The commercial honesty of the Chinese is remarked upon by all who have dealings with them, but is giving way gradually before the influx of eager foreign competition and the admission of a lower class of natives to participation in international dealings.

**Moneys.**—The currency at Canton in European transactions is the Mexican dollar, but the dollar coined at Hong Kong since May 1866 is expected to supersede this gradually. The Chinese have no silver coin, and keep their accounts in taels, mace, candareens, and cash, forming a decimal system, of which only the lowest member is represented by a coin. Weight of silver is, indeed, the basis of their notation in this respect. A tael or *liang* equals 1½ oz. of silver, and is divided into 10 mace (*tsien*), the mace into 10 candareens (*fun*), and the candareen into 10 *li*, to which 1 cash in copper should precisely correspond. Owing, however, to the decline in the value of the cash, which for nearly half a century has undergone progressive depreciation in the mintage, the average value of the tael is 1,400 copper cash (*lung-tsi'en*). These coins are cast in moulds, with a square hole occupying the centre, around which, on the obverse, are Chinese characters, denoting the reign, with the words 'Circulating Value,' and on the reverse the name of the mint in Manchu characters.

In large native transactions, pure silver, known as *sycee*, is the basis of exchange. The silver is cast in ingots, called *shoes*, from a fancied resemblance in shape; these weigh from ½ a tael to 100 taels. Silver of the highest standard of purity is produced at the Customs Bank by melting and refining the foreign dollars received in payment of

duties, and is known as *sycee*. It stands for the dollar currency of the respective dities.

**Exchange.**—The sterling in the book but its value varies according to the price of dollars in London. The proportional value may be by the multiplier 1 Spanish dollar be 60 the tael will be 79.7 in the same proportion.

**Finesness of Gold.**—Gold and silver is exchanged into 100 parts, called modern practices of 93 touch, it is under alloy and 93 of pure metal. The fineness of the these decimal proportions English proportions by Suppose gold is 91.66 11, the standard, and standard silver into to 92.5, the touch of ster

**Gold.**—Gold is not merchandise: it is sold in unmined weight; the large each; and the gold is it may be only 92 or 93.

**Weights.**—Gold and catty of 16 taels; the 100 candareens, or 12, reckoned to weigh 12, makes the tael equal to 37.566 grammes.

The principal weights are the picul, the catty, and divided into 100 catties,

1 tael weighs, around picul 16 taels, or 1 catty 100 catties, or 1 picul Hence the picul weighs 60.472 kilograms.

**Long Measure.**—That is *chih*; it is divided into equal to 0.3713 metres, Chinese have used *chih*, of which nearly 10 Chinese Commercial Gu The most important are

Canton. Tailor's *chih*, called Mercer's measure

Peking. Architect's measure Land surveyor's

**Land Measure.**—Land parcels by the *king* and *ang*; = 100 square *pai-t* (feet); is much employed ground; 60 of these

1847 *mow* = 1 English measurement adopted a based on official enquiries = 1 *pu*, and 2 *pu* = 1 *cha* 250 sq. feet. English = 1

The *li* contains 180 *fa* (feet), called engineer's, *li* = 180 *fa*; therefore the *li* = 180 *fa*; his measure a mean

partly; but European measurement divided the degree into 3600 English feet; which is 3600 English miles, or 11.131

duties, and is known as Hai-Kwan (i. e. Customs) sycee. It stands at a premium as regards the dollar currency of from 3 to 10 per cent. according to the respective abundance of the two commodities.

**Exchange.**—The tael used to be reckoned at 6s. 8d. sterling in the books of the East India Company; but its value varies, and is generally computed according to the price paid per ounce for Spanish dollars in London. The tables given for this proportional value may be calculated in pence sterling, by the multiplier 1·208. Thus, if the price of the Spanish dollar be 60d. per oz., the value of the tael will be 60 x 1·208 = 72·48d.; if at 66d., the value of the tael will be 79·728d.; and for any other price in the same proportion.

**Fineness of Gold and Silver.**—The fineness of gold and silver is expressed by dividing the weight into 100 parts, called toques or touch; similar to the modern practices of France. Thus, if an ingot be 93 touch, it is understood to contain 7 parts of alloy and 93 of pure metal, making in the whole 100.

The fineness of the precious metals, expressed in these decimal proportions, may be converted into English proportions by the following analogies:—Suppose gold is 91·66 touch, say, as 100: 91·66:: 12: 11, the standard, and vice versa; and to convert standard silver into touch, say, as 240: 222:: 100: 92·5, the touch of sterling silver.

**Gold.**—Gold is not considered as money, but as merchandise: it is sold in regular ingots of a determined weight; the largest of these weigh 10 taels each; and the gold is reckoned 94 touch, though it may be only 92 or 93.

**Weights.**—Gold and silver are weighed by the catty of 16 taels; the tael is divided into 10 mace, 100 candareens, or 1,000 cash. 100 taels are reckoned to weigh 120 oz. 16 dwt. troy, which makes the tael equal to 579·8 English grains, or 37·566 grammes.

The principal weights for merchandise are the picul, the catty, and the tael; the picul being divided into 100 catties, or 1,600 taels.

1 tael weighs, avoirdupois - lbs. oz. dwts. 0 1 5·333 = 1 1/2 oz.  
 16 taels, or 1 catty - 1 5 9·333 = 1 1/2 lb.  
 100 catties, or 1 picul - 135 5 5·333 = 135 1/2 lbs.  
 Hence the picul weighs 60·472 kilogrammes, or 162 lbs. 0 3/4 lbs. troy.

**Long Measure.**—That used in China is the coid or *chih*; it is divided into 10 inches (*ts'un*), and is equal to 0·3713 metres, or 14·625 English inches.

The Chinese have numerous variations of the *chih*, of which nearly 100 are enumerated in the *Chinese Commercial Guide*, ed. 1863, page 281. The most important are the following:—

Canton. Tailor's *chih*, called *pai-ts'ien-chih* - inches 14·625  
 Mercer's measure for buying wholesale - 11·721  
 retailing - 14·37  
 Peking. Architect's measure - 12·7  
 Land surveyor's rule - 12·875

**Land Measure.**—Land is measured in large parcels by the *king* and *now*. At Canton, the *king* = 100 square *pai-ts'ien-chih* (= 149·756 sq. feet), is much employed in measuring small plots of ground; 60 of these = 1 *now*, at which rate 647 *now* = 1 English acre. The standard of measurement adopted at the British Consulate, used on official enquiries, is as follows: 66 inches = 1 *pu*, and 2 *pu* = 1 *chang* (or 10 *chih*). Hence 2500 sq. feet English = 1 square *now*.

The *li* contains 180 fathoms, each 10 feet—the *li*, called engineer's, measuring 12·65 English fathoms; therefore the *li* = 1,897 1/2 English feet; and the *li* measure a mean degree of the meridian nearly; but European missionaries in China have divided the degree into 200 *li*, each *li* making 286 English feet; which gives the degree 69·166 English miles, or 11·131 French myriamètres.

**Measures of Capacity.**—Thirteen divisions of a decimal scale are enumerated by the Chinese, but only four are in actual use. These are the *ko*, *shing*, *half shing*, and *tow*. The *tow* measures usually about 1 1/2 gallon, containing 10 *shing*.

The following tables, extracted from the *Chinese Commercial Guide*, will be found useful:—

EQUIVALENTS OF CHINESE WEIGHTS ETC. IN ENGLISH DITTO.

Formula for reducing Chinese, English, and Indian Weights.

- One pound troy is equal to taels 9·933 nearly.
- One pound avoirdupois is equal to 3/4 catty, or 12 tls.
- One hundred weight is equal to 84 catties.
- Ninety catties *seda* at Macao are equal to 1 picul balance.
- One ton is equal to 16 piculs 80 catties.
- One ton is equal to 27·222 Indian maunds, or nearly 27 1/2 mannds.
- One Indian maund is 82 1/2 lbs. avoirdupois exactly.
- One maund or 100 lbs. troy is equal to 993·446 tals.
- One tola is equal to 3·221 taels.
- One Bengal factory maund is equal to 56 catties.
- One Bengal bazaar maund is equal to 61·6 catties.
- To convert taels into pounds troy.—Divide by 10, and to the quotient add 2/3rds of 1 per cent.
- To convert piculs into pounds avoirdupois.—Add a third to the number of catties.
- To convert pounds avoirdupois into piculs.— Subtract a quarter, and divide by 100.
- To convert hundred weights into piculs.— Multiply by 84 catties, and divide by 100.
- To convert Bengal factory maunds into piculs.— Multiply by 56, and divide by 100.
- To convert piculs into hundred weights.— Multiply by 100, and divide by 84; or if minute exactness is not required, add 1/5th, and from the result deduct 8 per mil.
- To convert piculs into Bengal factory maunds.— Multiply by 100, and divide by 56; or if minute accuracy is not required, add 3/4, and 2 per cent. upon the result.
- To convert Bengal bazaar maunds into piculs.— Multiply by 61·6, and divide by 1,000.
- To convert piculs into Bengal bazaar maunds.— Multiply by 1,000 and divide by 61·6; or if minute accuracy is not required, add 6 1/4 per cent.
- To convert Indian weights into avoirdupois weights.—1. Multiply the weight in seers by 12, and divide by 35; the result will be the weight in

Goods conveyed to and from Whampoa in Cargo Boats.—Cargo boats conveying goods from Canton to Whampoa for shipment there, must be taken for examination to the customs' jetty before the goods can be put on board the ship. On arrival at Whampoa their permits must be exhibited at the float-

ing Custom-house, for countersignature; in like manner, the permits of cargo boats conveying goods to Canton from ships at Whampoa must be countersigned at the Whampoa floating Custom-house, and on arrival at Canton they must repair to the customs' jetty for examination.

Foreign Merchants.—These consist of British, American, French, Dutch, Danish, Swedish, Spanish, and Portuguese, with Parsee and Indian Mahomedan British subjects. The Americans, French, and Dutch have each consular agents recognised by the Imperial Government. The same privileges have been, or are to be, conceded to all foreigners that have been granted to the English.

Rates of Commission in China, agreed upon in November 1831, and revised by the Chamber of Commerce, March 1838.

- On all sales of opium, cotton, cochineal, camphor, barres, birds' nests, diamonds, and other precious stones, pearls, ships and houses - 3 per cent.
- On sales of all other goods - 5 "
- On returns, if in goods - 2 1/2 "
- On returns, if in treasure, bullion, or bills - 1 "
- On purchases, not being returns for goods sold:
  - Of raw silk - 5 "
  - Of manufactured silk - 5 "
  - Of all other goods - 5 "
- On inspecting teas, whether for returns or otherwise, an additional charge of - 1 "
- On sale, purchase, or shipment of bullion - 1 "
- On drawing, sale, or negotiation of bills when not involving responsibility as drawer or indorser - 1 "
- On drawing, sale, or negotiation of bills when guaranteed by the agent as drawer or endorser, and not covered by adequate security - 2 1/2 "
- On purchasing bills, or effecting remittance by bills, of the agent or otherwise - 1 "
- On negotiating loans or respondentia - 2 "
- On guaranteeing bills, bonds, or other engagements - 2 1/2 "
- On guaranteeing sales when especially required without including responsibility for remittances - 2 1/2 "
- On guaranteeing both sales and remittance of proceeds - 1 "
- On bills of exchange, returned noted, or protested - 1 "
- On letters of credit for mercantile purposes - 2 1/2 "
- On all advances of money for purposes of trade, whether the goods are consigned to the agent or not, and where a commission of 5 per cent. is not charged - 2 1/2 "
- On entering goods or superintending the fulfilment of contracts, where no other commission is derived - 2 1/2 "
- On all goods, treasure &c. consigned, and afterwards withdrawn or sent to auction, and for goods consigned for additional delivery to others - 1/2 commission
- On procuring freight, or advertising as agents for

- owners or commanders, on the amount of freight, whether the same passes through the hands of the agent or not - 5 per cent.
- On receiving inward freight - 1 "
  - On ships' disbursements - 2 1/2 "
  - On chartering ships for other parties - 2 1/2 "
  - On effecting insurance, or writing orders for insurance - 1/2 "
  - Settling insurance losses, total or partial, and on procuring return of premium - 1 "
  - Debts, where a process at law or arbitration is necessary, 2 1/2 per cent.; and if recovered - 5 "
  - Collecting house rent - 2 1/2 "
  - Acting for the estates of persons deceased, as executors or administrators - 5 "
  - The management of the estates of others, on the amount received - 2 1/2 "
  - All cash receipts, not serving for the purchase of goods, and not otherwise specified above - 1 "
  - Shroffing - 2 per mil.
  - Transshipping goods - 1 per cent.
  - All advances not punctually liquidated, the agent to have the option of charging a second commission, as upon a fresh advance, provided the charge does not occur twice in the same year - 1 "
  - At the option of the agent, on the amount debited or credited within the year, including interest, and excepting only items on which a commission of 5 per cent. has been charged - 1 "

N.B.—This charge not to be applied to paying over a balance due on an account made up to a particular period, unless where such balance is withdrawn without reasonable notice.  
Port Charges are fixed under the new treaty at 4 mace per ton for vessels of more than 150 tons burden, and at 1 mace per ton for vessels of less than 150 tons.

The Act 6 & 7 Vict. c. 80 authorises the superintendent of the trade of her Majesty's subjects in China, being at the same time governor of Hong Kong, to issue, with the advice of the legislative council of the island, laws and ordinances for the government of British subjects in China, or within 100 miles of the same. Laws and ordinances so issued are to be laid before Parliament.

TRADE OF UNITED KINGDOM ETC. WITH CHINA.

Total	1,618,010	1,371,762	934,990

From this table it will be seen that the silk

trade is declining. The export of tea fell from 263,000 piculs in 1860 to 109,742 piculs in 1865.

#### Consular Fees.

For every declaration made before the consul in forms H. C. F. H. and L. in the schedule	£	s.	d.
of the Merchant Shipping Act	0	5	0
Endorsing a memorandum of change of master upon certificate of registry	0	2	0
For granting a provisional certificate of registry	0	10	0
For revoking a mortgage of a ship	0	10	0
Transfer of do.	0	7	0
Discharge of do.	0	7	6
Rate of ship	0	10	0
Inspection of register	0	1	0
Entry seaman engaged before consul	0	2	0
Alteration in agreement	0	2	0
Seaman discharged	0	2	0
Desertion certified	0	2	0
Attesting seaman's will	0	2	0
Examination of provisions and water, to be paid by party in default	0	10	0
Salvage bond (17 & 18 Viet. c. 104 s. 488)	2	0	0
Disbursements for distressed seamen	2	0	0
In all these cases the consul's interposition is required by law.			

In matters of voluntary jurisdiction, the following fees are claimable:—

	£	s.	d.
Noting protest, with certified copy if needed	0	5	0
Order of survey, with do.	0	5	0
Extending a protest with do.	0	5	0
If beyond 200 words, for each additional 100 words	3	2	6
Preparing and attesting botomy or arbitration bond	1	0	0
Attending do, when not prepared by remote attendance at shipwreck out of consular office with travelling expenses	1	1	0
Attending valuation of goods under 200l.	0	10	6
Do, if above, for each day's attendance	1	1	0
Attending sale of goods under 200l.	1	1	0
Do, if above, for each day's attendance	2	2	0
Certificate of due landing of goods from United Kingdom	0	9	0
Bill of health	0	10	0
Vise of passport	0	2	0
Opening will of British subject (not being seaman)	1	1	0
Management of property of do.	2	0	0
Registration of documents	0	2	6
If exceeding 100 words, for every 100 additional words	0	0	6
Every certified copy of document not before ment need	0	2	6
If beyond 100 words, for each 100	0	0	6
Administering oath and attesting signature, if required	0	2	0
Attesting signature	0	2	4
Attesting official seal to any document not previously named	0	5	0

No fee to be taken for custody of or endorsement on ship's articles and papers deposited with the consul in accordance with 17 & 18 Viet. c. 104 s. 279.

Where the fee is fixed in preceding tables for any particular act, no additional fee to be demanded for signature, attestation, or annexing seal of office.

The above fees, if not paid in English money, are to be calculated at the current rate of exchange.

The payment of our consuls by fees is much, and we believe justly, objected to at Canton. It is a bad practice anywhere, and especially so in China.

A Chinese ship or junk is seldom the property of one individual. Sometimes 40, 50, or even 100 different merchants purchase a vessel, and divide her into as many different compartments as there are partners; so that each knows his own particular part in the ship, which he is at liberty to fit up and secure as he pleases. The bulk-heads, by which these divisions are formed, consist of stout planks, so well caulked as to be completely watertight. A ship thus formed may strike on a rock and yet sustain no serious injury; a leak springing in one division of the hold will not be attended with any damage to articles placed in another; and from her firmness she is qualified to resist a more than ordinary shock. A considerable loss of stowage is, of course, sustained; but the Chinese exports generally contain a considerable value in small bulk. It is only the very largest class of junks that have so many owners; but even in the smallest class the number is very considerable.

Population of China.—For some remarks on the

conflicting accounts and theories that have been put forth with respect to the population of this empire, the reader is referred to the *Geographical Dictionary*, art. 'China.'

CANVAS (Fr. toile à voile; Ger. segeltuch; Ital. canevazza, lona; Russ. parusnoo polotno, parusina; Span. lona). Unbleached cloth of hemp or flax, chiefly used for sails for shipping. Masters of ships used to be required to make entry of all foreign-made sails and cordage, not being standing or running rigging, in use on board their respective ships, under a penalty of 100*l*. But this and all other restrictions and regulations in regard to foreign canvas are now repealed. It had been the practice for a considerable period to grant bounties on the exportation of canvas or sail-cloth: these, however, finally ceased on the 1st of January, 1832. By an Act passed in the reign of Geo. IV. new sails were ordered to be stamped with the maker's name and place of abode; but this regulation was repealed by the 10 Geo. IV. c. 43 s. 9.

It is usually made in pieces or "bolts" from 24 to 30 inches wide, and 38 to 40 yards long. A bolt of navy canvas (always of the best quality) is about 40 yards long. Each bolt of canvas is numbered, to show its quality, and bolts 39 yards long and 24 inches broad ought to weigh, No. 1 quality, 46 lbs.; No. 2, 43 lbs.; No. 3, 40 lbs.; No. 4, 36 lbs.; No. 5, 33 lbs.; No. 6, 30 lbs.; No. 7, 27 lbs.; No. 8, 25 lbs.; No. 9, 23 lbs.; and No. 10, 21 lbs. The two last are uncommon. (Young's *Nautical Dictionary*.)

#### Prices of Sail-cloth paid by Trinity House.

	per yard	per d.	per q.
For sails, canvas No. 1	1865 - -	1	4
	1864 - -	1	5
	1865 - -	1	5
Falling 1 <i>l</i> . per yard each number.			

The price fixed for the value of imports of sails and sail-cloth in 1866 was 1*s*. per square yard.

CAOUTCHOUC (Ger. federharz; Dutch, caustiek gom; Fr. caoutchouc; Ital. gomma elastica; Span. resina elastica). Caoutchouc, gutta, elastic, or India-rubber, are the general names for a substance now so well known, familiar, and important, that it seems matter for surprise that the latter half of the preceding century should have passed away before it was made known to Europe by memoirs read to a learned body: for the remainder of the century its extraordinary property of elasticity and the grotesque objects made by the Indians caused it to be met with in the cabinets of the curious; its general knowledge and use was confined to erasing marks of black lead pencil from paper, and in this country it received the common name of lead-eater. (Ure's *Dictionary*, by Hunt.)

The chief source of the 'India rubber' of commerce is the juice of several kinds of siphonia, and especially the *Siphonia elastica* of Central and South America. The largest quantity of caoutchouc is imported from Pará in Brazil.

Caoutchouc comes either in large flat pieces, or moulded on a framework of clay, in the shape of a bottle. The latter are formed by concreting successive layers of fresh juice on a clay mould. In order to facilitate the drying of these layers, the mass is exposed to smoke, which gives the substance a black colour. When it is not so treated, the mass is a yellowish white. It is said that acids, and especially alum, cause a more rapid coagulation, and that ammonia retards the process.

The properties of caoutchouc were first made known by Bouguer and La Condamine, who had been sent to Peru, by the Academy of Sciences in Paris, in order to measure a meridional arc in

CAPERS

1736. The tree producing the substance was first described by Aublet in 1768.

The following are the importations of caoutchouc since 1851:—

Year	cwt.	Year	cwt.
1851	15,269	1861	43,030
1852	19,647	1862	57,831
1853	47,386	1863	69,703
1854	87,588	1864	63,649
1855	44,703	1865	71,047
1856	39,763	1866	71,329
1857	32,000	1867	74,176
1858	35,135		79,756
1859	21,311		

These figures indicate the increase in the use of this valuable material.

In a report by Messrs. Neumann & Co., and given in the 'Economist' in March 1866, the price of rubber is stated to be 2s. 2½d. per lb., or 100 per cent. higher than its price in 1857.

**CAPERS** (Fr. capres; Ger. kappern; Dutch, kappers; Ital. cappari; Span. alcapparas; Kusa. kapersitz; Lat. capparis). The pickled buds of the *Capparis spinosa*, a low shrub, generally growing out of the joints of old walls, and the fissures of rocks, in most of the warm parts of Europe. Capers are imported into Great Britain from different parts of the Mediterranean—the best from Toulon in France. Some small salt capers come from Majorca, and a few flat ones from about Lyons. In 1866, 209,967 lbs. capers were imported, valued at 8,750l. In 1853 the duty of 6s. 4d. per lb. on their importation was reduced to 1½d. per ditto, and was repealed in 1860.

**CAPE-TOWN.** The capital of the British territory in South Africa, at the bottom of Table Bay, about 32 miles north from the Cape of Good Hope, and on the western side of the territory to which it gives its name; lat. 30° 55' 56" S., lon. 18° 21' E. The town was founded by the Dutch in 1650, and remained, with the territory subject to it, in their possession till it was taken by the British in 1795. It was restored to the Dutch by the Treaty of Amiens; but being again captured by the British in 1806, it was finally ceded to us in 1815. The streets are laid out in straight lines, crossing each other at right angles; many of them being watered by canals, and planted on each side with oaks. The population in 1842 amounted, according to the *Cape Almanac*, to 22,543, of whom about a third were blacks, and in 1856 according to the *Geographical Dict.* to 26,420. The town is defended by a castle of considerable strength. Table Bay is capable of containing any number of ships; but it is exposed to the westerly winds, which, during the months of June, July, and August, throw in a heavy swell—a cause of many distressing accidents. This, in fact, is the great drawback upon Cape-Town, which in all other respects is most admirably fitted for a commercial station. At the proper season, however, or during the prevalence of the easterly monsoon, Table Bay is perfectly safe; while the cheapness and abundance of provisions, the healthiness of the climate, and above all its position, render it a peculiarly desirable resting-place for ships bound to or from India, China, Australia &c.

**Port Instructions.**—Art. 1. On the arrival of merchant vessels in Table Bay, a proper berth will be pointed out to the masters thereof by the port captain when he boards them; and no master of a merchant vessel shall shift his berth without permission from the port captain unless in case of extreme emergency, when he must report his having done so as early as possible at the Port-Office.

2. Should it be the intention of a master of a vessel to discharge or receive on board any considerable quantity of merchandise, a berth will be pointed out to him as close to the jetty or other

CAPE-TOWN

landing-place as the safety of the vessel and other circumstances will admit; and the master will then moor with two bower anchors, with an open hawse to the NNE., taking especial care, in so mooring, not to overlay the anchors of any other ship, or in any way to give the vessel near him a foul berth. Ships and vessels touching in Table Bay for water and refreshments alone may ride at single anchor in the outer anchorage; but in this case it is particularly recommended to veer out 80 or 90 fathoms, if they ride by a chain cable, as the liability of starting or fouling the anchor, or breaking the chain, will thereby be greatly lessened; and if riding by a rope or coir cable, to run out a stream or good kedge, to steady the ship; and in both cases the other bower anchor should be kept in perfect readiness to let go. When the vessel is properly moored with bower anchors or well secured with a bower and stream anchor, and with good cables, buoys, and buoy ropes, the master will then take the exact place of the ship by the bearings of 2 land-marks, and the depth of the water; and should accident occur, by which the vessel may drift from this situation, or lose her anchors, a good bearing and depth of water must be taken at the time, and the same must be notified in writing to the port-captain. It is particularly recommended that vessels be kept as snug as possible, to counteract the effects of the periodical winds, which at times blow with considerable violence.

Cape Colony, extending as it does from Cape-Town on the west to the Keiskamma River on the east, is of very great extent, and contains every variety of soil, from the richest level land to the wildest mountain, and traces destitute of even the appearance of vegetation. The climate fluctuates between the two extremes of rain and drought. On the whole, its advantages and disadvantages seem to be pretty equally balanced, and the prospects which it holds out to the industrious emigrant, if not very alluring, are certainly not discouraging.

