under the land, is a low rocky island; there is a channel between the ledge and the cape, with 14 and 15 fathoms water, and also between it and the island with 4 and 5 fathoms; but the tides, which run here with great rapidity, render it unsafe to shipping.

The soundings under 100 fathoms do not extend above a league from the land to the southward and eastward of the cape, nor to the westward and northward of it, except on a

bank which are from 70 aux Basque fathoms.

bank which lies off Port aux Basque, between 2 and 3 leagues from the land, whereon are from 70 to 100 fathoms, good fishing ground. S. E.  $\frac{1}{2}$  S. about 13 leagues from Port aux Basque, in the lat. of 47 deg. 14 min. north, is said to be a bank, whereon are 70 fathoms.

**THE ISLAND OF ST. PAUL**, bears W. S. W.  $\frac{1}{2}$  W. distant 14 leagues from Cape Ray, in Newfoundland, and E. N. E.  $\frac{1}{2}$  E. 4 leagues from the North Cape of Breton Island; it is about 5 miles in compass, including the islet at its N. E. end; it has three high hills upon it, and deep water close to all round. On the northern part of this island, there is a lighthouse containing a fixed light, it can be seen in clear weather 18 miles from the sea.

**CAPE NORTH** is a lofty promontory at the N. E. extremity of Breton Island; the entrance into the Gulf of St. Lawrence is formed by this cape and Cape Ray, and the latter bears from the former E. N. E.  $\frac{1}{2}$  E. distant 18  $\frac{1}{2}$  leagues: the depth of the water between, excepting near the island of St. Paul, is generally above 200 fathoms.

**THE TIDES.**—Between Cape Chapeau Rouge and Cape Ray, in all the bays, &c. the tide generally flows till 9 o'clock, on full and change, and its perpendicular rise is about 7 or 8 feet on springs; but it must be observed, that the tides are every where greatly influenced by the winds and weather. On the coast, between Cape Chapeau Rouge and St. Pierre, the current sets generally to the S. W. On the south side of Fortune Bay, it sets to the eastward, and on the north side to the westward. Between Cape La Hune and Cape Ray, the flood sets to the westward in the offing, very irregularly; but generally 2 or 3 hours after it is high water by the shore. The tide or current is inconsiderable, excepting near Cape Ray, where it is strong, and at times sets quite contrary to what might be expected from the common course of the tides, and much stronger at one time than at another; these irregularities seem to depend chiefly on the winds.

## THE WESTERN COAST OF NEWFOUNDLAND,

### FROM CAPE RAY TO THE STRAIT OF BELLE ISLE.

**FROM Cape Ray to Cape Anguille**, the course and distance are N.  $\frac{1}{2}$  E. 17 or 18 miles. Cape Anguille is the northernmost point of land you can see, after passing to the westward of Cape Ray; it is high table land, and covered with wood, in the country above it. Between the high land of the two capes the coast is low, and the shore forms a bay, wherein are the great and little rivers of Cod Roy; the northernmost is the great river, which has a bar-harbor, fit to admit vessels of 8 or 10 feet draught only at high water. The shore may be approached between the two capes to half a league, there being no danger so far off. It is a good salmon fishery, and for building small vessels and boats, there being timber in abundance.

**ISLAND COD ROY.**—The Island of Cod Roy lies  $1\frac{1}{2}$  or 2 miles to the southward of Cape Anguille, close under the high land; it is a low, flat, green island, of nearly 2 miles in compass, in the shape of a horse-shoe, forming, between it and the main, a small, snug bar-harbor for vessels of 10 or 12 feet draught; the safest entrance to it is from the southward.

**COD ROY ROAD.**—South-eastward from the island is Cod Roy Road, wherein is very good anchorage for shipping, in 8, 7, or 6, fathoms, on a clay bottom. With the south point of the island bearing about W. N. W. and the point of the beach on the inside of the island, at the south entrance into the harbor, on with a point on the main to the northward of the island, you will lie in 7 fathoms, and nearly half a mile from the shore; one league to the southward of Cod Roy Island is a high bluff point, called Stormy Point, off which a shoal stretches out a full mile; this point covers the road from the S. S. E. winds, and there is good anchorage all along the shore, between it and the island.

**ST. GEORGE'S BAY.**—From Cape Anguille to Cape St. George, the course and distance are N. N. E.  $\frac{1}{2}$  E. nearly 12 leagues; these two capes form the Great bay of St. George, which extends inwards E. N. E. 18 leagues from the former, and E. S. E. 11 leagues from the latter; at the head of this bay, on the south side, round a low point of land, is a good harbor, with excellent anchorage in 8, 10, or 12, fathoms water: the river St. George empties itself into the head of this bay, but it is not navigable for any thing but boats. On the north side of the bay, before the isthmus of Port-a-Port, is good anchorage in 7 or 8 fathoms, with northerly winds; from off this place a fishing-bank stretches two-thirds across the bay, with from 7 to 19 fathoms water on it, dark sandy bottom.

**CAPE ST. GEORGE** may be readily known not only by its being the north point of the Bay of St. George, but also by the steep cliffs on the north part of it, which rise per-

pendicularly from the sea to a considerable height; and by Red Island, which lies 5 miles to the north-eastward of the cape, and half a mile from the shore: this island is about  $\frac{1}{3}$  mile in length, and of a middling height; the steep cliffs around it are of a reddish color: there is anchorage with off-shore winds under the N. E. end of the island, before a sandy cove on the main, which lies just to the northward of the steep cliffs, in 12 or 14 fathoms, you will there ride, covered from the S. W. winds by the island, and from the southerly and easterly winds by the main land, but there is no shelter whatever, with winds from the North or N. W. although this place was heretofore much resorted to by vessels in the fishing trade.

From abreast of Red Island, distant 4 or 5 miles, to Long Point, at the entrance into the bay of Port-a-Port, the bearing and distance are E. by N. 7 or 8 leagues: from Red Island to Guernsey Island, in the month of the bay of islands, E. N. E.  $\frac{1}{2}$  N. nearly 16 leagues: from Red Island to Cape St. Gregory, N. E. by E. full 20 leagues: and from Red Island to Point Rich, which is the north point of Ingomachois Bay, N. E.  $\frac{1}{2}$  E. 48 $\frac{1}{2}$  leagues.

**PORT-A-PORT.**—The land between Red Island and the entrance into Port-a-Port is rather low, with sandy beaches, except one remarkable high hillock, called Round Head, close to the shore, about 2 leagues to the E. N. Eastward of Red Island: but up in the country, over Port-a-Port, are high lands: and, if you are 3 or 4 leagues off at sea, you cannot discern the Long Point of land which forms the bay; this bay is capacious, being above 5 miles broad at the entrance, and 4 leagues deep, running in to the South and S. Westward, with good anchorages in most parts of it. Long Point is the west point of the bay; it is low and rocky, and a ledge of rocks extends from it E. N. E. nearly a mile. S. E. by E.  $\frac{3}{4}$  E. 4 miles from Long Point, and half a league from the east shore, lies Fox Island, which is small, but of middling height; from the north end of this island a shoal stretches out nearly 2 miles to N. N. Eastward, called Fox's Tail; and nearly in the middle of the bay, between Fox Island and the west shore, lies the Middle Ground, on one place of which, near the S. W. end, there is not above 3 or 4 feet water. From the head of the bay, projecting out into the middle of it, is a low point, called Middle Point, off which, extending 2 miles N. E. by N. is a shoal spit, part of which dries at low water: this Middle Point divides the bay into two parts, called East and West Bays. From the head of the East Bay, over to the Bay of St. George, the distance is a large quarter of a mile: this isthmus is very low, and has a pond in the middle of it, into which the sea frequently dashes over, especially at high tides, and with gales of wind from the southward. On the east side of it is a tolerably high mountain, rising directly from the isthmus, and flat at top; to the northward of this, and at about 5 miles distance from the isthmus, is a conspicuous valley, or hollow, hereafter to be used as a mark. N. E. by E.  $\frac{1}{4}$  E. above 2 leagues from Long Point, and half a league from the shore, lies Shag Island, which appears at a distance like a high rock, and is easily to be distinguished from the main: and W. N. W. about a league from it lies the middle of Long Ledge, which is a narrow ledge of rocks stretching E. N. E. and W. S. W. about 4 miles; the eastern part of them is above water, and the channel into the bay of Port-a-Port, between the west end of this ledge and the reef which stretches off from the west point of the bay, is a league wide.

In sailing in to Port-a-Port, if coming from the S. Westward, advance no nearer to the Long Point of the bay than  $1\frac{1}{2}$  mile, until you have brought the valley, in the side of the mountain before mentioned. (on the east side of the isthmus,) over the east end of Fox Island, or to the eastward of it, which will then bear south a little easterly; you will then be clear of the Long Point Reef, and may haul into the bay with safety; but, if coming from the N. E. without the Long Ledge, or turning into the bay, in order to keep clear of the S. W. end of Long Ledge, bring the isthmus, or the foot of the mountain, (which is on the east side of the isthmus,) open to the westward of Fox Island, nearly twice the breadth of the island, and it will lead you into the bay clear of Long Ledge; and when Shag Island is brought on with the foot of the high land on the south side of Coal River, bearing then E.  $\frac{3}{4}$  S. you will be within the Long Ledge: there is also a safe passage into the bay, between the Long Ledge and the main, on either side of Shag Island, and taking care to avoid a small shoal, of 2 $\frac{1}{2}$  fathoms, which lies W. by N. one mile from the island.

To sail up into the West Bay and Head Harbor, keep the western shore on board; this shore is bold to. In turning between it and the Middle Ground, stand no nearer to the Middle than into 8 fathoms; but you may stand to the spit of the Middle Point into 6 or 5 fathoms. The anchorage in West Bay is in about 8 fathoms, and in Head Harbor, in about 5 fathoms. The West Road lies before a high stone beach, about 2 miles south-westward of Long Point, where you may lie very secure from westerly and N. W. winds, in about 10 or 12 fathoms water; this beach is steep to, and forms an excellent place for landing and drying your fish; there is a good place at the northern end of Fox's Island for the same purpose. The whole bay and the adjacent coasts abound with cod, and extensive fishing banks lie all along the coasts.

The East Road lies between Fox Island and the east shore : to sail up to it, you should keep the high bluff head, which is about a league to the E. N. E. of the island, bearing

it, you should  
island, bearing

to the southward of S. E. by E. 1/2 E. until the isthmus is brought to the eastward of Fox Island; you will then be within the shoal called the Fox's Tail, and may haul to the southward, and anchor any where between the island and the main, in from 10 to 18 fathoms.

To sail up the East Bay, pass between the island and the east shore, and after you are above the island, come no nearer to the main than half a mile, until you are abreast of a bluff point above the island, called Road Point, just above which is the best anchorage with N. E. winds, in about 12 fathoms water; and to sail up the East Bay between the Middle Ground and the Fox's Tail, bring the said bluff point on with the S. W. point of Fox Island; this mark will lead you up in the fair way between the two shoals; give the island a berth, and anchor as before directed, in from 8 to 12 fathoms water.

**BAY OF ISLANDS.**—From the Long Point at the entrance of Port-a-Port to the Bay of Islands, the bearing and distance are N. E. by E. 8 leagues. Be careful to avoid the Long Ledge; the land between is of considerable height, rising in craggy barren hills, directly from the shore. The Bay of Islands may be known by the many islands in the mouth of it, particularly the three named Guernsey Island, Tweed Island, and Pearl Island, which are nearly of equal height with the land on the main. If you are bound for Lark or York Harbors, which lie on the S. W. side of the bay, and are coming from the southward, run in between Guernsey Island and the South Head, both of which are bold to; but with southerly and S. W. winds approach not too near the South Head, lest calms and sudden gusts of winds should proceed from the high land, under which you cannot anchor with safety. There are several channels formed by the different islands, through which you may sail in or out of the bay, there being no danger but what shows itself, excepting a small ledge of rocks, which lie half a mile north-eastward from the northern Shag Rock, and in a line with the two Shag Rocks in one. If you bring the south Shag Rock open on either side of the North Rock, you will go clear to the eastward or westward of the ledge. The safest passage into this bay from the northward, is between the two Shag Rocks, and then between Tweed Island and Pearl Island.

**LARK HARBOR.**—From Guernsey Island to Tortoise Head, which is the north point of York Harbor, and the S. E. point of Lark Harbor, the course and distance are nearly S. S. W. 6 miles; Lark Harbor extends inwards W. S. W. nearly two miles, and is one third of a mile broad in the entrance, which is the narrowest part: in sailing into it with a large ship, keep the larboard shore on board, and anchor with a low point on the starboard side, bearing W. N. W. N. N. W. or N. N. E. and you will ride in 6 or 7 fathoms water secure from all winds.

**YORK HARBOR.**—From Tortoise Head into York Harbor, the course and distance are W. S. W. nearly a league; there is good turning room between the Head and Governor's Island, which lies before the harbor: but you must be careful to avoid a shoal which runs off from a low beach point on the west end of Governor's Island, called Sword Point; there is also a shoal which spits off from the next point of Governor's Island, which must also be avoided: Tortoise Head just touching Sword Point will lead clear of it; in sailing in, give Sword Point a berth, passing which, the best anchoring ground is in 10 fathoms, along a sandy beach on the main, with Tortoise head open of Sword Point: West and N. West-erly winds blow here with great violence.

Harbor Island lies at the entrance of the river Humber, and S. by E. 1/2 E. 7 miles from Guernsey Island; at its S. W. point is Wood's Harbor, which is unfit for shipping. The River Humber, at about 5 leagues within the entrance, becomes narrow, and the stream is so rapid in some places, for about 4 leagues up, to a lake, that it is with great difficulty that even a boat can stem the current.

The North and South Arms are both long inlets, with very deep water up to their heads. On the east side of Eagle Island, between the North and South Arms, is anchorage in 8, 10, or 12 fathoms water. Under the north side of Harbor Island also is good anchorage with S. W. winds; and opposite to the S. E. end of Harbor Island, on the south side of the bay, is Frenchman's Cove, wherein is good anchorage in from 20 to 12 fathoms. The Bay of Islands was formerly much frequented by vessels in the cod fishery, and stages were erected at Small Bay, which lies a little on the outside of South Head; and the large beach on Swords Point, in Governor's Island, is an excellent place for drying the fish.

From the North Shag Rock to Cape St. Gregory the course and distance are nearly N. E. 8 miles; and thence 13 or 14 miles, on a similar bearing, will carry you to the entrance of Bonne Bay. The land near the shore from the north Shag Rock to Cape St. Gregory is low, along which lie sunken rocks, a quarter of a mile from the shore: but a very little way inland it rises into a high mountain, terminating at the top in round hills.

**CAPE ST. GREGORY** is high, and between it and Bonne Bay the land rises directly from the sea shore to a considerable height; it is the most northerly land you can discern when you are sailing along shore between Red Island and the Bay of Islands.

**BONNE BAY** may be known, at the distance of 4 or 5 leagues, by the land about it; all that on the S. W. side of the bay being very high and hilly, and that on the N. E. side, and thence along the sea-coast to the northward, being low and flat; but, at about one

league inland is a range of mountains, which runs parallel with the sea-coast. Over the south side of the bay is a very high mountain, terminating at top in a remarkable round hill, very conspicuous when you are to the northward of the bay. This bay extends inward E. S. E. nearly 2 leagues, then branches into two arms, one of which runs in to the southward, and the other to the eastward; the southern arm affords the best anchorage; small vessels should ride just above a low woody point at the entrance into this arm, on the starboard side, before a sandy beach, in 8 or 10 fathoms water, about a cable's length from the shore; there is no other anchorage in less than 30 or 40 fathoms, excepting at the head of the arm, where there are from 25 to 20 fathoms water; in sailing into the East Arm, keep the starboard shore on board; and, a little round a point at the entrance, will be found a small cove, with good anchorage in 17 to 20 fathoms, but you must moor to the shore. There is a snug cove also close within the North Point, with anchorage in 6 or 7 fathoms water; in sailing in or out of Bonne Bay, with W. S. W. winds, come not near the weather shore, lest you should happen to be becalmed, or should meet with heavy gusts of wind; as the depth of water is too great to admit of your anchoring.

Ten miles to the northward of Bonne Bay is Martin Point, high and white, off which, about three-quarters of a mile, is a small ledge of rocks, whereon the sea breaks. Broome Point is low and white, and lies about a league to the northward of Martin Point; about half a mile W. S. W. from it lies a sunken rock that seldom shows itself; on the north side of Broome Point lies the Bay of St. Paul, wherein vessels may anchor with off-shore winds, but it is quite exposed to the sea.

COW HEAD lies about 4 miles to the northward of the Bay of St. Paul: this is a promontory, which has the appearance of an island, it being joined to the main only by a very low and narrow neck of land: about three-quarters of a mile off this head lies Steering Island, which is low and rocky, and is the only island on the coast between the Bay of Islands and Point Rich. Cow Cove lies on the south side of Cow Head, and ships may lie there in from 7 to 10 fathoms, sheltered from northerly and easterly winds. Shallow Bay lies on the north side of Cow Head, and has water sufficient for small vessels; at the N. E. side of the entrance is a cluster of rocky islands, extending E. N. E. and W. S. W. and at the W. S. W. side are two sunken rocks close to each other, which generally show themselves; they lie a cable's length from the shore, and there is a channel into the bay on either side of them. Steering Island lies right before this bay, which you may pass on either side, but come not too near its N. E. end, as there are some sunken rocks extending from it. This is considered the best situated for a fishery on all the coast, and the ground about its environs is eminently productive.

INGORNACHOIX BAY.—From Steering Island to Point Rich the course is nearly N. E. distant 50 miles; Point Rich is the northern point of Ingornachois Bay. From Shallow Bay to the southern point of Ingornachois Bay the coast is nearly in a straight line, there being all the way neither creek nor cove, where a vessel can find shelter from the sea winds, although there are a few places where they might anchor occasionally with land winds. About 6 leagues from Steering Island there is a bill, standing half a mile inland, which is commonly called Portland Bill, probably because it resembles Portland Bill in the English Channel, and alters not its appearance in whatever point of view it is taken.

PORT SAUNDERS and HAWKES HARBOR.—These are situated within, and to the eastward of Ingornachois Bay; at the entrance lies Keppel Island, which at a distance, will not easily be distinguished from the main land; there is a passage on both sides of the island; to sail into Port Saunders there is no impediment or danger; you will leave Keppel Island on your starboard side, and when you get about half a mile within the entrance you can anchor in 12 or 14 fathoms water; but if you are intending to run up to the head of the harbor, you must keep the larboard shore on board, in order to avoid a ledge of rocks, which lies near the mid-channel; this is considered to be the best harbor for vessels that are bound to the southward.

HAWKES HARBOR.—To enter this harbor vessels commonly go to the southward of Keppel Island; the starboard shore is shoal, and has a sand-bank, which stretches along the land, and runs out two-thirds of the passage over, great part of which dries at low water; your course in will be E. S. E. keeping nearer to Keppel Island than to the main, until the eastern end of the island, which is a low stony beach, bears N. E. by N. or N. N. E. then steer S. S. E.  $\frac{1}{2}$  E. for a small island you will see, situated further up the harbor; keeping the larboard shore well on board, run direct for this island, and when you have brought the point at the south entrance of the harbor to bear N. N. E.  $\frac{1}{2}$  N. and are at the S. S. E. point of a bay on the starboard side of the harbor, you will then be beyond the shoal ground, and may anchor in 12 fathoms water; or else run within half a mile of the small island, and anchor there, which will be more convenient for both wood and water. This is the best harbor for ships bound to the northward. The land round about these harbors is generally low, and covered with wood: you may occasionally anchor outside, in the Bay of Ingornachois, according as you find the prevailing winds.

POINT RICH by the sea, being any other land on inward direction.

BAY OF ST. Head the course Eastward about 2 two of which are northernmost of t

**POINT RICH** is the south-western point of a peninsula, which is almost surrounded by the sea, being everywhere of moderate height, and projecting further to seaward than any other land on this side of Newfoundland, the coast from thence, each way, taking an inward direction.

**PORT AU CHOIX.**—Rounding Point Rich, on its northern side, you will meet with Port au Choix, small, but yet capable of admitting a ship of burthen, mooring head and stern; to sail in you should keep the starboard shore on board, and anchor just above a small island lying in the middle of the harbor. In this place, and also in Boat Cove, which lies a little to the N. Eastward, there are several stages and places for drying fish.

**OLD PORT AU CHOIX** lies to the eastward of Boat Cove; it is a small but safe harbor, having at its entrance an island called Harbor Island, and on its western side some rocks, both above and under water: there is also another island lying E. N. E.  $\frac{1}{2}$  N. distant nearly a mile from Harbor Island, about which are several rocks, some of which stretch out towards Harbor Island, and render the passage very narrow between them: there are 4, 5, 6, and 7 fathoms water between Savage Island and the main, and 4 and 5 fathoms between Savage Island Rocks and Harbor Island; and nearly the same depth between Harbor Island and the western shore. To sail into Old Port au Choix, on the western side of Harbor Island, you must keep the island close on board; but to go in on the eastern side of the island, give the N. Eastern point of the island a berth, and having well entered, you may anchor any where on the larboard side of the harbor, only avoiding the starboard side, for a shoal of sand and mud runs all along it.

**BAY OF ST. JOHN.**—This is an open and extensive bay, bounded by Point Rich to the southward, and Point Ferolle to the northward, having several islands within it, and some sunken rocks; the largest of these islands is St. John's, about 2 $\frac{1}{2}$  miles in length, and 1 $\frac{1}{2}$  broad; this lies E. N. E. distant 8 $\frac{1}{2}$  miles from Point Rich; on its S. Western side is a small harbor, well calculated for the cod fishery, but too much exposed for shipping, as S. Westerly winds commonly drive in a heavy sea. On the S. Eastern, or inner side of the island, and between it and One Head Island, vessels may lie much more secure, in 14 or 16 fathoms water, and sheltered from most winds; and this is considered to be the only safe anchorage in the whole bay. West from St. John's Island one large mile is Flat Island, having a rock above water at its southern end; the channel between St. John's and Flat Island has from 13 to 25 fathoms in it, and they are both bold to; the Twin Islands lie N. E. by N. from Flat Island, distant one league, and have no danger about them. To the westward of the Twins are several scattered rocks above water, named the Bay Islands; they have deep water around them, but no anchorage. The land at the bottom of the bay is very high, and there is the little river of Castors, the entrance to which is dangerous and shallow, therefore seldom frequented. From the northern point of this bay a rocky shoal extends all the way to Point Ferolle, stretching out 2 $\frac{1}{2}$  miles from the shore.

**POINT FEROLLE** lies N. E. by E. from Point Rich, distant 22 miles; it is of moderate height, and joined to the main by a neck of land, which divides the Bay of St. John's from New Ferolle Bay, making it appear like an island when seen from a distance; its northern shore is bold to, and this part of the coast will easily be known by the adjacent table land of St. John's, the west end of which mountain lies from the middle of Ferolle Point S. by W. and its eastern end S. E.  $\frac{1}{2}$  S.

**NEW FEROLLE BAY** is a small cove lying to the eastward of the point, and is quite flat all over, there being not more than 2 and 3 fathoms at any part; it is quite open to the northern winds, has a stage on each side of it, with plenty of room for others.

St. Margaret's Bay is large, and has several islands within it, also various inlets or coves affording good anchorage, particularly on its western side, which is the best situation for ships, being most clear of danger, and convenient for wooding and watering; on its banks are spruce and fir trees in plenty, and many rivulets of fresh water. Dog Island is to the eastward of Point Ferolle full 3 miles, and only divided from the main at high water; it is higher than any land near it, which gives it the appearance, when seen from the eastward, of an island situated at some distance from the main.

**OLD FEROLLE.**—To the eastward of Dog Island about 5 miles is Ferolle Island. This island lies parallel to the shore, and forms the harbor of Old Ferolle, which is very good and safe; the best entrance to it is at the S. W. end of the island, passing to the southward of a small island in the entrance, which is bold to; as soon as you are within it, haul up E. N. E. and anchor under the S. W. end of Ferolle Island, in 8 or 9 fathoms, good ground, quite land-locked. There is also good anchorage any where along the inside of the island, and a good channel up to the N. E. end thereof. There are some little islands lying at the N. E. end of Ferolle Island, and on the outside are some ledges of rocks a small distance off.

**BAY OF ST. GENEVEIVE.**—From the north end of Ferolle Island to St. Geneveive Head the course is E. N. E. 4 $\frac{1}{2}$  miles, and thence to the west end of Currant Island it is N. Eastward about 3 miles. There are several small islands lying in and before this bay, only two of which are of any considerable extent. The afore-mentioned Currant Island is the northernmost of the two, and the largest; it is of a moderate height, and when you are to the

E. N. E. of it, the western point will appear bluff but not high; and when you are to the westward of it, it appears flat and white. The other, called Gooseberry Island, lies nearly a mile to the southward of it, and its west point bears from the west point of Currant Island S. S. W.  $\frac{1}{2}$  W. nearly a mile. Gooseberry Island has a cross on its S. W. end, from which point stretches out a ledge of rocks near half a mile to the southward; there is also a shoal about half a mile to the W. S. W. from the S. W. point of Currant Island. The best channel into this bay is to the southward of these islands, between the rocks which stretch off them and a small island lying S. S. W. from them (which island lies near the south shore;) in this channel, which is very narrow, there are not less than 5 fathoms at low water, and the course in is E. by S. southerly, until you come to the length of the afore-mentioned island, passing which you should haul to the southward, and bring St. Genevieve Head between the small island and the main, in order to avoid the middle bank. You may either anchor behind the small island in 5 or 6 fathoms water, or proceed farther, with the said mark on, until the S. W. arm is open, and anchor in the middle of the bay, in 7 or 8 fathoms water. Here is wood and water to be had. There is tolerable good anchoring in most parts of the bay; but the snuggest place is the S. W. arm; the entrance to it is narrow, and has only 4 fathoms at low water. In coming into the bay, if you get out of the channel on either side, you will shoalen your water immediately to 3 or 2 fathoms.

**BAY OF ST. BARBE.**—From the west end of Currant Island to St. Barbe Point it is E. by N.  $2\frac{1}{2}$  miles, and from St. Barbe Point to Anchor Point it is N. N. E. nearly 11 mile. Between them lies the Bay of St. Barbe; it runs in S. by E. about 2 miles from Anchor Point. To sail in, give Anchor Point, and all the east side of the bay, a good berth, to avoid the sunken rocks which lie along that shore: you must be well in before you can discover the entrance into the harbor, which is but narrow; then steer south, keeping in the middle of the channel, and anchor as soon as you are within the two points, in a small cove, on the west side, in 5 fathoms water, on sand and mud, quite land-locked. Near this place branch out 2 arms or rivers, one called the south, and the other the east; the latter has 3 fathoms a good way up, but the former is shoal. Between the S. W. point of the bay and west point of the harbor is a cove, wherein are sunken rocks, which lie a little without the line of the two points; in the open bay are 7, 8, or 9 fathoms; but the N. W. winds cause a heavy sea to fall in here, which renders it unsafe.

From Anchor Point to the extremity of the Seal Islands, the course is N. E.  $\frac{1}{2}$  E. one league; off Anchor Point a ledge stretches itself W. by S. about one-third of a mile; there are no other dangers between it and the Seal Islands but what lie very near the shore.

The Seal Islands are white and rocky, and must not be approached but with care on their north and western sides, because there are some sunken rocks near them.

From the N. W. Seal Island, to the N. W. extremity of Flower Ledge, it is N. N. E. near 2 miles; part of this ledge appears at low water, and there are 10 fathoms close on its off side.

**MISTAKEN COVE.**—From the north part of Flower Ledge to Grenville Ledge, it is about  $1\frac{1}{2}$  mile E. by S. and Grenville Ledge lies about two-thirds of a mile W. by N. from the eastern point of Mistaken Cove, between which and Seal Islands lie also Nameless Cove and Flower Cove, neither of which are fit for ships.

**SAVAGE COVE.**—Close to the eastward of Mistaken Cove is Savage Cove, which has a little island in its entrance, and is only fit for small vessels and boats.

Sandy Bay lies 2 miles eastward from Savage Cove, where small vessels may ride in 3 or 4 fathoms water, with the winds from E. to S. W.

About E. N. E. 5 large miles from Sandy Bay is Green Island; between them, at 3 miles distance W.  $\frac{1}{2}$  S. from Green Island, is the north extremity of Double Ledge, which extends nearly two-thirds of a mile from the shore, and has only 8 or 9 feet of water on it.

Green Island lies about three-fourths of a mile from the main, is two-thirds of a mile in length, very low and narrow, and agreeable in color to the name it bears; from the east end of it a ledge of rocks extends three-fourths of a mile to the eastward, on which the sea breaks in bad weather. There are 4 or 5 fathoms water in the channel between the island and the main, where ships may anchor if necessary. To go in from the westward keep the

island close on board for the deepest water, which is 4 fathoms; and going in from the eastward keep the main on board. From this island to the opposite part of the Coast of Labrador, called Castles or Red Cliffs, which is the narrowest part of the Strait of Belle Isle, the distance is about  $3\frac{1}{2}$  leagues, and they bear from each other N. N. W. and S. S. E.

**BOAT HARBOR.**—From Green Island to Boat's Head it is E.  $\frac{1}{2}$  N. 8 leagues; between there is no shelter on the coast, but to the south-eastward of Boat's Head is a cove, called Boat Harbor, where small vessels and boats may lie very secure except with N. E. winds.

**TIDES.**—The tides flow at the full and change of the moon as follows : at New and Old Ferolle, till a quarter after 11 o'clock ; in the Bays of Geneveive and St. Barbe at half after 10, and at Green Island until 9. Spring tides rise 7 feet, neaps 4 feet. In the Bay of Pis-

It may be remarked, a boat at low water, ex-

tolet it flows till three quarters after 6, and in Noddy Harbor and Griquet until a quarter after 5: spring tides rise 5 feet, neaps about 3. Before Quirpon, in settled weather, the tide sets to the southward 9 hours out of the 12, and stronger than the northern stream. In the Strait of Belle Isle, the flood, in the offing, sets to the westward two hours after it is high water on the shore; but in blowing weather, this stream is subject to many alterations.

## RIVER ST. LAWRENCE.

**GENERAL REMARKS.**—The River St. Lawrence is one of the largest rivers in North America, it issues from Lake Ontario, and is the grand outlet by which the waters of the lakes Superior, Huron, Michigan, Erie, and Ontario are poured into the Gulf of St. Lawrence; in different parts of its course, it is designated by different names, but so far from the sea as Montreal, it is called the River St. Lawrence. Montreal is computed to be about 180 miles from Quebec, and 580 miles from the Gulf of St. Lawrence.

The River St. Lawrence is, at its entrance, divided into two passages, by the Island of Anticosti: these are called the North and South Channels; the former is, at its narrowest part, full 8 leagues asunder, and the latter is 13 leagues; both channels have deep water, for in some parts no bottom has been found with 180 and 200 fathoms of line.

### THE ISLAND OF ANTICOSTI AND THE NORTHERN SHORE FROM THE ESQUIMAUX ISLANDS TO POINT MILLE VACHE.

**THE ISLAND OF \*ANTICOSTI** lies nearly N. W. and S. E. being 36 leagues long, and of irregular breadth: about the middle it is 9 leagues wide, but its N. W. part is not above 9 or 10 miles broad: this island has been reported to be entirely destitute of either bays or harbors, calculated to afford shelter for large shipping: its soil is unpropitious, and its aspect forbidding; but Mr. Lambly, Harbor Master of Quebec, states, that "two leagues S. E. from the west end of the island lies Cape Henry, the west side of Grand Bay, (called also Ellis' Bay;) Cape Eagle forming its eastern boundary, bearing N. W. and S. E. of each other, distant 3 miles. This bay, he says, is  $2\frac{1}{2}$  miles deep, and has good anchorage for small vessels in from  $2\frac{1}{2}$  to 4 fathoms water." He further observes that "in running down from the west end of the island, you should not come into less than 10

\* On the outermost extremity of the west end of Anticosti, stands a direction board. From this board to the house of Gamache, where there is a depot of provisions, at the upper end of Grand Bay, by crossing the isthmus formed by Point Henry, the distance is six miles; but from this board, round Point Henry, and up the bay to the house, it is double the distance.

Six leagues to the eastward of Grand Bay, is Duck River, at the mouth of which, on the east side, stands the Direction Board.

Four leagues to the eastward of Duck River, is Otter River: close to its entrance stands the Direction Board.

Four leagues to the eastward of Otter River, is Seal River; on the east side of which is a Direction Board nailed to the house, used only in summer by Gamache's Salmon and Seal Fishers; at this house there are no provisions.

Two leagues from this river is the south-west point of the island; on both the extreme east and west ends of which stands a Direction Board, about one mile from each other; and about one mile from the easternmost stands another Direction Board, in the Bay to the Eastward of the Point.

Seven leagues to the eastward of South-West Point is Heath River, on the east side of its entrance stands the Direction Board.

Three leagues to the eastward of Heath River, is Pavilion or Flag River, and two miles to the eastward stands the Direction Board, on a point on the east side of the bay.

Six leagues to the eastward of Flag River is Hamel's Post at Jupiter River, where there is a Depot of Provisions.

Seven leagues to the eastward of Mr. Hamel, and on the south side of the east end of the island, is a Direction Board, and on the north side of the east end is another Direction Board.

Four leagues from this board, on the north side of the island, is the post of Belle Bay, kept by Mr. Godin.

It may be remarked, that all these rivers are mere creeks, there not being water in any of them for a boat at low water, except Jupiter River, at Hamel's Post.

fathoms; the breakers will then be visible on the shoal, which lies a quarter of a mile from the beach; and when you are abreast of Cape Henry, you may haul into 6 fathoms, towards a long flat spit of sand, which lies S. E. from the Cape; run along this spit, and round its S. E. end, in 4 fathoms at low water, you will then find yourself one mile and a half from the houses at the northern part of the bay. Here the bay is about one mile across; small vessels may anchor further in, sheltered from S. W. and even S. S. W. winds; but the outer anchorage will be exposed, and open to those from the S. S. W. round to the S. E. There a supply of provisions is constantly kept for the use of unfortunate seamen who may be wrecked on the island. The reef which runs from the west point of the island extends little more than two miles, and vessels at that distance may cross it in 10 fathoms with safety; but it is very narrow, and not more than 3 casts of the lead can be got upon it in crossing."

From Grand Bay to the S. W. point of the island the shore is all bold, and so steep there can be no surety in the lead; but you may stand on deck and see all the dangers about the beach, for there is not a reef or rock one quarter of a mile from the shore. A little to the north-westward of the S. W. point of the island is a considerable river, called Seal or Jupiter River; its entrance may be distinguished by some white cliffs.

A lighthouse has been erected on the S. W. point of the island, it is a revolving light, and will be lighted every night from sunset to sunrise, from the 25th of March until the last day of December in each year.

When ships are to the eastward of the lighthouse, they may safely stand towards the island until it bears N. N. W. by compass—they will then be in a good fair way, and if they wish to make more free with the land, they can do so by their lead. The land trending from the lighthouse S. E. by S. or nearly so.

When ships are to the westward of the lighthouse, they may safely stand towards the island until the light bears S. S. E.  $\frac{1}{2}$  E. they will then be in a good fair way for the land, and as before mentioned they can make more free by their lead.

Nearly east and west with the lighthouse, and about  $\frac{1}{2}$  of a mile from it, is the outermost part of a reef of rocks which joins the S. W. point. These are dry at low water, and are the only danger near the lighthouse; therefore a berth of a mile from the point is a good fair way. At the lighthouse are depots of provisions for the use of mariners in distress, or other shipwrecked persons.

From the S. W. point to the south point, the land is all bold, and may be approached within one mile, there being no danger whatever; but there is no anchorage. Off the south point of the island is a reef of rocks. To the westward of the south point there is an inlet, called by some Little Jupiter River; but by others Shallop Creek; here also is a depot of provisions kept for the shipwrecked mariner, similar to that at Grand Bay; this Creek is small and shallow, having only sufficient water to float a boat at low water. There is a small place to the westward of Shallop Creek, where a vessel may anchor, with a N. E. wind, on a spit of sand that runs from the east side of the river, in 4 fathoms; a cable's length outside of this, are 20 fathoms, and a little further off 50 fathoms. The east end of Anticosti is flat for 2 miles off. On Heath's Point a lighthouse, containing a fixed light, is erected.

This island has hitherto been considered dangerous to vessels bound to Quebec; but with care it will not be found so, for so soon as you can see the land, you may advance towards, and sail freely along it; by which you will always get faster to the westward with foul winds, than you can do to the offing. There can be no danger of getting embayed, and the floods are regular near the island. Mr. Lambly, in a fast sailing schooner, frequently laid to during the night with westerly winds, and always found himself to windward of the place in the morning; of course, ships beating will always gain ground.

**TIDES AT ANTICOSTI.**—The tides flow on the full and change days till 11 o'clock, and rise 10 feet, with spring, and 4 with neap tides.

**THE NORTH OR CANADIAN CHANNEL** is bounded on the southward by the island of Anticosti, and on the northward by the Mainland; here, in about the longitude of  $64^{\circ}$  W. is the River St. John; the land to the eastward of which, together with the adjacent islands, including Anticosti, is under the Government of Newfoundland; that to the westward of that river is under the Government of Quebec. To the eastward of St. John's River are the Mingan and Esquimaux Islands; these are a numerous cluster of islands lying off the main, with passages between, and places of good anchorage; the westernmost is named Mingan Island, and bears from the western point of Anticosti N. E.  $\frac{3}{4}$  E. distant  $10\frac{1}{2}$  leagues; the Mingan settlements lie to the E. N. Eastward of the island, distant about 7 or 8 miles; the harbor is formed between Canatchoa Island and the main; here vessels may ride securely in all weathers, the ground is good, and the anchorage in from 9 to 15 fathoms, with plenty of codfish, salmon and seals; the soil surrounding the settlement is fertile, the land level, and a profitable trade is carried on with the Indians.

**ESQUIMAUX ISLAND** is about 20 miles to the eastward of Mingan Island, and lies on a projecting point of land, named Esquimaux Point, between them is good and safe an-

chorage; from the most of the whole, particularly that 7 to 10 fathoms.

**THE TIDE** is about 12 feet; but a considerable variation.

**THE SEVEN** shore of the River harbor for shipping N. bearing N. W. Between the Ming anchorage, but nothing to the French to the Seven Islands, increasing towards the bay nearly N. when you approach to the westward of fathoms; the ground.

Captain Hardy, he strongly recommends point it out, and the ground and possible for even headway up the River, possibly be too late in her crew, for the sailing; but having no for the first favorable continuing in the.

**THE TIDE** is 19 feet, neaps 10 feet. Between the water is 22 leagues wide, westward of Seven Point Deamon, be contracted to about land to the eastward, where vessels.

**TRINITY BAY** mon, it is a safe place, the ground being fast sailing ships, with Bay the shore rocks above water.

On the N. E. point, main, with spring of the point; there to point, and there also may be found may be had in abundance.

To sail into Trinity point, on which stands W. Small vessels point of the bay be cross stands, is a less than 4 fathoms.

The land to the vessels sometimes.

**CAPE MONT** Mont-Pelo) on the lantern standing on part of Carribou point, and to the east.

**Ships approach**

chorage; from hence, 7 leagues to the eastward, lies the Isle of Geneveive, the easternmost of the whole range; there is good riding behind most of the intermediate islands, particularly that of St. Charles; within the east end of which a vessel may anchor in from 7 to 10 fathoms.

THE TIDE at these anchorages flows till 3 o'clock full and change, and its rise is commonly 12 feet; but the weather always has great influence over it, and frequently occasions a considerable variation.

THE SEVEN ISLANDS.—The bay of the Seven Islands is situated on the northern shore of the River St. Lawrence, in longitude  $65^{\circ} 52'$  W. and is an extensive and good harbor for shipping of all sizes, and with any winds; its entrance lies in latitude  $50^{\circ} 10'$  N. bearing N. W.  $\frac{1}{4}$  W. from the west end of Anticosti, from which it is distant 22 leagues. Between the Mingan Islands and the Seven Islands Bay, there are a few places of temporary anchorage, but none of note, or much frequented. Here formerly was a settlement belonging to the French, destroyed in 1759, and never re-established. The principal channel into the Seven Islands Bay is full two miles wide, and has from 60 to 30 fathoms water, decreasing towards the interior of the bay; on entering you should bring the west point of the bay nearly N. N. W. steer towards it in that direction, and pass between the islands; when you approach the point, you must give it a berth, steering in nearly north, and when to the westward of the harbor point, about one mile and a half, anchor in from 9 to 14 fathoms; the ground is good, and the shelter safe.

Captain Hardy, of the *Savage*, says this bay is so safe a shelter from westerly gales, that he strongly recommends every master of a vessel to run for it: the islands will sufficiently point it out, and the channels in are clear and bold; wood and water may be easily obtained, and the ground and shelter is perfectly good: for, he observes, it will be always totally impossible for even a fast sailing vessel, during westerly gales, to gain ground or make any headway up the River St. Lawrence, and a merchantman may beat about in vain, and possibly be too late in attempting to run for a roadstead, after having split her sails, and harassed her crew, for the squalls in the river are violent, and in thick weather give very little warning; but having run for the Seven Islands Bay and anchored there, you may wait in safety for the first favorable slant, and be up at Quebec far more readily than you would do by continuing in the river beating about.

THE TIDE in the bay flows till half after one, full and change, spring tides rise 18 or 19 feet, neaps 10 feet.

Between the west point of Anticosti and the Seven Islands Bay, the River St. Lawrence is 22 leagues wide, forming a clear open sea, without any danger whatever; but to the westward of Seven Islands Bay the main land bends to the southward, until it reaches Point Deamon, between which and the opposite shore of Cape Chat, the river becomes contracted to about 8 $\frac{1}{2}$  leagues: the shore is bold all the way; but Point Deamon, and the land to the eastward of it, is somewhat lower than to the westward, and there are a few places where vessels may occasionally anchor.

TRINITY BAY.—This Bay or Cove is about 2 $\frac{1}{2}$  leagues N. E. by N. from Cape Deamon, it is a safe place for vessels unable with westerly winds to make their way up the river, the ground being everywhere clean, and the current so strong with these winds, that even fast sailing ships will not be able to advance against it. Between Cape Deamon and Trinity Bay the shore is indented with some small sandy coves, and near them are three large rocks above water; keep in not less than 8 fathoms water and you will avoid them.

On the N. E. point of the bay are also two large rocks, the northern one dries to the main, with spring ebbs, but the southern one lies near a quarter of a mile to the southward of the point; there is no passage between them. This bay is 3 $\frac{1}{2}$  miles round from point to point, and there is a river falls into it, where good water can be obtained; another stream also may be found about half a mile to the westward of the west point of the bay, and wood may be had in abundance.

To sail into Trinity Bay, you must come to about half a mile to the eastward of the west point, on which stands a cross, and anchor with the point bearing W. S. W. or S. W. by W. Small vessels may anchor in 3 fathoms at low water, just within the reef, the western point of the bay bearing S. W. Three quarters of a mile S. W. of the point, where the cross stands, is a ledge of rocks, which dry at low water, and must not be approached nearer than 4 fathoms.

The land to the westward of the point trends N. W. and forms a little bay, where small vessels sometimes take shelter from N. E. winds, but of no use to large ships.

CAPE MONT-PELO.—A lighthouse has been erected on Point-des-Monts (or Cape Mont-Pelo) on the north side of the river St. Lawrence, nearly opposite to Cape Chat, the lantern standing nearly 100 feet above the water. The lighthouse lays with the outermost part of Carribou Point, N.  $52^{\circ}$  E.—and S.  $52^{\circ}$  W. by compass, and can be seen over that point, and to the eastward of it.

Ships approaching the lighthouse from the eastward, as they draw towards Carribou

**MANICOUGAN BAY AND GREAT SHOAL.**—Five leagues and a half west from St. Nicholas Harbor lies the east point of the entrance of Manicougan Bay. The shore between them is bold and rocky, with fifty fathoms water within 500 yards of the rocks. The land is all high, rugged, burnt and barren quite up to the Bay; but that to the westward is much lower, and of a yellow appearance, by which it will readily be known; it is sandy, and has a fine beach, flat for the distance of two miles off.

The eastern point of the entrance to Manicougan Bay faces a large cape, lying to the eastward of it, distant  $2\frac{1}{2}$  miles; between them is a deep round bay, on the N. W. side of which,  $2\frac{1}{2}$  miles from the eastern point of the entrance, is a small river running down by the sides of two hills, that are close to the shore; this bay is open when the river bears N. N. W. and when the west point of Manicougan Bay bears W. by S. distant five miles, you will then be on the east end of Manicougan Great Shoal.

When the small river above mentioned bears N. N. W. and you intend going into the bay, if you should find yourself close in to the northward, for the spit extends only  $4\frac{1}{2}$  miles from the river, you should edge off to the southward, in seven fathoms, along the east side of the point of entrance, until a cove comes open of it, bearing N. W. by W.  $\frac{1}{2}$  W. then haul up, and that course will carry you into the bay; the channel is narrow between the great shoal and the east point, and a bar stretches across with ten feet over it at low water.

The south side of the east point is rocky, and the rocks run off 100 yards from it; you must steer up half a mile to the W. N. W. of them, and anchor on the east side in sixteen feet at low water; then moor, for there is scarce room to swing safely.

The eastern side of the east point of the entrance, quite to the small river, is all flat and rocky for one mile off, to the eastward of which, small vessels may find shelter from westerly winds, in four fathoms; but if caught with an easterly wind and flood tide, they will not be able to clear the east spit of the Great Shoal.

In approaching the bar from the eastward, the soundings are very irregular. You rise from 60 to 20 fathoms, then ten, and four fathoms close to the bar; from the bar down to the east spit on the north edge of the shoal, there are seven and ten fathoms close to the breakers; the channel between the edge of the shoal and the east side of the bay is very narrow, while the Great Shoal to the south, S. W. and west, is completely dry, and for three miles to the S. W. the breakers are visible.

When at anchor, Mount Camille will be just open to the eastward of the west point of the bay, bearing S. W. by S. At high water, there are ten feet quite across the bay, which is three miles broad.

The flood tides run strong into the bay, and the ebb to the contrary. The bay, from the anchoring place, runs west one mile, then N. W. two miles, and N. N. E. half a mile; at the head are two small rivers, and the bay is about one mile wide across at the head.

**MANICOUGAN POINT** begins at the point which forms the east part of the bay, and extends from W. S. W. to W. by N. four leagues. The land is much lower on the point than any near it, and is easily known by its yellow appearance, being sand, with a fine beach all along, but very flat. The utmost extent of the Great Shoal from this point to the southward, does not exceed four miles and a half, but is every where so steep on the south side, that it is impossible to approach it with the lead; there are thirty fathoms within a quarter of a mile of it, and in some places fifty fathoms within 100 yards; it is the same at every part of the bank.

On shore, within the shoal, the tides ebb nearly one mile from high water mark; for another mile, there are only two feet water, and in strong winds, breakers are to be seen three miles off. Strong and irregular eddies are about all the edges of the shoals; and during a fresh gale of wind, vessels will not answer the helm, but will with difficulty be kept from running on the bank, or driving against each other. In short, it is a dangerous place, and should by no means be made free with by strangers.

The tide flows, full and change, at one o'clock, and rises eleven or twelve feet in the spring, and eight feet in the neap.

From the east spit Manicougan Shoal extends W. by S. and west, six leagues and a half, and at its western end it turns into the River and Bay des Outardes; it runs out nearly three miles from the land, and joins a flat, which stretches completely round Bay des Outardes so far as Betsimet's Flat. Betsimet's Point is the name of the west part of Bay des Outardes, and lies S. W. full five leagues from Manicougan West Point. After ships are two leagues to the westward of Manicougan Point, they may stand into the Bay des Outardes to within two miles and a half of the shore, but not nearer, for the flat runs off one mile and a half, and is very steep to and dangerous. In the north part of Bay des Outardes, are two rocky islands, but close to the main; Outarde River lies between these two islands and Manicougan Point, but is of no use to ships, the entrance being quite blocked up by shifting sand banks. Three miles to the N. E. from Betsimet's Point, is another river, but its entrance is completely shut up by sand banks. Ships in rounding Betsimet's Point should give it a berth of three miles, for a steep and dangerous sandy shoal quite surrounds the point, and the nearer you approach

the shoal, the stronger is the flood tide; indeed the flood is always strong hereabout, and the ebb weak.

From Betsimét's Point to Point Mille Vache, the bearing is S. W. by W. distant nearly 8½ leagues; between them lies La Valle Bay. This bay is quite clean and bold to within one mile of the shore; in the N. E. part of this bay stands Jerome Island. Just to the eastward of Jerome Island, is a remarkable *white patch* in the land, which, in fine weather, looks much like a large *Church*, and is a sure mark for the island, and much sooner seen than the island in going for it. Ships may make free with this bay quite up to Point Mille Vache, but they must give that point a berth of two miles and a half, as a steep sandy shoal surrounds it, like that at Betsimét's Point.

In Valle Bay, and to the westward of Jerome Island, there is a river open when it bears N. W. Ships falling into this bay, and seeing this river open, will be sure the point to the eastward of them is Betsimét's and not Manicougan, as there is no other river open, *in that bearing*, in any part of this coast: it may be proper to observe this, that strangers may be certain where they are, should they fall suddenly in with this part of the coast, after thick weather, at the same time seeing Jerome Island with the white buildings on it.—Observe also, there are two islands in the N. E. part of Bay des Outardes, and only one in this bay, and that much larger than either of the others.

Betsimét's Point bears from Father Point (the pilot's rendezvous) N. ½ W. distant thirty-two miles, and from Barnaby Island, N. by E. distant thirty-five miles. Here vessels with the wind at west, and flood tide, may cross over, and engage a pilot for the river; should the wind be S. W. by W. they will do well to keep the northern land on board, until they can make certain of fetching Father Point.

The current is always strong between Mille Vache and Biequette, running to the N. E.

Three miles to the eastward of Point Mille Vache, is a small river, with a settlement of two or three houses, belonging also to the North-west Company, called Portneuf. At this part are some remarkable white cliffs, appearing like chalk, which will distinctly point out the situation, there being no similar object in the river.

When abreast of Point Mille Vache, or near it, the Island of Bie will bear S. by E. distant twenty-two miles.

The tide flows at Mille Vache Point, full and change, till three o'clock.

#### THE SOUTHERN SHORE FROM CAPE GASPE' TO THE ISLAND OF BIC.

**SOUTH CHANNEL.**—The coast of the district of Gaspé is high, bold, rugged steep-to and totally destitute of harbors. Several rivulets fall into the sea between this and Cape Chat, but there are none of sufficient importance to warrant description. There is a small settlement at St. Ann's, about six leagues E. N. E. from Cape Chat, where a few families reside, who are always ready to afford the mariner assistance if required; but the little river of St. Ann's, as well as that near Cape Chat, are both barred at the entrance, and afford very little advantage to shipping: the latter, called Cape Chat River, becomes almost dry at low water, except one spot where ten feet water may occasionally be found, these rivers are therefore little frequented.

**CAPE CHAT** is a remarkable headland, known by a short Sugar Loaf Hill upon it; it is the most northerly point of land (by compass) on the south side of the River Lawrence, but the land that surrounds it, as well as that behind, is much more elevated.

From the N. W. end of Amicosti to Cape Chat, the bearing and distance are W. by S. thirty leagues; and from Cape Chat, to the opposite shore at Cape Deamon, the distance is only eight leagues and a half; these Capes bearing from each other S. S. E. and N. N. W. The land about Cape Chat has a remarkable appearance, the mountains being broken, notched, and irregular at their summits; this is a certain and a good mark for the River St. Lawrence, for there is no land like it to the westward.

From Cape Chat to Matins or Matane River, the coast trends W. ½ S. distant nearly 11 leagues; the coast between them is indented with three places like Bays, but no shelter on any part of the coast for anchoring, the shore is all bold and rocky.

The soundings between them, beyond the depth of fifteen fathoms, are all sand, but within that depth all hard and foul. In fifteen fathoms water you will not be half a mile from the rocks, and in some places close to them. The water deepens very fast from fifteen fathoms, so much so, that a mile and a half from shore, you will have fifty and sixty fathoms with fine clean sand, and somewhat farther off no ground at 100 fathoms.

The tide flows by the shore till 12 o'clock nearly at Cape Chat; but the tides in the River St. Lawrence are very much influenced by the winds. Strong easterly winds make them flow much stronger and rise much higher, while westerly winds will have a contrary effect; common springs will rise twelve and fourteen feet, neap tides eight feet.

The shore is all very barren quite up to Matane, and nothing to be got from it but wood and water.

**MATANE** is a river, and not more cliff standing by its the said bluff S. S. keep it so, and run water, and over the lie not a half mile go to the southward, hence of the upland melts, at which time

**BARNABY** Island shelter from west at low water. The Island a quarter of stone bears N. W. of a mile from the N. E. winds under which stands on the close to the main.

MATANE is a small river of little use, except to small vessels. When abreast of this river, and not more than three or four miles from it, you will see several houses, and a bluff cliff standing by itself close to the west side of the entrance; if desirous of entering, bring the said bluff S. S. E. and a lead-colored house will be just open to the eastward of it; keep it so, and run for the River; this mark will lead between two banks, which dry at low water, and over the bar, which has only six feet water on it at low water; the two Banks lie not a half mile from the shore; small vessels sometimes run down along the land, and go to the southward of the westernmost bank: the two Banks sometimes shift by the violence of the upland water from the mountains, in the spring of the year, when the snow melts, at which time the current runs very strong out of the river.

Ships may procure pilots or provisions here, if in want or in distress, when, with a pilot and high water, they may haul close round the west side of the entrance, and lie alongside the sand bank in 14 feet at low water.

Tide flows at Matane till three-quarters past 12 o'clock, full and change.

When one or two leagues to the eastward of Matane, and three miles from shore, you will see the Paps of Matane bearing S. W.  $\frac{1}{2}$  W. they stand inland to the westward of the River, and this is the best bearing to distinguish them in; Mount Camille will then bear S. W. by W.  $\frac{1}{4}$  W. distant 14 or 15 leagues; this mountain appears to the northward of all the land, then in sight, in the form of a circular island.

The course from Matane to the coast opposite Mount Camille, is from West to W. by S.; between them, and eight leagues to the westward of Matane, lies Little Mathis Cove; it is a place where small vessels may find shelter from westerly winds, in two and three fathoms at low water: in going in, give the east end of the reef a berth of 100 yards, or cross it in three fathoms, and haul to the westward and anchor in the middle of the cove. The reef runs one mile, nearly, to the eastward from the land, and from it to the shore or south land, the distance is near two miles, but there is a reef between, and all is dry to the southward of the second reef. The coast is all barren from Matane to this place.

Two leagues and a half S. W. from Little Mathis is Grand Mathis, a small Cove with a River on the S. W. side, of no use to ships, as the Cove nearly dries at low water; however, small vessels may anchor there with S. W. winds in three fathoms at low water, but with westerly winds they will have no shelter.

Little Mathis is known from Grand Mathis by its having a round bluff rock lying S. E. from the north reef, distant one mile and a half; a little to the eastward of the bluff rock stands a small hill on the mountain, in the form of a sugar loaf. Grand Mathis has a large rock standing in the middle of the Cove; Little Mathis has none. You must be within two or three leagues of the shore to make the Cove out, for the points of land and the reefs, which form the Coves, are very low.

The soundings from Matane to Grand Mathis extend further to the northward off the Mathis's than off Matane, having 35 fathoms water, with sand, four miles from shore, and from four to six miles off, you drop into 60 or 70 fathoms. The north edge of the bank is very steep quite up to Green Island. Within 10 fathoms water the ground is all hard and foul, and very bad landing with a boat, except in fine weather, at the Coves at Little and Grand Mathis. The coast between the Mathis's is very full of rocks: in some places they run near a half mile from shore. Three miles to the westward of Little Mathis is Death Cove, a small place where the pilot's boats find shelter with easterly winds, but dry at low water.

Tide flows at Mathis till one o'clock, full and change.

From Grand Mathis to Cock Cove, the easternmost part of Father Point, the land trends W. by S. and the distance is  $3\frac{1}{2}$  or 4 leagues. The ground is all foul half a mile from shore, but in from 12 to 15 fathoms, vessels may stop in calm weather with clean ground. The current generally runs strong down on the south shore. Mount Camille is between Grand Mathis and Cock Cove.

From Cock Cove to the west part of Father Point, the land trends due west, and the distance is 6 miles; between the Cove and Point, the land is low and well stocked with houses, and the pilots live on shore here, (at least many of them) as this place is the general rendezvous for them all. On the west part of the Point stands a house with the body of it painted red, it is the westernmost pilot's house. From this house to the Island of Barnaby the bearing is due west, three miles and a half.

BARNABY ISLAND lies W. by S. and is three miles long. Small vessels may find shelter from westerly winds under the east end of this Island, in from two to three fathoms at low water. There is a round large stone on the reef, which runs to the eastward of the Island a quarter of a mile. Cross the reef by the lead, and haul to the S. W. till the large stone bears N. W. by W. and the body of the Island bears W. by N. then anchor a quarter of a mile from the Island. Small vessels may likewise find good shelter from easterly and N. E. winds under the west end of this Island; run up to the westward until the Church, which stands on the main, is just open to the eastward of a bluff rocky Island which lies close to the main, and due south from the west end of Barnaby; with this mark, cross the

reef in three fathoms, (which runs to the N. W. from Barnaby) and come to mid-way between this bluff Island and Barnaby. Barnaby then will bear N. E. and you will have from 3 to 4 fathoms at low water. The channel from Barnaby to the bluff Island is three-fourths of a mile wide, and all clean good ground. At high water, spring tides, there are 14 feet water in the channel between Barnaby and the Main, but this becomes quite dry at low water, having many large stones here and there. Vessels of ten feet water may run through safely between the Island and Main, should they be caught at anchor at either end, by the wind shifting suddenly; but it must be at spring tides or nearly so, as at neap tides there is no where nine feet. The tide flows at Barnaby Island, full and change, till two o'clock. The Church above mentioned stands due south from the body of Barnaby Island, on the east side of the River called Remonsky. Remonsky is the name of this parish; it begins at Cock Cove, and continues three miles above this river. There are no houses on Barnaby Island, and very little water: ships in want of water must go to the river.

From Barnaby Island, Bic Island bears west, and Biquette W. a little Northerly. The first is three leagues distant, and the latter ten miles; Cape Arignole bears W. by S.  $\frac{1}{2}$  S. distant three leagues and a half. Cape Arignole or Original, and the east end of Bic Island lie due north and south of each other; the west end of the Island Bic bearing N. W. and the east end of the reef, which extends S. E. from the Island, N. N. E. the distance from the Cape to the Body of the Island is about two miles and three quarters.

Between Barnaby and Bic Islands, lies the River Ottey and Old Bic Harbor; the River Ottey bears S. W. from Barnaby, distant about five miles, and is of little use to shipping except to water at. Old Bic is to the westward of Ottey River, about three miles, and is a very good place for small vessels to lie sheltered from westerly winds. This harbor has two round Islands on the east side of it, and it is one mile from them to the west side of the harbor; anchor mid-way between the westernmost Island and the west side of the harbor in three fathoms at low water, the west point bearing west: a single family resides here, who occasionally can furnish you with provisions, if necessary.

Cape Arignole bears from the Harbor of Old Bic due west, and is distant about two miles and a half; from the Cape runs a reef E. by N. one mile, and the east part of that reef, the west point of Old Bic Harbor, and the west end of the Island of Bic are in a direct line bearing W. N. W. and E. S. E.; the distance from the east end of the reef to Old Bic Harbor is one mile. To the S. E. of the Cape, is a Bay of no use to shipping, being all foul ground and shoal water. The leading mark to clear the eastern reef of Cape Arignole, going in and out of Old Bic Harbor, is to keep the swashway in the S. E. part of Old Bic Harbor open to the eastward of the west point of the harbor, bearing E. S. E.  $\frac{1}{2}$  S. in four fathoms water, spring tides. The swashway here mentioned, is made by a river running down between the mountains. Just to the westward of the swashway the land appears like chalk, but it really is a white barren rock. It forms a very good mark for small vessels coming down from the westward, and intending to anchor at Old Bic, as the east part of the reef of the Cape is covered at high water, and is all rocks, which dry at low water.

THE ISLAND OF BIC is moderately high and well clothed with trees, its length east and west is about three miles, and it is surrounded on the east, west, and north sides by dangerous reefs. Off its northern shore lies a woody islet, 150 yards long, called Biquette; this is nearly a mile distant from the Island Bic, but there is no channel for vessels between them; the northern side of Biquette is steep to, and there are 30 fathoms water, at a musket shot distance from it.

#### FROM BIC ISLAND ALONG THE SOUTHERN SHORE, WITH THE ISLANDS, ROCKS, AND SHOALS IN THE RIVER, TO QUEBEC.

THE ALCIDES ROCK.—This is a danger on which is said to be no more than eight feet water, but recent navigators seem inclined to disbelieve its existence. Mr. Lambly, whose name we have already mentioned, says, "he is sure there is no such rock; there is, he states, a rock with 10 feet water, but that lies S. W. by S.  $3\frac{1}{2}$  miles distant from the west end of the Island of Bic, and only one mile from the main. Vessels sailing in 10 fathoms water, will go to the northward of it, it lying completely out of the fair way track of shipping: this rock and the N. W. Ledge that stretches from the west end of Bic, are the only dangers to be avoided."

South-west, distant one mile from Cape Arignole, lies the east side of the Bay Ha Ha; it is about three-quarters of a mile wide, and one mile deep; small vessels may anchor with the east part of the Bay bearing N. E. the east end of Bic Island will then be shut in with it, in two or three fathoms at low water, sheltered from easterly winds; but the Bay is of no use to large vessels.

Between two and three leagues to the westward of Ha Ha Bay there is a small rivulet, where in the spring of the year, there is a remarkable waterfall: and a league and a half further west, are the Razade or Bumper Islands.

THE RAZADE always above water, ters of a mile apart, ing a full league from the northward, Bank is commonly.

WHITE ISLAND  $3\frac{1}{2}$  leagues, being i

**THE RAZADE ISLANDS** are, strictly speaking, two large barren rocks, appearing always above water, and bearing from each other N. E. and S. W. being about three quarters of a mile apart. A Bank of soundings extends all the way from Biquette Island, reaching a full league from the shore, with from 10 to 20 fathoms upon it, and vessels may pass from the northward of the Razade and Basque Islands in 10 fathoms, but the edge of this Bank is commonly steep to, and being off it you will suddenly drop into deep water.

**BASQUE ISLAND** lies W. N. W. from the western Razade, distant two miles, and S. W. by W.  $\frac{1}{2}$  W. from the Island of Bic, distant about 6 leagues; it has a round appearance, and is covered with trees; at present there are no houses upon it, and its northern side is bold to. Behind Basque Island, and situated on the main land, is Three Pistoles, a small settlement.

**APPLE ISLANDS** lie a league and a half W. S. W. from Basque Island; they are three barren rocky islets, the middle one being considerably the largest: between them, and a little to the northward of the west end of Basque Island, there are some rocks which dry at low water; these are steep to, and very near them are 10 fathoms.

**GREEN ISLAND** lies to the S. west of Apple Islands, from which its northern point is distant nearly a league and a half, it thence continues in the direction of the land nearly N. E. and S. W. about three leagues; here, on a point that projects northward into the river, stands a lighthouse, which is 70 feet above the level of the low water mark; and exhibits a regular light from the 15th of April to the 15th of December, from sun set to sun rise, its bearings being as follow: from Red Island E. S. E. White Island E. N. E. northerly, the Brandy Pots N. E. by E.  $\frac{1}{2}$  E. Apple Island S. W. by W. Basque Island W. S. W.  $\frac{1}{2}$  S. from the shoal at the north-east end of Green Island S. W. by S. and from the shoal at the west end of the Island N. E. From Basque Island it is distant 13 miles; and from the middle Apple Island, 7 miles. To vessels either going up or down the river, the lighthouse will have the appearance of a ship, being very conspicuous, while the light will be visible six leagues off. There is no danger on the north side of Green Island, except the ledge that runs off the lighthouse, and this ledge stretches out  $\frac{3}{4}$  of a mile N. E. by N. from it; it is covered at high water spring tides, but steep to and rocky; the extremity of the shoal lies directly in a line with Basque Island and Cape Ariguole, bearing E. N. E.

There is a rocky reef at the western end of Green Island, which dries for a mile; the westernmost part of this reef is there detached from the dry part, and the flood tide sets through it strongly towards Cacana; this part is only covered at a quarter tide, and when the lighthouse bears N. E.  $\frac{1}{2}$  E. you will be in its direction.

It may be proper to state that the lighthouse on Green Island, was intended for a low light, as a high light was to have been erected on the island behind it, on such a spot, that a line drawn through their centres would form a line of sailing to lead ships in and out, between Red and Green Island Shoals, and sufficiently far to the eastward, to insure them a fair way between Bic and Mille Vache Shoal.

On the outermost part of the reef that lays N. E. by N. from this lighthouse, the north side of Basque Island and the high land to the southward of Cape a l'Original are in one line; therefore by keeping the said highlands open to the northward of Basque Island, a ship will clear the reef: by keeping White Island open to the northward of Hare Island, a ship will lead clear of, and be in a fair way berth from Red Island Shoal.

**CACANA** is the high bluff land lying S. S. W. from the S. W. end of Green Island, the water between is deep; one and a half mile to the westward of Cacana, and just to the northward of the stream of it, lie the Perces or Percy Rocks; these form two clusters, about a mile from each other, bearing east and west; they are distant from the main nearly one mile; and are almost covered at high water; but there is no passage to the southward of them. You will always go clear of them by keeping in not less than 10 fathoms water.

**BARRET'S LEDGE** is two detached rocks; on the south-western rocks lies a black buoy, having the northern extremity of the main land within Green Island, in a line with the northernmost high land of Cape Ariguole, bearing N.  $64^{\circ}$  E. the summit of the southernmost mountain in the Highland of Kamaraska in one with the south point of the Great Pilgrim Island S.  $30^{\circ}$  W. the eastern side of the trees on Hare Island in one with the west Cape of the Bay of Rocks, on the north shore N.  $47^{\circ}$  W. and two houses near the River du Loup S.  $29^{\circ}$  E. the latter are the only two houses between the Church and River du Loup. These rocks are distant from each other one quarter of a mile, bearing N.  $63^{\circ}$  E. and S.  $63^{\circ}$  W. the N. E. rock has 15 feet water over it, the S. W. rock only 12, while between them are 11 fathoms.

**RED ISLAND.**—This is a low, flat, reddish-looking island, without trees; and not above 20 feet above the level of the high water mark; it is surrounded with shoals; and situated nearly in the middle of the river, bearing from the lighthouse W. N. W. distant six miles; while the outer or eastern extremity of the reefs about it, bears from the same lighthouse N. W.

**WHITE ISLAND.**—This is a small island lying S. W.  $\frac{1}{2}$  W. from Red Island, distant  $3\frac{1}{2}$  leagues, being round and covered with trees; a reef of rocks extends N. E.  $\frac{1}{2}$  E. full 5

miles from the east end of Hare Island, drying to about half that distance; midway between the Red Island and this reef are 20 and 25 fathoms.

It may be proper to remark here, that, from this part, a bank extends nearly parallel to the shores of the river, so far as the Goose Islands; it is narrow, and may be crossed in many places, but it naturally divides the navigation of the river into two channels; that to the south-eastward is the one most commonly frequented, the other to the north-westward, having strong tides, deep water, and no good anchorage.

**HARE ISLAND.**—This island lies S. W.  $\frac{1}{2}$  S. distant only three quarters of a mile from White Island, thence it extends to the S. W. full eight miles; in no part exceeding in breadth one mile, but in several places not equalling half a mile. S. by W. one mile from the east end of Hare Island, lies the southernmost of some small islets called the Brandy Pots, on which a telegraph is erected. The northernmost Brandy Pot is close to the southern one; it is high and covered with trees; the southernmost is a whitish rock nearly barren; they are each about half a mile long, lying N. W. and S. E. of each other, the ground between them drying at low water; they lie nearly a  $\frac{1}{2}$  of a mile from the south side of Hare Island, with no passage for vessels between. A little to the east of the northern Brandy Pot is the Noggin, a small islet covered with trees; at low water these are connected by a chain of rocks, leaving a passage only fit for boats. Half way between the Noggin and the east end of Hare Island is a reef of rocks which dries at low water; it lies close to Hare Island, and therefore not in the way of shipping; and by keeping in 7 fathoms, you will always go clear.

To the westward of the Brandy Pots, the south side of Hare Island has a flat of hard ground, extending from it, being three miles long and one quarter of a mile broad: the whole of this side of the island is bounded by rocks.

**MIDDLE GROUND.**—South-westward of Barret's Ledge, and between Hare Island and the main land, lies a shoal called the Middle Ground, its north-east end begins where the Brandy Pots bear N. W. distant two miles; it runs S. W. by W. from thence about four miles; the least water on its N. E. part is 2 fathoms, on its middle 3 fathoms, and on its western end 5 fathoms: the anchorage upon it is good in fine weather. When the west end of Hare Island bears West, Cape Salmon, on the north side of the river, will be open to the westward of it: but you will observe that, with this mark on, about half a mile to the northward of the Middle Ground is a small knoll with only 14 feet water upon it. By keeping White Island between Hare Island and the Brandy Pots, you will pass to the southward of this knoll in 5 fathoms water.

**HARE ISLAND SHOAL.**—This is a long shoal, beginning about a mile above the west end of Hare Island, and running up in a S. W. direction, full three miles; and a considerable part of it becomes dry at low water; the western extremity that dries, bears from the west end of the Pilgrims N. 35° W. and the eastern extreme due north: the bank is composed of sand, some part of it being above the level of high water mark, but it is bold to on its southern side, and 7 fathoms will lead right along its edge. Between the shoal and the Pilgrim Islands, the channel is not three miles wide.

According to the information of Captain Watson, of the ship *Perseverance*, there is a bank of 13, 14, 15, and 16 feet in this part of the channel, lying in the same direction with the Hare Island Shoal, and having a narrow channel of 3 fathoms water between them; the south part of this bank lies W.  $\frac{3}{4}$  S. from the Northern Pilgrim, distant nearly 5 miles S. W.  $\frac{1}{2}$  S. from the Brandy Pots. S. S. W. from the western part of Hare Island, distant 4  $\frac{1}{2}$  miles, and N. E. by N. from the Kamaraska Islands, distant 6 miles, at which spot there are only 2  $\frac{1}{2}$  fathoms water: the bottom is hard, flat, and clear from rocks; should this description prove correct, mariners passing through this part of the river will do well to borrow somewhat closer towards the Pilgrim Islands, keeping at about a mile from them, they will then go clear of all danger, and have from 8 to 10 fathoms water.

**THE PILGRIMS** are four islands connected together by reefs, that become dry at low water; they occupy a space of about three miles, and are distant one mile and a half from the main, but there is no passage between them and the south land. The N. E. or Great Pilgrim, bears from the Brandy Pots S. 18° W. distant eight miles, and from the S. W. end of Hare Island, S. 36° E. distant 3  $\frac{1}{2}$  miles; this is the highest island, and covered with trees; the others appear white and barren. The south-westernmost or Long Island, has a telegraph upon it, and lies in the direction of S. W. and N. E. its west end bears from the west end of Hare Island S. 10° W. they are all bold to on the northern side.

**KAMARASKA ISLANDS.**—These are a collection of small islands lying off the south side of the river, between the Pilgrims and Cape Diable, and in front of the Church and settlement of Kamaraska. The Great or N. E. Island, bears from the western Pilgrim, S. W. distant two leagues; there is a bank extending from one to the other, with three fathoms upon it, and 10 fathoms close to its northern edge; the second is called Burnt Island, and lies close to the westward of Great Island; on its western end is a telegraph. Crow Island lies S. S. W. from the west end of Burnt Island, distant half a mile; there are also two lesser Islands at the inner side of Burnt Island. These Islands occupy a

space of water. Island has quarters. From Cape, in covered a Cape Dis in it, on mile or o The la ings befor Westerly eastern ba distance is a sand bar placed in by S. and St. Denis east end of Oval and it is shallow as the

If a mile: there  
lands occupy a

space of three miles, and are about one mile off shore, the bank between drying at low water. Great and Burnt Islands are both bold and steep to on the north side, but Crow Island has shoal water around it, and bears from Kamaraska Church N. W. distant three quarters of a mile; between is a safe landing place.

From Crow Island, Cape Diable bears S. W. distant nearly three miles, but from the Cape, in the direction of Crow Island, runs a rocky reef, the easternmost part of which is covered at a quarter flood, and is not more than a mile from Crow Island. Two miles above Cape Diable is Point St. Denis, to the southward of which is a little Cove with an Island in it, on which stands a Telegraph. There is good riding opposite to this Cove, at one mile or one mile and a half distance from shore, in from 10 to 15 fathoms.

The land from St. Denis runs S. W. to Point Oval, and is all low, with regular soundings before it; Point Oval has a rocky reef attached to it, which stretches out W. and S. Westerly a full mile and a half; rounding this point you will open the River Oval, on the eastern banks of which is a Church and Settlement: from Cape Diable to Point Oval, the distance is 7 miles. Nearly 8 miles to the south-westward of Point Oval is Point St. Roch; a sand bank stretches out from this latter Point, at the extremity of which a black buoy is placed in  $2\frac{1}{2}$  fathoms, this lies with the Road and St. Roch's Church in one, bearing S. E. by S. and the northernmost part of the Land of Kamaraska, just open of the low Point of St. Denis, bearing N. E. by E.  $\frac{1}{2}$  E. St. Ann's Church E.  $\frac{1}{2}$  S. Oval Church E. by N. the east end of Coude Island N. N. W.  $\frac{1}{2}$  W. and Cape Goose N. N. E. Between Points Oval and St. Roch is an extensive Bay, commonly known by the name of St. Ann's Bay: it is shallow all over, for a sandy flat beginning at Point Oval extends itself W. by S. so far as the buoy of St. Roch; this flat is studded with sunken rocks, and very dangerous.

A floating light vessel lies about a fourth of a mile below the station of the black buoy, which was laid many years since on the outermost part of the large shoal off St. Roch's Church, in  $4\frac{1}{2}$  fathoms at low water. The said buoy lays with the following land marks, bearings, &c. &c. St. Roch's Church S. E. by S. the steeple is then immediately in one, with the road that runs up from the church into the Concessions, and about 5 miles distant.

The northernmost high lands of Kamaraska in one with the low point of St. Denis, bearing about N. E. by E.  $\frac{1}{2}$  E. Pillar Boise, shut twice its breadth with the S. point of Goose Island, bearing S. W. quarter W. The buoy lies in  $2\frac{1}{2}$  fathoms water.

Ships should give the light vessel a fair berth and run up above the black buoy on their S. W. by W. course, and then haul in to the southward to 5 fathoms of water; the course will then be S. S. W. to the pillars, and the distance from the pillars to the light vessel is about 11 miles.

**ENGLISH AND MIDDLE BANKS.**—Directly opposite the black buoy of St. Roch, lies the red buoy of the Middle Bank, from which it bears N. W. by W. distant one mile, the marks being the summit of the second mountain of the high land of Kamaraska, in one with the low land of St. Denis; and Pillar Boise open its own breadth to the southward of Goose Island; the thwart marks are, the road behind St. Roch's Church, open to the westward of said Church, three times the church's length, and the black buoy S. E. by E. the channel for shipping is between these two buoys; the depth of water being from 11 to 14 fathoms. This is considered the most intricate part of the river; the currents here are various, irregular, and strong, so that it cannot be passed in safety, except at a proper time of tide. A bank occupies the middle of the River St. Lawrence, stretching all the way from Hare Island to the Middle Bank; it is generally about a mile wide, with from 3 to 14 fathoms over it; but the soundings are regular, and the bottom sand and mud, affording good anchorage. It is called the English Bank; and that part of the river between it and the southern shore is commonly called the English Channel. The Middle Bank begins a little to the westward of the red buoy where there are  $2\frac{1}{2}$  fathoms water; it thence extends S. W.  $\frac{1}{2}$  W. for 3 leagues, nearly reaching the Seal Islands; about  $1\frac{1}{2}$  mile westward of the buoy, it shallows to 4 feet, and continues so for a league, being composed of mud, sand, and stones; its western end dries at low water.

To the westward are the Seal Islands or Reefs; these are connected to the South Pillar by a reef of rocks, which, at low water, become dry in several places, and extend N. by W. towards the Island of Coude; they are a body of rocks nearly covered at high water, spring tides, and are very steep to on their southern and eastern sides.

The Pillar Boise or Woody Pillar lies to the S. Westward of these reefs, and is 3 miles N. E. from the east end of Goose Island; it is a high round rock, with some trees on its western part. The South Pillar is a barren high rock, one quarter of a mile long, and always visible: this Pillar marks the north side of the west entrance to what is called the \*Traverse.

\* On the Traverse a light vessel is placed every spring and removed every autumn, at the close of navigation; also Buoys placed as follows, viz. A red Buoy off St. John's Church, on the south bank

THE TRAVERSE is that part of the river which is bounded on the north side by the Seal and Middle Banks, and on the south side by the shoals off Point St. Roch, from Point Oval to the Three Salmon River; vessels frequently anchor there, but the ground is hard, and the currents strong.

THE ROCHE AVIGNON is a half tide rock, 100 yards in length, quite round at the top, and lies two or three cables' lengths S. E. from the body of the South Pillar; there are 7 fathoms water close to it. Crane Island, kept well open to the southward of the large reef off Goose Island, next described, leads clear to the southward of it.

S. W. by W. about two miles from the South Pillar, begins a ledge of high rocks, which runs up to the middle of Goose Island, from which the upper end is but half a mile distant; with the exception of their eastern part they are always above water; this is called Goose Island Reef, and forms the mark for clearing the Avignon. There is an opening between the east end of Goose Island Reef and the South Pillar, leading towards Pilier Boisse; but at low water it is surrounded with rocks both east and westward, it therefore forms no outlet for shipping.

GOOSE ISLAND is nearly three leagues in length, and, when above the reef, becomes bold to, with regular soundings; there is a farm house on the island, just to the eastward of which is the Hospital Rock; it is large and close to the low water mark: to the westward of this rock, for the distance of a mile and a half, ships may safely be run on shore, for it is all soft mud; but further on, two miles from the Hospital Rock, the shore becomes rocky, a long reef commencing, which, as it lies close to Goose Island, is out of the way, and consequently easily avoided.

CRANE ISLAND lies a little above Goose Island, and is about 4 miles long; the northern side is cultivated, and a farm house appears at the east end: to the S. E. of this house, about half a mile or three quarters of a mile, lies Madame Beaujeu's Bank, having on its shoalest part not more than twelve feet water over it; it is connected to the main land of St. Ignace by a shoal of 4 and 3½ fathoms. The channel between Beaujeu's Bank and the eastern end of Crane Island has 10 fathoms in it, but its breadth scarcely exceeds half a mile.

To the westward of Crane Island lies a cluster of small islands, named Canoe Island, the Heads, Onion, Margaret's, and Grosse Islands, and a little further are Rat and Madame Isles; above which is the large Island of Orleans.

From the western end of Crane Island a reef of rocks extends half a mile, drying at low water; there is an opening between Crane and Canoe Islands; but although there are 2½ fathoms in it, the channel is too narrow for shipping: the island of Margaret lies to the westward of Canoe Island, it is about 2½ miles long; the opening between Margaret's and Grosse Islands is half a mile wide, but shoal, and affords no passage for ships. Grosse is three miles in length, lying N. E. by E. and S. W. by W. It is inhabited.

Rat Island is about the length of Grosse Island, but narrow. Madame Island is somewhat smaller than Rat Island; both are covered with trees; from Madame Island a rocky reef extends S. W. by W. 3 miles, drying at low water, and ships ought not to go nearer to it than 10 fathoms water. The mark to clear it is, some part of Rat Island kept open to the southward of Madame Island. The western extremity of the reef lies with St. Valier's Church, bearing South.

At the back of these islands, there are numerous shoals extending all the way to the island of Coudre, among these the river craft frequently pass towards St. Paul's and Mal Bays; these form a continued chain to Neptune Rock, and Burnt Cape Ledge, being the outer boundary of the northern channel, now very little used or understood.

THE SOUTHERN SHORE.—In following the Southern Shore from St. Roch's Point you will see the Church of St. John's standing on a projecting point, about 2½ leagues distant from the Church of St. Roch; behind the latter, at some distance inland, is a Telegraph. Nearly at the same distance from St. John's Church, and in a similar direction, stands the Telegraph of the Islet St. Jean; and between these is Port Jolie and Three Salmon River, fit only for small craft; further on is the Church and Telegraph of St. Ignace; this lies to the southward of Madame Beaujeu's Bank, from which it is distant nearly 1½ league. The shore all the way from St. Roch's Point to St. Thomas's River is lined with a sandy flat of three, two, and one fathom water.

Two leagues to the S. Westward of Beaujeu's Bank, and about the same distance from St. Ignace, lies the entrance to St. Thomas's or South River; from this land, a flat or mud bank extends more than half way towards Crane Island; it is named St. Thomas's Bank, or Quart Point, its northern extremity bears S. W. by W. distant two miles, from the south point of the island; it is a dangerous bank, and chiefly dries at low water.

of the river, in 11.4 fathoms. A white Buoy on the middle ground. A black Buoy opposite to the last on the St. Roque Shoal, and a chequered black and white Buoy off St. Ann's Church, on the St. Ann's shoal, south bank of the river.

**THE WYE ROCKS** are immediately above the Bank of St. Thomas, this bank lies in the direction of S. W. by W. and is about half a mile long; over its western end are only four feet water, and over its east end ten feet; at its western end there now lies a black buoy, the marks for which are St. Thomas's Church E. S. E. St. Thomas's Telegraph S. ½ E. and the Seminary of St. Joachim just shut in with the east end of Rat Island, bearing N. 50° W. Its distance from the nearest shore is less than one mile; the long mark for this Rock is Belle Chasse Islands and St. Michael's Telegraph in one; the islands will then be twice their breadth open to the northward of Point St. Valier.

**THE BELLE CHASSE ROCKS** are two remarkable rocky islets that lie eight miles above the Wye Rocks, they are opposite to Berthier Church, and about a mile off shore; behind them is a small sandy cove, a reef of rocks running from its western point. Beyond these you will perceive, standing on rising ground, another Telegraph, No. 4, being part of a chain communicating to Quebec. St. Valier's Church is two miles to the westward of the Telegraph, and bears from the Church of St. John, in the Island of Orleans, S. E. distant three miles; there is a large cove to the southward of St. Valier's Point, but it dries at low water. The ground from St. Valier's Point is foul, and affords no anchorage all the way up to Quebec. Nearly five miles beyond St. Valier is the Church of St. Michael, near which stands another Telegraph; 3 leagues above this is the Church of Beaumont: St. Lawrence and Beaumont Churches bear from each other S. W. by S. and N. E. by N. distant 4½ miles: between them extends a large rocky shoal, called Beaumont's Shoal, it dries at low water, and extends nearly half way across the channel, uneven, dangerous, and steep to, there being 14 fathoms close to it. From Beaumont the coast turns about W. N. W. 7 miles to Point Levy.

**ORLEANS.**—The Island of Orleans bounds the starboard shore, from Madame Island to nearly abreast of Point Levy; its shores generally slope down to the beach, except in some few places where small rocky cliffs arise of neither great extent nor elevation. It is well cultivated, and very fertile; its northern shores are flat and muddy, and lined with a reef of rocks, but its southern side is fine sand, with here and there a pointed rock. The Churches of St. John and St. Lawrence stand near the shore, the distance between them being 5½ miles, this part is highly diversified with gardens and houses. Patrick's Hole is a little to the westward of Point St. Lawrence, and is a safe and well sheltered cove, where vessels outward bound commonly anchor in 10, 12, or 14 fathoms, previous to taking their final departure; the ground cannot be accounted good, but it is well sheltered from easterly gales, and the river here is bold on each side, being about 1½ mile wide; just to the eastward of the cove stands the Telegraph, No. 2; and on the western part of the point is a cluster of neat houses, where accommodations of all kinds may be obtained.

About half way between the west end of Orleans and St. Patrick's Hole are the Morand's Rocks, running out one cable's length from the shore; they have 10 feet water over them, and 12 fathoms in sailing past them. At the S. W. part of the island are other rocks which dry at low water; these are close to the land, and may safely be passed in 10 fathoms water. This is the highest part of the island, and here stands the Church of St. Peter, about 4 miles from the western point, and nearly opposite to the Falls of Montmorency.

The Point of Levy is surrounded with a reef, which continues along shore to the westward, but by giving the land a berth, you will go safely in 10 fathoms.

**QUEBEC.**—The Basin of Quebec is about one mile across, from Point Levy to Quebec, or to the opposite shore of Beauport; the water between is very deep. The **HARBOR** of QUEBEC may be said to commence at St. Patrick's Point, and extend to Cape Rouge River, three miles above Quebec.

**THE PORT OF QUEBEC** comprehends all that space which lies between Barnaby Island and the first rapid above Montreal. The **BALLAST GROUND** is a part appointed by law to heave the ballast into, being to the westward of two beacons that stand on the south shore, between Patterson's and Charles's Coves; these beacons are situated on the brow of a hill, and, when in a line, bear S. E.

The regulations, with respect to the shipping and quarantine, in the port and harbor of Quebec, must be strictly attended to: all pilots are bound to give the masters of vessels due information relative to quarantine, as soon as they come on board; and a copy of the harbor laws is delivered to each vessel, on her arrival, by the harbor master: and those respecting shipping are always to be seen at the harbor master's office.

**THE CITY OF QUEBEC** is built on Cape Diamond, which is exceedingly high; from hence, and from Point Levy, the views are magnificent and beautifully varied; the capitol on the summit of the Cape, the River St. Charles flowing to the northward, the Falls of Montmorency to the north-eastward, and the well cultivated Island of Orleans, form altogether a most beautiful spectacle.

The Island of Orleans divides the river into two parts, or channels, but the southern channel, which has been described, is the only one the pilots make use of for large ships.

The River St. Lawrence is not navigable from the early part of December to the middle of April, on account of the severity of the frosts; during this period its upper part, from Quebec to Kingston, in Upper Canada, and between the lakes, with the exception of Niagara and the Rapids, is frozen over; but below Quebec, although the river is never wholly frozen, yet the strength of the tides continually detach the masses of ice from the shores, and such immense bodies are kept in incessant agitation, by the flux and reflux, that navigation becomes impracticable. At the beginning of May, the ice is either dissolved or carried off by the current.

#### DIRECTIONS FOR SAILING UP THE RIVER ST. LAWRENCE, FROM ANTICOSTI TO QUEBEC.

**REMARKS.**—It has been observed that the current, between the S. W. point of Anticosti and the coast of Gaspé, sets strongly from the river to the south-eastward; that in the spring of the year, probably in consequence of the melting of the snow, its velocity is always the greatest. In summer it may be averaged at about the general rate of two miles an hour, but in spring it becomes variable, and much beyond that rapidity; at times it will run  $3\frac{1}{2}$  miles an hour, and often more than that, depending greatly on the quantity of ice and snow that has accumulated. And it has been said, that, during the months of May and August, the water will be elevated two or three feet above its ordinary level.

*Mariners entering the river between Anticosti and Gaspé*, when in the fair way, having the wind at north or north-east, and being uninformed of this current, will be led to imagine they are making a reach up, when really they will be approaching the southern shore; this is an error that must be particularly guarded against, especially in long dark nights and foggy weather; be, therefore, always careful to tack in time.

*Ships coming up with contrary winds*, and being far enough to the westward to weather the west point of Anticosti, should constantly stand to the northward, and endeavor to sail on, within 3 or 4 leagues of the northern shore: for the land is all bold to; you will be out of the strength of the current, and the nearer you get to the land, the more you will be favored by the tide. Run up so far as Point Deamon, and when up to Trinity Bay, should your vessel sail well, you will, by keeping in with the north shore, have the advantage of a flood tide, and may probably be enabled to get through the Narrows; but should your ship sail badly, you can take shelter in Trinity Bay, (which is described in page 65 of this work.)

Should circumstances render it necessary, you may proceed to St. Nicholas Harbor, which lies W. by N. about 5 leagues to the westward of Point Deamon; (see page 65,) keep close along the land, but take great care to avoid the Manicougan Shoals.

Abreast of the Manicougan Shoals and standing to the northward, distant about one-third of the breadth of the river from the northern shore, a strong rippling has been frequently observed; about 2 miles further to the northward you meet with a similar one, and 2 miles beyond that is another: these are visible only in fine weather, and are conjectured to be occasioned by the slack of the eastern current, which runs down, on the south shore and in the middle, and the regular flood to the north. Mr. Lambly has frequently tried for soundings upon them, but without finding any bottom. Vessels standing on towards Betsimet's and Mille Vache Points, will experience similar appearances, and when above Mille Vache the rippings increase; but there is no danger whatever, it being merely the conflicting concussion of the opposing streams.

It is advisable, when a ship has advanced on the northern side, so far as Betsimet's Point, with the wind at west and a flood tide, to cross over towards Father Point, in order to obtain a pilot: but should the wind shift to S. W. by W. it will be advantageous still to keep the northern land on board, until you can with greater certainty fetch that point.

The current between Mille Vache and Bic Island will always be found strong toward the N. E.; this must be particularly attended to, for if a proper allowance be not made for this current, you will be driven fast to the northward, and, before you are aware of it, will be drifted into imminent danger.

*Ships coming up with a fair wind*, and under favorable circumstances, may proceed along the south shore; the land all the way from Gaspé, is bold and high, but it affords no sort of shelter: soundings may occasionally be found, but very irregular, and there is no anchorage whatever. On advancing towards Cape Chat, which may be readily known by the Sugar Loaf Hill already described, as well as by its broken and uneven mountains, steer W. by S. for about 11 or 12 leagues, you will then be a little to the eastward of Matane, and may perceive the Paps of Matane, bearing S. W.  $\frac{1}{2}$  W.; these are two hills, standing somewhat inland, and appearing to the westward of the river; Mount Camille will also be visible bearing S. W. by W.  $\frac{1}{2}$  W. distant 14 or fifteen leagues; it forms in the shape of a circular island, and appears to the northward of all the southern land. From off Matane to abreast of Mount Camille, steer W. S. W. or W. by S. according to the wind. Continuing that course, you will pass Little and Great Metis, or Mathis, and, if desirous of an-

if desirous of an-

choring at Little Metis Cove, you must give the east end of the reef a berth of 100 yards, or cross it in 3 fathoms and let go: small vessels may find shelter here in 3 fathoms, at low water.

GREAT METIS is  $2\frac{1}{2}$  leagues S. W. from Little Metis, and is only fit for small vessels; these may find shelter and anchorage with S. W. winds, but it nearly dries, and therefore is of little use to shipping. Little Metis may be distinguished from Great Metis by a round bluff rock, which lies S. E. from the North Reef, distant  $1\frac{1}{2}$  mile, and a small sugar-loaf hill to the eastward of the rock. Great Metis has a large rock in the middle of the Cove, Little Metis has none; but you must be within 2 or 3 leagues of the shore to make these Coves out, for the points of land they are formed by, are very low.

The Bank of Soundings extends farther from the shore, about these Coves, than it does at Matane; at the distance of 4 miles from the land, you will here have 35 fathoms, beyond that distance you suddenly drop into 60 and 70 fathoms; the edge of the bank continues steep and high all the way up to Green Island; within 10 fathoms the ground is hard, and the landing bad, except in very fine weather; for the coast between Great and Little Mathis is full of rocks, which run off half a mile from the shore. Westward of Little Mathis is Death's Cove, where the pilot boats shelter in easterly winds, and lie dry at low water. Cock Cove is at the eastern part of Father Point. Between Great Mathis and Cock Cove ships may stop a tide, if the weather is fine, in 15 fathoms: this is the regular rendezvous for the pilots: here they repair about the month of April, but they will frequently, after that time, be met with off Matane, or so far as Cape Chat; on their sails and boats are their respective numbers. Should a vessel be off Cape Chat, distant about 3 leagues, she may safely steer W. S. W. or W. by S. 28 leagues, making a proper allowance for the current, and she will be up to Father Point, or very near it; then, should the weather be thick, she may haul to the southward, and after getting soundings, if the water shoals from 35 to 20 and 18 fathoms in a short distance, such as a mile, you will not be up to Father Point, and should run 4 or 5 miles higher; but if you get soundings, and the water gradually shoals from 35 to 30, 25, &c. fathoms, in a distance of three or four miles, then they are up to the Point, and may make the signal for a pilot, standing no nearer than 10 or 12 fathoms, as they will then be only two miles from shore; but should the weather be clear, they will see the houses, and may make as free as they choose, the shore being all bold.

The distance from Cape Chat to the west part of Father Point is about 23 leagues, and from thence to the anchoring place at Bic Island is 19 miles; make an allowance for the current, of five miles, and any ship may run it with safety.

Ships being off Little Mathis will see the high land which is to the southward of Cape Arignole, but the Cape itself and the Island of Bic being much lower, will not be visible; off Mount Camille, Bic Island may be perceived very plain in clear weather.

Some years ago, a master of a vessel mistook the Island of Barnaby for the Island of Bic, and hauled to the southward; when he found his mistake, after veering the ship, he but just weathered Barnaby Island. Now, should a ship be running up in thick weather, and not be certain of her distance, if she should be near Father Point, she cannot approach the land without gradually shoaling her water, consequently, keeping the lead going, and being in nine or ten fathoms water, should she make an Island suddenly to the southward, it must be Barnaby Island. And if falling in with an Island suddenly, without having hove the lead, in any bearing to the westward of W. S. W. one cast of the lead will reduce it to a certainty, for from W. S. W. to west, Barnaby will have only from 7 to 5 fathoms, and the Island of Bic will have, in the same bearings, from 15 to 12 fathoms.

Again, if the lead be kept going, and no soundings be found, then, falling in with land suddenly a-head, it must be Biquette, for there is deep water in the stream of Biquette, and when it bears S. W. distant half a mile, there are 60 fathoms water. In the stream of Biquette, when it bears W. S. W. if you should have ten fathoms water, and see no land, you must haul off to the northward, or run for Bic, as you think proper; if you are strangers, the safest way will be, to haul off to the northward, keeping in nine or ten fathoms water, and steer W. S. W. and W. by S. according to the depth of water; that course will lead to the southward of Bic, and if you get sight of the reef at the East end of the Island, which is always above water, steer west one mile and a half, or two miles, and anchor in 11 or 12 fathoms.

Ships being near Bic Island, in thick weather, should stand off and on to the northward of the Island, and wait for the weather clearing up.

If desirous of anchoring on the south side of Bic, and the wind should be easterly, run boldly to the southward, looking out for the reef at the east end of the island, as before directed; give this reef a berth of a quarter of a mile, and run along in mid-channel until you find Cape Arignole bears S. S. E. the body of the island then bearing N. N. W. large ships may anchor in 13 or 14 fathoms, the ground clear and good; but small vessels may run on until the island comes N. E. and the depth 10 fathoms; you will then be a quarter

of a mile off the island, but the bottom will not be so clear as when you are in deeper water. Fresh water may be obtained in the Cove to the westward of the island.

But, if the wind should be westerly, and you are to windward of the island, intending to anchor there, stand to the southward into 11 fathoms, then run down and anchor, as above directed: for with little wind 11 fathoms is the proper depth of the fair way, and the last quarter flood, and all the ebb, sets strongly between Biquette and Bic.

Should you, with an easterly wind, be too far to the westward to fetch round the east end of Bic, then, in order to gain the anchorage, you should give Biquette a berth of about half a mile, run up until the west end of Bic bears S. E. then Cape Arignole will be open of it; this latter mark leads to the westward of a reef, which is covered at a quarter tide, and extends S. W. by W. one mile from Biquette, while another reef, always visible, lies between the former and Biquette. By hauling round to the southward with Cape Arignole open, you will pass athwart the opening between Bic and Biquette, in from 16 to 9 fathoms; thence the water will shoalen to 6 fathoms upon a spit of mud and sand, which lies S. W. by W. from Bic, about one mile long: after you have crossed this spit, you will have 10 and 12 fathoms, where the passage will be open, and you can anchor. The N. W. ledge of Bic, the west end of that island, and Cape Arignole, are in a line, bearing S. E. When you are beating into Bic Harbor from the westward, while standing to the southward, take care not to shut in Mount Camille with Cape Arignole; and in standing to the northward, do not shut in Mount Camille with the Island Bic. In Old Bic Harbor lives one family, where some provisions may be got occasionally, and about two miles above the Bay of Ha Ha, or S. W. from Bic, lives another family, which are all the houses between this and Three Pistoles or Basque Island. Passengers wishing to proceed to Quebec by land from Bic, must go to the westernmost houses, and procure a guide to take them through the woods to the next parish, where horses may be got, or else take the boat up to Basque Island and land on the main, at Trois Pistoles, which is five leagues from Bic. By so doing strangers will know how to proceed, should they wish to leave the ship and go by land.

The tides flow at Bic Island, full and change, till three o'clock, and rise in spring tides, 12 or 14 feet; neap tides, 7 or 8 feet.

The flood tides never bend to the westward till an hour's flood by the shore, and in neap tides the floods are very weak, and with fresh westerly winds there is none at all, but in the spring tides, ships will always find a flood tide from Father Point to Bic Island.

Between Barnaby and Bic Islands there is a bank of soundings, being a continuation of that which runs from Cape Chat; at the westerly part, about Barnaby and Bic, it extends 2 leagues from the shore, and has regular soundings upon it; its edge is very steep, for from 35 fathoms it sinks suddenly into more than twice that depth: but from 35 fathoms towards the land it decreases gradually; vessels may therefore stand to the southward by the lead, and tack or anchor in any depth of water they think proper; but it will be advisable to go no nearer the land than  $1\frac{1}{2}$  mile, with Bic Island bearing from W. S. W. to S. W. lest you should shut in the channel to the southward of Bic; and with a sudden shift of the wind, should not be able to clear Bic to the northward.

Westward from Bic Island, the bank of soundings runs all the way to Basque Island, parallel to, and a league distance from the shore: beyond Basque Island it bends nearer to the land, and continues on to the Apple Islands, at 2 and  $2\frac{1}{2}$  miles distance from the main, ships may therefore stand to the southward by the lead, or keep on, in the fair way, in not less than 12 fathoms water.

**FROM BIC ISLAND TO GREEN ISLAND.**—Vessels having arrived at Bic Island, without being able to obtain a pilot at Father Point, and finding none to be had at Bic, may proceed towards Green Island, the latter bearing from the former S. W. by W. distant nearly 10 leagues: in this course you will pass the Razades, Basque, and Apple Islands, which have been already described, page 70; the edge of the bank of soundings continues all the way steep to, but from 35 fathoms the depth decreases gradually towards the land, and between Bic and Green Island vessels will find anchorage all the way in 14 fathoms, and ships of lesser burthen in 9 fathoms: between Bic and Basque Island the ground is all clean, but between Basque and Green Island it is foul: there is shelter for small vessels at the east end of the Razades, and also under the east end of Basque Island in three fathoms, giving the east end of the reefs, which run off those islands, a berth of a quarter of a mile: the anchorages are with the body of the islands bearing W. by S. or right abreast of Basque Island. Here, at Trois Pistoles, fresh water and provisions may be obtained, if necessary; and from hence are regular stages to Quebec. Pilots also reside here, and at Green Island.

Vessels passing from Bic toward Green Island, will keep about a league from shore, and have 14 and 15 fathoms all the way; and when up so far as Green Island, should the tide be done, they may anchor off the reef in 10 fathoms, and in the stream of the ledge, which runs N. E. by N. from the Lighthouse Point, at a mile distance from the ledge.

The height of the light is 120 feet, and is situated between the light and the north ground of the S. W. to bear up.

Should the weather be such that you will then be southward above the ward, and into 9 fathoms.

Vessels rily go near and W. N. tached to be taken, you are su enter the you may White Isl approach down betw weather, n distance;

arrived at Bic Island, to be had at Bic, S. W. by W. distance, and Apple Island of soundings continually towards the southward by the way in 14 fathoms the ground is the ground for small vessels the island in three fathoms a berth of a quarter mile by S. or right angles may be observed also reside here,

from shore, and should the tide be in the ledge, which is the ledge.

The high land of Arignole, kept open to the northward of Basque Island, will lead clear of the lighthouse ledge; and with the lighthouse bearing S. W. by S. the ledge will be exactly between the lighthouse and the ship. Vessels may also, in fine weather, stop between the lighthouse and the west end of Green Island for a tide, in 20 or 25 fathoms, close to the north side of the island, but, with a fresh breeze, it will be too near the shore, and the ground does not hold well. During N. Easterly winds small vessels frequently run between the S. W. Reef and Cacana, anchoring in 4 fathoms; but it will be always more prudent to bear up for the Brandy Pots, lest you should be caught by adverse stormy weather.

Should you therefore have passed Green Island Lighthouse, and no pilot be obtained, the weather clear, and the wind fair, steer boldly on S. W.  $\frac{1}{2}$  W. or S. W. by W. 5 leagues, you will then have White Island W. by S. and Hare Island with the Brandy Pots open to the southward, bearing W. S. W. Give the Brandy Pots a berth, and run on half a mile or more above them, there anchor in from 5 to 10 fathoms; or should the wind shift to the westward, and your vessels be up to White Island, the tide being spent, stand to the southward, into 9 fathoms, or towards White Island into 6 or 7, then anchor, the ground is good.

Vessels coming up the river, and giving the southern shore a wide berth, will necessarily go near Red Island. The body of this island bears from the lighthouse on Green Island W. N. W. distant 6 miles; and the eastern point of the dangerous reefs which are attached to it, bears from the same lighthouse N. N. W.: therefore the greatest care must be taken, especially at night, not to bring the light to bear to the eastward of S. by E. until you are sure you are within 5 miles of it. If with the light S. by E. you cannot venture to enter the narrows, wait the return of day; and should the wind be scant from the N. W. you may borrow on the south side of the Red Island, by observing these marks—open White Island to the northward of Hare Island, and as you draw to the westward you may approach the shoal of White Island by the lead, remembering that the ebb tide sets strong down between White Island and Red Island, and the flood the contrary. A vessel, in fine weather, may anchor on the south side of Red Island in 12 fathoms, at a quarter of a mile's distance; but the tides here are strong, and set all round the compass.

The soundings between Red and Green Islands are irregular; for, at the distance of a mile from either of them, there are 40 fathoms; further off, and towards the middle of the channel, no bottom is to be found at 70 fathoms; yet, during the ebb tides and the wind easterly, the water breaks and ripples, but you need apprehend no danger.

In beating up the northern shore from Bic to Green Island, you cannot stand to the northern land by the lead, on account of the great depth of water; but Mille Vache shoal begins at the little river of Port Neuf, and completely surrounds the whole of the low point that is to the westward of the houses for three miles. Its southern extremity is distant  $1\frac{1}{2}$  mile from the shore, part drying at low water, and steep to.

At Port Neuf is a trading post, and provisions may be occasionally obtained there. When you have passed Mille Vache Point and Shoal, the land forms a deep bay, but it is shoal and full of rocks. Two leagues to the westward of the Point are two islets, called the Esquamine Isles; to the eastward of these is Saut au Mouton, a small river, with a handsome cascade near its entrance: this will always attract notice when passing. Between the Esquamine Isles and Saguenay are three small inlets, Bondesire, Little and Great Beagerone. They are frequented by fishing boats, but unfit for shipping.

Ship working along the northern shore, between the Esquamine and Red Island, should keep two good leagues off the land; the shore is clear and bold, and the floods regular; but should a vessel be caught to the northward of Red Island by a sudden shift of easterly wind, and be unable to fetch round the east end of the Island Reefs, she may safely bear up, and run to the westward, giving Red, White and Hare Islands a berth of full two miles; and when you have run three leagues above Hare Island, haul to the southward, cross the English Bank, and enter the South Channel towards Kamaraska.

GREEN ISLAND to the BRANDY POTS.—From abreast of Green Island to the Brandy Pots, your course will be from S. W.  $\frac{1}{2}$  W. to S. W. by W. and the distance  $5\frac{1}{2}$  leagues. Between these are the Percy Rocks, lying near the main and Barret's Ledge, in the fair way, or middle of the stream: the latter has been already described in p. 70. There is no channel for shipping between Percy Rocks and the main; but vessels keeping in about 10 fathoms will go clear to the northward of them. Abreast of these rocks, and between them and the western end of Green Island Reef, are 20 fathoms, mid channel. Barret's Ledge has a black buoy upon it, lying in 12 feet water: the channel commonly used is to the northward of the Ledge; keep the southernmost mountain of Kamaraska in one with the Saddle of Great Pilgrim, or bring the Islet, lying on the N. E. side of Green Island, to touch the high land of Cape Arignole; either of these marks will lead you into the fair channel, and clear the Ledge to the northward. The telegraph standing on the southern Brandy Pot will then be seen. There is also a passage to the southward of Barret's Ledge, leading to the southward of the Middle Ground, and up to the Pilgrims; but the northern channel is more commonly made use of, and is always to be preferred by large

ships. In advancing towards White Island Reef, you may safely trust to the lead, but 7 fathoms will be sufficiently near for your anchorage, and it will be advisable to get into no less water before you tack, for this is in the fair way to the Brandy Pots, which are steep to, there being 10 fathoms close to their southern sides. The above anchorage, having St. Andrew's Church open, or between the Great and Second Pilgrim, is very good, and so is the anchorage to the westward of the Brandy Pots, in from 9 to 14 fathoms, this latter being considered the best sheltered roadstead for easterly winds, except that at Crane Island, of any in the river.

When you are to the eastward of White Island, and crossing towards the South Shore, your water will gradually deepen to 26 and 30 fathoms, and then shoalen regularly to 10 fathoms, this latter depth being abreast of the Percy Rocks. In running from White Island towards Barrett's Ledge, the water will deepen to 16 and 20 fathoms, and then shoal to 12 fathoms, which is as near as you ought to approach the Ledge; but as you get to the southward of it, you will, from 12 fathoms, gradually lessen your depth towards River du Loup to 5 fathoms, and none but small vessels must venture to go nearer. In the fair way between the Brandy Pots and the Ledge and Middle Ground, are 20 fathoms, and as you get on to the southward, you will cross a flat of 6 fathoms, which stretches from the Pilgrim Islands to Hare Island Spit; having passed which, you sink into 7, 10, 16, 20, and 30 fathoms; the latter being abreast of Kamaraska Island.

**TIDES.**—From the west end of Green Island ships will begin to have the advantage of a regular flood and ebb, the tide running 5 hours up, and 7 down the river, and being so far as the Brandy Pots, it sets regularly up and down, that is N. E. by E. and S. W. by W.

From the BRANDY POTS to the TRAVERSE and GOOSE ISLAND.—The passage from the Brandy Pots, southward, is between Hare Island and the Middle Ground; in order to sail in the deepest water, you should steer from the Brandy Pots S. W. for about half a mile; then bring the southern mountain of Kamaraska over the middle of the Second Pilgrim, and when White Island comes open between Hare Island and the Brandy Pots, bring it midway, and it will carry you clear between the Knoll and the west end of the middle in 4 and 3½ fathoms water; and when the west end of Hare Island bears N. W. you will be up to the Knoll or Flat, which runs across from the Pilgrims to Hare Island Spit. There is no passage between the Brandy Pots and Hare Island; and the Gut, or Deep Water Channel, between Hare Island and the Great Shoal or Spit, though nearly a mile wide, is seldom or ever used.

In standing from above Brandy Pots, or Hare Island, to the southward, you will have 20 and 18 fathoms water; on the north part of the Middle Ground, 4 fathoms; abreast of the middle of Hare Island, 20 fathoms; on the Spit of Hare Island Shoal, only 2 fathoms; to the eastward of that, 3½ and 4 fathoms; and between the Middle Ground and the Pilgrim Islands, 4 and 6 fathoms; and when a ship is in the latter depth, she should tack.

From abreast of the Pilgrims up to the Buoy of the Traverse the course will be S. W. ½ W. and the distance 9½ leagues. There is no passage for shipping to the southward of the Pilgrims: the bank between the Pilgrims and Kamaraska is steep; the mark for tacking is not to shut in the S. W. land with the great island of Kamaraska; in standing to the northward you will find 20 fathoms, and you may cross the English Bank in this part in 4 fathoms; but to the southward and opposite to Kamaraska Islands it deepens to 10 fathoms.

**KAMARASKA ISLANDS**, are Grosse or Great Island, Burnt or Telegraph Island, and Crow Island; the two former are steep to, but near Crow Island the bank becomes shallow; to the southward of Crow Island is a place where vessels may run on shore with safety; the mark for going in is to open the church 3 sails' breadths to the west of Crow Island, and steer in: with spring tides you will have 14 feet, and with neaps 10; the ground being all soft mud. N. 50° W. with the S. E. end of Crow Island in one of Kamaraska Church, distant from the former about 12 miles, lies Mal Bay. Cape Diable bears from Crow Island S. W. distant 3 miles, and the easternmost part of the reef runs from it to within a mile of Crow Island; therefore vessels from the westward should stretch along this reef in 6 fathoms water, and then haul in for the Church, agreeable to the mark just given; there are two openings in the reefs, but strangers must not attempt either.

With easterly winds, ships that have lost their anchors may run for the cove to the southward of Cape Diable, to enter which you should bring the Church and Crow Island in the direction before stated; and having got within the reefs, run up westerly, leaving a small island above the Church on your larboard side, then put the ship on shore in the S. W. part of the cove, and she will be safe; but if the wind be westerly, run her aground a little to the eastward of the Church. There is good riding opposite to Cape Diable, at about a mile from the shore.

**THE TRAVERSE.**—From abreast of Cape Diable, distant 3 miles, your course to the narrow channel, now called the Traverse, will be S. W. by W.; in the sailing on this direction, you will keep the high land of Kamaraska in one with the low point of St. Denis—this will lead you direct to the black buoy off St. Roch's Point; and when St. Roch's

our course to the  
sailing on this di-  
int of St. Denis—  
when St. Roch's

Church comes S. E. by S. the road behind the church will be in one with it, so soon as you arrive at the buoy: from hence you will observe to keep the Poirier Boisse Island just touching the south point of Goose Island, then run S. W. half or a quarter of a mile beyond the buoy, and haul up for the Pillars, keeping the south side aboard, in 7 fathoms water. Small vessels of 10 feet water, may run over the Bank of St. Roch, to the southward of the buoy, but it should not be done before half flood, and at about a mile off the buoy, which lies in  $2\frac{1}{2}$  fathoms. There is a red buoy now placed on the Middle Bank, in  $2\frac{1}{2}$  fathoms also; your passage through the Traverse is between these two buoys, the direct course, with a flood tide, being S. S. W. and with an ebb S. W. the distance being  $5\frac{1}{2}$  leagues.

In running from Cape Diable for the Traverse in thick weather, or at night, strike the bank off the Cape in 7 or 8 fathoms, steer about W. S. W. and it will conduct you to the buoy; when you have passed the point, you will deepen your water suddenly, and must haul to the southward and keep the south side on board. In beating up, from the Cape towards the buoys, you should take the English Bank for your guide to tack from, when standing to the northward, and the flat of St. Anne, when standing to the southward, anchoring on either side, as the wind best suits: the water between them is deep.

ANCHORAGES.—Vessels may anchor all along the English Bank, and upon the edge of the flat to the southward, in 9 fathoms, between the Pilgrims and Kamaraska: under the Pilgrims, in 3 fathoms, and under the east end of the Great Island of Kamaraska, in 9 fathoms; off Cape Diable, in 10 fathoms, and all along the flat, from the Cape up to the buoys.

In entering the Traverse with little wind, you ought to be careful to make proper allowance for the first part of the flood tide, for that sets strongly towards the point of St. Roch's Bank. In going through, if more than half flood, be guarded against the S. W. by W. set, and always keep the South Bank on board: but when you have got above the Pillars, the tide sets fair up the river.

In beating into and through this passage, be careful to tack from side to side on the first shoal east of the lead, but more particularly so on the edge of the Middle Bank; go not nearer to it than 10 fathoms water, and observe that the ship will go farther over towards the Middle Bank than towards the Shoals of St. Roch: and if there be but little wind, be sure to borrow on the south side of the channel.

Should the flood be done, and your ship in the Narrows, or between the buoys, and any circumstance make it necessary for you to anchor, do not bring to in the channel, but run below either of the buoys, on whichever side may be most convenient, and come to in 7 fathoms. After half ebb, the tides will be found to be more moderate below the buoys than between them; and in the deep water they run very strong. Should the wind incline to the westward, you may anchor half a mile to the eastward of the red buoy in 6 fathoms, on clean ground, and moderate tide. With southerly winds, anchor to the southward of the stream of the black buoy in 7 fathoms. But should a vessel be a mile or more beyond the buoys, it will be advisable to anchor on the edge of the Southern Bank, in 7 fathoms, taking care to give her a good scope of cable before the stream becomes strong, for should your anchor start, you may have to cut from it, as it seldom will take a fresh hold, the ground in every part of the Traverse being hard, foul, and unfit for holding well.

Further on, at or above the Pillars, the tides have less velocity, being seldom more than  $3\frac{1}{2}$  knots an hour; ships therefore will find good riding, with easterly winds, about 2 miles to the eastward of the South Pillar, in 7 fathoms, or to the southward of it, in a similar depth, on good ground; between the buoys are 13 fathoms mid channel, in the Traverse 12, 10, and 9 fathoms, and to the southward of the Pillars 8 and 7 fathoms.

From abreast of the South Pillar to Crane Island your course will be nearly S. W. by W. and the distance 4 leagues. In your progress you will pass Goose Island and Madame Beaujeu's Bank, both of which have been described in page 73 of this work. Crane Island is little above Goose Island, to which it is connected by a rocky ledge. The southern side of this part of the channel is formed by a muddy flat, with regular soundings as you approach, and 3 fathoms over it, having good anchorage all the way; but the northern side has the Rock Avignon and the Goose Island Reef, both of which are dangerous, and must be avoided. The mark to clear the Rock Avignon, is the whole of Crane Island open of the S. W. end of Goose Island: this will lead to the southward of the former, and along the outer edge of the latter.

In standing towards Goose Island Reef, do not get into less than 12 fathoms water; but when you have got above that reef, you may stand toward Goose Island to 7 fathoms; for it is bold to, and the soundings are regular: when you have passed the Hospital Rock, which lies to the eastward of a farm house, and close to the low water mark, vessels may if necessary be safely run on shore, for the beach is, for 2 miles, all soft mud.

TO CLEAR MADAME BEAUJEU'S BANK, you should keep the southernmost of the three mountains, which stand to the southward of Trois Saumon, on with the Islet on

which stands the Telegraph; run on in 4 fathoms water, until you get M<sup>c</sup>Pherson's House, which is at the east end of Crane Island, to bear N. W. you will then be close upon the Bank; then bring the bluff Point of St. Vallier two sails' breadth open to the southward of the west end of Crane Island, and that will carry you in the best water; and when you are up to Crane Island you may borrow close to it, for there are 7 fathoms close to the rocks.

**ANCHORAGES.**—Ships may anchor all the way from Pillar to the east end of Crane Island, in 7 fathoms water, the ground good and clean: there also is good riding off the body of Crane Island, in 10 fathoms. But the best roadstead in the river, with easterly winds, is one mile to the westward of Crane Island. Vessels bound down the river, when advanced so far as the Pillars, if caught by strong easterly winds and bad weather, had always better run back to this place than ride below it, at the risk of losing their anchors.

**FROM CRANE ISLAND TO POINT ST. VALLIER** the course will be about W. by S. and the distance about 6 leagues; in pursuing this track, you will have to pass the flat mud bank off St. Thomas's Church, the Wye Rocks, the Belle Chasse Islets, and the small bank off Grose Island. (For a description of these dangers see page 75.) In proceeding from Crane Island, you may keep the Island on board, for it is steep to; run on in from 7 to 10 fathoms, and S. W. by W. distant 2 miles from the southern part of Crane Island, you will meet with the northern extremity of St. Thomas's Flat, which runs out a full mile and a half from the main land, and dries at low water; in rounding Crane Island, steer W. by S. or stand toward it into 7 and 6 fathoms, soft muddy ground; and when St. Thomas's Church comes S. E. you will be abreast of the Point, and may steer up W. S. W. Having got above this flat, you will be abreast of the Wye Rocks.

**THE WYE ROCKS** are sufficiently distinguished in the day-time by a black buoy placed on their western extremity; it lies about a quarter of a mile from the shore, and has 4 feet over its western end, and 10 feet at its eastern part: keep in not less than 7 fathoms water, and you will at all times go clear of it; the long mark from the westward is to keep Belle Chasse Islands always open to the southward of Point St. Vallier.

When you have arrived above St. Margaret's Island, you should stand to the northward, but not into less than 6 fathoms, on account of the bank which runs from Grose Island; nor go nearer to Rat and Madame Islands than 7 fathoms, for both these latter shallow as you approach them: the south side of the channel is bold all the way to Belle Chasse Islands, having 8 fathoms near the shore, and 7, 8, 9, and 5 fathoms quite across; the ground clean, the stream moderate, and the anchorages all along good.

**Ships being up so far as Belle Chasse Islands,** should stand no nearer to them than 8 fathoms; nor to Madame Islands than 6 fathoms: the channel here is about three miles over. S. W. by W. 3 miles from the west end of Madame Island, a rocky shoal runs out, which dries at low water; come not nearer to it than 10 fathoms water, but always keep some part of Rat Island open to the southward of Madame Island, and you will be sure to pass to the southward of the Shoal in safety; and when St. Vallier's Church bears S. S. E. you will perceive it to be in one with an old windmill; you will then be to the westward of the danger, for the western end of the shoal bears from St. Vallier's Church directly north. From Belle Chasse to Point St. Vallier, you will have 8 fathoms all along the fair way of the channel; but having passed St. Vallier's Point, it deepens to 16 and 18 fathoms.

**FROM ST. VALLIER TO QUEBEC,** the course is W. by S. Westerly, for about 4 leagues, or up to St. Lawrence's Point in Orleans; both shores being bold to; you may therefore borrow on the northern side to 10 fathoms, and on the southern to 8; while in the middle of the channel there are 16, 18, and 20 fathoms, all the way to abreast of the Church of St. Lawrence: vessels may anchor towards the Island of Orleans, in from 16 to 10 fathoms; but the ground from St. Vallier's Point up to Quebec is not good for holding.

As you advance towards St. Lawrence Point the channel narrows, being not above 1½ mile across; on the opposite point stands the Church of Beaumont; between this and the Church of St. Lawrence, bearing from each other S. W. by S. and N. E. by N. is a large rocky shoal, extending almost half over the channel, and drying at low water; this is dangerous and steep to, having 14 fathoms close to its edge; you must therefore be careful to avoid it, by making short boards, until you are fairly above St. Lawrence's Point; then you may safely stand to the southward into 10 fathoms water.

From Point St. Lawrence steer W. by N. towards Point Levy, the distance being 2½ leagues. About 1½ mile to the westward of St. Lawrence is St. Patrick's Hole, a roadstead for vessels bound outward, with easterly winds, but the ground does not hold well: the river here is one mile and a quarter wide, and ships may tack into 10 fathoms water; in the middle of the river are 20 fathoms. In proceeding along the north shore, you must give the Morandan's Rocks a berth; they lie about half way between St. Patrick's Hole and the west end of the Island of Orleans, and have only 10 feet over them; pass them in 12 fathoms: there is also a reef stretching from the west end of Orleans, but

come not in to the north rate berth.

Having a miles; on cleared by eastern part Steeple of S. 36° W. thedrai, and ones: observed end, at English ste

Should s Madame Isl will find a go shore, the g

come not into less than 10 fathoms and there will be no danger: another small reef runs to the northward from Point Levy, but it lies close in shore, and requires only a moderate berth.

Having arrived at Point Levy, steer W. S. W. for Quebec, the distance being only 2 miles; on the northern side of the passage lie the Beauport Shoals, which are readily cleared by coming into not less than 10 fathoms. In the day time the mark for the eastern part of these shoals, which have some rocky patches among them, is the small Steeple of the Roman Cathedral, and the Steeple of the English Cathedral in one, bearing S. 36° W.; therefore keep the small Steeple open to the northward of the English Cathedral, and running up, keep the above small Steeple midway between the two large ones: observe the Roman Cathedral has two steeples on it, the small one standing at the east end, and the large one at its west end; both churches are covered with tin: the English steeple is a spire; the Roman has two cupolas.

**THE BASIN OF QUEBEC.**—Ships arriving at Quebec, with flood tide and easterly wind, should take in their sails and have their cables ready, for the ground does not hold well; the tides are commonly strong, and the water deep: if obliged to come to in the middle of the stream they will have from 16 to 20 fathoms abreast of the town; but within 2 cables' lengths of the Wharves, there will be 11 fathoms, and here the vessel may easily be brought up; while in the offing it will require 60 fathoms' length of cable. On the Point Levy side is a depth of 30 fathoms, and strong tides; near the Wharves they will not be so strongly felt; but should the wind be violent, and from the eastward, the best riding will be above the Wharves, abreast of Diamond Harbor, in 10 fathoms.

**THE BALLAST GROUND** is the place appointed for vessels to discharge their ballast in; this is to the westward of two beacons that stand on the south shore, above Quebec, and are placed on the brow of the hill near Charles' Cove, which, when in a line, bear N. W. and S. E. of each other.

The River St. Lawrence extends from Quebec to the City of Montreal, from which it is distant 155 miles, and from the Island of Bic 90 leagues; it is navigable to the Rapids of Richelieu, for vessels of 600 tons; the impediments are few, and those very easily surmounted. The banks of the river are in a high state of cultivation, and adorned with numerous towns and villages, most of which are built around, and adjacent to a church, which commonly makes a handsome appearance, and is generally a stone edifice; while single houses and farms keep up a regular kind of communication.

From Quebec, the shores of which are exceedingly lofty, the hills gradually decline, and become less elevated, until you reach the River St. Maurice, where the tide entirely ceases: here, on the north side of the river, stands the town of the Trois Rivieres. Beyond Trois Rivieres, 33 miles, is the Richelieu Rapid; at the entrance of which, and above the Lake St. Pierre, is the town of William Henry, formerly called Sorel. Lake St. Pierre, which is between the two towns, is 22 miles in length, and in some places nearly 8 in breadth; but its western part is encumbered with numerous islands, which divide into several channels; two of these are navigable, but that to the south is the cleanest, deepest, and best; the banks here are low, and shelve off to a considerable distance, leaving only a narrow channel of from 12 to 18 feet water: the river here is obstructed by masses of rock, and at the ebb-tide the descent of the Rapid becomes so great, that the utmost caution must be taken to pass it; vessels therefore should wait for the proper time of tide, and, if necessary, they may anchor at the bottom of the Rapid till a proper opportunity offers. From hence to Montreal, the banks are of a moderate height, and uniformly level.

Montreal is considered the most fertile part of Lower Canada: its port is convenient, and situated on the S. E. side of the city; the harbor is not large, but vessels drawing 15 feet water can lie close to the shore, near the Market Gate, and both deliver and receive their cargoes with expedition: the depth is generally from 3 to 4½ fathoms: its greatest inconvenience arises from the Rapid of St. Mary, which is about a mile below, whose current is sometimes so powerful, that without the benefit of a N. East wind, vessels will not be able to stem it, but must be detained for weeks, within two miles only of the spot where their freight should be delivered.

**REMARKS.**—The laws of the Trinity House are very strict with respect to shipping in the Harbor and Port of Quebec; and require the masters of vessels to pay a proper attention to the observance of them. The regulations relative to quarantine, the pilot is compelled to make them acquainted with, so soon as he comes on board; and the Harbor Master will deliver a copy of the Laws of the Harbor on their arrival, besides which the different laws are always kept open to view at the Harbor Master's Office.

Should ships have the misfortune to part with their anchors, either above or near Madame Island, it being high water, and the vessel's draught of water not too great, they will find a good cove at the west end of Grose Island, where they may safely run her on shore, the ground being all soft mud. In this cove are 14 feet spring tides, and 9 neap.

Should they part near Crane Island, they may safely run on shore on Goose Island, above the Hospital Rock.

Should they part in the Traverse, they may run into Kamaraska, observing the marks given in page 80.

Should they part near the Pilgrims, they may run on shore in safety on the S. W. part of Green Island, near Mr. Fraser's House.

Should they be obliged to run for a harbor below Bic Island, old Bic furnishes a proper place to run ashore; and to the southward of Barnaby Island a ship will be equally safe. Little Mathis Cove is also a good place for a vessel on emergency to take refuge in: see page 77.

As the ice sometimes sets in suddenly, should vessels be caught at that season, all the places above-mentioned will be proper and safe to winter in; and also in the space between Kamaraska and the Pilgrims, but at all times they should be hove up to high-water mark, spring tides.

Should they be assailed between Hare Island and Kamaraska, with easterly winds and in a dark night, and being bound up the river, they should run from Kamaraska, and have a night's drift, wearing as required by the lead, always taking the English Bank for their guide, and when the day returns, either anchor or run up, as most convenient.

**THE NORTH CHANNEL.**—This Channel, now very little frequented, was formerly the one most commonly used; its direction was to the southward of the Red Island, or Hare Island, between the English Bank and the Northern Mainland; to the northward of Coudre Island, along the Northern Shore, and through the Old Traverse, which is between the east end of Orleans Island and the western part of Madame Island. In this Channel the water is deep, the adjacent lands high, and heavy squalls very frequent, the tides strong, and that part called the Old Traverse, intricate, narrow and dangerous; besides which, there are few places fit to anchor in. Mr. Lambly, the Harbor Master of Quebec, emphatically says, "he believes few men now living will undertake to carry a ship through it; and that he conceives it would be the extreme of folly to attempt to open the use of it;" and further on he states to have "heard of men who knew and could do this, but never saw any of them take a ship through it;" and adds, "he is sure they never will." Nevertheless, as this channel has hitherto been described in all nautical publications of this nature, and as it may be satisfactory to know what has been formerly said of it, we subjoin the following account:—

It has been already stated that the N. W. Company, trading in furs, &c. have settlements on the northern side of the river, at the following places—at the Mingan Islands, Godbout River, Jeremy Island, Port Neuf, and Tadusac, where supplies of provisions or assistance, if required, may be obtained.

From Tadusac, or the River Sagunay, a reef extends to the westward, and the whole of the coast is rocky; vessels, therefore, must always give it a good berth, and not trust to the lead; about 9 leagues from Sagunay is Cape Salmon; and near 2 leagues beyond that is Cape Eagle. The channel between Cape Eagle and the English Bank becomes narrower, and only 4 miles wide. Having rounded Cape Eagle, you will open Mal Bay; here a rocky reef runs from the eastern point of the entrance and almost blocks the river up. To the southward is Cape Goose; the channel here bends to the westward, and is formed by the N. E. point of the Island of Coudre and the Main, on which latter, to the N. W. of the island, is St. Paul's Bay; this is rocky and shoal, and called by the French the Whirlpool; in navigating this part, a vessel should borrow on the Coudre Reef as close as she can, with safety, in order to keep out of the contrary current: bring the North Cape of Coudre Island a cable's length open of Cape Goose, and you will clear the reef. You will observe these rocks will be completely covered at high water, and the marks for their extremity are St. Paul's Church bearing N. 41° W. Cape Diable N. 27° W. and the North Bluff Point of the island S. 22° W.

In the channel between Coudre Island and the Main, the current is strong, the water deep and the ground bad for anchorage. In case of necessity you can anchor off Coudre, in 17 fathoms, coarse sandy ground, with Cape Goose just open of the land to the westward of it, bearing E. N. E.  $\frac{1}{2}$  E. and the east end of Coudre Island E. S. E.  $\frac{1}{2}$  E. but the tide here is very rapid, and a vessel will be apt to swing round. A small hill near Kamaraska Island, brought between the Island of Coudre and Cape Goose, but rather nearer to the former than the latter, will lead between the Reef and Whirlpool; then should the tide drive you towards the Reef, when in 7 fathoms anchor, but if you pass into 8 fathoms, you will be nearer the Island than the Main, and having passed it, you will deepen your water to 16 and 18 fathoms. A shoal, or ridge of rocks, stretches all along the northern shore, from St. Paul's Bay to Cape Hog. So soon as you have cleared the S. E. of Coudre Reef, haul in for the Main, sailing along in 10 and 12 fathoms, or mid-channel in 15, 16, and 18 fathoms, these soundings will diminish as you approach Burnt Cape Ledge. From Coudre, until the Church of the Little River Settlement

bears N. N. W. you will have a rocky bottom, and from thence it becomes tolerably good. From Coudre anchorage to Cape Torment, the distance is about 54 miles, the shore forming 7 capes, each of which appears split at the top, the course being nearly S. W. In this course you may anchor with Cape Millard bearing N. W. by N. distant one mile and a half, in a bottom of sand and mud, with 16 fathoms, or about a mile from the north shore in 9 fathoms, Pillar Island being in one with Neptune Rock, Cape Goose nearly in one with the S. E. part of Coudre, Cape Torment a little open with Burnt Cape, and the north part of Coudre N.  $36^{\circ}$  E. The Neptune Rock lies on the larboard side of the channel, and is never wholly covered, though in stormy weather the sea breaks over it; it lies rather more than 2 miles from Cape Rouge, and bears from Cape Raven S.  $35^{\circ}$  W. Cape Millard, S.  $22^{\circ}$  W. and Cape Torment, N.  $65^{\circ}$  E. Southward of this rock is Burnt Cape Ledge, lying directly opposite to Burnt Cape; between them is the Channel, narrowing abreast of the Cape to but little more than half a mile wide, but with not less than 8, 9, and 10 fathoms water; keep near the Main and you will sail along it in safety; the leading mark is the highest of the broken cliffs, in one with the N. W. end of Coudre, and be careful, when opposite Burnt Cape, to avoid shutting in the N. E. end of Madame Island, with the S. W. end of Rat Island. The best place of anchorage to wait for a wind to pass the Old Traverse, is a quarter of a league from the land, with Cape Torment bearing nearly W. by S. in 12 fathoms water.

**OLD TRAVERSE.**—This is the channel which divides Burnt Cape Ledge and the shoals adjoining it to the southward, from the Island of Orleans, and is considered dangerous, therefore it should, if possible, be passed on a clear day. First then, in order to keep clear of Burnt Cape Ledge, bring a part of the Butt, shut in behind Cape Torment, until Burnt Cape becomes N. by E. the soundings being irregular, and the edge of the ledge steep to: being past Burnt Cape, and it bearing N. N. E. haul over the Traverse, and observe the following marks:—On the south shore, considerably inland, are three mountains, the south-western one being the largest, bring the west end of this mountain in one with the east end of Rat Island, sail on with them in this direction until St. John's Point comes open of Point Dauphin; there is also a little hill to the westward of the above three mountains, which may always be seen in clear weather, keep this hill to the westward of Madame Island, until you have opened St. John's Point, as before mentioned, this is a good mark: having proceeded thus far, steer for St. John's Point, rather nearing Orleans Island to avoid a small knoll, on which are only 3 fathoms water; the mark for this knoll is the entrance of St. Ann's River, on with the east point of Orleans Island; and when St. John's Point is just opening, you will be in the deepest water, and may run along the Island in six and seven fathoms in safety. The passage between the Middle Shoal and Rat Island should be avoided, but if the mariner has occasion to use it, he will bring the east end of the westernmost of the three mountains before mentioned, in one with the east end of Rat Island, and steer on towards the Island, until St. John's Church comes open of the Point, you will then be to the southward of the Middle Shoal, and may proceed towards St. John's Point; the channel between the Middle Sand and that which stretches from Burnt Cape Ledge, is narrow, and in crossing the tide, you will not only lose time, but unless attentive to the foregoing marks, you will be driven out of your way, it therefore is never to be recommended; the west end of the middle lies with the west end of the Middle Mount in one with the west end of Rat Island, and as soon as the east end of the same mountain comes on; you will have passed the Shoal, and will have the channel open to the west end of Rat Island, you may then anchor between Orleans and Madame Island, or proceed up the river.

**OBSERVATIONS.**—At the Isle of Bic the stream never bends to the westward until an hour's flood by the shore. Here the neap floods are very weak; and with westerly winds, no tide will be perceptible. A spring flood is, however, always found within four miles of the shore between Father Point and Bic Island. Hence, all the way to Quebec, the tide, when regular, flows tide and quarter-tide; but it always is influenced greatly by the wind, and by no means to be depended on, as to its running any where below Hare Island, where there is a regular stream of ebb and flood.

Between Barnaby and Bic the stream of flood sets in from the N. E. at the rate of about two knots an hour; then fair through the channel until the last quarter flood, when it sets to the N. W. by the west end of Bic, and then gradually to the N. E. as the flood slacks. The whole of the ebb, both to the eastward and westward of the island, sets strongly to the N. E. The current between Biquette and the north coast is generally very strong to the N. E. without any regular change. In the summer and autumn, as well as in spring tides, this current slacks, and, near Biquette, runs to the westward during flood; but, until the upland waters have all run down, and the great rivers have discharged the freshets, caused by the thawing of the snows in the spring of the year, this current will always run downward.

From Bic to Green Island, on the southern side, the stream of flood is no where perceptible at a mile and a half from the islands. The ebb, or rather current, comes strongly from the N. W. out of the River Sagunay, and through the channel to the northward of Red Island. Here it always runs in a S. E. direction, two miles an hour, with a westerly wind; but only to the southward and eastward of Red Island. Between Red Island and Green Island, the ebb runs from 4 to  $6\frac{1}{2}$  knots. In crossing over to the north shore, this easterly current will be found to diminish; for, on the north side, the flood is pretty regular, and the ebb much weaker. Eastward of the Razade Rocks, and near Bic, the current assumes a N. E. direction, and sets strongly between Bic and Biquette. To the southward of Bic, spring floods run at the rate of a knot and a half: neaps are not perceptible. Ships that come to the southward of Bic, with a scant wind from the northward, should steer W. by N. to check the S. E. current, until they come into 18 fathoms water, or up to Basque, whence they may proceed for Green Island.

The first of the flood, with spring tides, sets from the N. E. along the north side of Green Island, and strongly towards the west end of it; then S. S. W. over the reef towards Cacana. In the middle of the channel no flood is perceptible. At two miles to the southward of Red Island it sets strongly to the N. W. and the ebb contrary. During spring ebbs, the meeting of the N. E. and S. E. tides, near the middle of Green Island, causes very strong rippings: and, to the eastward of Green Island, the S. E. ebb comes strongly about the east end of Red Island; here meeting, the N. E. tide causes a high rippling, much like broken water in strong easterly winds; but, in neap tides, the floods are very weak, and in the spring of the year there are none; thus rendering this part of the river more tedious in its navigation than any other, unless with a free wind.

From the west end of Green Island a regular stream of flood and ebb commences, which runs five hours upward and seven downward. At the Brandy Pots it flows tide and quarter tide; and above the Percy Rocks, on the south shore, it sets regularly up and down, N. E. by E. and S. W. by W. From the Brandy Pots, the stream of flood sets towards Hare Island; and near the west end, N. W. with great strength, through the passage between the island and shoal. Above Hare Island the flood sets regularly up the river. The ebbs contrarywise.

From the Pilgrims up to Cape Diable the flood is very weak, but it thence increases up to the buoys of the Traverse, where it runs at the rate of 6 knots. The first of the ebb sets towards the English Bank and Hare Island Shoal, when abreast of the greater island of Kamaraska, and the ebb contrary. At the Traverse, on the full and change, the tide on shore flows at half past four, but it continues to run to the westward until 6 o'clock, when regular in the channel. With westerly winds there is a deviation, but it is certain that the tide on shore rises three feet before the stream bends to the westward: and this allowance must always be made in every part of the river. In the Traverse the first of the flood sets from the N. N. E. at the buoys, at a quarter flood, it takes a S. W. direction: and when the shoals are covered at half flood, at the Seal Reefs, it sets until high water S. W. by W. The ebbs, in a contrary direction, run with great strength; frequently, in the spring of the year, at the rate of 6 or 7 knots.

From Crane Island the flood sets fairly up the river, but the first of the ebb of L'Islet sets to the northward for half an hour, then fair down the river, at the rate of not more than  $3\frac{1}{2}$  knots an hour with spring tides.

#### VARIATION OF THE COMPASS.

In the year 1775, variations were given by M. des Barres, as follows: North entrance of the Gut of Canso  $16^{\circ} 0'$  W.: Crow Harbor, (Chedebucto Bay)  $14^{\circ} 50'$  W.: entrance of Liscomb Harbor,  $14^{\circ}$ : Sable Island,  $13^{\circ} 57'$ : Halifax lighthouse,  $13^{\circ} 35'$ : entrance of Shelburn,  $13^{\circ} 30'$ : Cape Sable,  $11^{\circ} 15'$ .

In 1798, Mr. Backhouse found the variation at Halifax to exceed 16 degrees; an addition of  $2\frac{1}{2}$  degrees to the preceding, may therefore give the present variation very near the truth. Mr. Lockwood gives the variation at Halifax,  $17^{\circ} 28'$ , and at Cape Sable,  $14^{\circ} 27'$ : but it seems that the needle is now receding. At St. John's, New Brunswick, the variation in 1827 was about 16 degrees.

The following was taken in 1831, and sufficiently exact for the purpose of Navigation.

Brandy Pots, . . . . .	$16\frac{1}{2}$ deg. West.	Bay of the Seven Islands, 23 deg. West.
Island of Bic, . . . . .	$17\frac{1}{2}$	West end of Anticosti, . . . $23\frac{1}{2}$
Cape Chat, . . . . .	21	East end of do. . . . . $24\frac{1}{2}$

## THE GULF OF ST. LAWRENCE.

SHIPS bound for the Gulf of St. Lawrence, after passing the Islands of Miquelon and St. Peter's, will do well by endeavoring to steer a middle course between Newfoundland and Breton Island, passing on either side of St. Paul's Island, as best suits their convenience; but by no means should they run beyond the parallel of  $47^{\circ} 30' N.$  until they are assuredly well past Cape Ray, for the harbors on the South Coast of Newfoundland, to the westward of Fortune Island, are full of dangers, and but imperfectly known; while the whole shore is frequently enveloped in thick fogs, and the rocks cannot then be perceived before your vessel has got irrecoverably entangled among them. In this part also, shifts of wind are common, and it will often happen, that after blowing a gale from one point of the compass, it will suddenly vary to the opposite point, and continue equally strong; thus it has been known, that while one vessel has been lying to, with a heavy gale, another, not more than 30 leagues distant, has been in another gale equally heavy, but with the wind in a direct contrary direction; this has proved fatal to many ships, particularly in 1782, when the *Ville de Paris*, *Centaur*, *Ramiles*, and nearly a whole fleet of merchantmen were lying to, during a hurricane from the S. E. and by its suddenly shifting to the N. W. either were rendered unserviceable or foundered.

The winds within the Gulf are not so liable to such sudden changes as on the outside, or to the eastward of Breton Island.

Ships navigating the coast of Breton Island, and particularly those who have crossed the Grand Bank and are steering for the Gulf, should be particularly careful to make a proper allowance for a strong current which commonly sets S. by W. and S. S. W. about three miles an hour, and sometimes four, by which the unwary mariner will be greatly deceived: for while he is considering himself in a fair way for the entrance of the Gulf, he will be drifted upon the iron-bound shore, the attendant fogs in summer time concealing his dangers, until it becomes too late for him to avoid destruction; to persons who may unfortunately be driven too near this coast, it may be serviceable to be apprised, that a settlement is now formed at Ashpee Bay, and good anchorage is to be had behind the Island, where boats can land, and water and provisions be obtained; while for the want of the knowledge of such an establishment, many have been obliged to endure both hunger and fatigue unrelieved.

THE ISLAND OF ST. PAUL, on which there is a fixed light, is not dangerous, and may easily be discovered, even when the weather is foggy, by keeping a good look out; the shores of the Island of Breton are high, and although fogs do frequently obscure the land, yet, by proper attention, it will generally be discovered time enough to avoid danger. Having entered the Gulf, you will seldom fail to see the Magdalen and Bird Islands, as you must pass them in your route to the River St. Lawrence; you had better, particularly in thick weather, go either to the eastward and northward of these, between them and Newfoundland, or to the southward and westward, between them and Prince Edward's Island; for although, in fine clear weather, there is a good and safe passage between the Bird and Magdalen Islands, yet when it is dark and foggy, the channel will not be so easily distinguished, and perhaps might be mistaken and attended with danger. The weather to the southward of the Magdalens, and between them and Prince Edward's Island, is generally much clearer than to the northward, therefore the passage that way is to be preferred, particularly after the early part of the year, for then S. West-erly winds are most prevalent; and also, if necessary, clear and good anchorage is to be had at the S. Eastern part of the Magdalens in Pleasant Bay, very near the shore; this is a safe place for vessels to ride in, with westerly winds, and greatly more to be recommended than to hazard the beating about in the Gulf with a foul wind; the passage into it is safe, and runs in between Amherst and Entry Islands.

THE MAGDALEN ISLANDS are but thinly inhabited by persons employed in the fisheries; their extent is from E. N. E. to W. S. W.; there are no harbors, and you must give their N. E. extremity a berth of two miles, on account of a reef which runs out from it; in approaching towards them you must avoid the Pearl's Ledge of only 15 feet water; which lies with the S. Eastern extremities of Entry Island, bearing S. W. by W.  $\frac{1}{2}$  W. distant 5 miles.

A Rock upon which the ship Brothers struck, lies about 6 or 7 miles from the Dead-man, bearing nearly E. by N. from it. This has only 3 or 4 fathoms over it, and rests

upon the authority of Capt. M'Dougall. Another Rock is said to lie between the Dead-man and Seal Islands: this is situated in a line between the two, and nearly equi-distant, having only 8 feet water over it, and consequently very dangerous.

A Shoal with only 18 feet water, and which breaks but in heavy weather, bearing S. E.  $\frac{1}{2}$  E. by compass, seven miles distant from the east point of the Magdalens, has been discovered by Capt. Bayfield, R. N.

THE BIRD ISLANDS are small, and not far asunder; they are moderately high, flat at top, and have a white appearance; the southern one is the largest, and from its eastern end a ridge of rocks runs out; in a passage between them there is also a rocky ledge.

BRION OR CROSS ISLAND lies W. by N. distant 4 leagues from the Bird Islands, and N.  $\frac{3}{4}$  E. about  $10\frac{1}{2}$  miles from the N. E. end of the Magdalen Islands, being five miles long and very narrow; the depth of water between the Bird Islands and Brion is from 4 to 14 fathoms, the N. E. end is bold to, and there is no danger in the channel; but off the S. W. end of the Island there is a ledge of rocks, even with the water's edge; between Brion and the Magdalens are 10, 11, and 12 fathoms. It was formerly generally considered that beyond the Magdalen Islands all was deep water, but Captain Philip Aldridge asserts that a bank lies to the northward, having the following soundings upon it. He says that standing in for Brion's Island from the southward, and steering N. W. from the N. E. end of the Island, when he was 12 miles from it he sounded, and had 20 fathoms water, fine brown sand with black specks and pieces of broken shells; that he continued to have the same depth and bottom until he came within two miles of the Island, when the water shoaled to 17 fathoms, small stones; he continued the same course until within half a mile of the Island, the depth gradually lessening to 7, 5, and 4 fathoms, then 6 and 7 fathoms, until he opened the northern point of the N. Eastern Island; then he deepened to 15, 17, 16, and 18 fathoms, being two miles off the Island, and on a rocky bottom. With the N. E. point of the Island brought S. E. by S. distant 4 miles, he says you will have 30 fathoms, fine brown sand, with black specks and bits of shells, and with the N. E. end of Brion's Island S. S. E. distant 12 miles, 35 fathoms, rocky bottom.

Latitude	Longitude	Depth
47 58 0 N.	61 20 0 W.	35 fathoms, rocky bottom.
48 3 0	61 30 0 W.	38 ditto, fine brown sand and shells.
48 3 0	61 38 0 W.	43 ditto, stones.
48 9 0	61 48 0 W.	55 ditto, fine brown sand and shells.
48 12 0	61 57 0 W.	no ground with 110 fathoms.
48 4 0	62 8 0 W.	70 fathoms, light brown sand and stones.
48 2 0	62 19 0 W.	55 ditto, brown sand.
47 58 0	62 30 0 W.	40 ditto, fine brown sand.
47 54 0	62 42 0 W.	55 ditto, ditto.
47 50 0	62 52 0 W.	40 ditto, fine brown sand and shells.

The Captain further says, that many ships have got, in winter time and long nights, so far to leeward, that they have been forced through the Strait of Belle Isle; when, had they known that such a bank of soundings existed, they would have lain to until daylight, and not have been driven out of their route. In sailing from the Magdalen and Bird Islands, you will, after you have passed this Bank, drop into deeper water, and lose your soundings till you get near to Cape Rosier.

#### *Bearings and Distances of the Principal Points and Places.*

- Cape Ray to the N. side of Bird Islands, N. W. by W. 22 leagues.
- Cape Ray to the east point of Anticosti, nearly N. N. W.  $\frac{3}{4}$  W.  $46\frac{1}{2}$  leagues.
- Cape North to the N. E. end of the Magdalen Islands, N. by W.  $\frac{3}{4}$  W. 16 leagues.
- Cape North to the Bird Islands, North 18 leagues.
- N. E. end of the Magdalen Islands to the Bird Islands, N. E. by E.  $\frac{1}{2}$  E. 6 leagues.
- East side of St. Paul's Island to the east side of the Bird Islands, N. by W.  $\frac{1}{2}$  W. 18 leagues.
- Bird Islands to the eastern end of Brion Island, W.  $\frac{1}{4}$  N. 12 miles.
- Bird Islands to Cape Rosier, N. W.  $\frac{1}{4}$  W. 47 leagues.
- Cape Rosier to the S. W. point of Anticosti, N. E.  $\frac{1}{4}$  E. 13 leagues.
- Cape Rosier to the west end of Anticosti, N.  $\frac{1}{2}$  E. 20 leagues.

In crossing the Gulf of St. Lawrence, even during the summer months, islands of ice have frequently been met with. The ice that drifts out of the river all disappears by the latter end of May, but these masses make no part of it. The conjecture is, that they

are not formed on any of the neighboring coasts, but descend from the more northerly regions of Davis's Strait, &c. where, it is presumed, they are severed by the violence of storms, from the vast accumulations of the arctic winter; and, passing near the coast of Labrador, are drawn by the in-draught of the current into the Strait of Belle Isle. They often are a hundred feet in height, with a circumference of many thousands; the temperature of the atmosphere is very sensibly affected by them, which, even in foggy weather, when they are not visible, sufficiently indicates their neighborhood: by day, from the dazzling reflection of the sun's rays; also by moon-light, their appearance is brilliant and agreeable.

#### FROM GASPE' BAY TO ST. GEORGE'S BAY, OR THE DISTRICT OF GASPE' TO BRETON ISLAND.

**GASPE' BAY, &c.**—Cape Gaspé lies at the distance of 6 miles to the southward of Cape Rosier; and Point Peter, or Flat Point, lies 6 miles to the S. by W.  $\frac{1}{2}$  W. of Cape Gaspé. At the distance of about 5 miles S. S. E. from Cape Gaspé, is a small fishing-bank, with 15 fathoms over it, sometimes called the Norwich Bank, around which there is, at a short distance, a depth of 58 and 60 fathoms.

The Entrance of Gaspé Bay is formed by Cape Gaspé and Point Peter. In this bay, at the distance of 11 miles N. N. W. from the entrance, within a point on the southern side, near its head, there is an excellent anchorage in from 9 to 12 fathoms water, sheltered from all winds. Here the river divides, one branch running N. W. by N. the other, or S. W. branch, West, and S. Westerly. There is, also, good anchorage, with westerly winds, off Louisa's Cove, on the western side of the bay, at about 6 miles N. W. by W. from Cape Gaspé, in 9 or 10 fathoms. Throughout the bay there is deep water; nearly 50 to 40 fathoms in the middle, and 20 very near the shore on the eastern side: on the western side it shoals more gradually towards the coast. The shores of the bay are elevated, and the settlers upon them nearly all fishermen. The tide flows until 3 o'clock, on the full and change.

**DOUGLASS TOWN** is at the entrance of the River St. John, on the south-west side of the bay. On the opposite shore of the same river is the site of the town of **Hal-dimand**.

From Point Peter, off which there is a little islet, called **Hat Island**, the bearing and distance to **Bonaventure Island** are S. by W.  $\frac{1}{4}$  W. 6 miles. Between lies the bay called **Mal Bay**, or **Cod Bay**, which is nearly 5 miles in width.

**MAL BAY.**—Very near the southern point of Mal Bay is **Percée**, a remarkable rock, rising about 200 feet out of the water, and of about 1200 feet in length, in which there are three arches, completely wrought by nature: the central one is sufficiently large to admit a boat under sail to pass through it with ease. From this rock, along Mal Bay, to Point Peter, there is an excellent beach for fishing, part of which is named **La Belle Anse** or **Lobster Beach**: close to this place is the house of the late Governor Cox. The village called **Percée**, is situated on the rising ground that forms the southern point of Mal Bay, inhabited, principally, by fishermen. In front of it the beach is convenient for the curing of fish, and off it are some of the best banks for catching them. The **Isle of Bonaventure** lies at about a mile and a quarter from the shore opposite to the point; it is little better than a barren rock, but yet a few persons are hardy enough to winter there, for the sake of retaining possession of the fishing places they have occupied during the summer. There is a passage between the Island and the shore with 16 fathoms water.

The bearing and distance from Bonaventure to Cape Despair are S. W. by W. 8 miles, and thence to the north end of Miscou Island S. W.  $\frac{1}{2}$  S. 26 miles. Nearly S. S. E. 2 miles from Cape Despair, lies the **Leander Rock**, over which is a depth of 16 or 18 feet water. As this rock lies in the fair way of ships coming from the northward, with northerly winds, for Chaleur Bay, it should be avoided by giving the Cape a berth of 3 miles. The bearing and distance from Cape Despair to Point Maquereau or Mackarel Point are W. S. W.  $\frac{1}{4}$  W. about 7 leagues. Between these points lie the two coves called **Pabos** and **Petit Pabos**, or **Pabou** and **Little Pabou**.

On the western side of the entrance of Pabou Harbor is a small village; and on the opposite side, on a projecting point, stand the summer habitations of the fishermen. Several streams descend into this harbor from a numerous chain of small lakes to the north-westward. Next to the westward of Pabou is the township and inlet of Port Daniel, where vessels may find convenient shelter during the westerly and N. W. winds.

**CHALEUR BAY.**—Point Macquereau and Miscou Island form the entrance of Chaleur Bay, and bear from each other S.  $\frac{3}{4}$  E. and N.  $\frac{3}{4}$  W. distant  $4\frac{1}{2}$  leagues. From the entrance of Chaleur Bay to that of Ristigouche Harbor, which is at its head, the distance, on a west and N. W. by W. course, is 22 leagues. The bay is of moderate

depth near the shore on both sides, and has, towards the middle, from 45 to 20 fathoms water.

Nouvelle Harbor lies about 14 miles W. by S. from Point Macquereau, where are a church and several houses.

**NEW CARLISLE.**—The town of New Carlisle, the principal town of Chaleur Bay, is situate in Cox's Township, on the North shore, as shown in the Chart.

**BONAVENTURE.**—In the adjoining township of Hamilton, on the west, is the village of Bonaventure, containing a church and several houses, standing on level ground.

From Bonaventure the land turns N. W. by N. towards Cascapedia Bay, along an iron bound shore, and having several rivulets of fresh water; within this Bay is anchorage in 4, 5, and 6 fathoms water; this is in the township of Maria; the head of the Bay is shoal, into which the Great Cascapedia River empties itself.

In **RISTIGOUCHE HARBOR**, at the head of Chaleur Bay, there is good anchorage in from 8 to 12 fathoms, land-locked from all winds; but it is so difficult of access, that it should not be attempted without a pilot. The tide flows here, on full and change, until 3 o'clock, and its vertical rise is  $6\frac{1}{2}$  or 7 feet.

**NIPISICUIT.**—Vessels bound into Chaleur Bay should make for the Island of Miscou, which they can round by the lead, for it shoalens gradually from 20 to 3 fathoms, the latter depth being near Miscou Point; should it be foggy, which in summer time is frequently the case, it will be advisable to steer from thence towards the northern shore, when you will most probably fall in with Nouvelle Harbor; here stands a church, upon some rising ground to the northward of the town or village, which is built along the beach and lies low. Proceeding up the Bay of Chaleur from hence, you will pass round a low point and reach Carlisle; this is somewhat similar to Nouvelle, for the town stands on a low point and has a church above it; both are near the beach. Having got abreast of Carlisle, if you are bound across for Nipisighit Roads or St. Peter's, then, by keeping on the northern shore as thus directed, you will readily know how far you have proceeded up the bay, and may then haul across, with greater certainty, for the land, between Caraque Point and Cape Idas, which you may approach to by your lead without the least danger; the land on the northern shores of Chaleur Bay is in a high state of cultivation, when compared with the southern shores, and this, perhaps, is the principal cause why the fogs that obscure it are less heavy on the former than on the latter. From Cape Idas to Nipisighit Roads, the shore is clear of all danger, and when the weather is dark or foggy, you may safely run along the land by your lead, only observing to come no nearer than 5 fathoms water, for in that depth you will be only three miles off the land. From abreast of Cape Idas, steer W. by S. about 9 miles; you will have from 5 to 7 fathoms all the way; clear of all danger, and get good anchorage: in opening the bay, you will see Mr. Miller's house and store standing on Carron Point on the larboard hand, and appearing like an island; there is a large grove of trees to the southward of the house; and the open space between that and Mr. Sutherland's gives it that appearance: steer for the house and store on Carron Point until you get about 4 miles distant from it, then bring Mr. Miller's house on Carron Point to bear S. W. and anchor in from 7 to 5 fathoms, where you may heave your ballast; here a pilot will board you, but should no one come, and you are inclined to enter the river, your vessel having but a small draught of water, then the following directions by Captain Abtridge, will prove acceptable, and lead you over both bars; and when you get inside of them you will find good anchorage to the northward of Carron Point in 3 and 4 fathoms, good ground.

Bring Mr. Miller's house half a handspike's length of Indian Island; this has a round tuft of trees on it, and will lead you in mid-channel clear of all danger: when you arrive abreast of Carter's Point, you should open the upper part of Lathwood House; steer in that direction close to the beach, until you open the beach of Carron Point with Mr. Miller's house, then run a little further up and anchor in 12 or 14 feet water, sandy ground; from Carron Point to Munro's Wharf there are three bars, with not more than 6 feet over them, but there are places between them, with 16, 15, and 14 feet, where a number of vessels load.

The Tatigouche or Little River is only navigable by canoes; the middle river is deep, but bars run across the channel in many places: the banks on each side, from the village to Carron Point, dry at low water.

**TIDES.**—It flows full and change at three o'clock, and the water rises on the inner bar 8 feet, on the outer bar 5 feet, and in the harbor 8 feet, with regular springs, but it is much influenced by the winds which prevail in the Gulf of St. Lawrence; in summer time no vessel should load down to more than 13 feet, and then the bar should be attempted with the first of the springs.

From abreast of the north point of Miscou Island to the south point of Shippigan Island the distance is 19 miles, and the course is nearly S. W. by S. From the south point of Shippigan to Tracadie, the course and distance are S. W.  $\frac{1}{2}$  S. 4 leagues. From

lies off i

Tracadie to Point Esquimaux or Escuminac on the south side of the entrance of Miramichi Bay, the course is S. by W.  $\frac{1}{2}$  W. distance 9 leagues.

**MIRAMICHI BAY.**—This is a spacious bay, having at its entrance several islands: the northern shore is fronted by some small sand islands, having channels between them and the main, into which boats may enter; behind these is an Indian village called Negowack, but the chief passage into the harbor, is between Waltham or Portage Island and Fox Island: to enter this you must borrow towards the southern point of Escuminac, and pass to the southward of a long narrow shoal which stretches in front of Fox's Island, and forms the channel of  $1\frac{1}{2}$  mile wide, with 4 and 5 fathoms water in it; having advanced to the northward of Fox Island you must turn westerly, and pass between the southern point of Waltham Island and the northern point of Fox Island: on your starboard hand lie 3 black buoys, which mark the edge of the Horseshoe Sand; there is also a red buoy on the larboard side of the western part of the Bay de Vin Island; through this part of the channel you will have  $3\frac{1}{2}$  fathoms, and having arrived abreast of the Red Buoy de Vin, you may steer W. N. W. for Oak Point, in 3,  $3\frac{1}{2}$ , and 4 fathoms; here the greatest care must be observed, in order to take the passage between Sheldrake Island and the Sandy Spit which runs off Point Cheval; run very near the N. E. point of that island, steer S. Westerly for Nappan Bay, and round the south part of Sheldrake Island, you will then see Old Custom House situated upon the northern shore; from whence, by keeping mid-channel, and following the sinuosities of the river, you will safely pass Middle Island, and have 7 and 6 fathoms without any danger, until you reach the Town of Newcastle, here the water lessens to 3 fathoms; ahead you will perceive Beaubac or Frazier's Island, dividing the channel in two passages, that to the S. Eastward is the better one, and runs into the S. W. branch of the river; that to the northward leads into the N. W. branch, both these have their rise a considerable distance up the country. The New Custom House stands on the southern shore, about 2 miles beyond Middle Island: there are several places of good anchorage about this harbor, but the navigation is in general so intricate that a Pilot will always be necessary, and he will point out the best places for riding. Spring tides rise 5 and 6 feet, and the buoys are frequently shifted.

There is good anchorage with off-shore winds in Outer Bay, but you must not go into less than 7 fathoms water. The Pilots' houses are 4 or 5 miles to the westward of Escuminac Point, and Pilots for this place are sometimes obtained from the Gut of Canso. Considerable quantities of timber have recently been shipped from this harbor for Europe, but a late tremendous and extensive fire having made great devastation in the adjacent woods, destroying the dwellings and property of most of the inhabitants, and reducing them to the greatest distress, it will take some considerable time before they can recover their losses, or resume their former occupations.

From the northern part of Miscou Island to Escuminac Point, the soundings are regular; and, in thick weather, the shore may be approached by the lead to the depth of 12 or 10 fathoms. In passing Escuminac Point you must give it a good berth, for a sandy spit runs off it a full league.

**RICHIBUCTO.**—The depth of water at the entrance of this harbor is, at the best and highest tides, about 18 feet, and with common tides  $16\frac{1}{2}$  feet. When you are off the harbor's mouth, in 6, 7, or 8 fathoms water, you should endeavor to steer in, bringing the two large beacons in a line, and keeping them so, until you get up near to the Sand Hill; then run along the shore about N. W. in 3 or  $2\frac{1}{2}$  fathoms, until you find yourself in safety. There is a large buoy, laid down in 5 fathoms, outside of the bar, which is a good guidance in, and may be seen, as you approach, for upwards of a league off.

Within Cape Tormentin is the isthmus and boundary between New Brunswick and Nova Scotia, the narrowest part of which, from the Bay Verte to Cumberland Basin, at the head of Chignecto Bay, is only 15 miles in breadth.

**THE NORTHERN COASTS OF NOVA SCOTIA, &c.**—The general features of the Northern Coast of Nova Scotia are pleasing: the land low and even, or slightly broken by agreeable inequalities. The few Harbors are of a very limited capacity; the soil of the country is fertile, and the woods abound with Beach, Oak, Elm, Birch, Maple, Ash, Pine, Spruce, Larch, Juniper, Hemlock, and Fir. In the Strait of Northumberland, to an extent, from end to end, of not less than 100 miles, the bottom, in many places is nearly level, and varies in its depth only from 20 to 10 fathoms; being, generally, a stiff clay, and the ground holding well.

Between Cocagne, on the west, and the high rock called the Barn, on the east, the shore is, in general, bound with red cliffs, and beaches under them, and the island which lies between Tatmagouche and the basin of Cobequid, appears remarkably high to vessels in the offing.

Having rounded Cape Tormentin, either inside or outside of the 6 feet ledge which lies off it, you will open to the westward the Bay Verte.

**THE BAY VERTE** is wide at its entrance, and narrows as you advance, the shores are lined with flats, on which the water becomes shallow, but mid-channel the anchorages are good; here vessels of considerable burthen may take in their cargoes of timber, &c. On the northern side of the Bay, and near its head, is the small River of Gasperau, on the southern shore of which stands the Fort Monckton, and on the southern part of the Bay is another small rivulet called the River Tidnish, they are both too shallow for shipping to enter. The Bay of Verte is now rising into considerable importance, in consequence of its proximity to the Bay of Fundy, and the interior from the Bay to Amherst, Cumberland, La Plance, and Tantamaree is in a highly improving state and increasing population.

**RIVER PHILIP.**—To the southward of Cape Tormentin, at the distance of  $4\frac{1}{2}$  leagues, is the entrance to the River Philip, a bar harbor, having only 10 feet at the entrance. In advancing towards this place, when in the depth of 5 fathoms, another harbor will be seen on the eastern or larboard side, which is called Pogwash. In the latter, ships drawing 17 feet load with timber. This harbor is safe; but the entrance is so narrow as to require a pilot. Ships commonly anchor outside in 5 fathoms, at 3 miles distance from shore, with the entrance bearing to the S. E.

E. N. E.  $\frac{1}{2}$  E. about 8 miles from the entrance to the Bay of Pogwash is the Cliff Cape, and from Cape Tormentin to Cliff Cape the bearing and distance are S. by E.  $\frac{3}{4}$  E. 16 miles; from Cliff Cape to Shoal Point S. E. 3 miles; and from Shoal Point to Cape John S. E. by E. 11 miles. Between the two latter lie the harbors of Ramsheg and Tatmagouche, which are good and well sheltered, but each require a pilot.

**RAMSHEG HARBOR.**—Off the northern or Shoal Point is Fox Island, the flats from which extend so far from shore, at the entrance of the harbor, as to leave but a narrow channel, through which, at all times, excepting at slack water, the tide runs with great velocity, and renders the navigation into it very unsafe, although the depth up to the anchorage is sufficient for a frigate; there being, in mid-channel,  $3\frac{1}{2}$  fathoms at low water. In sailing in, steer south-westerly, towards Gravois Cliff, giving Shoal Point a berth of a mile, until the N. W. arm is well open; then steer for the latter, keeping your lead going, until the beach to the N. W. of Gravois Cliff bears S. W. by W.

**TATMAGOUCHE** is  $6\frac{1}{2}$  miles to the westward of Fox Island, and the channel on the western side of Amet Isle is quite clear; but, in sailing in from the eastward, between Cape John and the isle, you should keep nearest to the Cape, for a ledge extends from the isle to a considerable distance. Amet is a low island, without trees, and it will be most prudent to keep at least three-quarters of a mile from it every way. The best anchorage for ships is in the Harbor or River John, on the east side of the Harbor, in 4 or 5 fathoms, muddy bottom. Small vessels may run up to Tatmagouche, and anchor off the town in 10 or 12 feet at low water. Here the tide rises 5 feet, on full and change, and flows till 7 o'clock.

**RIVER JOHN.**—In coming from the eastward, when between Amet Island and Cape John, your course towards River John will be W. by S. In passing between the Island and Cape, you will have  $4\frac{1}{2}$  fathoms until you open the River John, on the larboard side. You will then have 7, 8, and 9, fathoms; and if bound for this river, or for Tatmagouche, may obtain a pilot, by making the usual signal. There is safe anchorage at 2 miles distance from shore.

In Ramsheg, Tatmagouche, and John Harbors, ships of fifteen feet draught commonly load with timber.

**CARIBOU HARBOR.**—From Cape John to Caribou Point the course and distance are E. S. E. 6 leagues. Here the water gradually shoalens to the shore, from the depth of 8 or 9 fathoms at two miles off. To strangers it may be dangerous to approach Caribou Harbor, as it has frequently been mistaken for Pictou, which lies to the south-westward, and some have run on shore before the error has been discovered. For it is to be observed that ships are seen riding, not in the entrance of the harbor, but within a sand bank, which stretches from side to side, having not more than 3 or 4 feet over it, and which appears like a good channel. Small vessels load with timber here. The promontory of Caribou may be known from Pictou by observing that the hollow land over it appears like a deep inlet; but the highlands of Pictou seem to fold over each other, and blind the entrance. The ledges about Caribou extend upwards of a mile from shore, and some of them are dry at low water. Nearly in mid-channel, to the northward of Caribou Point, is a rocky shoal of 10 feet. It is a quarter of a mile in circumference, and around it the depths are 4, 5, and 6 fathoms. The tides, both ebb and flood, set rapidly over it.

**SUNKEN ROCK.**—Between Pictou Island and Caribou Point, is a sunken rock. The rock lies in the fair way between Pictou Island and Caribou Point, being distant about one-third the breadth of the channel, in a W. by N. direction from the western point of the island. The circumference of the rock is about 400 yards, and the tide

was found to set over it at the rate of  $2\frac{1}{2}$  miles per hour, the flood setting to the N. N. W. making high water at full and change at 9 h. 30 m. On its western edge, the rock has 4 and 5 fathoms close to it, and 5 to 7 fathoms on its eastern edge. The position of this rock renders it extremely dangerous to ships leaving Pictou Harbor for the westward, as it lies immediately in the fair way. The channel to the westward of the shoal is generally adopted, in which there is from  $3\frac{1}{2}$  to 4 fathoms irregular soundings.

**PICTOU.**—The Harbor or River of Pictou has a bar across its entrance, having over it only 15 feet at low water; and without this is a shoal, called the Middle Ground, having the smaller depth of 7 feet. The entrance, on the south side of which there is a fixed light 54 feet high, lies S. W.  $\frac{1}{4}$  S. 5 miles from the west end of Pictou Island.

In approaching Pictou from the westward, between the island and the main, the light will not be seen until it bears W. by S. and may be run for when it bears west.

In approaching from the eastward, Cape George bearing S. one mile distant, the course is W. by S.; but after making the light it ought to be brought to bear W. or W.  $\frac{1}{4}$  N. when the light may be run for, and will serve for a leading mark over the bar, and may be approached within two and a half cables' lengths, where there is good anchorage, or haul up W. N. W. until abreast of the light, or until it bears W. S. W. when the course up the harbor is west.

The windmill near the town, is a line with the beach that forms the left or south side of the entrance, is the mark to clear the Middle Ground, and for the deepest water. Within the bar and the beach the water deepens to 5, 6, and 7 fathoms, muddy bottom. This depth continues up to the town, opposite to which a mud flat extends outward so far as to leave the channel midway between the two shores. Above the town the river divides into three branches; of these, the eastern one is winding, but navigable to vessels drawing 15 feet, about 4 miles upward; at which distance the river becomes impeded by a bar, although above that the water increases. At 9 miles above the town of Pictou are the well-known coal-pits, the produce of which is brought down to the bar in large flat boats. The Middle and West Rivers are navigable upward to a considerable distance. The lands hereabout being good, the population is rapidly increasing. The town of Walmisly, on the north side of the harbor, is the residence of the principal merchants who load timber in these parts.

**MERIGOMISH**, which is an excellent bar-harbor, lies 7 miles to the E. S. E. of the entrance of Pictou; the merchants of which place have ponds here, for the reception of timber, with which a number of ships are annually laden. To sail in for this place, bring the east end of Pictou Island nearly North, and keep it so until off the harbor's mouth, where you may either obtain a pilot, or anchor in 4 fathoms. A stranger should not venture to enter the harbor without a pilot, as a ledge stretches off from either side. There is a depth of 14 feet on the bar at low water, and the vertical rise of tide is about 8 feet. The depth within is from 4 to 7 fathoms, soft mud.

**PICTOU ISLAND**, which lies off the entrance of Pictou and Merigomish, is cultivated, and contains about 3000 acres. Fine quarries of free stone have been opened here, and strong traces of coal are visible in several places about the cliffs. From the east end a spit of rocks extends about half a mile; and at the E. N. E. from it, one league and a half, is a shoal of 21 feet. Between the island and Merigomish the bottom is muddy, and the depth from 11 to 7 fathoms.

There is no harbor between Merigomish and Cape St. George; but the coast is clear high, and bold, and vessels may sail along it in safety, at the distance of a mile. As a place of refuge for small vessels in distress, there is a new pier erected on the coast, 7 leagues to the eastward of Pictou, and at the indent formed by the rock called the Barn. Cape St. George is a promontory which runs out to the N. Eastward; it is bold to, and considerably elevated, forming the western point of entrance to St. George's Bay, but there is said to be good anchorage under the Cape, in from 10 to 7 fathoms; the ground is somewhat rocky, but you will ride there sheltered from westerly winds.

**ST. GEORGE'S BAY, ANTIGONISH.**—The entrance of the Harbor of Antigonish lies 10 miles to the S. by W. from Cape St. George. Here small vessels load with timber and gypsum, or plaster, of which there is abundance in the neighborhood; but the harbor is so shoal, that even these complete their cargoes outside of the bay, although the anchorage is not so safe.

At Pomket Harbor, 6 miles eastward from Antigonish, ships of any size may load in safety. In sailing in, when from the northward, you will leave the island on the starboard side, keeping close to a rock, which appears 5 or 6 feet above water. This rock is steep to, and lies off the east end of the island. Outside of it, at the distance of three quarters of a mile, lie several sunken ledges, which are dangerous. After passing the rock a bay, will open on the starboard side, which you must stand into, till you are shut in with the island, where there is anchorage in  $3\frac{1}{2}$  fathoms water, at about half a mile from the island.

ARBUSHEE, or AUBUSHEE, is an inlet which lies between Cape Jack and the Gut of Canso, forming a small harbor, occupied by an industrious and thriving people. Here a number of small vessels have been built, carrying from 15 to 50 tons. A rocky ledge extends outside the harbor, in a north-westerly direction.

#### THE GUT OF CANSO TO INHABITANT BAY.

REMARKS.—The Gut of Canso is formed by the Island of Breton on one side, and by the land of Nova Scotia on the other. Its length is about 5 leagues, and breadth more than three quarters of a mile. The east side is low, with beaches, but the west shore is for the most part high and rocky; Canso Porcupine being remarkably so. The deepest water is on the western shore; but the shoals are bold to and sound, excepting some sunken rocks, one of which lies near a cable's length from the eastern shore, and about midway between the southern entrance of the Gut and Ship Harbor; a second is between Ship Harbor and Bear's Head, running out nearly a cable's length from shore; and a third lies off Bear's Island, about 100 fathoms from the land; the depth of water over these rocks is about 6 or 8 feet. Mill Creek, Gypsum or Plaster Cove, Venus Creek, Ship Harbor, Holland Cove or Pilot Harbor, and Eddy Cove, afford excellent anchorages, with a moderate depth, and out of the stream of the tide, which generally sets in from the southward, but is very irregular, being much influenced by the winds. After strong N. W. winds, which happen daily during the fall of the year, the water in the Gulf of St. Lawrence is rendered low, which causes the current to run northward through the Gut, at the rate of 4 or 5 knots, and the contrary happens after southerly winds.

When off Cape Canso and bound for the Gulf of St. Lawrence, the best passage is through the Gut of Canso, being shorter, and having the advantage of several anchoring places, out of the strength of the tide, in case of contrary winds or bad weather.

CAPE ST. GEORGE, as before observed, is a remarkable promontory, lying at the distance of 10½ leagues to the eastward of Pictou Harbor; a course of 6 leagues, thence to the south-eastward, will lead to the entrance of the Gut, whence you may run along the Breton shore. It is to be observed that there is a ledge of rocks, in the offing, near Aubushee, already noticed; some of these are nearly dry at low water, and nearly in the direct course for the Gut; they must, of course, be carefully avoided.

Opposite Mill Creek, at the upper end of the Gut, on the Nova Scotia side, you may stop a tide or lie wind-bound, if it does not overblow. Keep the creek open, and come to anchor in 8 or 10 fathoms, within a cable's length of the steep rocks, on the south side of the creek. The best water is with the creek's mouth open. It will be necessary to carry a hawser on shore to the rocks, to steady the ship, as the tide here runs in eddies. You may obtain fresh water from the creek at low water.

Upon entering the Gut, there will be seen, on the larboard hand, a red house, on a point, called Belle Ashe's Point, off which, at nearly a cable's length from shore, there is a sunken rock, which may be readily distinguished by the eddy of the tide. Within this point, on the S. E. is Gypsum or Plaster Cove, where shipping frequently anchor. When abreast of Gypsum or Plaster Cove, the remarkable headland, on the western side, named Cape Porcupine, will bear nearly S. W. To sail into the cove, keep nearly in the middle; and, when in 10 fathoms, let go your anchor. You will find sufficient room for swinging round, in 7 fathoms; here, off the western side of the cove, is the sunken rock said to have been discovered lately, having only 6 and 8 feet over it, and lying about 60 fathoms off the shore; if this information be correct, the greatest care must be taken to avoid it.

SHIP HARBOR, which lies half way down the Gut, on the eastern side, is a good harbor for merchant shipping. It is, however, more particularly useful to those sailing northward, being a good outlet. It is a very proper place for ships of 16 feet draught. If bound in, from the southward, give the starboard side a berth of a cable's length, it being flat, and run in until you shut the north entrance of the Gut; and come to anchor in 4 or 5 fathoms, soft bottom; where you may wood on the Breton side, and water on the opposite shore, at Venus' Creek; the larboard side of this harbor is bolder to than the starboard side, and deepest water. Without the harbor, one third from the Breton side, you may anchor in 9, 10, to 13 fathoms, loose ground, in the strength of the tide.

Ships bound through the Gut, from the northward, may proceed through it with safety, by keeping nearly in the mid-channel, there being no danger until they arrive off the south point, called Eddy Point; but from this point extends a long spit of sand, with large round stones, which must be left on the starboard side, at the distance of half a mile from what may be seen above water. The race of the tide will serve to guide you from it. Having passed the Spit of Eddy Point, you may steer to the S. S. E. until

abreast of an island which appears covered with green spruce-trees, having red bark. Hence you proceed to sea, according to the charts.

Be cautious of running in the direction of a dangerous steep rock, called the Cerberus Rock, with only 10 feet water over it, and on which the sea breaks with a wind. This rock lies with Verte or Green Island in a line with Cape Hoagais or Iron Cape, on the Isle of Madame, at the distance of about  $4\frac{1}{2}$  miles from that island: to clear it to the southward bring Green Island open of the Albion Cliffs; to go clear to the westward of the Cerberus, bring the western point of Conway Island on with Cariton Cliffs, bearing N. N. W.

At the entrance of the Gut, within a mile of Eddy Point, there is a middle ground of 7 to 12 fathoms, on which ships may stop a tide in moderate weather. To the westward of this ground there is a depth of 18 fathoms, and to the eastward of it 20 to 25 fathoms. With the wind inclining from the southward, steer in nearly west, and keep the lead going, until you shoalen to 11 fathoms, when you may let go your anchor.

Gypsum, or Plaster Cove, is so called from its valuable quarry of gypsum, which appears to be exhaustless. The anchorage at the mouth of this cove has from 10 to 4 fathoms; bottom of soft mud. Cape Porcupine, opposite to this cove, is 562 feet in height, and this is the narrowest part of the strait. On the banks of the Gut, in general, the hills rise in easy acclivities, which present settlements on the whole range of the shore.

**INHABITANT BAY, &c.**—Those who wish to anchor in Inhabitant Bay or Harbor, may bring the farm that is opposite to Bear Head open, the Head bearing W. S. W. This mark will lead them clear, and to the southward of the Long Ledge, and in the mid-channel, between it and the steep rocks on the east or opposite shore; at the same time take your soundings from the Long Ledge, or north shore, all the way till you arrive at Flat Point; then keep in mid-channel between Flat Point and the island opposite, from the N. E. side of which runs off a spit or ledge of rocks, at the distance of a cable and a half's length; then port your helm, and run under Island Point, and come to in 5 fathoms, muddy bottom. Up the river Trent are plenty of Salmon, in the season, and there you may wood and water.

**N. B.** The leading-mark to clear the steep rocks of Steep Point is, to bring the peninsula in a line over the point of Turbalton Head, bearing S. or S.  $\frac{1}{2}$  E. until you open the island to the northward of Island Point: then haul up for the outer harbor, and come to in 10 or 12 fathoms, muddy bottom.

Those who are bound up the Gut of Canso, and meet a N. or N. W. wind, at the south end of the Gut, and who are desirous of good and safe anchorage in 10 to 12 fathoms water, may come to on the north side of Bear Island; but, should it blow hard, to a gale of wind, down the Gut, this anchorage is not altogether so secure as a careful master or pilot would wish. You must then leave the road of Bear Island, at a sail round the south end of Bear Point, giving a berth to the spit that runs off it, of 3 cables' length, then haul round to the N. E. into Sea-Coal Bay, and come to anchor, in 4, 5, or 6 fathoms, sandy and muddy bottom. There is also a rock under water, said to lie about 100 fathoms to the southward of Bear Island, having only 6 or 8 feet water over it; it will be necessary to give this point a good berth, for fear of this danger.

Marks for anchoring, viz: bring Bear Head in a line over Flat Head, bearing W. S. W. or W. by S. and Cariton Cliffs, to bear N. by E. or N. in 5 or 6 fathoms, you will then have a good berth, sheltered from the W. N. W. and N. winds. Here is sufficient room to moor ten or twelve sail of any ships of war, from the sixth to the third rate.

The following directions are given by Captain Aldridge for vessels bound through the Gut when coming from the southward. We made land abreast of Richmond or Melville Island, on the eastern shore of the entrance of the Gut of Canso, keeping at the distance of 2 miles or 1 $\frac{1}{2}$  mile from land, and steering N. N. W. until we opened the town of Arachat, when hauling further to the northward, so as to pass between the east shore and the Cerberus Rock, which is nearly dry at low water, but over which the water constantly ripples; continuing this course, and with the Red Bluff Point bearing in that direction, we passed quite clear of that danger; the above Red Point is the western entrance to the Gut of Canso, and off it there is a ledge of rocks. The marks for the Cerberus Rock are a small round land covered with trees, looking like an island, and having some houses behind it, on with the centre of it, bearing east, and the outer extremity of Albion's Cliffs bearing S. E. by E. you will then be abreast of the rock; and when the church comes open of the point bearing east, you will be opposite its N. W. end; by keeping a man at the mast head the rippling will be easily recognized, although it be nearly calm and the sea quite smooth; there is no danger between it and the Red Point on the larboard side, but you must give a good berth to that point which forms the entrance of the Gut, because of the Spit which runs off it; and when you are well past this Spit steer on mid-channel through the Gut, and you will go clear of all danger. When you have

got beyond Cape Porenpine, steer N. N. W. about 5 leagues, or until Cape St. George bears W. N. W. distant 7 miles; you will then have passed to the westward of the Hon-die Bank of only 2 fathoms water, which lies opposite to Jestico, and by adopting a N. N. E. course, you will clear the east point of Prince Edward's Island, and be in a fair direction for the Magdalen Islands.

Ships coming down the Gut of Canso, which may have reached past Eddy Point, or as far as Cape Argos, and caught with a S. E. to a S. S. W. Wind, and cannot hold their own by beating to windward, may bear up and come to anchor in Turbalton Bay, under Turbalton Head, where they may ride safely in from 5 to 7 fathoms water, muddy bottom. The marks for anchoring in Turbalton Bay are, to bring the peninsula point in a line over Turbalton Head, bearing S. or S.  $\frac{1}{2}$  W. or a point of land inland, a little up in the country from Cape Argos shore, with pine trees on it, open to the eastward of the Red Head; or the said point of land with pine trees on it, over the pitch or point of Turbalton Head; you are then sheltered by the rocks or spit that runs from Turbalton Head, in 4 to 5 and 6 fathoms water, and will ride very safely on good holding ground. But, should the wind shift to the S. W. or N. W. you must take up your anchor and beat out of the bay into Chedebucto Bay, and proceed on your passage to the southward. Should the wind over-blow at S. W. so as to prevent your beating to windward into Chedebucto Bay, you may come to an anchor in Eddy Cove, bringing the low part of Eddy Point to bear S. S. E. or S. by E. in 5, 6, or 7 fathoms water, taking care to give the ship sufficient cable, lest you drive off the bank into deep water, from 15 to 20 fathoms.

**TIDES** on the South Side of the Gulf of St. Lawrence. The tide rushes with great rapidity through the Gut of Canso; and in the narrowest part of the Gut, or Cape Porcupine, it seldom runs at a slower rate than 4 or 5 miles in an hour. Here it flows, on the full and change, at IX $\frac{1}{2}$ h.

Along shore, past Aunushee and Antigonish, it sets towards Cape St. George; and rounding that Cape, proceeds thence in a north-westerly direction. On the south shore of Northumberland Strait, the time of flowing, on the full and change, is from VII to VIII h. The perpendicular rise is from 3 to 7 or 8 feet.

The tides here are very materially varied by the winds; and it has been found that, at times the stream of the Gut of Canso has continued to run one way for many successive days.

#### ST. JOHN'S OR PRINCE EDWARD'S ISLAND.

This island is well settled, and possesses a good soil, fit for all general purposes. The climate is commonly healthy and temperate, and not subject to such frequent and heavy fogs as Newfoundland, and the adjacent Coasts of Breton and New Brunswick generally are, nor yet to sudden changes of weather. The first appearance of the island is like that of a forest emerging from the sea; the red cliffs, which are not very high, then appear; the lands are covered with lofty trees, and the sand hills on the northern side of the island are covered with verdure. The country is generally level, and abounds with springs of fine water, and groves of trees, which produce great quantities of excellent timber. The greater part of the inhabitants are employed in farming and fishing.

Rifleman's Shoal is situated off the south coast of the above Island, and the following remarks were taken at anchor in 7 fathoms, about 2 $\frac{1}{2}$  or 3 cables' length, S. S. W. of that part on which the British ship Rifleman grounded, viz. Point Prim N. N. W.  $\frac{1}{2}$  W. South Woody Island E. by S.  $\frac{1}{2}$  S. a point (supposed Point Jennings) N.  $\frac{1}{2}$  W. a merchant brig on shore on the Indian Rocks, bore S. E. about 3 or 4 miles distant.

The least water found upon the shoal was 8 feet, about half a cables' length to the northward of where the Rifleman grounded. It appears to be a rocky shoal, of considerable extent.

The coast forms numerous harbors, many of which are, however, fit for small vessels only. The principal loading ports at present are on the eastern side, Cardigan Bay, or the Three Rivers, and Murray Harbor; on the S. E. Hillsborough Bay and River; Bedeque Bay on the southern side; and Richmond Bay and Holland Harbor on the north.

**CARDIGAN BAY**, or the **THREE RIVERS**, lies between Boughton Island and Panmure Island; it is the common entrance to three rivers; namely, Cardigan River, Brudenell River, and Montague River. In the former there are from 7 to 3 fathoms water, and in the others from 4 to 2 fathoms. George Town stands on a peninsula between the rivers Brudenell and Cardigan. In these places many large ships have been loaded with timber. There is anchorage without, in Cardigan Bay, in from 10 to 15 fathoms, where a pilot may be obtained.

**MIRAY**, or **MURRAY HARBOR** lies close to the north-westward of Bear Cape; and the entrance is narrow and shoal, difficult of access, and not having more than 12 feet water. But small ships have frequently loaded here. Vessels coming from the

eastward, and bound to Murray Harbor, must avoid approaching too near to the eastern point, for a ridge of rocks stretches out a full mile from it; between the east point and Wood Island the ground is clear, with a depth of 3 fathoms all the way, near the shore, and the anchorage good.

**HILLSBOROUGH BAY** is the finest bay in the island, and the River Hillsborough is a large navigable river; but timber here is not plentiful. After passing the front about a quarter of a mile, keep towards the entrance of York River, for a shoal extends from the opposite shore to some distance, and anchor off the town in six or eight fathoms. Vessels bound for Charlotte Town, or passing through Northumberland Strait, must be careful to avoid the Indian Rocks, which are covered at high water; and by night it will always be advisable to keep on the Nova Scotia side, particularly when passing by the Island of Pictou.

**BEDQUE BAY**, which lies between Cape Egmont and Carleton Point, has good anchoring-ground in from 6 to 8 fathoms. The harbor will admit ships of 400 tons, but the channel is narrow, crooked, and requires a pilot. It is the chief port for loading timber; but the water freezes much sooner than at Pictou, or the harbors on the Nova Scotia coast.

Between Cape Egmont and West Cape, in Halifax or Egmont Bay, there is good anchorage with northerly and easterly winds, in 6 or 8 fathoms, but care must be taken to give a good berth to West Cape, as a shoal runs off it full 2 miles, in a S. W. direction.

From the North Cape of the island a shoal spits off nearly 2 miles, close to which there are 4 fathoms of water, and the ground is flat much farther off, there being only 6 fathoms water at the distance of 8 or 9 miles from the cape. Vessels sailing through the Strait of Northumberland, with the intention of going to any port on the northern side of the island, will, after giving the North Cape a wide berth, find all the other part of the coast clear from foul ground, to within the distance of a quarter of a mile of the land, and may anchor any where in not less than 3 fathoms water; and ships coming from the eastward, will find an advantage in sailing along the northern shore of the island, to going through the Strait of Northumberland, for there is more sea room, and the prevailing winds are from the S. Westward; they may safely run along within a mile of the shore, until they approach Richmond Bay. There is a reef extending from the east point of the island to the distance of 3 or 4 miles, and which should not be approached in the night nearer than to the depth of 17 or 18 fathoms. The only harbors on the north side of the island, for ships of large burthen, are Holland Harbor and Richmond Bay; and off these harbors, the sand banks, which form the bars, run off more than a mile from the shore.

**ST. PETER'S** is the first harbor on the north side, when coming from the eastward, and is fit for small vessels only. The bar runs out about a quarter of a mile.

Savage Harbor is fit only for small craft, and has a bar before it.

**TRACADIE, or BEDFORD BAY**, has about 8 or 10 feet of water on the bar, which extends outward half a mile.

**HARRINGTON, or LITTLE RASTICO**, admits only small vessels; it communicates with Great Rastico or Harris Bay, which is very shallow on the bar, and calculated to admit fishery schooners only.—The bar stretches off nearly half a mile.

**NEW LONDON, or GRENVILLE BAY**, has about 8 or 10 feet of water, but the bar is very difficult, and the channel runs in west. The bar extends nearly half a mile out.

**RICHMOND BAY, or MALPEC**, is a spacious harbor, having about 17 or 18 feet upon the bar. The sands which form the bar extend more than a mile off the harbor. The shoals on each side are generally discernible from the swell on them, and the course in and out is nearly east and west. On a vessel's anchoring outside the bar a pilot will come off. There are two entrances into the bay; between them is Fishery Island. The eastern is the only channel by which a vessel of burthen can enter; the western channel being very shallow and intricate. Vessels usually complete their landing at about a mile within Fishery Island, but a considerable current runs there. The anchorage is good, and vessels lay in perfect safety.

**HOLLAND HARBOR, or CASCUMPEC**, is the westernmost harbor on the north side. Here the sands form a bar as at Richmond Bay, and run off about a mile and a half. The harbor may easily be known by the sand hills which extend along the coast; about half-way between the entrance of Richmond Bay and Holland Harbor, is one sand hill, near Conway Inlet, much higher than the rest. Holland Bay may be known by its being at the west end of all the range of sand hills. There is good anchorage close to the bar in from 5 to 8 fathoms.

On the bar is a depth of 18 feet of water, and it will not be difficult for a stranger to run in with a ship not drawing more than 12 feet of water. There being two leading marks, painted white, bearing W. by N. by compass, a vessel of this draft, by keeping the two marks in one, with a leading wind, may run in with perfect safety. But as these marks will carry a vessel over the south tail of the northern sand, vessels drawing more than 12

feet should not venture without a pilot. There is a buoy on the end of the south sand; between that and the end of the north shoal there is 18 feet of water. Vessels entering the port, if drawing more than 12 feet of water, should not bring the marks in one till they are within the bay. The soundings off the harbor are regular, and the ground clear. Ships on coming to anchor off the bar, will immediately be attended by a pilot.

There is shoaler water between the outer and inner harbor, on which is about 14 feet of water in common tides. Vessels generally load to 13 feet in the inner harbor, and complete their cargoes in the outer one. In the former, they lie alongside a wharf at Hill's Town, in 4 fathoms water, where they lie without any current, as in a dock. In the outer harbor the spring tide runs strongly, but the water is smooth, the sea being broken off by the bar.

The CURRENTS around the island are very irregular, frequently running many days along the north coast, from east to west, and at other times from west to east.

The TIDES, also, in the north side ports, are irregular, excepting spring tides. They sometimes keep flowing for 48 hours, and at other times not more than 3. In common tides, the water seldom rises more than two feet; in spring tides, (except in strong winds from the northward and eastward,) not more than five feet.

#### GENERAL DESCRIPTION OF THE COASTS OF BRETON ISLAND, &c.

The N. W. Coast of Breton Island, all along from Cape North to Cape Linzee, is, in the inland parts of the country, very high; but, in some places, it falls down gradually towards the shore. Sailing along on this side of the island, from the northward, you may safely stand in to the distance of two leagues from shore, until you arrive off Justau Corp or Henry Island, when you may stand within one mile of the shore.

In the winter season, when the weather is mild, the S. E., N. E. and N. W. shores of Breton Island abound with all sorts of fish; and plenty of lobsters and oysters are to be found towards Prince Edward Island, especially in Hillsborough Bay.

The Eastern extremity of Breton Island appears, on the sea shore, and to some distance up the country, barren and rocky; and the tops of the hills, being much alike, have nothing remarkable to distinguish them. The ruins of the lighthouse and town of Louisbourg serve, however, to point out that part of the island on which they stand. The coast continues rocky on the shore, with a few banks of red earth, which appear less barren.

The N. E. Coast of Breton Island, from Cape North to Cape Ensume, the water is deep, except very near the shore. From Cape Ensume to Cape Dauphin is high land, but from Cape Dauphin to Scatara Island it becomes rather low: between Port St. Anne and Scatara Island, a vessel may stand in shore to 15, 10, and 5 fathoms, in clear weather, the water gradually decreasing in depth. The following soundings were taken by Capt. Philip Aldridge, on making Cape North:

Latitude 46 50	Longitude 59 50.....	92 fathoms, black mud.
46 57	59 57.....	85 ditto, ditto.
47 1	58 56.....	95 ditto, rocky bottom.
47 10	58 47.....	100 ditto, small red stones.

BLANCHEROTTE, or WHITE CLIFF.—On the south coast of Breton is a remarkable cliff of whitish earth. Four miles to the westward of it is a small woody island, lying at the distance of two miles from shore, and off the little harbor called St. Esprit. Without this island, at the distance of a mile and a half, on the S. E. is a breaker.

The land hence to the Isle of Madame, or Richmond, is generally low: it presents several banks of bright red earth, with beaches between them. Albion Cliff, on the south side of Madame, is rocky, remarkably high and precipitous. On the S. W. side of this island is the settlement called Arachat.

In the description of the Gut of Canso, already given, (page 94,) we have noticed the general appearance of its coasts. On proceeding towards this strait, it should be remarked that the Isles of Canso, on the Nova Scotia side, are surrounded with many low white rocks and breakers. The south shore of Chedabucto Bay is iron-bound and steep to; its north shore consists of red cliffs and beaches.

Off the Gut of Canso, from the southern entrance northward, the western shore, throughout, is high, rocky, and steep; the eastern shore low, with beaches. From the north end of the Gut, the eastern shore to Jestico, or Port Hood, is distinguished by high, rocky, red cliffs. The opposite shore has several remarkable cliffs of gypsum, or plaster, which appear extremely white. Cape St. George is iron-bound and very high, its summit being 420 feet above the level of the sea.

and very high,

JESTICO, or PORT HOOD, situate on the western side of Breton Island, is a safe harbor for frigates with any wind; the anchorage is in from 4 to 5 fathoms, mud and sandy bottom: here you may get both wood and water. The leading mark going in is, Cape Linzee on with the highest sand hills that are on the N. N. E. side of the beach, bearing N. by E. or N. N. E.; these kept in a line will lead you clear of Spithead, in 4 to 6 fathoms. On the opposite shore is a long and broad flat, stretching from the shore three quarters of a mile, called the Dean, to which come no nearer than in 4 fathoms. From hence the shore runs nearly in a straight N. E. direction to Cape St. Laurent, whence it turns easterly to Cape North: during the whole of this distance there is no harbor of note, but several salmon rivers. To the southward of Cape North four or five miles is Ashpée Harbor, where there is a settlement formed for the relief of shipwrecked seamen, and to the southward of that, about 30 miles, is the entrance to St. Anne's Harbor.

ST. ANNE'S HARBOR, situate on the N. E. side of the island, was called by the French, when in their possession, Port Dauphin, and is a very safe and spacious harbor. It has but a narrow entrance, and carries 4½ fathoms at low water, until you join the beach. When in mid-channel, you will have 9 to 10 fathoms, and in the harbor from 5 to 10 fathoms, muddy bottom. On the north side the land is very high, and ships of war may lie so near to the shore, that a water hose may reach the fresh water, and a ship may be loaded in one day, from a cascade which runs from the top of the rock.

For more particular directions for St. Anne's Harbor, you will observe as follows:—After you have passed the Siboux or Hertford Isles, on the east side of the entrance, keep the south shore on board, if the wind be to the S. E. and as you approach Passage Point, bring Cape Ensumé, or Cape Smoke, which lies to the northward, nearly on with Black Point: steer with these marks in one, until you are nearly abreast of Passage Point, off which lies a sunken rock of 6 feet water, and opposite to which begins the spit of St. Anne's Flat, and the narrowest part of the channel. Now keep a small hummock up in the country, nearest to the shelving high land to the westward of it; which hummock is on the middle land from the water-side, in a line over the fishing-hut, or fishing-stage erected on the beach: this will lead in the best water, until you enter the elbow part of the beach. When advanced thus far in, keep the opening open, (about the size of two gun-ports,) which makes its appearance up the S. W. arm. This opening looks like two steep cliffs, with the sky appearing between them, and will lead you between the beach and the south shore, in mid-channel, through 9 and 10 fathoms, and past the beach point, off which a spit stretches to the S. W. about 2 cables' length. Having passed this spit, come to anchor in either side of the harbor in from 5 to 10 fathoms, muddy bottom, and sheltered from all winds.

LA BRAS D'OR.—This place has hitherto remained unknown, and unfrequented, but having recently been visited by many vessels in the timber trade, some description may be acceptable. It appears, from the charts, there are two entrances to this lake or inlet, the Northern, or Great Entrance, and the Southern, or Little Entrance; they are thus described by Mr. Thomas Kelly, the only pilot of the place: but the names of the places he refers to are generally unknown, and cannot be applied to any publication extant.

*Sailing Directions for the Grand Bras d'Or Entrance.*—"Ships from the southward must give Point le Conic a berth of about two miles, and steer from thence for the eastern end of the inside Bird Island, until you bring M'Kenzie Point and Cary's Beach in one. Make for the Black Rock Point until you have Messrs. Duffus's Store just open of Point Noir; then steer for Gooseberry Beach, until you bring a clearing on Duncan's Head over M'Kenzie's Point. It is to be observed, that ships coming in with the tide of flood must keep Point Noir well aboard, to avoid the eddy and whirlpools on the north side of the Gut, which has various settings. You must then steer for Point Jane, to keep the fair stream of tide as far as the Round Cove, where there is fair anchorage in 7 or 8 fathoms, good holding ground. When abreast of the Round Cove, steer over for Duncan's Head; and when abreast of this Head, steer for Long Beach, until you bring a tall pine-tree, on the Upper Seal Island, in one with a notch or valley in the mountain. You will then make for the point of the Upper Seal Island, which will carry you clear of the shoals on the islands, as also the South Shoal, or Middle Ground. The marks for this shoal are a white rock in the bank for the eastern end, and a white birch-tree for the western end. When abreast the western end of this shoal you may keep the middle, there being no difficulty until you come to Red Head. If bound to Kent Harbor, after doubling the Red Head, steer for a remarkable red bank covered with small bushes, until you bring Mr. Duffus's house entirely open of the beach which is on the Island: there is a depth of from 4 to 5 fathoms in this harbor, and good holding ground."

*Directions for that arm of the Lake called St. Patrick's Channel and up to Whookamagh.*—"From Red Head you will steer well over for the Duke of Kent's Island, to avoid a mud

shoal which runs off from M'Kay's Point. When abreast of the western end of the Duke of Kent's Island, sail for Wassaback Head until abreast of Stony Island. Then steer for Cranberry Head, so as to clear a shoal lying off from Wassaback Head; when abreast of Cranberry Point, sheer well over for the Bell Rock, to avoid a shoal lying on the south side of the channel; when abreast of the Bell Rock, steer for Green Beach, observing to keep Bakdock River shut in until you are well up with Green Beach. You will then steer for a beach on the south shore, until you cross the opening of the Narrows; you may then sail through the Narrows, keeping the middle until you come to the western end, when you must haul round the southern shore (beach) until abreast of the Plaister Cliffs; you are then clear of all, and in the Whookanagh Lake."

*Of the Anchorage through the Bras d'Or.*—"The first anchorage is the Round Cove, where you may ride in 7 or 8 fathoms. You may anchor in 5 or 6 fathoms, in the centre of the harbor, on a middle ground; the marks for which are to bring the Table Island a handspike's length open of Black Rock Point and Point Jane bearing N. W. On the north side of the harbor there is good anchorage as far up as the Lower Seal Islands, and to the eastward of the Upper Seal Islands, in 5 fathoms, and to the westward of the same islands in 7 fathoms. There is no other place of anchorage from this to the Big Harbor, where you may ride in 7 or 8 fathoms; from thence you may anchor at any time."

*Setting of the Tide in Grand Bras d'Or.*—"The first quarter flood sets from the northward, directly over the shoal; last quarter W. S. W. being directly through the channel, and meeting with the tide coming over the shoal, sets towards the Black Point which occasions it to shoot across the Gut, making a number of whirlpools and strong eddies on each side of the channel, which slacks two or three times during the tide. The first quarter ebb sets over the shoal to the northward; last quarter directly through the channel.—N. B. The tide of ebb is the fairest setting tide. The tide runs in until half-ebb, and out until half-flood, in regular tides; but the winds make a great alteration, N. E. winds making high tides, and S. W. neaping them; also tides running out with S. W. winds until high water, and in until low water with N. E. winds. Tides rise four feet, unless affected by winds. High water ten minutes past 8 o'clock, full and change."

**SYDNEY HARBOR**, the entrance to which lies 4 leagues to the S. E. of that of St. Anne, is another excellent harbor, having a safe and secure entrance, with soundings regular, from sea into 5 fathoms. On a low point which you leave on the larboard hand going in, a Lighthouse is erected showing a fixed light, elevated 160 feet above the level of the sea.

Entering the harbor, give the point a berth of one-third of a mile, and steer W. S. W. when you will have from 7 to 9 fathoms water; within the point the shore is bold and perfectly safe.

In the inner part of the entrance, Beach Point and Ledge, on the south side, are steep to, but Sydney Flats, on the opposite side, are regular to 4 fathoms. When past the Beach Point, you may run up the river Dartmouth to the S. W. and come to anchor in any depth you please, to 5 and 10 fathoms, a fine muddy bottom.

The harbor of North Sydney, where the vessels are loaded with coal by lighters, lies 9 miles above the Lighthouse on the north side of the river. The coal is obtained three miles above the Lighthouse, on the same side of the river as the town. There is a Steam Engine at the Coal Mines, with three very tall chimneys, the smoke of which can be seen 8 or 9 miles at sea on a clear day. The tide in the harbor flows at 9h. and rises 6 feet.

West of Sydney Harbor are Indian Bay and Windham River, both places of anchorage, and fit for vessels to run into, although little frequented at present; beyond these is Murgain or Cow Bay, at the northern point of which is Flint Island; there is a passage between this Island and the main, with 14 fathoms water, but this should be adopted with the greatest caution, on account of the numerous rocks under water that are scattered about: this Bay is open to the north-eastward, and its further end is encumbered with an extensive shallow flat, which dries at low water.

Miray Bay is to the southward, and its entrance is bounded by Cape Murgain and the Island of Scatara; the Bay is wide, and runs in 3 leagues, branching off at its upper part into two rivers; there is deep water within it, from 20 to 6 fathoms, and clear from dangers, but it affords no shelter for shipping.

**SCATARA ISLAND** lies in about the latitude of 46° North; its length E. and W. is nearly 2 leagues, and its breadth about one; it is separated from Cape Breton by a channel into Miray Bay, but this is too hazardous for strangers, and frequented only by those coasters who are well acquainted with its dangers.

As vessels from Europe frequently first make the land about Scatara Island, it may be useful to give the following observations, communicated by Captain Philip Aldridge, who says, "I am of opinion the Banquereau Bank is laid down somewhat too far to the east-

ward in the charts, for on my passage to Quebec, in 1823, I found no bottom with 80 fathoms, where 30 fathoms is laid down: and with latitude  $44^{\circ} 44'$ , and longitude  $57^{\circ}$ , the longitude well corrected and ascertained, there was no ground at 80 fathoms; and in

Latitude	41 56	Longitude	57 34	.....no ground with 80 fathoms.
—	45 6	—	58 20	.....20 fathoms, white sand and stones.
—	45 8	—	58 24	.....22 ditto, sand and pieces of shells.
—	45 13	—	58 29	.....30 ditto, rocky ground.
—	45 26	—	58 30	.....no ground with 80 fathoms.

We made the Island of Scatara in the evening, during a fog, and saw great quantities of gannets, who very seldom fly far from the land."

**LOUISBOURG HARBOR** is situated on the S. E. side of Cape Breton, to the westward of Scatara Island, and is very easy of access; you may be soon in, and you may likewise be soon out, if you please. In doing so be careful to avoid the Nag's Head, a sunken rock on the starboard hand going in. The east part of the harbor is the safest. On the east head, and on the site of the old French Lighthouse, a White Beacon has been erected; it may be seen some distance. The inhabitants consist of a few fishermen only. Water is plenty here, but wood is scarce. The Nag's Head Rock lies nearly one-third from the lighthouse point, and has no more than 3 feet on it at low water. The larboard side going in is the boldest.

**GABARUS BAY.**—From the entrance of Louisbourg to Guion Isle, called also Portland Isle, the course is S. W. by W. and the distance more than 3 leagues. Between lies the bay called Gabarus Bay, which is spacious, and has a depth of from 20 to 7 fathoms. Off the south point of this bay, called Cape Portland, lie the Cormorants, a number of islets and rocks, which are dangerous. About 4 leagues to the westward of Gabarus Bay is the Forked Harbor, a narrow winding inlet, where small vessels may run into, and lie landlocked. And five miles S. Westward of this is the remarkable white cliff, already noticed, and called Cape Blancherotte. The shore now winds to the westward, to Cape Huichimbroke and the Isle of Madame.

Arachat Harbor has two entrances; the north-western one, being very narrow, ought never to be attempted without a leading wind, as there is not room for a large ship to swing to her anchors, should she be taken aback. When going in, give the ledge, to the westward of Seymour Island, a good berth, not approaching it nearer than 8 fathoms, and keep as near as possible in mid-channel, to enter by the South-Eastern passage steer for Port Marache, rounding it in 8 fathoms at about two cables' length off, and keep that shore on board at nearly the same distance and depth of water until the church bears north; you will then see a small house (the dead house) on the top of the hill behind the church; bring that on with the east end of the church, and then steer in that direction; you will thus pass mid-way to the eastward of the Eleven and Five Feet Shoals, and also to the westward of the Fiddle-head Shoal; proceed with this mark on, until a red house on Fiddle-head Point comes on with the dark rocky extreme of the point, bearing E.  $\frac{1}{2}$  S.; you will then be to the northward of the Twelve Feet Shoal, and may haul up to the westward, where you will have excellent anchorage on fine soft mud, opposite to the low sandy beach, on the middle of Seymour Island, in 10 fathoms.

Fox Island Anchorage is one of the greatest mackerel fisheries in North America, during the months of September and October. When sailing in you must pass to the westward of Fox Island, giving it a berth of a quarter of a mile, as there are rocks both above and under water, with 3 and 4 fathoms close to them. You may anchor in from 4 to 10 fathoms, with the west end of the Island bearing from E. N. E. to N. N. E. keeping about midway between the island and the main. The water shoals gradually to the bar, which extends from the island to the opposite shore; it has not more than 6 or 7 feet on its deepest part, and dries in one place about one-third of the distance from the island to the main; with northerly and with westerly winds, the fishing vessels ride to the eastward of it in from two to four fathoms, and shift to the westward with easterly winds.

At Milford Haven, it is high water full and change at  $8\frac{1}{2}$  h. and the common spring tides rise 8 feet. At the Bay of Rocks at  $8\frac{1}{2}$  h. rising 7 and 8 feet, and, at the Gut of Canso, at  $8\frac{1}{2}$  h. common spring tides rising  $5\frac{1}{2}$  feet.

To clear the Cerberus Rock to the westward, bring Arachat Church open of the west end of Seymour Island. To clear it to the southward, bring Bear Island just to touch Eddy Point: Green Island in a line with Point Pogan will lead directly upon it.

**CHEDABUCTO BAY** is wide and spacious; it is bold to on both shores, and free from danger; on its southern side, which is high and nearly straight, of Fox's Island and Crow Harbor. Fox's Island is small, and lies near the shore.

**CROW HARBOR** is situated on the south side of Chedabucto Bay, and is capable of containing ships of war of the 6th and 5th rates, merchant ships, &c. Many schoon-

ers and sloops resort here in the months of July and August, to take mackerel and herrings. The passage in is to the S. W. of the Island that lies in the entrance. On the south side of the beach, a beacon is erected, to lead ships clear of the Corbyn Rocks. Keep this beacon in a line with a remarkable tree upon the high land, and it will lead you also clear of the Rook Island Rock, that lies 25 fathoms from the N. W. point of Rook Island.

**MILFORD HAVEN**, or the Harbor of Guysborough, at the head of the Bay, is impeded by a bar, but a sloop of war may pass over it. Within the bar vessels lie in perfect security; the tide, however, sets in and out with great rapidity. The town is at present a place of little trade; but it is protected by a battery. A little to the southward of Guysborough is Salmon River, which rises a considerable way up the country, and contributes to fertilize an extensive tract of good land. From Manchester round the north shore of Chedabucto Bay the shores are full of settlements, and wear a pleasing aspect, and on the northern side of Chedabucto Bay you will see several red cliffs; this shore is sandy, with regular soundings in the middle of the Bay; the water is deep, from 25 to 35, &c. to 50 fathoms.

## THE SOUTHERN COAST OF NOVA SCOTIA.

### CHEDABUCTO BAY TO HALIFAX HARBOR.

**DESCRIPTION OF THE LAND.**—The eastern part of Nova Scotia is broken into the several islands and passages as represented on the Charts. Of the islands, which are low and covered with stunted fir-trees, the first on the N. E. is called Durell's Island, the second George's Island, and the third, Canso or St. Andrew's Island; outside this latter Island is the smaller one, called Cranberry Island, which is now distinguished by the lighthouse below described.\*

**CAPE CANSO** is the outer, or easternmost point of St. Andrew's Island. From this Cape, westward, to Torbay, the coast makes in several white heads or points; here the country is much broken; and near the S. E. extremity many white stones appear from the offing, like sheep in the woods. During a southerly gale the sea is dreadful here. From Torbay to Liscombe Harbor there are banks of red earth and beaches; and from Liscombe Harbor to the Rugged Islands, (excepting the White Isles, which are white rocks,) the Capes and Outer Islands are bound with black slaty rocks, generally stretching out in spits from east to west; and from the Rugged Islands to Devil's Island, at the entrance of the Harbor of Halifax, there are several remarkably steep red cliffs, linked with beach.

The fishermen of Arachat are well acquainted with the channels and inlets on this coast, and frequent them, more particularly in the spring and fall, to catch mackerel and herrings, of which large shoals commonly resort here; but the rocks are so numerous, and the passages so devious, that no stranger should attempt them.

Of the many rocks hereabout, the outer breaker called the Bass, a rock of 3 feet water, lies more than two miles E.  $\frac{1}{2}$  S. from the lighthouse on Cranberry Island. At seventenths of a mile S. E. from Cape Canso is a similar rock, called the Roaring Bull; and, at one mile to the E. S. E. of the latter, there is said to be another, discovered by a fisherman of Canso, in 1813; but its existence seems to be questionable.

**CANSO HARBOR.**—Sailing from the westward into this harbor, so soon as you have passed the Roaring Bull, over which the sea generally breaks, run for Pitipas or Red Head, taking care when above the Black Rocks, to keep them open of the rocky islets off Cape Canso, until you bring Glasgow Head and the north end of Inner Island in one, which will carry you above Man of War Rock; then steer westerly, being careful to avoid Mackerel Rock, and make for Burying Island, the north end of which you must not approach nearer than to have a depth of five fathoms; then anchor to the north-westward of it on a bottom of mud.

\* Near this Cape a new lighthouse has been erected on Cranberry Island, and calculated to be of most essential service to mariners who frequent this dangerous coast, but more particularly those who intend passing through the Gut of Canso. It has been observed that the Gut of Canso will, by these means, become the common thoroughfare to the Gulf and River of St. Lawrence, and tend to mitigate the inconvenience and rigors of a late or early passage to Quebec, &c.

St. Andrew's Passage, leading to Glasgow Harbor, being so thickly encumbered with rocks, can only be navigated by those who are well acquainted with its dangers.

Coming from the eastward pass between Cape Canso and Cranberry Island; giving the latter a sufficient berth to avoid a shoal which stretches to the southward of it, and steer for Pitigras Head, as before directed. The Northern Passage, between Durell's and George's Islands, notwithstanding its narrowness, yet having a depth of water, and a clear channel, will be found to be the best passage. In sailing in, keep mid-channel between Bald and Net Rocks, the former being above water, and the latter drying at one-quarter ebb, when you may steer with safety by attending to the chart, and the situation of Burying Island. At Cape Canso it is high water full and change at 50 minutes after 8 o'clock, and the tides rise from 5 to 8 feet.

DOVER BAY is a wild deep indent, with a number of islands and sunken rocks at its head; yet shelter may be found on the western shore, or during a south-east gale, by giving a berth to the rocks that lie off the south end of Big Dover Island; these are very visible in bad weather; haul up under the Island, and anchor between the small islands on the eastern side; within these islands Little Dover passage continues out south-eastward, having 5, 6, and 7 fathoms water, and quite safe.

Eastward of Little Dover is St. Andrew's Channel, for which no directions can be given, for even those who are well acquainted with the navigation, cannot keep themselves clear of the rocks. This channel leads to Glasgow Harbor, which is, in fact, a part of Canso Harbor.

These places, says Mr. Lockwood, deserve notice, as they may afford shelter in cases of emergency, and in war time are nests for privateers; while from the heights adjacent may be had an extensive view of whatever passes in the offing.

RASPBERRY HARBOR is to the westward of that of Canso, or Port Glasgow: it is small, and the shore is within quite bold. At the entrance, on the eastern side, is an island, having a ledge close to it on the S. E. By rounding this ledge, you may steer directly into the harbor, and come to an anchor under the island which lies in the middle of it, in the depth of 7 fathoms, where you will ride safely. The country here is rocky and barren, and there is a quarry of granite, much in request for millstones. The outlet between Raspberry Island and the main, is a complete dock, where vessels can lash themselves to both shores, and ride in 30 feet water; but half way through it has only 10 feet.

WHITE HAVEN, which is two leagues to the westward of Raspberry Harbor, is a place of hideous aspect. Of its rocky islets, the larger and outer one, called White Head, from the color of its sides, is 70 feet above the level of the sea. This islet appears round and smooth, and is a useful mark, as the passage in, on either side, is in mid-channel, not difficult to navigate, and the anchorage is good throughout, in a muddy bottom. Off the head are two breakers, one S. S. E. and the other E. by S. half a mile off.

TORBAY.—The entrance of this bay is formed on the west by a bold headland, called Berry Head. The channel in is between this head and the islands to the eastward. E. S. E. from the head, and south of George's Island, are three very dangerous rocks, which do not break when the sea is smooth. Within the bay, under the western peninsula, there is excellent anchorage in from 6 to 4 fathoms; muddy bottom, up to the eastern part of the bay, there is also anchorage on the western side of the bay in from 7 to 3 fathoms, similar ground, where a vessel may lie in safety during any gale. The adjacent lands are rocky, but vessels are built here of from 40 to 120 tons, which are employed in the fisheries.

The principal dangers to be avoided in entering, are the small sunken rocks in the offing, which in smooth water do not break; they should be left to the eastward. Within the bay the anchorage is excellent in a muddy bottom, with the exception of a few spots of rocks, sheltered from every wind.

*Torbay to Country Harbor.*—From Torbay, westward, to Country Harbor, the land, in general, continues rocky and sterile, with deep water close in, but regular soundings without, and from 30 to 20 fathoms of water.

Coddle's Harbor, which is  $3\frac{1}{2}$  leagues to the westward of Berry Head, affords shelter to small vessels only; and these enter on the eastern side, to clear the breakers. There is a deep inlet called New Harbor, which lies about 7 miles from the islands, and connected with a chain of extensive lakes, but its navigation is obstructed by a bar across its entrance; and it is open to southerly winds.

NEW HARBOR.—This place is so much exposed, that even small vessels which occasionally resort there in the fishing season, are under the necessity of leaving it the moment a southerly wind arises.

Inland Harbor lies between Harbor Island and the main, and affords excellent anchorage on a bottom of mud; it is particularly convenient for going to sea with almost any wind.

Isaac's Harbor is on the north-east side of Country Harbor, and has good holding ground, with sufficient depth of water for any vessel. Between Isaac Harbor and Harbor Point, the ground is foul and rocky.

**COUNTRY HARBOR.**—The fine harbor, called Country Harbor, is navigable for the largest ships, twelve miles from its entrance. It is, at present, but thinly settled, yet there are reasons for believing that, in consequence of improvements in the neighborhood, the population will speedily increase. The shores are bold; the anchorage soft mud, with a depth of 13 to 5 fathoms. Mr. Lockwood has said that, "no position in the province is more advantageous for settlers than this harbor: at its mouth the islands afford shelter to fishermen and small vessels, as well as the means of erecting their stages; and the fishing grounds, at a short distance in the offing, abound in halibut, haddock, cod, and what they term the bait-fishery; that is, mackerel, gaspereaux, smelts, &c. Salmon are plentiful in their season; and, but for the improvident use of this valuable addition to the means of subsistence, would continue for ages." The ledges off the harbor generally break, and between them are deep passages. On advancing from the eastward, there are two rocks to be avoided, which lie as shown on the Charts; proceeding inward, you should give Green Island a small berth, and the dangers on that side will be avoided. The rocks on the west of the entrance, named Castor and Pollux, are above water and bold to. When above them give Cape Mocodame a good berth, so as to avoid the Bull, a dangerous sunken rock, that breaks in rough weather, and lies about half a mile from the extremity of the cape. The black rocks are partly dry, and from them upwards, there is no danger, and the anchorage is good. Vessels entering this harbor, must use the utmost caution in steering between the ledges and rocks which are scattered about; fortunately they commonly show themselves whenever there happens to be any sea, this will render the entrance less difficult; but having passed the Black Ledge, which is the innermost danger, the navigation will be perfectly safe, for the largest fleet. The tide is scarcely to be perceived, except when in the spring the ice and snow dissolves, and heavy rains are prevalent. At the entrance of Country Harbor, it is high water on full and change at 8 h. 40 m. Tides rise from 6 to 9 feet.

**Fisherman's Harbor.**—In entering this place between Cape Mocodame and the Black Ledge, great care must always be taken, in order to avoid the Bull Rock, which dries at low water, but is covered at high water, and only breaks when the weather is bad.

**HARBOR ISLAND.**—The Islands on the east side of the entrance, Green Island, Goose Island, and Harbor Island, or the William and Augustus Islands of Des Barres, are low and covered with scrubby trees. Within Harbor Island is excellent anchorage.

**BICKERTON HARBOR**, to the west of Fisherman's Harbor, is fit for small vessels only. At two miles to the west of it is Hollin's Harbor, a place of shelter for coasters, and resorted to by the fishermen. Indian Harbor is a shallow and unsafe creek, but has good lands, well clothed with pine, maple, birch, and spruce. The next inlet, called Wine Harbor, has a bar of sand, which is nearly dry. There are a few, and but few, settlers on these harbors.

**ST. MARY'S RIVER.**—The navigation of this river is impeded by a bar of 12 feet water, which extends across at the distance of a mile and three-quarters above Gunning Point, the west point of the entrance. Below the bar, towards the western side, is a middle ground, which appears uncovered in very low tides; and, above the bar nearly in mid-channel, is a small rocky islet. The passage over the bar is on the eastern side of this islet. The tide, which is very rapid, marks out the channel: the latter is devious, between mud-banks, extending from each shore, and dry at low water. The depths upward are from 24 to 18 feet. Sailing in you should proceed for 4 miles N. N. W. then 2 miles N. by W. and afterwards N. N. W. to the Fork, where it divides, the western branch terminating in a brook: the eastern branch continuing navigable a quarter of a mile further up to the rapids. The town of Sherbrook is, at present, a small village at the head of the river, about three leagues from the sea.

**WEDGE ISLE.**—The islet called Wedge Isle, which lies at the distance of half a league south from the S. W. point of St. Mary's River, is remarkable, and serves as an excellent guide to the harbors in the neighborhood. The side of this islet, towards the main land, is abrupt, and its summit is 115 feet above the sea. From its S. W. end ledges stretch outward to the distance of half a mile; and some sunken rocks, extending towards it from the main, obstruct the passage nearly half way over. About  $2\frac{1}{2}$  miles south from the Wedge, is a fishing bank of 30 to 20 feet, the area of which is about 200 acres.

**JEGOGAN HARBOR** may be readily found, on the eastward by Wedge Island, and on the westward by the bold and high land, called Redman's Head. The passage in is easy, at the distance of a quarter of a mile from the Head, and anchorage good, in muddy bottom. Three-quarters of a mile from it is a dry ledge, called the Shag.

**LISCOMB HARBOR.**—The entrance of this harbor, which is one of the best on the coast, is between Liscomb Island and the head-land on the west, called Smith or White

Point. From the S. E. end of Liscomb Island, a ledge, with breakers, extends to the distance of three-quarters of a mile. Within and under the lee of the island is safe anchorage in from 13 to 8 fathoms. On the N. E. of the island, a vessel caught in a S. E. gale may be sheltered by Redman's Head, already described, with the Head S. S. E. in 6 and 7 fathoms, on a bottom of clay.

On the west side, the ground from Smith Point is shoal to the distance of nearly a mile S. S. E. and, at  $2\frac{1}{2}$  miles south from the point, is a rock, on which the ship Black Prince was lost. It constantly breaks, and is partly uncovered. The island-side is bold. The first direction of the harbor is nearly north, then W. N. W. Opposite to the first fish-stage, at half a mile from shore, is as good a berth as can be desired, in 7 fathoms. From this place the harbor is navigable to the distance of four miles: it is, however, to be observed, that there are two sunken rocks on the north side. At Green Bay (Liscomb Harbor) spring tides rise  $7\frac{1}{2}$  feet, neap  $4\frac{1}{2}$ .

**BAY OF ISLANDS.**—The coast between Liscomb and Beaver Harbors, an extent of 6 leagues, is denominated the Bay of Islands. Within this space the islets, rocks, and ledges are innumerable: they form passages in all directions, which have, in general, a good depth of water. At the eastern part of this labyrinth, near Liscomb, is Marie-et-Joseph, an excellent harbor for the largest ships, but requires caution to enter. Nicomquirque is a small settlement in the same range, the inhabitants of which are an industrious set of people. Newton-quaddy, next east of Beaver, is scarcely fit for any but fishing and other small craft, as the channel in is rocky and narrow.

The White Islands, nearly half way between the harbors of Beaver and Liscomb, appear of a light stone-color, with green summits. The latter are about 60 feet above the level of the sea. The isles are bold on the south side; the passage between them safe; and there is good anchorage with them, in from 10 to 7 fathoms. From these the rocks and ledges extend five or six miles from E. to E. N. E. they are bold to, and mostly dry, the water within them being always smooth.

**BEAVER HARBOR.**—The Pumpkin and Beaver Islands are very remarkable to vessels sailing along the coast, particularly Pumpkin Island, which is a lofty and dark barren rock; but they afford a smooth and excellent shelter inside of them during a southerly gale. Southerland Island has, on its N. W. side, a deep and bold inlet, where a vessel may lie concealed and secure as in a dock. When in the offing, the harbor is remarkable on account of the small island which lies north of the Black Rock, having at its southern end a red cliff, being the only one on this part of the coast; having entered the harbor, you may choose your anchorage, according to the direction of the wind, the bottom being generally mud. The basin on the west side is so steep to, that a small vessel may lie afloat, her side touching the beach.

The Harbor is too intricate to be recommended to a stranger.

**SHEET HARBOR.**—This harbor is nearly half-way between Country Harbor and Halifax. It is dangerous for vessels to approach in thick weather. The narrow channel between Sober Island and the main, affords secure anchorage on a bottom of mud.

Without the harbor are several ledges, which show themselves, excepting the outer one, called by the fishermen, Yankee-jack, and which, when the sea is smooth, is very dangerous. It has been asserted, that a rocky shoal lies half a mile to the south of the Yankee, but its position has not been ascertained.

Within the entrance is a rock, two feet under water, which will be avoided by keeping the Sheet Rock open of the island next within it, on the eastern side. In sailing or turning up, the harbor, give the sides a very moderate berth, and you will have from 11 to 5 fathoms, good holding ground.

The flood at the entrance of Sheet Harbor sets S. S. W. about one mile an hour. High water, full and change, at 8 h. 50 m. Tides rise 7 feet.

**MUSHABOON,** to the westward of Sheet Harbor, is a small bay, open to the S. E. which affords shelter at its head only, in from 7 to 5 fathoms, muddy bottom. It is connected to Sheet Harbor by a clear, deep, and bold passage, between an island and the main land, not having a shoal or obstruction in it. Here you may lash your vessel to the trees, and, lying in 5 fathoms, soft bottom, with the side touching the cliff, be perfectly sheltered from all winds. This place is uninhabited, the land being incapable of cultivation. In going through the passage to Sheet Harbor you must guard against a sunken rock at its mouth, which, from the smoothness of the water, seldom shows its position; this rock lies 400 yards off Banbury Islands, and may easily be cleared by keeping the Sheet Rock open of the island.

**SPRY HARBOR** has on each side the entrance, a high, rocky, barren cape, distinguishable at a long distance. When sailing in you will perceive the land in the centre of the harbor, appearing in three distinct hills; keep the valley between the two easternmost on with the Bald Rocks, which will lead you between Mad Moll Reef and Malo-

ney Rock; you may now steer in for the anchorage, at the western head of the harbor, where a fleet may be land-locked in a muddy bottom.

This harbor is open to S. E. and E. S. E. winds. At the entrance, the flood-tide sets in at about one mile an hour. The tide, at the entrance of Spry Harbor, sets in with the velocity of about one mile an hour.

DEANE, or POPE'S HARBOR, on the western side of Gerard's Isles above-mentioned, has a ledge at its entrance, forming an obtuse angle at the two points, three-fourths of a mile from each, and from which a shoal extends to the southward half a mile. It may be passed on either side: but, on the west, care must be taken to avoid a shoal extending from the outer Tangier Island. The best shelter is under the smaller island on the eastern side, where there are from 8 to 6 fathoms, with bottom of blue clay, mud and sand.

TANGIER HARBOR, next to Deane or Popes, is formed by craggy barren islands, which secure vessels from all winds. At about two miles from its mouth is a ledge that dries at low water. The anchorage is under the eastern shore, above Fisher's Nose, in 5 to 4 fathoms, stiff mud. Here are some good tracts of pasture land, and the few inhabitants are occupied in the fishing and coasting trade.

SHOAL BAY is the Saunders Harbor of Des Barres. This bay has a good depth of water and excellent anchorage, on fine white sand and strong mud. The latter is to the northward of the island now called Charles Island, and vessels lie in it, land-locked, in 7 fathoms. Off the mouth of the harbor is a rock, that always breaks; but it is bold to, and may be passed on either side. Some parts of the harbor will admit large ships to lie afloat, along side the shore, over a bottom of black mud. Supplies of stock, &c. may be obtained from the inhabitants of this place.

SHIP HARBOR is easy and safe to enter, having good anchorage in every part, the bottom being a tough clay of bluish color; it leads to Charles's River, above the narrows of which a fleet of the largest ships may lie alongside of each other, without the smallest motion. In this harbor, and on the isles about it, are near twenty families, who keep small stocks of cattle, &c. The entrance, called by Des Barres Knowles' Harbor, is deep and bold: it lies between two islands, of which the eastern is Brier's Island, on the western part of which is a lighthouse. A white cliff, which may be seen for a considerable distance in the offing, is a good mark for the harbor: at first it resembles a ship under sail, but on approaching seems more like a schooner's top-sail. Brier's Island, before mentioned, is a low rugged island, and ledges partly dry, extend from it three-fourths of a mile to the eastward: avoiding these when entering this way, you may range along the western island, and come to an anchor under its north point, in 6 or 7 fathoms, the bottom of mud. Ship Harbor, proper, commences about 7 miles to the N. W. of Brier's Island, at a beach in the western shore, which has 6 fathoms close to its side; its entrance is one third of a mile broad, widening as you ascend it: above Green Island are some shoals and ledges, but the anchorages below them are capacious and good. Spars, stock, water, and firewood may be obtained here.

OWL'S HEAD, or KEPPEL HARBOR, which is next to the west of the harbor last described, although smaller than many other harbors on the coast, has sufficient space for a fleet. It may be known, at a distance, by Owl's Head, on the western side, which appears round, abrupt and very remarkable. The neighboring coast and isles are rugged and barren, but the harbor has a few settlers. The entrance is of sufficient breadth to allow a large ship to turn in it; and, within the harbor, shipping lie land-locked, when in 6 and 7 fathoms, with a bottom of mud. In taking a berth, you will be guided by the direction of the wind; as, with a S. W. gale the western anchorage is to be preferred, and the eastern with a S. E. The tide sets into this harbor from the S. W. at the rate of one mile an hour.

LITTLE HARBOR is somewhat to the westward of Owl's Head Harbor, and is a place of safety for small vessels; but its entrance is intricate, and requires a good knowledge of the passages leading to it, in order to enable a vessel to enter.

JEDORE HARBOR.—In the offing at the distance of two leagues off the land, the body of the flood sets in S. W. by S. at the rate of half a mile an hour. From the appearance of this harbor on the Charts, it might be presumed that it is spacious and commodious; but on examination, it will be found to be really different. The entrance is unsafe and intricate; a shoal of only 11 feet lies at its mouth; the channel within is narrow and winding, and there are extensive mud flats, covered at high water, and uncovered with the ebb: hence a stranger can enter with safety only at low water, the channel being then clearly in sight, and the water sufficient for large ships. The best anchorage is abreast of the sand-beach, two miles within the entrance, in from 9 to 6 fathoms, on a bottom of stiff mud. Two and a half miles above the beach the harbor divides; one branch to the larboard, is navigable nearly to its extremity, and has several sunken rocks on it; while to the starboard is a large space with a clear bottom, and from 3 to 5 fathoms.

have, exc

On the eastern shore are Oyster Pond and Navy Pool, two deep inlets, but choaked at their entrance by a bed of rocks; the river terminates with a rapid.

The lands at the head of the harbor are stony, but tolerably good; the rest barren and deplorable.

Without the entrance, on the eastern side, are two isles, called Roger and Barren Islands, between and within which the passages are good, and afford shelter in case of necessity; from these the land runs nearly E. N. E. and forms a deep inlet, called Clam or Clamb Bay.

**THE BRIG ROCK.**—This is a very dangerous rock of 3 feet, about the size of a frigate's long boat; it lies S. E.  $\frac{1}{2}$  E. from Jedore Head, and S. W. two miles from the isle called Long Island. The weed on the top of it may frequently be seen at the surface. The marks for this rock are a house and barn in Clam Bay, just open of the east end of Long Island, bearing N. 5° E. and the house on Jedore Head open to the N. E. of Jedore Rock.

An account is given of a rocky shoal over which a vessel passed in 8 fathoms water, and upon which were taken the following bearings: Jedore Head N. N. W.  $\frac{1}{2}$  W.; west end of Long Island N. E. by N.; and Jedore Outer Ledge or Brig Rock, E. by S. This shoal may have less water upon it in other parts, but as these bearings do not agree with the chart, we apprehend there must be some error in its exact position. Mention is also made of a rock, bearing from Jedore Head S. 38° E. distant 6 miles; this has only 5 feet over it, and 22 fathoms close within and without it. This is supposed to be the Brig Rock, but if so, the bearings are not correct. These two notices are inserted to show that some dangers exist hereabout, and will be sufficient to warn the mariner to search for and cautiously avoid them.

It is high water at Jedore Head full and change at 20 minutes after 8 o'clock, and the tide rises from 6 to 9 feet. At Owl's Head, it is high water at 30 minutes after 8 o'clock, and the tide rises from 5 to 7 feet.

**POLLUCK SHOAL.**—At about nine miles south from Jedore Head is a reef, called the Polluck Shoal; its area is about one acre, having a depth of 24 feet over it; and, during a swell, the sea breaks on it with great violence.

**JEDORE LEDGES.**—Those advancing between the Brig Rock and Polluck Shoal, should be cautious in approaching any of the Jedore Ledges: they are laid down on the Charts, and said to extend from five to nine miles from the mouth of the harbor.

Between Jedore and Halifax, there are no harbors of any consideration for shipping, but there are numerous settlements. The land in this extent is, in general, of moderate height, rising gradually from the shore. Red and precipitous cliffs, the characteristic of the eastern coast, may be seen from seven to nine miles off. The best harbor is that called Three Fathoms Harbor. When you are within this harbor the passage will be found to be clear between banks of soft mud. But it is only fit for schooners and sloops, although it has occasionally been visited by large vessels. The anchorage is tough blue clay. The cliffs are composed of bright red earth, remarkable for vessels coming from the eastward. This harbor lies immediately to the east of an islet called Shut-in Island; and, with the wind on shore, is difficult and dangerous; so that it is to be attempted only in cases of real distress. The channel lies two-thirds over to the northward from Shut-in Island, and turns short round the starboard point to the westward.

In beating to windward, ships may stand to within a mile and a half of the shore, the soundings being tolerably regular, from 20 to 12 and 8 fathoms. Captain Aldridge says, "we made the land to the windward of Jedore Ledges, which bore E. S. E. and saw an island, appearing white along the bottom; between this and another island lay Jedore, a large rock, to the eastward; the island was quite white round the bottom, and had a thick green wood at top; to the westward of the westernmost of these islands, is Owl's Head; a large high bluff land, the western part of it is a darkish white, with a patch of red. A little to the eastward of this red patch are two houses, situated in Clamb Bay, to the west of which is a sandy beach. In coming from the bank we had 45 fathoms, stones, then 37, 39 and 40 fathoms, mud and small pebbles."

#### HALIFAX TO CAPE SABLE.

**GENERAL REMARKS.**—Vessels coming from the eastward, and bound for the harbor of Halifax, should pay particular attention to their soundings, especially when they consider themselves in the neighborhood of Sable Island; which island and its surrounding banks we shall hereafter describe; it will therefore only be necessary at present to remark, that the island is low, and appears like small sand hillocks; that, in summer, it frequently is enveloped in a fog, but you may always discover your proximity to it, by your soundings; and that on its N. E. and N. W. sides are dangerous bars; you will have, except on these sides, 2 fathoms, 2 cables' length off, and your depth will increase

in proportion to the distance you are from it, at a general rate of about 2 fathoms for every mile, until you are more than 20 miles from it. Signals are placed on the island, and also a gun to answer such as may be heard from vessels in distress, or in thick weather, which have already saved from shipwreck a number of vessels.

In making land more to the south-westward, and about Cape Sable, you must be particularly careful to avoid Seal Island Rocks and the Brazil Rock. To the westward of Great Seal Island the soundings are very irregular for upwards of 20 miles, at which distance are 45 fathoms, gravel and stones. Indeed the soundings along Nova Scotia from Cape Canso to Cape Sable, partake of the same irregularity, from 25 to 50 fathoms, therefore you should not come nearer the land than 35 fathoms, unless you are well assured of the exact part you are in, for otherwise, endeavoring to enter Halifax, you may be driven into Mahone or Mecklenburgh Bays, and be caught by S. E. winds. The weather is generally foggy 4 or 6 leagues off shore, both in spring and summer; but it becomes clearer as you get nearer the coast, and with the wind off the land it will be perfectly clear.

From one to three leagues out to the seaward, mackerel, halibut, rays, haddock, and cod are found in plenty; and at the entrance to the harbors and rivers, salmon is taken from April to August; the bays abound with herrings in June and July, and with tom-cod all the year round.

Mariners may always know their approach to, and arrival into, soundings by the increasing coldness of the water.

**HALIFAX**, the capital of Nova Scotia, is large enough to accommodate any quantity of shipping in perfect safety. Its direction lies nearly N. and S. being about 16 miles in length, and terminates in Bedford Basin, which is an extensive sheet of water, containing 10 square miles of safe anchorage. The town is situated on the declivity of a peninsula at the western side of the harbor, about 10 miles from its entrance.

**HALIFAX HARBOR.**—In approaching the harbor of Halifax, you will perceive the coast about its environs, particularly to the southward, to be ragged and rocky, with patches of withered wood scattered about, but the land is rather low in general, and not visible 20 miles off, except from the quarter deck of a 74; the high mountains of Le Have and Aspotogon excepted, which may be seen 9 leagues off. When Aspotogon Hills, which have a long level appearance, bear north, and you are 6 leagues distant, an E. N. E. course will carry you to Sambro lighthouse; this stands on Sambro Island, and is rendered remarkable by being a high tower, elevated above the sea 210 feet; there are two 24 pounders placed on the island, under the direction of a small party of artillery men; these are fired on the approach of vessels, and contribute much to the mariner's safety by warning him off the adjacent breakers. Sambro Island and lighthouse lies on the S. W. side of the entrance to the harbor. In standing in for the land you may know on which side of the harbour you are by a remarkable difference that takes place immediately from its mouth in the color of the shores; which, if red, denotes you are to the eastward, and if white, to the westward of it. S. by E. distant 2 full miles from the lighthouse lies the Henery Rock, with only 8 feet water over it; and E. N. E. distant one mile from the Henery, lies the Lockwood, of 12 feet: these appear to be but little known, although they are both so very dangerous.

**THE LEDGES.**—About two miles to the westward are the Western Ledges; these are the Bull, the Horses, and the S. W. or Outer Rock; the Bull is the westernmost and nearest to the land; this is a rock above water, lying about two thirds of a mile S. E. by E. from Pendant Point, the lighthouse bearing from it E. 7° S. The Horses are about a mile to the south-eastward of the Bull, the lighthouse bearing E. by N. distant one mile and three-quarters; and the S. W. Rock or Ledge lies with the lighthouse bearing E. by N. distant one mile and a half; to avoid these, constant caution will be requisite, though they are surrounded by deep water; the channel between the Bull and the main having 10 fathoms water, and the passage clear; between the Horses and the Bull are 16 fathoms, and no intermediate danger; and between the Horses and the S. W. Rock there are 20 fathoms.

The Eastern Ledges are the Sisters or Black Rocks; these lie nearly E. by S. from the lighthouse, distant two-thirds of a mile. There is also the Bell Rock, lying further in, and about a quarter of a mile from the land, the extremity of Chebucto Head bearing N. by E.  $\frac{1}{2}$  E. distant three-quarters of a mile. In advancing up the harbor you will meet with several other rocks, as the Rock Head, which lies with Chebucto Head S. W. by W. distant 2 $\frac{1}{2}$  miles, and the Devil's Island, N. E.  $\frac{1}{4}$  E. about the same distance; the Thrum Cap, which extends from the south end of Mac Nab's or Cornwallis's Island;

\* On Seal Island a Lighthouse is erected, showing a fixed light. From Cape Sable it bears W. N. W.  $\frac{1}{4}$  W. distant 16 miles.

the Lichfield, on the western side of the harbor, having only 16 feet water over it; and the Mars Rock, lying also on the western side, Point Sandwich bearing north distant half a mile, and nearly in a line with it and the west side of George's Island; all these are distinguished by buoys and flags being placed upon them. There is also a reef, called the Horse Shoe, which runs out from Manger's Beach on the west side of Mac Nab's Island; this is dangerous and must carefully be avoided. On Manger's Beach is a Tower, called Sherbrook Tower, on which is a lighthouse, elevated 58 feet above the level of the sea, erected for the purpose of guiding vessels up the harbor.

When abreast of Chebucto Head, or when Sambro Light bears W. S. W. the light on Manger's Beach should never be brought to the westward of north. By keeping the light from North to N. by E. will lead clear of the Thrum Cap Shoal. This lighthouse bears from the Thrum Cap buoy N.  $\frac{1}{2}$  W. two miles and a half.

#### *Directions for Sherbrook Tower Lighthouse.*

Vessels coming from the eastward, must keep Sambro Light open to the southward of Chebucto Head, until the light opens on Manger's Beach, which will then bear N.  $\frac{1}{2}$  W. when they will be to the westward of Thrum Cap Shoals, and may shape a course up the harbor, always keeping the light on the beach open, and on the starboard bow.

Vessels coming from the westward will see the light when they are as far to the eastward as Chebucto Head; by keeping it open and on the starboard bow, it will lead them up to the beach.

The light on Sherbrook Tower appears of a red color, which distinguishes it from any other on the coast.

High water, Halifax Dock-Yard, 8 o'clock; spring-tides rise from  $6\frac{1}{2}$  to 9 feet. High water at Sambro Isle 8h. 15m; spring-tides rise from 5 to 7 feet.

Half way between Manger's Beach and George's Island, is a shoal, on the opposite side, extending to the S. E. from Point Pleasant nearly one third of the channel over, and having a buoy at its extremity; the thwart mark for this buoy is a little islet at the entrance of the N. W. arm, on with a remarkable stone upon the hill, appearing like a coach-box, and bearing W. S. W. Between Point Pleasant Shoal and Manger's Beach, is a middle ground of  $4\frac{1}{2}$  and 5 fathoms, sometimes pointed out by a buoy; this middle ground extends north and south a cable's length, and is about 30 fathoms broad; as you fall off to the eastward of it there will be found from 7 to 13 fathoms water, muddy bottom; while on the west side there are from 10 to 14 fathoms, coarse rocky soundings.

REID'S ROCK has 12 feet water over it, and lies in shore, about mid-way between Point Pleasant and Halifax; the thwart mark for this danger is a farm house in the wood, over a black rock on the shore, bearing W. by S. and opposite to Reid's Rock is a buoy on a spit extending from the N. W. end of Mac Nab's Island.

MAC NAB'S ISLAND lies on the eastern side of the channel, and is nearly three miles in length and one in breadth; there is a small island to the eastward of it, called Carroll's Island; boats can pass this way or between it and the Devil's Island shore, in what is commonly called the S. E. Passage, but the channel is too shallow for shipping, and it is further obstructed by a bar of sand to the southward, over which is only 8 feet water. Mac Nab's Cove has good anchorage in from 9 to 4 fathoms, muddy ground; the best situation is in 7 fathoms, with Manger's Beach and Sandwich Point locked; George's Tower touching Ives's Point

Dartmouth is a settlement on the eastern side of the harbor, opposite Halifax.

*To Sail for Halifax Harbor.*—Having made the lighthouse, and coming from the westward at night, with a westerly wind, the light being 7 or 8 miles off, steer E. N. E. or E. by N. until you have passed the S. W. Ledges, and the lighthouse bears north; then run on N. E. or N. E. by N. until you bring it to bear N. W. which being done, take a N. N. E. or N. E. by N. course, until you bring it W. N. W. you will then, agreeably to the wind, haul up N. or N. by E. for Chebucto Head, avoiding the Bell Rock. Chebucto Head is bold to within half a mile from the shore; run on north, along the west shore for Sandwich Point, which also is bold: thus you will safely pass the Lichfield Rock, leaving it on your larboard side; this rock has a buoy placed on its eastern end, a mile northward of which is the Mars Rock, whose situation is pointed out by another buoy, which must also be left to the larboard. When abreast of Sandwich Point get as near Middle Channel as you can, for on the opposite side is the Horse Shoe, a dangerous shelf, which stretches out from Manger's Beach; steer on Mid-Channel between Manger's Beach and the Horse Shoe, and having passed the latter, edge over towards Mac Nab's Island. Midway between the Island and Point Pleasant Shoals, on the extremity of which is a buoy, and rather more than  $\frac{1}{2}$  a mile further, on the same side, is Reid's Rock, whose position is also denoted by another buoy: these are all to be left on the larboard side. On the starboard, or opposite side, is a red buoy placed upo

Spit, which runs off Mac Nab's Island; you will sail on between these two latter buoys, and having passed the Reef, steer directly north for George's Island, which you may pass on either side and run up for, and abreast of, the town of Halifax, where you will find anchorage in 9 and 10 fathoms, muddy ground; two cables' length east of the mooring buoys, or near enough to the wharves to throw your hawser on shore. There is a middle ground between Manger's Beach and Point Pleasant Shoal, which sometimes has a buoy upon it, but no less than 5 fathoms has yet been found upon it.

"The great difficulty of making Halifax from the eastward, particularly in the winter season, is that the winds are generally from the W. S. W. to N. W. and blow so hard as to reduce a ship to very low canvass, if not to bare poles; but should the wind come to the eastward, it is invariably attended with such thick weather, as to prevent an observation, or seeing any great distance; and consequently renders it imprudent to run on a lee shore under such circumstances, and more particularly in the winter time, when the easterly winds are attended with sleet and snow, which lodge about the masts, sails, rigging, and every part of the ship, becoming a solid body of ice so soon as the wind shifts round to the N. W. which it does suddenly from the eastward. What adds considerably to the above difficulty is, having been several days without an observation, and subject to a current, which sometimes runs strong to the southward; you may have the Bay of Fundy open, and be swept into it by the strong indraught which prevails when the wind has been any time from the southward or eastward.

"From the above circumstances, I would recommend that ships bound to Halifax in the winter, should shape a southerly course, and run down their longitude in latitude from  $38^{\circ}$  to  $36^{\circ}$ , in which parallel they will make the principal part of their passage in a temperate climate, until they approach the coast of America, when they will be met by the westerly or even north-west winds, which will enable them (having got soundings, on St. George's Bank,) to make their course good along shore, and with a free wind and clear weather, cross the Bay of Fundy, with confidence of their situation; then, so soon as they have shut in the Bay, keep the shore on board the whole way to Halifax Light-house."

Observe in coming from the eastward with an easterly wind, the Thrum Cap shoals must be particularly avoided; a red buoy, as before noticed, now marks their extremity, and to go clear of them you should bring the easternmost land in sight, a ship's length to the southward of Devil's Island, bearing E. N. E. nearly, and steer in W. or W. by S; as best suits the distance you are from the island, and according to the wind and situation; with respect to the shoals, you may pursue a West, N. W. or W. N. W. course, until George's Island comes a sail's breadth open to the westward of Mac Nab's Island; then stand up for Sandwich Point, or the fort, until St. Paul's Steeple in Halifax is open of Brenton House; keep this mark on, and you will go in the fair way, clearing Point Pleasant Shoals and Manger's Beach; then steer on as before directed.

The long mark for Halifax Harbor from abreast of Chebucto Head, and steering in north or N.  $\frac{1}{4}$  W. is the middle of three hills, over Dartmouth village, having some trees upon it, in a line with the N. W. end of George's Island; this will lead clear of the dangers on both sides, and over the Middle Ground, in from 5 to 8 fathoms and up to George's Island.

The marks for the Lichfield Rock are the Channel between the Devil's Island and the Main open, bearing E. N. E. and George's Island open to the eastward of Sandwich Point; over this rock are only 16 feet.

The marks for the buoy at the extremity of Point Pleasant Spit, is a small island at the entrance of the N. W. arm, on with the stone on the hill, bearing W. S. W. The marks which clear Point Pleasant shoals will also clear the Reid Rock; its thwart mark is a farm-house in the wood, over a black rock on the shore, bearing west by south.

In approaching from the westward, round the lighthouse, at the distance of a short league. To avoid the sunken rocks which lie to the southward, when the light bears N. W. by N. haul in N. by W. The flag-staves on Citadel Hill above the town are distinguishable at a considerable distance; by keeping them open of Sandwich Point, you are led clear of the Bell, Lichfield, and Mar's Rocks, on the west side; and the Rock Head and Thrum Cap to the east. When arrived at Sandwich Point, keep Chebucto Head in sight, by not allowing it to be shut in; this plain mark will lead in the fair way home to George's Island; leaving Point Pleasant shoals on the left, and Mac Nab's shoals on the right, round George's Island on either side, and anchor any where in 6, 10, or 13 fathoms, muddy ground; from George's Island to the entrance of Sackville River there is not a single obstruction. Men of war commonly anchor off the naval yard, which a stranger will distinguish by the masting sheers; merchant vessels discharge their cargoes, and load alongside the wharves.

Catch Harbor, fit only for small vessels, lies to the westward of Chebucto Head; it has a bar across with breakers, and only 9 feet water; within it are 3 and  $3\frac{1}{2}$  fathoms; there

Head; it has thoms; there

is a fine run of fresh water at the head of the harbor. Herring Cove is about 100 fathoms wide at the entrance, and bold on both sides, with 7, 5, and 4 fathoms up to the elbow that forms the Inner Cove, within which small vessels lie perfectly sheltered in 7 and 9 feet, soft mud, the sides being one entire body of rock.

REMARKS.—Leaving Halifax, and sailing Westward, you will find the shores to be steep, and appear from seaward broken and rocky, with whitish cliffs; the high lands of Aspotogon and Le Have, before mentioned, are conspicuous and remarkable; to the westward the rocks about the land appear black, with reddish banks of earth. Le Have appears bald or barren at the top, with red earthy hillocks under it, and between Cape Le Have and Port Medway or Jackson, are some hummocks inland, the coast to the seaward being level and low, and the shores marked with white rocks, with low barren points; from thence to Shelburne and Roseway it is woody. Near Port Latour are several barren places, and thence to Cape Sable the land is low, with white sandy cliffs, particularly visible at sea.

SAMBRO HARBOR is a mile and three-quarters N. N. W. from the lighthouse; off its entrance is the Bull Rock; there are also two other rocks between; the best channel into the harbor is between Pennant Point and the Bull, but vessels from the eastward may run up between Sambro Island and the Inner Rock; you are to leave the Isle of Man to the larboard in entering; the anchorage is within the island, on a muddy bottom, with 3 fathoms water.

The strait which connects the harbor with Londy Basin is exceeding narrow, and has only 2 fathoms water. This place is generally the resort of coasters in bad weather.

The passage between the rocks and ledges that lie to the southward of Sambro Harbor, may oftentimes conduce to the safety of vessels, that make the land by mistake so far to the westward of the light as to be unable to clear the dangers southward of it, but should be attempted only in cases of emergency; the depth of water is sufficient for the largest ships, but great prudence is required.

TENNANT HARBOR is situated round the point to the westward of Port Sambro, has a fair channel leading in between Tennant Great Head and Island, with good, and secure anchorage, particularly above the islands, in 6 or 8 fathoms; it is extensive and safe in bad weather, and the dangers are all visible.

TENNANT'S BAY is well sheltered above Macworth Point, and there is anchorage in 9 fathoms on a bottom of tough blue clay; the passage in lies between the rocks of Point Macworth and the white rocks. There is also a safe passage between Cape Tennant and Hervey Island, with anchorage in from 5 to 8 fathoms. When entering, the land presents to the eye of a stranger, the rudest features of nature, but it is extensive and safe, and in bad weather the dangers all show themselves. The tides rise 8 feet, and it is high water at three-quarters after 7.

PROSPECT HARBOR lies about 3 miles to the N. W. of Cape Prospect, which forms the west side of Bristol Bay; and its entrance is encumbered with a cluster of islands which form the western side of Bristol Bay; at the back of these islands is a considerable inlet, called by Des Barres, Parker's River, but little frequented. Prospect Harbor, wears, at its entrance, a rugged broken appearance, but it is safe, commodious, and extensive; and in rough weather the dangers mostly show themselves. Vessels coming from the eastward and rounding Cape Prospect, must beware of a rock with 17 feet over it; it lies south about one-third of a mile from the Cape; go not between it and the Cape, but proceed on its southern side in 20 and 21 fathoms water, and by keeping more than half a mile from the land you will steer quite clear of danger, and may sail boldly up its eastern channel between Prospect and Betsey's Islands; having passed these the channel narrows; the western passage is between Hobson's Nose and Dorman's Rock; there is good anchorage for large ships above Pyramid Island, and also for small vessels, within Betsey's Island, in  $4\frac{1}{2}$  fathoms, blue stiff clay. At the entrance to this harbor, depths are very irregular, and there is a rock, over which the seabreaks, having 3 fathoms water over it, and lying 2 cables' lengths to the eastward of Dorman's Rock. There are some residents on the western side of the bay.

LEITH HARBOR.—This lies about  $2\frac{1}{2}$  miles to the north-westward of Prospect Harbor, and here are situated the inlets called Shag and Blind Bays, both possessing excellent anchorages. At its entrance lies the Hog, a sunken rock, having 6 feet water over it, and bearing E. S. E. about one mile and a half from Taylor's Island. In fair weather the Hog Rock may readily be perceived by a constant ripple over it, and in bad weather, with an on-shore wind, it will be distinguished by the breakers; there are good channels on both its sides, but the eastern one is always to be preferred on account of the ledge which extends E. S. E. about half a mile towards it from Taylor's Island.

DOVER PORT lies at the western side of the entrance to Blind Bay, and is chiefly formed by Taylor's and the adjacent islands; this is the Port Durham of former charts, and affords safe and good anchorage; the eastern passage is the best, and in sailing in you

must give the reef that stretches off the east end of Taylor's Island a sufficient berth, anchoring within the body of the largest island in 7, 8, 9, or 10 fathoms, muddy bottom. The western entrance has some sunken rocks in it, and the water is in some places but shallow.

Between the harbors of Halifax and Dover the shores are craggy, broken, and barren, steep to, iron-bound, and destitute of trees; but the creeks and inlets abound with fish, and great quantities of cod, herrings, and mackerel, are caught and cured here for the markets.

**MARGARET'S BAY.**—The entrance to this bay is to the westward of Taylor's Island about one league; the bay itself is full 25 miles in circumference, in length nine miles, and in breadth, from Peggy's Point to Owl's Head, about two miles; here are harbors capable of receiving ships of war, even against the sides of the shore, and sufficiently wide to turn in. In choosing a berth, it is usual to be guided by the direction of the wind, taking the western anchorage, in S. W. gales, and the eastern one in S. E. where you lie land-locked, the bottom mud.

**OWL'S HEAD** is very remarkable, being round and abrupt; the lands and islands in the neighborhood are rugged and barren. The body of flood tide sets in from S. W. at the rate of one mile per hour.

Following the coast, which runs nearly 2 miles W. N. W. from Taylor's Island to East Point, there is a rock uncovered at low water, which lies near the land, having a passage between, with 4 and 5 fathoms water: the shore all the way is rugged and steep, against which the sea beats violently. N. N. W. from East Point one mile, is Contact Point, and in the same direction 1½ mile further, is Peggy's Point, beyond which a short mile is Shut-in-Island, 200 feet high and covered with trees; off the southern point of this island there is a shoal of 9 feet, with 6 and 7 fathoms between it and the island, and near to Peggy's Point there is another of 15 feet, with 6 fathoms to the northward of it; during southerly gales the water on the lee side of the islands becomes smooth, and the bottom holds well. Indian Harbor runs in here, and forms a place fit for small vessels, but affords no shelter, being entirely open to the sea. To the E. N. Eastward of Indian Harbor is Haggert's Cove, distant one mile, a cove or harbor of similar description. Luke's Island, Thrane Cnp, Jolliman and Wedge Islands, all lie off the eastern side of Margaret's Bay, and contribute to break off the force of the sea, so that under the lee of Luke's and Jolliman's Islands, there is good anchorage at all times for ships of every description.

**FRENCH COVE** is easy of access, and may be considered as a natural dock, extensive, with plenty of water, and well sheltered; there is a shoal of 10 feet water lies opposite to the entrance of this cove at the distance of two miles, but as the islands of the eastern shore are bold to, no vessel need go so far out into the bay as to approach too near this danger.

**HEAD HARBOR, or DELAWARE RIVER**, lies at the further end, on the N. Eastern extremity of the Bay, and is an anchorage of most excellent description, forming so complete a place of safety that a fleet of ships might be securely moored side by side, and remain undisturbed by the most violent hurricane: the surrounding lands are high and broken; Mason's Point is in itself a good farm, well stocked with cattle, and excellently cultivated; and Moser's Islands at its entrance are used as sheep folds: the land on the larboard side of the entrance to the Head Harbor is 446 feet high.

**INGRAM RIVER.**—To the westward of Head Harbor is Ingram River, running in to the northward of Moser's Islands; at its entrance it is one-third of a mile wide, with 7, 6, and 5 fathoms water, it then gradually decreases to its head, which is shallow and sandy. To the westward is Gaspar's Indent, open, shallow, and seldom frequented. These indents or coves have rugged points projecting southward, and it is from these places small craft are employed to take limestone, building sand, &c. the former of these being of a very superior quality. Cooper and Indian Rivers are both shallow rocky nooks, but are the resorts of salmon, and in the lakes above, trout abound in great quantities, of delicate flavor, and commonly of a deeper red than the salmon.

**HUBERT'S COVE**, is situated at the N. W. corner of Margaret's Bay; here at the entrance, is a ridge of rocks about 100 fathoms long, and covered at high water, so that when the sea is smooth it becomes invisible; in order to avoid this danger you have only to keep towards the western or eastern side of the harbor, for both sides are bold to; the western channel is much the wider and better of the two, and by keeping the larboard shore on board, a stranger, or a ship dismantled, or in distress, or without anchors, may turn in and find shelter, running aground with perfect safety.

*Long Cove* is 2½ miles to the south of Hubbert's Cove, and affords good anchorage with a westerly wind. To the southward of Long Cove the coast is bold and rugged, without any danger, except a small rock of six feet water which lies close into the land.

**NORTH WEST HARBOR** is about one league to the southward of Long Cove; at its entrance is Horse Island, which divides it into two channels; there is a good passage

with 10 fathoms water on each side of the island, and small vessels may find anchorage behind it in from 6 to 9 fathoms, or further up in 5, 4 or 3 fathoms. Owl's Head is an abrupt precipice, and forms the south point of entrance to North West Bay.

*South West, or Holderness Island*, is a remarkably rocky island, full 50 feet high, and steep on all sides: directly to the northward of the northern part of the South West Isle is a small spot of 3 fathoms water, and to the N. Westward of the island is what is commonly called the South West Harbor, formed between Owl's Head, which literally is a rocky island, separated from the main by a very narrow passage, not even navigable for boats; here are 5, 6 and 7 fathoms water, but the place is seldom frequented. To the E. N. E. of South West Island, distant nearly half a mile, is a rocky shoal of 4 fathoms; this the sea frequently breaks over, in bad weather, but it cannot be considered dangerous unless to vessels that draw very deep water.

*The Horse Shoe, or Dog Rock*, lies about south, distant one mile and a half from South West Island; directly west from East Point, distant 2 miles and three quarters, and from Taylor's Island W. by N. 4 miles and one third; there are several small sunken rocks about it; part of it is consequently above the surface of the water shelving on all sides, and the sea in stormy weather breaks violently over it; at a little distance from it, on the western side, is 6 fathoms, and on its eastern side at a similar distance, is 8 fathoms, it then sinks into deep water; between the Horse Shoe and the South West Island there are 12, 14, 26, 34, and 39 fathoms water. Vessels from the eastward, bound for Margaret's Bay, commonly go in between the Horse Shoe and East Point; a northerly course will carry you midway between them, right up to the head of the bay, without encountering any danger, except those already described.

To the Westward of South West Island is Aspotogon Harbor, too shallow for shipping; at its entrance are Black, Saddle, and Gravelly Islands and Shoals; to the southward of these is Seal Ledge, shallow and dangerous; it lies west  $\frac{1}{2}$  north, distant  $2\frac{1}{2}$  miles from the Horse Shoe, and W. S. W. nearly 3 miles from the southern part of South West Island.

**IRONBOUND ISLAND.** W. S. W.  $\frac{1}{2}$  S. from the south point of South West Island, distant 5 miles, is Ironbound Island, about one mile long, narrow, and steep to; it lies S. S. E.  $\frac{1}{2}$  S. one mile and a half from the extremity of the peninsula which divides Margaret's and Mahone Bays, and is called New Harbor Point; between which is a good channel, with from 6 to 17 fathoms water, the ground being chiefly a black sand.

**GREEN ISLAND.** S.  $\frac{1}{2}$  E. distant one league from Ironbound Island, S. W. by S. 7 miles from South West Island, W. S. W. 3 leagues from Taylor's Island, and W. N. W.  $\frac{3}{4}$  W. from abreast of Sambro Lighthouse, lies Green Island; it is small. Midway between Ironbound and Green Island there is said to be a shoal of only 2 fathoms, but its exact position is not accurately known, and therefore it is omitted in the charts; the mariner, in passing through the channel between these islands, will do well to look out for and guard against, the probable existence of such a danger; there is otherwise water sufficiently deep for any vessel.

**MAHONE BAY** is separated from Margaret's Bay by the peninsula, upon which the high and conspicuous Mountain of Aspotogon is situated, whose appearance, in three regular risings, is a very remarkable object to seaward, being visible more than 20 miles off; its entrance is encumbered with several islands, between all which are good passages with plenty of water, and few dangers; these lead to most excellent harbors, and places convenient and well adapted for the fisheries. We have already noticed Green and Ironbound Islands; these lie on the eastern side of the entrance to the Bay of Mahone; adjacent to these, and on the same side, are the Tancook Islands, Flat Island, and the Knahme Rock; there are also the Bull Rock, and the Outer Ledge. On the western side are the Duck and other islands.

Great Duck Island lies W. by S. from Green Island distant  $4\frac{1}{2}$  miles. Little Duck Island lies N. W.  $\frac{1}{2}$  N. about one mile and two thirds from Great Duck Island, and W.  $\frac{1}{4}$  N. 5 miles and one third from Green Island: nearly midway between Green Island and Little Duck Island, lies the outer Ledge, over which the sea always breaks; this danger bears from the east end of the Great Duck Island N. E.  $\frac{3}{4}$  N. distant one mile and two thirds; and from Green Island W.  $\frac{1}{2}$  N. one league; over it is 4 feet water, and round it are  $4\frac{1}{2}$ , 5, and 7 fathoms.

Flat Island lies due west from Ironbound Island, distant one mile and a quarter; and in a similar direction from Flat Island, somewhere about one mile off, lies the Bull Rocks, but the exact situation of this danger is not correctly ascertained, for Mr. Des Barres places it more to the southward, and Mr. Lockwood to the northward of this position; it is a blind rock, uncovered at one-third ebb, with deep water all round it. The southern part of Flat Island, in a line with the southern points of Ironbound Island, will lead on the rock, as Mr. Des Barres has placed it, while the northern part of Flat Island, in a line with the northern shore of Ironbound Island, will lead to the northward of it; and

Chester Church open of Great Tancook Island, will carry you clear to the westward of it in 7 and 10 fathoms water.

Great Tancook is one mile and three-quarters long, and about a mile broad; to the eastward, between it and the main land, is the Little Tancook Island, separated by a channel a quarter of a mile broad, in which are 7, 8, and 9 fathoms; a similar passage is between Little Tancook and Indian Point on the main, but there is a middle ground in it of 4 fathoms; Knolme Rock is above water, and shoals all round, it lies to the eastward of the south-east part of Great Tancook, and at this part of the island is anchorage in 8 or 10 fathoms water.

Westward of Great Tancook one third of a mile, is a rocky shoal of 6 feet, while between them the channel has 10 fathoms water: to the W. by N. of this shoal one mile, is another, with from 6 to 12 feet over it; between these shoals the passage is good, and has from 12 to 25 fathoms water in it. Off the north-west part of Great Tancook is Star Island, and a little to the eastward of it is a rocky patch of shallow ground, so that vessels should never attempt the passage between Star and Tancook Islands. There is yet another danger, called the Coachman's Ledge; it lies 2 miles to the northward of Great Tancook, and is only visible at low water; to lead clear to the eastward of this ledge, you should bring the eastern point of Great Tancook and the east side of Flat Island in one; to clear it to the southward, bring the west end of Ironbound Island open of the west part of Little Tancook: and Frederick's Island north point bearing W. S. W.  $\frac{1}{2}$  S. will carry you safe to the northward of it.

Having passed the Coachman, the head of the bay lies open; on your starboard side is the high land and small River of Aspotogon, where small vessels occasionally run in and anchor; there is a rocky shoal at its entrance, which must be avoided. To the northward is Cumberland Arm, easy of access, and affording good anchorage, with 7 and 8 fathoms, observing to give a berth to the starboard shore, which shallows some distance out. There is also good riding on the larboard shore, behind an island which lies on the eastern side of the Chester Peninsula; here vessels can ride, well sheltered, in 8 fathoms water.

Chester Town is situated at the northern part of Mahone Bay, and is surrounded by a fine and fertile country; its inhabitants are industrious people, and the adjacent islands are well clothed with sheep; wood and water is in abundance, and several vessels are built here; the anchorages between the various islands and before the town are good, well sheltered, and secure; and the depth of water moderate; the only danger is a shoal, which partly dries at low water: this lies west  $\frac{1}{2}$  south from the Town of Chester, from which it is distant one mile and three quarters.

On the larboard side of Mahone Bay, and directly west of Tancook Islands, is a large inlet or branch of a river, named by Des Barres, Princes Sound: the passages into it are very safe, only giving a wide berth to the southern end of Edward's Island; steer mid-channel, and, when well in, anchor in 9 fathoms, or within the innermost islands, in 5 or 6 fathoms; further in it becomes flat and shallow.

To sail into Mahone Bay from the eastward the first land visible will commonly be Green Island, which is round, bold, and moderately high; thence to Ironbound and Flat Islands, both steep to, is two miles and three-quarters; you may proceed and pass between them towards the Tancook Islands; these are inhabited; the channels between them are bold, and the anchorages under their lee good, in from 7 to 12 fathoms water: but if you are proceeding for Chester between Green and Duck Islands, you must beware of the Outer Ledge, which always shows itself by breakers; the mark to lead clear through this passage, is Chester Church well open of Great Tancook Island; this mark will also carry you safe to the westward of the Bull Rock, already described; and when you get near, or within half a mile of Tancook Island, steer out westward, and bring the same church to bear about north, and this will lead you up to the town.

LUNENBURG BAY, called also Malaguash, is now a place of great population and considerable trade; vessels carrying wood, cattle, vegetables, &c. are constantly employed from here to Halifax; the harbor is very easy of access, and there is good anchorage to the very town. At its entrance lies Cross Island, about 30 feet high, and containing 253 acres of land, on which a lighthouse is erected, the light and keeper's house are red and the lantern black; on the N. E. side of this island is a nook, where coasters ride in safety; off this part lie the Hounds Rocks, which, in passing, must have a berth; the west and south sides of the island are bold; and two miles from its southern end is an excellent fishing bank, with from 14 to 17 fathoms water. There are good channels on either side of Cross Island.

Vessels sailing in or out, through the northern passage, should endeavor to keep about the middle of the channel, in order to avoid the shoals and rocks above mentioned, and also those adjacent to the opposite, or Colesworth Point; having passed these, you should

to keep about  
entioned, and  
e, you should

keep the northern shore on board, bringing Battery Point to bear nearly N. W. by which you will also go clear of the Sculpin or Cat Rock.

The Sculpin or Cat Rock, lies nearly in the middle of the bay, bearing N. E. distant three-quarters of a mile from Oven's Point; according to Des Barres, there are but three feet over this danger, but it will easily be discovered by the breakers over it at low water. Sailing through the western channel, which is to be preferred, you should endeavor to steer N. N. W. between Cross Island and Rose Point, where you will have 10 and 12 fathoms water; keep the Town of Lunenburg in sight over the low land to the eastward of Battery Point, and this will lead you clear of the rocky reefs about the Oven's Point; but beware lest you lessen your water below 7 fathoms, for the soundings about the point are very irregular; bring the Wagon Road at Lunenburg open to the westward of the Battery Point, and this will run you to the westward of the Sculpin, and between it and a rocky knoll of 4 fathoms water; having passed the Sculpin, haul up towards the northern shore, until you bring Moreau and Battery Points in one; this being the direct mark for the Sculpin Rock, steer on in the direction of the Battery Point, approaching it no nearer than a cable's length, then round Battery Point, and bring the road well open of the Moreau Point; this will run you clear into the harbor, and between the Long Rock and the shoals off Battery Point, when you may direct your course for the town, where you will find 12 and 13 feet water along side the wharves, and near to them 20 and 24 feet, soft muddy ground, and perfectly secure.

Vessels having occasion to go to the southward of the Long Rock, which is the wider and safer passage, will observe there is a reef runs out from Woody Point, called the Shingles, which must be carefully avoided; to do this, when you have so far entered the bay as to be equi-distant between the Ovens, which are hollow cliffs, Battery and Woody Points, then edge off a little to the westward, until you bring a farm house, that stands over the middle of Sandy Bay, on with the end of a wood close to an opening like an avenue, bearing N. W.  $\frac{1}{4}$  N. steer with this mark on, until the west end of Lunenburg Town comes over Moreau Point, then steer N. Eastward a little, approach Battery Point, and proceed as before directed.

The best anchorage in the Bay of Malaguash or Lunenburg, is on its western side, about half a mile from the shore, and nearly mid-way between Oven's and Woody Points; where, with good ground tackling, you may safely ride out a S. Easterly gale; but the bottom is generally rocky and uneven. It is high water, full and change, at 9 o'clock.

*Dartmouth Bay.* This is situated between Oven and Rose Points; there are some settlements about the shores, and on an island at the bottom of the bay; it is easy of entrance, and you may anchor abreast of this island in 3, 4, 6, or 7 fathoms; in sailing into this bay, it will be always advisable to borrow somewhat towards the Rose Point shore, because of the shoals which lie to the southward of the Oven's Point; there is otherwise no danger whatever.

From Lunenburg to the Ironbound Island, at the entrance to Le Have River, the shores are bold, and much indented with irregular inlets or bays. Ironbound Island lies about W. S. W.  $\frac{1}{2}$  S. distant nearly 2 leagues from Cross Island; it is inhabited; and some small rocky islets surround its northern shore: S. E.  $\frac{1}{2}$  E.  $1\frac{1}{2}$  mile from this island is a bank of 20 and 25 fathoms, and W. S. W. three-quarters of a mile from that, is a small spot of 15 fathoms; these have from 30 to 40 fathoms about them.

*LE HAVE RIVER.*—Vessels coming from the south-eastward for Le Have River, will not fail to discover Cape Le Have, a steep abrupt cliff, 107 feet high, bearing W.  $\frac{1}{4}$  S. about 12 leagues distant from Sambro Lighthouse. S. E. by S. one mile from the Cape, is the Black Rock, 10 feet high, and 100 feet long, with deep water all round it, and 9 to 11 fathoms between it and the shore, except on a small knoll, lying off, and opposite to, the Cape, over which are only 4 fathoms; W. by S. distant  $3\frac{1}{2}$  miles, is Indian Island; and to the northward of the Cape, lie several islands, with passages between them; but the best entrance to the River Le Have is to the northward of them all. There is also a channel to the northward of Ironbound Island, but it is narrow, and to navigate this you must give the Ironbound Island a good berth; you will then have from 12 to 4 fathoms water all through it; but the best passage is to the westward of the island, which is above one mile and a half broad, and has from 10 to 14 fathoms water within it; about 3 miles to the N. Westward of Ironbound Island, is a bar which runs across from shore to shore; over this are 12 and 15 feet, the deepest water being one-third across from the eastern shore: the soundings from Ironbound Island towards the bar are 11, 14, 12, 9, 7, 6, 5, 4, and 3 fathoms, the latter depth being close to the edge of the bar; but when you are well over that, you drop into 4, 5, and 6 fathoms, the river continuing navigable 10 miles up, or so far as the falls; the general width of the river is half a mile, and when you are 8 miles up it, you will meet with the road from Lunenburg to Liverpool, where a ferry is established.

Within and to the westward of Cape Le Have is Palmerston Bay, at the head of this is Petit Riviere; off the eastern entrance of this bay lies Indian Island, bearing W. by S. distant  $3\frac{1}{2}$  miles from Cape Le Have.

PORT METWAY lies between Cape Le Have and Liverpool Bay, and is a place now rising into considerable consequence, on account of its navigable capacity, and its convenience to the fisheries. The entrance to this port bears from Indian Island W. S. W. distant 7 miles, the land to the eastward of it being remarkably broken and hilly; on the starboard point of the entrance lies Frying Pan Island, which is connected, by a sandy reef, to numerous islets which stretch along in a N. N. E.  $\frac{1}{2}$  Northerly direction, until they join the main land: that which is next to Frying Pan Island is commonly called Glover's Island, and lies half a mile to the northward, and bears S. E.  $\frac{1}{2}$  S. a good mile and a half from Metway Head. The entrance to this port may be known by the high land at Cape Metway, and the low ragged islands before mentioned; the width of the channel is about seven-eighths of a mile, and the depth of water from 5 to 14 fathoms. Directly in the way of your making for the entrance of the channel, lies the South West Ledge and the Stone Horse Rock; the former bears from the Frying Pan Island S.  $\frac{1}{2}$  E. distant  $\frac{3}{4}$  of a mile; there are 19 feet water upon it, and the sea, in rough weather, breaks over it: the latter, or Stone Horse Rock, lies E. by S. distant one-third of a mile from the S. W. Breaker, and dries at low water: there is 6, 7, and 8 fathoms between it and the Frying Pan Ledge, and should you pass this way, you must give the island a good berth, on account of a spit which runs out from it, in the direction of the Stone Horse Rock, a full quarter of a mile; but the best course will be half a mile outside of both these dangers, you will then pass in 12 and 14 fathoms water, and running on W. a little Southerly, toward Kempenfelt Head, you will open the channel, and may steer in directly north. Or, you will avoid the S. W. Ledge and Stone Horse Rocks, in coming from the eastward, by bringing the Liverpool Lighthouse, which stands on Coffin Island, open of the land to the eastward of it: and when Frying Pan Island comes N. N. E. distant  $1\frac{1}{2}$  mile, steer in N.  $\frac{1}{2}$  E. this will carry you past Metway Point; and when opposite to Neil's Point you may anchor in 4 or  $4\frac{1}{2}$  fathoms water: from hence mud banks considerably narrow the passage, and a pilot will be found necessary; but should you proceed further without one, you will continue mid-channel from abreast of Neil's Point, N. N. W.  $\frac{1}{2}$  N. until Collin's Island bears West, and until Alicia River is just opening of, Point Lucy, then steer N. W. by N. and W. N. W.  $\frac{1}{2}$  W. and anchor in 3 or 4 fathoms, muddy ground.

To run up Alicia River, you must sail between Grass Island and Point Lucy, keeping close to the southern and western shores, in order to avoid the flat which extends from the northward, leaving a deep but narrow channel. Barry Bay, or Branch, which runs up to the westward, is shallow, and full of rocky shoals; and so is Brier Bay, which is situated on the N. E. side of the port. The tide runs commonly with great strength, and it is high water at 45 minutes after seven.

At Cape Le Have it is high water full and change, at 8 o'clock, tide rises from 5 to 7 feet.

Malaquash Bay.....	6 to 8
Green Island.....	6 to 8
Mahone Bay.....	7

LIVERPOOL BAY.—The entrance to this bay bears about W. by S. distant 17 or 18 leagues from Sambro Lighthouse, Halifax; and W. S. W.  $\frac{1}{2}$  W. 15 miles from Cape Le Have; before it lies Coffin's Island, which is now distinguished by a lighthouse, 75 feet above the level of the sea; the light is on the revolving principle, and appears full at intervals of 2 minutes; between this island and the western land is the bay, affording good anchorage for large ships, especially with the wind off shore. In the bay there is sufficient room for turning to windward, and the deepest water will be found near the western coasts; the land in the vicinity of the harbor is broken, rocky, and of a barren appearance, yet the commerce of the town is very considerable. The channel to the northward of Coffin's Island is shallow, having a sandy spit running from it and joining the main land; therefore none but small vessels ever attempt it; but the passage to the southward is full one mile and a half wide, and has 15, 16, 17, and 18 fathoms water. Give the lighthouse point of the island a small berth, as a flat of 3 and 4 fathoms encompasses it, and there is no other danger. Bald Point, or Western Head, is bold to, and rendered remarkable by its having no trees upon it. Having entered this bay, and passed between Coffin's Island, and Moose Head, bringing the lighthouse to bear E. by N. distant  $1\frac{1}{2}$  mile, steer west; this will bring you abreast of Herring, or Schooner's Cove, situated on the N. E. side of the bay, and affording good shelter from sea-winds in 3 fathoms water, on a bottom of mud; or, proceeding further, vessels of two or three hundred tons, with high water, may pass over the bar, which stretches from Fort Point to the opposite shore; but at low water this cannot be done. for then it has not more than 9 or 10 feet

over it; when within the bar you will perceive the channel winds S. Westerly, and you can anchor in not less than 2 fathoms, opposite the Town of Liverpool. Herring Bay is much exposed to the heavy S. Easterly swells of the sea, and has not room for more than two sloops of war.

It is high water in Liverpool Bay, full and change, at 50 minutes after 7, and the tides rise from 5 to 8 feet.

PORT MATOON, or MOUTON, called by Des Barres, Gambier Harbor.—This port is formed by the Island Matoon, which lies across its entrances, dividing it into two channels. In the eastern passage lies the rocky ledge, called the Portsmouth, or Black Rocks, partly dry; this is about one mile to the eastward of the island, and lies S. W. by W. distant 5 miles from Bald Point; the passage on either side of this ledge has deep water, with sufficient room to turn into the harbor. From the N. W. part of Mouton a shoal runs off a full mile, having  $2\frac{1}{2}$  fathoms near its outer extremity; over some parts of this shoal you will have 3,  $3\frac{1}{2}$ , and 4 fathoms; here also is a small spot of foul ground, with 20 feet over it; this lies N. E. W.  $\frac{1}{2}$  W. from the N. W. end of Mouton Island, and N. E.  $\frac{1}{2}$  E. from the Northern Spectacles Island, distant half a mile. The Spectacles lie to the W. N. Westward of Mouton Island, and are visible as you enter the port; to the northward and westward of them are 10, 11, and 12 fathoms water, muddy and sandy ground, with good anchorage, secure from all winds. To sail into Port Mouton by the eastern channel, and with a leading wind, to the northward of the Black Rocks, you may steer in W. by N. passing at the distance of three-quarters of a mile from White Point, until you bring the Spectacle Islands to bear S. S. W.  $\frac{1}{2}$  W.; this will carry you clear to the northward and westward of Mouton Island N. W. Shoal, then haul up S. W. by W. for the anchorage before mentioned. To sail in to the westward of the Black Rocks, you should steer in N. W. mid-channel or nearly half a mile from Mouton Island; in this passage you will find from 8 to 10 fathoms water; always giving the southern part of the island a berth, on a sandy flat which runs off it. In adopting this channel, mariners must look out for a small knoll of 6 feet, said to lie E. N. E.  $\frac{1}{2}$  E. distant one mile and a half from the southern extremity of Mouton Island; this appears to be a modern discovery.

The Western Passage to Port Mouton is between the island and the main, and only frequented by coasters and vessels of a small draught of water; it is encumbered with shoals, and too intricate for strangers; the channel is narrow, and close to the main land, passing between it and the Bull Rock; having passed which, you can proceed to the anchorages, either off the N. W. shore of Mouton Island, or round the Spectacles.

The land now turns S. W.  $\frac{3}{4}$  W. from Point Mouton towards Port Jolie; midway is a black craggy point, with several rocks about it; S.  $\frac{1}{2}$  E. distant  $2\frac{1}{2}$  miles from Black Point, and S. W. 14 miles from Liverpool Lighthouse, lies Little Hope, an island 21 feet high, and 200 fathoms long; this is a very great danger, and should have a beacon to distinguish it; round the island is a shoal ground, partly drying, and with 3 and 4 fathoms upon some parts; it lies direct E. S. E. from the eastern point of entrance to Port Jolie, from which it is distant two good miles; between the island and point, somewhat nearer to the latter, there is said to lie a dangerous shoal, not hitherto noticed in the charts.

Port Jolie is an inlet more than 5 miles deep, but very shallow, and having scarce water enough for large boats; the lands adjacent appear barren and stony, yet have some families of fishermen settled there. Nearly south from the eastern point of Port Jolie, distant one mile, is a spot of 3 fathoms, over which the sea commonly breaks; and on the western entrance of the port are some rocky ledges, which show themselves by the breaking of the water over them; there is also a small island, lying to the S. Westward, called the Little or Lesser Hope.

PORT L'EBERT—This is the third inlet west of Liverpool, and may readily be known by the steep and abrupt appearance of its western head; and also by Green Island, which lies to the S. Westward of its entrance; this island is somewhat remarkable, being destitute of trees. Port L'Ebert is divided from Port Jolie by a peninsula, which, at the head of the respective ports, is scarcely half a mile across. The channel in runs nearly North 6 or 7 miles; but, although small vessels may run a considerable way up, ships of larger size can only find anchorage at its entrance; the depth half a mile from the head, is from 9 to 12 feet; but at the mouth of the port are 6, 4, and 3 fathoms.

SABLE RIVER lies to the S. Westward of Port L'Ebert, distant 5 miles; at its entrance, nearly midway of the channel, is a rocky islet; this lies S. W. by W. from Green Island, distant  $3\frac{1}{2}$  miles; there is a passage on either side of the rock; that to the eastward has 12, 13, and 15 fathoms water, but that to the westward is somewhat shallower; the two points of entrance of the river are distant from each other one mile and a quarter, with from 6 to 11 fathoms; but there is a bar which renders this place totally unfit for affording shelter to any but the smallest class of vessels; it is, however, not

destitute of inhabitants, some of whom are settled in a small nook close to the westward of the river, which is called the Little Harbor.

**RUGGED ISLAND HARBOR** lies W. by S. distant 15 miles from the Hope Island, and E. N. E. 9 miles from Shelburne Light. It seems to have been so named from its craggy and rugged appearance, and the numerous dangerous ledges and broken rocks at its entrance. This harbor is difficult of access, and seldom resorted to, unless by the fishermen, who are familiar with its navigation; yet the anchorages are good, with  $4\frac{1}{2}$  and 4 fathoms; during gales of wind, the unevenness of the ground frequently causes the sea to put on a most formidable appearance, breaking violently from side to side. Off the western head, distant about a mile, is the Gull, a bed of rocks, over which the water always breaks; but between the head and the Gull are from 6 to 8 fathoms. Vessels coming from the eastward will perceive St. Thomas's or Rugged Island, lying S. W. by W. from Green Island, distant  $6\frac{1}{2}$  miles; this island, having high rocky cliffs on its eastern side, affords a good mark for the harbor. To the S. W. of Rugged Island are some rocky ledges; the outermost of these is called the Bear Rocks, being distant from the island three-quarters of a mile; between Rugged Island and the Bear Rocks, are other dangers; and a little westward of the Bears is a sunken rock; these three latter, lying in a sort of triangular form: W. by N. from the Bear Rocks, distant one mile, is the Blow Breaker, a rock with only 4 feet over it; this appears to be the Tyger of Des Barres, by whose description it should bear south from Rugg Point, which is the eastern boundary of the harbor. To sail from the eastward for Rugged Harbor, you will see the eastern cliffs of Rugged Island bearing north, distant  $1\frac{1}{2}$  mile; keep a good lookout for the Blow, or Tyger Rock, and pass well to the outside of the foregoing dangers; and having cleared these, haul up N. N. W. for the islands on the left, or larboard side of the harbor: in so doing you must be careful to avoid a shoal which stretches half way over from the starboard shore, narrowing the channel very considerably, so that between the shoal and Muffatt Island, the passage is not above a quarter of a mile wide; pursuing this direction, you will readily reach the anchorage in the Northern Arm. In the best of the channel, Center Island will be just open of Muffatt Island. Small vessels may be well sheltered within Cubb Basin, which is to the northward of Muffatt Island; and vessels coming from the southward or westward will have deep water on either side of the Gull Rocks, or between the Bear and Blow Rocks. At Cape Negro and Rugged Island Harbor, at high water, full and change, at 8 o'clock; and the rise of the tide is about 7 feet.

**GREEN HARBOR.**—This port is to the westward of Rugged Island Harbor, having an island on its western side of entrance, and running in full three miles; this and the River Jordan, situated still further to the westward, appear to be places where good anchorages may be obtained, but they are at present little frequented by shipping, although they have many inhabitants; they are open to southerly winds, which cause a heavy rolling sea.

**SHELburne HARBOR, or PORT ROSEWAY,** is, according to Mr. Lockwood, justly esteemed the best in all Nova Scotia, from the ease of its access, and perfect security of its anchorages, which distinguishes it perfectly from Sambro Light. At the entrance of the harbor is the Island of Roseneath, or M'Nutt's, which is nearly 3 miles in length, and  $1\frac{1}{2}$  in its broadest part: on the S. E. point of this island stands an excellent lighthouse; this point is a high cliff of white rocks, the summit of which is without trees; the west side of the island is low. The lighthouse is painted white, and has a remarkable appearance in the day-time, on account of a dark wood that is behind it; while, at night, two lights are exhibited from it; the upper light is 125 feet above the level of the sea, and the lower about one-third from the top of the building. This lighthouse bears from the lighthouse of Sambro W. S. W. distant 30 leagues; from Cape Negro N. E.  $\frac{1}{2}$  N. 7 miles; from Point Beny S. W.  $\frac{1}{2}$  S.  $2\frac{1}{2}$  miles; from the breakers South-west of Rugged Island W. N. W.  $\frac{1}{2}$  W. 8 miles, and from the Jigg Rock, which has only 6 feet water over it, N. N. E.  $\frac{1}{2}$  E.  $1\frac{1}{2}$  mile. When coming in from sea, make for the lighthouse, bringing it to bear N. W. or N. by N. then steer directly towards it: the dangers to be left to the eastward of you, are those adjacent to the Rugged Rocks already mentioned, the Bell Rock, which is always visible, appearing black and bold to, lying E. N. E.  $\frac{1}{2}$  E. distant  $2\frac{1}{2}$  miles from the lighthouse. In coming from the westward, you may steer for the entrance on either side of the Jigg Rock, and if for the eastward, on either side of the Bell Rock. When you get abreast of the lighthouse you may sail in to the northward of M'Nutt's Island about N. W. by N. keeping nearly in mid-channel; the island's side is bold to, and the anchorage is good, in 7, 8, or 10 fathoms, the bottom mud; keep the western shore on board, for there is a shallow spot somewhere about the eastern side, between George's and Sandy Points. Sandy Point is about two miles beyond the N. W. part of M'Nutt's Island; give it a berth, for a sandy spit extends from it 300 yards. With M'Nutt's Island locked to this point, the

anchorage safety during a storm, a mile from the shore, easily be obtained. Island open in it, but free from the ride in 5, the course from rounded.

In coming to, the shoal lighthouse or you may.

Shelburne except a very harm all time, it was observed to be supplied and sail in for support should you full and the S. E. 3 feet.

a berth, for  
is point, the

anchorage is exceedingly good, and shipping may, with good ground tackling, ride in safety during the most violent storm. In the channel, about S. by E. distant nearly one mile from Carlton Point, lies the Adamant Rock, abreast of Durley's House; this will easily be avoided by going into no less water than 4½ or 5 fathoms, or by keeping Petit's Island open of Surf Point. The inlet which runs up to the N. W. has several shoals in it, but the eastern shore has regular soundings, from Sandy Point upwards, and is free from danger, while in the upper part of the harbor, above Carlton Point, vessels may ride in 5, 6, or 7 fathoms, the ground holding well. We have already stated, that your course from the entrance towards Sandy Point will be about N. W. by N. and having rounded Sandy Point, you can proceed N. by W. and North, according to your mind.

In coming from the eastward of this harbor, be careful to avoid, and give a good berth to, the shoals off Rugged Island; and do not haul up for the harbor until you get the lighthouse to bear W. by N. ½ N. by which precaution you will go clear of every danger: or you may stop a tide at the entrance in from 16 to 10 fathoms, sand and clay.

Shelburne affords excellent shelter for ships in distress, and is secure against any wind, except a violent storm at S. S. W. abreast of the town, the wind from S. to E. does no harm, although from S. by W. to S. W. by S. if blowing hard for some considerable time, it will set the smaller vessels adrift at the wharves; but in the stream, as has been observed before, with good cables and anchors, no winds can injure you. Here you may be supplied with cordage, duck, spars, provisions, and water. Carpenters, pump, block, and sail makers, can be obtained, if required; and the port charges for vessels which put in for supplies only, is no more than 4d. per ton, light money, on foreign bottoms; but should you enter the custom-house, the duties become much higher. It is high water, full and change, at 8 o'clock; spring tides rise 8 feet, neaps 6, but a fresh breeze from the S. E. commonly brings on high water sooner, and causes an additional rise of 2 or 3 feet.

CAPE NEGRO HARBOR is named from Cape Negro, the eastern limit of an island which lies before its entrance; this Cape is remarkably high, rocky, and barren, bearing S. W. ½ S. distant 7 miles from Shelburne Lighthouse; this island is very low midway, and has the appearance of being two islands. There are two passages into the harbor, one to the eastward of the island, and the other to the westward of it; the former is much the better of the two, but this is rendered dangerous, on account of two sunken rocks which lie off its entrance; these are called the Gray Rocks and the Budget: the Gray Rock lies N. N. E. from the Cape, distant a full mile, and is situated nearly on the starboard side of the channel; some parts of these rocks are always visible, and serve as a mark for the harbor. The Budget is a blind rock of 6 feet, lying nearly mid-channel, and only a quarter of a mile from the island, having deep water round it. In the channel to the eastward of the Budget you will have 10, 12, and 14 fathoms, and the best direction to enter the harbor, will be to steer one-third from the rocks off the eastern point, until Shelburne Lighthouse is shut in, then you will be within the danger. There is excellent anchorage off the N. E. part of Negro Island, in from 6 to 4 fathoms, on a bottom of stiff mud. The northern part of the island presents a low shingly beach, from which a bar extends quite across to the eastern shore, over which are 15 feet at low water; above this bar it is navigable full 6 miles, having a smooth clayey bottom, with 3, 4, and 5 fathoms water.

The passage to the westward of Negro Island is somewhat intricate, encumbered with rocks and dangers, and should not be attempted except in cases of extreme emergency: in such circumstances, indecision or timidity might produce certain destruction; then the commander's post should be aloft, and if not possessing confidence himself, he should affect it. Captain Des Barres, says, "if coming from the westward, in hauling round Point Jeffery, to avoid the ledges, blind rocks, and shoals, extending easterly from the western shore, you should shape your course N. N. E. ½ N. towards the Cape, giving the Savage Rocks a berth of three cables' lengths, until you open Davis's Island, a sail's breadth off Point William; Davis's Island is the largest, and westernmost at the head of the harbor; run up in that direction, observing to keep clear of a sunken rock which lies E. S. E. from Point William, about 300 fathoms from the shore. Fishery Beach is bold-to."

To sail through the north-east passage, which is not so difficult, keep Gray's Rocks on board, and steer N. W. for Point John, until you see across the isthmus in the middle of Cape Negro Island, or until Shelburne Lighthouse is shut in, and having passed the Budget, from thence haul over to the westward, keeping along the shore about 2 cables' lengths from the island, to avoid the shoal, which extends half the distance over from Point John, towards the island; and when you have opened the small islands at the head of the bay shape your course N. N. W. to the anchoring ground, the bottom is mud and clay; along the N. E. side of Cape Negro Island, the anchorage is good stiff clay.

The River Clyde, which descends from a chain of lakes that extends E. N. E and W. S. W. a considerable distance in the interior, falls into the head of Negro Harbor, after a run of 28 miles.

**PORT LATOUR**, or **HALDIMAND**, is situated a little westward of Negro Harbor, being separated from it by a narrow peninsula; the extreme points which bound the entrance to the southward, are Point Jeffery, or Blanche Point, to the eastward, and Point Baccarro to the west; between and within there are several clusters of rocks, rendering the harbor unfit for any but small craft; and the tide leaves the head of the inlet dry in many places; the adjacent lands are barren, and the settlers are but few; nevertheless, as some vessels may be driven to seek shelter here, the following directions of Mr. Dés Barres may prove acceptable. "To sail into this port, coming from the westward, continue your course easterly, until you have Brehem Isle a ship's length open to the eastward of North Rocks: thence you may steer northerly for Isle George, and when you come up within the distance of two cables' lengths from its south end, incline to the westward in a direction with the western extremity of Pond Beach until you open Prospect House on the north side of the northernmost Mohawk Ledges, and then haul into anchorage in 3 fathoms, muddy bottom.

"Nearly midway between Baccarro Point and the South Ledge lies the Folly, a sunken rock, within which and the western shore is a channel of 6 fathoms. The Vulture, a dangerous breaker, lies S. W.  $\frac{1}{4}$  S. nearly two miles from Baccarro Point."

**BARRINGTON BAY**.—This is a spacious inlet, situated to the westward of Port Latour, and formed by Cape Sable Island, which lies in front of its entrance; there are two passages into it, that to the eastward is between Baccarro Point and Sable Island, being at its entrance three miles wide; that to the westward is not more than a mile broad; both are encumbered with numerous and extensive flats, narrowing the passages, and rendering the navigation dangerous; for although the channels may generally be discovered, by the waters appearing dark, yet it will require a leading wind to wind through to the anchorage, which is towards the head of the bay, and about one mile and a half below the town; here there are from 18 to 26 feet water. The passage to the northward and westward is used by small vessels only, and is not safe without a commanding breeze, as the tide of ebb is forced unnaturally through to the eastward, by the Bay of Fundy tide, at the rapidity of 3, 4, and sometimes 5 knots an hour; setting immediately upon the rocks which lie within it.

The Town of Barrington is situated at the north-eastern extremity of the bay. Vessels venturing into this bay by the eastern passage, must be very careful to avoid Baccarro Point, giving it a wide berth of full 2 miles on account of the Bantan, Shot Pouch, the Vulture, and other rocks which lie off it; the Vulture Rock is very dangerous, and lies W. S. W. from Baccarro Point, distant nearly 2 miles; the Bantan bears S. S. W. from the point about a similar distance, and from the Vulture S. E. almost one mile; they are both exceedingly dangerous.

**CAPE SABLE** is the south-eastern extremity of a small narrow island which is separated and distinct from Cape Sable Island; it is low and woody, but the Cape itself is a broken white cliff, apparently in a state of decomposition, and visible 4 or 5 leagues off; from this island spits of sand extend outward, both to the south-east and south-westward; the Eastern Ledge is called the Horse Shoe, and runs out  $2\frac{1}{2}$  miles S. E. by S.; the Western, or Cape Ledge, stretches to the S. W. about 3 miles. The tides, both flood and ebb, set directly across these ledges at the rate of 3 and sometimes 4 knots an hour; causing a strong break to a considerable distance, particularly when the wind is fresh; it will then often extend full 3 leagues out, shifting its direction with the tide, the flood carrying it to the westward and the ebb to the eastward, the former running a considerable time longer than the latter. This rippling, or breaking of the water, may be considered hazardous to pass through in a gale of wind, but there is not less than 8, 10, 12, and 20 fathoms, rocky ground.

It is high water at Cape Sable, full and change, at three quarters after 7 o'clock, and the spring tides rise 12 feet neap 6.

**BONNETTA COVE**.—To the north-westward of Cape Sable is a small island, called Green Island, to the N. East of which an inlet runs in to Cape Sable Island, forming Bonnetta Cove, where good anchorage may be found in 3 fathoms water; the entrance to it is narrow, and runs in between a spit and the island; this will be too difficult for a stranger to discover, but is frequented by the coasters and fishermen.

**FAVORITE COVE** is situated in the Western Channel, and about the middle of Cape Sable Island; here also small vessels may run in and anchor in 2 fathoms, behind a small islet which lies mid channel, at its entrance, affording a passage on either side, but that to the eastward is the best, and has the deeper water. With S. W. gales there is always good anchorage off the N. E. side of Cape Sable Island; but the Shag Harbor, which lies on the opposite side of the Western Channel, and bears N. N. W. from Bon-

netta Cove, is full of shoals, and must not be attempted, unless you are well acquainted with it. It is here high water, full and change, at 9 o'clock, spring tides 11 feet, neaps 8 feet.

**THE BRAZIL ROCK.**—This is a flat rock, covering a space of 10 yards, over which are only 8 and 9 feet at low water; a tail extends 90 or 100 yards from its base, having 6 to 8 fathoms water; the tide running strong over this, causes a ripple, and makes the rock appear larger than it really is. Southward of the rock, at the distance of about a mile, you will have 35 and 34 fathoms, then 30 and 22 as you approach nearer to it; but towards the Cape Sable shore the soundings are regular, from 19 to 15 fathoms, you will then lessen your water to 10 and 7 fathoms, when you will be at the edge of the Race-horse Shoal; to the northward of the Brazil Rock, in the direction of the Bantan Rock,\* you will have 16, 19, 15, 17, 16, 15, and 10 fathoms; with this latter depth you will be near the Bantan, and must tack to the westward. The exact position of this rock has been much disputed, but the place assigned to it by Mr. Des Barres, appears to be nearly correct; its latitude is  $43^{\circ} 24' 15''$  N. and longitude  $65^{\circ} 22'$  W.

**ICE.**—H. M. packet brig Express fell in with two islands of ice on Sable Island Bank, the 7th July, 1836, in 45 fathoms water, estimated heights 180 and 150 feet. Latitude  $43^{\circ} 13'$  N. longitude  $25^{\circ} 17'$  W. Air  $46^{\circ}$ , water  $42^{\circ}$ .

## THE ISLE OF SABLE AND BANKS OF NOVA SCOTIA.

ON the days of the new and full moon, it is high water along the south shore of the island at half an hour after 8 o'clock, and it flows till half an hour past 10 o'clock on the north side, and till near 11 o'clock in the pond. Common spring tides rise seven feet perpendicular, and neap tides four. The flood sets in from the S. S. W. at the rate of half a mile an hour, but it alters its course, and increases its velocity, near the ends of the island. At half-flood it streams north, and south at half-ebb, with great swiftness, across the north-east and north-west bars; it is therefore dangerous to approach without a commanding breeze. The north-east bar runs out E. N. E. about four leagues from the eastern extremity of the island, all which is very shoal, having in a few places no more than 2, 3, or 4 fathoms water, whence it continues E. and E. by S. deepening gradually to 12, 15, and 18 fathoms water, at the distance of 8 or 10 leagues, and shaping to the S. and S. E. sloping gently to 60 and 70 fathoms water. To the northward and eastward it is very steep, and, in a run of 3 miles, the water will deepen to 130 fathoms. Abreast of the body of the island the soundings are more gradual. The shoal ground of the north-west bar shapes to the westward, and deepens gradually to 70 fathoms water, at the distance of 20 or 25 leagues from the isle, and winds easterly and southerly, until it meets the soundings off the north-east bar. The quality of the bottom in general, is very fine sand, with a few small transparent stones; to the northward, and close to the north-east bar, the sand is mixed with many black specks; but near the north-west bar, the sand has a greenish color. The north-east bar breaks in bad weather, at the distance of 8 and 10 leagues from the island; but in moderate weather, a ship may cross it at 5 leagues distance, with great safety, in no less than 8 or 9 fathoms water; and, if the weather be clear, the island may be seen hence very distinctly from a boat. The north-west bar breaks, in bad weather, at 7 and sometimes 8 miles from the island; but when the sea is smooth, ships may cross it

\* This course cannot be sailed upon account of the intervention of the land.

within the distance of 4 miles, in 7 fathoms water.—These bars are thus described by Mr. Des Barres: but repeated storms, and the violence of the sea, may, in course of years, have considerably altered their form and extent.

Along the north and south sides of the island are many spits of sand, nearly parallel with and within a mile from the shore. Vessels may anchor on the north side of the island, between the spits, and not be liable to be driven off by southerly winds. On the south side, it is boldest off the body of the island, having 10 or 12 fathoms water, within a mile of the shore; but towards the bar it is more shoal, and dangerous to approach; for the currents, which are uncertain, are, in a great degree, influenced by the winds which have preceded. The surf beats continually on the shore, and in calm weather, is heard several leagues off. Landing on this island, with boats, is practicable on the north side after a continuance of good weather only. The whole island is composed of white sand, much coarser than any of the soundings about it, and intermixed with small transparent stones. Its face is very broken, and hove up in little hills, knobs, and cliffs, wildly heaped together, within which are hollows and ponds of fresh water, the skirts of which abound with cranberries the whole year, and with blueberries, juniper, &c. in their season; as also with ducks, snipes, and other birds. This sandy island affords great plenty of beach grass, wild peas, and other herbage, for the support of the horses, cows, hogs, &c. which are running wild upon it. It grows no trees; but abundance of wreck and drift wood may be picked up along the shore for fuel. Strong northerly winds shift the spits of sand, and often even choke up the entrance of the pond which is on the South side of the island. In this pond are prodigious numbers of seals, and some flat-fish, eels, &c. and on the south-west side, lies a bed of remarkably large muscles and clams. The south shore is, between the cliffs, so low, that the sea breaks quite over in many places, when the wind blows on the island. The Ram's Head is the highest hill on this island; it has a steep cliff on the north-west, and falls gently to the south-east. The naked Sand-hills are 146 feet in perpendicular height, above the level of high water mark, and always appear very white. Mount Knight is in the shape of a pyramid, and situated in a hollow, between two steep cliffs. Mount Luttrell is a remarkable hummock on the top of a large swelling in the land. Gracia Hill is a knob at the top of a cliff, the height of which is 126 feet perpendicular, above high water mark. The Vale of Misery is also remarkable, as is Smith's Flag-Staff, a large hill, with a regular ascent every way. From the offing, the south side of the island appears like a long ridge of sandy cliffs, lessening towards the west end, which is very low.

Ship masters are too ready to abandon their vessels when stranded on the shores of this island: in moderate weather an immediate attempt should be made to get out an anchor; for, as the sand is soft and moveable, it will often happen that a vessel can be got off at once, which in a few hours would be totally lost: when the surf is so smooth as to permit landing, it is generally smooth enough to carry out an anchor. The British barque *Tottenham*, in 1832, got on the N. W. bar; the crew and passengers landed, and in 11 hours she was discovered to be afloat, and all hands went on board and succeeded in getting clear. The ship *Eagle*, of New York, with a very valuable cargo, got on shore in August, 1835, on the S. E. part of the island; after being on shore 4 or 5 days she floated off, having very little water in her, and brought up a mile further to the eastward, where she was finally lost.

At the present time, there are three houses on the Isle of Sable, one on each extremity, and one near the centre of the island, in which individuals reside, who are employed by the Provincial Government of Nova Scotia, to assist any vessels which may be wrecked on these shores. Adjoining the house at the west end is a garden, and a piece of cultivated land, the only spot of the kind on the island, where vegetables and a considerable quantity of hay are annually produced.

As when a vessel is on shore in a fog, it is of the utmost importance to ascertain her true position, in order to save the ship or the lives of those on board, the following directions should be attended to:

If breakers are seen to extend in a direction N. W. and S. E. you are on the N. W. bar.

If breakers are seen to extend W. S. W. and E. N. E. you are on the N. E. bar.

If breakers are seen to the northward ahead, and extending from east to west, you are on the south side of the island.

If breakers are seen to the southward ahead, and extending from east to west, you are on the north side of the island.

The eastern end of this island is in 43° 59' N. latitude, longitude 59° 48' W.: the western end is in 43° 57' N. lat., long. 60° 14' W.

The Nova Scotia Banks extend nearly 70 leagues, in a westerly direction. From the Isle of Sable, they are from 20 to 25 leagues wide, and their inner edges are from 14 to 18 leagues off-shore. They are intersected by narrow winding channels, (the bottom of

TIDE  
of the t

which is mud,) running N. W. and S. E. Between these banks and the shore, are several small inner banks, with deep water and muddy bottom. The water deepens regularly from the Isle of Sable, to the distance of 22 leagues, in 50 fathoms, fine gravel; thence proceeding westward, the gravel becomes coarser; continuing westward to the western extremity of the banks, the soundings are rocky, and shoalen to 18 and 15 fathoms water: Cape Sable bearing N. by W. distant 15 leagues.

The south-west extremity of Banquereau, lies seventeen leagues E. N. E. one half E. from the east end of the Isle of Sable. This bank extends E. by N. 35 leagues, and is near 8 leagues in width; its shoalest part is about 5 leagues from its eastern extremity, in 16 and 18 fathoms water, slimy sand and clams: whence it deepens regularly every way to 60 and 70 fathoms, towards the edges of the bank.

This bank is steep to; and from its soundings on the north side, you fall immediately into 90 or 100 fathoms water, black mud; and, on the south side, into 120 fathoms.

REMARKS.—It may be observed, generally, that the soundings all along the Nova Scotian Coast, between Cape Canso on the E. N. E. and Cape Sable to the W. S. W. are very irregular; from 25 to 40 and 50 fathoms; therefore in foggy weather, do not stand nearer in shore than 35 fathoms, lest you fall upon some of the ledges. By no means make too bold with the shore in such weather, unless you are sure of the part of the coast you are on; for you may, otherwise, when bound for Halifax, fall unexpectedly into Mahone or Mecklenberg Bays, and thus be caught and endangered by a S. E. wind.

The weather on the coast is frequently foggy in the spring and some part of the summer; in particular at the distance of 4 or 5 leagues from the shores; but on approaching nearer, the weather is found more clear; and, with the wind from the land, it is perfectly clear and pleasant.

## THE WEST AND NORTHERN COASTS OF NOVA SCOTIA, AND THE COAST OF NEW BRUNSWICK, INCLUDING THE BAY OF FUNDY, WITH MANAN ISLANDS, &c.

REMARKS.—Whoever examines and well considers the situation of the south western coast of Nova Scotia, the Bay of Fundy, and Manan Islands, will readily perceive the dangers attendant upon the navigation of its harbors, its natural exposure to the Atlantic Ocean the variability of its tides and winds, and the many rocks with which it is environed. These, therefore, must be expected to involve the mariner in occasional difficulties, which will call forth his utmost energies, and require no common share of attention to surmount; yet, although the loss of vessels in these parts fully justify a perilous apprehension, there are few obstacles which a moderate exercise of skill and resolution would not have been able to overcome; and we fear it is more to the want of these qualifications in the navigators, than to the dangers of the navigation, that such losses have ever occurred.

"It is essential," says Mr. Lockwood, "to the safety of those who are navigating the Bay of Fundy, that it should be clearly understood," and in cases of necessity, many are the places of safety to which vessels might resort, even without the advantage of a pilot; although no man would attempt to justify the economy of saving the expense of pilotage, on a coast like this, where currents, fogs, and changes of weather may confound the best judgment.

In order to lessen these accidents, if not totally to prevent such fatal occurrences in future, let the mariner be fully convinced of the necessity of frequently sounding with the deep-sea lead, and see the expediency of having his anchors and cables fit for immediate use; this cannot be too strongly impressed upon his mind, for vessels well equipped and perfect in gear, with their anchors stowed as in the middle of the Atlantic Ocean, have been here wrecked, in moderate weather, and so frequently, that such gross neglect cannot be too much reprobated; such serious losses will, we trust, be hereafter prevented, more especially as it is so dependant upon the mariner himself, and may be in most cases, remedied by only sounding in time, and keeping the lead in continual action.

TIDES.—Another subject most particularly essential to the mariner, is a knowledge of the tides; this we recommend seriously to his attention.