**Population.**—According to the official returns, the population of the Cape Colony in 1866 amounted to 496,381, of whom 314,789 were coloured.

**Produce.**—Large quantities of corn of a very good description are produced in the immediate neighbourhood of Cape-Town, and in other parts of the colony; but agriculture is crippled by the Dutch law of succession, which, by dividing a man's property equally among his children, hinders the accumulation of capital in masses, and the formation of proper farming establishments. (Thomson's *Travels in Southern Africa*, p. 324.)

Natal is the principal market for the corn of the Cape, and efforts are being made to improve its harbour. The exports of wool have increased with astonishing rapidity, having risen from 113,077 lbs. in 1833, to 1,754,757 lbs. in 1843, to above 16,000,000 lbs. in 1858, and in 1865 to 32,806,246 lbs., valued when exported at 1,681,565l. It is now by far the most important article sent from the colony. The native breed of sheep is very inferior: its fleece is worth nothing, and it is remarkable only for the size of the tail, which sometimes weighs 20 lbs. But fine-woolled Spanish merinos, Saxon and English sheep succeed remarkably well, and their wool fetches a high price. The eastern district of Albany is especially suitable for sheep.

Large quantities of wine, and of what is called brandy, are produced at the Cape; but, with the exception of Constantia, they are very inferior. The effect of allowing the importation of Cape wines into the United Kingdom at a comparatively low duty is, not to occasion their direct consumption, but to cause them to be employed as a con-

venient means of adulterating others; so that besides being injurious to the revenue, such reduction of duty promotes fraudulent practices, and detracts from the comforts of the public.

Considerable quantities of hides, skins, and horns are exported. They are principally brought from Algoa Bay, on the eastern side of the colony; and the trade has increased very fast during the last 15 years. Aloes are an important product; and wool, butter, beef, ivory, argol, and various other articles are among the exports. The latter also include dried fish, whale and seal oil &c., the Cape fisheries being of considerable value. Copper ore is also become an important article of export.

The imports of the Cape consist of woollens, cottons, hardware, furniture, haberdashery, paper, books, and portions of most articles used in this

country. Piece goods and teak timber are imported from India, tea from China, sugar from India, the Mauritius &c.

Trade.—The trade between the colonists and the independent natives is subjected to various restraints, of which it is not always very easy to discover the policy. The sale of gunpowder and firearms to the natives has been prohibited; a regulation which might have been a judicious one, had they not been able to obtain them from any one else. The Americans have, however, traded with the eastern coast, and have liberally supplied the natives with these and various other articles; so that by keeping up the regulation in question we merely exclude ourselves from participating in what might be an advantageous trade. Since we have taken possession of Natal, this intercourse may perhaps have been stopped.

Account of the Quantities and Values of Domestic Products and Manufactures exported from the United Kingdom to the Cape Colony in each of the 5 Years ending with 1866.

But we should fall into the greatest error if we supposed that either the whole or even the greater portion of this produce was shipped from Cape-Town. On the contrary, Port Elizabeth, on the W. side of Algoa Bay, with an excellent harbour, being situated in the most fertile district of the colony, and the most suitable for the growth of wool, is become the centre of a considerable trade, its exports in some years having exceeded those of Cape-Town. The recent annexation of British Kaffraria, however, will no doubt increase the relative importance of Cape-Town. The following table shows the comparative commercial importance of the places referred to:—

Statement showing the Number and Tonnage of the Vessels that entered each of the undermentioned Ports of Cape Colony in 1863-65.

In the 5 years 1862-6 we exported to the Cape foreign and colonial produce and manufactures of the values of 113,315*l.*, 102,424*l.*, 108,825*l.*, 57,360*l.*, and 60,989*l.*

CUSTOM-HOUSE REGULATIONS, DUTIES, FEES ETC.

On Admission of a Ship to Entry, observe—

1. The ship's register must be lodged in the Custom-house until the vessel clear again for sea.
2. The manifest of the cargo on board for this place must be deposited there.
3. The cockets of cargoes shipped from any place in Great Britain or Ireland for this place must also be deposited there.

From the endorsement of such cockets an extract is to be made, which will show the contents of the different packages on board, and facilitate the making out of the entries.

4. In making out the declarations, the value by invoice of the different commodities must be given by the importer, in order to enable the Custom-house to estimate the duties payable, and to send in to Government, annually, the required statement of the total duties received upon the several articles imported.

In the clearing of a Ship outwards, observe—

1. The master must produce a certificate from the harbour-master that the tonnage duties of the port have been paid.
2. The export manifest must be examined with the permits granted, in order to ascertain whether packages have been shipped without a permit.

3. Export declarations must be sent in by the several shippers of the quality and value of goods or produce shipped by them, in order to ascertain the amount of the exports of the colony.

4. When Cape wine is shipped for exportation to England, affidavit of the particular description of such wine must be delivered, and a certificate granted, by the collector or comptroller of customs, to the master, of his having received such affidavit.

5. Manifests, in triplicate, of such goods as are shipped from the Cape for Great Britain, must be delivered signed and sworn to by the master, before the collector or comptroller.

The original of which is to be returned to the master to accompany the cargo.

The duplicate to be forwarded, by the first conveyance sailing subsequently to the vessel containing the original, to the commissioners of customs in England or Scotland respectively, as the case may happen.

And the triplicate, written on or covered with a stamp, to remain in an office copy.

N.B.—Ships taking in cargoes for other parts of the world are required to deliver only original and duplicate manifests.

6. When whale oil or whale bone is shipped from the Cape for England, the proprietor of the whale fishery is to make oath before the collector or comptroller that the same were bonâ fide the produce of fish, or creatures living in the sea, actually taken and caught wholly by her Majesty's subjects usually residing in this colony; and the collector or comptroller is to grant a certificate under his hand and seal to the master, testifying that such oath hath been made before him.

7. When salted seal skins are shipped from the Cape for England, the shipper is to make oath before the collector or comptroller that the same are really and bonâ fide the skins of seals taken and caught on the coasts appertaining to the Cape of Good Hope, wholly by her Majesty's subjects usually residing in this colony; and that all the salt used in the curing or preserving of the same was not made in, or exported from, Great Britain or Ireland; and the collector or comptroller is to grant a certificate to the master accordingly.

8. The original manifest, and a copy thereof, of ships touching at the Cape of Good Hope, with cargoes from the eastward for England, to be delivered and sworn to by the master before the collector or comptroller. The original to be returned to the master, and the copy forwarded from the Custom-house to the commissioner of customs.

9. If any part of such cargo shall be discharged at the Cape of Good Hope, the collector or comptroller is to endorse upon the manifest the part of the cargo so discharged, and verify the same.

*A Table of Duties of Customs payable on Goods, Wares, and Merchandise imported into the Colony of the Cape of Good Hope, per Act I. 1855.*

Provisions or stores of every description, imported or supplied for the use of her Majesty's land or sea forces, when the customs duties shall not have been paid thereon.  
Seeds, bulbs, or plants.  
Specimens illustrative of natural history.

Wine, imported or taken out of bond for the use of military officers serving on full pay in this colony or in British Kaffraria, and also for the use of officers of her Majesty's navy serving on board any of her Majesty's ships: subject, however, to such regulations as the governor shall think fit to make; and provided that if any such wines shall be subsequently sold in this colony, except for the use or consumption of any of her Majesty's military or naval officers serving as aforesaid, the same shall be forfeited, and be liable to seizure accordingly.

All articles of naval or military uniform or appointments imported by officers stationed in this colony, or British Kaffraria, for their own use.

Custom House Fees.—All fees abolished by Ordinance No. 6 of 1853.

Queen's Warehouse Rent.—A certain sum per week is charged upon goods, in proportion to their bulk and value.

Commission.—The following rates of commission are charged and allowed, namely:—

1. On the net amount of all sales of goods by public sale, and on the gross amount of all other sales - - - - - Per cent. 5
2. Goods consigned, and afterwards withdrawn - - - - - 2 1/2
3. On purchases effected from the proceeds of goods on which a commission has already been charged - - - - - 2 1/2
4. On all other purchases, or shipments of goods - - - - - 5
5. On the sale or purchase of ships, houses, or lands - - - - - 2 1/2
6. On ships' disbursements - - - - - 5
7. On procuring freight - - - - - 5
8. On collecting freight on ships bound to this place - - - - - 2 1/2
9. On guaranteeing bills or bonds by indorsement or otherwise - - - - - 2 1/2
10. On collecting debts without recourse to law - - - - - 2 1/2
11. Ditto where legal proceedings are taken - - - - - 3
12. On effecting remittances by bills of exchange - - - - - 1
13. On the negotiation of bills - - - - - 1
14. On effecting insurances - - - - - 1
15. On the administration of estates - - - - - 5
16. On cash advances - - - - - 2 1/2
17. On the debtor and creditor sides of cash accounts, on which no other commission is charged - - - - - 1

Money.—Accounts are either kept in pounds, shillings, pence, and farthings, or in rix-dollars, schillings, and stivers.

The Commissariat department grant bills on the Treasury at a premium of 1 1/2 per cent.

**Revenue and Expenditure.**—In 1865 the revenue of Cape Colony amounted to 499,812*l.*, of which 275,559*l.* was derived from the Customs. During the same year the expenditure amounted to 651,515*l.*

**Banks &c.**—Five joint-stock banking companies have been established in Cape Town, viz. the Cape of Good Hope Bank, established in 1837, with a paid up capital of 70,000*l.*; the South African Bank, established in the following year, with a paid-up capital of 60,000*l.*; the Colonial Bank, established in 1844; the Union Bank in 1847; and the Commercial Bank in 1854. These banks transact ordinary banking business, and allow interest on deposits, but the first only issues notes. Joint-stock companies have also been formed for conducting the business of insurance and for other purposes.

**Weights and Measures.**—The weights made use of in the Cape are derived from the standard pound of Amsterdam; and those assized are from 50 lbs. down to 1 loot, or the 32nd part of a pound, which is regarded as unity.

**Liquid Measure.**

16 Hasks = 1 anker,  
 4 ankera = 1 aam,  
 4 aams = 1 leaquet

**Corn Measure.**

4 schepels = 1 muid  
 10 muids = 1 load

107 schepeis=52 Winch. bushels, or 4 schepeis=3 Imp. bushels, very neatly.

The muid of wheat weighs, at an average, about 110 lbs. Dutch, being somewhat over 126 lbs. English.

**Cloth and Long Measure.**

12 Rhyland inches = 1 Rhyland foot  
 27 ditto = 1 Dutch ell  
 141 ditto = 1 square foot  
 141 square feet = 1 rood  
 600 roods = 1 morgen

**Colonial Weights and Measures compared with those of England.**

**Weights.**

100 lbs. Dutch = nearly 109 lbs. English avoirdupois  
 100 lbs. English = nearly 92 lbs. Dutch

**Wine or Liquid Measure.**

1 Hask = 0,6 old gallon, or 4/946 Imperial gallons  
 1 anker = 94 " " 7/9 " "  
 1 aam = 38 " " 51 1/2 " "  
 1 leaquet = 152 " " 126 1/2 " "  
 1 pipe = 110 " " 91/6 " "

**Saldanha Bay**, in lat. 33° 6' S., long. 17° 58' 15" E., being 16 1/2 leagues North of Cape-Town, is one of the best and most commodious harbours in the world. It is perfectly safe at all seasons.

Besides the *Cape Almanac* for 1865, one of the best of that class of publications, and the other authorities referred to, we have derived part of the above details from the *Geographical Dictionary*, the papers of the Board of Trade &c.

**CAPITAL.** In Political Economy, comprises those portions of the produce of industry that may be directly employed either to support human beings or to assist in production. (*Principles of Political Economy*, 5th ed. p. 47.) But in commerce, and as applied to individuals, capital is understood to mean the sum of money which a merchant, banker, or trader adventures in any undertaking, or which he contributes to the common stock of a partnership. It signifies likewise the fund of a trading company or corporation; in which sense the word *stock* is generally added to it. Thus we say the *capital stock* of the Bank &c.

The profit derived from any undertaking is estimated by the *rate* which it bears to the capital that was employed.

**CAPSICUM.** [PEPPER.]

**CARAT.** [COINS; DIAMONDS; WEIGHTS AND MEASURES.]

**CARAVAN.** An organised company of merchants, or pilgrims, or both, who associate together in many parts of Asia and Africa, that they may travel with greater security through deserts and other places infested with robbers, or where the road is naturally dangerous. The word is derived from the Persian *hervan*, or *cárván*, a trader or dealer. (Shaw's *Travels in the Levant*, p. 9, 4toed.)

Every caravan is under the command of a chief or *aga* (*caravan-bachi*), who has frequently under him such a number of troops or forces as is deemed sufficient for its defence. When it is practicable, they encamp near wells or rivulets, and observe a regular discipline. Camels are used as a means of conveyance, almost uniformly, in preference to the horse or any other animal, on account of their wonderful patience of fatigue, eating little, and subsisting 3 or 4 days or more without water. There are generally more camels in a caravan than men. [CAMEL.]

The commercial intercourse of Eastern and African nations has been principally carried on, from the remotest period, by means of caravans. During antiquity the products of India and China were conveyed either from Suez to Rhinocellura, or from Bussorah, near the head of the Persian Gulf, by the Euphrates, to Babylon, and thence by Palmyra, in the Syrian desert, to the ports of Phœnicia on the Mediterranean, where they were exchanged for the European productions in demand in the East. Sometimes, however, caravans set out directly from China, and, occupying about 250 days in the journey, arrived on the shores of the Levant, after traversing the whole extent of Asia. (Gibbon, vol. vii. p. 93.) The formation of caravans is, in fact, the only way in which it has ever been possible to carry on any considerable internal commerce in Asia or Africa. The Governments that have grown up in those continents have seldom been able, and seldom indeed have they attempted, to render travelling practicable or safe for individuals. The wandering tribes of Arabs have always infested the immense deserts by which they are intersected; and those only who are sufficiently powerful to protect themselves, or sufficiently rich to purchase an exemption from the predatory attacks of these freebooters, can expect to pass through territories subject to their incursions without being exposed to the risk of robbery and murder.

Since the establishment of the Mohammedan faith, religious motives, conspiring with those of a less exalted character, have tended to augment the intercourse between different parts of the Eastern world, and to increase the number and magnitude of the caravans. Mohammed enjoined all his followers to visit, once in their lifetime, the *Caaba*, or square building in the temple of Mecca, the immemorial object of veneration amongst his countrymen; and in order to preserve continually upon their minds a sense of obligation to perform this duty, he directed that, in all the multiplied acts of devotion which his religion prescribes, true believers should always turn their faces towards that holy place. In obedience to this precept large caravans of pilgrims used to assemble annually in every country where the Mohammedan faith is established; and though, owing either to a diminution of religious zeal, or the increasing difficulties to be encountered in the journey, the number of pilgrims has of late

years declined greatly, it is still very considerable. Few, however, of the pilgrims are actuated only by devotional feelings. Commercial ideas and objects mingle with those of religion; and it redounds to the credit of Mohammed that he granted permission to trade during the pilgrimage to Mecca, providing at the same time for the temporal as well as the lasting interests of his votaries. 'It shall be no crime in you if ye seek an increase from your Lord by trading during the pilgrimage.' (Sale's *Koran*, c. ii. p. 36, ed. 1764.)

The numerous camels of each caravan are loaded with those commodities of every country which are of easiest carriage and readiest sale. The holy city is crowded during the month of Dhalhaja, corresponding to the latter part of June and the beginning of July, not only with zealous devotees, but with opulent merchants. A fair or market is held in Mecca and its vicinity on the 12 days that the pilgrims are allowed to remain in that city, which used to be one of the best frequented in the world, and continues to be well attended.

'Few pilgrims,' says Burckhardt, 'except the mendicants, arrive without bringing some productions of their respective countries for sale; and this remark is applicable as well to the merchants, with whom commercial pursuits are the main object, as to those who are actuated by religious zeal; for, to the latter, the profits derived from selling a few articles at Mecca diminish, in some degree, the heavy expenses of the journey. The Moggrebyns (pilgrims from Morocco and the north coast of Africa) bring their red bonnets and woollen cloaks; the European Turks, shoes and slippers, hardware, embroidered stuffs, sweetmeats, amber, trinkets of European manufacture, knit silk purses &c.; the Turks of Anatolia bring carpets, silks, and Angora shawls; the Persians, Cashmere shawls and large silk handkerchiefs; the Afghans, tooth-brushes, called Mesouak Kattary, made of the spongy boughs of a tree growing in Bokhara, beads of a yellow soapstone, and plain course shawls manufactured in their own country; the Indians, the numerous productions of their rich and extensive region; the people of Yemen, snakes for the Persian pipes, sandals and various other works in leather; and the Africans bring various articles adapted to the slave-trade. The pilgrims are, however, often disappointed in their expectations of gain; want of money makes them hastily sell their little adventures at the public auctions, and often obliges them to accept very low prices.' (*Travels in Arabia*, vol. ii. p. 21.)

The two principal caravans which yearly rendezvous at Mecca are those of Damascus and Cairo. The first is composed of pilgrims from Europe and Western Asia, the second of Mohammedans from all parts of Africa.

The Syrian caravan is said by Burckhardt to be very well regulated. It is always accompanied by the pacha of Damascus, or one of his principal officers, who gives the signal for encamping and starting by firing a musket. On the route, a troop of horsemen ride in the front, and another in the rear to bring up the stragglers. The different parties of pilgrims, distinguished by their provinces or towns, keep close together. At night torches are lighted, and the daily distance is usually performed between three o'clock in the afternoon and an hour or two after sunrise on the following day. The Bedouins or Arabs, who carry provisions for the troops, travel by day only, and in advance of the caravans, the encampment of which they pass in the morning, and are overtaken in turn and passed by the caravan on the following night, at their own resting place. The journey with these Bedouins is less fatiguing than with

the great body of the caravan, as a regular night's rest is obtained; but their bad character deters most pilgrims from joining them.

At every watering place on the route is a small castle and a large tank, at which the camels water. The castles are garrisoned by a few persons, who remain the whole year to guard the provisions deposited there. It is at these watering-places, which belong to the Bedouins, that the sheikhs of the tribe meet the caravan, and receive the accustomed tribute for allowing it to pass. Water is plentiful on the route; the stations are nowhere more distant than 11 or 12 hours' march; and in winter, pools of rain-water are frequently found. Those pilgrims who can travel with a litter, or on commodious camel-saddles, may sleep at night, and perform the journey with little inconvenience; but of those whom poverty, or the desire of speedily acquiring a large sum of money, induces to follow the caravan on foot, or to hire themselves as servants, many die on the road from fatigue. (*Travels in Arabia*, vol. ii. pp. 3-9.)

The caravan which sets out from Cairo for Mecca is not generally so large as that of Damascus, and its route along the shores of the Red Sea is more dangerous and fatiguing. But many of the African and Egyptian merchants and pilgrims sail from Suez, Cosseir, and other ports on the western shore of the Red Sea, for Djidda, whence the journey to Mecca is short and easy.

The Persian caravan for Mecca sets out from Bagdad; but many of the Persian pilgrims are now in the habit of embarking at Bussorah, and coming to Djidda by sea.

Caravans from Bagdad and Bussorah proceed to Aleppo, Damascus, and Diarbeker, laden with all sorts of Indian, Arabian, and Persian commodities; and large quantities of European goods, principally of English cottons, imported at Bussorah, are now distributed throughout all the eastern parts of the Turkish empire by the same means. The intercourse carried on in this way is, indeed, every day becoming of more importance.

The commerce carried on by caravans, in the interior of Africa, is widely extended and of considerable value. Besides the great caravan which proceeds from Nubia to Cairo, and is joined by Mohammedan pilgrims from every part of Africa, there are caravans which have no object but commerce, which set out from Fez, Algiers, Tunis, Tripoli, and other states on the sea-coast, and penetrate far into the interior. Some of them take as many as 50 days to reach the place of their destination; and as their rate of travelling may be estimated at from 18½ to 22 miles a day, as they are heavy or light, the extent of their journeys may easily be computed. As both the time of their outset and their route are known, they are met by the people of the countries through which they travel, who trade with them, Indian goods of every kind form a considerable article in this traffic; in exchange for which, the chief commodity the inhabitants have to give is slaves.

Three distinct caravans are employed in bringing slaves and other commodities from Central Africa to Cairo. One of them comes direct from Mourzouk, the capital of Fezzan, across the Libyan desert; another from Senaar; and the third from Darfur. They do not arrive at stated periods, but after a greater or less interval, according to the success they have had in procuring slaves, ivory, gold dust, drugs, and such other articles as are fitted for the Egyptian markets. The Mourzouk caravan is said to be under the best regulations. It is generally about 50 days on its passage, and seldom consists of less than 100,

or of more than from Senaar a very irregular, in Egypt for 2 the occupation Mohammed Ali, Egypt has become regular. The n Egypt by these c one time, to abou of a caravan from important event; attention of the w kind of era. (Bro p. 78.) A caravan if it has 2,000 cam the Moorish pilgrim Souakin and Mass Arabia, and then t Burckhardt states who arrive in the spectable character Central Africa.

Caravans are dist Camels loaded with heavy caravan; lig applied to designate a moderate load, or p The safety of a car the conduct of the Niebuhr says that w and honest, and the language, and is a method of travelling; desert is rarely either But it is not unusual realise considerable su of conducting caravan lieved in the East th order to indemnify the arrange with the Arab of the caravans, and sh At all events, a leader for the situation, ever must impose proportion association. Hence the caravans is, to attach an active and experie considerable property e With ordinary precauti trifling. It would be ca thing like proper arrang ment, to render travell on all the great rou (Niebuhr, *Voyage en A Amst. 1780.*)

No particular formal tion of a caravan. periods are mostly und ment, by whom the lea generally speaking, st form a company and inal in whose name it is the leader, unless he is his place. When associate together in the and appoint officers to desies may arise during er details with respe *Modern Part of the Unive 4-243; Robertson's C 54; Rees's C without a single word of a ell's Travels in Arabia, Turkey and its Resou y's Travels in Bokhara*

or of more than 300, travellers. The caravans from Senaar and Darfur used formerly to be very irregular, and were sometimes not seen in Egypt for 2 or 3 years together; but since the occupation of the former by the troops of Mohammed Ali, the intercourse between it and Egypt has become comparatively frequent and regular. The number of slaves imported into Egypt by these caravans was said to amount, at one time, to about 10,000 a-year. The departure of a caravan from Darfur is looked upon as a most important event; it engages for a while the attention of the whole country, and even forms a kind of era. (Browne's *Travels in Africa*, 2nd ed. p. 78.) A caravan from Darfur is considered large if it has 2,000 camels and 1,000 slaves. Many of the Moorish pilgrims to Mecca cross the sea from Souakin and Massouah to the opposite coast of Arabia, and then travel by land to Mecca; and Burckhardt states that of all the poor pilgrims who arrive in the Hedjaz, none bear a more respectable character for industry than those from Central Africa.

Caravans are distinguished into *heavy* and *light*. Camels loaded with from 500 to 600 lbs. form a heavy caravan; light caravans being the term applied to designate those formed of camels under a moderate load, or perhaps only half loaded.

The safety of a caravan depends materially on the conduct of the *caravan-bachi*, or leader. Niebuhr says that when the latter is intelligent and honest, and the traveller understands the language, and is accustomed to the Oriental method of travelling, an excursion through the desert is rarely either disagreeable or dangerous. But it is not unusual for the Turkish pachas to realise considerable sums by selling the privilege of conducting caravans; and it is generally believed in the East that leaders so appointed, in order to indemnify themselves, not unfrequently arrange with the Arabian sheikhs as to the attack of the caravans, and share with them in the booty! At all events, a leader who has paid a large sum for the situation, even if he should be honest, must impose proportionally heavy charges on the association. Hence the best way in travelling with caravans is, to attach oneself to one conducted by an active and experienced merchant, who has a considerable property embarked on the expedition. With ordinary precaution, the danger is then very trifling. It would be easy, indeed, were there any thing like proper arrangements made by Government, to render travelling by caravans, at least on all the great routes, abundantly secure. (Niebuhr, *Voyage en Arabie*, tome ii. p. 194, ed. Amst. 1780.)

No particular formalities are required in the formation of a caravan. Those that start at fixed periods are mostly under the control of Government, by whom the leaders are appointed. But, generally speaking, any dealer is at liberty to form a company and make one. The individual in whose name it is raised is considered the leader, unless he appoint some one else to his place. When a number of merchants associate together in the design, they elect a chief, and appoint officers to decide whatever controversies may arise during the journey. (For further details with respect to caravans, see the *Modern Part of the Universal History*, vol. xiv. pp. 244-243; Robertson's *Disquisition on Ancient India*, note 54; Rees's *Cyclopaedia*, art. 'Caravan,' part of which is copied from Robertson, though without a single word of acknowledgment; Burckhardt's *Travels in Arabia*, vol. ii. passim; Urquhart's *Turkey and its Resources*, pp. 137, 151; Vamsey's *Travels in Bokhara*; &c.)