## CAPE SABLE TO BRIER'S ISLAND, ON WHICH IS A LIGHTHOUSE.

**THE COASTS, ISLANDS, &c.**—Before we give a description of the main land, from Cape Sable to the entrance of the Bay of Fundy, it may be proper to notice the islands and rocks which lie adjacent and to the westward of Cape Sable; these are the Blonde Rock, the Seal, (on which is a lighthouse) and Mud Islands; the Tusket Islands, the Grannet Rock, and Green Island, &c. The Seal Islands southernmost point bears from Cape Sable nearly W. N. W.  $\frac{1}{2}$  W. distant 16 miles, being somewhat more than two miles in length from North to South. Its southern part is covered with scrubby trees, elevated about thirty feet above the sea; to the southward of this part, distant two miles and seven-tenths, is a rock uncovered at low water called the Blonde, from a vessel that in 1777 was wrecked upon it; round this rock are 7, 9, and 10 fathoms water. About a mile to the westward of the Blonde are very heavy and dangerous overfalls, having a very alarming appearance. The ship *Waterloo*, in passing between the Blonde Rock and Seal Island, struck twice upon a rocky shoal, with only eighteen feet water over it, and thereby knocked off her rudder; this was supposed to be a part of the ledge which runs off to the southward of the Seal Island. The Blonde Rock is particularly dangerous, as the ebb tide sets so strongly towards it; and from the lowness of the Seal Islands you are so likely to be deceived, even in fine weather. The tide also runs with great rapidity past the Seal and Mud Islands, which occasions the sea to break over the shoals in their vicinity, making them appear more extensive than perhaps they really are. In sailing, therefore, between the Seal Island and the Mud Islands, large vessels should always keep one mile off the latter, by which they will avoid the overfalls in 3 fathoms. Off the western part of the Seal Island, distant one mile, lie two small rocky islets, called the Devil's Limb; and the Limb's Limb; the Devil's Limb is visible at all times, and the Limb's Limb is only seen at half tide. The smoothest anchorage is midway between these and Seal Island in  $3\frac{1}{2}$  or 4 fathoms, clear sand; wild fowl and fish are here in abundance. The fishermen resort to this island for wood and water; the former they obtain from wrecks, the latter from a pond near the centre of the island.

The Mud Islands, called also the North Seals, are 5 or 6 low ragged islands, the largest of which lies N. E. by N.  $3\frac{1}{2}$  miles from the Southern Seal Island; it is one mile and a quarter long, and off its southern point lies the Noddy, a little low islet; to the southward of which are overfalls of eighteen feet; large vessels, in passing between Seal and Mud Island, should be careful to borrow within a mile of Seal Island, for these overfalls extend full three-quarters of a mile from Noddy Islet. To this islet the petrels, or Mother Cary's chickens, annually resort in great quantities to hatch their young, flitting about in astonishing numbers. Nearly N. W. by N. distant two miles from the largest Mud Island, is a ridge of rocks, called the Soldier's Ledge; it is commonly uncovered at half ebb. The course from abreast of Cape Sable to pass between Seal and Mud Islands, is N. W. by W. you will meet with some overfalls in this direction, but no danger.

**Tusket Bald Islands** are a cluster of islands lying to the northward of the Mud Islands and to the south-westward of the entrance of the Tusket River; some of them are of considerable dimensions, and there are many shoals and dangers among them, so that although there may be navigable channels between, no stranger should attempt these passages. In the channel which separates the Tusket and Mud Islands, is a rocky shoal, called by Des Barres the Acteon; it lies N. N. W. distant 4 miles from the largest Mud Island, but Mr. Lockwood places it one mile and a half further off; nevertheless, these are generally supposed to be the same dangerous shoal, although its position does not seem to have been exactly determined; it appears to have from 2 to 4 fathoms over it, and therefore must be carefully watched for and guarded against by those who should venture through this channel.

**TUSKET RIVER** runs in to the north-eastward of the Tusket Islands, and is one of several inlets that are navigable on this part of the coast; it has several settlements, on its banks, but at present it is little known or frequented.

**PUBNICO HARBOR** is, according to Mr. Lockwood's account, "an excellent ship harbor, easy of access, and well situated for vessels bound for the Bay of Fundy, and distressed for either shelter or supplies. Its entrance is distant from the south end of Seal Island 12 or 13 miles, from which it bears N. E.  $\frac{1}{2}$  E. the depths of water between them being from 16 to 20 fathoms, and from thence to 12 and 7 fathoms up so far as the beach, which is the proper place for strangers to anchor. Above this beach, on the western side, is a ledge, which becomes partly dry at low water. About 2 or 3 miles, on the starboard shore, before you arrive at the entrance to Pubnico is St. John's Island, under the northern side of which is good shelter in S. easterly gales; and small vessels fre-

quently lie through the Cockewit, partly sho-

, and is one settlements,

cellent ship dy, and dis- end of Seal tween them s the beach, the western iles, on the land, under vessels fre-

quently lie round the beach which forms its eastern part; but coasters commonly pass through the inner channel, within St. John's Mutton, and Bonne Portage Islands, by Cockewit, and thence towards Harrington Bay by Shag Harbor; but these places are partly shoal, and totally unfitted for large vessels.

From the entrance to Pubnico a W. N. W.  $\frac{1}{2}$  W. course for 4 leagues, will lead clear to the southward of the Tusk Islands, but in this route you must be very careful to avoid the Soldier's Ledge and the Acton, both of which have been already described. Having passed to the westward of the Mud and Tusk Islands, you will encounter, in your passage to the northward, the Gannet Rock, which lies N. W. by W. nearly 6 miles distant from the Southern Bald Island, and S.  $\frac{1}{2}$  W. 10 miles from Cape Fourchu; it is 36 feet above the surface of the water, and always appears whitened by the dung of birds: about two miles to the south-westward of the Gannet is the Opposum's Ledge, which is visible at half tide, and appears to have endangered the lives of many, having been formerly represented to lie 4 miles W. by N. from the Gannet; Des Barres has placed this danger in latitude  $43^{\circ} 40' 40''$  and longitude  $66^{\circ} 9'$ .

GREEN ISLAND lies N. N. E.  $\frac{3}{4}$  N. distant  $3\frac{1}{2}$  miles from the Gannet Rock Light; there is a reef runs out from this island to the S. Westward almost  $\frac{2}{3}$  of a mile; round this reef are 6 and 5 fathoms water, and between it and the Gannet Rock from 12 to 17 fathoms. West of Green Island, about  $1\frac{1}{2}$  mile, is also a sunken ledge; it lies directly in the fair way of the channel to the Little Harbor of Jebogue, which is shoal and intricate, being the common resort of fisherman and coasters; the lands adjacent are moderately high, and are both well cultivated and settled. Should a stranger venture for this harbor, he must not only avoid the dangers already described, but also a rocky shoal, called the Dragon, which is situated S. W. Southerly a full mile from Jebogue Head, and N. N. E. one mile and three-quarters from Green Island; there are 8, 10, and 12 fathoms between the Dragon and Green Island, and 5, 6, and 7 fathoms between it and Jebogue Head; there is also a knoll of 3 fathoms at the entrance of the harbor, and shoal water off its eastern side.

CAPE FOURCHU, or the Forked Cape, so called from the island which forms it, having two narrow prongs running out to the southward, but the inlet formed between these must not be mistaken for Yarmouth Harbor, which lies to the eastward of them both. This Cape, according to the best authorities, lies in latitude  $43^{\circ} 52' 30''$ , and forms a remarkable object in these parts, being rocky, high, and barren; it bears from Jebogue Head N. N. W.  $\frac{3}{4}$  N. distant  $4\frac{1}{2}$  miles.

YARMOUTH.—Vessels intending to run for Fourchu or Yarmouth Harbor, will find it the safest way to proceed to the westward of Seal Island, the Gannet Rock, and Green Island, giving the Gannet a berth of about two miles; they will then have no danger to encounter, but from 20 to 30 fathoms water all the way. Having passed Green Island, their course towards Yarmouth Harbor will be about N. N. E.  $\frac{1}{4}$  N. in this passage they will meet with the Bagshot Rock, which dries at low water, and is dangerous, running out shoal full half a mile to the southward; it bears from Cape Jebogue nearly N. W. from which it is distant almost  $2\frac{1}{2}$  miles, and from Cape Fourchu S. by W. almost  $2\frac{1}{2}$  miles; you may pass on either side of this rock, and run on N. by E.  $\frac{1}{4}$  E. for the harbor's mouth; this is considered a safe but small harbor; the fair way is to follow the eastern shore until you reach the eastern point; this you are to give a berth, and proceed mid-channel; you will readily perceive the isthmus, with a battery upon it, and under its lee, to the northward, is the anchorage; the ground is good, and the depth of water from 5 to 6 fathoms. About a mile above the anchorage is the town of Yarmouth, which is numerously peopled, the houses large, though straggling, the grounds adjacent well cultivated, and the circumstances of the inhabitants generally good.

From Cape Fourchu to Cape Mary the main land extends N. by W. and from Cape Mary to the Lighthouse on Brier's Island is N. N. W. 13 miles. Almost opposite to Cape Fourchu is the Lurcher's Rocky Shoal, and between that and Cape St. Mary is the Trinity Ledge, and these are the only dangers in the passage.

THE LURCHER ROCK lies nearly W. N. W. from Cape Fourchu, distant 13 miles; it covers a spot of about 3 acres of shoal ground, the least water over which is 12 feet; around the edge of the shallow water are 10, 11, and 12 fathoms, and a little further off from 20 to 30 fathoms.

THE TRINITY LEDGE comprehends a smaller space than the Lurcher, about three-fourths of an acre, having the tops of three small rocks showing themselves at low tides; this danger bears from Cape Fourchu N. by W. distant 14 miles, and from Cape St. Mary S. W.  $\frac{3}{4}$  W.  $6\frac{1}{2}$  miles; the depth of water to a mile round it is from 12 to 15 fathoms. The stream runs very strongly over these two dangers, but the anchorages in their vicinity are tolerably good for a tide.

Vessels coming round Cape Sable, and intending to take the Tusk Passages, may

steer N. W. by N. and proceed through either of the channels which have been described before, as best suits their convenience, or else proceed to the southward of Seal Island for about 35 miles, passing at the distance of 20 miles to the westward of Seal Island; thus the Bay of Fundy will be open, and their course up N. N. W. This will carry them outside of the Lurcher, but the tide will make one point difference in this course, and it sets S. E. and N. W. through the channels of Mud and Tusket Islands, and near the Manan Ledges, the ebb running W. S. W. and the flood E. N. E. at the rate of 4 knots an hour.

From the Seal Islands up to Cape St. Mary, the soundings extend full 20 and 30 leagues off the land westward of Brier's Island Light, and near the Manan Ledges are 60, 80, and 100 fathoms at 3 and 4 miles distance; therefore the lead should always be kept going.

#### BRIER'S ISLAND, AT THE ENTRANCE TO THE BAY OF FUNDY, TO CHIGNECTO BAY.

**BRIER'S ISLAND** lies at the S. W. entrance of St. Mary's Bay; it is 4 miles long and  $1\frac{1}{2}$  mile broad; on its western side stands a lighthouse, *ill constructed and badly lighted*; the mariner, therefore, cannot place his dependence upon seeing it, which is the more to be lamented, on account of the dangers which surround it. In advancing from the westward towards the island, the tide ripples strongly, even in 33 and 45 fathoms, when you are at the distance of 8 or 10 miles off the island. There is a long and narrow reef runs out S. W. from the S. Eastern part of the island, full two miles, some parts of which are visible, and called the Black Rock; in the same direction to the S. W. is a small spot of 3 fathoms; this lies about  $1\frac{1}{4}$  mile from the extremity of the reefs; between the knoll and reef, and also around the knoll, there are from 15 to 34 fathoms: vessels, therefore, going round to the southward of Brier's Island must always give it a wide berth. About 3 miles N. W.  $\frac{1}{4}$  W. from the northern end of the island lies the N. W. Ledge of 10 feet; it is small and dangerous: nearly S. W. three-quarters of a mile from this, is Betson's Ledge, and between these two ledges and the island are two others, said also to be dangerous, with deep channels between them, but the exact situations of these are not clearly known; it will therefore be particularly dangerous for the mariner to approach nearer to the northern side of this island than four or five miles.

**LONG ISLAND** is separated from Brier's Island by a narrow channel, called the Grand Passage, in which are from 5 to 15 fathoms water; the island runs in a N. E. and S. W. direction, being nearly 10 miles long, and about  $1\frac{1}{2}$  mile broad; its coasts are almost straight, and at its further end is the Petit Passage, dividing it from a narrow neck of land which continues so far as the Gut of Annapolis; thus Brier's Island, Long Island, and this peninsula, form the northern shores of

**ST. MARY'S BAY.**—While from Cape St. Mary, upwards into the bay, the southern shore is low and runs out with sandy flats, in some places almost so far as three-quarters of a mile; the opposite or northern shore, is constituted of high cliffs, having deep water close under them. Nearly mid-channel, and full two-thirds up the bay, is a rocky bank, with 4, 5, and 6 fathoms over it, whilst on each side of it are channels of 12 and 15 fathoms, muddy ground. Far up the bay, on the southern shores, is the River Sisibou, the entrance to which is shoal, with a depth of only 2 fathoms water. At the further end of St. Mary's Bay, is an extensive sandy beach, on entering which you will lessen your depth from 4, 5, and 6 fathoms to 12 feet, and should you advance, it will become more shallow. On the north side, and nearly opposite to Sisibou River, is Sandy Cove, where vessels, when it comes on to blow hard, may run aground on a bottom of soft mud, and lie sheltered from all winds.

**GRAND PASSAGE.**—We have already stated that this channel runs in between Brier's and Long Islands; its southern entrance bearing North, distant 29 miles from Cape Fourchu, and N. by W. 12 miles from Cape St. Mary; in running for it, from abreast of Cape St. Mary, you will have no impediment whatever, but a depth of from 14 to 30 fathoms; at the entrance of the passage is 18 fathoms mid-channel, and having advanced within you will perceive Billy Islet; this may be left on either side, although Mr. Des Barres says the western channel is the best and widest; here, a little to the northward of the island, is one of the safest and best harbors in the vicinity; from hence to the northward are 4, 5, 6, and 7 fathoms; following the shore of Brier's Island, opposite its northern point, the water deepens to 13 and 14 fathoms; you are then clear of the Grand Passage, and may borrow towards Long Island, steering N. Easterly, or N. E. by N. into the Bay of Fundy.

**PETIT PASSAGE** lies at the further extremity of Long Island, and is the channel which separates that island from the main. It is situated about 3 leagues to the north-

N. Easterly, or

is the channel  
to the north-

eastward of the Grand Passage, and is 280 fathoms wide in its narrowest part: its shores are bold to, and there is from 20 to 30 fathoms of water within it; a N. N. E.  $\frac{1}{2}$  Northerly course, from abreast of Cape St. Mary, will carry you right through it. Near its northern entrance, on the western side, is Eddy Cove, a very convenient place for vessels to anchor in, for here they may ride out of the stream of tide, which commonly runs so rapidly, that without a fresh leading wind, no ship could possibly stem it.

**ANNAPOLIS GUT.**—Pursuing the coast along shore from Brier's Island to Annapolis Gut, it has very few curvatures; the shore is bound with high rocky cliffs, above which a range of hills rises gradually to a considerable height; their summits appear unbroken, except at the Grand and Petit Passages, at Sandy Cove, and Gulliver's Hole, where they sink down in valleys, and near the Gut, where they terminate by an abrupt and steep declivity. The mariner, in navigating this coast, will by keeping about a mile or a mile and a half from the land, have 50, 40, and not less than 30 fathoms water all the way; and when at the entrance of the Gut,  $1\frac{1}{2}$  mile distant from the lighthouse on Point Prim, he will find the latter depth. The Gut of Annapolis, says Mr. Des Barres, lies in latitude  $44^{\circ} 45' 30''$  N. and longitude  $65^{\circ} 46' 30''$  W. The shore on both sides of the Gut is iron bound for several leagues; the stream of ebb and flood sets through the Gut with the velocity of 5 knots an hour, causing various eddies and whirlpools, but the truest tide will be found off the eastern side, which is so bold to approach that a ship may rub her bowsprit against the cliffs, and yet be in 10 fathoms water. There is a lighthouse upon Point Prim, the light from which is exhibited from a window 120 feet above the sea, and is an object of pitiful and useless economy; but it may perhaps serve to prevent the fatal error of mistaking the real entrance of the Gut from Gulliver's Hole, which the land much resembles, but which the latter has no such distinguishing building upon. Point Prim runs off shoal about 30 fathoms, and off the eastern entrance is the Man of War Rock: it lies about a cable's length from the land, and has no channel within it. The entrance to the Gut is very narrow, but keep mid-channel, and after you get within it the harbor widens, and ships can anchor on the east or west side of the basin, or run up to Goat's Island, if the latter, they should observe that when they get within half a mile of the island, they must stretch two thirds of the way towards the larboard shore, until they are past the island, which is shoal all round, and from thence they can steer up mid-channel towards the town.

In addition to the above, Mr. Lockwood observes, "That the abrupt precipices of the high lands which form the Gut, cause those gusts of wind which rush down so suddenly and so violently from the mountains. The tide also hurries your vessel through with great force. At the entrance there is no anchorage except close in shore, near the outer western point; in some places the depth is from 40 to 80 fathoms."

**ANNAPOLIS TO THE BASIN OF MINES.**—From the Gut of Annapolis up the bay to Cape Split, the coast continues straight, and nearly in the same direction, with a few rocky cliffs near the Gut, or narrows, and many banks of red earth under high lands, which appear very even. In the channel or narrows leading into the Basin of Mines, from Cape Split to Cape Blownedown, and from Cape D'Or on the north side, to Partridge Island, the land rises almost perpendicularly from the shore to a very great height. Between Cape Blownedown and Partridge Island, there is a great depth of water, and the stream of the current, even at the time of neap tides, does not run less than 5 or 6 fathoms. Having passed Cape Blownedown, a wide space opens to the southward, leading to the settlements of Cornwallis, Horton, Falmouth, and Windsor, &c. these are now rising into great mercantile consequence, and abound in mines of coal, plaster, limestone, and other valuable minerals. While to the eastward the river extends to Cobequid Bay, having on its banks the towns of Londonderry, Truro, and Onslow, this latter place forming a direct communication with the Bay of Tatmagouche in the Gulf of St. Lawrence. Off Cape Split there are considerable whirlpools, which, with spring tides, are very dangerous, and frequently run 9 knots an hour. Should a vessel be at anchor between Cape Sharp and Partridge Island, and you should be desirous of proceeding to Windsor River, it will be necessary to get under weigh two hours before low water, in order to get into the stream of the Windsor tide on the southern shore; otherwise, without a commanding breeze, a vessel would run the hazard of being carried up with the Cobequid tide, which is the main stream, and runs very strong, both with flood and ebb; while the Windsor tide turns off round Cape Blownedown to the southward, and is then divided again, one part continuing its course up to Windsor, and the other forming the Cornwallis tide, running up the river of that name.

In sailing up Windsor River, the house on Horton Bluff should be kept in a south bearing, and the gap in the Parsborough River north; this will carry you through the channel between the flats, which cannot be passed at low water by a vessel drawing 15 feet much before half tide. Off Horton Bluff the ground is loose and slaty, and a ship will be likely to drag her anchors, with a strong breeze, particularly at full and change;

therefore it might, perhaps, be better for men of war to moor across the stream, and full one third from the Bluff.

**HAUTE ISLAND.**—This island is situated at the entrance of the Mine's Channel, and is not  $1\frac{1}{2}$  mile in length, and about half a mile broad; it bears from Cape Chignecto S. W. distant 4 miles: the channel on either side is good; that between it and the Cape has 14, 20, and 22 fathoms water in it, and that between Haute and Jolyffe Head from 20 to 40 fathoms; it forms a prominent and very remarkable object, from the height and steepness of its rocky cliffs, which, in a most singular manner seem to overhang its western side; there is, however, a fair landing at its eastern end, and anchorage half a mile off in 18 fathoms, with the low point bearing about N. E. by N. here also is a stream of fresh water running into the sea. Cape D'Or and Cape Chignecto are high lands, with very steep cliffs of rocks and red earth, and deep water close under them. You have nearly the same kind of shore to the head of Chignecto Bay, where very extensive flats of mud and quicksand are left dry at low water. The tides come in a bore, rushing in with great rapidity, and are known to rise, at the equinoxes, from 60 to 70 feet perpendicular.

**CHIGNECTO BAY** runs up E. N. E. and may be considered to be the north-eastern branch of the Bay of Fundy; it is divided from the Mine's Channel by the peninsula, of which Cape Chignecto is the western extremity: having advanced about 12 or 13 miles within it, you will see a point on the larboard or northern shore running out to seaward, this is called Cape Enrage or Enraged Cape; 11 miles beyond which it divides into two branches, the one leading to Cumberland Basin, and by the River Missequash to Verte Bay, in the Gulf of St. Lawrence, and now becoming a place of very considerable commerce; the other running northerly, and taking the name of the Petcuadiac Bay; these parts, like the Basin of Mines, are fast rising into consequence, and becoming seats of numerous settlements. The Cumberland Branch is navigable to within 10 miles of Verte Bay; and it is remarkable that when the rise of the tide in Cumberland Basin is 60 feet that in Verte Bay will only rise 8 feet. The River of Missequash, which runs across the isthmus, is the present boundary between the provinces of Nova Scotia and New Brunswick.

#### CHIGNECTO BAY TO THE MANAN ISLANDS, AND PASSAMAQUODDY BAY.

**THE NORTH COAST OF THE BAY OF FUNDY**, from Cape Enraged, to Quaco, in the township of St. Martin's, is, at present, but thinly inhabited, and continues to be so as far as St. John's: the land is good, but much broken with steep valleys; the weather is generally humid, the winds boisterous and changeable, and the intervals of sunshine limited and evanescent: but from Quaco to St. Johns the interior hills rise in easy inequalities; the ravines of the cliffs are deep and gloomy, and the indentations frequently have beaches: at Black River, which is about 12 miles west of Quaco, is a safe inlet for a small vessel, although it is dry from half-tide.

**QUACO LIGHT** is on a small rock off Quaco Head, W.  $\frac{1}{2}$  S. from St. Martin's Head; it is a revolving light, time of revolution 30 seconds.

**QUACO LEDGE.**—This is a dangerous gravelly shoal, situated about 12 miles S.  $\frac{1}{2}$  E. from Quaco, and W. by N. distant 11 miles from Haute Island; it extends N. W. by N. and S. E. by S. about  $3\frac{1}{2}$  miles, and is half a mile broad; vessels have frequently grounded upon this bank; there are several irregular patches of rocks lying off its N. E. side; the ledge shows itself at half tide, and dries for about 100 yards, having but 12 feet water over it with common tides; half a mile to the N. E. the eddies with the flood tides are strong and numerous, the ship's head going nearly round the compass in the space of half an hour; the ebb is a true tide, and sets in a W. S. W. direction towards the ledge; the soundings are from 7 to 14 fathoms, at about two cables' lengths all the way round, but they shoal more gradually from the N. E.

The night tides here, and generally throughout the bay, are highest: at St. John's they are so during the summer, but the contrary during the winter months, or between the equinoxes. The mark to go clear to the southward of the Quaco Ledge is Cape D'Or on with the south side of the Island Haute.

**ST. JOHN'S HARBOR.**—The entrance to this harbor bears from the Gut of Annapolis about N.  $\frac{1}{2}$  W. distant 11 leagues: it is distinguished by a lighthouse which stands on Partridge Island, after mentioned. Vessels coming from seaward, and making for this harbor, should, so soon as ever they can well discern the lighthouse, make their signal for a pilot; but if unable to succeed in reaching the harbor that tide, then endeavor to run in between Megegenes Island and the main, going either on the south or on the north side of this island, in doing which you will no where have less than 4, 5, and

6 fathoms water, with a bottom of sand and mud. Here you will obtain the best anchorage, by bringing the three hills in the country to the N. E. in a line over Rocky Point Island, and the house on Meogenes Island S. E. by S.

THE CITY OF ST. JOHN stands on an irregular descent, having a southern aspect, and on entering the river, has an imposing appearance. Partridge Island is about two miles to the southward of the city, answering the double purpose of protecting the harbor, and, by its lighthouse, guiding and directing the mariner to its entrance; the lantern is 166 feet above the level of the sea, and the light is good and well attended. The ground for several miles to the southward of Partridge Island is muddy; the depths gradual from 7 to 20 fathoms, affording excellent anchorage; the passage westward of this island has in it 10 feet, that to the eastward has 16 feet, and abreast of the city are from 7 to 22 fathoms. Three fourths of a mile to the northward of the lighthouse is a beacon fixed on the edge of a rocky ledge, forming the west side of the channel, and having deep water close to it. A breakwater is erected further on at the eastern side of the channel and below the town; this greatly intercepts the violence of the waves, which southerly gales usually occasion. Every possible assistance is here given to ships wanting repair, they lie upon blocks, and undergo a thorough examination, without incurring the expense, injury, and loss of time occasioned by heaving them down.

Vessels having made the harbor, and finding themselves able to enter, may, when they have passed Meogenes Island, edge in shore towards Rocky Point, until they perceive Meogenes Point is in a line with, or over the N. W. corner of Meogenes Island: then, sailing in between Rocky Point and Partridge Island, with these marks on, will lead them, in the deepest water, over the bar, until they open Point Maspeck to the westward of the low point of Partridge Island; when putting the helm starboard, they then edge over towards Thompson's Point, until they get the red store at the south end of St. John's in a line over the beacon; keep them in one, until they have passed the beacon at the distance of a ship's breadth: then haul up N. N. W. for the harbor, and the blockhouse, at the upper part of the harbor, open to the westward of the king's wharf, situated by the water side; which mark will lead them, mid-channel, up to the wharves, where they may lie aground, dry at half-tide, and clean the ship's bottom, or ride under in the stream at single anchor, with a hawser fastened to the posts of the wharves on shore. The flood tide is weak here, but the ebb runs down rapidly past Meogenes Island into the Bay of Fundy.

Should the tide of ebb have taken place at the beacon, then it would be highly improper to attempt gaining the harbor that tide; but wait for the next half-flood to go over the bar; as both sides of the entrance to the harbor are composed of sharp rocks, which dry at low water; and the tide of ebb, especially in the spring of the year, when the ice and snow is dissolving, is so exceedingly rapid and strong, that all the anchors you possess will not be sufficient to prevent the ship from driving.

"The River St. John," says Mr. Des Barres, "has sufficient depth of water for large ships to the falls; whence it continues navigable eighty miles up the country, for vessels of 100 tons. At Fort Frederick the rise of the tide is 18 feet, and at equinoctial spring tides 25 feet; above the falls it seldom rises more than 4 feet. When the tide has risen 12 feet at the fort, the falls become smooth, after which, during the space of 20 minutes, they are passable. At times of great freshets, which generally happen between the beginning of April and the end of May, from the melting of the snow, the falls are absolutely impassable for vessels going up the river, for then the tide does not rise to their level."

The falls are situated nearly 2 miles beyond the City of St. John; it is a narrow channel, 80 yards wide, and 400 long; this channel is straight, and has a ridge of rocks stretching in such a manner across it, as to hold and retain the river water from running out into the sea. After passing the falls, you enter a gullet, which is a quarter of a mile wide, and two miles long, winding in different courses, and having 16 fathoms in the channel. Next to this gullet is a fine and extensive basin, a mile and a half wide, and eight miles long, which enters the main river. The river branches some hundreds of miles up in a serpentine manner; and runs through a country which abounds with timber, coal, limestone, and many other minerals; and the surrounding lands are now becoming highly cultivated. There is water sufficient to navigate vessels of 50 tons, as high as Frederickton, and in all the branches to the lakes adjacent, except in dry seasons.

In the middle of May, or earlier in favorable seasons, the snow and ice in the country, dissolving, occasion a general overflow in the river, which, in some years, rises so high as to inundate all the low lands.

In autumn, the River St. John is swollen by rains, and between the middle of April and the beginning of May, by the melting of the ice and the great quantity of snow that accumulates on the banks of this vast navigable river. From these causes, the water streams out to seaward continually: therefore vessels, at that time, seldom enter the harbor with-

out a fresh leading wind. The falls are then impassable, as the tides do not rise to their level.

The body of the river is  $17\frac{1}{2}$  feet above low water mark, consequently after the tide has arisen to that height, the water descends, or literally falls up into the river. When the tide has flowed 12 feet, the falls are smooth and passable for 20 minutes. Above the falls the water rises 4 feet, and at Majorfield, which is 60 miles in the interior, it rises only  $1\frac{1}{2}$  foot.

To the W. S. Westward of Meogenes Island is Flat Bay, called also Visarinkum; it is a small harbor, with 5 and 4 fathoms water, used sometimes by the coasters. From hence the land runs nearly W. S. W. passing Negro Head to Cape Musquash; off the point of which is Split Rock; it lies close to the Cape, and has 8 fathoms water very near it, being distant from Partridge Island  $8\frac{1}{2}$  miles; the shore is ironbound all the way, and has deep water close in to the land.

**MUSQUASH HARBOR** lies about a mile to the westward of the Split Rock; its entrance is about half a mile wide, and there is good anchorage a little way in, with 4 fathoms water, but further on a bar runs across the harbor, over which is only  $1\frac{1}{2}$  fathom; small vessels sometimes pass to the westward of the islands, and run up the river, which, when past the bar, has 2,  $2\frac{1}{2}$ , and 3 fathoms water; but this harbor is open to the southward.

From the entrance to Musquash the coast runs W. S. W. westerly nearly 10 miles to Point Lepreau, on which there is a tower with two fixed lights, one elevated 18 feet above the other. In this space are 4 or 5 inlets, but only calculated for small craft; the first of these is about  $1\frac{1}{2}$  mile to the westward of Musquash western point, and is of no note whatever; in your way to it, a berth must be given to the shore, particularly about Musquash Point, on account of some rocks lying off that part; there are channels between these rocks, but few vessels will venture through them. About a mile further is Chance Harbor, which is a mere shallow cove of two fathoms water. Little Dipper is westerly still, and situated  $3\frac{1}{2}$  miles from Musquash Point; this also has only 12 feet water in it; and scarce fit for any thing but boats. Great Dipper is divided from Little Dipper by a flat point of land, round which are several scattered rocks; this harbor can accommodate small craft, which sometimes run in there for shelter; but it is by no means to be recommended, unless in cases of necessity; there is a creek of fresh water and a point called Moose Creek. Further westward, and about  $1\frac{1}{2}$  mile from Point Lepreau, is Carriage Harbor: this is open to the eastward, and affords anchorage at its entrance in from 7 to 3 fathoms. The land all the way from Musquash to Point Lepreau is high, broken, and, many scattered rocks lie off it; therefore vessels, in passing, should carefully give it a good berth.

**MACES, or MASON'S BAY**, is formed to the westward of Point Lepreau, between Red Head and Red Head; these bear from each other N. W.  $\frac{1}{2}$  N. and S. E.  $\frac{1}{2}$  S. distant full 5 miles. There are numerous rocks, shoals, and small islets within it, but its navigation seems insecure, for Mr. Lockwood emphatically observes, "this point ought to be classed as one of the dangers of the Bay of Fundy, for many serious accidents have lately happened in the neighborhood of this promontory." Mason's Bay he calls a deep and ugly indent; so much so, that ships bound to the River St. John, dreading to pass its entrance, get frequently embayed there, and some valuable vessels have thus been lost. "Yet, at the head of this bay," he observes, "is a place called Pok Logan, where there is good shelter. Several rivers appear to fall into this bay; and, perhaps, a better knowledge would tend much to strip it of its fancied dangers."

W. by S. from Point Lepreau, distant  $3\frac{1}{2}$  or 4 miles, there is supposed to be a dangerous shoal, but its actual situation is not known: if such should exist, it must be surrounded with very deep water, for a small distance from this imagined situation, are 26, 28, and 31 fathoms, mud, mud and sand, and gravel.

**THE MANAN ISLANDS.**—Grand Manan is an island situated at the north-western entrance of the Bay of Fundy; it is in the province of New Brunswick, and forms a part of Charlotte County; being  $14\frac{1}{2}$  miles in length, and 7 in breadth. According to the Chart, the N. Western part of this island is distant from Passamaquoddy Head about 7 miles: its N. Eastern point, or Bishop's Head, bears from Cape Maspeck W. S. W. nearly 10 leagues, and W. N. W. from the entrance to the Gut of Annapolis, about 14 leagues; and from Petit Passage, N. W. by N. 32 miles. Its S. W. end, or head, bears from the lighthouse on Brier's Island N. W. by N. nearly, from which it is distant 28 miles; and N. W. by W. from the northern entrance to Petit Passage, distant 30 miles. Thus situated, it commands an uninterrupted view of every vessel that passes to or from the Bay of Fundy; it is naturally strong, and possesses harbors where the largest ships may ride in perfect security: its fisheries are in great estimation.

On its western side the cliffs are nearly perpendicular, rising 600 feet above the level of the sea; but on this side there is only one little inlet along the whole range, that can

nge, that can

shelter even boats; it is commonly called Dark Cove, being situated about 4 miles from the northern part of the island: there is indeed a place called Bradford's Cove, about 5 or 6 miles more to the southward, but this is of no note whatever. There are soundings all along the shore, from Bishop's Head to the S. W. Head, 3, 4, 5, and 6 fathoms close to the land, deepening to 13, 20, 21, and 22, half a mile off, to 30, 40, and 50 fathoms at a mile distance, and still deeper as you increase your distance from the island.

The Northern, or Bishop's Head, is abrupt and bold; but on its eastern side there is anchorage in a place called Whale Cove: this is situated between Swallow's Tail and the North Point; here vessels frequently ride during southerly winds, to wait the turn of tide; the soundings are from 15 to 25 fathoms; but it must not be resorted to in northerly gales.

*Long Island Bay.*—This lies to the S. Eastward of Whale Cove, and is formed by the Swallow's Tail, which is a bold, high, ragged, and barren looking point, and Long Island, which bears nearly south from it, distant 1½ mile. This bay is easy of access, and possesses all the advantages of a harbor; the bottom of the bay is generally mud, excepting a ridge of rocks and gravel, which extends from the ledge that shows itself within the Swallow's Tail, and the cluster of sunken rocks that lie half a mile N. N. E. from Long Island Point, and these are 5 feet under water at low spring tides. In the northern part of the bay the bottom is a stiff clay, and vessels ill provided with gear have often rode out the severest gales there; and under Long Island, opposite the beach, is good anchorage, even locking in the northern end of Long Island with Swallow's Tail: the ground here is a strong mud, and you will ride safe and unaffected by sea or wind from any quarter.

Further to the southward, and on the eastern coast of Great Manan, are the Duck Islands; here a pilot will be necessary, for though the ground is good about Great Duck Island, yet there are dangers which, when the tide becomes high, are completely hidden. To the south-westward of Duck Islands, are the Islands of Ross, the northern point of which is scarcely separated from Manan, Cheney's Island, and White Head Island; these are connected together by a sandy and rocky reef of foul ground, which extends S. by W. to the Diamond Rocks—of which we shall speak hereafter. On White Head Island resides an able and active pilot, and the cove opposite to his house is commonly a great resort for vessels employed in the fisheries; but with easterly winds, this is no desirable place. At the western side of Ross Island is part of what is called Grand Harbor; it is a shallow muddy basin; but vessels may enter and lie securely in it, on the mud; a convenience somewhat desirable, should you have lost your anchors and cables on any of the outer ledges: the entrance to this place has 4, 5, 6, and 7 fathoms water, with a clayey bottom; the channel is narrow, but secure from the sea.

A little to the westward of White Head Island are the Green Islands, and to the southward of the Green Islands, about one mile, are the three Kent's Islands, these latter are low and ledgy; the eastern, or largest one, is bold to the rocks, which are at all times to be seen; and to the N. Westward of these rocks is a ledge called the Constable, which dries at low water; under the lee of these and the Green Islands, occasional anchorage may be obtained in from 14 to 7 fathoms.

WOOD ISLAND lies off the southern part of Grand Manan, and is one mile and three quarters long; it runs parallel to the south-west head of Manan, and forms an excellent harbor between; the upper part of this inlet, and the head of it, afford most secure anchorage; and the inhabitants about Seal Cove and Red Head, will furnish you with all necessary supplies you may stand in need of, for these places are all well settled.

THE MANAN LEDGES are those more distant islets, rocks, and dangers, which lie to the southward of Grand Manan; the outer and most dangerous of these is the Old Proprietor; covering a space of half an acre at low water, and drying at half ebb; but when covered the tide sets directly over it, at the rate of 4 miles an hour. It lies S. by E. distant 9½ miles from Great Duck Island; S. by E. nearly 7 miles from the north eastern part of White Head Island; E. ½ S. 6½ miles from the Gannet Rock; S E. by E. 4 leagues from the south west head of Manan; N. N. W. ½ N. 18½ miles from Brier Island Lighthouse; N. N. W. ½ W. 18 miles from the northern entrance to the Grand Passage; N. W. ¾ W. 18½ miles from the Petit Passage; West 35 miles from the Gut of Annapolis; and S. W. 15 leagues from the Lighthouse on Partridge Island.

About 2½ miles N. E. ¼ N. from the Old Proprietor is the Clerk's Ground; a rocky shoal of 4½ fathoms. N. W. by N. one mile and two thirds from the Old Proprietor, is Crawley's Shoal, of 7 feet only; and west of the Crawley, one mile and a half, is the Rans' of 5 feet. The Roaring Bull bears N. ½ E. from the Old Proprietor, distant 4 miles; and, although it has 6 fathoms over it, it usually has a heavy dangerous ripple. The marks to go clear to the eastward of all these dangers, is the north-easternmost high-land of Manan well open of the Long and Duck Islands; the mark to lead to the southward of them is the south-west head of Manan open to Kent's Three Islands. In easterly winds the tide-rips are impassable.

There are also other rocks within these; a range of which lie south of the south-west point of White Head Island; some of these have deep water between them, and occasion a continual ripple three miles from the shore, quite home to the long point; these are called the Tinker, Three Diamonds, Rans, and many others without names; some of these show themselves, others have only 3 and 4 feet water over them.\*

S. S. E.  $\frac{1}{2}$  S. about three quarters of a mile from the southern point of the Three Islands is a knoll called the Kent, it is dangerous and has only 7 feet water over it; it bears about W. N. W.  $\frac{1}{2}$  W. from the Rans, and is not included within the confines of the mark given to avoid the dangers to the southward, viz. the S. W. head open of all the islands. There is also a danger said to lie S. E.  $\frac{1}{2}$  S. from the Kent Knoll, distant 2 miles, and W. S. W.  $\frac{3}{4}$  S. one mile and a quarter from the Rans, but this is doubtful.

THE GANNET ROCK, on which is a lighthouse, is forty feet above water, and lies S. W. by S. distant 3 $\frac{1}{2}$  miles from the southern point of the Three Islands, and S. S. E. 6 $\frac{1}{2}$  miles from the S. W. head of the Grand Manan; it has a number of small ledges and sunken rocks about it, which are always breaking: this stands conspicuous, being in the immediate vicinity of all the sunken rocks and dangers. Nearly W. S. W. from the Gannet, distant one mile and a half, is St. Mary's Ledge; part of which is always above water; and to the northward of St. Mary's Ledge, one mile, is the Long Ledge, equally visible; between and around these are numerous rocky shoals, with deep water between them, rendering this part particularly dangerous. Other reefs are supposed to exist to the westward, and between the Gannet Ledges and the Machias Seal Islands; their imaginary situations are marked on the Chart, but no further particulars of them are known.

THE THREE MACHIAS SEAL ISLANDS lie W. S. W. from the S. W. head of Manan, distant about 9 or 10 miles; they have channels between them, with 10, 20, and 30 fathoms round them. A sunken rock is said to lie to the N. Eastward, between them and Manan; but its exact position is not ascertained. Mariners navigating this part should keep a good look out, for report places many dangers hereabouts, some of which probably have existence, and might otherwise be attended with consequences the most fatal.

Harbor lies about 4 miles to the eastward of Bliss Island, and is above a mile from the entrance, with 10 fathoms water on each side, and 20 fathoms mid-channel. In entering keep the western shore on board, until you bring the Goat Rock to bear east, distant about half a mile, where you may anchor in 4 or 5 fathoms, good holding ground. There are no regular pilots, but the fishermen on the coast are well qualified for the task, though in clear weather they are not absolutely necessary, yet strangers to the place will most probably require their assistance. There are several rivulets running into various parts of the harbor, but there is no convenient watering place.

Etang Harbor is situated to the southward of the Magagadawe, and runs into the north-eastward of Campo Bello; before it lie many islands. There are three entrances into this harbor, so that vessels may go in or out at any time. The western entrance leads to La Tote Harbor, where anchorage may be obtained in from 10 to 5 fathoms, but there is no passage for ships round the northern end of Payo's Island. The channels between Payo's and Bliss Islands are considered to be the best; as they will admit of vessels working through them; but the eastern passage requires a leading wind. A pilot will be necessary on account of the intricacies of the channel, but one can easily be obtained any where on the coast; water can be procured in various places. The Bay is extensive, secure, and well sheltered, having good anchorage throughout.

ST. ANDREW'S HARBOR lies on the eastern side of the entrance of the River Scoddic, and has two entrances; the eastern one is narrow and intricate, but is the deeper, having 4 or 5 feet at low water; the dangers in entering through this passage are a reef of rocks with a beacon on it, extending nearly three quarters of a mile from Navy Island, and a reef of sand and large stones with a pole on it, extending nearly two miles from the block house on the main land; the narrowest part of the channel is not more than a cable's length; the mark for entering is to keep the town of St. Andrews open, and steer directly in for the harbor. In the bay, in general, there are from 17 to 25 fathoms water.

\* The British Ship Alert is said to have discovered an additional rock, upon which that vessel struck in 1810, not noticed on any Chart: by that ship's account it is said to lie S. S. E.  $\frac{1}{2}$  S. distant 6 or 7 miles from the S. W. end of White Head Island; N. by W. distant 17 miles from Brier's Island Lighthouse; and distant 14 miles from the west end of the Grand Manan; and named by the fishermen, Shand's Rock; we cannot help noticing the discordancy of the above bearings and distances, and are apprehensive there is some error in the account; at any rate if this danger is not the Old Proprietor, it must be situated some where not far distant from it; and forms an additional stimulus for the vigilance of the mariner.

The western entrance is not so difficult, but has less water than the eastern, the bar being dry at the last quarter ebb. A dangerous reef of stones, with a floating beacon on it, lies off the west end of Navy Island. In steering you must keep close to the northward of the two poles on the bar, where at high water you will have from 18 to 20 feet water.

There is a Harbor Master and branch pilots belonging to St. Andrews, and large vessels should never attempt to enter without having one of them on board. High water 10h. 45m. Common tides rise 24 feet; spring tides 30 feet.

**GENERAL DIRECTIONS AND REMARKS FOR SAILING TO AND WITHIN THE BAY OF FUNDY.**—Ships navigating the Bay of Fundy have to encounter an atmosphere almost constantly enveloped in dense fogs, the tides setting with great rapidity over the rocks and shoals with which it abounds, and a difficulty of obtaining anchorage on account of the depth; so that, under these circumstances, the most unremitting attention is requisite to prevent the disastrous consequences which must necessarily attend a want of knowledge and caution.

When you are off Cape Sable with a westerly wind, and destined for the Bay of Fundy, it will be advisable to make for the coast of the United States, somewhere about the Shuttock Hills, or Tit Manan Lighthouse, as you can pass with greater safety to the westward of Grand Manan than to the eastward, having also, if necessary, shelter in Petit River, Machias, Passamaquoddy, Etang, or Beaver Harbor, &c.

Between Grand Manan and the State of Maine the passage is free from danger; vessels beating through generally stand from side to side, particularly during fogs, the depth being from 12 to 70 fathoms, with a bold shore on each side, and the tide through strong and regular. The Wolves may be passed on either side, having deep water close to them; but they afford no sheltered anchorage, except for small fishing vessels in summer time; they are from 60 to 100 feet high. With light winds, a lee tide, or thick weather, may let go an anchor any where between the Wolves and Beaver Harbor, in good holding ground, with a depth of 20 or 25 fathoms. Point Lepreau is bold to, but dangerous in dark weather, as it projects so far out to the seaward; but from thence to St. John's course is free from dangers, except those which lie near the head, and which have been described in page 129.

When steering between Grand Manan and Brier's Islands the utmost caution is requisite during thick weather, as vessels are frequently drawn in among the islands and driven to the southward of Manan, by the flood setting directly upon them; the most dangerous of these is the Old Proprietor, which, at low water, dries for the space of half an acre. When the wind, therefore, veers at all to the southward, make the best of your way to St. John's Harbor, or you may secure an anchorage in Grand Passage or St. Mary's Bay, as it seldom blows in that direction above 18 hours without bringing on a breeze.

There is no difficulty in going through Annapolis Gut, if you have but a commanding breeze, although the tide is very rapid, the flood and ebb running 5 knots an hour, and the eddies strong: about one-third through lies the Man of War Rock, about a cable's length from the eastern shore; therefore, if you keep mid-channel, you will be sure to clear it.

The prevailing winds here, and throughout the whole coast of Nova Scotia, are from W. S. W. to S. W. nearly as steady as trade winds, except during the summer months, when they become rather more southerly, accompanied with but little intermission of fog, which requires a N. Westerly wind to disperse. It is therefore recommended not to leave an anchorage, without making proper arrangements for reaching another before dark, or the appearance of a fog coming on, which with a S. W. wind is so sudden, that you become enveloped within it unawares; neither should you keep the sea at night, if you can avoid it. But you will observe that, whenever the wind blows directly off the land, the fog will soon disperse.

**TIDES.**—The tides at the entrance and within the Bay of Fundy are very rapid, but regular, and although the wind against them alters the direction of the rippings, and sometimes makes them dangerous, yet it has little or no effect upon their courses. The flood tide sets from Cape Sable to the N. Westward, through the \*Seal, Mud, and Tusket Bald Islands, at the rate of 2 or 3 miles an hour; and in the channels among the islands, it increases to 4 and 5 miles; from thence taking the direction of the main land, it flows past Cape St. Mary, and then N. N. W. towards Brier's Island: it runs up St. Mary's Bay but slowly, which adds to its strength along the eastern shore; then increasing its rapidity as the bay contracts, it rushes in a bore into the Basin of Mines, and up Chignecto Bay; so that here the water sometimes rises to the extraordinary height of 75 feet.

\* On the western Seal Island, two lighthouses are erected, as mentioned in pages 136, and 138.

To the above may be added the additional observations: "The great volume of fresh water which constantly flows down the Harbor of St. John, in April and May, causes a continual ebb-tide, during that period, sometimes to the depth of nearly 5 fathoms, under which the flood and ebb-tides flow regularly; the maximum of its velocity was found to be four knots and a half, and the minimum at two knots; but as the log floated very deep in the fresh water, and ultimately sunk into the salt water, underneath, it will not be too much to estimate the maximum at five knots, and the minimum at two knots and a quarter. The fact of the under-tide beginning at the depth of nearly 5 fathoms was ascertained by sinking a lead down to that depth, when it was carried the same way as the current on the surface; but when lowered below that, it was drifted in a contrary direction.

"Between Brier's Island and the opposite northern coast, and for some distance up the bay to the eastward, the first of the flood sets strongly, nearly north, so that it will be extremely dangerous for a vessel to run in the night, or during thick weather, from any part of the southern towards any part of the northern coast, without making a large allowance for the set of the tides, and keeping the lead constantly going; the Jaseur, Captain Napier, was nearly run on shore, having been drifted by this tide in a fog, eight miles and a half in three hours and ten minutes."

## COAST OF THE UNITED STATES.

*Directions to go to the eastward of the Island of \* Campo Bello, between the said island and the † Wolf Island, and up the Bay of † Passamaquoddy.*

**THE BAY OF PASSAMAQUODDY** abounds in good anchoring places, well sheltered from all winds, and divides the United States from that of the British territory, the western side of which is distinguished by a lighthouse on West Quoddy Head, situated 90 feet above the level of the sea, and may be seen 7 leagues in clear weather. It shows a fixed light. If bound to the river of Passamaquoddy, in a large vessel, your best way is to go to the eastward of Campo Bello, keeping your course N. E. by E. which will carry you to the Wolf Islands, distant about 3 leagues. The Wolves lie about

\* **CAMPO BELLO LIGHTHOUSE.**—The following bearings were taken from the top of it.

To the East Point of Grand Manan, (Fish Head) S. 18 deg. E. or S. by E. 1.2 E.

To the southernmost of the Wolves, S. 66 deg. 30 E. or E. S. E.

To the northernmost do. S. 87 deg. E. or E. ½ S.

To Point Lepreau N. 84 deg. E. or E. ¼ N.

To entrance of Beaver-Harbor N. 70 deg. E. or E. N. E. ½ E.

To the White Horse Island, the top of the Rock, which is white, N. 45 deg. E. or N. E. This you leave on the starboard hand.

Spruce Island bearing from N. 6 deg. E. to N. 15 deg. W.

To Black Rock, very dangerous, N. 61 deg. 30 W. or N. W. by W. ¼ W.

To Casco-Bay Island, N. 33 deg. W. or W. ¼ N.

† The Wolves, or Wolf Island, which lie 9 miles to the N. E. from Grand Manan, are from 60 to 100 feet in height, steep and bold. The passages between them are deep, and they afford temporary shelter, in the depth of from 20 to 12 fathoms. Between Manan and these isles, the depths vary from 70 to 40 fathoms, bottom of ooze and mud. Between the Wolves and the island of Campo Bello there is a depth of from 60 to 100 fathoms: With the latter bearing S. S. E. or S. E. there is a depth of 19 and 20 fathoms, where ships may anchor safe from all winds. The course thence to Moose Island is W. S. W. 2 leagues.

‡ There are three rivers which fall into Passamaquoddy Bay: the largest is called by the modern Indians the Scoudia, but by Demons and Champlains, Etchemons. Its main source is near Penobscot river. The mouth of the river has 25 fathoms water, and the land is very bluff.

In November, 1817, the commissioners appointed by the respective governments under the treaty of Ghent, (the last treaty of peace,) decided that Moose, Dudley, and Frederic Islands, in the Bay of Passamaquoddy, do belong to the United States; and that all the other Islands in the same bay, with Grand Manan, in the Bay of Fundy, do belong to Great Britain, by virtue of the treaty of peace of 1783. The citizens of the United States continue to enjoy the privilege of navigating through the ship channels between Deer Island and Campo Bello.

E. N. E. from Campo Bello, on the north-east point of which is a lighthouse showing a fixed light, and the lantern is 60 feet above high water mark,—it is placed between the Main Ship Channel and the northern entrance into Head Harbor, and within 250 feet of the extreme point. Ships in entering into the main channel, or vessels bound to Head Harbor, may safely pass at a cable's length from the lighthouse. In sailing up the main channel, care should be taken not to keep far from the shores of Campo Bello, as the flood tide sets directly over from the point at the lighthouse, to the islands and ledges on the north side of the channel, which is here upwards of a mile in width, and at two hours flood the tide sets directly towards the Black Rock, which is a very dangerous ledge between Spruce and Casco Bay Islands, upon which several vessels have been wrecked; after passing up and leaving the light about a mile to the eastward, the tide becomes more regular, and sets along the direction of Campo Bello shore.

Common tides rise here 25 feet. At full and change it is high water at half past 11 o'clock at Moose Island, and runs, when strongest, between Moose Island and Marble Island, and between Deer Island and Campo Bello, nearly 5 miles an hour. In the western passage, common tides rise from 20 to 25 feet, and within Passamaquoddy Bay the stream of tide is scarcely perceptible.

Vessels from the southward, when bound up for this bay, should make for the western coast, or that of the United States, as it is the most clear, and the flood most favorable, being from 7 to 8 miles wide; both shores bold, the depth quickly increasing, on each side, from 12 to 70 and 75 fathoms; the greatest depth near Grand Manan, where you haul quickly from 10 to 75 fathoms.

There are three passages into Passamaquoddy Bay, namely, the Western Passage, the Ship Channel or Middle Passage, and the Eastern Passage. The first is that between the isle of Campo Bello and the main land to the west. Middle Passage lies between Campo Bello and Deer Island, and the Eastern Passage is to the eastward and northward of both islands, which is preferred, being of easy access, with good depth of water.

If bound into the Western Passage, give a berth to the Seal Rocks, which are remarkable rocks that lie about half a mile from West Quoddy Head, and, at a distance, resemble a ship. To the eastward of these, there is a whirlpool. In passing here, be requisite to give these objects a berth of half or three-quarters of a mile before you haul in. After passing them, steer to the westward, keeping nearest to the south shore, for two and a half or three miles, where you may come to anchor in 4 or 5 fathoms, well sheltered, either by day or night. You must not proceed higher, as a rocky bar stretched across, which is dry at low water. Here a pilot may be obtained, on firing a gun, and making the usual signal, who will take the ship to Snug Cove, or Moose Island, whence another may be obtained for St. Andrews, or the river of Scoodic.

Between the Wolves and the island of Campo Bello there is a depth of from 50 to 60 fathoms. With the light bearing S. S. E. or S. E. there is a depth of 19 and 20 fathoms, where ships may anchor securely from all winds. The course thence to Moose Island is W. S. W. 2 leagues.

Off the N. E. end of Campo Bello, is a remarkable large rock, called the White Rock; and here lies Head Harbor, a secure and safe place, small, but of great use, and with 6, 7, and 8 fathoms water, muddy bottom.

Harbor Delute lies on the western side of Campo Bello, and at its S. W. end is Snug Cove, a good harbor. Moose Island is on the opposite side of the channel, and belongs to the United States. The entrance to Passamaquoddy comprehends a space of about twelve miles.

If bound for Moose Island up the River Scoodic, as you pass Todd's Head, (which is half a mile N. E. from the town landing on Eastport,) give it a berth of half a mile, as a ledge of rocks lies off it. Having passed this Head, the course and distance to Oak Point or Devil's Head, will be N. by W. 8 leagues; in going which distance, (24 miles,) you pass Fross' Ledge on your larboard hand, six miles from Todd's Head, and three-quarters of a mile from the land; when continuing your N. by W. course 5 leagues, you will come to Robinstown, two miles above which, off a small island, from which it bears N. E. is a shoal on your larboard hand, and to avoid it you must keep your starboard hand best on board, till you come up with Neutral Island, which you leave on your larboard hand, one-fourth of a mile distant; and your course from this to the Devil's Head, (before mentioned,) which you leave on your larboard hand, is N. N. W. 3 miles. When you have passed the Devil's Head, your course is W. N. W. 1 league, when you will come to a large ledge of rocks that you must leave on your larboard hand, which is bare at two hours' ebb, and extends half way across the river. Keep your starboard hand on board, and when you pass this ledge, your course is W. S. W. distant one mile to Turner's Point, and from said point to the harbor, your course is N. W. by N. distant three miles, and the next reach to the Falls is W. N. W. distant one mile; the tide flows here

25 feet, and there are only 6 or 7 feet in the channel at low water, with long flats of mud on both sides. The Devil's Head may be seen at the distance of 10 or 12 miles.

There are several good harbors on the west side of this river, and all the difficulty is the great depth of water, which is, in general, from 18 to 24 fathoms. There is also a good harbor on your starboard hand going into Deer Island, which lies to the southward of St. Andrews, 2 leagues distant. It may be easily known, as there is a large bay between the two islands, which lies N. E. from the river St. Croix, 3 leagues distant.

\*GRAND MANAN AND MOUNT DESERT HILLS.—These places may easily be known from the western coast. Mount Desert Hills may be seen 20 leagues at sea, and when within 4 or 5 leagues of them, you may see Scutec Hills bearing about N. N. E. The tide of flood sets here E. N. E. and the ebb W. S. W. but as soon as you are 9 or 10 leagues from the land, the current runs in general to the S. W. westward.

\*GRAND MANAN.—This island, 14½ miles in length, by 7 in breadth, is included in Charlotte County, in the province of New Brunswick. Its northern point is in latitude 44° 54' and longitude 66° 45'. The nearest distance, from the opposite coast of Maine, is nearly 9 miles. The western side is very high; its cliffs being nearly perpendicular, and about 600 feet high above the level of the sea. On this side is but one little inlet, (Dark Cove,) which affords shelter for boats only. The northern head is equally abrupt and bold; but to the eastward of it is Whale Cove, having anchoring ground, with 25 to 35 fathoms, in which ships may stop for a tide during a southerly gale, but it is exposed to the easterly gales.

To the S. E. of White Cove, on the N. E. side of the island, is Long Island Bay, so called from the island on the S. E. side of it. The N. E. point of this bay, called, from its shape, the Swallow's Tail, is high, bold, rugged and barren. The bay is open, but possesses all the advantages of a harbor; the bottom is wholly of mud, excepting a ridge of rocks and gravel, that shows itself within the Swallow's Tail, and the north end of Long Island: there is also, a small cluster of sunken rocks, of five feet at low water, at half a mile from Long Island Point.

Under Long Island, and opposite to the beach, ships may anchor, even locking in the north end of Long Island with the Swallow's Tail, on a strong muddy bottom, entirely sheltered from the wind and sea. In the northern part of the Bay, bottom of stiff clay, vessels have frequently been protected during a severe gale.

Half way down, on the eastern coast of Grand Manan, is Great Duck Island, under which there is good ground; but here a pilot may be required, as there are hidden dangers in the vicinity. To the south-eastward of Duck Island lie Ross, Cheney, and White Head Islands; the latter occupied by a skilful and intelligent pilot: from these the rocks and foul ground extend 3 leagues to the S. E.

On the southern bank of Grand Manan, the most dangerous ledge is that called the Old Proprie, which lies two leagues S. S. E. from White Head Island, and covers the space of half an acre at low water; it is dry at half-ebb. When covered, the tide sets directly over it, at the rate of four miles an hour. At three miles more to the S. E. is another shoal, Clerk's Ground; and east from it, nearly four miles, lies the Roaring Bull, a bank of 8 fathoms, over which is a heavy and dangerous ripple. The S. W. head of Manan, open of all the islets off the south side of that island, will lead clear to the southward of these dangers. The north-easternmost high land, open of the islets on the east, leads clear to the eastward of them. During an easterly wind the tide-rips are impassable.

The Three Islands, (Kents), the southernmost of the Manan Islets, are low and ledgy. The eastern side of the largest is bold to the rocks, which are at all times visible. Off the N. W. of these rocks is a ledge called the Constable, dry at low water. These islets, with Green Islets to the northward of them, afford occasional anchorage, in from 14 to 7 fathoms.

Wood Island, on the south side of Manan, and the S. W. end of the latter, form a bay containing excellent ground. The upper part and head of it, in a gale of wind, are places of security; and here supplies, if requisite, may be obtained from the inhabitants.

Between Wood Island on the west, and Ross Island on the east, is the passage to Grand Harbor, a shallow muddy basin. It is a convenient place for ships without anchor or cable, as they may lie in the mud, in perfect security. At the entrance, which is narrow, the depths are from 7 to 5 fathoms, bottom of clay.

W. by S. ½ S. from Grand Manan lie the Western Seal Islands. On the western island two light-houses are erected, showing fixed lights, distant from each other about 140 feet, in the direction of E. S. E. and W. N. W. by which they are distinguished from all other lights upon the coast; they are elevated about 50 feet above high water mark. From the westernmost of these lighthouses the following bearings were taken;

To the southernmost of the Murr Ledges, E. S. E.

To Gannet Rock Lighthouse, E. by S. ½ S. about 12 miles.

To N. E. Rock, N. E. by N. about 1½ mile.

To southern head of Grand Manan, E. by N. ½ N.

To West Quoddy Lighthouse, N. N. E.

To Little River Head, N. by W.

To Libby Island Lighthouse, N. W. by W.

To south point of Kent Island, (on the chart three isles,) East.

If you fall in with Mount Desert Rock, which lies S. 6 leagues from Mount Desert Hills, you must observe the tide of flood sets W. S. W. along shore, till you come to the Fox Islands; but the same flood runs up to the northward, into Blue Hill Bay, Union River, and Isle-au-haut Bay.

The next remarkable land is Penobscot Hills, which you will see over the Fox Islands, bearing from the N. W. to the N. N. W. of them. When you pass the Isle-au-haut, in steering W. S. W. you will leave †Mantinius Islands, and Mantinius Seal Islands to the southward of you. If at night, or thick weather, it is advisable to go to the southward of all these islands, unless you are well acquainted. When you pass to the westward of Mantinius Islands, the main passage from sea to Penobscot Bay lies about N. by W. If you go into this passage, you leave Mantinius Island on your starboard, and the two Green Islands on your larboard hand, steering north-westerly 4 leagues; and if bound up the bay, follow your directions for Penobscot Bay.

If you come in from sea, and make the island of Manheigen, on which is a lighthouse, (described hereafter,) when it bears N. or N. N. W. it appears like two islands, but when it bears east or west, it appears in one island. Damiscove Islands lie to the W. by N. of it, which are all bare of trees, except the north part. The rocks called Baitain Ledge, lie two miles from Damiscove, W. S. W.; when you are 6 or 7 leagues off at sea, you will have 70 or 80 fathoms water, with a S. S. W. current. In general, between Damiscove and Manheigen Island, the flood tide parts, and sets E. N. E. to the eastward, and W. S. W. to the westward, as far as the island of Seguine, and to the northward up to Broad Bay, Sheepscut, and Kennebeck rivers, and the ebb sets the contrary way.

**MACHIAS TO †PASSAMAQUODDY.**—When you leave Machias, and are bound to Passamaquoddy, bring Grass Island to bear S. W. by W. and steer N. E. by E. † E. distant 9 leagues to West Passamaquoddy lighthouse, near which is an ALARM BELL, which will, during foggy weather, strike ten times in a minute, unless neglected, which is often the case, as the machinery is out of order, and it is now rung by hand; but when rung, the sound may, when calm, be heard five miles. But if the wind takes you to the eastward, there is a good harbor, about two leagues to the N. E. of Cross Island. This harbor bears due west from the middle of Grand Manan Island, and is called Little Harbor, but you cannot see it except you are near the north shore. You must not run in for it before it bears N. W. or N. N. W. There is a bluff point of rocks on the starboard hand, as you go in, and an island in the middle of the harbor. As you pass in, leave the island on your larboard hand, and when you have passed it half a mile, you may anchor in 4 or 5 fathoms, muddy bottom, and remain safe from all winds. Your course from this harbor to West Passamaquoddy light, is N. E. by E. † E. distant 7 leagues. When you come from the S. W. and are bound into West Passamaquoddy, you must give the Seal Rocks, before mentioned, a berth of three-quarters of a mile, before you haul in for the harbor, as there is a whirlpool to the eastward of them. The bay is about one league from this point; it is high water here, at full and change of the moon, about 10h. 45m.

There is a good bay that lies about W. S. W. from this point, three-quarters of a mile distant, where you may anchor; but it is not safe for any stranger to go over the bar without a pilot, which may be easily obtained. The bar bears N. N. W. from the anchoring ground, three-quarters of a mile distant.

When up as far as Allen's Island, if you leave it with the tide of flood, steer N. N. E. 3 miles, when you will have the tide against you four hours; and two hours before high water the tide sets S. S. W. till you come down to the Collector's Island, when it sets over the bar S. S. E. The tide rises here twenty-five feet. There is a fine cove on the south end of Moose Island, where a ship of 500 tons may lie, moored head and stern, safe from all winds, but the anchors are very much exposed with the wind to the south-east.

\* The Isle-au-haut is remarkable land, composed of high steep cliffs, and makes with a large bay on each side of it; has good landing on its eastern end, and anchorage half a mile off, in 18 fathoms, with the low point bearing about N. E. by N. where is also a stream of water running into the sea. The highest part of the island is in the middle, and represents a saddle.

† Mantinius Rock Lights are at both ends of a dwelling house. The house is 40 feet in length and 20 feet in breadth, to which the lights are attached, and are both fixed lights. Height of the lantern above the level of the sea, 82½ feet. The course from this to Manheigan Light is W. † N. distant 8½ leagues. [See mention of these lights page 142.]

‡ West Passamaquoddy lighthouse contains a fixed light, as before mentioned, page 134, situated on West Quoddy Head, 90 feet above the level of the sea, and may be seen at a distance of seven leagues in clear weather.

\*TITMANAN.—In coming from the westward, bound to Pigeon Hill, or Bowbear Harbor, bring the light to bear S. W. and run for it, giving it a berth of one-fourth of a mile, and then steer N.  $\frac{1}{2}$  W. 4 miles: in steering this course, you will leave the Egg Rock on your starboard land, when you will make the westerly shore, giving it a berth of half a mile; then steer N. N. E. one mile, when you will be opposite Dyer's House, where you may anchor safe from all winds in 3 fathoms water.

In coming from the eastward, bound to Dyer's Bay, give Titmanan Island light three-fourths of a mile berth, leaving it on your starboard hand; bring the light to bear N. E. three-fourths of a mile distant, then steer N. by W. which will carry you into the mouth of the bay, leaving a large dry ledge on your larboard hand: when abreast of this ledge, which is bold to, give it a berth of 5 or 6 rods, then steer N.  $\frac{1}{2}$  E. 4 or 5 miles, where you may anchor safe from all winds, in 4 or 5 fathoms, muddy bottom.

Goldsborough Harbor lies N. N. W. from Titmanan lighthouse, two leagues distant, leaving one island, covered with trees, on your starboard hand, and two on your larboard hand; then your course is N. N. W.  $1\frac{1}{2}$  mile, then N.  $\frac{1}{2}$  E. 4 miles, which will bring you up with Goldsborough Point, where you may anchor safe from all winds, in 3 or 4 fathoms, muddy bottom.

In coming from the eastward, bound to Prospect Harbor, give Titmanan light a berth of three-fourths of a mile, bring it to bear E. S. E. and steer W. N. W. 4 leagues, which will bring you up with the western shore, or Birch Head Harbor. In running the above course, you will leave Cranberry Rock point on your starboard hand, Moulton's Ledge, and the two black ledges on your larboard hand. Your course from Cranberry Rock point is N. W. by N. In case you should not make the point, continue your course W. N. W. until you make the western shore, giving it a berth of half a mile, then steer N. N. E. until you open the harbor, then steer N. W. which course will carry you safe

if you fall in with Chuttock Island, and are bound to Prospect, give it a berth of three-fourths of a mile, then steer N. N. E. which course will carry you safe into the harbor. In running this course, you will leave the two black ledges on your starboard hand, giving them a berth of three fourths of a mile.

Moulton's Ledge bears from Titmanan lighthouse W. by N. 4 miles distant; this ledge is not bare, except at low tides; strangers should not approach too near it; it lies  $\frac{1}{2}$  mile from Goldsborough Harbor. There is a sunken ledge that lies S. E. by E. from the lighthouse, 12 miles distant, on which there is but 5 feet at low water. S. W. 4 miles distant from the lighthouse, lies a sunken ledge, on which there are 12 feet at low water.

†MOUNT DESERT TO GOLDSBOROUGH AND MACHIAS.—In going from Mount Desert to Goldsborough, you must steer E.  $\frac{1}{2}$  N. for Scuttock Point, four miles, where is an island, which you may pass either side of, but it is best to leave it on your starboard hand, and then steer N. E. about 3 $\frac{1}{2}$  leagues, which will carry you up with Goldsborough Harbor. You will see three islands which lie in the mouth of the harbor; you must leave them on your larboard hand, and go in the eastern passage. In standing in for this place, you will see Titmanan Island, which has a lighthouse on it, containing a fixed light, already described, which you leave on your starboard hand. North from Titmanan, one eighth of a mile distant, lies a ledge, bare at half tide, which you keep within half a cable's length of when going over the bar, which you pass on your starboard hand, when bound eastward, at which, as you pass the bar, Scuttock Isl-

\* Titmanan Light is a fixed light, elevated 53 feet above the level of the sea, on the south end of Titmanan Island, near the mouth of Naraguagus River; S. S. W. from it, 4 miles distant, is a ledge having 12 feet at low water; also, S. E. by E. from it is a dangerous sunken ledge, about 5 miles distant, but there is plenty of water inside the shore; on the southern and northern sides of the island are shoals. Give the island a berth of half a mile. Near the light, are two good harbors, viz. Dyer's Bay, and Goldsborough Harbor.

† Cranberry Rock lies near Baker's Island Light, Cranberry Island and Mount Desert. The light is elevated 70 feet above the level of the sea, and shows a fixed light, bearing E. N. E. from Titmanan Light, 22 miles distant, and E. N. E. easterly, from Moose Peck Head Light, distant 41 miles.

‡ Mount Desert Island is about fifteen miles long, and twelve broad. It is intersected in the middle by the water flowing into the south side from the sea. On Mount Desert Rock, six leagues south from the island is a lighthouse containing a fixed light, elevated 56 $\frac{1}{2}$  feet above the level of the sea.

There are two considerable islands on the S. E. side of Mount Desert Island, called Cranberry Islands, which assist in forming a harbor in the Gulf, which sets up on the south side of the island.

§ Machias Light House is built on Libby Island, which lies on the western entrance to Machias Bay, 65 feet above the level of the sea, and contains a fixed light.

¶ There are five hills on Scuttock, remarkable from any hills in the eastern country, and at a distance they appear round.

and will be a handspike's length open to the southward of \*Seutock Point, but to go over this bar requires a pilot. When near the bar, and up with Titmanan Island, keep E. S. E. one half a mile distant, which will clear a ledge having 9 feet water at low water, that lies E. of the channel going over the bar, one-fourth of a mile distant. There is a bar that runs from the shore to this little island, which is about one league from the land. This bar has 3½ fathoms at high water, and 9 feet at low water.

If you are bound to Machias or Passamaquoddy, your course from Mount Desert is E. 12 leagues, which will carry you up with †Moose Peck Light, which you leave on your larboard hand; then steer N. E. by E. for Machias Light, on Libby Island, 4½ leagues. In steering the above courses and distances, you pass by nothing but islands on your larboard hand, with inlets and sundry good harbors, pleasant rivers, Moose Peck Reach, and Chandler's River, which are all good harbors, but too intricate to be described for strangers to attempt with safety. If you cannot steer your courses as above directed, you must observe, after passing Moose Peck Head Light, there are three low islands to the S. W. of Grand Manan Island, which lie due S. E. from Machias, called Seal Islands, distant 4 leagues, on one of which are two lighthouses. You may see the island of Grand Manan 6 leagues before you come to it, and when it bears N. E. these islands run S. W. from Grand Manan, about 2 leagues distant, and in thick weather, if you make these islands, you may run for Machias Light, bringing the S. W. end of Grand Manan to bear S. E. by E. and then run N. W. by W. for the entrance of Machias, 5 leagues distant, and when you have passed Cross Island, which you leave on your starboard hand, you may steer N. but in passing Cross Island, you must be careful of some dangerous ledges lying off it 1½ mile, in a S. W. direction. In steering this course, you will leave a large white rock on your larboard hand; and if you do not want to go into Machias Harbor, you may haul to the westward. After you have passed the rock about half a mile, bring a high round island that is covered with trees to the S. W. you may anchor in 4 or 5 fathoms, muddy bottom. This is called Jones Island. If you mean to go up to Machias, you must keep your course N. till you reach the island on your larboard hand, when you may shape your course W. N. W. for a point that is covered with young birch trees, and a house on it, for the S. W. board hand there is nothing but flats and shoals. You may keep your larboard hand after you pass this house, until the river opens to the northward, when you may run up to Cross River, where you may anchor in 4 fathoms; but if you are bound to the S. W. mills, you must haul away to the westward. When you get up with Mr. Parker's house and barn, which are on the starboard hand, you must leave the barn open to the south-westward of the Pott-Head. This Pott-Head is a large hill that you leave on your starboard hand. [For description of Grand Manan, see page 136.]

**LONG ISLAND TO THE SOUTHWEST HARBOR OF MOUNT DESERT.**  
—Your course is N. N. E. distant 3½ leagues. You must leave the two Duck Islands on your starboard hand, and three islands on your larboard hand. It is not safe for a stranger to run here in the night, as there is a large ledge that is covered at high water, and bare at half tide. You leave this ledge on your starboard hand, which is about one mile from the harbor. There is a long ledge on the larboard hand, which runs off half a mile, but there is a good turning channel between them. The S. W. passage is fit to enter, even with a large vessel, at low water, keeping nearest the starboard hand, as you go in, for there is a long point that lies about half a mile off from the larboard hand. When you pass the point on your larboard hand, you have the harbor open, and must bear up N. W. or W. N. W. and anchor well up the harbor in 5 or 6 fathoms, muddy bottom, where you may lie safe from all winds. If you are in a large vessel, and make the Isle-au-haut, bring it to bear W. by S. and steer E. by N. 10 leagues, which course and distance will carry you up the eastern passage going into Mount Desert. You must leave all the islands to the northward, and go to the northward of Mount Desert Rock, which lies E. S. E. from the Isle-au-haut, S. E. from Long Island, and S. from the Duck Islands. When you bring the harbor to bear W. N. W. you may steer directly in, for you may go about with a first-rate man-of-war in this passage. You may steer in this channel, with a fair wind, from W. N. W. to W. by N. till you come to Langley's Island, which lies about one league up the harbor, and makes the starboard hand of the

\* Seutock Point forms the eastern, and Mount Desert the western extreme of Frenchman's Bay.  
† Moose Peck Head Light is on Mziuke Island, 54 feet above the level of the sea, and contains a revolving light: Time of revolution four minutes; showing two lights and two darks; when at the distance of six leagues, their time of darkness will be no longer than that of light; as you approach it, the time of darkness will decrease; within 5 or 6 miles it will not wholly disappear, but in the revolution the greatest power of light will be as 24 is to 1 at least. The light bears S. W. by W. ¼ W. from Libby Island Light.

river that runs from the N. E. Be careful of this island, as there is a sunken ledge of rocks abreast of it, near half a mile off. The river above-mentioned has water enough for any ship to go in, and is a safe harbor.

**FOX ISLAND PASSAGE.**—On Brown's Head, at the western entrance of Fox Island thoroughfare, a light, showing a fixed light, is erected on the Southern Fox Island, and stands two rods from the shore, and 80 feet above high water mark.

The following are the results of observations by compass:—Fiddler's Ledge bears from the light, W.  $\frac{1}{4}$  S. distant about 3 miles; Fiddler's Ledge from Crabtree's Point, W. S. W. distance about half a mile. Fiddler's Ledge is above the surface of the water at two hours' ebb.

Crabtree's Ledge bears from the light W. by S. distant about  $1\frac{1}{2}$  mile; Crabtree's Ledge bears from Crabtree's Point S. W. by S. distant about half a mile. This ledge may be seen breaking at high water with a little motion.

Inner Dog Fish Ledge bears from the light S. W. distant about 3 miles; Inner Dog Fish Ledge bears from Crabtree's Ledge S. S. E. distant about  $1\frac{1}{2}$  mile.

In running from Owl's Head Light\* for Fox Island thoroughfare, bring the light to bear west, and steer E.  $\frac{1}{2}$  S. until you bring the light on Brown's Head to bear E. N. E., and then steer for it until you are within one cable's length from the light. In running this course, you pass between Crabtree's Ledge and Dog Fish Ledge, leaving Crabtree's Ledge on the larboard hand, and Dog Fish Ledge on the starboard, which is separated by a channel  $1\frac{1}{2}$  mile broad; you may then run half a cable's length of either of them. When abreast of the light, and between the light and Sugar Loaves, steer N. E.  $\frac{1}{2}$  E. for Young's Narrows. The Sugar Loaves are two high rocks, formed somewhat like sugar loaves, and are located nearly in the centre of the passage. There is good anchorage between the Sugar Loaves and light, in  $7\frac{1}{2}$  fathoms, at low water.

This entrance to Young's Point is narrow at low water, off which lies a ledge of rocks, which are covered at high water. There is also a quantity of sunken rocks at the larboard hand, near a mile to the W. N. W. which lie off the Dumplings. These Dumplings are three islands, which you leave on your larboard hand. Your course in this passage is E. S. E. and W. N. W. keeping your starboard hand on board. When you pass this point on your starboard hand, you must keep your starboard hand on board, and steer E. S. E. about two miles, when you will make Deep Cove on your starboard hand, which lies to the eastward of a very high bluff of rocks. If you have neither cables nor anchors, you may run into said cove, or secure your vessel with the main or fore-sheet, or come to anchor in 7 fathoms water off the said cove. There the flood meets, one from the W. N. W. the other from the E. N. E. which makes an eddy against this cove and highland; here you may ride safe with any wind. When you leave this place, and are bound to the eastward, you steer E. S. E. and keep your starboard hand on board till you come up to a clear spot of land, where the trees have been cut off. As soon as said spot bears W. S. W. you steer E. N. E. for the middle narrows. When you draw near the Narrows, you will see two large white rocks in the middle of the passage, unless at high water, at which time they are covered about one hour, but may be seen at all other times of tide. You may go on either side, but the deepest water is at the southward of them. Continue your course E. N. E. about one league, when you must keep your starboard hand on board, as there are several sunken rocks and ledges on your larboard hand, which are covered at high water. You will make the eastern narrows on your starboard hand, and as soon as you bring it to bear S. S. E. you may run through, where you will have a fine harbor, which is safe to ride in with all winds except at E. N. E. but you may remain in the west passage with the wind at E. N. E. or anchor at the northward of a bare island, that you will see on your starboard hand as you go back to the westward. When you pass the eastern passage of Fox Island, you must steer E. N. E. about 4 miles, which course will carry you into a large bay that lies between Fox Island and the Isle-au-haut. This bay lies N. and S. and about 4 leagues E. and W. When you get into this bay from the above-mentioned passage, and are bound to the eastward of the Isle-au-haut, you may steer E. S. E. 6 leagues, which course will carry you to the southward of the Isle-au-haut.

When you come from the westward, having passed the island of Manheigen and the entrance of Penobscot Bay, you may steer E. N. E. which course will carry you between the Fox Islands and Mantinicus Islands; on the latter, at each end of the keeper's house, a lighthouse is erected, which shows two distinct fixed lights, sailing coastwise, north-easterly and south-westerly; and one light, sailing N. N. W. and S. S. E. leaving all the Fox Islands on your larboard hand, but bring the Isle-au-haut to bear W. N.

\* Owl's Head Light is near the entrance of Penobscot Bay, on the larboard hand; is 147 feet above the level of the sea, and shows a fixed light.

W. and steer E. N. E. 7 leagues to Long Island, which you leave on your larboard hand. If you are bound to Blue Hill Bay, or Union River, as soon as you pass Long Island, you will open a large sound to the N. N. W. which course you are to steer seven leagues, when you will be up with Robertson's Island, leaving the Ship and Barge,\* on your larboard hand. Robertson's Island is the only island near that place that has a house on it. The south part of the island is clear of trees, on which the house stands. When you come near the south part of the island, give it a berth of three-quarters of a mile, as there are several sunken rocks off said point. When you bring this island to bear from S. W. to N. W. you may anchor in 6 or 7 fathoms water, muddy bottom; but if you are bound to Blue Hill Bay, you may stand to the northward direct for the Blue Hills, which you may see 10 or 15 leagues off. If you are bound for Union River, you had better take a pilot at Robertson's Island, for it is not fit for a stranger to go without one.

**CAMDEN HARBOR.**—North-east Ledges bear from the light on Negro Island, at the mouth of Camden Harbor, N. E.  $\frac{1}{4}$  N. distance about three eighths of a mile. North-east Ledges to Morse's Point, N. by W. distance about half a mile; those ledges are covered at high water, but are above the surface of the water at two hours' ebb. Barrit's Point forms the western side of Camden Harbor, and bears from the light S. W. by S.  $\frac{1}{2}$  S. distance about three eighths of a mile. Morse's Point lies opposite the lighthouse and forms the eastern side of the harbor. Barrit's Point to the Graves, S. E.  $\frac{1}{2}$  S. distance about 1  $\frac{1}{2}$  mile. From the light to the Graves, S. by E.  $\frac{1}{2}$  E. distance about 2 miles. Owl's Head Light bears from Camden Light S.  $\frac{1}{2}$  W. distance about 12 miles. From the Graves to the Owl's Head Light S. by W.  $\frac{1}{4}$  W. distance about 1  $\frac{1}{2}$  miles.

Camden Lighthouse is situated on the S. E. part of Negro Island, and contains a fixed light, elevated 49 feet above the level of the sea.

In coming from the westward, and bound to Camden Harbor, bring Owl's Head light to bear south, and steer N.  $\frac{1}{4}$  E. for Camden Light, leaving the Graves and North-east rocks, on the starboard hand: the Grave is a small black rock, and is above the surface of the water at all times, and you may near it within a cable's length, on all sides. When up with the lighthouse leave it on the larboard hand one cable's length, and steer N.  $\frac{1}{4}$  N. or N. N. W. distance nearly half a mile, and anchor near the north shore, from four to five fathoms water, good holding ground. If you are to the eastward and bound for Camden Harbor, bring the light to bear W. S. W. or S. W. by W. to clear the north east ledges, then follow the above directions.

**CASTINE.**—The beacon on Otter Rock bears from the lighthouse on Dice's Head, at the entrance of Castine Harbor, S. E.  $\frac{1}{2}$  E. distance half a mile; Noddle's Island Point, S. E.  $\frac{1}{4}$  S. distance about 1  $\frac{1}{2}$  miles; Bull Head, on Holbrook's Island, south, distance about 2 miles; Turtle Head, W. N. W. distance about 4  $\frac{1}{2}$  miles; Belfast, N. W. by W. distance about 11 miles. From the beacon on Otter Rock to Noddle's Island Point, S. E. by S.  $\frac{1}{2}$  S. distance about three eighths of a mile; from Noddle's Island Point to the beacon on Hosmar's Ledge, E. N. E. distance about three-quarters of a mile; from Otter Rock Beacon to the beacon on Hosmar's Ledge, east, distance about three-quarters of a mile; Hosmar's Ledge Beacon to the town of Castine, N. N. E. distance about half a mile.

Otter Rock is a small round rock, and lies about two cables' length from the northern shore, and has on it an iron beacon, with a cask placed upon a staff at its centre, and is about 12 feet above the level of the sea at high water. Noddle's Island Point is a low black rock, and very bold. Bull Head is a high bluff of rocks, and of a yellowish cast, and lies on the south side, without the entrance of the harbor.

Hosmar's Rock lies about one eighth of a mile from the southern shore of Castine Harbor, and has on it an iron beacon, as described on Otter Rock. Turtle Head is the northern head of Long Island. Stubbs' Point Ledge lies opposite the town, but is not in the way of vessels going into Castine Harbor, on which there is a beacon to be erected this season.

If you are bound up Penobscot Bay, and are to the eastward of Long Island, and intend going into Castine Harbor, bring the light on Dice's Head to bear N. E. by N. and run for it until you are within a half a mile of it, then steer E. by N. for the beacon on Hosmar's Ledge, leaving Otter Rock Beacon on the larboard hand, one cable's length distance, and Bull Head, Noddle's Point, and the beacon on Hosmar's Ledge on the starboard hand, you may near the starboard shore off the entrance of Castine Harbor, within one cable's length, and steer E. N. E. which will carry you in ship channel way. You may anchor off the town, near the wharves, in from 8 to 10 fathoms water.

\* The Ship is an island that has three trees on it, and appears like a ship at a distance; and the Barge is a dry rock, which appears like a barge.

This harbor is easy of access, and vessels may approach it with safety by following the above directions.

**\*WHITE HEAD.**—Vessels bound from the southward, and intending to fall in with White Head Lighthouse, should endeavor to take their departure from the High Land of Cape Cod, on which is a lighthouse, containing a fixed light, from which to Manheigen Light, the course is N. N. E.  $\frac{1}{2}$  E. distant  $35\frac{1}{2}$  leagues. The shore near Manheigen is bold, with good water on all sides, having no shoals or sunken rocks about it; there are some dry islands and ledges on the north side, but they are bold, and good water all among them. From Manheigen light to White Head Light, the course is N. E. distant about 7 leagues, with a fair open sound. There is a small ledge lies about half a mile from White Head Light, bearing S. by E. which is just out of water at common tides: at low water you pass between this ledge and the light to go in the Muscle Ridge Channel, or into the harbor. You continue your course N. E. by the light about three-quarters of a mile, when you will open the harbor on your larboard hand, between a small ledgy island next the light, and a high white island with some spruce trees on it. When you open the harbor N. W. you steer N. W. and sail on till you pass all the ledges on your larboard hand, and anchor in about 5 or 6 fathoms, good holding ground.

Vessels of 60 or 70 tons, may double close around the head of the light, soon as it bears N. E. and anchor right abreast of the store. This is called Sail Harbor. Vessels taken with calm and ebb tide, may anchor any where off the light, in from 12 to 20 fathoms water. If the wind takes you at N. E. and ebb tide, that you cannot get into Sail Harbor, you may run into Tarrent Harbor, which bears W. by S. about 4 miles distant. You will continue your W. by S. course, till the first house on the starboard hand bears N. N. W. when you may anchor in about 4 or 5 fathoms water, good ground.

**TARRENT HARBOR, MUSCLE RIDGE, AND PENOBSCOT BAY.**—In sailing from this harbor, you may steer east one league, to White Head Light, but be careful not to haul in for it till it bears N. E. as there is a large ledge of rocks bearing W. N. W. from said Head, one mile distant, but within it, a pistol shot from the light, is safe navigation. In going in, you must give the larboard hand a berth, as there is a sunken ledge, which extends about two-thirds across the mouth of the harbor, that is dangerous when there is any sea, unless at high water.

**SAIL HARBOR** lies to the northward and eastward of White Head, about three-quarters of a mile. If you wish to go into this harbor, haul up round the Head, within about a cable and a half's length, run until the light bears S. W. then steer N. by W. run in and anchor in 8 fathoms, sticky bottom. This is a good harbor in winter. Vessels getting becalmed can anchor near the Head in 10 or 12 fathoms water. Attached to this light is a bell weighing 1000 lbs. striking, in foggy weather, three times a minute.

Your course from White Head Light is N. E. to Ash Point or Island, one league distant, which has a large rock to the S. W. of it, about half a mile distant, which you must leave on your larboard hand. It is not in the way except you are obliged to go about. When you haul round this island, give it a small berth, and steer N. N. E. or N. E. by N. for the Owl's Head, leaving two islands on your starboard hand; but when you draw near the larboard shore, you steer about E. N. E. for the Owl's Head, which has a good harbor on the larboard hand as you go to the eastward. This harbor makes with a deep cove. You may bring a rocky point that lies on your starboard hand to bear N. E. and a ledge of rocks that lies without said point to bear E. N. E. and anchor in 4 fathoms, muddy bottom.

This harbor is open to the wind at E. by N. and E. N. E. but in all other winds you are safe. The tide of flood sets to the eastward, and the tide of ebb S. W. through the Muscle Ridges.

If it is night when you come to White Head Light, you had better not attempt going through the Muscle Ridges. Your best way is to go by Two Bush Island, which you must leave on your larboard hand, keeping your course E. N. E. or N. E. by E. [Two Bush Island is round and barren, but has only one bush on it. Formerly it had two bushes.]

If you are in a large vessel, your best way is to go in this passage, as it is the most safe. You must follow your course, as above directed, about two leagues, when you

\* White Head Light is built on White Head Island, remarkable for the many white rocks on the head. It is 7 leagues from Manheigen, bearing N. E.; is a fixed white light, 58 feet above the level of the sea. The light is small, but of great importance, as all vessels bound to Penobscot Bay, going in shore, are obliged to pass by the light through the Muscle Ridges. A stranger wishing to pass this light must, if coming from the westward, run in for the land east of Manheigen, until the light bears S. W.; then steer N. E. and you can pass within half a cable's length of the head.

will have \*Penobscot Bay open, and then you may direct your course to either side of Long Island. If you go to the westward, your course is N. N. E. to Great Spruce Head, which having passed seven leagues, your course is N. E. by N. 5 leagues to Old Fort Point. In steering said course, you will leave Belfast Bay and Brigadier's Island on your larboard hand, which island has a good harbor, and if you mean to go into it, you must leave it on your larboard hand, and steer in about N. or N. by W.

You may run up above this island, and anchor on the starboard hand, if the wind is to the eastward; but if to the westward, or S. W. you must not. There is a bar that lies from this island to the main land, which is covered at high water. There is also a good harbor to the westward of this island, called Long Cove. If you turn into either of these harbors, you must be careful of some rocks that lie to the southward of this island, more than half a mile from the main land. But in going to Penobscot, proceed as above, and keep your larboard hand on board. When you pass this island for the Old Fort Point, which has no trees on it, you must observe before you come to it, that a large ledge of rocks lies about three-quarters of a mile to the E. S. E. of it, which is covered at high water, but bare at half tide. You may go within a cable's length of Old Fort Point, in smooth water. These rocks may be discovered when the wind blows.

If you are bound up Penobscot, from Old Fort Point, with the tide of ebb, and the wind a-head, you may make a good harbor in the east river, which lies about E. N. E. from Old Fort Point,† about one league. This river lies to the south-westward of Orphan Island, in which place you will lie safe from all winds, and anchor in six or seven fathoms, good holding ground.

Orphan Island is a large island, which you are to leave on your starboard hand, and sundry rocks on your larboard hand, which are above water. When you pass Orphan Island, you may anchor to the N. W. of it, on the starboard hand, as you go through; but if wind and tide are in favour you may proceed up to Marsh Bay, keeping the larboard hand best on board. Marsh Bay is about two leagues from Orphan Island. When you pass Marsh Bay, you may keep in the middle of the river, and you have neither rocks nor shoals until you get up to the falls. You have no particular course in going up this river, but may sometimes go to the westward of N. and sometimes to the eastward of N.

When you enter Penobscot Bay, and are bound to the eastward of Long Island, you must steer N. E. by N. leaving Long Island on your larboard hand, which course will carry you up to Castine.‡ If you intend going into this harbor, as soon as it bears E. N. E. you may run in, steering E. N. E. keeping the middle of the channel until you pass the first island, giving it a berth of half a mile; then haul to the southward until the island bears W. S. W. when you may anchor in 8 or 10 fathoms, muddy bottom, and lie safe from all wind.

In going into the harbor of Castine, you leave three islands on your starboard hand; but if you are bound up Penobscot River, you must steer north, leaving the ledge of rocks off the Old Fort Point on your larboard hand: then follow the same directions you have for running into the Penobscot River, which will carry you up to the Falls. The tide ebbs and flows, at full and change, about 10 or 11 feet.

GEORGE'S RIVER.—Bring the North Daniscove Island, which is called White

\*PENOBSCOT BAY AND RIVER.—This extensive bay is included between Sedgwick Point, on the east, and White Head on the west; the distance between these points is about 11 leagues; and it therefore includes the Isle-au-Haute, Deer Island, the Fox Island, Long Island, and a number of small isles, rocks, and ledges. Through the bay to the mouth of the river of its name, the western channel is by the headland on the west, called Owl's Head: thence, by Camden on the west, and Cape Rosarie on the east, to Bagaduce Point or Castine River. The eastern channel is between Isle-au-Haut on the west, and the smaller isles on the east, through a channel called Long Reach, formed by the shore of Sedgwick on one side, and Deer Island on the other, until it unites with the main channel between Cape Rosarie and Long Island. Above this, on the east, stands Fort Castine near to which is the town of Castine, opposite to Penobscot. Castine is the port of entry. This noble river, which empties its waters into the bay, and which is now decorated with numerous townships, is the most considerable in the State of Maine, and has its sources about 130 miles above the inlet of Castine. The head of tide and navigation is, however, at Bangor, about 30 miles from the same: but vessels of 30 tons may approach within a mile of this place. At the entrance of the river is a depth of 10 fathoms.

† On Old Fort Point, above Castine, there is a lighthouse to indicate the direction to Prospect Harbor.

‡ Castine Lighthouse is built on Disc's Head, at the entrance of Castine harbor, and is an important light running up and down Penobscot Bay. It shows a fixed light 116 feet above the level of the sea, N. W.  $\frac{1}{2}$  N. from Fort Point ledges, and from the eastern end of Long Island S. E. by E.  $\frac{1}{2}$  E. The shore near the lighthouse is bold.

Island, (from its being white,) to bear W. S. W. and steer E. N. E. for \* Franklin light-house, that you leave on your starboard hand, and which you may pass within a cable's length of. When abreast of Franklin Island light, (which is on your starboard hand,) steer N. E. for Otter Island, 4 miles distant, and continue until within one-quarter of a mile of it, leaving it on your larboard hand; then steer E. N. E. for †Cauldwell's Island, at the S. W. end of which is a high round rock, called Goose Rock. When abreast of said rock, which you may pass within one cable's length of, leaving it on your starboard hand, steer N. E. by E. and N. E. keeping Cauldwell's Island best on board, to avoid a ledge in the middle of the river.

In beating into George's River, you must be careful of a sunken ledge which bears E. N. E. from Franklin Island Light, 6 miles distant; also of a ledge off the S. E. end of Gay's Island, which extends one third of the way across to Goose Rock.

Should you fall in with Manheigen Island Light, and bound to George's River, you may steer N. N. W. leaving Manheigen Island on your starboard hand, until Franklin Island Light bears N. E. by E. when you may run for it, and steer as above directed. Franklin Light may with safety be run for when bearing from N. E. by N. to E. N. E.

In running from White Islands for George's River, be careful of New Harbor Ledges, which bear E. N. E. from †Pennequid Point Light, one league distant, on which are 5 feet water at low water. After passing these Ledges, you will see a large dry rock called the Western Egg Rock, which bears E. N. E. from Pennequid Point, two leagues distant, and W. by S. from Franklin Light, one league, which you leave on your larboard hand; you will also see the Eastern Egg Rock, which bears south from Franklin Light, one league distant, which you leave on your starboard hand. These Egg Rocks bear E. S. E. and W. N. W. from each other, one league distant, and their appearance much alike, which you pass between, with a clear and open channel. You may distinguish one from the other by their bearings from the light.

Should you have the wind ahead, and be obliged to turn to windward, you may stand to the northward until Franklin Island Light bears E. N. E. and to the south-eastward until it bears N. N. E. without danger.

To the northward of the range of Pennequid Point and the Western Egg Rock, and to the south-eastward of the range of the Eastern Egg Rock, the ground is foul and rocky; and also to the eastward of the range of the Eastern Egg Rock. [NOTE. McCobb's Island is the western entrance of George's River, and bears N. W.  $1\frac{1}{2}$  mile distant from Franklin Island Light.]

**JOHN'S BAY HARBOR.**—John's Island bears from Thrum Cap Island N. N. E. distant about three miles. Thrum Cap Island is a small bare island, and forms the western side of the entrance of John's Bay, bearing from Pennequid Point W. S. W. distant about two and a half miles. Pennequid Point forms the eastern side of the bay, and is a low bare point; but the shores are bold on all sides. The lighthouse is situated on the S. E. side of Pennequid, and bears from the western point E. N. E. distant about half a mile; from John's Island to Butford's Island, west, distant about one mile; Stuart's Island, N. W. by W. distant about one mile; High Island Head, N.  $\frac{3}{4}$  W. distant about two miles; McFarling's Point, N. W. by N. distant about one and a half miles—one-eighth of a mile from McFarling's Point there are several ledges, covered at high water, but are not in the way of vessels running into this bay, as they lie so near the western shore they may be seen at all times, with a little motion of sea;—McCown's Point from John's Island, north, distant about one and a quarter mile; Pennequid Point, S. by E. distant about three miles; Pennequid's Harbor, N. E. distant about half a mile. Thrum Cap Island bears from White Island N. E. distant about two miles. High Island Head is a high bluff covered with trees, and you may near it within 200 feet of the shore.

John's Island is small and high, covered with spruce trees, located near the centre of the bay, and has a house on the N. W. part of it, which cannot be seen until you are up with the island; if you wish to run into Pennequid Harbor, you may go to the eastward of John's Island, leaving two dry rocks on the starboard hand, keeping them close on board; or you may leave them on your larboard hand, and after passing them you will

\* Franklin Light is erected on the north end of Franklin Island, near the end of George's River. The lantern is elevated 50 feet above the level of the sea, and contains a fixed light.

† Cauldwell's Island lies on the east side of George's River, about  $9\frac{1}{2}$  miles from the entrance; it is a high round island covered with trees.

‡ A lighthouse is erected on Pennequid point, 30 feet high, and 75 feet above the level of the sea, which exhibits a fixed light. It is a light to Bristol and Waldoborough Rivers; bears N. W.  $\frac{1}{4}$  W. from Manheigen Island Light, distant 12 miles.

see the entrance of the harbor, bearing about N. E. half a mile distant, where you may run in, and lie safe from all winds.

Vessels westward bound, and falling in with Manheigen Island, and wish to make a harbor in a strong S. W. wind, must observe the following directions:—Bring Manheigen Light to bear S. E. and steer N. W. distant about 11 miles, for Pennequid Point, and when the light on said point bears E. N. E. distant half a mile, you are then up with the western point of Pennequid; leave it on your starboard hand, and give it a berth of one-eighth of a mile, then steer north for John's Bay Harbor, leaving John's Island, McConn's Point, on your starboard hand; Butford's Island, Stuart's Island, and McFarling's Point on the larboard hand. If you are from the westward, and bound into this harbor, you may bring John's Island to bear N. by E. and run until you are within one cable's length of it; then steer north for High Island Head, which you leave on your larboard hand, and when abreast of said head steer N.  $\frac{1}{2}$  E. about three-eighths of a mile and anchor in from 4 to 5 fathoms water, good holding ground. John's Bay lies about 5 miles to the eastward of Townsend Harbor, and is a fair open bay, having no rocks or shoals at its entrance, and vessels may run in without fear, by following the above directions.

DAMARISCOTTA RIVER.—The buoy at the mouth of Damariscotta River, and the bearings of different objects about it, and directions for the river:—Hern Island, S. W. part, bears from the buoy, E. by N. distant about a quarter of a mile; White Island, S.  $\frac{1}{4}$  W. distant 2 $\frac{1}{2}$  miles; Varnum's Point, north, distant about 3 $\frac{1}{2}$  miles; Foster's Point, N. by E. distant about 2 $\frac{1}{2}$  miles; from Hern Island to White Island, S. S. W. distant about 3 miles. Hern Island forms the eastern side of the entrance of Damariscotta River, and is high, covered with spruce-trees. Varnum's Point is a high bluff point, and is on the western side of the river, and is also covered with trees. The shores on both sides of the river are bold.

In coming from the westward, and bound to Damariscotta River, bring White Island to bear S.  $\frac{1}{2}$  W. and steer north, leaving the buoy, Hern Island, and Foster's Point on the starboard hand, give the buoy a berth of a cable's length, and steer N. by E. keeping in the middle of the river, and when up with Varnum's Point, which you leave on your larboard hand, you will see Hodgden's Mills on the western side of the river, about 1 $\frac{1}{2}$  mile. Hodgden's house and mills are painted red: you may anchor abreast of them, near the middle of the river, in 5 fathoms water, good holding ground, where you may lie safe from all winds. The abovementioned buoy is a spar buoy painted red, elevated about 12 feet above the surface of the water, and is moored about 100 feet to the westward of the ledge, in 6 fathoms, at low water.

Should you fall in to the eastward of Seguine, and wishing to go outside of Damariscove Islands, bring Seguine Light to bear E.  $\frac{1}{2}$  N. and steer E.  $\frac{1}{2}$  S. 5 leagues distant, to clear Bantam Ledge, which lies east from Seguine 3 $\frac{1}{2}$  leagues distant, and S. S. W. from  $\frac{1}{2}$  Pumpkin Rock, one league: you then steer N. E. until you make Franklin Light, and then steer as above directed, or continue your E.  $\frac{1}{2}$  S. course until Pumpkin Rock bears north, then steer N. E. for Franklin Light. Your course from Pumpkin Rock to Franklin Light is N. E. by E. five leagues distant. In hazy weather you will do well to get a departure from this rock, as you cannot see Franklin Light more than 4 miles distant. You may anchor in Gay's Cove, taking care to avoid a sunken ledge which lies E. from Gay's Cove near the middle of the channel, and has 4 feet at low water. This ledge must be left on your larboard hand, keeping Cauldwell's Island close on board. Gay's Cove lies on your larboard hand about 8 miles to the E. N. E. of Franklin's Island Light. You may know this Cove, as Gay's house and barn lie to the N. W. of it. But if you are bound through Herring Gut, bring Capt. Henderson's House to bear N. N. W. and steer S. S. E. for Herring Gut. This Herring Gut has a bar from side to side, but you may go over it at two hours flood keeping your larboard hand best on board. As you come on the bar, you will see a large rock on your starboard hand, and the deepest water is within a cable's length of the rock; your course over the bar is S. S. E. You may anchor to the N. W. of the bar in 4 or 5 fathoms, muddy bottom, and wait for the tide. The tide of flood sets to the northward, and the ebb to the southward.

\* Seguine Lighthouse is situated on an island near the mouth of Kennebeck River. The lantern is elevated 200 feet above the level of the sea, and contains a fixed light of the first magnitude, and may be seen at the distance of 9 or 10 leagues in clear weather.

† Pumpkin Rock lies off the S. E. point of Damariscove Islands, half a mile distant. It is a dry flat rock, elevated about 20 feet above the level of the sea.

‡ At the entrance of Herring Gut, on Marshall's Point, a lighthouse elevated 30 feet, containing a fixed light is erected.

§ Capt. Henderson's House is white, and his store red, and both lie on the larboard hand.

**HERRING GUT HARBOR.**—Old Cilly bears from the light on Marshall Point, at the entrance of Herring Gut Harbor, south, distant about 3 miles; Black Rock, S.  $\frac{1}{2}$  W. distant about  $1\frac{1}{2}$  mile; Henderson Island, S. S. W. distant 1 mile; Bradford's Island, W. by S. distant half a mile; Gunning Rock, S. E. by S.  $\frac{1}{2}$  S. distant about 1 mile; Two Brothers, S. E. distant about  $2\frac{1}{2}$  miles; Henderson Island from Gunning Rock, west, distant about half a mile; Gunning Rock to Black Rock, S. W.  $\frac{1}{2}$  S. distant about half a mile. S. E. by S.  $\frac{1}{2}$  S. from Gunning Rock, distant a quarter of a mile, lies a sunken ledge, which can be seen breaking at low water in a heavy sea. From Old Cilly to the light on Manheigen Island, S. W. by S. distant about 9 miles; Musquito Island from Old Cilly, N. E. by E. distant about 4 miles; Green Island from the Brothers, S. E.  $\frac{1}{2}$  S. distant about a quarter of a mile. Old Cilly is a low black rock, and can always be seen above the surface of the water. A reef extends off east, distant nearly a quarter of a mile, which must be avoided. Black Rock is a small round rock, and is also above the surface of the water. Henderson Island is a small low island, with no bushes or trees on it. Bradford Island is high, and covered with spruce-trees, and forms the western side of Herring Gut Harbor. Green Island is also a small bare island. The two islands called the Brothers, are small, and covered with spruce-trees. Gunning Rock is high and bare, with a yellowish color: this ledge is very bold, and you may near it within 100 feet.

**Sailing Directions.**—In running from Manheigen for Herring Gut Harbor, bring the light on Manheigen to bear S. W. and steer N. E. by N. and when the light on Marshall's Point bears N. by W.  $\frac{1}{2}$  W. then run for it: in running for the light you will leave the Old Cilly, Black Rock, and Henderson Island on the larboard hand; Musquito Island, Green Island, Two Brothers, and Gunning Rock, on your starboard hand. Give the light a berth of two cables' length, and when it bears east of you, steer N. N. E. distant about one mile, and anchor in from 4 to 5 fathoms, where you lie safe from all winds: you will find good anchorage any where between Marshall's Point and Bradford's Island.

You may run into this harbor by bringing the light on Marshall's Point to bear W. N. W. leaving the Green Island, Two Brothers, and Gunning Rock on the larboard hand; Musquito Island on the starboard. This passage is full of shoals, and had better not be attempted unless well acquainted.

The harbor is easy of access, and vessels may approach it with safety by following the above directions.

When you go out of this harbor, and bound to the eastward, be careful and give the larboard hand a good berth, for there are two ledges of rocks on the same hand of the eastern point, which are under water, and lie off about a cable's length. When you are clear of these ledges, you may steer E. by S. or E. S. E. one mile to the barren island, which you leave on the larboard hand, and 3 or 4 islands or ledges on the starboard hand. When you pass these ledges and Musquito Islands, if bound to White Head, you may steer N. E. by E. 2 leagues, and when you bring the light to bear N. E. run for it, but when you pass the S. W. White Head, leave it on your larboard hand, and be careful of a sunken rock, that lies S. E. from the eastern White Head, about one cable's length distant. Your course through to the eastward is N. E. and to the westward S. W. keeping near the middle of the passage. Before you come up with Ash Point, you must be careful of a sunken rock, which lies off the point about one third of the passage, which has not more than 8 feet at low water. But if you should go through this passage in the night, keep Potatoe Island, which is right against Ash Island, about S. S. W. from it, and bare of trees, which you leave on your starboard hand, best on board. When you pass Potatoe Island, and are bound into Owl's Head, your course is N. N. E. about 2 miles, which will leave two islands on the starboard hand. When you open the passage to Owl's Head, and bound to Edgemavoggan Reach, your course is N. E. by N. till you pass the Lime Islands, which you leave on your larboard hand. Continue said course till you make a large bare rock on your starboard hand, and a little round island to the eastward on the same hand, which is covered with trees. Continue your course to the N. E. and you will make a large island on your starboard hand; when you pass this island you have the passage open to Buck's Harbor; continue your course N. E. till you pass by all the islands, to the southward and northward. In the day time you may see Blue Hills bearing E. N. E. over all the land. This passage is safe to go through with a first rate man of war. When you come within two miles of the reach, you will make a small island on your starboard hand, which has a sunken rock to the northward of it. Your safest way is to keep the middle of the passage, as there is a sunken rock (or ledge,) on the larboard hand, that lies E. by S. from an island which you leave on your larboard hand about half a mile distant. If you want to make a harbor, you may go into Buck's Harbor by a N. E. or N. E. by N. course. When you come into this harbor, (which is 12 leagues from Owl's Head,) you must leave an island covered with young birch trees, on your starboard hand, steering N. N. W. and when you get to the northward of said island

you steer E. S. E. till you bring it to bear S. S. W. where you will be land-locked from all winds, in 4 or 5 fathoms, soft bottom. When you leave Buck's Harbor, and bound to the eastward, you steer S. E. till you come to a large rock and four islands, which you leave on your larboard hand, keeping the said rock and islands best on board, for there is a sunken ledge that lies S. S. W. from them. You will make a black island on your starboard hand with burnt trees on it. This ledge lies N. N. E. from said island, near the middle of the passage, but keeping the eastern shore best on board, you will go clear of it. When you have passed this ledge, you leave two islands on your starboard and two or three on your larboard hand. Continue your course to the S. E. till you make two islands between which and Buck's Harbor the course is S. E. and N. W. 6 leagues. To the eastward you may go between both islands, steering E. by S. 1 league, which course will carry you up with Trum Cap, which island has a bar of rocks, that lie near half a mile to the northward; but if you have a head wind, and are obliged to run through, you will observe the channel is two miles wide at Channel Rock, which is always above water.

When you leave this Trum Cap, steer E. by S. which will carry you between the Ship and Barge, and three islands which you leave on your larboard hand, which are covered with large rock-maple trees. The Barge is a bare rock, which you leave on your starboard hand; but there is a rock about a cable's length to the northward of the Barge.—Continue your course E. by S. for Bass Harbor, distant from Trum Cap 5 leagues; but you must have some regard to the tide of ebb, which sets very strong to the S. S. E. and the tide of flood to the N. N. W. If you are bound into Bass Harbor, you keep Rich's Point within a cable's length, which you leave on your larboard hand, for there is a large ledge of rocks, which lie off about half a mile, which is bare at half tide, and bears S. E. from Rich's Barn, and S. by W. from the entrance of Bass Harbor. You give the larboard hand a good berth in going into Bass Harbor; in entering which you must give both sides a berth, for at low water, it is shoal. When you get into this harbor, anchor on the larboard hand, with a cove to the westward of you, in 3 or 4 fathoms, muddy bottom.

**BASS HARBOR.**—When you leave this harbor, bound to the eastward, steer out S. W. till you bring Bass Harbor bar to bear S. S. E. then run S. S. E. keeping the larboard hand best on board. This bar has not water enough for a loaded vessel before half tide, having 8 feet only at low water; but a light vessel may go over at low water, keeping the larboard hand best on board. When you get over this bar, you steer E. by S. till you bring the S. W. entrance of Mount Desert to bear N. E. then you may run N. E. leaving Cranberry Island on your starboard hand. But this passage is shoal at low water, and not fit for loaded vessels to go through; but at full tide there is water enough keeping the middle of the passage. Continue your course to the N. E. till you pass Cranberry Island; then you may steer E. S. E. and anchor between the two Cranberry islands, where you will be safe from easterly or S. W. winds. You may lie in from 5 to 7 fathoms, good holding ground.

When you leave this port bound to the eastward, you steer E. by S. till you get up with Baker's Island Light, which lies to the eastward of the Cranberry islands; then you steer E. by N. 4 leagues, to Scuttock Island. When you pass said island, and are bound to Goldsborough, you must steer N. E. about 5 leagues, and keep that course till you bring Goldsborough harbor to bear N. N. W. then you must leave three islands on your larboard and one on your starboard hand, and run into the harbor, where you may lie safe from all winds, and anchor in 5 or 6 fathoms.

**DYER'S BAY, &c.**—This harbor lies a little to the eastward of Goldsborough. When you make Titmanan Light, bound to Dyer's Bay, leave it on your starboard hand, and steer north for the eastern head. You leave a large dry rock on your larboard hand, and, after passing it, you will see a small island, covered with trees, which you leave on your starboard hand, then haul round said island, where you will be safe from all winds.

**SCUTTOCK ISLAND.**—When you come from the westward, and bound to Titmanan, you pass Scuttock Island; steer E. N. E. from Scuttock Island 5 leagues, to Titmanan light, before described.

**TITMANAN LIGHT TO LADLE ISLAND.**—When you pass the light bound to bear S. W. and steer N. E. about 4½ leagues, which course will carry you to Ladle Island. This island has a remarkable appearance, being formed exactly like a ladle, and has a large black rock to the S. W. a little distance from it. You may go any side of this island, but the best channel is to the S. E. of it.

**CAPE SPLIT HARBOR.**—When you pass Titmanan Light, bring it to bear S. W. ½ S. and steer N. E. ½ N. for Cape Splitt, distance 5 leagues, which course will carry you safe into the harbor. In steering said course, you will make a black rock, which you leave on your starboard hand, distance one mile from Cape Splitt. This harbor is safe from all winds but S. W. which blows right in; but if you anchor in a cove on the starboard side, and moor N. W. and S. E. you will lie safe from all winds.

**PLEASANT RIVER.**—When you come from the westward, and bound to Pleasant River, in passing Titmanan Light, bring it to bear S. W. by S. and steer N. E. by N. 5 leagues distance. In steering said course, if it is clear weather, you will see Capt. Wasse's house open between the island and main land; but this passage will not do at low water. You must leave this island, (and a high dry ledge of rocks that lie to the westward of it,) on your starboard hand; when you pass the bare ledge, you will see a bare isle, which you leave on your starboard hand; then you may haul up for Capt. Wasse's house and anchor, and take a pilot for Pleasant River, as it is not safe going without one, except you are well acquainted.

Narrow Gauges is one mile to the westward of Pleasant River, too difficult to be described, as there are sundry small islands at the mouth of the harbor or bay. The best way for a stranger, is to go into Cape Splitt harbor and get a pilot, as there is no difficulty in going into Cape Splitt in the day-time, keeping the larboard hand best on board.

**MOOSE PEAKE REACH.**—When you come from the westward, and pass Ladle Island on your larboard hand, steer ~~E. by N.~~ for Tibbet's Island, which you leave on your larboard hand. When you come to the east end of this island, give it a good berth, for at low water, there is a ledge of rocks that lie a cable's length to the S. E. of said island. When you pass it, and bring Moose Peake Reach open, you may steer east for Mr. Beall's house, but you must keep the starboard hand best on board, for there is a rock that lies about the middle of the sound which has not above two feet of water on it at low water. You may anchor to the westward of Mr. Beall's house.

**MOOSE PEAKE PEACH.**—When bound to the eastward over Moose Peck bar, which you must ~~not~~ cross before two hours flood, you steer for Kelley's Coffee-House, which lies on the ~~larboard~~ hand, as you go to the eastward on the N. E. point of Moose Peake Reach. When you are entering on the bar, you will bring a bushy tree right against Kelley's House, which stands on the point. Your course over the bar is east. You leave the Virgin's Breasts, one on your starboard and one on your larboard hand; but if you are bound to Chandler's River, you will leave the Virgin's Breasts on your starboard hand, and Rogue's Island on the same hand. There is a muddy bar that lies between Rogue's Island and the main land, but water enough on it at two hours flood. Rogue's Island has a good harbor at the N. W. of it, safe from all easterly winds, and a small distance from Chandler's River.

When you go over Moose Peake Bar, bound to Machias, you leave the Virgin's Breasts as before mentioned, keeping your course east, and a bare rock, called Pulpit Rock, on your starboard hand; you must keep \*Libby's Island Light open to the southward of this bare rock. [N. B. This bare rock, which you leave on your starboard, may also be left on your larboard hand; and steer E. S. E. for Libby's Island Light.]

**MOOSE PEAKE HEAD TO MACHIAS.**—Give the light a berth of one mile, leaving it on the larboard hand, and steer N. E. by E.  $4\frac{1}{2}$  leagues, when you will be up with Libby's Island Light on your starboard hand; then run N. N. E. 2 leagues, which will bring you up with Stone's Island, on your larboard hand, having a rock lying E. one-third of a mile from the centre of the island: from this steer N. for Round Island, from which follow the eastern directions for Machias.

**TOWNSEND TO MANHEIGEN HARBOR.**—When you take your departure from Squirrel Island, you steer E. S. E. for Manheigen Light, on the north side of which are some small dry islands and ledges, but good water between them and the other sides of the island, keeping that course until the passage between George's Island and Manheigen bears N. E. You may then steer N. E. about seven leagues, through a fair open sound, for White Head Light, leaving George's Islands, (which are three in number,) on your larboard hand. The eastern island has no trees on it. There are two dangerous rocks, bearing due south from the middle of the middle island, called the Old Man and the Old Woman, which are bare before low water. They lie about one mile from the shore; and at high water when the wind blows off the land, they do not appear. If you are bound to the eastward, and the wind should take you ahead, when you are between Manheigen and George's Islands, bring the middle of Manheigen to bear S. and run in N. which course will carry you between the eastern George's Island and the middle island. You may run as near as you wish to the eastern island, but the middle island

\* Libby Island Light is on Libby Island, at the entrance of Machias Bay; is a fixed light, 60 feet above the level of the sea, bearing N. E. by E.  $\frac{1}{2}$  E. from Moose Peake Head Light.

† Manheigen Island Light has ten lamps and reflectors, fitted on two sides of an oblong square, one side producing a blood red light, the other a common white light, and is a revolving light. Its time of revolution is 2' 15" and elevation 170 feet above the level of the sea. You can run close to the island on either side, taking care to go between some dry ledges on the northern side of it. In the island there is a small harbor open to the S. W. It bears E. N. E. from Segune Light.

has a ledge of rocks that lie to the eastward of it, which are always dry, that you are to leave on your larboard hand. When you get to the northward of this island, you must haul to the westward and run up between it and the western island, so as to bring the body of the middle island to bear N. E. of you. Here you moor your vessel, if you stay any time.

If you are bound to the eastward from this island, you may go to the northward of the eastern island, but you must be careful of a ledge that lies to the eastward of said island, which you must leave on your starboard hand; and when you bring Manheigen Light to bear S. W. you may go N. E. It might should come on, or the wind ahead, you may haul up about N. E. by N. for Terrant Harbor, which lies about 8 leagues from George's Islands. You cannot miss this harbor in the day-time. You will make Musqueto Harbor, which lies between two islands, covered with spruce trees. The entrance of the harbor is north. Having passed this harbor, you will run about two miles, keeping your course N. E. by N. when you will pass an island with burnt trees on it, which you leave on your larboard hand, and two islands on your starboard hand, which also have burnt trees on them; then you must bring the harbor to bear W. N. W. before you enter. This is a good harbor, provided you have neither cables nor anchors, as you may save your vessel by running up to the head of it, on muddy bottom, which will be dry at low water.

**TOWNSEND HARBOR.**—The entrance of Townsend is wide; from the Cuckolds to the Damiscope Islands is about three miles; and Squirrel Island lies N. E. by N. about 2<sup>1</sup>/<sub>2</sub> miles; and from Squirrel Island to the western shore is about 1<sup>1</sup>/<sub>2</sub> mile; and Burnt Island\* Light bears N. distant about two miles from the westerly point of Squirrel Island. Bunting Ledge lies south, a little westerly, from Burnt Island Light. If you are outside of Damiscope Islands, be careful to stand so far to the westward as to bring Burnt Island Light to bear N. by E. then you may run for it without fear.

If the wind should be ahead, and you have to beat into the harbor, you may stand from shore to shore without fear, and beat up either to the eastward or westward of Squirrel Island; you may find good anchorage under the lee of Squirrel Island, and go round the island with any vessel.

In coming from the westward, leave Seguin Island on your larboard hand, giving it a berth of about half a mile; then steer N. E. by E. 3 leagues, when you will, if clear weather, open Townsend Light, on Burnt Island, bearing about N. N. E. but still continue your N. E. by E. course until Burnt Island Light bears N. by E. then stand for it, continuing N. by E. leaving it on the larboard hand, till up the harbor. About three-quarters of a mile N. N. E. from the light, there is a small island called Mouse Island, which you leave on your starboard hand, which is bold, after passing it, you haul up N. E. for the eastern harbor, or continue your course N. by E. till you get the western harbor to bear W. N. W. then you may run in till you shut Burnt Island Light in by the land; or you may anchor any where inside of Mouse Island, as there are neither rocks nor shoals lying off from the land.

In coming from the eastward, get Manheigen Light to bear E. S. E. and steer W. N. W. about 5 leagues, which course and distance will carry you into the passage between all the outer islands and the main; and in steering said course, you will make Burnt Island Light, bearing about N. W. by W. then steer W. by N. till you get Burnt Island Light to bear N. W. then haul up for it, keeping it on your larboard bow, till you get up with it, then steer N. by E. and follow the directions before given, in coming from the westward.

† **KENNEBECK AND SHEEPS CUT.**—If coming into Kennebeck River from the westward, keep about one-fourth of a mile from Seguin Island† Light, in doing which you will avoid Jack-knife Ledge, which bears from Seguin Light N. W. distant 1<sup>1</sup>/<sub>2</sub> mile, and Ellingwood's Rock, lying N. one-fourth of a mile from Seguin. After pas-

\* Burnt Island lies off the entrance of Townsend (Booth Bay.) On it is a lighthouse containing a fixed light, elevated 56 feet above the level of the sea.

† Kennebeck River is one of the most important in the State of Maine. Swan Island, 4<sup>1</sup>/<sub>2</sub> mile long, lies 30 miles from the mouth of the river, and 5 miles from the chops.

‡ Seguin Island, on which a lighthouse is erected, containing a fixed light as before mentioned, lies 2<sup>1</sup>/<sub>2</sub> miles S. 4 E. from Pond Island, on which is also a lighthouse, containing a fixed light. It is remarkable when bearing east or west, being nearly 2 miles from land, and when it bears north shuts in with it. Cape small Point bears N. W. from it, and Wood Island N. N. W. 1<sup>1</sup>/<sub>2</sub> mile distant. There are several rocky ledges near Seguin, which bear from the light as follows; 5 fathoms ledge S. by W. distant three quarters of a mile—Ellingwood's Rock north, one quarter of a mile Seguin Ledges, N. N. E. half a mile, always dry—Jack-knife Ledge, N. W. 1<sup>1</sup>/<sub>2</sub> mile, 8 feet water—Wood Island Reef, N. N. W. 1<sup>1</sup>/<sub>2</sub> mile, 4 feet water—Whale's Buck, N. N. E. 1<sup>1</sup>/<sub>2</sub> mile.

sing Ellingwood's Rock, bring Segune Light to bear S. and steer N. for Pond Island\* Light, which is  $2\frac{1}{2}$  miles from Segune. Leaving Pond Island a cable's length on the larboard hand, care should be taken on the flood tide to haul quickly round Pond Island Point to avoid the Sugar Loaves, (two small islands north half a mile from Pond Island) upon which the tide sets very strongly. The course after passing Pond Island, is about N. W. to the fort on Hunnewell's Point, (which you will give a berth of a cable's length) and steer north for Coxe's Head (on which also is a fort) one mile. The course is then N. E. to Perkin's Island, which you will leave on the starboard hand about one mile, and you will give it a berth of a cable's length to shun two sunken ledges that lie nearly abreast of Perkin's Island, and about in the middle of the river; then steering about north one mile, you have fine anchorage at Perkins' Flats, in 4, 5, and 6 fathoms. This is as far as it would be prudent for a stranger to attempt with a heavy vessel.

There is good anchorage in moderate weather any where between Segune and Pond Island, within half a mile of the latter, in from 5 to 8 fathoms. Should the wind blow violently, or in case of stress of weather, and if far enough to windward to weather Ellingwood's Rock and Segune Ledges, it might sometimes be advisable to run to Townsend Harbor.†

If bound into Kennebeck, and falling to the eastward of Segune, bring the light on Pond Island to bear N. W. by W. and run for it till within a cable's length, then follow the preceding directions.

There is safe anchorage with an off-shore wind, any where between Small Point and Segune, avoiding Jack-knife Ledge, before mentioned.

Safe anchorage may be had from Coxe's Head to Perkins' Island, nearest the eastern shore. The usual rapidity of the tide, between Segune and the mouth of the river, is 3 and 4 knots.

There is also a passage into Kennebec River, leaving Pond Island, on the starboard hand, but only 16 feet can be carried at high water, and it is not recommended.

You have deep water to the eastward of Segune. At the westward the tide of flood sets strong to the northward into New Meadows, and W. N. W. into Broad Sound, and up to Portland, and the ebb tide the reverse. Your soundings, between Segune and Cape Elizabeth, are various; at times you have 18 or 20 fathoms, rocky bottom, and within a cable's length you will find 30 or 35 fathoms, muddy bottom.

The land between Segune and Cape Elizabeth, is all in islands: on the Cape is a pyramid, bearing S.  $10^{\circ}$  W. from Portland Lighthouse, 4 miles distant, and a windmill to the eastward, near Richmond's Island, which is the first windmill you see when coming from the eastward. Richmond's Island lies 1 league west of Portland, and has a bad ledge about S. E. from the N. E. end of it, half a mile distant.

If you are bound to Sheepscut River from the westward, and make Segune Light, you may leave it on your starboard hand, giving it a berth of half a mile: when you pass to the eastward you must bring it to bear S. W. by S. and steer N. E. by N. which course will carry you to Ebenicook Harbor, distant 3 leagues, leaving three dry ledges on your starboard hand, and one on your larboard. This harbor is very narrow at the entrance, but makes a large basin when you get into it; in the entrance it lies E. N. E. you cannot get in here with a N. E. or easterly wind, but must have the wind south or westerly: after you get into this harbor you must haul up N. E. or N. E. by N. for there are several sunken rocks on the starboard hand as you go in, which you are to avoid. The best anchorage is against Capt. Smith's Wharf, where you are 4 fathoms, muddy bottom; and you will lie safe from all winds. But if you are bound up Sheepscut River in a large vessel, and come from the westward, you must go to the southward of Segune Light, steering about N. E. or N. E. by E. 1 league, and when the river bears north, or north a little westerly, you may run north, and must keep the starboard hand best on board: there are many rocks and ledges, some of them above and some under water,

\* The lantern of Pond Island Lighthouse contains a fixed light, 52 feet above the level of the sea, bearing N.  $\frac{1}{2}$  W. from Segune Light, distant  $2\frac{1}{2}$  miles.

† A dry dock lies off the eastern shore, about half a mile above the lower Fort, called Shag Rock, and is the only obstacle between Hunnewell's Point and Coxe's Head.

\* With the wind at N. W. and a flood tide, you may, by fetching within a cable's length of the lower Sugar Loaf, and leaving it on the larboard hand, run into good and safe anchorage, in from 6 to 3 fathoms, in Pease's Eddy.

§ Hendrick's Head Light is situated at the mouth of Sheepscut River, and is a fixed white light, elevated 30 feet above the level of the sea.

If bound up Sheepscut River, pass Segune Light to the southward, steer N. E. until you bring Hendrick's Head Light to bear north a little westerly, then run for it, keeping the starboard shore close aboard.

which are all to the eastward of Segnine. When you get up as high as Ebenicook, you leave the two Mark Islands on your larboard hand, keeping your course north a little easterly, but if you only come here to make a harbor, when you get up to Capt. Hodgson's, you will see a bare ledge on your larboard hand, if it is low water, which is covered at high water; you may anchor at 8 fathoms to the northward of it.

On Little Mark Island a Stone Column is erected, as a landmark for vessels running into, or passing, either Harpswell or Broad Sound. It is also a conspicuous mark for the mariner, standing in from sea, in any direction between Cape Elizabeth and Cape Small Point. This island, at the entrance of Harpswell Sound, (half way between Portland and the entrance of the River Kennebeck,) is one-fourth of a mile in length, without trees, its elevation 40 feet above the level of the sea; the column is placed near the centre of the island, 50 feet high, painted perpendicularly in black and white stripes, except near the top, which is black on each side. Course up Harpswell Sound, N. E.  $\frac{1}{4}$  N.

If you want to go up to Wiscasset Point, you must keep your starboard hand best aboard, north-easterly, till you come to Cross River, which you leave on your starboard hand. You will not attempt to go up to Wiscasset Point with a head wind and the tide of ebb, for it is 1 $\frac{1}{2}$  league from Cross River; but when you have a fair wind and tide, you may proceed without fear. This river is narrow, and lies more to the westward; when you are about a mile or a mile and a half up, you must keep your larboard hand best on board, for there is a ledge of rocks which reaches near half way across the river, which is on your starboard hand, and the rock near the middle is covered at high water, but may be seen two hours before. The river runs straight to Decker's Narrows, then turns round to the westward: when you enter these narrows, you may see the town. In case you should go up in the night, you must be careful of two large rocks that lie S. W. of these narrows; the tide of flood sets very strong for them, and they are covered at half tide; you may go on either side of them, and may anchor in 10 or 12 fathoms water, muddy bottom.

It is high water here, at full and change of the moon, about 10 h. 45 m.

**NEW MEADOWS.**—This river bears N. E. 8 leagues distant from the Pyramid on Cape Elizabeth, and about one league west from Cape Small Point. If you should fall into this bay with the wind at S. E. or S. S. E. and bound to the eastward, you may make a good harbor in the above river. In standing to the northward, you will have a large round island on your starboard hand, covered with spruce-trees, together with two large rocks, one called the Brown Cow, and the other the White Bull, which are some distance from each other. You must leave the Brown Cow on your starboard, and the White Bull on your larboard hand, the latter of which you may go within a cable's length of, and when you have passed it, must stand over for Horse Island, that lies on the starboard, which has a house on it, that you may go within a quarter of a mile of. To the westward of the island lies a large rock, which is covered at high water, but bare at half tide; you may go on either side of it when it is in sight, but the widest passage is to the eastward. When you have passed this rock, steer N. by W. or N. N. W. which course will carry you up with a large island, called Bear Island, which is covered with spruce and birch trees. When you have passed this island about one quarter of a mile, you may haul in for the starboard shore, and anchor in 5 or 6 fathoms water. This is the best place to anchor, with the wind at S. S. E. or east, but be careful of a ledge of rocks that runs to the northward of this island, about a half a mile off. You may anchor in this bay according as the wind may be; if it should be at the eastward, anchor on the east side. If you have lost your cables and anchors, there is a large cove on the starboard hand, about two miles from Bear Island, bearing about N. which is sufficient

hold 30 or 40 sail of vessels. It is land-locked all round, so that no wind can damage a vessel after she gets into it.

**HUSSEY'S SOUND.**—If you come from the eastward, and make Seguin Light, bring it to bear E. and steer W. for Hussey's Sound, if you have a fair wind and daylight, as you have nothing but islands on your starboard hand. The tide of flood sets very strong in between these islands: when you get within two miles of Hussey's Sound, you will make two islands which have no trees on them, called Green Islands. You continue your course till you make Hussey's Sound, bearing N. N. E. then you may steer in with your course N. N. E.

When you pass the two islands, after entering Hussey's Sound, you leave three islands on your larboard, and two islands on your starboard hand: the northern island, on your starboard, is called Smith's Island; when you pass said island about three-quarters of a mile, you may haul away E. N. E. till you shut in said island to the S. E. then you may anchor in 8 or 9 fathoms, muddy bottom; Hog Island to the S. W. Basket Island to the N. W. Great Gabegue Island to the N. E. and Smith's Island to the S. E. Here you may moor 200 sail of ships, safe from all winds, and when wind and tide serve, you may be out to sea in one hour.

**HALF-WAY ROCK** is high and black, about 600 feet in diameter, elevated 16 feet above the level of the sea, at high water. At the distance of 600 feet from the rock, on the N. W., N., N. E., E. and S. E. side, there are from 5 to 6, and gradually deepens to 25 fathoms, within three quarters of a mile of it. A reef extends off W. by S. distant about an eighth of a mile. Within one cable's length of said reef you will find from 10 to 12 fathoms water. You may near this rock on all sides within a quarter of a mile, and find from 15 to 25 fathoms water. Seguin Lighthouse bears from the rock E.  $\frac{1}{2}$  N. distant about 15 miles; Drunken Ledges, N. N. E. distant about 2 $\frac{1}{2}$  miles; Mark Island, N. by E.  $\frac{1}{2}$  E. distant about 4 $\frac{1}{2}$  miles; the lighthouse on Cape Elizabeth, S. W. by W.  $\frac{3}{4}$  W. distant about 9 miles; Cod Rock, (shoalest part,) S. W. by S. distant about 6 miles; Portland Lighthouse, W.  $\frac{1}{2}$  S. distant about 11 $\frac{1}{2}$  miles; Green Islands, W.  $\frac{1}{2}$  N. distant about 5 miles; Jewill's Island, N. W. by N. distant about 3 miles; Eagle Island, north, about 4 $\frac{1}{2}$  miles. Drunken Ledges may be seen at all times, breaking with a little motion of the sea. Mark Island is a small bare island, and has a stone monument erected on it as a guide for vessels running into Broad Sound. Eagle Island is a small high island, covered with trees, at the entrance of said sound. Mark Island and Eagle Island form the eastern side of the entrance to Broad Sound. Brown Cow and Jewill's Islands form the western side. Green Islands are two in number, and bear from Jewill's Island, S. W. distant about one and a half mile.

Cod Ledge is about half a mile in circumference, and has on the shoalest part of it two and a half fathoms, at low water, and gradually deepens to 3, 5, 7, 8, and 12 fathoms, and bears from Portland Lighthouse, E. S. E. distant about 7 miles, and from Cape Elizabeth Lighthouse, E. by N. half N. distant about 5 miles; Green Island S. S. E. distant about 3 miles. This ledge often breaks in a heavy south-east gale.

**PORTLAND HARBOR.**—A Buoy has been placed on Alden's Rock, off the light-houses at Cape Elizabeth. The following is the report upon that subject.

Anchored at low water, in seven fathoms, near Alden's Ledge.

Hussey's Sound bears from the Buoy N. about 8 $\frac{1}{2}$  miles distant.

Northern Lighthouse on Cape Elizabeth, N. W. by W.  $\frac{1}{2}$  W.

Southern Lighthouse, on the same, N. W. by W.  $\frac{1}{2}$  W. distant 3 miles.

The Barn on Richmond's Island W., distant 4 $\frac{1}{2}$  miles.

Portland Lighthouse, N. N. W.  $\frac{1}{2}$  W., distant 6 $\frac{1}{2}$  miles.

Wood Island Lighthouse, S. W. by W.  $\frac{1}{2}$  W., distant 13 miles.

The most dangerous part of this ledge are two rocks bearing from each other E. S. E. and W. N. W. The distance between these rocks is 420 feet.

The Western rock is about 12 feet in diameter, and has 5 $\frac{1}{2}$  feet on it at low water. The Eastern rock is about 30 feet in diameter, and has but 7 $\frac{1}{2}$  feet at low water. Between these rocks are 3, 4, and 5 fathoms. The Western rock bears from the Buoy S. by W., distant 240 feet. The Eastern rock bears S. E.  $\frac{1}{2}$  S., distant 520 feet. At the distance of 600 feet from the Eastern rock, on the South East, East and North East sides, are 4, 5, and 6 fathoms water. At the distance of 3000 feet from the Western rock, on the South West, West and North West sides, are 6, 7, and 8 fathoms.

Vessels bound to Portland, falling in to the Westward, and making Wood Island Light, must bring it to bear S. W. by W.  $\frac{1}{2}$  W., and steer N. E. by E.  $\frac{1}{2}$  E. 13 miles, which will bring them up with the Buoy on Alden's Ledge.

Should they fall in to the Eastward, and make Seguin Light, they must bring it to bear E. by N.  $\frac{1}{2}$  N., and run W. by S.  $\frac{1}{4}$  S. 9 leagues which will bring them up with the Buoy.

In passing the Buoy to the E., give it a berth of one quarter of a mile. If to the West you may near it within a cable's length.

If running for Portland Harbor, bring the Buoy to bear S. S. E., and steer N. N. W. 6½ miles, which will bring you up with Portland Light. Continue this course until you are half a mile within the Lighthouse, then bring it to bear S., and steer N. by W. for House Island, which is two miles N. by W. from Portland Light. Should you wish to go further up the harbor, follow the directions of the Coast Pilot.

The course from the Buoy to Hussey's Sound is North.

Vessels falling in with Cape Elizabeth, and wishing to make a harbor in a strong N. W. wind, must observe the following directions:

Give this Cape a berth of one quarter of a mile, and steer N. E. nine miles, leaving the Green Island on the starboard hand, which will carry you up with the S. W. point of Crotch Island. Give this point a berth of half a mile, and steer N. N. E. ½ E., which will carry you between Hope Island on the North and Crotch Island on the South. You may anchor midway between the two Islands, in about 13 fathoms water. The shores on each side are very bold.

The above mentioned Buoy is a spar, painted red, about twenty feet above the surface of the water, with a staff about 12 feet in length, to which is attached a red flag, which can be seen from 6 to 7 miles.

There are also two watch Buoys, within 15 to 20 feet of the principal Buoy.

N. B. Vessels of a large draught will find the best water by bringing Portland light to bear N. W. by N., and running directly for it.

Coming from the south-westward, when within half a mile of \*Cape Elizabeth, the red buoy, on Broad Cove Rock may be seen; it bears N. N. E. from the pitch of the cape, distant one and a half mile, and lies in twenty-four feet water. When up with this buoy, leave it on the larboard hand, half a cable's length distant, and steer N. by E. ½ E. 1 mile, which will carry you up with the white buoy on Trundy's Reef, which lies in 16 feet water. Giving it the same berth as the other, you may then run N. by W. ½ W. for †Portland Lighthouse, 3 miles distant. When up with the head on which the lighthouse stands, give it a small berth, and steer N. by W. leaving Bang's Island on the starboard hand, till you come to House Island, the S. W. point of which bears N. from the lighthouse, distant almost 2 miles. Before you are up with this island, the black buoy on Spring Point Ledge may be seen; it bears N. W. by W. from the S. W. part of House Island, distant half a mile, and lies in 14 feet water. When up with the buoy, you open the town. Giving the black buoy a small berth, you may haul up N. W. for the white buoy on Stanford's Ledge: this buoy lies also in 14 feet water, and one mile distant from Spring Point Ledge buoy. Giving the white buoy a small berth, you may keep up midway the river, and anchor opposite the town, where you please, in safety.

Vessels coming from sea, and bound into Portland, may, by giving the lights on Cape Elizabeth a berth of 4 miles, run to the northward and eastward until Portland Light bears N. W. and then stand directly for it, which will clear all the ledges.

\* Cape Elizabeth Lights are situated on Cape Elizabeth, entrance to Portland Harbor, about 140 feet above the level of the sea, and 300 yards apart, bearing from each other S. W. ½ W. and N. E. ½ E. The western light revolves once in two minutes, and can be seen ten leagues distant in clear weather.

E. S. E. from these lights, 2½ miles distant, is a dangerous ledge, called Alden's Rock, with four feet water on it at low tide. Also a reef, called Taylor's Reef, bearing S. E. by S. ½ mile distant, having 2½ fathoms at low water. E. by N. ¼ N. from the lights 5½ miles distant, lies Bulwark Ledge, having 2½ fathoms on it at low water. Portland Light bears north-easterly from them, distant 5½ miles.

The following are the bearings and distances from the north-easterly light, of the shoals and reefs, and of other lighthouses in sight of and near the Cape, viz:

Alden's Rock.....	S. E. by E.....	2½ miles,
Hue and Cry.....	S. E. ½ S.....	3½ do,
Taylor's Reef.....	S. S. E. ½ E.....	1½ do,
Broad Cove Rock.....	N. N. E. ½ E.....	1½ do,
Outer point of Watch Ledge.....	S. W. ¼ S.....	2 do,
S. E. side of Richmond Island.....	S. W.....	2½ do,
Seguine Light.....	E. by N. ¼ N.....	24 do,
Wood Island Light.....	S. W. ½ W.....	10½ do,
Portland Head Light.....	N. ¼ E.....	4 do,

† Portland Lighthouse is on a point of land, called Portland Head, at the western entrance of the harbor. It is a stone edifice, 72 feet high, exclusive of the lantern, which is 13 feet, and contains a fixed light.

There are also two small buoys, on two ledges in Whitehead Passage, at the N. E. part of Bang's Island. This passage is narrow, and but seldom used with large vessels. By keeping midway between the two buoys, the red on the starboard, and the white on the larboard hand, in coming in, you will have not less than 5 fathoms water. After passing the buoys, keep midway the passage, and run one mile distance, which will carry you into Ship Channel, the same as if you had passed the lighthouse.

[N. B. All the abovementioned buoys are to be left on the larboard hand, in coming in, and the depth of water put down, is at low water.]

*NOTE.—If by accident either of the buoys should be removed, the following directions for sailing into Portland Harbor will be found useful.*

When you come from the south-westward, and intend to go into Portland, give Cape Elizabeth a berth of half a mile, and steer N. N. E. until you bring Portland lighthouse to bear N. N. W. when you must haul up N. N. W. if the wind will permit; but if you are in a large ship, and the wind N. W. or W. N. W. your safest way is to continue your course N. N. E. which will carry you safe into Hussey's Sound, allowing it to be tide of flood, as Portland Sound is narrow, but bold between the lighthouse and Bang's Island, the latter of which is on your starboard hand. If you should turn into Portland in the night, in standing to the south-westward, you must go about as soon as the light bears N. N. W. and in standing to the eastward, you must go about as soon as the light bears W. N. W. for there is a ledge of rocks that bears S. by E. from Portland lighthouse, and also a low island, called Ram Island, east northerly, one mile distant from the lighthouse; but if you have a leading wind you may go in without fear, keeping about middle of the channel way, and when abreast of the light, steer about N. by W. for House Island, which you leave on your starboard hand; when you pass House Island, bring it to bear S. E. by E. and steer N. W. by W. or W. N. W. with the tide of flood. In steering the above course, you will see a round bushy tree to the north of the town, and a house with a red roof, and one chimney; bring the tree to the west of the house, which course will carry you up the channel way, in 6 or 7 fathoms water; but when you come abreast of the fort which stands on a hill, haul away W. S. W. as there is a shoal bank on your starboard hand that has not more than 10 or 12 feet on it at high water, which you are to avoid. Here you will be careful of two ledges of rocks, one called Spring Point ledge, two miles N. by W.  $\frac{1}{2}$  W. from the lighthouse, and the other three miles, bearing N. by W.  $\frac{1}{2}$  W. called Stanford's ledge, which has a buoy on it, and stretches off from your larboard hand near half a mile in length. They lie to the S. W. of House Island, and are all bare at low water. If you are obliged to turn in here, they are much in the way, and when you are standing to the southward, be careful of them. The marks will do in the day-time, but are of no service in the night. There is a pilot who generally attends here. This harbor is open to the wind at N. E. and E. N. E. If you should come in a dark night, your best way is to go into Hog Island Road, which may be done by steering as follows:—when you pass the lighthouse, steer N. by W. until you pass Bang's Island, which you will leave on your starboard hand; in steering this course, you will make House Island, which you will leave on your larboard hand; when you are between both of these islands, you steer N. E. by E. till you come to the second island on your starboard hand. If it is day-time, you will see a large house on said island, and may anchor as soon as abreast of it, in 10 or 12 fathoms, muddy bottom. [See the PLAN.]

If you should fall into the eastward of Portland, and make Segune Light, bring it to bear E. and steer W. which course you are to continue till you make Portland Light to bear from N. W. to W. N. W. when you may run for it without fear.

You must have some regard to the tide of flood, which sets very strong between the islands to the eastward of Portland. [See the PLAN.]

MASTERS who sail from Portland, or ports adjacent, are informed, that from the OBSERVATORY on Fort Hill, by means of the telescope placed there, vessels approaching the coast may be discovered at 15 leagues distance; and their colors or private signals can be distinguished 8 leagues, if the weather should be clear and the colors hoisted, or suspended in such a manner as to present them fair to the observatory. Should any need assistance, they will set their ensign over their private signals; and may be assured, if they can be discerned, that their situation will be made known to their owners.

The Observatory bears N. N. W.  $\frac{1}{2}$  W. from Portland Lighthouse, 4 miles distance; and these, in range, are a good mark to clear Alden's Rock; which, keeping the above in range, you will be nearly three-quarters of a mile to the eastward of.

The Observatory is on an eminence 141 feet above high water mark; and the building 32 feet high, painted red, and the telescope placed near the top.

BOON ISLAND.—This island is very low, about one-quarter of a mile in length. A Lighthouse is built on the west part of the island, a little to the westward of the former light. It is 50 feet above the surface, shows a fixed light, elevated about 70 feet above the level of the sea, is a fine light, and may be seen 6 or 7 leagues distant.

There is a passage between the island and the main, half a mile within the former, between 4 and 5 miles wide, in from 12 to 20 fathoms, nearly up with York Ledge, some parts of which are above water at low tide, and bears from the island W. by S. about 6 miles distant; the Nubble N. 52° W. 6 miles; Boon Island Ledge E.  $\frac{1}{2}$  N. 3 miles; Duck Island S. 52° W. 12 miles: there is a ledge off the north part of Boon Island, one-fourth of a mile distant, which shows at low water.

*The following are the soundings around Boon Island.*

Boon Island Lighthouse bearing W. $\frac{1}{2}$ S. ....	1 mile distant,	21 fathoms.
do. ....	$\frac{1}{2}$	25 ditto
do. ....	$\frac{1}{2}$	24 ditto
W. $\frac{1}{2}$ N. ....	2	12 ditto
W. $\frac{1}{2}$ N. ....	2	8 ditto
W. by N. ....	2	18 ditto
W. by N. $\frac{1}{2}$ N. ....	$\frac{1}{2}$	23 ditto
S. E. by S. ....	2	15 ditto
S. E. $\frac{1}{2}$ E. ....	1	23 ditto
S. E. by E. ....	2	12 ditto
E. $\frac{1}{2}$ N. ....	4	18 ditto

[NOTE.—To Capt. THOMAS M. SAW, United States Revenue Cutter, stationed off Portsmouth, (N. H.) we are indebted for information respecting White and Boon Island Lights, and confirmation that Gun Boat Shoal, off Portsmouth Harbor, is correctly laid down on the PLAN here published.]

From Agamenticus Hill, Boon Island bears S. E. distant 5 or 6 leagues, and when you come in from sea, and make Agamenticus Hill, being N. W. by N. you are then to the westward of Boon Island Ledge, but when said hill bears N. W. by W. you are to the eastward of it. From Boon Island to Cape Elizabeth the course is N. E. distant about 40 miles.

I would recommend to all mariners, in coming from the eastward, not to go to the northward of lat. 43° N. in thick weather, unless they are well acquainted, and judge themselves to be to the westward of Boon Island Ledge, as this has proved fatal to many who were unacquainted.

We have been informed there is a ledge of rocks due north from Boon Island, one mile distant: the gentleman who gave the information, since deceased, and whose veracity and experience could be relied on, said, "I have passed this place several times, but never discovered the ledge till the year 1783, when, being bound to the eastward, the wind took me from the westward, but the vessel having no more than steerage way, I hove over a line to catch fish, and found I had 24 fathoms water, sandy bottom, and in a few minutes I had but 10 feet of water, and my vessel drawing 9; all that saved me from striking was, that the water being entirely smooth, the current set me to the eastward, and I got into 24 fathoms within the length of the vessel, from where I sounded, and had but 10 feet."

WHITE HILLS.—These Hills lie N. W. from Portland and N. N. W. from Wood Island lighthouse. You may see them in clear weather when no other part of the land is in sight. At the first sight they appear like a cloud, and are always white, occasioned, it is said, by their being covered with white moss. They have been seen when in lat. 43° 10' N. 23 miles S. from the lighthouse on Cape Elizabeth. The depth of water in the above latitude is 80 fathoms, muddy bottom. When you steer N. W. or W. N. W. from this latitude you will make Agamenticus hills, and when bearing W. by N. 6 or 7 leagues, they appear like three hills, and the smallest of them to the eastward. At the same time you will make Well's Hills, bearing W. N. W. and when you are on the northern part of Jeffery's Ledge, in 45 fathoms water, you will see the hills of Agamenticus bearing W. by N. or W. N. W.

Between Jeffery's and the Isles of Shoals you will have 70 and 75 fathoms water, muddy bottom, and a strong current setting to the S. W. You may see the Isles of Shoals 5 or 6 leagues when you are to the eastward of them, but will first see the lighthouse, which is on White Island, and the meeting-house on Star Island, bearing N. E. and S. W. from each other, distant seven-eighths of a mile.

CAPE PORPOISE TO \*WOOD ISLAND LIGHT, KENNEBUNK.—Wood

\* Wood Island Light is situated near the entrance of Saco River, on the east side of the island. The lantern is elevated 45 feet above the level of the sea, and contains a revolving light, which may be seen 7 or 8 leagues distant. When you first make it, the eclipse will be total, until you are within 6 or 7 miles of it, when the light will not wholly disappear, but in the revolutions, the greatest power of light will be to the least as 24 to 1.

Island, on which a lighthouse is erected, is high woody land, and very even, and lies N. E. 3 leagues distant from Cape Porpoise. In running for the light, bring it to bear N. N. W. or N. W. and run till within a cable's length with safety. You may go into this harbor either at the eastward or westward of the island. There are several rocks to the westward of the island, and also a long bar which lies to the S. W. about three-quarters of a mile distant, together with two ledges, one of which bears S. E. by S. from the light, distant half a mile, having 10 feet water on it at low tide, and the other is a dangerous ledge called Danceberry, bearing S. by E. from the light, distant about three-fourths of a mile, and breaks at all times. When you have the wind to the southward, you may lay your course in, and anchor near Stage Island, on which is a Monument: this is called Winter Harbor. You may go in the eastern way, and have room to turn your vessel, which is an advantage you cannot have in going in to the westward; but here you are exposed to the wind at N. E. and E. N. E. but if your cables and anchors are not good, you may run into the Pool, and lie safe from all winds.

In running in the eastern passage, you open a small channel for boats only, between Wood and Negro Islands, but no man of experience would mistake it. Negro Island is small, with two stores on it, and is left on the larboard hand.

Saco lies about a league to the north-west, but is a barred place, and has not above 10 feet at high water, which makes it not fit for a stranger to go in; there is, however, considerable navigation owned here, and the inhabitants are enterprising.

The next place to Wood Island is Richmond's Island, which lies about N. E. northerly 4 leagues. This place is only fit for small vessels, such as coasters, and but few vessels put in here, it being only one league to the westward of Portland, which is the principal port in the State.

In sailing by Richmond's Island, you must be careful of a sunken ledge, called Watch Ledge, that lies off about S. E. near half a mile from the N. E. end of the island; it does not show itself except the wind blows fresh, but you need not go so near the island, unless you have a scant wind, or turning to windward.

At the mouth of Kennebunk Harbor are two piers, one on the eastern and one on the western side of the channel, running from the shore about 3 or 400 feet towards the bar, extending a little beyond low water mark, with a flag staff and beacon on the top, which may be seen about one mile distant. A ledge of rocks lies off the harbor, called the Fishing Rocks, distant about three quarters of a mile from the head of the piers, between which is the anchoring ground. The ledge bears due south from the head of the piers, and is all covered at high water. Vessels approaching the harbor should keep well to the eastward of the ledge; though there is a tolerable passage to the westward, but it ought not to be attempted by a large vessel, without a good pilot.

Depth of water on Kennebunk Bar, at low water, from 2 to 3 feet; rise and fall of common tides from 8 to 9 feet, increasing sometimes to 10 and 12 on full and change. Time of high water, full and change, 11h. 15m.

**CAPE NEDDOCK TO CAPE PORPOISE.**—Your course from Cape Neddock to Cape Porpoise is N. E. distant  $4\frac{3}{4}$  leagues. Cape Porpoise is a bad harbor, and not to be attempted, unless you are well acquainted or in distress. In going in you must leave two small islands on your larboard hand, and three on your starboard. It may be known by the highland of Kennebunk, which lies to the N. W. of it. When the harbor bears N. W. you must haul in, but be careful of the point on your larboard hand, and not go too near it, as it is very rocky. As soon as you are in the harbor, and clear of the point of rocks on your starboard hand, your course must be N. W. about two cable's lengths, when you must come to, and moor N. E. and S. W. or run direct for the wharf. A vessel that draws 10 feet will be aground at low water. The harbor is so narrow that a vessel cannot turn round; is within 100 yards of the sea, and secure from all winds, whether you have anchors or not.

**CAPE PORPOISE HARBOR.**—The lighthouse stands on the south-west part of Goat Island, and contains a fixed light elevated thirty-three feet above the level of the sea. The following are the directions for the harbor:—If you are to the eastward, and make Wood Island Light, and bound to Cape Porpoise Harbor, bring Wood Island Light to bear N. E. by N. and run S. W. until you bring Cape Porpoise Light to bear N. by W.; then steer direct for the light until you shut Wood Island in by the eastern head of Cape Porpoise Harbor: then you are abreast of a breaking ledge called the Old Prince, which bears from Cape Porpoise Lighthouse S. E. by S. half a mile distant; then steer N. N. W. until Cape Porpoise Light bears E. N. E.: you are then up with the entrance of the harbor. Then, if low water, keep midway between the two points; but if high water, keep the larboard shore best aboard. When up with the points, steer N. W. a quarter of a mile, and anchor in three fathoms water, at low water. By following these directions you will find from 3 to 6 fathoms water. In coming from sea, and making Cape Porpoise, and intending to go into the harbor,

The

bring the light to bear N. by W. and follow the above directions. This harbor is not so safe for large vessels, and must not be attempted unless with a fair wind. Wood Island lies about 10 miles to the N. E. of Cape Porpoise, and has on it a repeating light. Folly Island lies opposite the lighthouse, and forms the western side of Cape Porpoise Harbor. The S. S. E. part of Folly Island Point bears from the light, S.  $\frac{1}{2}$  W. distant about  $1\frac{1}{2}$  mile. The shoal runs off nearly three quarters of a mile.

**NOTE.**—A spar buoy, painted red, elevated 9 feet above the surface of the water, has been moored near the Old Prince, in 8 fathoms water, at low water, and bears from Cape Porpoise Lighthouse, S. S. E. distant about five eighths of a mile; Old Prince bears from the buoy N. N. E. distant about one eighth of a mile; Folly Island Point, west, distant about one quarter of a mile. In running for Cape Porpoise Harbor, you may go on either side of the buoy, by keeping it close on board, and after passing it bring it to bear S. E. by S. and steer N. W. by N. for the entrance of the harbor, and follow the above directions.

**KENNEBUNK.**—A buoy has been moored near the Fishing Rocks, at the mouth of this harbor. The Fishing Rocks extend E. N. E. and W. S. W. nearly half a mile distant. The shoalest parts of the rocks are bare at 2 hours' ebb, and may be seen breaking, at all times, with a little motion of sea. On this shoal there is a spindle erected, with a small cask upon its end; the buoy bears from the spindle, N. E. by E.  $\frac{1}{2}$  E. distant about a quarter of a mile; from the spindle to the piers at the entrance of the harbor, N. E. by N.  $\frac{1}{2}$  N. distant about 1 mile; Flying Point, E. by N. distant about three quarters of a mile; Fox Point, N. E. distant about three quarters of a mile; Boothby Point, N. by W. distant about three quarters of a mile; Harding's Rock, W. N. W. distant about three eighths of a mile. This is a barred harbor, and cannot be entered except at high water. If bound to Kennebunk, you must leave the spindle and buoy on Fishing Rocks on the larboard hand, about a cable's length distant, and Flying Point and Fox Point on the starboard hand, and after passing them steer north, or N. by W. a quarter of a mile, and anchor in from 3 to 4 fathoms water, sticky bottom, where you may lie safe, with the wind from N. E., N. or N. W. Flying Point and Fox Point are bold, and you may bear them to within an eighth of a mile. The abovementioned buoy is a spar, painted red, elevated 10 feet above the surface of the water, and is moored in 4 fathoms at low water. Kennebunk is not frequented as a harbor, but vessels may, in stress of weather, run in and lie safe, with the winds abovementioned.