CARAVANSERA. A large public building or inn appropriated for the reception and lodgment of the caravans. Though serving in lieu of inns, there is this radical difference between them—that, generally speaking, the traveller finds nothing in a caravansera for the use either of himself or his cattle. He must carry all his provisions and necessaries with him. They are chiefly built in dry, barren, desert places, and are mostly furnished with water brought from a great distance and at a vast expense. A well of water is, indeed, indispensable to a caravansera. Caravanseras are also numerous in cities, where they serve not only as inns, but as shops, warehouses, and even exchanges.

CARAWAY-SEED (Fr. carvi, cumin des prés; Ger. keummel, brodkümmel; Ital. carvi; Span. alcaravea). A small seed, of an oblong and slender figure, pointed at both ends, and thickest in the middle. It is the produce of a biennial plant (*Carum carvi*), Nat. Order *Umbellifera*, with a taper root like a parsnip, but much smaller. It should be chosen large, new, of a good colour, not dusty, and of a strong, agreeable smell. It is principally used by confectioners, and is extensively cultivated in several parts of Essex. The Russian liqueur *kümmel* derives its flavour from the caraway seed.

This plant is a native of southern Europe, but it has been naturalised in most countries, growing wild as well as being cultivated. The root improved by culture is edible, and is used for food in northern Europe. In 1866, 13,793 cwts. were imported into England, almost entirely from Holland, and were valued at 1*l.* 15*s.* 4*d.* per cwt.

CARBON, BISULPHIDE OF. (*Dictionary of Manufactures*.)

CARBONATE. [DIAMOND.]

CARBUNCLE (Ger. karfunkel; Fr. escarboucle; Ital. carbonchio; Span. carbunculo; Lat. carbunculus). A precious stone of the garnet kind, of a very rich glowing blood-red colour, highly esteemed by the ancients. The term *carbuncle* among jewellers is applied to such garnets as are cut *en cabochon*, i. e., with a flat base, and a smooth convex top. If they are pure, of large size, and are free from spots, they are, says Mr. Emanuel, occasionally worth as much as 20*l.*

CARD (Fr. cardes; Ger. karditschen, karden, wollkratzen; Ital. cardi; Russ. bardü; Span. cardas). An instrument, or comb, for arranging or sorting the hairs of wool, cotton &c. Cards are either fastened to a flat piece of wood, and wrought by the hand; or to a cylinder, and wrought by machinery; or are made to move over 2 cylinders. The spikes with which carding cloth is armed range from fine wire, used to hackle delicate tissues, to strong wire, employed to dress coir &c. The machinery by which carding cloth is manufactured is very elaborate.

CARDAMOMS (Fr. cardamomes; Ger. karlamom; Ital. cardamomi; Span. kardanomas; Hind. gujarati elachi; Arab. ebil; Chinese, peh-tau-kau). This spice, the name of which is derived from the Greeks, has been imported from the East into Europe uninterruptedly for many centuries. It was known to our forefathers under the name of grains, or grains of Paradise, and was the cheapest of the Oriental spices introduced by the Italian merchants into mediæval Europe. (Rogers's *Agriculture and Prices in England*, vol. i. p. 609.)

The spice is the seed of various kinds of Scitamineæ, as the *Elettaria major*, *Amomum cardamomum*, *Amomum angustifolium*, *Amomum grana Paradisi*, and especially *Elettaria cardamomum*. The first of these, according to Dr. Pereira, is the produce of Ceylon. The pod contains numerous angular, rug-

ged, yellowish-red seeds, which have a peculiarly fragrant odour. The second, which is identified with the *Amomum* of Dioscorides, and is the 'round cardamom' of commerce, grows in Sumatra, Java, and other East Indian islands. The capsules, rather smaller than a cherry, contain a number of cuciform seeds. Sometimes the capsules are sent into the market in their native clusters, and then form the *Amomum racemosum*, or *anome à grappes* of the French. This kind is chiefly sent to the south of France. The third or Java cardamom is of very inferior quality. The fourth is obtained from Madagascar, where it grows in marshy ground. The fifth, known also as Guinea grains, grains of Paradise, or Maleguetta pepper, are obtained from western Africa, are strongly hot and peppery, are of a round or ovate form, often angular and cuciform, rough, brown externally, and white within. They have but a feeble aromatic odour. Similar seeds have been sent from Trinidad, and are probably to be procured from other West Indian islands. They are chiefly used in veterinary practice, and to give a factitious strength to beer and spirits. The various plants, in short, called *Scitamineæ* have a wide geographical range within the tropics.

The true cardamom of pharmacy is the last named. The fruit is a three-celled capsule, containing many seeds.

The plant is a native of the Malabar mountains. When the forests and undergrowth are removed, it springs up everywhere spontaneously. It yields fruit at the end of the fourth, and continues to bear for many years. The ripe capsules are collected, dried over a gentle fire, and then rubbed by the hands from the foot-stalk and calyx. They contain numerous small angular, irregular, rough, brown seeds. The seeds are about 74 per cent. in weight.

According to Pereira, three varieties are distinguished in British commerce—shorts, long-longs, and short-longs—the distinctions being founded on the shape of the capsules.

It is said, and with obvious probability, that the purchase of the seed collected by the natives is made a Government monopoly, the agents sent to collect the produce putting a fixed price on the article, and selling it to the merchants at enhanced rates. Such a custom is very general in the East, and ought assuredly to be put an end to.

Cardamoms are used in cookery as an ingredient in curries, and largely in medicine. The consumption of this article is very considerable among Eastern nations. They should be kept whole, as they lose their virtues in powder. These virtues depend on a peculiar volatile oil, which when extracted, though air be carefully excluded, loses its peculiar odour and taste. (Wood and Buche's *Dispensatory*.)

**CARDS or PLAYING CARDS** (Dutch, kaarten, speelkarden; Fr. cartes à jouer; Ger. karten, spiel karten; Ital. carte da giuoco; Russ. kartu; Span. carras, naipes; Swed. kort). The only thing necessary to be noticed in this place with respect to cards is the regulations as to their manufacture, sale, and the payment of the duty.

It was regulated by the 9 Geo. IV. c. 18, that an annual license duty of 5s. shall be paid by every maker of playing cards and dice. The duty on every pack of cards was 1s., and was to be specified on the ace of spades. Cards were not to be made in any part of Great Britain except the metropolis, nor in Ireland except in Dublin and Cork, under a penalty of 100*l.* Cards are to be enclosed in wrappers, with such marks as the Commissioners of Stamps may appoint. Before license can be had, bond must be given to the amount of

500*l.* for the payment of the duties &c. Selling or exposing to sale any pack of cards not duly stamped, subjected a licensed maker to a penalty of 50*l.*, and any one else to a penalty of 10*l.* Any person having in his possession, or using, or permitting to be used, any pack of cards not duly stamped, to forfeit 5*l.* Second-hand cards may be sold by any person, if sold without the wrapper of a licensed maker; and in packs containing not more than 52 cards, including an ace of spades duly stamped, and enclosed in a wrapper with the words 'Second-hand Cards' printed or written in distinct characters on the outside; penalty for selling second-hand cards in any other manner, 20*l.*

The former duty of 1*s.* per pack on cards produced, in 1861, the sum of 13,637*l.*; showing that 272,740 packs had been disposed of. But in 1862 the stamp duty was reduced to 3*d.* a pack. At the same time the license of cardmakers was raised, in case the maker also sold them, from 5*s.* to 1*l.* Dealers only previous to the Act of 1862 exempt from license pay 2*s.* 6*d.* Since the change the produce of the stamp duty has been very uniform, being a little less on the average than 9,000*l.*, the license duty yielding 1,040*l.* in 1866-7. The customs duty on foreign playing cards is 3*s.* 9*d.* per dozen packs.

**CARMEN**, of the city of London, are constituted a fellowship by act of common council. The rates which they are allowed to charge, and the regulations by which they are to be guided, are settled at the quarter sessions. In other respects they are subjected to the rule of the president and governors of Christ's Hospital, to whom the owner of every cart pays an annual license duty of 17*s.* 4*d.*

Carmen are to help to load and unload their carts; and if any carman exacts more than the regular rates, upon due proof, before the Lord Mayor or any two magistrates, he shall suffer imprisonment for the space of 21 days.

If any person shall refuse to pay any carman his hire, according to the regular rates, upon complaint made, the president of Christ's Hospital, or a justice of the peace, may compel payment.

Merchants or other persons may choose what cart they please, except such as stand for wharf-work, tackle-work, crane-work, at shops and merchants' houses, which are to be taken in turn; and every carman standing with his empty cart next to any goods to be loaded shall, upon the first demand, load the same for the accustomed rates; and if any person shall cause a carman to attend at his house, shop, warehouse, or cellar, with his loaded cart, the carman being willing to help to unload the same, he shall pay the carman after the rate of 12*d.* for every hour after the first half hour for his attendance.

Every licensed carman is to have a piece of brass fixed upon his cart, upon which is to be engraven a certain number; which number, together with the carman's name, is registered in a register kept at Christ's Hospital; so that, in case of any misbehaviour, the party offended, by taking notice of the number of the cart, may search for it in the register, and the name will be found.

Carmen not conforming to these rules, or working without a numbered piece of brass fixed on the cart, may be suspended from their employment.

Carmen riding upon the shafts of their carts, or sitting within them, not having some person on foot to guide the horses, shall forfeit 10*s.*

**CARMINE** (Ger. karmin; Dutch, karmyn; Fr. carmine; Ital. carminio; Lat. carminium). A powder of a very beautiful red colour, bordering upon purple, and used by painters in miniature. It is a species of *lake*, and is formed of finely pulverised

## CARNELIAN. [AGATE.]

CAROB BEANS or LOCUST BEANS. The seed in the pods of the carob tree, the *Ceratonia siliqua*, St. John's bread; one of the Natural Order of the *Leguminosae*. (Syn. Ger. karobbaum, Johannisbrodbaum; Span. algarrobo; Port. algarrobo; Ital. carrubio, caruba; Arab. kharoob.) The carob tree grows in southern Europe, in Asia, and all the Mediterranean coasts. At Malta it is almost the only tree that grows. The pods contain a sweet, nutritious pulp, and are used as a common article of human food where the tree is a native. They are principally used, however, in most of the southern countries of Europe, and in Egypt and Asiatic Turkey, as a nutritious and fattening food for cattle and horses. They are at present also used to a small extent in England in the preparation of artificial food for cattle. In the island of Cyprus great attention has of late years been devoted to the cultivation of the carob tree. The sale of carobs in that island was formerly a Government monopoly, but since its abolition about 40 years since the production has largely increased. In 1852, 27,000 cwt. were exported from the island; and in 1864 the export had increased to 7,087 tons, of the value of 31,500*l*. The tree grows wild in Cyprus, but is more particularly abundant in the districts of Limassol and Kerinea: the finest trees are found at Lefcara. (*From Consular Reports and other sources*.)

CARPET, CARPETS (Ger. teppiche; Dutch, tapyten, vloer-tapyten; Fr. tapis; Ital. tappeti; Span. alfombras, alfatisas, tapices; Port. tapetes, alfatisas; Russ. kowrú, kilim). Indian, Persian, and Turkish carpets are the most esteemed. In England, carpets are principally manufactured at Kidderminster, Durham, Halifax, Wilton, Cirencester, Worcester, Axminster &c.; and in Scotland, at Glasgow and Kilmarnock. Those made at Axminster are believed to be very little, if anything, inferior to those of Persia and Turkey. In 1866 there were exported 7,600,511 yards of carpets and druggets, the produce of the United Kingdom, valued at 1,217,682*l*. (For much curious and instructive matter on carpets, tapestry &c. in connection with the Paris Exhibition, see Mr. Digby Wyatt's *Report*, in vol. ii., presented to Parliament 1868.)

## CARRIAGES. [COACHES.]

CARRIERS. Persons undertaking for hire to carry goods from one place to another.

Proprietors of carts and waggons, masters and owners of ships, hoymen, lightermen, bargemen, ferry-men &c. are denominated common carriers. The master of a stage coach who only carries passengers for hire is not liable for goods; but if he undertake to carry goods and passengers, then he is liable for both as a common carrier. The Postmaster-General is not a carrier in the common acceptance of the term, nor is he subjected to his liabilities.

1. *Duties and Liabilities of Carriers.*—Carriers are bound to receive and carry the goods of all persons for a reasonable hire or reward; to take proper care of them in their passage; to deliver them safely, and in the same condition as when they were received (excepting only such losses as may arise from the act of God or the queen's enemies); or, in default thereof, to make compensation to the owner for whatever loss or damage the goods may have received while in their custody, that might have been prevented.

Hence a carrier is liable, though he be robbed of the goods, or they be taken from him by irresistible

force; and though this may seem a hard rule, yet it is the only one that could be safely adopted; for if a carrier were not liable for losses unless it could be shown that he had conducted himself dishonestly or negligently, a door would be opened for every species of fraud and collusion, inasmuch as it would be impossible in most cases to ascertain whether the facts were such as the carrier represented. On the same principle a carrier has been held accountable for goods accidentally consumed by fire while in his warehouse. In delivering the opinion of the Court of King's Bench on a case of this sort, Lord Mansfield said—'A carrier, by the nature of his contract, obliges himself to use all due care and diligence, and is answerable for any neglect. But there is something more imposed upon him by custom, that is, by the common law. A common carrier is in the nature of an insurer. All the cases show him to be so. This makes him liable for everything except the act of God and the king's enemies; that is, even for inevitable accidents, with those exceptions. The question, then, is, *What is the act of God?* I consider it to be laid down in opposition to the act of man; such as lightning, storms, tempests, and the like, which could not happen by any human intervention. To prevent litigation and collusion, the law presumes negligence except in those circumstances. An armed force, though ever so great and irresistible, does not excuse; the reason is, for fear it may give room for collusion, which can never happen with respect to the act of God. We all, therefore, are of opinion that there should be judgment for the plaintiff.' (*Forward v. Pittard*, 1 *T. R.* 27.)

A carrier is not obliged to have a new carriage for every journey: it is sufficient if he provide one that, without any extraordinary accident, may be fairly presumed capable of performing the journey.

A carrier may be discharged from his liability by any fraud or concealment on the part of the individual employing him, or of the bailor; as if the latter represent a parcel as containing things of little or no value, when in fact it contains things of great value. But when the carrier has not given a notice limiting his responsibility, and when he puts no questions with respect to the parcel to the bailor, the latter need not say anything with respect to it; and though the bailor should represent the thing delivered to the carrier as of no value, yet, if the latter know it to be otherwise, he will be responsible in the event of its being lost or damaged. If the bailor deliver goods imperfectly packed, and the carrier does not perceive it, he is not liable in the event of a loss occurring; but if the defect in the package were such that the carrier could not but perceive it, he would be liable. On this principle a carrier was made to answer for the loss of a greyhound that had been improperly secured when given to him.

A carrier may refuse to admit goods into his warehouse at an unreasonable time, or before he is ready to take his journey; but he cannot refuse to do the ordinary duties incumbent on a person in his situation.

It is felony if a carrier open a parcel and take goods out of it with intent to steal them; and it has been decided that if goods be delivered to a carrier to be carried to a specified place, and he carry them to a different place, and dispose of them for his own profit, he is guilty of felony; but the embezzlement of goods by a carrier without a felonious taking merely exposes to a civil action.

No carrier, waggonman, carman, or whinman, with their respective carriages, shall travel on Sundays, under a penalty of 20*s*. (3 *Ch. l. c. 1*.)

A carrier is always, unless there be an express agreement to the contrary, entitled to a reward for

his care and trouble. In some cases his reward is regulated by the Legislature, and in others by a special stipulation between the parties; but though there be no legislative provision or express agreement, he cannot claim more than a reasonable compensation.

2. *Limitation of Responsibility.*—Until the Act of 1830 a carrier might, by express stipulation, giving public notice to that effect, discharge his liability from all losses by robbery, accident, or otherwise (except those which arose from *misfeasance and gross negligence*, from which no stipulation or notice could exempt him), and provided the notice did not contravene the express conditions of an Act of Parliament.

Notices generally bore that the carrier would not be responsible for more than a certain sum (usually *5*l.**) on any one parcel, the value of which had not been declared and paid for accordingly; so that a person aware of this notice, entering a box worth 1,000*l.* without declaring its value, or entering it as being worth 200*l.*, would, should it be lost, have got in the first case only *5*l.**, and in the latter only 200*l.*, unless he could have shown that the carrier had acted fraudulently or with gross negligence. But, to avail himself of this defence, the carrier was bound to show that the bailor or his servant was acquainted with the notice at the time of delivering the goods. No particular manner of giving notice was required. It might be done by express communication, by fixing it up in a conspicuous place in the carrier's office, by insertion in the public papers or Gazette, by the circulation of handbills &c.; it being in all cases a question for the jury to decide whether the bailor was really acquainted with the notice of the limitation; since, if he were not, he was entitled to recover, whatever efforts the carrier may have made to publish it. Thus, a notice stuck up in a carrier's warehouse, where goods were delivered, was of no avail against parties who could not read; neither was it of any avail against those who could read, and who had seen it, *unless they had actually read it.* On this principle it was held that a notice in a newspaper is not sufficient, even when it was proved that the bailor read the newspaper, unless it could also be proved that he had read the notice itself.

These attempts to limit responsibility gave rise to a great deal of litigation and uncertainty; and to obviate the inconveniences thence arising, the important statute 1 Wm. IV. c. 63 was passed. This Act declares that carriers *by land* shall not be liable for the loss of certain articles specified in the Act, when their value exceeds 10*l.*, unless the *nature and value* of such articles be stated at the time of their delivery to the carrier, and an increased charge paid or agreed to be paid upon the same. It is further declared that no publication of any notices by carriers shall have power to limit their responsibility at common law for all other articles except those specified in the Act. But as the Act is of great importance, we subjoin it.

From and after the passing of this Act, no mail-contractor, stage-coach proprietor, or other common carrier *by land* for hire, shall be liable for the loss of or injury to any article or articles or property of the description following, viz. gold or silver coin of this realm or of any foreign state, or any gold or silver in a manufactured or unmanufactured state, or any precious stones, jewellery, watches, clocks, or timepieces of any description, trinkets, bills, notes of the Governor and Company of the Banks of England, Scotland, and Ireland respectively, or of any other bank in Great Britain or Ireland, orders, notes, or securities for payment

of money, English or foreign stamps, maps, writings, title-deeds, paintings, engravings, pictures, gold or silver plate or plated articles, glass, china, silks in a manufactured or unmanufactured state, and whether wrought up or not wrought up with other materials, furs, or lace, or any of them, contained in any parcel or package which shall have been delivered, either to be carried for hire or to accompany the person of any passenger in any mail or stage coach or other public conveyance, when the value of such article or articles or property aforesaid contained in such parcel or package shall exceed the sum of 10*l.*, unless at the time of the delivery thereof at the office, warehouse, or receiving house of such mail contractor &c. the value and nature of such article or articles or property shall have been declared by the person or persons sending or delivering the same, and such increased charge as hereinafter mentioned, or an engagement to pay the same, be accepted by the person receiving such parcel or package. (Sec. 1.)

When any parcel or package containing any of the articles above specified shall be so delivered, and its value and contents declared as aforesaid, and such value shall exceed the sum of 10*l.*, it shall be lawful for such mail contractors, stage coach proprietors, and other common carriers to demand and receive an increased rate of charge, to be notified by some notice, affixed in legible characters in some public and conspicuous part of the office, warehouse, or other receiving house, where such parcels or packages are received by them for the purpose of conveyance, stating the increased rates of charge required to be paid over and above the ordinary rate of carriage, as a compensation for the greater risk and care to be taken for the safe conveyance of such valuable articles; and all persons sending or delivering parcels or packages containing such valuable articles as aforesaid at such office shall be bound by such notice, without further proof of the same having come to their knowledge. (Sec. 2.)

Provided always, that when the value shall have been so declared, and the increased rate of charge paid, or an engagement to pay the same shall have been accepted as hereinbefore mentioned, the person receiving such increased rate of charge or accepting such agreement shall, if required, sign a receipt for the package or parcel, acknowledging the same to have been insured, which receipt shall not be liable to any stamp duty; and if such receipt shall not be given when required, or such notice as aforesaid shall not have been affixed, the mail contractor, stage coach proprietor, or other common carrier as aforesaid, shall not have or be entitled to any benefit or advantage under this Act, but shall be liable and responsible as at the common law, and be liable to refund the increased rate of charge. (Sec. 3.)

And be it enacted, that from and after the 1st day of September 1830, no public notice or declaration heretofore made or hereafter to be made shall be deemed or construed to limit or in any wise affect the liability at common law of any such mail contractors, stage coach proprietors, or other public common carriers as aforesaid, for or in respect of any articles or goods to be carried and conveyed by them; but that all and every such mail contractors, stage coach proprietors, and other common carriers as aforesaid shall, from and after the said 1st day of September, be liable, as at the common law, to answer for the loss of any injury [so in the Act] to any articles and goods in respect whereof they may not be entitled to the benefit of this Act, any public notice or declaration by them made and given contrary thereto, or in

anywise limit (Sec. 4.)

And be it enacted, that any contract made under this Act, in relation to any parcel or package, which shall be delivered, either to be carried for hire or to accompany the person of any passenger in any mail or stage coach or other public conveyance, when the value of such article or articles or property aforesaid contained in such parcel or package shall exceed the sum of 10*l.*, unless at the time of the delivery thereof at the office, warehouse, or receiving house of such mail contractor &c. the value and nature of such article or articles or property shall have been declared by the person or persons sending or delivering the same, and such increased charge as hereinafter mentioned, or an engagement to pay the same, be accepted by the person receiving such parcel or package. (Sec. 1.)

Provided always, that when any parcel or package containing any of the articles above specified shall be so delivered, and its value and contents declared as aforesaid, and such value shall exceed the sum of 10*l.*, it shall be lawful for such mail contractors, stage coach proprietors, and other common carriers to demand and receive an increased rate of charge, to be notified by some notice, affixed in legible characters in some public and conspicuous part of the office, warehouse, or other receiving house, where such parcels or packages are received by them for the purpose of conveyance, stating the increased rates of charge required to be paid over and above the ordinary rate of carriage, as a compensation for the greater risk and care to be taken for the safe conveyance of such valuable articles; and all persons sending or delivering parcels or packages containing such valuable articles as aforesaid at such office shall be bound by such notice, without further proof of the same having come to their knowledge. (Sec. 2.)

Provided also, that when the value shall have been so declared, and the increased rate of charge paid, or an engagement to pay the same shall have been accepted as hereinbefore mentioned, the person receiving such increased rate of charge or accepting such agreement shall, if required, sign a receipt for the package or parcel, acknowledging the same to have been insured, which receipt shall not be liable to any stamp duty; and if such receipt shall not be given when required, or such notice as aforesaid shall not have been affixed, the mail contractor, stage coach proprietor, or other common carrier as aforesaid, shall not have or be entitled to any benefit or advantage under this Act, but shall be liable and responsible as at the common law, and be liable to refund the increased rate of charge. (Sec. 3.)

And be it enacted, that from and after the 1st day of September 1830, no public notice or declaration heretofore made or hereafter to be made shall be deemed or construed to limit or in any wise affect the liability at common law of any such mail contractors, stage coach proprietors, or other public common carriers as aforesaid, for or in respect of any articles or goods to be carried and conveyed by them; but that all and every such mail contractors, stage coach proprietors, and other common carriers as aforesaid shall, from and after the said 1st day of September, be liable, as at the common law, to answer for the loss of any injury [so in the Act] to any articles and goods in respect whereof they may not be entitled to the benefit of this Act, any public notice or declaration by them made and given contrary thereto, or in

anywise limit (Sec. 4.)

And be it enacted, that any contract made under this Act, in relation to any parcel or package, which shall be delivered, either to be carried for hire or to accompany the person of any passenger in any mail or stage coach or other public conveyance, when the value of such article or articles or property aforesaid contained in such parcel or package shall exceed the sum of 10*l.*, unless at the time of the delivery thereof at the office, warehouse, or receiving house of such mail contractor &c. the value and nature of such article or articles or property shall have been declared by the person or persons sending or delivering the same, and such increased charge as hereinafter mentioned, or an engagement to pay the same, be accepted by the person receiving such parcel or package. (Sec. 1.)

anywise limiting such liability, notwithstanding. (Sec. 4.)

And be it further enacted, that for the purposes of this Act, every office, warehouse, or receiving house, which shall be used or appointed by any mail contractor, or stage coach proprietor, or other such common carrier, for the receiving of parcels to be conveyed as aforesaid, shall be deemed and taken to be the receiving house, warehouse, or office of such mail contractor, stage coach proprietor, or other common carrier; and that any one or more of such mail contractors, stage coach proprietors, or common carriers, shall be liable to be sued by his, her, or their name or names only; and that no action or suit commenced to recover damages for loss or injury to any parcel, package, or person, shall abate for the want of joining any co-proprietor or co-partner in such mail, stage coach, or other public conveyance by land for hire as aforesaid. (Sec. 5.)

Provided always, and be it further enacted, that nothing in this Act contained shall extend or be construed to annul or in anywise affect any special contract between such mail contractor, stage coach proprietor, or common carrier, and any other parties, for the conveyance of goods and merchandises. (Sec. 6.)

Provided also, and be it further enacted, that where any parcel or package shall have been delivered at any such office, and the value and contents declared as aforesaid, and the increased rate of charges been paid, and such parcels or packages shall have been lost or damaged, the party entitled to recover damages in respect of such loss or damage shall also be entitled to recover back such increased charges so paid as aforesaid, in addition to the value of such parcel or package. (Sec. 7.)

Provided also, and be it further enacted, that nothing in this Act shall be deemed to protect any mail contractor, stage coach proprietor, or other common carrier for hire, from liability to answer for loss or injury to any goods or articles whatsoever, arising from the felonious acts of any coachman, guard, book-keeper, porter, or other servant in his or their employ, nor to protect any such coachman, guard, book-keeper, or other servant, from liability for any loss or injury occasioned by his or their own personal neglect or misconduct. (Sec. 8.)

Provided also, and be it further enacted, that such mail contractors, stage coach proprietors, or other common carriers for hire, shall not be concluded as to the value of any such parcel or package by the value so declared as aforesaid, but that he or they shall in all cases be entitled to require, from the party suing in respect of any loss or injury, proof of the actual value of the contents by the ordinary legal evidence; and that the mail contractors, stage coach proprietors, or other common carriers, as aforesaid, shall be liable to such damages only as shall be so proved as aforesaid, not exceeding the declared value, together with the increased charges as before mentioned. (Sec. 9.)

And be it further enacted, that in all actions to be brought against any such mail contractors &c., the defendant or defendants may pay the money into court. (Sec. 10.)

It will be observed that carriers continue, notwithstanding this Act, liable, as before, for the felonious acts of their servants, and their own misfeasance or gross negligence. It is not possible, however, to lay down any general rule as to the circumstances which constitute this offence. Differing as they do in almost every case, the question, when raised, must be left to a jury. But it has been decided, that the *misdelivery* of a

parcel, or its *non-delivery within a reasonable time*, is a misfeasance that cannot be defeated by any notice on the part of the carrier limiting his responsibility. In like manner, the sending of a parcel by a different coach from that directed by the bailor, the removing it from one carriage to another, are misfeasances. Where a parcel is directed to a person at a particular place, and the carrier, knowing such person, delivers the parcel to another who represents himself as the consignee, such delivery is gross negligence. Leaving parcels in a coach or cart unprotected in the street is also gross negligence.

At common law, there is no distinction between carriage performed by sea or land; but by the 7 Geo. II. c. 15, and 26 Geo. III. c. 86, corrected and amended by the 53 Geo. III. c. 159, it is enacted that ship owners are not to be liable for any loss or damage happening to goods on board through the fraud or neglect of the master, without their knowledge or privity, further than the value of the vessel and the freight accruing during the voyage. [OWNERS.]

3. *Commencement and Termination of Liability.*—A carrier's liability commences from the time the goods are actually delivered to him in the character of carrier. A delivery to a carrier's servant is a delivery to himself, and he will be responsible. The delivery of goods in an inn yard or warehouse, at which other carriers put up, is not a delivery so as to charge a carrier, unless a special notice be given him of their having been so delivered, or some previous intimation to that effect.

A carrier's liability ceases when he vests the property committed to his charge in the hands of the consignee or his agents by actual delivery; or when the property is resumed by the consignor, in pursuance of his right of stopping it in transitu. It is in all cases the duty of the carrier to deliver the goods. The leaving goods at an inn is not a sufficient delivery. The rule in such cases, in deciding upon the carrier's liability, is to consider whether anything remains to be done by the carrier as such; and if nothing remains to be done, his liability ceases, and conversely.

A carrier has a lien upon goods for his hire. Even if the goods be stolen, the rightful owner is not to have them without paying the carriage.

In order to obviate any risks which might be incurred on the part of the public in consequence of the actual monopoly possessed by railway and canal companies, whose interests are now generally united, the Railway and Canal Traffic Act was passed in 1854 (17 & 18 Vict. c. 31), and inter alia provided: That every railway and canal company shall be liable for the loss of or any injury done to any horses, cattle, and other animals, or to any articles, goods, or things in the receiving, forwarding, or delivering thereof, occasioned by the neglect or default of such company or its servants, notwithstanding any notice, condition, or declaration made or given by such company contrary thereto or in anywise limiting such liability—every such notice, condition, or declaration being hereby declared to be null and void; provided always, that nothing herein contained shall be construed to prevent the said companies from making such conditions with respect to the receiving, forwarding, or delivering of any of the said animals, articles, and goods or things as shall be adjudged by court or judge before whom any question relating thereto shall be heard, to be *just and reasonable*. It then provides that the maximum value of a horse shall be 50*l.*, of cattle 15*l.*, of sheep or pigs per head 2*l.*, unless a previous *declaration* should be made of higher value, in which case the company may demand a reasonable per centage in ad-

dition to cover the extra risk: proof of the value to lie on the claimant. It then provides that no special contract between such company and any other parties respecting the receiving, forwarding, or delivering of any animals, articles, goods, or things as aforesaid, shall be binding upon or affect any such party unless the same be signed by him or by the person delivering such animals, articles, goods, and things respectively for carriage.

The following interpretation was put by Chief Justice Jervis on this clause, which is confessedly obscure: 'The fair meaning of this section, as it seems to me, is this: the first branch of it declares that all notices, conditions, and declarations made and given by the company shall be null and void in so far as they go to release the company from liability for loss or injury to goods &c. in the receiving, forwarding, and delivering thereof, occasioned by the neglect or default of the company or its servants. But then it goes on to provide, in the next branch, that this shall not prevent the company from making such conditions, which shall be adjudged by the court or judge before whom any question relating thereto shall be tried, to be just and reasonable; and further, though just and reasonable, such condition or special contract shall not be binding unless signed by the person sending or delivering the goods. The result seems to be this: a general notice is void; but the company may make special contracts with their customers, provided they are just and reasonable, and signed; and whereas the monopoly created by railway companies compels the public to employ them in the conveyance of their goods, the Legislature have thought fit to impose the further security that the court shall see that the condition or special contract is just and reasonable.' The Court of Exchequer took a different view, and held that the first part of the Act applies only to notices, conditions, and declarations by the company; and that the parties were, by a special contract signed by the person sending the goods, at liberty to make whatever arrangements they pleased; and where there was such a signed and special contract, the question of reasonableness and unreasonableness of its terms did not arise. Ultimately the Court of Exchequer Chamber overruled this decision of the court below, and adopted and confirmed Chief Justice Jervis's construction. (Smith's *Mercantile Law*, ed. 1865, p. 290.)

For further details as to this subject see Jeremy *On the Law of Carriers*, passim; Chitty's *Commercial Law*, vol. iii, pp. 369-386; and Smith's *Mercantile Law*. There are some excellent observations with respect to it in Sir William Jones's *Essay on the Law of Bailments*. (For an account of the regulations as to the conveyance of passengers in stage coaches, see COACHES, STAGE.)

**CARROT** (*Daucus carota*, Linn.) (Fr. carotte; Ger. gemeine mahre, gelle rube; Ital. carota; Span. zanahoria). A biennial plant, a native of Britain. Though long known as a garden plant, its introduction into agriculture has been comparatively recent. The uses of the carrot in domestic economy are well known. It is extensively cultivated in Suffolk, whence large quantities are sent to the London market. Horses are remarkably fond of carrots. In 1866, 426 cwt. of carrot seed were imported into the United Kingdom.

**CARTS**. Every cart &c. for the carriage of anything to and from any place, where the streets are paved, within the bills of mortality, shall contain 6 inches in the felly. No person shall drive any cart, waggon &c. within 5 miles of the General Post Office, unless the name, surname, and place of abode of the owner be painted in conspicuous letters, at least 1 inch in height, on the

right or off side thereof, under a penalty of 5l. Any person may seize and detain any cart, waggon &c. without such mark. (1 & 2 Wm. IV. c. 22.)

#### CASCARILLA. [BARK.]

**CASH**. In Commerce, the ready money, bills, drafts, bonds, and all immediately negotiable paper in an individual's possession. [CANTON.]

**CASH ACCOUNT**. In Book-keeping, an account to which nothing but cash is carried on the one hand, and from which all the disbursements of the concern are drawn on the other. The balance is the cash in hand. When the credit side more than balances the debit or disbursement side, the account is said to be in cash; when the contrary, to be out of cash.

**CASH ACCOUNT**. In Banking, the name given to the account of the advances made by a banker in Scotland to an individual who has given security for their repayment. [BANKS (Scotch).]

**CASHEW NUTS** (Ger. akajunüsse, Westindische anakarden; Dutch, catojnooten; Fr. noix d'acajou; Ital. acaju; Span. nueces d'acaju; Port. nozes d'acaju). The produce of the *Anacardium occidentale*, a native of the West Indian Islands and tropical America. They are externally of a greyish or brownish colour, of the shape of a kidney, somewhat convex on the one side, and depressed on the other. The shell is very hard; and the kernel, which is sweet and of a very fine flavour, is covered with a thin film. Between this and the shell is lodged a thick, blackish, inflammable oil, of such a caustic nature in the fresh nuts, that if the lips chance to touch it, blisters immediately follow. The kernels are used in cooking, and in the preparation of chocolate.

#### CASPIAN SEA. [TAGANROG.]

**CASSIA**. There are 4 species of cassia in the market, viz. *Cassia lignea* or *Cassia Bark*; *Cassia fistula*; *Cassia Buds*; and *Cassia Senna*.

1. *Cassia lignea*, or *Cassia Bark* (Fr. casse; Ger. cassia; Port. cassia lenhosa; Arab. selcekeh; Hind. tuj; Malay, kayu-legi). The bark of a tree (*Laurus cassia*, Linn.) growing in Sumatra, Borneo, the Malabar coast, Philippine Islands &c.; but chiefly in the provinces of Quantong and Kingsi, in China, which furnish the greatest part of the cassia met with in the European markets. The tree grows to the height of 50 or 60 feet, with large, spreading, horizontal branches. The bark resembles that of cinnamon in appearance, smell, and taste, and is very often substituted for it; but it may be readily distinguished; it is thicker in substance, less quilled, breaks shorter, and is more pungent. It should be chosen in thin pieces; the best being that which approaches nearest to cinnamon in flavour: that which is small and broken should be rejected. A good deal of the cassia in the Indian markets is brought from Borneo, Sumatra, and Ceylon. Malabar cassia is thicker and darker coloured than that of China, and more subject to foul packing; each bundle should be separately inspected. (Ainslie's *Materi. Indica*; Milburn's *Orient. Com.*; &c.)

2. *Cassia Buds*, the dried fruit or berry of the tree (*Laurus cassia*) which yields the bark described in the previous article. They bear some resemblance to a clove, but are smaller, and, when fresh, have a rich cinnamon flavour. They should be chosen round, fresh, and free from stalk or dirt. Cassia buds are the produce of China. (Milburn's *Orient. Com.*; *Anglo-Chinese Calendar*; and *Parl. Paper No. 257*, Sess. 1843.)

3. *Cassia fistula* (Fr. casse; Ger. rhonkaste; Ital. polpa di cassia; Lat. cassiæ pulpa; Arab. khyar sheber) is a tree which grows in the East and West Indies, and Egypt (*Cassia fistula*, Linn.).

The fruit is a thickness of length. Those principally from East Indies, are smaller smooth of the pulp. In 3,747 exported.

The fruit is a woody, dark brown pod, about the thickness of the thumb, and nearly 2 feet in length. Those brought to this country come principally from the West Indies, packed in casks and cases; but a superior kind is brought from the East Indies, and is easily distinguished by its smaller smooth pod, and by the greater blackness of the pulp. In 1866, 14,321 lbs. were imported, 8,747 exported. (*British Pharmacopœia*, 1867.)

4. *Cassia Senna*. [SENNA.]

The duties on cassia were  $1\frac{1}{10}d.$  and  $3\frac{3}{10}d.$  per lb. They are now repealed.

In 1866 the imports of cassia buds amounted to 78,048 lbs. and the exports to 22,881 lbs. Cassia buds are worth in the London market about 9l. per cwt. The imports of Cassia lignea in 1866 were 349,449 lbs., and its price from 4l. 15s. to 5l. 4s. 7d. per cwt.; that from China being 4l. 18s. 6d. Of Cassia vera 115,782 lbs. were imported from Holland.

CASTOR (Fr. castoreum; Ger. bibergeil, kastoreunt; Dutch, bevoergeil; Russ. babrowaja struja; Ital. castoro; Span. castoreo). The produce of the beaver. In the inguinal region of this animal are found four bags, a large and a small one on each side: in the two large ones there is contained a softish, greyish yellow, or light brown substance, which, on exposure to the air, becomes dry and brittle, and of a brown colour. This is castor. It has a heavy but somewhat aromatic smell, not unlike musk; and a bitter, nauseous, and subacid taste. The best comes from Russia, and is obtained in autumn and winter, but of late years it has been very scarce; and all that is now found in the shops is the produce of Canada. The goodness of castor is determined by its sensible qualities: that which is black is insipid, inodorous, oily, and unfit for use. It is said to be sometimes counterfeited by a mixture of some gummy and resinous substances flavoured with castor; but the fraud is easily detected. In 1866 the imports were 4,989 lbs., valued at 1,122l.; the exports 3,696 lbs.

CASTOR OIL (Fr. huile du ricin; Ger. rizinsöl; Ital. olio di ricino; Span. aceite de ricino) is obtained from the seeds of the *Ricinus communis*, or *Palma Christi*, an annual plant found in most tropical countries, and in Greece, the south of Spain &c. The oil is separated from the seeds either by boiling them in water or by subjecting them to the action of the press. It is said that though the largest quantity of oil may be procured by the first method, it is less sweet, and more apt to become rancid, than that procured by expression, which in consequence is the process now most commonly followed. Good expressed castor oil is nearly inodorous and insipid, but the best leaves a slight sensation of acrimony in the throat after it is swallowed. It is thicker and heavier than the fat oils, being viscid, transparent, and colourless, or of a very pale straw colour. That which is obtained by boiling the seeds has a brownish hue; and both kinds, when they become rancid, thicken, deepen in colour to a reddish brown, and acquire a hot, assulous taste. It is very extensively employed in the materia medica as a cathartic. (*Thomson's Dispensatory*.)

The duty of 1s. 3d. per cwt. on castor oil was repealed in 1845. In 1866 the imports amounted to 23,037 cwt., and the exports to 6,103 cwt.

CATECHU (Fr. caehou; Ger. kaschu; Hind. cutt; Mal. gambir). An extract prepared from the wood of the *Acacia Catechu*. The *acacia* which produces it is a small tree about 12 feet in height, growing abundantly in Hindostan and the Burmese empire. It is said to be also common in Jamaica.

The wood of the tree abounds in astringent matter which is extracted by boiling and inspissating the product. Before its source was discovered it was supposed to be a kind of earth. Hence its commercial name, *terra japonica*. After it was found to be of vegetable origin, it was taken to be an extract of the betel nut; but the real nature of the drug was first determined by Mr. Kerr, of the Bengal Civil Hospital, an eye-witness of the manufacture. Catechu, or *terra japonica*, is also called *cutch* by the English traders, who have derived this name from the Hindostanee *cutt*.

Catechu has several uses. It has long been employed as an astringent medicine, being the most powerful of the kind. It is consumed in large quantities by the natives of tropical Asia, who mix the substance with a small quantity of lime and aromatic drugs, and wrapping it in the leaf of the piper betel, use it as a masticatory. It is used for this purpose in France, made into small pills or lozenges.

But its most important economical use is as a dye and tanning drug. It owes these properties to the large amount of tannic acid it contains, amounting occasionally to more than half the weight of the substance. It is said that a pound of catechu has as much tanning power as seven or eight pounds of oak bark.

Catechu is derived from many countries and in various forms. The following have been enumerated: 1. Cuke catechu, in quantities weighing from a few ounces to 2 pounds. This is resinous in its fracture, and bears marks of having been inspissated in saucers or similar flat vessels. 2. Pegu catechu, imported in masses of large size, sometimes nearly a hundred weight. This is of excellent quality, compact, dark brown in colour, and resinous in character. 3. Bengal catechu, in quadrangular cakes, about 2 to 3 inches in length and breadth, and similar in character to those mentioned above; and 4. A catechu in balls, the quality of which is generally inferior.

As the plants producing catechu are so widely distributed, the cost of the article depends in great degree upon the cost of labour and carriage. The quantities sent to Europe are increasing. The price of catechu varies at the Eastern ports from 10s. to 15s. the cwt. (*Wood and Baché, United States Dispensatory*, from which excellent and exhaustive work the above has been chiefly compiled.)

CAT'S EYE. A mineral of beautiful appearance. Its colours are grey, green, brown, red, of various shades. Its internal lustre is shining, its fracture imperfectly conchoidal, and it is translucent. It has derived its name from a peculiar play of light, arising from white fibres interspersed. The French call the appearance *chatoyant*. Among jewellers this gem is also known by the names of *cat's eye*, *chrysoberyl*, and *cymophane*. It is found in Ceylon, Brazil, Moravia, the Ural Mountains (where a beautiful variety is known as Alexandrite), and in the United States. Good cat's eyes, according to Mr. Emanuel, are worth from 100l. to 300l., and are becoming more valuable than formerly. It scratches quartz, is easily broken, and resists the blow-pipe. It is set by the jewellers as a precious stone.

CAT SKINS. The skin or fur of the cat is used for a variety of purposes, but is principally dyed and sold as false sable. It appears from evidence taken before a Committee of the House of Commons (1859) that it is a common practice in London to decoy the animal and kill it for the sake of its skin. The fur of the wild cat is, however, far more valuable than that of the domestic cat. The

wild cat skins imported into this country are brought almost wholly from the territories of the Hudson's Bay Company. The animal from which they are taken is a good deal larger than the English wild cat, and is sometimes called the *lop cervier*, or Canadian lynx. It is very courageous. At an average about 30,000 cat skins are annually imported, of which more than a half are retained for home consumption.

**CATTLE.** A collective term applied to designate all those quadrupeds that are used either as food for man or in tilling the ground. By *neat* or *horned cattle* is meant the two species included under the names of the ox (*Bos*) and the buffalo (*Bubulus*); but as the latter is hardly known in this country, it is the former only that we have here in view.

The raising and feeding of cattle, and the preparation of the various products which they yield, have formed, in all countries emerged from the savage state, an important branch of industry.

It would be quite inconsistent with the objects and limits of this work to enter into any details with respect to the different breeds of cattle raised in this or other countries. They are exceedingly various. In Great Britain they have been vastly improved, in the weight of carcase, the quality of the beef, and the abundance of the milk, by the extraordinary attention that has been given to the selection and crossing of the best breeds, according to the objects in view. This sort of improvement began about the middle of last century, or rather later, and was excited and very much forwarded by the skill and enterprise of two individuals—Mr. Bakewell of Dishley, and Mr. Culley of Northumberland. The success by which their efforts were attended roused a spirit of emulation in others; and the rapid growth of commerce and manufactures since 1760 having occasioned a corresponding increase in the demand for butchers' meat, improved systems of breeding, and improved breeds, have been very generally introduced.

But the improvement in the size and condition of cattle has not been alone owing to the circumstances now mentioned. Much of it is certainly to be ascribed to the great improvement that has been made in their feeding. The introduction and universal extension of the turnip and clover cultivation has had, in this respect, a most astonishing influence, and has wonderfully increased the food of cattle, and consequently the supply of butchers' meat.

It was stated in the First Report of the Select Committee of the House of Commons on Waste Lands (printed in 1795), that cattle and sheep had, at an average, increased in size and weight about a fourth part since 1732; but there are strong grounds for supposing that the increase had been much more considerable than is represented by the committee.

The average price of oxen, during part of the thirteenth and the whole of the fourteenth centuries, as exhibited in Mr. Rogers's work *On Agriculture and Prices in England*, 1259-1400, was 13s. 1d., of cows 9s. 6d., of bulls 10s. 4d. These averages have been derived from many thousand entries, and indicate that the oxen were on the whole intended to be used as meat, since the price is considerably in excess of that at which cows were sold, and that no general attempt was made to improve the herd, since bulls were cheaper than oxen.

The average weight of an ox in the year 1547, if we can rely on a victualling bill of the navy, preserved in the Public Record Office, and containing the weights of 40 oxen, was 4 cwt. It is

possible that the herd may have improved during the century and a half which follow on the period comprised in the work referred to. (*Agriculture and Prices in England*, vol. i. p. 53.)

According to an estimate of Dr. Daventur in 1710, the average weight of the *net* carcase of black cattle was only 370 lbs., of calves 50 lbs., and of sheep only 28 lbs.; but according to Sir F. M. Eden (*History of the Poor*, vol. iii. Appendix p. 88) and Mr. Middleton (*Agriculture of Middlesex*, 2nd ed. p. 541), the average *net* weight of the carcase of bullocks killed in London might be taken, about the end of the last or the beginning of this century, at 800 lbs., calves at 140 lbs., sheep at 80 lbs., and lambs at 50 lbs.

**Consumption of Butchers' Meat in London.**—The number of head of cattle, sheep, and lambs sold in Smithfield market, each year from 1732 to 1852, has been as follows:—

Year	Cattle	Sheep	Year	Cattle	Sheep
1732	76,210	511,700	1793	216,848	728,480

1791	101,164	710,360	1852	226,948	1,575,340
1792	107,318	760,850			

The number of *fatted calves*, exclusive of sucklers, of which no account is taken, sold annually in Smithfield from 1821 to 1852 inclusive, was as follows:—

Date	Number	Date	Number
1821	21,768	1837	17,716
1822	21,255	1838	18,655
1823	22,759	1839	18,148
1824	21,949	1840	21,151
1825	20,938	1841	17,054
1826	22,118	1842	19,648
1827	20,729	1843	20,113
1828	20,832	1844	19,985
1829	20,879	1845	18,734
1830	20,500	1846	18,616
1831	19,522	1847	20,232
1832	19,216	1848	20,706
1833	18,929	1849	20,212
1834	19,721	1850	20,728
1835	20,859	1851	21,773
1836	18,500	1852	20,607

The contract at Greenwich below:—

1750	-
1740	-
1760	-
1770	-
1780	-
1790	-
1800	-
1810	-
1815	-

But it should be 1860, the quality been 'prime.' (1868) consists of beef of butchers.

We suspect, practical men of assigned by Sir the cattle sold when their estate excess; but the in the breeding of the empire average size; and now, we have been the mark. In we shall take the lbs.; and supposed to be nearly right. I knew the respect to estimate the the furnished for London. Inclusive of hogs a cow, however, distinct is known that the as 3 to 1; so that weight of the sheep

Average Number of Animals sold in Smithfield in each of the 3 years ending Dec. 31, 1852

215,411 cattle	-
1,569,590 sheep and lambs	-
53,192 calves	-
Total	-

This quantity, exclusive of sucklers, would cost 7,902,384l.

But exclusive of the sheep so called, including the head and horns, is used as food.

A part of the cattle of the towns in the vicinity of London, many cattle are slaughtered for the account is taken.

The latter quantity, supposing that the above quantity regarded as forming meat required for the pigs, suckling calves, hams, and so on, is a distance. The account are very large. In the introduction of steam cattle and sheep at distant parts of the country, sent up for sale, have no means of support on such a subject, that the carcasses

The contract prices of butchers' meat per cwt. at Greenwich Hospital, since 1730, have been as below:—

	£	s.	d.		£	s.	d.		
1750	-	1	5	8	1830	-	3	10	4½
1740	-	1	8	0	1825	-	2	19	6½
1730	-	1	6	6	1820	-	2	3	6
1760	-	1	11	6	1835	-	2	0	7½
1770	-	1	8	6	1840	-	2	14	0
1780	-	1	12	6	1845	-	2	6	9
1790	-	1	16	10	1850	-	2	1	5½
1800	-	3	4	1	1855	-	3	18	9
1810	-	3	12	0	1860	-	2	17	5½
1815	-	3	8	0	1865	-	3	12	7

But it should be remarked that since January 1, 1860, the quality of the meat contracted for has been 'prime.' The mutton for the hospital now (1868) consists entirely of legs and loins, and the beef of buttocks and thick flanks free from bone.