**PORTSMOUTH HARBOR.**—If you fall in to the eastward, make Cape Cod Neck, and are bound to Portsmouth, when within half a mile of said Cape, your course is S. S. W. 4 leagues, which course you will continue till you bring Portsmouth Lighthouse to bear N. by W. and the lights on Whale's Back to bear N. N. E. when you may run within one quarter of a mile of the former, then steer N. by E. or N. N. E. (leaving Whale's Back Light on the starboard hand,) having four fathoms water, until you are abreast of Portsmouth Light, when you must steer N. W. until it bears S. S. E. and anchor in 9 fathoms, good bottom.

If coming from the eastward of the Isles of Shoals in the night, bring Portsmouth Light to bear N. W. by W.  $\frac{1}{2}$  W. which course will carry you clear of Duck Island, continue this course until White Island Light bears S. S. W. then haul up W. by N. and continue that course until the light bears N. by W. when you may run for it with safety.

\* Portsmouth Lighthouse is at the mouth of the harbor on the west side. The height of the rock, on which it stands, is five feet, and the height of the lighthouse, to the middle of the lantern, is 85 feet, making an elevation of 90 feet above the level of the sea. It shows a fixed light.

**GUN BOAT SHOAL.**—Four miles from Portsmouth Lighthouse, bearing S. 40° W. lies Gun Boat Shoal, having not less than 34 fathoms on it, and that only on its shoalest part, which is small: It runs E. N. E. and W. S. W. about two cables' lengths, and bears from Whale's Back Light S. by W.  $\frac{1}{2}$  W. From Odiorne's Point S.  $\frac{1}{2}$  E.

† Whale's Back Lighthouse is situated on the east side of Portsmouth Harbor. Its height is 68 feet from low water mark. The base, including the ledge on which the lighthouse stands, is 24 feet, from thence to the middle of the upper lantern is 434 feet, which allowing the rise of the tide 10 feet, makes the height of the light 58 feet above the level of the sea. It has two fixed lights, one ten feet below the other. The upper light has 10 patent lamps and reflectors, and the lower one five patent lamps and reflectors. The extreme height of the upper light is 58 feet.

The following are the bearings and distances of places from Whale's Back Lighthouse.

Western Sister.....	E.....	2 miles distant.
Eastern part of Duck Island.....	S. 44 E.....	7 do.
Boon Island Light.....	N. 78 E.....	14 do.
Odiorne's Point.....	S. 40 W.....	$1\frac{1}{2}$ do.
Kitt's Rock Buoy.....	S. 23 E.....	$\frac{1}{2}$ do.

You may also, if coming from sea, and make the Isles of Shoals, and are to the eastward of them, run for them till within one mile of the eastern isle, then steer W. N. W. until Portsmouth Light bears N. by W. then follow your directions as above, passing Whale's Back Light on the starboard hand.

Beating into Portsmouth Harbor, it is not prudent to stand to the eastward farther than to bring the light to bear N. N. W. or to the westward farther than to bring it to bear N. by W.

If you come to the westward of the Isles of Shoals, give White Island Light a berth of one mile and a half, bring it to bear east, and then run N. by W. for Portsmouth Light, 9 miles distant.

On the east side of the entrance of the harbor, lies Kitt's Rock, on which is a White Buoy, and S. by W. one quarter of a mile from the lighthouse lies Stillman's Rock, over which is a Black Buoy; both rocks are under water. Give the buoys a good berth, and there is no danger.

The following are the bearings and distances of places to be observed and avoided in approaching the harbor, viz.

Kitt's Rock Buoy bears S. 27° E. 2 miles distant, }  
Odiorne's Point, S. 9° W. 2 miles distant, } From Portsmouth Lighthouse.

When you come from the S. W. and make Cape Ann, and to the eastward of the Dry Salvages, bring them to bear S. by E. and steer N. by W. or N.  $\frac{1}{2}$  W. In steering this course you will make the Isles of Shoals, from which you may take a new departure, by bringing the lighthouse to bear east, distant  $1\frac{1}{2}$  mile, and run N. by W. for Portsmouth Light.

If you are bound to the eastward from Portsmouth Harbor, you steer S. by E. one league from the lighthouse, then steer N. N. E. for Old York or Cape Neddock, which is 4 leagues from Portsmouth, but if the wind should come from the northward, you must be careful of York Ledge, which bears from Swett's Point S. E. distant 2 leagues. There is a sunken ledge that lies S. W. one mile from York ledge; it is never bare, but always breaks at low water, and is called the Triangle. Some part of York Ledge is bare at half tide, and the N. E. breaker and Boon Island Light bear E. by N. and W. by S. [See PLAN.]

**ISLES OF SHOALS.**—By the benevolence of the Massachusetts Missionary Society, subscriptions of several gentlemen in Newburyport and the neighboring towns, a meeting-house has been erected on Star Island (one of the above islands.)

The following is the description and relative situation of the islands; \* White Island (the westernmost island) is a rocky island, three quarters of a mile in length, from S. by W. to N. W. and about one mile and three quarters distant from the meeting-house. There is a reef that extends about one third of a mile from the N. W. end, which, in passing, you must give a good berth. The S. E. end bears from the meeting-house S. W.  $\frac{1}{2}$  S. the N. W. end S. W.  $\frac{1}{2}$  by W.  $\frac{3}{4}$  W.

In running in for this light there is nothing in the way when coming from the southward or eastward, except Cedar Island Ledge, Anderson's Rock and White Island Ledge.

When running in for Portsmouth Light, give White Island Light a berth of one mile, and steer N. by W. and in so doing you will leave Whale's Back Light on your starboard hand.

*The following bearings from White Island Lighthouse, are the mean of a number of experiments by compass.*

Portsmouth light-house bears N. N. W. distant nine miles. Square Rock lies directly in the range, distant from White Island five-eighths of a mile. Boon Island light, N. E. by N. distant 14 miles. Cape Ann lights, S.  $\frac{3}{4}$  W. distant 21 miles. Rye meeting-house, N. W. by W.  $\frac{1}{4}$  W. distant 9 miles. Star Island meeting-house, N. E. distant seven-eighths of a mile. North-west point of Hog Island, N. by E.  $\frac{3}{4}$  E. Cedar Island Ledge E. by N.  $\frac{1}{4}$  N. distant  $1\frac{1}{2}$  mile. Anderson's Ledge, S. E. by E.  $\frac{1}{2}$  E. distant  $1\frac{1}{2}$  mile. White Island Ledge, W. S. W. distant one third of a mile.

\* White Island Lighthouse is built on the westernmost island of the Isles of Shoals. The height of the rock on which the lighthouse is built, is 43 feet, and the height of the lighthouse to the middle of the lantern is 44 feet, making the whole height of the light 87 feet above the level of the sea. This light is lighted with 15 patent lamps and reflectors, on a revolving triangle, the whole revolution is in 3 minutes and 15 seconds, showing in this space of time a bright red, and a bright and dim natural colored light. There appears to be a total eclipse of about 15 seconds between each light at the distance of 9 miles, but within 3 or 4 miles it is visible at all times. The light can be seen at the distance of 7 leagues.

Londoner's (or Lounging) Island lies about  $1\frac{1}{2}$  mile to the northward of White Island, is about five-eighths of a mile in length, from S. to N. and is high at each end; in high tides the middle is sometimes covered; a number of rocks lie close about the island, in almost every direction, some of which are always bare. The south end bears W. from the meeting house; the north end W. N. W.  $\frac{1}{2}$  W. about half a mile distant. About half way between this island and Star Island, lies a rock which is bare at low water; it bears from the meeting-house N. W. by W.  $\frac{1}{4}$  W. one third of a mile distant.

Star Island (on which the meeting-house stands) is about three-fourths of a mile in length from S. E. to N. W. and about half a mile in breadth; it is covered with buildings on the north side. The meeting-house stands on an eminence a little to the northward of the middle of the island; is 12 feet high from the foundation to the roof; to the top of the steeple is 30 feet more; the whole height from the surface of the water is about 65 feet; it is painted white, and the steeple is placed in the middle of the building; it stands fronting the west, and may be seen at a distance of eight or nine leagues, in almost any direction at sea; it bears from Thatcher's Island lights (Cape Ann) N.  $\frac{1}{2}$  E.  $6\frac{1}{2}$  leagues distant; from Pigeon Hill N. by E.  $6\frac{1}{2}$  leagues distant; from Newburyport lighthouses N. E.  $\frac{1}{2}$  E. 6 leagues distant; from Portsmouth lighthouse S. S. E.  $\frac{1}{2}$  E.  $3\frac{1}{2}$  leagues distant; from the western Agamenticus mountain S.  $\frac{1}{2}$  E.; from the eastern do. S.  $\frac{1}{2}$  E.; from Boon Island lighthouse S. W.  $\frac{1}{4}$  S.  $4\frac{1}{2}$  leagues distant; from Boon Island Ledge (which lies one league E. from Boon Island) S. W. by W.  $4\frac{1}{2}$  leagues distant. Off the south end of this island, about three quarters of a mile from shore, lies Anderson's Rock, which is bare at half tide; in passing give it a good berth; it lies from the meeting-house S. S. E.

Cedar Island is small, and about one-third of a mile in length from east to west, situated between Star and Smutty-nose Islands. The east end of Cedar Island bears from the meeting-house E.  $\frac{1}{4}$  N. and the west end E. N. E.  $\frac{1}{4}$  E. three-eighths of a mile distant. A rock lies off the S. E. end of this island, half a mile distant, bare at half tide, bearing from the meeting-house E. by S.

Between Cedar and Smutty-nose Islands, the Government a few years since erected a sea wall, to afford a shelter to vessels from easterly gales, and to make the roadstead off the Northerly side of Star Island more secure; the violence of the sea in a short time greatly injured the wall, so that the object of its erection has been but partially effected.

Smutty-nose Island is about one mile in length from E. to W. and about half a mile in breadth; at the west end is a harbor, called Haley's Cove, where 15 or 20 small vessels may lie safe from all winds. There are several buildings near this harbor. There is a fine channel between this island and Hog Island, which has water sufficient for any vessel, keeping near the middle of the passage. The west end of Smutty-nose Island bears from the meeting-house N. by E.  $\frac{1}{4}$  E. and the east end E. N. E. about five-eighths of a mile distant.

Hog Island is a high island, lying to the northward of Smutty-nose Island; is about one mile in length from E. to W. and five-eighths of a mile from N. to S. The west end lies from the meeting-house N. by W.  $\frac{1}{4}$  W.; east end of do. N. N. E. seven eighths of a mile distant.

Duck Island (the northernmost island) is a long, low, rocky island, some parts of it are covered at high water, with rocks projecting in every direction, especially at the N. W. end, where a ledge runs off half a mile. It is the most dangerous of any of the *Isles of Shoals*, and ought carefully to be avoided; it is about seven-eighths of a mile in length from N. W. to S. E. The east end bears from the meeting-house N. N. E.  $\frac{3}{4}$  E. The west end N. by W.  $\frac{3}{4}$  W. about  $3\frac{1}{2}$  miles distant. [See the Plate.]

NEWBURYPORT, IPSWICH BAY, &c.—When you come round Cape Ann, and are two miles to the northward of the dry Salvage Rock, bring said rock to bear S. E. and steer N. W. by W.  $3\frac{1}{2}$  leagues, which course and distance will carry you up with Newburyport Bar. In running for the bar from the eastward, strangers should not approach too near Hampton Harbor, as off the mouth of it lie several sunken rocks. Hampton Harbor lies about five miles north from the southern extremity of Salisbury Point, between which and Hampton Harbor, N. by E.  $\frac{1}{2}$  E. from the lights on \*Plumb Island, 3

\* Plumb Island, so called, is situated between the mouth of Merrimack River on the north, and Ipswich Bay on the south, and is separated from the main land by a narrow sound. Its length is about  $8\frac{1}{4}$  miles, and its width from the sea to the main, not more than 500 paces. On the north end of the island are two lighthouses, containing fixed lights, which are constantly lighted at night, and so constructed as to be easily moved, a circumstance requisite from the frequent shifting of the bar at the mouth of Newburyport Harbor. This bar is probably formed by the current of the river in its progress out, meeting the drift of the sea and opposing winds, and by that means forming a bank of loose sand, which the strength of the tide is insufficient to force out. It extends across from Plumb Island, about a mile below the lights, to Salisbury Beach. The channel over it is ex-

New York: Published by Edmund & George W. Blunt, 1853.

miles distant, lies another dangerous rock, having only 3½ feet water on it. If you go no farther to the westward than for the lights on Plumb Island, to bear S. W. there is no danger from either of the above-mentioned rocks, but that course to the bar would run you on the north breakers; therefore you must bring the lights to bear W. by S. and anchor in 11 or 12 fathoms water, if the tide will not permit your coming in. No vessel, in coming in, ought to go nearer the south breaker than 7 fathoms water, nor nearer the north breaker, in coming from the eastward, than 9 fathoms. There are several pilots belonging to this harbor, who will, if possible, be outside the bar, to take command of any vessel wanting their assistance. If they cannot, you must keep the lights in range, and run for them till within a cable's length of the eastern light, when you must haul to the westward, and anchor between the two lights in 4 fathoms water. A vessel that draws 10 feet water may come in at two thirds flood. They should always keep to the windward of the bar, unless the wind should be fair. If the sea is so great as to prevent the pilot's getting over, a signal will be made by him, when you must run direct for his boat, keeping the lights in range, which will carry you safe over. If your cables and anchors are not good, you may bring the western lighthouse to bear S. E. by S. and run N. W. by N. for Salisbury Point; \* but as soon as you make said point, you must haul up N. W. which course will carry you clear of †Badger's Rocks, Black Rocks,

truly narrow, and terminated on each side by very dangerous shoals; that on the north, called the North Breaker, and that on the south, the South Breaker. The lighthouses are always so situated as to be brought in a range by the mariner coming over the bar; and as by the violence of winds or other the bar shifts, the lighthouses are shifted to conform to it. By keeping the lights in one, vessels may, by day or night, come in with safety, and find good anchorage in 4 or 5 fathoms water, abreast or between the two lights.

That part of the island bounding on the sea, and extending above half its width, consists entirely of yellow sand, perfectly smooth on the beach, but farther from the sea, driven by the wind into hillocks, or heaps, of fantastic forms, and preserved in that shape by the successive growth of grass and shrubs. On the back part of the island, where it is washed by the sound, is an extent of salt marsh, bounding its whole length. The products of Plumb Island are scarcely worthy of remark; beach grass is the principal, and is used only for manufacturing brooms. A species of plumb, from which the island derives its name, grows here in tolerable abundance. It is produced on low running shrubs, on the summit and sides of the sand hillocks; it is pleasant to the taste, and generally in its season an article for the market. There is likewise the beach pea, of which little or no use has ever been made; and indeed it is not found in sufficient plenty to become much more than an article of curiosity. At the southernmost end of the island there are several houses, with families, and a considerable spot of land, in good cultivation. To the northward of this, there is a grove of pine trees of a mile and a half in extent.

To facilitate the means of conveying immediate assistance to those unfortunate mariners who may be wrecked on this island, a number of gentlemen were incorporated for the purpose, and have completed a bridge and turnpike road from Newburyport to Plumb Island. This road leads in a south-easterly direction from Newburyport, and the bridge across Plumb Island near about one quarter of a mile to the S. W. of Seal Island. An elegant hotel has been erected at the east end of the bridge, within 100 rods of the sea shore, one mile south from the lights. The hotel is painted white, has three white chimneys, and may serve as a landmark for seamen.

If a vessel, by stress of weather, should be obliged to run ashore on this island, and the master can make any choice of place, it is most eligible to run on as nearly opposite this house as possible, as assistance and shelter can be more promptly afforded, and the communication more direct with Newburyport.

It rarely happens that any life is lost on this beach, in attempting to escape from the wreck, when the crew remain on board till low tide. Unless the vessel is in imminent danger of going to pieces immediately the seamen should never take to their boat.

\* In a course nearly N. from the lighthouses on Plumb Island, and about half a mile distant, across the mouth of Merrimack River, is the southern extremity of Salisbury Beach, called Salisbury Point. From this point a sand beach extends on the verge of the ocean, without an inlet or interruption of any consequence, until it reaches Hampton River. This beach is connected with the main land by a salt marsh of considerable extent, intersected by a variety of small rivulets and creeks, which render it impossible for a shipwrecked mariner to reach the inhabited parts of Salisbury. Here, too, the hapless seaman is sometimes destined to suffer the misfortunes of shipwreck, and to reach a desolate and inhospitable shore, only to aggravate the horrors of his death. If he can attain the first and wished for object, in evading the jaws of the angry ocean, he yet finds himself a solitary wanderer on the coast, without shelter and without sustenance; and in his fruitless search for them, must inevitably perish. As the N. E. storms are generally most fatal to vessels on this part of the coast, Salisbury Beach is not so often a place of shipwreck as Plumb Island.

† Badger's Rocks bear N. W. ½ N. from the lighthouses, distant half a mile, and are covered at two thirds flood, which you leave on your starboard hand. Black Rocks bear N. W. from the light-houses, three quarters of a mile distant, and are always dry, which you also leave on your starboard hand. Half-Tide Rocks, (on which is placed a pier,) bear W. by S. ½ S. from Black Rocks, distant 1½ mile, and bare at half-tide, which you leave on your larboard hand. North Rocks, (which also

and the Hump Sands. Across the channel, from the Hump Sands to Black Rock Creek, lie 7 or 8 piers, on which are from 7 to 2½ feet water, at low water, which were sunk in the year 1776, and have not since been removed; the mark to pass between them is to bring the beacon, at the west end of the town of Newburyport, (which may be distinctly seen in clear weather,) over the south corner of the north meeting-house. The Hump Sands lie S. W. from Salisbury Point, which makes the channel very narrow and difficult for strangers. When you pass the Black Rocks, you must haul up W. by S. ½ S. which will bring you in channel way, and good anchorage. And if it be in the night, or dark weather, when you judge yourself about half a mile from Black Rock, you may come to with safety. I would recommend to all masters, whether they belong to Newburyport or not, to avoid attempting that port in a gale of easterly wind, except they are well acquainted, and have a good prospect of getting in, as no pilot can get over the bar when it blows a gale from the eastward. And if you should make Cape Ann lights, and bring them to bear S. by E. or the Dry Salvages to bear S. by E. you may run with safety N. by W. or N. ½ W. distant 10 leagues from Cape Ann to Portsmouth. In running the above course, you will make the Isles of Shoals, if it is any way clear, from which you take a new departure: when you pass the said islands, you bring Star Island, (on which the meeting-house stands,) to bear S. S. E. and then steer N. N. W. distant from said island 3 leagues to Portsmouth; or give White Island light a berth of a mile and a half, bringing it to bear east, and then run N. by W. for Portsmouth light. White Island is the south-westernmost island. There is a very good harbor in the Isles of Shoals, from the wind from north-easterly round to southerly, and you may lie land-locked with any of them; but if the wind hauls to the S. W. or W. N. W. you may run in between Smutty-nose Island, which has a wind-mill on it, and Hog Island, where there is water enough for a first rate man-of-war, and where you anchor, have 12 fathoms, muddy bottom. [For description of Isles of Shoals see page 158.]

In going into Portsmouth, you may bring the lighthouse to bear N. N. W. till you get within Wood Island. Then you may haul away N. or N. by E. till you pass the lighthouse; you may then haul up W. N. W. or N. W. by W. and bring the lighthouse point to shut in with Wood Island, where you will be safe from all winds, and may anchor in 8 or 9 fathoms water.

When you come from the eastward, with the wind at E. or E. S. E. with which wind you cannot weather away Cape Ann, and you are to the northward of the Isles of Shoals, your only shift is to Portsmouth, and you are obliged to run so far to the westward as to bring said port to bear N. N. W. as, generally, the wind at E. at sea, hauls two or three points to the northward, which makes it a head wind. [See the PLATE.]

**SIGNALS FOR VESSELS.**—When in sight, supposed to be bound to Newburyport, and the sea is so large on the bar that pilots cannot get out to their assistance.

When a vessel comes into the bay, and cannot come over the bar at high water, owing to insufficiency of the tide, a Red Square Flag will be hoisted, and a Pendant under it, and as soon as those signals are seen from the vessel in the bay, she must keep off, and try some other port.

When the usual signals for vessels are kept up, the vessel must lay off and on at the bar, keeping to windward, until signals be made for her to come in; and when it is a suitable time to come over the bar, a Red Square Flag will be hoisted at half mast; she may then come in, keeping the lights in range.

When a Pendant is hoisted half mast, the vessel may come in, keeping the lights a little open to the northward.

When a Blue Burgee is hoisted half mast, the vessel may come in, keeping the lights a little open to the southward.

When a vessel is seen in the bay, and does not come in before night comes on, the following lights will be made, viz:

For a vessel to keep off, and not to attempt to come in over the bar during the night, a Lantern will be hoisted to the top of the flag staff.

When there is a proper time for a vessel to come in over the bar during the night, two Lanterns will be hoisted, one at the top of the flag staff, and the other half mast high. The vessel must then lay off and on at the bar, until a light is made in the eastern lighthouse, at a window about eight feet below the lantern. The vessel may then come over the bar, keeping the lights in range, and when she gets abreast of the upper light, there is good anchorage.

The signal for a vessel in distress, is a White Square Flag, with a large black ball in the centre, hoisted half mast high.

have a pier on them,) bear W. by S. from Black Rocks, distant 1½ mile, and are seen only at very low tides, which you leave on your starboard hand, between which and Half-Tide Rocks is the channel.

**•ANNIS SQUAM HARBOR IN IPSWICH BAY.**—The masters of vessels out of Newburyport should generally be acquainted with the harbor of Squam: and for their benefit a plan of the harbor has been taken from actual survey, which will be of the greatest importance, when obliged to make a harbor from Ipswich Bay, through stress of weather. When a vessel at anchor off Newburyport Bar, cannot get into port, or parts a cable, with the wind at N. E. or E. N. E. if she can carry double reefed sails, she may run S. S. E. 5 leagues, which course, if made good, will carry her a little to the eastward of Squam Bar; and if the weather is so clear as to see half a mile when you make the land to the eastward of Squam, you may run within a cable's length of the shore; your course is S. S. W.

Squam Bar bears from Hallowboat Point (the N. E. point of Cape Ann) from W. S. W. to S. W. distant about 2 leagues. In running from Hallowboat Point, you must be careful of Plumb Cove Ledge, which shows till near high water, and bears from Squam Light N. N. E. distant 1½ mile. When you have passed this ledge, you leave a deep cove, called Hodgkin's Cove, and a long point or neck of land, called Davis' Neck, on your larboard hand. When up with this neck, haul S. W. or S. W. by W. for Squam Bar.

Having made Halibut Point, or Folly Cove Point, bring either of them to bear south from a quarter to half a mile distant from them. Then run W. S. W. until you bring the light to bear S. If you judge there is sufficient water on the bar, you will then run for the light: you will pass between the two buoys. The white one is on Harraden's Rock, which you will leave on the larboard hand. The black one is on the north spit of the bar, which you will leave on the starboard hand. You may pass close to either of the buoys, when you have passed the black buoy 20 or 30 rods, you may run S. by W. half W. which will carry you close along by the Monument on the Lobster Rocks, which you must leave on the larboard hand, and pass on until abreast of Babson's Point; then a S. S. E. course will bring you into the harbor. If it is so dark that the buoy cannot be seen, continue your south course until within 60 yards of the light, then your course must be S. S. W. which will carry you abreast of Babson's Point, on your larboard hand, and opposite the Dry Bar Rocks, on your starboard hand, then S. S. E. as before directed. The bar has 6 feet of water at low tide. If you should judge there is not water enough on the bar to carry your vessel over safe, you will come to outside of the bar, and hoist a signal for assistance, which will come off if possible; if not, a flag will be hoisted near the lighthouse, when there is water enough on the bar for a vessel to run in safely.

**SANDY BAY PIER.**—If from the southward, in passing outside Streightsmouth Island, be careful of Avery's Rock, which bears north from the eastern part of Streightsmouth Island, about one third of a mile distant. Run W. by N. until you bring the meeting-house to bear S. W. by S., then run in for the Pier Head, in approaching which keep away a little, and run in until you can see into the Pier Pool; then huff and run in. Those constantly in the habit of entering said Pool when the wind is eastwardly, make up the headsails and keep up the mainsail, which enables them to have command of the vessel, and avoid falling against the wharf built out from the beach. If from the northward, after having passed Andrew's Point, bring the meeting-house to bear S. S. W. and run for it. This course will carry you clear of Dodge's Ledge, which you will leave on the starboard hand.

The passage through Streightsmouth Gap is not safe except at nearly high water, as there is but three feet water at low tide, and rocky bottom.

**•Ann's Squam Lighthouse** is a wooden building, of octagonal form, about 40 feet high, containing a fixed light, elevated about 50 feet above the surface of the water at common high tides. It is painted white, and may be known by being lower than any other lighthouse on the coast of Massachusetts, and its inland situation. It bears from Portsmouth Lighthouse about S. by W. distant 10 or 11 leagues, and from Newburyport Bar S. S. E. 5 leagues.

† On the Lobster Rocks is a Monument, 12 feet at the base, 17 feet high, built of stone, and is 7 feet out at high water. The lighthouse on Wigwam Point bears from the Monument N. E. by N. ¼ N. distant one quarter mile; the Black Buoy placed outside the bar bears N. ¼ E. distant 1¼ mile; the White Buoy near the Harraden Rocks bears N. by E. ¼ E. distant 1¼ mile, leaving the White Buoy on the larboard hand, you may steer direct for the Monument, course S. by W. ½ W. The channel abreast of the Monument is about 45 fathoms wide; the Monument going in is left on the larboard hand, and may be approached at three fathoms distant, and then have two fathoms at low water; the Black Buoy just without the harbor, lies in 10 feet at low water, and bears from the lighthouse N. ¼ W. and is to be left on the starboard hand; the White Buoy lies in 10 feet water off the N. W. side of Harraden's Rocks, bearing from the lighthouse N. by E. ¼ E. distant one mile, which is to be left on the larboard hand. A red buoy is placed off the Plumb Rock Ledges, in three fathoms water, and bears from Squam Light, N. N. E. distant 1½ mile. On Squam Bar, at low water, is about 6 feet. High water, full and change of the moon, at 11 o'clock.

A canal connects this harbor with that of Gloucester. It is about 120 rods in length, 30 feet wide, and has for its depth about the whole flow of the tide, which is about 12 feet in spring tides, and 8 feet in neap.

If you are bound to Ipswich, your course from Hollowboat Point to the mouth of the channel that leads into the harbor, is W.  $\frac{1}{2}$  N. distant about 8 miles. There are two beacons erected a small distance to the southward of Castle Hill, which may be run for, but as the bar is often removed by storms, it is not safe to run into the harbor unless acquainted. [See PLAN of Annis Squam.]

**CAPE ANN HARBOR.**—When you come from the eastward, and make \*Cape Ann Lights in the night, bring them to bear S. W. and run direct for them, which course will carry you within the Londoner, and when you pass the said rocks, bring the two lights in one, at which time they will bear N. by E.  $\frac{3}{4}$  E. and then steer S. S. W.  $\frac{1}{2}$  W. keeping said course about one mile, which will carry you clear of Milk Island, which is very low, and cannot be seen in a dark night. When you judge yourself to the westward of said island, you haul to the westward until you bring the lights to bear E. N. E. when you must steer W. S. W. about five miles, which course will carry you to Eastern Point. When you pass said point, keep your course W. S. W. until you bring Norman's Woe, which is the highest land on the north side of the harbor, to bear N. N. W. then run N. N. W. till you shut the lights in, then N. N. E. will carry you safe in.

If you want to go inside the Salvages, keep close aboard Hollowboat Point, which has a tree on the eastern part of it, and steer S. S. E. for Straightmouth island, but be careful to avoid Avery's Rock, by keeping the lights on the dry point of Straightmouth Island, till you get up close aboard, then haul round the point, and S. S. F. will carry you to the lights. To avoid the Londoner, you must keep the lights close aboard the north side of the island, on which they stand; the Londoner lies half a mile off, breaks at low tide, is quite dry at low water, and bears E. S. E. from the middle of Thatcher's Island. A long shoal runs off N. E. half a mile distant from the Londoner. Between the Londoner and Thatcher's Island there are 3 fathoms at low water. From the Salvages, Hollowboat Point and Sandy Bay, there lies a large spot of flat ground, which at low tide will take up a small vessel. Outside the Salvages is very bold. Hollowboat Point bears from the Salvages W. N. W.  $\frac{1}{2}$  miles distant, and the Salvages bear from the point N. E. 3 miles distant.

In sailing from Cape Ann Lights to Cape Ann Harbor, you will first open Brace's Cape before you come up with the harbor, which will, when open, bear N. N. W. which must avoid. Cape Ann Harbor, lies one mile farther to the westward, and when open, bears N. N. E.

We are also requested by a gentleman in whom implicit confidence may be placed, to state that no shoal or ledge lies off the western shore of this harbor, from Kettle Bottom to Ten Pound Island, more than a cable's length; therefore giving the western shore a berth of  $1\frac{1}{2}$  cable's length, and steering N. E. keeping Ten Pound Island Light open with Norman's Woe until Baker's Island Lights are shut in with Norman's Woe, then steer N. E. until Ten Pound Island Light bears from N. to N. N. W. will bring them into anchorage as any in the harbor, to the eastward of Ten Pound Ledge, in 7 to 10 fathoms water, clear bottom, and good holding ground.

**TEN POUND ISLAND LIGHTHOUSE.**—Vessels bound for Cape Ann Harbor, and falling into the eastward of the eastern point, on which a lighthouse is erected and a fixed light, you must give the point a berth of about one mile, and when the light on Ten Pound Island bears N. N. E. you are then to the westward of the ledge, that extends off from the point, on which is a Spar Buoy, the head painted red, in 10 feet water at low water, bearing from Ten Pound Rock E.  $\frac{1}{2}$  S. and may steer direct for the light; this ledge bears from the light on Ten Pound Island S. by W.  $\frac{1}{2}$  W. and is about half or three quarters of a mile from the shore. Running this N. E. course, will carry you between Ten Pound Island and Ten Pound Ledge, which bears from the light S. W.  $\frac{1}{2}$  W. about two thirds of a mile distant, has but 6 feet water at low spring tides, and is about 10 fathoms diameter. Passing between the island and the ledge, you will have 13 to 15 feet water at low spring tides; the east end of Ten Pound Island is foul ground, and no safe passage; the south, west, and north sides are bold, and may be approached

\* Cape Ann Lighthouses are built on Thatcher's Island, which lies about two miles east of the south-east point of Cape Ann, and forms the northern limits of Massachusetts Bay. The lanterns are elevated about 90 feet above the level of the sea, and contain fixed lights, which may be seen 7 or 8 leagues distant. A ledge lies off Thatcher's Island, as described under "Directions for Marblehead."

† Ten Pound Island lies in the harbor of Cape Ann. There is a lighthouse on it containing a fixed light; the base of which is about 25 feet above the level of the sea, and the tower 20 feet high.

within 40 to 60 fathoms at low water; give the west end of the island a berth of 50 to 70 fathoms, and steer in for the inner harbor N. E. you may anchor at any distance from 100 fathoms to three quarters of a mile from the island; the light will then bear from S. to S. W. Anchor in 6, 5, 4, or 3 fathoms spring low tides, muddy bottom; this inner harbor is safe against all winds that blow.

Bound for Cape Ann Harbor, and falling in to the westward, as far as Half-way Rock, take care not to bring the light on Ten Pound Island to bear to the eastward of N. E. by N. until you are a mile or a mile and a half to the eastward of Half-way Rock, to avoid the S. E. breakers that extend from Baker's Island, and which bear from the lights on Baker's Island S. E.  $\frac{1}{2}$  S. to S. S. E.  $\frac{1}{2}$  E. and about  $2\frac{1}{4}$  miles distant. On the S. E. part of these breakers is placed a spar buoy, painted black, bearing from Half-way Rock N. E. by E. about one mile distant, and from the lights on Baker's Island, S. S. E.  $\frac{1}{2}$  E.  $2\frac{1}{4}$  miles. When passed to the eastward of these breakers, you may then bring the light on Ten Pound Island to bear N. E. and run for it; on this course you will leave Ten Pound Ledge on your starboard hand, and the ledges off Norman's Woe Rock and Fresh Water Cove on your larboard hand; when up with Ten Pound Island, anchor as above directed.

The outer harbor of Cape Ann is safe and good anchorage against a northerly or east wind, where you may anchor in  $7\frac{1}{2}$  to  $6\frac{1}{2}$  fathoms, low tides, muddy bottom, the lighthouse bearing about S. E. by E. distant about one mile or a mile and a half.

The S. E. harbor is also safe and good anchorage against a northerly, east, and to the south-east winds: bring the light to bear from N. by E. to N. N. W.; anchor in 9, 8, 7, or 6 fathoms, at low spring tides, muddy bottom, distant from the light, one eighth to half a mile.

Gloucester Canal, which connects the harbor with Squam River, passes immediately by the west part of the town, or what is called the Harbor Parish. It is about 120 rods in length, 30 feet wide, and has for its depth about the whole flow of the tide. It was excavated at low water mark, spring tides: say in spring tides 12 feet, neap tides 8 feet.

**LEDGES OFF TEN POUND ISLAND.** Bearings, &c., viz.—The ledge that makes off from the eastern point, bears from the light S. by W.  $\frac{1}{2}$  W. about 2 miles distant, and has from 6 to 10 feet water at low tides: this ledge lies off from the eastern point about half a mile.

There is a single rock that lies about midway between the eastern point and Norman's Woe, called the Round Rock, on which is a spar buoy, in 2<sup>1</sup> fathoms, low water. The head of this buoy is painted black, and bears from the lighthouse on Ten Pound Island, S. W.  $\frac{1}{4}$  S. distant 1<sup>1</sup> mile. Round Rock and Ten Pound Ledge bear from each other S. S. W.  $\frac{1}{4}$  W., and N. N. E.  $\frac{1}{4}$  E. Ten Pound Rock and Cove Ledge bear W.  $\frac{1}{4}$  N. and E.  $\frac{1}{4}$  S. from each other. Round Rock and Cove Ledge bear S. by W. and N. by E. from each other.

A spar buoy is placed on Cove Ledge or Old Field Rocks, in two fathoms at low water. The top is painted black, and it bears from the lighthouse W. by S. half a mile distant.

A spar buoy, placed on the west end of Dog Bar Ledge, with the top painted white, in two fathoms at low water, common tides, bearing from the lighthouse on Ten Pound Island, S. by W.  $\frac{1}{4}$  W. distant  $1\frac{1}{4}$  mile; Dog Bar and Ten Pound Ledge Buoy bear N.  $\frac{1}{4}$  E. and S.  $\frac{1}{4}$  W.; Dog Bar and Round Rock N. W. by W.  $\frac{1}{4}$  W. and S. E. by E.  $\frac{1}{4}$  E.; Dog Bar and Cove Ledge S. by E.  $\frac{1}{4}$  E. and N. by W.  $\frac{1}{4}$  W.

The shoal called Round Rock, is a shoal formed by large and small popple stones, and always the same uniform depth of water on it, as before mentioned. Dog Bar consists of large rocks.

About 30 fathoms off from Norman Woe Point is a large high rock, called Norman's Woe Rock, of 20 to 30 fathoms diameter, and about 100 fathoms off this rock, in a southerly direction, is a ledge that has 7 or 8 feet water on it at low tides. About one quarter of a mile off from Fresh-water Cove lies a ledge with only 3 feet water, low spring tides, bearing from the light W.  $\frac{1}{4}$  N. distant 2 miles.

Half-way Rock and the rock on Ten Pound Island, bear S. W.  $\frac{1}{2}$  W. and N. E.  $\frac{1}{2}$  E. of each other, distant about 8 or 9 miles.

**REMARKS ON CASHE'S LEDGE,** by an experienced Navigator.—I took my departure from Thatcher's Island, which lies two miles to the eastward of Cape Ann. The island bore from me north, 3 miles distant; from the bearing, I steered E.  $\frac{1}{4}$  N. 65 miles,

\* Baker's Island Lights bear from the Monument W. by S.  $\frac{1}{2}$  S. distant 7 miles; S. point of Kettle Island, W.  $\frac{1}{4}$  S. distant 4 miles; Half-way Rock, S. W. by W.  $7\frac{1}{2}$  miles; lighthouse on Ten Pound Island, N.  $\frac{1}{4}$  E. distant  $1\frac{1}{4}$  mile; the White Buoy on the west end of Dog Bar, W. N. W. half a mile.

with a fair wind, and fell in with the north part of the bank, where Cashe's Ledge is, about two leagues to the northward of the shoal, in 60 fathoms, hard black clay. This bank lies N. and S. seven leagues, and E. and W. two leagues, and in the centre of the bank is the shoalest ground. Its length and breadth is one quarter of a mile. There are on it in some parts 10 fathoms, in others only 4½, all exceeding rocky. In the length of a boat you will have from 10 to 4½ fathoms, and there are 17 fathoms within a cable's length of the shoal, which gradually deepens as you stand from it, all over the bank, to 90 fathoms: at this sounding you are on the edge of the bank. You will, in general, have upon the bank oozy and sandy bottom, with black stones and broken shells, till you get into 25 or 30 fathoms; it then becomes rocky.

The current sets exceeding strong and irregular; in less than an hour it will run all round the compass. All ships and vessels should endeavor to steer clear of this shoal, for I am persuaded, that in a fresh gale of wind they must strike; if not, the sea must run so as to founder them.

By four days' observation, the weather being exceedingly clear, found the shoal to lie in lat. 43° 04' north, long. 69° 11' west.

### GEORGE'S SHOALS.

*A Report relative to the survey of George's Shoals, made in Sloop Orbit, by direction and at the expense of the Author, assisted by United States Schooner Science, under authority of Capt. Isaac Hull, at his request, in 1821.*

There are, properly, four shoals on George's Bank; the whole of them included between latitudes 41° 34' N. and 41° 53' 30" N. and longitudes 67° 18' W. and 67° 59' W. Between them there is from 15 to 35 fathoms water.

The largest and on which is the chief danger, is the most southerly and westerly. It is somewhat triangular, with a long and narrow spit making out from the S. E. angle. The S. E. point is in latitude 41° 34' N. and longitude 67° 40' W. The west point is in lat. 41° 42' N. and longitude 67° 59' W. The N. E. point is in latitude 41° 48' N. and longitude 67° 47' W. The eastern side of this shoal, although somewhat irregular, runs nearly S. S. E. and N. N. W. having on it from three feet to nine fathoms at common low water. It is composed of a great number of sand spits, very narrow, so that the width of a narrow vessel will make several fathoms difference in the depth of water. The general range of the spits is from S. E. to N. W. As there are no rocks, they are consequently liable to change, in some measure, their positions and ranges. On the eastern edge, even in calm weather, unless it be high or low water, the tides run with great rapidity, and form considerable breakers when setting to the westward, and a large waterfall when setting to the eastward. This is accounted for, by a knowledge of the fact, that directly on the edge of this shoal, there is from twelve to sixteen fathoms of water, so that the edge forms a species of dam, stopping the force of the flood tide, and over which the ebb falls.

When there was considerable wind, we observed that the breakers were higher, within the edge, to the westward, than on the edge; and I have no doubt that the water there was still shoaler, and that we should have seen the sand had it not been for the heavy sea. The breakers were such, unless it were entirely calm, that it was impossible to go among them with boats; nor was it considered safe to attempt it with the vessels. For, besides the danger of striking on the hard sand spits, the vessels would have been liable to be filled by the breakers. Even on the eastern edge, and at nearly slack water, the vessels were at times nearly covered with them. And it was not thought necessary to attempt it, as the objects of survey, to ascertain if there was danger on the shoals, and the situations and extent of them, could be accomplished without the risk.

Had not the sea been very smooth, and at high water, we should not have been able to have gotten on where we found three feet reducing it to low water. The prevailing wind was to the eastward; and I have no doubt but that this place would have been bare with any continuance of an off-shore wind.

I think there are no rocks about the shoals. We had one cast on the S. W. side, which indicated rocky bottom, in 15 fathoms; but I believe it to have been some sharp

stone that the lead struck on, although I have marked it according to the appearance, on the chart.\*

The centre of the northern shoal is in latitude  $41^{\circ} 53' 30''$  N. and longitude  $67^{\circ} 43'$  W. It extends east and west about four miles. The shoalest part having six fathoms, is very narrow, and composed of hard sand. But there is not more than twelve fathoms of water for three miles south of the above latitude. On the north side, at two cables' lengths from the shoal, the sloop dropped into 33 fathoms. The breakers on this shoal are very heavy, and when there should be a sufficient sea, to endanger a vessel, they may be seen some miles, and heard at a very considerable distance; and as the shoalest part is not more than a cable's length inside, and no danger near it, a vessel might avoid it.

To the eastward of the last mentioned shoal, in latitude  $41^{\circ} 51'$  N. and longitude  $67^{\circ} 26'$  W. is another small shoal, with eight fathoms water, having, however, considerable breakers. There are but 17 fathoms for three miles N. of it. But very near to the east of it, are 31 fathoms, and from 20 to 30 fathoms to the south and west.

The centre of the east shoal is in latitude  $41^{\circ} 47'$  N. and longitude  $67^{\circ} 19'$  W. It is about two miles long from east to west, and has several fathoms water. To the south, there are but 17 fathoms for two miles. In other directions there are from twenty to thirty fathoms.

The above described shoals, I am confident, are all which are on George's Bank. Their positions and sizes may be relied on, as well as the places of the sounding which I have laid down on the chart. They were ascertained by a vast number of celestial observations, taken with good and well adjusted instruments on board the two vessels, and very carefully and faithfully calculated. The rates of the chronometers were found by a transit instrument previously to sailing from Boston, and after our return, and all the observations re-calculated for the small variation which appeared.

At anchor, different places, and on different days, we determined the set and strength of the tides, and as nearly as possible their rise and fall. The rise of them is from one to one and a half fathoms. They set round the compass every tide, setting S. E. nearly, at full moon, and running from one to four knots per hour at a mile's distance from the breakers. The mean rate, however, is materially varied by the winds; they set strongest at W. S. W. and E. N. E. and which is undoubtedly the strength of the flood and ebb. From these causes and variety in the tides, arises a principal danger in approaching the shoals. When under way about the shoals, in a few hours time we found ourselves drifted far out of our reckonings, and to ascertain our situations, when both vessels were under weigh, we took continued observations for the longitude by the chronometers, and at the same time double altitudes for the latitudes; which latter were calculated by Brosier's new and certain method. By allowing for the sets of tides, as ascertained at anchor, the observations and reckoning agreed very nearly, so that the latitude and longitude of every sounding placed on the chart may be considered as certain. Should any vessel fall in with the shoals, a knowledge of the course and strength of the tides would be of the greatest importance. And they can be calculated for any day and hour by the preceding facts.

In going from Cape Cod to the Shoals, at 5 leagues from the light, there are 86 fathoms, muddy bottom. The water gradually deepens to 133 fathoms; and then gradually decreases towards the shoals. In lat.  $41^{\circ} 51'$  N. and long.  $68^{\circ} 11'$  W. there are 90 fathoms. In lat.  $41^{\circ} 50'$  N. and long.  $68^{\circ} 3'$  W. there are 49 fathoms, sand and gravel, on the western edge of the bank. The water then shoals fast. To the northward of the shoal, in lat.  $41^{\circ} 59'$  N. and long.  $67^{\circ} 52'$  W. on the south side of the north channel, there are 60 fathoms soft mud. In lat.  $42^{\circ} 12'$  N. and long.  $67^{\circ} 51'$  W. there are 102 fathoms. In lat.  $42^{\circ} 10'$  N. and long.  $67^{\circ} 18'$  W. there is no bottom at 175 fathoms. To the eastward we did not ascertain the extent of the Bank. In two miles southward of the S. E. point of the shoals, there are from 20 to 26 fathoms of water, which soundings continue for at least 20 miles to the southward and westward.

The bottom on the Bank, so far as we ascertained it, is of such a narrow character, that it is difficult for a vessel to ascertain her situation by it. We often found a great variety of soundings in a very short distance; such as sands of various colors, and differently mixed, coarse and fine, gravel pebbles of various colors, stones, sponge, and shells. Of all these, except sand, I saved a number of specimens, with marks to note the places from whence they were taken.†

Notwithstanding this variety, some general character of the soundings may be useful. To the westward of the shoals, and at some distance from them, the bottom is coarse

\* This Chart is published by E. & G. W. BLUNT.

† It may be worthy of remark, that at one end of the lead, on examining the arming, I found one third black sand, one third white, and one third green shells, in as distinct dimensions as they could have been drawn.

sand and gravel of all colors; to the N. W. a mixture of white, black, and yellow sand; to the N. black and white sand; to the N. E. chiefly gravel and pebbles; to the E. fine white and yellow sand, and in lat.  $41^{\circ} 57' N.$  and long  $68^{\circ} 40' W.$  some white moss: to the S. E. fine white and yellow sand.

As the shoals are approached, in whatever direction, the soundings become coarse, and are frequently mixed with shells of different kinds. Near the shoal much of the bottom is pebbles; and to the east of the largest and most dangerous shoal, there are stones of the size of hen's eggs, with moss and sponge on some of them. Near the S. E. point is from 15 to 20 fathoms; a prevailing character of the soundings is green shells, and chiefly of the species usually called sea-eggs. If a vessel be far enough south to avoid danger, she will have no shells. The quality of the soundings, as far as we were able to survey the bank, will be best understood from the chart, where they have been carefully rated.

The time and weather prevented making a complete survey of all parts of the Bank; and although we ascertained the boundaries of it to the westward and northward, I have not delineated it on the chart, being unwilling to borrow any thing from charts which disagree so essentially, and which we found very incorrect in the material points. Of the shoals themselves, I do not believe a more perfect survey can be made, unless in a calm time, the main shoal could be penetrated. This, however, does not seem to be an object, as no vessel would be safe in attempting to pass over it.

The reports that rocks have been seen on the Shoals, are undoubtedly incorrect. Had there been any there, we could not have failed of discovering them. At the west part of the bank, in strong tide rips, we saw large quantities of kelp and sea-weed, which, at a distance, had the appearance of rocks. But on sounding we found good water and regular and clear bottom.

It will be seen by the bottom that the holding ground is not good. But the vessels employed in the survey, by having a long scope of cable, rode out a considerable gale of wind for 22 hours, on the east side of the main shoal, and to windward of it. At this time the sea broke very high in 10 fathoms water.

NOTE.—In coming from the southward for George's Bank, you will get soundings in lat.  $40^{\circ} 4' N.$  if on the S. S. W. part of the bank. Should you not get soundings in the lat. of  $40^{\circ} 30' N.$  you may be certain you are to the eastward of the shoal, when you must direct your course accordingly to clear it, when your first soundings will be in from 75 to 60 fathoms. When steering to the northward, you will shoalen your water gradually to 20 fathoms, when you will be in latitude  $41^{\circ} 20' N.$  which depth of water you will have 10 or 12 leagues distant, either east or west.

Soundings from George's Bank continue W. by S. until you are nearly abreast of the east of Long Island, then southward to Cape Hatteras.

SALEM HARBOR.—Vessels inward bound, and falling in with Cape Ann, must observe the following directions, viz.—When abreast of Cape Ann Lights, bearing N. N. W. about two miles distant, steer W. S. W. about three leagues, which will carry them up with the eastern point of Cape Ann, then steer W. by S.  $\frac{1}{2}$  S.  $7\frac{1}{2}$  miles, which will carry them up with the lights on Baker's Island.

Ships bound to Salem, falling to the southward and running for the lights, must, when they have made them, keep the northern or lower light open to the eastward of the southern light, and run for them, which will carry them to the eastward, and clear of the south breaker of Baker's Island, which bears from the lights, S. E. by S.  $2\frac{1}{2}$  miles distant, and is very dangerous.

Vessels bound to Salem, having made the lights with a westerly wind, in beating up, must not stand to the southward or westward, further than to shut one light in with the other, on account of the south breaker, nor to the northward, further than to bring the lights to bear W. by S.  $\frac{1}{2}$  S. on account of Gale's Ledge, which bears from the lights N. E. by E.  $\frac{1}{2}$  E.  $1\frac{1}{2}$  mile distant, having but 4 feet water at low tides.

In going into Salem by the common or ship channel, between Baker's Island and Misery Island, being up with Baker's Island, you may pass within 100 fathoms of it and

\*Baker's Island lies on the south side of the principal entrance of Salem Harbor, is about a third of a mile in length, from north to south, bearing east from Fort Pickering, distant about 5 miles east, from the town of Salem. There are now two separate lighthouses on Baker's Island, the bases of which are about 45 feet above the level of the sea. One is 72 feet, and the other 81 $\frac{1}{2}$  feet high, and bear from each other N. W.  $\frac{1}{4}$  W. and S. E.  $\frac{1}{4}$  E. The southern light is the highest, and may be seen from 6 $\frac{1}{2}$  to 7 leagues. The water is deep near the island, but there is no convenient landing place. The north and east sides are high and rocky. There is a small channel between the south rocks and the dry breakers, but it is safe only to those who are acquainted with it.

† Misery Island lies from Baker's Island about one mile, is joined by a bar to Little Misery, which makes the north side of the channel opposite Baker's Island. Misery Ledge has eight feet wa-

steer W. by N. for the \*Haste; this course will carry you clear of †Hardy's Rocks, leaving them to the southward, and will leave †Bowditch's Ledge to the northward. If you are in the mid-passage, between Baker's Island and the Misery, you may steer W. N. W. till you have passed Bowditch's Ledge, or till you get §Cat Island open to the westward of †Eagle Island, then haul up for the Haste. Any stranger may there anchor in safety, in about 5 fathoms of water, good anchorage; but if you choose to proceed into Salem Harbor, you must steer about west for the Haste, which you will leave on your larboard hand, about half a mile distant, then steer S. W. by W. which will carry you into Salem Harbor, but you must observe, that there is a ledge runs off from the N. E. end of †Winter Island, and that Abbot's Rock lies abreast of it; to avoid which you must keep above a quarter of a mile from the shore. Abbot's Rock is found by bringing Castle Hill and house into the cove north of Fort Pickering, and Beverly Meeting-house well in with Juniper Point (or S. E. point of Salem Neck.) Abbot's Rock has seven feet at common ebb. The mean of common tides is 12 feet. In keeping off shore, to avoid Abbot's Rock, you must not go too far off, for fear of the Aqua Vitæ, which are sunken rocks, lying E. S. E. from Fort Pickering, distant nearly half a mile.

When coming from the southward, if you are near Cat Island, you may pass to the eastward or westward of it; if you are to the eastward, you must give a berth of a quarter of a mile, and steer N. by W.  $\frac{1}{2}$  W. or N. N. W. leaving the \*\*Brimbles and Eagle Island to the starboard, and ††Coney Island Ledge to the larboard—that course will carry you clear of Eagle Island Bar; continue upon the same course till you have passed the Haste, and get into common ship channel, or you may continue the same course till you get under the north shore, where there is good anchorage.

If you are to the westward of Cat Island, you may pass in the middle channel between that Island and ††Marblehead Rock, and steer over north for the ship channel, leaving §§Gray's Rock and Coney Island to the westward. After passing the Haste, and entering the ship channel, you may proceed as before directed.

at low spring tides, and bears from the lighthouse N. W. by W.  $\frac{1}{4}$  W.  $\frac{1}{4}$  mile distant. Misery Island or Great Misery, is 174 rods in length from N. to S. and 96 rods in breadth. Little Misery is 40 rods in length, with its most western point projecting into the channel. South part of Little Misery Island bears from the lights N. W.  $\frac{1}{2}$  N. three quarters of a mile distant.

\* The Lante Rock is a broken rock above water, lying near the channel, bearing from Baker's Island Lights, W.  $\frac{1}{2}$  N. distant  $2\frac{1}{2}$  miles, and  $1\frac{1}{2}$  mile from Salem Rock.

† Hardy's Rocks (on which a beacon is erected) bear W.  $\frac{1}{4}$  N. from Baker's Island Lights, distant five eighths of a mile. They are covered at high water, and are dangerous. At half tide they appear with 7 feet on them at low water. Rising States Ledge bears W.  $\frac{1}{4}$  N. from them, 150 fathoms distant.

† Bowditch's Ledge, on the east end of which a black spar buoy is placed, in  $2\frac{1}{2}$  fathoms, bears from Baker's Island Lighthouse W. N. W.  $\frac{1}{4}$  mile distant, and is seen at low spring tides.

§ Cat Island is situated about S. W. by W. from Baker's Island, 2 miles distant, and about  $1\frac{1}{2}$  mile from Marblehead Neck; and ranges from Baker's Island just clear of Marblehead Neck. On the N. W. end is a high beach, directly opposite the point of Marblehead, called Peach's Point. The shore is irregular and rocky. Beyond, and in a line with the island, are two other heads, of nearly the same projection; and on the southern side are three high rocks, but not so large as the former. Two of them are connected with the island by bars of sand, out of water at the ebb; the other stands boldly up within these two, but more southerly. The Marblehead Marine Society has erected on Cat Island Rock a spar, 40 feet high, to the top of which is annexed a cask of about 130 gallons measure, which is seen at sea 20 to 30 feet above the land. A black spar buoy lies off the S. E. end, bearing from the lights S. E.  $\frac{1}{2}$  S. to S. S. E.  $\frac{1}{2}$  E.  $2\frac{1}{2}$  miles distant.

† Eagle Island is about  $1\frac{1}{2}$  mile from Peach's Point, and bears from the lighthouses W. by S.  $\frac{1}{2}$  S. distant  $1\frac{1}{2}$  mile. A bar runs off from the western point of this island in a N. W. direction, half a mile distant, and has a red spar buoy on the end of it. It may be avoided by keeping Gray's Rocks to the southward of Marblehead Fort.

† Winter Island lies on the north side of the entrance of Salem Harbor, about half a mile in length; the highest part is on the south of the island, opposite a point of rocks on the neck (which is a point of land running north-easterly from the town, about one mile.) It has a store and a wharf on the southern end, at the entrance of Cat Cove. On the eastern point stands Fort Pickering.

\*\* The Brimbles bear S. W. by W. from the lighthouse, distant  $1\frac{1}{2}$  mile, S. S. E. from Eagle Island, and nearly half a mile distant. They are sunken rocks, bare at low water: near to it is a spur buoy painted red. It comes out of water at half ebb.

†† Coney Island is a small island that lies near the mouth of Salem Harbor: it bears from Marblehead Point, N. E. one mile distant; from Fort Pickering, on Winter Island, E.  $\frac{1}{4}$  S. two miles distant; and from Baker's Island Light, W.  $\frac{1}{4}$  S.  $2\frac{1}{2}$  miles distant.

‡ Marblehead Rock bears S. W. from the western part of Cat Island, distant three fourths of a mile. It is above water, and may be approached on either side, very near, with safety.

§ Gray's Rock bears N. W. from Cat Island, distant three quarters of a mile, W. by S.  $\frac{1}{2}$  S. from the lighthouse, distant  $2\frac{1}{2}$  miles, is high out of water, and may be approached with safety.

If in coming from the southward and eastward, you should find yourself near \*Half-way Rock, you may bring it to bear S. E. and steer N. W. for the Haste, passing near to †Satan or Black Rock, leaving it on the larboard hand, and the Brimbles and Eagle Island on the starboard; continue this course, and you will leave the Haste on the larboard hand, enter the common ship channel, and proceed as above.

There are several other channels for entering Salem Harbor, but they ought not to be attempted without a pilot.

**BEVERLY AND MANCHESTER.**—To enter Beverly Harbor, follow the directions for Salem Harbor, till you bring the Haste to bear E. S. E. and run W. N. W. about two miles, and you reach Beverly Bar, which is a spot of sand running out from the southern or Salem side of the entrance, and has commonly a beacon upon the head of it, above a quarter of a mile from the shore. The bar has very shoal water on the eastern or outward side near it, but good anchorage within. There is good water at the head of the bar. Having passed the bar, there is a sandy point from Beverly, on the northern side of the entrance, and beyond this point are the Lobster Rocks, which bear from the head of the bar W. a little S. and not half a mile distant, and they are above water at half tide. To avoid this point, after having well cleared the bar, you will steer towards Ram-horn Rock, which has also commonly a beacon, and is to be seen at half tide, bearing S. W. by S. from the head of the bar, one eighth of a mile distant. There are several fathoms of water within a vessel's length of Ram-horn Rock. Giving this a good berth, you then clear the sandy point, and steer for the Lobster Rock Beacon, bearing from Ram-horn Beacon N. W. by W. distant about one quarter of a mile. Giving this a good berth, you are then opposite to the wharves, and may anchor in deep water, in a very safe and excellent harbor.

To enter Manchester Harbor, you must bring the southern light on Baker's Island to bear S.  $\frac{1}{2}$  E. and run N. one mile distant, where you may anchor on good bottom.

Eastern Point bears from Baker's Island Lights E. by N.  $\frac{1}{2}$  N.  $7\frac{1}{2}$  miles distant. Half-way Rock bears from the lights S.  $\frac{1}{4}$  E. 2 miles distant. Hardy's Rocks bear from the lights W.  $\frac{3}{4}$  N. distant five eighths of a mile.

**MARBLEHEAD.**—Vessels inward bound, and falling in with the lights on Thatcher's Island, may observe the following directions, viz. Thatcher's Island Ledge bears from the body of the island from E. S. E. to S. S. E. extending about two miles from the island. After getting the west light to bear N.  $\frac{1}{4}$  W. you are to the westward of the ledge: then haul to the N. W. to bring the lights to bear N. E. by E. and steer S. W. by W. for the eastern point, which is about  $7\frac{1}{2}$  miles distant from Thatcher's Island. Then your course is W. by S. distant  $7\frac{1}{2}$  miles, for the lights on Baker's Island.

Vessels bound to Marblehead, and falling to the southward, and running for the lights, after making them must keep the north and lower one open to the eastward of the southern light, and run for them, which will carry them to the eastward and clear of the south breakers off Baker's Island, which bear from the lights from S. E.  $\frac{1}{4}$  S. to S. S. E.  $\frac{1}{2}$  E. distant two miles and one quarter.

Having made the lights with a westerly wind, and beating, when within two and a half miles of them, you must not stand to the southward and westward so far as to shut the north light up with the south light, on account of the south breakers, nor to the northward further than to bring the lights to bear W. by S.  $\frac{1}{4}$  S. on account of Gale's Ledge, which bears from the lights N. E. by E.  $\frac{1}{4}$  E. distant  $1\frac{1}{2}$  mile. Drawing near to the lights, take care of a ledge, called the Whale's Back, which bears from the lights N. by E. distant four fifths of a mile, and comes out of water at quarter ebb.

In going into Marblehead, and being up with the lights, give the north point of Baker's Island a berth of one quarter of a mile or less. Having the lights one in with the other, you are up with the point. When the south light is open with the north light, you have then passed the point (leaving the Misery Island on your starboard hand, which bears from the lights N. W.  $\frac{1}{2}$  N. three fourths of a mile.) Then steer S. W. by S. or S. S. W. until you bring the south light to bear N. E. by E.  $\frac{1}{4}$  E.; then steer S. W. by W.  $\frac{1}{2}$  W. distant 3 miles, for Marblehead Harbor. You will leave Hardy's Rocks, Eagle Island, and Gray's Rock, on the starboard hand; Pope's Head, (which is a large high rock, bearing S. W. by W. from the lights, two thirds of a mile distant,) Brimbles, and north point of Cat Island, on the larboard hand. The Brimbles bear from

\* Half-way Rock is about 180 feet in diameter, 40 feet high, and bold to; lying about half way between Boston and Thatcher's Island Lighthouses, on which a pyramidal monument has been erected, the stone work of which is 15 feet high, with a base of 10 feet; above the stone work is a spindle 15 feet high, on which is a copper ball 2 feet in diameter.

† Satan, or Black Rock, is above water, steep to, and bears S. W. by S. from Baker's Island, distant one and two thirds mile, and from Half-way Rock, N. W. by W.  $\frac{1}{4}$  W. a mile and one sixth.

Eagle Island S. S. E.  $\frac{1}{2}$  E. distant half a mile; and Gray's Rock from the north point of Cat Island, N. W. by W. seven eighths of a mile.

Falling in with the south point of Baker's Island, and it blowing hard from the eastward, if you cannot avoid it, you may pass the point by keeping it well on board, say at the distance of from 20 to 50 fathoms from the shore, where you will have from 4 to 5 fathoms water. When up with the S. W. point, steer W. S. W. which will carry you between the north Gooseberry Island (which bears S. W.  $\frac{1}{2}$  S. from the lights, distant two thirds of a mile) and Pope's Head, leaving the former on your larboard hand, and Pope's Head on your starboard hand, between which you will have from  $3\frac{1}{2}$  to 5 fathoms of water. As soon as you have passed Pope's Head, haul to the northward, until the south light bears N. E. by E.  $\frac{1}{2}$  E., then steer S. W. by W.  $\frac{1}{2}$  W. for Marblehead Harbor.

The south end of the Harbor of Marblehead is bold, and may be approached with safety with the point of the neck at the S. E. side of the harbor, bearing from N. N. W. to W. by N. until you are within half a mile of it; then bring the light to bear W. by S. and run for it until within two cables' lengths; then steer N. W. by W. until the lighthouse bears S. S. W.; then steer S. W. and anchor with the light bearing from E. by S. to N. E. by E. from a quarter to a half a mile distant, in 6 fathoms, good holding ground and clear bottom, secure from all but easterly gales. The following are the bearings from the lighthouse:

Marblehead Rock.....	S. E. by E. $\frac{1}{2}$ E.....	distant $\frac{1}{4}$ mile.
Half-way Rock.....	E. by S.....	" $2\frac{1}{2}$ do.
Cat Island Rock.....	E. $\frac{1}{2}$ N.....	" $\frac{3}{4}$ do.
Baker's Island Light.....	N. E. by E.....	" 3 do.
Hardy's Rocks.....	N. E.....	" $2\frac{1}{2}$ do.
Eagle Island.....	N. E. $\frac{1}{2}$ N.....	" $\frac{3}{4}$ do.
Gray's Rock.....	N. E. by E. $\frac{1}{2}$ E.....	" 1 do.
Peache's Point.....	N. by W. $\frac{1}{2}$ W.....	" 1 do.
Fort Head.....	N.....	" $\frac{1}{2}$ do.

The above are by compass.

Vessels coming from the eastward, and running for Half-way Rock, which is a high bold rock of about 30 fathoms diameter, lying S.  $\frac{1}{2}$  E. from Baker's Island lights, distant 2 miles, (and described in page 169,) must not bring the rock to bear to the southward of W. S. W. to avoid the south breaker, which bears from Half-way Rock N. E.  $\frac{1}{2}$  E. distant one mile. Being up with Half-way Rock, and bound into Marblehead, bring the rock to bear E. by S.  $\frac{1}{2}$  S. and steer W. by N.  $\frac{1}{2}$  N. for Fort Head, distant 3 miles, leaving Cat Island on the starboard hand, which bears from Half-way Rock W. N. W. distant  $1\frac{1}{2}$  mile, and Marblehead Rock on the larboard hand, which bears from Half-way Rock W.  $\frac{3}{4}$  N. distant 2 miles. Black Rock bears from Half-way Rock N. W. by W. distant  $1\frac{1}{2}$  mile. Cat Island Rock and Point Neck bear east and west of each other, distant about one mile.

Vessels being up in Boston Bay, may, by bringing Boston Light to bear S. S. W. run N. N. E. for Marblehead Rock: they are distant from each other about 12 miles. Half-way Rock and Boston Light bear from each other S. W. and N. E. distant 15 miles.

Hardy's Rocks are covered at high water, and may be seen at quarter ebb. Whale's Back is covered at high water, and may be seen at quarter ebb. Gale's Rocks have but 4 feet water at low tides, and bear N. E. by E.  $\frac{1}{2}$  E. from the lights, distant  $1\frac{3}{4}$  mile. The south breakers, off Baker's Island, are always covered. The Brimbles are covered at high water, and are seen at half tide. Black Rock is always out of water, but low. Cat Island Rock, Half-way Rock, Marblehead Rock, Gray's Rock, and Pope's Head, are large, and high above water. Half-way Rock is very bold all round it. Eagle Island is bold only on the south and east; from the N. E. part of it, quite to Hardy's Rocks, is very shoal water, and no passage for ships.

\* On Marblehead Rock is erected a monument, painted white at the bottom and black at the top, being about 8 feet in the base, and 15 in height. Strangers will observe that the course from Half-way Rock to Marblehead Fort is W. by N.  $\frac{1}{2}$  N. 3 miles distant, leaving the beacon which is placed on Cat Island Rock on the starboard hand, and the monument on the larboard hand; the monument bears from the beacon W. by S.  $\frac{3}{4}$  S. distant seven eighths of a mile.

Archer's Rock, on which is a spar buoy, painted red, (has 7 feet at low tides). . . . .	S. W. by W. $\frac{1}{2}$ W. 2 $\frac{1}{2}$ do.

Outer Breakers, known generally by the name of Outer, Middle, and Inner Breakers; this is a very extensive and dangerous shoal, extending from Searl's Rocks, in a N. E. direction, about two miles, and in a westerly direction about three quarters of a mile, bearing from the lights S. E.  $\frac{1}{2}$  S. to S. S. E.  $\frac{1}{2}$  E.; two and a quarter miles; to pass to the eastward of this dangerous shoal, have the northern or low light a little open to the eastward of the high light.

Searl's Rocks, a small part comes out of water at low spring tides, and bears from the south light S. E. three eighths of a mile distant, and from the S. E. points of Baker's Island, S. E. distant a small one fourth of a mile. There is a good channel between island and Searl's Rocks, by keeping the island best on board, say at the distance of 2 to 40 fathoms; in this channel is 3 to 5 fathoms water, at low common tides.

BOSTON HARBOR.—From \*Cape Ann to Boston Lighthouse, the course is W.  $\frac{1}{2}$  S. distant 8  $\frac{1}{2}$  leagues. After making the light, with the wind fair you will run it to bear W. by N. or W. N. W. and then run for it, till you come within 2 lengths of it. If the weather is bad, and you cannot get a pilot from the lighthouse, after running abreast of it so as to bring it to bear N. by E. you may run W. by S. until the light on Long Island Head bears N. W. by N.; then steer N. W. about one mile, or until the old light is hid by George's Island, where you may anchor in 5 fathoms in: safety in Nantasket Road.

\* We must here remark the necessity of every commander's making himself acquainted with the different lighthouses on the American coast, and on first appearance know at once his situation, as an error may be attended with disastrous consequences, which was the case in Nov. 1834, when a fine brig of 314 tons was lost, with one of her officers and a seaman, by mistaking Cape Light for Boston Light. The Captain says, "he made Cape Ann Light, bearing N.  $\frac{1}{2}$  E. distant, on Tuesday, at 6 o'clock, P. M. run W., made Salem lights, soon after run S. W. light ahead, supposed Boston, thinking Boston a standing light, continued the course until within about 6 miles, then run southerly until the light bore W. by N., then run W. until she struck the light."

† Long Island Light is elevated on a tower 73 feet, with a lantern 7 feet high, bearing from Boston light W.  $\frac{1}{2}$  N. It is lighted with ten patent lamps, and you leave it on your left hand.

The main entrance into Boston Harbor lies between \*Lighthouse Island on the north side, and Point Alderton on the south, (off which lies a shoal, as described in the PLATE, to which the reader is referred.)

To work into Boston Bay, you may stand to the southward till you bring the light to bear W. N. W. and to the northward till you bring it to bear W. S. W. till you come within one league of the light; then you must not stand to the northward any farther than to bring it to bear W. by N. and to the southward to bring it to bear W. N. W. You may anchor in the bay with safety if the wind is off shore. If you fall to the southward of Boston Harbor, be careful to avoid Cohasset Rocks, which lie above water some distance from the land, say from  $1\frac{1}{2}$  to 2 miles; the outer part of which, called Minor's Rock, has a black buoy on it, that lies in 5 fathoms water, which you leave on your larboard hand. This rock comes out of water at low common tides, and bears from Boston lighthouse S. E.  $\frac{1}{2}$  E. 9 miles. Your course from this buoy to the lighthouse is N. W. by W. distant 3 leagues. N. N. E. from Minor's, four miles distant, lies a ledge of rocks, which is small and bold; near it you have 20 fathoms. In running the above course and distance, you will pass a white buoy which lies in 4 fathoms water, that is on the N. E. part of Harden's Rocks, and bears S. E.  $\frac{1}{2}$  S. from the lighthouse, distant  $1\frac{1}{2}$  league, which rocks may be seen two hours before low water, that you also leave on your larboard hand. There is another buoy on your larboard hand, which is red, that lies in 3 fathoms water on Point Alderton. When in the middle of the Lighthouse channel, steer W. by N. one mile distant, to the beacon on the Spit, which you may run within one quarter of a cable's length of, leaving it on your starboard hand, opposite to which lies a black buoy in 2 fathoms water, on George's Island Rocks. Between the lighthouse and George's Island lies a rock, having a black buoy on it, called the Centurion, in mid-channel, with 14 feet water on it, bearing from the lighthouse W. S. W. Your course from this to Gallop's Island Point, is N. W. by N. half a mile distant. From thence through the Narrows, by Nick's Mate, your course is N. N. W. half a mile distant. Nick's Mate has a monument on it, and must be left on your larboard hand, one cable's length distant, and then steer W. by N. for Castle Island, distant 4 miles. In running W. by N. from Nick's Mate, you will first leave a white spar buoy on the Lower Middle, on your starboard hand, distant 3 miles from Nick's Mate; then, three quarters of a mile distant, you will see a white buoy, which is on the Castle Rocks, in two fathoms, which you leave on your larboard hand. When abreast of the Castle, steer N. N. W. one quarter of a mile, to clear the Upper Middle Ground, which has a black buoy on it in 2 fathoms water, that you leave on your larboard hand; if the buoy should be removed, run N. N. W. till you bring the two northernmost steeples in Boston a handsplike's length open, then steer N. W. by W.  $2\frac{1}{2}$  miles, which will carry you opposite the town.

Broad Sound, which is the north entrance of Boston harbor, is not a proper channel for large vessels; but those who frequent it, will follow the directions here given: when up with the Graves, which are a parcel of dry rocks that appear white, you must leave them on your larboard hand, two cables' lengths distant, then bring them to bear S. E. and run S. W. by W. 4 miles, when you will be up with Long Island light, which is elevated on a tower 20 feet, on which is a lantern 7 feet high, bearing from the old lighthouse, W.  $\frac{1}{2}$  N. It is lighted with 10<sup>th</sup> patent lamps. You leave it on your larboard hand.

In passing from the Graves to Long Island light, you will see two buoys on your larboard hand, one of which is on a reef called the Devil's Back, is painted red, and lies in 4 fathoms water; the other is on Ram's-head bar, painted black, and lies in 15 feet water on the N. E. end, bearing from Long Island light E. N. E. You will also pass a white

\* Boston Lighthouse is situated on an island at the entrance of the harbor. The lantern is elevated 82 feet above the level of the sea, and contains a revolving light, which may be seen 9 or 10 leagues distant. When at the distance of 7 or 8 leagues, the time of darkness will be twice that of light; as you approach it the time of darkness will decrease, and that of light increase, until you get within three leagues of it, when the light will not wholly disappear, but the greatest power of light will be to the least, as 44 to 1. Two huts are erected at Long Beach (on Nantasket) for the accommodation of shipwrecked seamen.

† *Remarks on the single rock that lies off the north part of Point Alderton, viz:—*The rock on with the first fence that runs over the east side of Strawberry Hill; Newcomb's Barn (on Gallop's Island) half way between the lighthouse on Long Island and the beacon on the spit. When Newcomb's barn is on with the beacon, you pass just to the north of this rock, on the north of which the buoy is placed, and near it.

‡ *Marks for a shoal in Lighthouse Channel.*—The east low point of Gallop's Island, just seen clear of the N. E. of George's Island; the buoy on the Centurion just clear to the north of the Great Brewster: this is something of a shoal; on it, at low water, are 12 to 13 feet. Mr. Wilson, Pilot for Boston Harbor, struck on this shoal in a ship drawing 14 feet 9 inches water. Then the tide had flowed about three quarters of an hour.

buoy on your starboard hand, which lies on the N. E. point of Faun bar, in  $2\frac{1}{2}$  fathoms, (at which time Long Island head light will bear S. W.) when you must follow the directions above, for the town.

A black buoy with a white vane, has been placed near to the Barrel Rock, which lies in the Broad Sound channel, at the entrance of Boston harbor. The buoy is moored about 7 fathoms N. E. from the rock, in  $3\frac{1}{2}$  fathoms water, about  $1\frac{1}{2}$  mile W. by S. from the body of the Graves, one half mile N. W. from the Devil's Back, W. N. W. from the house on Green Island, and N. E.  $\frac{1}{2}$  E. from the tree on Long Island head. This rock is 10 or 12 feet long, and 5 or 6 feet wide, ranging N. N. W. and S. S. E. having 4 or 5 feet of water upon it at low tide, and  $3\frac{1}{2}$  fathoms round it. Vessels may pass with safety either side of the buoy, giving it a berth of 12 or 15 fathoms, but the eastern passage is said to be preferable for strangers.

The Lower Middle Ground lying in the way, the directions are as follows, viz.

The Lower Middle Ground, which lies on the north side of the channel, a little above Spectacle Island, is in part dry at low water. On the eastern part is a red buoy, and on the western part is a black buoy, in two fathoms water, both which you leave on your starboard hand, at which time you may see the white buoy on the Castle Rocks, before mentioned.

pudding Point, or Shirley Gut Entrance, is between Faun Bar and Winship's Bar. You must bring it to bear S. W. and run for it, leaving Shirley Point on the starboard, and Deer Island on the larboard hand. The channel from this gut to Boston is so crooked and narrow, that no person should attempt to go in with a large vessel, unless acquainted, without a pilot.

**HYPOCRITE PASSAGE.**—Coming from sea, you leave the Graves, Roaring Bull, Green Island, and Half-tide Rocks, on your starboard, and the Outer Breacher, Little and Great Calf Island, on your larboard hand. [NOTE.—Half-tide Rocks lie to the west of Green Island, one third of a mile, and opposite Little Calf Island, distant about half a mile, and come out at half ebb.]

Giving the Graves a berth of one quarter of a mile, the course up for Little Calf Island's N. E. point is about W. by S. distant  $1\frac{1}{2}$  mile from the Graves. As you pass up, give the south side of Green Island a berth of one quarter of a mile to avoid a ledge of rocks that runs off from the south side of the island, about one-eighth of a mile. When nearly up with the N. E. point of the Little Calf, give it a berth of about 40 or 50 fathoms, and after passing it, steer for the north point of the Great Calf Island, from the west end of which the course is S. W. or run up by it, keeping the S. W. head of Pettick's Island open to the west of the beacon on the spit. In passing between Lovell's Island and the beacon on the spit, keep nearest the island, as a ledge of rocks extends from the spit from 60 to 80 fathoms, and comes out of water at half ebb, lying about one third of a mile N. E. from the beacon. There is also a ledge (or rock) lying about midway between the beacon and the S. E. point of Lovell's Island, having 6 feet on it at low spring tides. After passing the beacon, you enter the Narrows. Lovell's Island makes the east side of the entrance to the narrows.

\* In consequence of part of Deer Island's washing away, a shoal is made off from the S. or S. W. point, in about a W. S. W. direction, called the Handkerchief, about 40 or 50 fathoms long, ranging about E. N. E. and W. S. W. It is covered at high water, but dry at very low tides, which makes it dangerous for vessels coming in and going out through Broad Sound. A black buoy is now placed near the point, which must, in passing, be left to the northward, when passing through Broad Sound.

† The Roaring Bull lies between the west end of the Graves and the east end of Green Island.

Long Island Lighthouse.....	S. W. $\frac{3}{4}$ S.
North point of Deer Island.....	S. W.

Vessels outward bound, from Boston Lighthouse, who would wish to fall in with \*Cape Cod, the course is S. E. by E.  $\frac{1}{2}$  E. distant 11 leagues, thence 3 leagues to the lighthouse. When up with the lighthouse, and it bears S. W. 2 leagues distant, you may then steer S. S. W. which will carry you out of the south channel.

Vessels in Boston Bay, who put away for Cape Cod Harbor, must endeavor to fall in with Race Point Lighthouse, which contains a revolving light, and run for it until within half a mile; when it bears E. N. E. haul up E. S. E. or as near as the wind will permit, and anchor in from 10 to 4 fathoms, in Herring Cove, where is a good lee, with the wind from N. N. E. to S. E. by E. Should the wind shift to the N. W. Provincetown Harbor is under the lee, to which we refer. Should you first make Cape Cod Light, bring it to bear E. by N. and run for it until you have soundings in 14 or 15 fathoms water; then steer N. E. until the light bears E. by S.; then run in N. W. for the harbor. The course from Boston Lighthouse to Sandwich is first S. E. by E. 3 leagues to Cohasset Rocks; thence to Sandwich S. S. E. 14 leagues.

When between Cape Ann and Cape Cod, you will have 35 to 19 fathoms water, which latter sounding is within 2 leagues of Boston Lighthouse; the quality of the soundings is more to be depended on than the depth of the water, as you will find a difference of 5 or 6 fathoms in running a cable's length. You will observe that the quality of soundings is sandy on Cape Ann side, and sandy on Cape Cod.

At full and change, it is high water off Race Point at 10 o'clock and 45 minutes. Vessels in leaving Cape Cod, bound to Boston, should calculate the tide, as the flood sets strong to the S. W. off Cape Cod, from the Race to Chatham; flood sets to the south, ebb to the north; southern tide, 9 hours; northern tide, 3 hours.

The upper buoys in Boston Harbor will be taken up during the winter season; but those in the vicinity, including Salem and Cape Ann, are not taken up during the winter. (See the PLATE.)

**BOSTON LIGHTHOUSE TO CAPE ELIZABETH LIGHTS.**—From Boston Lighthouse to Thatcher's Island Lights, which lie two miles east from Cape Ann, the course is N. E.  $\frac{1}{2}$  N. and the distance  $8\frac{1}{2}$  leagues; but to clear the Londoner, which you leave on your larboard hand when bound to Cape Elizabeth, the course is N. E. by E. About half way, and near the north shore, is a high bold rock, called Half-way Rock, of about 30 fathoms diameter, (on which is a Monument) bearing S. W. by W. distant  $7\frac{1}{2}$  miles from the eastern point of Cape Ann, before described.

From Thatcher's Island E. S. E. one half of a mile, lies a ledge of rocks, called the Londoner, which show themselves at half tide, and extend E. N. E. and W. S. W. distant two miles from the island. If you should be forced to the northward of Cape Ann, there is a very clean bay, called Ipswich Bay, and north-east from it lies the harbor of Portsmouth, the entrance to which is formed by Great Island on the west, and Gerrish's Island on the east, on the former of which the town of Newcastle is built.

From Cape Ann Lights to the Isles of Shoals, the course is N.  $\frac{3}{4}$  E. distant  $6\frac{3}{4}$  leagues. These Isles are low and level, and near two miles in length. South from their west end half a mile distant, lies a rock, which may be seen at half tide, and by giving the west end of these islands a berth of  $1\frac{1}{2}$  mile, a N. by W. course will carry you to the entrance of Portsmouth Harbor, 9 miles distant. The westernmost of these islands has a Light-house on it, as fully described in page 158.

Strangers should never attempt to go round the east end of these islands; but if driven thereto, give them a berth of half a mile, and steer N. W. by N. which will carry you to Portsmouth. North-east from the east end of these islands, 4 miles distant, lies York Ledge, which is always to be seen, and extends N. E. and S. W. two miles. From York Ledge to Boon Island Light the course is E. N. E. distant 9 miles. From Boon Island Light to Boon Island Rock, (on which the sea always breaks) the course is east, and the distance 3 miles. From Boon Island Light to Wood Island Light, the course is N. N. E. distant 12 leagues, and from thence to Cape Elizabeth the course is N. E.  $\frac{1}{2}$  E. distant 4 leagues.

**BOSTON BAY, FROM CAPE COD OR CAPE ANN, TO BOSTON LIGHTHOUSE.**—Boston Lighthouse, as before mentioned, stands on a small island at the en-

\* Cape Cod is low and sandy land. Cape Ann is middling high, with many trees on it. On the latter is a remarkable land, called Pigeon Hill, which appears like a boat bottom up.

trance of the channel, and is about 82 feet high, including the lantern. To steer for it from Cape Cod, when in 5 fathoms, off \*Peaked Hill bar, your course is N. W. by W.  $\frac{1}{2}$  W. 14 leagues. Should it be thick weather, and you should fall in with the south shore of Scituate in 15 fathoms, steer north till you get into 16 fathoms, when Boston light will bear W. N. W.

From the Race Point lighthouse to Boston lighthouse, is about 11 leagues. From Cape Ann lights to Boston light, the course is S. W.  $\frac{1}{2}$  S. distant  $8\frac{1}{2}$  leagues.

There are two lights on Thatcher's Island. This island contains about 30 acres of land, secured by an iron-bound shore, and is situated about two miles east of the main land of Cape Ann. It affords no harbor, nor is there any safe anchorage very near it. There is a passage between that and the main, through which small vessels may pass even at low tide, but the water is shoal, and the bottom covered by a collection of large round stones. The lighthouses were erected there for the benefit of vessels coming in from sea, as well as for those coasting around the shores. As soon as these lights are discovered, they can know their real situation; for being two lights, they cannot be taken for the single revolving light at Boston Harbor, or for the Plymouth lights, where there are also two, but the distance between them is only 11 feet 6 inches, while the distance between those on Thatcher's Island is about one third of a mile, and can be brought to range one with the other when you are abreast of the island, and bear N. by E.  $\frac{1}{2}$  E. and S. by W.  $\frac{3}{4}$  W. from each other, and those on Plumb Island bears E. by N. and W. by S. from each other. The lights on Thatcher's Island are of great use to all vessels in their passage in or out, as they point out the situation of the Salvages on the north, and the Londoner on the south. Besides, from the different bearings of the lights, a safe departure may be taken for the different harbors in the bay, as well as for those bound northerly and to sea. For remarks more minute, you will find them in the directions for sailing to Boston light to Baker's Island lights, and to those on Plumb Island, at the mouth of Newburyport harbor.

†SCITUATE.—The lighthouse at the entrance of Scituate harbor was erected more for the benefit of foreigners, who fall into the bay southward of Cohasset rocks, and as a guide to southern coasters to avoid Cedar Point, which is flat, and projects into the bay beyond the cliffs, than for any advantages to be derived from the harbor, which is small, having only about 12 feet water on the bar at high water middling tides. Scituate lighthouse is four miles to the southward of Cohasset Rocks, elevated thirty feet above the level of the sea, showing two lights, one above the other, the lower one red, and the upper one white, distinguishing it from Boston light, on the north, which is a revolving light, and Plymouth lights on the south, which show two lights (or lanterns on the same building.)

From the body of the lighthouse, the northerly part of Cedar Point, and a Ledge called Long Ledge, extends N. N. W. nearly one mile; so that vessels falling in a little more than one mile northward of the light, may bring the light to bear south; and if they make good their course north, they will clear the outer ledges of Cohasset Rocks: half a mile east of the body of the light will clear Cedar Point, Long Ledge, and the first Cliff Ledge.

[NOTE.—There are ledges extending from all the four cliffs, but none between them; and half a mile from the shore will clear all, except frigates and large vessels.]

From the body of the lights, running S. S. E. will clear Branch's Point, consequently, giving the lights half a mile berth, there will be no danger in running S. S. E.

There is a passage within Cohasset Rocks, used by coasters, which is found by giving the lights half a mile berth, and running N. W. by N. to the southerly entering rock.

There is a meeting-house about two miles W. by N. from the lights; and a farm-house near the north-west side of the harbor, with two large barns a little north. To go into the harbor (the mouth of which is about one third of a mile wide) bring the meeting-house or farm-house to bear about W. by N. from the middle of the entrance of the harbor, and run in W. by N. for the farm-house, until you have passed the bar, which is a hard bed of stones and gravel that does not shift; and after passing the bar, and coming on sandy bottom, haul up and anchor near the beach on the south side of the harbor.

\* Remarks by Capt. Trevett, off Cape Cod.—“Being well in with the land, when the lighthouse on the Highlands was abeam, we steered N. W. by W. about two leagues, which brought us up with Peaked Hill bar; then W. S. W. three leagues, which brought us up with Race Point; then steered S. S. E. for Wood End Point, about 3 leagues, or until we got the light on the Highland to bear E. by N. then run E. by N. about 4 miles, to good anchorage.”

† Scituate light is on Cedar Point, at the entrance of a small shallow creek which forms Scituate Harbor, 13 miles to the southward of Boston Light.

\*PLYMOUTH HARBOR.—The high land of the Monument bears from the lights S.  $\frac{1}{2}$  W. 3 miles, and †Monument point S. S. E. 3 leagues and Branche's point N.  $\frac{1}{2}$  W. about 3 leagues. Saquash Head W.  $\frac{1}{2}$  S. 3 miles, the easternmost part of Brown's Islands or shoal that dries, S. S. W.  $1\frac{1}{4}$  mile, and the Gurnet Rock from the body of the lighthouse E. by S.  $\frac{3}{4}$  S. one third part of a mile; on this rock you have but 3 feet at low water, at which time all the soundings were taken, and  $3\frac{1}{2}$  fathoms along side at the same time. A white buoy is placed near this rock, bearing E. S. E. from the lighthouse, distant about one third of a mile. When you have shut in the Sandy Hill with the Gurnet Head, you are clear of the rock; after which you must mind not to haul in too close to the head, as there are many sunken rocks some distance from the shore. When you bring Saquash Head to bear W. by N. you may steer up W. by S. and if you are bound for Plymouth you must keep that course for a large red cliff on the main, which is a very good mark to carry you clear of Dick's Flat; then you must steer more southerly for Beach Point, or run up until you are abreast of Saquash Head, giving it one quarter of a mile distance; then steer W. by S.  $\frac{1}{2}$  S. which will clear you of Dick's Flat, and carry you directly for Beach Point, keeping within 15 or 20 yards of the Sandy Point, steering away for the southward, keeping that distance until you have shut in the lights, where you may anchor in 3 and 4 fathoms, but the channel is very narrow, having nothing but a flat all the way to Plymouth, except this small channel, which runs close by this neck of land: you will have 4 and 5 fathoms close to this point. If you are bound into the Cow-yard, you must steer as before directed, which will clear you of the stone monument on Dick's Flat, and that on the Muscle Bank, both of which you leave on your starboard hand, when you may anchor in 7 or 8 fathoms water. If bound to Kingston, you will keep the house on Gurnet Head just open with Saquash Head, until you have opened the high pines with Clerk's Island; then you are clear of the Muscle Bank, when you may steer N. W. until you have 3 fathoms at low water, not running into less.

In coming from the northward, bound into Plymouth, you must not bring the lights more southerly than S. by W. to avoid High Pine Ledge, which lies north from the Gurnet Head, about  $2\frac{1}{2}$  or three miles. When you are on the shoalest part of this ledge, some part of which appears at low ebb, you will have the high pines in range with Captain's Hill, which will then bear W. by S. This ledge of rocks lies  $1\frac{1}{2}$  mile from the shore, extending about N. N. E. for near a mile, and close to this ledge you will have 4 and 5 fathoms, which deepens gradually as you run from it to the eastward: within one mile, you will have 10 and 12 fathoms.

In coming from the southward, bound into Plymouth, you must not open the northern light to the westward, but keep them in one, which will carry you in 5 fathoms by the easternmost part of Brown's Islands or shoal, keeping that course until you are within half a mile of Gurnet Head or higher, where you will have but 4 fathoms; then Saquash Head will bear W. by N. a little northerly, and the two outermost trees on the head in one; then you may steer directly for them, until you bring the lights to bear E. N. E. and the house on Saquash Head to bear N. W. just open with the first Sandy Beach, where you may anchor in 4 fathoms in Saquash Road, good clear bottom; but if you are bound for Plymouth or the Cow-yards, you must steer as before directed. If in the night, it is best to anchor here, as it is difficult to make Beach Point (as it is mostly covered at high water) if dark, or to go into the Cow-yard.

In turning into Plymouth, you must stand to the northward into not less than 3 fathoms, as it runs a flat a long way from the Gurnet Head to Saquash; and from both the heads lies off a point of rocks a good way from the shore, many of them but just under water at low ebbs. And all the way from Saquash to the Muscle Bank, you have shoal water; so that you must not stand in less than before mentioned. And in standing over for the sands to the southward, you must go about as soon as you shoalen your water to 4 fathoms, as it is bold to, and you may observe the rips, unless it is very smooth. This

\* This harbor is capacious, but shallow, and is formed by a long and narrow neck of land, called Salthouse Beach, extending southerly from Marshfield, and terminating at the Gurnet Head, and by a smaller beach within, running in an opposite direction, and connected with the main land near Eel River, about 3 miles from the town. There are two lighthouses on the Gurnet, which are about 86 feet above the surface of the sea, 15 feet apart, containing fixed lights, and cannot be brought into one to the northward, unless you are on the shore. But to the southward you may bring them in one, which is a very good mark to clear you of Brown's Island or sand bank. On Salthouse Beach is placed one of the huts erected and maintained by the Humane Society of Massachusetts, for the reception and relief of shipwrecked mariners. There is a breach in the inner beach, which exposes the shipping, even at the wharves, during an easterly storm. The Gurnet is an eminence at the southern extremity of the beach.

† Monument Bay (from which the point takes its name) is formed by the bending of Cape Cod. It is spacious and convenient for the protection of shipping.

s than 3 fathoms, n both the heads ust under water ave shoal water; ding over for the your water to 4 y smooth. This

neck of land, called Gurnet Head, and by the main land near et, which are about cannot be brought ou may bring them ak. On Salthouse of Massachusetts, inner beach, which et is an eminence

ding of Cape Cod.

sand extends from abreast of the lights to Beach Point, most of which is dry at low ebbs. From the easternmost part of this sand to Dick's Flat, it rounds with a considerable sweep; you have but 5 fathoms water from the easternmost part of Brown's Island to the Gurnet Head, and not more than 7 or 8 until you are abreast of Dick's Flat, where you will have 13 or 14 fathoms in a deep hole, and then shoalen to 5 fathoms abreast of Beach Point.

If you should fall in to the southward of Brown's Islands or shoal, between them and the Monument Land, where you have 20 fathoms in some places, you must not attempt to run for the lights, until you have them shut in one with the other, when they will bear N. N. W.  $\frac{1}{2}$  W.; if you do, you may depend on being on Brown's Islands or Shoals, as there is no passage for even a boat at low water.

In coming in from the northward in the night, you must not bring the light to bear more southerly than S. by W. to avoid High Pine Ledge, and keep that course until you have them to bear N. W. or N. W. by W. when you will be clear of the rock, and may steer up W. by S. until you have lights to bear E. N. E. where you had best anchor in the night. Here the tide runs strong channel course from the Gurnet to the Race Point of Cape Cod; the course is E.  $\frac{1}{2}$  N. about 6 leagues distance; and from the Gurnet to the point going into Cape Cod Harbor, is E. by S. 7 leagues.

If you should make the lights in land northerly or N. W. winds, and cannot get into Plymouth, you may then run for Cape Cod Harbor, bringing the lights to bear W. by N. and steer directly for Race Point Light, following the directions given for entering Provincetown Harbor, by the fixed light on Long Point, and come to anchor. If it should blow so hard that you cannot turn up the harbor, you may anchor off the point, clear bottom; you have 8 and 9 fathoms very nigh the shore, so that there is no danger of being on it, unless very dark.

At the Gurnet and Plymouth the tides are much the same as at Boston; that is a S. E. moon makes full sea.

**CAPE COD HARBOR.**—If you wish to go into Cape Cod Harbor, you may pass within half a mile of the light on Race Point. After passing it, bring it to bear N. N. W. and run S. S. E. until the light on the highland bears E. by N. then run for it 2 or 3 miles, when you will be clear of Wood End Bar; then N. E. to bring the light on the Highland to bear E.  $\frac{1}{2}$  S. when haul up N. W. for the harbor, and anchor in 4 fathoms, when the light will bear E. by S.  $\frac{1}{2}$  S. 5 or 6 miles distant.

In going into Cape Cod Harbor in the night, you may follow the above directions till the light on the Highlands bears E. by N. when you may run for it till you get into 5 fathoms, when you must steer N. W. for Provincetown, keeping the same soundings, about 2 miles distant.

Ships of war should bring the light on Race Point to bear N. by W. and steer S. by E. to pass Wood End Bar in 10 fathoms; as soon as the light on Long Point bears N. E. by N. steer N. E. until in 8 fathoms water, when anchor, the light on the Highlands of Cape Cod bearing from E.  $\frac{1}{2}$  N. to E.  $\frac{1}{2}$  S.

Good anchorage may be found in a N. E. gale, by running for Race Point Light, giving it one third of a mile distance as you pass it; as soon as it bears E. N. E. when you will be safe with the wind from N. N. E. to S. E. by E. haul up E. S. E. and anchor in from 10 to 4 fathoms.

Vessels inward bound, who fall in with the back of Cape Cod, may bring the light to bear S. W. 2 leagues distant, and then steer W. N. W. for Boston Lighthouse, which contains a revolving light.

When up with Race Point, you will find it very bold about one mile to the westward of the lighthouse, and it may be known by a number of fish-houses on it. About one mile to the southward of Race Point is what is called Herring Cove, where you may have good anchorage half a mile from the shore, the wind from E. to N. N. E. in 4, or even in 3 fathoms water.

In passing Race Point to the southward, you must give it a berth of one mile, as there is a long flat of sand that lies to the southward of said point. You must not haul to the eastward till you come near Herring Cove.

\* There is a lighthouse erected on the extreme point of Race Point, which contains a revolving light (on the same plan as Boston Light) to distinguish it from the one on the Highlands of Cape Cod, but it cannot be seen from vessels coming from sea until it bears S. S. W.  $\frac{1}{4}$  S. when they run for it. The light is 25 feet above the level of the sea, and 155 feet from high water mark.

† The lighthouse is erected on land at the Clay Ponds (high land of Cape Cod) elevated about 150 feet, which, with the elevation of the lantern, makes the whole height 200 feet above high water mark. It contains a fixed light, and is seldom seen more than six leagues distant.

In running from Race Point to Wood End, after you pass the Black Land or Hummocks, you will come up with a low sandy beach which forms the harbor, extending between two and three miles to Wood End, which is difficult to be distinguished in the night; it is very bold, and you will have 25 fathoms water within one quarter of a mile of the shore.

In beating into Cape Cod Harbor, you must keep the eastern shore aboard until you get into 5 fathoms water. Stand no further to the westward than to bring the light to bear E. by S. as there is a long spit of sand runs off from the western shore, which being very bold, you will have 11 fathoms water within a stone's throw of the shore.

If it blows so hard that you cannot beat into the harbor, you will have good anchoring without, in from 10 to 15 fathoms water. Or, if it blows hard at N. E. bring Race Point Light to bear N. W. by N. and steer S. E. by S. 7 leagues, which course will carry you into Wellfleet. In steering this course, you will make Harwich right ahead: When you open the bay, you will bring Billingsgate Island Light on your larboard hand, when you may haul to the eastward, and anchor safe from all winds.

**\*PROVINCETOWN HARBOR.**—In running for this harbor, vessels may pass Race Point Light within half a mile; then steer S. S. E. until the light on Long Point bears N. E. by N. which will clear Wood End bar; then steer for the light until within one third of a mile, at which distance pass it; then haul up N. N. W. and anchor in from 3 to 5 fathoms water, low tides.

Beating into this harbor, vessels may stand towards the eastern shore, into 4 to 2½ fathoms, with gradual soundings; the western side is bold, having from 9 to 10 fathoms, close to Long Point.

**BILLINGSGATE ISLAND LIGHTHOUSE** is fitted up with eight Lamps and Reflectors. It is situated so far up Barnstable Bay that it cannot be mistaken for any other.

Billingsgate Island is about 13 feet above the level of the sea at high water. It is high water in this Bay, at the full and change of the moon, at 11 o'clock; the rise of the spring tides is from 12 to 14 feet; common tides from 9 to 11 feet. From the west end of Billingsgate Island extends a long shoal of hard sand 10 or 11 miles, in a W. by S. ½ S. to W. by N. from the lighthouse, and in a N. W. to N. N. W. direction, 5 or 6 miles; at the distance of 1½ to 2 miles from the light, is about 8 feet at low water, common tides; and the meeting-house with a steeple in Brewster, S. by E. at the distance of five miles from the lighthouse, 10 to 12 feet, the meeting-house bearing S. S. E. at the distance of 7 miles, 2½ fathoms of water, the meeting-house bearing S. E. by S. at these depths of water the lighthouse bore from E. by N. to E. by N. ½ N. Crossing this shoal point of flats, you drop into 4 to 5 fathoms at the distance of 40 fathoms from the edge of this shoal, when the lighthouse will then bear E. N. E.

In coming around the shoal, approach no nearer than 2½ fathoms. Soon as you deepen to 4 fathoms, haul up for the light and anchor.

Vessels drawing 12 feet of water, or upwards, should bring the lighthouse to bear E. N. E. to N. E. by E. and steer in E. by S. to E. S. E. until the lighthouse bears N. by W. when they will have good anchorage in 3 to 4 fathoms low water, common tides, soft muddy bottom, and distance from the lighthouse, 1½ to 1¾ mile; Brewster meeting-house on with a windmill that stands not far from it, when they will bear S. by W. ¾ W. also the north meeting-house, that stands on a hill in Eastham, and no other building near it, bore at the same time, E. ½ N.

The following bearings and distances taken from the lighthouse:—The high land of the North Point of the Monument, W. by N. ¾ N. distance about ten leagues; entrance of Barnstable, the Black Land, called by some Scargo Hill, in Dennis, S. W. distance 16 miles, S. W. ½ S. about 11 miles, Brewster meeting-house with a steeple to it, S. by W. to S. 9 miles; entrance of Orleans, S. E. ¾ S. 6 miles; Eastham north meeting-house, S. E. by E. ¾ E. 4 miles; Silver Spring Harbor of Eastham, E. by N. ¾ N. four miles. The above places are all barred harbors, and flats extend off shore from one to two miles, with little water over them.

A rock that is in the passage way up to Wellfleet, that is about 12 feet long and 8 feet broad, called Bay Rock, on which is about one or two feet water at low tide, and round this rock is nine to eleven feet water at low tide, bearing from the lighthouse E. by S. ½ S. distance one and a quarter mile. When on this Rock, Chipman's Wind-

\* A lighthouse, containing a fixed light, has been erected on Long Point, at the entrance of Provincetown Harbor, and lies close to the Point, elevated 25 feet above the sea.

† Billingsgate Island Lighthouse is on Billingsgate Point, at the entrance of Wellfleet Bay, five leagues S. W. by S. from Race Point light, contains a fixed light. It is elevated 40 feet above high water.

mill, which is the South mill in Wellfleet, a little open to the north of a large rock called Blue Rock, by some, and stands near the shore of Wellfleet when it will bear N. N. E. ¼ E. this rock is covered at high water; and a Windmill on a hill in Eastham, over the salt mills, which is near the shore at Eastham, these bearing E. by S. from Bay Rock. The East point of the Horse Shoe bears from the lighthouse E. N. E. distant about one-third of a mile. On the south side of Billingsgate Island, the flats extend off the distance of one half to three quarters of a mile, having on them at low water, common tides, 6 to 9 feet water.

There is no meeting-house with a steeple to be seen to the eastward of Barnstable, but the one in Brewster; and this meeting-house is a good mark to pass over the Long Shoal Point that extends off from the lighthouse.

From the lighthouse on the Race Point of Cape Cod, when bearing E. N. E. the course to Billingsgate point of flats, is S. by E. distance 21 miles. Vessels drawing 12 feet water or upwards, should steer from the Race Lighthouse, south, when distant from the Race, one or two miles.

**BARNSTABLE BAY.**—From Center Hill point to Sausett inlet, is about 4 miles, bearing S. ½ E. This is a clean and bold shore, and may be approached at the distance of one third to half a mile, carrying 3½ to 4 fathoms, sandy bottom. There is a bar of sand that lies parallel with the shore, near Center Hill point, extending to the southward, and terminating about three quarters of a mile to the northward of Sausett. From the shore over this bar to 3 fathoms water, the distance is 240 to 250 fathoms, and the bar is from 100 to 140 fathoms wide, having on it from 9 to 11 feet water, and between that and the shore from 3 to 3½ fathoms. From the south end of this bar along shore to the entrance of Sandwich, is 3 fathoms, and distance 70 to 90 fathoms, sandy bottom, and regular soundings, as you approach the shore.

On the south side of Sausett inlet is a low rocky point of 90 fathoms. Three fourths of a mile off shore are 3 fathoms, and at the distance of 1½ or 2 miles, are 9 to 10 fathoms, muddy bottom.

Passing from Sandwich towards Barnstable, the flats run off shore 90 to 180 fathoms. The soundings are reduced to low water; the neap tides 8 feet, common tides 9 to 10 feet; spring tides 12 to 13. High water in the bay at full and change of the moon, at 11 o'clock.

**\*BARNSTABLE HARBOR.**—When coming from the northward, the bar must not be approached in less than 5 fathoms water, until the lighthouse on Sandy Neck bears S. W. ½ W. which will bring you up with the buoy on the bar, haul close round it, leaving it on your starboard hand, run two cables' lengths S. S. W. then steer S. W. by W. ¼ W. 1½ mile, which will bring you up with the tongue of Yarmouth Flats, or until the light bears S. W. by S. then steer for the light. Be careful to make the above course good, as the flood sets strong over Yarmouth Flats, and the ebb strong to the northward over the bar. Continue to run for the light until within the cable's length of the beach, and follow the shore round the point. There is safe anchorage inside, abreast of the light, against all winds, it bearing from S. W. to N. E. in 5 to 2½ fathoms water.

Vessels drawing 8 feet water may, at high water, bring the light to bear S. W. ¼ W. and run directly for it. Full sea at full change at 11 o'clock. Tide rises 16 feet, and there is 7 feet water on the bar at low water.

*Description of the eastern coast of the county of BARNSTABLE, from Cape Cod to Race Point, in lat. 42° 5' N. to Cape Mable, to the Sandy point of Chatham, in lat. 41° 34' N. pointing out the spots on which the Trustees of the Humane Society have erected huts, and other places where shipwrecked Seamen may look for shelter.*

The curvature of the shore, on the west side of Provincetown, and South of Race Point, is called Herring Cove, which is three miles in length. There is good anchoring ground here, and vessels may ride safely in four or five fathoms water, when the wind is from north-east to south-east.

On Race Point stand about a dozen fishing huts, containing fire-places and other conveniences. The distance from these huts to Provincetown, which lies on Cape Cod Harbor, is three miles. The passage is over a sandy beach, without grass, or any other vegetable growing on it, to the woods, through which is a winding road to the town. It would be difficult, if not impossible, for a stranger to find his way thither in the dark; and the woods are so full of ponds and entangling swamps, that if the road was missed, destruction would probably be the consequence of attempting to penetrate them in the night.

Not far from Race Point commences a ridge, which extends to the head of Stout's Creek. With the face to the east, on the left hand of the ridge, is the sandy shore; on the right is a narrow ran-

\* A fixed light is erected at the entrance of Barnstable Harbor, in a lantern erected on the wall of a dwelling house, above which it rises 16 feet.

dy valley; beyond which is naked sand, reaching to the hills and woods of Provincetown. This ridge is well covered with beach grass, and appears to owe its existence to that vegetable.

Beach grass, during the spring and summer, grows about two feet and a half. If surrounded by naked beach, the storms of autumn and winter heap up the sands on all sides, and cause it to rise nearly to the top of the plant. In the ensuing spring, the grass sprouts anew; is again covered with sand in the winter, and thus a hill or ridge continues to ascend, as long as there is a sufficient base to support it, or until the circumscribing sand, being also covered with beach grass, will no longer yield to the force of the winds.

On this ridge, half way between Race Point and the head of Stout's Creek, &c. Trustees of the Humane Society have erected a hut. It stands a mile from Peaked Hill, a landmark well known to seamen, and is about  $2\frac{1}{2}$  miles from Race Point. Seamen, cast away on this part of the coast, will find a shelter here, and in north-east storms, should they strike to the leeward of it, and be unable to turn their faces to the windward, by passing on to Race Point, they will soon come to the fishing huts before mentioned.

At the head of Stout's Creek the Trustees have built a second hut. Stout's Creek is a small branch of East harbor in Truro. Many years ago there was a body of salt marsh on it; and it then deserved the name of a creek. But the marsh was long since destroyed; and the creek now scarcely exists, appearing only like a small depression in the sand, being entirely dry, and now principally covered with beach grass. The creek runs from north-west to south-east, and is nearly parallel with the shore on the ocean, from which it is at no great distance. Not far from it the hills of Provincetown terminate; and should not the hut be found, by walking round the head of the creek, with the face to the west, the hills on the right hand, and keeping close to the shore on the harbor, in less than an hour the shipwrecked seaman would come to Provincetown. It is high water at Truro about 30 minutes sooner than at Boston.

The Humane Society, several years ago, erected a hut at the head of Stout's Creek, but it was built in an improper manner, having a chimney in it, and was placed on a spot where no beach grass grew. The strong winds blew the sand from its foundation, and the weight of the chimney brought it to the ground, so that in January, 1802, it was entirely demolished. This event took place about six weeks before the Brutus was cast away. If it had remained, it is probable that the whole of the unfortunate crew of that ship would have been saved, as they gained the shore a few rods only from the spot where the hut had stood.

The hut now erected, stands on a place covered with beach grass. To prevent any accident from happening to it, or to the other hut near Peaked Hill, the Trustees have secured the attention of several gentlemen in the neighborhood. Dr. Thaddeus Brown, and Capt. Thomas Sinalley, of Provincetown, have engaged to inspect both huts, to see that they are supplied with straw or hay in the autumn, that the doors and windows are kept shut, and that repairs are made when necessary. The Rev. Mr. Damon, of Truro, has also promised to visit the hut at Stout's Creek twice or thrice a year; and the Rev. Mr. Whitman, of Wellfleet, distinguished through the country for his activity and benevolence, has undertaken, though remote from the place, the same charge.

From the head of Stout's Creek to the termination of the salt marsh, which lies on both sides, and at the head of East Harbor river, the distance is about  $3\frac{1}{2}$  miles. A narrow beach separates this river from the ocean. It is not so regular a ridge as that before described, as there are on it one or two hills which the neighboring inhabitants call islands. It may without much difficulty be crossed every where except over these elevations. By these hills, even during the night, the beach may be distinguished from those hereafter to be mentioned. It lies from N. W. to S. E. and is in most parts covered with beach grass. The hills have a few shrubs on the declivities next the river. At the end of the marsh the beach subsides a little, and there is an easy passage into a valley in which are situated two or three dwelling houses. The first on the left hand, or south, is a few rods only from the ocean.

The shore which extends from this valley to Race Point, is unquestionably the part of the coast the most exposed to shipwrecks. A north-east storm, the most violent and fatal to seamen, as it is frequently accompanied with snow, blows directly on the land; a strong current sets along the shore: add to which, that ships, during the operation of such a storm, endeavor to work to the northward, that they may get into the bay. Should they be unable to weather Race Point, the wind drives them on shore, and a shipwreck is inevitable. Accordingly the strand is every where covered with the fragments of vessels. Huts, therefore, placed within a mile of each other, have been thought necessary by many judicious persons. To this opinion the Trustees are disposed to pay due respect, and hereafter, if the funds of the Society increase, new huts will be built here for the relief of the unfortunate.

From the valley above mentioned the land rises, and less than a mile from it the high land commences. On the first elevated spot (the Clay Ponds) stands the lighthouse, which contains a fixed light, which every navigator should impress on his mind. The shore here turns to the south; and the high land extends to the table land of Eastham. This high land approaches the ocean with steep, and lofty banks, which it is extremely difficult to climb, especially in a storm. In violent tempests, during very high tides, the sea breaks against the foot of them, rendering it then unsafe to walk on the strand, which lies between them and the ocean. Should the seaman succeed in his attempt to ascend them, he must forbear to penetrate into the country, as houses are generally so remote, that they would escape his research during the night: he must pass on to the valleys, by which the bank are intersected. These valleys, which the inhabitants call hollows, run at right angles with the shore; and in the middle, or lowest part of them, a road leads from the dwelling-houses to the sea.

Province-town. This is a vegetable.

half. If surrounded by trees, and cause it to rise; is again covered with there is a sufficient basis in grass, will no longer

at the high land compass, which contains a here turns to the south; approaches the ocean in a storm. In view of this, it is unsafe for a seaman to succeed in his houses are generally so on to the valleys, by the hollows, run at right angles from the dwelling-

The first of these valleys is Dyer's Hollow,  $1\frac{1}{2}$  mile from the lighthouse. It is a wide opening, containing 200 rods broad, from summit to summit. In it stands a dwelling-house, a quarter of a mile from the beach.

A mile and a half south of Dyer's Hollow is a second valley, called Harding's Hollow. At the entrance of this valley the sand has gathered, so that at present a little climbing is necessary. Passing over several fences, and taking heed not to enter the wood on the right hand, at the distance of three quarters of a mile a house is to be found. This house stands on the south side of the road; and not far from it, on the south, is Pamet River, which runs from east to west through a body of salt marsh.

The third valley, half a mile south of Harding's Hollow, is head of Pamet Hollow. It may with ease be distinguished from the other hollows mentioned, as it is a wide opening, and leads immediately over a beach to the salt marsh at the head of Pamet River. In the midst of the hollow the sand has been raised by a brush fence, carried across it from north to south. This must be passed, and the shipwrecked mariner will soon come to a fence which separates what is called the road from the marsh. If he turns to the left hand, or south, at the distance of a quarter of a mile, he will discover a house. If he turns to the right hand, at the distance of half a mile, he will find the same house which is mentioned in the foregoing paragraph.

The fourth opening, three quarters of a mile south of Head of Pamet is Brushy Valley. This hollow is narrow, and climbing is necessary. Entering it, and inclining to the right, three quarters of a mile will bring seamen to the house, which is situated at the head of Pamet. By proceeding straight forward, and passing over rising ground, another house may be discovered, but with more difficulty.

These three hollows, lying near together, serve to designate each other. Either of them may be used; but Head of Pamet Hollow is the safest.

South of Brush Valley, at the distance of 3 miles, there is a fifth opening, called Newcomb's Hollow, east of the head of Herring River in Wellfleet. This valley is a quarter of a mile wide. On the north side of it, near the shore, stands a fishing hut.

Between the two last valleys the bank is very high and steep. From the edge of it, west, there is a strip of sand, 100 yards in breadth. Then succeeds low brush-wood, a quarter of a mile in width, and almost impassable. After which comes a thick, perplexing forest, in which not a house is to be discovered. Seamen, therefore, though the distance between these two valleys is great, must not attempt to enter the wood, as in a snow storm they would undoubtedly perish. This place, so formidable in description, will however lose somewhat of its terror, when it is observed, that no instance of a shipwreck on this part of the coast is recollected by the oldest inhabitants of Wellfleet.

Half a mile south of Newcomb's Hollow, is the sixth valley, called Pearce's Hollow. It is a small valley. A house stands at the distance of a little more than a quarter of a mile from the beach. W. by S.

The seventh valley is Cohoon's Hollow, half a mile south of Pearce's Hollow. It is not very wide. West from the entrance, several houses may be found at the distance of a mile. This hollow lies E. by N. from Wellfleet Meeting-house.

Two miles south of Cohoon's Hollow, the eighth valley is Snow's Hollow. It is smaller than the last. West from the shore, at the distance of a quarter of a mile, is the county road, which goes round the head of Blackfish Creek. Passing through this valley to the fence, which separates the road from the upland and marsh at the head of the creek, a house will immediately be found by turning to the right hand or north. There are houses also on the left, but more remote.

The high land gradually subsides here, and  $1\frac{1}{2}$  mile south terminates at the ninth valley, called Fresh Brook Hollow, in which a house is to be found a mile from the shore, west.

The tenth,  $2\frac{1}{2}$  miles south from Fresh Brook Hollow, is Plumb Valley, about 300 yards wide. West is a house, three quarters of a mile distant. Between these two valleys is the table land. After this there is no hollow of importance to Cape Malebarre.

From Fresh Brook Hollow, to the commencement of Nausett Beach, the bank next the ocean is about 60 feet high. There are houses scattered over the plain, open country; but none of them are nearer than a mile to the shore. In a storm of wind and rain they might be discerned by daylight; but in a snow storm, which rages here with excessive fury, it would be almost impossible to discover them, either by night or by day.

Not far from this shore, south, the Trustees have erected a third hut, on Nausett Beach. Nausett Beach begins in latitude  $41^{\circ} 51'$ , and extends south to latitude  $41^{\circ} 41'$ . It is divided into two parts by a breach which the ocean has made through it. This breach is the mouth of Nausett or Stage Harbor; and from the opening the beach extends north  $2\frac{1}{4}$  miles, till it joins the main land. It is about a furlong wide, and forms Nausett Harbor, which is of little value, its entrance being obstructed by a bar. This northern part of the beach may be distinguished from the southern part by its being of a less regular form. Storms have made frequent interruptions through the ridge, on which beach grass grows. On an elevated part of the beach stands the hut, about  $1\frac{1}{2}$  mile north of the mouth of Nausett Harbor. Eastham Meeting-house lies from it W. S. W. distant  $1\frac{1}{2}$  mile. The meeting-house is without a steeple; but it may be distinguished from the dwelling-houses near it by its situation, which is between two small groves of locusts, one on the south, and one on the north, that on the south being three times as long as the other. About  $1\frac{1}{2}$  mile from the hut, W. by N., appear the top and arms of a wind-mill. The Rev. Mr. Shaw, and Elisha Mayo, Esq. of Eastham, have engaged to inspect this building.

The southern part of Nausett Beach, most commonly called Chatham Beach, and by a few persons Potanumaquint Beach, begins at the mouth of Nausett Harbor, and extends 8 or 9 miles south

to the mouth of Chatham Harbor. It is about 50 rods wide. A regular well formed ridge, which, in the most elevated part of it, is 40 feet high, runs the whole length of it, and with the exception of a few spots, is covered with beach grass. This beach forms the barrier of Chatham Harbor, which, from Strong Island, north, receives the name of Pleasant Bay. A mile south of the entrance of Nausett Harbor, it joins the main land of Orleans, except in very high tides, when the sea flows from the north-eastern arm of Pleasant Bay into the harbor of Nausett, completely insulating the Beach. By those who are acquainted with the shallow, it may be safely forded at any time; but strangers must not venture to pass it when covered with water, as below the channel is 7 feet deep. On this beach about half way between the entrance of Nausett and Chatham Harbors, the Trustees have erected a fourth hut. The spot selected is a narrow part of the beach: on the west the water adjoining it is called Bass Hole. Salt Marsh is north and south of it, next the beach, but is here interrupted; Orleans meeting-house lies from it N. W. The meeting-house is without a steeple, and is not seen; but it is very near a wind-mill placed on an elevated ground, a conspicuous object to seamen coming on the coast. It may be necessary to add, that there are three wind-mills in Orleans, forming a semi-circle: that the mill referred to is on the right hand, or N. E. point—and that the mill in the middle point of the semi-circle stands on still higher ground. The Meeting-house of Chatham is situated from it S. W. This meeting-house is also without a steeple, and is concealed by Great Hill, a noted land-mark. The hill appears with two summits, which are a quarter of a mile apart. The hut lies east from Sampson's Island, in Pleasant Bay. Timothy Bascom, of Orleans, has undertaken to inspect this hut.

Least seamen should miss this hut, by striking to the leeward of it, the Trustees have erected another on the same beach. It stands a mile north of the mouth of Chatham Harbor, east of the meeting-house, and opposite the town.

Another spot on the same beach would be a proper situation for a hut. It is north of the fourth hut, and east of the middle of Pochet Island. The highest part of the ridge is nearer it south. A break in the ridge, over which the sea appears sometimes to have flowed, divides this high part from the northern portion of the beach.

On the beach of Cape Malebarre, or the sandy point of Chatham, the Trustees have built a sixth hut. This beach stretches from Chatham 10 miles into the sea, towards Nantucket, and is from a quarter to three quarters of a mile in breadth. It is continually gaining south: above three miles have been added to it during the past 50 years. On the east side of the beach is a curve in the shore called Stewart's Bend, where vessels may anchor with safety, in 3 or 4 fathoms water, when the wind blows from north to S. W. North of the bend there are several bars and shoals. A little below the middle of the beach, on the west side, is Wreck Cove, which is navigable for boats only. The hut stands 200 yards from the ocean, S. E. from the entrance of Wreck Cove, half of a mile between the mouth of the cove and hut, is Stewart's Knoll, an elevated part of the beach. The entrance of the hut from the commencement of the beach is 6 miles, and from its termination at Great Hill, in Chatham, bears N. by W. distant 6 miles, and the south end of Morris' Island, which is on the west side of the beach, N. by E. distant 4 miles. Richard Sears, Esq. of Nantucket, has engaged to visit the two last mentioned huts. Two miles below the sixth hut is a small hut built of thatch, in the form of a wigwam. It stands on the west side of the beach, a quarter of a mile from the ocean. Annually, in September, it is renewed; and generally remains in perfect preservation during the winter.

Another spot a few rods from the sea, 4 miles south from the commencement of the beach, and half a mile north of the head of Wreck Cove, would be a proper situation for a hut. A little south of this spot, in storms and very high tides, the sea breaks over from the ocean into Wreck Cove. Cape Malebarre Beach may be distinguished from the two beaches before described, not only by its greater breadth, but also by its being of a less regular form. It is not so well covered with grass as Chatham Beach. From Stewart's Knoll, south to the extremity, it is lowest in the middle. In this valley, and in other low places, fresh water may be obtained by digging two feet into the sand. The same thing is true of Nausett and Chatham Beaches.

The six huts, the situation of which has thus been pointed out, are all of one size and shape. Each hut stands on piles, is 8 feet long, 8 feet wide, and 7 feet high: a sliding door is on the south, a sliding shutter on the west, and a pole, rising 15 feet above the top of the building, on the east. Within, it is supplied either with straw or hay, and is farther accommodated with a bench. The whole of the coast, from Cape Cod to Cape Malebarre, is sandy, and free from rocks. Along the shore, at the distance of half a mile, is a bar which is called the Outer Bar; because there are smaller bars within it perpetually varying. This outer bar is separated into many parts by guzzles, or small channels. It extends to Chatham; and as it proceeds southward, gradually approaches the shore, and grows more shallow. Its general depth at high water is two fathoms, and three fathoms over the guzzles; and its least distance from the shore is about a furlong. Off the mouth of Chatham Harbor there are bars which reach three quarters of a mile, and off the entrance of Nausett Harbor the bars extend half a mile. Large heavy ships strike on the outer bar, even at high water, and their fragments only reach the shore. But smaller vessels pass over it at full sea, and when they touch at low water, they beat over it as the tide rises, and soon come to land. If a vessel is cast away at low water, it ought to be left with as much expedition as possible; because the fury of the waves is then checked, in some measure, by the bar, and because the vessel is generally broken to pieces by the rising flood. But seamen shipwrecked at full sea, ought to remain on board till near low water, for the vessel does not then break to pieces, and by attempting to reach the land before the tide ebbs away, they are in great danger of being drowned. On this subject there is one opinion only among judicious mariners. It may be necessary, however, to remind

them of a truth, of which they have full conviction, but which, amidst the agitation and terror of a storm, they too frequently forget.

**\*POINT GAMMON LIGHT, AND HYANNES HARBOR.**—Vessels coming from the eastward, bound through the North Channel, must leave the Bishop and Clerks on the larboard hand, and not go nearer them than 4 fathoms. They are a dangerous ledge of rocks, bearing S. by E. from the lighthouse, 3 miles distant, and are always dry. When the light bears N. by W. steer W. N. W., keeping in 4 fathoms, till the light bears N. N. E.; then steer N. W. or N. W. by N., keeping in 3 fathoms, which will keep you clear of a dangerous reef running from the light to a great rock which you leave on your starboard hand; when abreast of this rock, the light will bear S. E.  $\frac{1}{2}$  E.; then steer N. N. W. and anchor within one mile of the shore, in 3 fathoms, soft bottom. The brig Monroe, Capt. Bears, in coming through the Vineyard Sound, struck on a dangerous rock, which is in the direct track in passing the North Channel, and bears about W. S. W. from Point Gammon Lighthouse, distant two or three miles. It is a large square rock, and it is supposed there are on it about three feet of water, at low water. Several vessels have struck on it at different times, and it is extremely important to the safety of people and property, that it should have a buoy on it. Vessels should not come nearer than three quarters of a mile of the light, as there are sunken rocks that lie one half a mile from the land.

Vessels bound to the westward from Hyannes, must run to the southward till the light bears E. by N.; then steer W. by S. which course will carry them clear of the southwest rock, which bears west from the light, 4 miles distant, with several sunken rocks near it; said rock is dry at low water. W.  $\frac{1}{2}$  S. 8 miles distant from the light, is a dangerous ledge called Culler's Ledge, 3 miles from the shore. There are 3 fathoms water round it, and the ledge is part dry at low water. In running this W. by S. course, (the light bearing E. by N.) you will have from 3 to 4 fathoms, and sometimes 5, as it is ridgy. If farther towards the Horse-shoe, to the southward, you will have 4, 5, 6, 7, 10, and close to the Horse-shoe, 13 fathoms: northern part of the Horse-shoe dry at low water. On the S. E. part of the Horse-shoe is a black buoy placed, in 16 feet water, bearing from Nantucket Light N. W. by W.  $4\frac{1}{2}$  leagues, and from Tuckanuck Island, N. by E.  $\frac{1}{2}$  E. 5 leagues. Tide rises about 5 feet; high water at full and change, at 12 o'clock; and runs from 2 to 3 knots east and west in the following manner, viz. it begins to run to the westward at half flood, and continues to half ebb, then runs to the eastward, the three last hours of ebb, and three first of flood.

A floating light has been anchored on the eastern extremity of Tuckanuck Island, (which lies between Cape Poge and Tuckanuck Island,) and the following bearings taken from the vessel:

Point Gammon Lighthouse bears N.; Chatham Light, N. E.; Sandy Point Light, N. E. by E.; Nantucket Great Point Light, E. S. E.; Nantucket Brandt Point Light, E. S. E.  $\frac{1}{2}$  E.; Nantucket Beacon Light, S. S. E.; Cape Poge Light, W. by N.; centre of Tuckanuck Island, S. S. W.  $\frac{1}{2}$  W. distant 7 miles.

In proceeding from the Horse-shoe towards Holmes' Hole, observe the following directions, viz.: When to the northward of the Horse-shoe, in 12 fathoms water, one mile distant from the dry spots, at low water, steer S. W. for Holmes' Hole,  $3\frac{1}{2}$  leagues distant. If bound to the northward of the Hedge Fence, (between that and Lemedue Shoal,) get the point on which the wind-mill stands, (which is east of Wood's Hole,) to bear W. by N., and run for it till within half a mile; then W. S. W. will carry you through the Vineyard Sound, leaving Tarpaulin Cove and Cutterhunk Lights on your starboard hand, and Gay Head Light on your larboard hand. You will not see Cutterhunk Light till 4 leagues to the westward of Tarpaulin Cove Light, when it will open on the starboard hand; when it bears N. E. by E. distant  $3\frac{1}{2}$  miles, you may run west for Point Judith Light, (if bound up the Sound,) 10 leagues distant.

**CAPE COD TO HOLMES' HOLE.**—Bring Chatham Lights to bear N. N. W. then by steering S. S. E.  $3\frac{1}{2}$  leagues, you will pass the Pollock Rip, in 3 or 4 fathoms

\* Hyanne's Light is situated on Point Gammon, at the entrance of the harbor, south side of Cape Cod. The lantern is elevated 70 feet above the level of the sea, and contains a fixed light.

† East from Hyannes lies Bass River, near which are the towns of Dennis and Yarmouth, between which a large pier has been erected, which has washed away. A buoy is placed on Dogfish Bar. A beacon, (or rather a large stick,) on the top of which is a small cask, is also stuck up on the Bishop and Clerks.

‡ Holmes' Hole is a harbor to which vessels resort during the winter season, and as every master should embrace the first opportunity to advise his owner, we state there is a Post Office, and a regular mail made up twice a week for Boston, &c. which is taken in a passage boat to Nahant, on

water; and if the weather is clear you will make the lighthouse on Sandy Point (Nantucket Island)  $5\frac{1}{2}$  leagues distant, which bring to bear S. W.  $\frac{1}{2}$  W.; then steer for the lighthouse, keeping it in this direction, and you will pass between the Great and Little Round Shoals, on the former of which is a black buoy, and on the latter a white buoy, with a small pole in the end of it, bearing N. W. by N. and S. E. by S. from each other, distant  $2\frac{1}{2}$  miles. Great Round Shoal, partly dry at low water; on Little Round Shoal 7 feet.

On the east end of Pollock Rip is a red buoy, in 14 feet water, bearing from Chatham Lights S.  $\frac{1}{2}$  E. 11 miles; from Monomoy Point E.  $\frac{1}{2}$  N. 7 miles, and from Little Round Shoal buoy, N. E. by N. 4 miles. Shoalest water on this rip, 5 feet.

When you are within about three miles of the lighthouse, steer W.  $\frac{1}{2}$  S. until you are past the Point Rip, on the N. E. end of which is a red buoy in 14 feet water, bearing from Sancy Head, N. by W. 4 leagues; from Nantucket Light N. E. by E.  $\frac{1}{2}$  E. 2 miles, and from the black buoy, on the Horse-shoe, E. S. E. 6 leagues. Shoalest water on Point Rip 8 feet; or you may bring the lighthouse to bear E. by S.  $\frac{1}{2}$  S. and steer W. by N.  $\frac{1}{2}$  N. taking care to make your course good for Holmes' Hole Light, 11 leagues distant, observing, while running from Nantucket Light to Holmes' Hole, you leave on your larboard hand Cape Poge Light, which must bear W.  $\frac{1}{2}$  S. to clear the Cross Rip, on the north-east part of which is a white buoy, in 15 feet water, bearing from Cape Poge Light E. by S. 5 leagues; from Tuckanuck Island N. by W. 2 leagues; and from the red buoy on Squash Meadow, E. by S.  $\frac{1}{2}$  S. 5 leagues. Shoalest water on this rip, 12 feet.

To go through the North Ship Channel, bring Chatham Lights to bear N. N. W. and steer S. S. E.  $3\frac{1}{2}$  leagues, when you will pass the Pollock Rip in 3 or 4 fathoms water, when you must steer W.  $\frac{1}{2}$  S. 5 miles for Butler's Hole, in 15 fathoms water, when you will see a white buoy to the north of you, which lies in the S. S. W. passage, when you must run W. S. W. for the south part of the Handkerchief, which has a white buoy on the west end of it, bearing from Monomoy Point Light S. W. 2 miles, when you will be in 3 fathoms water, fine sand; from Nantucket Light N. by E.  $\frac{1}{2}$  E. 4 leagues, and from the red buoy on Pollock Rip W. by S.  $\frac{1}{2}$  S. 3 leagues.

Crossing the Handkerchief, on a W. S. W. course, in 3 or 4 fathoms water, you will see W. for the black buoy on the Horse-shoe,  $11\frac{1}{2}$  miles, leaving it on the starboard hand, when you will continue your course W. for Holmes' Hole Light,  $4\frac{1}{2}$  leagues distant.—As you enter the Swash, in the Horse-shoe, Hyannis Light will bear N. N. E. Cape Poge Light W. S. W. Holmes' Hole Light, W. Part of the Handkerchief dry at low water. There is a channel of 9 feet, still north of the above, which may be found by bringing Chatham Lights to bear N. W. when in 7 fathoms, and running S. S. W. for Sandy Point Light, when the light bears S. W. then run for it till you cross from 3 fathoms, when you will be within 3 cables' length of the light, where you may anchor and continue till  $2\frac{1}{2}$  hours flood, when, if bound to the westward, continue the shore on the north side of the point, crossing a spit between Egg Island and Monomoy Point, in 2 fathoms, then steer N. W. till the light bears E. when you must run W. N. W. for Hyannis Light, or haul into Stage Harbor Bay and anchor.

the N. E. part of the Vineyard Sound, 9 miles distant; from thence by land carriage to Sandwich, &c. Passengers will find a speedy conveyance from Falmouth. A lighthouse, showing a fixed light, is erected on the West Chop of Holmes' Hole, on the starboard hand as you enter the harbor. Four miles west of Falmouth is Nobsque Point, on which a lighthouse is erected, showing a fixed light, elevated 80 feet above the sea. It is intended to guide vessels passing over the shoals, through the north channel into the Vineyard Sound. The following bearings have been taken:—West Chop Lighthouse, S. E.  $\frac{1}{2}$  S. distant 4 miles; east end of Middle Ground, S. E.  $\frac{1}{2}$  S.  $3\frac{1}{2}$  miles; west end of do. S. W. by S.  $\frac{1}{2}$  W. 15; Tarnaulin Cove Light-house, W. S. W. 6; Falmouth Wharf, N. E. by E. 3; Saccanau Set Point, E.  $\frac{1}{2}$  N. 7; S. W. part of the Hedge Fence, E. S. E. 4; Cape Poge Lighthouse, S. E.  $\frac{1}{2}$  E. 14; East Chop Holmes' Hole, S. E. 6. By keeping the Nobsque Light open, by the East Chop of Holmes' Hole, will clear the Old Town Flats.

Nantucket Lighthouse is on the north point of Nantucket Island, and shows a fixed light, elevated 70 feet above the sea, and can be seen far as any one on the coast.

The buoys on Nantucket Shoals and the Vineyard Sound, were placed by Capt. Trevett, in the Revenue Cutter, and Wm. Dagget, Branch Pilot for the Vineyard Shoals, and from their authority we publish them.

On Monomoy Point a fixed light is erected, elevated 25 feet above the sea, on what was the extreme southern point of Cape Cod, but within a few years the sea has broken through this sand beach about 5 miles from the point, and 3 from the main land, making it an island. The channel thus made is deep enough for small craft to pass, at high water, and is nearly half a mile wide.

Cape Poge Light is situated on the N. E. point of Martha's Vineyard. The lantern is elevated 55 feet above the level of the sea, and contains a fixed light.

**OLD STAGE HARBOR.**—If you intend, when passing Monomoy Point to make a harbor, when about 100 yards west from the Point, steer N. N. W. from 5 to 6 miles to avoid the common Flat which makes off from the beach, then steer E. N. E. 2 miles, which will bring you to anchorage, in from 3 to 5 fathoms, good holding ground. This harbor is exposed to winds from South to West by North.

Monomoy Point bears from the anchorage South, distant about 8 miles.

To go through the S. S. W. Channel, get Monomoy Point Light to bear N. by E.  $\frac{1}{4}$  E. and run S. S. W.  $\frac{1}{2}$  mile, into Butler's Hole, in 7 fathoms and a S. S. W. course continued will carry you to the westward of Nantucket Point Light, 5 leagues. In the S. S. W. channel, are 2 fathoms at full tide.

[NOTE.—While passing Chatham in thick weather, approach no nearer than 5 fathoms to cross the Pollock Rip; edge off and on from 5 to 7 fathoms, which will carry you over the Pollock Rip in 3 fathoms.]

Bring Chatham Lights to bear N. by W. on which bearing keep them till you cross the Pollock Rip in 3 fathoms water, and deepen into 7 fathoms; then steer S. W. by S, which carries you across Butler's Hole to 5 or 4 fathoms; then steer W. S. W. which will carry you to the northward of the Little Round Shoal up to Tuckanuck Channel; when you will be up with the S. E. end of the Horse-shoe, where you have 9 fathoms; then steer W. by N. for Cape Poge Light. From the Stone-horse, to the S. E. end of the Horse-shoe, the distance is 5 or 6 leagues. To go through the Mcskeoket Channel, bring the light on Cape Poge to bear N. by W. and steer S. by E., which will carry you to the eastward of Skiff's Island, which you may go within half a mile of.

To go through the Swash of the Horse-shoe, bound to the westward, after passing the Stone-horse, and you deepen your water to 6 fathoms, steer W. till you bring Cape Poge Light to bear W. S. W.; then steer directly for it through the Swash of the Horse-shoe, till you deepen twelve fathoms; then steer for the East Chop of Holmes' Hole.

To go to the northward of the Horse-shoe, bring Point Gammon Light to bear E. N. E.; Seconset Point to bear W. N. W., when you will see the northernmost dry shoal of the Horse-shoe. Bring Cape Poge Light to bear S. S. W. and run for it. In beating to windward, come no nearer the north shore than 3 fathoms; when past the dry spot of the Horse-shoe, steer S. W. by S. till you bring the East Chop to bear W.

To go through the South Ship Channel, steer from Chatham Lights S. S. E. until you pass the Pollock Rip in 3 or 4 fathoms water; if the weather be clear, you will make Nantucket Great Point Light; continue your course S. S. E., S. by E. and S. until the lighthouse bears W. from you; then steer directly for it, until you are within 3 miles of it; you should then steer N. W. until the lighthouse bears S. W. by W.; then steer W. by S. till the lighthouse bears E. by S.  $\frac{1}{2}$  S., and then run W. by N.  $\frac{1}{4}$  N., which course good for Holmes' Hole Light, as before directed, when, if you wish, you may run S. W. till the light bears N. W. by N., and anchor in 4 and 5 fathoms mud, and out of the tide.

**\*CHATHAM HARBOR.**—Chatham is situated on the exterior extreme of Cape Cod, bounded E. by the ocean, S. by Vineyard Sound, W. by Harwich, and N. by Pleasant Bay. Its Harbor is convenient for the fishery, in which they have numerous vessels employed, and contains 20 feet at low water. The place is remarkable for shipwrecks on its shores.

**TIDES.**—On the South Shoal the flood tide sets north about 3 hours; then E. by E., when the ebb commences at south, and continues till low water. At Sconcy Head, the flood sets N. E. and ebb S. W. In the middle (or E. N. E. channel) the flood sets N. E. by E. and ebb S. W. by W.

In Butler's Hole the ebb sets west, and flood east. From Chatham to Pollock Rip, the flood sets S. S. W. and ebb N. N. E.

From Butler's Hole to the Horse-shoe, ebb W. S. W.; then W. by N. to Holmes' Hole.

The depth of water on Nantucket Shoal and the Vineyard Sound, are taken at low tide. At Pollock Rip, Great Rip, Little Round Shoal, Point Rip and the Handkerchief

\* There are two fixed lights at Chatham, on James' Head, about 70 feet above the sea, 70 feet apart, and may be seen 5 or 6 leagues distant. Chatham being a barred harbor, and frequently shifting, two lights were erected for the purpose of mooring, as the bar changed, to act as a leading-mark over the bar, into the harbor: but the beach has made out three or more miles to the east, rendering the lights entirely useless as harbor lights, the original purpose of their erection. They bear from Nantucket Lighthouse N. N. E., distant  $10\frac{1}{2}$  leagues, and from the shoal N. N. E. These lights are said to be of some use to vessels bound over Nantucket Shoals.

the tide rises and falls 5 to 6 feet. At the Horse-shoe, \*Cross Rip, Hedge Fence, Squash Meadow and Middle Ground, the tide rises and falls 3 to 4 feet. S.  $\frac{1}{2}$  E. moon makes full sea in the Sound.

**NANTUCKET HARBOR.**—If the †Lighthouse on the south side of the harbor cannot be seen, bring the light on Brant Point, (which lies on the starboard hand and shows a fixed light) to bear S. by E. (none to the south of that) and run for it till within about a cable's length; then run to the eastward for the end of the point, and pass it as near as you please.

*Nantucket Bar.*—It is understood that a new channel over this dangerous shoal has been explored and buoyed out, by some of our enterprising master mariners and pilots; and that the keeper of the lighthouse on the south side of the harbor, having been waited upon by them, and several of the principal merchants and ship owners, has caused the removal of the lighthouse under his care to a point designated. As this new channel is declared by the pilots to be considerably deeper than that formerly used, and has the advantage of being straight and easy of access, the public good is greatly subserved by an alteration which will facilitate its use; and which has been made, we understand, without any additional expense to the United States.

*Directions for ships bound over the Shoals of Nantucket, from the Bar.*—From Nantucket Bar, the course is about N. N. E. to the Great Point; if a west tide, run for the lighthouse, pass the Great Point, keeping it about two miles distant from you; an east tide may set you on the Point Rip. Keep the town open, clear of Great Point, until you are three miles, to the N. N. E. of the point; then run S. E. keeping three miles from the land, until the light is west from you; then running east, keeping the lighthouse bearing west, will carry you to sea. When you are in 25 fathoms, you are without the Great Rip. If a light wind, and a southern tide, there is danger of being set by the tide too near the Rip; therefore it is best, after being sure that you are without the Round Shoal, to run E. by N., or E. N. E., according to the wind and tide. When you have passed the Round Shoal, there is nothing to fear, from N. to E. until you come to the State of Maine, on the one hand, or the shoal of George's on the other. Do not cross George's Bank north of lat. 41° N. The above is the Old Channel-way.

After you are three miles N. N. E. from the Great Point Light, run S. E., keeping three miles from the land, until Sancoty Head bears S. W.; you may then run N. E. which will carry you channel-way. The Round Shoal bears from the Great Point Light, E. N. E. eight miles off.

When you are three miles to the N. N. E. of the Great Point Light, with the town open clear of the Point, run S. E., keeping three miles from the land, until the town is over the middle of the head of the harbor; keeping it so, will carry you out channel-

the town is shut in by the highland of Pocomo or Squam, you are in danger of the north end of the Base Rip, also the north end of the Great Rip.

The tide turns at the foot of the Shoals, three hours before it is high water at the bar. Abreast of the Great Rip, the ebb tide sets to the S. S. W. and the flood to the N. N. E.; therefore it is necessary, in light winds, to be careful that you do not get set by the tides on the Rip.

The Fishing Rip bears about E. S. E. from the Great Rip, from five to seven leagues distant. It has been said by many experienced men, that there are but 24 fathoms on the shoalest part of the Great Rip. From the Great Point Light to the Great Rip, is E. by S.  $\frac{1}{2}$  S. 5 leagues distant; the Fishing Rip is from 10 to 12 leagues distant from

\* Near the north end of Cross Rip, a floating light is moored in 7 fathoms water; 200 fathoms south of the light are 11 feet water. Bring Nantucket Light to bear E. S. E., and run W. N. W. will carry a vessel to the Light Boat, and thence to Holmes' Hole.

*Directions for entering Nantucket Harbor.*—Bring the south light, and the light on Brant Point in one, at the outer buoy; and the south light should be opened to the westward on this range, one handspike's length, to run the channel from the bar or outer buoy, to the shoaling of the water on Brant Point.

From Brant Point N. N. W. ½ W. 300 fathoms; then N. by W. ½ W. 100 fathoms; then N. 350 fathoms over the bar.

From the bar N. by W. ¾ W. eight and one half miles will cross Tuckanuck Shoal in 17 or 18 feet water.

**BLOCK ISLAND CHANNEL, &c.**—*Directions for those running for Block Island Channel, to the southward of Martha's Vineyard, Vineyard Sound, Nantucket Island, and such as are bound into the Vineyard Sound, and intend going over the Shoals to the eastward.*

In approaching the south end of Block Island (on the N. W. point of which two houses are erected, as after described) from the southward, the water shoals gradually. When the island bears from N. W. to N. by W. the bottom is mud: this is commonly called Block Island Channel. This island, if you come from the southward, appears round and high; and if you approach it from the S. E. it appears like a saddle, being high at both ends, but highest to the southward. Your course from the south-east head of Block Island to Gay Head Lighthouse is E. by N. 15 leagues. The current in Block Island Channel is N. N. E. and S. S. W. two knots. If you fall to the southward of

\* Gay Head Lighthouse stands at the south-west end of Martha's Vineyard, on a remarkable promontory called Gay Head, elevated above high water 134 feet, elevation of light above the sea 150 feet.

The cliff, which rises about 134 feet above the water, is very conspicuous from the different colors of the earth, which have been exposed by the action of the elements.

The lights revolve once in about four minutes, and are observed twice in each revolution. At its distance of twelve miles they are obscured about three fourths of the time: at three miles distance they may always be seen, though dimly, through parts of each revolution. Cape Poge Light, at the N. E. point of the Vineyard, may be seen over the land from sea, is a fixed light, to distinguish it from that of Gay Head; also Cuttchunk Light, at the N. W. part of Cuttchunk Island, south entrance of Buzzard's Bay, which is also a fixed light. The Devil's Bridge, a rocky shoal, makes off about S. W. from the light, one and a half mile distant. Bearings and distances from the light:—West part of Noman's Land Island bears S. 8° W. from Gay Head, 6½ miles distant. The island is about three miles long and one broad. Old Man, S. by E. This is a ledge of rocks which lies two thirds of the distance from the Vineyard to Noman's Land Island, which has a passage on both sides that is but little used. Those who go through must keep near Noman's Land Island all the light bears north. You will have 7 fathoms water in this passage. Sow and Pigs, N. W. by W. 3½ leagues. This is a ledge of rocks which is very dangerous. Newport, (Rhode Island) Light, W. by N. ½ N., distant 11 leagues.

Martha's Vineyard, and can see Noman's Land Island, and intend going over the shoal to the eastward, bring Noman's Land Island to bear W., and steer E. by S. 8 leagues, which will bring you up with Nantucket Island, to which you must give a distance of two miles, until you have passed Micomic Reef, which extends one mile from the shore, has two fathoms water, and bears from the South Tower at Nantucket, S. by W. When you get to the eastward of this rip, you may nigh the shore to within one quarter of a mile, until up with Tom Never's Head, which lies  $1\frac{3}{4}$  of a mile to the southward and westward of a small village called Sciasconset, where you may anchor, if necessary, in 4 or 5 fathoms.

If you wish to continue through the channel, which lies between Nantucket Island and the Old Man, you may run within three cables' lengths of the shore, which will carry you over Pochick Rip, on which there are but 2 fathoms, and of course only fit for small vessels. When on this rip, haul to within one cable's length of the shore, and continue in 5 fathoms, till up with Sancoty Head, which is the highest eastern land of Nantucket. Bring Sancoty head to bear S. W. when in 5 fathoms water, and run N. E. till you deepen to 15 fathoms, when the Round Shoal Buoy will bear N. W., after which you shoal into 7 and 8 fathoms, fine ridges, which having passed, and come into 10 fathoms, a north course will carry you to the High Land of Cape Cod, 17 leagues distant. If in a large ship, and you make the south side of Nantucket, bound over the shoals, you may proceed either within or without the Old Man, but the latter is preferable.

If you wish to go between the Old Man and Pochick Rip, bring Tom Never's Head to bear N. W. by W. and run S. E. by E. till Sancoty Head bears N. N. W.  $\frac{1}{2}$  W. where you will have 9 fathoms water, when you will run direct for Sancoty Head, till in 5 fathoms, which will be close on board; then continue your course N. E., as before mentioned, for the Round Shoal. In running the S. E. by E. course, you go through a swash half a mile wide, having 7 fathoms.

If you are coming from sea, and make the island of Nantucket to the northward of you, it may be known by two towers, and four windmills, which stand near each other, upon an eminence. You may then steer directly for the land, until you are within half a mile, and may, if bound to the eastward, run along the shore in 4, 5, and 6 fathoms water, to the S. E. part of the Island, where there are shoals and rips, on which you will have only 2 $\frac{1}{2}$  or 3 fathoms water. Sancoty Head is the easternmost head land of Nantucket.

If, in coming from sea, you make the South Shoal, which lies in  $41^{\circ} 4' N.$  lat. give it a berth of a mile. If you intend to make Nantucket Island, steer N. by W., and when you come near the Island, you may proceed along the shore, according to the former directions.

If, when you make the South Shoal, you are bound to Boston Bay, and choose to go to the eastward of all the shoals and rips, pass a mile or two to the southward of the shoal, then bear N. E. by E. about 7 leagues, when you will be up with the Fishing Rip. In this N. E. by E. course, you will deepen to 25 fathoms, which is about midway between the Shoal and Fishing Rip. From the Fishing Rip, in 17 or 18 fathoms, steer N. N. W. for the High Land of Cape Cod 18 leagues, on which is a lighthouse, containing a fixed light.

If you come from the eastward, and are bound for Long Island or New York, you should be careful not to go to the northward of  $41^{\circ} N.$  latitude, until you pass the South Shoal of Nantucket. If, by stress of weather, you should be driven so far to the northward as to be near the Vineyard, you may pass through the channel to the westward of Nantucket Island, by bringing Cape Poge Lighthouse to bear N. by W. and steering right for it, will lead you through, in from 3 to 4 fathoms, clear of all shoals, leaving Skiff's Island, which is a dangerous shoal, on your larboard hand. Martha's Vineyard Island lies in much the same latitude as Nantucket Island, and may be known by a small round island which lies at the southward of Gay Head Light, called Noman's Land Island, before mentioned, 8 miles distant. You may sail between this island and Martha's Vineyard; but you must take care to avoid a ledge of rocks, which bears from Gay Head Light, S. by E.  $5\frac{1}{2}$  miles distant, called the Old Man.

In bad weather, coming from the eastward, and you wish for a harbor, and the wind admitting, you may bring Nantucket light to bear E. S. E. and run W. N. W. making your course good, until Cape Poge lighthouse bears W. by S.; if bound into Edgartown harbor, then steer for the light until you get in 3 fathoms water, then run W. N. W.; if shoals, haul to the northward; if not, keep on until the light bears south, then run S. W.; you will have 3 and 4 fathoms, hard bottom. As soon as you get in  $5\frac{1}{2}$  or 6 fathoms, sucky bottom, then run S. S. W. until the light bears N. E.  $\frac{1}{2}$  E.; then you may anchor in about 5 or 6 fathoms water with safety, in case your cables and anchors are unworthy; otherwise, if you wish to go into the harbor, when the light bears N. E.  $\frac{1}{2}$  E. you may run S. W. by W. until you get  $3\frac{1}{2}$  fathoms, hard bottom, then run west about half a mile, and you will be within the flats, which you leave on your starboard hand,

coming in; you will find it smooth, and about 3 or 4 fathoms water, where you may anchor with safety, though your ground tackling is poor.

To enter the Vineyard Sound bring Gay Head Light to bear S. E. 4 miles distant, and steer E. N. E.

To enter Buzzard's Bay through Quick's Hole, bring Gay Head Light to bear S.  $\frac{1}{2}$  W. and steer S.  $\frac{1}{2}$  E. to the entrance of Quick's Hole, which is six miles from Gay Head.—Menemsha Bite, which lies on the north side of Gay Head, affords good anchorage  $2\frac{1}{2}$  to 3 miles east from the light, with the wind from E. to S. W. but being much exposed to the influence of northerly winds, it should be resorted to only in the summer, or at other times from necessity.

From Gay Head Lighthouse, the south part of Cuttchunk Island bears N. 45° W. distant  $7\frac{1}{2}$  miles.

If you wish to go to Holmes' Hole or through the Sound, bring Cape Poge light to bear S. E. by E.  $\frac{1}{2}$  E. and run N. W. by W.  $\frac{1}{2}$  W. you will run for the East Chop, and leave Squash Meadow shoal on your starboard hand; get 3 fathoms water on the Chop, then haul to the N. N. W. until you deepen to 7, 8, or 9 fathoms; then run S. W. by W. for Holmes' Hole roadstead, in 4 or  $3\frac{1}{2}$  fathoms; or N. W. for the Sound, to clear the West Chop and Middle Ground:

Gay Head is the westernmost land of Martha's Vineyard. When you come by Gay Head with a southerly wind, the south channel is best. From Gay Head to Nantucket Point, the tide sets directly through the Vineyard Sound with a little variation, after passing Cape Poge to the eastward, which is caused by a strong tide setting through Tuckanuck Channel. The land of Gay Head is high and of divers colors, namely, red, yellow, and white, in streaks. In steering from \*Block Island for Gay Head, you must be careful to avoid the Sow and Pigs; they make a ledge of rocks, some of which are above, and others under water. These rocks lie  $2\frac{1}{2}$  miles S. W. by W. from the westernmost of Elizabeth Isles, and W. N. W. from Gay Head  $2\frac{1}{2}$  leagues distant; the first of the flood tide sets strong to the northward over them into Buzzard's Bay, which is very foul. Your course along Elizabeth Isles is E. N. E. in 15, 14, 12, 8, 15, 16, and 17 fathoms water; give the isles a berth of about three-quarters of a mile. In running from Gay Head Light into Vineyard Sound, if you wish to make a harbor on the north side, bring Gay Head Light to bear S. W. and run N. E.  $3\frac{1}{2}$  leagues, which will carry you up with  $\frac{1}{2}$  Tarpaulin Cove Light, where you may anchor in from 4 to 18 fathoms, on fine sand, the light bearing from W. by N. to S. W. affording safe anchorage with northerly winds.

When coming from sea, you may run for Gay Head Light, when it bears from N. N. E. to E. S. E. giving it a berth of two miles, to clear the Devil's Bridge, which bears from the light S. W.  $1\frac{1}{2}$  mile distant. As measuring the distance in the night would be uncertain, you must keep your lead going, and if you should have 7 or 8 fathoms when the light bears S. E. by E. or S. E. haul up north till you have 10 or 12 fathoms; then with ebb steer N. E., and with ebb N. E. by E. 3 leagues; then E. N. E. will be the course of the Sound, which will carry you to the northward of the Middle Ground, which has a black buoy on the east end, in 16 feet water, bearing from Tarpaulin Cove light east, 4 leagues; from West Chop Light N. W. by W. half a mile; and from the black buoy on Hedge Fence W.  $\frac{1}{2}$  N. 3 leagues, (shoalest water on Middle Ground two feet) when you will see the West Chop of Holmes' Hole Light, which you may run for, keep one mile from shore till you open the East Chop one cable's length, and with a flood tide steer direct for it, and with ebb keep it one point open, till you open a wind-mill on the west side of the harbor about one cable's length, then run up in the middle of the river, till you come to 4 or 3 fathoms, where you may anchor on good ground. The usual mark for anchoring is the West Chop, bearing from N. N. W. to N. W. by N. but if you lie any time here, the best anchoring is well up the harbor, and close to the shore, mooring S. E. and N. W. in 4 or 5 fathoms' water. In this harbor, which is about two miles deep, you will lie secure from all winds except a northerly one.

You must not keep further than two miles from the West Chop, as there is a shoal, called Hedge Fence, on the east end of which is a black buoy, in 16 feet water, bearing from West Chop east, 6 miles, and from the black buoy on Middle Ground, E.  $\frac{1}{2}$  S. 3 leagues. The Hedge Fence lies about  $3\frac{1}{2}$  miles N. E. by N. from Holmes' Hole Light, and extends

\*Block Island is about 9 miles in length, extending N. by E. and S. by W. and 5 miles in breadth.

†Tarpaulin Cove light lies on the larboard hand as you enter that harbor, and shows a fixed light elevated 80 feet above the sea. It bears about N. E. by N. from Gay Head light, which is a fixed light  $3\frac{1}{2}$  leagues distant.

‡A lighthouse, showing a fixed light, is erected on the West Chop of Holmes' Hole, elevated 100 feet above the sea, as previously mentioned.

W. N. W. and E. S. E. 6 miles, is about half a mile broad, and has 4 feet water on the shoalest part. Between this shoal and Holmes' Hole, there are from 8 to 12 fathoms water.

If you make the Chop in the night, when it bears S. E. you are clear of the Middle Ground; steer for the east side of it till you strike in 4 or 3 fathoms on the flat ground near the Chop, then steer S. E. by E. observing not to go nearer the land than 3 fathoms. If, in running S. E. by E. you fall into 6 or 7 fathoms, haul up S. by W. or S. S. W. and run into 4 or 3 fathoms, as before directed.