We suspect, from what we have heard from practical men of great experience, that the weights assigned by Sir F. M. Eden and Mr. Middleton to the cattle sold in Smithfield were, at the time when their estimate was framed, decidedly in excess; but the great improvements since made in the breeding and feeding of cattle in all parts of the empire have materially increased their average size; so that the above weights are now, we have been well assured, not far from the mark. In order to be within bounds, we shall take the nett weight of the cattle at 750 lbs.; and supposing this and the other estimates to be nearly right, we should be able, provided we knew the respective numbers of sheep and lambs, to estimate the total quantity of butchers' meat furnished for London by Smithfield market, exclusive of hogs and pigs. Sheep and lambs are not, however, distinguished in the returns; but it is known that the former are to the latter nearly as 3 to 1; so that we may estimate the average weight of the sheep and lambs at about 70 lbs.

Average Number of Animals sold in Smithfield in each of the 5 years ending Decr. 31, 1852	Gross Weight		Nett Weight		Butchers' Meat
	lbs.	lbs.	lbs.	lbs.	
215,411 cattle	1,000	250	750	182,538,250	
1,560,520 sheep and lambs	99	20	79	109,866,100	
55,192 calves	175	55	140	1,616,880	
Total				297,071,530	

This quantity, estimated at the average price of 6d., would cost 7,426,788s.; at 8d. it would cost 9,902,384s.

But exclusive of the above, or of the beef properly so called, a large portion of the offal, including the head and tongue, heart, tripe, fat &c., is used as food.

A part of the cattle sold in London go to supply the towns in the vicinity; but, on the other hand, many cattle are sold in the adjoining towns, and slaughtered for the use of London, of which no account is taken. We have reason to think that the latter quantity rather exceeds the former; but, supposing that they mutually balance each other, the above quantity of 297,071,530 lbs. may be regarded as forming the annual supply of butchers' meat required for London (in 1853); exclusive, however, of the offal used as food, and of hogs, pigs, suckling calves &c., and exclusive also of bacon, hams, and salted provisions brought from a distance. The quantities thus omitted from the account are very large indeed; and since the introduction of steam navigation great numbers of cattle and sheep are killed in Scotland and other distant parts of the empire, the carcasses of which are sent up for sale in the London market. We have no means of forming any correct conclusion on such a subject, but we are inclined to think that the carcasses so sent up, added to the offal

used as food, and the hogs killed in town, may be considered as fully equivalent to the butchers' meat used in the victualling of ships. On this hypothesis there will remain 297,071,530 lbs. of butchers' meat for the supply of the metropolis, which, taking the population (for 1853) at 2,400,000, gives 123½ lbs. for the consumption of every individual, exclusive of bacon, hams, and salted provisions, and also of poultry. If the population of the metropolis be taken at 3,000,000, the quantity required, on the preceding calculation, will be 371,121,530 lbs.

This, though not nearly so great as has been sometimes represented, is, we believe, a larger consumption of animal food than takes place any where else by the same number of individuals. Mr. Middleton (*Agriculture of Middlesex*, p. 642) estimates the consumption of animal food in London, exclusive of fish and poultry, at 234 lbs. a-year for every individual! And he further estimates the total average annual expense incurred by each inhabitant of the metropolis, for all sorts of animal food, at 8l. 8s. According to M. Chabrol, the consumption of butchers' meat in Paris amounts to between 85 lbs. and 86 lbs. for each individual. At Brussels the consumption is a little greater, being supposed to average 89 lbs. each individual; being rather more than 3 lbs. above the mean of Paris, and 3½ lbs. under the mean of London.

There were 342,398 cattle, 40,207 calves, 1,624,405 sheep, and 30,803 pigs brought into the Metropolitan Cattle Market in 1855.

In estimating the weights of the animals killed in country towns, a lower standard must be adopted than that taken for London; first, because the largest and finest cattle are brought to the metropolis; and secondly, because a very large proportion of the calves killed in country towns are sucklers, which are excluded from the London accounts. Neither is the consumption so great in country towns as in the metropolis; and supposing the consumption in the latter to be at the rate of 123 lbs. per individual, it does not probably exceed 100 lbs. per do. in Manchester, Glasgow, Liverpool, and other great provincial towns. In 1851 there were slaughtered in Glasgow 29,569 oxen, 4,413 calves, 123,188 sheep and lambs, and 5,157 pigs. And this statement taken in connection with the fact that very large quantities of fresh and salted meat are imported into Glasgow, and that, so late as 1760, the slaughter of bullocks for the supply of the public market was unknown in that city, sets the wonderful improvement that has taken place in the food of the Scotch people in the most striking point of view. Previously to 1780 it was customary in Glasgow, Edinburgh, and the principal Scotch towns, for families to purchase in November what would now be reckoned a small half-fed cow or ox, the salted carcase of which was the only butchers' meat they tasted throughout the year. In the smaller towns and country districts this practice prevailed till the present century; but it is now everywhere abandoned. We believe, indeed, that there has never been, in any country, a more rapid increase in the quantity, or a greater improvement in the quality, of the food brought to market, than has taken place in Scotland, since 1770. In so far as respects butchers' meat, this has been occasioned partly by the growing numbers and opulence of all classes, and partly by the vast increase in the food of cattle consequent on the introduction of green crops, and of an improved system of cultivation. [BREAD.]

The introduction of steam navigation, and the improved means of communication by railroads

and otherwise, have already had, and will no doubt continue to have, a material influence over the supply of butchers' meat. Owing to the difficulty and expense of their conveyance, cattle could not formerly be conveniently fattened at any very considerable distance from the great markets; but steam navigation has gone far to remove this difficulty. Instead of selling their cattle, lean or half-fed, to the Norfolk graziers, by whom they were fattened for the London market, the producers, in various districts of Scotland, now fatten them at home, either sending the live animals or the carcasses by steam to London, Liverpool &c. This practice is indirectly as well as directly advantageous to the farmer, inasmuch as it enables him to turn his green crops to better account, and to raise larger supplies of manure. The same practice is also extending in Ireland; and will, no doubt, spread itself over every part of the country where feeding can be carried on, that has the required facility of transport.

Exclusive of the cattle raised in Great Britain, we import considerable supplies of beef and of live cattle from Ireland.

*Account of the Number of Cows and Oxen, and of the Quantities of Beef, imported into Great Britain from Ireland in the undermentioned Years.*

Year	Cows and oxen	Beef
1801	no.	barrels
1801	51,513	28,911
1805	21,862	28,519
1810	41,553	71,603
1815	33,809	60,307
1820	59,014	24,291
1825	63,519	65,537

In 1825 the trade between Great Britain and Ireland was placed on the footing of a coasting trade, so that there are no means of continuing this account to a later date from official returns. But the following statement collected by the Customs from non-official sources has been continued from 1860 to 1866 from the valuable Statistics of Ireland, published in Mr. Thom's *Almanac* for 1868:—

*Imports of Cattle, Sheep, and Swine from Ireland into Great Britain during each of the undermentioned Years ending with 1866.*

Year	Oxen, bulls, and cows	Calves	Sheep and lambs	Swine
1816	186,483	6,363	259,257	489,847
1817	189,960	9,997	324,179	106,407
1818	195,012	7,086	255,582	110,787
1819	201,811	9,831	241,061	68,053
1820	181,616	4,162	176,915	109,170
1821	185,769	2,171	151,807	156,162
1822	253,287	31,295	419,791	362,912
1823	551,504	21,560	407,176	358,187
1824	587,151	41,868	558,651	561,651
1825	599,503	42,587	517,532	552,938
1826	589,119	19,076	370,781	356,545
1827	524,652	11,082	578,831	385,132
1828	561,881	31,350	598,816	504,224

The average annual value of the total imports for the last seven years being 7,279,376*l*.

*Number of Head of Cattle in Great Britain.*—It would, on many accounts, be very desirable to have an accurate estimate of the number and value of the stock of cattle in Great Britain, and of the proportion annually killed and made use of; but owing to the little attention that has been paid to such subjects in this country, where most branches of statistical knowledge are at a low ebb, there are no means of arriving at any conclusions that can be depended upon. The following details may not, however, be unacceptable.

Arthur Young has given, both in his *Eastern and Northern Tour*, estimates of the number and value of the different descriptions of stock in

England. The greatest discrepancy, unaccompanied by a single explanatory sentence, exists between them; but there can be no doubt that the following estimate (*Eastern Tour*, vol. iv. p. 456), though, perhaps, rather under the mark, is infinitely nearer the truth than the other, which is about twice as great:—

Number of draught cattle	-	-	681,491
"    "    "    "    "    "	-	-	741,553
fattening cattle	-	-	515,369
young cattle	-	-	914,656
			3,858,018

Now, taking this number at the round sum of 3,000,000, and adding a half to it for the increase since 1770, and 1,500,000 for the number of cattle in Scotland, we shall have 6,000,000 as the total head of cattle of all sorts in Great Britain. The common estimate is, that about a fourth part of the entire stock is annually slaughtered; which, adopting the foregoing statement, gives 1,500,000 head for the supply of the kingdom; a result which all that we had heard down to 1850 inclined us to think was not far from the mark.

But in 1866 an enumeration of the cattle, sheep, and pigs was taken for England, Wales, and Scotland. The number in Ireland has been stated for some years past. This census gives 4,785,846 as the total number of cattle in Great Britain. Of these, 3,307,054 were returned for England, 541,401 for Wales, 937,411 for Scotland. In Ireland the cattle were 3,423,414; those in the Isle of Man and the Channel Islands 37,700: making a total of 8,316,960 for the United Kingdom.

The cattle reared and held in the United Kingdom is considerably less than that held on an average in foreign countries. We subjoin a table of the population and number of cattle in several of these countries according to the latest returns, the countries being arranged according to the number of their population.

Countries	Date of return of live stock	Population	Cattle
Russia	1859-63	71,139,394	23,411,069
France	1869	37,368,713	11,197,560
Austria	1863	36,267,648	11,257,116
United States	1860	31,145,000	16,911,175
United Kingdom	1866	29,070,952	8,316,960
Prussia	1862	18,491,280	5,653,500
Spain	1863	15,658,531	2,901,598
Bavaria	1863	4,807,410	5,185,892
Belgium	1856	4,029,161	1,237,619
Sweden	1860	3,859,728	1,016,608
Holland	1861	5,613,159	1,333,887
Naples	1861	2,225,840	638,460
Hanover	1861	1,880,070	919,179
Wurtemberg	1861	1,740,708	957,172
Denmark	1861	1,662,751	1,116,724
Baden	1861	1,429,199	621,486
Hesse	1863	833,515	516,655
Hessein	1861	661,811	297,572
Mecklenburg Schwerin	1857	559,254	266,837
Nassau	1861	468,511	200,645
Schleswig	1861	421,366	300,011
Oldenburg	1852	271,637	219,913

These figures will show how much less is the proportion of cattle to head of population in the United Kingdom than it is to be found in some other communities.

*Importation of Cattle.*—Previously to 1812 the importation of horned cattle, sheep, hogs, and other animals used as food was strictly prohibited; but this prohibition was then withdrawn, and the importation of the animals in question permitted on paying a duty of 20*s*. a head on oxen and bulls, 15*s*. on cows, 3*s*. on sheep, 5*s*. on hogs &c. This certainly was one of the boldest and most important inroads ever made on the prohibitive system, and reflected the greatest credit on the administration of Sir Robert Peel. It was supposed at the time that this change would lead to a very heavy fall in the prices of all sorts of stock, a supposition which was in some degree realised

by the panic which no good foundation this we endeavor this Dictionary prohibition.

The home produced by the change—during the prevalence of 1816 Sir R. Peel cattle trade by the result has been lean stock, the most profitable business.

*Account showing*

Oxen, bulls, cows, and sheep and lambs	-	-	-

It is in evidence th arises to cattle from b drovers, and that cat Spain arrive in a bet Ireland.

In the voyage fro allowed space to lie pressed food, and water animals are packed close

by the panic which it occasioned. But there was no good foundation for such anticipations; and this was endeavoured to show, in the edition of this Dictionary published soon after the repeal of the prohibition.

The home producer was not affected adversely by the change—indeed no real change occurred during the prevalence of these duties. Hence in 1846 Sir K. Peel completed his reform in the cattle trade by admitting animals duty free. The result has been a considerable importation of lean stock, the fattening of which has been the profitable business of farmers and graziers. Cattle

imported are rarely in condition for the butcher, for the confinement and hardships of a sea voyage toll severely upon lean stock, and would involve a serious loss on beasts shipped in prime condition.

A temporary check, however, was given to the importation of foreign cattle by the late prevalence of the cattle plague. In the period from June 24, 1865 to November 10, 1866, 198,481 cattle in England were attacked, of which but 21,589 recovered, while 38,443 healthy beasts were slaughtered to prevent the spread of the disease. (*Miscellaneous Statistics*, p. 323.)

Account showing the Number and Declared Real Value of the Foreign Cattle, Sheep &c. Imported into the United Kingdom in 1865-67 (Statistical Abstract, 1868).

	1865		1866		1867

Total	—	6,189,368	—	5,594,253	—	4,210,771

According to the last Report on the Trade in Animals (July 16, 1866, Parl. Paper No. 427), the chief sources of cattle imports into Great Britain are Spain, Portugal, France, Belgium, Holland, Schleswig, Denmark, and Sweden. The market is also supplied from Orkney and Shetland to the Scotch ports, and from Scotland and Ireland to England. Importations are permitted to certain ports only, these having been approved by the Customs authorities, the regulation being practically a measure of quarantine. The chief ports for foreign cattle are Liverpool, London, Harwich, Hull, Newcastle, Leith, and Granton; and for Irish cattle, Glasgow, Sillith, Morecambe Bay, Liverpool, and Bristol. Scotch cattle are generally carried to Liverpool and London.

The following are extracts from the Report of the House of Commons' Committee of 1866 appointed to enquire into the manner in which the home and foreign trade in animals is conducted:—

*Transit.*—The sea-borne cattle arrive generally in good condition. The vessels are, with some exceptions, specially fitted up for the purpose, and have divisions for every four or six animals, windsails or other means to secure ventilation, and in some cases shelter for the cattle on deck. The cattle, however, in well-ventilated vessels appear to suffer from the want of a free current of air when the vessels are coming up the Thames or are waiting for the tide to discharge their cargo, as at Newcastle, Hull, Bristol, and Leith, where the cattle cannot be landed at all states of the tide.

The animals carried between decks are usually tied with their heads to the sides of the vessel, though the best mode is to tie them with their heads to the centre, because this latter method affords greater facility for feeding and watering, and for good ventilation; the Irish store cattle are brought over loose.

There is no rule respecting the numbers put on board, but with the exception of some cases in the Irish and Bremen trade, the vessels do not appear to be overcrowded.

It is in evidence that in Ireland much injury arises to cattle from bad treatment received from drovers, and that cattle landed from Oporto and Spain arrive in a better state than those from Ireland.

In the voyage from Oporto, each animal is allowed space to lie down, and is fed with compressed food, and watered; in other cases the animals are packed close to one another, so as to

prevent their lying or being shaken down, and sometimes are neither fed nor watered until landed.

The animals are chiefly made to walk on and off board, and the practice of slinging is nearly abandoned.

It has always been the practice to cleanse the ships, more or less, after each voyage, and recently disinfectants have been used.

On the railways cattle are often overcrowded and badly treated, especially in Ireland, and are carried for 36 to 48 hours without being fed or watered.

It is bad for the cattle and troublesome to un-truck them, while there is some difficulty in watering them while in a truck—a difficulty, however, which is not insuperable.

A journey, whether by sea or rail, causes cattle to deteriorate in value, and makes them feverish, and tends to produce, if it does not actually cause, the foot and mouth disease. These evils are very much increased if cattle are ill-treated or not properly watered.

Since the recent Orders in Council, the cattle trucks appear to have been properly cleansed as far as is possible. Possibly the floors might be constructed so as to admit of a more thorough cleansing than is at present practicable.

The Committee is of opinion that it should be made imperative upon all railway companies or steamboat proprietors who are engaged in the carriage of animals, to thoroughly cleanse and disinfect the trucks, steamboats, and pens used by them after every journey or voyage; and that provision should be made under Government superintendence for the proper ventilation of all vessels employed in carrying cattle by sea; and also that similar provision should be made with respect to the vessels employed in carrying cattle from Ireland and Scotland.

The laws relating to cruelty to animals might be often enforced with advantage in the case of both vessels and railways.

*Home Trade.*—If London and other large towns could be supplied entirely with meat killed in the country, a great deal of the traffic in cattle, and consequently a great deal of the chance of spreading infectious diseases, would be avoided.

London and other large towns can, except in hot weather, be supplied, to a great extent, with dead meat from a distance; and frequently country-killed meat, though not so good looking, is better and keeps longer than town-killed meat.

At present, the cost of sending carcasses by rail is larger than that of sending live cattle; but, with proper arrangements, the cost of carriage might be diminished.

If animals are slaughtered in districts which are thinly peopled, there is great difficulty in disposing of the offal, which does not bear the expense of carriage. It would be a loss to the farmer in such districts to be obliged to send his cattle to distant markets, dead instead of alive, and to the poor of London and large towns, who are great consumers of offal, and who would be deprived of it if those places were supplied by dead meat only.

The trade generally object to a dead-meat system; they say that the supply is very irregular, and that prices are only kept from violent fluctuations by the live-meat market.

Moreover, while admitting that the general demand is tolerably uniform, they say that their individual demand varies—that they can only meet this irregularity by buying cattle and keeping them alive in their own lairs to slaughter when required.

Many butchers and contractors who supply the suburbs of London are dependent for their meat on the metropolitan markets. If they could only obtain dead meat at these markets, it would be impossible to supply meat in as good a condition as they do at present.

The Committee is of opinion that it is not possible at present to dispense with a live-meat market in the metropolis and other large towns.

Both in London and in the provincial towns, butchers of the suburbs or neighbouring places have been in the habit of purchasing cattle in the live markets; and removing them to their own premises, and keeping them there until required for slaughter. These persons have suffered great inconvenience and extra expense by the recent prohibition of such removal, by the Orders in Council made in consequence of the cattle plague.

There does not seem to be any general desire permanently to restrain the general home traffic in cattle, but the Committee recommend that the Metropolitan Market should be confined to animals intended for immediate slaughter; and that all animals exhibited therein should be branded, and not allowed to be exhibited for sale in any other market, but should be slaughtered within 10 days, and that, subject to this regulation, the animals might be moved so as to allow butchers to take them to their own places and slaughter them.

The Committee does not recommend that any permanent restrictions, other than those above suggested, should be placed on the home traffic in cattle. That they are of opinion that the wilful exposure for sale in a public market of animals suffering from infectious disorders, such as rinderpest, sheep pox, pleuro-pneumonia, or glanders, or the knowingly driving such animals upon the public highways, or conveying them upon railway or boat, should be rendered an offence punishable in a summary manner; and, if necessary, a Bill to effect this should be introduced into Parliament.

The great inconvenience of cattle driving in the streets of London and other towns arises partly from cattle being driven to the live-meat markets and partly from cattle being driven from those markets to private slaughter-houses.

The live markets are not unhealthy in themselves, nor are slaughter-houses if properly kept, though they usually attract several trades which, in crowded localities, are injurious to public health.

The private slaughter-houses are occupied by two classes, carcass butchers and retail butchers.

The carcass butchers kill animals for the purpose of selling them wholesale in the dead-meat market. This slaughtering could be carried on at a public slaughter-house adjoining the live market as well as at private slaughter-houses; and if this were done, the number of cattle driven through the streets would be very much reduced, and the noxious trades which are connected with them would be removed.

The slaughter-houses of the retail butchers stand on a different footing. Their abolition would cause great hardship to many butchers who have slaughter-houses adjoining their shops, and can slaughter animals as they require them under their own superintendence.

For the public interest it would be advisable as far as practicable to adopt a system of public slaughter-houses, and in all cases slaughter-houses should be placed under regulations and proper inspection, as is the case at present in some of the provincial towns; and this Committee is of opinion that power should be given by a general Act to local authorities to acquire land for the erection of slaughter-houses, and to make regulations respecting them.

That the system of inspection at present existing in the City of London should be extended to the whole metropolitan district, although not entirely satisfactory inspection of meat can be carried out until all meat is killed in specified public slaughter-houses.

*Foreign Trade.*—The importation of foreign cattle is very important, for, as the home supply of cattle is reduced, the importation tends to keep down the price of meat, and it appears impossible to supply dead meat from foreign ports, to any but a very small extent.

The introduction of disease is, to a great extent, prevented by the system of inspection, which makes importers careful to send sound animals. The inspection is at present carried out effectually, though the accommodation at some wharves is deficient.

Diseased animals are slaughtered, but the rest of the cargo is sold, except in cases of rinderpest, when the whole cargo is slaughtered. Store stock affected with foot and mouth disease are, in some cases, detained until cured.

Inspectors cannot discover undeveloped seeds of disease in an animal, and therefore, with the view of preventing the importation of disease from abroad, many persons are desirous of placing store cattle in quarantine, and of maintaining the present regulation as to slaughtering fat cattle at the port of discharge within four days from their arrival.

The compulsory slaughter of all foreign cattle at the port of discharge, under the recent Orders in Council, has prevented the importation of any store cattle or sheep (which was an increasing trade), much to the detriment of the Scotch farmers, who have been unable to stock their lands, and has diminished the importation of fat cattle, a trade which would otherwise have increased.

The temporary inconvenience of insufficient accommodation for slaughtering at the wharves could no doubt be removed, but the evil of causing a large amount of additional slaughtering in large towns, as Liverpool and Hull, is more difficult to deal with.

Compulsory slaughter at a port, like compulsory slaughter at a market, is more expensive to the butcher, hampers the trade, and will diminish the importation, and raise the price to the consumer.

The Committee recommends that all imported

fat cattle should be English fat cattle.

That the country, in which the cattle plague is and to prohibit animals therefrom shall only that animals in any market, entry within four

fat cattle should be subject to the same rule as English fat cattle when exposed in a market.

That the Privy Council shall declare any country, in which they have reason to believe the cattle plague is existing, to be an infected country, and to prohibit the importation altogether of animals therefrom, or to declare that such importation shall only take place at certain ports, and that animals so imported shall not be taken into any market, but be slaughtered at the port of entry within four days of their being landed.

Besides the general question of slaughtering at the port of discharge, it was suggested that there might be a separate market for foreign fat stock in London close to the wharves, and that foreign stock might be excluded from the metropolitan market, or on the banks of the Thames.

The plan would prevent the chance of introducing infection from foreign cattle into the metropolitan market, and would stop the inconvenience of driving cattle through the streets from Blackwall to Copenhagen Fields, many of which are brought back to Whitechapel.

It is objected to by several inspectors, and by nearly all the butchers and salesmen, who alleged that the separation of the home and foreign markets would be inconvenient, would decrease the competition, and tend to diminish the importation; while by giving additional trouble to the butchers it would increase the price, and would give an unfair advantage to owners of English stock.

Although to some extent one class of butchers purchase foreign, and another class English fat cattle, yet there are many who purchase both. The separation of the markets would exclude these men from one or the other market.

Such a separation of the two markets seems therefore undesirable. The evil of the cattle driving in the streets might be much diminished if the cattle were landed lower down the river than at present, and brought up by rail, while this course would also bring the cattle in better condition, and allow of better accommodation at the wharves.

The chance of infection will also be much diminished if the metropolitan market be made exclusively a fat meat market, as in that case all the cattle would be, according to our previous recommendations, killed within 10 days.

It seems desirable, where practicable, in large towns to separate the fat and store cattle markets.

Any system of quarantine will require extensive accommodation at the port of arrival, and in some cases (as Liverpool and London) there will be great difficulty in providing this.

The objections urged to any system of quarantine are the expense, the interference with trade, and the deterioration of the animal during the quarantine, while it is said that the animal might catch the disease from the place where it is quarantined. A quarantine would, no doubt, act as a tax on importation, and if it did not stop importation altogether, would diminish it, and raise the price to the purchaser.

It is alleged on the other hand that a purchaser would gladly pay an increased price, as he would have a kind of warranty of the soundness of the animal; but it may be doubted whether the quarantine furnishes an adequate security that the animal is free from disease.

The only disease for which quarantine appears to be at all reasonable is the rinderpest.

Where countries like Spain or Denmark are not only free from rinderpest, but are not a channel for the exportation of cattle from infected inland countries, there seems to be no reason for a quarantine for cattle exported from them.

The Committee is of opinion that a permanent department of the Council Office should be appointed to keep up communications with the Board of Customs and her Majesty's consuls abroad, in order to have accurate accounts as to the existence or otherwise of the cattle plague, upon whose recommendation the Council could, if they thought fit, order a quarantine, or impose such restrictions upon the trade in animals as circumstances might appear to them to justify.

*Laws as to Cattle.*—No salesman, broker, or factor, employed in buying cattle for others, shall buy for himself in London, or within the bills of mortality, on penalty of double the value of the cattle bought and sold. (31 Geo. II. c. 40.)

Cattle not to be driven on Sunday, on penalty of 20s. (3 Ch. I. c. 1.)

Any person unlawfully and maliciously killing, wounding, or maiming any cattle shall be guilty of felony, and, upon conviction, may be transported, at the discretion of the court, beyond seas for life, or for any term not less than 7 years, or be imprisoned for any term not exceeding 4 years, and kept to hard labour; and, if a male, may be once, twice, or thrice publicly or privately whipped, if the court shall think fit so to order. (7 & 8 Geo. IV. c. 30.)

Persons wantonly and cruelly abusing, beating, or ill-treating cattle may, upon being convicted before a justice of such offence, be fined in any sum not exceeding 5*l.* and not below 10*s.*; and upon non-payment of fine may be committed to the house of correction for any time not exceeding 3 months.

Complaint must be made within 10 days after the offence. Justices are instructed to order compensation to be made, not exceeding 20*s.*, to persons vexatiously complained against. (3 Geo. IV. c. 71.)

**CAVIAR** or **CAVIARE** (Fr. caviar, caviar; Ger. kaviar; Ital. caviario, caviare; Span. caviario; Russ. ikra; Lat. caviarium). A substance prepared in Russia, consisting of the salted roes of large fish. The best, which is made of the roe of the sturgeon, appears to consist entirely of the eggs, and does not easily become fetid. It is packed in small casks or kegs; the inferior sort being in the form of dry cakes. Caviar is highly esteemed in Russia, and considerable quantities are exported to other countries. It is principally made of the roe of the sturgeon caught in the Wolga, in the neighbourhood of Astrachan, as many as 30,000 barrels of caviar having been exported from that city in a single season. In 1866, 128 cwts. of caviar were imported into Great Britain, valued at 2,313*l.* (*Geog. Dict. art. 'Astrachan.'*)

**CAYENNE PEPPER** or **GUINEA PEPPER**. [**PEPPER.**]

**CEDAR** (Ger. zeder; Dutch, ceder; Fr. cèdre; Ital. and Span. cedro; Russ. kedr; Lat. cedrus). The cedar of Lebanon, or great cedar (*Pinus cedrus*) of the Old Testament. It grows to a very great size. The timber is resinous, has a peculiar and powerful odour, a slightly bitter taste, a rich yellowish brown colour, and is not subject to the worm. Its durability is very great; and it was on this account (*propter aeternitatem*, Vitruvius, lib. ii. sec. 9) employed in the construction of temples and other public buildings, in the formation of the statues of the gods, and as tablets for writing upon. In the time of Vitruvius cedars were principally produced in Crete, Africa, and some parts of Syria. (Loc. cit.) Very few are now found on Lebanon; but some of those that still remain are of immense bulk, and in the highest preservation.

Cedar exceeds the oak in toughness, but is very inferior to it in strength and stiffness. Some very fine cedars have been produced in England.

There are several other kinds of timber that are usually called cedar: thus a species of cypress is called white cedar in America; and the cedar used by the Japanese for building bridges, ships, houses &c. is a kind of cypress, which Thunberg describes as a beautiful wood, that lasts long without decay. The *Juniperus oxycedrus* is a native of Spain, the south of France, and the Levant; it is usually called the brown-berried cedar. The Bermudian cedar (*Juniperus Bermudiana*), a native of the Bermuda and Bahama islands, is another species that produces valuable timber for many purposes, such as internal joiners' work, furniture, and the like. The red cedar, so well known from its being used in making black lead pencils, is produced by the Virginian cedar (*Juniperus Virginiana*), a native of North America, the West India islands, and Japan. The tree seldom exceeds 45 feet in height. The wood is very durable, and, like the cedar of Lebanon, is not attacked by worms. It is employed in various ways, but principally in the manufacture of drawers, wardrobes &c., and as a cover to pencils. The internal wood is of a dark red colour, and has a very strong odour. It is of a nearly uniform texture, brittle, and light. (Tredgold's *Principles of Carpentry: Library of Entertaining Knowledge, Vegetable Substances; Rees's Cyclopaedia; &c.*)

The duties on cedar, which produced only a trifling sum, were repealed in 1845. A duty of 1s. per ton was, however, imposed on cedar in 1860, but the importation has been free since March, 1866. The imports in 1866 were 5,647 tons, valued at 59,224l. The use of cedar in pencil making has been superseded to a considerable extent by other and cheaper woods.

**CEMENT.** Another name for hydraulic mortar, i. e. mortar which solidifies under water, and thereupon becomes impermeable to it. These cements always contain alumina and silica, and the rationale of their action is the formation of a hydrated silicate of lime, alumina, and occasionally magnesia. The sources of hydraulic lime are—

1. The septarie of the oolite and London clay, found on the coasts of Kent, the Isles of Sheppey and Thanet, Yorkshire, Somerset, and the Isle of Wight, as well as in many continental countries.
2. The blue lias cement stones found in South Wales, Somerset, Lyme Regis, and Nottinghamshire.
3. The Isle of Portland cements of similar character may also be made artificially by the calcination of lime with silica and similar compounds. (Ur's *Dictionary*.)

The value of British cement exported in 1866 was 280,916l., about the average of the former 3 years.

**CERTIFICATES.** In the Customs, *Certificates of origin* were required in respect of all goods which are entitled to any exemption from or remission of duty, or other peculiar advantage, on their being imported. They were required, for example, in the case of sugar and spirits from the British possessions in America and the Mauritis, of sugar from places within the limits of the East India Company's charter, of wine from the Cape of Good Hope &c. The clauses with respect to them were embodied in the Customs Consolidation Act. [IMPORTATION AND EXPORTATION.] The statute enacted that the Commissioners of the Treasury may by order under their hands declare that a certificate of production shall be required upon the exportation of any goods from any British possession abroad or other place, or upon the importation of such goods into the United Kingdom, and frame such regula-

tions respecting such certificates and goods as they may think fit; and if any goods in respect of which such certificates are required be imported without such certificate, they shall be deemed to be foreign goods and liable to any duty attaching to them as such; and such orders of the Treasury shall be published in the London and Dublin Gazettes three times at least within three months from the date thereof respectively. (Sec. 78.)

The following clauses relate to the importation of goods from the Channel Islands—

**Goods of Guernsey, Jersey &c.**—Any goods of the growth of the Channel Islands, and any goods manufactured in the said islands from materials of the growth of the said islands, or from materials not subject to duty in the United Kingdom, or from materials upon which the duty has been paid in the United Kingdom, and upon which no drawback has subsequently been granted, may be imported into the United Kingdom from the said islands respectively without payment of any duty, and such goods shall not be deemed to be included in any charge of duties imposed by any Act on the importation of goods generally from parts beyond the seas; but such goods shall be charged with any proportion of such duties as shall fairly countervail any duties of excise payable on the like goods the produce or manufacture of the part of the United Kingdom into which they shall be imported, or payable upon any of the materials from which such goods are manufactured; and all goods manufactured in any of the said islands shall be declared and taken to be foreign goods. (Sec. 82.)

**Master to deliver Certificate of Produce.**—Before any goods shall be entered as being the produce of the said Islands (if any benefit attach to such distinction), the master of the ship importing the same shall deliver to the collector or comptroller of customs a certificate from the governor, lieutenant-governor, or commander-in-chief of the island whence such goods were imported, that proof had been made in manner required by law that such goods were of the produce of such island, stating the quantity and quality of the goods, and the number and denomination of the packages containing the same. (Sec. 83.) These regulations are now repealed.

**CHAIN.** In Surveying, a measure of length, composed of a certain number of links made of iron wire, serving to take the distance between two or more places. Gunter's chain contains 100 such links, each measuring  $7\frac{1}{4}$  inches, consequently equal to 66 feet, or 4 poles.

**CHAIN CABLES.** [ANCHORS AND CABLES.]

**CHALDRON.** A dry English measure. 36 coal bushels make a chaldron, and 21 chaldrons a score. The coal bushel is 19½ inches wide from the outside, and 8 inches deep. It contains 2217·6 cubic inches; but when heaped, 2815·3, making the chaldron 58·65 cubic feet. There are 12 sacks of coal in a chaldron; and if 5 chaldrons be purchased at the same time, the seller must deliver 63 sacks: the 3 sacks additional are called the *ingrain*. But coals are now sold in London, and almost everywhere else, by the ton of 20 cwt. avoirdupois. The Newcastle chaldron of coals is 53 cwt., and is exactly double the London chaldron. [COALS.]

**CHAMBER OF COMMERCE.** An assembly of merchants and traders, where affairs relating to trade are treated of. There are several establishments of this sort in most of the chief cities in France; and in this country chambers of this kind have been erected for various purposes.

**CHAMBER OF ASSURANCE,** in France, denotes a society of merchants and others for carrying on

**CHAMPAGNE.** One of the most esteemed and celebrated of the French wines. [WINE.]

**CHANKS or CHANK SHELLS.** Common conch shells (*Voluta Pyrum*) are fished up by divers in the Gulf of Manaar, on the coast opposite Jaffnapatam, in Ceylon, in about 2 fathoms water; and at Travancore, Tuticoreen, and other places. Large fossil beds of chanks have also been found. Chanks are of a spiral form. They are important as an article of trade in India, being in extensive demand all over the country. They are sawn into narrow rings or bracelets, and are worn as ornaments on the arms, legs, fingers &c. by the Hindoo women: many of them are also buried with the bodies of opulent and distinguished persons. Those which, from being taken with the fish, are called green chanks, are most in demand. The white chank, which is the shell thrown upon the beach by strong tides, having lost its gloss and consistency, is not worth the freight up to Calcutta. The value of the green chank depends upon its size. A chank opening to the right, called in Calcutta the right-handed chank, is so highly prized as sometimes to sell for 400, or 500, or even 1,000 rupees. (Bell's *Commerce of Bengal*; and *Private communications*.)

The fishery of chanks used to be monopolised by Government, who formerly let the banks for from 3,000l. to 4,000l. a-year. But of late years the fishery, partly from the poaching of the fishermen of the contiguous coasts, and partly from a decrease in the supply of chanks, declined so that the rental of the banks fell off to from 300l. to 400l. a-year; and this smaller sum was not paid, as formerly, for a license to dive for live chanks, but for permission to dig up the dead shells along the shore of the Gulf of Manaar. Under these circumstances Government have wisely abandoned the chank monopoly, which, without being of any value in a financial point of view, obstructed the employment of the inhabitants on the shores of the Gulf. (See the valuable *Report* of Sir J. E. Tennent, p. 55 of *Papers on Ceylon*, presented to Parliament in 1848.)

**CHARCOAL** (Fr. charbon; Ger. kohlenstoffe; Ital. carbone; Span. carbon). There are three forms of carbon—*diamond*, *graphite* or *plumbago*, and *charcoal*. The origin of the first two has not been determined; the latter is an artificial product. The most important kinds of artificial carbon are **LAMP-BLACK**, **vegetable charcoal**, and **animal charcoal**.

Vegetable charcoal is prepared by igniting wood and admitting as small a quantity of air as possible during the process of combustion. Branches of trees are piled in a conical shape, and are covered with turf, a few holes being left at the bottom of the pile, at which air is admitted. The pile is then ignited from below, and suffered to burn slowly till smoke ceases to be evolved. The apertures are then closed, and the charcoal suffered to cool. This method of manufacturing charcoal is very ancient, and has been practised in this country for centuries. The man who found the body of Rufus in the New Forest was a charcoal burner, and his descendants followed the occupation up to the close of the last century. Large quantities of charcoal are also produced by the distillation of wood in close vessels, in the manufacture of pyroligneous acid and wood naphtha. Coke is an impure variety of charcoal. The charcoal used in the manufacture of gunpowder is made of the young branches of various plants, the lighter and more vascular parts—excepting the bark, which contains more salts than the rest of the tree—being selected. These woods are charred in

iron vessels at high temperatures, and the product reduced to an impalpable powder.

The economical uses of wood charcoal are considerable. It has powerful disinfectant and decolorising properties, and arrests putrefaction in animal and vegetable substances. These qualities appear to depend on its extraordinary power of absorbing gases, particularly those which are the result of putrefaction. Thus 1 volume of charcoal will absorb 90 volumes of ammoniacal gas, and 55 volumes of sulphuretted hydrogen, giving off these products on being heated. Hence charred casks are the safest vessels for water to be used in by sea voyagers, and piles charred at the end are much more able to resist rot than uncharred wood. Disagreeable odours are eliminated by charcoal. It also absorbs colours. Hence its power of bleaching water, and its familiar use as a filter. Its properties are most notable in proportion to its lightness, which varies greatly with its origin, since its specific gravity when solidified is 3.5, while some kinds of porous charcoal are as low as .44.

Animal charcoal is obtained by submitting certain animal substances, generally bones, to a red heat, the vessel containing the material being closed. The product when obtained from bones is called bone black, or ivory black.

The extraordinary decolorising power of animal charcoal does not depend on the mere fact that the substance is carbonised, but on the minuteness to which the division of particles is carried. This division in the case of ordinary bone black is effected by the phosphate and carbonate of lime contained in the product, which being intimately blended with the charcoal, though only in a state of mechanical combination, render the surface of the charcoal, in which the decolorising power consists, more extended. By far the most powerful form in which animal charcoal can be obtained is from the ignition of dried blood, hair, albumen, and similar animal substances, with carbonate of potassa, and washing the product. Such a kind of charcoal, when compared with the decolorising power of ordinary bone black, the latter being taken as unity, exercises twenty times as much power in decolorising sugar, and fifty times as much in producing the same effect on a solution of indigo. If, however, the substance combined with the charcoal undergoes fusion, and so permanently coats the surface of the charcoal, the product is worthless.

Animal charcoal has great value in the art of the sugar refiner, in that of the dyer, and in various departments of economical chemistry.

**CHARLESTON.** A city and sea-port of the United States, in South Carolina, in 'lat. 32°46' 33" N., long. 79° 49' W'. Population in 1860, 51,200, including the suburbs of Neck &c. beyond the limits of the city.

The situation of Charleston is not unlike that of New York, being built on a point of land between the Ashley and Cooper rivers, at their point of confluence. The exports principally consist of cotton and rice (particularly the former), which are the staple products of the state. There are a few other articles exported, such as naval stores, hams, bacon &c., but their value is inconsiderable. All the cotton sent from South Carolina to foreign countries is shipped at Charleston. In the year ending August 31, 1857, the shipments of cotton to foreign countries amounted to 229,185 bales; the shipments of cotton coastwise during the same year were estimated at 169,348 bales. But during and since the civil war which closed in 1865 the state of her trade has been abnormal. The imports from

foreign countries principally consist of cottons, woollens, linens and silks, hardware, iron and steel, coffee, sugar, tea, wine, spices &c. The greater part of the imports do not, however, come from abroad, but from the Northern and Middle States. The former supply her with fish, shoes, and all sorts of coarse manufactured goods for the use of the slave population; while the latter supply her with wheat, flour &c. The largest portion of the imports of foreign produce is also brought at second-hand from New York, which occupies the same rank in the Union that Liverpool and London do in Great Britain. In South Carolina the dollar is worth 4s. 8d. currency, so that 11 sterling = 11. 0s. 8d. currency. *Weights and Measures* same as in England. [New York.]

*Port.*—Charleston Harbour is spacious and convenient; but the entrance to it is incommoded by a range of sandbanks, stretching from Sullivan's Island on the north to Folly Island on the south, about 2½ leagues. There are several channels through these banks, but only three (the middle or direct channel, the ship channel, and Lawford channel between the latter and the mainland) that ought to be attempted by ships of considerable burden. The entrance to the ship channel is in lat. 32° 10'. The depth of water on the shallowest part of the bar at ebb tide is 12 feet, and at flood from 17 to 18 feet; whilst the depth in the middle channel at low water does not exceed 9 feet, and in Lawford channel it does not exceed 10 or 11 feet. There are two lights on Morris Island, lat. 32° 41' 56" N., long. 79° 52' 29" W., and on the west of the Ship channel. There are two lights on the east end of Charleston Battery, and two in Charleston harbour. But the lighthouse system of this, like that of the other harbours in the Southern States, has been deranged by the late war. After getting into the channel, which is marked by the breakers and buoys on each side, the proper course for a ship to steer is to bring the lighthouse to bear NW. by W., and stand direct for it till you get within the banks, when the course is N. by W. But it is unnecessary to enter into further details on these points, as all ships entering Charleston harbour are bound, provided they are hailed by a licensed pilot off the bar, to pay him full pilotage fees, whether they accept his services or not. In point of fact, however, they are always accepted: for the shifting of the sands, the influence of the tides &c. render the entrance so difficult to those not perfectly familiar with it, that even the packet ships that sail regularly to and from New York uniformly heave-to without the bar for a pilot.

Ships usually moor alongside quays or wharves, where they are in perfect safety.

*Shipping Charges.*—The charges of a public nature paid by ships entering this port differ but little in amount on a native and a foreign ship. On a vessel supposed to be of 300 tons burden, entering, unloading, taking on board a mixed cargo and clearing out, they would be as under:—

	dols.	cts.	¢	¢	¢
Fee on entry at the Custom-house	2	50	0	11	14
Surveyor's fee, on a foreign ship	5	00	1	1	44
ditto, on a native ship	5	00	0	12	00
Port warden's survey, when required	10	00	2	2	84
Fees on clearance at the Custom-house, of a native ship	5	50	0	14	11½
ditto, of a foreign ship	2	70	0	11	64
Photage inwards and outwards, supposing the ship to draw 14 feet water	50	00	10	15	64
Wharfage, per ditto	1	00	0	4	34

The difference in the fees on the clearance at the custom-house of a native and a foreign ship is owing to the former being obliged to give certain bonds which are not required of the latter.

## CHARTERPARTY

The greater or smaller tonnage of the ship makes no difference on any of the above charges except that of pilotage, which is in proportion to her draught of water, and is the same whether for a foreign or a native ship.

Harbour fees are 1½ cent per ton, according to the tonnage in the vessel's register or papers, on all vessels of the United States, and upon all foreign vessels entering upon the same terms as vessels of the United States, payable every voyage, excepting steamboats and packets, and other vessels performing regular successive voyages from North Carolina and Georgia, which vessels pay 1 per cent. per ton, once in every quarter. Fees to be paid at the harbour-master's office 48 hours after arrival. All other foreign vessels not entering upon the same terms as vessels of the United States pay double, or 3 cents per ton. All vessels owned in the State of South Carolina, and steadily plying or trading within the limits of the same, are exempted from the above fees. (See Mr. Edwards's excellent *British Shipmaster's Guide*, Longmans, 1866.)

*Rates of Commission.*—The rates of commission or factorage usually charged and allowed at Charleston on transacting different sorts of business are as follows, viz.—

For selling domestic produce, 2½ per cent.  
For selling foreign merchandise, 5 per cent.  
For guaranteeing either of these sales, 2½ per cent. additional is commonly allowed.  
For purchasing with funds in hand, or drawing domestic bills for reimbursement, 2½ per cent.  
For purchasing goods and drawing foreign bills for reimbursement, 5 per cent. is charged.  
For the sale of real or personal estate, the regular charge is 5 per cent.; but where the property to be sold is of any considerable value, the parties in general enter into an agreement beforehand, and a much lower rate of commission is allowed.

*CHART* (Ger. seekarten; Dutch, zeeakten; Fr. cartes marines; Ital. carte marine; Span. and Port. cartas de marear). This term is properly applied to a projection of some part of the sea, as the term *Map* is to a portion of the land; wherefore charts are sometimes denominated 'Hydrographical maps.' They are distinguished into several kinds, as plane, globular, and Mercator charts.

**CHARTERPARTY** The name given to a contract in writing, between the owner or master of a ship and the freighter, by which the former hires or lets the ship, or a part of the ship, under certain specified conditions, for the conveyance of the goods of the freighter to some particular place or places. Generally, however, a charterparty is a contract for the use of the whole ship: it is in commercial law what an indenture is at common law.

No precise form of words or set of stipulations is requisite in a charterparty. The forms subjoined to this article are those most commonly in use; but these may, and, indeed, in many cases must, be varied, to suit the views and intentions of the parties.

A charterparty is seldom under seal; for generally a printed or written instrument is signed by the parties, called a *memorandum of a charterparty*; and this, if a formal charterparty be not afterwards executed, is binding. The stamp in either case is the same.

Charterparties, when ships are let or hired at the place of the owners' residence, are generally executed by them, or some of them; but when the ship is in a foreign port, a charterparty must necessarily be executed by the master, and the merchant or his agent, unless the owner's name

an agent in such act for them in

A charterparty when he is in a the ship's employment, circumstances which or when it is in circumstances which or implied assent the latter. But, no direct action instrument itself signed and sealed (authorise the master to enter into the strictly expressed only as agent.

When a ship is several persons, tuted by each, o action for non-per party be not except parties, but rurs denied witnesseth with consent of A the ship to freightment contains cov A and B; in this action upon the co with them; but m cannot be sued upon proper form.

The general rule of construction of this, aments, is, that the agreeable to the conformable to the of the particular relates.

The charterparty of the ship; and by of 1681 it is requi Molloy (bk. ii. ch. i) by the ton, and found by the payment shall and if a ship be fr and if a ship be fr abouts, the addition author) is commonly less; but it is now register measurem

The usual covenan worthy, and in a cond the owners to prepara to commence and fu the charterparty con owner of the vesse bound, as a carrier, to be fit to perform th he should give notic from losses occasioned his vessel, unless s want of ordinary ce if his ship were not s In all maritime t the utmost consequ delay, the object or lost; and therefore, by the time appointe the other may seek bring an action to r sustained.

The manner in wh cargo is, for the m custom and usage of it, unless there be an charterparty with re ever, the owner is bo

an agent in such port, having proper authority to act for them in such matters.

A charterparty made by the master in his name, when he is in a foreign port in the usual course of the ship's employment, and, therefore, under circumstances which do not afford evidence of fraud; or when it is made by him at home, under circumstances which afford evidence of the expressed or implied assent of the owners; is binding upon the latter. But, according to the law of England, no direct action can be maintained upon the instrument itself against the owners, unless it be signed and sealed by them, or unless they authorise the master (or agent, as the case may be) to enter into the contract, and unless it be distinctly expressed in the charterparty that he acts only as agent.

When a ship is chartered by several owners to several persons, the charterparty should be executed by each, or they will not be liable to an action for non-performance. But if the charterparty be not expressed to be made between the parties, but runs thus—'This charterparty indented witnesseth, that C, master of the ship W, with consent of A and B, the owners thereof, lets the ship to freight to E and F,' and the instrument contains covenants by E and F to and with A and B; in this case A and B may bring an action upon the covenants expressed to be made with them; but unless they seal the deed, they cannot be sued upon it. This, therefore, is a very proper form.

The general rule of law adopted in the construction of this, as of other mercantile instruments, is, that the interpretation should be liberal, agreeable to the real intention of the parties, and conformable to the usage of trade in general, and of the particular trade to which the contract relates.

The charterparty usually expresses the burden of the ship; and by the famous French Ordinance of 1681 it is required to do so. According to Molloy (bk. ii. ch. iv. s. 8), if a ship be freighted by the ton, and found of less burden than expressed, the payment shall be only for the real burden; and if a ship be freighted for 200 tons, or *thereabouts*, the addition of *thereabouts* (says the same author) is commonly reduced to *five* tons more or less; but it is now usual to say so many tons 'register measurement.'

The usual covenant, that the ship shall be seaworthy, and in a condition to carry the goods, binds the owners to prepare and complete every thing to commence and fulfil the voyage. But though the charterparty contained no such covenant, the owner of the vessel would be, at common law, bound, as a *carrier*, to take care that the ship should be fit to perform the voyage; and even though he should give notice, limiting his responsibility from losses occasioned to any cargo put on board his vessel, unless such loss should arise from want of ordinary care &c., he would be liable if his ship were not seaworthy. [SEAWORTHY.]

In all maritime transactions expedition is of the utmost consequence; for even by a short delay, the object or season of a voyage may be lost; and therefore, if either party be not ready by the time appointed for the loading of the ship, the other may seek another ship or cargo, and bring an action to recover the damages he has sustained.

The manner in which the owner is to lade the cargo is, for the most part, regulated by the custom and usage of the place where he is to lade it, unless there be any express stipulation in the charterparty with respect to it. Generally, however, the owner is bound to arrange the different

articles of the cargo in the most proper manner, and to take the greatest care of them. If a cask be accidentally staved in letting it down into the hold of the ship, the master must answer for the loss.

If the owner covenants to load a full and complete cargo, the master must take as much on board as he can do with safety, and without injury to the vessel.

The master must not take on board any contraband goods, whereby the ship or cargo may be liable to forfeiture and detention; nor must he take on board any fals- or colourable papers; but he must take and keep on board all the papers and documents required for the protection and manifestation of the ship and cargo by the law of the countries from and to which the ship is bound, by the law of nations in general, or by any treaties between particular states.

If the master receive goods at the quay or beach, or send his boat for them, his responsibility commences with the receipt in the port of London. With respect to goods intended to be sent coastwise, it has been held that the responsibility of the wharfinger ceases by the delivery of them to the mate of the vessel upon the wharf. As soon as he receives the goods, the master must provide adequate means for their protection and security; for even if the crew be overpowered by a superior force, and the goods taken while the ship is in a port or river within the country, the master and owners are liable for the loss, though they may have committed neither fraud nor fault. This may seem a harsh rule; but it is necessary, to put down attempts at collusive or fraudulent combinations.