If bound into Vineyard Sound, with the wind at the eastward, and you are near the south side of Martha's Vineyard, to go between Squibnocket and the Old Man, run round Squibnocket in 3½ and 4 fathoms water, continuing N. N. W. along the beach till you come to Gay Head Light, and if ebb tide, anchor in 5 fathoms, the light bearing from N. to N. E.

Vessels entering the Vineyard Sound, should leave \*Cuttehunk Light on the larboard hand, giving it a berth of three miles, to avoid the Sow and Pigs, the western part of which bears S. 56° W. from the light, 2½ miles distant. Cuttehunk is one of the Elizabeth Islands.

In entering Buzzard's Bay, bring Cuttehunk Light to bear east, 3 miles distant, and steer N. E. by N., which course will carry a vessel to good anchorage, in 6½ and 7 fathoms, about one mile from the Dumplin Rock Light, with it bearing from N. N. E. to N. E. by N. This is as far as a stranger should venture without a pilot, who can always be had on setting a signal.

In coming into the Sound in the night, with a strong north-westerly wind, haul to the northward till you have smooth water under the Elizabeth Islands, where you may anchor in 14 or 10 fathoms. Should you have the wind to the southward, it will be best to run down through the South Channel, or Vineyard side. When Gay Head Light bears S. S. E. your course is N. E. by E. ½ E., or E. N. E., observing not to come nearer the land than into 7 fathoms water, till you are abreast of Lambert's Cove, in which is good anchoring, with southerly or easterly winds, and may be known by a high sand bank, called Necunkey Cliff, on the east side of it, about midway the Cove, opposite which you may come to in 5 or 3 fathoms, sandy bottom, where is the best anchoring. The middle Ground lies about two miles without the Cove, and has 12 feet water on it. If you intend running down for Holmes' Hole, your course, when opposite Necunkey Point, is E. by N., keeping near the land to clear the Middle Ground, the east end of which bears east from Tarpaulin Cove Light, 4 leagues distant. You may track the shore by the lead in from 7 to 4 fathoms, till you come near the light; but come no nearer than 3 fathoms, and you may track the Chop around, the same as running down to the northward of the Middle Ground, which bears from West Chop Light N. W. by W. half a mile, and from the east end of the Hedge Fence, W. ½ N. 3 leagues. There is good anchoring along this shore, in 6 or 4 fathoms, after you are to the eastward of Necunkey Point, till you come near the West Chop. If you wish to make a harbor after entering the Vineyard Sound, bring Gay Head Light to bear W., distant 8 miles, and run S. E. till you come into 7 fathoms water, which will be on the east side of the bay in Nimshebite, near Clark's Spring, where the best water may be had in great abundance, and lie in good anchorage, Gay Head Light bearing W. by N. Your course from Gay Head Light to Tarpaulin Cove Light, is N. E. by N., and the distance 4 leagues. In this harbor you may anchor in from 4 to 2½ fathoms, and lie safe, with the wind from N. E. by E. to south. It will be best to anchor in 3 fathoms, as with that water you will be out of the tide, where the ground is good for holding. The tide flows at change and full days of the moon, at 9 o'clock, but in the channel between Elizabeth Islands and Martha's Vineyard, the flood runs till 11 o'clock. In this channel there is a Middle Ground, which is a narrow shoal of sand, the eastern end of which bears N. W. by N. from the

\* Cuttehunk Light stands on the south-west part of the island at the entrance of Buzzard's Bay, intended to guide vessels into the Bay, and point out the location of the Sow and Pigs, to those entering the Bay and Vineyard Sound. It is a fixed light, elevated 48½ feet above the sea at high water.

light. There is not more than 3 or 4 feet on the eastern end. N. W. from Necunkey Cliff are 3 and 4 fathoms across the ground. Opposite Lambert's Cove is 12 feet, and to the westward of that, is 3 or 4 fathoms. The shoal lies W. by S. and E. by N., is about 4 leagues in length, and has several swashes on it. When the East Chop of Holmes' Hole comes open of the West Chop, you are to the eastward of the Middle Ground. Your course from Tarpaulin Cove Light to Holmes' Hole Light, is E.  $\frac{1}{2}$  N. distant 3 leagues. In steering this course, you must have regard to the tide, as the ebb may set you too far to the southward, and the flood too far to the northward, and stand in for the harbor, when you have opened the East Chop, as before directed. From Holmes' Hole Light to Cape Poge Light, the course is E. S. E., and the distance about 3 leagues; in the channel between them there are 12 and 11 fathoms water. In going over the shoals through this channel, you must be careful to keep your lead going, in order to avoid a dangerous sand which lies on the north side of it, called the Horse-shoe, distant from Cape Poge 3 leagues. The channel between this sand and Cape Poge, and also between the former and \*Tuckanuck Shoal, is narrow; in it there are from 12 to  $4\frac{1}{2}$  fathoms water, the latter of which is between the east end of the Horse-shoe and Tuckanuck Shoal. When Tuckanuck Island bears S. S. W. you are to the eastward of the Horse-shoe. On the south side of the channel, also, there are several spots of shoals, to avoid which you must keep your lead going.

† EDGARTOWN HARBOR lies between Martha's Vineyard and Cape Poge. Vessels bound eastward and wishing to enter Edgartown Harbor, from the east end of Squash Meadow Shoal, in 3 fathoms water, bring the harbor light to bear S. and Cape Poge Light to bear S. E.; then steer S. S. E.; they will pass the Long Flat in 4 fathoms of water, until the harbor light bears S. W. by S.; then steer S. S. W.; they will have 6 and  $6\frac{1}{2}$  fathoms water, until the harbor light bears W.; then steer W. by S. and pass the light about a cable's length to the right hand, which courses will carry them up to the wharves.

Vessels bound westward, and wishing to enter Edgartown Harbor, after passing near Cape Poge, in 4 or 5 fathoms water, bring the harbor light to bear S. W. by S. and steer S. S. W. until the harbor light bears W.; then steer W. by S. and pass the light, about a cable's length to the right hand, which courses will carry them up to the wharves.

If vessels wish to anchor in the outer harbor, they will follow the above directions until the harbor light bears W. by S. and Cape Poge light bears N. E.  $\frac{1}{2}$  E. when they may anchor in  $4\frac{1}{2}$  or 5 fathoms water, and very good holding ground.

In leaving Holmes' Hole to pass over the shoals, keep the West Chop open to the northward of the East Chop, until you have passed Squash Meadow Shoal, on the N. W. end of which is a red buoy, with a small pole in the end of it, placed in 16 feet water, bearing from Cape Poge Light N. W.  $\frac{1}{2}$  W. 6 miles; from West Chop Light S. by E.  $\frac{1}{2}$  E. 6 miles; and from the black buoy or Hedge Fence S. by E. 2 miles. The east water 5 feet. The buoy lies about  $2\frac{1}{2}$  miles from the East Chop, must be left on the starboard hand, when your course will be E. by S. in 10 or 12 fathoms water, which course you must continue till you pass Cape Poge Light. If it should be tide of flood, you must steer E. by S.  $\frac{1}{2}$  S. as the tide of flood sets very strong to the northward, between Cape Poge and Tuckanuck Island, and the tide of ebb to the southward, so that you must govern your course by the tide. In clear weather you may see Nantucket Lighthouse 18 miles, which you must bring to bear E. by S.  $\frac{1}{2}$  S. which course you are to steer, passing it at the distance of one league, when you must bring it to bear west, and steer east, taking care to make this course good, which will carry you over the shoals in ship channel; the ground is very uneven, and you will have from 4 to 8 fathoms water. When you have passed over the shoals, you will have from 10 to 14 fathoms water, and then by steering north, you will make Cape Cod Lighthouse (which contains a fixed light) distant 18 leagues.

To go to the northward of the Great Round Shoal, on the northerly part of which is a black buoy, which you leave on your starboard hand, placed in 14 feet water, bearing from Sancoty Head N. by E.  $\frac{1}{2}$  E. 5 leagues, from Nantucket Light E. N. E.  $\frac{1}{2}$  N. 10 miles, and from the red buoy on Point Rip E. N. E. 3 leagues, shoalest water 5 feet, you must proceed according to the foregoing directions, until you pass the lighthouse, and bring it to bear S. W.  $\frac{1}{2}$  W. then by making a N. E.  $\frac{1}{2}$  E. course good, you will go between the Great and Little Round Shoals, on the south part of which is a white buoy, with a small pole in the end of it, placed in 14 feet water, bearing from Chatham Lights

\* Tuckanuck Shoal lies between Cape Poge and Tuckanuck Island. On the shoal a floating light is moored.

† A fixed light is erected at the entrance of Edgartown Harbor, on a pier running from the west side, 1000 feet from the beach. It is elevated 50 feet above the level of the sea.

S. by W.  $4\frac{1}{2}$  leagues; from Nantucket Light N. E. 3 leagues; and from the black buoy on the Great Round Shoal N. W. by N.  $2\frac{1}{2}$  miles: shoalest water 7 feet, in  $2\frac{1}{2}$ , 3, 4, and 5 fathoms water, until you have crossed the Pollock Rip, where you will have about 3 or 4 fathoms water, on which is a red buoy, which you leave on your larboard hand. The Little Round Shoal bears N. W. from the Great one, distant about  $2\frac{1}{2}$  miles. Continue your N. E.  $\frac{1}{2}$  E. course, until you deepen your water to 12 or 13 fathoms, and then steer north for Cape Cod Lighthouse before mentioned, and described in page 177.

As the South Shoal of Nantucket lies in lat.  $41^{\circ} 4' N.$  and the Gulf Stream, southward from this part, reaches as far to the northward as lat.  $38^{\circ} 30' N.$  you should pass Nantucket Shoals between these latitudes. The shoal on George's Bank (east end) lies in long.  $67^{\circ} 42' W.$  and the W. end in long.  $67^{\circ} 59' W.$  and the South Shoal of Nantucket in long.  $69^{\circ} 56' W.$

By observing the foregoing directions, and keeping between the Gulf Stream and the Shoals, you will shorten your passage to New-York, Delaware, Virginia, or other western ports; for you will have the advantage of the eddy current, running contrary to the Gulf Stream; the latter would retard your progress at the rate of 60 or 70 miles a day. The Nantucket whalers, by their constant practice of whaling on the edge of the Gulf Stream, all the way from their island to the Bahamas, are well acquainted with its course, velocity, and extent. A stranger may know when he is in the Gulf Stream, by the warmth of the water, which is much greater than that on either side of it. If, when you are crossing the Gulf Stream, you are bound to the westward, you should get out of it as soon as possible.

### NANTUCKET\* SOUTH SHOAL, &c.

THIS dangerous Shoal, which lies in lat.  $41^{\circ} 04' N.$  long.  $69^{\circ} 56' W.$  bears S. by E. from Sango Head, 4 leagues distant. It is composed of hard white sand, over which the sea breaks in the most tremendous manner, having on it in many parts, only 3 feet water, and the tide meeting it obliquely, passes over it in different directions. The course of the tide is N. E. and S. W. beginning to run S. W. at 10 o'clock on the day of full moon, and continues in that direction about 7 hours. It extends from east to west one mile, and is in breadth two cables' lengths. It often breaks in 5 fathoms, on the east and west of the Shoal. The rip which extends from the western end, has about 7 fathoms water on it.

South from the South Shoal, half a mile distant, the bottom is uneven, from 3 to 5 fathoms. There is a rip puts off from the west end of the Shoal to the south and west,

\* This Shoal, together with George's Bank, have been surveyed at the expense of the Author, and published on a large scale, together with a general Chart of the Western Ocean, by E. & G. W. BLUNT, 133 Maiden Lane, corner Water-street, N. York.

and sweeps round so that the south end of the rip bears nearly south from the Shoal, on which it sometimes breaks in 7 or 8 fathoms water, at the distance of 5 miles from the Shoal; between the outer part of the rip and the Shoal is uneven bottom and full of rips. The tides run round the compass in 12½ hours, but the southern tide has the greatest duration, and runs the strongest.

All who pass near the South Shoal should, for their own safety, pay particular attention to the tides, sometimes a current sweeping them over the bottom with a velocity as great and even much greater in some instances than the vessel moves through the water.

*Extract from the surveying sloop Orbit's Journal.*

"Sancoty Head bearing N. W.	}	Came to a large swash through the Bass Rip, with 5 fathoms. Standing on the rip had from 8 feet to 2 fathoms, hard sand.
Siasconset town N. W. ½ N.		
Southernmost land W.		
"Sancoty Head bearing N. by W.	}	On the south breaker of Bass Rip, in 9 and 8 feet, and less.
Siasconset N. N. W.		
Tom Never's Head N. W. by N.		
Southernmost land W. N. W.		

"Kept standing on to the southward in a channel of from 6, 7, and 8 fathoms. Sancoty Head bearing N. by W. 8 miles, crossed a dangerous Rip in 2½ fathoms, lying S. W. by S. From this Rip, E. S. E. 3 miles distant, is another Rip, between which are 9, 15, 17, 14, 6, and 4 fathoms, which is the shoalest water on the Rip; then standing east, had 7 and 8 fathoms; three cables' lengths from this Rip, came to another with 4 fathoms water; from this, at equal distance, came to a third, then a fourth, all of which were within the limits of 3 miles, and lay N. and S. Although they have the appearance of danger, there is not less than 4 fathoms on the shoalest part. After crossing the fourth Rip, came into deep water within one mile, viz. 12, 17, 22, and 25 fathoms, sand and red gravel. When over, had smooth water with 3 fathoms, and made a south course, having 4, 11, 18, and then 11 fathoms, and crossed the east end of the South Shoal in 2 fathoms, running down the south side in 13 fathoms, 80 fathoms distant, when we anchored in 10 fathoms. Got under way and stood to the westward; had 7, 4, 5, 4, and 7 fathoms; doubled round the west end in 3 fathoms, fine sand; when over had 7 fathoms, the tide setting N. N. W. Kept along the north side in 24, 2½, and 2 fathoms, one cable's length from the breakers. When about mid-way the Shoal, perceived a swash, through which we crossed between the breakers, in a S. S. E. direction, had 2½ and 4 fathoms, and one east 9 feet, at which time it was about half-tide. In a few moments deepened to 4, 5, 6, and 7 fathoms, 2 cables' lengths from the Shoal, hard white sand. From this steered S. ½ W. to make a south course good, kept the lead going, and increased the soundings gradually to 10 fathoms, fine black and white sand; then 12 fathoms from the Shoal. From this sounded every three miles, depth increasing about one fathom per mile, till at the distance of 7 leagues from the South Shoal, where we found 28 fathoms, fine black and white sand. This was in lat. 40° 42' N. long. 69° 05' W. The same quality of soundings continue till you get in lat. 40° 31' N. when you will have 40 fathoms, soft mud, from which it continues muddy bottom till off Nantucket, and in 40° 00' N. no bottom, with 120 fathoms."

NOTE.—The Orbit (Capt. J. Colesworthy) was sent by the author of this work to ascertain the exact situation of the South Shoal, which differing so much in latitude from what it had ever been laid down, induced several gentlemen in Nantucket again to engage in the enterprise, who confirm the surveys made in that vessel, and make the following report: "Observed in lat. 41° 4' 11" N. abreast of the Shoal, as laid down by Capt. Colesworthy; steered off S. by W. 22 miles, and regularly deepened the water to 35 fathoms; steered E. N. E. twelve miles, to 30 fathoms; N. W. twenty miles to 18 fathoms; S. S. W. ten miles, to 30 fathoms; and N. N. W. fourteen miles, regularly shoaling until 6 A. M. made the Mills, and came in at one P. M. These several courses formed a track over where Paul Pinkham has laid the South Shoal of Nantucket, and on which there are 28 fathoms."

Eight or ten leagues S. E. from the south part of George's Bank, lies the Gulf Stream, where there is a strong E. N. E. current, and if you are bound to the westward, you had better go very near the Bank, quite on soundings, till you are abreast of the South Shoal of Nantucket, where you have 30 leagues from Bank to current, and by doing which you will certainly shorten your passage.

Seven leagues to the westward of the South Shoal, in 25 or 30 fathoms, you will have black mud of a shining smooth nature, when you will be in Tuckanuck channel.

To the westward of the South Shoal of Nantucket, you have no shoals, rips, nor tides to hurt you, until you come near the land; but clear sea, good navigation, and regular

soundings. To the eastward and northward of the South Shoal, you will have a rapid tide.

A Shoal called Pochick Rip, lies off the S. E. part of Nantucket Island. It commences a few rods south of Siasconset town, and then runs E. S. E. one mile, when you come to a corner on which are 6 feet at low water; between this corner and the island there are a few swashes from  $2\frac{1}{2}$  to 3 fathoms, through which vessels may pass. From the corner the Rip runs south  $1\frac{1}{2}$  mile, when you come to another swash, half a mile wide, with 7 fathoms, W. S. W. one quarter of a mile from this channel is a very shoal spot, with 6 feet, which runs S. W. by W. one quarter of a mile, when you fall into a swash 40 rods wide, Tom Never's Head bearing N. N. W. 3 miles distant. You then come to the east end of the Old Man, which runs W. S. W. about 4 miles, on which are from 9 feet to 3 fathoms; when over the Old Man, you will drop into 7 fathoms, fine sand, with black specks.

Between the Old Man, Tom Never's Head, and Pochick Rip, there is a very good roadstead or anchorage; and with the wind at N. W., N., N. E., E., S. E. and far as South or S. S. W. preferable to any harbor in the Vineyard Sound for vessels bound to the Northward or Eastward, particularly in the winter season, provided your cable and anchors are good. Tom Never's Head bearing E. N. E.  $\frac{1}{2}$  N. the southernmost land W. by N. you will have 5 fathoms, coarse sand; from which to the Old Man you will have 5, 6, 6, 7, 8, 9, 10 to 14 fathoms, red sand, then half way between the two; from this you shoal to 13, 11, 8, 7, 5, 4 and 3 fathoms, fine sand, with black specks.

The Great Rip is about  $4\frac{1}{2}$  leagues from Sancoty Head; on this Rip, about E. S. E. from Sancoty Head, there are 4 feet water, and east from Squam there are 5, but on many other parts of it there are 2, 3, and 4 fathoms water.

Fishing Rip is about  $11\frac{1}{2}$  leagues from Sancoty Head, and has from 5 to 7 fathoms water on it. Between this and the Great Rip, the ground is uneven; there are 12, 22, and 15 fathoms water. These two Rips stretch nearly north and south, and are about 12 miles in length. Off the east part of Nantucket Island, lies the Bass Rip, about 3 miles from Sancoty Head.

Around the coast of Nantucket and the Shoals, you will have sandy bottom, and in moderate weather had better anchor than be driven about by the tide, which is very rapid.—The course of the tides at and over Nantucket Shoals, is nearly N. E. and S. W. and regular. The N. E. tide makes flood. S. S. E. moon makes high water. South moon makes full sea at Nantucket Harbor.

South of Noman's Land Island, in 20 or 25 fathoms, you will have coarse sand like gravel stones; and S. S. W. from it, in 28 or 30 fathoms, coarse red sand. S. S. E. from Block Island, which is in Block Island Channel, in 40 or 50 fathoms, you will have oozy mud, but as you shoal your water to 25 or 20 fathoms, you will have coarse sandy bottom.

N. E. and W. N. W. moon makes high water on the Shoals; the tide of flood sets N. E. by E. and ebbs S. W. by W. from 2 to 3 knots an hour. It ebbs and flows about 5 or 6 feet.

If when coming from sea, you fall into Block Island Channel, you will have soundings in lat.  $40^{\circ}$  N. 100 fathoms, mud and ooze, which quality of soundings continue decreasing gradually, till you get into 40 fathoms. In 38 fathoms, Block Island bearing N. by W.  $4\frac{1}{2}$  leagues distant, you will have fine red and black sand; two and one half leagues distant, same bearing, you will have 28 fathoms, coarse sand. When Block Island bears N. distant 4 or 5 leagues, you cannot see any land to the northward or eastward; but as you approach the island, you see Montock Point to the westward, making a long low point to the eastward, on which is a lighthouse. In sailing W. S. W. you will make no remarkable land on Long Island, from the eastward of said island to the westward, its broken land appearing at a distance like islands; but may discover Fire Island lighthouse, which shows a revolving light, containing 18 lamps, elevated 80 feet 3 inches above the level of the sea, and 70 feet 10 inches from the base, bearing N.  $77^{\circ}$   $35'$  E. from Sandy Hook light, 12 leagues distant. From Fire Islands light, a shoal extends south three-fourths of a mile and joins the bar, which is very dangerous, as it shoals suddenly from 8 to 6 fathoms, then directly on the Shoal, on which the flood tide sets very strong. It is not safe to approach the shore nearer than two miles when the light bears to the east of North. To the eastward of the light the shore is bold; the bar is subject to change, and has 7 feet water on it. When Fire Islands light bears N. in 10 fathoms water, you may steer W. by S. which will carry you up with Sandy Hook light. The quality of the bottom is various, viz. yellow, red, brown, blue and grey sand, within short distances. About south from Fire Islands, 33 miles distant, and 40 miles S. E. by E. from the Highlands, lies a Bank, extending from N. E. by E. to S. W. by W. having on it from 10 to 14 fathoms, pebbles. Within this, a short distance, you will get 20 fathoms, when it shoals into 16

fathoms.

m the Highlands,  
rom 10 to 14 fath-  
en it shoals into 16

fathoms, grey sand, which depth you will carry till you get into what is called the "Mud Hole, where are from 20 to 36 fathoms water, marl or green ooze, and sometimes pebbles; the deepest part of which bears east from the northernmost part of the Woodland, 10 miles; and S. E.  $\frac{1}{2}$  S. 15 miles from Sandy Hook light. From the Mud Hole to the Bar of Sandy Hook, the water shoals gradually, as laid down on the Chart. On the Bank is plenty of fish.

You will have 20 or 22 fathoms water out-sight of the land, sandy bottom in some and clay in other places. When you come in sight of Sandy Hook lighthouse, you will see the Highlands of Neversink, which lie W. S. W. from Sandy Hook, and is the most remarkable land on that shore. On the Highlands two lighthouses are erected.

**NEW BEDFORD, THROUGH QUICK'S HOLE.**—Bring Gay Head lighthouse which contains a revolving light, to bear S.  $\frac{1}{2}$  W. and run N.  $\frac{1}{2}$  E. till you come to the passage through the islands, which forms Quick's Hole, which you must enter as near the middle as possible; but if you deviate, keep the starboard hand best on board, to avoid a spit or flat which runs off from the S. E. point of Nashawina, on the larboard hand, when you will have from 5 to 6 fathoms, then haul square into the Hole, keeping the larboard hand best on board, following somewhat the bend of the shore. You will keep Gay Head Light open about a ship's length by the S. E. point of Nashawina, till you are at least one mile north of the Hole, which will carry you to the eastward of a ledge and rock that lie that distance from it, with only 5 to 12 feet water on them, to the westward of which is a good channel, and 5 fathoms all round. Then steer N.  $\frac{1}{2}$  W. till you strike hard bottom in 5 fathoms water, on the S. E. corner of the Great Ledge, which is on the western side of the channel; then N. E. by N. about three fourths of a mile, till in  $5\frac{1}{2}$  or 6 fathoms, sucky bottom, when the light will bear N. N. W.; then steer N. by W. and run into the river.† After passing †Clark's Point Light, you will see a small island, called Outer Egg Island, just above water, which you will leave on your starboard hand, giving it some berth, as there are rocks which lie south-westerly from it, say one third of a mile distant, but still keeping nearer to it than to the main land, to avoid Butler's Flat, which makes off from the west shore. To steer clear of this flat, keep the lighthouse open a ship's length to the westward of the Round Hills. As soon as you open the north line of the woods with the clear land, about a mile north of the lighthouse, you are to the northward of the flat, and may steer direct, either for the hollow or the high part of Palmer's Island, hauling a little to the eastward as you approach it. The passage between this island and Fort Point, on the starboard hand, is narrow. A flat which extends out S. W. from the point, makes it necessary to keep nearest the island. As you draw towards the north end of the island, give it a berth of two ships' lengths, as a small flat makes off east from its N. E. point. As soon as you have passed the island one cable's length, the town will appear open on your larboard hand, when you may run for the end of the wharf which projects out farthest into the channel (Rotch's Wharf); or to anchor in the deepest water, bring Clark's Point Light without Palmer's Island.

Other directions from Quick's Hole to New Bedford are, to make a north course good till you strike hard bottom in 5 fathoms, on the eastern side of the channel, and then haul up N. N. W., but the former directions the pilots consider safest.

In coming into New Bedford from the westward, the eastern channel is safest for strangers. Give the Sow and Pigs a berth of one mile, and run N. E. by N. till Punc Island bears S. E.; then E. N. E. till Gay Head Light bears S., and then N.  $\frac{1}{2}$  W. as before directed.

A rock lies off N. W. from the north end of Punc (or Puncuese, as it is sometimes called) about one mile distant, on which there is only 8 feet at low water. Between this and Wilke's Ledge (on which there is a black buoy) is an open ship channel, free from danger, and courses may be varied as circumstances require. By those who are acquainted with the bay, the western channel is most commonly used. Giving the Old

\*This Mud Hole, with the soundings off the Hook, are correctly laid down on a chart of the Harbor of New York, with the Coasts of Long Island and New Jersey from Fire Islands to Barnegat Inlet, compiled and surveyed by EDMUND BLUNT, and published by EDMUND & GEO. W. BLUNT, No. 133, Maiden Lane, New York.

† When running from Quick's Hole for the N. Ledge, as soon as you find yourself in 7 fathoms water, you may be sure that you are abreast of the Great Ledge, or have passed it.

‡ Clark's Point Lighthouse stands on the south end of Clark's Neck, containing a fixed light, elevated 52 feet above the level of the sea, at high water, and is intended to guide vessels into the harbors of New Bedford and Fairhaven. The light bears from Cutterhunk Light, S. 20° W. 12 $\frac{1}{2}$  miles distant.

From the light to Dumplin Rock Light, S. 24° W. 4 miles.

" " Centre Quick's Hole, S. 10° E. 10 do.

" " Black Rock, S. 54° E. 2 $\frac{1}{2}$  do.

Cock, Hen and Chickens a sufficient berth, the only danger to be avoided in approaching Mishom Point, is a rock which lies about one mile S. W. by S. from it, on which there is only 6 feet water. Having passed Mishom Point, directly south of which, one mile distant, there is a ledge, on which there is not more than 3 fathoms at low water, and sometimes less, you may steer directly for the \*Dumplin Rocks Light, off the Round Hills, and which may be passed within two cables' lengths to the eastward. Hence to Clark's Point Light the course is N. N. E.; but to avoid the Middle Ledge, (on which there is a red buoy,) and which lies very near in a direct course from the outer Dumplin to the light, it is better to steer N. E. by N. about a mile, and then haul up N. N. E., when you will leave the ledge on your larboard hand. You may also carry in 4 fathoms to the westward of the ledge, but the channel between it and the Lone Rock, which lies N. W. from it, is narrow.

When bound to sea a S. W. by S. course from the Dumplin Rock Lights will carry you just without the ledge south of Mishom Point, and in a fair channel way between the Sow and Pigs, and Hen and Chickens.

From Seaconnet Rocks (giving them a berth of one mile) to the entrance of Buzzard's Bay, the course is E.  $\frac{1}{2}$  S. By this course made good, all the dangers of the Hen and Chickens will be avoided. Soundings generally, from 9 to 7 fathoms, and mostly hard bottom, till it deepens to 16 fathoms, sucky bottom, when Cutterhunk Island Light will be upwards of a mile distant, and Clark's Point Light will bear N. N. E. and you may run directly for the light till up with the Dumplin Rocks, to which a sufficient berth must be given. Or you may stand on this N. N. E. course till in 7 fathoms, sucky bottom, which will be between Mishom Point and the Round Hills, and come to anchor; or otherwise, steer N. N. E. till Pine Island bears S. E. and then E. N. E. for Quick's Hole channel, as before directed. It may be well to observe, that if, when you have stood in from Seaconnet Point towards Cutterhunk Island light, and the light on Clark's Point is not to be seen, but you can see Gay Head light, you may stand on your course E.  $\frac{1}{2}$  S. till you shut it in behind the west end of Cutterhunk, but must then immediately change your course to N. N. E. If neither light is to be seen, the soundings are the only dependence, and must be very carefully attended to. In light winds you must take care the flood tide does not carry you into Buzzard's Bay, or on the Sow and Pigs.

**ADDITIONAL REMARKS.**—To the S. E. of the Dumplin Rocks light, one-half to three-quarters of a mile distant, is a sand spit with only 7 feet of water on it. Between this spit and the rocks, there are 5 fathoms water.

Lone Rock, on which a black buoy lies, about 35 feet S. by E. from the rock: from which, Clark's Point lighthouse bears N. N. E.—Outer Dumplin Rock, S. by W.  $\frac{1}{2}$  W. Round Hill S. W.  $\frac{3}{4}$  S.—White Buoy at Hussey's Rocks S. W. by W. distance by estimation, one mile—the entrance of Apponeganset River N. W. and N. W. of the Middle Ledge, nearly half a mile distant, is nearly or quite dry at low water, when there are  $2\frac{1}{2}$  fathoms round it. Between this rock and the Hussey Rock is the entrance to Apponeganset River; depth of water, in the channel,  $3\frac{1}{2}$  fathoms. There is also a channel between the Hussey Rock and White Rock. Course from Quick's Hole to entrance of Apponeganset River, N. N. W.

The White Rock, on which a white buoy lies, about 40 feet S. S. E. from the Hussey's Rocks, from which Round Hills bear S. S. W.—White Rock south, and distant by estimation, one mile—Clark's Point lighthouse N. E. by N.—Buoy at the Lone Rock N. E. by E. and the entrance of Apponeganset River, N. N. W. appears considerably high above water, and the two rocks to the westward of it, called the Rugged Rocks, are always to be seen.

A small rock to the S. W. of the North Ledge, (about one mile distant from the buoy) with only 7 feet water on it, and another small rock to the N. E. of the same ledge (about half a mile distant from the buoy) with 10 feet water on it, were recently discovered by Capt. Mosher. On the former he struck with the brig Commodore Decatur, and on the latter with the brig Elizabeth.

Packet Rock, a small sunken rock, on which there are 4 feet water, lies half a mile or upwards W. by N. from Black Rock. The passage for coasting vessels bound from New-Bedford up the bay, is between Packet and Black Rocks.

\* Dumplin Rock Light, on one of the Dumplin Rocks in Buzzard's Bay, 6 miles S. S. W. from Clark's Point Lighthouse. The lantern is on a tower on the centre of a dwelling-house, showing a fixed light, with patent reflectors, 43 feet above the sea. The following are the bearings: Clark's Point Lighthouse, N. N. E. distant 5 miles; Buoy on Middle Ledge, N. E. by N.  $\frac{1}{2}$  N.  $2\frac{1}{2}$  miles; Buoy on North Ledge, N. E.  $\frac{1}{2}$  E. 3 miles; Buoy on Great Ledge, E.  $\frac{1}{2}$  S. 2 miles; Wood's Hole E. by S. 15 miles; Quick's Hole S. by E.  $\frac{1}{2}$  E. 12 miles; Buoy on Wilke's Ledge, S. by E.  $\frac{1}{2}$  E.  $2\frac{1}{2}$  miles; Pine Island, S. by W. 10 miles; Cutterhunk Lighthouse, S. S. W. 12 miles; Sow and Pigs, S. S. W.  $\frac{1}{2}$  W. 14 miles; Mishom Point, S. W.  $\frac{1}{2}$  W. 2 miles; White Rock, N.  $\frac{1}{2}$  E. half a mile.

The soundings across the western entrance of Buzzard's Bay, between the Sow and Pigs, and Hen and Chickens, and some distance within them, are very irregular, varying from 5 to 10 and 15 fathoms, and bottom generally hard.

A south-east moon makes high water in the bay, and the average set of tide is  $1\frac{1}{2}$  knot.

\* BUZZARD'S BAY.—The entrance of Buzzard's Bay lies between Bird Island on the N. W. and Wing's Neck on the S. E. Sailing for Monument River, the best water is near to Wing's Neck, and from the point of Wing's Neck, nearly up to the southernmost of the Tobus Islands, are from 4 to 6 fathoms water. Near to the Island (Tobus) commences a ridge of flats extending over to the N. W. shore, on which are 7 to 9 feet water. Having passed over this ridge, you will have from 15 to 20 feet water, which

\* Bird Island is on the north shore of Buzzard's Bay, near the east side of Sippican Harbor, in the town of Rochester, about 12 miles E. N. E. from New-Bedford lighthouse. It is small, not containing more than three acres of land, and is about five feet above the level of the sea. The light and dwelling-houses are built of stone, and are white-washed. The tower of the former is 25 feet high, on which is a lantern 7 feet high, that is lighted with 10 patent lamps, with a 16 inch reflector to each, fitted on two sides of an oblong square, which revolves round once in  $3\frac{1}{2}$  minutes, at the distance of five leagues, which is as far as it can be seen for the land. The time of total darkness is twice that of light. As you approach it, the time of total darkness increases, until you get within two miles of it, when there will not be a total darkness, but the greatest strength of light will be as 40 to 1 over that of the least light, in the course of the revolution of the apparatus.

† There are three of the Tobus Islands, but at low water they are all connected.

depth you may carry until abreast of a large single rock, called the Old Cow, which lies about one quarter of a mile from the shore, when you will come up with a ridge of hard sand, from 100 to 120 fathoms wide, on which are from 7 to 9 feet water, which after passing, you will have from 18 to 22 feet water, quite up to Back River Harbor. The soundings are reduced to low water. Rise from 3 to 6 feet. High water at full and change of the moon at 8 o'clock.

**BUOYS IN BUZZARD'S BAY.**—There are 5 buoys placed in Buzzard's Bay, viz.—A yellow buoy on the S. E. part of the north ledge, in 2½ fathoms water; a red buoy, lying in very shoal water, on the centre of the Middle, which is a small ledge; a white buoy on the S. E. part of the Great Ledge, in 3 fathoms water; a black buoy on the S. W. part of Wilkes' Ledge, in 2½ fathoms water—all on the western side of the bay; and a white buoy in 2 fathoms water, on West's Island Ledge, on the eastern side.

All these buoys, except the one on West's Island Ledge, are taken up in the winter.

*Bearings and distances from Bird Island Lighthouse.*

The south point of West's Island,.....S. W. ¾ W. 10 miles.  
West's Island Ledge,.....S. W. ¾ W. 11 miles.  
The north entrance of Quick's Hole,.....S. W. by S. 25 miles.  
Wood's Hole, due,.....S. 10 miles.  
The entrance of Monument River,.....E. N. E. ¼ N. 7½ miles.

*Bearings and distances of sundry places in the vicinity of Buzzard's Bay.*

This is a detailed nautical chart of the Cape of Good Hope region in South Africa. The chart features the coastline with various depth soundings in fathoms. Key locations and features labeled include 'Beaver Head', 'Perry', 'Mackerel', 'Phard', 'hard', 'Beaver Tail', 'Newton Rock', and 'rocky hard'. A scale bar at the bottom provides measurements in both statute and nautical miles.

on the N. W. point of this island, (as described in the note,) are so near together, they appear as one light until you are within two or three miles of them. Off the N. W. point, a shoal makes out N.  $\frac{3}{4}$  E., which renders it dangerous for large ships to pass within two miles of the lights. \*Point Judith Light bears from these lights N. E.  $\frac{1}{2}$  N. distant 11 miles. After passing Point Judith, follow the directions given below for sailing into Newport.

From the S. E. part of Block Island to Rhode Island Lighthouse, the course is N. by E.  $\frac{3}{4}$  E. and the distance 7 leagues; about midway between them there are 24 fathoms water. If you are on the west side of Block Island, with the body of the island bearing E. N. E. in 8 or 10 fathoms water, your course to Point Judith Light is N. E. by E. about 6 leagues. This point appears like a nag's head, and is pretty bold; between Block Island and the Point, there are from 30 to 6 fathoms water, except a small shoal ground, which, in thick weather, is often a good departure, say 4 to 5 fathoms, bearing about W. by S. from Point Judith Light, distant 3 miles. From Point Judith, when not more than a quarter of a mile from the point to Rhode Island Harbor, your course is N. E., and the distance is about 8 miles. When in 13 fathoms water, Point Judith light bearing W. or W. by N. the course to Rhode Island Harbor is N. E. by N.  $\frac{1}{4}$  N., and the distance to the lighthouse 2 leagues. The lighthouse, together with the Dumlins, must be left on your larboard hand; it stands on the south part of Conanicut Island. This point is called the Beaver's Tail, and is about 2 leagues distant from Point Judith.

After leaving the lighthouse on your larboard side, there is a sunken rock due south from the lighthouse, about 200 yards distant, called Newton Rock.

A little within the lighthouse, and near to the shore on the west side, there is a cove called Mackerel Cove, the entrance to which is shoal and dangerous. As both ends of these islands are pretty bold, you may pass into the anchoring at either end, and are nearer to Goat Island side than to that of Rhode Island, as the other parts of the harbor are grassy, and would be apt to choke your anchors. Rhode Island is navigable all round, by keeping in the middle of the channel.

Narraganset Bay lies between Conanicut Island and the main. Your course in is about north, taking care to avoid Whale Rock; you may pass in on either side, and anchor where you please. From the lighthouse on Conanicut Island to Gay Head, Martha's Vineyard Island, the course is E. by S.  $\frac{1}{4}$  S. and the distance 9 leagues.

You must take care to avoid the rocks which lie off south from Castle Hill, some of which are above water. Castle Hill is on the east side of Rhode Island Harbor, from which is Fort Adams, from the north end of which a reef extends.

Vessels coming from the eastward, to clear Brenton's Reef, bring Newport Light to bear W. N. W., and steer for it until they see Goat Island Light from the distance.

for a vessel to pass within 2 miles of the light. From this shoal, Montock Point Lighthouse bears S. W. by W.  $\frac{1}{4}$  W.; Point Judith Point Lighthouse N. E.  $\frac{1}{2}$  N.; Watch Hill Lighthouse, W. by W.; Clay Head (Block Island) S. E. by E.; Rocks off Gay Head, S. E. by E.  $\frac{1}{4}$  E.; and the W. part of Block Island, S. S. W.  $\frac{1}{4}$  W.

The two lights cannot be made separate when to the northward, unless in a position to make Point Judith Light N. E., when they appear like the lights of a steam-boat.

\* The lighthouse on Point Judith is a stone edifice, 40 feet high. The lamps are 60 feet above the level of the sea, and contain a revolving light, to distinguish it from Newport Light, which stands on Conanicut Island, and is a fixed light. The distance from the lighthouse to high water mark, is as follows:—E. from the lighthouse to high water mark, 16 rods; S. E. 14 rods; S. 10 rods; S. S. W. 23 rods, which is the extreme part of the point, to which a good berth should be given. The light on Point Judith bears S. W.  $\frac{1}{4}$  S. 2 leagues distant from Newport (Rhode Island) Lighthouse. Point Judith Light may be distinguished from Watch Hill Light, by the light not wholly disappearing when within 3 leagues of it.

† Conanicut Island lies about 3 miles west of Newport, the south end of which (called the Beaver's Tail, on which Newport Lighthouse stands,) extends about as far south as the south end of Rhode Island. The lighthouse on Goat Island bears N. 60° E. from the light on Conanicut Island, and Kettle-bottom Rock N. E. The east shore forms the west part of Newport Harbor. The ground the lighthouse stands upon is about 12 feet above the surface of the sea at high water. From the ground to the top of the cornice is 50 feet, round which is a gallery, and within that stands the lantern, which is about 11 feet high, and 8 feet in diameter. It contains a fixed light.

‡ Goat Island lies before the town of Newport, about 5 miles N. E. from Newport Light, and has a lighthouse on the north end, containing a fixed light, from which the following bearings have been taken:—Newport Lighthouse bears S. 60 W., equal to S. W. by W.  $\frac{1}{4}$  W., distant 5 miles; west shore of Castle Hill, S. 54 W., or S. W.  $\frac{1}{4}$  W., 2 $\frac{1}{2}$ ; Brenton's Point, S. 51 W., or S. W.  $\frac{1}{4}$  W. 1; South Dumlins Rock, S. 70 W., or W. S. W.  $\frac{1}{4}$  W., 1 $\frac{1}{2}$ ; Conanicut Ferry, N. 21 W., or W. N. W.  $\frac{1}{4}$  W., 2 $\frac{1}{2}$ ; south point of Rose Island, N. 58 $\frac{1}{2}$  W., or N. W. by W.  $\frac{1}{4}$  W., 1; Goat Rock, N. 11 $\frac{1}{2}$  W., or N. by W.  $\frac{1}{4}$ ; West shore of Coster's Harbor Island, N. 1 $\frac{1}{2}$ ; buoy on the north point of Goat Island, N. 50 E., or N.  $\frac{1}{4}$  E.,  $\frac{1}{2}$ . Large vessels go south of the buoy.

KE. T. S. N.

will then bear N. E.  $\frac{3}{4}$  E.; then run for Goat Island Light until it bears E., (or continue your course until it bears E. S. E.) at the same time keeping Newport Light bearing S. W. by W., and anchor in 7 to 9 fathoms, good bottom. In coming from the west, after passing Point Judith, (the lighthouse whereon has a revolving light,) steer N. E. by N. until you draw up with Newport Light, to which giving a berth, run for Goat Island Light, and anchor as above directed. Goat Island lies before the town of Newport, extends about north and south, and has a fort on it; off the N. E. point lies a buoy in 16 feet water.

A large white buoy is also placed at the end of the shoal, which makes out from the south end of the island, in 10 feet water. The shore on the north and south ends is rocky, and you must not attempt going between the buoys and the island.

Vessels coming from the westward through Long Island Sound, bound to Rhode Island, will leave Fisher's Island on the larboard hand, and steer E. by N., which will carry them to Point Judith, keeping in not less than 10 fathoms water, giving the point a berth of one mile, when you will see Newport Light, bearing N. E.  $\frac{1}{4}$  N., distant 6 miles; steer for it, leaving it on your larboard hand: you will then steer for Goat Island Light, which bears from Newport Light N. E. distant about 5 miles; keeping the latter bearing S. W. by W. until you bring Goat Island Light to bear E. or E. S. E., and anchor in from 7 to 9 fathoms water, good holding ground. Between Newport Light and the North Dumplin, you will have from 18 to 28 fathoms water.

If, after passing Point Judith, as before directed, you wish to proceed toward Providence through the West Passage, your course is N. E., leaving Newport Light (on Conan-nicut Island) on your starboard hand, half a mile distant, when your course will be N. by W.  $1\frac{1}{2}$  league to Dutch Island Light,\* which you also leave on your starboard hand, one quarter of a mile distant, from which you steer N.  $\frac{1}{2}$  E. 14 miles, for the light on Warwick Neck, leaving it on the larboard hand, one quarter of a mile, where you may anchor in 3 fathoms water, as it is not safe to proceed further without a pilot, unless you choose to depend on finding the channel, which is marked out by stakes.

In entering this passage, keep nearest Conan-nicut Island, to avoid the Whale Rock, which bears from Newport Light S.  $82^{\circ} 30'$  W., distant about three fourths of a mile, with some scattering rocks north and south of it. A sunken rock lies south of Beaver Tail, called Newton Rock, on which it breaks if there be any sea, distant 200 yards from Rhode Island Lighthouse.

**BUOYS AND SPINDLES PLACED AT NEWPORT HARBOR.**—A Spindle on Saddle Rock, eastward of Rose Island, on either side of which there is a passage.

A Spindle with a Ball on a Rock, at the south end of the island, which you leave to the eastward.

One Red Buoy, with a Cross, on Dyer's Reef, south part of Coaster's Harbor, which you leave on the starboard hand.

One on the ledge off the Bishop's Rock, called the Triangle Rock, on either side of which you may pass, giving the buoy a berth.

One Red Spar Buoy at the south, and one at the north end of Gull Rocks, both of which you pass to the eastward.

One Spar Buoy on Providence Point, which is the north end of Prudence Island, to the northward of which is the main channel.

**NEWPORT TO PROVIDENCE.**—Pass Half-way Rock, which lies nearly in middle of the river, about  $5\frac{1}{2}$  miles from Newport, and  $1\frac{1}{2}$  mile from the south end of Prudence Island; there is a passage on both sides the Rock. West from Prudence Island, lies Hope Island, having a passage all round, giving the N. E. end a small berth.

From the Triangle Rock, which lies off the Bishop Rocks, on which is a Buoy that may be passed on either side, to Warwick Neck Light, the course is N.  $\frac{3}{4}$  W. After leaving Prudence Island 3 miles N. E. by N. from Warwick Neck Light, you pass on your larboard hand a Spar Buoy, which you may go very close to. E.  $\frac{1}{2}$  S. from Warwick Neck Light lies a Spar Buoy, which you leave on the starboard hand. When Warwick Neck Light bears W. steer N. N. E. for Nyatt Point Light, leaving the Spar Buoy on Providence Point on the starboard hand, and running so far to the eastward as to bring Prudence Island to bear South, by which you leave the Middle Ground, which has a Buoy on it, on the larboard hand. Nyatt Point Light is on the starboard hand, and 9 miles from Providence. Soon after passing the light you come up with a Pyramid, directly opposite the village of Patuxent, the base of which is painted black, with a white

\* Dutch Island Lighthouse is erected on the south part of the island, and shows a fixed light.

† Warwick Neck Lighthouse is erected on the south part of Warwick Neck, and shows a fixed light. A spar buoy is placed on Long Island Point, off Warwick Harbor,  $1\frac{1}{2}$  mile distant, which must be left on the larboard hand going into East Greenwich.

top, erected on a ledge of rocks, which you may approach very near, leaving it to the larboard hand. At a short distance you come to another pyramid, and a stake, both which you leave on your larboard hand. One fourth of a mile from the last pyramid lie Lovett's Rocks, having a spar buoy on them, which must be left on the starboard hand, going very near to them.

**BRISTOL HARBOR.**—Bristol Harbor lies 9 miles from Newport, and east of Warwick Light. At the mouth of the harbor lies Castle Island, having a pyramid on it, which is left on the starboard hand, and a red buoy on the larboard, steering N. E. when entering.

**STONINGTON HARBOR AND FISHER'S ISLAND.**—If off the south-east part of Fisher's Island, bring the highest steeple in the town of Stonington open to the east of Stonington \*Lighthouse, and steer for it N.  $6^{\circ}$  E. until Watch Hill bears east, when you will have passed through Lord's Channel, which is between the Spindle on Wicopessett Island Ledge, and the Spindle on Catumb Ledge, you will then be in 12 to 13 fathoms water, then steer N. Westerly to clear the shoal water extending from Bartlett's Reef, until the light bears N. by E. when you may steer directly for the lighthouse or the Breakwater, into the harbor.

If you should be to the eastward of Watch Hill Light and bound through Fisher's Island Sound, give the Light a berth of one-third of a mile, and steer W.  $\frac{1}{2}$  N. until the Light on Stonington Point ranges with the highest steeple in the town, when you may steer as above directed, into Stonington, or if bound west, you may continue your course on, passing the spindle on Latimer's Reef, on your starboard hand, about 150 yards, until Stonington Light bears E. N. E. and the house on Ram Island N. W. when you may steer W. S. W. and pass directly between the north and south Dumplings, which are two small islets of moderate height. On steering the last course, you will leave Ellis' Reef, on which is a Spindle, on your starboard hand, and East Rock, Middle and West Clumps, on your larboard; the three last are reefs of rocks trending W. by S. and E. by N. between the South Dumplin and Latimer's Reef.

Should you go the southern channel, you will, on passing Latimer's Reef, keep over towards Fisher's Island and steer about W.  $\frac{1}{2}$  S. to avoid East Rock, and the Middle and West Clumps, which are nearly covered at high water, until the centre of what is called †Flat Hummock bears north, distant three-fourths of a mile, and the W. point of Fisher's Island in sight, bearing W. New London Lighthouse will then be open between the South Dumplin and Fisher's Island, when you may steer for it N. W.  $\frac{1}{2}$  W. keeping in mid channel, to avoid the shoal water off the west point of West Harbor, and the shoal which puts off between the South Dumplin and the Flat Hummock, in the form of a Horse-shoe, until you have passed the Dumplings, when you are clear of all danger. South of the Dumplings and Flat Hummock, is the west harbor of Fisher's Island, where there is good anchorage in 2  $\frac{1}{2}$  fathoms, soft bottom, Flat Hummock bearing north and the point of the harbor W. N. W. Ellis' Reef, on which is a spindle, lies south of the point on Ram Island, distant about one-third of a mile, between which there is a very narrow passage of 5 fathoms water. Potter's Reef lies N. W.  $\frac{1}{2}$  W. from the North Dumplin, distant one mile, between which there is a fine passage, free from all danger; this reef is of small extent, and has a spindle on it, which may be passed on either side. W.  $\frac{1}{2}$  S. from Ram Island, and half way to Potter's Reef, is the extreme point of Groton Long Reef. This is a conspicuous point on Fisher's Island Sound, and may be known by being cleared of trees at the south part; it is not to be approached from the south nearer than half a mile.—A shoal called the Horse-shoe, lies W. of Groton Long Point, and N. E. from Potter's Reef; as there is no spindle on the Horse-shoe, vessels should avoid going much to the north of Potter's Reef.

There is good anchorage to the east of Groton Long Point, in 2  $\frac{1}{2}$  fathoms, soft bottom, distant from the shore one-third of a mile.

After you have passed Fisher's Island Sound, you should be careful to keep the South Dumplin in range with the N. E. point of Fisher's Island, to clear the Triangle Rocks, which form the south point of Bartlett's Reef, on which there is a buoy. When Two tree Island bears N. by W. or Little Gull N. by E. you are past this danger, and may follow the general directions up the Sound.

\* Stonington Lighthouse shows a fixed light, on the extreme point of land at Stonington, and bears from Watch Hill Point Lighthouse, N. W.  $\frac{1}{2}$  W. 2 miles distant; from Naper Tree Point N. N. W.  $\frac{3}{4}$  W.  $\frac{1}{2}$  mile; from Catumbett Rocks spindle N.  $2\frac{1}{2}$  mile. Wicopessett N. by E. 2 miles. Latimer's Reef, N. E.  $\frac{1}{2}$  E. 2 miles. Wamphasgett Shoal, E.  $\frac{1}{2}$  N. half a mile. North Dumplin, N. by N.  $\frac{1}{2}$  N.  $5\frac{1}{2}$  miles distant.

† The North Dumplin is bold to, except on the east side.

‡ Flat Hummock is a barren sandy island, of a few acres in extent.

If bound through from the westward, you should on no account go to the southward of the South Dumplin, but should, after passing either between the Dumplings or to the north of them, bring Stonington Light to bear E. N. E. and run for it until the Break-water bears north, when you may steer for the anchorage.

If you wish to pass through the Sound, when Stonington Light bears E. N. E., and the House and Ram Island N. W., steer E.  $\frac{1}{2}$  S. for Watch Hill Light, leaving Latimer's Reef on your larboard hand, and giving Nappertree Point and Watch Hill Point a berth of about one third of a mile, leaving Watch Hill Reef, on the east end of which is a spindle, on your starboard hand. This spindle bears from Watch Hill Light S. S. W.  $\frac{1}{2}$  W., distant about two thirds of a mile. A rock, with 6 feet water on it, lies south from Watch Hill Point, distant about one eighth of a mile.

Fisher's Island Sound is perfectly safe with the foregoing directions, and to be preferred if bound east on the flood, or west with an ebb tide, to going through the Race, but it should not be attempted without a leading wind, by strangers, and great attention should be paid to the lead.

The Eel-grass Shoals lie between Ram Island and Stonington Light, and extend in spots for some distance; the largest of these shoals lies south of the \*White Rock, but you are clear of them when Stonington Light bears E. N. E.

**RHODE ISLAND LIGHT & THROUGH THE SOUND.**—The first course from Rhode Island Lighthouse on Beaver-tail Point, is S. W.  $\frac{1}{2}$  S., distant 2 leagues to Point Judith Light; thence from Point Judith Light through the Race to †Little Gull Light, the course is W. by S., 11 leagues distant, leaving †Watch Hill Point Light, Stonington Light, and Fisher's Island on your starboard hand, and Little Gull Light on your larboard hand. You must be careful to avoid a reef which runs off from the west of Fisher's Island, W. S. W. towards Race Rock, on which is a spindle, distant one mile from the point of the island; and which you must leave on your starboard hand, and continue your course until the Little Gull is south of you, if the tide should be flood, about one mile; if the tide should be ebb, you should, as soon as the Little Gull bears west, and ‡New London Light in range with the highest steeple in the town (N. 2° W.) steer north-westerly, until it is south of you 2 miles, when you may steer W.  $\frac{1}{2}$  N. for ¶Falkner's Island Light, distant 8 leagues, on which course you should be careful to avoid the Long Sand Shoal, off Cornfield Point, and which extends east and west 5 miles. Should you make the above course good, you will, when off Cornfield Point, be 1½ mile south of the shoalest part. This shoal is very narrow, and as you approach it, you will shoalen your water from 12 to 2 fathoms very suddenly. You should in the night time come no nearer to Falkner's Island, when north of you, than 14 fathoms, (fourths of a mile distant,) when you may steer S. W. by W.  $\frac{3}{4}$  W. for ¶Old Field Point Light, 8 leagues, which carries you to the south of the Middle Ground. You should come no nearer Old Field Point than 8 fathoms, (distant half a mile,) in the night; and when it bears south of you, steer W.  $\frac{1}{2}$  N. 17 miles, which will take you to the north of †Lloyd's Neck, in 13 fathoms water, leaving Norwalk Light, which is revolving, on your starboard hand, and \*\*Huntington Light (on Eaton's Neck) on your larboard hand,

\* White Rock lies E. N. E. from Ram Island, half way to the lighthouse on Stonington Point, and is always conspicuous.

† Little Gull Light is situated on Little Gull Island, at the entrance of Long Island Sound, through the Race. This light may be considered as the key to the Sound. The lantern is elevated 50 feet above the level of the sea, and contains a fixed light.

‡ Watch Hill Light is situated on Watch Hill, at the entrance of Fisher's Island Sound. The lantern is elevated 50 feet above the level of the sea, and contains a revolving light.

¶ New London Light is located at the entrance of the harbor, on the western side. The lantern is elevated 80 feet above the level of the sea, contains a fixed light, and bears E. N. E. from Little Gull Light, about 2½ leagues.

¶ Falkland Island Lighthouse is elevated 75 feet above the level of the sea, and exhibits a fixed light.

¶ The lighthouse on Old Field Point shows a fixed light, having 10 lamps, elevated 67 feet above the sea, and 27 feet from the base. It bears from Eaton's Neck Light N. 89° 6' E., 12½ miles distant. From Stratford Light S. 9° W., 10½ miles distant. From Black Rock Light S. 19° 4' E., 11 miles distant. From New Haven Light S. 34° 28' W., 18½ miles distant.

\*\*\* Eaton's Neck lighthouse contains 12 lamps, fronting from the east round north to the south-west, elevated 134 feet above the level of the sea, and 49 feet 8 inches from its base, showing a fixed light. It bears S. 5° 15' E. from Norwalk Light, distant 5 miles and nine tenths. A reef extends from the light N. N. E. half a mile, on which are a number of rocks.

Vessels should not come nearer the shore than three fourths of a mile, when the light bears between west and south. On the west side the shore is sandy and pretty bold.

6° E., 12 ½ miles dis-  
light S. 19° 4' E., 11

l north to the south-  
its base, showing a  
tenths. A reef ex-

in the light bears be-

from whence you may steer S. 66° W., which will take you between \*Sands' Point and Execution Rocks, on the latter of which, on the east end, is a buoy, bearing N. by W. from the light, distant seven eighths of a mile. If, when up with Falkland Island, you should prefer going to the north of the Middle Ground, steer W. ½ S. for Stratford Light 20 miles, and giving it a berth of half a mile, in 3 ½ fathoms water, steer S. 66° W. for Sand's Point Lighthouse.

In case of flood tide and southerly wind, when you come through the Race, your course should be W. ½ S. until you come up with Old Field Point light, distant 16 leagues, taking care to allow for the tide, which runs very strong, and flows on the full and change days of the moon until half past 11 o'clock. In coming up with Old Field Point light, you should not bring it to bear to the West of W. by S. ½ S. on account of a shoal off Mount Misery, or if in the day time, keep Crane Neck, which is a bluff, two miles to the west of the light, open clear of the light, and pass the point in 8 fathoms, as above directed.

If a ship could have a fair departure from the middle of the Race, and is compelled to run in a dark night, or in thick weather, the best course would be west 15 leagues toward Stratford light, as it would afford the largest run on any one course, and if made good, will carry you 1 mile south of Stratford Point light in 6 fathoms water, and 4 miles to the north of the Middle Ground: on this course you will leave Saybrook, Falkland Island and New Haven lights on your starboard hand, Plumb Island light on your larboard hand; and will pass three miles south of Falkland Islands in 17 fathoms water. When up with Stratford light, and it bears north 1 ½ mile distant, your course to Sand's Point light is W. S. W. 11 leagues. West of Stratford light, 1 ½ mile is Point-no-Point, which is shoal for some distance from the shore, but you are clear of it when Black Rock Light bears W. ½ N.

Should you wish to anchor under Falkner's Island, there is good holding ground on the east or west side in 2 ½ and 3 fathoms water, but the best place with the wind from the west, is close to the N. E. point of the Island, the lighthouse bearing S. W. by S. in 2 ½ fathoms. North from the island a narrow shoal puts off one quarter of a mile, and is bold to, but you are to the north of it, when the centre of Goose Island bears S. W. by W., and when the light bears S. E. by E. you may run for it and anchor.

The passage inside of Falkner's Island is perfectly safe, but you should not, in standing over towards the Connecticut shore, bring Hammonasset Point to the south of east. This point may be known by having two small bluffs at the extremity, and it bears E. N. E. from Falkland's Island, distant 5 ½ miles. When standing to the S. towards Goose Island, you should be careful of the Shoal extending to the north of it, and you are just clear of it when Falkner's Island light bears E. S. E. and Goose Island S. by W. in 2 ½ fathoms, rocky bottom; after you have passed Goose Islands you should keep more to the southward, to avoid Whetton's and Brown's Reef lying off the Thimble Islands, and Branford Reef, which is dry at very low tides: on this Reef is a buoy bearing from Falkland Island Light W. ¾ N. distant 6 ½ miles, and from New Haven light S. E. by E. 2 ½ miles. To the north of Branford Reef there is a good passage, but it should not be attempted by strangers without a favorable opportunity; but in case you should be compelled to navigate as during the late war, you may, after passing Goose Island, bring the lighthouse to bear E. S. E. and steer W. N. W. for the outer Thimble, giving it a berth of 30 or 40 yards, then steer W. ½ S., on which course, if made good, you will keep the outer Rock of the Thimble in range with the large Hotel on Sachem's Head, astern of you. Vessels of any draft of water may go through this passage, and you will leave Whetton's Reef, which is one fourth of a mile S. S. W. from the outer Thimble, and Brown's Reef, on which there is a buoy, on your larboard hand, and Thimble Buoy to the west of the Thimble, half a mile, and the buoy on the Nigger Heads, on your starboard hand; this range takes you within 100 yards of the Nigger Head Buoy, and about seven eighths of a mile north of Branford's Reef, when you may steer W. by S. ½ S. for Stratford Point. Goose Island is W. S. W. from Falkland's Island, one mile distant.—It is shoal on the East and North sides, and a resting place for gulls, which are purposely left undisturbed, as their noise serves to give notice of your approach to the Island in thick weather.

\* Sands' Point Lighthouse is N. 42° 30' E. from Throg's Point Light, distant 4 miles and six tenths. The rocks extend from the shore opposite the light, N. W. one eighth of a mile.

† Stratford Lighthouse contains a revolving light. The revolution is such as to exhibit the light once in 90 seconds. From it Old Field Point light, on Long Island, bears S. 9° W.; New Haven light N. 63° E., 10 miles distant; Middle Ground S. 3° W., 5 ½ miles distant; Black Rock light S. 88° W.

‡ A lighthouse, elevated 63 feet above the level of the sea, exhibiting a revolving light, is erected on the west end of Plumb Island, and will be of great advantage to vessels bound to the eastward, or round Montock Point, when, through stress or foggy weather, it is not prudent to go through the Race.

S.  $\frac{1}{2}$  W. from Stratford light, distant  $5\frac{1}{2}$  miles is the Middle Ground, the entrance of which bears from Eaton's Neck Light E. by N.  $\frac{3}{4}$  N., 15 miles. From \*Black Rock Light S. E.  $\frac{1}{4}$  S.,  $7\frac{1}{2}$  miles; and from Oldfield Point Light N. by E.  $\frac{1}{4}$  E., distant 5 miles. On this shoal are two feet water at low tide; on the south side is a white spar buoy, and on the north side a black spar buoy, both in 19 feet water, bearing nearly north by east and south by west from each other, half a mile distant. You may go on either side of the shoal you please: on the north are from 3 to 11 fathoms, and on the south side from 8 to 24 fathoms water; a mile either to the east or west of this shoal you will have 12 fathoms.

A ledge lies off the N. E. point of Eaton's Neck, three fourths of a mile from the shore, but after the light bears S. E. the shore is bold to all the way up on the east side of Huntington Bay, where you may anchor in easterly winds.

In beating up Sound, when Eaton's Neck Light bears S. W. by S., you should not stand over to the north shore nearer than to bring Norwalk Light to bear W. by S.  $\frac{1}{2}$  S. on account of the reef which puts off from Caukeen Island E. by S.  $1\frac{1}{2}$  mile, and on which there is a buoy. When Goose Island, which is the first island S. W. from Caukeen, is west from you, you are south of the reef. There is a passage for small vessels between these islands, but to the west of Goose Island there is no passage, as the reefs extend to the buoy on Green Ledge, one mile W. by S.  $\frac{1}{4}$  S. from Norwalk Light. W. by S. from Norwalk Light, 3 miles distant, is Long Neck Point: there is good anchorage to the eastward of it when the light bears east from you, but when you are to the west of Long Neck Point, you should be careful of Smith's Reef, which lies S. W. one mile from it, and also of a reef called the Cows, which is also S. W. from Long Neck Point,  $2\frac{3}{4}$  miles, and south from Shippan Point, three fourths of a mile, on both which there are buoys, and they are bold to until you are close on the rocks. After you pass the Cows, the first point is Greenwich Point, which is bare of trees, and is the S. E. point of a neck of land running into the Sound, the S. W. point of which is called Flat Neck Point, and covered with trees; the water off both these points is shoal. The easternmost of the Captain's Isles, lies S. W. by W. from Flat Neck Point,  $1\frac{1}{4}$  mile distant, between which is a fair passage, but in going in you must keep half way between Flat Neck Point and the island, on account of the rocks extending N. E. from the island, and S. E. from the point, and steer north, and when Flat Neck bears east you may anchor. The passage between Captain's Islands and the main, should not be attempted by a stranger. Captain's Islands are three in number, the largest of which is the westernmost one, which has a lighthouse on its east end, showing a fixed light, bearing from Norwalk Light W. by S.  $\frac{3}{4}$  S., distant  $10\frac{1}{2}$  miles; from Eaton's Neck Light, W. by N.  $11\frac{1}{2}$  miles, and from Sand's Point Light N. E.  $\frac{1}{2}$  N., 9 miles. You may approach these islands, but after you have passed them to the west, you should keep at least half a mile from the shore, on account of several rocks and reefs between those islands and Bye Point.

On the south shore of the Sound, after passing Eaton's Point to the westward, is Loyd's Neck, the north point of which is low and sandy, E. by N. from which is a reef on which there is a buoy, lying off the highest bluff, half a mile from the shore: the reef is very small and has 3 fathoms close to it. To clear this reef, and the Sandy Point, you should not bring Eaton's Neck Light to the N. of E.  $\frac{1}{4}$  S. in passing it. To the west of Loyd's Neck is Oyster Bay, in standing in towards which you should be care-

\* Black Rock light on Fairweather's Island at the entrance of Black Rock harbor, regularly displays a strong and brilliant light, on the improved plan of Capt. Winslow Lewis. This edifice is of an octagon form, built of stone, in the most durable manner, 19 feet diameter at the base, where the walls, the exterior of which are handsomely faced with hewn free stone, are 5 feet in thickness, and rise to the height of 31 feet, surmounted with a platform of solid masonry, which supports the lantern 40 feet above high water mark. The building is painted white, defended from the sea by a strong circular fortification of massy rocks, is in every respect faithfully built, and prepared to withstand the storms of ages, and reflects no little credit on the faithfulness and skill of its enterprising builders.—Black Rock harbor, from its central situation, is one of great importance to vessels navigating the Sound, at all seasons of the year, especially in winter. Next to the harbor of New London, it is the most safe and convenient on the whole coast of Connecticut, admitting vessels of a large draft of water at all times of tide. During the inclemencies of winter, when the communication with New-York is obstructed with ice, numerous vessels and of all sizes, are not unfrequently compelled to seek a harbor here for weeks together, where they ride secure from the drifting ice, and the violence of every wind, in the immediate neighborhood of a flourishing commercial village, capable of furnishing every necessary repair, stores, or refreshments that may be required, and on as good terms as in any of our larger sea-ports.

*Remark by the Author.*—The above is literally copied from a Newspaper, and is said to be written by one of the contractors. A more contemptible Lighthouse does not disgrace Long Island Sound, most shamefully erected and badly kept. (1828)

ong Island Sound,

ful of the shoal which puts off from the north point of Hog Island in a N. N. W. direction nearly a mile; you are to the north of it when Oak Point is open of a hill on Matinecock Point (S. W. by W.) and Cooper's Bluff, which is the highest up the Bay, is open clear of the east point of Hog Island, (S. S. E.,) when you may steer S. E. for the eastern side of the bay, to clear the Middle Ground, and make a harbor either in Cold Spring or Oyster Bay, keeping but a short distance from the shore.

One mile east of Sand's Point Light is the Pulpit, a large rock on the shore; when this rock is between S. S. W. and S. E. from you, you should not bring Sand's Point Light to bear west of S. W., on account of a reef of rocks off it, and in standing to the north you should, when the light is S. by E. from you, make but short tacks on account of the Execution Rocks, which lie N. N. W. seven eighths of a mile from the light, and also on account of some scattering rocks, one eighth of a mile from the point. After you pass the point your course is S. W. for the south point of Hart Island, on which course you pass Success and Gang Way Rocks, on both which are buoys, left on the larboard hand on the above course, although you may go on either side of them. Success Rock is bare at low water, and is S. W. from the lighthouse on Sand's Point, about one mile. Gang Way Rock has 6 feet water on it, and is one sixth of a mile W. N. W. from Success Rock, lying (as its name imports) in mid-channel. The south point of Hart Island has two single trees on it, and is bold to. The course from this to Throg's Point Light is S. S. W.  $\frac{1}{2}$  W., on which course you will leave the buoy on the Stepping Stones on your larboard hand, and you may stand over to the westward, guided by your lead, but as you come up with the Stepping Stones, which is about half way, do not bring the trees on Hart Island to bear to the north of N. N. W., and give Throg's Point a berth of one eighth of a mile. You may, after passing Throg's Point Light, steer west towards Whitestone Point, which is the first point on your larboard hand, and Old Ferry Point, which is beyond it on your starboard hand, between which and Throg's Point there is good anchorage. Other bays that put in, to the west of Old Ferry Point, are shoal until you are beyond Waddington's Point, which is opposite Riker's Island. Between Old Ferry and Waddington's Point, are Clauson's and Hunt's Points, the former of which has a buoy off it, and both are shoal for a short distance. South of Clauson's Point, and nearly two thirds over to the Long Island shore is a reef of rocks, on which there is a buoy which must be left on the larboard hand: you open Flushing Bay when you come up with it, and from mid-channel may continue your course on west from the north point of Riker's Island, which is bold to; you can anchor to the westward of it in such water as you think proper, with the north point bearing east.

HART ISLAND affords good anchorage either in easterly or westerly winds. To anchor on the east side you may stand towards a barn which is in the bend towards the south part of the island, and anchor in three fathoms, the trees bearing S. S. W. about half a mile. Should you wish to anchor the west side, between that and Old Island, you may haul close around the south point of Hart Island, and anchor west of the trees, in such water as you think proper.

HUNTINGTON BAY has a fair entrance and sound ground. There is good anchorage in Lloyd's Harbor, in 2 fathoms water, secure from all winds. To enter it, steer S. W.  $\frac{1}{2}$  S. from the light, when it bears N. E.  $\frac{1}{2}$  N. until the north point of Lloyd's Harbor, which is a low sand point, is W. from you, when you may steer directly into the harbor, leaving Sandy Point 20 yards on your starboard hand.

In going in or coming out of Lloyd's Harbor, you should be careful of the shoal water which is to the east of the Sandy Point, and on the west side of Huntington Bay.

SHOALS IN THE SOUND.—We will now notice more particularly the Shoals in Long Island Sound.

Hatchett's Reef, to the E. of Connecticut River; it bears E.  $\frac{1}{2}$  S. from Saybrook Lighthouse, and S. S. W. from Hatchett's Point, and is dangerous. Between this Reef and the shore is Burrow's Rock, lying W. N. W. from it. Strangers should not approach the north shore on account of these Reefs, the Bar off Connecticut River, and the Shoal off Cornfield Point.

Should you want a pilot to enter Connecticut River, by making a signal off the Bar, they will come on board. The bar extends  $1\frac{1}{2}$  of a mile from the shore.

To the S. W. of Norton's Point, which is on the Long Island side, and S. E. from Falkner's Light, the water is shoal for the distance of 3 miles, but from thence the shore is bold until you come up with Roanoke Point, a distance of ten miles, after passing this point you should not come nearer to the shore than one mile, until you are west of Wad-

\* Throg's Point Lighthouse stands on the S. E. point of Throg's Neck, and contains a fixed light.

ing River, on account of a Shoal off the \*Friar's Head, and Herrod's Point, after passing Wading River, you may come within half a mile of the shore, till nearly up with Mount Misery, when you should not bring Old Field Point Light to bear W. of W. by S.  $\frac{1}{2}$  S. on account of a shoal already described.

**SECOND DIRECTIONS FOR BLACK ROCK HARBOR.**—Bring the light on Fairweather Island, to bear N.  $\frac{1}{2}$  W. and run for it, if it should be in the day time, when on that bearing it will range with a single hill, situated in the interior, several miles, which you must keep in range, until you are distant half a mile from the lighthouse, you will then have passed the saddle on the Cows, and will be in 4 fathoms water, when you may steer N. N. W. until the light bears E. by S. leaving a rock S. by W. from the light, on which is a Buoy, on your starboard hand, when you may anchor; in steering the above courses you will have 5 fathoms, when up with the Spindle on the Cows, and it shoalens gradually.

**BLOCK ISLAND TO GARDNER'S BAY.**—Montock Point, the easternmost part of Long Island, which has a lighthouse on it, is 4 leagues W. by S. from the S. W. point of Block Island, on the N. W. point of which are two lighthouses; between the island and the point, there are 16 and 18 fathoms water. As you approach the point, you will quickly come into 9, 7, and 5 fathoms water. A flat runs off from the above point, on the outer part of which are 5 fathoms water, rocky bottom, and S. by W. from the light, 9 miles distant, lies Frisbie's Ledge, extending N. W. and S. E. 4 miles, with from 8 to 15 fathoms on it, hard rocky bottom, and deep water very near.

Between Montock Point and Block Island, there is a shoal with only 4  $\frac{1}{2}$  fathoms on its shoalest part, on which the sea breaks in moderate gales from the southward. It lies nearly half way between the point of Montock, and the S. W. part of the island. W. by S. from the latter, and about E.  $\frac{2}{3}$  N. from the lighthouse on Montock, distant 8  $\frac{1}{2}$  miles, you suddenly shoal your water from 13 to 6 fathoms on the N. W. side of the shoal, and before you get a second cast of the lead you are over the shoalest part, into 7, 8, 10, and 12, and then into 14 fathoms. The rippling of the tide is very conspicuous when approaching the shoal in fine weather, and the sea breaks on it so in bad weather that, even in small vessels, it is recommended to avoid coming near it, especially in southerly or S. W. gales. You will suddenly shoal from 13 to 9 fathoms, and Montock Light bearing W.  $\frac{1}{2}$  S. 8 miles distant, you will have 5  $\frac{1}{2}$  fathoms. The soundings from the shoal towards Montock are 6, 9, 14, 13, 11, 10, and 9 fathoms. Towards the lighthouse when it bears from W. to S. W. by W. the bottom is strong; towards the shoal the bottom is coarse sand, and a very strong tide. A shoal runs off from the north side of Block Island, 2 miles.

From Montock Point, a reef runs off in a N. E. direction, 2 miles, having a bed of rocks on its outer end, with 10 and 8 feet on them, on which the sea constantly breaks, and causes a great rippling. They may be easily avoided by keeping a good lead, and in rounding Montock, come no nearer than 9 fathoms, or keep the two bluffs, or high parts of the land, (to the westward of Montock) open one of the other, until Willis' Point comes open of Montock False Point. These marks will carry you clear of all the shoals in 3  $\frac{1}{2}$  and 9 fathoms, and a N. by W. course will then carry you clear of the Shagawanoek Reef, which lies N. W.  $\frac{1}{2}$  N.  $\frac{3}{4}$  miles from Montock Lighthouse, and has 6 feet on its shoalest part, 6 fathoms on the N. E. and N. W. side, 3 and 4 fathoms on the S. E. and S. W. side, and 3, 4, and 5 fathoms between the shoal and Montock False Point. The tides set strong round Montock Point; the flood N. E. and ebb to the contrary. At the Shagawanoek the flood sets W. by S. and ebbs to the contrary. When on the Shagawanoek, in 6 feet, anchored a boat, and took the following marks.

1. Willis' Point in a line with the westernmost point of Fort Pond Bay, or the bay closed by the points being brought in a line S. W. by W.  $\frac{1}{2}$  W.
2. Montock False Point S. about 1  $\frac{1}{2}$  mile.
3. The White Cliff, or high sand hills on the west end of Fisher's Island, called Mount Prospect, N. by W.  $\frac{3}{4}$  W.
4. The Gull Islands N. W. and the bluff sand cliff of Gardner's Island, W. Mon-

\* The Friars Head is a remarkable Sand Hill, to the east of the Horse and Lion, which resembles the bald head of a Friar, it being bare of trees on the top, and the soil white. The Horse and Lion are two small spots in the bank, bare of bushes, which some years ago resembled those animals.

\* The lighthouse on Montock Point is on the east end of Long Island, bearing W. by S. from the S. W. point of Block Island, 4 leagues distant. From Montock Lighthouse to the west point of Fisher's Island, N. W. by N. 13 miles distant. The lighthouse contains a fixed light, elevated 100 feet above the level of the sea, and may be seen 9 or 10 leagues.

tock False Point is 2 miles N. W. from the lighthouse. Willis' Point is the easternmost point of Fort Pond Bay.

In rounding Montock in the night (when the land or light can be seen) with westerly gales, you may anchor when the lighthouse bears S. W. by S. in 8 or 9 fathoms, coarse sand. Having brought Montock to the southward of west, the weather thick, you cannot clearly ascertain the distance you are from the point, the lead must be your guide. Steer as high as W. N. W. until you have got into 9 fathoms. Steer off again into 13, and if you suddenly shoal from 10 to 6, steer off E. by N. until you are in 11 or 12, which suddenly deepens (as a bank of not more than 5 fathoms, extends from the N. E. Reef to the Shagawanoek) and a good lead kept going will prevent you going too near these shoals, by steering off into 12 and 13 fathoms, before you attempt to steer to the westward, after having sounded in 6 or 7 fathoms. In the day time, having rounded Montock, and bound to Gardner's Bay, steer N. by W. until you clearly discover that Fort Pond Bay, and the red cliff on the western Point, are open of Willis' Point; you may then steer W. by S. for the bluff point of Gardner's Island, and you will pass between the Shagawanoek and Middle Ground (or Cerberus Shoals.)

The Middle Ground (or Cerberus) is a rocky shoal, having from 2 $\frac{1}{2}$  to 5 fathoms on the shoalest part: the north and east sides are steep, having 10 and 15 fathoms within half a cable's length of the shoalest part. It extends N. by E. and S. by W. three quarters of a mile. The south and west sides shoalen gradually from 13, 10, 9, 8, 7, to 5 fathoms, sandy bottom. It lies N. W.  $\frac{1}{2}$  N. 7 $\frac{1}{2}$  miles from Montock Lighthouse; E. S. E. 7 miles from the Gull Light; S. W. by S. 9 $\frac{1}{2}$  miles from the lighthouse on Watch Hill Point; 5 miles S. by E.  $\frac{1}{2}$  E. from Mount Prospect, or the high sand hills on the west end of Fisher's Island. The tide in general makes a great rippling over the shoalest part. To avoid these rocks in the day time, observe a conspicuous hill with a notch in its centre, at the back of New London, called Pole's Hill. This kept a ship's length open, either to the eastward or westward of Mount Prospect, (or the sand hills of Fisher's Island) will keep clear of the rocky shoal, in 10 or 15 fathoms to the eastward, and in 8 or 9 fathoms to the westward. The tide sets strong over the shoal. In calm or little winds, ships should anchor before any of the marks or bearings are too near.

Being bound for New London, and having brought the Gull Light W. by N. and the light on Watch Hill N. E. steer so as to open New London Lighthouse of Fisher's Island; and when the spire of New London Church is in one with the gap on Pole's Hill, steering with it in that direction will carry you between the Race Rock (on which is a spindle or beacon) and the middle Race Rock, on which are 17 feet at half flood, and lies about half way from the Race Beacon and the Gull light, or you may bring New London lighthouse a sail's breadth to the eastward of the church spire, bearing N. 55 E. which will carry you to the westward of the middle Race Rock, or between that and the Gull lighthouse. You may then steer direct for New London Lighthouse.

About 3 miles within Montock Point,  $1\frac{1}{2}$  mile from the shore, lies a reef, bearing W.  $\frac{1}{2}$  N. from the point, on which there are 6 feet water, which is very dangerous. S. by W. about 9 miles from Montock light, is a small fishing bank, having 8, 10, 11, and 15 fathoms on it, before mentioned.

In the evening, between Montock and Black Island, it is high water at half past 10, full and change, but on the shore two hours sooner.

Montock False Point is about 2 miles W. N. W. from the true point. The Shagawanoek, or Six Feet Rocky Shoal, lies N.  $1\frac{1}{2}$  mile from it, and has been previously described. Willis' Point is on the east side of the entrance of Fort Pond Bay. This bay is very convenient for wooding and watering; the ground is clear and good, and you may anchor in any depth you please. In a large ship you may bring Willis' Point to bear N. E. and even N. E. by N. and then have in the middle about 7 fathoms water. Near the shore at the bottom of the bay there is a pond of fresh water.

The N. E. part of Gardner's Island is  $5\frac{1}{2}$  leagues W. N. W. from Montock Point. With westerly winds you may anchor off this part of the island, which is sandy; the marks for anchoring are the Lighthouse of Plumb Island N. W. and the south part of Gardner's Island in sight, bearing S. by W. or S. you will have 12 or 10 fathoms water. The bottom is sand and mud.

The entrance of Gardner's Bay is formed by the north end of Gardner's Island, and the south end of Plumb Island. If you are bound through the Sound towards New York, your passage from Gardner's Bay is between the west end of Plumb Island and Oyster Pond, through which channel you will have from 4 to 20 fathoms water. When going into the bay, you may go within a cable's length of Gardner's Island, where you will have 10 fathoms water. You should be careful not to go too nigh "Gull Rock; as

\* This is a single black Rock, between Plumb Island and Great Gull, and called "Old Silas." (See page 209.)

there is a rocky spot one and a half mile from it, on which there are three fathoms at low water. This shoal lies with the following marks and bearings, viz.—a house on Plumb Island, (standing about one-third of the way between the middle and the N. E. end) on with the northernmost of the two trees which appear beyond the house; the north end of Plumb Island to bear N. N. W. or N. by W.  $\frac{1}{2}$  W. and the southernmost end of Plumb Island on with the northernmost point of Long Island. In order to avoid this rock, when going into, or coming out of Gardner's Bay, you must be sure to keep the south point of Plumb Island open of the N. W. point of Long Island, whilst the house on Plumb Island is on with the northernmost of the two trees, as before mentioned. There are several trees, but they appear, when viewed at a distance, to be only two trees. This shoal is called by some, the Bedford Rock, because the English ship Bedford grounded on it, August 15, 1780. E. by N. one league from Plumb Island, lies a dangerous reef, which extends to the Gull Islands, and the passage between is not fit to be attempted, as there are several rocks, some of which may be seen. In Gardner's Bay you may anchor in what depth of water you please, from 5 to 8 fathoms.

On the S. W. side of Gardner's Bay there is very good riding. If you are to the eastward of this island, with an easterly wind, and wish to take shelter under the S. W. side, you must give the N. W. end of the island a large berth, as above directed, and as you open the west side of the island, you may haul round the N. W. point, and anchor where you please. The soundings are regular.

Ships, in turning up into Gardner's Bay, and standing to the southward, will observe a single conspicuous tree on the S. E. part of Plumb Island, and tacking before it is brought to touch the south end of the wood on Plumb Island, will avoid the Superb's Reef, which lies E. by N.  $\frac{1}{2}$  N. from the low point on Gardner's Island, one third of a mile distant. It then extends S. E. by E. about two thirds of a mile, and is about 200 yards broad: Three fathoms on the middle, 6 fathoms close to the N. W. end, 4,  $4\frac{1}{2}$ , and 5 fathoms close to the S. E. end, 5 and 6 fathoms close to the east side, lying parallel with the low point of the island. To avoid this shoal, the leading mark into Gardner's Bay is to keep Plumb Gut a ship's breadth open. Stand to the northward until Plumb Gut is nearly closing on the N. E. bluff of Long Island, nearly touching the S. E. point of Plumb Island, and until New London Lighthouse is brought to the north and west of the Gull Lighthouse, but tack before the points close, or stand into no less than 7 fathoms water, otherwise you may shoot over on the Bedford Reef, which is a bed of rocks, about 30 yards wide and 400 long, lying S. E. and N. W. with 16 or 17 feet on its shoal-est part. You may anchor in Gardner's Bay in 5 or 6 fathoms. New London Lighthouse kept a ship's breadth open to the eastward of Plumb Island, will run you up into the middle of the bay, into the deepest water, and out of the tide. Ships going in through the Race, or going out of New London, in order to avoid the Middle Race Rock, (which has only 17 feet on it at half flood, and lies about half way from the Race Beacon and the Gull Lighthouse,) having from 30 to 32 fathoms on the north side, and from 10 to 30 on its south side, should observe the following marks:—Going out of the roads, and to the westward of the rock, which is the best channel, bring the spire of New London Church a sail's breadth open to the westward of the lighthouse; keep this mark until a grove of trees, standing on a high hill on Fisher's Island, comes on with the east side of Mount Prospect, or the white sand hills on the S. W. side of Fisher's Island, N. 60° E., or the Gull Light W. S. W. The tide flows at the Gull 11h. 30m., full and change.

To go to the northward of this rock, and to the southward of Race Rock beacon, bring New-London Church spire in one with the middle of the gap on Pole's Hill, at the back of New-London (N. 8° W.); keep this mark until Watch Hill Lighthouse comes a little open of the south side of Fisher's Island, N. 70° E., and when the Gull Lighthouse is in one with the middle of Great Gull Island, S. 73° W., you are then to the eastward of the rock. Coming up the Sound through the Race, bring Watch Hill Lighthouse just open of the south side of Fisher's Island, until the south Dumbell comes open to the northward of the north part of Fisher's Island, or until New-London Lighthouse bears north; you are then to the westward of the Race Rock, and may steer for the Lighthouse of New-London, and anchor in the roads, with Montock Lighthouse S. E. by S. then just open of the west point of Fisher's Island, Gull Lighthouse S. W. by S., and New-London Lighthouse N. by W., and the gap and spire of the church in one; you will have 12 fathoms, stiff clay bottom.

Going to the westward through the Race, and to the southward of the Race Rock, steer for the Gull Lighthouse, keeping it to the northward of west until New-London Lighthouse bears N.  $\frac{1}{2}$  E., then steer for it, leaving the Gull Lighthouse half a mile on the larboard hand.

The above to be observed in case the weather should be thick, and New-London church spire not to be seen, or when the Gull Lighthouse bears S. by W. You may then steer N. N. E. for the roads, making allowances for tides, which are very strong in

very strong in

the Race. Flood runs to the westward till 11h. 30m. full and change days of the moon; but in New-London roads, only 9h. 30m. It rises 5 or 6 feet spring tides. The flood sets through the roads, first half flood W. N. W. last half W. S. W. Ebb, first quarter, sets S. S. E. the last three quarters S. E. for the S. W. point of Fisher's Island.

To go through Plumb Gut to the westward, give Pine Point, which is steep, a berth of 2½ cables' length, and steer so as to bring the north bluff of Plumb Island N. by W. ½ W. Keep it in that bearing until you have brought the poplar tree clear of the east end of Mr. Jerome's house, or until you have got Pine Point to the southward of east; you will then observe a wood close inland of the high bluff of Long Island, which when bearing W. ½ S. will be in one with the rocky point, which is the next point to the Oyster Pond Point. Steering with the wood and this point in one, will carry you clear of the reef, which lies off the north bluff.

In running through to the eastward, keep the point over the middle of the wood before-mentioned, until the poplar tree is to the west end of the house; then steer to the southward, giving Pine Point a berth, as before. Pine Point E. ½ S. will lead clear of the shoals coming to the eastward.

The tide runs 6 or 7 knots in the Gut. The flood sets about N. N. W. and the ebb S. S. E. It flows at 10 o'clock on the full and change days of the moon.

*Marks for the Valiant's or Middle Race rock, which has only 17 feet on it at half flood, and lies about half way from the Race Beacon, and the Gull Lighthouse.*

1. New-London lighthouse in one with two conspicuous trees, which stand on the declivity of a hill, at the back of New-London, being remarkable for a gap on its summit, N. 4° W.

2. The west side of the south Dumplin just touching with the north hill or point of Fisher's Island N. 41° E.

3. The east bluff point of the Great Gull Island in one with the west lower extreme of Little Gull Island, or the Gull lighthouse, a small sail's breadth open to the eastward of the east part of Great Gull Island S. 64° W.

4. The north end of Long Island just shut in with the N. W. point of Plumb Island S. 76° W. Gull lighthouse S. 63° W. and Mount Prospect or High White sand hills on Fisher's Island, N. 60° E.

*Marks for the New-Bedford reef, a bed of rocks about 30 yards broad, and 400 yards long, lying S. E. and N. W. with 16 or 17 feet on its shoalest part.*

1. The N. E. end of the northernmost grove of trees on Plumb Island, touching the south declining end of the southernmost of the White sand hills on Plumb Island. These sand hills are the two next south of the houses in the bay.

2. A large notch or gap in the wood on the main land, to the westward of Black Rock, a sail's breadth open to the northward of a single black rock, which is between the south end of Great Gull Island, and the N. E. end of Plumb Island N. W. by N.

Thus appears the rock, called Old Silas.

*Marks for a bed of rocks, about 40 yards square, lying three quarters of a mile off shore, on the S. E. side of Plumb Island. At low water the shoalest part has not more than three feet on them, and about the size of a small boat's bottom. It may be seen at low water; three fathoms all round, not more than eight feet from the rock. Other parts of the reef, eight fathoms are around the shoal,*

1. The largest house with two chimneys in the bay, east side of Plumb Island, in one with a large stone or rock on a hill behind the house N. 33° W.

2. The Gull lighthouse touching the east end of Great Gull Island, N. 65° E.

3. The White sand hills on the south side of Fisher's Island, or Mount Prospect, half way open to the westward of Great Gull Island. S. E. part of Plumb Island, S. 74° W. and the N. E. end of same, N. 45° E.

*Marks for a shoal in the middle of Plumb Gut, which is a compound of rocks and large stones, with only 16 feet on it, having 16 and 17 fathoms on the N. E. side, 20 on the N. W. and 6 and 7 on the south side. When on the shoal, took the following marks:*

1. A small poplar tree in one with Mr. Jerome's door, N. N. E.

2. A single conspicuous tree in one with the east side of a grey cliff on Gardner's Island, S. E. by E.

3. Oyster Pond Point W. ½ N. and the S. E. (or Pine Point of Plumb Island) E. by N. and the rocky point or bluff point of Plumb Island, north. The passage through Plumb Gut is to the northward of this rock.

There is another rock, with only 24 feet upon it, about 400 yards from the rocky or bluff point on Plumb Island, on the latter of which is a revolving light.

*Marks for anchoring in Plumb Island Roads.*

Mount Prospect or the high white sand hills of Fisher's Island, touching the Gull lighthouse, N. 62° E. and the N. E. part of Long Island in one with the S. E. end of Plumb Island, bearing W. or the east bluff points of Gardner's Island in one with the low beach which extends from the north side of the island, S. 45° E. With these marks you will have from 7 to 8 fathoms, soft mud, and quite out of the tide, and not more than three quarters of a mile from the shore of Plumb Island, where there is very convenient and good water.

From Block Island a reef of rocks lies one mile distant from the north end of the island.

South-west Ledge lies W. S. W. from Block Island, 4 miles distant, having 4½ fathoms at low water, and breaks a heavy sea. As you open the passage between Montock and Block Island, you will deepen your water, and have soft bottom on an E. N. E. course, and when abreast of Block Island, you will shoalen your water to sandy bottom; when past it, you will again deepen to soft bottom.

[For more particular directions for passing Block Island, where are two lighthouses, see page 198.]

*Bearings and distances of sundry places from the lighthouse on Montock Point.*

The S. part of Block Island bears E. by N. from the lighthouse on Montock Point, 20 miles distant.

The eastern rips lie E. by N. 1½ mile from the lighthouse. The northern rips lie N. E. ½ E. 3 miles from the lighthouse. These rips, although they may appear to the mariner dangerous, may be crossed with any draft, in 6, 7, 8, and 9 fathoms.

Shagawonock Reef, on which a spear is placed, bears N. W. ½ N. from the lighthouse on Montock Point, 3 miles distant; the reef ranges N. by E. and S. by W. about one quarter of a mile in length. There is a good channel way between the reef and Long Island, about 1½ mile wide, in 3, 4, and 5 fathoms water.

Frisbie's ledge is only a place of hard rocky bottom before you approach the lighthouse to the westward, from 8 to 15 fathoms, and no ways dangerous to any vessel. You may keep the shore on board from the Highlands (say three quarters of a mile) and haul round Montock.

The east end of Fisher's Island bears N. ½ W. from the lighthouse on Montock Point, 13½ miles.

Watch Hill Point lighthouse (which contains a repeating light) bears nearly N. from Montock Point lighthouse, distant 14 miles; there is a reef extending from Fisher's Island to Watch Hill Point, leaving a passage between the E. end of the reef and Watch Hill Point, half a mile.

The Race Rock, where there is an iron spear placed, bearing S. W. by W. three quarters of a mile from the W. Point of Fisher's Island, bears from Montock lighthouse, N. W. by N. 13½ miles distant.

The Gull Islands bear S. W. by W. from the Race Rock, 4 miles distant. The lighthouse standing on the west chop of New-London Harbor, bears N. by W. ½ W. 5 miles from the spear on the Race Rock. On the Little Gull Island there is a lighthouse containing a fixed light, bearing S. W. by W. from the west point of Fisher's Island, four miles distant.

Bartlett's Reef, on which a buoy and light vessel, with one mast and a bell, are placed, bears N. W. by W. ½ W. 4 miles distant from the Race Rock.

Little Goshen Reef, where a buoy is placed, bears N. E. ½ E. about 2 miles distant from the buoy on Bartlett's Reef.

The lighthouse at New-London Harbor, bears from the buoy on Little Goshen Reef, N. N. E. ½ E. about 1½ mile distant, and contains a fixed light.

The S. W. ledge, where a buoy is placed, bears N. by W. from the Race Rock, 4½ miles distant.

The east chop of New-London Harbor bears N. by E. ½ E. from the S. W. ledge, ¾ mile distant.

The lighthouse bears from the buoy on S. W. ledge N. W. by N. ¾ mile distant.

**GARDNER'S ISLAND TO SHELTER ISLAND.**—If you fall in with Gardner's Island, you must sail on the N. side of it till you come up with a low sandy point at the W. end, which puts off two miles from the Highland. You may bring the island to bear east, and anchor in 7 or 8 fathoms water, as soon as within the low sandy point.

**GARDNER'S ISLAND TO NEW-LONDON.**—Your course from the east end of Gardner's Island to New-London is N.  $\frac{1}{2}$  E. about 4 leagues. In steering this course you will leave Plumb Island and Gull Islands on your larboard, and Fisher's Island on your starboard hand. In this pass, you will go through the Horse Race, where you will have a strong tide. The flood sets W. N. W. and the ebb E. S. E. This place breaks when there is any wind, especially when it blows against the tide. Your soundings will sometimes be 5 fathoms, at others 15 and 20.

In passing the west end of Fisher's Island, you must give it a berth of one mile, as there are several rocks to the westward of it; then your course to the lighthouse is N. by W. distant two leagues; but in going in here you must not make long hitches: you will leave a sunken ledge on your larboard, and one on your starboard hand. When within one mile of the lighthouse, you may stand on to the eastward, till the light bears N. N. W. and then run up about N. N. E. till abreast of the light, where you may safely anchor, or run N. for the town.

**NEW-LONDON.**—If you are bound into New-London, after getting to the northward of the S. W. part of Fisher's Island, keep New-London light bearing from N. N. W. to N. N. E. if you are beating to windward, but if the wind is fair, bring the light to bear N. when at the distance of 2 leagues, and run directly for it; leave it on your larboard hand in running in: when in, you may have good anchoring in 4 or 5 fathoms water, clayey bottom. In coming out of New-London, and bound West, when you have left the harbor, bring the light to bear N. N. E. and steer directly S. S. W. till you come into 15 fathoms water, in order to clear a reef that lies on your starboard hand, when the north part of Fisher's Island will bear E. distant 2 leagues. If a ship could have a fair departure from the middle of the Race, and was compelled to run in a dark night, or thick weather, the best course would be W. to Stratford Point, and would afford the largest run of any one course.

**NEW-LONDON OR WESTWARD.**—Keep Gull Island light to bear W. N. W. until you judge yourself within about two miles of the light; your course then to New-London light (after you pass Race Rock, which lies W. S. W. from the point of Fisher's Island, distance  $\frac{1}{2}$  of a mile) is N.  $\frac{1}{2}$  W. In coming in, or going out of New-London, (when opposite the Gull light) bring the Gull light to bear S. S. W. and New-London light N. N. E. leave the light on your larboard hand in going into the harbor; keep well to the W. if it be winter season, and wind to N. E. and stormy—your course to break off a N. E. gale, in good anchorage, is W. N. W. from the Gull, distance 5 miles, then haul up, if the wind be N. E. and steer N. W. when you get into 10 fathoms of water, muddy bottom; anchor as soon as possible—you will be between Hatchett's Reef and Black Point; this is the best place you can ride in, if you have a N. E. gale, and thick weather, and cannot get into New-London. † Saybrook light, will then bear W. by N. or W. N. W.

Saybrook is not a good harbor to enter, but if you must attempt it, bring the lighthouse to bear N. N. W. and steer for it until within one mile, then steer N. E. till the light bears N. W. by W. and then run for it until within half a mile distance, from which a N. N. W. course will carry a vessel up the river to good anchorage near the town.

When bound up Sound, and off Saybrook Light in clear weather, give it a berth of three or four miles; your sound course then is W. S. W.  $\frac{1}{2}$  W., 50 miles distant, which will carry you up with Eaton's Neck Light, leaving Stratford Shoal on the starboard hand. This shoal, which has a white spar buoy on the south, and black spar buoy on the north, between which you cannot go, bears north from Satanket (Long Island) and S.  $30^{\circ}$  W. from Stratford Point Light. The buoys are placed in 19 feet water. In leaving Falkner's Island Light north two miles, steer W. (until you get into 5 or 7 fathoms water,) distance 20 miles to Stratford Point Light, hard bottom, which leaves Stratford Shoal, that bears S. by W. from the light, on the larboard hand; then your course is W. S. W. to Mantinicoek Point.

**FROM PLUMB GUT TO GREENPORT.**—Vessels bound to Greenport may make their course S. W. and run 3 miles, which will carry you up to Ben's Point, on Long Beach. This beach is  $3\frac{1}{2}$  miles long, and covered with low cedar-trees, which you

\* New-London lighthouse stands at the entrance of the harbor, on the western side. The lantern is elevated 80 feet above the level of the sea, contains a fixed light, and bears N. by E. from Little Gull light, about  $6\frac{1}{2}$  miles.

† Saybrook Point light is a fixed light, at the mouth of the Connecticut river, on the west chop of the entrance to that river; it stands on a low sandy point, projecting into the sea, having on its west side a considerable tract of salt marsh, containing a pond of brackish water, which by its evaporation, creates a mist, at times, which very much impedes the light, the weather at the same time clear off shore. Height of the lighthouse from the sea 44 feet.

leave on your starboard hand going up to Greenport. You will have, from Plumb Gut to Ben's Point, from 4 to 4½ fathoms water, and then your course is W. S. W. 3¼ miles. In running this course you will shoal your water to 3 fathoms, and if you get any less water, haul to the southward, and as soon as you get 3 fathoms, keep your course, and run until you, by heaving your lead, from one heave will have from 3 to 7 fathoms water. As soon as you get 7 or 8 fathoms water, your course is W. N. W. one mile, which will carry you to Hay Beach Point, on Shelter Island, which you leave on your larboard hand; haul close round Hay Beach Point, and your course is W. S. W. 1½ mile to Greenport; then you may come to anchor in a good harbor.

FROM GARDNER'S POINT TO GREENPORT the distance is 12 miles, and your course is W. by S. Running this course you will shoal your water from 6 fathoms, gradually, to 3 fathoms, on Long Beach side; and then you follow the above directions to Greenport. Five fathoms of water can be carried into Greenport, but large vessels should take a pilot—one is always to be had.

OYSTER POND POINT AND PLUMB ISLAND.—In sailing through this strait, (called Plumb Gut,) you leave the light on your larboard hand, running boldly to the north on which it stands, then steering S. E. by E. till the Gull Light bears N. E. by N. when you may shape your course for Point Judith, or wherever you may wish.

When passing the light, you will open Gardner's Bay, which is the passage to Sag Harbor, and also leave Oyster Pond Point on your starboard hand, off the eastern part of which a shoal extends one third over toward the south end of Plumb Island.

The bearings of the lighthouse have been taken from the following places:—From Oyster Pond Point and the reef, N. E. by E., distant from the outer part of the reef 1½ mile; from Saybrook Light S. E. ¼ S., distant 8½ miles; from Pine Point (the S. W. part of Plumb Island) N. W. by N. distant three quarters of a mile; from Cherry Harbor Point (the S. W. part of Gardner's Island) N. 30° W., distant 6 miles; from Gardner's Point N. W. ¼ W., distant 3½ miles; from New London Light S. W. ¼ S., distant 10 miles; from Cedar Island (at the entrance of Sag Harbor) N. N. E. ¼ E., distant 8 miles.

If bound into New Haven, give Falkner's Island a berth of one mile, and steer W. by N. till New Haven Light is north of you, in 6½ fathoms water, when you may steer N. giving the light a berth of 1½ mile, to avoid the S. W. Ledge, on which there is a buoy, bearing from the lighthouse S. W. by S. ¼ S., distant 1 mile, which you may have on your starboard hand, and when the light bears N. E. you may steer up N. E. for the Fort, to the north of the Pallisades, leaving the white buoy on Adams' Fall to your starboard hand. When you are nearly abreast of the Fort, give it a berth south of a mile, and steer up N. ¾ W. for the end of the Long Wharf, leaving the edge, which is one fourth of a mile N. W. of the Fort, on your starboard hand. When on Adams' Falls bears from the light S. W. half a mile, and from the S. by E., half a mile.

The spindle on Quick's Rock, which bears from the light S. ¾ E., distant three miles. The buoy on Adams' Fall bears from the spindle N. W., distant 1 mile. The buoy on S. W. Ledge bears from the spindle W. S. W., distant half a mile.

Vessels bound in from the eastward, may pass between the buoy on South West Ledge and the spindle, as there are three fathoms water in this channel, keeping about 20 rods between them, and leaving the white buoy on Adams' Fall 20 rods to the eastward of them, and then steer for the end of the wharf. On this shore, in channel-way, you will have 3, 4, and 5 fathoms water, muddy bottom. Bringing the light to bear S. E., you may anchor in Morris' Cove, near the east shore, in two fathoms water, muddy bottom. Your course from this up the harbor with a fair wind, is north. Give the Fort Rock, in running for the pier, a small berth.

Vessels bound in from the westward will leave both buoys on the starboard hand, and they may pass with safety within 20 rods of either of them. If beating in, your soundings will be from 2 to 3 and 4 fathoms. Stand in no farther than 2 fathoms upon the west shore, on which you will have hard bottom. In beating up, after getting in muddy bottom, (which is channel soundings,) it is best to keep the lead a going often, on account of bordering on the west shore, where you will have hard bottom, and soon aground.

New Haven Lighthouse is situated on Five Mile Point, at the entrance of the harbor, and lies on the starboard hand. The lantern is elevated 35 feet above the sea, and contains a fixed light. New Haven Light the following bearings and distances are taken, viz:—Stratford Point Light W. 10° miles; Middle Ground S. 42° W., 14 miles; buoy on Adams' Fall S. 50° W.; S. W. Ledge S. 30° W.; beacon on Quick's Ledge S. 10° E.; Falkner's Island Light S.

**BRIDGPORT.**—Vessels bound into Bridgport must leave the outer \*buoy on the larboard hand, and steer direct for the beacon on Wells' Point, which bears N. E. from the outer beacon that is on the west flat, about 350 yards distant, leaving the buoy on Stony Bar, on the starboard hand, and Allen's Flats on the larboard.

**FAIRWEATHER ISLAND, OFF BLACK ROCK HARBOR.**—The harbor of Black Rock, although safe and easy of access, is so situated, that no direct course can be given to steer for the light, that will carry you direct into the harbor, as that depends wholly on the distance you are from the light, at the time you make for it; therefore, judgment is to be used in varying the bearing of the light as you draw near in, which is easily done by observing the following rules:—In coming from the westward, if you mean to harbor, to avoid the reef called the Cows, you bring the light to bear N. by W. and run directly for it, until within three quarters or half a mile distant, when, if occasion requires, you may stretch into the westward in a fine beating channel, leaving from 5 to 3 fathoms water, and good ground. As you approach the light, which stands on the east side of the harbor, the water gradually shoals to about two fathoms. The mouth of the harbor, although not very wide, is not difficult; the light bearing east brings you completely into the harbor. The island on which the lighthouse stands, and the reef called the Cows on the south and west side, form the harbor of Black Rock. On the easternmost rock of this reef stands a spindle, distant from the light half a league, and from which the light bears north. The light stands 44 rods from the south point of said island at low water. From this point puts off a single rock, 30 rods distant, on which is 8 feet at high water, making in all about 74 rods distance. The light bears from this rock N. by E.  $\frac{1}{2}$  E. As soon as you pass this point or rock, the harbor is fairly opened to the northward, in any point from N. to W. N. W. You can run for the light with safety, observing, as you draw nearly in, the above directions, and due attention to the lead. The bottom for some distance from this rock southerly, is hard, but you may continue your course, and it will soon deepen. It is safe and good anchorage to the eastward of the light, for all winds from W. S. W. to N. N. E. quite down to the mouth of Bridgport Harbor, which is distant about two miles. The shore on the eastern side of the light is bold to, in 3 fathoms, close aboard the light, and so continues until you are quite down to the south point of the island. This bay, to the leeward of the light, between that and Bridgport, is one of the best bays for anchorage on the north shore in Long Island Sound, and affords from 4 to 3 fathoms water, the light bearing west. In coming from the eastward, crossing Stratford Point Light close aboard, your course to Black Rock Light is W. by N., and you keep sounding on the starboard side not less than 4 fathoms, nor more than 8 fathoms, to the north of Bridgport Harbor, which is distant about two miles. The shore on the eastern side of the light is bold to, in 3 fathoms close aboard the light, and so continues until you are quite down to the south point of the island.

**†LONG ISLAND.**—Long Island, from Montock Point to Red Hook, extends from S. about 102 miles, and is at the broadest part about 25 miles across. The island is generally pretty low and level, excepting a few hills, which lie about 40 miles westward of Montock Point, and Hempstead Hill, which is 319 feet above the level of the sea. Along the south side of the island a flat extends about a mile from the shore in some places it runs out a mile and a half. The east end of the flat is sandy, the middle and west parts are sand and stones. Your course, Montock Point Light, distant north 7 miles distant, along Long Island shore, is W. S. W. 22 leagues, and W. S. W. 22 leagues. About 4 leagues distant from the island there are from 15 to 18 fathoms, and from that distance to 20 leagues, the water deepens to 80 fathoms; in the depth you will have oozy ground, and sand with blue specks on it. About four leagues off the east end of the island, you will have coarse sand and small stones; and at the same distance from the middle and west end, there is a small white sand and gravel, with black specks. From the S. W. end, off Coney Island Point, a shoal extends about 10 miles towards Sandy Hook, which forms the East Bank.

There are a few inlets on the south side of the island. The first one of any importance is Fire Island, on which bar there is 7 feet at low water. It is a dangerous bar, and is to be attempted by the aid of a pilot, who can be found on board of the coasters.

\* In the harbor of Bridgport are three buoys, placed as follows, viz:—One on Marchand Flats, which lies a mile S.  $\frac{1}{4}$  W. from the outer beacon; one on Stony Bar, bearing S. E. from the beacon 150 yards distant; one on Allen's Flats, being inside the harbor.

† Long Island Sound is a kind of inland sea, commencing at Sands' Point, where is a lighthouse, and extending to Gull Island Light. It is from 3 to 17 miles broad, dividing it from Connecticut, and affords a safe and convenient inland navigation, having good anchoring places, and several lighthouses to guide the mariner throughout its whole length.

from the place. The remaining inlets are shallow, with the exception of Rockaway, to which bar the remarks on Fire Island above, will apply.

We have previously mentioned respecting Fire Islands Lighthouse, but think it advisable to repeat, it bears N.  $77^{\circ} 35'$  E. from Sandy Hook Light, 12 leagues distant, and exhibits a revolving light, from which a shoal extends south one mile, which is very dangerous, having 6½ fathoms very near it, then suddenly ashore, and on which the flood tide sets very rapid. From this to Sandy Hook the soundings are various, viz. yellow, red, brown, black and grey sand.

**HIGH LANDS OF NEVERSINK.**—Neversink Hills, on which two lighthouses are built, extends N. W. and S. E. about S. W. from Sandy Hook on the Atlantic Ocean, to Rariton Bay, and is frequently the first land discovered by mariners when they arrive on the coast. The correct altitudes of the following places, which present themselves to mariners as they approach them, are—

Mount Mitchell, the highest point of Neversink, Monmouth County, (N. J.)	282 feet.
Tompkins' Hill, on Staten Island, .....	307 do.
Hempstead Hill, Queen's County, Long Island, .....	319 do.

**NEW-YORK.**—If you fall in to the southward, and make Cape May, on which is a lighthouse exhibiting a revolving triangular light, it would be prudent to keep about 3 leagues off, to avoid Herreford Bar, which lies from 4 to 6 leagues from the Cape to the southward, and 8 miles from the inlet of that name. This inlet is frequented by the Delaware pilots, having no other harbor to the northward until they reach Egg Harbor. After passing Herreford Bar, you may steer N. E. when in 10 fathoms water, taking care that the flood tide, which sets very strong into the inlet, does not draw you too close; this course continued will carry you up with Egg Harbor, you will then have fine white and black sand intermixed with small broken shells; by continuing the same course, you will deepen your water, and so continue till you draw near Barnegat Inlet. [In running along the shore do not steer to the northward of N. E. if in 10 fathoms water or less, as you will be apt to get on Absecon Shoals, or Egg Harbor Bar.] On the south side of Barnegat inlet a lighthouse containing a fixed light is erected, off which you will get bright coarse yellow gravel. The shoal off Barnegat does not extend beyond two miles from the beach, and is steep to; you may turn this shoal in six fathoms water, within pistol shot of the outer breaker. It would always be prudent to keep in nine or ten fathoms water during the night, and not steer to the north of north-east, unless certain being to the north of the shoal. The soundings are so much to be depended on, that the moment you lose the above soundings you are past the shoal, when you will have fine black and white sand, and very hard bottom; you may then haul in for the land N. by E. which course will bring you along shore in from 15 to 17 fathoms water, but if the wind and weather permit, I would recommend hauling in N. N. W., which will bring you in with the southernmost part of the Woodlands, which is very remarkable, having no other such land in the distance from Cape May up to the \*Highlands, and can be distinguished by its being very near the beach, and extending to Long Beach.

In passing from Barnegat to Sandy Hook, when to the southward of the lights on the Highlands, you must not open the northern light (which is a fixed light) to the westward of the southern light, (which shows a revolving light,) as that will bring you too near the Jersey shore.

Thus appears the south part of the WOODLANDS.

By passing Barnegat in the day-time it may easily be known: should you be so far off as not to see the breakers, you may perhaps see a grove of wood back in the country apparently 3 or 4 miles long, known to the coasters by the name of Little Swamp, and lies directly in the rear of the inlet of Barnegat, so that by sailing to the northward, your having the north end of this land directly abreast, you are certainly to the northward of Barnegat: there is also another grove directly in the rear of Egg Harbor, known by the name of the Great Swamp, which has the same references as respects Egg Harbor—but that the one may not be taken for the other, it must be observed, the Great Swamp of

\* The lighthouses on the Highlands bear N.  $23^{\circ}$  W. and S.  $23^{\circ}$  E. from each other, distant 100 yards. The South Light has 15 lamps, revolves once in 2½ minutes, elevated 241 feet above the level of the sea. The North Light has 16 lamps fixed, facing as follows viz. Six Lights N. W. Seven Lights N. E. Three Lights South, and is 246 feet 7 inches above the sea. The lights are 39 feet 9 inches from the base to the top.

Egg Harbor will appear much higher, and in length 8 or 10 miles; neither can they be seen at the same time, as Barnegat and Egg Harbor are 15 miles apart. Barnegat bears due S. by W. 41 miles from Sandy Hook. In hauling in for the Woodland before mentioned, you may, if the wind is off the shore, keep within a cable's length of it all the way, until up with the Highlands; and should your vessel not draw more than 10 feet water, you may continue on until you get Sandy Hook light to bear W. or W. by N., when you may steer N. by E., to avoid the point of the False Hook, until you get into deep water, say 7 fathoms, then steer W. N. W., until the light bears S. by E.; then, with a flood tide, steer N., and with an ebb steer N. N. W.—the true course is N. by W.—which will carry you over the East Bank, and up to the black buoy of the Middle. [For directions to go to the city, see page 216.]

In going over the East Bank, be careful you do not get set by the tide on Romer; the mark to keep clear of Romer is, to keep Sandy Hook light open with the east end of the Highlands.

One and a quarter mile E., a little northerly, from Sandy Hook light, there is a small shoal spot, with only 12 feet water on it at low water: it is the remains of the Old False Hook.

E. S. E. 2½ miles from Sandy Hook light, is the Oil Spot, having only 10 feet in one part at low water; it is of a triangular shape, and about half a mile on each side in extent: the along-shore channel is inside of it.

**SWASH CHANNEL.**—We omit directions for this channel, as it should not be attempted without a Pilot.

HIGHLANDS, N. 63° W.

**NOTE.**—S. ½ E. from Sandy Hook Light, 5 miles distant, is a ledge about 1 mile from the shore, with not less than 2½ fathoms on it.

**\*SANDY HOOK CHANNEL-WAY.**—In running into New York, if intending to go ship channel-way, give the Jersey shore a berth of 3 miles, until the light on Sandy Hook bears West, which will bring you midway between the buoys, of the bar; then steer in for the point of the Hook, keeping the lighthouse well open on the larboard bow, (taking care, if it is flood, not to be set too far to the northward, and if ebb, to the southward,) when abreast of the Hook, so that the lighthouse and east beacon range, keep within half a mile of the shore, to avoid Flynn's Knoll, which has on it only seven feet water, and lies N. by W. 1½ mile from the light, and seven eighths of a mile from the point of the Hook. After you have passed the beacon, you may haul into the bay, S. W., if you mean to anchor, giving the Hook a berth of a mile, until you bring the lighthouse to bear E. by N. or E. N. E., where you may anchor in from 5 to 7 fathoms water, soft muddy bottom. But, should you wish to proceed to New York, when you have come in as before directed, and got abreast of the beacon, or the point of Sandy Hook, steer up west by north until you bring the lighthouse to bear south-east, and Brown's Hollow to bear south half east, leaving five black spar buoys and the Black Can Buoy of the south-west Spit on your starboard hand, when you may steer up N. by E. ½ E., leaving the White Can Buoy of the Knoll on your larboard hand, for the bluff of Staten Island, which will at that time bear exactly north from you. As you pass the Can Buoy of the Knoll, Prince's Bay Light will bear West, standing on the west side of the bay.

[That you may not be deceived with respect to Brown's Hollow, it is the hollow which makes the termination of the Highlands to the westward.] Having turned the S. W. Spit, continue steering N. by E. ½ E. until you shoal your water, which you soon will do if it is young flood, as it sets from 2½ to 3 knots to the westward; here you will observe, at the time you turn the spit before mentioned, on the Jersey shore, above the Narrows, two

hummocks of land, each forming, as it were, a saddle, thus:  The

\* The lighthouse on Sandy Hook contains a fixed light. It is lighted with 18 patent lamps, to each of which is fixed an eighteen-inch metallic reflector. The strength of light in this lantern is greater than any other on the coast, and if properly attended, may be seen at the distance of 10 leagues.

Two beacons are erected on the Hook, the easternmost one on the north point ranging with the light and buoy of the Upper Middle; and the westernmost one and light ranging with the buoy on the S. W. Spit, in both of which are lamps.

† The spar buoys are not always put down, but the can buoys are, except in the winter season, when they are substituted by spar buoys, which are put in the same spot.

eastermost of the two is the mark for coming up the channel so as to avoid the Upper Middle, on which is a black can buoy, on the starboard hand, by keeping it just open with the bluff on Staten Island, which will be the case if you turn the spit as before directed; this will bring you up channel-way, when you have sailed 5 or 6 miles the course described, and with this mark open; then you haul more to the eastward, until you open the other hummock, which is called the Westernmost Hummock: by keeping both easterly and westerly hummocks open to your view, you avoid the Middle and West Banks, on the latter of which is a black can buoy, and on the former a white can buoy, and come up channel-way through the Narrows. Between the can buoy of the West Bank and the bluff of Staten Island, are four white spar buoys, which you leave on your larboard hand. When thus far, you must, to pass Fort Diamond, keep Staten Island shore aboard. The mark to pass Fort Diamond is to keep Bedlow's Island open with the point of Long Island; for if you can see Bedlow's Island in coming through the Narrows, there is no danger from the Narrows to come up to New York; you will steer up for Bedlow's Island to avoid the Mud Flat, on which four black buoys are placed, which you leave on your starboard hand. This flat is a kind of oyster bed, or bank of mud and shells, and has not more than 11 feet on it at low water; but to avoid this flat do not stand too far to the westward, on account of Robbin's Reef, between which and Bedlow's Island are three white spar buoys, which, to avoid running on the west side of the channel, the mark is to keep the point of land up the North River (on which Fort Lee stands) open with the east side of Bedlow's Island, after which there is nothing material to obstruct the navigation to New York, it being very steep near the point of Governor's Island, and the rocks near the Battery do not extend 100 yards from the shore. There are three reefs of rocks in the East River, viz. one off the north side of Governor's Island, with 15 feet water on it; one off the Battery, having 9 feet over it, and one off Corlaer's Hook, which is very dangerous: they may generally be distinguished at all times by the rip of tide going over them, both flood and ebb.

*Other Directions.*—Or you may, after making the Highlands of Neversink, run in boldly within three miles of the beach, and in steering along to the northward, observe to keep in about 8 fathoms water, until you get the lighthouse to bear W.  $\frac{1}{2}$  N. then, if you have a round hill, called Mount Pleasant, some distance in Jersey, in one view with the land about one quarter of a mile to the southward of the lighthouse, you are in a situation to pass the bar; steer in W. by N. until you are over it: you will have on it at low water, 3 fathoms; when over, you will be in 4  $\frac{1}{2}$  fathoms. Pass the Hook and lighthouse about half a mile, at which distance you will have 5 and 6 fathoms. When you have the point of the Hook on which the beacon stands bearing S. S. E. you may then haul to the southward, and round the Hook and come to, from one to two miles distant, the Hook bearing from E. to N. E. in good holding ground, 5 fathoms water. When you make Long Island, it is necessary to keep somewhat in the offing, on account of the East Bank, and observe the same marks running in as before mentioned.

If sailing up in the night, when abreast of the S. W. Spit, the two lights on the Highlands will range, when you may steer N. by E.  $\frac{1}{4}$  E. until you make the buoy of the Upper Middle, when the east Beacon and Sandy Hook Light will range in one. After passing the Upper Middle, you will deepen your water to 6 fathoms, when you may steer N. up through the Narrows, and you will deepen your water to 7, 8, 10, 12, and 16 fathoms.

N. B. The above answers for the Upper Middle and buoy of West Bank, with the exception of one half hour later.

*Bearings from the Telegraph at Neversink Hills.*

Sandy Hook Lighthouse N. 7° W. with the west side of Fort Lafayette in range. Telegraph on Staten Island N. 10° W. Level of the hill at the Telegraph where the

lighthouses are erected, 205 feet, making the two lanterns 250 feet above the level of the sea.

*Bearings from Prince's Bay Lighthouse.*

Point of the Neversink Hills, S. 54° E.

Sandy Hook Lighthouse, S. 71° E. distant 10 miles.

Spar Buoy on the north side of the Round or Middle Shoal, at the entrance of Prince's Bay, S. 86° E.

At Prince's Bay, where the lighthouse is erected, the level of the hill is 77 feet above tide-water. The elevation is 30 feet from its base.

*Directions for sailing in by Sandy Hook, corresponding with the Chart, published by EDMUND and GEORGE W. BLUNT.*

In coming up with the Bar, when midway between the buoys, steer W. by N. till the light on Sandy Hook ranges with the easternmost of five trees on the Highlands; you may then steer W. till you get the west Beacon on the point and the lighthouse in range, and so keep them till you make the black buoy of the S. W. Spit: after hauling round the Spit, steer N. by E.  $\frac{1}{2}$  E. until you make the buoy of the Upper Middle, but be careful of the flood tide, which sets directly over to the West Bank; after you have passed the buoy of the West Bank (which is the upper buoy) you should not bring Staten Island light north of N. by W. as the edge of this bank is very shoal, and extends to the point of the island.

If you wish to run for Prince's Bay, bring the light to bear W. N. W. and run for it, anchoring as near the shore as you please; E. S. E.  $\frac{1}{2}$  S. from the light will take you on the N. point of the shoal, on which a buoy is placed; this buoy is left on the larboard hand in going in, but as it is liable to be carried away by the ice, the light should never be brought to bear north of W. N. W.

*The following are the bearings, courses and distances, of the buoys placed in the Harbor of New York.*

**CAN BUOYS.**—The black buoy on the bar, bearing E. by N. from the lighthouse, distant 3 $\frac{1}{2}$  miles—ranges with the lighthouse and Mount Pleasant, in New Jersey.

The white buoy on the bar, bearing E.  $\frac{1}{2}$  S. from the lighthouse, 1 $\frac{1}{2}$  mile distant, and S. from the black buoy, 1 $\frac{1}{2}$  mile distant; between these buoys is the channel. This buoy ranges with the West Beacon and Block House.

The black buoy on S. W. Spit 2 $\frac{1}{2}$  miles from the lighthouse, bearing N. W. by W. ranges with the West Beacon and lighthouse.

The white buoy on the Knoll, bearing N. W.  $\frac{1}{2}$  N. from the lighthouse, distant 4 miles and one tenth.

The black buoy of the Middle, distant 5 miles from the lighthouse, bearing N. 15° W. ranges with the East Beacon and lighthouse.

The white buoy of the West Bank N. 15° W. from the lighthouse, 6 $\frac{1}{2}$  miles distant—ranges with Snake Hill, in New Jersey, and the bluff of Staten Island, where the lighthouse is erected, as before mentioned, and where the Telegraph now stands.

**SPAR BUOYS,**

*Between the Ocean and the City of New-York, in conformity to Act of Congress.*

Five black spar buoys between the outer bar and the black can buoy of the Spit.

Four black spar buoys between the can buoy of the Spit, and the can buoy of the Middle.

Three black spar buoys between the can buoy of the Middle and Coney Island.

Four black spar buoys on the shoal opposite Gowanus Bay.

*On the west side of the Main Channel.*

One black spar buoy on the north side of the Round or Middle shoal, opposite Prince's Bay.

Four white spar buoys between the white can buoy of the bar, and the point of Sandy Hook.

\* Prince's Bay Lighthouse stands on a bluff on the west side of the bay, bearing N. 71° W. from Sandy Hook Light, distant 10 miles, and W. from the Knoll Buoy. It shows a fixed light, facing E. S. E. having eleven lamps, elevated 106 feet 11 inches above the level of the sea, and 29 feet 11 inches from its base.

Six white spar buoys between the can buoy of the Knoll, and the can buoy of the West Bank.

Four white spar buoys between the can buoy of the West Bank and Staten Island.

Three white spar buoys between the point of Roblin's Reef and Bedlow's Island.

*In the East River and Long Island Sound.*

One white spar buoy on the Middle Ground, opposite Bushwick Creek, where the Dry Dock is located.

One black spar buoy on the Governor's Table, Blackwell's Island.

One black spar buoy on Lawrence's Reef, south from Westchester Creek, near Long Island.

[NOTE.—In sailing Ship Channel, the White Buoys are to be left on the larboard, and the Black Buoys on the starboard hand. None of the Buoys are in less than 19 feet water.]

NOTICE.—Harbor Master's Office, for the port of New York, is kept at the Nautical store of EDMUND & GEORGE W. BLUNT, 154 Water-street, corner of Maiden-Lane.

COAST EASTWARD AND WESTWARD OF SANDY HOOK.—If you come in near Cape Hatteras, be very careful of its shoals, and make your way to the N. N. E. which will carry you on the soundings of the Jersey shore. When you get 20 fathoms water in lat. 40° N. then haul in to make the land, by which you will avoid the difficulties of the coast, and the shoals nearer in shore: but if you cannot, see the following:

When you are up with Chincoteague Shoals,\* in 16 fathoms water, it is near enough to approach them; from this station, if bound into the Delaware, steer N.N.E.  $\frac{1}{2}$  E., which is the course parallel to the land, until Cape Henlopen light bears W. You may then run in for it; or, if bound to New-York, keep on that course until you have passed the pitch of Long Beach, taking care, as remarked before, not to run into less than 10 fathoms water, if night. You then can steer for the Hook. If, in running up, you deepen your water suddenly, from 14, 18 to 25 and 30, or 35 fathoms, oozy bottom, you are in what is called the Mud Hole, the centre of which is 13 miles from the Tavern, at Long Branch, and S. E. 15 miles from Sandy Hook lighthouse.

NEW-YORK BAY.—New-York Bay is 9 miles long, and 4 broad, and spreads to the southward before the city. It is formed by the confluence of East and Hudson's rivers, and embosoms several small islands, of which Governor's Island (on which are Castle Williams and Fort Columbus) is the principal. It communicates with the ocean through the Narrows, between Staten and Long Islands, which is a mile and one quarter wide. The passage up to New York from Sandy Hook (the point that extends farthest into the sea) is safe, and not above 18 miles in length.

†SANDY HOOK, ‡CAPE MAY, AND CAPE §HENLOPEN LIGHT HOUSES.—When sailing from Sandy Hook lighthouse, as soon as to the eastward of the bar, steer S. if night, till you pass Barnegat; if day-time, when passing, you may go nigh the breaker, say  $5\frac{1}{2}$  fathoms. In sailing between the Highlands and Barnegat in the day-time, you may go within one quarter of a mile of the land, if the wind is off shore. When you have passed Barnegat, steer S. W. by S. 10 or 11 leagues, which will carry you up with Great Egg Harbor, which has a shoal bank one league from the shore, that has not more than 6 feet water on it.

This land may be known by its appearing like broken islands, with the Highlands of Neversink to the westward of Sandy Hook, which has a singular appearance from any land on that coast. In the day time you may go within two leagues of the shore, but in the night it will be prudent to keep further off. When you have passed Great Egg Harbor, steer S. W. by W. 10 leagues, which will bring you up with Cape May light.

Between Barnegat and Cape May there are three inlets, one of which is fit at high water, for vessels drawing 15 feet, viz. Little Egg Harbor, off which buoys are placed. Great Egg Harbor may be run for in time of danger, and will give 12 feet at high water. The navigation is not so safe as other places.

In running for Cape May, while steering your S. W. by W. course, you will pass five inlets, before you come up with Cape May light, viz. Coston's, Townsend's, Herreford, Turtle Gut, and Cold Spring, all which have bars lying off their entrances; when abreast

\* A lighthouse, containing a fixed light, is erected on the S. E. point of Assatague Island, to point out the proximity of Chincoteague Shoals.

om Cape May, and

of Herreford inlet, you may, if bound to Cape May, steer W. by S. but if bound to Cape Henlopen, steer S. S. W. till the lighthouse bears W. when you may run for it till within two miles.

E.  $\frac{1}{2}$  S. from Cape May light, 15 or 18 miles distant, lies Five Fathom Bank, with not more than 12 feet water on it. The south point bears E.  $\frac{1}{2}$  S. from Cape May, and from Cape Henlopen it bears E. by N. 30 to 32 miles distant, and ranges N. N. E. and S. S. W. It is dangerous for large vessels.

**LITTLE EGG HARBOR.**—During the winter season, it frequently occurs that vessels are prevented entering the Delaware or Sandy Hook, by violent north-west winds, and often driven off the coast into the Gulf: to remedy, so far as possible, this inconvenience, the Author inserts the directions, which will enable them to make a safe harbor, viz.

Running through the Sod Channel, keep within 30 or 40 yards of Small Point, and you will have 2 $\frac{1}{2}$  fathoms; pass the point, then gradually haul round, giving the breakers a small berth; or steer in for the beach, when you are opposite Tucker's house, until you are in 4 fathoms, then steer W. S. W. which course will carry you through the same channel.

The following described Buoys are placed at the entrance of Little Egg Harbor:

One Spar Buoy in the middle of the Sod Channel, a little outside the bar or breakers.

One Spar Buoy in the same channel at the point of Sods, upon the north side of the main channel. The Buoy at the point of Sods upon the north side of the main channel, bearing S. W. from the buoy on the bar, both lying in 2 $\frac{1}{2}$  fathoms.

One Spar Buoy upon the point of Hugh's Bar, on the west side of the main (or east) channel, bearing from the buoy on the point of Sods, W. N. W.

One Buoy at the middle of the East (or main) channel, a little outside the Bar (or breakers) in 2 $\frac{1}{2}$  fathoms water.

One Spar Buoy at the point of the Round Shoal in 2 $\frac{1}{2}$  fathoms water, upon the north side of the East channel, bearing from the outward buoy in the East channel, W. S. W.

**ABSECUM INLET.**—Absecum lies 5 $\frac{1}{2}$  miles S. W. from Little Egg Harbor. Off Absecum, from East to E. by S. 3 miles, lies a Shoal, having on it several lumps, on which there are only 10 feet water; the ground is broken, having between the lumps, 4 and 5 fathoms. On this Shoal the ship *Citizen* was lost in 1822.

*To enter the Harbor.*—Bring the house which is on the starboard hand point, to bear N. W. and steer directly for it, until within one fourth of a mile from the house, when you must steer north till you get to the Marsh, where you may anchor in from 3 to 6 fathoms; depth of water on the bar at low water 9 feet, common rise of tide 5 feet.

If you should pass Nantucket Shoals in 38° N. lat. or 38° 30' or 39° 00' or 39° 30', you will, if possible, observe when you leave the Gulf Stream, from which, about 10 leagues, you may begin to expect soundings, and a S. W. current, as soon as you get soundings; then the observation by lead and line, is to aid the navigator.

If you are beating to windward, off the Hook, waiting for a pilot, or for a wind (night or day) in standing to the northward, when you suppose the lighthouse of the Hook bears W. by S. it is near enough. When you approach Long Island, the soundings are fine white sand and small pebbles; but on the Jersey shore the soundings are coarser and darker. There is what is called a Hook Channel in this channel; the soundings are mud and sand.

W. S. W. and E. N. E. moon makes full sea at the Hook. Variation 4° W.

\* **CAPE MAY LIGHT.**—Vessels approaching the Delaware by Cape May, will get the light to bear W. N. W. in 4 or 5 fathoms, then run for it, and make a safe entrance into the Delaware, clear of all shoals, with vessels drawing 12 or 13 feet water.

Running for the light keep about two miles to the northward and eastward of it, till about three quarters of a mile from the shore, where is a windmill and several houses, occupied by pilots principally. From this you must keep the shore close on board,

\* Cape May lighthouse is on the extreme southwest point of the Cape, at the entrance of Delaware Bay: its elevation from the sea, is about 80 feet; contains a revolving light, of fifteen lamps, and makes a revolution in three minutes; its intervals of darkness and light are varied in proportion to the distance that vessels are from it. In passing the light, it may be seen, with a clear horizon, from 15 to 25 miles. It bears N. E. by N. from Cape Henlopen light, distant about 12 $\frac{1}{4}$  miles. Brandywine lighthouse bears N. W. by W.  $\frac{1}{2}$  W. distant about 9 $\frac{1}{4}$  miles.

There is good anchorage and harbor under Cape May light, with the wind at N. or N. N. E. and after passing the light and keeping the land on board in 3 to 5 fathoms water, vessels will find safe anchorage, and a good harbor, with the wind at the eastward.

† As soon as in sight of the light, and in want of a pilot, you had better hoist some signal, as those who do not, are considered not in want of one.

when you will be in 5 fathoms water, till you double round the Cape, when you will leave the Great Shoal on your larboard hand, over which it continually breaks, when covered, bearing S. E. by E. from the light, distant  $1\frac{1}{2}$  mile, bare at low water. After you have doubled the Cape, steer N. till the light bears S. E.  $\frac{1}{2}$  S. when you must steer N. W. till you deepen into 7 and 8 fathoms. In running the above course, you will have from 5 to  $2\frac{1}{2}$  fathoms, before you come into 8 fathoms, which is three leagues distant from the light. After you have got into 8 fathoms, you will immediately come into 3 fathoms, when you must steer N. W. by W. 5 leagues, which will carry you into the main channel, between the Brandywine Lighthouse\* on your larboard, and Cross Ledge on your starboard hand, bearing N. N. W. and S. S. E. from each other, distant 3 leagues. The lighthouse on the Brandywine is  $1\frac{1}{2}$  mile upon the shoal, above the S. E. point of it. The outer extreme of the Brown and Brandywine Shoals is about 3 miles.

Cross Ledge has a Beacon Boat with one mast, moored on it in summer; and in winter a Buoy.

On the first of the flood, the tide sets to the westward, and on light winds should be guarded against, by steering from one to two points more to the eastward, and on the ebb the contrary; this course will keep you from the shears about  $1\frac{1}{2}$  mile.

In running the above course, you will have 3,  $3\frac{1}{2}$ , and  $2\frac{3}{4}$  fathoms, till you come near the main channel, when you will deepen into 5 fathoms, which is a swash that runs up to the eastward of the Cross Ledge; still keep your N. W. by W. course till you have crossed this swash, when you will shoal your soundings into  $2\frac{1}{2}$  fathoms, and then deepen into 7 fathoms, which is the main Ship Channel, when you must steer N. W. till you have only 5 fathoms, which is on the Fourteen Feet Bank, (which has a buoy on the S. S. E. end) and then alter your course to N. N. W. for Cross Ledge. One league distant from this ledge lies a Shoal, called Joe Flogger, bearing W. S. W. from the buoy.

**CAPE HENLOPEN LIGHTS.**—Bring Cape Henlopen Light to bear W. and run for it till within two miles; when abreast of it, you will have 15 or 16 fathoms water. After you have passed it, steer W. S. W. till you bring it to bear E. S. E. where you may anchor in 3 or 4 fathoms.

E.  $\frac{1}{2}$  S. from Cape Henlopen, 25 miles, is a Shoal, with 4 fathoms on it, gray sand.

Entering Lewistown Roads, you will observe the depth of water, at low tide, on the piers deposited at the Breakwater, is reduced to 12 feet, and that in order to mark the situation of these piers, and to render secure the approach of all vessels to the roads off Lewistown, twelve Spar Buoys have been anchored round the piers; and Two Signal Lights, fixed on the shore abreast of the piers, will be kept burning all night during the winter season.

On approaching Lewistown Roads, when you have the Signal Lights on the shore abreast of the piers in range, avoid bringing the Beacon Light on the pitch of Cape Henlopen to bear S. E. by  $\frac{1}{2}$  E. for at this bearing, and the Two Signal Lights in one, you will be in danger of the sunken piers.

There are now two hundred yards of the Breakwater five feet above high water, and a continuance of four hundred yards at the south part a wash at common high tide, making a range of protection in length, six hundred yards. At the lee Breaker, about sixty yards are above high water, and two hundred and fifty yards at the east part, a wash at common high tide, making a protection of three hundred and ten yards. There is no difficulty with common attention, in running into the anchorage to the southward of the

\* The lighthouse on the Brandywine Shoal is entirely destroyed.—The Light Boat is anchored on the West side of the shoal, bearing from Cape Henlopen N. by W. distant 12 miles, and from Cape May W. N. W. it shows two lights on separate masts: it is only anchored there from the 10th of March to the 10th of September.

† Cape Henlopen lies in lat.  $38^{\circ} 47'$  N. and in long.  $75^{\circ} 05'$  W. There is a lighthouse here, a few miles below the town of Lewis, of an octagon form, handsomely built of stone, 115 feet high, and its foundation nearly as much above the level of the sea, containing a fixed light. The lantern is between 7 and 8 feet square, lighted with 8 lamps, and may be seen in the night, 10 leagues at sea. East of this lighthouse, is the Hen and Chickens Shoal, after described. The nearest part of the Overfalls, which has on it from 2 to 5 fathoms, bears N. E. by N. from the land, distant  $4\frac{1}{2}$  miles; the outer point N. E. by E.  $\frac{1}{2}$  E. distant 5 miles. When the main lighthouse bears about S.  $\frac{1}{2}$  W. distant  $3\frac{1}{2}$  miles, then the lighthouse on the Brandywine Shoal bears N.  $\frac{1}{2}$  W. distant  $11\frac{1}{2}$  miles. This course will take you three quarters of a mile to the S. E. of the buoy of the Brown.

‡ NOTICE TO MARINERS.—A Beacon Lighthouse has been erected, and is now lighted with a brilliant fixed light, that can be seen six leagues. It stands on the extreme north end of Cape Henlopen, very near the beach. It bears N.  $5^{\circ}$  W. three fourths of a mile from the Old Lighthouse. Ships running in for Old Kiln Roads, may, when the Beacon Light and the lighthouse are in one, approach the Beacon Light within a cable's length; then steer W. N. W. until the Old Lighthouse bears S. E. and anchor in 4 fathoms good holding ground.

from the Old Lighthouse.  
the lighthouse are in one,  
until the Old Lighthouse

Breakwater, even in a gale of wind, either between the two works, or by the passage to the S. E. of both. There is to be a signal light kept on the N. W. end of the Breakwater, (it is now on the Brig.)

In approaching from sea and going in by the south passage, give the Beacon Light on the pitch of the Cape a berth of from four to five hundred yards, and when you bring the west end of the Breakwater to bear N. W. steer for it, and anchor in a line between it and the Government House on the beach, as close on the works as you can with safety, the light on the west end bearing about N. or N. by W.

**FIVE FATHOM BANK.**—Vessels bound into the Delaware, coming from the northward, or having fallen to the northward of Cape Henlopen, should be careful not to approach nearer than 12 fathoms water, until they have got into the latitude of said Cape, to avoid the Shoal called the Five Fathom Bank, on which a light vessel, having two masts, with a lantern on each, is moored in  $7\frac{1}{2}$  fathoms water, Cape May light-house bearing W.  $20^{\circ} 30'$  N. distant  $15\frac{1}{2}$  miles; the centre of the shoalest ground on which is found 12 feet water, bears N.  $28^{\circ}$  E. from the light ship, distant  $2\frac{1}{2}$  miles. It extends N. by E.  $\frac{1}{2}$  E. and S. by W.  $\frac{1}{2}$  W. three fourths of a mile, and is half a mile in breadth, and very bold on its eastern edge, as there are 12 fathoms half a mile to the eastward of the shoal water.

Vessels coming from the northward should not run for the light ship, while bearing from it between N.  $14^{\circ}$  E. and N.  $41^{\circ}$  E. S. E. three fourths of a mile from the light ship, there are 5 fathoms water.

There is a passage inside of this Shoal, by taking your soundings from the land in 6 or 7 fathoms, but strangers in large vessels should not attempt it.

In running up the Bay, keep the old lighthouse to bear S.  $\frac{1}{2}$  E. until you pass the Beacon Boat with one mast, on the Brown, distant 9 miles, then steer N. by W. for the light boat near the Brandywine Shoal, until you come within half a mile, then steer N. N. W. for the upper part of the Brandywine, on which there is a Beacon Boat with two masts; then steer N. W. by N. for the lower part of the Fourteen Feet Bank, on which there is a small Buoy. When in 5 fathoms water, steer more northerly, until you deepen your water into 6 and  $6\frac{1}{2}$  fathoms; then steer a point more westerly, until you shoal again to 5 fathoms on said bank. By keeping off and on this bank you will be certain you are on the western side of the channel, until you come up abreast of the Cross Ledge, which is on the eastern side of the channel, and has on it a Beacon Boat, with one mast, in summer; and in winter, a Buoy. The channel here is very narrow, not more than  $1\frac{1}{2}$  mile wide. You will then be nearly up to the upper end of the Fourteen Feet Bank, where there is placed, from March to December, a Floating Light Vessel, with one light, which you leave on your larboard hand. From thence to Upper Middle, (near which is also a light vessel,) is four miles, on which there is a Buoy; it has 3 or  $3\frac{1}{2}$  fathoms at low water on it. You may go to the westward of the Middle in 4 or  $4\frac{1}{2}$  fathoms, soft bottom; to the eastward there are 6 or 7 fathoms, hard bottom. This is the main ship channel. The course from the Middle to Bombay Hook Bar is N. W. twelve miles; you must not approach this bar nearer than  $5\frac{1}{2}$  fathoms, as it is steep to. From Bombay Hook to Reedy Island, the course is N. W. distant eighteen miles.

**REEDY ISLAND TO PHILADELPHIA.**—Being up with Reedy Island, (which you leave on your larboard hand, to the north of which lies a shoal,) you have also, on the starboard hand, Fort Delaware, in which is a lantern erected to guide the mariner in his passage, and which you leave on the starboard hand. This Fort is built on the Pea Patch, and while passing it keep your larboard hand best on board till you bring the river to bear N. E. or N. E. by N., when you may stand up for New Castle. This place is 40 miles from Philadelphia. When you have passed it about a mile, you give the larboard hand a berth, as there is a flat shoal near half a mile off. If you have a fair wind you may keep in the middle of the river. This river winds from New Castle to Marcus Hook, from N. E. to E. N. E., distant 20 miles. Your course from this to Chester Island is N. E. by E. 4 miles, leaving said island on your starboard hand, and Ti-

\* The following lighthouses are erected in Delaware Bay:

One at Mispillion Point, which is on a dwelling house, and is only used for vessels bound into Mispillion Creek, and drawing less than 6 feet of water.

One at Mahon's Ditch. Mahon's Ditch is south of Bombay Hook Island; and this light is also on a dwelling house, and is useful to vessels drawing 10 feet, or less.

One on the northern point of Bombay Hook Island, which is likewise on a dwelling house, 36 feet above the sea.

And one on the northern side of the Bay, at Cohancy Point. This light is on the larboard side, at the entrance of Cohancy Creek.

There is also a lighthouse on the starboard side, at the entrance of Christianna Creek. Christianna Creek is about 4 miles above New Castle, and leads up to Wilmington, Delaware.

Fort Delaware has been destroyed by fire, which prevents a Light being exhibited.

nicum and Maiden Islands on your larboard hand, keeping your starboard hand best on board till you come up with \*Billing's Port, (which is 12 miles from Philadelphia,) when you will haul up for Mud Fort; but before you come up with this fort, you will see a black buoy in channel way, which you may go close to. Run direct for this fort, which is an E. N. E. course, till you are abreast of it, when you will see a small island on your larboard, and another on your starboard hand, which you must go between. When you have passed between these islands, steer E. by N. two miles, when you must haul up N. E. by N. for Gloucester Point, distant one mile, from which you must keep your larboard hand best on board, and steer N. 5 miles, which will carry you opposite Philadelphia.

**CAPE HENLOPEN TO †CAPE HENRY.**—This coast is studded with shoals, lying at a distance off, from 3 to 6 miles from the nearest point of land. The first is the Hen and Chickens, the northern point of which lies E., a little southerly, from Cape Henlopen light, and runs off S. E. by S. 5 miles; the Cap, on which there are 3 fathoms, lies S. E., easterly,  $6\frac{1}{2}$  miles; Indian River Shoal, on which there are 3 fathoms, S. by E.  $\frac{1}{2}$  E., 19 miles. The Little Gull Bank, on which there are 12 feet, lies E. 10 miles from the south end of Fenwick's Island. Within the Little Gull lies the Gull Bank and Sinepuxent Shoals. The next shoals are those generally known by the name of Chincoteague Shoals, and are clustered around the southern end of Assateague Island, on which there is a lighthouse containing a fixed light. These shoals have deep channels between them, but they are only attempted by the coasters. From Chincoteague to Cape Charles the land trends S. S. W.  $\frac{1}{2}$  W., with several barred inlets. The land is low, sandy and marshy.

*Remarks on the land from Cape Henlopen to Chincoteague Shoals.*

**CAPE HENLOPEN.**—Rehoboth Bay lies 9 miles to the southward of the lighthouse. This bay is only for small vessels that draw not more than 6 feet water. The north end of Fenwick's Island lies 10 miles to the southward of the lighthouse, and separates Delaware from Maryland. It has a grove of trees on it, and you will have 6 or 7 fathoms water within a league of the land, and a strong current setting to the southward. When you are within half a mile of Fenwick and Chincoteague Shoals, (Chincoteague Light, which is a fixed light, is on the S. E. point of Assateague Island,) you will have 12 fathoms water. The land from Chincoteague to Cape Charles makes broken land, with islands and several small inlets. There is a good harbor within Chincoteague Shoals, which goes by the same name. Matomkin Harbor has 12 feet water on the bar at spring tides. In running in for the bar, you will have gradual soundings from 7 fathoms. One cable's length from the bar, you will have  $2\frac{1}{2}$  to 2 fathoms.

In running over the bar, keep the north shore on board, and steer S. W. On the larboard hand, one mile from the bar, give the point a small berth, and round in to the N. W. and anchor in 4 fathoms water.

To the northward of the bar, one quarter of a mile, lies the wreck of a vessel. From the bar up the inlet, the navigation is very dangerous, being filled with oyster beds.

\* This is a high sandy point, and bluff.

† This Cape is on the larboard hand going in, and lies 12 miles S. by W. of Cape Charles, both of which form the entrance of Chesapeake Bay. On it is a lighthouse whose lantern is elevated 120 feet above the sea, containing a fixed light. The light cannot be seen at a great distance.

These are very dangerous harbors in a gale of wind, but you may ride along shore with the wind from N. W. to S. W. When the wind blows hard at N. E. or E. N. E., and you are in sight of Chincoteague Shoals, your only chance for safety is to stand to the southward; for you cannot clear the land to the northward, or go into the harbor of Chincoteague. When the wind is to the eastward, it is generally thick weather on the coast. After you pass to the southward of Chincoteague, steer S. S. W. for the lighthouse on Cape Henry, for the northern part of Machapungo Shoals lies 4 or 5 leagues to the northward of Smith's Island,\* and the southern part of them comes near abreast of said island. In steering to the S. W. westward, 5 or 6 leagues S. E. of Smith's Island, you will have 12 or 13 fathoms, and in some places 3 and 4 fathoms. When you are 20 leagues from the land, in the latitude of  $37^{\circ} 30'$ , you will have from 30 to 35 fathoms; but when to the southward of Cape Henry, you will have from 7 to 8 fathoms, within a league of the land, and a strong southerly current, which in general runs from 2 to  $2\frac{1}{2}$  knots an hour.

**CAVES OF VIRGINIA.**—In coming from sea and falling in to the northward, you may make an island called Hog Island, which has a shoal on the N. E. side, 5 miles from the island, and also Machapungo Island; the latter is a smaller island. Hogg Island and Smith's Island are about 6 or 7 leagues from each other, and the latter has a lighthouse on it. Hog Island is longer than Smith's; the trees stand more open, and are not so thick as on Smith's Island, and in going on to the southward from off Hog Island, you will make Sand Hills which lie between Hog Island and Smith's Island, being a sure mark you have not passed Smith's Island. Be careful not to come nearer than 7 fathoms when off the sand hills, as nearer than that depth the ground is broken.

Smith's Island is the first island after passing the sand hills above mentioned; on the northern end of it there are some straggling trees which appear like a grove, but which join on to the island. As you draw up with Smith's Island, you may haul into 6 and 5 fathoms, till you get near abreast of it.

Smith's Island is a good place to anchor under, with the winds from N. N. W. to W. N. W. and vessels often come to there if the wind is coming out from N. and westward.

If you intend to anchor there, bring the light to bear W. S. W. and run for it, and you may go in as near as your draft of water will admit, into three fathoms or less, if you choose; you will have blue mud and sand, and when you get under way from thence, steer S. by W. till you cross the north channel in  $7\frac{1}{2}$  fathoms; keep on until you raise your ground into 5 fathoms on the Middle Ground, then steer S. W. which will cross the Middle in 4 fathoms; keep on S. W. until you deepen into 6 or 7 fathoms, ship channel; then with a strong breeze steer W. by N. which will carry you across in deep water until you raise your ground on the Horse Shoe. When at anchor under Smith's Island, Cape Henry light bears about S. S. W.

In coming in from the southward, bound to Cape Henry, keep in 7 fathoms until you begin to draw up with False Cape, which lies about 7 leagues from Cape Henry towards Currituck; then 9 to 10 fathoms, is full near enough to False Cape. After you have got to the northward of False Cape, you may then keep again in 7, 8, and 9 fathoms (ship channel) till you get up with Cape Henry. From off Poanoke the soundings along shore is hard sand all along until nearly up with Cape Henry, when it is sticky bottom, and you will be in channel way.

The shore between False Cape and Cape Henry makes in like a bay, something like Lynhaven Bay, and in thick weather a stranger might mistake it for Lynhaven Bay, and False Cape for Cape Henry, if it is so thick that the lighthouse on the latter cannot be seen; but in round False Cape it is all hard bottom, and in Lynhaven Bay it is soft or sticky bottom, and in some places very tough bottom.

The passage between Cape Charles and Outer Middle is little known, and not frequented by large vessels. It is only used by small vessels of 3 or 10 feet water.

**HAMPTON ROADS.**—When abreast of Cape Henry light, steer W. by N. or W.  $\frac{1}{2}$  N. till you get on the Horse Shoe, in 5 fathoms, sandy bottom. There are no soundings at 5 fathoms on those courses between Cape Henry and the Shoe. The first soundings on the Shoe, on those courses, are 6 to 7 fathoms, a sticky or tough bottom, and the distance about 4 miles from Cape Henry Light, but the 5 fathoms sandy is about a mile farther on the Shoe (say about 5 miles from Cape Henry Light) where vessels can anchor. Then steer west until you get on the south side of the channel, for an ebb tide; but tide aflood, steer W.  $\frac{1}{2}$  N. or W. by N. Those courses will carry you into 5 fathoms on the

of Cape Charles, both  
lantern is elevated 120  
great distance.

\* On Smith's Island, which lies north easterly from Cape Charles, a lighthouse is erected, showing a revolving light, distinguishing it from that on Cape Henlopen, which is a fixed light, as described in note to page 220, and the one on Cape Henry, described above, which also exhibits a fixed light.

south side; then you may steer W. N. W., which will carry you into 6 or 7 fathoms, sticky bottom, until nearly up with Willoughby's Point, and when you deepen your water to 9 or 10 fathoms on your W. N. W. course, you have passed the bar off Willoughby's Point; then bring †Old Point Comfort Light to bear west, or W. by S., and run for it, until nearly up with it (say within half a mile) but take care and go no nearer to Hampton Bar on the north side, than 10 fathoms, it being steep to; then haul up S. W. by W. till you bring Old Point Comfort Light to bear about N. W.; then steer S. W. for the Roads, 5, 6, or 7 fathoms, good anchoring, but go no nearer to the south shore than 9 fathoms, lest the bar off Sowell's Point hooks you in. Should you, after passing Willoughby's Point, fall into 14 or 15 fathoms, Old Point Comfort Lighthouse bearing W. N. W., steer up S. W. by W., but go no nearer to Hampton Bar on the north side than 10 fathoms, it being steep to, until you pass Sowell's Point, when Old Point Comfort bearing N. E. you will fall into 7, 8, and 9 fathoms good anchoring. When up with Old Point, steer S. W., which course continued will bring a low tree half way between the lighthouse and the house occupied by the Colonel, which will carry you inside Sowell's Point; then haul to the southward till the light boat off Craney Island bears S. by E., which course you continue till up with her, leaving her on the starboard hand, but be careful not to shut the lighthouse in with Sowell's Point, till the light boat on Craney Island bears S. by E.

If requisite, when entering the Capes, and advisable to anchor in Lynhaven Bay, you may run in, with the lighthouse bearing W. by S., as this course will lead to the channel-way, in from 7 to 10 fathoms, sticky bottom. It is then proper to take soundings towards the southern shore; and in order to this, steer west until you have advanced to a short distance from the lighthouse; then rounding the point you may haul in the bay, and drop an anchor as most convenient, in from 7 to 4 fathoms.

REMARKS.—In steering W. N. W., as before mentioned, should you deepen your water to 9 or 10 fathoms, or more, you may know you have passed the bar off Willoughby's Point.

If going along on the south side, you shoalen your water from 5 fathoms, haul off to the northward and keep in about 6 or 7 fathoms, till you judge yourself nearly up with Willoughby's Point; go no nearer to it than 7 fathoms. By hauling to the northward you will deepen the water. On the Horse-shoe side the bottom is hard sand, and on the south side it is soft bottom, until drawing on to Willoughby's Point, where it is hard: therefore, being on the south side, where the ground is soft, you may always know drawing up with Willoughby's Point as soon as you get hard sandy bottom. Then haul off as before directed, for Old Point Comfort Light.

OF THE THIMBLE.—It is a small lump S. W. from the Horse-shoe, with about 2 fathoms water on it. It is steep to, say 7 fathoms; but, being small, it is quickly passed. It lies a little below Willoughby's Point, on the opposite side, to avoid which is the reason why it is necessary to get soundings first on the Horse-shoe. The Thimble is about  $1\frac{1}{2}$  or 2 miles off the shore. Near the Thimble you will have sticky bottom, and on the Horse-shoe hard sand.

†Back River Point Light, which is revolving, bearing N. N. W., you are abreast of the Thimble. The light bears N.  $\frac{1}{4}$  W. from the floating light off Willoughby's Spit,  $3\frac{1}{2}$  miles distant.

There is good anchoring all over the Shoe, from  $3\frac{1}{2}$  to 4 miles from land, to the tail or outer part of it, and higher in shore for small vessels.

As the setting of the tide varies much at different stages thereof, attention should be paid as well to the bearing of the light as to the soundings, when running up from the cape to Willoughby's Point, for fear you cross the channel.

\* A floating light vessel has been stationed off Willoughby's Spit, in  $3\frac{1}{2}$  fathoms water:—

Old Point Comfort Light bearing W. $\frac{1}{4}$ N., distant.....	2 miles.
Black River Point Light, N. $\frac{1}{4}$ W.....	$3\frac{1}{2}$ do.
Cape Henry Light, E. S. E.....	13 do.
Willoughby's Bluff, S. S. E.....	2 do.
The Rip Rap, W. S. W.....	3 do.

Vessels going out or coming into Hampton Roads, should not pass to the southward of the light vessel. She may be distinguished from the light at Old Point, by having two lanterns—one more elevated than the other. A bell will be rung in foggy weather.

† Old Point Comfort Lighthouse lies on the starboard hand, bears W. N. W. from Cape Henry Light, 5 leagues distant, and is the guide to vessels bound to Norfolk or James River. It shows a fixed light.

† On Back River Point a lighthouse, showing a revolving light, elevated 40 feet above the river, is built, which serves as a guide to vessels navigating the river.

into 6 or 7 fathoms, when you deepen your sound the bar off Willoughby's Spit, or W. by S., and haul up to; then haul up to N. W.; then steer to nearer to the south. Should you, after Old Point Comfort Lighthouse, when Old Point Comfort Bar on the north point, when Old Point anchoring. When up low tree half way beach will carry you in at off Crane Island, when on the starboard side, till the light boat

Lynhaven Bay, you will lead to the channel to take soundings. When you have advanced to Lynhaven Bay, you may haul in the bay,

From Hampton Roads to Norfolk the channel is intricate to strangers, and we should recommend anchoring in the Road, but the following directions, strictly followed, will carry them to Norfolk:

As you approach Old Point Comfort, you will discover a low tree standing to the westward of the lighthouse; steer S. W. till you bring this tree over the house occupied by the Colonel, which is the first house to the westward, and painted white; continue this course till up with Sowell's Point, when you may haul to the southward till the light boat off \*Crane Island bears S. by E., observing at the same time not to shut Old Point Light in with Sowell's Point, and continue steering S. by E. till you pass the light boat, leaving her on your starboard hand; then take your soundings off Lambert's Point, on the larboard hand, in 4 fathoms, and steer S. S. E. till you get into 5 fathoms; then S. E.  $\frac{1}{2}$  E. till you get up to the Fort, 3 miles distant, having from 5 to 6 fathoms.

**CAPE HENRY LIGHTHOUSE.**—When coming from sea in the latitude of Cape Henry, you meet with soundings about 25 leagues off, which you may observe by the color of the water. In the south edge of the bank you will have 40 fathoms water, which will shoal to 20, and still decrease as you approach the shore, generally sandy bottom. In clear weather, you may see the land when in about 10 or 11 fathoms, regular soundings, at which time you will be about 5 leagues to the southward of it. To the northward of the land, in 6 fathoms, the soundings are irregular and the ground coarser. In coming in, with the wind northwardly, you must be careful of the outer part of the Middle Ground, which lies 9 miles E. N. E. from Cape Henry, and 7 miles S. E. by E. from Cape Charles. You may go so near it as to bring Cape Henry to bear W.  $\frac{1}{2}$  S., which will carry you round the tail of it, in 4  $\frac{1}{2}$  or 5 fathoms water, when you will deepen into 11, 12, or 13 fathoms, and then haul away for the bay, the cape being steep to. The channel between the Cape and Middle Ground, is about 4 miles wide, and 5 and 6 fathoms water close to the latter. When Cape Henry Lighthouse bears W. N. W. W., distant about 3 leagues, it appears thus:

With a fair wind you may bring the lighthouse to bear west; but if you have the wind ahead, and are obliged to turn in, you may stand to the southward till the lighthouse bears N. W. by N., and to the northward till it bears W. by S. You will have 9 or 10 fathoms within a mile of the lighthouse, and from 6 to 5 fathoms close to the Middle Ground.

**HORSE-SHOE.**—In coming in by Cape Henry, and no pilot, with a free wind, commanding breeze, tide either ebb or flood, bring Cape Henry Light to bear E. S. E. and steer W. N. W., and you will get soundings on the Shoe, 7, 6, to 5 fathoms, as after described; after that, make towards the south side, and follow directions given for Hampton Roads.

**TIDE.**—The flood tide runs in round Cape Henry and Lynhaven Bay, until 11 o'clock, on the full and change, and out of the way of the Chesapeake stream it flows at 10; in Hampton Roads, at 10  $\frac{1}{2}$ . The tide varies considerably in its direction, according to the time from ebb to flood. The ebb from James and York Rivers sets over the Middle Ground to the eastward, which renders navigation thereabout dangerous in the night.

**NEW POINT COMFORT.**—When you bring Cape Henry to bear S. S. E., you may steer N. N. W. 8 leagues, which course and distance will carry you to New Point Comfort. If you wish to anchor at New Point Comfort, which bears from the Cape about N. W. by N., distant 8 leagues, you must take care of the spit that runs off the point about S. E. 2 miles. Keep to the westward of this point of sand, and you may run in under the point, and anchor in 4 or 5 fathoms water, fine bottom, where you will be secure from northerly or N. E. winds.

Vessels at anchor in Mobjack Bay, are exposed to the wind from E. S. E. to S. E. and I would therefore recommend in that case to go into Severn River, where they will lie safe from all winds. Your directions for this port are to bring the south point of New Point Comfort to bear E. by S. and steer W. by N. 2 leagues, which course you will continue till Severn River bears W. S. W., when you must steer into the river W. S.

\* A light vessel, having one light at her masthead, has been placed at the extremity of Crane Island Flats, in Elizabeth River, in 4  $\frac{1}{2}$  fathoms.

† On New Point Comfort, which forms the eastern side of Mobjack Bay, is a lighthouse containing a fixed light.

W. or S. W. by W. which will carry you safe, where you may lie land-locked from all winds. In running for this river, you will make two bunches of trees on your larboard hand, which at a distance appear like two islands, but as you approach them you will find they are on the main land. In going into this river, you must keep your lead going, keep in the middle, and go between two points of marsh, and you will have no more than 3 fathoms between New Point Comfort and Severn River, muddy bottom. You may go to sea from this river with the wind from S. W. to N. W.

In running from York River, when you open Iron Point east of New Point Light, and bound up the bay, you will pass York Spit, in 3 fathoms water.

**CAPE HENRY UP THE BAY TO BALTIMORE.**—When you come in from sea, and are bound up the bay, bring Cape Henry Light to bear S. S. E. and steer N. N. W. about 4 leagues, which will carry you to the northward and westward of the Middle Ground, that lies between the two capes, and when you have Smith's Island (off Cape Charles) to bear E. by S. or Back River Point Lighthouse W. S. W.\* you will be to the northward of the shoal part. If you have the wind ahead, and are obliged to turn to windward, you must not stand further to the eastward after the lighthouse (or the cape) bears S. S. E. as the western part of the Middle Ground is steep. In standing to the westward you may go into 2½ and 4 fathoms without danger; but in standing to the eastward, you must not go into less than 8 fathoms, as you will be near the Middle Ground.

After you are clear of the Middle Ground, as before directed, and have the cape to bear S. S. E. and a fair wind, you may steer up the bay north: come not to the westward of north till you have Gwin's Island, which lies off Hill's Bay, 3 leagues north from New Point Comfort, to bear west, to avoid a dangerous shoal, called the Wolf Trap, which lies N. N. E., 2 leagues from New Point Comfort Light, and S. E. 2 leagues from Gwin's Island, which is small. From the Wolf Trap steer north about 11 leagues, which will carry you to the mouth of the Potomac. In running the above course and distance, you will have from 10 to 4 fathoms before you come up with the Tangier Islands, which lie off the mouth of the Potomac River. If you should come into three fathoms, as you approach these islands, you may haul a little to the westward, when you deepen your water. Off Watts' and Tangier's Islands the soundings shoalen gradually.

If you want to go into Rappahannock River, off which lies a light vessel, which is about 5 leagues to the northward and westward of New Point Comfort, and 1½ league from Gwin's Island, you must bring the light boat to bear N. W. and run for it, leaving it on the starboard hand, where you will have from 7 to 3 fathoms.

Windmill Point is remarkable, and it appears, when bearing W. ¾ S., 7 miles distant, as here represented.

*View of Windmill Point, at the North Entrance of the Rappahannock.*

This point is just half way between New Point Comfort and Smith's Point. The Windmill Reef now extends 2 miles from the Point to the S. E. by E., and forms a broad shelf of 2½, 2, and 1½ fathoms, thence shoaling to the dry shore, on the end of which is a floating light, bearing S. E. by E. from Windmill Point, two miles distant, and showing one light.

As you come up with the larboard head of the river, keep your soundings on the larboard hand from 3 to 7 fathoms, and not deepen your water more than 7 fathoms to the northward, to avoid a long spit of sand that runs off 2 miles S. E. from the northern head of the river, which is very steep, but keep round the southern head, in the above depth of water, where you may anchor in 7 or 8 fathoms, good bottom, and lie safe from all winds.

If you wish to go into Tangier Sound, bring Windmill Point to bear S. W. by W.; steer in N. E. by E., and you will get soundings on the Tangier Bar in 5 fathoms; the

\* The lighthouse on Back River Point is a revolving light, and bears from

Old Point Comfort.....	N. N. E.....	5½ do.
New Point Comfort.....	S.....	13¼ do.

**DIRECTIONS** for coming out of the Susquehanna River with small draft of water only. Keep the eastern ferry house opposite Havre de Grace (a stone building) astern, and passing near \*Point Concord Lighthouse, run for a large tree near the thoroughfare island of Specutia Island, until you just shut in two Lombardy poplars, or till you get Turkey Point and a gap in the Highlands south side of Elk River to range, nor for the last marks until you open a single tree on the Highlands, south side of Sassafras River, with the easternmost point of Specutia Island, then run for a red bank east side of the bay, having Landsdale's House, which is a large brick one above Havre de Grace, right astern, until you open a single tree, east end of a long ridge of black woods south side of Elk River with Turkey Point, then N. W. westerly for Poole Island; a short distance below, and on the starboard hand after leaving Point Concord, lies a shoal called Devil's Island, which at low tide is nearly out of water, and on the opposite side of the channel is a very extensive flat or shoal, which also must be avoided by making short tacks when beating in or out of the river.

### NAVIGATION OF THE PATAPSCO.

*Directions for Mariners, Bay Craftsmen, &c. for sailing up or down the Patapsco, and for passing through the Swash Channel.*

The Can and Log Buoys heretofore used to buoy off the Swash Channel and River Patapsco, having been removed, and spar or mast buoys adopted in lieu thereof, as being more conspicuous from their erect position, and showing a mast of from 9 to 20 feet above the water, it is conceived necessary to give due notice of the changes, viz.

The Buoys now moored are numbers 5, and from 11 to 20, and are painted, some of them entirely white, others entirely black, and others again black at the surface of the water and at the head, with white between. The white buoys designate the south or larboard side of the channel, coming up—the black buoys the north or starboard side—and the white and black buoy denote the knolls that lie in the channel way, or elsewhere, and to be avoided. Their particular positions are as follows:

No. 5.—A buoy painted black and white alternately on the edge of a hard knoll of 15 feet, immediately on the Ship Channel range, abreast of the easternmost Man of War Shoal, in 3 fathoms, sticky bottom.

No. 12.—A white buoy is placed on the larboard side of the channel, to mark the south-east bar.

No. 13.—Shows the starboard side of the channel, and is placed just at the edge of the 7 feet knoll.

No. 11.—A white buoy in 18 feet soft, on the outer edge of the Rock Point Shoal.

No. 14.—A white and black striped buoy, in 18 feet soft, on the edge of a hard knoll of 14 feet, between North Point and Rock Point.

No. 15.—A black buoy, in 18 feet soft, denotes the shoal off North Point.

No. 16.—A white and black striped buoy, in 18 feet, just outside of the Rock Knolls.

No. 17.—A black buoy, in 18 feet soft, on the outer edge of the Sparrow's Point Knolls, of 12 feet hard.

No. 18.—A white buoy, in 4 fathoms soft, on the outer edge of the shoal, extending from Hawkin's Point Bar.

No. 19.—A black buoy, in 20 feet soft, on the outer edge of a shoal of 14 feet hard, extending from Sellar's Point Bar.

No. 20.—A black buoy, in 18 feet soft, on the eastern extremity of the shoal, extending from the Lazaretto.

No. 22.—There is a buoy painted black and white alternately, on the sunken rock between North Point and Sparrow's Point.

**NOTE.**—No. 5 shows 12 feet above the surface of the water; all the others show from 12 to 14 feet, except No. 19, which does not show as high.

A good berth should be given to the stripe buoys, as they are expressly placed to mark the shoals.

The black buoys indicate the northern extremity of the channel.

\* Concord Light, at Havre de Grace, is a fixed light, the navigation to which, in passing together with the port, is fit only for vessels drawing not over 8 feet; the channel is narrow and crooked; on the shoals are only three feet water. It is impossible to give a stranger courses and distances, who must be guided altogether by the lead, and it should not be run in the night.

† On Poole Island is a lighthouse containing a fixed light; it shows the way through the western channel, in which there are only 7 feet water. Few vessels take this channel, as the eastern is the safest, having from 3 to 7 fathoms water.

The white buoys indicate the southern extremity of the channel, so that it is dangerous to attempt to pass to the northward of the first, or to the southward of the latter.

Besides the above enumerated buoys, there will be placed a black and white buoy at the old wharf, abreast of Fort McHenry, which will be No. 21.

Spar or mast buoys will also be placed as soon as they can be completed, to buoy off the ship channel, leading from the Chesapeake Bay into the River Patuxent, of which due notice will be given.

**NEW POINT COMFORT TO POTOMAC RIVER.**—From this point a spit extends S. E. 2 miles, which you will avoid by not going into less than 4 fathoms water. About 5 miles N. N. E. from New Point Comfort, lies the Wolf-trap Rock, on which there are 12 feet at common tides; between this rock and Point Comfort, there are 8 and 9 fathoms. From the spit, which runs off from New Point Comfort, to the entrance of Rappahannock River, the course is N. by W., and the distance 6 leagues. You may keep in 5 or 6 fathoms water. Near the Wolf-trap Rock there are 7 fathoms.

From the entrance of Rappahannock River, off which is a light vessel showing one light, to the flat which runs off from Smith's Point Light (which is the south side of Potomac River,) the course is N. by E., and the distance 6 leagues. You may run in 5, 6, or 7 fathoms water. When you draw near the shoal which runs off from Smith's Point, you should not go into less than 7 fathoms. This shoal extends about  $2\frac{1}{2}$  miles E. S. E. from Smith's Island; on its extremity there are only two fathoms water, and very near to it eastward, there are 10 or 12 fathoms. The mark for the shoalest part of this sand, is a house with a white chimney, standing among the trees on the shore within Smith's Island, open to the northward of the island, and bearing west. When this house bears W. by N., you are to the southward of the extremity of the shoal; and when it bears W. by S. you are to the northward of it. That which adds considerably to the danger of this shoal, in going either up or down the Chesapeake, is the broken islands which lie on the east side of the channel, and the flats of sand which extend from 5 to 8 miles to the westward from them.

The Tangier Islands lie to the southward of Cooper's Island, and the Tangier Islands and Watts' Island make the entrance of Pokomoke Bay, which bay separates Virginia from Maryland on the eastern shore.

Potomac River separates Virginia from Maryland; its entrance is formed by Smith's Point on the south side, and Point Lookout on the north side. The distance between these two points is about  $3\frac{1}{2}$  leagues. On Smith's Point is a lighthouse.

If you are bound to St. Mary's River, you must give Point Lookout, and also the shore about it, a good berth; and when you approach St. George's Island, you must keep nearer to the main than to the shoal, which extends from the Island. Your course into the river is N. W., and as it is all open to your view, you may anchor when you please in 5 or 6 fathoms water.

If you are bound to Wicomic, in Potomac River, your course from the east end of St. George's Island to Ragged Point is N. W.  $\frac{1}{2}$  W. and the distance 2 leagues. On the south or larboard side, there are flats lying off from the shore, which in some places extend one mile; come no nearer to them than 7 fathoms. In the middle of the channel you will have 11, 10, 13, 10, and 8 fathoms. You must give Ragged Point a good berth, to avoid the shoal, which extends from it nearly one mile. From Ragged Point to Clement's Island your course is W.  $\frac{1}{2}$  N., and the distance 2 leagues. In the middle of the channel you will have 6, 5,  $4\frac{1}{2}$ , and 7 fathoms water. On the south side, a little below Clement's Island, is Nomine Bay. From abreast of Clement's Island steer W. N. W. in 6, 5, and 4 fathoms water, until you have Wicomic River open; then pass pretty near to the island, which is on the east side of the entrance, in order to avoid the shoal which runs off from the point the west side. Steer about north into the river, and anchor on the south side of Newton's Point, in 5, or  $4\frac{1}{2}$  fathoms water.

**POTOMAC RIVER TO PATUXENT RIVER.**—From Point Lookout a flat runs off a considerable way, which you must be careful to avoid, by not coming any nearer to it than 7 or 8 fathoms water. Opposite this point, the flat of Tangier Islands extends so far to the westward as to narrow the channel of the Chesapeake to about  $4\frac{1}{2}$  miles. This part of the flat is steep, and has 13 fathoms close to it. About two leagues to the northward of Point Lookout is Point Again, off which, above 2 miles, there lies a shoal. About 3 leagues to the northward of Point Again, is Cedar Point. Between them, 7 or 8 fathoms is a good depth to keep in. Nearer to the flat on the east side, there are 10, 16, 9, and 11 fathoms.

Cedar Point is on the south side of the entrance of Patuxent River. The ground is low and sandy, and has some straggling trees standing on it. From this point, a flat extends to the eastward, and also to the northward. On this north side of the river there are high hills, called Cliffs, with trees on them; and from this side also a flat extends, but the shoalings on each side of the channel are gradual and the ground soft. In the

middle of the channel there are 8 fathoms water. Higher up is Ronsly's Point on the south side, and the Drum Point on the north side: the latter is a low sandy point. You may anchor without these points, or you may go further up the river, always observing the following general rule in all the deep bays throughout Virginia and Maryland, viz. to every point, more especially where the land is low, give a good berth in passing, because spits, or flats of sand extend from them, and consequently the water is shoal in such places.

**CAPE HENRY OR LYNHAVEN BAY, YORK RIVER.**—As Cape Henry S. S. E. would lead you near the tail of the Middle Ground, and as the proceeding with it at S. E. would carry you on the tail and north edge of the Horse-shoe, your keeping the Cape on any bearing between S. S. E. and S. E. will carry you through between the two shoals. On the tail, and along the north side of the Horse-shoe, the shoalings are gradual. With Cape Henry bearing S. S. E. or S. E. by S., steer N. N. W. or N. W. by N. until you bring Cape Charles to bear E. by N.: you are then to the northward of the Horse-shoe, and may steer N. W. or N. W. by W., according as you have the wind and tide. As the ebb sets strong out of the Chesapeake over the Horse-shoe, you must not, with a northerly wind and ebb tide, approach any nearer to the shoal than 5 or 6 fathoms water. When you have brought New Point Comfort to bear N. N. W. and Back River Light to bear S. by W., you are then on the tail of York Spit, in 3 fathoms water. When you are a little above Long Isle, you must not come any nearer to the shore than 5 fathoms, until you enter the river above the marsh; then keep in 9 or 10 fathoms, and run up and anchor between York and Gloucester, in what depth you please.

With a contrary wind stand towards the Horse-shoe in 4½ or 5 fathoms, and from it into 6½ or 7½ fathoms, until you are abreast of the entrance of Poceasin, where there is a gut of 7 fathoms, which runs close to the entrance; you should therefore be careful to avoid going too far in, and thereby getting on the tail that extends from Toes Marsh. When you have got thus far up, you should go no nearer to the shore on this side, than 7 or 6½ fathoms, all the way up to York Town. On the other side, you should not stand any nearer to the small isles on York Spit, than 10 or 11 fathoms. Close to the tail of this spit there are 6 fathoms; close to the middle of it there are 10 fathoms; and close to it, abreast of the islands, you will have 13 fathoms, and before you can get another east of the lead you will be ashore. When you have entered the river, you must not come any nearer to the flat than 8 or 9 fathoms water. This flat extends from the north shore, almost one third over the river.

**\*CAPE HATTERAS.**—This cape lies about S. S. E. 37 leagues from Cape Henry; between them lie the inlets of Currituck, which are shoal, and New Inlet, on which are 5 feet water. About 6 leagues N. by E. from the cape lie the Wimble Shoals, on which are 3 and 4½ fathoms water, extending N. by W. and S. by E. about 3 miles, and is about 3 miles wide. The inner edge of this shoal is about 3 miles from the shore, and the soundings between them 8, 10, and 7 fathoms. About 5 miles N. by W. from the north end of this shoal, and 3 miles S. E. from the north end of Hatteras Island, there lie some small knolls, on which are only 9 feet at low water.

Cape Hatteras Shoals extend 8 miles in a south-easterly direction, with 5 and 6 fathoms on the extreme parts. The most dangerous shoal lies in lat. 35° 10' N., the middle of which is 4 miles distant from the cape, and has barely 9 feet water. This is called the Diamond Shoal, between which and the cape there is a good passage for small vessels in moderate weather, or when the wind is off the land, but it would be always safest to go round the shoal in 10, 12, and 15 fathoms.

The lighthouse at Cape Hatteras exhibits a fine light when in order, and can be seen very plainly in 9 and 10 fathoms water on the outer part of the shoals, when only 10 feet above the level of the sea; but when on board a large vessel, it might be seen in 20 or 25 fathoms. The soundings from the cape are 2, 3, 4, 4½, 5, 6, and 7 fathoms, and then

\* On the pitch of this cape, (which is low sandy land,) a lighthouse is erected, painted white, 97 feet above the level of the sea, containing a fixed light. There is a good channel, three miles from the light, keeping the land on board. The light bears from the S. W. part of the outer shoals, N. by W. ½ W. and from the S. E. part, N. W. distant 3 leagues; from the S. W. part of the middle shoals, within which vessels bound along the coast generally pass, the light bears N. N. W.

The light at Cape Hatteras, being 95 feet above the level of the sea, will be seen from a considerable distance without the outer shoals, and to a vessel steering from Ocracoke W. by N., W. N. W., or even N. W. by W., the light on the cape will first show, and will continue to be seen till the light appears within the bar.

The point of Cape Hatteras having made out into the sea since the lighthouse was built, the light now stands 14 mile back from the point of land that makes out from it.

deepens to 9, on the S. S. E. part. There is a current with a south wind which runs N. N. E. two miles per hour, and with a north wind S. S. W. two miles per hour.

W. S. W. from Cape Hatteras, 8 leagues distant, is \*Ocracock Inlet, on the bar of which are 9 feet water; this bar is subject to change, and should not be entered without a pilot.

From Cape Hatteras to Cape Henry the ground is fine sand, and to the northward of Cape Henry, coarse sand with some shells among it.

It is high water at Cape Hatteras Shoals, on full and change of the moon, at 3 o'clock and 45 minutes, and the tide flows from 4 to 5 feet, being governed by the winds in the offing, and in easterly gales it runs several feet higher.

On a point of land on the south side of Pamlico River, 35 miles below Washington, running into Pamlico Sound, stands a lighthouse, 30 feet above the level of the sea, with a fixed light.

Vessels bound to Washington, from the S. W. end of Royal Shoal, on which is a light boat, will make their course good N. W. by N., which will bring them up the main channel of Pamlico River, and will be within a quarter of a mile of the light.

†CAPE LOOKOUT.—Cape Lookout lies in  $34^{\circ} 37' N.$  lat. and  $76^{\circ} 33' W.$  long., and the Cape Woods (where the lighthouse is) in lat.  $34^{\circ} 39' N.$  and long.  $76^{\circ} 32' W.$  The shoals extend from the cape 10 miles, in a S. S. E. direction, being broken ground as far as lat.  $34^{\circ} 28' N.$  In that latitude there are 14 fathoms water, and from thence to the Gulf Stream, the soundings are gradual, 95 fathoms: the tracks are faithfully laid down in the chart, (published by E. & G. W. BLUNT,) together with all the soundings from the outer part of the shoal to the edge of the Gulf Stream.

The outer part of Cape Lookout Shoals lies S. W.  $\frac{1}{4}$  W. 22 leagues from Cape Hatteras, and 22 leagues S. W.  $\frac{3}{4}$  W. from the outer part of Cape Hatteras Shoals. Seven miles from Cape Lookout Light lies a shoal which is dry at low water, bearing S.  $\frac{1}{4}$  E. from the light; the sea breaks constantly S. E. from this shoal for the distance of 2 miles, which is the S. E. point of breakers. Between this shoal and the shore there are numerous spots, on which are  $1\frac{1}{2}$  and  $1\frac{1}{4}$  fathoms; south of this shoal the least water is  $2\frac{1}{2}$  fathoms. On the eastern part of Cape Lookout Shoals there are  $2\frac{1}{2}$  fathoms, near them; on the northern and southern sides, are 4, 5, and 9 fathoms. On the N. and E. of Cape Lookout Shoals you will have 7 and 8 fathoms, dead, dark, broken shells, with sand.

Old Topsail Inlet, or entrance to Beaufort, lies about 3 leagues W. N. W. from Cape Lookout. It has  $2\frac{1}{2}$  fathoms water, but the eastern side of the entrance is formed by a long spit extending westward. The channel lies first N. E. by E. and then alters gradually round the flat, which extends from the larboard or western side to the N. N. W. In proceeding up to Beaufort, you will have 2, 4, and 3 fathoms in the channel, and may anchor in 3 fathoms at low water.

If you wish to come within the shoals of Cape Lookout, after making Beaufort, keep along the shore at the distance of 2 miles, until you come up with the point of sand forming a pretty good harbor, with the wind from the N. W. to E. for small vessels. If bound to the northward, keep, as near as you can judge, the same distance, or a little less, from the beach, until you bring the lighthouse to bear N. W. by N.; you will at that distance have not less than quarter less three; then keep N. E., and you will deepen to 5 and 6 fathoms in a few minutes.

\* At the entrance, on Ocracock Island, a lighthouse is erected, exhibiting a revolving light, which you leave on your starboard hand entering the Inlet. The time of each revolution is two minutes. It is elevated 75 feet above the water.

A floating light is stationed within the point of the 9 feet shoal, near Peach's Hole Swash. She is moored in 2 fathoms water, with the light on Ocracock bearing S. E., distant  $2\frac{1}{4}$  miles; Shell Castle bearing S. W.  $\frac{1}{2}$  W.  $4\frac{1}{2}$  miles, and the light boat at the S. W. Straddle W. by S. 9 miles. A bell will be tolled at intervals in thick and foggy weather.

A floating light is also moored at the mouth of Neuse River. She is moored in  $4\frac{1}{2}$  fathoms water, sticky bottom, near the upper edge or western side of the shoal, extending out from the point of marsh with the point bearing due south, distant about three miles; Gum Thicket, bearing S. W.  $\frac{1}{4}$  W.; Brant Island due N.; Swan Island S. E., and the South West Straddle Light Boat due east.

A bell of 200 lbs. weight will be tolled at intervals, in thick and foggy weather.

† Cape Lookout Lighthouse is painted with red and white stripes horizontally, and can be seen 16 or 18 miles, and resembles a ship under sail. It contains a fixed light, elevated 100 feet above the level of the sea. The house is surrounded by a small growth of trees, from which a bold sand beach extends in a S. E. direction about 3 miles, in the centre of which are small hillocks of sand. This light, although seen clearly all night, until near the approach of day, cannot then be discerned, owing, it is thought, to a mist that rises between the vessel and the lamps. It is judged imprudent to approach the shoals of Lookout in the night nearer than 7 fathoms on the east, or 10 on the west side.

West, 10 leagues from Cape Lookout, lies Bougue Inlet, on which are 8 feet water; W. by S.  $\frac{1}{2}$  S. 4 $\frac{1}{2}$  leagues from Bougue Inlet, lies New River, on which you have 8 feet water; S. W.  $\frac{3}{4}$  W., 6 leagues from New River Light, lies New Topsail Inlet, on which are 10 feet water; S. W.  $\frac{1}{4}$  W. from New Topsail Inlet, 3 leagues distant, you make Deep Inlet, on which are 7 feet water; S. S. W. from Deep Inlet, 6 leagues, lies New Inlet, on which are 7 feet water. This inlet is between the sea coast and N. E. end of Smith's Island. It will admit vessels drawing 6 feet, and is about 2 miles wide at its entrance, having 7 feet water, at low tide, over the bar. It continues its breadth to the flat, and is navigable for large vessels 21 miles from its mouth, and 20 miles to Wilmington, to which town vessels drawing 10 or 12 feet can reach without any risk. S. by E., 8 leagues from the New Inlet, will carry you into 15 fathoms, south from the Frying-pan Shoals.

**CAPE FEAR LIGHTHOUSE.**—Near the western bend of the Frying-pan Shoal, about 15 miles from the land on the S. W. end of Smith's Island, Bald Head Lighthouse is erected. It is painted black, in order to distinguish it from the lighthouse on Federal Point, from which it bears about S. W. by S. distant 8 $\frac{3}{4}$  miles, and stands one mile from the sea, 90 feet high, and contains a fixed light. The lamps are 110 feet above the level of the sea, and 50 feet above the tops of the trees which stand on the hills between the light and the sea. Smith and Oak Islands form the main entrance into the river.

To go over the main bar, bring the lighthouse to bear N.  $\frac{1}{2}$  E. The buoy is within the bar, close to it, and on the western side of the channel. From the buoy the lighthouse bears about N. N. E., distant one and a half mile. On the bar, at high tide, you have 14 $\frac{1}{2}$  feet, and its rise is 5 feet. From the point of the cape the lighthouse bears N. W., distant 4 miles, and from the extremity of the Frying-pan Shoal, N. W. by N.  $\frac{1}{2}$  N., 5 leagues.

The general direction of the land from Bald Head Lighthouse to Little River, (thirty miles from the bar,) is W.  $\frac{1}{2}$  S. From the western projection of Frying-pan Shoals, to the mouth of Little River, the soundings are from 9 to 10 fathoms, sometimes sand, and sometimes rock.

It may be necessary to observe to strangers, that, in passing the shoals, especially in a dark night, it is most prudent to steer W. in lat. 33° 20' or 25' at most, until they shoal their water to 7 or 8 fathoms; by doing this they may be sure of being to the westward of the bar.

Your course from Cape Fear Bar, when in 9 fathoms water, to clear Cape Roman Shoal, is S. W., and distance 72 miles. When sailing towards these coasts, it is prudent to keep nearly a degree to the southward of the latitude of the place you intend to make, until you reckon yourself on the edge of the Gulf Stream, when you must be directed by judgment, according to circumstances. Do not, if possible to avoid it, sail to the northward of 33° 20', or at highest, 33° 25', until you obtain 10 fathoms water. In this depth you will be within the south or outer end of the Frying-pan Shoal, which lies in lat. 33° 36'. In approaching the coast, in 33° 20', your first soundings will be from 30 to 35 fathoms; in this depth you will be very near to the edge of the Gulf Stream. You will have fine grey sand, with black spots, when you will get into 17 fathoms; there is a long flat in this depth of water. In steering west you will, for the first 5 or 6 leagues, shoalen the water very little. When you come in 14 fathoms, you shoalen your water quicker but gradually. You will see the land from 10 fathoms water, if the weather be clear, and may then be sure that you are within the Frying-pan, from the outside of this shoal. To the westward of north-west no land can be seen, when without the shoals.

The currents on the coast of North Carolina are governed mostly by the wind: during the summer months, the prevailing winds are south-westerly, and the currents then set the direction of the coast to the eastward, and when the southerly winds cease blowing, it changes suddenly to the contrary direction, which is a sure precursor of a north-east wind.

The land on Cape Lookout is very low, and cannot be seen more than a league in the clearest weather, from on board a small vessel.

[We decline giving directions for sailing into many ports in North Carolina, as all the harbors are barred, and always subject to alteration by every gale, particularly in the equinoctial storms; but the bars create only a part of the danger in sailing into those ports; it is the vast bed of shoals that lies within the bars, with their innumerable small channels, which give to tide so many different directions that even the pilots who live on the spot, find it difficult to carry a vessel in without some accident. Here also the westerly variation appears to cease, and at Savannah becomes easterly.]

**NORTH BAR OF THE NEW INLET.**—To enter, the marks are, to bring the west end of Buzzard's Bay point of sand on H. Helly's large white house in Smithville, and the bearings will be south-west by west, keeping the point of Smithville with these bearings until over the bar; then keep the spit of sand or beach that makes off from

\*Federal Point Light close on board, which will carry you into the river channel, where there is good anchorage 1 along the sand, in 3 and 4 fathoms water. On this bar there are 10 feet at low, and 12 at high water.

OLD BAR at NEW INLET, or as now called, THE SOUTH BAR.—In running in when the lighthouse on Federal Point bears W. or W. by S. you will make a thick and high hummock of woods, called Merryck's Wood Bluff, before you make the light; but should it bear to the north of west, you will make the lighthouse and bluff at the same time, the former of which may be seen in clear weather, about 15 miles, from a ship's deck, in about 10 or 11 fathoms water, and when first discovered, has the appearance of a distant sail. As you approach the light, the water becomes gradually shoal. In 4 to 5 fathoms water, one mile and a half from the lighthouse, bearing W. S. W. to W. there is good anchorage, soft bottom.

In running in, bring the lighthouse on with the south end of the barracks, which you will continue till over the bar, and near the beach, and so along the beach, until you are in the river. On the bar, at high water, 11 to 12 feet; at low water, 6 feet only. The depth of water, and channel, however, are subject to variation, so that it is not advisable for strangers, except in cases of necessity, to run in without a pilot.

THE MAIN BAR OF CAPE FEAR RIVER.—Vessels running down from the westward, should not approach nearer the Middle Ground, than to bring the Cape (which is the most eastern part of the Bald Head Woods) to bear E. by N. When you bring the lighthouse to bear N.  $\frac{1}{2}$  E. in about 4 fathoms water, steer immediately for it, which will be a little open to the eastward of a Pole Beacon, with a cask on the top, painted black. A continuation of this course will carry you clear of the Fingers, when you will see a buoy ahead, or a little on the larboard bow, which you will pass, leaving it on the larboard hand; as soon as you leave the buoy, steer N. W. or keep the breakers close on board the larboard side, when you will luff or bear away, as the water may deepen or become more shoal, to be ascertained by heaving the lead. This will carry you clear of a long sand shoal, that makes off the point of Bald Head, which is dangerous to ground upon, as the flood tide sets directly over, and breaks upon it with the wind from the S. W. In approaching Bald Head, caution is necessary, as the shoals on both sides are very steep, frequently from 6 to 3 fathoms at one cast of the lead. Keep close to this shoal by sounding as above directed, until you reach Oak Island, when you may steer direct for Smithville. Outside of the bar, in 5 or 6 fathoms water, the lighthouse bearing N. there is good anchorage in soft bottom. There is on the bar, at low water, 10 feet, and at high water 14 $\frac{1}{2}$  feet: and the sea is scarcely ever so rough as to prevent a pilot's boarding a vessel at the buoy.

OAK ISLAND CHANNEL.—Vessels drawing not more than 9 feet water, running into Wilmington through Oak Island Channel, may bring the easternmost part of the lump of trees on the east end of Oak Island to bear N. E. by E. and run for it, which will carry them over in the best of the water, 7 $\frac{1}{2}$  feet at low water, and 11 feet at high water; as soon as you deepen your water over the bar, steer for the end of the sandy point of Oak Island, till close up with it, then steer E. S. E. for opening Cape Creek, till you deepen into 4 fathoms, then haul up N. or N. N. W. along the beach, till you get up with Fort Johnson, where you may anchor.

\* The lighthouse on Federal Point, bears N. E. by N. from Bald Head Light, distant about 8 $\frac{1}{2}$  miles. It is elevated 48 feet above the level of the sea, painted white, and stands on the main land, north side of the entrance of Cape Fear River, where formerly stood a beacon. The bar bears from the light E. S. E., distant one mile.

The lighthouse on Federal Point was destroyed by fire in April, 1836; it will, without doubt, be rebuilt on the same site; the directions are therefore left as above. January, 1837.

From Fort Johnson to Brunswick, or from Brunswick to Wilmington, or vice versa, one half the pilotage from Fort Johnson to Wilmington.

From Fort Johnson to Five Fathoms Hole, from Five Fathoms Hole to Brunswick, from Brunswick to Campbell's Island, and from Campbell's Island to Wilmington, or vice versa, one fourth of the pilotage from Fort Johnson to Wilmington.

GEORGETOWN.—Georgetown entrance is 18 leagues S. W. ¼ W. from Cape Fear; between lies a bank, on which there are 5 fathoms water. The north end of this bank lies about 5½ leagues S. W. by W. from Cape Fear; it thence extends S. W. ½ S. 3½ leagues. The inner or N. W. side of this bank is about 4 leagues from the shore; near to this edge there are 10, 9, and 8 fathoms water: it shoals gradually as you advance toward the shore; this is called Long Bay. Near to the north end of this bank, there are 10 fathoms; along its S. E. side there are 8, 7, and 6 fathoms: to the southward of this bank there are several shoals.

In sailing to Little River Inlet, which divides North from South Carolina, you pass Lockwood's Folly Inlet, which lies west from Cape Fear Light 3½ leagues distant. The land appears broken, and contains no safe harbor.

In continuing your course towards Georgetown, several other inlets may be discovered in clear weather, and at length you pass North Inlet, about 3 leagues from Georgetown Lighthouse: this inlet is the northern boundary of North Island, on which island the

lighthouse is situated. The entrance into this inlet is from the northward, the south breaker forming nearly a crescent, runs apparently across the mouth of the inlet: there is generally not less than six feet water on the bar at low water, but the depth varies with the direction and violence of the prevailing winds. The direction of this channel has been within a few years considerably, though gradually, changed by the elongation and curve of the south breaker, throwing the channel more to the northward. In entering it in its present situation, Georgetown lighthouse will bear about S. by W. distant three leagues: a small, but distinct sand hill, (the most northern on the north end of the North Island) S. W.  $\frac{1}{2}$  S. the most southern building on the south end of the opposite islands W. by S.; you may then run in between the heads of the two breakers, rounding along the edge of the south breaker, and thus passing between the breakers into the harbor. The flood tide comes in from the S. E. and sets across the south breaker towards the north breaker. On the north end of North Island, about 3 leagues from the light, there is a village of about 20 or 30 dwelling houses, (a summer residence) which is distinctly seen from sea, and often mistaken for Sullivan's Island near Charleston; there are several houses on the north point of the opposite island. To small vessels, this inlet affords a safe harbor; there are two passages leading from it up to Georgetown, but from the shoalness of the water, they cannot be conveniently navigated, except by boats; in case of necessity, however, vessels of 6 or 7 feet draught may be navigated with some delay through the most southern, which is the deepest passage into the bay, or river, leading to the town.

**GEORGETOWN HARBOR.**—Georgetown Lighthouse is a lofty circular white tower, and black lantern, erected on North Island, which is on the northern and eastern sides of the harbor, at the entrance of Winyaw Bay, on a low sandy spot, and exhibits a fixed light, 90 feet above the level of the sea at high water, bearing N.  $\frac{1}{2}$  W. from the entrance of the bar, 6 miles distant. From the easternmost part of Cape Roman Shoals, to the entrance of the bar, the course is N. N. E. and the distance 15 miles, and from the southernmost part of Cape Roman Shoal, it bears N. by E.  $\frac{1}{2}$  E. 20 miles distant. On the out Cape Shoal are 5 feet at low water, and 9 feet at high water, and a channel within at high water, of  $2\frac{1}{2}$  fathoms, from  $1\frac{1}{2}$  to 2 miles wide, and 5 fathoms outside, close on board the shoal.

In approaching Georgetown Bar from the northward, the harbor is shut out from view by North Island, and the lighthouse appears to be situated in a low wood.

In passing the light, either northerly or southerly, vessels will find 5 fathoms water, within 5 miles of the land: on this shoal there are about  $7\frac{1}{2}$  feet at low water, about 12 feet at high water, and 5 fathoms all round it. The principal entrance into the harbor lies to the southward of the lighthouse.

There are several spar buoys placed in the best water on the bar, and in the channel, in sailing by which, the following directions must be observed, viz. The first buoy on the bar lies directly in the channel, which, of course, may be passed on either side, close to; from this to the second (channel) buoy, the course is about N. W. one mile distant, and when up with it, immediately steer N. E.  $1\frac{1}{2}$  mile distant, which is also in the channel, to the third buoy, when you will immediately steer N. by W. for the lighthouse, 4 miles distant, keeping that course until within 100 fathoms of the light, leaving it on the starboard hand, when you will be in good anchorage.

The North Inlet channel into Georgetown, cannot be recommended, under any circumstances.

Vessels at sea will find deep water, and when the wind is to the southward and westward, convenient and safe anchorage near the land, about  $1\frac{1}{2}$  or 2 miles to the northward of the lighthouse. A common flood tide rises nearly 4 feet; it is high water on the bar at the full and change of the moon, about 7 o'clock.

**CAPE ROMAN.**—Cape Roman is very low land; it has neither tree nor bush, and appears, when seen at a distance, to be a sand left dry by the tide.

The Shoal off Cape Roman runs off S. E. about 6 miles from the light; the outer point has only 4 feet water, with a swash channel of  $2\frac{1}{2}$  fathoms, between that and the light; off the point of the Shoal, the water shoals from 7 to 5 fathoms, then directly on the breakers.

From the south entrance of Santee River, to about 6 miles S. E. of Cape Roman, there is a shoal, which extends to a considerable distance from the land; the S. E. point of it lies about 4 leagues S. from Georgetown Lighthouse, and the S. point lies about 2 leagues S. E. from Cape Roman. Close to this dangerous sand, there are four and three fathoms; the land is so low that you cannot see it from the deck of a ship, at the extremity of the shoal.

The outer shoal of Cape Roman bears (as previously described,) from Georgetown. The entrance of Santee River lies between the shoal and the lighthouse. The distance is  $2\frac{1}{2}$  leagues from the entrance of Georgetown River, and 3 leagues from

Cape Roman. Ships that fall in with the shoals of Georgetown entrance, should not come into less than 4 fathoms water; and although the mudiness of the water is apt to frighten strangers, there is no real danger to be apprehended. The land here is low, and appears, when viewed at a distance, in hummocks, like a range of islands.

By steering W. N. W. from the S. W. part of Cape Roman Shoal, you will soon see \*Raccoon Key Light, which lies about W. by S. from Cape Roman: steer W. S. W. or S. W. by W. in about 5 fathoms water. As there is a shoal runs off about 5 miles S. E. by E. from the N. E. end of Bull's Island, you should take care to avoid it in passing. Senee Bay, or Bull's Harbor, lies between Raccoon Keys and Bull's Island. There are shoals lying off the west end of Raccoon Keys, and you should anchor near to Bull's Island, in 6 fathoms water.

From the shoal off the N. E. end of Bull's Island to Charleston Bar, the course to go clear of the Rattle Snake, is S. W. by W. and the distance 7 leagues. There are four islands between Senee Bay and Charleston Bar, viz. Bull's, Cooper's, Davies', and Long Island. Flats extend from all the islands, along which the soundings are regular. With Charleston Churches northward of Sullivan's Island, you will be in  $5\frac{1}{2}$  fathoms water, on the edge of the Rattle Snake; and when the churches are open to the southward of Sullivan's Island, you are clear of that shoal. You should approach no nearer to this bank than 5 fathoms water.

GEORGETOWN, (S. C.) TO CHARLESTON, (S. C.)—From Georgetown Bar, outside of Roman Shoal, steer S. by W., distance 15 miles.—From thence to Charleston Bar, S. W. by W., distance 39 miles: If, after passing Roman Shoal, you wish to go to Bull's Harbor, steer W. by S. until you bring Bull's Island to bear W. N. W. or N. W. by W. In steering for Bull's Island, you will pass Raccoon Keys. Going over Bull's Harbor Bar, at low water, you will have 2 fathoms. Keep the N. E. part of Bull's Island to bear W. N. W. until you are within a cable's length of the shore, where you will have 4, 5, and 6 fathoms water; follow the shore around until you open a Creek, where you may anchor in 3 fathoms, muddy bottom, safe from all winds.

CHARLESTON, (S. C.)—The entrance of Charleston Bar lies in lat.  $32^{\circ} 40' N$ . In running in for Charleston lighthouse, which may be seen some distance at sea, you will have gradual soundings. When you come near the bar, you may see the north and south breakers, between which, is the entrance over the bar. In running over the bar, you bring the lighthouse to bear N. W. by W. and stand for it, and when you make the Beacon, bring it to bear about two handspike's length north of the light; this will bring you up with the South Breaker Buoy; give this buoy a berth to the southward of you, of about a cable's length, and the middle buoy a berth to the northward of you, of about half that distance. After passing the latter, stand more to the northward of the North Breaker Buoy, giving it a berth of half a cable's length to the northward of you—in passing which, the Beacon should be nearly touching the north side of the light. You may then stand up for Sullivan's Island. The Beacon on with the light carries you on to the North Breakers; care should therefore be taken to keep it open to the northward.

In crossing the bar, care should be taken that the flood tide does not set you on the north breaker, till you come within half a mile of the lighthouse, when you may anchor in 3 fathoms water. Buoys are in general placed on the bar, in 12 feet water at low tide. The buoys are black.

There is another ship channel to the southward of this, called Lawford's Channel, where you will have from 10 to 12 feet, according as the tide may be. In going into this channel, the course is N. N. W. There is a buoy here also. This anchorage is called Five-fathom Hole, but it has no more than  $3\frac{1}{2}$  fathoms. From thence your course is about N. by E.  $3\frac{1}{2}$  miles, in 6 or 8 fathoms water, which will carry you abreast of Cumming's Point; when this point bears W. half a mile distant, steer N. N. W. for the S.

\* On Raccoon Keys, near what is termed Cape Roman, a lighthouse is erected, showing a fixed light, distinguished by red and bright lights. It is elevated 87½ feet from the river, at high water. The intention of this light is to warn mariners of their approach to Cape Roman Shoals, which lie S. E. from it, 6 miles distant. The lighthouse is painted alternately white and black, beginning with white at the base, and ending with black at the lantern. The pitch or southern point of Cape Roman bears S. E. from the lighthouse; the Old Mill N. ½ W. and the large Raccoon Key W. by S.

† Charleston lighthouse is built on Lighthouse Island, and contains a revolving light, which may be seen at the distance of 8 or 9 leagues. The time of darkness will be twice to that of light; as you approach it, the time of darkness will decrease, and that of light increase until you get within three leagues, when the light will not wholly disappear, but the greatest strength of the light will be as 1 to 44 to the least.

‡ The south breaker has a buoy on the east end, in 12 feet water, and in the middle of this channel is a buoy with a small white flag upon it, in 10 feet water, low tide—on either side of which you may go when running in.

W. part of Sullivan's Island; you will have from 7 to 10 fathoms water. You may go within a quarter of a mile of Sullivan's Island, as it is bold. Your course from thence to Charleston is about W.  $\frac{1}{2}$  N. and the distance 4 $\frac{1}{2}$  or 5 miles. When you bring Hog Island to bear N. and Fort Johnson to bear S. by W., you are up with the eastern end of the Middle Ground, which you must not go nearer to than 3 fathoms. You may then steer nearly W. keeping in 4 or 5 fathoms water, which will carry you between the Marsh or Shute's Folly, and the Middle Ground. This channel is narrow, not being more than a quarter of a mile broad, as the flats lie off from Shute's Folly one quarter of a mile. Continue your west course till you come up to the town, where you may anchor in 5 or 6 fathoms water. In running up from Sullivan's Island, stand no nearer to the southward than till you come into 3 fathoms, for fear of the spit (a Middle Ground that lies off to the N. E. and E. from Fort Johnson's Point) as far as Cumming's Point, nor to the northward nearer than 3 or 4 fathoms.

After sailing from Sullivan's Island, as before directed, you must, if bound through the S. W. channel, or by Fort Johnson's Point, bring the point of land, on which the fort is, to bear S. S. W. and run directly for it, where you will have from 4 to 6 fathoms. When abreast of this point, direct your course about N. W. by W. in 6 or 7 fathoms, about one mile, or till you bring a point of woodland to the northward of the town of Cooper's River, to bear N. N. W., when you may run N. W. by N. about one mile, which will carry you up to the town, and anchor as above directed.

Boys having been placed to mark out the channel of the North Bar of the port of Charleston, S. C., the following directions must be observed in running for the same:

In standing in to make the outer buoy, (painted red,) off the bar, bring Fort Moultrie, on the S. W. end of Sullivan's Island, to bear N. W. by W. until you are up with that buoy on the edge of the bar. The middle buoy, (painted white) bears from the outer buoy N. W. by W. In crossing the bar you must keep the middle buoy, which is the second buoy, on with the S. W. corner of Fort Moultrie until you are up with it; then haul up for the inner buoy, (painted black,) which bears W. by N.  $\frac{1}{2}$  N. from the middle buoy, which lies on the inner edge of the bar; when up with the inner buoy, then steer W. by N. for the main ship channel.

There is a ridge between the outer and middle buoys that extends across the channel, with not more than about 7 feet water on it at low water; at high water from 12 to 14 feet.

Between the middle and inner buoys there are 11 feet of water, by keeping very near the north chain of breakers.

You may see Charleston lighthouse, in clear weather, in 10 fathoms water. The winds on the soundings govern the current. Var. 3° 45' E. 1822. [See the Plate.]

\*PORT ROYAL.—From 3 fathoms water, South of Charleston bar to North Eddisto inlet, the course is S. W. by W.  $\frac{1}{2}$  W. and the distance 5 leagues; this course will carry you clear of shoals which lie off Stono inlet, which lie further off than any that are in your way to Eddisto. Stono inlet is about two leagues from the south channel of Charleston; between them lie two islands, viz. Morris Island, on which the lighthouse stands, and the island called the Coffin Island. With the lighthouse open of the Coffin Island, you will go clear of the Stono shoals, in 6 fathoms water; but if you shut the lighthouse in with Coffin island, you will not have more than 5 $\frac{1}{2}$  fathoms off Stono shoals: you will pass close to the breakers, and consequently be in danger: the breakers, unless the sea be smooth, show where the shoal is. In Stono inlet there are 9 or 10 feet of water at low water, but it was not much frequented until Charleston was blockaded in the year 1775.

From Stono inlet to North Eddisto inlet, the course is W. S. W. and the distance 11 miles; between them the soundings are regular, and the shoalings, when you are coming from the offing towards the shore, are very gradual; the bar of North Eddisto, and the shoals which are contiguous to it, lie off about 4 or 5 miles from the land. Close the bar

\*Port Royal is 5 leagues N. E.  $\frac{1}{2}$  E. from Tybee lighthouse, at the entrance of Savannah River, and has a harbor sufficient to contain the largest fleet in the world.

annah River,

and shoals there are 3 and 4 fathoms water: on the bar, there are 9 and 10 feet at low water. South Eddisto is 3 leagues W. S. W. from North Eddisto. The shore of the islands which lie between them may be approached with your lead without danger. The shoalings towards it are gradual.

If bound to the southward or northward, and obliged through stress of weather, to make a harbor in North Eddisto, you must, when within about 5 miles of the land, open a tree (which resembles an umbrella,) with the south point of the harbor, and then steer in N. W. without any danger, and anchor in 6 fathoms water on the northern side of the harbor. [The tide here is very rapid.] In the harbor, 4 miles west from anchorage, you may get good water.

When you are coming from sea, for Port Royal Harbor, you should get into the latitude of St. Michael's Head, which is  $32^{\circ} 6'$  N. then steer W. for the head, and when you come within 15 leagues of it, you will have from 20 to 25 fathoms water. Continue your west course until you make the land, which you will do, if the weather be clear, at a distance of 6 leagues, in 12 fathoms water. The land hereabouts is generally low, but the trees are high. Port Royal entrance is known by a small grove of trees, which stand on the west side of it, and tower above all the other trees, like a high crowned hat; hence this grove is called the Hat of Port Royal. Continue to steer as before, keeping your lead going until you get into 8 fathoms water, when you will be about 3 leagues from St. Michael's Head. You may then steer a point to the southward of west, until you get into 5 fathoms water; then steer more southerly, taking care not to bring St. Michael's Head to the northward of N. W. by N. until you see the great north breaker, called Cole's Care, close to which there are 4 fathoms water: this shoal must be left on the starboard side. As you approach this breaker from the northward, you will see another breaker to the southward, called Martin's Industry; between these two breakers lies the entrance of the channel into Port Royal Harbor, which is about a mile wide. The mark to go clear the north breaker is a parcel of high trees, which stand near the mouth of the River May, and appear like an island, kept just open of Elizabeth Point. your course through between the two shoals, is W.  $\frac{1}{2}$  N. or W. by N. In this channel there are not less than  $3\frac{1}{2}$  or 4 fathoms, at low water. Continue to steer as aforesaid between the two breakers, until you bring Philip's Point to bear N. N. W. then steer directly for it, and you will have as you proceed, 9, 8, and 7 fathoms water. When you are abreast of Philip's Point, give it a small berth, and steer up N. by W.  $\frac{1}{2}$  W., in 6 and 5 fathoms; in the latter depth you may anchor, very safe harbor.

There is also a channel between Martin's Industry and Gaskin Bank, called the South Channel, in which there are not less than 12 feet at low water. In order to go in through this channel, you must, when in 7 fathoms water, bring Hilton's Head to bear N. W. by N. and then steer, with an ebb tide, N. W. and with a flood tide N. W. by N. until Philip's Point bears N. by W.  $\frac{1}{2}$  W. You may then steer for the Point; and proceed as before directed.

About  $3\frac{1}{2}$  miles S. E. from Hilton's Head, and 4 miles S. by E. from Philip's Point, lies the east end of the Joiner's Bank; it thence extends W. N. W. about  $2\frac{1}{2}$  miles, and has  $3\frac{1}{2}$  fathoms on it at low water. Hilton's Head is on the south side of the harbor, and is a higher bluff point of land than any thereabouts.

Tybee Inlet lies 5 leagues S. W.  $\frac{1}{4}$  W. from the entrance of Port Royal south channel; between them is Hilton's Head Island; it is large, fertile and well inhabited. From this island the Gaskin Bank extends about 8 miles on the broadest part. You may proceed along this bank, in 5 fathoms water. Some, when bound to Port Royal, reckon it best to make the land about Tybee, because the lighthouse makes that part of the coast distinguishable from any other part. Tybee Inlet is the entrance of Savannah River. Ships which draw 14 or 15 feet water, may go in at Tybee, and proceed through land to Beaufort, in Port Royal Islands, and from Beaufort, vessels of 8 or 9 feet water, may go through land to Charleston. From Charleston, vessels drawing 7 or 8 feet water may go through land to the River Medway, in Georgia, which lies 30 miles south of Savannah. On this coast it is observed, that N. E. easterly, and S. E. winds cause higher tides than other winds, and also, somewhat alter their course. At Port Royal entrance the tide flows on the change and full days of the moon,  $\frac{1}{4}$  past 8 o'clock. About 6 leagues from the land, in 12 fathoms water, the flood sets strongly to the southward, and the ebb to the northward, further off from the shore there is no tide at all. Near to the entrance of the harbor there is a strong indraught during the flood tide, and an outset with an ebb tide.

**SOUTH CAROLINA.**—When the wind blows hard, in the N. E. quarter, without rain, it commonly continues to blow violent for some time, perhaps 3 or 4 days; but if such winds are attended with rain, they generally shift to the E. E. S. E. and S. E.

S. E. winds blow right in on the coast, but they seldom blow dry, or continue long.

6, 8, or 10 hours after their commencement, the sky begins to look dirty, which soon produces rain. When it comes to blow and rain very hard you may be sure that the wind will fly round to the N. W. quarter, and blow very hard for 20 or 30 hours, with a clear sky.

N. W. winds are always attended with clear weather. They sometimes blow very hard, but seldom do so longer than 30 hours.

Gales on the coast of South Carolina frequently increase much in violence toward their conclusion, and then break off at once, leaving a cross sea, with almost no wind.

The most lasting winds are those which blow from the S. S. W. and W. N. W. and from the N. to the E. N. E. When the wind is in any of these quarters, the weather is the most settled.

Thunder gusts are very common on this coast in the summer time; they always come from the N. W. quarter, and are sometimes so heavy that no canvas can withstand their fury; they come on so suddenly, that the greatest precautions are necessary to guard against the effects of their violence.

**ST. HELENA SOUND.**—The entrance of this Sound lies between South Eddisto Island and the northernmost Hunting Island; it is about 2 leagues wide. This place is navigable by vessels of 7 or 8 feet water only; it is full of sand banks, many of which are dry at low water. Six rivers empty themselves into this Sound, viz. South Eddisto, Ashappo, Cumbahaw, Chehaw, True Blue and Corsaw. These rivers are all navigable; some of them come 200 miles down the country, but few of them can be navigated by vessels of 6 feet water, for more than 30 or 40 miles from the Sound. From the entrance of St. Helena Sound, along the Hunting Islands, to the entrance of Port Royal, the course is S. W.  $\frac{1}{2}$  S. and the distance about  $5\frac{1}{2}$  leagues. The soundings are regular: you will have 5 or 6 fathoms water.

**CHARLESTON BAR TO TYBEE.**—When over the bar, in 8 fathoms water, the course is S. W. distance 20 leagues. As you come near the latitude of Port Royal entrance, which is  $32^{\circ} 8'$  N. be careful to avoid a very dangerous shoal called Martin's Industry; it lies 4 leagues from the S. side of the entrance of Port Royal, which is the north side of Hilton Head, the highest land in sight: come no nearer than 7 fathoms, keeping your lead going; and in the night or thick weather, do not approach nearer than 10 fathoms; the tide of flood sets boldly in. Shoal ground, with 6 or 7 fathoms, coarse shells, lies S. E., 14 or 15 miles from Tybee light. When you get to the southward of Hilton Head, you will see the lighthouse, which stands on the island of \*Tybee.

If in the night, and you are to the northward of Tybee, be careful of going nearer the Gaskin Bank than 5 fathoms. In fresh winds you take a pilot abreast of the lighthouse—in moderate weather without the bar. In clear weather you may see the lighthouse at the distance of 12 miles.

Near the Gaskin Bank and Martin's Industry, the flood runs strong into Port Royal, to which may be attributed the loss of so many vessels on these banks.

Off Tybee there are two large coppered buoys, one on the tail of the knoll, in 2 fathoms water, bearing from the lighthouse N. N. W., the other in  $4\frac{1}{2}$  bearing N. E. by N. from the lighthouse, in mid-channel, where large vessels may anchor with safety, when wind and tide will not permit to proceed higher up.

A beacon is erected on Tybee Island, which is lighted, and bears E.  $\frac{1}{2}$  S. from the lighthouse, 600 yards distant. It is  $10\frac{1}{2}$  feet high.

The Beacon light on with Tybee light, is the direct course over the bar. The best anchoring ground is with Tybee light bearing from S. S. W. to S. the former be preferred, and distant about one cable's length from the beach. On the bar is a buoy with a white top, in  $4\frac{1}{2}$  fathoms water, distant  $4\frac{1}{2}$  miles from the lighthouse. The deepest water is between the buoy and the south breaker head.

On Savannah Bar there are 18 or 19 feet at low water. On the south breaker there are not more than 7 or 8 feet water; and  $1\frac{1}{2}$  mile from the light, it is bare at low tide.—On the north breaker there is not less than 12 feet for the distance of a mile. The head of Stone Horse Shoal commences at the North Breaker, and extends from the land about 6 or 7 miles. [The Brig Pocahontas, Capt. Walford, was totally lost on this shoal, the 27th Sept. 1829, at flood tide; Tybee light then bearing about N. N. E. distant about 8 miles, very bold near the shore.]

After getting into 4 fathoms water, you will be over the bar, when you must haul up W. N. W. until the lighthouse bears S. S. W. then anchor.

The point of shoal which runs down from Cockspur Island, and separates that chan-

nel. Tybee Island lies at the mouth of Savannah River, to the southward of the bar. It is very pleasant, with a beautiful creek to the west of it, where a ship of any burthen may lie in safety at anchor. A lighthouse stands on the island, 80 feet high, containing a fixed light, is 14 miles E. S. E.  $\frac{1}{4}$  E. from Savannah, and 6 leagues S. W.  $\frac{1}{4}$  W. from Port Royal. Warsaw Sound is formed by the southward end of this island.

nel from the ship channel, bears N.  $\frac{1}{2}$  W. from the light, and has not more than 5 feet on it at low tide. When to the northward of this point, the light bearing S. S. E. you may anchor in 4 or 5 fathoms.

Vessels drawing not more than 8 or 9 feet may keep the light or island side on board, and run into Cockspur and anchor, as they cannot pass the upper end of the island until half flood, there being only 7 or 8 feet at low tide.

There are three bars, having from two to three fathoms on the back of Tybee and Cabbage Islands; but they are never to be attempted but in absolute necessity.

NOTE.—Sailing into Savannah you will observe the following marks and buoys, viz. a large buoy lies on the outer edge of the bar in the deepest water, having all the leading marks on the beacon and lighthouse in one, bearing W.  $\frac{1}{2}$  N. distant 4 miles. Another buoy lies in the same direction, one mile within the bar; a third buoy lies one mile farther W. by N. from the second, a fourth buoy lies N. W. by W. from the third; after passing which, there is safe anchorage for a large fleet, in 4 or 5 fathoms, at low water, the lighthouse bearing S. S. W.

The buoys lie and lead in the deepest water, having a channel half a mile to the northward, and one quarter of a mile to the southward of them, (the narrowest place) nearly the same depth of water; and there are 20 feet on the bar at lowest tides; you may sail either side of the buoys. [See the Plate.]

Tybee Creek has 11 feet through it, at low water. Forty miles south of Savannah lies Sunbury, a port of entry, at the head of St. Catharine's Sound, between Medway and Newport Rivers, about 15 miles south of Ogeechee River. There is a bar here, but the harbor is capacious and safe, and has water sufficient for ships of great burthen.

Warsaw has 10 feet on the bar, but it is too intricate for strangers.

HOGOHEEHIE RIVER.—Hosaba Bar, at the mouth of the river Hogoheehie, has 18 feet water on it, to cross which, bring Green Island to bear N. W. by W. steer in W. by N. till you deepen your water, then haul up N. W. by N. and you will soon get in 8 or 9 fathoms, when your eye and lead will be your best directions; at the extremity of the channel you will keep Hosaba nearest on board, until nearly up with the lower part of Buzzard Island, when the channel will be close under the starboard shore.

Green Island is much higher land, has taller timber than the surrounding forests, containing several hundred acres, covered with pine, which generally has a greenish appearance.

ST. CATHARINE'S BAR, which is difficult for strangers, lies one mile south of the north point of the island, has but 8  $\frac{1}{2}$  feet at low tide; channel not more than 200 yards wide, the shoals generally dry each side of the bar. It is better for vessels bound to Newport, Sunbury, or up these streams, to enter at Sapelo or Hosaba, and go the inland passage, which is not difficult.

DARIEN.—Doboy Bar lies in lat. 31° 21' N. long. 81° 16' W. Vessels making the land, when in 5 or 6 fathoms water, will, during clear weather, see the Beacons on Wolf Island, which must be brought to bear W.  $\frac{1}{2}$  S. and run this course till the buoy on the outer edge of the bar is made, which may be passed on either side. Continue this W.  $\frac{1}{2}$  S. course till near the inner buoy, opposite the north breaker, by which you will pass the 8 feet Knoll on your starboard hand. In passing them, the north breaker is to kept on the starboard, and the buoy on the larboard hand, taking care at the same time that the flood tide does not set the vessel on the north breaker. In running this course, the bar is crossed with not less than 12 feet at low water. When abreast of the inner buoy, run from it 1  $\frac{1}{2}$  mile in a direction exactly N. W. by W. where the anchorage is excellent, in 4 fathoms, at low water, which will bring the vessel in the vicinity of the lighthouse.

Or you may, after making the light on \*Sapelo Island, and steering directly for the Bea-

\* The lighthouse is erected on the south point of Sapelo Island. The lantern is elevated 74 feet above the level of the sea, and contains a revolving light, which revolves once in every five minutes, during which period the greatest power of light and a total darkness will be produced three times each alternately at any distance between 10 miles and 8 leagues: when you approach the light within 3 leagues, it will not totally disappear, but the greatest strength of light is to that of the least as 40 to 1.

To distinguish this lighthouse from any other on the neighboring coasts in the day, the tower is painted with stripes horizontally, red and white, which gives it the appearance of a ship with the sails clewed up.

Two beacons having been erected on the east side, and nearly on the north end of Wolf Island, a S. S. E. direction of the lighthouse on the south point of Sapelo Island, and both have lantern each, with six lamps and reflectors: four of the lamps in each beacon forms a circle to S. W., having a nine inch convex polished lens, placed before them; from which circumstance ever a vessel from out the bar brings the two lights any where near in a range, the lights will have a different appearance to what they will have when either to the northward or southward of the range.

To designate those beacons from any other on the neighboring coast, the tower of the

cons on Wolf Island, bringing them in a line, and keeping the lead constantly going, the lighthouse bearing W.  $\frac{1}{2}$  N. (true course,) cross the bar in 13 feet water. Neap tide ebbs 7 feet.

The following are the depths of water, bearings, and distances to the two buoys, placed in Doboy Inlet, leading to Darien, Georgia.—

Buoy No. 1, sunk in 18 feet water, at low water, on the outer edge of the bar, bearing E.  $\frac{1}{2}$  N. from the beacon on Wolf Island,  $3\frac{1}{2}$  miles distant, and  $4\frac{1}{2}$  miles from the south point of Sapleo, in an E. S. E. direction.

Buoy No. 2, sunk in 21 feet water at low water, off the north breaker head, bearing E.  $\frac{1}{2}$  N. from the beacon aforesaid, about  $2\frac{1}{2}$  miles, and in a S. E. by E. direction,  $3\frac{1}{2}$  miles from the south point of Sapelo. This buoy is S. E. by E.  $\frac{1}{2}$  E.  $5\frac{1}{2}$  miles from Doboy Island, and from the most southern part of the north breaker, one third of a mile W. by S.  $\frac{1}{2}$  S.

**TYBEE TO ST. SIMONS.**—Bring Tybee lighthouse to bear N. W. when in 10 fathoms water, and steer S. W. by S. distance 21 leagues, to go clear of the shoal of \*St. Simons, which lies off St. Simons E. S. E. 2 leagues. There are 4 and 5 fathoms close to this shoal, to avoid which come no nearer than 8 or 9 fathoms. The island of St. Simons is on the north side of the sound or harbor of the same name, which lies in lat.  $31^{\circ} 7' N.$  and may be known by four trees standing thus † † † †. On the south side of that harbor lies Jekyl Island, on which are remarkable trees, appearing like umbrellas, and thence called the umbrella trees. St. Simons and Jekyl Island beaches are remarkably white. The bar at the entrance of St. Simons' Sound lies 5 miles from the light.

**ST. SIMONS.**—Bring the lighthouse to bear N. W. by W., and steer for it until abreast of it, which course will carry you over the centre of the bar, which is about 5 miles distant from the lighthouse.

**ST. MARY'S AND AMELIA BAR.**—Vessels from the northward, after passing Jekyl Island, which lies in latitude  $31^{\circ}$ , ought to keep in 7, 6, or 5 fathoms water, as weather and size of the vessel may permit. As you proceed towards the southern part of †Cumberland, you will open Dungeness House, which is about  $1\frac{1}{2}$  mile distant from the south point of said island, and is the only conspicuous large building on this coast, and is hid by the trees when you are to the northward. Southward of this house there is a space of about two miles, with no trees on it, which makes the south point of the island appear, at a distance, like an island of about two miles in length.

There are placed on Amelia Island, two beacons for crossing what is termed the Old Channel: they must be brought in one, when they will face W.  $\frac{1}{2}$  N., and a buoy on the inner end of the bar will be in range. There are  $6\frac{1}{2}$  feet water at low water; tide rises 6 feet; high water about 8 o'clock, full and change of the moon. In crossing the bar, bring the beacons in one until up with the buoy; then steer for the north point of Amelia Island, giving the shore a good berth; when between the points of Amelia and Cumberland, there is good anchorage near to Cumberland. This bar lies  $2\frac{1}{2}$  miles north of the main bar, where there are 12 $\frac{1}{2}$  feet at low water, and a buoy on the inside of the North Breaker Head. The course over that bar is W. N. W., leaving the buoy on the starboard hand; but strangers should bring the buoy to bear N. W. by W., when they may run with safety, allowing for the tide and the draft of water of the vessel. After passing the buoy, steer N. W. by N.  $2\frac{1}{2}$  miles, which will bring you to the upper buoy for Old Channel; this may be run for from one buoy to the other, and can be passed on either side, when the course will be as directions for Old Bar, before mentioned.

In running southwardly for the bar, keep in 6 or 7 fathoms water, until the lighthouse bears N. W.  $\frac{1}{2}$  W., then steer for it; when on the bar there will be 12 feet at low water; within the bar, where a buoy is placed, 3 fathoms. Leaving the buoy on your starboard hand, steer N. W. by N. 3 miles, which will bring you on the tail of the Middle Ground, lying on the larboard hand, keeping in 3 fathoms water. When the south point of Cumberland bears N. E. distant half a mile, there is good anchorage.

or highest beacon is painted white. The lantern is elevated 25 feet above the surface of the earth. The eastern or lower beacon is painted black, and the lantern is elevated above the surface of the earth 15 feet.

The height of the tower of St. Simons' Lighthouse, from its base to the foot of the lantern, is 75 feet. It is built of a composition of lime, which gives it the appearance of having been painted white; is on the extreme south end of the island, and shows a fixed light.

† On the south point of Cumberland Island a lighthouse is erected. The light is elevated 80 feet above high water, and is a revolving light, showing a clear bright light toward the sea, twice in each revolution, which is in three minutes, each time occupying a space of one and a half minute. Its location is not so eligible as it would be on Amelia Island, where it would be a leading mark over the bar, and it now only serves as a mark for the inlet. It is distant 7 miles nearly a N. W.  $\frac{1}{4}$  W. direction from the main bar, consequently buoys and beacons are resorted to.

Full sea at St. Mary's Bar on full and change, at half past 7 o'clock; slack water at 8. Average tides 7 feet.

**ST. MARY'S TO \*ST. JOHN'S.**—The course is S. by E., distant 7 leagues to St. John's; in making this place when bound into St. Augustine, there is a round high bluff, at the south side of the river, known by the name of the General's Mount: the small craft running in from Amelia to St. Augustine generally make it, and take their departure. On the north side of the harbor is Talbot's Island, full of trees, lying north and south, and about the same height with the General's Mount: there are 11 feet water on the bar at high water. In running into St. John's, bring the lighthouse to bear S. W.  $\frac{1}{2}$  W. and open the top of the chimney in the west end of the dwelling house, about 3 feet to the S. and E. of the light; then run in until within the South Breaker Head; then steer S. S. W. for the General's Mount within a cable's length of the shore; then haul up to the westward, keeping the shore about the same distance from you to clear the Middle or North Breakers, which show plain if there is any wind. When nearly opposite the swash, incline towards the north shore, or Fort George Island, to clear a flat that makes off from the shore a considerable distance. Spring tides rise 12 or 13 feet; neap tides not more than 10 feet. The currents run out until quarter flood, and sometimes half flood. High water at full and change of the moon, about 20 minutes past 7. The tides are very much influenced by the winds.

The St. John's is a long and broad bay, which receives the impressions of the tide at more than 150 miles from its mouth, running parallel with the ocean. This bay affords fine navigation; you will find in all parts of it, after passing the bar, up to the entrance of Lake George, 20 feet water: this lake, to its south-east extremity, is upwards of 10 feet in depth.

Lake George is a little sea, of nearly 60 miles in circumference, at the extremity of which is found a bank of shells, on which you have only about 5 feet water; but at two or three miles above this, the branches of the St. John's reunite, and a broad and deep channel conducts you to a lake. At full and change it flows S. E. by S. and N. W. by N. 9h. 45m.

**NOTE.**—The brig *Young Maria* struck several times on a sunken rock, and immediately after had 5 fathoms water, while running between St. Augustine and Amelia Island, but the particular situation of the rock we are ignorant of.

**ST. AUGUSTINE.**—Should a vessel be obliged, in consequence of some accident, or any particular reason, to stand in for a harbor, the port of St. Augustine is the nearest and most advantageous place.

St. Augustine is situated on the main, about 2 miles within the bar, immediately opposite the inlet: it is not passable for vessels drawing over 15 feet of water. The island of Matanzas runs parallel with the ocean, and forms a point of the south end of St. Augustine inlet. When in 9 fathoms water, off the bar of St. John's, the course is S. S. E. distant 10 leagues. The northernmost land of the bay is called Point Cartel. When you are as far to the southward as this point, you will see the island of Anastasia, in length 15 miles, and on the south side of the bay, on the north end of which is a lighthouse, showing a fixed light.

The pilots who attend the bar, board vessels outside, when the weather will permit, but if not, they bring them in by signal, which they wave as they wish the vessel to steer. Rate of pilotage two dollars per foot. The bar of St. Augustine has no more than 8 or 9 feet water on it at high water, spring tides, and at low water 5 feet, which at times makes it impossible for boats to pass. There is a swash to the northward of the bar, with 11 and 12 feet water; but the sand shifting often, and the passage being so narrow and crooked, the pilots seldom attempt it. It flows, at full and change, S. E. by S. and N. W. by N. 9h. 45m.; variation off St. Augustine 7° E., 1819.

**ST. AUGUSTINE LIGHT.**—Vessels bound to this port, if running down coast the north, must not bring the light farther to the westward than S. W. by W. If the wind be to the south, bring the light to bear west; if moderate, come to and anchor in from 7 to 9 fathoms water, muddy bottom, off which three buoys are placed.

All vessels bound to this port will show, when off the bar, how much water they draw by signal, hauling down the flag and hoisting it again equal to the number of feet they draw.

\* The Lighthouse at St. John's has been taken down, to prevent it from falling. A new one will be put in a more favorable situation.

† An appropriation is made for placing three buoys on the bar, at the entrance of St. Augustine Harbor, and they are moored.

‡ St. Augustine Lighthouse is built on the north-end of St. Anastasia Island, lat. 29° 42' N. long. 81° 25' W., and shows a fixed light. It is a square tower built of shell stone, and painted white. The tower is 70 feet high from the ground, exclusive of the lantern, which is 7 feet; the top of the building is arched, with a stone cornice and a granite stone deck, 12 feet diameter. The lantern is of iron, and contains six patent lamps.

**MUSQUITO INLET.**—Sixty-five miles to the southward of St. Augustine Lighthouse, is Musquito Inlet. On the bar there is 5 feet at low water. Rise of tide  $3\frac{1}{2}$  feet. On the south side of the inlet there was a \*lighthouse intended for a fixed light. The town of Smyrna is within this inlet.

**REMARKS OFF ST. AUGUSTINE.**—From the first of November to the last of February, the hardest gales prevail that blow on this coast, and in general from N. N. E. to S. S. E. The wind any way easterly comes on very suddenly to a gale during the season above mentioned; and these gales give but very little warning. An experienced navigator says, "I was at anchor in St. Augustine Bay, when it came on to blow at E. N. E., and in fifteen minutes time I was obliged to slip, and had we not carried sail to the utmost we should not have cleared the land to the southward." When the wind backs against the sun, with a small rain, you will perceive the sea to rise before the wind comes; then prepare for a gale, which in general will last 50 or 60 hours. If you should be obliged to cut or slip, carry all the sail you possibly can, to get an offing before it increases so as to put you past carrying any sail, which is always the case, and observe, that the flood tide setting to the southward will be of no service to you farther out than 12 fathoms' water, when you will be in the southern current until you get into 46 fathoms, which is about 15 leagues from the land, and in the Gulf Stream, where the current runs strong N. N. E. as far to the northward as latitude  $35^{\circ} 15' N.$ , when it sets more easterly, or about N. E. by N., as far as latitude  $37^{\circ} N.$ ; from thence, as far as the Capes of Delaware, its direction is about E. N. E., and from latitude  $38^{\circ} 57' N.$  it sets nearly east.

*Directions for making a speedy passage through the Gulf to New York.*—When in sight of Memory Rock, steer N. N. W. to lat.  $29^{\circ}$ ; then N. to lat.  $30^{\circ}$ , (allowing, however, for the effects of strong breezes any way, to clear dangers on both sides,) which will keep you in the whole force of the stream; then N. E. till in lat. of  $32^{\circ}$ ; then steer N. E. by N. until you get into the latitude of Cape Hatteras, which is in  $35^{\circ} 14' N.$ ; then you may haul up more northerly half a point, till you get on soundings in or near the latitude of the Capes of Virginia. When in 18 or 20 fathoms, and near that latitude, steer N. N. E. 79 leagues, and look out for the Highlands of Neversink, which are 282 feet above the level of the sea, and lie S. S. W. from the entrance of the harbor of New York. When you have nearly made the distance before mentioned, be careful not to run in the night or thick weather; come no nearer than 12 or 14 fathoms.

**NOTE.**—Along the southern coast of America you will find no tide farther out from the shore, than 10 or 12 fathoms water; from that depth until the edge of soundings, you will have a current setting to the southward, at the rate of one mile per hour: when out of soundings, you will have the Gulf Stream setting to the N. E. quarter, and the farther you get to the northward, it sets more easterly, but not so strong as before mentioned; when you get to the northward of  $39^{\circ}$ , it sets about east.

**GENERAL REMARKS.**

From the Atlantic, when over the Bank, and bound for New-Orleans, you may shorten your distance very much by running down the Florida Reef, keeping in colored water in day-time, and off into the Stream by night, as a strong eddy or counter current, sets westwardly along the outside of the reef, between it and the regular set of the Gulf. To do this with advantage, you must calculate to fall in with the Florida coast as early in the forenoon as possible, that you may take advantage of the eddy through the remainder of the day. Your best way, therefore, will be, on leaving the bank in lat.  $24^{\circ} 40'$

\* This lighthouse was never lighted: a few months after being built [by contract] it fell to the ground. It is uncertain when a new lighthouse will be lighted to indicate the entrance to this inlet.

Bank, its e

with a good breeze, to steer W. S. W. 25 leagues, and if at day light \*Florida Reef is not in sight, steer west, W. by N. or W. N. W. and make them at once; you will fall in with them between †Key Largo and Old Matacumbe, which has high trees on its north end, the tops of which are quite level, and at first sight appear like table land; keep down in colored water by daylight, and at night haul out at a respectful distance, until fairly daylight again, when you may haul into the northward, and again make the land. Or, should you be so far to the westward as between the Marques Keys and the †Tortugas Light, where you cannot see the land unless within 4 leagues of the one or the other, you must keep a lookout for colored water, and when fairly into it, keep down to the westward and make the ‡Tortugas, which you may pass at a respectful distance either to windward or leeward, as best suits your fancy, and as the winds will admit of. Between Sombrero Key and ‖Sand Key Light, you may see the Beacon on Looe Key, which is 30 feet high, and on which is a large ball painted red; 4 or 5 miles east of Looe Key is a White Buoy on a Reef in  $3\frac{1}{2}$  feet of water, and between Looe Key and the west end of Florida Reef, you may make the lighthouse on Sand Key.

Should the wind be far southerly or light, it would be most advisable, on leaving the bank, to keep to the southward and get under Double-headed Shot Bank, and out of the force of the stream; and with light and westerly winds (which sometimes continue for several days during the summer) it is usual to get on the Double-headed Shot Bank, and lay on its western edge for a breeze, or cross over into St. Nicholas Channel, and take advantage of the land breeze from the Island of Cuba, to get to the westward.

## DESCRIPTION OF THE BAHAMA BANKS, ISLANDS, AND CHANNELS.

**BAHAMAS.**—Under this general denomination are included all those groups which appear on the banks between the Matanilla Bank on the N. W. and Square Handkerchief on the S. E. The principal islands are situated on those remarkable flats called the GREAT and LITTLE BANKS OF BAHAMAS, which are divided by the channel of Providence, and of so much importance did we consider a correct description of the navigation, being the passage for vessels from the ports of the United States to those of the Mexican Sea, as to induce the author, in 1820, to send the sloop Orbit, under the direction of E. C. Ward, U. S. Navy, to make surveys.

The banks are generally of sand, with coral. The islands are low, flat and interspersed with porous rocks, of fresh water, but the supply is, however, scanty, it being obtained only from pools, formed during the rains, or from wells dug in the sand, into which the sea-water filters. In the woods are found the wild hog and the Agouti.

Within the jurisdiction of the Bahamas are therefore included the Great Bahamas and Abaco Isles, New Providence, Ancros, the Berry Isles, †Eleuthera or Ethern,

\* A lighthouse, showing a fixed light, elevated 70 feet above the level of the sea, 490 yards from the beach, and about 7 miles from the Gulf Stream, is built on the south point of Key Biscayne [Cape Florida]. Vessels drawing 10 feet may approach it till within  $2\frac{1}{2}$  miles. It is about 7 miles from the Gulf Stream, lat.  $25^{\circ} 40'$  N., long.  $80^{\circ} 5'$  W., a little south of Cape Florida.

† On the reef off Key Largo is a floating light vessel, showing two fixed lights, one about 50 feet high, the other 40 feet, bearing from the highest land on Key Largo E. by S. 7 miles distant; from the elbow on Carysfort Reef N.  $\frac{1}{2}$  E., distant 3 or 4 miles; the outer reef [say 14 fathoms water] bearing east  $2\frac{1}{2}$  miles distant, lat.  $25^{\circ} 6'$  N., long.  $80^{\circ} 28'$  W. It may generally be seen 12 miles, and its object is to warn vessels from the dangerous rocks and shoals near which she is moored. In hazy weather, a bell will be struck frequently, to warn vessels to keep off.

‡ Tortugas Light.—Stationary, on one of the Dry Tortugas Islands, near the western extremity of the reef.

§ A spar buoy, painted white, in 15 or 18 feet water, showing 3 feet above the water, is placed at the west end of the quicksands, [Dry Tortugas,] 15 miles E.  $\frac{1}{2}$  S. from East Key, which is the most easternmost key, and where there is a shoal of not more than 7 or 8 feet water.

‖ Sand Key Light revolves once in 54 seconds. It is the best light on the coast, S. W. by S.  $8\frac{1}{2}$  miles from Key West Light, situated directly on the reef. The light is 70 feet above the sea.

¶ Eleuthera or Ethern, to the northward of the Exuma Keys, is one of the largest islands on the bank. It is, as shown on the chart, of very irregular shape, and being on the edge of the Grand Bank, its eastern shore is washed by the blue and fathomless ocean, while on the west, it is a fine,

Guánahan, otherwise St. Salvador or Cat Island, Watland's Island, Exuma, \*Yuma or Long Islands, the Crooked Islands, Mayuana, the Caycos, the Inagues, and many smaller groups.

*Directions for sailing over Nassau Bar, during stormy weather, when a pilot boat cannot go out.*

Vessels approaching Nassau in tempestuous weather, when the pilot cannot cross the bar, by observing the following directions, may come safe over, when the pilot will be ready to receive and conduct them to their anchorage.

On a white flag being hoisted on the point of Hog Island near the lighthouse, a small white flag flying, will be in readiness within the bar, the vessel will then steer in, giving the point of Hog Island about 80 fathoms distance, and keeping Toney's Rock (a small rock within the bar on which a beacon is erected) and the west end of Fort Charlotte barracks in one; keep this course until you bring the white flag on the point to bear east; then put your helm to the starboard and keep for the boat. It sometimes happens that the sea breaks from point to point, even in moderate weather. When this is the case, and the wind should be to the south or east it would not be prudent for vessels of a large draught at water to enter, as there are not more than 17 feet water at low tide on the bar. By order of the Commissioners of Pilotage.

[We recommend to every navigator to make himself acquainted with the set of the currents through the whole extent of the Gulf, and with the description of all the Islands and Keys which compose the Bahama Banks, as at times a knowledge of them may be highly important.]

*Tides and Currents between Watland's Island and New Providence.*

The tides or currents between Watland's Island and the Hole-in-the-wall are generally found to set to the S. W. About Egg Island they set in various directions. Off Douglass Rocks, New Providence, the tide runs very regular; and at the entrance of the New Anchorage, it flows, on the full and change, at 8h. 30m. The flood sets to the N. E. and very strong between the rocks. The vertical rise of a spring tide is 4 feet. In the passage between Egg Island and Nassau, the stream has been found to set at the rate of  $4\frac{1}{2}$  knots; the flood setting east, and running strongly over the reefs. Near Egg Island the current is very uncertain; great attention should here be paid to the lead.

The stream sets strongly over the Egg Island Reef, when the wind is from N. W. The flood sets very strongly between the rocks to N. W.

The tide about the Berry Islands rises 2 feet higher when the sun advances to northward of the line, than it does when it is to the southward. The flood sets strongly over the bank, and the ebb over the bar. In the N. W. Channel of Providence, the current generally runs to the eastward two miles in an hour.

**LITTLE BAHAMA BANK, WITH ITS ISLANDS.**—The Hole-in-the-wall, which is the southernmost extreme of the Island of Abaco, bears N. N. W. from Egg Island,  $7\frac{1}{2}$  leagues distant, and the two form the mouth of what is called the Northeast Channel of Providence; and the Hole-in-the-wall, with Stirrup's Key, forms the eastern mouth of what is called the Northwest Channel of Providence; and this N. W. Channel's Mouth is formed by the Great Isaac, and the western extremity of the Island of Great or Grand Bahama. About one mile west of the N. E. point of Abaco, is a fine bay, called Hurricane Bay, with water enough for small vessels.

After passing the Hole-in-the-wall, the land is indented, both on its surface and beach, and tends nearly east and west, forming a slope, the highest land to the eastward. Two miles W. by S. from it, lies the southernmost point of the Island of Abaco, and Little Bahama Bank.

From the south point of Great Abaco to Rock Point, the bearing and distance are N. W. by W. 16 miles; the latitude of the latter is exactly  $26^{\circ}$ ; from Rock Point to

shallow and smooth water of the bank. "The force of the Atlantic waves has pierced a magnificent arch through the rock of the island; which is the greatest curiosity of the Archipelago. The island is moderately high, and the east side is very foul, having a reef called the Alabaster Rocks, and other dangers."

Harbor Island is close to the north end of Eleuthera, and has a settlement on the south side of the island.

The current sets to the westward of Harbor Island, are Russell Island, Royal Island, and Egg Island. They are low, and between them and Eleuthera is a channel through which small vessels may pass. On the north a bank extends about two miles out, with 9, 11, 12, and 13 fathoms on it. From Egg Island, [the most western,] the anchorage off New Providence bears S.  $30^{\circ}$  W. and, 7 leagues distant.

\* Yuma or Long Island is about 17 leagues in length, from S. E. to N. W.

Key Gorda, on which fresh water may be found, is N. W. by W.  $\frac{3}{4}$  W. 10 miles. Along the edge of the bank, N. W.  $\frac{1}{4}$  N. from Key Gorda, in an extent of 6 leagues, is a continued series of keys and reefs, and within these on the bank is Moose Island. In this distance you will have a dangerous rocky shore, on the west end of the bank. About half way between Moose Island and the S. E. end of Great Bahama Islands, are Burrows' Keys.

The Island of Abaco is divided into two parts by a small shoal channel, and when it is seen to the eastward, it forms two pretty high lumps. There are commodious anchorages on the western and southern edges, well sheltered from the sea, one of which is on the western part of Abaco, which from the Hole-in-the-wall bears N. W. and terminates in a bay, 9 miles from the point.

This bay, with winds at N. W., N. N. E., E., and even S. E., affords a good shelter, with a depth of  $7\frac{1}{2}$ , 8, and 9 fathoms water, and although the wind at S. E. is along shore, it makes no sea, and it is excellent holding ground.

In the bottom of this bay is the channel which divides the island of Abaco into two parts; a number of houses are erected there by people from New Providence, who come to cut wood. This anchorage is safer in winter than in summer, as during the latter you have constant squalls from the southward, from which the lightning often does harm, and earthquakes are frequent, which drive off the people, who retire to Providence and Eleuthera.

From the west part of this bay, a chain of keys extends 20 miles W. by N., after which you will see the east end of the island of Great Bahama, which continues on nearly the same direction for 19 leagues, and the whole of these two spaces of the bank are foul, with reefs and rocks, as far as the middle of Great Bahama, from whence it is clean and has a smooth bottom.

On the S. E. side of GREAT BAHAMA ISLAND, which is wholly bordered with a reef, forms a light, which is 14 leagues in length, and very dangerous, with strong S. W. winds. Within the S. E., or more properly the south point, there is fresh water; and at this point, in lat.  $26^{\circ} 28'$ , long.  $78^{\circ} 40'$ , is a narrow spot of good anchoring ground, having 10 or 11 fathoms. Towards this coast there is generally an outset from the Florida Stream on the west, which however varies according to the wind, &c., and at all times it is necessary to give the west end of Great Bahama a good berth, not only on account of its shoals, for if the wind should hang to the southward, you would be embayed.

The western edge of LITTLE BAHAMA BANK, are several keys and dangerous reefs. Off the N. W. point of Great Bahama Island, are the Wood and Indian Keys,

at a league to the northward of which is Sandy Key, and at two leagues to the N. by W. of Sandy Key is Memory Rock, which stands about half a league within the edge of the bank, and appears when bearing N. E. as represented in the margin.

From Memory Rock the edge of the bank trends to the N. W., and at 4 miles from the rock, is the south end of a reef which is even with the water's edge. This reef is 2 leagues in length, and is succeeded by several others, to the distance of three leagues more to the north. Between these and the Matanilla Reef, the ground appears to be clear, with soundings on the bank in the northern half, 18, 19, and 20 fathoms.

In the extreme western part of the Great Bahama there is excellent anchorage, from which the soundings of the bank run off 5 miles.

When there is a sea from the N. E. on the N. W. point of this bank, in that part of it in  $25^{\circ} 30'$  and 40 fathoms, it makes at flood tide a race, and whirlpools, produced by its encountering with the gulf current, so as to cause it to break heavy, and makes it appear like shoals; on the contrary, getting to the southward of this race, you will have smooth sea, and may keep in 15, 16, 14, 13, 8, and 7 fathoms water. The bottom is sand, gravel, and some stones, upon which you may occasionally anchor. On this bank the water is green, and you cannot see the bottom until in  $2\frac{1}{2}$  and 3 fathoms, upon which, or in the green water, there never has been any current experienced; therefore the Gulf Stream does no more than touch along the edge of soundings.

The Matanilla should be avoided on a flood. It has been represented in the old charts as extending to  $27^{\circ} 50' N.$  It has been sought for in that parallel, and not having been found there, presumed not to exist, but still we think it should be avoided. The Orbit entered on the bank in lat.  $26^{\circ} 45' N.$ , long.  $79^{\circ} 12' W.$ ; from thence she steered N. 10 leagues, leaving Memory Rock to the eastward, and the Western Reefs to the westward; from the lat.  $27^{\circ} 15'$ , long.  $79^{\circ} 12'$ , she steered N. E. 27 miles, having 20, 16, 15, 13, 10, and on the centre of the bank,  $4\frac{1}{2}$  fathoms; from thence to the eastern edge, the water deepened to 23 fathoms, and then no bottom, lat.  $27^{\circ} 33'$ , long.  $79^{\circ} 42'$ . "The Derrotero de las Antillas," says, "It has been generally believed that the bank terminates in a great reef; but the truth is that there is none, only the shock of the cor-

flicting currents, particularly when the wind is from the northward and westward, causes heavy overfalls, and the sea to break much, which led to this mistake."

Capt. Livingston, in advising to this passage, says, "I have been informed that, after Capt. Laso de la Vega discovered there was no reef on the Matanilla Bank, the ship of war *El Angel*, of 80 guns, was sent from Havana, under the command of Don Dionisio Alcola Galiato, to examine it, and did so most minutely as far as  $27^{\circ} 51'$ , and found no danger whatever. I have also been told by an intelligent master of a New Providence wrecker, that he has been at anchor on it, and that it is all perfectly safe, with a fine sandy bottom."

The Derrotero also says, "When there is a N. E. swell on, upon the edges of the Matanilla Bank, and in 25, 30, and 40 fathoms, the sea is jumbled up much by the shock of the current, and so forms overfalls or breakers, which seem to indicate a shoal, but there is none; on the contrary, to the southward of these overfalls, you may find smooth water, with 16, 15, 18, and 7 fathoms."

De Maine, who surveyed the Bahama Banks by order of the British government, says, "he struck on the Matanilla Bank, and knocked off his keel." We have given all our authorities and submit to the judgment of the reader.

The extensive chain of keys which borders the northern side of the Little Bahama Bank, extends from the Elbow Reef 34 leagues W. N. W., and the late delineations prove how very inaccurately they have ever before been represented. The bank which supports these keys is generally shoal, but there is a passage between them and the Abaco Isles, having from 4 to 2 fathoms, which leads to the centre of the bank. The entrance to this passage is close to the west of Great Guana Key, and the Whale Key Rocks in lat.  $26^{\circ} 45'$ , long.  $77^{\circ} 6'$ . To small vessels it affords excellent shelter between the keys and Abaco.

But it is to be noted, generally, that a very heavy swell commonly sets upon this coast; and it is never advisable for a stranger to advance nearer than two leagues, as the wind is mostly from the eastward. This is the case along the whole of the north-eastern keys; and, therefore, when sailing in this part, whether beating up or running down, a too near approach is both unnecessary and dangerous.

**ABACO, OR THE HOLE-IN-THE-WALL.**—The N. E. point of the island of Abaco lies in latitude  $26^{\circ} 17' N.$ , longitude  $76^{\circ} 57' W.$  When in its latitude, it's ant nine miles, steer S. by W.  $\frac{1}{2} W.$  12 miles, which will carry you on the bank off the Hole-in-the-wall, in about 14 fathoms water. The first island to the northward of the N. E. point, is Little Harbor Key. North of this, Linnyard's Key, and still farther north, Little Guana Key. Linnyard and Pelican Keys run S. by W.  $\frac{1}{2} W.$  and N. by E.  $\frac{1}{2} E.$  The distance between Linnyard's Key and Abaco is about two miles, fine sandy bottom, clear of rocks, and good anchorage, and bears north from the N. E. point of Abaco.

On the N. E. side of the island of Abaco, in a direction N. N. W. from said point, N. W. from the south, and S. W. by S. from the north end of Linnyard's Key, is a good watering place, called Weatherford's Well. To enter the channel leading to the watering place, which lies between Linnyard's Key and Little Guana Key, you must keep a small island which forms the north side of the channel (about 300 yards from Linnyard's Key) well on board on your starboard hand, and you will pass the bar in 3 fathoms, and find good anchorage in 4 or 5 fathoms water, within about two miles west from the north point of Linnyard's Key. This channel is far preferable to the one at the N. E. point of Abaco, independent of its safety and facility in getting water, as you may approach within a mile and a half of the watering place with three fathoms, or come immediately abreast in two fathoms, within 300 yards of the shore. Wood may be had in abundance among the keys, together with shell and scale fish.

The water breaks where there is danger, with the wind to the eastward, and it is advisable to have a lookout aloft while going in.

The eastern part of the coast is completely iron-bound, and fragments of wrecks are found on all its shores and keys.

The first point, south of the N. E. point of Abaco, is called Rocky Point. S. S. W.  $\frac{1}{2} W.$  from this point, 6 miles distant, is a reef of rocks 9 miles in length, and  $1\frac{1}{2}$  in breadth, running in the same direction as the shore, inside of which is Cheeric Sound, which makes a channel between the two.

After passing the reef which lies off Rocky Point, the water is bold to within half a mile of the shore, till up with the Hole-in-the-wall.

The land between Rocky Point and the Hole-in-the-wall forms a deep bay, in which you must be careful not to be caught with a south-easterly wind.

**PROVIDENCE CHANNEL, BAHAMA BANK,** with its islands, Gulf Passage, and the **FLORIDA COAST.**—In preference to running down for Rocky Point, (which lies about 2 miles S. S. W. from the N. E. point of the island of Abaco,) where you get embayed, you must lie up S. S. E. and S. E. by E. to run along the

land, it is more prudent to run into the latitude of the Hole-in-the-wall, and with the wind any way to the southward of east, it is presumed every man would do it.

**HOLE-IN-THE-WALL.**—The Hole in-the-wall lies in latitude  $25^{\circ} 51'$  North, longitude  $77^{\circ} 10'$  West, and is the south-east point of Abaco. By making Rocky Point in the day time, you may have a safe run on your S. by W.  $\frac{1}{2}$  W. course, 12 leagues, and then, if you do not choose to run, lay by, should it be in the night. The generality of the vessels make the land too far north in the latitude of  $26^{\circ} 10'$  or  $26^{\circ} 20'$ , because an opinion prevails that the land thereabouts is soonest seen, and are not aware of its forming a bay to the south and west. If, at night, they make the land in the parallel of  $26^{\circ} 10'$ , with a strong breeze from the N. E., they are so close in shore, before they can discover the land, that it is almost impossible to clear it, for the land, in that latitude, trends a little to the westward, forming a bay, a few miles north of the Hole-in-the-Wall, with a reef of rocks outside, in one part, half a mile from the shore; and should they make the land farther north, the danger, with a scant wind, is still greater, as there is constantly a heavy swell setting on the shore.

Vessels should run down their longitude in the parallel of  $25^{\circ} 50'$ , or from that to  $26^{\circ}$ , and not farther north. By keeping in this latitude they cannot miss the Hole-in-the-wall, and they will likewise avoid the land on the South or Harbor Island side.

Off the Hole-in-the-wall lies a bank, in a S. E. direction, 7 or 8 miles in length, and about 4 miles broad in the middle, ending with a point at the S. E. extremity.

*Soundings taken on the bank.*

Hole-in-the-wall,	W. 2 miles.....	12 fathoms.

do.	W. $\frac{1}{2}$ N. 3 miles.....	12 do.	
do.	W. by N. $2\frac{1}{2}$ miles.....	11 do.	
do.	N. W. $\frac{1}{2}$ N. $2\frac{1}{2}$ miles.....	15 do.	
do.	N. W. by N. 3 miles, off the bank.		

Beyond 15 fathoms there were no soundings with 80 fathoms. You may know when on this bank, as the water changes at once from a dark sea blue, to a beautiful vivid green, is more agitated by a ground swell, and discovered the moment you are off, particularly with a S. E. wind, at which time the above soundings were taken.

The Hole-in-the-wall (or Hole-in-the-rock) is an arch through the land, about 10 feet wide, and 4 or 5 feet high, the bottom nearly one foot above the water, which breaks through the Hole, and may be seen when bearing S. S. W. to W. S. W. and N. N. E. to E. N. E. and at first sight appears like a sand bluff, but at 3 or 4 miles distance may be plainly distinguished to be an arch-way through the land.

South from the Hole-in-the-wall 100 yards distant, is a rock, 60 or 70 yards long, hollowed out all round at its base by the water, which may be doubled within half a mile.

On the south point of the main land is another corresponding projection, both which appear to have been caused by some convulsions of nature, of which the whole coast bears evident marks. It is covered with fragments of vessels, spars, &c. and the western side has a complete barrier of stones, formed on the beach, above the tide mark, both by nature and the S. W. gales, which at times blow very hard.

Five miles to the westward of the Hole-in-the-wall, and about 300 yards from shore, the soundings are regular,  $2\frac{1}{2}$  and 3 fathoms, and deepening rapidly as you leave it.

One quarter of a mile off the S. W. part of the island, you will have two fathoms, fine level sandy bottom. The land here is low, and covered with brushwood. Here the ebb sets N. E. and tide rises three feet.

**\* Abaco Revolving Light.**—At one third of a mile from the Hole-in-the-wall, this lighthouse has been erected, in  $25^{\circ} 51' 30''$  N. lat. and  $77^{\circ} 10' 45''$  W. long. Its base is 80 feet above high water, and the tower is 80 feet high. The light revolves once in every minute, and may be seen in all directions except where the high parts of the island intervene; and being 160 feet above the level of the sea, it will be visible in clear weather at the distance of 15 miles to an eye elevated 10 feet.

17 do.	do.	20 fms.
19 do.	do.	40 do.
21 do.	do.	80 do.

There is good anchorage [during the ordinary winds] in 10 and 11 fathoms, with the lighthouse bearing E. by N. about half a mile from the shore. The time of high water at full and change is at 8h., and the tide rises 3 feet.

† The Hole-in-the-wall is seldom seen when to the eastward of it, as it is not exposed very near the shore, or when you are S. W. of it.

Vessels of any draught ought not to approach the land nearer than about 400 yards, where they will lie in about 4 fathoms water. Inside this the water shoals suddenly to two fathoms.

Vessels in the night, or in foggy weather, may run to the westward, when in latitude  $25^{\circ} 16'$  N. and sound till they get in 14 or 15 fathoms, and be then sure to clear the Hole-in-the-wall by a west course, six miles, when it will bear north, and then run W.  $\frac{1}{2}$  N. sixteen leagues, when Stirrup Key will bear south six miles distant. Vessels running down in the latitude of the Hole-in-the-wall, will not get soundings till up with it.

In taking your departure from the Hole-in-the-wall for the Great Bahama Bank, steer west twelve leagues, and if the land be not in sight, haul W. S. W. or S. W. by W. and make the  $\frac{1}{2}$  Berry Islands, keep down past these and keep a good look-out for the westernmost key, called Stirrup Key, before : ed, which lies in latitude  $25^{\circ} 48'$  N. and longitude  $78^{\circ} 2'$  W.

*Extract from the log-book of the surveying sloop Orbit.*

"In approaching the Berry Islands, the water is bold close in; two and a half miles from the shore, 11 fathoms; two miles, 9 fathoms; one mile, 8 fathoms; the northernmost part of Stirrup Key bearing W. by N. three and a half miles, 7 fathoms; W. N. W. two and a half miles 8 fathoms, rocky bottom; west, one mile, 7 fathoms; W. S. W. three quarters of a mile, 9 fathoms; and all along to the westernmost key, 8, 9, and 10 fathoms, generally fine sandy bottom. The moment you get on soundings, in approaching the Berry Islands, the water changes color.

"Sailed around the Berry Islands till they bore N. N. E. two miles, and had 5, 4, 3, and  $3\frac{1}{2}$  fathoms; and far as five miles, 4, 3, 4, 4,  $3\frac{1}{2}$ , 4,  $3\frac{1}{2}$ , and  $3\frac{1}{2}$  fathoms; N. by E. six miles, 2 $\frac{1}{2}$  fathoms. West Berry bearing N. N. E. and Blackwood's Bush S. S. E. course W. N. W. the soundings were 2, 4, and 5 fathoms; at 2 $\frac{1}{2}$  h. steered W. 4 fathoms; at 3 h. S. S. W. 7 fathoms; at 3 $\frac{1}{2}$  h. S. S. W. 7 fathoms; 3 $\frac{3}{4}$  h.  $6\frac{1}{2}$  fathoms; at 4 h. 6 fathoms; at 4 $\frac{1}{2}$  h.  $5\frac{1}{2}$  fathoms; at 4 $\frac{1}{2}$  h.  $4\frac{1}{2}$  fathoms; at 4 $\frac{1}{2}$  h.  $3\frac{1}{2}$  fathoms; at 5 h. 3 fathoms; at 5 $\frac{1}{2}$  h.  $2\frac{1}{2}$  fathoms; at 5 $\frac{1}{2}$  h.  $2\frac{1}{2}$  fathoms; at 6 h.  $2\frac{1}{2}$  fathoms; at 6 $\frac{1}{2}$  h.  $2\frac{1}{2}$  fathoms; at 6 $\frac{1}{2}$  h.  $2\frac{1}{2}$  fathoms; at 7 h. only 11 feet, and came to anchor among black patches, which we sounded and found to be flat rocks, about one foot high, covered with weeds. The water was shoal far to the westward of this. Vessels should not go among these black patches; the regular channel is quite free from them, and the water is muddy, having a milky appearance, which prevents the bottom being easily seen."

The best courses for crossing the Bahama Bank are the following, viz. when Stirrup Key bears S. 8 miles distant, (at which time it can be just seen from deck) steer W. S. W. 6 leagues, then haul to S. W. by S. 10 leagues; thence S. S. W. or between that and S. W. by S. to latitude  $24^{\circ} 55'$ , when you may keep away W. and make  $\frac{1}{2}$  Orange

Off Stirrup Key there is good anchorage in 7 fathoms. To get shelter from strong easterly winds, in order to repair any damage or to obtain water, you may anchor to the west of the westernmost island, in 7 $\frac{1}{2}$  or 8 fathoms, on good holding ground. W. S. W. from Stirrup Key 4 miles distant, the Brig Dromo struck in 9 $\frac{1}{2}$  feet, hard coral bottom, having 2 $\frac{1}{2}$  fathoms to the S. and W. on both side, and 5 fathoms to the northward. On Stirrup Key there is a settlement, and a Custom House established: the place is called Williamstown. Here refreshments of every kind can be obtained.

† The Berry Islands consist of about thirty large keys, with innumerable smaller ones; they lie to the N. E. of Andros Island, the south-easternmost of which is Frozen Key, and the northernmost Stirrup Key. There are soundings all round the group; and 20 fathoms may be found at two miles from any of the keys. The surface of the bottom is sand, and below that, a kind of a limestone. The isles form several small harbors, where water and other refreshments may be had, but are seldom frequented by any other than the people of New Providence. At the Berry Islands the tide rises two feet more when the sun is to the northward of the equator, than it does when to the southward of it. In the anchorage, or little harbor of these islands, the tide runs with strength among the rocks, in a N. W. direction.

‡ Orange Keys is a cluster of rocks and keys, lying near the west edge of the Great Bahama Bank, extending from latitude  $24^{\circ} 53'$  to  $24^{\circ} 58'$  N. and longitude  $79^{\circ} 6'$  W. The main rock is about three quarters of a mile in length; and the broadest part about 120 yards, highest part 20 feet, and narrowest 8 yards. It is a barren rock, the eastern side quite straight, and runs S. S. W. and N. N. E.—S. by W. of the main island, distant three-quarters of a mile, are two rocks, 6 feet out of water, about 15 feet in length; and one half a mile S. by W. of these, lie two smaller rocks. It is dangerous to pass between either of these rocks, and the principal island, as reefs run out and connect them, 30 or 40 yards broad, and soon as over 4 fathoms. One mile south of these rocks, you may sail with safety. They are a mass of solid rock, and may be approached to the westward to their very edge on 11 feet water. N. W. of them is good anchorage in 8 $\frac{1}{2}$  fathoms, foul; there is also good anchorage S. E. of Orange Keys in 6 fathoms, without other danger than the eye announces. To the northward it is not safe to approach within three miles, as the water breaks, and

Keys, or continue on your course to latitude  $24^{\circ} 45'$ , when you may keep down west, and leave the bank without danger. In case you should prefer to haul to sooner than directed, in crossing the bank, and find your water shoaling, you may, by keeping off W. 3 leagues or more, find the deep water of the channel, which is 5 leagues in breadth; bear up as soon as you get but  $2\frac{1}{2}$  fathoms, as it shoals suddenly and irregularly from that depth.

You may even run 7 leagues on your on W. S. W. course, after leaving Stirrup Key, without danger: be careful to allow for the tide. On the north side, the flood sets S. S. E. and ebb N. W. and as you draw on the bank, the force of the tide decreases, for when you have got 4 or 5 leagues on the bank, the tide is but a slight set. Or when Stirrup Key bears South 5 miles distant, you may steer S. W. by W. 44 miles, and then S. S. W. until off the Bank. The water in the regular channel is milky white, to the eastward you have it clear with black spots on the bottom, and to the westward clear with hard white bottom.

By crossing the Bank as above directed, you will see few or no spots of sponge, and the bottom is with difficulty discerned, and may be sure of three fathoms all the way.

Be careful of Orange Keys in the night-time, as they are very low, and cannot be seen until on board of them, and the soundings are deepened regular, until very near them on their east side.

S. W. from Orange Keys, 5 or 6 miles distant, is good anchorage in 20 fathoms water. When up with these keys, a passage is secured through the Gulf, for then you may make sail either in the morning or at midnight, steering S. W. 10 or 11 leagues, that will enable you to fall in with Salt Key Bank, which for 10 leagues on the north side stretches E. and W. and consequently the current sets stronger as you come to the westward. In coming over you have good soundings all along by it. There is anchorage by spots all the way in, but the soundings are narrow at the Double-Headed Shot, the N. W. point of which lies in latitude  $23^{\circ} 52' N.$  This route, however, demands the most zealous care, in order to avoid any shoal which may exist, although unknown. North  $4^{\circ} W.$  four miles distant from Orange Keys is the Galeon Shoal, having only twelve feet.

The edge of soundings, between the \*Riding Rocks and Orange Keys, is clean; you

has a ridge, projecting to a very considerable extent. There is no sign of verdure on these keys, but round them plenty of fish.

Many persons mistake Orange Keys for the Riding Rocks, north of which you cannot go; but north from Orange Keys, 3 miles distant, you will find a passage, although it is not safe for strangers to go this way, neither should it be attempted by any one, as you are obliged to pick your way through black patches, which are sometimes shoal. Var.  $4^{\circ} 26' E.$  1820.

\* Riding Rocks lie 6 leagues north of Orange Keys, consisting of one rock or key, about half a mile long, and 12 yards wide in the broadest part, which is nearly divided one-third from its south point by a bay. This Key is very irregular in its height, and more uneven than Orange Keys; about  $2\frac{1}{2}$  miles to the northward of this rock, is a small island about  $2\frac{1}{2}$  miles long, and 250 or 300 yards broad in the broadest part. To the northward of the southernmost key lies three small rocks, about 10 or 12 yards long, each running N. W. by N. The southern key runs N. by W.—the one next to this key is 50 yards from it: this, 100 yards from the third, and the third 100 yards from the second. These rocks are about 3 or 4 feet high. South of this key are two haycock rocks, just out of water, 6 or 8 yards from the land. There are also two rocks which lie half a mile east of the southernmost key, the largest 80 feet long, and the smallest 50 feet long, about one hundred feet asunder, and 12 feet high. These two rocks lie N. and S. There is a rock as big as a small boat about half a mile to the northward of these two rocks. A reef extends all along between these rocks, with the southernmost of the Riding Rocks bearing N. N. W. distant 11 miles, 5 fathoms. Eastern Rock and the northern key, in a line bearing N. by W.  $2\frac{1}{2}$  miles, 44 fathoms fine level sandy bottom;  $2\frac{1}{2}$  fathoms immediately, and 3 miles distant, 3 fathoms. Northern Riding Rocks bearing W. 5 miles, 34 fathoms. Southern Key, bearing S. W. by W. 2 miles, 34 fathoms, Main or Northern Key bearing W. N. W.  $2\frac{1}{2}$  miles, 3 fathoms. There is a shoal runs out from this key in a N. N. E. direction, on which are 6 feet water. You will not have a passage to northward of the Riding Rocks for vessels drawing 6 feet water. Ebb sets N. E.  $1\frac{1}{2}$  mile per hour. S. by E.  $1\frac{1}{2}$  mile from the east lump of the Riding Rocks, there is a sizeable isle, with various small keys in its vicinity, called Rock Key; there is good anchorage on its west part, in 74 and 8 fathoms, and the edge of soundings lies  $1\frac{1}{2}$  mile off.

In steering from the Orange Keys to the Riding Rocks, the deepest soundings are 84, and the shallowest  $4\frac{1}{2}$  fathoms. The western edge of the bank is an iron bound shore, being connected by one grand chain of rocks, extending under water from Key to Key.

Extract from the *Orbit's log-book*.—"Laying at anchor, among these shoals, at low water had 12 feet, and at high water, 13 feet; had a light wind at W. S. W. and could see the edge of soundings off deck, not more than three quarters of a mile distant: got under way at first ebb, and in making a tack crossed over some shoals with only 13 feet water on them, on which there could not

may enter on it without other care than that of the lead. From Orange Keys, which are the southernmost keys on this side of the bank, the edge of soundings runs about S. by E. very clean to  $24^{\circ} 10'$ , and more or less deep; it forms, with the keys on Salt Key Bank, a channel, which is bottomless, and called Santaren. The above observation, in entering on to the bank between Orange Keys and Riding Rocks, means only the edge; as you get further on, you find the soundings obstructed in their regularity by many coral shoals, but by day, and with a free wind, you can pick your way.

In star-light nights the bank reflects a bright light into the air, which may be seen at 4 or 5 leagues. You may observe this reflection all over both the Bahama Banks, but not on Salt Key Bank; neither can you see it while on the bank; but when in the Gulf, you can plainly distinguish the Providence Channel, having none of this reflection between the two reflections of the Great and Little Bahama Banks.

An experienced navigator (the late Capt. Parke, of New-York) while crossing the Bahama Bank, made the following remarks, which we know are entitled to full credit: "Having been three days detained by light S. W. winds and calm weather on my last passage across the bank, I made the following observations on the tide, viz the flood tide sets south, veering to S. W. and the ebb north, veering to N. E. For three days in succession the tide set nearly two knots in each direction, and very regular; on the third day the weather being still and calm, I weighed anchor and drifted with the tide south, S. S. W. and S. W. When the vessel stopped drifting, I anchored in 3 fathoms water, and rode the ebb: when the tide slackened, I again measured the depth of the water in the same place, and found 15 feet."

It is not presumed the same depth of water can always be carried over the bank, even in the same track, as it must occur to the mind of every person that a strong easterly wind will drive the water off the bank, as well as a strong northerly increase its quantity; in all parts of the channel the bottom is of a sticky quality, whereas to windward the bottom is hard, and spots thicken as you shoal your water. Almost every regular trader has a different course to run across the bank, but the principal object is to clear \*Sheep Key Shoals; with the wind scant, and not drawing a heavy draft of water, you should haul to a little sooner, but not without a leadsman constantly in the chains, and should bear up as soon as you shoal your water to  $2\frac{1}{2}$  fathoms. With the wind steady and free, so that you could lay to windward of south, you should always make sure of westing to clear the shoals to windward, taking care not to run so far as to get among the shoals which stretch off from the east side of the keys which border the bank on its western edge.

There were scarcely two men who crossed the Bahama Bank that agreed as to the latitude of the Orange Keys, and many doubted their existence; this difference of opinion induced sending the sloop Orbit: the subject is now at rest, as marine and land surveys have been made by her officers, of the Orange Keys, Riding Rocks, Cat Keys, Great and Little Isaac, with the rocks, &c. adjoining, all which are previously described.

**GUN CAY LIGHT.**—At 250 yards from the southern extreme of Gun Cay (a narrow ridge of coral which stands on the western edge of the Great Bahama Bank) a light-house has been erected in  $25^{\circ} 34' 30''$  North Latitude, and  $79^{\circ} 18' 24''$  West Longitude. Its base is 25 feet above high water, and the height of the Tower is 55 feet. The light revolves once in every minute, and may be seen in all directions, except between the bearings of S. by W.  $\frac{1}{4}$  W. and S.  $\frac{3}{4}$  E. (Magnetic) where, at the distance of about 8 miles, it will be intercepted by the Bemini Islands.

When within 5 miles distance, vessels should not bring the light to the southward of the S. E., as the chain of Cays and Reefs project in a curve to the westward, and as they lie within a mile of the outer edge of the Bank, there might be scarcely time to obtain soundings. The flood tide also sets strongly to the eastward through the intervals of the Cays, where it is high water at full and change at 7h. 30m. and the tide rises three feet.

be more than 7 or 8 feet at low water; and I have no doubt, but, at times, after heavy gales, these shoals may be above the water's edge.

"High water, at full and change on the edges of the bank, at 8h. 50m. On the north side the water is 3 feet; on the west, to the northward of Orange Keys, 3 feet; to the southward of Orange Keys, 4 feet; and in lat.  $24^{\circ} 10'$ , 5 and 6 feet. The flood and ebb set from three quarters of a mile to two miles, on and off the bank."

\* Sheep Keys bears S. S. W.  $\frac{1}{4}$  W. 7 or 8 leagues from Stirrup Key, and lies off the N. W. part of Andros Islands; from these keys it is, as before observed, very foul to the westward, and the shoal extends quite round to Stirrup Key; the bottom covered with spots of sponge and rocks, the size of a barrel or the head of a hoghead; and any object on the bottom may as plainly be seen as if no water intervened. Ebb the tide rises 4 feet.

On the Bahama Bank, in lat.  $24^{\circ} 10'$  to latitude  $24^{\circ} 20'$  it is shoal near the edge. The tide rises 6 feet, and there are many spots in this space with less than 10 feet at low water. The shoal lies within one mile of the edge of the bank: they are of quicksand, and of course the depth of water on them must alter with every gale.

Should you prefer running down the Cuba shore, you may steer S. W. after leaving the bank in latitude  $24^{\circ} 40'$ , and when sure of having passed the Double-Headed Shot, haul a little more southerly, say S. W. by S. and make the island of Cuba; this is called the route by the Santaren Channel, and is at all times preferable. Keep down in shore as far as the table land of Mariel, which cannot be mistaken, when you may run over N. W., and if not more than 24 hours in the Gulf, you will clear the Tortugas; but if you are a longer time in crossing, it would be prudent to keep a look out for colored water and the Tortugas. The Pan of Matanzas bearing S. S. W. to S. appears like one round hill, but at any other bearing you will see another each side of it, not so high and adjoining to it. If you are near in shore, on passing the Havana, you will see the shipping in the harbor, and the Moro Castle light may be seen 8 leagues off. The table of Mariel is 9 leagues from the Havana.

When you anchor on any part of the edge of the bank, in order to pass the night, or for a favorable tide, you ought to have every thing ready to make sail the moment it may be necessary; and also, if the sky looks ill, you should have the topsails reefed. From any one of these anchorages you may make sail with any wind; and, generally speaking, every one in these parts, who requires to anchor, may find a proper place to do so, and in which he may be sheltered from the winds that molest him, or which he foresees coming; and without eddy winds to leeward, which cause trouble in case of fouling the anchor, though they only require vigilance and a seaman-like dexterity.

On leaving the bank, you must be careful not to fall in with the Florida Shore or Double-headed Shot Keys in the night-time; but with day-light and a breeze, there is no danger in making either.

High water at full and change on the edges of the bank at 8h. and 50m.—on the north side it rises two feet; on the west to the northward of Orange Keys, 3 feet; to the southward of Orange Keys, 4 feet; and in latitude  $24^{\circ} 10'$ , it rises 5 and 6 feet. The flood and ebb set from three-quarters to two knots on and off the bank.

**PROVIDENCE N. W. CHANNEL, AND N. W. EDGE OF THE GREAT BAHAMA BANK.**—As vessels drawing over 13 feet water cannot cross the Great Bahama Bank from the Berry Islands to the Orange Keys, it is necessary to navigate along the edge to the north of the Isaacs, and doubling them go as far south as the Orange Keys; the best course is, when up with the Hole-in-the-wall, to steer W. by N. 36 leagues, which will carry you to the west edge of the bank, and about 2½ leagues from the Great Isaac, taking care to keep in 12 or 16 fathoms, in which you ought to pass two miles from the Great Isaac; then shape your course through the gulf, exercising the utmost care so as not to get far out from the edge of soundings, because the moment you leave the edge, and get into blue water, you will be in the general current or Gulf Stream, which sets strongly to the northward; therefore, if the wind does not permit steering along the edge of the bank, you ought to anchor on it and wait till the wind be favorable. He who has no experience in this place, ought not to pass beyond the Great Isaac by night, but may anchor to the N. E. of the centre of the island, in from 7 to 10 fathoms, on sand, and wait for day-light.

To run along the edge of these banks you have to attend to the lead, and keep an unusually strict lookout, as the Gingerbread Ground, in the neighborhood of the Little Isaac, makes up at once from deep water; with which guide, and the notice we have given, you will have sufficient information to enable you to avoid all danger. On the edge of soundings, although you do not feel the general current, yet there is a set of the tide, which may either run a vessel off the edge, or upon the keys; but this cannot happen if the lead, which ought to be kept constantly going, is properly attended to, as it will warn whether to keep to starboard or larboard, in order to preserve the proper depth. In this passage you will pass \*Little Isaac, †Great Isaac, and ‡Bemini Isles

\* Little Isaac consists of three islands or rocks, running in an E. S. E. direction: the western rock is about 40 feet in length; the eastern rock, rather larger, about 5 miles from the western one; between these two, in a direct line, is a smaller rock, about one mile distant from the eastern Isaac, on the same line: they lie about 5 or 6 miles in on the bank: outside of them the soundings are

From Orange Keys you may leave the bank and enter the Gulf without dread of the current, steering as before directed for the Double Headed Shot Keys. Or you may from the Riding Rocks steer for the Salt Key Bank, navigating along its edge, and, as it were, having doubled the western angle, steer for the coast of Cuba; but to do this it is necessary to steer from the Riding Rocks S. S. W., and sail more than 4 miles the hour, and as one is not master of the winds, if it should be calm you will be in danger of drifting to the north, a thing you should by all means guard against, on which account we consider the navigation by the Santaren Channel as preferable.

This navigation, which we have just described, is not in common practised by those

clean; you will have 14 fathoms on the edge, diminishing gradually, so that one mile from them you have 6 fathoms. In all the distance between Stirrup Key and Little Isaac, the edge is clean, and you may navigate down it by the hand lead. S. E. from the Little Isaac you may anchor, good holding ground, but a heavy sea. The shoal ground on which these rocks exist is called the Gingerbread Ground: it extends 5 leagues E. by S. from the western Rock, and has some dangerous rocky heads upon it, with only 7 to 9 feet water. Under the S. W. end of the Gingerbread Ground, within the Little Isaac, you may anchor in 3½ and 4 fathoms. The holding ground is good, but there is often much sea. There is also good anchorage in 8 and 9 fathoms off the east end of the Gingerbread Ground, at 12½ leagues to the westward of Little Stirrup Key, which may be found useful during a northerly wind.

† Great Isaac is a key of moderate height, about half a league in extent from east to west, in lat. 26° 1', long. 79° 2', and bears about W. N. W. from Little Isaac, distant 5½ leagues. A cluster of little islets and rocks, called the Hen and Chickens, lies at the distance of two miles to the S. S. W. of its western point. There is also a round rock, about 20 yards broad, at the distance of two miles N. E. by N. from the N. E. point, and a reef called the Brothers, at the distance of a league to the east, from the east point. The ground in other parts is clear, and to the N. W. and S. W. of the isle is good and extensive anchoring ground, with regular soundings from 15 to 5 fathoms, with soft limestone bottom and broken shells. The Brothers are two haycock rocks, lying W. S. W. and E. N. E. 1½ mile distant, the easternmost being about 5 miles from the Great Isaac. The Hen and Chickens have good anchorage on the west side of them in 5½ or 6 fathoms of water, fine sand. The bank of soundings extends 6 miles to the west of the Great Isaac, with increasing depths, from 7 to 16 fathoms; and to the S. W. nearly 6 leagues, with 7, 6, 7, 6, 10, and 17 fathoms, and from the Great Isaac to Bemini Islands, the soundings are 9, 9, 8, 7, 7½, 8, 8, 8 fathoms. On the bank you can anchor, the Great Isaac bearing S. E., in 8, 5, and 10 fathoms. Near the Great Isaac, at the N. W. extremity of the Providence Channel, the current runs to the east at the rate of two miles an hour.

Too much caution cannot be used between the Great Isaac and the Bemini Isles, as there are several rocks under water. The shoal on which the British brig Moselle struck is the most dangerous, and the bearings of the land from the spot were as follows:

The N. E. point of Bemini Isles, S. S. E. ½ E. 5 or 6 miles. The southernmost part in sight S. by W. ½ W. The ground water rock (which appears above water, and lies to the northward of Bemini) S. E. ½ S. 1½ mile distant.

This reef is upwards of a mile in length, and about 60 feet wide. It lies in a S. by W. and N. by E. direction, and has 3 and 4 fathoms close to it on both sides. In some spots there is not more than 10 feet at high water, the tide rising and falling between 3 and 4 feet; flood setting to the N. E. and ebb to the S. W., forming a rippling, like the meeting of two currents. Position, when aground, latitude 25° 46' N., longitude 79° 19' W. De Mayne places the rock in 25° 50' N. and longitude 79° 15' W.

The flood here sets at the rate of about 1½, and the ebb 3 miles an hour.

† The Bemini Isles are low, with some small trees, or rather bushes on them, particularly on the S. E. part of the South Isle. They are the westernmost isles of the Great Bank, and lie in latitude 25° 44' N., longitude 79° 4' W. Under the south point there is a bay, with some low keys lying S. S. E. and S. E. of it, in which you can anchor and have shelter from winds at N. round to S. E., with 4½, 5, and 6 fathoms, or you can pass the night here when bound southward. On these keys and islands there is some wood and water.

These islands are represented from a plan made by the officers of the British brig Moselle, in July, 1810, which exhibits a shoal on the south side of the Southern Bemini, as having only 3 feet of water, white sand and sponge. On the edge of the bank, south of the S. W. point of the same isle, there are no soundings within a cable's length of the rocks; but westward of the same point, is the anchorage above described, extending outward about one league: and the edge of the bank thence continues in a N. N. E. direction, but having within it similar soundings to the distance of 5 leagues. Beyond this, is a dry rock, and a ledge on which the Moselle grounded.

The inlet or harbor, between the Bemini, has throughout from 12 and 11 to 10 and 9 feet at low water.

From the S. W. point of the Southern Bemini, a chain of low keys and rocks, called the Turtle Rocks, extend about 3 miles to the south. Some of them do not rise to the level of the water. Here the bank is very steep, as, at the distance of a pistol shot, no bottom is to be found, and, at the half length of a ship, are 14 and 15 fathoms, on sand. Barnett's Harbor, a hole in the bank, of 2½ fathoms, divides this from a succeeding group of keys, called the Cat Keys, which extend to the south, nearly to 25° 30' N.

bound from Europe to Havana, or to the Gulf of Mexico, as it offers no advantage over that of the old channel, or that to the south of Cuba, which is more direct; but it may be well for vessels from the United States, and for those who, driven out of the Bahama Channel, by calms or accident, wish to avoid the long circuit of gaining sufficient east longitude to make Point Maysi and return to Havana by the old channel.

**SOUTHERN BORDER OF GREAT BAHAMA BANK.**—Key Verde is the south-easternmost key of the Great Bahama Bank, in lat.  $22^{\circ}$ . It is only a mile and a half in length, and about two cables' length broad, extending E. S. E. and W. N. W., and is destitute of fresh water. From this key the edge of the bank extends W. S. W. 11 leagues, to the Key of St. Domingo, in the mouth of the Bahama Channel. The ground between Key Verde and St. Domingo's Key is generally clean; but there are two shoals, one at 13 miles from Key Verde, on the edge of the bank, is called St. Vincent's, and does not exceed a cable's length in extent from N. N. W. to S. S. E., by half a cable at its greatest breadth, with only 3 feet over it: the second shoal is also on the edge of the bank, 9 miles from St. Vincent's, and 22 from Key Verde: it is formed of rocks, is not so large as the former, and has one fathom over it.

The Key of St. Domingo is arid: it is a cable's length long, and half a one broad, and its middle forms a small hill, covered with the Indian fish-bush, which looks like an upset vessel, and may be seen at the distance of three leagues. A breaker extends from the S. S. W. side to the distance of three leagues; and W. by S. from its middle, at the distance of two or three cables, there is a bank of 6 and 7 fathoms, with very clear water, where shelter from the breezes may be found.

On the southern part of the bank, to the westward of the Key of St. Domingo, there is no particular object which is not sufficiently described. The only spots above water are the two keys called Lobos and Guincho, or Wolf and Ginger Keys, both of which have foul ground about them, from north round by east to south, so that, in these directions, they should not be approached nearer than a mile. Both may be seen at the distance of 6 or 8 miles. The shoal grounds named the Mucaras, which are about 20 miles to the south-eastward of Lobos, have weeds or grass at the bottom, and it is, therefore, requisite to notice that the water on them remains as dark colored as in the mid-channel. Without them are no soundings, and they should, therefore, be approached with great caution, for without this a vessel may easily be lost, even in day-light. On the very edge of the bank, between Lobos and Guincho, there are some other shoal spots; and vessels of great draught should not venture upon the bank. There are, likewise, some rocky spots to the westward of Guincho, so that caution here is also required.

**ANGUILA OR SALT KEY BANK.**—This bank lies opposite the western end of the Old Channel of Bahama, between the Great Bank of Bahama and the Island of Cuba, and forms the channels of Santaren and St. Nicholas, the former on its N. E. and the latter on its south side.

The following description of this bank is by Mr. De Mayne, who surveyed it in 1828: "Its greatest extent is from N. W. to S. E. about  $20\frac{1}{2}$  leagues, and the broadest part is about 12 leagues. Its western edge is bounded by a chain of barren rocks, called the Double-headed Shot Keys, the north-westernmost of which, called Elbow Key, lies in latitude  $23^{\circ} 55'$  N., and longitude  $80^{\circ} 25' 30''$  W. From this point they extend to the N. E. by E. in rather a circular direction, 9 miles to Water Key, which is the largest of this chain, being nearly 2 miles in length, and about half a mile broad. Near the centre of this key, and close to a good boat landing-place on the south side, is a natural well of fresh water, formed by a hole in the rock."

"Opposite Water Key, as well as all these chains of rocks, on the south, or bank side, there is good anchorage in 5 or 6 fathoms water at any distance from them, and good holding ground; and from these rocks being so closely connected, they form a complete breakwater against the winds from the west, N. W. north, and N. E. quarters, which sometimes blow with great violence, particularly in the months of February and March. The wind from any other quarter seldom blows stronger than what may be termed a brisk gale."

"From abreast of Water Key, the bank trends to E. N. E. about 8 or 9 leagues, and thence S. E. by S. to the Anguila Islands, a distance of about  $13\frac{1}{2}$  leagues. In this space, there are several clusters of rocks, rugged and barren, some of which are very little above the sea, situated at about 4 miles within the edge of the bank, forming channels or passages to the bank, which appear safe to sail through. They are distant from each other from 1 to 10 miles. On examining the four westernmost of these passages, there was not found less than 5 fathoms water; the bottom very rocky, until you get well on the bank. Ships should be cautious not to approach too near these clusters of rocks; the deepest water will be found by keeping as near mid-channel as possible."

"The Anguila Islands are situated on the south-eastern extremity of the bank: they are so closely connected, that they may be said to form but one island, about 6 miles in

length, and three quarters in breadth, and can be seen 4 leagues off. They are covered with brush-wood, but afford no fresh water: on the N. E. side the approach is dangerous; but on the S. W. side there is good anchorage in 5 or 6 fathoms water, sheltered from north to S. E. winds."

"The S. E. extremity of the Anguila Islands appears in latitude  $23^{\circ} 29' 40''$  N., and longitude  $79^{\circ} 27' 40''$  W. The north-westernmost of the Dog Rocks, in latitude  $24^{\circ} 4' 10''$ , and longitude  $79^{\circ} 50'$  W. A dangerous shoal is represented near the eastern edge of the bank, in latitude  $23^{\circ} 46\frac{1}{2}'$ ; but this, with the various keys near the edge, and rocky heads in the interior of the bank, will be best understood by inspecting the chart."

"Key Sal" is situated near the S. W. extremity of the bank, and distant from the Elbow Key of the Double-headed Shots, about  $4\frac{1}{2}$  leagues. This island is of a triangular shape, and about  $1\frac{1}{2}$  mile in length, having an excellent salt pond in its centre, the produce of which is of the finest quality. The centre of this key is in latitude  $23^{\circ} 42' N.$ , and longitude  $80^{\circ} 20\frac{1}{2}' W.$  Nearly east from Key Sal, distant  $2\frac{1}{2}$  miles, is a small shoal, even with the water's edge, called Lavanderas; and in a north-west direction from the same key, about 4 miles, is another small shoal, also even with the water's edge. Both these dangers can be seen at all times, in the day, at a sufficient distance to avoid them."

"The general depths on the interior of the bank, those on the rocky heads excepted, are from 4 to 5, 6, and 7 fathoms."

"The tides, on the west part of the bank, being much influenced by the Gulf Stream, run in various directions. The flood sets strong through all the openings, or between the rocks, towards the centre of the bank, and the ebb contrary. It is high water on full and change days, at Anguila Island, at three quarters after 8, and at Water Island at 9 o'clock. Spring tides generally rise 3 feet 4 inches, neaps 2 feet 3 inches; but much depends on the wind."

The Derrotero says, Key Sal may be discovered at the distance of 10 miles, and fresh water may be procured on it with facility, although there is not any on Anguila, or the other keys in its vicinity. This bank has three rocky shoals upon it, as shown in the charts; but vessels may navigate upon it without danger, in  $7\frac{1}{2}$ , 8, and 9 fathoms water, in all the months from October to May. Whenever the appearance of the sky indicates a hard north, it is advisable to enter on the bank, and anchor under the shelter of the keys; or you may lie to there, being careful only to make use of the lead, until the wind changes, so as to enable you to proceed.

The current does not always set through Nicholas Channel to the westward, but a regular tide of ebb and flood prevails throughout; the flood setting eastward, and the ebb westward, at the rate of about one mile in an hour.

In the Santaren Channel, between the Great Bank of Bahama and the Salt Key Bank, there is said to be rarely any current, unless after heavy gales, when it runs with great violence up and down. If it predominates in one direction more than another, it is to the N. N. W., and about one mile an hour.

#### *Description of the Southern and Eastern Coast of East Florida.*

**TORTUGAS ISLANDS.**—On the southern edge of soundings, which extend off the western coast of the promontory or peninsula of East Florida, are 10 or 11 keys or small islands, called the Tortugas Islands, which is the westernmost land, and which announces the proximity of the General Florida Reef, which terminates the southern edge of soundings, and which continues to the east, doubling the above mentioned promontory, and extends to Cape Florida.

The Tortugas (often called the Dry Tortugas) are generally looked upon to be very dangerous, and to a person unacquainted with them they undoubtedly are so, especially in the night time; yet, when they are known, on many occasions, they may be found both useful and convenient. They extend east and west 9 miles, and north and south 6 miles, and although very low, can be seen at the distance of 12 miles, being covered with bushes; you should not come nearer them than two miles, as they have some rocky spits, which extend that distance from them.

To the west there is a large bank of coral rocks, intermixed with white patches of sand, on which the soundings are irregular; but as the bottom shows itself very plainly, there is no danger. This bank is of an oblong form, and between it and the Tortugas Islands there is a clear channel of three miles wide, with soundings from 13 to 17 fathoms water.

The Tortugas are situated N.  $14^{\circ}$  W., true, about 30 leagues from the nearest part of Cuba the table land of Mariel, and 14 leagues from the westernmost of the Florida Keys. The S. W. key, which, though one of the smallest, is the most material to be known, lies, according to Gauldt, in lat.  $24^{\circ} 32' 30''$ . A reef of coral rocks runs off it S. W. a quarter of a mile, on which the water is discolored.

\* On Key Sal a lighthouse will probably be soon erected.

If you are bound to the eastward, and meet with a strong easterly gale, which is frequent there in the summer season, you may safely come to an anchor in 5 or 6 fathoms, about a quarter of a mile off shore under the lee of the Long Sandy Island to the northward of the South-West Key. There is a good anchorage also in several other places, particularly in a small but snug harbor, near Bush Key, which is entirely sheltered from the sea by a large reef of rocks, and a flat shoal within them, about half a mile broad; the bottom is soft clay and mud. This harbor is quite smooth, even in a gale of wind, and in case of necessity a vessel might easily be hove down there, as there are 3 fathoms water close to the bank. There is no drinkable water to be got on any of the Tortugas, except on the northernmost island; nor is there any fire wood, except a few bushes, which it were a pity to cut down, as they serve to distinguish the keys at a distance; but the Tortugas abound with variety of sea birds, turtle, and excellent fish. There is a broad channel to the eastward of the Tortugas, from 10 to 17 fathoms depth, but it is by no means advisable to be attempted, unless you can see the Tortugas distinctly, and keep within 2 or 3 leagues of the easternmost island, as there is a coral bank of 12 feet water at the distance of 5 leagues; and further eastward towards Cayo Marquese, a very dangerous and extensive bank of quicksand, on every part of which you have no more than 4 or 5 feet water. It is of a remarkable white color, especially all along the north edge, and may easily be seen and avoided in the day time.

The tide between the Tortugas and Cayo Marquese sets variably through to the northward, and ebbs to the E. S. E. about 3 or 3½ feet by the shore.

Eighteen miles to the eastward of the eastern Tortugas, the General Florida Reef begins, between which there is a good channel of 9 fathoms water; but you must take care of a coral reef of 12 feet, which lies 11 miles from the Tortugas, on which the ship Rebecca, of New York, lost part of her cargo in 1820. To go through this channel, you must keep the easternmost Tortuga in sight off deck, so as to pass at 2 or 3 leagues from them.

The proximity of the Florida Reef is shown clearly in the day time by the whiteness of the water, so that there can be no danger in drawing in with it; but if safe by day, it is not so by night, nor in bad weather, when you should carefully avoid it, and be sure to keep the lead going, by which means you can avoid danger at the distance of two miles from the edges of the keys or reefs.

In passing the promontory of Florida it is not this reef alone which you see, but an innumerable quantity of keys and islands, raised upon a bank north of it.

**BANKS AND COAST OF FLORIDA.**—Twenty miles to the eastward of the easternmost Tortuga, is placed the west edge of a bank, called the Marques Bank, and 13 miles farther east are placed, on this bank, the key called Marques Key, which is the westernmost of a group, of which the northernmost is called Boca Grande Key; this key is the largest of the group, and is near six miles east and west. About one mile to the eastward of this key the first bank ends, whose eastern edge runs about north and south. The first bank is separated from the following by a channel of two miles wide, with 10 or 12 feet water, sandy bottom. This channel is called Boca Grande, but no man who is not well acquainted, should ever attempt to take the channel, as there are some shoals in it.

The second bank, called the Mangrove Islands, is like the first, upon which is raised a portion of islands, of which the three southernmost have white sandy beaches. This second bank may be viewed as distinct from the following, although they are united on their northern part by an isthmus of half a mile wide; otherwise they are separated by a channel of 1 mile in breadth, which contains from 10 feet to 12 fathoms water, low tide.

The third bank is that of Key West and the Pine Islands, at the western part of which it is called by the former, and at the eastern by the latter name.

The first island on its western edge, is Key West, which lies E. by N. and W. by S. 6 miles in length, N. and S. 2 miles in breadth, and about 56 miles from the main land of Florida, and its southern coast is very sandy. This island is covered with trees, espe-

\* On Bush Key (Garden Key) one of the Dry Tortugas, is a lighthouse elevated 70 feet above the level of the sea, showing a fixed light, and can be seen when a vessel is on shore, and is without doubt the worst kept light on the coast. It can be approached within 3 miles on the west, south, and east sides, but on the north you should keep at the distance of 6 miles.

† A lighthouse is built on Key West, containing a fixed light, and a number of buoys are placed, viz.:

A white buoy, showing 3 feet above the water, and on the reef, in 26 feet water, bearing from the lighthouse on Whitehead Point S. S. E., and from the lighthouse on Sand Key, E. by N. ½ N.

A white buoy, showing 3 feet above water, moored in 27 or 28 feet, and bearing S. S. W. ½ W. from the lighthouse on Whitehead Point, [Key West,] near the dry rocks which lie to the west of Sand Key, to show the west channel into Key West.

cially on its western part, in which there is a secure anchorage, with a channel of  $4\frac{1}{2}$  fathoms to enter it, and  $2\frac{1}{2}$  fathoms within, well sheltered. To enter this channel you must observe the following directions, viz. :—In running along the Gulf Stream you must not attempt to pass the reef, which is about six miles from the island, until you bring Whitehead Point Lighthouse, which is on the S. W. point of the island, and which exhibits a fixed light, to bear N. N. W. ; then steer for the harbor, which lies at the N. W. point, leaving \*Sand Key Lighthouse, which exhibits a revolving light, on your larboard hand, as you cross the reef, and taking care to give Whitehead Point a berth of one mile on account of a reef that makes off from it. The lighthouse on Sand Key bears from Key West Lighthouse S. S. W. nine miles distant. After you pass the reef (at the inner edge of which a buoy has been placed, as before mentioned,) haul up for the flag-staff. You will have  $3\frac{1}{2}$  to 4 fathoms water crossing the reef, and then from 6 to 7 fathoms until you enter the harbor, where you may anchor with perfect safety. There is a powerful tide here, rising and falling about 4 to 5 feet, and setting alternately N. E. and S. W.

There is a passage through Key West from Florida Stream, into the Bay of Mexico, for vessels drawing 12 feet, at low water. This passage is about 6 miles in extent, and vessels by passing through it, save the danger and delay of going round the Dry Tortugas, which are a group of ten distinct islands or keys, lying off the west coast of East Florida, low, some covered with mangroves, surrounded with reefs and sand banks, extending N. E. and S. W. 10 or 11 miles, and from east to west 8 miles, and may be seen at the distance of 4 leagues. Good pilots can be obtained at Key West to carry vessels through. The harbor is large and commodious, admitting vessels of the largest class, where they are protected from all winds within 200 yards of the N. W. point of the island, and several ponds of fresh water, which for nine months in the year produce excellent water.

From Key West eastward for 24 miles, there are nothing but low mangrove islands, in whose channels nothing but canoes can pass. This third bank terminates at †Bahia Honda, and the islands to the eastward are somewhat larger, and covered with pine-trees, but are low and drowned like the others, and their channels are navigable only for boats. Of the whole of these islands there is but one, which is 13 miles from Key West, which, although small, is of tolerable height, is rough and covered with trees, and in whatever direction you see it, appears in the form of a saddle.

The next bank is called Bahia Honda, separated from the last by a channel of half a mile wide, which channel is called Bahia Honda, and in which there is anchorage in 3 and  $3\frac{1}{2}$  fathoms. This channel is easily known, because on its western part, and on the very eastern part of the last bank of Key West and Pine Islands, there are three small islands, and on its eastern part, upon this fourth bank of Bahia Honda, there is one called Palm Island, which is large and has a sandy beach, and is remarkable by the many high palm trees with which it is covered, and are the first you see coming from the westward. This bank of Bahia Honda has but few keys, and extends E. about four leagues.

From the fourth the fifth follows, called Key Vacas, or Cow Keys, extending to the eastward about 5 leagues, upon which bank a group called by the same name, is raised, the easternmost of which is called Dutch Key, or Cayo Holandes; between this Key and Key Bivoras is one league. This Key is remarkable by its white sandy beach, and by a tolerable high hill covered with trees, which is on its western part.

Concerning the whole of the channel to the westward of the Cow Keys, it may be necessary to state the following remarks, namely, that you will have three fathoms water all the way within a mile of the keys, and will always find the deepest water nearest to the reef. That the usual method navigating between the reef and the keys, is, to proceed in the daytime, and lie at anchor in the night; and that should you be obliged to anchor where there is any coral, it will sometimes be necessary to buoy up your cable to prevent its being rubbed.

From the eastern extreme of Key Bivoras to the westernmost part of Old Matecumbe, is  $3\frac{1}{2}$  miles. Old Matecumbe is 4 miles long in the direction of N. E. and S. W. and its N. E. point is covered by some very high trees, appearing like table-land. On the north end of Old Matecumbe is a natural well, in a rock, containing excellent water.

One mile east of Old Matecumbe, lies Indian Key, to the eastward of which there is a channel running to the northward, with 10 and 12 feet water, where by doubling the N. E. point of Old Matecumbe, you may anchor, sheltered from all winds. This channel is

\* Sand Key Lighthouse is erected off the coast of Florida, near Key West. The lantern is elevated 74 feet above the level of the sea, and shows a revolving light, which revolves once in 54 seconds.

easily discovered by the white shoals of only 2 or 3 feet, bordering both sides of it, which serve as an excellent beacon.

Two miles N. E. of Old Matecumbe, you will find Little Matecumbe, which in this same direction has 4 miles in length: this key is covered with high trees. Off its N. E. part there is a small mangrove island, separated by a channel of half a mile wide, and N. E. of the last, there is another of tolerable size, separated by another channel of the same breadth. This is also separated by another channel, like the others, from Long Island.

N. E. from Long Island lies \*Key Largo, separated like the others by a small narrow channel. Nearly east from this channel,  $1\frac{1}{2}$  mile, lies Key Tavernier, to the northward of which there is excellent anchorage for vessels drawing not over 8 feet water, and is one of the anchorages much frequented by the fishermen. About N. E. by N. from Key Tavernier lies the Key Melchor Rodrigues, which is an island of tolerable extension, and the land so spongy that the roots of the trees are discovered.

The coast runs from Melchor Rodrigues to Key Largo. Off this Key lies that most dangerous reef called Carysfort's, (which appears like main land) N. N. E., N. by E. and N. on which last course there are various keys for some distance, of which the last is called †Key Biscayne; a little to the northward of this key there is an island of moderate size, off the main land, the eastern point of which is called †Cape Florida; from this cape to the northward, it is clear of keys and reefs, and is all low and drowned. The shores of this coast are lined with a bank of regular soundings, which run off a good distance; this regularity of soundings extends from Cape Florida to Cape Canaveral, and is of great benefit to navigators, except in about the lat. of  $26^{\circ} 30'$  N. where the soundings narrow, and scarcely extend two miles from the coast. From  $26^{\circ} 30'$  the soundings widen from the coast, and the whole is very clean, with the exception of Cape Canaveral, from which, at a long distance, you will find upon the same soundings various shoals; but as the soundings run farther out to sea than these shoals, he who navigates here must run with care, and have his lead at hand.

From Cape Canaveral the coast runs N. W. by N. 26 leagues, to the entrance of New Smyrna, which is barred, and only fit for boats and launches; the coast is very clean, and you may, without danger, keep within two miles of it.

Seven leagues N.  $25^{\circ}$  W. from New Smyrna, is the entrance of Matanzas, but only vessels of very light draft can enter it: this bar has 8 feet, at high water. From this entrance there is an island navigation to St. Augustine, formed by the island of St. Anastasia and the main: the tide rises 4 feet at spring tides, and it is high water at full and change at 7h. 15m. The whole of this piece of coast is equally clean with the anterior. You have 8 fathoms one league from the land.

From Matanzas to St. Augustine is 12 miles, and the island of St. Anastasia extends the whole length; you may keep along it at two miles distance, in 5 and 6 fathoms. You can see this island from 15 fathoms, as it is pretty high, and also distinguished by the Lighthouse, showing a fixed light; the coast to the northward is very low, and you can see it but at a short distance, so that it makes a good mark to know if you are N. or S. of St. Augustine.

From the foregoing observations it clearly appears that there can be no great difficulty in getting fresh water on most of the islands; and except the Tortugas, there is plenty of fire-wood upon the whole of them. With respect to water, it may be observed that just within the sandy beach, the islands are generally bordered with mangrove swamps, of about 100 yards broad; beyond these swamps the ground rises higher, and is generally of a rocky bottom, where you will often find fresh water ponds or natural tanks, which receive rain water.

#### SOUNDINGS OFF FLORIDA.

The whole of the coast from Cape St. Blas, as after mentioned, sends off a bank of sounding which stretches a long distance from the land, and these soundings are generally known by the name of Tortugas soundings, and are so clean that other danger is not known in the whole of it than a spot or knoll of sand in lat.  $28^{\circ} 35'$ , and lies about 12 miles east of the meridian of St. Blas. § This knoll has but 3 feet on it, and so steep, that from

\* A Floating Light is placed off Key Largo, bearing from the highest land on the Key E. by S. distant 7 miles, from the elbow of Carysfort Reef N.  $\frac{1}{2}$  E. distant 3 to 4 miles. The outer Reef (say 14 fathoms water) bears E. distant  $2\frac{1}{2}$  miles. Lat.  $25^{\circ} 6'$  N. long.  $80^{\circ} 28'$  W.

† Key Biscayne lies a little to the southward of Cape Florida. On it is a lighthouse, the lantern elevated 70 feet above the level of the sea, and exhibits a fixed light.

‡ A White Buoy, showing three feet above water, is placed on a reef near Cape Florida; Soldier's Keys bears from it W. by N. and Saunder's Hat bears S. S. W.

§ It is extremely doubtful whether this knoll exists.

100 fathoms you will be upon it, and is probably what was called in ancient charts, Providence Island. The whole of these soundings are very equal, diminishing gradually towards the shore.

When you enter on these soundings, without a sure knowledge of the latitude, and in parallels near the Tortugas, it is necessary to run carefully to get soundings on its edge, and not get into less than 40 or 35 fathoms, which is a depth to keep clear of the Tortugas, which lie in 30 fathoms; that is, if they did not exist the regular soundings of the bank would be 30 fathoms where they are placed; on the western part of these keys, the soundings are steep.

You should take the same precaution when entering on soundings in parallels north of the Tortugas. You should take this same precaution when navigating to the southward, that you may leave soundings with safety off its southern edge; so that what is said is sufficient to liberate you from all danger offered by the Tortugas.

On the edges of this bank the waters run lively to the southward, so that when navigating from the westward, with intention of sounding on its edge, the ship will be retarded by the wind, which fixes itself at E. N. E. or east; but when for two days you experience a difference of latitude to the southward, of 20 miles more than account, you may be sure that you are in the vicinity of soundings, in which case you may suppose yourself in the meridian of the edge, and calculate an error if not exceeding 30 miles, and thence take your route with security.

**FLORIDA REEF.**—To the eastward of the Tortugas, and at the distance of 17 miles, the Florida Reef commences. Its breadth is about three miles; and it preserves the same, or nearly the same breadth, as far as the eastern meridian of Boca Grande, and thus far has, at least, 3 fathoms water over it. You can cross this portion of the reef with any ship of 16 feet draught; but you should ever remember, that over White Shoals you always endanger the ship if she is large, especially if the weather is thick, when the bottom does not show itself clearly. You may in such weather soon encounter a coral shoal of only one fathom, or even less; so that when we say, that the least water is 3 fathoms on this portion of the reef, it is because it is so generally, and that the inequalities found on the other parts of the same reef to the eastward, are not found here on this portion of it.

On Bush (or Garden Key) one of the Dry Tortugas, is a lighthouse, elevated 70 feet above the level of the sea, showing a fixed light, composed of 15 reflecting lamps, and can be seen at the distance of 18 miles. It can be approached within 3 miles on the west, south, and east sides, but on the north side you should keep at a distance of at least 6 miles.

From the eastern meridian of Boca Grande the navigation is safe, till within  $4\frac{1}{2}$  miles of Sand Key, on which is a lighthouse, showing a revolving light, bearing S. S. W. from Key West Light, distant 9 miles; 4 miles from Sand Key, W.  $\frac{1}{2}$  S., on the outer edge of the reef, lies a group of dry rocks, and N. E. by E. from these rocks, is another group of dry rocks, bearing north from Sand Key, and between them in the same direction, are two or three shoals with only 9 feet on them. One and a half mile east from Sand Key is another group of dry rocks, on a bank which extends 4 miles east from the Sand Key, on which there are from 2 to 3 $\frac{1}{2}$  fathom water. Six miles E. by N.  $\frac{1}{4}$  N. from Sand Key, is a coral shoal, with 3 fathoms on it, between which and Sand Key lies the Eastern Channel into Key West, (see Index.) From this shoal the reef leads E. N. E. and is very dangerous, being full of coral rocks, on which there is as little as 10 feet water, till you come up with Looe Key, on which is a beacon with a red ball on the top. Off Looe Key the bank is very steep. Sixteen miles from Looe Key lies Sombrero, which is the easternmost key on the reef. To the eastward of this key is very dangerous, being cut up by coral rocks, with channels which should only be attempted through necessity, and in day-light, as nothing is so useful in the navigation of this reef as a good lookout. S. S. W. to S. by W.  $5\frac{1}{2}$  miles distant from Dutch Key, (the easternmost of Cow Keys) are two groups of dry rocks. South  $4\frac{1}{2}$  miles from the west end of Old Matabumbe is a coral bank, with only 8 feet on it. S. E. by E.  $4\frac{1}{2}$  miles from the eastern end of Old Matabumbe is another shoal, with only 2 feet, called Alligator Shoal, from the circumstance of the U. S. schooner Alligator being lost on it, and on which the ship Spargo was also lost. Between lat.  $24^{\circ} 51'$  and Key Tavernier, which is in lat.  $24^{\circ} 56'$ , lies the great inlet of the Florida Reef. From this inlet the reef takes a sudden bend, and makes what is called \*Carysfort Reef, on which the current sets very strong. From this the reef trends N. N. E. till up with Cape Florida, passing Key Biscayne, on which is a lighthouse showing a fixed light.