The master must, according to the terms of the charterparty, commence the voyage without delay, as soon as the weather is favourable, but not otherwise.

The courts of law have recently given some important decisions on the subject of delay, and other contingencies arising from local customs.

Thus there is a custom at Newcastle that coal should be loaded by *turns*. In a case in which the cargo was to be coke, and an action was brought for delay, the Court of Common Pleas held that there should be evidence alleged that the custom extended to coke.

Again, it was held that, a custom prevailing at Liverpool, by which 3 months' interest or discount might be deducted from freights payable under bills of lading on goods coming from New Orleans, and a shipowner demanding a full freight, the Court of Queen's Bench held that the custom was not repugnant to the written contract.

Again, when it was agreed by the charterparty that the ship should load with all possible despatch in the customary manner a full and complete cargo of coke, to be loaded in regular turn, it was held that evidence was not admissible to show that, according to a custom at the port of lading under a contract so framed, the shipowner was bound (provided reasonable despatch was used) to wait his turn, according to a list kept by a coke manufacturer, who was not named in the contract, but whose name was mentioned at the time when it was entered into. The court held that such evidence would be inconsistent with the terms of the charterparty. (Maude and Pollock, p. 234.)

Several important decisions have been made, subsequent to the Russian war, on the fulfilment of the terms of a charterparty after a declaration of war, and an agreement made, previous to this declaration, to sail to a port which, by the fact of war being declared, became hostile. In the case of *Exposit v. Bowen* it was decided by the Court of

Queen's Bench that the plea alleged was not sufficient, for that the contract might have been performed either by purchasing a cargo before notice of declaration or from a British subject at Odessa. But the Court of Exchequer Chamber, on appeal, reversed this decision, on the ground that a shipment of cargo from an enemy's port was, *prima facie*, illegal, and therefore that the contract was dissolved. (Maude and Pollock, p. 247.)

For the effects of blockade on contracts of affreightment, see *CONTRABAND and NEUTRALITY*.

Sometimes it is covenanted and agreed upon between the parties, that a specified number of days shall be allowed for loading and unloading, and that it shall be lawful for the freighter to detain the vessel a further specified time, on payment of a daily sum as *DEMURRAGE*. If the vessel be detained beyond both periods, the freighter is liable to an action on the contract. The rate of demurrage mentioned in the charterparty will, in general, be the measure of the damages to be paid; but it is not the absolute or necessary measure; more or less may be payable, as justice may require, regard being had to the expense and loss incurred by the owner. When the time is thus expressly ascertained and limited by the terms of the contract, the freighter is liable to an action for damages if the thing be not done within the time, *although this may not be attributable to any fault or omission on his part*; for he has engaged that it shall be done. (Abbott *On the Law of Shipping*, part iii. c. 1.)

If there has been any undertaking or warranty to sail with convoy, the vessel must repair to the place of rendezvous for that purpose; and if the master neglect to proceed with convoy, he will be answerable for all losses that may arise from the want of it.

The owners or master should sail with the ship for the place of her destination with all due diligence, and by the usual or shortest course, unless in cases of convoy, which the master must follow as far as possible. Sometimes the course is pointed out in the charterparty. A *deviation* from the usual course may be justified for the purpose of repairs, or for avoiding an enemy or the perils of the seas, as well as by the sickness of the master or mariners, and the mutiny of the crew.

By an exception in the charterparty, not to be liable for injuries arising from the act of God and the queen's enemies, the owner or master is not responsible for any injury arising from the sea or the winds, unless it was in his power to prevent it, or it was occasioned by his imprudence or gross neglect. 'The question,' said Lord Mansfield, in an action brought by the East India Company, 'is, whether the owners are to pay for the damage occasioned by the storm, the act of God; and this must be determined by the intention of the parties, and the nature of the contract. It is a charter of freight. The owners let their ships to hire, and there never was an idea that they insure the cargo against the perils of the sea. What are the obligations of the owners which arise out of the fair construction of the charterparty? Why, that they shall be liable for damages incurred by their own fault, or that of their servants, as from defects in the ship, or improper stowage &c. If they were liable for damages occasioned by storms, they would become insurers.' The House of Lords confirmed this doctrine by deciding (May 29, 1788) that the owner is not liable to make satisfaction for damage done to goods by storm.

The expression *perils of the sea* is held to cover the following losses:—A 'loss by pirates,' 'accidental collision,' 'the swell of the tide in a

dry harbour,' 'the wilful but not barratrous act of the crew in throwing ballast overboard,' and a stranding rendered necessary by leakage produced by the careless loading of the cargo.

But on the other hand it was not held to include losses caused by the injury of worms at sea, by another vessel firing into the ship by mistake, or injury to goods by rats. Losses when a vessel has been under repair on the beach, or by alteration in the banks of a navigable river due to natural causes, or by the rising and falling of a vessel with the tide while moored in harbour, are not losses by sea perils.

In one case when the defendants agreed to convey some boxes of gold-dust from the Pacific across the Isthmus of Panama to London, and provided against robbers, dangers of roads, of whatsoever nature or kind, the court held that robbers did not protect the defendants from liability for the loss of one of the boxes stolen from a railway track between Southampton and London, for that robber meant robber by force, and danger of roads must be that arising from the condition of roads, e.g. the overturning of carriages.

The charterer of a ship may lade it either with his own goods, or, if he have not sufficient, may take in the goods of other persons, or (if not prevented by a clause to that effect in the charterparty) he may wholly underlet the ship to another. (For further details, see *Abbott On the Law of Shipping*, part iii. c. 1; *Chitty's Commercial Law*, vol. iii. c. 9 &c.; and the articles *BILL OF LADING, FREIGHT, MASTER, &c.*)

*Forms of Charterparties.*—The following is one of the most usual forms of a charterparty:—

'This charterparty, indented, made &c. between A B, &c. mariner, master, and owner of the good ship or vessel, called &c. now riding at anchor &c. of the burden of 200 tons, or thereabouts, of the one part, and C D of &c. merchant of the other part, witnesseth, that the said A B, for the consideration hereinafter mentioned, hath granted and to freight letten, and by these presents doth grant and to freight let, unto the said C D, his executors, administrators, and assigns, the whole tonnage of the hold, stern-sheets, and half-deck of the said ship or vessel, called &c. from the port of London to &c. in a voyage to be made by the said A B with the said ship, in manner hereinafter mentioned. (that is to say), to sail with the first fair wind and weather that shall happen after &c. next, from the port of London with the goods and merchandise of the said C D, his factors or assigns, on board, to &c. aforesaid (the act of God, the queen's enemies, fire, and all and every other dangers and accidents of the seas, rivers, and navigation, of whatever nature and kind, in so far as ships are liable thereto, during the said voyage, always excepted), and there unlade and make discharge of the said goods and merchandises; and also shall there take into and on board the said ship again the goods and merchandises of the said C D, his factors or assigns, and shall then return to the port of London with the said goods, in the space of &c. limited for the end of the said voyage. In consideration whereof, the said C D, for himself, his executors and administrators, doth covenant, promise, and grant, to and with the said A B, his executors, administrators, or assigns, by these presents, that the said C D, his executors, administrators, factors, or assigns, shall and will well and truly pay, or cause to be paid, unto the said A B, his executors, administrators, or assigns, for the freight of the said ship and goods, the sum of &c. (or so much per ton), within twenty-one days after the said ship arrived, and goods returned, and discharged at the port of London

aforesaid, for also shall and shall be by de factors or assign and every &c. v, the said A B, administrators, to and with th ministrators, and the said ship or of London to ta or before &c. ne for himself, his within 10 days a be thus ready, t said ship, to pr also, on arrival days to have his said ship, to retu said A B, for h ministrators, cloth and with the said trators, and assign now is, and at all be, to the best en his executors an and their own pr things made and k apparelled, furnishe men and mariners s and govern the sa rigging, boats, tac provision, and appu for the said men a ship during the voy

The great variety different voyages ar ing diversity in char of which the follow example of the more struments:—

'It is this day mu B. Rann, owner of th the *Mermaid*, Willi measurement of 472 the river Thames, an firm of Messrs. Thom of Mauritius, mercha tight, staunch, and s for the voyage, shall sail and proceed to New S convicts out to New S troops, merchandise, mentioned port of Ca at Madras on her v owner's account, or so safely get, and there l said merchants at Ca cargo of rice, or any o charterer engages to same to Port Louis, i deliver the same free there a full and compl or other lawful mercha nage, which the char exceeding what she carry over and above visions, and furniture: therewith proceed to L as she may safely get being paid freight, viz. equal to the actual qua that may be shipped a at 12s. 6d. per ton of 2 and should the vessel de port of London than th goods, actually shipped

aforsaid, for the end of the said voyage; and also shall and will pay for demurrage (if any shall be by default of him, the said C D, his factors or assigns) the sum of &c. per day, daily, and every day, as the same shall grow due. And the said A B, for himself, his executors and administrators, doth covenant, promise, and grant, to and with the said C D, his executors, administrators, and assigns, by these presents, that the said ship or vessel shall be ready at the port of London to take in goods by the said C D, on or before &c. next coming. And the said C D, for himself, his &c. doth covenant and promise, within 10 days after the said ship or vessel shall be thus ready, to have his goods on board the said ship, to proceed in the said voyage; and also, on arrival of the said ship &c. within &c. days to have his goods ready to put on board the said ship, to return on the said voyage. And the said A B, for himself, his executors and administrators, doth further covenant and grant, to and with the said C D, his executors, administrators, and assigns, that the said ship or vessel shall be, to the best endeavours of him, the said A B, his executors and administrators, and at his and their own proper costs and charges, in all things made and kept stiff, staunch, strong, well-apparelled, furnished, and provided, as well with men and mariners sufficient and able to sail, guide, and govern the said ship, as with all manner of rigging, boats, tackle, and apparel, furniture, provision, and appurtenances, fitting and necessary for the said men and mariners, and for the said ship during the voyage aforsaid. In witness &c.

The great variety of circumstances under which different voyages are made produce a corresponding diversity in charterparties. The charterparty of which the following is a copy affords a good example of the more complex species of these instruments:—

'It is this day mutually agreed between Mr. T. B. Rann, owner of the good ship or vessel called the *Mermaid*, William Henniker master, of the measurement of 472 tons, or thereabouts, now in the river Thames, and Mr. David Thomson, of the firm of Messrs. Thomson, Passmore, and Thomson, of Mauritius, merchants, that the said ship, being tight, staunch, and strong, and every way fitted for the voyage, shall, with all convenient speed, sail and proceed to Calcutta, with leave to take convicts out to New South Wales, and from thence troops, merchandise, or passengers, to the aforementioned port of Calcutta, with leave to touch at Madras on her way thither, if required on owner's account, or so near thereunto as she may safely get, and there load, from the factors of the said merchants at Calcutta, a full and complete cargo of rice, or any other lawful goods which the charterer engages to ship, and proceed with the same to Port Louis, in the Isle of France, and deliver the same free of freight; afterwards load there a full and complete cargo of sugar in bags, or other lawful merchandise of as favourable tonnage, which the charterer engages to ship, not exceeding what she can reasonably stow and carry over and above her tackle, apparel, provisions, and furniture; and, being so loaded, shall therewith proceed to London, or so near thereunto as she may safely get, and deliver the same on being paid freight, viz. for such quantity of sugar equal to the actual quantity of rice, or other goods, that may be shipped at Calcutta, at the rate of  $\$1.12s. 6d.$  per ton of 20 cwt. nett, shipped there; and should the vessel deliver more nett sugar in the port of London than the quantity of rice, or other goods, actually shipped in Calcutta, the owners to

be paid on the excess at the regular current rate of freight for sugar which other vessels, loading at the same time at Port Louis, receive; the tonnage of the rice, wheat, or grain, to be reckoned at 20 cwt. nett per ton; that of other goods at the usual measurement (the act of God, the queen's enemies, fire, and all and every other dangers and accidents of the seas, rivers, and navigation, of whatever nature and kind soever, during the said voyage, always excepted). The freight to be paid on unloading and right delivery of the cargo, as is customary in the port of London. Ninety running days are to be allowed the said merchant (if the ship is not sooner despatched) for loading the ship at Calcutta, discharging the cargo at Port Louis, and loading the cargo there; the said lay days to commence on the vessel being ready to receive cargo, the master giving notice in writing of the same at Calcutta, and to continue during the loading there; and from the time of her arrival at Port Louis, and being ready to discharge, till the final loading at that port, and to be discharged in the port of London with all possible despatch; and 20 days on demurrage over and above the said luying days at 12*l.* per day. Penalty for non-performance of this agreement, 4,000*l.* The cargo to be brought to and taken from alongside at the expense and risk of the merchants. The necessary cash for the disbursements of the vessel at Calcutta, not exceeding 350*l.*, to be advanced by the charterer's agents; they taking the master's drafts on the owner for the same, at the regular current rate of exchange, and at three months' sight; and if the said bills be not regularly accepted and paid when due, the same to be deducted from the freight payable by this charterparty. The vessel to be disbursed at Port Louis by the chartering agents; sum not to exceed 300*l.*, free of commission; and the amount to be deducted from the freight at the final settlement at the port of London. Captain not to ship goods without consent. In the event of the ship being prevented by damage or any other cause, reaching the Mauritius on or before the 1st day of January, 1843, the charterer or his agents shall be at liberty to employ the vessel for one or two voyages to Calcutta, at the rate of 2*l.* per ton of rice, or other goods, delivered at Mauritius. Fifty running days, to load and discharge, to be allowed on each voyage; it being understood that the charterer or his agents shall load the ship, as before agreed, either at the end of the first or second voyage, as the case may be. The freight on the intermediate voyages (if any) to be paid on delivery of the cargo, in cash, or by bills on London at usance, at the option of the master. The vessel to be addressed, both at Calcutta and Isle of France, to the agents of the charterer. In witness whereof, the said parties have hereunto set their hands and seals, at London, the 2nd day of December, 1811.'

*Stamp Duties on Charterparties.*—By the 55 Geo. III. c. 184, charterparties were made liable to a duty of 1*l.* 15*s.* In case the document contained more than 2,160 words, every entire quantity of 1,080 words above the first 1,080 was liable to a further stamp duty of 1*l.* 5*s.*

But by 5 & 6 Vict. c. 79 these duties were repealed, and in place it was enacted that every charterparty, or agreement or contract for the charter of any ship, and every memorandum, letter, or other writing between the captain, master, or owner of any ship and any other persons for or relating to the freight or conveyance of any moneys, goods, or effects on board any ship, must be stamped with a 5*s.* stamp. By 28 & 29 Vict. c. 96, the duty was further reduced from

5s. to 6d. The stamp may be impressed, without the payment of any penalty, within 14 days after the charterparty bears date, and has been executed by the party who first executed it. Within a month from this time the stamp may be obtained on payment of a penalty of 10l.: beyond this period it cannot be affixed at all.

**CHAY OR CHOY ROOT.** The roots of a small biennial, rarely triennial, plant, the *Oldenlandia umbellata*, Nat. Order *Rubiaceae*, growing spontaneously in light, dry, sandy ground near the sea; and extensively cultivated, especially on the coast of Coromandel. The cultivated roots are very slender, and from 1 to 2 feet in length, with a few lateral fibres; but the wild are shorter, and supposed to yield one fourth part more of colouring matter, and of a better quality. The root gives a yellow colour to cold, a reddish to hot water, which becomes bright red by alkalis. The basis of the dye is *alizarine*. The roots are employed to dye the durable reds for which the Indian cotton yarn and chintzes have been long famous, and which can only be equalled by the Turkey red.

Chay root forms a considerable article of export from Ceylon. Only a particular set of people are allowed to dig it. It used to be all bought up by Government, who paid the diggers a fixed price of 75 or 80 rix-dollars a caudy, and sold it for exportation at about 175 rix-dollars. (Hertolacci's *Ceylon*, p. 270.)

This root has been imported into Europe, but with no success. Dr. Bancroft suspects it may be injured by the long voyage; but he adds, that it can produce no effect which may not be more cheaply produced from madder. It is a very bulky article, and is consequently burdened with a very heavy freight. (*Permanent Colours*, vol. ii. pp. 282-303.)

**CHEQUES, CHEQUES, or DRAFTS.** Orders addressed to some person, generally a banker, directing him to pay the sum specified in the check to the person named in it, or bearer on demand. The following is the usual form:—

£100, London, 10th November, 1853.  
Pay A. B. Esq., or bearer, One Hundred Pounds  
on account of C. D.  
Messrs. Glyn, Mills, and Co.

In point of form, checks nearly resemble bills of exchange. They are assignable by delivery only, and are payable instantly on presentment, without any days of grace being allowed. But by the custom of London, a banker has until 5 of the afternoon of the day on which a check is presented for payment, to return it; so that where a check was returned before 5, with a memorandum of 'cancelled by mistake' written under it, it was held a refusal to pay. If a check upon a banker be lodged with another banker, a presentment by the latter at the clearing-house is sufficient. Checks are usually taken conditionally as cash; for unless an express stipulation be made to the contrary, if they be presented in due time and not paid, they are not a payment. It is difficult to define what is the due or reasonable time within which checks, notes, or bills should be presented. A man, as Lord Ellenborough has observed, is not obliged to neglect all other business that he may immediately present them: nevertheless it is the safest plan to present them without any avoidable delay; and if received in the place where payable, they had better be presented that day, or next at furthest. If a check be not presented within a reasonable time, the party on whom it is drawn will be justified in refusing to pay it; and

the holder will lose his recourse upon the drawer. (Claity *On Commercial Law*, vol. iii. p. 591; Woolrych *On Commercial Law*, ch. iii. s. 2 &c.)

In consequence of the alteration of the law effected by the 16 & 17 Vict. c. 53, checks were for a time of two sorts, viz. those on unstamped or plain paper, and those on paper impressed with a penny stamp.

1. In plain checks the place of issue and the date of issue had to be correctly stated, and to be drawn upon bankers having their place of business within 15 miles of the locality where the checks are issued; and not payable to order, but to bearer.

2. Checks on stamped paper enjoyed sundry privileges. Thus it was not necessary to affix the date or the place of their issue; they might be drawn upon any one, whether banker or not; they might be issued at any distance from the place where they were to be paid; and they might be payable either to bearer or to order. If made payable to order, it was essential that they 'purport to be indorsed' by the payee; but the party on whom they were drawn, provided he was a banker, was not bound to enquire whether such indorsement was genuine. By 21 Vict. c. 20 the stamp duty is extended to all checks.

If the party on whom a stamped check payable to order is drawn be not a banker, his responsibilities are not affected by the late Acts, and we apprehend that to make himself secure he should be satisfied, before paying the check, of the authenticity of the signature of the payee.

The system of drawing checks on a balance held by a banker is almost peculiar to our monetary system. The practice commenced about a century ago, when the London bankers adopted it in place of issuing their own notes. It is only, however, within the last twenty years that the use of the check-book has become almost universal, not only with traders, but with professional men, and even those who have fixed incomes, though of small amount. The exchange of checks [CLEANING HOUSE] has greatly aided the general adoption of the banking and check system.

To the economist and the merchant the check system presents some striking phenomena. It has infinitely facilitated business transactions; but it has also had a remarkable effect on the metallic and paper currency, economising the former, and contracting the latter, even under the circumstances of an incredible increase of home and foreign commerce.

In consequence of questions having arisen as to the legal effect of crossing a cheque, the 21 & 22 Vict. c. 79 provides that a cheque crossed with the name of a banker should be paid only to that banker; and if crossed with the words 'and Company,' or any abbreviation thereof, then only to some banker. [BANKS.]

**CHEESE** (Ger. käse; Dutch, kaas; Fr. fromage; Ital. formaggio, caseo; Span. queso; Russ. sur; Lat. caseus). The curd of the milk separated from the whey, or pressed or hardened. It has been used as an article of food from the earliest ages; vast quantities of it are consumed in Great Britain, and in most countries of Europe.

There is an immense variety of cheeses, the qualities of which depend principally on the richness and flavour of the milk of which they are made, and partly on the way in which they are prepared. England is particularly celebrated for the abundance and excellence of its cheese, Cheshire and Gloucestershire are, in this respect, two of its most famous counties; the cheese produced in the former has been estimated at 14,000 tons a year. There are two kinds of Gloucester cheese, double and single; the first is made of the milk

and cream, the half the cream, double generally single, or Berkel out of fashion, a cheese is also 1 which borders Wiltshire. The Cheshire cheese; Gloucestershire cheese, somewhat at Cheddar in Somerset, pale or coloured, the largest price. Stilton is made in the villages round reckoned sufficient be two years old; decayed, blue, and made at Leigh, in made in England, name, either from quality, are the Southam cheeses. cheeses, of a peculiar where they are made in Bath, York, and Bury for their cream cheese and Banbury in Oxfordshire for these cheeses; made in it, very large to London and Birmingham distinguished for its best is called Dunlop Ayrshire, where it is Dunlop cheeses generally; and are, in most of Derbyshire, except Cheeses made to resemble extensively produced Large quantities of cheese, which is reckoned in Holland. Hydrochloric acid is instead of rennet. The preserves it from mould called from Parma in France, is merely a sharp its rich flavour to the along the Po, where Parmesan cheese is kept ever carried to many months old. Swiss cheese nominated Gruyère, famous in the canton of Gruyère cheeses are milk, and are generally weigh from packed for exportation cheeses each. According to Mr. Ma produce of cheese from land is from 3 to 4 cwt. weight of the butter. *Statistical Account of Britain* The duty on all des counted, previously to but in that year the duties on British possession was in 1813 the duties were 1s. 6d. per cwt. respectively from and from British the duty on cheese from further reduced to 2s. 6d. wholly abolished in 1850.

and cream, the latter of the milk deprived of about half the cream. They are of various sizes; the double generally run from 30 to 40 lbs., and the single, or Berkeley, which are, however, fast going out of fashion, average 16 lbs. A great deal of cheese is also made in that part of Shropshire which borders upon Cheshire, and in North Wiltshire. The former goes under the name of Cheshire cheese; the latter was, till lately, called Gloucestershire cheese: now it receives its appellation from the county where it is made. A strong cheese, somewhat resembling Parmesan, is made at Cheddar in Somersetshire. This sort is either pale or coloured, and being much in favour brings the largest price. The celebrated rich cheese called Stilton is made in Leicestershire, principally in the villages round Melton Mowbray. It is not reckoned sufficiently mellow for cutting unless it be two years old; and is not saleable unless it be decayed, blue, and moist. A rich cheese is also made at Leigh, in Lancashire. The other cheeses made in England, which have acquired a peculiar name, either from the quantity made or from the quality, are the Derbyshire, Cottenham, and Southern cheeses. The last two are new milk cheeses, of a peculiarly fine flavour: the places where they are made are in Cambridgeshire, Bath, York, and Buckinghamshire are remarkable for their cream cheeses. The county of Warwick, and Banbury in Oxfordshire, are also remarkable for these cheeses; the former for the quantity made in it, very large supplies being sent from it to London and Birmingham. Banbury cheese is distinguished for its richness.

Scotland is not celebrated for its cheese; the best is called Dunlop cheese, from a parish in Ayrshire, where it was originally manufactured. Dunlop cheeses generally weigh from 20 to 60 lbs. each; and are, in most respects, similar to those of Derbyshire, except that the latter are smaller. Cheeses made to resemble those of Dunlop are now extensively produced in other parts of Scotland.

Large quantities of very good cheese are produced in Holland. In the manufacture of Gouda cheese, which is reckoned the best made in Holland, hydrochloric acid is used in curdling the milk instead of rennet. This renders it pungent, and preserves it from mites. Parmesan cheese, so called from Parma in Italy, where it is manufactured, is merely a *skim-milk* cheese, which owes its rich flavour to the fine herbage of the meadows along the Po, where the cows feed. The best Parmesan cheese is kept for 3 or 4 years, and none is ever carried to market till it be at least six months old. Swiss cheese, particularly that denominated Gruyère, from the bailiwick of that name in the canton of Friburg, is very celebrated. Gruyère cheeses are made of skimmed or partially skimmed milk, and are flavoured with herbs. They generally weigh from 40 to 60 lbs. each, and are packed for exportation in casks containing 10 cheeses each.

According to Mr. Marshall, the average yearly produce of cheese from the milk of a cow in England is from 3 to 4 cwt., or more than double the weight of the butter. (For further details, see *Statistical Account of British Empire*, i. 501, 3rd ed.)

The duty on all descriptions of foreign cheese amounted, previously to 1842, to 10s. 6d. per cwt.; but in that year the duty on cheese imported from a British possession was reduced to 2s. 6d. per cwt. In 1843 the duties were fixed at 5s. per cwt. and 1s. 6d. per cwt. respectively on cheese from foreign ports and from British possessions. And in 1853 the duty on cheese from a foreign country was further reduced to 2s. 6d. per cwt. The duty was wholly abolished in 1859.