\* A floating light is moored on Carysfort Reef, bearing E. by S. 7 miles distant from the highest land on Key Largo. From the elbow of the reef she bears N.  $\frac{1}{2}$  E. from 3 to 4 miles distant, the outer reef (say in 14 fathoms water) bearing east, distant  $2\frac{1}{2}$  miles.

CARYSFORT REEF, inside of which there is a light ship stationed, as described before, is the most dangerous reef on the whole coast, the south extremity of which is in lat.  $24^{\circ} 59' N.$ , lies immediately off Sound Point. Mr. Gaul says, "it is on this reef, which is very extensive, its north part lying opposite Angel Fish Creek, that almost every vessel that is cast away, meets her fate." It is called Carysfort Reef, from his Majesty's ship of that name having been run there by the pilot on the 23d of October, 1770. She was brought off by the skill and diligence of the master, Mr. Hunter, and is the first vessel known to have got clear."

That part of the reef on which the Carysfort ran aground is very uneven, having between some of the patches 3 or 4 fathoms water. Upon one of the patches a ship laden with mahogany ran aground the same night with the Carysfort, but 3 miles without her. It being low water when the merchant ship ran aground by lighting her she got off at high water. And we would just hint to every one who passes along this coast, that, on seeing a light to the westward, it behoves him to look out for breakers, if he stands in for that quarter.

In latitude  $25^{\circ} 35' N.$  according to Mr. Bishop, his Majesty's ship Fowey, after losing all her anchors, beat over the reef in 3 fathoms water, and when within it, drifted five leagues to the northward in 5 or 6 fathoms water; and was afraid of drifting out in the Florida stream.

The FOWEY ROCKS, lie at the north end of the reef, and are partly dry. The eastern edge of these rocks lies about 6 miles to the eastward of Key Biscayno: they have many bad bars within them. Key Biscayno hath also a bank lying off from its east side.

There are several openings, or in and outlets, over this reef; all of which are safe communications between the Hawke Channel and Florida Stream, having a depth of no less than 18 feet water. By placing a boat on the reef at those entrances, it will always point them out in such a manner, that you may be able to enter, safely, any one of them in moderate weather, when want of fresh water, contrary wind, or any other cause, renders this shelter necessary. Two of these inlets, however, require a little more to be said of them; those are Great Inlet and Spencer's Inlet.

Great Inlet, in  $24^{\circ} 56' 30''$  latitude, has a knoll of dry rocks on the south-east point of the reef, directly on the edge of the channel, whereby it is easily known. Here your eye must be your guide: the land may also help a little, as the two small mangrove keys, Tabano and Rodrigues, show themselves plainly enough in the west.

Spencer's Inlet, in latitude  $24^{\circ} 46'$ , is opposite to Old Matacumbe, and above 6 miles wide: the eye must be your guide here, as well as in the former, but there are no such visible marks.

The soundings in both are as marked in the chart; and to any person who knows that in a gale, by reason of a reverting current, anchorage is full as safe under a reef as under land, we need not enlarge much about the utility and knowledge of these channels; much less to a man who is either in want of water, or who, upon falling in with these shoals, and thinks himself in danger, has courage enough not to despair. At the other inlets, the land appears so much alike, that it requires years of experience to know it.

*Directions for sailing from the Eastward through the Hawke Channel,*

Key Biscayno, on which there is a lighthouse containing a fixed light, lies within, and forms the west side of the northern entrance of the channel or passage between the Florida Keys, or Martyrs, on the west and north side, and the Florida Reefs on the east and south side, called Hawke Channel. The coast for 4 or 5 leagues to the northward of the key, has foul ground, and the sea breaking on it has a frightful appearance, but there is no where less than 3 fathoms; but, by keeping off 5 or 6 miles from shore, you will find generally 5 or 6 fathoms, fine sandy bottom: and when you approach the end of the Reef, you may haul in towards Key Biscayno, observing to give the Reef a good berth without you, on account of several bad sand bars on its inner edge. You will not find less than 3 fathoms any where within, till you come abreast of the south end of the key, where there is a small bank of eleven feet only; but be careful to give the key a good berth, as a large flat stretches from it.

You then steer to the eastward of south, and pass to the eastward of the shallow bank that surrounds Oswald Keys, when the course will be more westerly, by the edge of the bank. The general rule to sail along through the channel, from the Soldier's Keys to the southward, is, to have a careful man at the mast-head, to look out; he will see all the heads and other shoals, in a clear day, at least a mile off. Thus, making the eye your pilot, came no nearer to the Soldier's Keys than 12 feet, and no farther off to the eastward of them than 18 feet.

About a mile E. S. E. from Saunderson's Bank, lies a small round bank, with only 9 feet water

on it; from this Black spot to Caesar's Creek, there are several sunken heads, and the bar of that creek reaches a great way out. Right abreast of this spot, and northward of the bar, is a very fine anchorage of 22 feet water, close to the back of the Reef, which makes the Inlet.

From Saunder's Cut to Saunder's Point there are only 11 feet of water to be depended on; that is, if you keep in that part of the channel which is clearest of rocks, you may find deeper water, by going out farther towards the Reef; but the care necessary to be taken in order to avoid the heads is inconceivable.

When you are clear to the southward of Angel Fish Creek, the same rule of keeping between 18 and 12 feet in the channel is to be observed; but after all that can be said, a careful inspection of the chart, together with a comparison of it, with the course of the land you sail by, and especially a good look out, will constitute you a better pilot, than any direction that can be given for this navigation. The course from Angel Fish Creek to the north part of Sound Point, is S. by W.  $\frac{1}{4}$  W. and the distance is 5 leagues.

Sound Point is the only spot that may be said to form a true promontory, from the spring in the rock.

From the north end of Sound Point to Rodrigues Key, the course and distance are S. W.  $\frac{1}{2}$  S.  $7\frac{1}{2}$  miles. There is a good harbor for small craft off the N. W. part of the Key, formed by a reef running off its N. E. point; and another good place for shelter to the S. W. of it; but neither has a greater depth than 9 feet at low water. Tavernier's Key, or Tabano, is only a large thicket of mangroves, without any dry soil on it, and affords only some aquatic birds and their eggs.

From abreast of Sound Point to abreast of Tabano, the course is S. W.  $\frac{1}{2}$  S. and the distance is 3 leagues. From Tabano, the direction of the coast alters to S. W. and to the east end of New Matacumbe, the distance is 7 miles. New Matacumbe has nothing remarkable, except a well of good fresh water on the east end: but that being known to few, the island is little frequented. Off its S. W. end lies a small drowned mangrove island, called Umbrella Key; a channel 10 feet deep runs in to the south-westward of it, and extends up to the larger island; but there being nothing worthy of notice on this key, it is very seldom visited. In coming this way from Tabano, the channel is in general deeper than before; but the same rule for keeping without 12 and within 18 feet, still holds good; but observe that directly abreast of New Matacumbe, within a mile and a half to the eastward of the land, are several dangerous sunken heads, called the Hen and Chickens, which require particular attention.

The next to the south-westward, is the island of Old Matacumbe, remarkable for being the most convenient, and best watering place on all this coast. On its east end are five wells in the solid rock, which appear to be natural chasins, yielding excellent water in abundance; and some ponds near them likewise afford some; insomuch, that in a wet season, all the east end of the key is overflowed, and water enough may be had to supply a whole fleet. There are likewise some ponds and wells at the west end, but the water is of a much inferior quality. This island was one of the last habitations of the Indians of the Coloosa nation. About a mile from its N. E. end, on the extremity of a reef, lies the small bushy gravelly key, called Indian Key, which is the leading mark for finding the watering place on Old Matacumbe. Run to about a cable's length off the east side of the key, and the channel will be easily distinguished by your eye, as before said. Observe that the tides being very rapid, require particular attention, in going in or out; and that the channel is very narrow, having only just room enough for a small vessel to turn to windward.

From the south-west end of Old Matacumbe to the west end of Cayo Bivoras, or Viper Key, the course and distance are S. W. by W.  $\frac{1}{4}$  W. 7 miles; the depth of water is from 16 to 18 feet, sandy bottom; but you must be careful to give the Bivoras a berth of at least a mile and a half. From abreast of the west end of Bivoras S. W. by W.  $\frac{1}{4}$  W. 11 or 12 miles, brings you to a contraction of Hawke Channel, between the Outer Reef and Cayos de Vacas; your depth is generally 18 feet, the bottom is sandy, and a broad bank runs off from the Vacas Islands. At this contraction of the channel the course must be altered W. S. W.  $\frac{1}{4}$  W. going through the like depth of water for 5 miles. In running this last distance, care must be taken to avoid the shoals lying off the S. W. part of Cayos de Vacas, heretofore described.

From the west end of Cayos de Vacas to Cabbage Tree Island, or Bahia Honda, the course and distance are W. S. W.  $\frac{1}{4}$  W. 10 miles. In this run you will find 3 fathoms water all along within a mile of the keys, the deepest water being nearest to the reef. Hence to the west end of Cayo Hueso, or Key West, the course and distance are W. S. W. 31 miles, the depth of water from 17 to 23 feet. Key West is about  $5\frac{1}{2}$  miles in length, having a shallow bank before it, which extends close round its west end, as has already been said, and near which end is a well of ordinary water. All these keys have plenty of venison, and in some of them honey is found. From abreast of Key West, a

W. by S. course, 5 leagues, and W. S. W.  $\frac{1}{2}$  W.  $8\frac{1}{2}$  leagues, will carry you to the west end of the channel, abreast of the west end of the Quicksands, which extend westward from Cayo Marques. This bank of quicksand may be always seen in the day time, it being very white, and therefore may be easily avoided.

**THE TIDES.**—The tide ebbs and flows here regularly, and the time of high water on full and change of the moon, at Key West Harbor, is 20 minutes after 8 o'clock. Spring tides rise 4 feet 5 inches, and it is nearly the same every where, from the Dry Tortugas to the Cayos de Vacas. The tides from Cayos de Vacas, north-eastward, rise not quite so high, and the time of high water is earlier. Within the northern entrance of Hawke Channel, opposite Soldier's Keys, it is high water at half an hour after 5 o'clock, and spring tides rise only 2 feet 6 inches. To the northward of Key Biscayno, the stream on soundings is much influenced by the wind when it blows fresh; but with moderate breezes the ebb sets northward, and the flood southward; a due attention to this will contribute to shorten a passage over soundings to the reef.

Having observed, in the course of long experience, that several masters of vessels, who had the misfortune to be cast away on the Martyrs, and the coast of Florida, ignorant of the existence of any settlement at Cape Florida, have attempted to proceed to the northward in their boats, deprived of every assistance, I feel it incumbent upon me to inform such as may hereafter experience a like misfortune, that if they pass to the north side of Key Biscayno, on which a lighthouse is erected, as before mentioned, they will find the entrance of Boca Ratones, through which they can safely go with their boats, and they will see the houses in front, on the main land.

In case of shipwreck to the northward of Boca Ratones, at the distance of two miles therefrom, they will perceive mangroves thinly scattered, from whence the houses may be seen, and in that situation, on making signal with fire, or otherwise, they will obtain assistance.

If it should happen to the southward of New River, they may proceed southwardly along the beach, where they will meet, every four miles, with posts fixed in the ground, on which is an inscription in English, French, and Spanish, informing where wells of fresh water have been purposely dug for relief.

#### *Channel of Florida, between the Reef and Keys,*

The western part of this channel begins with a breadth of  $3\frac{1}{2}$  or 4 miles, and you will find in it from  $6\frac{1}{2}$  to 10 fathoms water, sand and mud or ooze, as far as Boca Grande, from which to Key West Light, it is generally about three miles wide, and its depth 6 and 10 fathoms, fine sand and mud. In this last piece of the channel there are two shoals; the one nearly north and south with the easternmost part of Key Boca Grande, and the other S. S. W. from the westernmost part of Key West, and both in the middle of the channel.

From these shoals the channel continues with a breadth of four miles as far as Samboes keys, from which to the eastward, its breadth diminishes, and the reef increases in the same proportion, so that the channel is only  $1\frac{1}{2}$  mile wide at the distance of 5 miles west of \* Looe Key Beacon, and this is the narrowest part of the channel, but drawing up with Looe Key Beacon, the channel begins to widen, so that north and south of Bahia Honda, it is three miles wide. The depth in these narrows is three fathoms, and continuing to the eastward, you augment your depth to 6 fathoms.

From Looe Key the channel continues to its end with a breadth of two or three miles, but its depth varies remarkably, so that as far as Cow Keys, you have 4 to 6 fathoms, and from thence to the eastward of it goes on diminishing, and when abreast of Old Matecumbe, you have but 3 fathoms, and abreast of Key Tobano only 2 and  $2\frac{1}{2}$ ; besides which, from Looe Key, the channel has many coral shoals, which although by day they offer no risk, (as the dark color shows their place,) yet by night they are very dangerous; and it is absolutely necessary to anchor, and lie by for the night, throughout all parts of this channel.

In Bahia Honda you get excellent water by digging wells, and on the south side of Cow Keys, about 8 miles from its western end, you again have a fine spring.

These are the only places among the keys, where you can find water from natural springs, but there are many natural tanks, where rain water is preserved till evaporated.

On the north side of Cow Keys, and about 6 miles east of the west end, you will find a natural pond, that never wants water, which is in a valley, distant from the beach about 100 yards, and the landing is something to the westward of three small mangrove islands, called Stirrup's Keys. You may also, at times, find water on the western extreme of Key Vacas (Cow Keys)—also, in some of the keys in its vicinity, and on

\* On Looe Key is a beacon, 30 feet high, on which is a large ball, painted red.

Dutch Key, and generally in all those places where the earth is rocky, you will find water, especially after rains.

**KEY • WEST.**—Bring the light to bear N. N. W. and steer for it, and when the Sand Key Light bears W. S. W. you will have passed the reef in about 5 fathoms water. Run for Key West Light until within two miles; then steer N. W. until you open Fleming's Key, which is a mangrove island, in the northern part of the harbor, and run for it. The best anchorage is in the upper part of the harbor.

*N. W. Passage between Key West and the Mole Keys, into the Bay of Mexico.*

Bring the lighthouse on Key West to bear S. E. and run N. W., which will carry you between the banks in the channel: as you approach the bar there is a small middle ground with 9 feet water; go either side of it, and cross the bar in 12 feet water. While on the bar the lighthouse on Key West will bear S. E. by S. about eight miles from the northern Mole Key, the N. E. side of the bar is broken ground, having only 9 feet water on the knolls; the S. E. side is clear, and soundings regular. When you bring the west end of the northern Mole Key open with a key bearing S. W. from it, you have passed the bar, and the latter direction will enable vessels coming from the westward into Key West Harbor, to enter the channel by running with the above named two islands open until they have 24 fathoms, and the light upon Key West bearing S. E.; then run for Key West Light, keeping near the bank, which may be distinctly seen.

*North West Passage between Key West and the Mud Keys, into the Gulf of Mexico.*

Five large spar buoys have been moored in the channel leading from the Gulf Stream, through the harbor of Key West, into the Bay of Mexico, vessels drawing 9½ feet of water, and bound to Mobile, Pensacola, and New Orleans can, by observing the following directions, pass through the channel with safety, and thus avoid the tedious and dangerous navigation of the gulf.

It is recommended to masters of vessels to steer from buoy to buoy, keeping close to them on either hand. They are moored in the deepest water, and can be distinctly seen from each other. The bearings of the buoys are as follow:

The first buoy at the entrance of the channel, and nearly in the harbor of Key West, bears from the lighthouse on Key West, by compass, N. W. by W. distant 1 mile.  
 Second buoy bears from the first buoy.....N. W. by N.  
 Third buoy bears from the second buoy.....N. W. ½ N.  
 Fourth buoy bears from the third buoy.....N. W. ½ N.  
 Fifth buoy on the bar bears from the lighthouse on  
 Key West .....N. W. by W.

Vessels requiring pilots can obtain them at Key West, as there is a board of branch pilots established.

The shoalest water at low water is 10 feet, and at high water 12½ feet on the bar.

By a late ordinance of the City Council at Key West, vessels bound through the "North West Passage," to or from ports farther west, stopping at the island to land passengers and letters, or to procure supplies, are no longer subject to any charge for pilotage, unless a pilot is desired and employed. Vessels entering the port for the purpose of trading, and taking a pilot, are to pay as follows:

Drawing 5, and not over 12 feet .....	pay \$1.50 per foot.
All above 12, and not over 16 feet .....	" 2.00 "
All over 16, and not over 18 feet.....	" 2.25 "
All above 18 feet.....	" 2.50 "

Vessels not spoken until within 3 miles of the light on Whitehead's Point, Key West, are exempted from any charge.

**CAPE ROMANO** is a long, low point with mangrove-trees on it. Off this point lies a sand bank, which extends off 9 miles S. W. from the point, and has about 3 feet water on it. The shoal is regular as you approach it. Thirty miles to the N. W. lies the island of Sanibel. If you are running for this island, keep in 4½ and 5 fathoms water. At the S. W. end of this island there is a good harbor with 12 feet water in it, which, if you wish to enter, give Sanibel Point a berth of 5 miles, as there is a long bank making off from it; run in for the land in 2½ fathoms, and then steer up N. W. till you shut in the point of the islands, where you can anchor in 12 feet water.

\* A lighthouse is erected on Whitehead's Point, which is the S. W. point of the island of Key West, lat. 24° 29', its long. 81° 55' W. The light is elevated 83 feet 6 inches above the level of the sea, and shows a fixed light.

There is a large Spanish establishment for fishing, and you can obtain provisions, wood and water.

*General description of the Coast from Cape St. Blas to Point Tancha.*

**CAPE ST. BLAS.**—Cape St. Blas is a low point, which runs to the southward two miles: from that part where trees end on this point, a shoal of sand runs S. S. E. four miles, bearing from S. S. E. to S. S. W. from the point. Various shoals and small spots of sand, having less than 3 fathoms water on them, also lie off the same point, the southernmost of which is 17 miles distant; between these shoals there are 7, 8, and 9 fathoms water.

S. 77° E. 16 miles from Cape St. Blas, lies the south point of St. George's Island, called Cape St. George, between which is the main entrance to St. George's Sound and Apalachicola Bay; the bay is distant about 12 miles from the entrance into the sound between St. Vincent's and St. George's Islands in a straight line, but owing to the obstructions in this part of the Sound, vessels are obliged to bend their course to the east to reach Apalachicola River, which increases the distance to 18 miles.

Vessels drawing 10 feet water can anchor in the bay, but only 7½ feet can be carried to the town.

From Cape St. Georges (which is shoal to the south) for 5 miles the coast doubles round to E. N. E. and at the distance of 24 miles from the Cape is the east end of this island, and the middle entrance into the Sound: this entrance is formed by the east end of St. George's and the west end of Dog Islands, the distance between the two is 3 miles; the channel is contracted between by shoals which make out from the two islands; the depth of water on the bar is about 14 feet, and the width one third of a mile. The channel is near Dog Island.

**MIDDLE ENTRANCE INTO ST. GEORGE'S SOUND.**—For vessels drawing 12 feet of water this entrance is to be taken, as you cannot carry into the main entrance, so called, which is between the N. W. end of St. George's Island and St. Vincent's Island, over 11 feet at high water. The middle entrance or passage into St. George's Sound, is between the west end of Dog Island and the east end of St. George's Island, and is about 3 miles wide: it is rather difficult to find for strangers, as the west end of Dog Island and the east end of St. George's Island are both low sand beaches, and there is a sand beach on the main directly in front of the passage, so that it looks, at 3 or 4 miles distance, like one continued beach.

After making the passage steer for it, keeping most towards Dog Island, as the channel is altogether on Dog Island side. You will soon see a large green buoy which lies in the best water on the buoy; pass close to this buoy on either side, and stand in N. N. W. along Dog Island Reef, which can be plainly seen, until the eastern point of George's Island bears S. W. or S. W. ½ W., then haul up the sound for the shipping, say about W. S. W.; continue on this course until the eastern point of St. George's Island bears about E. 2 miles distant, and a black buoy on shore well under St. George's Island, bears about S. E. ½ S. half a mile distant, when you may anchor in from 2 to 2½ fathoms.

There is a barrel buoy a short distance outside the green buoy, a black buoy on Dog Island Reef, and a white buoy on the eastern extreme of St. George's Island Reef; these buoys are not to be relied on, as they shift their position with every strong breeze; they are placed there by the pilots: the channel being perfectly plain and the reefs visible they would in any case be of little use.

Dog Island is 6 miles long, and trends nearly the same as St. George's; at the east end is the eastern entrance into St. George's Sound: this entrance offers a depth of 14 feet on the bar, which is above one third of a mile wide; and is within that distance of the island.

St. George's Sound, from the Eastern to the Middle Pass, affords from 2½ to 3 fathoms water, but to the westward, towards the Main Entrance, the Sound is much obstructed by oyster banks, through which, vessels drawing more than 6 feet water cannot shape their course.

The mean rise of tide 2½ feet.

N. 50° E. from the east end of Dog Island, 7 miles distant, is the S. W. Cape; this distance is shoal, if we except the channel above mentioned, and to the S. of the Cape the Shoal extends to the distance of 3 miles.

From the S. W. Cape the coast bends to the northward and after to the eastward, and forms a large bay, into which the river Apalache is emptied.

This river is shoal, and obstructed at its entrance, and for a long distance off, by many oyster banks, which are dry at low water; the tide rises 2½ feet.

About eight miles up the river from the bar, is the fort of St. Mark's, situated on a

point which forms the confluence of the river, of which the east branch is called St. Mark's, and the other Warcaller. The shoal water which is found in this river is also found all over this large bay, and 8 feet is the best water in the channels.

St. Mark's River affords 8 feet water at its mouth at high water, and 8 miles lower down, good anchorage for vessels drawing 10 feet. Here are two bars, one 3 miles below Fort St. Mark's, called the Devil's Elbow, with a depth over it of 8 feet at high water; the other, called the Outer Bar, 8 miles from the Fort. From this bar to the Devil's Elbow the average depth is 10 feet; the channel takes a sudden turn at the Devil's Elbow, and the width is reduced to about 40 feet for a quarter of a mile. From the Devil's Elbow to Fort St. Mark's, 8 feet can be carried through at high water. The place called the Spanish Hole, 3 miles within the outer bar, is the best place to anchor; the depth is 12 feet at high water. The outer bar is in some way connected with the extensive shallow banks, which to the east and west obstruct this part of the coast, and serve to protect the anchorage within the outer bar, which is the only shelter for vessels drawing 10 feet water from the S. W. Cape to Espiritu Santo.

From Apalache Bay the coast bends off to the southward and eastward to the river Suwannee in Vassasousa Bay, which is 23 leagues distant from the river of Apalache. Oyster banks obstruct this bay, and the Suwannee cannot be entered at high tide by vessels drawing more than 5 feet. From the river Suwannee to the southward, you lose sight of the land, as only canoes can get nigh enough to discover the keys called Sabinas. Fifty miles south of the Sabinas lies the key Ancloste, or Anchor Island, and before you come to it you may discover the coast. The whole of the coast from S. W. Cape to this Key, is so shoal, that at ten leagues from land you have but 5 and 6 fathoms, and two leagues you will have from 6 to 7 feet. Key Ancloste is distant across from the main land four miles, and in length about eight miles north and south; it is divided into three parts, and its south part has good anchorage in 3 fathoms water.

From Key Ancloste the coast runs S. E. by E. 30 miles to the entrance of Tampa Bay, or Bahia del Espiritu Santo. The coast between is clear and deeper than the anterior. At 3 leagues from the land you will have 6 fathoms water, and no impediment to your keeping in with it by the lead. Off this coast there are various keys, which lie, at most, only four miles from the main.

From Tampa the coast continues S. E. by S. 22 leagues, to the Bay of St. Carlos; all this piece of coast is bordered with keys which lie about four miles off from the main land; the whole is clear with the exception of a sand bar, which runs off from what is called Boca Quarazote, which is an opening formed by two of the above mentioned keys, and is distant from Tampa 21 miles. On this bar there are 2 fathoms water, and all along the coast you will have 4 fathoms at 5 or 6 miles from it, so that there is no danger in keeping in with it by the lead.

Carlos Bay is a large entrance made in the coast, in which are emptied various rivers, whose mouths are covered by many keys and shoals, which leave between them channels more or less wide; the northernmost is called Friar Gaspar, and has 6 feet water; the next, called Boca Grande, is the deepest, having 14 feet water. This bay is only good for vessels of 8 feet draught, by the little shelter which it affords in gales in winter; and although the holding ground is good, you are obliged to look for the bends of the bay to shelter you from the wind which blows. The tide rises two feet, and when the wind is off shore, it runs with great velocity.

The key, whose north extreme forms what is called Boca Cautivo, is the same whose southern extreme forms Boca Ciega, which is the opening which said key forms to the northward, and Sanibal to the southward.—This opening extends to Shoal Lagoon, which communicates by various shoal channels with Bay St. Carlos.

Key Sanibal has good anchorage on its south part in 2 fathoms, sheltered from all winds. This anchorage of Sanibal is known by a palm tree, two leagues to the southward of it, and is the only one you see on the whole coast. To anchor in Sanibal, it is necessary to run with care, and the lead in hand, that you may avoid the shoal bottoms which run off four miles from Sanibal, and the keys S. E. of it.

From Sanibal the coast runs S. E. by E. eleven leagues to Point Largo, or Key Roman. This piece of coast is clean, having 3 fathoms at two miles from the land. Point Largo sends out S. and S. W. of it a shoal, which runs from it seven miles, and the coast bending to the eastward forms a bay of 12 feet water, in which vessels of light draught may enter and find shelter from winds any way on the northern board.

The coast from hence runs S. S. E. twenty-five leagues to Point Tancha, which is the southernmost promontory of the Peninsula of East Florida.

The whole of the coast has regular and clean soundings, whence the lead is the best guide.

ce Edward Isl-  
le, which has a

good harbor, with 18 feet water on the bar. If you wish to run into this harbor, bring the N. W. end to bear N. N. E., steer in for the point, and you will see a small sand island; you will have 4 and 5 fathoms water, and can see the bank on both sides; about one mile from the point of this island, stands a high bunch of trees; a little to the S. E. of them stands five scattering Cabbage Trees, and the point of the other island which forms the harbor is a low sand point. Here there is another Spanish fishing establishment, and the bay affords plenty of fish and oysters: The bar lies about 5 miles from the entrance, and it is advisable to keep in 5 fathoms water till you get your bearings.

**TAMPAS BAY.**—The next harbor to the N. W. is Tampas Bay or Spiritu Santo; a spar buoy 20 feet high, with a barrel on it painted white and black, is planted on Egmont Island, it may be seen before the land.

To enter the bay, bring the beacon to bear E.  $\frac{1}{2}$  S. by compass, then run for it, until you have  $3\frac{1}{2}$  fathoms water, which will take you over the bar; then steer E.  $\frac{1}{2}$  N. until the beacon bears E. by S., and then follow the northern bank, which can always be seen within a cable's length. Run for the beacon to near a cable's length, and you will have 10 fathoms water, the beacon bearing south; then run E. by S. to  $4\frac{1}{2}$  or 5 fathoms; then E. N. E. 6 miles, and N. E. to 3 fathoms, off Mangrove Point; then N. to 4 fathoms, and N. E. to the anchorage at Gadsen's Point.

This Bay has sufficient depth of water for frigates; for there is within it 5 and 6 fathoms water, and although there is a bar at its entrance, the least depth on it is  $3\frac{1}{2}$  fathoms. The entrance is obstructed by several sand banks, upon which rise some inlets; between these banks there are three channels, named the West, the South West, and the South East. The two first have plenty of water on their bars, for the first has  $3\frac{1}{2}$  fathoms, and the second has  $2\frac{1}{2}$  fathoms. The channels are clear, and to take them there is no necessity for instructions, as the shoals are distinctly seen at high water, and at low water they are dry.

A few miles to the N. W. of Tampas Bay is Prince Edward's Island, the western one of which is a small round high island; the course of these islands from this to St. Mark's, forms a deep shallow bay, the shoal ground runs 7 miles from the land, and the bank is nearly up and down, with three fathoms along the edge of it.

If you are bound to St. Mark's and fall in to the S. E. of it, work along this bank, which will bring you up to the mouth of the river, and if you wish to run into port St. Mark's Harbor, the entrance affords 12 feet water, and you will see, on the N. E. bank, which is nearly dry at low water, a large stake sticking on it, and the one on the other side has three stakes on it. You will see a small house, on an island four miles from the mouth of the river, which bring to bear N. by W. leaving the lighthouse on your starboard hand, and that course will carry you up between the two stakes; when you are between the banks, half way up, you have good anchorage: From this up to Fort St. Mark's you can have but 9 feet of water. A pilot can be obtained here at any time. S. S. W. from St. Mark's Lighthouse, 15 miles distant, lies the South point of James' Island, called the S. W. Cape; a bay makes in between St. Mark's entrance and this cape, into which the River Okonofsky discharges itself; this river is shoal at the entrance, and the shore from the cape to the light should not be approached nearer than two miles.

A shoal, having three feet water on it, lies E. by N. from the cape, and the easternmost end bears from the lighthouse South.

The coast trends from S. W. Cape, S. W.  $\frac{1}{2}$  W. 37 miles to Cape St. George, which is the southernmost point of George's Island; this island is 24 miles long, and forms with Dog Island, the South side of George's Sound. The east end of Dog Island is S. W.  $\frac{1}{2}$  W. 7 miles from the S. W. Cape, between which is the eastern entrance to St. George's Sound. Dog Island is about 6 miles in length.

**APALACHICOLA BAY.**—When the south point of St. George's Island, (which lies to the southward of Apalachicola Bay) bears north, two leagues distant, you will be in  $2\frac{1}{2}$  fathoms. From these bearings and depth of water, steer N. N. W. or N. by W. until you make the large black buoy,\* which can be seen at the distance of 4 miles; by keeping the buoy close on board, you have the best water; the course from the buoy is due north, until you bring the three tall trees on St. Vincent's Island to bear N. E. then run for them. The entrance then being fairly open, steer for the point of St. George's Island,† or between the point of that island and St. Vincent, you will have three fathoms when over the bar, deepening gradually, and between the islands of St. George's and St. Vincent, you have 8 fathoms when fairly in. When past the point of St. George's haul to the eastward, and keep from one half to three quarters of a mile distant from

\* An island called Flag Island formerly existed at the entrance of this port, but it was washed away in 1835; the buoy alluded to was placed on a rock.

† On the N. W. point of George's Island a lighthouse with a fixed light is placed to indicate the entrance between George's Island and St. Vincent's Island in to St. George's Sound.

**St. George's Island.** The water will shoal in this course to 2 fathoms, soft bottom, when you had better come to anchor and wait for a pilot, which you will obtain by hoisting the usual signal.

When off the entrance, in 6 fathoms, no inlet can be discovered between the two islands, but the place may be known by the bearings of the land. It is a low sand beach, having a hummock of bushes about one mile from the west point of St. George's Island, to the westward of which are four umbrella trees, the two easternmost standing 6 or 8 feet apart, at top connected, and at a distance having the appearance of one tree. To the west of these trees is a hummock of Palmetto trees, which stand nearly on the extreme west end of St. George's, which are considerably larger than the hummock of bushes before mentioned; and these, when distant so far that you cannot see the beach, that bearing N. E., appears as separated from the other land, and to form an island by itself, but when bearing N. W. appears connected with the Island of St. Vincent, which is thickly wooded on the eastern end. This hummock is, however, on St. George's.

The south point of the Island of St. George's is thickly wooded, and can be discerned when in 10 fathoms bearing N. E.

Should you have a foul wind, and be obliged to turn to the windward, keep the Island of St. George's on board, when fairly to the westward of the south point, the water is good near the beach, and soundings regular.

† Directly off the south point of St. George's, there is a dangerous shoal of 2 or 3 leagues extent.

The Shoal of Cape St. George makes off at least 6 miles from the south part of the island, and has not more than 5 or 6 feet of water, perhaps less. The soundings near the shoal, on the W. edge, are irregular, from 3 to 4 and 2 fathoms.

*Description of the Coast from Cape St. Blas, Westward.*

From Cape St. Blas a narrow peninsula or tongue of land extends N. by W. 17 miles, forming the Bay of St. Joseph. This bay is nearly land-locked, and has a width at its mouth of about 3 miles, and is about 14 miles in length. The bar lies west of the north point of the peninsula about one mile. Within the bar the bay affords from 25 to 33 feet of water for about 8 miles up the bay, and it is sheltered from all winds. The tide rises about one foot. This is the next best harbor to Pensacola on this coast, the depth on the bar at low tide being 17 feet. The tongue of land that forms this bay is so narrow, that in some places it is only two cables' length in width. There are various breaches in it in time of the rains, by which the water of the bay unites with the ocean.

To enter this bay, you must coast along the tongue of land in 4 or 5 fathoms, until you pass a tongue of sand, a little before you come to the mouth, from whence you steer N. E. and E. N. E. till within, always coasting the tongue which is the deepest water.

N. W. by N. 10 miles from St. Joseph's Bar is the entrance to the Bay of St. Andrews; in this distance the coast should not be approached nearer than 5 miles, on account of a shoal that extends the whole distance, called the Middle Ground, which may be easily discovered by the whiteness of the water. The S. E. extreme of this shoal, and the above tongue, form the entrance to the Bay of St. Joseph.

**BAY OF ST. ANDREWS** is covered by Crooked and St. Andrews Islands, which comprehend between them and the Main St. Andrews Sound, which leads into the Bay.

There are three entrances into this bay; the eastern is through the opening between Crooked and St. Andrews Islands, the depth 3 fathoms on the bar, and the channel which is one-sixth of a mile wide close by the latter island; the distance between the islands is above two-thirds of a mile. The middle or main entrance is near the western end of St. Andrews Island; the depth 21 feet and the channel 200 yards wide. The western entrance is about two miles N. W. of the latter; the depth on the bar 10 feet. This bay is very large, but as yet there can be no motive for ships to call here; but should you do it for shelter in bad weather, the bay is said to be shoal, but from the main to the eastern entrance you have 3 fathoms in the sound, and good shelter under St. Andrews Island.

N. W. by W. from St. Andrews Bay, distant 50 miles, is the entrance to St. Rosa's Sound: in the whole of this distance the shore is bold, and you will have 4 fathoms close to the land. On this coast the trees are very thick, and close to the shore, where there are also some red bluffs, and white sand hummocks.

**ST. ROSA'S BAY.**—The east point of this bay is known by some bright reddish colored bluffs, which are upon it. The channel, or mouth of the bay, is very narrow, and a bar of only 5 or 6 feet impedes its entrance. To enter, steer N. till you pass the east extreme of the island, whence steer N. W. and anchor as soon as you have shelter. This bay is of extraordinary length, extending 24 miles to the eastward, with a breadth of 4 to 6 miles. The best water in it is 3 fathoms, which is only found when you are E. and W. with the red cliffs at the entrance, about two miles from the bar. The other part of the bay is full of shoals and palisadoes, navigable only for boats.

From St. Rosa's Bar to the western end of St. Rosa's Island, the distance is 44 miles. This long and narrow island lies about W. by S. and E. by N. parallel to the main, and covers a sound of the same name; its greatest breadth is not more than half a mile: on it there are many sand bluffs and some scattering trees. The sound affords a navigation for vessels of less draught of water than 4 feet to Pensacola.

**PENSACOLA.**—The Bay of Pensacola affords a good harbor, having, at low water, on the bar, 21 feet. The eastern point of its entrance is called Point Signenza, and is the western point of the Island of St. Rosa, on which fortifications are erected, making it very conspicuous from the sea. St. Rosa Island extends E. by N. and W. by S. 14 leagues, and completely fronts the whole Bay of Pensacola; it is so low that the seas, in gales, wash its tops, and is no where more than one fourth or one third of a mile wide. There are some red bluffs on the main coast, which are higher than the rest of it, and one of which, and the largest of all, is on the eastern side of Pensacola Bay; and in or near the front of the entrance, are three red bluffs adjoining each other, and called the Barancas.

The channel entering Pensacola Bay is from the south-east, and turns round a middle ground which projects nearly one mile to the S. W. of Point Signenza; it then bends to the eastward towards the bay. A bar, projecting about two miles to the south, and extending from the western end of St. Rosa Island to the main opposite, has at low tide 21 feet on it. The width of the bar taken in the direction of the channel is about one mile. The entrance between St. Rosa's and Foster's Island, is about a mile and a quarter wide. After passing the bar the entrance to the bay is between the Barancas and Point Signenza. This port would be difficult to recognize, were it not for the lighthouse and bluffs, which, consisting of three adjoining each other, cannot be easily mistaken.

The interior of the bay affords great depth of water and good bottom for anchoring. However, a considerable extent of its shores are shallow, but at some points a good depth is found within a short distance of the land, viz. at the Careening Ground, 18 feet are to be found at about 50 yards from the shore; at Tartar's Point, where the Navy Yard is, 30 feet are found within a few yards of the point and 12 feet west of it; at the English Careening Ground, 18 feet can be carried close to the shore.

The bar is not the only difficulty entering Pensacola, since you meet, when within it, the Middle Ground, as previously stated, and although it is decidedly the best harbor in the Gulf of Mexico, you must observe the directions, and frequently have recourse to your plan of the port, which will give you a correct idea of its configuration.

Vessels coming from the eastward, should keep in 7 fathoms water until the \*light-house bears by compass N. by W. when they can stand in for the bar, until in 3½ fathoms, which is the shoalest water on the bar at low water, with the light bearing N. by W.

Vessels of large draft of water should not attempt to enter in the night, as there is a Middle Ground on the east side of the main channel, one mile inside the bar, on which there are not more than 7 feet water, and the course around it is very circuitous.

Vessels making the land, should keep off four or five miles, until they make the lighthouse, which cannot be seen until nearly opposite, as the trees on St. Rosa Island to the east, and on the main land to the west, obscure it from the river.

To come in over the bar, on which generally there are 4 fathoms, bring the light to bear N. by W. and run directly for it, until over; the bar is about 600 yards across, on which is a buoy; soon as over, the water deepens to 5 and 6 fathoms, when run N. W. until the lighthouse bears N., in order to avoid the Middle Ground, when run for it until within the point of St. Rosa Island; then haul up east until the west end of St. Rosa Island bears S. W., when you may anchor in 4 or 5 fathoms water, safe from all winds.

Small vessels drawing not more than 14 feet, can bring the light to bear N. ½ W. and steer for it in the night until within half a mile, where they can anchor with the wind off shore; but if they have a fair wind, they can steer E. by N. until sheltered by St. Rosa Island, where they can anchor in a good harbor until day-light, as it is everywhere excellent.

Vessels coming in or going out on ebb tide should (preserving the necessary depth of water) keep near the eastern edge of the channel, as the tide runs to the south-west across the Caucus Shoal, and the flood sets directly over the middle ground.

Vessels drawing not more than 10 feet water, can pass through a small channel between the Middle Ground and point of St. Rosa Island.

\* Pensacola Lighthouse is on an eminence, about 40 feet high, and directly opposite the entrance over the bar; the lantern is about 40 feet from its foundation, making an aggregate height of 80 feet above the level of the sea; is about half a mile west of the point of St. Rosa Island. The light is revolving, each revolution one minute ten seconds, is very brilliant, and may be seen at the distance of from 18 to 20 miles.

From Pensacola Bay the coast trends W. by S. to Perdido Bay, distant 11 miles; this bar is subject to change, and affords but about 4 feet water, and 28 miles to the westward is the bar and entrance to Mobile Bay.

**MOBILE BAY.**—The entrance to this bay is between \*Mobile Point and the eastern point of Dauphin Island; the distance between them is  $3\frac{1}{2}$  miles. To the south of Dauphin, about one mile, is Big Pelican Island, which is barren and of small extent, and E. S. E. from the latter island, distant  $3\frac{1}{2}$  miles, is Little Pelican or Sand Island, which is of but few yards in extent, and nearly even with the water's edge. A bank, projecting to the south of Dauphin Island and Mobile Point, on which are the above islands, obstructs the entrance to the bay; but, however, affords through it various channels, the main one having 15 feet on the bar at the lowest tide. The interior of this bay has water enough for any vessel that can pass over the bar; but on account of a shoal formed opposite the mouth of Dog River, 11 miles south of the town, vessels drawing more than 8 or 9 feet cannot, at low tide, ascend the bay further up.

By following close to the south shore of Dauphin Island, and having Big Pelican Island on the starboard hand, coming from the westward, vessels drawing 7 feet water can enter the bay at low water; but to do this, you must, when the east point of Dauphin Island is north of you, steer to the southward to avoid a narrow sand spit which projects off from the point  $1\frac{1}{2}$  mile S. S. E.; haul close round this spit, and steer up the bay.

There is a good anchorage between Big Pelican and Dauphin Islands, and close to the latter, for vessels drawing 12 feet: this anchorage can be entered either from the westward, by steering close to Dauphin Island, or from the main channel, leaving it when Big Pelican Island bears W. by N. (about 2 miles S. W. from Mobile Point.) During the prevalence of northerly winds, when vessels from sea are prevented from entering the bay, this anchorage affords good shelter.

Those off Mobile should recollect the necessity of getting an offing as soon as there are appearances of a gale on shore, either to weather the Balize, or which is better, to take in time the road of Naso, as destruction is inevitable if you come to anchor outside Mobile Bar during the gale.

Strangers approaching Mobile Point in the night, should keep in 10 fathoms water till the light bears north, to avoid the dangerous sands lying to the eastward, and the shoals off Pelican and Sand Islands, on which is a beacon, to the westward of the bar.

In running in for the land, should you make it to the westward of the bar, it will appear broken, as it consists of small islands, which occasion several openings. More to the westward the land is very level. Dauphin Island, on the western point of the bay, appears high and bluff; Mobile Point, low and sandy, with a single tree on the extremity.

Vessels approaching the entrance to Mobile Bay in the day, should not run for the bar until the beacon on Sand Island ranges between the east and west ends of the woods on Dauphin Island.

Vessels not drawing over 10 or 11 feet, and with easterly winds, may haul in for the bar as soon as the beacon comes on within the west end of the woods, and keep it on thus until they get 7 or 8 fathoms water, when they will gradually haul more northerly; at this time all the dangers will be visible. Heavy ships must bring the beacon on with the centre of the woods, and cross the bar with it thus, in about 18 feet water, steering up N. N. W. until abreast or past the beacon and island on the larboard, from which an extensive shoal makes in every direction. Within the bar are two buoys, the first to be left on the starboard, and the second on your larboard hand. The channel up thence is deep and plain. Mobile Point Lighthouse bearing between N. and N. N. E. Tide rises  $2\frac{1}{2}$  feet.

Five buoys are placed at the entrance of Mobile Bay, viz. a spar buoy on the S. E. extremity of the shoal projecting from Mobile Point, which you leave on the starboard hand entering the harbor. One on the west side of the channel from the bar. One on the west side of the channel on the bar, both which you leave on the larboard hand. One on the S. E. side of the spit, projecting from Sand Island, and one on Dog Point Bar.

From Mobile Bay to the Bay of St. Louis, the distance is 65 miles west: on this extent of coast there is a chain of islands parallel to the main, forming a sound, which affords a partial inland navigation, and is about 7 miles wide. This coast is marshy, but at two or three miles from the shore it is covered with pines and oaks. The islands are sandy.

\* A lighthouse is erected on Mobile Point. The lantern is 55 feet above the ocean level, and shows a revolving light of one minute in duration, which may be seen 13 or 14 miles off in good weather. S.  $50^{\circ}$  E. from the light, 5 miles distant, you have 3 fathoms on the bar. The east end of Dauphin Island will then bear N. N. W.  $\frac{1}{2}$  W. and Sand Island (just above water) will be on the middle of Dauphin Island. The beacon is 30 feet above water, on a frame of iron work, and may be seen in good weather from 5 to 6 miles, and is 3 miles S. S. W. from Mobile Point.

obile Point.

The sound enters Mobile Bay between the main and Dauphin Island. At this place the bottom, formed of oyster beds, presents three shallow passes, viz. Pass Aux Huîtres, with a depth of 3 feet at high water; Pass Guillori, 2 feet at common high tides, and the Pass an Heron, with nearly 5 feet.

Dauphin Island is 7 miles in length, and the next succeeding is Massacre Island. The entrance between these two is 3 miles wide, and the depth of water 5 feet. Massacre Island is narrow, but it is very easily known, since it has a wood in the middle of it: it is about 9 miles in length.

The passage between Massacre and Horn Island is two miles wide, and vessels drawing 9 feet water can enter it. The length of Horn Island is about 15 miles. On its western point there is a lighthouse with a fixed light, to point out the entrance to Dauphin Island Sound, between the western end of Dauphin Island and Ship Island. There are some groves on it, but at the eastern part it is entirely barren.

The next of the chain is Dog Island, a small island lying midway between Horn and Ship Islands. To the east of Dog Island there is a passage close to Horn Island, of 18 feet; but to the west there is no passage, as the shoal which makes off from Ship Island extends beyond Dog Island, having a channel of only one third of a mile wide. The distance from Horn to Ship Island is about 5 miles. Ship Island is 7 miles long, and wider than the rest of the chain: in its middle it is covered with herbs and some pines, but the rest is entirely bare. There is a well of very good water in it on the north side about the middle.

West from Ship Island is Cat Island, between which the distance is 5 miles. There is a bank which puts off from Cat Island, towards the west end of Ship Island, having a channel of only a mile wide, which turns round the west end of Ship Island, and in which there are 18 feet.

Cat Island is the last of the chain extending to the Westward and forming the Sound. On its western point there is a lighthouse with a fixed light, and on the main land, bearing nearly N. W. from the former, there is another lighthouse, also with a fixed light. These two lighthouses indicate the passages through Pass Christian and Pass Mary Ann. To the S. W. of Cat Island are several keys distant about 3 miles: (which are near the coast, and called St. Michael's Keys:) this channel is no where less than 15 feet; but within this part of the sound, vessels drawing more than 8 feet, cannot reach the Aux Malheureux Island, or steer to the eastward between Cat Island and St. Mary's Key, or enter the Bay of St. Louis: thus between the island Aux Malheureux and this Bay, the Sound becomes shallow and obstructed.

The impeded part of the sound, in the direction of Cat Island and the entrance of the Bay of St. Louis, is called Pass Christian; and does not admit of vessels drawing more than 8 feet at medium tide. This draught of water can be carried through Lake Borgne. From Pass Christian to Pass an Heron, 12 feet can be carried through the sound by keeping on the island side, but vessels drawing 8 feet must have the sound between Massacre and Horn Island, and shape their course for the main entrance to Mobile Bay. Lake Ponchartrain is separated from Lake Borgne by Pine Island, to the north of which is the entrance called Rigoletts, and to the south called the Chef Menteur; these entrances and outlets afford, on their respective bars, in Lake Borgne, a depth of 9 feet at high water, and 8 feet at medium tide. This depth can be carried through the lake within a short distance of the shore, to Madisonville, to the mouth of the Manchac, and to the mouth of Bayou St. Jean, which connects the city of New Orleans with the lake.

**BAYAU ST. JEAN, on LAKE PONCHARTRAIN.**—To enter the Bayau, bring the light to bear S. E.  $\frac{1}{2}$  S. The entrance is on the west side of the light, and usual depth of water in the channel, 6 feet.

South, 15 miles from Dog Island, is the north point of the Chandelier Islands, which run to the southward, and with Grand Grosier and Isle au Breton, which bend to the S. W. nearly join the mouth of the Mississippi River. They will be described hereafter.

**CHANDELIER ISLANDS.**—From Passe a l'Ouvre, (one of the entrances of the Mississippi) the coast doubles to the westward, and soon to the northward, to the parallel of 29° 27', in which latitude lies Isle au Breton, which is a group of small keys, whose western limits are 5 miles distant from the coast, so that it forms a bay, called Poza Bay, in which there are 4 or 5 fathoms, with some shoals of less water. East of Isle au Breton, is the isle of Grand Grosier, from which a ledge runs N. N. E. and breaks to the isle of Palos, which is the southernmost of the Chandeliers. There is a good passage inside the Chandeliers with 8 to 11 feet water, but a good pilot is requisite. From Isle au

\* The lighthouse is at the mouth of Bayau St. Jean, has one small fixed light, elevated 48 feet above the ordinary surface of the lake, and can be seen in a clear night about eight miles. It is 25 miles S. E. by E.  $\frac{1}{2}$  E. from the mouth of Cheninata river, 25 miles S. W. from the Rigoletts—15 miles S. W. from Point Resence, and 5 miles north from the city of New Orleans.

Breton a shoal stretches two miles S. W. bold at the very point. Shelter can be had from a N. E. wind inside this island, but the navigation is difficult for strangers, and requires much survey to describe it properly.

The whole of the Chandeliers Islands are very low, with some myrtle bushes upon them, and form a chain of coast very injurious, and to be dreaded by navigators, not only that you cannot see them at a regular distance, but because the winds at S. E. (which blow hard in winter) are right on the coast; nevertheless, there is good shelter for all ships to the westward of the north extreme of the Chandeliers, called the Road of Naso, where the heavy English men of war lay during the siege of New Orleans. This is the only good shelter for large men of war in the whole coast of Florida. (Tampa Bay and Pensacola for small sized frigates excepted) not only because it is defended from winds on shore, but because there is no bar, breakers, nor impediment whatever, to your entering it in all weathers. To enter the Road of Naso, you have only to run so as to double the north point in 5 or 6 fathoms water, which will be one mile from the land, and then navigate from west round to south, keeping in 4, 5, or 6 fathoms, according to the draft of the ship, and you may anchor in 4 fathoms, when the north point bears N. N. E. distant 2 miles; but if you wish deeper water, you must not run so far south, but anchor when the north point bears E. N. E. in 5 to 6 fathoms water. In the Chandeliers, and almost the whole coast of the Mexican Gulf, you can get water by digging wells in the beach, but there is no other wood on the Chandeliers than the drift logs left in abundance on the beach. Its lands produce nothing but the myrtle, from which the green wax is produced.

Northwesterly of the north extremity of the Chandeliers, 14 miles distant, is Ship Island, west of which, 8 miles, is Cat Island, and to the southward of this, various keys, called St. Miguel, run and extend out from the coast of the islands; between these and Cat Island is the pass into Blind Lake and Lake Ponchartrain, in both of which there is very little water, especially in Blind Lake. Between Cat and Ship Islands there is a large shoal running out from the east point of the first, which leaves a channel of less than half a mile wide, to enter to the northward of them; this channel has good 12 feet water; the anchorage is N. and S. with the west end of Ship Island  $\frac{2}{3}$  of a mile distant, in 4 and 5 fathoms. Ship Island is long E. and W. and very narrow, and widest in the middle, which is partly covered with pines, but barren at both ends. The hurricane of 1819 cut a small channel through Ship Island  $1\frac{1}{2}$  mile from its west end; in it is a well of good water, which is on its north coast, and about midway the island. East from Ship Island, 5 miles distant, lies the west end of Horn Island, and between the two lies Dog Island: from the first a shoal runs out to the east, which not only embraces the Dogs, but leaves a channel of only 150 fathoms wide; the bar has 21 fathoms, when you immediately drop into 5 fathoms. East of Horn Island lies Massacre Island, then Dauphin Island, which is on the W. side of the entrance into Mobile.

**GENERAL OBSERVATIONS.**—The whole coast, from Mississippi to Cape St. Blas, sends off a bank of soundings to a great distance from the shore, whose edge runs out to latitude  $28^{\circ} 50'$ , but the depth is very unequal; this inequality is very clean. If you except the sand bank that lies in the vicinity of Cape St. Blas, you will find no danger in the whole of it that cannot be prevented by care and the use of the lead, and as the whole of the coast is very low, having few visible marks to distinguish it in its whole extension, and besides is often cloudy and foggy, exposed by the continuation of winds from S. to W. and from W. to N. which blow with great force in winter, and by hurricanes in August and September, all which create the necessity of saying something on the method of making the land, and navigating its coast.

**NEW ORLEANS, MOBILE AND PENSACOLA**—Are the three important points of destination on this part of the Gulf of Mexico; to go to either of which it is best to make well to the eastward of them respectively, when coming from any place S. E. of them, that is, when you have the winds easterly, which is the wind that predominates here; but if you come from the westward of them, you have no other resource but to beat to windward from that point of the coast which you have made, and the greater or less distance of it, according as you are best accommodated, with respect to the season, the quality and size of your ship, &c.

The making to the eastward of your destination is necessary to be more or less distant, according to the confidence and security you have in the situation of the ship, so that bound into the Balize, you will look for soundings in the meridian of  $29^{\circ} 30'$ , or thereabouts; and if bound to Pensacola or Mobile, in the meridian of Cape St. Blas.

Should you strike soundings in lat.  $29^{\circ}$ , steer N. W. by W. awhile, so as to make it E. northerly of it, that is, to make its bearing W. southerly, to prevent falling into the southward of its parallels, especially in winter, when it is best to run heading for the middle of the Chandeliers; in this route you find no regularity in soundings, as whatever the parallel may be, you will as often get more water as less: nevertheless, from 20 fathoms down, the soundings are very regular; and from the meridian of Pensacola westward, to

ss, from 20 fathoms  
eacola westward, to

the southern limits of the Chandeliers, you will get 10 fathoms, 10 miles from the coast; from Pensacola eastward, you have 10 fathoms at 4 miles from the coast, and 25 fathoms at ten or twelve miles.

But as navigating for the Balize, you may want an observed latitude, and have it so cloudy or foggy as to impede making the land, in such circumstances, or to run for it in the night, the soundings will serve as a secure guide, for which you must recollect that navigating to the westward, if you find 40 to 50 fathoms, loose mud, sticking to the touch, mixed at times with small black and white sand, it is a certain signal that you are in the parallel of the Balize, and from that depth to less water, you will always find the same quality of soundings, but if from 40 to 50 fathoms to less water, you get bottom of fine sand, with very little mud or without it, you will be in the parallel of between the Balize and Breton Key or Island: if you get small white sand, you are in the parallel of said key, and if coarse sand and snail shells, you will be in a parallel between said key and Chandeliers; and if you get coarse sand, with gravel, small stones, and large shells, you will be in front of the Chandeliers. From the Balize to the westward, the bottom is of sand alone, so that those from the southward who look for the Balize, sand alone will be a signal that they are west of it.

When navigating N. W. or north, from the getting 40 or 50 fathoms, sand, and in diminishing the bottom or depth, if the quality of soundings does not vary till in 10 or 12 fathoms, you are to the southward of the Balize: but if in this N. or N. W. route, you have crossed mud or ooze, and entered in 10 fathoms, you find sand, then it is a signal that you have crossed the mouth of the Balize, and drawing in with Breton Island, and the Chandeliers. The better to explain these soundings, we shall place them in form of a table.

In the parallel of the Balize Crossing these soundings, you cross this parallel.	}	Loose mud, sticky to the touch, mixed at times with small fine black and white sand.
In the parallel of between the Balize and Breton Island or Key.	}	Fine sand with very little mud, or sand alone.
In the parallel of Breton Island.	}	Fine white sand.
In the parallel of between Breton Island and the Chandeliers.	}	Coarse sand and snail shells.
In the parallels of the Chandeliers.	}	Coarse sand with gravel, small stones, and large shells.
West of the Balize, the bottom is sand alone.		

When you come in, looking for the Balize, either in its parallel, or that of the Chandeliers, you must take care not to get foul of the land at night, but maintain your position, in 15 or 20 fathoms, at anchor or under weigh; but if you do not wish to delay for more safety, you may stretch in towards the Balize, to anchor in 10 or 12 fathoms, outside the bar.

If the running in for the land has been in the parallel of the Chandeliers, as soon as you get 10 or 12 fathoms, you will steer S. S. W. trying to maintain this depth without danger of running aground, or among shoals, as is shown by the following breakage in the soundings:—

In this S. S. W. route there is, in the middle of soundings, a good mark to know the place of the ship, which is as soon as you arrive in a parallel with the S. end of the Chandeliers, which is as far up as Alcatrazes, the depth begins to augment to 12, 14, and 18 fathoms, which is athwart with the Poza. This augmentation ceases as soon as you arrive abreast of Pass l' Outre, where you find anew the 10 fathoms; this knowledge is of importance in looking for the Balize with security, so as not to pass to the southward of it.

In running as above, be careful not to get into less than 10 fathoms, when stretching from E. or from S. to W. because from this depth to less, you cannot weather the Balize with the wind at east, and you have no opportunity for running for the road of Naso, as follows:

Placed in 10 fathoms water, in a S. E. gale (and no appearance of the wind's ceasing) and getting into less water, you have the resource of navigating to the northward, sounding continually to maintain 8 or 10 fathoms, so as to coast the Chandeliers, and you will

know you have passed the northernmost point; if you lose the oozy soundings, sometimes mixed with white shells, which is found off the Chandeliers, and finding fine white and black sand, you may steer W. and run in 10, 8, and 6 fathoms to anchor, under shelter in the road of Niso, as the atmosphere is cloudy. In such weather you can discover nothing, and to get to this anchorage, there is no other guide than the lead; but if you can see the land, you will easier get to the anchorage, as you have only to double the spit of sand which runs off the N. E. end of the Chandeliers, on which the sea breaks, with easterly or south-easterly winds.

This convenient resource will be better, if embraced as soon as you consider the passing or weathering the Balize doubtful; as here you have your choice of water from 3 to 7 fathoms, sheltered from winds in 3 fathoms from N. E. and in 7 fathoms from winds from E. round on the southern board to S. W. It is also necessary to advise, that as soon as the winds haul round to between W. and N. you should lose no time in getting out of this roadstead, as the water will fall from 4 to 6 feet.

It is a good rule in running for the Balize to get soundings in any parallel between  $29^{\circ} 10'$  and  $29^{\circ} 30'$  or  $35'$ , to get in 25 fathoms, from whence the Balize will bear S. W.—from 25 fathoms, in any parallel between  $29^{\circ} 10'$  and  $29^{\circ} 35'$ , the Balize bears S. W. and by steering that course you will hit the Balize, about the N. E. Pass.

If your destination is Mobile or Pensacola, you should run in for the land, the eastward of them respectively, not only to avoid passing the port, but because landmarks are so wanting, and the coast so low, that a stranger has nothing to guide himself by except the lighthouses, the former of which shows a fixed, and the latter a revolving light, which may be some guide to the navigator; nevertheless, the soundings indicate sufficiently well the meridian in which the ship is found; a little more or less, if you attend to the quality of coarse sand and coral found outside of land, which is a sure indication that you are off the east end of Santa Rosa Island, where you find the same quality of soundings as off Tampa Bay and the other parts of East Florida, but can cause no equivocation, because the points are so distant from the one now treated of.

I am suspicious of a shoal or shoals near the edge of soundings, in about lat.  $26^{\circ}$  N. having once passed quickly through two colored patches, in about that latitude, and was clear of the appearance before I had time to sound. They looked like coral shoals, and I passed between them with a ship drawing  $17\frac{1}{2}$  feet. I had sounded in 45 fathoms water shortly before, and had no bottom shortly after.

*Directions for the river Mississippi, and to prevent falling to the westward.*

Should you take your departure from the Tortugas, on one of which (Gordon Key) is a lighthouse, on leaving them make a N. W. course good, and you will fall into the latitude of the Balize, 20 leagues to the eastward; keep on to latitude  $29^{\circ} 20'$ , when you may steer W. or W.  $\frac{1}{2}$  S. to 25 fathoms, then haul to S. W. for the Balize, taking care not to pass its latitude in the night time, and you may make sure of seeing \* Frank's Island light. Should the weather be thick, keep in 16 fathoms, and you will fall in on Passe a l'Ontre, where pilots are always stationed: but should you see the land, or vessels at anchor, if the wind will permit, haul to S. S. W. or more southwardly, and lead along in 12 fathoms.

Should it be very foggy, as it sometimes is in summer and fall, either anchor in 12 or 15 fathoms water, or stretch to the northward, as the currents to the southward of the bar set strong along the land to the southward, and by keeping to the southward you will be liable to be driven to the southward of the south point, in the latitude of which you will have 35 fathoms, within three miles of the land. A large bell has been provided, which will be kept tolling by night and by day, whenever from fog, or any other cause, the light or lighthouse cannot be seen at least four miles, at which distance it is calculated the bell may be heard in moderate weather.

In coming from the sea, the  $\frac{1}{2}$  S. W. Pass is said to have advantages, there being but

\* On Frank's Island, the lighthouse at the entrance of the river Mississippi is built. It contains a fixed light, elevated 78 feet above the ordinary surface of the sea, and can be seen, in clear weather, six leagues distant, your best course running for the light is due west, and vessels may safely anchor in 10 fathoms water.

The following bearings from Frank's Island lighthouse are the mean of a number of experiments by Compass:

Passe a l'Ontre, N. N. W. distance 2 leagues; S. E. Pass S. S. W. one and a half league.

South West Pass, S. W. distant 22 miles, but from it the light cannot be seen, on account of the cypress growth lining the sides of the Pass itself, as well as the intervening mud banks, which are generally covered with bushes.

† At the S. W. Pass, a lighthouse is erected, painted white and black in perpendicular stripes, showing two fixed lights, one elevated 30 feet above the other. It is on an island on the south side

few shoals. The water is very deep close to the bar, and the softness of the mud such as to do little harm to a vessel, even should she ground. Vessels after making the light, are often blown to the southward of the Balize, where they have been known to lie embayed for days and weeks together. Ships drawing 16 feet have been taken over this bar without touching, whereas ships drawing 14½ feet water often lie on the S. E. bar for days. The N. E. and S. E. passes are subject to changes, although much frequented by vessels of the largest class. From the S. W. Pass, 22 miles distant, the light on Frank's Island cannot be seen. Profiting of this Pass, these delays may, in a great measure, be avoided.

The principal entrances to the Mississippi are the N. E. Pass, lat. 29° 07' 25", between 3 and 4 miles S. E. of the light; that of the S. E. Pass, lat. 29° 08', 4 or 5 miles S. S. E. from the light; and the S. W. Pass, 22 miles from the light on Frank's Island; but approaching the Balize, you should keep 2 or 3 leagues to the northward, by which you will have good soundings to guide you. When you have struck soundings, you may run in the parallel above directed into 18 or even 16 fathoms, and you will then see the lighthouse on Frank's Island, and have the Block House or Balize bearing south-westerly; the anchorage is good every where, and should it fall calm, a light kedge will prevent being drifted by the current, which is sometimes pretty strong on the coast, but it is much stronger in the latitude of the river's mouth than elsewhere, and no soundings until you come close in with the land. In running from Passe à l'Outre for the main bar at the S. E. Pass, in the night, it is not safe to keep in less than 15 fathoms water; in the daytime vessels may approach within 8 or 10 fathoms, observing to keep the lead going. Being off Passe à l'Outre in 15 fathoms, in order to go around the N. E. Pass in 10 fathoms, the course is S. S. E. distant 2 leagues; from thence to the anchorage off the bar S. S. W. 1½ league. The Block House at the Balize bears from the best anchorage to wait for a fair wind to come over the bar, W. by N. ¼ N. distant 2 leagues, where will be found 8 to 11 fathoms. At the entrance of the S. E. channel on the bar, the Block House bears N. W. by W. distant 5 miles.

**COMMON ERROR OF STRANGERS.**—Captains not acquainted on the coast, are frequently alarmed when they come near the river, by the appearance of the water, particularly during the first summer months, when the river is high, for at that time the fresh water of the river rushes out with great force, and being lighter than the ocean water, floats on the top, making an appearance altogether singular and alarming, for where the fresh water has not entirely covered the salt water, but leaving spots, it has the appearance of rocks, the river water being of a milky color, while the other is quite dark, and changes suddenly. When the river is low, the white muddy water extends about 3 leagues off, and when high about 5. On coming into it, it ripples like shoal breakers, but your soundings are regular.

**ON THE SETTING OF THE CURRENT.**—The current sets, with very little variation to the east; and when any variation is experienced, it is either to the north or south of the river's mouth. It is very evident to every man of reflection, that so large a column of water, rushing into the ocean, must spread, when it is no longer confined, and produce different currents, until it has found its level, and will be found to vary from the original course, in proportion as you approach the edges: allowing the current to set due east, I have known two ships to come into the river at the same time, and the one complain of a southerly, and the other of a northerly current, and that because the one had been to the south and the other to the north of the river's mouth; however, as every stranger should get into the proper latitude before he comes within the influence of its current, I do not think it necessary to say any more on that subject.

**ENTRANCE OF THE RIVER.**—The land at the entrance of the Mississippi River is nothing more than mud banks, continually increasing, with reeds and rushes growing upon it, at the height of 10 or 12 feet above the water. The lighthouse on Frank's Island, or vessels at anchor, are generally the first you discover. The general winds are from the N. E. and you should avoid getting to the southward. The winds make a difference over the bar, at the entrance of the Mississippi, and the general depth of water is from 11 feet 6 inches to 14 feet.

In lat. 29° 18' N. you will strike soundings in 45 or 50 fathoms, small gray sand, with black specks. The Balize bearing W. by S. ¼ S. 40 miles distant, when in 15 or 18 fathoms, soft sticky mud, you will see the Balize bearing S. W. (if clear weather.) With the Balize bearing S. W. run into not less than 12 fathoms, on account of some

of the Nine Feet Channel, about three miles inside the bar, and left on the larboard hand on entering the river.

A lighthouse is also built on a shoal or island, near the south point of South Pass, showing a revolving light, which is left on the starboard hand going into the river. The building is painted black and white, in horizontal stripes.

mud banks, scarcely discernible above the surface, until the Balize bears W. N. W. and N. N. W. in 10 fathoms. The Balize bearing N. W. is good ground to anchor, and advantageous for getting under way to go over the bar. In foggy weather run no further in for the land than 15 fathoms, and it is preferable anchoring in light breezes to being drifted about by the currents, which are uncertain. From the bar (or entrance of the Mississippi River) to New Orleans, is 120 miles.

**TO SAIL UP THE RIVER.**—In sailing up the river, if you have a fair wind, run from point to point, carefully avoiding the bends, and by doing so, you will shorten the distance, have less current, and what is of more consequence, you will avoid the danger of having your vessel sunk by the trees which frequently lie under water. As you are coming up to and passing a point, it will be well to heave a cast of the lead; with light winds, or when the wind is scant, always keep on the leeward side of the river.

**ON COMING TO OR BRINGING UP.**—Every vessel, while in the river, should have their boat alongside, with a good hawser in it, according to the size of the ship, ready to run out to a tree, which method of bringing up is always preferable to letting go an anchor, for you are sooner under way, and avoid the danger of losing your anchors.

Every vessel, while in the river, should have a haulabout block lashed under the bowsprit to reeve a rope through, which rope should be bent to the crown of the anchor, in the same way as a buoy rope, and be strong enough to weigh it. The crown line should be of length sufficient, that when the anchor is let go, you may veer it away with the cable and always have the end on board, as by this means, if you should get foul of any thing with your anchor, (which frequently happens) you will get it again; otherwise you will be obliged to cut your cable and lose your anchor. If you are obliged to let go anchor, it should be, if possible, at a point, for you will be more likely to find clear bottom. In the bends the bottom is always foul, being full of sunken trees, and there are few instances where an anchor need be let go in the bends, because you may always run a fast to a tree.

**SHOALS IN THE RIVER.**—About 3 miles above the Look-out-house, and opposite what is called the Pas Aux Cantres (one of the outlets of the river) there is a flat makes out a full half way over the river; this should be avoided by keeping near the pass, into which you must take care not to get drifted; this is what may be called the first shoal; the next is about 7 miles above the fort at Plaquemine, on the larboard side of the river, as you are coming up: to avoid it you must keep nearer to the marsh on the starboard side; the marsh is the first land you come to without trees after leaving Plaquemine; here the land is very narrow, and by going a few steps up the shrouds, you may see the sea at not more than a musket shot distance; by these marks you may know when you are coming up with the shoal. The fort lies opposite the marsh, and runs full one third of the way over; these are the only shoals that may be called dangerous, but as I have before observed, the lead should be cast whenever you are approaching a point.

**BOUND DOWN THE RIVER.**—Vessels going down the river, should always have sufficient sail on them to be able to keep clear of the shore; without great care you will be driven into the bends and lose your rudder, and this has frequently happened with experienced seamen. I would observe also, that every vessel, unless the wind is fair, and settled weather, should bring to at sunset.

We are confident that the great depth of water at the South West Pass will have more important bearings upon the commerce of New Orleans than all may imagine. It is decidedly the best channel, which has induced the government to erect lighthouses at the entrance.

Going down the river, a slight inflexion to the right takes you to the head of the Pass, which runs S. W. almost as straight as an arrow. The shores on each side are very bold, there being 7 fathoms water, in many places, almost touching the bank. A vessel can often proceed this way, when it would be dangerous or impracticable to drop down the bend at the most frequented channel, past the middle ground.

About the same distance has to be gone over in order to reach the bar at the N. E. or Old Ship Channel (via the Balize) or to go down the S. W. Pass; but the course to the latter is direct, and there are no such dangerous shoals as the middle ground in going to it. The latter bar has 4 or 5 feet more water than the other, and the bottom is soft mud; whereas that of the N. E. Pass is rather hard and gravelly in many places. During flood tide there are never less than 20 feet water in the S. W. Pass, about 18 at low water. Var. 61° E.

**COAST WEST OF THE MISSISSIPPI.**—West 47 miles from the S. W. Pass, is the east end of Toubalier or Timbalier Island; in this distance the coast bends to the N. W. and S. W. forming a bight in the coast, in which is the entrance to Barrataria Bay. The whole coast in this bight is low and covered with a kind of rushes, with the exception of a few trees to the east of Barrataria Bay. The course from the S. W. Pass

to the Bar is W. N. W. and the distance 35 miles. In navigating between Toubalier Island and the S. W. Pass, you should not come in less water than 4 fathoms. The coast to N. E. of Barrataria takes a turn to the S. W. and you may know the entrance to the bay by a settlement on the east of the harbor. The bay is about 10 miles wide in every direction; its depth varies from 6 to 12 feet. On the sea side it is covered by Grand Terre Island, which leaves between it and the main two entrances, the eastern of which is filling up; and the western, called the Grand Pass, affords on the bar 9 feet water. To the east of Toubalier Island the La Fourche discharges itself by several mouths; a bar makes off from the east end of this island in a S. E. direction about 2 miles.

Toubalier or Timbalier Island lies nearly E. and W. but bends to the northward at the west end. It is 10 miles long, and fronts a bay in which there are from 2 to 4 feet water. A shoal extends from its west end 2 miles in a W. direction as far as the east end of Cayo Island, which is the next succeeding.

The east end of Cayo lies N. W. from the west end of Toubalier Island 2 miles distant; it is 4 miles in length, from east to west. Fresh water may be found on its east end, and likewise in a small bight to the N. W. part of the island. Good anchorage for vessels drawing 8 feet water is found at the east end; to take it, it is only necessary to bring the S. E. point to bear N. E. and steer for it, and with your lead for your guide, when near it, haul a little to the eastward, until the point is north, when you may steer and anchor as close to the island as you please. W. S. W. from Cayo Island  $1\frac{1}{2}$  mile distant is another island of above  $2\frac{1}{2}$  miles in extent, and 2 miles further on the same course, is the east end of Vine Island. The shoal water extends some distance off the island lying between, and you should not come nearer the shore than 2 miles. Vine Island is about 6 miles long, running W. S. W., and is separated from Derniere Isle by a small creek; Derniere Isle is 11 miles long, and runs west until near its west end, when it turns to the N. W. Fresh water can be found at its west end, which is called Racoon Point. A shoal on which the water breaks, lies W. S. W. 20 miles distant from Racoon Point (lat.  $28^{\circ} 53'$ ); between the point and the shoal you will have from 4 feet to  $2\frac{1}{2}$  fathoms. A shoal likewise lies in the meridian of the point, to the southward, between which and the point are 2 to 5 fathoms. Vessels drawing 5 feet may anchor under Racoon Point by bringing the point to bear north and running for it, and giving it a berth of 200 yards; haul round the point and anchor in 7, 8, or 9 feet water. The bays formed behind the islands last mentioned are shoal, having only from 2 to 4 feet water, and the shore to the north of them is marshy. Racoon Point is about 7 miles from the main, which runs about W. N. W. 41 miles to Point Au Fer.\* This part of the coast is shoal, as at 2 miles from the coast you have 6 and 7 feet water, and for the whole distance it is marshy.

*From S. W. Pass to Belle Isle.*

On leaving S. W. Pass steer W. by S. about 18 leagues; this course will carry you in 7 fathoms water off  $\frac{1}{2}$  Timbalier; the coast from thence to Racoon Point, a distance of about 11 leagues, may be approached within one mile or less. Near the meridian of Racoon Point is a bad shoal of hard sand, supposed to be distant 10 or 12 miles, as land could but just be discerned from mast-head. It is always safest to pass between the shoal and Racoon Point, keeping the lead going. Give the point a berth of 2 miles, and you will have not less than 2 fathoms water. By a good observation this point is in lat.  $28^{\circ} 58' N.$ ; course from hence to Point Au Fer is about W. N. W. northerly, distant 15 leagues. It is best to keep the lead constantly going, and approach as near the land as your draft of water will permit, say 10 feet, to avoid running past the light, as in hazy weather you can scarcely see the light in  $2\frac{1}{2}$  fathoms water; lat. of the point  $29^{\circ} 19' N.$  Bring the light to bear E. by S., steer W. by N. 7 or 8 miles, till you have Tucka Hummock bearing N. N. W.; steer for it till you have Belle Isle bearing N. E. by N.; then haul up into the bay E. N. E.; the stranger must then be guided by stakes, which designate the channel.

\* On Point Au Fer is a lighthouse showing a fixed light, elevated about 70 feet above the level of the sea, lat.  $29^{\circ} 19' N.$ , long.  $91^{\circ} 52' W.$ , and serves as a guide for vessels going into Achafalava Bay; it bears from Belle Isle S. S. E. 12 miles, and from the entrance of the river S. by W. 10 miles; from the outer buoy E. by S.; going in the buoys are all left on the starboard hand, except in the narrows, where there are two, and you go between them.

† A lighthouse is erected on this island.

One channel is to bring Belle Isle to bear N. N. E. and steer in for it, but this channel is intricate, and not generally used. Vessels drawing over 7 feet will find much difficulty in getting into the river.

The highest part of Belle Isle is 130 feet above the level of the sea. It can be seen at a considerable distance, there being no land resembling it on the coast.

**FROM POINT AU FER WESTWARD.**—The Coast to the west of Point Au Fer is shoal for some distance from the shore, until you are up with Tiger Point, which may be known by a large ridge of high land, covered with oak trees. In this distance, which is about sixty miles, there is no navigation of consequence to the west of Belle Isle; a number of small islands and shoals to the west of Belle Isle and a large Island bound the coast until within 10 miles of Tiger Point, and form behind them Vermilion Bay, which communicates with the sea at the East and West points of the island. This bay has from 5 to 9 feet water in it, and in the western strait, which is the clearest, there is a bar with 5 feet water on it.

Beyond Tiger Point the land runs west about 8 miles to the Bayaus of Great and Little Constance, which have bars at their entrances.

From these Bayaus the coast lies W.  $\frac{1}{4}$  N. to the mouth of the River Mermentau, distant 15 miles: this piece of coast is swampy and without trees, but the beach is good; the river has from 4 to 5 feet water on the bar at its mouth, and the land for 2 leagues up the river is swampy; it thence rises and is well covered with wood.

W. by N. 30 miles from Mermentau is the river Calcasu, and 20 miles W. from the Calcasu is the Mouth of the River Sabine and the boundary between the United States and Mexico: in all this distance there is a good beach, clear and without trees, but in some places it is swampy; the Sabine has a bar at its entrance with from 6 to 8 feet water.

## COAST OF MEXICO FROM THE SABINE WEST TO TAMPICO.

The coast from the Sabine lies W. and then trends S. W. as you approach the entrance to Galveston Bay, a distance of about 50 miles, the whole of which is clean, having about 3 fathoms within a mile of the shore.

**GALVESTON BAY.**—The entrance into this bay is between point Bolivar on the N. and the east end of the St. Louis or Galveston Island, on the S. between them are four channels.

Should it be your intention to go into Galveston Bay, be careful to haul to the south, when the wind is from that quarter, to avoid being hemmed in to the north, in which case you will be obliged to take the N. passage, which has but  $7\frac{1}{2}$  feet water, and will only carry you as far as the point: to take this passage you will keep along the north shore, and when near up with the entrance, leave a shoal which is dry at low water, south of you; you will have 8 or 9 feet water until nearly up with the point, when it will shoalen to  $7\frac{1}{2}$  feet, and soon after deepen to 9 and 10; continue along shore about a mile when you will have 2 and  $2\frac{1}{2}$  fathoms; here you must anchor, as you cannot pass this next point with more than 4 or 5 feet, on account of a bank which extends from the dry shoal above mentioned, all the way south of you, until it turns quite round the point to the west. Here you are safe in a common gale.

Nearly a mile to the south of the above passage is another with 9 feet, the course into which is N. W., leaving the dry shoal on the starboard hand; and three quarters of a mile south of this, is another, having 13 feet: the course into which is also N. W., and after passing the shoal, which lies to the south of you, you may steer direct for the north point of Galveston Island, and having passed the bar, you will have 3, 4, and 5 fathoms till up with the point, which pass within one hundred yards, gradually increasing your distance as you pass, when you will see the bank on the north bar, which is steep to,

with more dry sa S. by E. from tiago; and 10 mi between them is tiago, and on whi

steer then to the S. W. up the channel in 3 or 4 fathoms, till you see a small bunch of bushes about two or three miles from the point, which bring to bear S. E. and anchor in 3 or 4 fathoms. Fresh water may be had near the bushes.

Should you wish to go in by the South Pass, keep along the beach of Galveston Island in 2 fathoms, until near the point, when you will not have more than 10 or 11 feet, haul round the point as before directed, and steer S. W. for the anchorage.

Galveston Island is about 20 miles long, and trends N. E. and S. W.; it is low, but you cannot mistake it, as there are three single trees about the middle; at the west end there is a wide pass with a small island nearly in the middle of it, and back of it about 7 miles distant, is a long wood, called Oyster and Chocolate Dye Wood.

From the S. W. end of Galveston Island, the coast continues S. W. distance 15 miles, to the mouth of the Rio Brazos, and you will have 3 and 4 fathoms water at  $2\frac{1}{2}$  or 3 miles from the shore. As you come up with the mouth of the River you will see a long house on the N. E. point, called Michael's, and to the N. W. of the mouth you will see the Woodlands of Brazos, distant about 7 or 8 miles from the beach. The bar at the entrance has from  $4\frac{1}{2}$  to 5 and 6 feet water on it, but like all the other entrances it is subject to change.

S. W. from the mouth of the Brazos 12 miles, is the entrance to Bayo St. Bernard's, which is narrow, and has from 5 to 7 feet at times; as you approach it you will see the woodlands back of the beach at the distance of 8 miles.

In running down from Bayo St. Bernard's for Pasa del Caballo, the land trenches somewhat in, but the general course is about S. W. and the distance 55 miles: you will pass a small bayo about 8 miles from St. Bernard. This bayo has a range of woodland which runs nearly to the beach, at the end of which is the bayo. After passing this, the land is low all the way, and you may keep in 3, 6, and 7 fathoms.

**PASA DEL CABALLO.**—As you approach this pass, which is in lat.  $28^{\circ} 19' N$ , you will see a wide opening from the N. point, (called Point Clevery) between which and the S. point is a sand island. You will cross the bar about 5 miles distant from the N. point in 9 feet at low water, by bringing the south point to bear from N. W. to N. N. W., and steering for it; but you will always find some lumps on the bar, and your judgment must direct you. After passing the bar, follow the west breakers till you pass all, and then keep the south shore close on board in  $2\frac{1}{2}$ , 3, and 4 fathoms, till you get up with a sand island which you will leave on your starboard hand, and having passed within two hundred yards, steer for the west part of the north point, as there is a low flat on the west side: in running here, you will have  $2\frac{1}{2}$ , 2, and 3 fathoms; and as you approach the point, give it a small berth. You may anchor abreast of the island, or if you wish to proceed up the bay, give the marsh a small berth, in from 6 to  $2\frac{1}{2}$  fathoms, as the ground is steep on both sides. Below the point, for the distance of two miles, is more flat; and if you wish to go to the Lavacker, run N. W. till you haul in under the south shore, and continue in 9 and 10 feet till you come up with the first oyster rock, when you must go ahead with your boat, and if bound to the mouth of the Colorado or Matagorda Town, continue along the marsh at the pass, keeping your lead going till you reach the Oyster Bank, which runs from the river to the sea beach, 5 miles, and from the pass 30 miles. This bar is subject to change, like the others, but for many years there has not been less than 9 feet at low water.

From Pasa del Caballo to Aranza Inlet, the course is about S. W. The land curves somewhat in, and the distance is 40 miles. It lies in lat.  $27^{\circ} 55' N$ . All the coast is low; and when you get about half the distance, you will, in clear weather, see some woodland back of the bay, but nothing very remarkable on the coast. The entrance is very narrow, and not more than 7 and 8 feet at low water. The north point is somewhat high, with a low sand point stretching to the south point.

**ARANZA INLET.**—In going in, bring the south point to bear W. by S. or W. by N. and after crossing the bar, steer direct for the south point, taking care the tide does not affect you, as it is very strong, and you may go within pistol shot of the point, hauling to the north soon as you have passed it, and take your soundings in 10, 11, and 12 feet: or you may anchor soon as you pass the south point 400 yards, in 3 fathoms. If you intend going up the bay, continue in the above soundings, till you get up with the north point, leaving a long flat on the west. The channel is very narrow, and course about N. by E. or N. N. E. about 2 miles.

South of Aranza the coast runs S. W. by S. or S. S. W. to Corpus Christi, distant about 25 miles. The coast, after leaving the point 3 miles, is high and hilly all the way, with more dry sand hills.

S. by E. from the entrance to Corpus Christi, distant 92 miles, is the Barra de Santiago; and 10 miles farther to the south is the entrance to the Rio del Norte; midway between them is Boca Chica, which enters into the same lagoon as the Barra de Santiago, and on which you will have 4 feet water,

But few vessels enter the Rio del Norte, the trade to Matamoras being carried on through the Barra de Santiago, which affords a depth of feet water on its bar, while the river affords but about 6 feet.

*Directions for the Brazo de Santiago and the Rio del Norte, by Thomas M. Thompson, Branch Pilot.*

In running down for the Brazos, between the months of March and September, be careful to keep to the south of  $26^{\circ}$  N., for should you fall in to the southward of the bar, you will find it very easy to make your northing, as a continued current is running northerly of from two to three knots per hour. Should you fall in with the land, not having had an observation previous, so as to know if you are north or south of the bar, by going to the mast head you will see, if you are to the northward, a large lagoon of water, and scarcely be able to see the main land.

N. B.—This lagoon extends to the north of  $28^{\circ} 30'$  latitude, and is a certain sign of your being to the north. If you are to the south of the river, you will find your water of a muddy green color, and no lake to be seen on the inside from the mast head. If your vessel is in the vicinity of the river, the water will be the same as approaching the Mississippi. If you fall in between the river and the bar of Santiago, you will be able to discern a large house, that stands on an eminence at the entrance of Beca Chica, a little narrow inlet situated 5 miles south of the Brazos. Vessels bound here, between September and March, will do well to keep as near the  $26^{\text{th}}$  degree of north latitude as possible, as the current is then altogether governed by the winds. With the exception of an east wind, the current is northerly.

A white flag will signify that a vessel cannot enter, and will never be shown except there is danger in entering, and will be hauled down when the danger ceases.

A red flag will be hoisted to know your draught of water, which you can answer by hoisting your flag as many times as your vessel draws feet of water.

When a blue flag, it will tell you the pilot is coming out to take you in; or if you draw too much water, and will have to lighten.

A white and red flag will be hoisted for you to anchor, with two flags in a range, and in four or five fathoms water, and a lighter will be sent out to you immediately.

A white and blue flag signifies that you may haul off for the night, as it is too late to enter, but you will be attended to in the morning.

Any vessel appearing off the harbor in distress, will be promptly attended to, on making the usual signal, viz. the ensign, union down. I would recommend a white square flag with a large black ball in the centre, as a signal much quicker discerned.

#### *Other Directions for Vessels bound to Texas.*

From the S. W. pass of the Mississippi, steer W. S. W. one hundred miles with the wind at S. E. to avoid the flat ground of the Oyster Bank, which lies off Vermilion Bay. This bank is large, and has from 2 to 3 and 5 fathoms on the outer part, and on the inner part, 2 and  $2\frac{1}{2}$ , a long distance: W. by S. course will cross this bank at times in 3 and 4 fathoms, soft bottom. As the current is so uncertain, it is almost impossible to know when you make your course good. After passing this shoal, you may steer for the Brazos without fear, and soon be on soundings again, and have from 16 to 20 fathoms, till you gradually shoal your water to 9, 8, 7 and 6 fathoms. Should you wish to go for Pasa del Caballo, on a W. S. W. course, you will have soundings from 20 to 10 fathoms, 75 miles distant; and when in 8 fathoms, clear weather, you will see the land. In the latitude of Aranza, you will strike bottom, 22, 25, or about 30 miles from land, and shoal very gradually; and, when in 8 fathoms, you will see the land 20 miles in clear weather. More south, the water is much deeper; and you will have 7 fathoms close to the land, changing suddenly to 18 fathoms, 12 miles from land.

The course from the S. W. Pass to Baratania is W. N. W. and distance 37 miles. Ship Island is nearly in the same latitude as the S. W. Pass.

The current on the whole coast is generally governed by the winds; but more rapid currents set to the south in a north wind than in any other. Vessels falling south of the port, with a north wind, will find it almost impossible to hold their own in a strong breeze. When bound to the eastward for New Orleans, your better way is to go no nearer the land than forty miles, until in the latitude of its entrance, as you will by that have no current to hurt you; but on soundings and in shore, the current runs, in moderate weather, regular ebb and flood, and the easterly current but a small part of the time. The tide at the passes, in common, rises 2,  $2\frac{1}{2}$ , and in spring, 3 feet, and only in 24 hours; but it is altogether governed by the winds. In heavy winds on the coast, it is known to run in 36 hours, and sometimes 48; and on a sudden change of wind to the north, it will run out as long, in moderate weather. Sometimes there is a half tide, which rises nearly to high water, but seldom runs in.

We have for ing more conv Gulf, commen

From the Rio del Norte the coast trends S.  $3^{\circ}$  E. 7 miles, then S.  $15^{\circ}$  W. 29 miles to the Barra de San Fernando or River Tigre, on the bar of which there are nearly 3 feet at low water; for the whole distance the land is low. The water of this river is brackish from the communication it has with the lagoon, and is only fresh after the rains; on the south coast of the bay formed by it, there is a good pool, where any urgent necessity may be relieved.

From Rio de S. Fernando the coast continues S. in nearly the above direction 23 miles to the Bocas Ciegas or Cerrados, which are four openings in the space of a league, and through which the sea enters when there are heavy gales: they may be distinguished 3 or 4 leagues at sea, and they communicate with Madre Lagoon, which extends nearly to the Barra S. Ander. The land from R. St. Fernando to Bocas Ciegas is low.

S.  $\frac{1}{2}$  W. about 24 leagues from Bocas Ciegas, is the entrance to the River St. Ander; the shore for the whole of this distance is low and sandy: on the bar there are 6 feet water, and the hills of Corrigo and Palma serve as marks for it, the bed of the river being midway between them, and forming in part, a large lagoon, whose shores are low. Eight leagues up the river is the town of Santa de la Marina. The lagoon, after the bar is crossed, and before you enter the river, is full of shoals, and you have only one channel of 11 or 12 feet water, but in the river you have 4 or 5 fathoms.

From the Barra de St. Ander the coast runs S.  $3^{\circ}$  E. 18 leagues to the Barra del Tordo; all the bottom is good in this distance, save that there are some detached rocks three leagues to the S. of St. Ander, where they extend 2 miles from the coast; on the Barra del Tordo there are scarce 3 feet at low water.

The marks for crossing this bar are those double hills called the Martinez, they lie west from it, and the N. W. of Martinez in the interior you can see the range of high land called Tamaolipas stretching in that direction.

South of Barra del Tordo 10 miles, is that of Trinidad, the bottom is good except some pointed rocks here and there, none of which extend further than 2 miles from the shore. All the shore of this coast is sand or low mounds, of which those about 2 leagues south of Barra del Tordo are of greater elevation than the rest, and are called the Hill of Chapopote or Comandante: on Barra del Trinidad there are but 2 feet water.

S.  $\frac{1}{2}$  E. 7 miles from Trinidad is Barra Ciega, and within a lagoon extending the whole distance. The coast is clear, save near the shore the bottom is rocky. West from Barra Ciega is the hill of Metate. Barra Ciega has 3 feet water on it.

From Barra Ciega to Tampico Bar the coast runs S. by W. and the distance is 19 miles. The coast is clear, save some pointed rocks which extend south of Barra Ciega 6 miles, after which it is clear.

GENERAL OBSERVATIONS on the coast from Tampico to Galveston Bay. (From the Derrotero)—The greater part of the lagoons that are formed on this coast have not more than 3 or 4 feet water, at their greatest depth, and some parts of them are quite dry except in the rainy season. From August to April, these coasts are dangerous, on account of the heavy sea upon them, and which makes it impossible for a ship to ride at her anchors; for in that season the E. S. E. wind blows with great violence for 2 or 3 days before it shifts to the north; but in the other months, from April to August, the navigation is very good and secure; the current always setting to the North and N. E. which facilitates increasing the latitude; and although the east winds prevailing from April to June send in much sea, yet a ship may ride at her anchors in 7 or 8 fathoms, in a case of necessity: in such a situation she will be in sight of the shore; but if possible, it will be more advisable to keep under sail. The land breezes are frequent in the summer from midnight until 9 or 10 in the morning, when they yield to the sea breeze; but this only takes place so high as  $26\frac{1}{2}$  degrees of latitude, where the mountain range terminates; all the other parts are very flat, low and swampy; on which but little rain falls, which is the chief cause in producing the land winds.

We have followed the northern coast of the Gulf of Mexico as far as Tampico, it being more convenient to continue on thus far; we will now resume the description of the Gulf, commencing with Cape Catoche and ending with Tampico.

## GULF OF MEXICO.

*In this Chapter the Bearings are the true.*

**GULF OF MEXICO.**—The Mexican Bay is an immense gulf, surrounded or enclosed on all parts except on the S. E.; the island of Cuba advancing considerably to the West, forms with this S. E. opening two Straits or Channels; one on the south with Cape Catoche, by which a communication is opened between the Gulf and the Caribbean Sea, and the other on the East with the South Coast of Florida, which communicates with the Atlantic Ocean, so that these are the only two routes leading into the Mexican Gulf.

**CAPE CATOCHE TO POINT XICALANGO.**—The N. E. land or knee of Yucatan has several islands at a short distance from it; these are Cancun, Mugeris, Blanquilla, and Contoy; the last, which is the northernmost one, lies about 7 miles from the main coast; its shore is clear, and you may pass at 2 miles from it, in 6 fathoms: between it and the coast there appears to be anchorage; but this part is imperfectly known. The north point of Contoy lies nearly east, true, twelve miles from Cape Catoche.

Cape Catoche has two islets along its shore, which extend out scarcely a mile from it, and form with the island of Jolvos, two mouths, called Joujou and Nueva, fit for canoes only. From the said cape the coast bends somewhat to the south of west, for the distance of 18 miles, to the western extreme of Jolvos Island, which forms the Bocas del Conil: this coast is foul, having a rocky bank with little water extending off to the distance of  $2\frac{1}{2}$  miles. Between Jolvos Island and the main, a lake is formed, obstructed by various islets and grassy spots, and fit only for canoes.

From the Bocas del Conil, the coast continues to the W. by N. about fifty miles to the Rio Lagartos, (Lizard River,) whence it inclines W.  $13^{\circ}$  S. the distance of thirty-five leagues to Punta Piedras, or Rocky Point. All the coast from Cape Catoche is very low and flat, without any remarkable objects upon it, excepting a Cairn, or little mount of stones, intentionally raised by the passing Indians on the very beach of Lagartos, 38 miles W. from Cape Catoche, which may be known by its resemblance to a hat, and the little woody hills, which are comprised between this and the Vigia, or Lookout, of the River Lagartos; next to it is that of Silan, where water may be procured with facility; to the Lookout of Silan follows that of Santa Clara, to which succeeds that of Telchaac, where, also, water may be procured: next comes that of Ygil, then that of Chuburna, and to this, finally, the Castle of Sisal. None of these Lookouts (Vigias) except the Cairn of Lagartos, and Castle of Sisal, can be seen farther off the shore than from 6 fathoms of water. From the Cuyo or Cairn at Lagartos, to Chuburna, you may anchor without fear in from 4 fathoms outward, but not nearer land, as there are many stones, shoals, and banks and rocks, which cannot be easily ascertained by the lead, because they are covered with a coat of sand, and thus they cut the cables, whereby anchors are lost; in addition to which the depth often suddenly diminishes upon them, and therefore vessels are in much danger of getting aground, and of being lost.

The Castle of Sisal is built on the shore close to the sea, and near to it are three or four houses, used for depositing articles of merchandize, that are transported coastwise, to be taken to Merida; and also for receiving the produce sent from Merida and other inland places of this province. At the castle there is abundance of water, and it can be procured with the greatest ease.

Upon Point Piedras there is a little mount, named No-te-perderas, (Do not lose yourself,) which serves for a good mark to know it by, and which is seen from Sisal Shoal, or at 14 miles off. From this point the coast rounds about to the S. W. for thirty miles, to Point Desconocida, forming the N. W. front of the Peninsula of Yucatan: this coast, as well as the former, may be seen well from  $5\frac{1}{2}$  fathoms of water, and is commonly named the Palmares; for, among the wood with which it is covered, many Palmitos (Cabbage Palms) are seen, though there are none on the other parts of this coast. On the coast of Palmares no one ought to anchor, for the bottom is of stones covered with a thin coat of sand, which deceives the lead.

From Point Desconocida, the coast trends to the south, but rather inclining to the east, true, twenty-two miles, to Las Bocas, (The Mouths,) which are two little inlets formed by the coast; in front and very near to them are two very little islets. From the Bocas, the coast continues to the south, with some inclination to the west, true, to the distance of fifteen miles, or to Jayna, which is another inlet of the coast, at the mouth

of a river; in front of this there is another islet; there is also an islet named Piedras (or Rocky) Islet, half way between the Bocas and Jayna.

From Jayna the coast continues with some inclination towards the west, true, to the distance of twenty-one miles, towards the river of St. Francisco, which is four and a half miles to the N. E. of Campeche, the only point of commerce on all this coast.

The coast between Point Desconocida and the River of St. Francis cannot be seen farther off than from 3 or 4 fathoms depth, and then it appears to the view with various breaks, which look like very low keys; all of it is remarkably shallow and clean, so that, with the lead in hand, there is not the least danger on the whole of it, excepting that which arises from the hull of a sunken vessel, which lies to the west of the Isle Piedras, and in  $3\frac{1}{2}$  fathoms of water, to which, vessels navigating in this depth, ought to give a berth.

From the River of St. Francisco, the coast continues to the S. W. for twelve miles, to Point Morros, in which space the Castle of St. Josef is the first thing seen; afterwards the city of Campeche; to it follows the Castle of St. Miguel, next comes the town of Lerna; after it succeeds a point of the coast extending out to the sea, and which is named Point Martin; the next to it is Point Morros: all this front of coast, which forms the anchorage of Campeche, may be seen plainly from  $4\frac{2}{3}$  fathoms; but the water is so shallow that you will find  $3\frac{2}{3}$  fathoms at fifteen miles from the land, and  $2\frac{1}{2}$  fathoms at 4 miles from it. This anchorage, therefore, needs no pilot, nor any particular advice for taking it; for, once arrived at the depth convenient for the vessel's draught of water, you may let go your anchor, remaining as if in the middle of the ocean: hence results an immense labor in discharging and loading cargoes; for even those vessels which can approach nearest to the land, remain  $4\frac{1}{2}$  miles distant from it. In order to diminish this labor, and to manage so that boats, lighters, or launches may go to and return from the shore under sail, they anchor to the west of the tower. In this anchorage, although open entirely to the north and N. W. winds, which in the season blow with great force, there is not any thing to fear, for they do not raise any sea of consequence, and vessels remain at anchor with sufficient safety.

To the west of Point Morros, and rather more to the south, it is not so shallow; and, according to information, 4 fathoms may be found there, at a league from the land. Any one who approaches this coast, with the object of wooding and watering, ought to endeavor to take this last anchorage, in the vicinity of which, and somewhat to the south, is the town of Champoton, where they may provide themselves with the articles required.

From Point Morros, the coast trends S.  $25^{\circ}$  W. 36 miles to Point Javinal, forming, as it were, a bend in the coast: as it approaches the latter point, the land trends more to the west, and S.  $60^{\circ}$  W. 61 miles distant from it is Point Xicalango, which is the western extreme of the Lagoon or Lake of Terminos. This Lagoon is a great bay, about 40 miles wide, and having about 30 miles of bight: between its two outer and extreme points are two islands, which shelter it; the western, named Carmen, is the largest. At the western extremity of Carmen is a garrison, named that of San Felipe (St. Philip.) Between this and Point Xicalango is the principal entrance to the Lagoon, with rather more than two fathoms of depth, and of it we are informed only that it is very difficult to enter, and that it is absolutely necessary to have a pilot.

**THE SOUNDINGS OR BANK OF CAMPECHE.**—The Campeche Bank is a great shoal, which extends from the north coast of Yucatan almost as far as lat.  $24^{\circ}$ , and from the coast of Campeche, to the west, as far as the meridian of  $92^{\circ} 30'$ ; the depth as well as the quality of the soundings on it are so uncertain, that it is not possible to ascertain your situation on it by the lead; it will be sufficient to take a glance at the chart to convince yourself of this fact; nevertheless, the soundings from 18 fathoms towards the shore are so regular, that you may navigate along it with all safety; for having once caught that depth, which you will find at 10 or 12 leagues from the coast, the depths will be found to run uniformly with the coast until you are to the N. W. of Point Piedras, when it suddenly diminishes two fathoms. The same regularity is remarked all along these soundings, from 18 fathoms to 4 fathoms; and you will always find the diminution to the N. W. of Point Piedras, which is undoubtedly caused by some spit of rocks that extends out from the point; for upon it the soundings are always on stones. From 4 fathoms to the shore, in all the tract of coast between the Cayo or Cairn of Lagartos and the Lookout Tower of Chuburna, we have already said that there are various stones and shoals, most perilous to navigation.

The quality of soundings, from 18 fathoms towards the shore, does not preserve regularity; for sometimes it is gray sand with gravel, at others gravel alone, and at others sand with shells, and coral; thus it alternates until to the N. W. of Point Piedras, where, as we have already said, the soundings are on stone or rock, which make a very good mark to know a vessel's situation by, and to enable her to shape a course with security, so as to pass between the Triangles and New Shoal, (Triangulo y Baxo Nuevo,)

which is the channel that ought to be preferred for running off the bank on its western side; but it is still better to ascertain the vessel's place by the course which is necessary to preserve the depth of 18 fathoms: for, if you retain that, steering W. by S. it is a proof that you are between the meridians comprehended between the Cairn of Lagartos and Point Piedras; but, if you augment the depth on this course, it is necessary to change it to W. S. W. and S. W., it is a proof that you have passed the meridian Point Piedras, and that you are abreast of the N. W. front of the coast, or between Point Piedras and Point Desconocida; and, finally, if, in order to obtain the same depth, you are obliged to steer south, you need not doubt that you have passed, or are at least abreast of, or on the parallel of, Point Desconocida. What we have said of 18 fathoms depth applies also to any lesser depth on this coast; but on the rest of the soundings, or bank, that is, from 18 to 20 fathoms, into deeper water, there is no regularity whatever, either in the depth of water or quality of soundings, especially on the north part of it; and this necessarily follows, for it is sown with shoals most dangerous to navigation, of which we shall speak in order.

Baxo del Corsario (the Privateer Bank) has been explored by Don Ciriaco de Cevallos and Don Juan Lopez de Aguilla. It extends N. N. W. from the west point of the island Jolvas, and has near it 10 fathoms water; there are breakers on it only when there is a heavy sea.

The last edition of the "Derrotero de las Antillas," says, the shallowest part of the Corsario Bank, is situated, according to the survey of Don Ciriaco Cevallos, in lat.  $21^{\circ} 37' 30''$ , and long.  $87^{\circ} 15' 30''$ , from Greenwich, giving it an extent of 3 miles from east to west, and about half a mile from north to south; its west end being on the meridian of the west end of Jolvas Island, four and a half miles distant. The shoal has been examined by the pilot Josef Gonzales Ruiz, who gives the following description:

"The Corsario Shoal is a rocky spit, which begins to the eastward of Mosquitos Point, with a turn of about 3 leagues to the north and to the westward of that point; it extends about N. W. by N. to that or rather a less distance, and ends in 7 or 8 fathoms of water. All this bank is of rocky spots, which shoalen towards the land, until, at about  $3\frac{1}{2}$  miles from Mosquitos Point, at that distance there is a shoal extending about 2 miles east and west, and less than half a mile in breadth. This shoal, at low water, has 8 and 9 feet of water; and, at high water, 10 and 11 feet. Some of the rocks rise higher than others. The shoal is of micara rock, with black spots, and some red ones, which seem to be sponges. Those spots farthest to the east bear from the west part of the island, (which is distant 2 leagues from Mosquitos Point,) N. N. E." It may be observed that the situations given by this pilot do not accord with those of Cevallos, and the latter are supposed to be entitled to the greater confidence.

SISAL SHOAL.—The "Derrotero de las Antillas," says, "This shoal was sought for and found by Don Ciriaco Cevallos, on running from the anchorage at Sisal. He says, the least water on it is 2 fathoms, according to the traditional information of the people of the country; but he could find only 18 feet, surrounded, very near, on all sides, by 6, 8, and 9 fathoms. Between it and the contiguous lands of the continent is a channel of 12 miles, fit for the largest vessels. It is true, when he found 18 feet, we were ignorant of the state of the tide, which, at that time, rose from 3 to 4 feet at high water. From the shoal Mount No-te-perderas (i. e. Don't lose yourself) bears true S.  $7^{\circ}$  E. 14 miles; and this mount is the best mark of keeping clear of it, whether passing to the northward or southward."

This shoal was surveyed by Mr. C. Brown, master of his Britannic Majesty's ship *Baun*, in 1819. It is seven eighths of a mile in length, nearly S. E. and N. W., and a quarter of a mile wide. It has several rocky patches, with  $2\frac{1}{2}$  a 2 $\frac{1}{2}$  fathoms on them; and one, which is the shallowest, with only  $1\frac{1}{2}$  fathom on it. The latter is nearly one-third of a mile from its S. E. end. Here are 5, 6, and 7 fathoms within a cable's length of it all around.

The Alacran is a shoal of great extent. In its south part there is a little safe and well sheltered harbor, in which vessels drawing 11 feet may anchor. This harbor is frequented only by the Campeche coasters, who make oil from the immense quantity of fish which they find here. All others ought to shun the proximities of the shoal; no one should ever sail hereabout, from the east to the west, in 26 fathoms depth or upwards, but should always pass in from 18 to 20 fathoms. The situation of this shoal has been well ascertained by the survey of Don Ciriaco de Cevallos, who says, the shoal extends 14 miles from north to south, and 11 from east to west. The islets upon its southern part are named Perez, Chica, and Pajaros, and it has various banks and reefs rising more or less above the surface of the water. The harbor is formed by the reefs, which extend around Perez and Pajaros. At its entrance the depth is from  $2\frac{1}{2}$  to  $6\frac{1}{2}$  fathoms, and farther in, from  $2\frac{1}{2}$  to 7 fathoms. The best anchorage is to the south the middle of Perez Isle, in 6 fathoms, on sand and shells, having to the south the

rocky bank, about six cables' length.

The Arca, the southernmost of the islets, is by N.  $27^{\circ}$  E. 10 miles, and may be entered with care than to the middle of the anchorage, the largest island, which runs from the south, forms the true width.

The western end of the islets, 1 $\frac{1}{2}$  cables' length, is the anchorage is in it for all of himself well.

The S. E. length in breadth, by which channel of the vel, by which trance to the

"The southern end of the islets, two miles E. of the middle of the sand and gravel of a mile to the To the W. S.

A sand bank, Campeche Bay, says, "a beam, bearing about N. W.

rocky bank, which extends from the S. W. end of that isle towards the E. and E. S. E. about six cables' length."

The Arcas are three islets, which may be seen at the distance of 5 miles. They are the southernmost upon the western edge of these soundings, and lie almost nearly W. by N. 27 leagues from Campeche. They form of themselves a good harbor, which may be entered on the N. W. or S. side, as is most convenient, and without any other care than to avoid the spits stretching from them. The N. W. entrance may be taken by bringing the south part of the N. E. island (which is also the largest) on with the middle of the S. E. island, bearing nearly S. E. by E.; this will carry you clear of a spit which runs out to the N. W. of the greater island, and which is the object that shelters the anchorage from the northerly swell. To enter by the south passage between the largest island and the westernmost island, you ought to be careful to avoid the reefs that extend from the large island to the S. and to the W. N. W., forming a shoal which bears from the south extremity of the said island N. W.  $\frac{1}{4}$  W. near half a mile; and which forms the true channel between that and the westernmost area, of two cables' length in width.

The westernmost island sends off reefs to the W. N. W. and W. S. W.; also at 2 and  $1\frac{1}{2}$  cables' length from the north point of the large islands there are three foul reefs extending to the west, the farthest of which is 4 cables' length from the said point. This anchorage is very superior in northerly gales to that of Campeche; and as there is depth in it for all classes of vessels, he who under such circumstances, can catch it, will find himself well sheltered and secure.

The S. E. Area is surrounded by reefs, separated from it by a space of about a cable's length in breadth. This islet, with the reefs at the S. E. part of the large one, form a channel of two short cables' length, with from 5 to 15 fathoms, on sand, stone, and gravel, by which, in case of necessity, and according to the situation a vessel is in, an entrance to the anchorage may be attempted.

The Cabezo, a head rock, which lies  $13\frac{1}{2}$  miles to the S. W. of the Arcas, having only one fathom over it, must be cautiously avoided.

About N.  $40^{\circ}$  W. from the Arcas, at the distance of 7 leagues, there is a shoal of small extent, named the Baxo del Obispo, (the Bishop's Shoal,) on which it appears there is some rock that may be seen, but which cannot be discovered at more than two miles off, by day, in clear weather, and with great vigilance.

Its situation has been well ascertained, and to be a flat rock or stone, with 5 fathoms of water on it, and so steep that up and down at its edge, there are 25 fathoms; and this causes the sea to break heavily on it; wherefore, at all events, it should be avoided. The Placer Nuevo, lies 5 leagues N.  $80^{\circ}$  E. from the Obispo; on it there are 9 fathoms, and to this, also, a berth ought to be given.

To the north of the Obispo, is the Triangle, (El Triangulo,) which consists of three islets, lying about N. E. and S. W., in which direction they extend about seven miles. They are visible at seven miles distance, and send out spits and shallows, which render it improper to pass between them, or to approach them nearer than two miles to the W. N. W. of the northernmost. At six miles from the latter, there is another islet of sand, of about half a mile in extent, which is very clear on the south part, and which sends out a spit to the north; it is very low, and is covered with birds and some drift wood. The situation of these islands has, also, been accurately ascertained, and the Derrotero de las Antillas says the Triangle lies to the north of the Obispo, at the distance of twenty-four miles. It is composed of three islets, of which the two eastern are two miles distant from each other, but they are connected by reefs. The westernmost bears from the easternmost, which is the largest, N.  $75^{\circ}$  W. eight long miles; and between the western and middle one is a channel, six miles broad, having from 17 to 30 fathoms, on sand, gravel and rock. From the easternmost islet a reef extends, with a large rock above water, first to the N. N. E. and then to the N. W. forming a bow or crescent, two miles in length. From the north and east of the western island, shoals also extend to a short distance.

"The soundings in the vicinity of the Triangle are 18 fathoms, on fine sand, at two miles E. by S. from the larger islet; 23 fathoms, sand, gravel and rock, at seventenths of a mile; 26 fathoms, sand and clay, at nearly a mile to the S. E.; 18 fathoms, sand and gravel, at 2 cables' length to the south; 19 fathoms, from three to six tenths of a mile to the south of the reefs which connect the eastern island to the middle one. To the W. S. W. of the middle are 19 fathoms, on sand and gravel."

A sand bank, lying about N. W. about 5 miles from the westernmost Triangle, on the Campeche Bank, was discovered by Capt. James, of the British ship *Sprey*. This officer says, "at 4 P. M. he saw the Triangle Shoals from the mast head on the larboard beam, bearing S. W.  $\frac{1}{4}$  S. about 8 miles; shortly afterwards saw a sand bank lying about N. W. from them. At 5 I passed them on the north side, and found it to lie in

lat.  $21^{\circ} 2' N.$ , long.  $92^{\circ} 12' 30'' W.$  This bank is very low, with a range of breakers lying out to the northward. It has a hummock in the middle like a small hut, and may be seen 4 miles in clear weather from the mast head. I tried for soundings at the distance of 3 miles north from the bank, with a line of 35 fathoms, without getting bottom. It must be therefore very dangerous in passing this bank at night, or even in thick weather in daytime, without being quite sure of the latitude and longitude.

The Bajo Nuevo (New Shoal) is a head of sand, which shows at low water, with various rocks, which also show a little. The sea breaks upon it in ordinary breezes, and it is so steep that 25 fathoms are found at half a mile from its western head. This shoal is hardly of the extent of a cable and a half from north to south, and four cables from east to west. Its given situation is, as yet, rather doubtful: for the observations of latitude made in the two ships of the Spanish line, San Leandro and Dragon, when the latter was lost on it, differ six minutes—being, according to the one, in  $21^{\circ} 50'$ , and according to the other, in  $21^{\circ} 44'$ . Its longitude, although not deduced from particular observations made on the spot, cannot vary much from the truth. The shoal has been placed by Don F. Bauza in his new chart, in lat.  $21^{\circ} 50'$ , and long.  $91^{\circ} 56'$ , which is, we presume, correct.

**ISLA ARENAS (Sandy Island).**—Cevallos has determined the situation of the island, which is  $22^{\circ} 8' N.$  and  $91^{\circ} 16' W.$  This isle is low, and forms nearly a parallelogram, in the direction of  $N. 48^{\circ} E.$  to  $S. 48^{\circ} W.$  true, 3 miles, its greatest breadth being 2. It is foul all round, and a great stony spit extends from its north end, with some rocks above water, to  $N. 35^{\circ} W.$  and  $N. 69^{\circ} W.$ , true, 9 miles. From the  $S. W.$  part another, of a like kind, extends  $N. 62^{\circ} W.$  and  $S. 89^{\circ} W.$ , true, 6 and 9 miles. Between the reefs there is a good harbor, to the  $W. N. W.$  of the island, sheltered from the winds from the north, round by  $E.$  to  $S. W.$  with a depth of  $3\frac{1}{2}$  fathoms at 2 miles from the island to  $6\frac{1}{2}$  between the points of the reefs.

**ISLAND BERMILIA.**—This, as placed in the old charts, is of very doubtful existence. The Lieutenants of the Navy, Don Miguel Anderete and Don Andres Valderrama, in their inquiries in search of the Negrillo did not see it. The same happened to Don Ciraco de Cevallos in July, 1804, who purposely searched for it, for which reason we believe its existence is not true. Nevertheless, we have placed it in the chart in latitude  $22^{\circ} 33'$  and longitude  $85^{\circ} 5'$  west of Cadiz, ( $91^{\circ} 22'$  west of Greenwich,) until more elaborate surveys in every respect decide whether it exists or not.

The Negrillo is a shoal spoken of by all who navigate these seas, but no one has been able to give the exact position of it. In the ship of the line San Julien, commanded by D. Juan de Joaquin Moreno, the deposition of the gunner D. Manuel Sandoval, was taken, in which he declared that being on board the ship of the line Buen Consejo, commanded by D. Joaquin Olivares, on his voyage from Vera Cruz to the Havana, and on the ninth day after sailing from the port at 2 P. M. they saw breakers; that having sent a boat in which the deponent went as bowman to examine the spot, they discovered a rock of about half a boat's length of extent; and that he held on it with a boat hook, while others sounded over the stern with 120 fathoms without finding bottom, and which was repeated with equal diligence all round the rock with similar results; that over the rock there were not more than 3 or 4 palms depth of water; and that he heard the officers and pilots of the ship say that this must have been the Negrillo Shoal. In consequence of this declaration we have made many efforts to obtain this ship's log book, but without success.

Alderete and Valderrama in their expedition of 1775 had the discovery of this shoal as their principal object, but they were unable to find it, after cruising in all directions assigned to it by old charts; but from a declaration from a seaman who had navigated the Gulf of Mexico many years, taken at Vera Cruz by Don Tomas Ugarte, that going in a private brig, and having observed and passed to the westward in the afternoon, they sailed  $N. W.$  for 30 or 40 miles, and then hove to, two hours before day-break, to avoid, as he heard the Captain say, crossing the parallel of the Negrillo in the dark. At daylight they found themselves drifted into a channel or canal between two shoals about a cable's length wide and without soundings, which the Captain said was the Negrillo. From this information, laying it down on the chart, and allowing the same difference as for the Alacran, the result is, that the shoal must be in latitude  $23^{\circ} 2'$  and longitude of  $83^{\circ} 53' W.$  of Cadiz, ( $90^{\circ} 10' W.$  of Greenwich,) a point certainly out of the tracts in which Alderete and Valderrama cruized for it, and consequently leaves us without surprise at their not finding it.

There is another very confused account of an extensive shoal which was discovered in the year 1768 by the pilot Juan de Hita Salazar, in the Bilander Poder de Dios, whose journal was examined at the Havana by command of Don Juan Antonio de la Colina; we do not possess the journal itself; but we have the report made by the pilots who were commissioned to examine it, from which nothing more can be deduced than that the ves-

sel sailed from the Eastern edge of Campeche Soundings on courses in the N. E. quarter for the Havana, whither she was bound. On the third day she was in latitude  $24^{\circ} 2'$ , and about 58 leagues W. by S. from the Tortugas, and steered on courses in the S. E. quarter to make the land of Cuba; at 3 P. M. finding himself on the Campeche Soundings in 32 fathoms, he stood N. N. E. increasing the depth until the noon of the 6th day, when the observed latitude was  $23^{\circ} 15'$ , and the depth 46 fathoms. From this spot he steered N. E. with light winds inclining to calm, keeping the same soundings until 11.30 a. M. when he suddenly shoaled to 13 fathoms on rocky bottom; he immediately anchored and remained until the morning, when, after examining it as far as he could, and finding nothing dangerous, he weighed and stood N. E. sounding frequently. In a short time he got into 51 fathoms and saw at the bottom great heads of black rocks with some patches of sand. He then steered eastward to get clear of the shoal, which he conjectured must be the Negrillo. Standing on this course at the end of two hours he had 46 fathoms, sand; when resuming a N. E. course, the depth increased to 65 fathoms, and at noon he had 37 fathoms on rocky bottom, the latitude by a good observation then being  $23^{\circ} 28'$ . From this noon until day-break on the 8th day the soundings were irregular, from 35 to 43 fathoms on rocky bottom, when he got upon sand, and so much increased the depth that by noon, on observing, in latitude  $23^{\circ} 46'$ , he had 68 fathoms, and with a N. N. E. course, he kept the same depth until midnight, when he found 35 fathoms rocky bottom, on which he continued until day-break, when he found more water and a sandy bottom, still augmenting the depth until noon, when he had 156 fathoms on sandy bottom in the observed latitude  $24^{\circ} 3'$ ; whence he shaped a course for the Tortugas Soundings, which he reached correctly, according to his reckoning.

From all this ambiguous narrative we can only collect that the soundings ran through by this vessel, was from the meridian of the Alacran to the Eastward; that the edge of the Bank extends as far as  $24^{\circ}$  of latitude, and that there are many shoals on it, certainly but little known, and very dangerous to navigation.

Since this part of the present work was written, Captain Don Ciriaeo Cevallos has transmitted the process verbal and declaration made by Don Domingo de Casals, captain of the schooner Villabonosa, who saw it on the 14th day of November, 1806, at 3 P. M. in latitude  $23^{\circ} 25'$ , deduced from the latitude at noon, that was carefully and correctly observed, and longitude  $89^{\circ} 39' 34''$  West of Cadiz, or  $89^{\circ} 56' 34''$  West of Greenwich, as deduced from the points of departure from the Campeche Soundings and the making of Vera Cruz. According to the description given by the Captain, this shoal is no more than a rock of a quarter of a cable in extent N. E. and S. W. over which the water washes, except at the two extremities, which show a little; these could not be seen before getting within a cable and a half of them; and at less than a cable's length from it no bottom could be found at 70 fathoms.

Besides these shoals, which are known on the oldest charts, others have been more recently discovered: of which we have the following notices:—

The first, which we have distinguished by the name of the Argus, was seen by a lieutenant of the Spanish navy, Don Sebastian Rodríguez de Arias, commandant of the brigantine Argus: in sailing from Vera Cruz to Havana, at 2 P. M. 11th of July, 1818, being then in latitude  $24^{\circ} 2'$ , and longitude  $89^{\circ} 43'$  W. (from Greenwich) discovered a breaker, which on examination, disclosed a small bank, of about a cable and a half's length in all directions, with a breaker of from 12 to 15 fathoms, the centre, on which the water broke heavily, although the sea was otherwise very smooth, and the wind very calm. At mid-day the commandant had observed in latitude  $24^{\circ} 4'$ ; and at 5 P. M. he found the longitude, by lunar distances,  $89^{\circ} 56'$ , both observations to be depended on, and corrected to 2 P. M. and referred to the situation of the shoal, he made it in lat.  $24^{\circ} 3' 30''$  and long.  $89^{\circ} 41'$ . This shoal appears to be the same which was seen on the 19th of November, 1800 by Don Narciso Riera, captain of the Spanish merchant schooner Catalina, bound from Campeche to New-Orleans; but as his longitude was deduced from dead reckoning, we have more confidence in the position assigned to it by Arias; nevertheless navigators sailing on this parallel, ought to be on their guard lest the two dangers should really exist.

Don Manuel Bozo, pilot of the Spanish bombard Nuestra Señora del Carmen, in sailing from Vera Cruz and Terminos Lagoon, towards Havana, on the 8th of December, 1817, at day-break, saw a breaker or rock off the starboard gangway. The sea being smooth, and the wind moderate from the eastward, there was no doubt of its being a shoal, the extent of which he estimated at from two to three cables' length, extending N. E. and S. W.; and on its ends he saw two rocks or pinnacles, about three feet high, and his distance from it was from three to three and a half cables' length, where he sounded and found no bottom in 64 fathoms; and although he thought to examine it with his boat, he could not effect it, on account of the heavy break in the vicinity of the shoal; but he saw the spit of rocks of which it was composed, running the whole length of the danger. Having corrected his reckoning for 6h. A. M., the hour at which

he saw the shoal, he found it lay in latitude  $24^{\circ} 6'$ , and longitude  $91^{\circ} 6' W$  of Greenwich. At noon, he observed in lat.  $24^{\circ} 22'$ , with certainty, and this was only one minute north of his D. R., and referring this to the shoal, by his run for 6 hours, he found its latitude by this to be  $24^{\circ} 7'$ , and long.  $84^{\circ} 49' W$ . of Cadiz; nor could there be any considerable error in his reckoning, in three days sailing from the Vigia of Chuxulu, off which he had been at anchor.

This shoal appears to be different from the former, although its latitude is so nearly the same. The short time which intervened between his departure from the Vigia of Chuxulu and his making of the Tortugas Bank, when he found only thirteen minutes of error in his longitude by dead reckoning, shows that its situation as to longitude cannot be materially wrong. The shape and circumstances of the shoal, as described by Bozo, also show it to be different. Many old charts indicate a danger, with the word doubtful, almost in the same position, which also tends to confirm the belief of its existence.

In December, 1801, Don Dionisio Galiano passed over an extensive sand bank, exhibited on the new charts, which lies about 24 leagues to the eastward of the Negrillo, and having on its S. W. part  $16\frac{1}{2}$  fathoms. As it does not appear to be dangerous, it requires no further description. The situation seems well ascertained.

These are the shoals which down to the present time have been known as existing on the Campeche Bank of Soundings. He who navigates on it in 18 fathoms, will go clear of the Corsario, Alacranes, and Sisal Reefs, and in a secure track for passing through the channels formed by the shoals on the western edge. Of all these channels the best is that between  $21^{\circ}$  and  $22^{\circ}$ , formed by the Triangle and New Shoal, (Bajo Nueva,) because it is the clearest, and we recommend it always to be taken by those bound to the west. The soundings which conduct the mariner through the middle of it, and clear of the shoals on each side, are tolerably regular; for, after he is to the north-west of Point Piedras, in lat.  $21^{\circ} 40'$ , and having between 20 and 25 fathoms water on fine sand, if he continues his course W. S. W. and W. by S., true, 18, 22, and 25 fathoms water, on fine white sand, will be found; and still continuing to the westward, in lat.  $21^{\circ} 20'$ , there will be found 30, 42, 55, and 73 fathoms, on mud and soft ooze; and at a little distance farther you will be outside of the western edge, and clear of the reefs. In the first charts that were published in the Hydrographical Directory, and in the first edition of Derrotero, it is said,—“About the middle of this channel there is a bank with 26 fathoms water, on hard sand and gravel, having a patch of rock of 9 fathoms, which generally created some alarm to those who sounded on it, from exciting a suspicion of being in the proximity of some of the shoals.” According to the last soundings and survey made in this passage, a bank of 24 fathoms, gravel, is placed in the latitude  $21^{\circ} 26' 30''$ , and on the meridian of the New Shoal, (Bajo Nuevo,) without giving notice of the above quoted bank, which perhaps may exist. The chart published in 1799, places it in  $21^{\circ} 20'$  latitude, and longitude  $91^{\circ} 44'$  west of Greenwich.

#### *Directions for navigating on the Campeche Soundings.*

**CAMPECHE SOUNDINGS.**—It is undoubted that the eastern edge of this bank is an excellent corrector for the longitude of a ship: inasmuch as it runs nearly north or south, every one who gets soundings on this edge may consider himself as in  $86^{\circ} 20' W$ . of Greenwich; and thus, those who sail from the eastward, to enter on the soundings or bank, ought to sound frequently, in order to catch bottom at the edge, or in its proximity, in order to have this correction of longitude.

But this excellent means of rectifying the longitude ceases to be so when there is great uncertainty in the latitude; for, as the water between Cape Antonio and Cape Catoche at times runs to the northward at the rate of 3 miles in an hour, it is necessary to allow for this, so as to enter on the soundings in a convenient parallel, that you make a course to the S. W.; and it is clear, that by steering about S. W. you may not only get soundings on the eastern edge, but on the northern also, in which case, having no certainty of the longitude, it would be very dangerous to direct the subsequent navigation by making courses to the S. W. in order to obtain the depth of 18 fathoms, and to pass at a proper distance to the east of the Alacranes. Such an attempt was the cause of the loss of a merchant vessel named the St. Rafael, which got aground on the eastern extremity of the Alacran Reefs, from which the other vessels of the same convoy, escorted by the ship of the line, Santiago la Espana, passed about two miles clear. This loss, which happened in 1795, authorizes us in recording it, and in pointing out the necessary means of preventing similar mistakes in future.

Once on the bank of soundings, and having ascertained your latitude or situation on its eastern edge, you may make the rest of the navigation by it with much security; for, placed on it, you have a mean of keeping a very exact reckoning, and free from the errors

produced from the lead, by vessel runs, with bearings of the good, and which that, if there is bank, you ought to the shoal useful method of use of the

produced from currents. In place of a log-chip, in heaving the log, make use of a lead, for the lead, by resting firm on the bottom, will show the whole distance or rate that the vessel runs, whether that rate be caused by the wind or by the current; and marking the bearings of the line the opposite direction will be the direct course which the ship makes good, and which requires no further correction than for magnetic variation. It is true, that, if there be much depth, this practice will be very difficult; but as in general on this bank, you ought not to sail in more than 18 fathoms, and in the rest from Point Desconocida to the shoals, there is no part so deep as 28 fathoms, there can be no reason why this useful method of ascertaining the vessel's place should not be adopted; nor is the frequent use of the hand lead of less importance; it ought to be constantly going.

Many neglect sounding, because they are not aware of its importance. If, in fact, a vessel which has to sound in 30 fathoms, has to take in sail, in order to heave the topsails aback, she cannot sound frequently; for, in doing so, half the day would be consumed in sounding; but it is well known that there is no necessity for so much work, in order to sound, even in more than 30 fathoms, as those well know who are expert in this part of their duty. In depths between 15 and 20 fathoms, the hand lead will be sufficient, and for this it is indispensable to have seamen acquainted with this work; without which every vessel might be lost that has to navigate over shoal places, on which, usually, the dangers are only discoverable by the lead.

#### DIRECTIONS FOR THOSE WHO NAVIGATE FROM EAST TO WEST.

—1st. You ought to shape courses, so as to compensate as much as possible for the effects of the currents which prevail between Cuba and Yucatan, and so that you may enter upon the bank in 22° 15', a little more or less. To be able to correct your course with judgment, and in good time, you should omit no means of observing the latitude, not contenting yourself solely with what the meridian altitude of the sun gives, but taking also those of any stars of the first magnitude, or of planets, when an opportunity offers.

2d. Attending to your reckoning, sound in time, that you may, at any rate, not pass far from the edge of the bank, without having obtained soundings on it; and, so soon as you have got them, correct your longitude by them, establishing thus a new point of departure.

3d. So soon as you are in 30 fathoms heave your log, with a lead in place of a log-chip, that you may thus keep a more accurate reckoning, and free from the effects of currents.

4th. In the season of the Norths, you should be directed by the depths of 18 or 20 fathoms, which you will find in the parallel of 22°. Sail on this depth until you are on the meridian of Point Desconocida, when you will steer W. by S., true, until you are on the parallel of 21° 25', when you must run to the west, to pass between the Triangle and New Shoal.

5th. It is very advisable to know the latitude by observation, for passing between these shoals, or in default thereof, of being sure of the situation by your course, and the quality of the soundings N. W. of Point Piedras, which offer a good means of knowing the vessel's place; and, if both these data fail you, and you are in consequence doubtful of the situation of the vessel, you ought not to attempt passing between the shoals during the night, but keep in 18 fathoms, in order to take the passage by day, when you will run no risk, especially if you incline your course to the direction of the Triangle; for that, as we already explained, may be seen at the distance of 5 miles.

6th. If a north wind comes on, while you are on this bank, the only alarm you can be under is, while the vessel is to the eastward of the meridian of Point Piedras, when it will be necessary to carry sail sufficient to proceed to the westward, without departing much from the depth of 18 fathoms, in order that you may pass the said point clearly and without danger from the Sisal Bank or Shoal: but this offers no great difficulty; for there is little sea on these soundings, and as the winds from the north are generally free, with very little difficulty you may clear the point.

7th. If the navigation is made in the season of the rains, or from May to September, you may sail nearer the coast, in 11 fathoms; and you may also, from the time you are in 18 fathoms, abreast of the River Lagartos, steer S. W., true, with which course you will run to make the lookout tower of Chuburna, and thence, with your course parallel to the land, you will pass between it and the Sisal Shoal, without any other care than to keep in 4½, 5, or 5½ fathoms, according to the vessel's draught; but with large ships, and not having to anchor at Sisal, it will be best to pass outside of the shoal. At this time it is preferable to leave the bank by the south side of the Arcas, and to effect this with more certainty, you will keep in the depth of 9 or 14 fathoms, until you cross the parallel of Campeche, when you will steer so as to leave the soundings in 19° 30' or 19° 40'. The reason of approximating the coast more in the summer, is because, having in that season many calms, with squalls and continual rains, which at times deprive you of observation for two or three days, it follows, that the navigation among shoals is very unsafe. On the contrary, near the coast they enjoy more land breezes, and the changes of the breezes are more certain.

8th. Until now we have supposed you to have entered on the bank with a good knowledge of your latitude, and consequently to have ascertained your position on the edge of it; but, if you enter on the bank with great uncertainty as to your latitude, which must always be the case when you are without observations for one or two days, in such a case, so soon as you have caught soundings, steer S. E., true, or as near to that as the wind will permit. With this course it is clear you will either catch the 18 fathom soundings, or you will lose bottom very soon. If the first happens, you will have attained your object by getting into the proper depth to navigate with safety; having happily freed yourself from the dangers of the Alacranes, upon which you would indubitably have gone with any south-westerly course, for you will have caught the soundings on the northern edge of the bank, and in about  $88^{\circ} 47'$  W. of Greenwich. In this case, from the time you catch 18 fathoms, you will run to the west, in order to retain them; and you cannot be certain of your longitude until you are abreast of Point Piedras, in consequence of having failed of observing your true situation by the soundings on the east edge of the bank. If the second of these cases happens, namely, running soon out of soundings, not the least doubt can remain that you are on the eastern edge of the bank, and you must steer to the S. W. to get the 18 fathoms depth, as we have already advised.

9th. You may also steer to the west, taking soundings in  $23^{\circ} 30'$  of latitude, and running along that parallel in 46 and 55 fathoms of water on a sandy bottom, keeping afterwards so as to pass to the north of the Bermeja; but we are very far from advising this route to be followed, from two reasons: first, because we have seen that there are well founded fears of shoals on the north edge of this bank, which as yet is imperfectly explored; and second, because, in the summer, you could not enjoy the advantage of the land-breezes, and the changes of the breezes, which you might have in the proximity of the land, and your voyage would thus be rendered longer.

As we have said all that is necessary to be kept in mind for navigating on this bank from east to west, we shall now give some notices for sailing in a contrary direction.

**DIRECTIONS FOR NAVIGATING FROM WEST TO EAST.**—1st. It is evident that, to enter on the Campeche Bank by its western edge, nothing more is necessary than the latitude; for, running on a free parallel, you proceed without risk of shoals on the bank; and, whatever may be the error of longitude, you can correct it so soon as you strike soundings: but it must be remembered that the track between the New Shoal (Bajo Nueva), and Bermeja Island, cannot be considered as clear, for we neither know the situation of the latter, nor are we even certain of its existence.

2d. Having entered on the bank, it will itself indicate when you are to the eastward of the shoals, which will be when you have less than 25 fathoms, and then the quality of the bottom will be of sand, if you have entered to the north of the Arcas; but if you have entered to the south of them, you will keep on clay to 11 and 9 fathoms.

3d. But, if you have to enter on the bank while uncertain of the latitude, and in obscure weather, which occurs when the north winds blow, it is advisable to shun, as much as you can, entering on it by night, and endeavoring to do it by day, between the Triangle and Arcas, or it is even better to keep to the south of the Arcas, as a little more or less than the latitude by account will answer for this; but you must remember that the north winds always produce currents to the south: and from this you will always find your vessel more or less to the south of the reckoning. Under this circumstance you may expect the effects of the current to be about 18 miles in 24 hours.

4th. If in this case, when running to the east, you have soundings on the edge of the bank, you may continue to the east, although it be by night, so long as you find clay; but the greatest attention must be paid to sounding frequently, so long as you do not consider yourself to the eastward of the shoals, which, as we have said, will be soon as the depth diminishes to 25 fathoms. This remark is most essential, and of itself will save any vessel from being lost; for if, sounding in more than 25 fathoms, you find gravel and sand, or rock, it is an infallible sign that you are near some shoal, which known, you should immediately steer S. W. in order to get again upon the clay soundings, when you may steer again to the east; and so soon as you are past the shoals, and are to the east of them, you need take no other care than to steer in to the east, because the bottom is the only object you have to guide you, whether it be to go to anchor at Campeche, to lie to till a north wind blows over, or, beating to windward on the bank, until you can leave it by its eastern channel.

5th. Beating to windward on this coast is very easy, and the navigation expeditious, especially in April, May, June, July, and August, because in these months the winds during the day are changeable from N. W. to N. E., and the land-breezes are from E. S. E. to S. E. during the night, with which you may navigate towards the east with very advantageous tracks, which tracks ought to be so managed as to stand off shore into 18 or 20 fathoms, with land-breeze, and turn towards shore with the sea-breeze as far as 6 fathoms.

6th. On the even a vessel not to forget lie to, in from draught of the falling to lee prefer steering

W. e 24 feet, which houses at Cam Michael, S. 73 ros, the S. W. nine and a half

6th. On this bank the sea is very moderate, even with heavy north winds; and thus even a vessel which finds herself between the coast of Vera Cruz and this bank, ought not to forget that when a north wind comes on, she may find security on it, either to lie to, in from 18 to 8, or 6 fathoms, or to anchor in 8, 6, or 4 fathoms, according to the draught of the vessel; and if she find herself in about the parallel of  $20^{\circ}$ , and is afraid of falling to leeward and getting ashore on the coast of Tabasco, she ought immediately to prefer steering east, in order to get upon the bank, and take advantage of it.

7th. We shall conclude these directions with one about the mode of leaving this bank, when you navigate from Campeche to the north, bound to any of the harbors on the northern coast of the Gulf. In the manuscript directions, (drawn up by those who call themselves Pilots for the Mexican Gulf,) and which were the only ones until now, it is recommended to steer north as far as the parallel of Sisal, you should then steer N. N. E. on purpose to run out between the Negrillo and Alacran, following the said course to the  $24^{\circ}$  of latitude: here it is proper to remark, how arbitrary these directions are; for they are written as if the writers were certain of the situation of the Negrillo, which they were not; and even if they had known it, they ought (it seems to us) to have been a little more cautious in giving their directions, than to have advised passing by a strait formed by two shoals; of which, if the one is dangerous on account of its great extent, the other is no less so on account of its smallness, for it cannot be seen till you are almost on it. By following this route, the brigantine, in which went the mariner, by whose account we have placed the Negrillo, got within it; and it is very wonderful that this shoal has not proved more fatal to navigation by causing the loss of many vessels.

It appears to us proper to advise, that those who wish to leave this bank, by its northern edge, should steer to the north, and so as to pass to the east of Arenas Island: and leaving the bank at such an hour as to be able to cross the parallel of  $23^{\circ} 30'$ ; with daylight they ought to keep the same course, until they pass that of  $24^{\circ}$ , when they may shape their course as convenient.

*Directions for sailing to Campeche, by Captain John Mackellar, of the British Navy, (1817.)*

In sailing from Jamaica for Campeche, be sure to make Cape Antonio, and steer to the West, so as to gain the latitude of  $22^{\circ} 0'$ ; then steer W.  $\frac{1}{2}$  S. 100 miles, sounding frequently, and having good soundings on the bank. You may then, with great confidence, keep in the soundings laid down in the Chart, either in going within the shoal of Sisal or without it; but, in fine weather, I should always prefer making the land to the eastward, and then run down along the coast, in 5 or 6 fathoms. On approaching Sisal, keep the land freely on board, by your soundings; and, in doing so, you avoid the risk of running on it, either by day or night, for you will see the castle of Sisal 5 or 6 miles off, and you may run down in 5 or 6 fathoms. The great advantage of this will be, the certainty of land-winds off-shore, from about 4 o'clock in the afternoon until 7 or 8 the next morning; the sea-breeze setting in generally from the northward and eastward. If you are in a vessel drawing more than twelve feet water, avoid a shoal laid down in the Spanish chart, on which  $2\frac{1}{2}$  fathoms only have been found: this shoal lies off the village of Jayna, about ten miles, which village, or any part of the coast, cannot be seen off deck; therefore great caution is necessary in running for, or leaving Campeche.

The town of Campeche is situated in lat.  $19^{\circ} 51' 15''$  N. and long.  $90^{\circ} 28' 15''$  W. of Greenwich. Proceeding for the anchorage from the northward, and having advanced toward Point Deseonocida, on the N. W. part of Yucatan, distant from it 8 or 9 miles, your depth of water will be from 5 to 6 fathoms; from this proceed to the southward, about S. by W. observing that you must not go nearer to the shore than 6 fathoms, until you are as far as the lat. of  $20^{\circ} 0' N$ : then, being in that latitude, and your depth of water 6 fathoms, if clear weather, you will see the land, which is very low and difficult to make out; from this, if the wind will allow you, steer E. S. E. or S. E. by E. until you make the land out plainly. The most remarkable spot on it is Fort St. Michael, which is a large white fort, on the very top of the hill. This is the first part of the land you can make out, and it may be seen in lat.  $19^{\circ} 56'$ , in  $5\frac{1}{2}$  fathoms. So soon as this is made out plainly, bring it to bear E. by S. and steer for it: you will then be in the deepest channel for Campeche, and may choose your depth of water to anchor in. When you have  $4\frac{3}{4}$  fathoms, the steeples of Campeche are just in sight, from a frigate's deck; and when in  $4\frac{1}{2}$ , the church at Lerma can be seen from the deck; the Point Morros, which is the S. W. extreme of the land, will bear S. S. E. and Campeche East; and, when in 24 feet, which is the depth I should propose for a frigate to anchor in, the tops of the houses at Campeche are just well in sight from the deck, bearing S.  $83^{\circ} E$ . Fort St. Michael, S.  $73^{\circ} E$ . Lerma Church, at the bottom of the hill, S.  $66^{\circ} E$ . and Point Morros, the S. W. extreme of the land, S.  $19^{\circ} E$ ; your distance from the town will then be nine and a half miles, and lat.  $19^{\circ} 53' 47''$ , and long.  $90^{\circ} 37' 30''$  W. Should your ship

be of less draught of water than a frigate, proceed on for Fort St. Michael, keeping it bearing as above, and anchor in what depth you please, but within  $3\frac{1}{2}$  fathoms; in this direction the bottom is bad, being covered with large shells, and, of course, dangerous to anchor in.

In the event of running for Campeche, in hazy weather, which often is the case on this coast, in the fore part of the day, I should recommend proceeding as follows:—After you reach the lat. of  $20^{\circ} 0'$  N. haul up to the E. S. E. keeping your lead going; and should you not see the land, endeavor to get into the lat. of  $19^{\circ} 54'$  before you are in less than  $4\frac{1}{2}$  or 5 fathoms of water. So soon as you consider yourself in this latitude, proceed to the eastward, until you shoalen your water to what may appear best to anchor in; taking care, if you have to beat up, not to pass to the southward of  $19^{\circ} 52'$ , nor to the northward of  $19^{\circ} 56'$ , for between these two latitudes is the deepest water, and anchor as near the latitude of  $19^{\circ} 54'$  as possible.

In lat.  $20^{\circ} 12'$  and long.  $90^{\circ} 41'$  there is a small spot of ground with only fifteen feet of water on it; but, running along shore, and keeping in 6 fathoms, you will pass to the westward of it: the soundings near this part are very irregular, altering sometimes a fathom and a half between two casts; there is no other part on the bank where this is the case.

The town of Campeche is a walled town with four gates, N., E., S. and W.; the north gate leads into the town from the sea by a pier of about 50 yards long; but the water is so shallow that small boats only can land, and then only at high water; the rise is about three feet.

Though Campeche is walled, it has only a few guns on each angle; the military force does not exceed 500: the town is abundantly supplied with all kinds of stock and Indian corn, but no water except in tanks. The principal wells are at the south gate about half a mile, and that not good. The population appears great, and the natives active and well made.

*Remarks on sailing towards Campeche, by Captain J. W. Monteath.*

On rounding the bank of Sisal, in 12 fathoms, I hauled up South, until we had attained the latitude of Point Desconocida, and the depth of water 5 fathoms: steering this depth, the first object I observed, was a large white building on the second lump of high land visible, and which is a fort (St. Michael's,) two miles S. W. from the city. Steering on, the next objects that appeared were the steeples of the churches in the city. Steer directly for the fort, until in  $3\frac{1}{2}$  fathoms, when you will observe the village of Lermos, which lies 5 miles S. W. of Campeche. Steer in, keeping the Church of Lermos on your starboard bow, until you bring it to bear South, and Campeche E. by N. when you may anchor in from 18 to 16 feet of water, at the distance of  $4\frac{1}{2}$  miles from Campeche; in this position the depth of water, for above a mile, does not vary more than 12 or 15 inches.

During my stay, (from June 10th to July 10th, 1817,) I observed the tides were very irregular, and greatly influenced by the wind; so that ships (with the wind off shore) must pay attention, if drawing much water, to get under weigh, and run out farther into deeper water. On the 2d of July, the Fame, then drawing 17 feet, and lying in  $3\frac{1}{2}$  fathoms, grounded with an off-shore wind, and in a few hours had only 14 feet alongside, and for three days never more than  $16\frac{1}{2}$  feet, until the wind shifted to the northward; and had she not been a remarkably strong vessel would have strained very much.

Vessels with hempen cables ought to be careful in picking out a clear berth, as a number of vessels were formerly in the habit of heaving out stone-ballast where they lay: this is now prevented, by a fine of 500 dollars being laid on a vessel that does so. Sand ballast is allowed to be thrown overboard, by shifting the vessel often, so that there is no danger of banks being formed by it.

**PORT LAGUNA.**—The port of Laguna, or town of Carmin as it is called by the Mexicans, lies on the west end of the Island of Carmin, about one mile within the S. W. point of the island. The bar makes out from 5 to 6 miles from the S. W. part of it, in a N. W. direction. The latitude of the point is  $18^{\circ} 38'$  N. and long.  $91^{\circ} 49'$  W. by the mean of three Chronometers: Lat. of the middle of the anchoring ground  $18^{\circ} 37' 12''$ , the S. W. point bearing N. W.  $\frac{1}{2}$  W. by compass, a short mile distant.

Ships bound to Laguna should endeavor to make land to the windward; if they fall in with Port Royal, it may be known by an island lying in the middle of the entrance, which is precisely the plan that Laguna is laid down on the common charts, but it is a mistake, as there is no island to be seen at the Lagoon, but a Sand Bank, which the sea breaks all over in rough weather, which cannot be seen until you come in to 3 fathoms water on the entrance of the bar; the middle part of the Sand Bank bears N. W.  $\frac{1}{2}$  N. by compass, about 3 miles distant from the S. W. part of the island. Inside of the Sand Bank is a passage for small craft.

Run down the Island of Carmin at 4 or 5 miles distant in from  $4\frac{1}{2}$  to  $5\frac{1}{2}$  fathoms, sticky bottom, all the way from Port Royal, but to the east of Port Royal, you will have hard bottom, after getting into 7 or 8 fathoms.

The entrance of Laguna does not open until it bears south, but if any shipping in port you will see their masts over the land before you open the harbor.

*To go over the Bar.*—After opening the harbor part off shore until Cape Jacilango bears three W. S. W. by S. by compass, and then steer for it, but keep your lead going, and come in no less than 3 fathoms, until a small Indian Village, on Jacilango Island, bears S. or S.  $\frac{1}{2}$  E. by compass, then steer directly for it, and keep that bearing until the Church in the centre of the town bears E. by compass, then haul up for it and anchor before the town, near the shore as you please.

There are from  $12\frac{1}{2}$  to  $13\frac{1}{2}$  feet on the bar, hard mud; pilots come off with the land breezes in the morning, in canoes, with one or two sails.

Strangers had better anchor in 3 or 4 fathoms, after opening the harbor, and wait for a pilot. The water shoalens quick after opening the harbor, from  $5\frac{1}{2}$  to  $3\frac{1}{2}$  fathoms, but there is no danger by keeping your lead going.

### THE COAST FROM POINT XICALANGO TO VERA CRUZ AND TAM- PICO.

*Courses in this Chapter the true Courses.*

From Point Xicalango the coast trends about W. a distance of 32 miles to the River of San Pedro: and all this part is called Lodazar (Mud Bank) because the bottom is of mud so soft and loose, that there have been instances of ships having been driven upon it by the Norths without receiving much injury in their hulls. The land is high, and is called the Altos or Heights of San Gabriel.

From the River San Pedro it is S.  $75^{\circ}$  W. 55 miles to the River of Tupilco; the coast between, forms a bight of about 5 miles in depth within the line of bearing; and has in it the River Tabasco, that of Chiltepec and Dos Bocas or Two Mouths. The bars of San Pedro and Chiltepec, have 7 or 8 feet water over them; there are 4 feet in the Dos Bocas and Tupilco. That of Tabasco, which is the deepest, forms two mouths, separated by the Isle del Buey, or Ox Island: the easternmost of these has 7 feet, and the westernmost, 9 feet water: all these bars are subject to shift, excepting that of San Pedro, which is fixed about midway between the two points of the river.\*

From the River Tupilco the coast forms a bight or bay, as far as the bar of the Lagoon of Santa Ana, distant from the former 31 miles S.  $52^{\circ}$  W.

All the coast, from Xicalango to Santa Ana is clean; so that, from the Lodazar to Chiltepec, there are 4 or 5 fathoms at a mile from the shore, and 10 miles between Chiltepec and Santa Ana: the quality of the bottom between Lodazar and Chiltepec is mud; between Chiltepec and Dos Bocas, mud and rotten shells; from Dos Bocas to Tupilco, coarse olive-colored sand, and between Tupilco to Santa Ana, coarse sand with shells, and in some parts gravel. There is mud in the mouths of all these rivers as far out as the heads or points of the bars. The whole of the shore is rather low than otherwise, and from about 2 leagues to windward of the San Pedro to the Chiltepec, it is covered with palm and mangrove trees, and thence to Santa Ana, with mangroves and Miraguanos.

From the bar of Santa Ana, west 25 miles, is the River Goazacoalcos, and in the intermediate space, the River Tonala discharges its waters.

The River Goazacoalcos is known by its east point forming a scarped Morro or Hill, the west point being very low. S.  $34^{\circ}$  W. from the said east point of the river, at the distance of 4 miles and 4 tenths, there is, on a height, a Vigia or lookout tower with a house at its foot, which serves as a warehouse or magazine of gunpowder; and somewhat more to the east, a Corps de garde with a battery, which has a flag-staff at its east part, and which serves as a mark for the bar of the river. When this bears S.  $130^{\circ} 30'$  W. it will direct you over the middle of the said Bar, the least depth of which is  $2\frac{1}{2}$  fathoms, increasing as you pass it, from 7 to 13 and 15 fathoms.

At the distance of 13 miles W. from this bar is that of the River Barrilla, which, with the River Goazacoalcos forms an island called Barrilla.

N.  $20^{\circ}$  W., at the distance of 10 miles from Barrilla, is the point of San Juan with an islet, and at N.  $35^{\circ}$  W. from it, distant 17 miles, is that of Zapotilan, from which it

\* Buey Inlet varies from 8 to 11 feet, fine white sand; you can always get a pilot. Ten miles to the eastward the palm trees commence very thick. The town of St. Juan Baptista, is 75 miles up the river, and 12 miles from the bar the river forms three branches, on the westernmost of which, the town is situated.

trends N. 49° W. for the distance of 11 miles to the point los Morrillos, and afterwards N. 59° W. 7 miles to Roca Partida. West from Zopotitan Point, distant one league, is the Boca or Mouth of Sontecomapa Lagoon, and S. S. E. from Point los Morrillos, there is a Vigia or watch-tower. The coast between Barrilla and Roca Partida, forms the base of the Sierras or Mountains of San Martin, on the highest summit of which, is the volcano of Tuxtla, which broke out in March, 1793, and whence eruptions still continue. This mountain can be distinctly seen at Vera Cruz, which is distant 25 leagues. When it is in an active state, the flames by night and the column of smoke by day, afford an excellent land mark.

N. 86° W., distant 37 miles from Roca Partida, lies the bar of Alvarado, which, though it has not so great a depth of water as that of the Goazocoalos, will admit vessels of 9 or 10 feet draught. On the intermediate coast is the Vigia or lookout of Tuxtla, and that of Barrancas.

\* N. 44° W. distant 21 miles from the Bar of Alvarado, is the River Salado Chico, which is the southernmost part of the anchorage of Anton Lizardo. All this coast, from the River Santa Ana to the River Salado Chico, is equally as clear as that to the eastward, and on all that part on which we have written from the Lagoon of Terminos to the last mentioned place, it is very dangerous to anchor from October to April, on account of the norths blowing directly on the shore; and it ought not to be approached with any vessel that cannot enter over the bars which have been described; for it might easily happen, in spite of all exertions, that you may be driven upon the coast, seeing that the norths are very strong, and with them there is no way of getting off.

The anchorage of Anton Lizardo, which is distant 12 miles from Vera Cruz, is formed by various shoals and reefs, with clean channels between them, of very easy access, especially when a fresh wind causes the sea to break on the shoals. These shoals, although they afford no shelter against the winds, break off the sea so much that ships ride very safe and securely at their anchors, even during the hardest N. gales. The anchorage is spacious, and fit for every class of vessels, for which reason, and because with the norths it is to leeward of Vera Cruz, a thorough knowledge of it is of the utmost importance to those who cannot reach that port with those winds.

Captain Don Francisco Murias surveyed and drew a plan of the place in 1818, which is published by the Hydrographical Office, an inspection of which is sufficient to obtain a knowledge of its goodness and excellence. We copy what Murias has said on it:—"To go into this anchorage, although it has four excellent entrances of a sufficient depth of water, the two which are formed by the rocks with the coast should be preferred, and of these the western one is always the best. In taking this channel you ought to steer about midway between the coast and the Island Blanquilla, in which case steer east, and continue on that course until you are somewhat within it, when you must steer more to the northward in order to take a berth most convenient for your purpose. The best anchorage is to the N. E. and E. N. E. of Point Anton Lizardo, (on which there are some houses,) in 10 fathoms on gray sand, and sand and shells."†

\* The entrance to Alvarado is very narrow, and cannot be seen until bearing from S. by E. to S. by W. It is, however, known by a remarkable sand bluff, and appears thus:

S. 15° W.

Vessels bound here, on making the usual signals for a pilot, by firing a gun and hoisting colors, will be furnished without delay. A pilot proceeds from town in a pirogue or canoe, manned by 8 or 10 men.

The anchorage off the bar is indifferent, and after the month of September, very dangerous, as should a ship be caught here in a north wind, she must inevitably go on shore, unless she can cross the bar, and that can only be done by vessels drawing 10 feet or less. These winds come on so quick, and a current runs so strong to leeward, that it is very improbable a ship would work off the coast.

During the rainy season the current runs constantly out of the river, and it requires all the sail you can make to cross the bar: if the ship should be of such draft as to render it uncertain, a person should be procured from town, who could talk with the pilot fluently, as the least mistake might be fatal. In 1824 I crossed this bar without touching, drawing 11 feet in a very fast vessel, while a dull sailer of less draft directly after struck and went to pieces.

The anchorage after you are in, is good, and about 2 miles from the bar, directly opposite the town.

† The holding ground is excellent, being formed of thick sand and clay; and from this circumstance of the wind on this part of the coast never blowing any more than a fresh breeze from any quarter except the N. and N. N. W., the anchorage is as secure as most harbors.

N. 27° W., at about 4 leagues distance from Point Anton Lizardo, is the castle of San Juan de Ulua, which forms the Harbor or Port of Vera Cruz, which is more known and frequented than all the others in the Mexican Gulf, and likewise the most dangerous to take, particularly during northerly gales. It is not a commodious harbor, but an open roadstead, covered with several islands, on one of which the fortress of St. Juan de Ulua is erected. The access to this port is difficult, but we subjoin such directions as we are in possession of.

The principal land-marks to vessels advancing towards Vera Cruz, are the Peak of Orizava, and the high land to the north of it, called the Cofre de Perote, both of which are far inland to the westward of Vera Cruz. Still further from the city is the Volcano de Tuxtla, on the eastern part of the Sierras or Mountains of San Martin, and bearing from Vera Cruz S. E. by E. about 78 miles distant.

The Peak of Orizava is in lat. 19° 3' N., and 61 miles W. 9° S., true, from Vera Cruz. It is of a conical form, and always covered with snow. This mountain burst forth in 1545, and continued in action for 20 years, since which time there has been no appearance of combustion. Its height is 2,981 English fathoms above the level of the sea. It may be readily known, as it shows in the form of an isosceles triangle, and may be seen at the distance of 25 leagues from the coast.

The Cofre de Perote is 2,332 fathoms above the level of the sea. It stands in lat. 19° 29' N., about 13 leagues from the nearest part of the coast. It is the highest of the mountain range to the north of Orizava.

*Directions for Vera Cruz, by Capt. John Mackellar, of his Majesty's ship Pique, 1817,*

The Harbor of Vera Cruz is formed by the walls of the town on the south side, and by the walls of the Castle of San Juan de Ulua, where the lighthouse stands, on the north. The Castle is built on an island opposite the town, and has a large reef of rocks running off from it to the N. by E., nearly 2 miles. This reef is called the Gallega, and always shows a part above water. The harbor is bounded on the S. E. and E. sides by three or four small islands and reefs, with good passages through between them. On the N. W. side is the principal entrance, on account of the ships getting easier in and out; and that is the only side which is clear and open to seaward.

1. The town is situated in latitude 19° 12' 34" N., and longitude by chronometer 96° 10' 30" W., by sun and moon 96° 8' 30". The variation of the compass is about 6° E. This port has a very good revolving light on the N. W. of the Castle of San Juan de Ulua; the centre of the lantern is elevated 79 feet above the level of the sea; and the light is on the same principle as the generality of revolving lights in the English Channel, having 21 lamps with reflectors, making 7 lamps on each side of a triangle, which makes the revolutions of the lights as follows:—From the first appearance of the light, it is about 6 seconds bright; then succeeds a faint glimmering for 40 seconds, and so on alternately. This light may be seen 12 miles off at sea in clear weather.

2. In running for this port I should recommend to you to get into the latitude of 19° 20', before you pass the 95th degree of longitude, and from that proceed to the westward, keeping in that latitude: by so doing you will pass 10 miles to the northward of Anegada de Fuera,\* and approach Vera Cruz 6 miles to the northward of all the shoals that lie off from it. If in the night time, a good lookout must be kept for the light, on the larboard bow; and on making it stand on to the westward until it bears S. S. W. from you; then, if in the latitude of 19° 20', you will be 8 miles from the N. N. E. side of the shoals off the harbor. Here bring to, with the ship's head to the northward, observing, during the night, not to approach nearer to the light than 5 or 6 miles, and to keep it bearing from you between S. S. W. and S. The S. S. W. bearing will keep you clear

Ships, in approaching Anton Lizardo from the southward, should be particularly careful to avoid the outer shoals, which lie to the N. E. of the anchorage, about 9 or 10 miles, and are dry at low water; and as the tide rises seldom more than 4 feet, must be dangerous at all times.

In approaching the land in the winter season, there is frequently a haze which prevents you from making it out, until you are close upon the shoals; it is therefore much safer for ships to make the land to the northward.

\* In these directions Captain Mackellar seems to have assumed that circumstances are favorable. In order to guard against the effects of an unexpected north, or a northerly wind, Captain Hester, in some former directions, written in 1764, says explicitly, that none should fall to the southward of 19° 50', or between that and 19° 40', until the summit of Orizava is seen, and that care should be taken not to bring that mountain to the westward of W. S. W. The Captain of the port, Don Bernardo de Orta, says, as shown hereafter, that the course should be made to windward on the parallels of 19° 30' or 19° 40', and especially so in the months of May, June, and July, when the sun is in the proximity of the zenith. It is at least clear, that the safest course is to the northward, particularly to such as cannot rely on their observations.

of any shoals that may lie to the eastward of the light, that is, more than 2 miles from it; and the south bearing will keep you clear of the N. W. shore. At daylight, in getting sight of the town, steer for it, observing the following directions:

3. Before you approach nearer than 3 or 4 miles of the town, bring the largest domed top steeple, in the centre of the town, to bear S.  $\frac{1}{2}$  E. It will then appear with two sharp spire-topped steeples close to it, on the west side, and on the small hill behind the town. There is a division between part of a hill that is covered with grass, and part that is covered with sand. This division will be on with the steeples bearing as above—the grass part to the S. E. and the part covered with sand to the N. W. With this mark proceed on to the southward, along the west side of the Gallega Reef: your soundings here will be regular, from 10 to 5 fathoms; and when you are so far as to bring the S. W. side of the square building that the look-out house stands on in the fort to touch the N. E. side of the lighthouse, bearing about E. S. E., steer for it, taking care not to open the lighthouse to the N. E. of the look-out house, until you are close to the Castle. This mark will carry you up to the lighthouse; then steer round it to the southward, and anchor close to the south side of the Castle, in from 5  $\frac{1}{2}$  to 4  $\frac{1}{2}$  fathoms.

During the months of November, December, January, February, and March, the strong northerly winds prevail, and at times blow very strong, which occasion a considerable sea in the harbor: and, as the ground is not good for holding, I should recommend mooring in these months with the small bower to the N. W., and best to the N. E., in order that you may ride by both anchors, with the wind at north, and lay your stream anchor astern, as this will be sufficient to hold you with the land wind, which seldom blows with any force. During other months of the year, moor with your small bower to the N. W., and best to the S. E., in order to have an open hawse to the eastward.

4. There is no regular tide here, but in moderate weather, there is one ebb and one flood in 24 hours, or rather one rise and one fall in that time; for it is the case sometimes, that the tide runs to the N. W. for three or four days, and the same to the S. E.; but it appears to be governed chiefly by the winds blowing in the same direction: as the wind blows, its rise and fall is from two to three feet; but in strong breezes, sometimes there is neither rise nor fall for three or four days.

5. The anchorage at Vera Cruz is extremely bad, and, if once you part there is no chance of saving your ship, having nothing but broken ground to leeward of you.

The men of war of the country always moor with the small bower to the N. W. in 5 fathoms, and the best bower cable to the rings in the Castle of San Juan de Ulua, with a cable over the stern to the S. S. W. in 6 fathoms, by which mode they lie so close under the castle, that they are, in a great measure, sheltered from the violence of the N. and N. W. winds. I anchored, in June, 1817, by bringing the S. W. angle of Fort St. Juan to bear N. E. by E.  $\frac{1}{2}$  E. about 600 yards off; from which bearing only four guns from the castle or outworks could be brought to bear on the ship. This position may be taken by running in to the southward of the castle, between the shoals of Galleguilla and Blanquilla, which always show themselves, and round the Gallega Reef, in 5 fathoms, until you bring the bastion of St. Crispin (on the south corner of the castle) to bear N. E. by E.  $\frac{1}{2}$  E. Drop your anchor on a quarter-spring, to act according as the wind and circumstances may require.

The town of Vera Cruz furnishes no certain supply of any kind for ships, excepting water, and that bad, and during the winter months difficult to get off, as the sea breaks with so much violence on the pier as to prevent boats from landing for three or four days at a time. As the sea and land breezes, throughout the year, are regular, there is seldom any difficulty in going in or out of the harbor. During the months of August, September, and October, the rains set in, with close sultry weather, and the vapors arising from the marshy ground makes the season extremely subject to the yellow fever, of which many hundreds die yearly, equal to a tenth part of the whole population, particularly strangers.

*Brief Directions for Vera Cruz, communicated to Captain Livingston, by Don Cayetano Olivella, 1819.\**

Run in for Ponta Gorda (lat. 19° 14  $\frac{1}{2}$ ') until the Castle of San Juan de Ulua bears S. E. by S. and then keep away to the south-eastward until you bring that castle to bear S. E. You will then steer so as to keep the foremost shroud of the vessel always on with the castle, that is, the foremost shroud of the larboard side, the bearings to be from the wheel or tiller of the vessel. Keeping it so will lead you clear round the reef into the anchorage.

\* These directions for entering appear to be particularly adapted to small vessels.

In case of parting one anchor, never attempt to let go another, but make sail immediately, and run the vessel right for the Mole. The current, which runs with great velocity, will not allow you to fetch the Mole, but, steering for it, you will fetch the beach at the S. E. end of the city, by which, at least, the lives of those on board will be saved; whereas, were you to take time to let go another anchor, it would not bring you up, but you would infallibly go on either the Lavandera Shoal, the Isle of Sacrificios, or the reef of rocks off the Punta de Hornos, in either of which cases not a soul could be saved.

You anchor under the Castle of San Juan, and near to it, the centre of the castle walls bearing N. N. E.  $\frac{1}{2}$  E., or thereabout.

Vessels should always keep their fore-topmast staysails, and such others as may be required to run them on the beach, ready bent.

The reefs generally show, either by breaking or by the water's being discolored. You moor with the bower anchors to the N. W. and north, and a stream anchor out astern to the S. W.

*Description of, and Directions for, the Port of Vera Cruz, by Don Bertardo de Orta.*

1. The Sierras of San Martin, whose highest summit is called the Volcano of San Andres de Tuxtla, bears S.  $54^{\circ} 20' 35''$  E. from the Castle of San Juan de Ulua, distant 25 leagues, and is in the proximity of the coast. The peak of Orizaba and the Cofre de Perote, which is found at a little less distance to the west, from its great elevation, may be seen in clear weather a long distance out at sea; and, particularly at night, the light or fire of the Volcano of Tuxtla, are objects which may facilitate making the port by getting good bearings of them, and thereby regulating the succeeding navigation.

2. This premised, whether in running through the soundings of Campeche, or keeping on the outside of them, in the season of the Norths, the course should be directed to Point Delgada; and in the summer, the parallel of Vera Cruz should on no account be run down, (as some directions recommend,) on account of the tempestuous north winds, with which, and even before they come on, there are currents running towards the south, which may, in some cases, carry a ship towards the Inner and Outer Shoals, and more particularly on the Aneгада and Aneгадаilla; for this reason, and because there are such extensive shoals on the edge of these soundings, the land should be made to windward, in  $19^{\circ} 30'$ , or  $19^{\circ} 40'$  of latitude, and that too with the utmost care, in the months of May and July, on account of the proximity of the sun to the zenith, when many persons are not sufficiently expert in the use of their instruments, to attribute their errors to the currents.

3. Having obtained a sight of the land, you will pass to the east of Point Delegada, Bernal Chicho, Point Zempoala, &c. at the distance of 4 or 5 leagues, and steering from S. by E. to S. S. E.  $\frac{1}{2}$  E. you will gain sight of Vera Cruz or the Castle of San Juan de Ulua, without getting into Antigua Bay.

4. We have seen many, who, coming from a lower latitude than  $19^{\circ} 30'$ , steer for the port without doubt, guided by the outer shoals; and if they were, the unsteady course pursued by some in order to effect it, and the direct course steered by others, towards one or other of these shoals, by which means they have got entangled with a great risk of being lost, has been observed. It is intended, as much as possible, to avoid these wandering courses, by methodising the manner of making the port, and by pointing out before the causes that contribute to render the approach to it so uncertain.

5. It is evident they must have proceeded from a point of departure incorrectly calculated, from two, or perhaps from one mark or bearing taken on the coast to windward, a method always erroneous, by mistaking the objects on the Charts, and more particularly so, from estimating the distance, (if only one bearing be taken,) usually, greater than it ought to be. The result of this is, that they take their departure from a point and follow a course more to the eastward than they should do, in the confident expectation of discovering the buildings of the city and the castle: this expectation is frequently disappointed, even when they might have seen them, by the culpable negligence, or prejudicial confidence with which they navigate, which is evident from the courses they steer, and the total want of the necessary precautions in approaching it during the night; and by getting into the parallel of the desired point, without obtaining sight of it, they stand on until the breakers of one or other of the shoals, under their bows, deceive them. The same also happens to those who, by cloudy weather or contrary winds, are prevented from hearing or seeing the signal gun fired from San Juan de Ulua, to warn them of their erroneous course. But by whatever method they discover their real situation, it will have been, most generally, not until much valuable time is lost, that would have been quite sufficient to have entered the harbor by day, and passed the night in safety.

Don Cayetano

Ulúa bears S. castle to bear sel always on bearings to be round the reef

6. A main cause of establishing an incorrect point of departure, is the greater or less clearness of the atmosphere, at the time of taking the marks on the land; for when the marks appear very clear, as they are high, they are estimated nearer than they really are, and the consequences are those pointed out. If the weather be not clear, or the marks not seen at all, the contrary occurs, and in which there is not so much danger, because the beach, the color of the water, or the depth, if due care be taken, will indicate the measures that must be adopted.

7. The most remarkable objects from which the point of departure is usually established, is the most salient point of the coast, called the Sierra or Maria Andrea, (whence the shore runs to Point Delegada,) which bears from the high platform of San Juan de Ulua N. 29° W.; (Bernal bears from it N. 32° W., Bernal Chicho N. 34° W., and Point Zempoala N. 38° W.);—It appears to be an easy, simple, and safe method of avoiding the errors, dangers, and delays, already pointed out; as so soon as one of these places on the coast is seen and known, and it is determined to proceed for the harbor; after establishing a point of bearing with either of them, such course should be steered as may be deemed eligible for getting into one of the preceding bearings, either the nearest, or that which is most convenient, according to the situation of the ship, and the wind she then has, or that which is to be expected; and, on getting into the situation, steer the opposite course, when, if the vessel be more to the southward than was expected, the buildings of the city and castle, and the masts of the large ships, should there be any in the harbor, will be seen; and if they are not then visible, they will be seen ahead shortly afterwards. In either case you should manœuvre as before directed.

8. Should it so happen that the buildings, masts, or one of the inner shoals be seen in the S. W. or N. W. quarters; or supposing that you may be to the eastward of these bearings mentioned, and also of the Port; and consequently it becomes necessary, according to your position, to steer a course in one of these quarters, either to double these shoals, if you are much to the eastward or southward, or to open the mouth of the harbor if you are not so; with the understanding that the middle of the Inner Anegado, lies N. 77½° E. 4½ miles from the high platform of the Castle of San Juan de Ulua; and the N. W. part of the Gallega, which must be left on the larboard hand, lies N. 40° E. from it. (Between the latter and the inner Anegada, is the Island Blanquilla and Galleguilla.)

9. If at that moment the wind should beat large from the eastward, it will be sufficient to pass within sight of them, and after rounding them, to pass within a prudent distance of the west points of Galleguilla and Gallega, for the purpose of bringing on the bearings that will be hereafter shown, because the same wind, if it is not northward of E. by N., will afterward be scant from Point Soldado inward. If at that moment it should be scant to the northward, or on the starboard tack, it will be necessary to luff, in order to pass to the windward of the Anegada; and if this be easily accomplished, the Galleguilla may also be passed, for the most projecting parts to the north of both these shoals, runs S. 85° 20' E., and contrary about 3½ miles; the said Island Blanquilla lying somewhat to the south of this line.

10. If this landfall should take place under such circumstances and weather, that the north wind will not admit of standing to the westward to pass to windward of Inner Anegada, nor to the eastward to pass the Outer Anegada, there remains no choice but to bear south or S. W., in order, if possible, to take shelter under Isle Verde, (Green Island,) or that of Los Sacrificios, in 6 to 13 and 15 fathoms water, on good holding ground, riding with two or three anchors down until the easterly breezes set in. But if from anchoring too far off this shelter does not answer your expectation; if a pilot be on board and the wind continues ahead, so as not to admit you to enter the harbor or to obtain better shelter, it will be advisable to seize the first favorable opportunity of running to anchor under Isle Blanquilla, or Blanca, which is to the northward of Point Anton Lizardo.

11. Some, by their temerity, run into these difficulties when they might have been avoided; for by having obtained sight of the Outer Anegada, they have plied to the westward with a scant wind, in the persuasion of its becoming more large, which does not always happen; and the currents still operated on by the head winds, set with velocity towards the channels between the shoals. The safest way is, when the wind will not permit, according to the situation of the vessel and the time of day, a certainty of passing the Inner Anegada, (which lies with the Outer Anegada bearing S. 69° E., distant 4 leagues,) and of getting into the harbor with daylight, to make a board to the eastward, because the shoals will be left astern, and because the current being favorable, will operate with very good effect.

12. If being more to the westward, and so situated as to be unable to weather round the Galleguilla, in standing to the westward, and the Inner Anegada on the board to the eastward, you ought, without hesitation, to bear up and steer S. W. or S. S. W. in mid channel, between the latter and Blanquilla, which will be seen on your starboard side;

leaving the Anegado breakers, and of the Galleguilla shallowness of breakers on shoals where other shoals board anchor.

leaving the Anegada and Isle Verde on the larboard, keeping a good lookout to avoid the breakers, and steering successively S. W., W. S. W., and W., passing the eastern part of the Gallega Shoal on your starboard, and on the larboard the Lavandera Shoal, the shallowness of which, as well as those preceding it, will be distinctly shown by the breakers on such occasions; hauling up more or less to anchor, in a seamanlike manner, where other ships will be seen riding with two anchors down, and letting go your starboard anchor first.

This is called the S. E. entrance; and Captain D. Fabio Ali Ponzone, who made a survey of the port in 1807, gives the following account of it. "As all the reefs which surround the exterior of the port may be sounded, and their dangers seen, and the channels which they form, being of considerable depth, not less than the sea within them, it becomes only necessary to be particularly careful of that called la Lavandera, (or Washerwoman,) which is covered with water and cannot be distinguished, except when there is some swell, which breaks on it, particularly with northerly winds:—Therefore, in order to enter by the South-east Channel, when it becomes necessary to pass near the above shoal, you will always clear it, by keeping Point Gorda a little open of the N. E. angle of the fortification, under the Castle of San Juan de Ulna, until an isolated stone building, which serves for a slaughter-house, comes on with the angle of the city, on the wall of which, and at its point, is constructed a building of considerable extent, for barracks. Having arrived at this last mark, you will have passed the Lavandera sufficiently to steer for the vessels which are in anchorage, but without going too near the shallow soundings at the southern extremity of the bank, in which the reef of Gallega terminates hereabout.

"The only channel, although deep, which from its narrowness ought not to be passed without a good knowledge of it, is that formed by the reef of Pajaros with that of Sacrificios; the mark for sailing through it, is that before given, of keeping Point Gorda a little open of the N. E. angle of the fortification under the Castle of San Juan de Ulna.

"The narrowness of the deep channel of the Lavandera and the Hornos Reefs, does not allow of its being adopted, except by small craft with pilots.

13. Under the same circumstances, and being further to the westward, there will be the choice of steering south to pass between Galleguilla and Blanquilla Island, and successively within sight of the Gallega Bank, rounding it in the manner just mentioned, up to the anchorage. In fine weather, with a ship of moderate size, and a competent knowledge of the place, this passage is more commodious than the N. W. Channel, as it will save the trouble of warping, should the breeze shift to the S. E.

14. A little experience of the Inner Shoals would render these difficulties much less common, as there is as good anchorage under Isle Verde and the Pajaros Reef, as at the Island Sacrificios; and also under shelter of Isle Blanca or Blanquilla, off Point Anton Lizardo, that point itself, and some of the outer shoals, the channels between which, with a favorable wind and a competent knowledge of them, are quite free; for through them, as well as between all the inner shoals, the harbor may be entered by the S. E. Channel by ships not drawing more than 18½ feet water; for the breeze generally raises a little sea, and the depth in the narrow part between the Gallega and the Lavandera is not more than 21 feet.

15. If, in consequence of any irregular navigation or mistake, either of the channels that the outer shoals form with each other, or with Point Anton Lizardo, should have been passed through with a vessel of greater draught than 18½ feet, that is, the ship being between the outer and inner group of shoals; or if, from either of these causes, she should be in that situation, and be under the necessity of entering the harbor by the N. W. Channel, the method pointed out in the eighth paragraph must be resorted to immediately.

16. Having thus described the method of entering the harbor by the S. E. Channel, and explained the incidents that render that passage necessary, we shall now proceed to describe the principal or N. W. Channel.

17. All the well grounded fears respecting this harbor may be removed, by not approaching it with a fresh north wind, or by mooring or securing your vessel well before it blows with violence. In other respects it presents but little risk for shipping not drawing more than 15 feet water; for the only invisible dangers for ships of greater draught in this channel, are the outer and inner Laxas, which are composed of flat stones. The extensive banks of the Gallega and Galleguilla on the east side of the entrance, and the reef off Point Gorda on the west, form the opening called the Outer Channel, whose extent is scarcely 3 miles; and Point Soldado upon the Gallega on the east, with the reef of Caleta on the west, form the Inner Channel. These reefs are visible, particularly when there is any wind to raise the breakers on them: they may be safely passed at the distance of a cable's length. If there be no sea, and the rising tide has covered the rocks that terminate the visible salient or projecting parts of the Gallega and Galleguilla, a very moderate degree of care will enable any one to distinguish them very readily by the

color of the water, as they cannot have more than 3 feet over them in the mornings during the summer, and in the afternoon in the winter, which is the order most generally remarked in the irregular rise of the tides at this place. By night they are certainly dangerous under the combination of darkness, high water, and so little wind that the sea does not break upon them.

18. If, in consequence of an error in the reckoning, you should be to the westward of the last of the bearings mentioned in the 7th paragraph, or off Antigua Bay, the coast itself, or the low land, will point out the necessity of running along it, S. E. or E. S. E., in search of the harbor, which will be seen ahead; but you ought not to go in less than 8 or 9 fathoms off the points Brava and Gorda, the reefs of which are shown by the breakers with all winds, and should it happen that at daybreak or in the morning, the land-breeze is from south to S. E., the ship must be kept on the starboard tack as long as possible, in order that she may be to the northward of the harbor when the sea-breeze sets in; and there will be no loss of time in running a little to the eastward, with the expectation of the wind inclining more to the N. E., with which the anchorage may be reached on one tack, thereby avoiding the necessity of anchoring outside, and the subsequent labor of warping in.

19. If, from the same cause, the ship should be, at daybreak, to the north or N. N. E. of the city, and in sight of it, with the wind off the land, you must not pass to the westward of the meridian of the port, nor of the first bearing of it (mentioned in the 7th paragraph) with the coast, if the latter be in sight and the former not; for should the breeze shift to the S. E. and the land-wind not reach, or be inclinable to abate, it might cost some days to get in; for with such winds to the eastward, the current runs with great force to the N. W. However, with any object in sight, it will be easily perceived what method ought to be followed, by attending to its bearings, and by night to the soundings.

20. Being to the eastward of the harbor, and seeing the city and castle, the Inner Anegada, Blanquilla Isle, &c., with the wind from the eastward, which, as mentioned in the 9th paragraph, may be seen from Point Soldado inwards, a course must be steered, more or less free, according to the wind, so as to bring the high tower of the castle to the south, a little to the eastward of which bearing lies the N. W. extremity of the Gallega, and seeing it, as well as distinguishing in the city the two towers of San Francisco and the great church,\* proceed inward by keeping away to avoid the Galleguilla and Gallega, until they appear in a line, bearing south or very nearly so, which is the first leading mark on the plan of the port; but if you are to the westward of that bearing, and close hauled on the larboard tack, it will be sufficient to get on it, and afterwards continue on it, as on being north of the Galleguilla, it will not be necessary to proceed to the eastward, except in the case mentioned in the 18th paragraph.

21. Being to the westward of these shoals in 23 or 28 fathoms water, with the two towers in a line or even with that of the great church open to the S. E. to that of San Francisco, if the wind should be from E. N. E. or E. by N., as mentioned in the 9th paragraph, you will proceed for the entrance by the first mark, diminishing the depth to 6 and 4 fathoms, good holding ground, until the salient angle of St. Crispin's Bastion, or of the S. E. of the Castle of San Juan de Ulua, comes open with the equally salient angle of the San Pedro or N. W. Bastion, (the second mark on the plan,) or, what amounts to the same thing, until the whole of the Island of Sacrificios is open to the S. W. of the castle. Then steer for Point Hornos, and successively on proceeding inward to Point Mocambo or Island of Sacrificios, in which directions having passed the Caleta Reef and Point Soldado, and luffing up or keeping away, as may be necessary to keep the middle of the channel, the harbor may then be entered clear of the Outer Laxa, which is the most dangerous, and also of the inner one, by running close to their buoys, if they are laid down, until the angle of San Pedro's Bastion bears E. N. E. from the entrance of the Round House, or from the binnacle, and then luff up to let go the larboard anchor, which should lie to the N. W., and you ought to occupy a place in the first tier of ships; but should it be necessary to proceed to another, stand further on, and let go the same anchor where the pilot may direct, according to the orders he has received for placing the ship, or to the situation which, according to circumstances, she may occupy. In doing this, every thing should be quite clear for anchoring when you are off the breastwork of the castle, at the moment the order is given; for if, on the contrary, there be any delay, the least inconvenience and risk will be that of weighing the anchor again, and carrying it out, which you cannot always do as you may wish.

\* They are the two westernmost. That of San Francisco is a complete tower terminating in a square flat roof; the other is not—it has not a third story, nor a terminating point, and is consequently square. The little tower and cupola of the Hermitage of Pastora, which is farther to the west than these two towers, cannot cause any mistake, as it is so small; nor that of St. Augustin, which terminates also in a square flat roof, and lies to the eastward of them.

## CAUTIONS.

22. If the anchor remains in its proper place, and the wind be from E. N. E., or thereabout, proceed with running out a warp of at least two stream cables or hawsers to the S. E. to get the ship up nearly to the berth which she is to occupy; and by passing the warp aft (which will be attended with no little trouble, as both wind and tide will be against you,) heave her round and carry out springs; at the same time receive on board, on the starboard side, the bend of a cable, which is kept ready; and if you do not get this assistance, you must send a stream cable to be made fast to the ring, and with it haul close in, which will afterwards serve as a guy for the launch to carry the ends of the cables on shore.

23. If, from the scantiness of the wind, the anchor has not been dropped in its proper place, the warp must be of greater length, or another must be prepared, that by heaving it in at the same time as the cable, the anchor may be tripped and let go again in its right place, without impeding the general work.

24. If the winds be from N. E. to N., or in the N. W. quarter, it is advisable, if it be possible, before heaving in the cable, to have on board the hawser, which is made fast to the ring or to the end or bight of the cable prepared in it to haul in by. In this case, although the current sets inward, there will be little difficulty in bringing the ship round.

25. The utmost care will be necessary with the N. W. anchor, when anchoring with the wind from E. N. E. to E. S. E., because as you must let it go on bearings nearly opposite to the vessel when moored in her place, if it does not turn when you are warping past by it, the crown will remain towards the ship instead of the ring; and if so, it will not turn itself until she come to bang by it in some north wind, and then perhaps it might not hold. It is therefore indispensably necessary to ascertain this immediately, for it will cost but little trouble to weigh it, and drop it again in a proper manner, the neglect of doing which might be attended with great danger; an omission, however, not without examples. It is also necessary to be very careful in placing this N. W. anchor so that its cable should not bear a greater strain than that to the N. E.; the latter can be replaced from the castle or the vessel; but the former cannot either from one or the other, and if it fails, a tragical catastrophe may ensue.

26. What has been said in the instructions respecting the winds by this author, is directed to the object of reaching this port, properly prepared with 4 anchors ready, and the best cables bent, and also for lying in it, without placing any confidence in its not being the season of the norths; for, as before noticed, they sometimes come on so suddenly, and blow with such violence out of that season, that at sea they do not afford time to prepare for them properly; and in the harbor they render it in a moment impossible to communicate with the shore by boats, and much more to get any assistance, unless it be given from the Curtain of the Castle; and which cannot always be reckoned upon with the necessary promptitude, either from being impracticable on account of the distance, or because an interposed vessel or tier of ships may prevent it; and if the N. W. cable should fail, there is no remedy, as I have before said.

27. For these reasons every mariner who is acquainted with the exposed situation and narrowness of this harbor, can infer how dangerous it will be, particularly for a man of war or other large vessel, during the season of the norths, to anchor at nightfall within sight of the city; or afterwards, in sight of the light in the lighthouse, and also in the mouth of the Inner Channel, that is, abreast or off Point Soldado, as it happens that when the breeze comes to the S. E., it will not permit of seeking security in the manner directed in paragraphs 22 to 24; and therefore, whenever they have to anchor off that point, warps must immediately be got ready for warping in the very instant the wind will allow it, without delaying it under any consideration whatever; because, whether there have been any symptoms of Norths or not, gales more violent or more sudden, have never been experienced, than those which have come on the serene nights, and with the clearest sky.

28. If on account of calms, a ship has been brought to anchor in sight of Vera Cruz, or of the lighthouse, or out of sight of them on the coast of Chacalacas, Juan Angel, &c. in from 50 to 20 fathoms, good holding ground; the topsails should be reefed and every thing prepared for weighing on the slightest wind or appearance of cloudiness in the north, which ought to warn you; or to slip or cut, if it comes on suddenly, that you may manoeuvre or work as may be necessary, in consequence of its force, the time, the situation, and the size of the ship, or other circumstances; whether by standing to the eastward and carrying all the sail possible, which is the most certain method of clearing the Outer Aagada, where there is the greatest danger, or by standing off and on until daylight and then to run for the harbor, or to run for it with sail proportioned to the distance and the time.

But of these two last determinations, the first ought only to be taken in case of being entangled and unable to clear the Inner Anegada; and the second from urgent necessity, in consequence of shortness of provisions, damages, &c. or from having a small vessel with good anchors and cables, and sufficient experience to work with correctness; or in case of the wind's decreasing, when it might be practicable to run in towards the coast. You ought always to keep in mind the risk there is, particularly with a large ship, in going into the harbor in the strength of the gale, for it blows more violently within than it does without; and casualties may defeat the most ably concerted measures for anchoring, under circumstances so critical as those produced by the combination of a violent wind, heavy sea, narrowness of the anchorage, the numbers of anchors scattered over it, the vessels in it, and the want of assistance. On such occasions the necessary operations are not a little embarrassed by the melancholy effects produced by ships driven from their anchors, and others obliged to cut, driven ashore on the Hornos Reef, or the Lavandera Shoal, to the imminent peril of many lives.

29. Some expose themselves to these difficulties when they might be avoided; for on getting within sight of Vera Cruz, at the close of day, they stand on towards the harbor with an expectation of the continuance of the breeze, but this does not always happen; for although it might favor them a little, yet in general, it gives way to the land wind, (from west to south when it announces fine weather, and if from north to west it indicates the contrary,) or to a calm; consequently frustrating the attempt in the first case, and in the latter they are compelled to remain outside and exposed.

30. Knowing this, and that when the land breeze comes, there is no dependence upon its continuance, or that it will be suitable for clearing the Galleguilla and Gallega, and to open the mouth of the harbor, it will be necessary at sunset, (when the manoeuvre made can be seen from the signal tower, or even before,) to determine the succeeding operations, according as the season of the year, appearance of the weather, the distance from Vera Cruz, or the shoals, and the number of ships in the harbor, may render them advisable; and should there exist the smallest doubt of being able to get in before dark, if in the time of the norths, it will be expedient to haul to the wind on the starboard tack, and stand off for 7 or 8 leagues to the N. N. W., N. N. E. or N. E. of it. Such a position will be a good one in case of a north wind coming on during the night; and if not, for working at daybreak, so as to get early in sight of the castle, city, &c.; but if you have not a large ship, and if it be not in the season of the Norths, this precaution will admit of some modifications.

31. From the preceding remarks it will be inferred that entering the harbor by night, is by no means to be approved of, especially with ships of the line, or of ships of nearly the same draught. It has, however, been successfully done, and doubtless will be accomplished again, but the author of these instructions once entered it with a combination of all desirable circumstances, and yet very narrowly escaped the most disastrous consequences.

32. Notwithstanding what has been said in the instructions relative to the winds, if in the good season there can be any confidence in them, it may be expected in the months of May, June, July, and perhaps August, during which, in approaching the harbor, and nearing the Inner Channel, if with a large ship, the following instructions must be observed, if the wind will permit; but if not, according to the greater or less distance you may be from the harbor, when it becomes adverse, or falls calm, either come to an anchor or not, in the confidence that every practicable assistance will be given you, and that you will have a pilot off with the least possible delay, by two guns in quick succession, as an indication both of your intention to anchor and being in want of a pilot, which will be answered from the castle by two guns being fired in slow succession, both to indicate your signal hath been understood, and to give an opportunity, by the flash of the second gun, of taking the bearing, if not previously ascertained.

33. Night then coming on, when you are in sight of Vera Cruz and of the lighthouse, on the east side of the harbor, and of one, two, or three miles to northward of the Inner Anegada, Blanquilla Island, or the Galleguilla, steer to the W. N. W. to open the mouth of the harbor, until the lighthouse bears S. S. W. and then to the West, until it bears south; and afterwards S. W. until it bears S. by E., when you should steer south, which will be on, or nearly so, with the first leading mark of the plan and in the Outer Channel, diminishing the depth to barely 4½ fathoms, until the light bears S. E. ½ E., in which situation, (where it is usual to take a pilot,) if it be a ship of the line, or one of great draught of water, and you have determined not to enter, let go an anchor to wait for daylight. But if the ship be of a medium draught, and without a pilot to direct the entrance, which it is desirable to effect, you must steer S. E. by S. for the purpose of passing the Outer Laxa, until the light bears E. by S., when you must stand in E. S. E., passing close to the N. W. buoys, and proceed afterwards as directed in paragraphs 21 to 24, or seamanlike, as different circumstances, not therein specified, may occur.

34. Should N. W. of the south being according to the

## USE OF THE TABLE.

The first column indicates maritime miles; the second the apparent angular altitudes of the Peak of Orizava, corresponding to the miles stated; the third indicates the variation of the angular altitude in 3 miles of distance to 31' 48", and in 6 miles to 1' 52".

## EXAMPLE.

Suppose that the altitude of the Peak above the horizon of the sea, was observed to be  $0^{\circ} 59' 00''$ , and that the depression or dip, was  $10' 20''$ ; what is the distance between the vessel and the Peak of Orizava?—Horizontal angle observed corrected for the error of the instrument observed with.....  $0^{\circ} 59' 00''$   
Dip of the horizon,.....  $10' 20''$

Apparent altitude of the Peak, 48 40

On consulting the table, it will be seen that this angle is comprehended between 105 and 108 miles distance, and without any other operation, it is at once seen that it is nearly 106 miles; but if it is desired to determine it with greater accuracy, note the difference for 3 miles in the angular altitudes between the two distances that are nearest, which is  $3' 59''$ , and the difference between the angle observed, and that corresponding in 105 miles of distance is  $1' 43''$ ; therefore the true distance will be  $= 105 + \frac{3' 59''}{3' 59''} = 106' - 18''$ , or  $105' 42''$ .

FROM VERA CRUZ TO THE RIVER TAMPICO.—From the Harbor of Vera Cruz the coast trends about N.  $53^{\circ}$  W. a distance of 11 miles to the River Antigua, where with some sinuosities it extends N.  $20^{\circ}$  W. 6 miles farther to the Point and River Chacalacas, thus forming a Bay named that of Antigua. From Chacalacas, it continues in the same direction North  $20^{\circ}$  W. 6 long miles farther to the Point of Zempoala, forming also between the two a bight extending to the westward, and in which at the distance of 3 miles the River Juan Angel disembogues. From Zempoala the coast trends to the westward, and forms a regular bay with Point Bernal, which lies about 10 miles N.  $21^{\circ}$  W. from Zempoala Point. This Point Bernal bears from Vera Cruz N.  $29^{\circ} 28'$  W.

On the south side of Point Bernal and at the distance of about a mile there is an islet called Bernal Chicho, which bears from Vera Cruz N.  $31^{\circ} 52'$  W. and which as well as all the coast of the bay is very clear; there is room to pass between it and the point in 5 and  $5\frac{1}{2}$  fathoms water without risk. To the south of it there is shelter against winds from the N. W. quarter as far as North, but none from winds to the Eastward of North.—

\* Although the foregoing directions by Don Bernardo de Orta are somewhat verbose, we prefer giving them in full to curtailing them.

To anchor in this bay, there is no need for any other guide than the lead, there being, at half a mile from the beach, 4 fathoms water. Off the coast between Zempoala and Bernal there is a shoal which is visible, and which lies north a little easterly from Zempoala Point, at the distance of 4 miles, and at a similar distance from the coast abreast of it. It is necessary to be cautious of it, especially in the night time; and with large ships it should always be passed on the outside, for in the channel between it and the shore, there is a ridge of rocks running off the land on which there are not 4 fathoms water.

From Point Bernal the coast runs North a distance of 4 miles to that of Maria Andrea, which bears from Vera Cruz N. 26° 32' W. From Point Maria Andrea the distance is 9 miles N. 18° W. to Point Delgada, whence the coast trends N. 33° W. 10 miles to Point Piedras, from which the direction of the coast continues N. 33° W. a distance of 70 miles to the River Tzampam; from this river the distance is 15 miles N. 15° W. to the bar of Tanguijo, and thence it is 23 miles N. 10° W. to Cape Roxo, which by good observations is in latitude 21° 35' N. and 1° 14' 45" west longitude from Vera Cruz.

Between Cape Roxo and the River Tzampam there are various shoals and islets lying at a distance from the coast, which form good breakwaters and excellent anchorages, sheltered from the Norths. The first and the southernmost, is the shoal of Tzampam, lying about 11 miles N. 60° E. from the river of that name; on this shoal there are some very small islets, and on the S. W. part of it there is good anchorage in from 7 to 9 fathoms water, on coarse sand, at about 2 cables' length from its edge. About N. W. from this shoal, and at the distance of 12 miles, is the Bajo de Emedio or Middle Shoal, which is distant from the coast and east of the River Tanguijo 8 miles; this shoal is much smaller than the preceding; but it affords good anchorage on the S. W. part, in 5½, 7 or 9 fathoms, on sand. North somewhat to the east of this shoal, and at the distance of 3½ miles, is that named Tanguijo Shoal, which on its S. W. part presents better anchorage than either of those just mentioned. The channels formed between these two shoals are very clear, with a good depth, and between them and the coast there are no dangers but what are visible.

Off Cape Roxo are the Islands Blanquilla and Lobos; the first, which is a bank with several small islets on it, lies E. S. E. from the Cape, distant about 5 miles; south a little easterly from it, and at the distance of 6 miles, is the Island Lobos, in lat. 21° 26' N. and longitude 1° 8' 45" W. of Vera Cruz. From the north side of this Island, a great rocky shoal extends, which leaves a strait of only 3 miles wide between it and Blanquilla; and in the middle of this strait there is a shoal; so that the utmost caution is required in passing through it. To the S. W. of these islands there is an excellent anchorage, well sheltered from the Norths, and which requires no particular instructions for reaching it.

All the coast which we have described from Vera Cruz to Cape Roxo is clear and deep, and without any other dangers than the rocky ridges which stretch off from Juan Island, in the Bay of Bernal and at Point Gorda; and throughout the whole of it there is a bank of soundings extending from the shore 8 or 10 leagues, and is so deep that at one or two miles from the beach there are from 4½ to 6 fathoms. The land is not very high, and terminates almost at every part in a sandy beach, is covered with brushwood and small trees which are very thick and show their verdure at a moderate distance, and although there are no prominent marks to distinguish the land by, the latitude will be sufficient to point out what part of the coast a ship may be on. Nevertheless, it may serve in some cases to know that Mount St. Juan and the Island Blanquilla bear S. 65° W. and N. 65° E. from each other.

From Cape Roxo the coast rounds or trends to N. 19° W. a distance of 7 miles, and forms the front of the Cape; and thence to the mouth of Tampico River, the bearing and distance are N. 34° W. 43 miles. The River Tampico is considerable, and has a sufficient depth of water for ships that draw less than 12 feet; the bar lies N. W. and S. E. on which there is more or less water, according to the currents of the river; it is situated by good observations, in latitude 22° 15' 30" N. and longitude, 1° 42' 33" W. from Vera Cruz. Although in this line of coast there are no marks which can be distinguished but by pilots, nevertheless a *height* which is to the southward of the mouth of the River may serve as a guide (it is the highest land between Cape Roxo and the bar, where the heights of Macate, Chapapote, and Martiner, commence); and also the opening of the land formed by the river's mouth, which is easily distinguished at the same time as the surf on the bar. You may anchor, as before said, in any depth you please, as the ground is good for holding; the only inconvenience being the sea raised by the wind, and the heavy sea during the calm nights.

About 5 miles within the bar, upwards, there is a little channel on the southern bank, which leads to the lagoon of Tampico, or Old Town, with three islets in it; and at the entrance the Old Town or that of Tampico, bears about S. S. W. from the Bar, distant scarcely 5 miles. To the N. W. of that channel, there is another which leads to the

turn of Altamira that of Pannec Coast, comprised, there is of Tamiagua fr

turn of Altamia; and 10 leagues in a straight line from that of Tampico up the river, is that of Panneo; at all three towns provisions of every sort may be obtained. On the Coast, comprised between Tanguijo and the River Tampico, in which Cape Roxo is situated, there is nothing more than a narrow tongue of land, which separates the lagoon of Tamiagau from the sea.

*Directions for Tampico Anchorage and Bar, by Capt. John Mackellar of H. B. M. Ship Pique, 1818.*

Tampico Bar is situated in lat.  $22^{\circ} 15' 56''$  N. and long.  $97^{\circ} 50' 18''$  W. the variation of the compass  $8^{\circ} 25'$  E. As the land is low all around this place, and having nearly the same appearance, it is rather difficult for a stranger to find out the entrance of the river; on that account I would recommend proceeding in the following manner:—

Ships coming from the eastward, and having got soundings in 60 fathoms, ought immediately to get into the lat. of  $22^{\circ} 16'$  or  $22^{\circ} 18'$ , and from that make a west course.— If the latitude can be ascertained, this is the most certain method of making a good land fall; but in the event of your not being able to get your latitude, and making your land to the northward or southward of the river, it may be known thus: in the latitude of  $22^{\circ}$  there is a range of small hills not higher than large houses; this land is S. by E. by compass about 5 or 6 leagues from the bar. In latitude  $22^{\circ} 9'$ , and apparently 4 miles in shore, on the fall of a cliff, stands the Town of Tampico, which may be seen from the sea, and is the only town on this part of the coast: in the south end of it there are two long white houses, like barracks; the rest appears to be scattered houses off to the N. N. W.— From this town to the anchorage off the bar, it is north 6 or 8 miles. The entrance to the river cannot be made out more than 4 or 5 miles off, as there is nothing more than three or four small boats on the south side of the entrance. To the north of the river, in lat.  $22^{\circ} 23'$ , and 3 or 4 miles in shore, there is a small flat hill; this appears, when you are 6 or 7 miles off, in the shape of a flat boat, bottom upwards; between this and the entrance of the river, the white sand covers the tops of the small hillocks along the shore, having the appearance of small sand hills, rather than of a sandy beach. These are the only objects that can be pointed out to be of any assistance to a stranger in making the land.

Having made the river out, and intending to anchor, bring the entrance of it to bear S. W. or S. W. by W. and run in on that bearing until you are in 8 or 7 fathoms, and then anchor; your distance from the shore will be about 3 miles. The bottom is very good and clear, being fine soft mud, and holds well to the northward of the river, with plenty of room to get under way, should it come on to blow; but this anchorage is not in the least sheltered from either wind or sea; and during the winter months, that is, from November to the middle of April, when the northerly gales prevail, no vessel is safe here that cannot go into the river; for these gales blow with such violence that it is impossible for any ship to remain at her anchors; and in the event of the wind's coming to the eastward of north, you cannot carry sail to clear the land. Therefore particular attention ought to be paid to the appearance of the weather; and as soon as there is the least sign of its blowing, get under way and make sail to the N. E. until you are off soundings; then bring to for a change of weather. These gales, in general, blow from N. W. by N. to N. by W., and I have never seen them to the eastward of north.

The entrance of the river is, I think, the most dangerous I have ever seen. The general depth of water on the bar, is from 8 to 14 feet; and the strong run of the river coming out and meeting the surf, makes one continual sheet of broken water, the bar being composed of quicksand, which shifts with every gale of wind; and even in a fine day and smooth water, and at the anchorage, the bar has a very alarming appearance to a stranger. It is attended with much greater danger on coming out in a boat than in going in, and coming out with the wind blowing in, ought to be well considered before you attempt it; for should you be prevented from pulling out by the heavy sea and wind, you will find great difficulty in getting back against the stream of the river; and winding your boat is attended with greater danger than all the rest. Within the river there are from 3 to 5 fathoms of water, and it is about three quarters of a mile broad. It is navigable about 39 leagues from its entrance. About  $5\frac{1}{2}$  miles up, is the old village of Tampico: it stands on the south side of the river, or rather on the south side of a lake. Boats can only go within half a mile of it.

## BERMUDAS OR SOMER'S ISLANDS.

*General Instructions for making the Bermuda Islands.*

	Latitude.	Longitude.
Saint George's Town, at the eastern end.....	32° 22' N.	64° 33' W.
Wreck Hill, at the western end .....	32 18½	64 50
S. W. Breakers.....	32 10	64 45
Variation 3° W.		

High water, full and change, at St. George's, one quarter past 8. Common tides rise about 4 feet; but on the springs, or in gales of wind, frequently to 6 and 7 feet. The floods in the offing set to the N. E. and ebb to the S. W. but near the shore they run in various directions. These islands being surrounded with innumerable shoals much precaution is necessary in approaching them. The principal dangers lie to the westward and northward, and extend, from the land, between 3 and 5 leagues, in a due west line, from their south-western point (round northerly) to a N. N. E. one, from David's Head, their eastern extreme. The remainder of the coast, forming their southern and eastern boundary, may be approached in every part within a mile, and in several places to less than half that distance.

On account of the prevalence of westerly winds in the Atlantic, it has become the general practice for all vessels bound to the Bermudas to make the land from the westward, by getting into their latitude about the 68th degree of longitude, and then steering an east course till they become visible.

When running down a parallel for Bermudas, with a large wind, and not making the land towards night, but expecting to be near it, no vessel in this situation ought to lie to, but should rather turn to windward under an easy sail until daylight, because of a probable current which is variable, and it is known that vessels have been carried by it out of their reckoning to the distance of many leagues, and brought them unexpectedly among the rocks. The land not being high, (for Gib's Hill, the highest land in the islands, is but little more than 180 feet above the level of the sea) it cannot be seen at any great distance from a small vessel. Add to this the thick haze that frequently prevails here, particularly in fine weather, renders making the land somewhat difficult, and at times precarious, unless the latitude be accurately ascertained, for instances have happened of vessels missing the islands; and, after a fruitless search, steered for the American coast, in order to take a fresh departure for running down the latitude again.

The rocks and islands of Bermudas lie N. E. by E. and S. W. by W. about 9 leagues, and in breadth about 5. Wreck Hill forms the west point, and St. David's Head the east. Round the west, N. W. and north sides, it is a continued and very dangerous ledge of rocks, beginning at the Long Bar, the north part of which lies 6 miles W. S. W. from Gib's Hill; trending then N. E. it is called the Chub-Heads, which, off Wreck Hill, lies 9 miles from the shore. The ledge hence rounds to E. N. E., and joins the North Rock, which is always above water, and lies N. N. W. 12 miles from Catharine Point. From the North Rock the reef rounds E. and E. S. E., and ends in Mill's Breaker, which dries at low water, and lies at N. E. 6 miles from Catharine Point, and N. N. E. from St. David's Head. The outer edge of the ledge is close and compact, leaving no passage through it for ships, excepting a small one near Wreck Hill, another by the North Rock, and one round Catharine Point. Round the outer edge of this ledge is a margin of soundings, of from one to two miles broad, having from 9 to 14 fathoms on it. There are, likewise, soundings for two miles from the shore round the N. E. east, and S. E. sides of the island; but, as the water here is deeper, it would be prudent for those who suspect themselves near the longitude of Bermudas in the night, or in thick weather, while between the latitudes of 32° and 32° 40', to keep a lead constantly going; being assured that at 14 fathoms they will strike the ground in time to avoid danger. The lead might be incased with tallow, for the greater certainty of striking ground. This precaution, I am persuaded, would prevent many of the wrecks that constantly happen here.

There is a rocky bank lying from S. S. W. to S. W. from Gib's Hill, or (S. W. part of Bermudas) from 3 to 5 leagues distant. Various depths, from 17 to 45 fathoms, are on it, and on others large ships have grounded.

The latitude of 32° 8' N., being two miles to the southward of every danger, seems best adapted in fine clear weather for this purpose, and will bring you in sight of Wreck

Hill, which being markable. The distinction of these islands, each from the land, is evident, with David's Head to be seen, during that eastward.

Should you not have got sight of 4' or 5'; and if it beyond 32°.

If bound to Bermuda a direct course become contrary maining longitude latitude of 32° 8', should fair winds from the eastward to the southward there is no danger that latitude until may be approached.

In the course of contrary, or the west the northward of the islands, you may

Ships bound from well to the south the latitude of Cape of 32° 5'. Thus direction far to the longitude; and, of ing thence so far tudas, at 4 or 5 d

You should by ways make them to the set of the G ships from the coast

Having ascertained of 32° 5', and 4 miles clear of the west end, about 8 well as the S. W. southernmost land lying parallel with keep in 32° 7' N.

You must avoid the preceding tions, and you will of the islands) and Breakers the land a mile off, and that you pass Castle H board hand. You lot, who will soon be pressed for time ter having passed t George's Road, bri

A high island, n eastern extreme, a about half a mile. Head, is called St. vid's Head S. ½ W. fathoms water; but

Hill, which being of a conic form, and having a volcanic appearance, is the more remarkable. The moment this hill becomes shut in with the other lands, or is no longer distinguishable, you will pass the only danger to be apprehended off the southern part of these islands, called the S. W. Breakers, (which do not, however, lie more than  $1\frac{1}{2}$  mile from the land,) and may then immediately close in with and steer along the south-eastern shore, within a mile, till you have got the length of Castle Harbor, or brought David's Head to bear about N. by E. where you must wait to receive your pilot, taking care, during that time, not to be drifted to leeward, as the currents generally set to the eastward.

Should you meet with a contrary wind, or the weather be extremely hazy, before you have got sight of land, it will be prudent in the night not to stand to the northward of  $32^{\circ} 4'$  or  $5'$ ; and if the wind should be inclining to the southward, I would recommend not beyond  $32^{\circ}$ .

If bound to Bermudas from England or from any part of Europe, I should recommend a direct course to be steered as long as the winds permit; but the moment they become contrary, to get to the southward into the trades, and then run down the remaining longitude, taking care to haul to the northward in sufficient time to reach the latitude of  $32^{\circ} 8'$ , about the  $68^{\circ}$  of longitude, and then proceed as above described; but should fair winds continue the whole passage, the land may be made with equal safety from the eastward, by steering for them in the latitude of  $32^{\circ} 18' N.$ , which is two miles to the southward of David's Head, their south-eastern extreme, and off which head there is no danger beyond half a mile, care being taken not to come to the northward of that latitude until you have brought the head to bear W. S. W., on which bearing it may be approached with safety till within one mile thereof, or till you receive your pilot.

In the course of making the land from the eastward, should the wind become contrary, or the weather prove dark, hazy and tempestuous, come not during the night to the northward of  $32^{\circ}$  or  $32^{\circ} 6'$ , in which latitude, if you should be found to have run past the islands, you must proceed as before described, in making them from the westward.

Ships bound from the southern parts of America, within the Gulf Stream, should steer well to the southward, perhaps as much as S. S. E., until they get within 3 or 4 miles of the latitude of Cape Hatteras, and then steer S. E. by E. until they get into the latitude of  $32^{\circ} 5'$ . Thus you will avoid crossing the Gulf Stream where it is very broad, and its direction far to the eastward, and pass it where it affects your latitude more than your longitude; and, of course, be of less consequence to the ship's reckoning; and, by steering thence so far to the southward as S. E. by E. you will fall into the latitude of Bermudas, at 4 or 5 degrees of longitude to the westward.

You should by no means run for these islands unless sure of your latitude; and always make them from the S. W. if possible, looking out in time for the land, as, owing to the set of the Gulf Stream, and the general tendency of the currents to the eastward, ships from the coast of America will almost always be far ahead of their reckoning.

Having ascertained your latitude, and being well to the westward, get into the parallel of  $32^{\circ} 5'$ , and steer due east. This course will bring you to the island, passing about 4 miles clear of the south end of Club-Heads, a very dangerous shoal, lying across the west end, about 8 miles from the land, with not more than 12 feet on it at low water, as well as the S. W. Breakers, which lie about one mile and a half S. S. W. from the southernmost land, being the shoalest part of a ledge of rocks of considerable length, lying parallel with the shore. Should the wind in the night incline to the northward, keep in  $32^{\circ} 7' N.$ , if to the southward, in  $32^{\circ} 2'$ .

You must avoid, by all means, running in the night, without having a good observation the preceding day, and being pretty sure of your longitude. Follow these directions, and you will first make Wreck Hill (which is high land on the western extreme of the islands) and the land trenching from it to the S. E. Having passed the S. W. Breakers the land lies about E. N. E. and W. S. W., having danger no more than half a mile off, and that generally visible; you may run safely along shore at a mile, until you pass Castle Harbor, which is easily known by the castle on an island on the star-board hand. You should bring to off the eastern point of this harbor, and wait for a pilot, who will soon come off, and carry you into St. George's Harbor. But, should you be pressed for time, or the pilot not come off, you may haul round by the breakers, after having passed the islands, which form the south part of Castle Harbor, into St. George's Road, bringing on the following marks:

A high island, next to the N. E. part of the small ones off Castle Harbor, has, at its eastern extreme, a bluff rocky point, called St. David's Head, having breakers off it about half a mile. The northernmost land in sight after you haul round St. David's Head, is called St. Catharine's Point; bring this point to bear W. N. W., and St. David's Head S.  $\frac{1}{2}$  W. and you will be in as good a berth as any in the road, with 7 or 8 fathoms water; but, in every part of these roads, you must be guided by the eye where

to drop your anchor, clear of foul ground, which is every where easily seen, owing to the clearness of the water, and the whiteness of the sand, where the anchorage is safe.

In case you have been driven to the eastward of the islands, (a situation, however, which you are to avoid with the utmost care,) you may run for them in latitude  $32^{\circ} 14'$  N., which will bring you to them 5 or 6 miles to the southward of St. David's Head, for which you may haul up upon making the land; but you are not to run in till you are far enough to the S. W. to follow the directions before given for coming from the westward, should you make sail for Bermudas from any part of the Gulf Stream, or without it.

Great allowance is recommended for being to the eastward of your reckoning, and try to fall into the parallel of latitude above mentioned, in longitude  $70^{\circ}$  or  $71^{\circ}$  W.

As the soundings do not extend more than a mile and a half from the land, on the southern side of the islands, a correct latitude, and a good lookout, together with a strict attention to these instructions, is absolutely necessary.

*Other directions in coming from the westward.*—On coming from the westward, the S. W. points of the land ought to bear E. N. E., before you come within four leagues of the land, when you may steer directly for it without danger. The breakers, on the south side, always show themselves, so that a ship may safely approach within gun-shot from the S. W. end to the S. E., and, when getting to the eastward of the castle, round into St. George's. Do not go farther to the northward than to keep Cooper's Island open within St. David's Head till you take a pilot, and the subscriber engages no ship will ever strike, if this be attended to.

THOMAS LEAN.

## WEST INDIES.

From the Hole-in-the-Wall to the west end of Hog Island, or the entrance of the Harbor of New Providence, the bearing is south and the distance 15 leagues. But allowance in sailing must be made for the current, which generally sets, with considerable strength, between Abaco and the Berry Islands. At Great Egg Island, and in its vicinities, the currents are very uncertain, and there much caution is necessary.

Vessels from the eastward, in general, had best make the coast of Eleuthera, in a track between the parallels of  $25^{\circ} 20'$  and  $25^{\circ} 30'$ , not exceeding the latter, or the parallel of Harbor Island.

On leaving the Bird Rock, when bound for New Providence, it is best to make Watland's Island, proceeding along the west side of that island, or between it and Rum Key, for a good departure. You must be careful not to approach the little island called Conception Island, because a long and dangerous reef extends in a N. N. E. direction from that island, above 7 miles.

Harbor Island lies in latitude  $25^{\circ} 31'$ , but a reef extends about three miles from its north shore, to which a berth must be given, there being several rocks near to the outer edge, nearly even with the surface of the water. The water is, however, perfectly clear, and they may be seen from the fore-yard or bowsprit end, in time to be easily avoided. The bank extends W. and W. by N. to Egg Island, a distance of  $7\frac{1}{2}$  leagues, and a reef extends from that island, nearly 4 miles in a N. N. W. direction. Having advanced to the northward of the Cow and Bull, off Harbor Island, the course to Egg Island, the westernmost isle of the range, is W. by N. and the distance, to clear the reef, 8 leagues. On running along shore, you will pass some rocks, called the Perno Rocks; but the islands are too closely connected to be particularly distinguished.

Egg Island is a small island, covered with brush-wood, with a rise of land in the middle of it. Beag off this island, keep well out to avoid the reef, the pitch of which lies with the centre of the island S. S. E.  $\frac{1}{2}$  E. On rounding the reef, you will open a small rocky island, situated to the south of Egg Island, called Little Egg Island. The course, by compass, hence to the lighthouse or Nassau Bar, will be S. W. by S. 10 leagues, and to the Douglas Passage, eastward of the harbor, S. by W. 8 leagues.

The keys between Egg Island and Providence, upon the edge of the bank, form a bay, as represented on the Chart, and the reef is steep to. Of course, vessels passing in the winter or during the prevalence of northerly winds, must cautiously avoid being embayed there; as the only shelter is an inlet between the eastern end of Rose Island and the Booby Rocks, where there is a depth throughout, of 27 feet. But in summer, as northerly winds then seldom prevail, and the trade wind, generally, the shore may be kept well on board; and especially, because the current may sweep you past the Harbor of Nassau, which could not be regained without difficulty.

owing to the harbor is safe. However, the entrance is 32° 14' N. Head, for you are far from the west without it, and try to find, on the north side of the island, sheltered on the north by Hog Island, and stands at the westward of the harbor. It may be distinguished at a distance, by means of the Government House, which is a large white house upon the top of a hill, seen over Hog Island. Bring this to bear S. S. W. or S. S. W.  $\frac{1}{2}$  W. By keeping it so until within 2 or 3 miles of Hog Island, or perhaps sooner, a pilot may be obtained.

The entrance into the harbor is at the western end of Hog Island, which is distinguished by the lighthouse. It has 18 feet of water, with sandy ground. The latter is not good for holding. In the middle of the harbor there is a bank of 3 or 4 feet water; but there is a channel on each side of considerable extent.

The Douglas Passage and New Anchorage, are situated on the east and south side of Rose Island, to the eastward of Nassau Harbor. The entrance is denoted by beacons fixed on two rocks, called Douglas' Rocks, which form the entrance, and a black buoy, which is placed at the end of a reef stretching from those rocks, and situate at N. by E.  $\frac{1}{2}$  E. 179 fathoms from the high or upper beacon. These beacons can be seen from the deck of a frigate, when steering in a line between Egg Island and Nassau.

The black buoy above mentioned, is placed in 9 feet water; but at a boat's length from it, there is a depth of 4 fathoms. Opposite to it is the end of a reef which extends from Booby Island, leaving a passage of 160 fathoms in breadth, which has a depth of 4 fathoms at very low tides.

To steer for this anchorage bring the beacons in a line, bearing nearly S. E. by E., and steer directly for them until you bring Booby Island end on; then haul up for the buoy, passing it on the starboard side and to the eastward, at the distance of about 30 fathoms. When past the buoy every danger may be seen, and you may haul round to the westward and anchor in  $4\frac{1}{2}$  fathoms, good holding ground, with the beacons in one, bearing N. W. by W. distant about 2 miles, where you will be well sheltered from N. W. winds.

A frigate, drawing 18 or 20 feet of water, may proceed to the S. E. side of Rose Island, and anchor in a quarter less five, at about 6 miles from the town of Nassau, well sheltered from N. W. winds, and from the S. E. by the Bank.

The direct bearing from the Hole-in-the-Wall to Providence Bar or Lighthouse, is S.  $\frac{3}{4}$  W. 15 leagues. The bearing and distance from the Hole-in-the-Wall to the pitch of Egg Island Reef, are S. E.  $\frac{3}{4}$  S. 20 miles.

Those bound to New Providence, who are unacquainted with the Douglas Passage and the New Anchorage, should not attempt to pass the Hole-in-the-Wall with a N. W. wind, when blowing strong, there being no safe anchorage hereabout.

In the event of making the Hole-in-the-Rock or Egg Island in the afternoon, with a strong wind from the N. E., you should haul close round Egg Island Reef, and steer S. by W. 8 leagues, for the Douglas Beacons; and having made the beacons, bring them in one, bearing nearly S. E. by E. and steer for them. Keep your lead going, and you will have gradual soundings. When in 9 fathoms you may anchor with the marks in one, fine sandy bottom, well sheltered from northerly winds by the rocks, &c.

At Nassau, New Providence, and in the entrance of the New Anchorage, and in its channels, the tide runs at the rate of  $4\frac{1}{2}$  miles, and rise 4 feet at the springs, and the currents have much force.

ELEUTHERA is one of the largest islands, and is of very irregular shape. Its west end bears N. E.  $\frac{3}{4}$  N., distant about 10 leagues from the east end of New Providence; it thence extends eastward about 9 leagues, then S. E. about 4 leagues to Palmetto Point; and lastly, about S.  $\frac{1}{2}$  E. 12 leagues to its south end, denominated Powel's Point, being of irregular breadth, from 2 to 4 miles. The E. and N. E. shores are washed by the Atlantic Ocean, while on the west, is the shallow and smooth water of the bank. On the west side are the settlements of the Rock Sound.

GUANAHANI OR CAT ISLAND.—The N. W. end of this island lies about  $8\frac{1}{2}$  leagues, E.  $\frac{1}{2}$  S. from Powel's Point, in Eleuthera; it thence extends south-eastward 16 leagues, having a breadth of 3 to 7 miles. Its eastern side is lined by a reef, on which the sea continually breaks, and renders it inaccessible; on the S. W. side is good anchorage. This island was the first land seen by Columbus, who landed here on the 12th of October, 1492. By him it was called St. Salvador, but it is now commonly called Cat Island. Between its N. W. end and Powel's Point, at the distance of  $4\frac{1}{2}$  leagues, S. E. from the latter, is the N. W. end of Little Cat Island, joined to Cat Island by a bank which surrounds both of them.

Between the south end of Eleuthera and Little Cat Island, is a channel 3 leagues wide, called Ship Channel.

YUMA OR LONG ISLAND, so called from being peculiarly narrow in proportion to its length, is nearly 17 leagues in length from S. E. to N. W. The north-west end lies  $8\frac{1}{2}$  leagues south from Cat Island, and its south-east end bears from the Bird Rock,

at the west end of Crooked Island, W. by N. 8 leagues. There is an anchorage on its east side, called Great Harbor, whence it exports salt.

**EXUMA, &c.**—The islands called Great and Little Exuma, lie to the westward of Long Island and to the southward of Cat Island. Their Chief produce is salt, and the Great Isle has a port of entry.

North-westward of Exuma, to the distance of 22 leagues, on the eastern edge of the Great Bank, are a number of little islands, distinguished by the name of Exuma Keys; to these succeed several others in a more northerly direction, to a distance of 8 leagues, the northernmost of which, called Ship Channel Key, lies E. by S. 10 leagues from the east end of New Providence.

Between the bank which surrounds the Cat Islands, and the east edge of the Great Bahama Bank, is a channel 6 leagues wide, called Exuma Sound, on the western side of which is a key, called Leeward Stocking Island; and farther northward, between Ship Channel Key and the bank that surrounds Eleuthera, is Rock Sound, of about 4 miles in width, at the north part of which you suddenly find 2 fathoms water; this is denominated the Twelve Feet Channel.

**WATLAND'S ISLAND**, which lies 13 leagues to the east of the S. E. point of St. Salvador, is about four and a half leagues in extent, from N. E. to S. W., and is of moderate height. It has a pretty little town on the south side, and on approaching in that direction, you will see several houses on the summit of a hill, and appearing nearly in the centre of the island. Off the S. E. point are two remarkable rocks, called the Pigeon's Rocks. On the east side of the island are a number of sandy spots. It is one of the most dangerous reefs of the Bahamas, extending about seven miles, having several rocks or heads which cannot be perceived by the color of the water before you are close upon them, and which have 5, 4, 7, 9, and 10 fathoms water between them, and a current setting west and W. S. W. into Exuma Sound. Off the north side are the dangerous rocks, called the White Rocks, and a reef extends outward four or five miles to the N. W.;—vessels ought, therefore, to be very careful in rounding them. There is a small reef projecting from the S. W. point, but it always shows itself.

Captain Dowers of the navy, has stated that, in the route from New Providence to Jamaica, in 1814, when "passing along the west side of Watland's Island, about one and a half mile from the sandy beach, with the S. W. point bearing S. by W., just at dusk we discovered a ledge of breakers, (about a ship's length east and west,) close to us.

"When about a cable's length to the westward of them, we had the following bearings, viz: a remarkable black rock, close to the shore, and breakers in one, E. S. E.; the N. W. point of the island east, the S. W. point S. by E.

"We had 5 fathoms at about two cables' length to the northward, and deepened our water gradually as we increased our distance to the westward. No bottom with hand line, about half a mile outside; the water of the same color as the ocean; at this time land was distinctly seen from the mast head bearing S. W. and very low."

**RUM KEY.**—No reef of any extent lies off this island, except Pindar's Reef. This lies off the N. W. part of the island, extending out north, about 2 miles. There is a small reef, very close in, near the S. E. harbor point. The shore, in general, is bold; and if a trifling reef, shoals, or sunken rocks are known, they are chiefly on the north side of the island, not frequented by any shipping, and lying very near the shore. The S. W. point is a sand spit, with very bold water on either side of it; vessels of any size can anchor within 200 yards, and procure fresh water from wells dug near the beach.

With the exception of Pindar's Reef, vessels of any size can approach with safety, any part of the island, within a quarter of a mile, and many places, (particularly the west end,) within 150 to 200 yards.

The west side of Pindar's Reef is very bold; vessels may run a north course so close along, as to throw a biscuit on it. The east part of the island shows white cliffs, more northerly again, black cliffs.

The vessels that load at Old Pond, run down the south side in going to sea, round the west end, keeping to the eastward of Little Island; in sight, distant 13 miles, and to the westward of Watling's Islands, about 20 miles from Rum Key.

If the vessels returning homeward, cannot pass to the eastward of Rum Key, and are obliged to take the south side, they should keep close in with Rum Key, and well in with the west end, which would allow them to pass well to windward of Little Island. Variation, 5° E.

There are settlements all round the island. Rum Key has two salt ponds; the old salt pond, situated on the south side of the island, nearest the east end. The anchorage is good about half a mile from the beach, and will admit vessels of any size, affording shelter from the S. E., E. N. E., and round to N. W. Pilots will go out, on vessels making the usual signals. There is always a considerable quantity of large grained salt for sale, and every dispatch given while loading.

Carmichael Pond, a new one, is at the west end of the Island, and the facilities for procuring salt are good; the anchorage, an open roadstead, at the west end, and immediately off the pond, is protected by the island, with the wind from N. by E. round to S. E. by S. Not far from the beach is a signal flag-staff; vessels may anchor off it, within 250 yards of the shore. Should the anchorage prove rough, by the wind getting out westerly, vessels can easily weigh anchor and run round Sandy Point. A few minutes after weighing anchor a vessel will be out to sea. The salt is carried along side in boats and put on ship board.

CONCEPTION is a little island, surrounded by a reef, and lies half-way between Rum Key and Cat Island. From its N. E. side a reef extends 7 miles to the N. N. E., which was not known till the year 1812, at which time the British frigate Southampton was wrecked upon it. This reef is accounted one of the most dangerous in the Bahamas, having several dangerous rocks or heads, which cannot be perceived by the color of the water before you are close to them.

ATWOOD'S KEY is 3 leagues from east to west, and narrow from north to south. The island is surrounded by a white shoal, bordered with a reef. Off the west end the reef extends out one league; and under this point, in the extent of another league, along shore, there is an opening or interval in the reef; and here vessels may anchor in the white ground, in 7 or 8 fathoms, but very close to the shore. Off the edge of the white ground, no soundings are to be found. To the east of the island are two small islets; the outer one at a league and a half from shore; these are surrounded with reefs and white shoals.

Atwood's Key is low, with bushes, and presents the same appearance as the other isles in this passage. Its greatest breadth, which is in the middle, is about 3 miles; for each extreme terminates in a point. The reef on the north side breaks, and extends above 2 miles from the land. The same reef, continuing to the west, forms a head, which is a mile and a half to the southward of the point. "On the south side, about two miles from the west point, you may anchor at three cables' length from the land, and, for half a league at least, along the shore, sheltered from westerly and N. E. winds. Having brought the west end N. N. W. about one mile off, we saw that end was a point only, and that the other side rounded away E. N. E. full of breakers, which were at least two miles from it; we also saw some ahead of us, and to leeward; we were obliged to haul our wind, and stand for the anchorage afore-mentioned, on the south side of the island. This anchorage extends about a mile each way from whence we were, and about three cables' length from the island. You may let go your anchor in 8 fathoms, sand and broken shells, but it is not good holding ground."

The CROOKED ISLANDS.—Of this singular group the best idea may be formed by returning to the particular plan of them. The positions appear to be well ascertained; and particularly of Castle Isle, or the South Key. Pitt's Town, a settlement on the N. W. part of the northern island, is the port of entry.

CASTLE ISLAND is an islet lying off the south end of the southern Crooked Island; between are several white rocks, one of which is very remarkable, appearing, when you first make it, like a white fort or castle, from which the islet takes its name. The position of the islet, previously given, was  $22^{\circ} 7' 45''$  N. and  $74^{\circ} 17' 30''$  W. Mr. De Mayne, in 1815, made it  $22^{\circ} 7' 37''$  N. and  $74^{\circ} 17' 52''$  W. So that its position may be considered as finally determined. Variation,  $4^{\circ} 40'$  E.

Between Castle Island and Fortune Island, the land forms a great indent, named the Great Bay, at the entrance of which lie the Fish Keys. These keys are not to be approached too near. Between Castle Island and Salina Point, is a fine sandy bay, called Jamaica Bay, wherein ships may anchor in 9 fathoms, well sheltered from S. W. winds. To the N. E. of this bay are two wells, with excellent water, and wood may be obtained.

FORTUNE ISLAND, distinguished by its salt ponds and wharfs, is rather more than 10 miles in length and  $\frac{1}{2}$  in breadth. It lies nearly N. N. E. and S. S. W. The south end is very bold. Off its north end are two islets; and, a little to the north of these islets, is a sandy point known by the name of French Wells. From this a small settlement will be seen, on the high land to the northward. A vessel may anchor in 8 fathoms, with the French Wells due east, 2 miles. The anchor should be let go immediately, when on the bank, only taking care to pick out a clear spot. At this place are several wells of excellent water, which give name to the point: stock and wood, also, may be obtained here.

The BIRD ROCK, or PASSAGE ISLET is a low islet off the N. W. point of Crooked Island. A very dangerous reef extends two miles from it, in a N. N. W. direction; it then trends in a circular direction, to the E. S. E., or towards the shore. This reef forms the Bird's Rocks anchorage, which is rather indifferent, the ground being partly foul.

Southward of the Bird Rock is a sandy bay called Portland Harbor, in the middle of which, close to the beach, is a well of spring water. The best anchorage in this place is off the first rocky point to the southward of the sandy bay, at about three cables' length from the shore, in 7 or 8 fathoms. You may anchor as soon as you are on the bank, with the Bird Rock bearing nearly N. N. W., but, without great caution, the anchor will be lost.

If you anchor in the sandy bay, above mentioned, you must be careful to avoid a rocky head, having only 16 feet water on it, and which lies off the centre of that bay, at about three fourths of the distance between the beach and the edge of the soundings.

**CROOKED ISLAND PASSAGE** is the best of all the windward passages for ships to sail through.

The prevailing winds being from the north quarter, as soon as you enter the passage, you will find smooth water and plenty of sea room. In the event of its blowing strong from the N. N. W., or N., you will find good anchorage under the south end of Fortune's Island, in 5 or 6 fathoms, about three quarters of a mile from the shore, with the Point bearing N. W. by N., and the sand breaker E.  $\frac{1}{2}$  S. just on the edge of soundings.

There is also anchorage at Bird Rock, but the ground is very rocky. Wood, water, and stock can be procured.

Of the Crooked Island Passage, the Count Chastenot de Puysegur says, this is the longest of these passages, but it is far the most convenient for ships coming out of the Bay of Gonaives, or from the southern ports of Hayti, and for those which are bound to the United States. These commonly take their departure from Cape St. Nicholas; and being 2 leagues from the Cape in the offing, must steer N. by W. 23 leagues, to make the S. W. point of Great Heneagua. This course will generally lead 2 leagues to the westward of the point.

When you are opposite the west point of Great Heneagua, at 2 leagues off, steer N. N. W.  $2^{\circ}$  or  $3^{\circ}$  W. for twenty-five leagues, when you will make Castle Isle, which you may approach within two miles, or nearer, without fear. If you should depart from Heneagua in the evening, it would be better to steer N. W.  $\frac{1}{2}$  N. for 17 leagues, to avoid the Hogsties; then to haul up, and make a good N. by W. course; when, having run 8 leagues, you would be one league to the westward of Castle Island.\*

Should you make Heneagua toward noon or afternoon, it will be best to drop anchor in the N. W. or Great Bay, and get under way at midnight, or at 2 in the morning, according to the strength of the breeze, and steer N. W.  $\frac{1}{2}$  N. until you have run sixteen or seventeen leagues; then haul up N. N. W. or N. by W., when there will be daylight for any thing through the rest of the passage. But should there be light baffling winds in the night, with probably a weather current, keep the lead going, and you will avoid the Hogsties; as, in advancing towards them, there will be found soundings of 50 to 30 and 20 fathoms.

From the west end of Castle Isle you steer north or N. by W. seven and a half leagues, to make the west end of Long Key. This course and distance will lead within a league of it. Continue in the same direction to make Bird Rock, off the western extreme of Crooked Island. Having thus run six leagues, you will be one and a half league west of this islet; so that the direct course from Castle Isle to the end of the passage, is N.  $5^{\circ}$  W. fourteen leagues.

When you are come to this place, you suppose yourself out of the passage; nevertheless, should the wind happen to the N. E. or E. N. E., you have to fear Watland's Island, which bears from Bird Island N.  $4^{\circ}$  W., true, twenty-three leagues; therefore, to avoid it, you ought, in leaving the passage, to keep as much to the eastward as the wind will permit; but should the wind be at S. E., and you steer at N. E., you would make Atwood's Key; so that, keeping the wind when you are out, you must observe not to steer higher to the eastward than N. E., nor more to leeward than N. by E.

**DIANA REEF**, so called from its having been discovered by his Majesty's packet Diana, when passing through Crooked Island Passage, in the year 1805. It appears that she had been driven to leeward by a westerly current, and made Long Island; and afterwards, when standing to the S. E., struck soundings on a shoal, which was not to be found in any chart. On the 5th day of December, the latitude observed was  $22^{\circ} 56' N.$ , and on the 6th it was  $22^{\circ} 54' N.$  At 3 A. M. on the 6th, they found 20 fathoms water, and continued to sound regularly, from N. W. to S. E., for about two miles, the depth about 12 fathoms, (the bottom plainly to be seen, composed of sand and rocks, like the anchorage at Crooked Island,) then suddenly had no soundings, with 25 fathoms of line. The Commodore, who stretched a quarter of a mile farther northward, had only seven fathoms. Captain Edgecumbe, of the Nassau government schooner, was once becalmed

\* The Hobart Breakers lie about 3 leagues to the S. W. of Castle Island.

near it, and rowing round in his boat, in one place found only 4 feet water. This reef is supposed to lie about 9 leagues N. W.  $\frac{1}{2}$  N. from Castle Island.

**CURRENTS.**—You have little occasion to fear the currents in this passage, which, in a fresh breeze, are scarcely perceptible; but, in calms and light winds, they may set you to the westward, but slowly and so feebly that, in a passage so short, you need not to mind them, especially as you generally make it with a large wind. Nevertheless, in the months of June, July, and August, when calms or light westerly winds are common, you may experience a current setting to the west, strong enough to alter your course; which effect only can happen in this passage, and is occasioned by the proximity of the extensive shoals, forming the channel of Bahama and those of Providence Island. In this season it would be proper, if you have a wind sufficient to make you go more than two knots an hour, to allow a quarter of a mile an hour for the current setting to the westward; if you go three knots and upwards, this allowance will be unnecessary.

**WINDS.**—The N. E. trade generally prevails here, except from October to April, which are considered as the winter months: during these months you have, sometimes, strong gales from the N. W. and very variable weather; particularly about the full and change of the moon which ought to be guarded against.

The MIRA-POR-VOS, an assemblage of barren rocks, with one low sandy islet, lies to the west of Castle Island, in  $22^{\circ} 7' N.$ , on a shoal similar to that of the Hogsties. They are very dangerous, and should be carefully avoided, particularly when the islands bear in a N. W. direction.

When the wind blows from the northward, they break very heavy, and at all times a heavy swell; the current generally sets from the N. E. one mile per hour. On the western side is an indifferent anchorage; the east side is bold, and on the S. E. side, at a mile distant, there are from 20 to 25 fathoms, coral and rocky ground. As these keys are to leeward, they are not often seen by vessels in ranging along Castle Island; however, if it is necessary to turn, you may approach the bank within half a league. All the dangerous parts break, and the white ground will give you notice in good time. You may, if you choose, pass to the westward of the Mira-por-vos, with the precaution only, of not approaching too near. Captain William Dowers was passing this way in an evening of January, 1814, and came suddenly on a reef stretching out from the S. W. Key, which bore east,  $\frac{1}{2}$  miles. Captain Dowers says, "We had 10 fathoms, sand, while in stays; but observed black rocks and less water in many places."

"This reef appears to run off west for 3 miles, and then extends to the S. S. E. for some distance. We counted ten above water. They are all barren rocks, excepting the S. W. which is a low sandy island, about half a mile in length, and covered with brush-wood."

The Mira-por-vos range nearly N. E. and S. W. The middle of the group bears W. 11 miles, from Castle Island. In making them you will gain soundings in 11 fathoms; and at three quarters of a mile thence may pass to the westward of them; but the general channel is between them and Castle Island. High water fall and change  $9\frac{1}{2}$  30m.

**TO RAGGED ISLAND, (ONE OF THE BAHAMAS.)**—It lies in lat.  $22^{\circ} 8' N.$  If bound to it from the Windward Islands, a N. W. course from Cape Maize, will fetch it, distance 45 leagues. Vessels bound to Ragged Island should pass to the northward of Key Verde, in lat.  $22^{\circ} 00' N.$ , thence steer W.  $\frac{1}{2}$  N. by compass for Ragged Island. The island is surrounded by innumerable dangers, whose local positions are but little known. I would advise all masters of vessels bound to it, in coming up the straits, to keep the Cuba shore on board until they run up as high as the well noted high hills of Givari, which is a Saddle Hill; then steer as above directed, and if they exceed 8 feet draft of water, keep the island under their lee, and run the shore close on board until they bring the flag-staff and houses to bear due south, then you will open the entrance into the harbor, when you must haul in S. W.; then ahead of you, a small Key, with storehouses on it, will appear, and at your entrance into the harbor, a low black rock will appear on your starboard side; give it a berth, and in running in, you will observe a large red Cal Bank on your larboard side, which you may run close to until you come abreast of a low black point of rock on the same quarter, and when you come abreast of a couple of cannon mounted thereon, you may drop your anchor in 3 or 4 fathoms water, until a pilot boards you, unless he may have met you on the outside. Ragged Island is distinguishable from all other sounding keys by a lofty hill about the middle of it, the number of houses and inclosures, as well as the flag staff that appears on it. Vessels running far from Cape Maize or Barracoa generally make Key Verde, close up to which, either to windward or leeward, there is plenty water for vessels of any draft. Due south of Ragged Island, distance 4 leagues, there are three small keys close to each other, called the Brothers, that have from 2 to 3 fathoms water close up to them. Kiobanc or St. Domingo Key lies S. by E. of Ragged Island, distance 12 leagues, to leeward of which there is plenty of water; but no vessels should attempt to edge the bank

to windward of it until you are close under the lee of Key Verde, as there are many dangerous ledges of rocks betwixt them, on the edge of the Straits, on which many vessels have been lost.

*Remarks on the action of the ebb and flow of tides at Ragged Island, by DUNCAN TAYLOR.*—From the first of January to the last of April they flow from 16 to 18 inches, and the tide that flows an hour after the rising of the moon, is uniformly 6 or 8 inches higher than the tide which flows after the setting of the moon.

I have frequently, during the above months, observed them not to flow more than from 6 to 12 inches. The spring tides during the above months, generally rise from 6 to 10 inches higher than the common tides.

From the beginning of May to the first of October, both tides gradually flow till they arrive at the height of from 10 inches to 2 feet 4 inches, and from 18 inches to 3 feet 6 inches, and then continue diminishing until the month of January.

*Directions for sailing from Jamaica, through the Windward Channel and Crooked Island Passage.*

To those who are bound from Jamaica to Europe, or any part of the north-eastward, it is recommended, if possible, to take the Crooked Island Passage in preference to any other. From Point Morant, Jamaica, you should endeavor to gain easting as soon as possible; and by taking advantage of the wind's shifting from N. N. E. to east, which it generally does in the night, you will gain ground very fast; and by working up under Cape Dame Marie, on Hayti, you will avoid a strong set to the S. W., caused by the trade wind.

There is found, however, at times, great difficulty in working around Cape Maize, owing to the strong lee-current which generally prevails with a strong N. N. E. wind, particularly in the months of January, February, March, and April, during which months the strong northerly winds prevail. This current is found to run strongest between Cape Maize and Cape Dame Marie (or Donna Maria,) the stream occupying a space in breadth equal to the distance between the contracting points, and runs at the rate of two knots an hour, setting, during the strong N. E. winds, to the S. W. between the N. E. end of Jamaica and the Morant Keys.

Some commanders, after clearing the east end of Jamaica, have stood over to the Cuba shore, in order to round Cape Maize; but they, also, have found a strong lee-current, and having little or no land-wind to assist them in working along the south side of that land, in the months above mentioned, they have at last been obliged to bear up for the Gulf Passage.

It is to be understood that the following directions are not intended as a standing rule for working, at all times, around Cape Maize. In the fine season there are variable winds, and the current is sometimes in your favor, of which every advantage should be taken, according to circumstances.

In sailing between Cape Maize and Cape St. Nicholas, the Montagnes de la Hotte, or Grand Anse Mountains, (the westernmost high land of Hayti,) are often seen. They may be descried at the distance of 30 or 40 leagues; and by their situation and bearing, become a good guide in working up the Windward Channel.

In sailing from Port Royal to windward, and finding a strong lee-current against you, stand well out, and work in the stream of the Morant Keys, endeavoring to get to the eastward of those keys as soon as possible. The Morant Keys are by no means dangerous, as they can at all times of the day be seen at a sufficient distance to avoid the dangers that surround them; under the N. W. side is anchorage.

Having made the Morant Keys, stand well to the eastward, and keep working, in a direct line, for the high land over Point Boucan, which is to the E. S. E. of Cape Tiburon; and by not standing further to the westward than with Cape Tiburon bearing N. E. you will avoid the stream of the current, and gain ground very fast. When you have advanced as far to the northward as  $17^{\circ} 40'$ , you will sometimes meet with a counter current, and it frequently happens, particularly in the night, that squalls are met with from the southward, which are caused by the high lands of Hayti. In this case, keep well to the eastward of the Isle Navaza, between it and Cape Tiburon. With frequent flaws of wind in your favor, endeavor to get close under Cape Tiburon, and keep working along that shore, which is very bold, to Cape Dame Marie; and, by not standing further off shore than 7 or 8 miles, you find a very little current.\*

In the channel between Cape Nicholas and Cape Maize, the current sets with great strength, particularly on the Cuba side, where it however varies with the seasons. It

\* It has however, been observed that by keeping too close in with the land about the S. W. end of Hayti, you may be becalmed for a month.

is, therefore, necessary to work up to Cape Nicholas before you attempt to weather Cape Maize; and by keeping within the line of Cape Nicholas and Cape Dame Marie, you will work to windward very fast. When Cape Maize is brought to the westward of north, you may venture to stand across the channel to the northward, and you will generally, as you stand over, find the wind more easterly. Fetch over to the Great Heneagua, as that island should always be made if possible.

In proceeding from off Cape Maize for the Crooked Island Passage, make the land of Heneagua if it be possible, as short departures are best in navigating among these islands, particularly as the currents are found in various directions.

On proceeding from Great Heneagua to Castle Island, you should leave Heneagua so as to allow sufficient time for entering the Crooked Island Passage before dark, or in the evening, so as to arrive there by daylight in the morning. The latter is generally preferred. The course from Great Heneagua to Castle Island is N. W. by N.

Having entered between Castle Island and the Mira-por-vos, the course to Long Key is N. by W.  $\frac{3}{4}$  W. 7 or 8 leagues. Towards the northern end of Long Key is a rise of land, with a flag-staff on the summit. In advancing towards this place, you will perceive a sandy point, called the French Wells, off which there is good anchorage for men of war, in 7 fathoms, about two miles from shore.

From abreast of Fish Keys to the Bird Rock, off the N. W. point of Crooked Island, the course and distance are north,  $8\frac{1}{2}$  leagues. You may run along shore, there being no danger but what may be seen in the day. The Bird Rock lies in lat.  $22^{\circ} 48' 50''$ , long.  $74^{\circ} 19' 25''$ .

When you get abreast of this key, you may with safety haul up N. E. if the wind permits to go clear of Watland's Island. It is very dangerous to approach Watland's Isle in little wind or calms, the current setting wholly on it: as it is very rocky and steep to, there would be no possibility of saving the ship. Capt. Hester observes, in his Journals, that it had been remarked of late years, by those who have passed both ways through the Crooked Island Passage, that in going to the northward you can seldom clear Watland's Island, after you are past Crooked Island, without beating to windward; and going to the southward, after you are past the Mira-por-vos and the Hogsties, it is difficult weathering or rounding Cape Maize.

**BROWN'S SHOAL.**—For our knowledge of this danger we are indebted to Capt. Livingston, who has given us the following account of it:—"Brown's Shoal, 10 leagues S. S. E., by compass, from Key Verde, was seen by Capt. William Brown, of the schooner Union, of Plymouth, Mass., who stated to me that it is of considerable extent, and that, from the manner in which the sea broke over it, he does not suppose there can be more than 2 or 3 feet of water on the shoalest part. Latitude and longitude, inferred from the position of Key Verde,  $21^{\circ} 30' N.$  and  $74^{\circ} 52' W.$

The **HOGSTIES** are three low keys, encompassed to the eastward by an extensive reef. They lie at the distance of ten leagues N. by W.  $\frac{3}{4}$  W. from the N. W. point of Heneagua. About them are many rocks and broken ground, and when it blows hard the sea breaks over them all. The southernmost is the smallest, and bears from the middle key, which is the largest, S. S. E. The smallest requires a good berth, it being shoal all round; but you may sail close to the largest, and anchor in 4 or 6 fathoms, with that key bearing E. S. E. About a mile to the westward of the Hogsties is a depth of 18 and 20 fathoms.

**GREAT HENEAGUA.**—Great Heneagua is rather low, and cannot be seen at a considerable distance, in consequence of the haze which constantly prevails in these latitudes. In making the west end there is no danger whatever. Two sandy bays at that end afford good anchorage. From the trade wind's blowing over the island, the northernmost bay is the best. Stand in, and you will perceive the line of soundings by the color of the water, extending about half a mile from the beach. So soon as you are in soundings, let go your anchor in 6 or 7 fathoms.

This island is about 15 leagues in length, and 10 miles in breadth. The body of it lies in lat.  $21^{\circ} 5' N.$  Fresh water may be procured in the northernmost bay, on the west side, at a small distance from the beach.

A shoal, marked doubtful, which is exhibited on some charts as lying off the S. W. end of Great Heneagua, has been carefully sought for, and said not to exist, but we think otherwise.

M. Chastenet de Puysegur says, "Great Heneagua, like all the islands which bound the Windward Passages, is very low, with small hummocks, which, at a distance, appear like detached islets. The land, in clear weather, may be seen at the distance of 5 or 6 leagues, and you need not fear coming within half a league on the western side. In a fine bay which you leave on your starboard side when going through the passage, you may anchor on white bottom, choosing your ground by your eye, as in many parts of such bottom there are stones which sometimes rise to a considerable height above the level of the sand."

There are some rocks about the southwest point, with a reef which stretches out to nearly the extent of a mile. In the bay between this and the west point, called Shallow Bay, you may anchor close in. The bay is surrounded by a reef, which, however, shows itself, although there are 2 or 3 fathoms over it. Without the reef is a white sand, to the distance of three cables' length, and on this is the anchorage, in 7 or 8 fathoms. Farther out, in a line between the two points, which lie S. S. E. and N. N. W. from each other, in 15 fathoms, is rocky ground. This bay is not so deep as the Great Bay; but, as the bank is less steep, ships are not so liable to drive here; neither is the landing so easy, but there are clear places in the reef. There is no water but in the rainy season; then it is not very good, as it lies among the mangrove bushes.

The GREAT BAY is sheltered from the north by the north-west point, and from the south by the west point. This bay is two and a half leagues wide, and one deep; and all along the shore there is a border of sand four cables' length wide, on which you will have 5 fathoms, at a pistol shot from the shore, to 15½ fathoms; and at half a cable's length from that, 45 fathoms of water. If you should be there in the season of the norths, you may anchor under the north-west point, so as to be sheltered from the W. N. W.; and if there when the southerly winds prevail, you may anchor under the south point so as to be sheltered from the W. S. W. There are not more than four or five points of the westerly winds which could hurt you; but they are not to be feared, as they seldom blow, and never violently. It is easy landing all round the bay.

Having rounded the N. W. point, you will see a little islet to the E. N. E. and a ledge of reefs for more than a league along the shore, and upwards of a mile from it. This coast will be known by a hummock, (le Mornet,) the only one on the north side, which is lower than the south, and covered with bushes.

At the eastern part of the north side of Heneagua is a bay, 3 leagues wide, and nearly one deep, where you may anchor, but will be sheltered from southerly winds only. This bay is little known. At about a mile from the S. E. point is a little islet, and around it the bottom appears white: upon this you may anchor, at about a musket shot from the island. The white bottom continues along the south part, with here and there some reefs with breakers.

**BISHOP'S REEF.**—This is a very dangerous reef, bearing, by compass, E. S. E. from the rock at the N. E. point of Great Heneagua. Capt. Livingston, who has given us the information, says, "I saw it in September, 1816, on my passage from Jamaica to Charleston, S. C., in the brigantine Agnes, of Greenock, then under my command. The sea broke very heavy on it; and, from appearances, I cannot suppose that there are more than 3 to 5 feet water on the shoalest part of it. The white water showed at a considerable distance to the eastward of the breakers, and I am disposed to think the shoal extends fully two leagues out, from the N. E. end of Great Heneagua; but I conjecture there is a passage between it and the island."

"I was informed by the late Francis Owen, master attendant at Port Royal, Jamaica, that the Statira frigate was lost upon this shoal, and Mr. Owen mentioned that it had been seen many years ago by Mr. Bishop. The variation here is only about one quarter of a point easterly, but it increases near St. Domingo."

In his notice of a rock, supposed to be this, Mr. Bishop says, when it bore N. W. ½ W., distant about 2 leagues, they saw the ground under them, having no more than 3½ fathoms water: therefore hauled up S. S. E. and kept the lead going till they had from 3½ to 4, 4½, 8, 10 fathoms, and then no ground.

**LITTLE HENEAGUA.**—This island, which lies to the northward of the N. E. point of Great Heneagua, is low and uneven, except a little mount or hummock, which is at an equal distance from the N. E. and S. W. points; not far from the shore, almost round the island, it is sandy, except at the S. E. point, where a ledge of rocks stretches off and breaks, nearly one mile and a half. On the south side there is a white bottom, bordered with a reef, at the foot of which is a depth of 40 fathoms. This island is divided from Great Heneagua by a deep channel, a league and a half in breadth.

**CUIDADO REEF.**—The shoal thus named lies to the northward of the eastern side of Little Heneagua, bearing N. ½ E., by compass, 6 leagues from the body of that island. S. S. E. ½ E. 10½ leagues from the S. W. point of Mogane, and N. W. by W. ½ W. 10 leagues from the West Cayco, is a very dangerous reef of sunken rocks, called by the Spaniards the Cuidado Reef. The body of it lies in about 21° 53' N., and 72° 55' W. This reef was seen in passing, by Mr. De Mayne, in the Landrail, surveying cutter, 1816, and is particularly to be noticed as lying in a direct line between Little Heneagua and the east end of Mayaguana, and only a few miles to the west of a line between the West Cayco and the S. W. point of Mayaguana, being nearly in mid-channel between each.

**MAYAGUANA** is an island, 8 leagues in length, between the parallels of 22° 18' and 22° 30' N. It is surrounded by a reef, which runs above a league and a half to the

eastward. water. N. with a small water, on a go through

It is there and also wit Crooked Isl Islands and Castle Islan are in lat. 22 leagues, and

\* Captain M quarters further He has, I und spring-well on

eastward. On the eastern part of this reef are several keys, and 5 or 6 huge rocks above water. Near the northernmost point of it is an islet, three quarters of a mile long, with a small key to the S. W. of it. The rest of the reef is bordered with rocks under water, on which the sea breaks. On the south side is a passage for small vessels, to go through, and be sheltered by Mayaguana on one side, and the reef on the other.\*

From the S. W. to the N. W. point of Mayaguana, the coast is clear, and forms two bays, the bottoms of which are of white sand, where you may anchor at about two cables' length from the land. The two points lie N. N. E. and S. S. W. from each other, distant 7 miles. It is very necessary to be acquainted with these anchoring places, as you might be caught here with a north; then it would be better to anchor under the N. W. point, where you would be sheltered from the N. N. W., N. E., E. S. E., and as far as the S. S. W., and that by the island and reefs, which run a long league to the N. W., and on which the sea breaks with great violence. From the N. W. point the coast inclines to the E. and E. S. E. forming a kind of bay, bordered by reefs 3 miles from land, and having some passages for very small vessels. At the east point of this bay, a little inland, are two little hillocks; then the coast trends E. S. E. full five leagues to the east point, which we have already described. Mayaguana and Caycos Islands form the Caycos Passage.

The FRENCH KEYS, between Mayaguana and the Crooked Islands, have been described by the pilot of the Eagle, a French bark, as follows: "These keys, hitherto but little known, have been said to be three; but what probably gave rise to that, was a rock which appeared out of water as high as a boat. It is about half a mile to the N. E. of the largest island, among the reefs and banks east from which, 4 miles distant from the N. E. point, lies a dangerous rock, even with the water's edge," says the pilot, "we stood for the French Islands, and anchored in the white water on the west side of the largest, about two cables' length from it, sheltered by a reef, which runs to the N. and N. W. 2 miles.

"This island is no more than 3 miles north and south, and half as much east and west. The east and north sides are surrounded by reefs which break. The anchorage is about three quarters of a mile from the south point, near which is a landing place; and by digging two or three feet in the sand, you will get good fresh water. Some English people, who were wrecked here, had made a pond, which dried up on the Eagle's filling four casks out of it, but in a quarter of an hour it was as full as ever. It is very surprising, that at about ten paces from it there is a salt water pond. This island is low and almost even, though when you are at a distance there appear some small risings, which diversify a little its appearance. The ground is nothing but sand or rock, with some bushes upon it, fit only for firing. The other island, which is the smallest, lies east and west, about two miles to the eastward of the first; but the passage between them, made very narrow by the reefs on both sides, is not a mile wide, and is fit only for small craft."

*On Mayaguana and Crooked's Key Passage; translated from the French.*

This passage may be very useful and convenient:

1. For ships intended for Crooked Island Passage, and meeting, after they are past Heneagua, with the wind at north, N. N. W. or N. W.; then, not being able to sail up to Castle Island, they are obliged to sail to the southward of these islands, going along the Planas or French Keys, and between Mayaguana and Atwood's Key.

2. For those intending to go through the Caycos Passage, who, when advanced to the West Caycos, if the wind is at N. N. E., would be obliged to sail to the southward of Mayaguana, and to pass between this island and Atwood's Key.

3. When they are about, assing between the two islands, if the N. N. E. wind is too near, they may advance westward, and sail between Atwood's Key and the Crooked Island.

It is therefore of great importance that you should be acquainted with the dangers, and also with the places where you may anchor about these islands. If, in going for Crooked Island Passage, the wind obliges you to pass to the southward of the Crooked Islands and the French Keys, it is usual to sail mid-channel, between the Hogsties and Castle Island, from which they are distant 11 leagues, and then make the Planas, which are in lat.  $23^{\circ} 43'$  or thereabout. They bear N. by E. from the Hogsties, about 20 leagues, and lie 5 leagues to the eastward of the N. E. point of Crooked Islands. You

\* Captain McGowan was lately cast away on Mayaguana Reef. He says it lies a mile and three quarters farther out than the charts shows. I previously considered that it did, a mile and a half. He has, I understand, determined the position of some points in the Passage Islands, and found a spring-well on Heneagua; a matter of much importance under a tropical sun.

may safely pass them and the latter, keeping mid-channel, or rather over to the French Keys; for in case of necessity you may anchor on the west side of the largest of them.

*Passage between Crooked Islands and Atwood's Key.*

Those who are obliged to pass to the westward of the French Keys, may go between Crooked Island and Atwood's Key, which is a very good passage, 5 leagues wide. After having the French Keys about a league to the eastward of you, make your course N. N. E. a little eastwardly, 10 leagues; you will then get sight of the east point of Atwood's Key, which you must not approach nearer than 4 or 5 miles; but having brought it S. W. from you, 2 or 3 leagues, there is nothing to be feared.

It is necessary to observe that the Norths in this passage are very dangerous winds, and may throw you upon the reefs, which border all the banks on the east side of the Crooked Islands: this happened to the French man of war, the *Orox*, 1736, which was very near being wrecked, and was obliged to anchor close to them in foul ground.

Being in sight of the French Keys, you may also, according to circumstances, pass to the southward of them, giving them a berth of 4 or 6 miles: and, having cleared them, stand away to the northward, to sail between Atwood's Key and Mayaguana, which is a fine clear passage.

The CAYCOS.—The Caycos are an assemblage of several islands and islets, which inclose a white bank, some parts of which are very shallow, and others tolerably deep. There are four principal islands, viz., the Grand Cayco, the North Cayco, the North-west or Providence Cayco, and the Little or West Cayco: these form a semi-circle from the east to the west, round by the north, and are terminated on the south part by a great bank, on which there are from 3 to 15 feet of water.

The northern part of these islands is bordered with a white shoal, on which is a reef, extending half a league from the shore; at the N. E. part the white shoal extends outward a whole league; and, at its extremity, is a reef called Basse St. Philippe, or St. Philip's Reef, on which the sea breaks with violence. At a cable's length to the north and the east of this shoal, you will not have less than 7 fathoms. South of it the white bottom extends to the south, and approaches imperceptibly towards the shore; you find 4 or 6 fathoms between it and the shore, which in an urgent case leaves a sure passage.

From the south point of the Little Cayco, a chain of breakers extends to the east three leagues, after which they decrease, trending southward, to join a sandy islet called French Key. This is low, with some bushes on it, and bears from the south point of Little Cayco nearly E. S. E. five leagues. The reef from the French Key stretches to the south seven and a half leagues, to join another sandy islet, which has not more than 20 paces extent, and is entirely drowned at high water; all this part of the reef is bold, and, as the water breaks pretty strongly upon it, you readily see it; but, south of the sandy islet, there are no breakers, and you cannot have notice of the edge of the bank, but by the whiteness of the water.

From this sandy islet the bank sweeps a short league to the south, then to the S. E. six leagues, whence it trenches to the east five and a half leagues, and N. N. W. two and a half leagues to abreast of the southern islets, which are situated more than a league within the white water.

From the sandy islets, as far as abreast of the southern ones, the bank is very dangerous; you cannot see any land, and come suddenly from a sea without bottom into 2 or 3 fathoms. The color of the water is the only thing that can warn you of the danger; and this is by no means certain, for navigators, accustomed to see on the surface of the water the shadow of clouds, which sometimes has the appearance of shoals, are often lulled into a fatal security. No motive then ought to induce you to approach this part of the bank, and you will do right to keep at a good distance.

If, after having been turned to windward several days in this neighborhood, you have not seen the land, the safest way is never to cross the latitude  $21^{\circ}$  in the night, but to wait for daylight; then, should you perceive any change in the water, which indicates white grounds, without seeing either land or breakers, you may be sure you are on the western side; when you may steer N. W.  $\frac{1}{2}$  W. to fetch the Little Cayco, and go through the passage to leeward of these islands.

Should you see the southern islets bearing about north or N. W. you may stand on upon the white water, in from 7 to 12 fathoms; then make a tack or two to get to windward, and go through the Turk's Island Passage, which is to windward of the Caycos.

So soon as you see the southern islets, the bank is no longer dangerous, and you may go on it as far as one or one and a half league: south and S. W. of these islands you will not have less than 7 fathoms, and generally from 9 to 11.

\* A shoal cal shoal was disco from Grand Key proached without

rowest part : it is a good passage, and without any danger ;\* you may come within half a league of the Caycos, and on the eastern side of the islets without fear. Through this passage you may turn with great safety, and will not feel the current, if you do not come within one and a half league of the shore.

You will find an anchorage on the white shoals, near the south point of the Great Cayco, which may shelter ships that do not draw more than 15 or 16 feet ; west of this point there is a fresh water lagoon.

The best anchorage for small vessels is to the west of the North Cayco, near the small Island of Pines, in the inlet which that island makes with Providence Island. Within the reef that border that part of the coast, lies L'Anse a l'Eau, (Watering Bay) where you anchor in 3 fathoms, upon a white bottom : there is good water, and it is the watering-place of the *Providenciers*. You will discover the entrance of the bay, by coasting along the reef, from the rounding in of the coast, after passing the west point of the Three Maries and Booby Rocks. When you perceive a great extent of white water within the reef, you must send your boat to find the channel, and moor her in it, making use of your lead : and, if you want to get in, be not afraid of coming near the reef. When you are once within the reef, you may let go your anchor in 3 fathoms : you may go farther in, by towing or turning with caution ; the entrance is not more than half a league or two miles from the shore.

At the N. W. point of Providence Key, the reef terminates. There is anchorage off this coast in 8 or 10 fathoms, but you must range the shore pretty close to be on the White Shoals, bringing a steep hummock, seen a quarter of a league inland, to bear S. W. then you will see the shoal recede a little from the shore, and afford a large space for the turning of the ship. Four miles south of the N. W. point, a reef commences from the coast, running S. W. westerly  $2\frac{1}{4}$  leagues : this reef is terminated by a small sandy islet, almost under water.

From this sandy islet the reef runs in to the eastward, and afterwards trenches out to join the north part, off the Little Cayco, which is surrounded with white shoals.

The Little Cayco bears S. W. by S. from the N. W. point of Providence Cayco, which is of a middling height, and of a white color ; you may range along the N. W. part, close to the edge of the white grounds : the west part is very bold to the south point, where you may anchor in from 5 to 7 fathoms on the white bottom.

Of the Caycos and Mayaguana Passages, Captain Livingston has said, "For vessels bound from North America to Jamaica, I consider the Caycos Passage preferable to that of Turk's Islands, which has been commonly used ; because, if you can only distinctly make out the N. W. point of the Caycos, and bring it to bear E. or E. by N. however dark the night may be, you may run safely, steering at first S. W.  $\frac{1}{2}$  W. by compass, 5 leagues, and then S. by W. till daylight ; by which courses you run no risk, either from the Caycos Reefs or the Heneagua ; and, however fast your vessel may sail, you have more distance than you can run in one night before you can make Hayti or St. Domingo. By steering this course, or rather these courses, you also avoid all danger of being dragged by a lee current down upon the coast of Cuba."

The Caycos Passage is also recommended as the best passage for ships bound from Cape Haytien, formerly Cape Francois, when the winds are not steady from the E. S. E. You will always go with a large wind, which is of great advantage ; and will avoid all the white grounds to the S. E. of the Caycos, which it has been customary to make. This custom of coming to the white grounds is very dangerous ; but there is no risk in making the land some leagues to leeward of the Little Cayco.

In leaving the Cape, you must steer a N. by W. course ; and after having thus run 35 leagues you will find yourself  $2\frac{1}{4}$  leagues S. W. of the Little Cayco ; then you may haul up your wind, first as high as north only, on account of the reefs of Sandy Key, which lie to the north of the Little Cayco ; after which you may steer N. by E. 5 or 6 leagues, when you may haul up N. E. or continue to steer north without any fear. Having run 10 or 12 leagues on this course, you will be out of the Passage.

If, when you are two leagues S. W. of the Little Cayco, the winds do not permit you to steer N. by E. or to make a good north course, after having run 13 leagues, without getting sight of Mayaguana, the best way, if night comes on, is to tack and stand to the S. E. 3 or 4 leagues ; then tack again to the north, and you will weather, by 3 or 4 leagues, the breakers off the east point of Mayaguana.

If, when you are to the S. W. of the Little Cayco, two or three leagues, and the wind will not suffer you to lay north, you must not attempt to go to windward of Mayaguana,

\* A shoal called the Swimmer Bank, lies on the western side, as shown on the Chart. This shoal was discovered some years since, by Mr. Cooper, master of the vessel Speedwell, and bears from Grand Key, S. W. by W. six and a half leagues. It is dangerous, and should not be approached without great caution.

but must fetch the channel between it and the French Keys. You steer for it N. W.  $\frac{1}{2}$  N. Having run 12 leagues, you will come in sight of the S. W. point of Mayaguana, which ought to be north of you, two leagues distant; you do not run any risk in approaching this point, which is safe. A small white shoal extends from it, with three fathoms water on it, almost close to the shore.\*

When you have doubled the west end of Mayaguana, so as to bring it to bear east, you may, if the wind permits, steer N. In that case you will pass 4 or 5 leagues to the windward of Atwood's Key; but, if your course is not better than N. by W. after having run on 12 or 13 leagues, and the night comes on before you can see that island, tack and stand on for 5 or 6 leagues. Then, if you can make good a N. by W. course on the other tack, you will weather the eastern breakers of Atwood's Key, at about 3 leagues. Should you be 2 leagues from the west point of Mayaguana, and the wind will permit you to make a course only N. N. W. after having run thus 6 leagues, you will see the French Keys, bearing nearly W. N. W. 2 leagues. You may pass to windward or to leeward of them, as the wind may admit. When you are 2 leagues N. N. W. or N. W. by N. from them, upon running in that direction, 12 or 13 leagues, you will be out of the passage. You must not go in the least to the northward of this course, as the breakers off the west point of Atwood's Key bear nearly N. N. W. from the westernmost of the French Keys.

The French Keys are very low; they bear from the S. W. point of Mayaguana N. W.  $\frac{1}{4}$  N. 8 leagues. You may go pretty close on the east, north and south sides: the white bottom which encloses them, being pretty steep. On the N. W. of the large island, the reef running out some little way, it is necessary to give it a good berth. You may anchor in the S. W. part on the white bottom, but very close to the shore. There is a small lagoon of fresh water, supplied entirely by the rain. The isles have been previously described.

On leaving Cape Haytien, you will generally find the wind at S. E. or E. S. E. and near the shore the current runs to windward: these are two powerful inducements to engage you to steer N. E. or N. N. E. for the Turk's Island Passage: but, at about 10 or 11 o'clock, the wind generally chops round to the E. N. E. or N. E. Being then 5 or 6 leagues from the coast, and the current no longer felt, you would necessarily make the white grounds to the southward of the Caycos. This circumstance has caused many shipwrecks, merely from the eagerness of going 20 leagues to windward, in a voyage of perhaps 1500 leagues. Under these circumstances, I would advise mariners from the Cape to steer at once for the Little Cayco.

*Additional Remarks on the Coasts, Isles, &c. which form the Windward Passages; by several French and English Navigators.*

CAYCOS PASSAGE, &c. by Capt. Hester.—After having cleared the east end of Jamaica, says the Captain, I would endeavor to get to the eastward as fast as possible, taking every advantage of wind. In so doing, when advanced to Cape Nicholas, I would prefer the beating up as high as the island of Tortue, (or Tortuga, or Turtle Island) and take my departure for the Caycos Passage, thinking it less tedious and difficult than the passage by Crooked Island.

From the Mole to the west end of Tortue, in latitude  $20^{\circ} 5' 20''$ , the course is N. E. by E. about eleven leagues. It is all a bold clear shore, giving it 2 or 3 miles berth.—The N. E. part is foul 3 or 4 miles, but from that part down to the west end it is bold; and the west end is as steep as a house-side. When the high hill, which is seen over Port Paix, bears S. W. by S. then the east end of the island is between you and it.

From off the middle of the Island Tortue, to go between Heneagua and the Caycos, take your departure in the evening, steering north by compass, taking care not to run more than 18 leagues at the most before daylight, with the distance off from it included, at taking your departure; when, if you see nothing of the east end of Great Heneagua, continue your course for 7 or 8 leagues, and you will not fail of seeing the Little Caycos, or Little Heneagua.

You may borrow near to the Caycos, and haul your wind to N. E. which will clear you of Mayaguana, and its reef, the outer point of which lies in latitude  $22^{\circ} 20'$ , then you are in the open ocean, clear of every thing.

If you find a leeward current, or a scant wind, between Heneagua, and the West Cayco, so that you cannot weather Mayaguana and its reef, you may bear up and sail under the lee or west end of Mayaguana, there being no danger but what you may see, to sail between Mayaguana and the French Keys, which is a wide and fair channel. Then you

haul your wind to windward of Atwood's Key, which lies in latitude of  $23^{\circ} 11'$ . In going through either of these passages, there is a greater advantage gained, with less trouble, and sooner, than by Crooked Island Passage. Though I think that, in time of war, it would be very tedious and difficult to attempt any of them with a convoy: not only because you are so fully exposed to be annoyed by cruisers and privateers, but also because of the almost impossibility of keeping a number of vessels together in these narrow channels. As for the Turk's Island Passage, in sailing to the northward, I would not offer to mention it, looking upon it to be both tedious and hazardous: but in coming from the northward, it is, in my opinion, a very easy, safe and expeditious passage.

*Caycos, &c. translated from the French.*

The Little Cayco extends N. N. E. and S. S. W. about 7 miles, being its whole length. You may anchor all along the western side, there being 4 or 5 fathoms water close to the land; but it is a hard bottom, and too near the shore. At the N. E. point is a bank of rocks, extending to the N. E. near a mile, on which the sea breaks; there are 2 and 3 fathoms close to it.

The length of the Little Cayco has been measured in a boat in a fresh breeze, and smooth water; the log bore frequently, and there was not any difference in the going and coming back, therefore it is probably very exact. This island is of low land, whose border is of sharp stones, which resound like a bell: it is the worst ground which can be seen; there are neither salt-pits, savannahs, nor fresh water. On the north side, about 200 paces from the shore, there grow in the sand a few *Lataniers*, which always denote a bad ground: the inland parts are covered with bushes. There are some ponds with brackish water; and, as rain is not uncommon here, people who have the misfortune to be cast away on this isle, may obtain fresh water.

By good observations, the latitude of the S. W. point is  $21^{\circ} 36'$ , longitude  $72^{\circ} 26'$ ; you may run along the south side, very close to it, upon the White Bank, in 5 or 6 fathoms, and no reef. When that point bears north, you have a full view of all the Caycos Bank. This elbow is a shelter against the north, for there are 5 or 6 fathoms of water close to the breakers, which are very near the land.

Although the west side of the Little Cayco is quite clear of rocks, and there are 6 or 7 fathoms within musket shot of the shore, so that you may anchor there, yet the best place to anchor (and which is most known) is under the N. W. point, rather within it, in 8 fathoms, sandy bottom: there you are sheltered from the easterly breezes. It is prudent, however, to have another anchor S. by W. in 14 fathoms, clear ground: this precaution will secure you against a sudden westerly wind; and by that, in case it should continue, you get easier under weigh.

The north side of the Little Cayco is covered by a reef, beginning off the N. W. point and stretching as far as the Great Cayco. This reef is the only difficulty in the passage between. It is nearly 4 leagues from the N. W. point of the Little Cayco to the N. W. Point of the Great Cayco, and the reef extends along that space; that is, as far as the western point of the Great Cayco, which is about  $2\frac{1}{2}$  miles distant from the N. W. point of the island. To the southward of the last point is Canoe Cove, (L'Anse au Canon,) the only good anchorage in this western part, of which we shall speak hereafter.

On the west side of the reef there is a little key, called Sand Key, bearing north-west-erly from the east part of the Little Cayco. It is very low, and has a reef on its north part. Many ships have been lost on it, by its not having been laid down in the charts; for, after their running along the west side of the West Cayco, they have hauled to the eastward for the Providence Cayco; whereas, when you have run along the former about a league, you should make a N. by W. course, to give a berth to the Little Key, and the reef which stretches to the northward of it.

To the southward of the islet, between that and the reef, is a passage of about  $1\frac{1}{2}$  mile, to the Bank. Without the islets are 10, 8, and 6 fathoms; in the middle 4 fathoms, and within it 3; but then you immediately come into 2 fathoms.

From Sandy Key, the reef runs N. N. E. 2 leagues, being bordered with white water, on which you have 10 fathoms, within musket shot of the reef that joins the N. W. part of the Great Cayco, a little to the southward of Canoe Cove.

It has happened that ships intending to go through the Caycos Passage, have made Little Heneagua, either by inattention or from the currents. To make sure of being far enough to the windward, when bound from Cape Haytien, you should make your course good N. or N. by E. 25 or 26 leagues, and you will see the white water on the banks, which you may run along at the distance of a league without fear. On the western edge of the bank is the islet called Sandy Key, which you may approach within that distance; then make a N. W. course, and, four leagues from Sandy Key, you will see French Key; when the latter is north from you, thence steer W. by N.  $6\frac{1}{2}$  leagues,

which will bring you south from the Little Cayco; and being past this, you are to make a N. or N. by E. course, as before directed.

According to the survey, made with great care, the white bank and the reef continue between the French Key and the Little Cayco. You may run along them very near, in 10 fathoms, and you will see the openings in the reef, through which small vessels go in upon the bank.

The reef which borders the White Bank, from the Little Cayco to French Key, begins one league east from the former, and it always breaks. You may stand very near it coming from sea; but if you are upon the bank, you must take great care, for half a mile within, you will find but 3 fathoms water; and in getting nearer, it shoals very quickly. Here is a great deal of swell, it being open to the breezes. The bottom is sand and good holding ground.

*Particular Observations on the Little Cayco, &c., from the Journal of the Emerald.*

"Being at noon, with the Hope, a small vessel, off the S. W. point of the Little or West Cayco, a mile from it, we ran along the west side, at that distance, and then made the Hope anchor in 7 fathoms, hard sand, within half a cable's length of the N. W. point. Seeing that the vessel drove, the bank being very steep and narrow, and the weather inclined to be squally, we preferred keeping under sail, and made several trips, keeping well in with the land, at one mile distance. Along the reef, on the west side, we landed very easily in some hollow places, filled with sand, and made by the sea in the sandy stones which compose the island. Opposite these holes at about three quarters of a mile from the N. W. point, is the best anchoring.

"The west side of the Little Cayco runs N. by E. and S. by W. about five miles and a half. On this side is the anchorage, sheltered from the trade-winds: nearer the N. part, (which is nothing but a steep border of sand) at a cable's length, you anchor at about a pistol-shot from the shore, in 8 fathoms; at two ships' length, there are 15 fathoms; and at half a cable's length farther, there was no ground under the ship. If you want to stay there, the best way will be to have the outer anchor in 15 fathoms water, and to carry another on shore. There is no swell with the E. N. E. and E. S. E. breezes, however hard they may blow."

**CANOE COVE.**—This little bay is on the west side of Providence Cayco, and may be of great use, as there is water enough for all sorts of ships, sheltered from the Norths, which you should always guard against in this passage. The largest ships may anchor in 6 or 7 fathoms, on a sandy bottom, looking out for a clear ground, and here and there you will find it rocky. You are sheltered from the N. to the E. and to the S. E. by S. The anchoring is within the west point, which you bring to bear N. taking care not to come near the reef, which runs round this point for a quarter of a league; the reef ends there, and does not begin again till near 2 miles farther to leeward; then it must bear S. by W. from you.

From the north-west point of the Little Cayco to this cove, is N. N. W.  $3\frac{1}{2}$  leagues; but you must make a more westerly course, in order to avoid the reef and the Little Key already spoken of.

**WATERING BAY and PINE'S KEY.**—To the N. E. of the N. W. point of Providence Cayco, the coast forms a bight, the two points of which are five leagues asunder; between them is Watering Bay and Pine's Key.

At this anchorage you are sheltered from the N. E. to the S. S. W. passing by the East. The greatest advantage of Pine's Key is a great lagoon of fresh water, sufficient for fifty ships; it is very drinkable, and not far from the beach.

The bottom is too white near the land, and in the Cove, for you to catch large fish with a seine; but you must go in a boat on the edge of the reef without; and you will succeed still better, if you sail over with your lines aloft.

From the east part of Pine's Key you may descry all the islands and keys, which are scattered within the Caycos, from N. to S. E.

The following remarks on the Caycos, &c. have been written by Captain Livingston:

"The whole of the north side of the Caycos is bounded by a reef, through which, though there are various openings, they ought not to be attempted by a stranger without a pilot. Vessels ought not to near the land within a league and a half, in running down to the northward of the Caycos. Watering Bay is extremely dangerous, and is most incorrectly laid down in every chart I have seen. The Providence Caycos is bordered to the eastward, and northward, and westward, by as dangerous reefs as I ever saw; among which, if a vessel once gets embayed, it is next to impossible that she can escape. The American sloop of war Chippewa, the ship Aimwell, of London, and brig Messenger, Kunkley, were all lost upon these reefs in 1816, within a few weeks of each other; and two days after the Aimwell was lost, a vessel narrowly escaped the same fate; to this I

"After rounding the northwest point of the Caycos, and bound to the southward through the Passage, having brought the N. W. point to bear E. or E. by N. you may run safely, even in the darkest night, steering at first S. W.  $\frac{1}{2}$  W. by compass, for 5 leagues, and then S. by W. till daylight. By these courses you will clear the elbow reef off Sandy Key, between the Providenciers and Little Caycos, and at the same time, keep sufficiently to windward of the Heneagua and Bishop's Shoal.

The Caycos are connected by a reef of coral rocks, and there is no danger of them in the day, as the white water shows itself. Vessels making the land about dark, should never attempt to run through this passage in the night, unless sure of their situation.

**TURK'S ISLAND PASSAGE.**—There are three principal islands, Grand Turk, Salt Key, and Sandy Key; which they always make who go through the passage.

The western side of these islands is bold, and they may be approached very near, although there is a white shoal, with many rocky spots, which extends about a quarter of a league from the shore.

You may anchor in two places off the Grand Turk; one towards the middle of the island, opposite the huts, the other off the south part of the island; but neither of them can be considered as good. You let go your anchor as soon as you are on the white ground, and take care to find out a clear bottom; as, in some places, the points of rocks rise to within 8 or 10 feet. After you have let go your anchor, and veered to half a cable under your stern, you will not get any ground. Off the south part of the island the anchorage is of more extent, and you will find, on the point near which you anchor, a lagoon of water that may serve for cattle. The white shoal S. W. of Sandy Key decreases gradually to 5 fathoms, half a league from the shore.

East of these islands are several islets, which are connected by white grounds, with very little water on them; they are bold on the east side, and surrounded with a white ground that extends to the southward and S. W.

**TURK'S ISLAND PASSAGE.**—This passage is very short and good; but you cannot always be sure of fetching it from Cape Haytien. You ought to steer N. E.  $\frac{1}{4}$  E., and the wind often will not admit running so much to the eastward; it is therefore recommended, in leaving the cape, to keep the wind as close as you can, with the early breeze, and tack so as to fetch the Grange before night. You will generally bring it to bear S. E. or S. S. E. If the ship sails well, or has been favored by the breeze, you may bring it to bear S., whence, making good a N. N. E. course, you need not tack until you have run 18 or 19 leagues. If your last course should not have been better than N. by E. or N., you must be particularly cautious not to pass the latitude of 21°. In the night, when you think you are near that latitude, be sure to sound; and the moment you have bottom, about-ship and stand the other way till morning, when you may again tack and fetch to the windward of the white shoals of the Caycos.

The white bottom is very readily seen: you may run on the edge of the bank to the southward of the Southern Keys, for a league, or perhaps a league and a half, in from 7 to 14 fathoms; but farther on there are rocks, with 3 fathoms at the most, on them. In the daytime you may stand on to the northward, (supposing that you have not seen the land,) and you will descry the Southern Keys of the Caycos; or, if farther to windward, Sandy Key. You must be careful not to go to leeward of the white shoals which extend south of a small sandy islet, which is entirely drowned at high water. It is very difficult to be seen, and your lead even, cannot give you warning, as you fall suddenly into three fathoms.

To the southwestward of Sand Key, lies the Endymion Reef or Shoal, which is described in the following page.

When you have Sand Key bearing east, at the distance of 2, 3, or 4 leagues, steering N. by E. or N. N. E. 8 or 10 leagues, will entirely clear you of the passage. In going through, keep the Turk's Islands side on board, in order to avoid the Reefs of St. Philip, which extend from the N. E. point of the Grand Cayco.

Sand Key is one mile long; and, in fine weather, may be seen three leagues off; when you are to the southward of it you would take it for two islands, its middle part being a low drowned land. On the west side are 7 or 8 fathoms, upon the bank which borders the key at the distance of three leagues, and joins a reef that extends a mile from the north point of it.

The south point has, at about two cables' length, three rocks close to each other, by which it may be known; but, to have them open and clear of the land, you must not be far off, nor bring them to the eastward of N. E.

The most certain mark by which you may know Sand Key, is, that from the N. E. and the W. N. W., you will see no other island, and the sand upon it is quite white in the sun. The anchorage is only known by the white water, from 6 to 4 fathoms, within swivel shot of it; but ships which draw much water must anchor about half a mile off, bringing the south point to bear S. E., and the middle of it from E. to E. by N.; the north rocks there cover you as far as N. N. E., and you may easily get under weigh with any wind, as the norths, which are most to be feared, blow only along the coast, so that the west side may be reckoned a good roadstead. A ship which may, by some accident, have been prevented from sailing through the Passage, would find a good shelter here, and might, without difficulty, wait for a more favorable wind. The reef, on the north part of the key, stretches from it north a little westerly, a long mile, when it makes a little hook to the S. W. but breaks every where, and within pistol shot there are 8 fathoms; though you must not come so near on the other parts of the island, for here and there are some rocks, which have only 2 fathoms water upon them. The east side has high breakers quite to the shore.

Sand Key is low and barren, being burnt by the sun, and continually beaten by the winds and the sea: it produces some small bushes only.

**SAND KEY.**—Sand Key may be seen about 3 leagues off; it makes at first like three islands, being formed of two little hillocks and a rock, known by the name of Split Rock, though there is water knee-deep between it and the key. This rock serves to distinguish Sand Key, over which it is probable that the sea breaks in all the norths, and other impetuous winds, for it is very low; you may easily land upon it under the hillock, where there was formerly a pyramid.

This Key is scarcely more than 1300 geometrical paces (of 5 feet each) long. From the south end the Reef runs off three quarters of a mile S. and S. by W., at the end of which are three rocks, which always break and show themselves. The hillock on the south part is joined to that of the middle part, by a low land, which looks like a savannah; and from that to the west point, the land is also very low and even: you cannot land here, nor must you anchor near this part, but towards the south, where all the dangers show themselves. From the N. W. point is a reef to the N. by W. N. N. W. more than 2 miles, and about a swivel shot from the end of this Reef, is a large rock, always above water; three quarters of a mile from which you have 6 fathoms rocky ground. You cannot land at the east side, which is surrounded with rocks. The anchorage may be made very convenient, by carrying an anchor, with two or three hawsers, to the westward, and then you would clear the island with every wind. But in the months of May and June, you had better anchor about a mile or a mile and a half off, to be less exposed to the swell sent in by the S. E. breeze, which is generally violent.

To the south-westward of Sand Key, lies the Endymion Reef or Shoal, upon which the British ship Endymion, commanded by Lieutenant Woodriff, was lost in 1790. The following remarks upon this danger, were obligingly communicated by the commander himself.

"The danger of this shoal is but of small extent: it consists of seven or eight heads of rocks, one of which has only  $8\frac{1}{2}$  feet of water; and this is the rock whereon the British ship Endymion was wrecked, on the 28th of August, 1790, and till then undiscovered. Some of the rocks have 2, 3, and 4 fathoms on them, and between them 7, 8, and 9 fathoms of water. The exact soundings between the key and the shoal, could not be ascertained, by reason of the blowing weather, and from want of time. There are some rocks which lie off to the eastward of the south end of Sandy Key; two of them appear above water, and two others are even with it. The reef, from the north end of the key, stretches off to the northward  $1\frac{1}{2}$  or 2 miles, and has some rocks out of the water. The channel between the shoal and the key appears to be clear and spacious.

"The north part of Sandy Key bore from the Endymion, when aground, N. N. E. and the south part of N. E. about 7 miles distant. The rocks extended about a cable's length from the ship, which laid on the eastern and shoalest part."

South-west of Sandy Key is a white shoal, extending about  $3\frac{1}{2}$  miles from shore, on which may be found from 7 to 9 fathoms.

*General Observations on Turks' Islands and Turks' Islands Passage, coming from the Northward. By Captain Hester.*

"When bound to the Old Riding Place, at the Grand Turk, your eye must be your pilot, or you will come from no ground immediately into white water, when you must be very brisk in letting go your anchor, as it is very little more than one third of a mile from no ground to the beach, with not more than 4 or 5 feet water on it; and from the outer edge of the bank to the reef, not above a cable's length distance. It is very rocky ground

all in and about the anchorage. Bring the centre of the highest hill you see in the bay, to bear east; then steer right for it, till you come into white water, and you will have 4½ fathoms, white sand.

"From October 6th to October 9th, the north point of the Grand Turk bore north, and the south point S. E., Salt Key S. by W. ¼ W., the body of the town east; the extremes of ditto, N. E. by E. to S. E., distance off shore 1½ mile; distance of the reef 1½ cable: depth of water at the anchor, a quarter less seven; veered out to half a cable, then had 17 fathoms under the stern. The Grand Caycos from W. ¼ N. to N. W. by W., wind at E. by N. latitude 21° 28', variation 6° 40' E. Tides rise and fall about 3 and 4 feet; a N. N. E. moon makes high water. Currents very uncertain. The autumnal equinox subject to north winds, and rain very variable; the vernal equinox to the contrary.

"Wood may be cut with leave at Grand Turk; water is scarce and very bad. They have no provisions; but turtle and fish may be caught at times. The trade consists in salt, with which they load for America and the adjacent islands.

"The north point of the Grand Turk, lies in latitude 21° 30'. To make this island, coming from the sea, run down in the parallel of 21° 40'; when you think you draw nigh them, night coming on and seeing nothing, stand off to the northward, under an easy sail, endeavoring to be as near the same place at daylight, as you were the preceding evening; but do not sail further to the westward than what you could see the night before, and keep running down in the above latitude. It may so happen that you will be obliged to do the same thing the second night, if not the third; but that depends on the justness of your reckoning. You cannot well pass the Turk's Islands, in the latitude above said, without seeing them; likewise you would make the N. E. part of the Great Caycos, which lies to the N. W. of the Grand Turk. There is a reef which runs to the northward of the latter about two miles, but nothing but what is discernible. The course through is S. S. W. 7 leagues, and then you will be in the open channel, between all the islands and the north side of St. Domingo, and may shape your course as you please.

"It is true that the channel between the Caycos and Mayaguana is wide; but when I consider the difficulties which will arise from thick, blowing, hazy weather, and night coming on; from your being more in the stream and way of currents, between the reef off the S. E. end of Mayaguana and the back of the Caycos; from the possibility of driving or passing between them without seeing them, &c. all this would make me give the preference to Turks' Islands Passage. In attempting the Caycos Passage, coming from the northward, you will not be able, (at least it would not be advisable,) to run in the night any more than in endeavoring for the other; and in case of a continuation of blowing hazy weather, you might be puzzled and at a loss how to behave, if, (which could very well happen,) you were surprised with the breach of the Hogsties; whereas, by endeavoring for the Turks' Islands, though you should pass them, you would be sure of making the Great Cayco; and then it would be but running down back of that isle, and choose your channel and time, either to windward or leeward of Heneagua, having a known departure to go from."

**SALT KEY, or the LITTLE TURK.**—When you leave Sand Key, and steer for Salt Key, you must make a north course along the reef, which runs off more than one mile; on these bearings from you, you come almost within a stone's throw of it; for at that distance, there are 8 fathoms. Having gotten round the head of it, you are to make a N. N. E. course to the Little Turk, which you may then see; and you will lose the soundings so soon as you have brought the reef any thing to the southward of you. It is two leagues from the reef to the N. W. point of the Salt Key, near which you may anchor; but the bank is very steep: for when your anchor is gone in 5 fathoms, within musket-shot of the shore, you will find the ship in 20 fathoms, and no ground a very little way astern. You bring one point N. N. E. or N. E. by N. and the other point S. by W. or S. S. W. you must look for clear ground, or you will have your cable cut with the rocks. These places are fit only when the trade wind is settled; for you must not be caught here with any other.

Salt Key is N. by E. from Sand Key, and lies N. by E. like the two others; it is of a triangular form, its length something more than three miles: it is higher than Sand Key, and you will see here and there some little risings or hillocks, and a great many bushes and small trees, fit only for fire wood.

**GRAND KEY, or GRAND TURK.**—Having advanced to the north point of Salt Key, you will see the Great Key bearing N. N. E. 2½ leagues; so soon as you are clear of the reefs, which stretch off from the Little Turk, two cables' length, it will be found that the bank continues from this, N. E. by N. to the south point of the Great Key, for which you should make a N. N. E. course, though you might run along the west edge of the bank in 4 fathoms, or might indeed anchor upon it, as you would be sheltered from

the trade wind by the bank and its keys. You must, however, be cautious in steering N. E. of a reef that runs off from Cotton Key W. by N., seldom showing itself in moderate weather, and stretching as far as the South Point of the Great Key.

If you mean to anchor on the west side, which is much like that of Salt Key, (though not so good as the Sand Key,) you had better keep along the Bank, lest you get too far to the leeward, and haul in west from a hillock, which may be plainly distinguished when nearly in; the bank is very steep, and looks shoal; but you will find 4 or 5 fathoms water very close to the land. You must, however, stand in only upon white water, till you bring English Point E. by N.; off that point are some breakers quite close to the shore, and there is shoal water. When the before mentioned hillocks bear E. by S., you may anchor within half a cable's length of the island, looking out for clear ground; English Point will then bear north, and the South Point S. E.; your anchor will be in 4 or 5 fathoms, the ship in 9 or 10, and the stern in 20, 25, or perhaps no ground to be found. It will be prudent in staying here to observe when the trade wind dies, for you have very little room to turn; you should also always buoy your cables, for the sandy bottom is full of large stones, among which cables and anchors have often been lost.

The vessels which load salt, generally anchor to the northward of English Point, that being nearer to the Salt Pond; but neither the shelter nor the ground are so good as at the other place. No passage is to be found to the southward of this island, but for a boat, as there is a reef, which is a branch of that surrounding the weather side of these keys and banks. The Great Key has the best ground of the three islands.

Of the two Salt Ponds which are on the key, one only furnishes salt; it is about 4200 yards wide, and its middling breadth above 200. It produces three times as much as the pond of Salt Key; but the grain of the salt is coarser, and not so bright as that of the latter.

The latitude of the Grand Turk, by a very accurate astronomical observation, is  $21^{\circ} 26' 42''$  N.

*Remarks on the rest of the Keys which are upon the Turk's Islands Bank.*

To the windward of the Turk's Island, (that is to say, to the eastward,) are several little barren keys. The northernmost of these are three rocks, called the Twins. They lie three quarters of a mile east from the south part of the Great Key, and are very nearly together. S. E. one mile from these is Pelican's Key, lying north and south, about three quarters of a mile long, and very narrow. Bird Key, which is larger, is about  $2\frac{1}{2}$  miles in the same line. A reef, with great breakers, runs from one to the other of these keys, ending at another small one, called Breeches Key, which has two rocks at the south end, and is close to the S. E. of Bird Key. To the southward of these you might come in upon the bank, there being from 10 to 6 fathoms of water. Between the N. E. point of Salt Key and Bird Key is another called Cotton Key. It lies nearly south from the Great Key,  $4\frac{1}{2}$  miles, and is the largest of all.

SQUARE HANDKERCHIEF, or Mouchoir Quarrè Shoal, is a dangerous and extensive shoal: the N. E. breaker is in lat.  $21^{\circ} 7'$  and long.  $70^{\circ} 27'$ . The extent of this shoal from E. to W. is about 30 miles, and from N. to S. 20 miles. The principal dangers are confined to the N. W. side of it, in which there is a key or bank, on which there are only 8 or 10 feet water. From this shoal the bottom runs E. by N. 7 leagues, to a rocky spot, where the sea breaks with great violence. It is natural to suppose that all the interval is full of sunken keys, which render its approach very dangerous. On the south and south-west parts the bottom shows and gives warning, and you will find from 10 to 15 fathoms: however, the best way is to bear up, and pass to leeward, unless you are sure of being on the east end of the white grounds, and can weather them the next tack.

"Having entered, at 6 o'clock in the morning, the white grounds of the Square Handkerchief, on the south-west edge, we found from eleven to fourteen fathoms, coral bottom. Stood to the N. N. E.; at 50 minutes past 7 sounded in fourteen fathoms; saw ahead, a little to windward, a bottom which appeared nearer the surface; we bore up, but too late for the vessel was stranded on a sunken key, in 9 feet water. This may show how dangerous it would be to run on these grounds. Close to the N. W. edge of this key we could get no bottom with 40 fathoms line. This key lies in the latitude of  $21^{\circ}$  N."

THE SILVER KEY BANK.—This shoal has more extent than the Square Handkerchief. The southern point is in the latitude of  $20^{\circ} 13'$ , and the northernmost part in  $20^{\circ} 55'$ . It is very white ground in many places, especially in the north part, and very brown in the S. and S. E. parts.

The north and N. N. W. parts have some keys, with no more than 8 or 9 feet of water, and perhaps less; but it appears that these keys are not exactly on the edge. The mas-

ter of a schooner coming down rather the N. E. than the N. W. the length of the

The east part of the bank, Compt de Kermadec, showing the depth, them to agree with the eastern part of the bank, but about  $1\frac{1}{2}$  miles N. E. which runs. Ships ought often fall from the edge of them, the bottom of the grounds.

The Silver Key, south, in the Gulf of Cape Francois.

You experience directions of the S. E. part of the bank, league from the shore.

In general, these passages are dangerous.

SILVER KEY, from Cape Hay, your course good, you would pass sight of the bank, must not pass it as far as  $20^{\circ} 35'$  south, the bottom to get to the north, be entirely out of sight.

north part, and

r 9 feet of water,  
dge. The mas-

ter of a schooner drawing 9 feet of water, found himself ashore on the Silver Keys, in coming down after he had run near a mile S. W. on very white grounds. The east, or rather the N. E. edge is very dangerous. In this part there are three keys within a cable's length of the edge, which have not more than 10 or 12 feet of water.

The east part of the Silver Keys was explored and sounded in 1753, by Monsieur Le Comptde Kersoret, who, at that time, commanded the king's ship l'Emérande. In following the details of his route, and trying his longitude, soundings, bearings, &c., I found them to agree so well, that nothing remains to desire on the exact position of the eastern part of this shoal. The western side is safe, and there is a great depth of water; but about  $1\frac{1}{2}$  league on the eastern side the bottom decreases, and you see shoals in the N. E. which rise very near the surface.

Ships ought never to venture within any part of the white grounds, because they may often fall from 14 fathoms to 10 feet; if, by accident, they find themselves in the middle of them, the best way is to tack, and go out the same way they come in, ranging along the grounds.

The Silver Key is 11 leagues long, east and west, and 7 leagues broad, north and south, in the greatest dimension. The westernmost part lies north and south from Old Cape François.

You experience on the edges of the shoals weak currents, which generally follow the directions of those edges. On the Square Handkerchief they are scarcely felt; on the S. E. part of the Silver Keys you find them setting to the west and N. W.; but a short league from the grounds their effect is not perceivable.

In general you ought not to mind, in your reckoning, the weak currents which exist in these passages, they being no where to be feared.

**SILVER KEY PASSAGE.**—Should you, by any circumstance, be forced to go from Cape Haytien through the Square Handkerchief, you must at the departure make your course good N. E. by E. and E. N. E. If the winds suffer you to steer that course, you would pass in the mid-channel; but if you are forced to turn, and should not get sight of the Haytien shore, after you have once got into the longitude of  $70^{\circ} 20'$ , you must not pass the latitude of  $20^{\circ} 25'$  without frequently heaving the lead. If you come as far as  $20^{\circ} 35'$  without getting ground, you have nothing to fear from the Silver Keys, and must only look out for the Square Handkerchief, which is not dangerous on the south, the bottom giving you notice in 10 and 15 fathoms. In the latter case, continue to get to the north-eastward, and when you come into the latitude of  $21^{\circ} 20'$  N. you will be entirely out of the passage.

**THE BANK-BLINK OF THE CAYCOS AND BAHAMAS.**—In a letter dated September 30, 1819, Captain Livingston asks, "Has Mr. De Mayne taken any notice of the Bank-blink? I name this from the Ice-blink, to which I presume it bears a resemblance.\* On the Caycos Bank I have seen it very distinctly in a dark night. On the Bahama Banks I have not had the same opportunity of observing it distinctly, though I have also noticed it there. Once on approaching the Caycos, when coming from the United States, I saw it appearing extremely beautiful, during sun-shine, and consider it as arising from the rays of light reflected by the white sand of the banks in day-light, and the reflection of the white sandy bottom on the atmosphere at night."

Another voyager, on passing over the Great Bank, has made similar remarks on the reflection of light from the white sand of the bank to the atmosphere. His words are, "It was a novel situation to behold an expanse of sea, unbounded by any land, and the bottom, at the same time, distinctly visible at the depth of a few feet. Although the day was cloudless, and the atmosphere uncommonly pure, the azure of the horizontal sky seemed flushed with an infusion of pink color, producing an effect as beautiful as it was singular. We now drew near to New Providence."—*M'Kinnon's West Indies*, 1804.

In allusion to this passage Captain Livingston says, "There was a greenish rather than a pink tinge thrown up over the Caycos Bank, at the time I most particularly remarked it. Some of the fainter hues of the rainbow come the nearest to its appearance at that time."

#### *General Directions making, and navigating on, the Coast of Cuba,*

In the rainy season, or season of the southerly winds, vessels bound from Europe to Cuba ought to pass to the northward of Porto Rico and Hayti or St. Domingo; and during the season of the norths, they should pass to the southward of these islands, unless their port of destination requires them to do otherwise. There are other reasons for

\* The Ice-blink is an effulgence or reflection of light, seen over the congregated ices, and even about individual icebergs. It enables the mariner to distinguish them at some distance, even in the darkest night.

adhering to this mode of navigating. In Cuba the ports to which vessels are bound from Europe, may be reduced to two: these are the St. Jago de Cuba and the Havana. If bound to the first it is necessary, in every season, to direct your course directly to it; that is, in the season of the norths to steer from Cape Tiburon, the S. W. point of Hayti, in order to make some point on the south side of Cuba, to windward of the intended port, or even to windward of Guantamoo; and, in the season of the souths, to steer from Cape Nicholas' Mole, on the N. W. coast of Hayti, almost west for the port, marking, in the first place, the various points of the coast of Cuba, which are after described. But if bound to Havana, attention should always be paid to the season; that is, if your passage is made in the time of the norths, you should go to the south of Cuba, although you have to return the distance between Cape Antonio and Havana; because this inconvenience is not comparable to that which might be occasioned on the north side by a hard north, which would not only expose a vessel to heavy risks, but might retard the voyage much longer than the time required to reach Havana from Cape Antonio; for this distance may be worked up in a short time, as you may have the assistance of the current to the eastward, as more particularly described in the directions for the Strait of Florida.

Those navigating on the south of Cuba, who have no occasion to touch at Trinidad, or any other part of that coast, should give it a good oiling, and proceed to the west from Cape de Cruz. Here it may be observed that, at the distance of 35 leagues from that Cape, is the western end of the low island called the Caymanbrack, the N. E. end of which is surrounded by an extensive reef, the making of which is dangerous by night, because a reef extends from it 4 miles out to sea; and allowance must always be made for the current, which, although variable, is generally prevalent here. The safest course appears to be to the northward of the Cayman's; but even here it is requisite to beware of a shoal, on which 14 fathoms have been found, and which was discovered by a Spanish packet bound to Trinidad, in 1800, and there is reason for suspecting that it has spots of very little water. The position of this shoal, according to the last Spanish chart, is lat.  $20^{\circ} 11' N.$  long.  $80^{\circ} 38' W.$  It had previously been represented more than half a degree farther to the eastward.\*

The navigation on the north of Cuba is that of the Bahama or Old Channel. For this channel it is customary to take a pilot, who may be engaged either at Aguadilla, on the N. W. coast of Porto Rico, or at Baracoa, in Cuba, as noticed hereafter. If approaching Baracoa, for this purpose, it will be requisite to determine the ship's place, in the vicinity of Cape Maysi; for otherwise you may happen to fall in to leeward of Baracoa; and even without the necessity of calling for a pilot, it will be proper to make the land in the neighborhood of the cape, for the sake of a departure hence to the westward, and for correcting any error produced by current. The remarkable points of all this coast will be described. These descriptions, must, of course, be especially regarded, and strictly attended to.

We have already noticed that in this channel, *independent of any current*, there is a regular tide. The current itself is very uncertain, and no doubt fluctuates according to the variations of the Gulf Stream, winds, &c. It sometimes sets E. S. E. at other times W. N. W. and again ceases. With every precaution, a vessel ought not to cross the meridian of Point Maternillo without having made and remarked it well; as all the care of the most zealous and attentive navigator may otherwise be of no avail to keep him clear of the Mucaras Shoal, on the north side, which shows no symptom of its existence until a vessel is aground upon it. If obliged to beat up at night, it ought to be done so as not to prolong the tack more than will completely and certainly clear the Mucaras. Having passed over the night in this manner, so soon as it is clear day, steer so as to make the coast, and recognize it well. If it be not in sight, steer to the south until you make it.

Having once recognized Maternillo Point, direct your course so as to pass Guincho, or Ginger Key, at the distance of two leagues, if by night; or make it by day, and thence keep over toward the edges of the Great Bank and Salt Key Bank, rather than to the keys of the Coast of Cuba, which offer few marks that can be depended on; and an approach to which is therefore dangerous. You will have passed all these keys when abreast of Point Ycaeos, and may thence proceed. But the safest way, as before noticed, is towards the southern edge of the Salt Key Bank, passing thence to the westward, according to judgment, the state of the current, &c.

\* The same chart represents another shoal of 8½ fathoms to the north-eastward, in lat.  $20^{\circ} 30'$  and long.  $80^{\circ} 27'$ .

## ISLAND OF CUBA.

**CUBA.**—This is the largest island in the West Indies, and is situated at the western extremity of the multitude of islands, keys, and banks, which separate the Caribbean Sea from the Atlantic Ocean. Its length from Cape Maize, on the east, to Cape St. Antonio, on the west, is about 208 leagues; its breadth is unequal, being from 12 to 24 leagues.

Cape Maize, the most easterly point of the south part of Cuba, is situate in or near lat.  $20^{\circ} 13' N.$ , and longitude  $74^{\circ} 1' W.$  The point itself is a low beach, and cannot be clearly seen until you are nearly up with it. Landing on it is extremely dangerous, for a reef extends from it nearly a mile to the eastward; and advancing towards it during the night, is very unsafe, unless you have previously, in daylight, marked the high lands of the interior country, either of Cuba or of Hayti. From this point the coast trends to the N. W., and rounds to river Maysi, at a mile from the Cape. From this river to Point Azules, which is another mile, nearly in the same direction, the coast is bounded by a reef, which extends out about a cable's length, and has a break at the mouth of the Maysi. From Point Azules the land begins to rise, and the coast is clean and trends about W. N. W. for 5 miles, to Punta Frayle or Friar's Point, whence it extends west 6 miles, to the River Yamuri, and continues in the same direction two miles more, to the Harbor of Mata. All this coast is very clean, and you may run along it within half a mile.

The Harbor of Mata is very small, and too shallow to admit vessels drawing more than 12 feet. To enter it you have only to keep in mid-channel and anchor in from 14 to 18 feet water, almost in the middle of the bay. All the shores have shoal water from them, so that there is a space of only two cables' length in diameter, in which there is sufficient depth for anchoring.

From Puerto de Mata, the coast trends nearly N. W. 6 miles, to Port Majana, and at 2 short miles from it is the mouth of the River Boma. This piece of coast, as well as the preceding, is very clean.

Point Majana and Baracoa Point, which lie nearly east and west, 2 miles distant from each other, form a bay, in the east part of which is the anchorage of Playa de Miel, (Molasses Beach;) and in the west, the mouth of the Port of Baracoa; in the middle, between these two anchorages, is the Town of Baracoa, standing on the S. E. point of the harbor of the same name. In this town dwell the pilots for the Bahama or Old Channel; and therefore vessels which have not previously engaged one at the Aguadilla, in Porto Rico, come here for one.

The anchorage of Playa de Miel is very open to the norths. To anchor in it, you have only to approach Point Majana, and anchor something to the south of it, in from 10 to 30 fathoms, on a sandy bottom, taking care not to get to the east of that point, where you would be immediately in 4, or even in less than 4 fathoms of water. The general object of coming to Baracoa, being only to obtain a pilot, there is no necessity, in that case, to anchor; but approaching Point Majana, even within two cables' length, if you choose, fire a cannon or gun and a pilot will come off directly. As the Playa de Miel is entirely open to the norths, in the season of them, it is much exposed; and, therefore, any vessel under the necessity of anchoring, should steer at once for Baracoa, to the entrance of which there is no obstacle, as it is completely clean, having no danger but what may be seen; and consulting the plan of it, you may choose the spot to anchor in, which best suits the draught of water of your vessel.

**BARACOA HARBOR**, though secure and sheltered, has the great inconvenience of presenting its mouth to the breeze, and a great swell consequently sets in; and, being able to get out of it with the land breeze only, vessels are often detained much time in it during the norths, when the land breeze is not frequent; but in the rainy season, you may almost reckon on having it every night. The Anvil Hill of Baracoa, (El Yunque de Baracoa,) which is a little mountain about 5 miles to the westward of the harbor, is an excellent mark to recognize it by, as, in clear days, it may be discovered at a distance of more than 12 leagues, and appears, over the other high land, like the flat top of an anvil.

From the Harbor of Baracoa, the coast trends almost true north, 3 miles to Point Canas, which, although very clean, ought not to be approached, because, being completely open to the breeze, there is always a heavy swell setting upon it. From Point

Canas to the Harbor Maravi, is two miles; the coast trends nearly west, and is very clean.

PORT MARAVI, though small, is well sheltered from the norths. Its entrance is not difficult, for you have only to keep in mid-channel, which is less than a cable's length in width, and running in for the middle of the bay, anchor as soon as an islet, which is on its western side, bears in the same direction.

From Maravi the coast trends nearly north, making a bend, (or bight,) to Point Van, and from thence it runs to the N. W., forming another bend to Port Navas, which is an opening of about two cables' length in extent, in all directions, with its mouth to the north; therefore, useful only as a shelter from the breezes. To enter it, no more is necessary than an inspection of the plan.\*

From Port Navas to Port Cayaguaneque, the distance is only two short miles. Cayaguaneque is fit for very small vessels only, and its entrance is only 40 yards wide. The plan will give a perfect knowledge of it, and of the difficulties which present themselves in taking it.

TACO.—Three and a half miles from Cayaguaneque, is the Harbor of Taco. It is well sheltered; but though, in its interior, there is depth for any class of vessels, yet its entrance has a bar with only from 13 to 18 feet on it, and it is also obstructed by rocky shoals with little water on them, which stretch out from both shores; but as, on account of the bar, vessels drawing only 10 or 12 feet water should go in, those will run no risk in running over the shoals, and therefore may take this harbor by keeping in mid-channel; and, when once past the entrance, they may direct themselves to that part of the harbor which suits them best.

From the Harbor of Taco to Point Jaragua, is  $2\frac{1}{2}$  miles; and the coast, which is a sandy beach, is clean. At Point Jaragua it ceases to be so, though all between it and Cape Maysi, may be run along at a mile's distance. Point Jaragua sends out a reef which stretches to the N. W. of it; this point is the eastern one of the anchorage of the same name, which is only an opening in the reef, by which a vessel may enter upon the bank or shoal, and find shelter from the sea, behind the reef. The break or mouth is only two thirds of a cable's length wide; and from it to some islets which are to the S. W. of it, the distance is two cables. The islets are three in number; the southern one is the largest; the anchorage for large vessels extends only till you are E. and W. true, with the south part of the middle islet; as farther in, there are only 12 to 18 feet of water. To take this anchorage, it is necessary to sail outside the reef, which extends out from Point Jaragua, until the east part of the great islet bears nearly S. W., then steer directly for it; and, if the vessel be large, anchor as soon as you are E. and W. with the middle islet, in 6 fathoms, on a sandy bottom; but if the vessel draws not more than 14 feet, you may run further in, keeping, if you choose, within a quarter of a cable of the great islet, and about a cable's length from the middle of it, you may anchor in 19 feet on clay. You may also enter the mouth without attending to the given mark of S. W., because the reef itself shows the opening. This harbor should never be taken except in a case of necessity, as there can be no other motive for vessels coming to it.

From Point Jaragua the coast trends, first to the N. W. and afterwards to the north, forming a great bay to Point Guarico, which is 7 miles distant from the former. The reef which extends to Point Jaragua, rounds the whole of it, and stretches out about two miles from Point Guarico. In approaching this side of Cuba, be careful not to mistake Guarico Point for Cape Maize, it being dangerous at night and in thick weather, when you cannot recognize, and use as marks, the eastern lands of the island, and particularly when you are uncertain of your latitude.

From Point Guarico, the coast trends nearly N. W. 8 miles, to the River Moa; it is all bordered by a reef, which extends about two miles out to sea. Almost N. by W. from the mouth of that river, and between the reef and the shore, is an islet, named Cayo Moa, which offers an excellent anchorage, sheltered from all sea. It is entered by an opening in the reef, almost due north from the mouth of the river. This opening is about two cables' length in width, and continues W. by S., forming the channel and anchorage, until the east part of Cayo Moa bears north. To take it, run along the east side of the reef until up with the opening, which will be when the eastern part of Cayo Moa bears W. by S.; and then steer S. W. until the south part of Cayo Moa bears W. N. W.  $\frac{1}{2}$  W.; then steer W.  $\frac{1}{2}$  S. and continue so till you anchor to the southward of the eastern part of Cayo Moa, in  $6\frac{1}{2}$  or 7 fathoms, upon clay. The plan of the port will give a perfect idea of this anchorage; for recognizing, or finding which, some mountains about 4 leagues inland, named the Sierras de Moa, may serve as land-marks.

\* The Plans referred to in these directions, are those of the *Portulano de la America Setentrional*, published at Madrid in 1809.

merica Satentrio-

From the anchorage of Moa, the coast trends about west; it is all bounded by a reef, which extends 2 or 3 miles from it, as far as Port Yaguaneque, which is 11 miles distant from the former. On this part of the coast, and between it and the reef, are two keys, the eastern one named Burros, (Asses,) and the western Arena, (Sand;) these keys may serve as marks for knowing this part of the coast. The Harbor of Yaguaneque is fit for small vessels only, because its bottom is shallow and unequal, and its entrance narrow and difficult to take, for the mouth is formed merely by a break in the reef. To take this port, it is necessary to follow the edge of the reef to windward, until you come to the opening, which lies N. W. two thirds of a mile from Arena Key; then steer to the southward, keeping along the edge of the weather-reef, because the lee-reef, which commences when you are west from Arena Key, narrows the entrance so much, that there is scarcely a cable's length of width in the channel. It is fit for small craft only.

CANANOVA.—A mile and a half from Yaguaneque is the Port of Cananova, which is properly, an opening of the coast only, and must be entered by another opening through the reef.

Three miles to the westward of Cananova Harbor, is that of Cebollas, which is alike most difficult to enter, or to get out of, and therefore unfit for large vessels.

TANAMO.—Ten miles west from Cebollas, is Port Tanamo, and the intermediate coast is foul, with a reef which extends out about two miles from it. Tanamo is a large harbor, and fit for vessels of any denomination; to enter it, you must run along the edge of the windward reef until you find the opening in it; then steer S.  $\frac{1}{2}$  E. until you have passed the leeward point, when you may keep away up the elbow which the channel makes, in the middle of which you ought to keep; but no more is necessary than to give a berth of a third of a cable, to all that is visible. With the Plan and your eye, no farther directions are needful.