In 1866, 872,342 cwt. of cheese were imported into the United Kingdom, of the value of 2,801,579*l.* Of this vast amount, 415,221 cwt. came from the North Atlantic ports of the United States, and 426,559 cwt. from Holland. The average value of American cheese was 3*l.* 6s. 8d. per cwt.; of Dutch *3*l.* 1s. 9d.* In 1867 the imports had swelled to 965,476 cwt., valued, however, at but 2,555,264*l.*

**CHERRIES.** The fruit of a tree (*Prunus Cerasus*, Linn.) too well known to require any description.

They derive their name from Cerasus, a city of Pontus, whence the tree was brought by Lucullus, about half a century before the Christian era. It soon after spread into most parts of Europe, and is supposed to have been carried to Britain about a century after it came to Rome. The principal supplies of cherries for the London market are brought from the cherry orchards in Kent and Herts. The wood of the cherry is close, takes a fine polish, and is not liable to split. (Rees's *Cyclopædia*; London's *Encyclopædia of Agriculture*; &c.)

**CHESTNUT.** A forest tree (*Fagus castanea*) growing abundantly in most parts of the southern countries of Europe. It was at one time very common in England, and is still frequently met with. It is long lived, grows to an immense size, and is very ornamental. The wood is hard and compact: when young, it is tough and flexible; but when old, it is brittle, and often shaky. The chestnut contains only a very small proportion of sap-wood; and hence the wood of young trees is found to be superior to even the oak in durability. It is doubtful whether the roof of Westminster Hall be of oak or chestnut; the two woods being, when old, very like each other, and having been formerly used almost indifferently in the construction of buildings. A good deal of chestnut has been planted within the last fifty years. (Tredgold's *Principles of Carpentry*.)

**CHESTNUTS.** *Castanea vesca*, Nat. Order *Corylaceæ* (Fr. châtaignes; Ger. kastanien; Ital. castagne; Span. castañas; Russ. kaschtanil; Pol. kasztang). The fruit of the chestnut tree. Chestnuts grow in this country, but are very inferior both in size and perfection to those imported from the South of Europe. In some parts of the Continent they are frequently used as a substitute for bread, and form a large proportion of the food of the inhabitants. This is particularly the case in the Limousin, in Corsica, and several districts of Spain and Italy. The inhabitants of the Limousin are said to prepare them in a peculiar manner, which deprives them of their astringent and bitter properties. Chestnuts imported from Spain and Italy are frequently kiln-dried, to prevent their germination on the passage. In this country they are principally served up roasted at desserts.

The chestnut is very widely disseminated, being a native of all temperate regions of Europe, Asia, and America, but not of any part of Africa.

The chestnut contains a large quantity of starch, a peculiar sugar, and a small quantity of gluten, so small that the flour cannot be fermented. In France, where the chestnut is of great economical importance, the large chestnut is known by the name of *marron*. These sorts are chiefly grown in the hills of Vivarais, Forez, and Dauphiné, but being generally sold in Lyons, are called *marrons de Lyon*. The best chestnuts come from the neighbourhood of Périgord. There are from ten to twelve varieties of the edible chestnut.

The duty of 2s. a bushel on chestnuts, repealed in 1845, produced in 1842, 3,435*l.* 3s. nett, showing that the consumption must have amounted to

31,351 bu. hels. In 1866, 67,701 bushels were imported, chiefly from France. The imports were valued at 27,299l.

**CHETWERT or TSCHETWERT.** A measure of corn in Russia, equal to 5.77 Imperial bushels; hence 100 chetwerts = 72.12 Imperial quarters.

**CHILCA RED.** A colouring matter analogous to indigo, obtained from the leaves of the *Bignonia Chilca*, a tree found in Central America. It is used by the natives as a dye, and has been imported into this and other countries, under the name of *Cajum*.

**CHICORY or SUCCORY.** The wild endive, or *Cichorium Intybus* of Linnæus. Natural Order *Synanthesæa* (Span. achicoria; Fr. chicorée; Ger. zichorien, wagwart; Ital. cicoria). This plant is said to be originally a native of China, and to have been introduced into Europe at the middle of the sixteenth century. It is now found growing wild on calcareous soils in England, and in most countries of Europe. In its natural state the stem rises from 1 to 3 feet high, but when cultivated it shoots to the height of 5 or 6 feet. The root, which runs deep into the ground, is white, fleshy, and yields a milky juice. In Germany, the Netherlands, and France, chicory has long been extensively cultivated for the sake of its root, which is used as a substitute for coffee. When prepared on a large scale, the roots are partially dried, and sold to the manufacturers of the article, who wash them, cut them in pieces, kiln-dry them, and grind them between fluted rollers into a powder, which is packed up in papers containing from 2 oz. to 3 or 4 lbs. The powder has a striking resemblance to dark ground coffee, and a strong odour of liquorice.

Chicory contains a large quantity of sugar, from 24 to 35 per cent. in the dry root. When it is kiln-dried, and partially charred, a portion of this sugar is converted into *caramel*, and it is to the production of this substance that the peculiar properties of roasted chicory are due. The admixture of chicory with coffee may be detected in various ways: 1. by the presence of sugar; 2. by the large quantity of silica contained in its ash; 3. by the red colour of its ash, due to the presence of iron; 4. by the fact that it gives a colour to cold water, in consequence of the caramel produced by roasting; 5. its structure may be detected under the microscope.

Chicory is destitute of the peculiar properties of coffee, those, namely, which render the latter exhilarating and restorative. It gives only bitterness and colour to the infusion. Hence, as it is a cheap product, and was not till lately subject to an excise duty, it is largely employed as a means for adulterating coffee.

If chicory be sold under its own proper name, there can be no fair objection to its culture, or to its being exempted from taxation; but if it be fraudulently sold under the name of coffee, which in truth and reality is the very purpose to which it has been applied, and used as a substitute for and a means of adulterating the latter, then there can be no question that justice to the coffee-growers and to the public requires that this abuse should be prevented, or that chicory should be subjected to the same duty as coffee. And yet, singular as it may appear, the fraudulent substitution of chicory for coffee was in effect legalised by a Treasury minute of August 4, 1849; and though much objected to, this minute was not rescinded till 1852, when a new minute was issued, prohibiting the sale of coffee mixed with chicory, but allowing coffee dealers to sell the latter in parcels marked as such. But though a great improvement on the previous practice, this arrangement

was said not to realise all the advantages that were expected; and after a good deal of further enquiry and discussion a fresh minute was issued on February 25, 1853, permitting the sale of chicory mixed with coffee, provided the parcels containing such compound be labelled 'MIXTURE OF COFFEE AND CHICORY.' And notwithstanding the objections that have been taken to this minute, we do not well see what more can be required. It is illegal to sell coffee mixed with chicory without giving intimation that such is the case; but if parties aware of the circumstance prefer the mixture to pure coffee, it is merely an affair of taste, to the gratification of which, whatever we may think of it, there can be no good objection.

In 1860 a small excise duty was levied on chicory. This was gradually increased to 1l. 4s. 3d. the cwt., or to nearly the same rate as the customs' duty on coffee. But the produce of the excise tax on chicory in the year ending March 31, 1866, was only 13,273l. Foreign chicory when raw or kiln-dried pays 1l. 6s. 6d. the cwt., while roasted carries the same duty as roasted coffee, viz. 4d. the pound. In 1866 our imports of chicory were 103,763 cwt.s., raw or kiln-dried, of the value of 41,763l.

**CHINA GRASS.** The fibre of a species of nettle. A valuable Report by Mr. Abbot, United States Consul at Bradford, states that prepared China grass makes an excellent material for admixture with long staple woollen textiles, particularly for those requiring a stiff, strong, and cool texture, combined with a glossy silk appearance. The Report, which is of some length, is to be found in the United States *Commercial Relations with Foreign Countries for the Year ended September 1865*.

**CHINA ROOT** (Ger. chinawurzel; Dutch, chinawortel; Fr. squine, esquine; Span. raiz china, coccolmea; Arab. rhusimio). The root of a species of climber (*Smilax China*, Linn.). It comes from the West Indies as well as from China; but that from the latter is best. It is oblong and thick-jointed, full of irregular knots, of a brownish colour on the outside, and a pale red within; while new it will snap short, and look glittering within; if old, the dust flies from it when broken, and it is light and kecky. It should be chosen large, sound, heavy, and of a pale red colour internally. It is of no value if the worm be in it. It is used for the same purposes as *SARSAPARILLA*.

**CHINA WARE.** [PORCELAIN.]

**CHIN-KIANG.** [THE TREATY PORTS OF CHINA AND JAPAN.]

**CHINTS or CHINTZ** (Fr. indiennes; Ger. zitze; Ital. indiane; Russ. siz; Span. chites, zaraza). Fine printed calico, first manufactured in the East Indies, but now largely manufactured in Europe, particularly in Great Britain. [CALICO.]

**CHIP HATS.** [HATS.]

**CHOCKING.** [DUNNAGE.]

**CHOCOLATE** (Dutch, chocolade; Fr. chocolat; Ger. schokolade; Ital. cioccolata; Port. chocolate; Russ. schokolad; Span. chocolate). A kind of cake or confection, prepared principally from the cocoa nut. The nuts are first roasted like coffee; and being next reduced to powder and mixed with water, the paste is put into tin moulds of the desired shape, in which it speedily hardens, being, when taken out and wrapped in paper, fit for the market. Besides cocoa the Spanish use vanilla, sugar, maize &c. in the preparation of chocolate. This article, though celebrated for its nutritious qualities, is but little used in Great Britain; a circumstance which is probably, in

some considerable degree, owing to regulations to which its importation used, and though this prohibition the duties on it are upon cocoa, we manufacture required for our consumption is said to be very large, and Castile soap. (Edin. p. 364, ed. 1819.) In from France) 176,959 colate, valued at 10,37 were entered for consumption per lb. amounting to 1,

some considerable degree, ascribable to the fiscal regulations to which it has been subjected. Its importation used, indeed, to be prohibited; and though this prohibition no longer exists, yet, as the duties on it are proportionally heavier than upon cocoa, we manufacture at home almost all that is required for our consumption. British chocolate is said to be very largely adulterated with flour and Castile soap. (Edwards's *West Indies*, vol. ii. p. 364, ed. 1819.) In 1866 we imported (chiefly from France) 176,559 lbs. of cocoa paste, or chocolate, valued at 10,974*l.*, of which 171,227 lbs. were entered for consumption; the duty at 2*d.* per lb. amounting to 1,427*l.* [Cocoa.]

'Alike easy to convey and employ as an aliment, it contains a large quantity of nutritive and stimulating particles in a small compass. It has been said with truth, that in Africa, rice, gum, and shea butter assist man in crossing the deserts. In the New World, chocolate and the flour of maize have rendered accessible to him the tablelands of the Andes and vast uninhabited forests.' (Humboldt's *Pers. Nar.* vol. iv. p. 231, Eng. trans.)

**CHRISTIANIA.** The capital of Norway, situated at the bottom of a fiord or gulf, in the province of Aggerhuus; in lat. 59° 53' N., long. 10° 48' E. Population in 1860, 44,212. The average tonnage which entered the port in the three years 1862-4 was about 142,000, while about 130,000 cleared from it. Christiania is about 60 miles from the open sea; the gulf is in some places very narrow, and its navigation somewhat difficult; but it is sufficiently deep for the largest vessels, having 6 or 7 fathoms water close to the quay. It is compulsory on all ships to take a pilot on board at the mouth of the bay. The trade of the town is considerable. The principal exports are timber and deals, which are largely imported into the United Kingdom; glass, particularly bottles; iron and nails, bones, smalts, oak bark &c. Salted and pickled fish, one of the staple products of Norway, is principally exported from Bergen. The deals of Christiania have always been in the highest estimation; a consequence of the excellence of the timber, and of the care with which the sap-wood and other defective parts are cut away; and not, as Mr. Coxce seems to have supposed, of the skillful sawing of the plank. The saw mills were formerly licensed to cut a certain quantity only, and the proprietors were bound to make oath that it was not exceeded. (Coxce's *Travels in the North of Europe*, 5th edit. vol. iv. p. 28.) This absurd regulation no longer exists. Consul-General Crowe, in his *Report* of Feb. 1868, remarks, 'that the Norwegian timber has sensibly decreased of late years, owing to the injudicious and culpable system of felling, which undoubtedly has materially reduced this hitherto staple capital of the country.' There are far fewer restrictions on industry and commerce in Norway than in Sweden. In the former, British manufactured goods are admitted on moderate duties, and are very generally made use of. The principal articles of import are colonial produce; iron and hardware; machinery; woollen, linen, and cotton goods; coals, butter, wine, brandy &c.; corn is sometimes extensively imported.

**Customs Regulations.**—Within 24 hours after a vessel has got to her moorings, the master should deliver to the collector his general report as to ship and cargo, or present the requisite documents for having such report made out with the assistance of a ship broker, whose services masters of foreign vessels cannot entirely dispense with. On making this general report, the measuring bill is to be exhibited, and payment of the tonnage and other dues inward is to be made. If the ship have

not been previously measured in Norway, and is, consequently, not provided with a Norwegian measuring bill, she is to be measured, to ascertain her burden in Norwegian commercial lasts, for the calculation of the tonnage duty.

The general report having been made, the Custom-house officers in charge of the vessel are furnished with the books for delivery, and the discharge of the cargo commences under their inspection; and the consignees may make their special reports under their responsibility and signature. If they are without precise information as to the contents of any or all of the packages or bales to their address, these bales or packages may, at their request, be opened in the presence of the officers before report is made. If a consignee omits availing himself of this permission, his pretending thereafter that more or other goods than he had ordered, or been advised of, have been sent to his address, will not be attended to. In the reports or entries is to be stated whether it is intended to pay the duties forthwith, whether the goods are intended for exportation, or whether they are to be landed.

Prior to commencing loading outwards, the master is to give verbal notice of his intention at the Custom-house. If he have no Norwegian measuring bill, the vessel is to be measured. This being done, the shipper or shippers of the outward-bound cargo are each of them to make their special entries as to the quality, weight, and measure of the goods they mean to load. A copy of such entries is to be deposited at the Custom-house, and the loading commences under the control of the officers. This applies to all mixed cargoes; but if the outward-bound cargo consist exclusively of wood, the shipper or shippers are only to notify that they intend loading wood, without specifying quantity, measure &c., as the export duty on wood is charged according to the burden of the vessel. When the master clears outwards, he produces the proper documents for showing the burden of his vessel, and to what port she belongs, and he is then, on proper application being made, provided with a pilot, who takes his vessel to sea.

**Warehousing.**—In Norway, goods brought from abroad may be bonded or warehoused, with a view to their being again exported at some future period. Goods entered for home consumption may also be bonded for a certain period, in order to facilitate the payment of the duties.

The former is called *transit oplat*, i.e. depositing or warehousing goods for exportation, subject to transit duties only. The latter is called *credit oplat*, i.e. warehousing or bonding on credit.

1. *Transit Oplat.*—Under this system, goods from abroad may be warehoused for exportation free of import duty, paying on exportation a transit duty, which, in most cases, is  $\frac{1}{15}$  of what they would pay if entered for home consumption. If the goods are deposited in the Custom-house warehouses, they lie free of rent or dues during 14 days; and if in private warehouses, under the key and seal of the Customs during 6 months. If they remain long, viz. beyond 14 days in the one, and beyond 6 months in the other case, they pay rent or dues equal to  $\frac{1}{4}$  of the transit duty per month; which, after the lapse of 3 months, as regards goods in the Custom-house warehouses, is increased to  $\frac{1}{2}$  of the transit duty per month.

2. *Credit Oplat.*—This system allows most goods imported from abroad to be placed in the owner's or importer's own warehouses, under his own lock, free of duty, for a given time, on his reporting to the Customs, every 3 months, how much he has

sold, otherwise consumed, or exported, and then paying the duty on such amount; the Custom-house officers, who are bound quarterly to examine the goods, convincing themselves by ocular demonstration that no more is missing than the quantity reported to have been taken away.

This credit on the duties in no case to exceed 2 years from the time the goods were imported.

By way of security for payment of the duties on which the credit is granted, Government reserve to themselves—

1. Priority of mortgage on all the goods in question.

2. Priority, or first right, in the property, goods, and effects of every description belonging to the trader availing himself of this credit, in as far as such property is not previously legally mortgaged.

3. Liberty for the Custom-house officers, when and as often as they shall deem it expedient, between the stated quarterly inspection, to look over the stock on hand, with a view of ascertaining

whether there remains sufficient value for the duties; and if they see reason to doubt this, full right, in default of other satisfactory security being offered, to seize the stock, and to sell the whole, or as much as shall cover the duties.

4. In case of death or failure of the party, an equal right to sell forthwith the whole of his stock at public auction, and to retain as much of the proceeds as shall cover the duties; and in case of deficiency, an established claim for the remainder on the estate of the deceased or bankrupt, as the case may be.

In charging the duties, no allowance is made for waste or damage in the warehouses.

The warehouse rent charged on goods bonded under the transit system in the Custom-house warehouses is as follows:—

	Per month.
On a quarter of wheat, for the first 3 months	0 0-5578
Afterwards -	0 1-1076
On a ton of raw sugar, for the first 3 months	0 11-5581
Afterwards -	1 11-9769

To these exports of produce from the United Kingdom there should be added, of foreign and colonial produce, coffee, raw cotton, wool, hides, tobacco, tea &c., the aggregate value of which in 1866 was 265,511*l*, making the value of the total exports 1,119,859*l*. Of our imports from Norway the most important are timber, about two-thirds of the whole, fish, oats, iron and copper ore, oil, and ice. The trade in ice is of growing importance. It will be seen from the account that our total imports are valued for 1866 at 1,611,359*l*. The value of our imports from Sweden and Norway in 1867 was 6,477,865*l*.

For the cod and herring fisheries of Norway see *COB. HERRING*. Considerable quantities of salmon are sent per steamer from Christiansand to Hull and London, and shark fishing is now found to be a profitable employment in Norway.

**Money, Weights, and Measures.**—In Norway there are no gold coins. The principal silver coin, called a species dollar, is divided into 120 skillings. There are, also, half species, or 60-skillings pieces;  $\frac{1}{3}$  species, or 24-skillings pieces;  $\frac{1}{4}$  species, or 8-skillings pieces; and what is denominated skillingmynt, or small change, i.e. 4 and 2 skillings pieces. The species dollar contains 390.58 English grs. pure silver, and is consequently worth 4*s*. 6*d*. sterling, the par of exchange being 4 species dollars 12  $\frac{1}{2}$  skill. = 1*l*. All Norway coins, except the small change, are alloyed with  $\frac{1}{4}$  copper, so that

the species dollar weighs 418.38 English grs., an 1 its divisions in proportion. Small change coins are alloyed with three times their weight of copper. There are 1 and 2 skillings pieces of copper.

**Weights and Measures** same as at COPENHAGEN. **Shipping Charges.**—The various charges of a public nature payable by a ship of about 300 tons burden, entering the port of Christiania with a mixed cargo on board, unloading there, taking on board another cargo, and clearing out, are as follows:—

1. Charges Inwards.

Pilotage from Farder, at the mouth of Christiania Bay, where all ships must take a pilot on board - - - - -	£	s.	d.
Bill of health, assuming that the crew, including the master, consists of 11 persons - - - - -	—	0	17 9
Tonnage dues and light money - - - - -	—	9	16 9
Broker's fees - - - - -	—	1	5 4
	£	11	2 0

2. Charges Outwards.

Pilotage - - - - -	£	0	9 2
Castle dues - - - - -	—	0	1 7
Master's toll of crew - - - - -	—	1	0 5
Pale or stake money - - - - -	—	0	3 2
Measuring bill - - - - -	—	2	4 5

Tonnage dues and light money - - - - -	—	10	11 1
Highland light - - - - -	—	0	0 9
Pilotage to Farder - - - - -	—	1	16 8
Broker's fees - - - - -	—	1	18 11
	£	18	6 11

N.B.—There is no difference between the charges on native ships in Norwegian ports, and privilege foreign ships, i.e. the ships of countries having reciprocity treaties with Norway; nor in

the duties on goods imported by native ships and such privileged foreign ships. Great Britain is a privileged country.

The shipping of Norway has declined considerably of late years; a proof, if any such were wanting, of the groundlessness of the clamours kept up in this country as to the supposed pernicious influence of reciprocity treaties on our shipping.

We borrow from Consul-General Crowe's Report of Feb. 1868 the following

*Review of the Aggregate Amount of Imports into and Exports from Norway during 1866, with the Official Estimate of their Relative Value, reduced to British Sterling, with the Amount of Duties collected.*

**Banking.**—There are no private banking establishments in Norway; but there is a public bank, having its principal office at Drontheim, with branches at Christiania, Bergen, and Christiansand. It was established by a compulsory assessment in 1816. Its capital consists of 2,000,000 species dollars, in transferable shares, divided amongst those who were forced to contribute to its formation. These shares are now at a premium of 30 per cent. Its managers are appointed by, and are accountable to, the Storting or Norwegian Parliament. It issues notes for 100, 50, 10, and so low as 1 species dollar. These notes should be payable in specie on demand; but they are at a discount of 35 per cent., and are paid by the bank at that rate. It discounts bills at 2 and 3 months' date at 6 per cent. per annum; advances money on mortgage at 4 per cent.; and transacts the ordinary banking business of individuals. It does not allow interest on deposits.

**Credit.**—Goods are sold partly for ready money and partly on credit, but principally the former.

**Commission &c.**—The number of brokers in Christiania is limited to 4. Commission on the sale of goods, 2 per cent., or, *del credere* included, 3 per cent. Brokerage is fixed by law at  $\frac{5}{8}$  per cent., which, in practice, is paid by the sellers.

**Insurance.**—All houses situated in Norwegian market towns must be insured in the General Insurance Company at Christiania, which is guaranteed by the state. The premium is moderate, being, on buildings situated in towns,  $\frac{1}{4}$ , and on those situated in the country  $\frac{1}{8}$  per cent. Sometimes, however, when very destructive fires occur, it is raised.

**Provisions &c.**—Christiania is not a favourable place for careening and repairing ships; but

supplies of beef, bread, water, and other sea stores may be had as cheap or cheaper than in any other port of Norway. The distance, however, of the city from the sea is too great to allow of its being visited by ships desirous merely of victualling. (We have derived these details from various sources, but principally from Consular Returns.)

**Timber.**—A standard Christiania deal is 11 feet long, 14 inch thick, and 9 inches broad; and 51-2 such deals make a load.

Freight of deals from Norway to England is calculated at the rate of single deals, the standard measure of which for Christiania and all the southern ports of Norway, except Dram (a small town on the Drammen, about 20 miles SW. of Christiania), is 11 feet long, and 14 inch in thickness. A single deal from Dram is reckoned 10 feet long, and 14 inch thick.

**Battens.**—Three battens make 2 deals, retaining their own length and thickness. Half deals are only counted as deal ends if they run under 6 feet; but if they run 6 or 7 feet long, then 2 half deals are counted a deal, retaining their own thickness.

**Ends of Deals.**—Four ends of deals, although 5 feet long, make but a deal 11 feet long, retaining their thickness, which the owners and captains of ships think unreasonable; but as the freighters of ships seldom wish to have this assortment, which commonly run from 3 to 5 feet, and are taken on board as stowage, consequently for the advantage of the ship and not the freighter, the ship ought to bear the burden.

**Ends of Battens, called Larwick Palings.**—No less than 6 ought to be counted a single deal, 11 feet long and 14 inch thick.

**Pale-boards,** when they have their proper length, are 7 feet long; 3 pale-boards are counted a single deal.

**Staves for hogsheds** take up much room; in consequence of which more than 10 cannot be computed a single deal.

The width of deal is never noticed in the calculation of freight: a good deal ought to run 9 inches within the sap, which not a twentieth part of a cargo does at present; but, though some may be above 9 inches wide, many are only 8, therefore one must make up for the other.

**Timber or Heavy Goods** cannot be exactly computed according to the contents in deals, because it cannot be stowed in a ship in the same manner as deals: the freight is, therefore, agreed for by the lump, or according to the number of deals which the vessel may have taken on board on a former occasion.

One hundred deals = 120.

A ton = 40 solid feet of timber, cut to a square.

One load of balk, or timber, = 50 solid feet.

Two loads of timber are reckoned for 150 deals.

The several bills of lading contain together an exact account of the cargo which the captain has received on board his ship, consequently binding him to deliver according to their contents: when, therefore, the deals are mentioned as usual 9 and 10 feet, and 11 and 12 feet, he cannot insist on more freight than half of the length, according to its description.

One thousand Norway standard deals are reckoned equal to a keel of coals, which is 21 tons.

**Boesprits** pay duty as masts; capravens are above 12 and under 18 inches in circumference at the middle, and without bark. Clapboard is exported in whole pieces and unquartered. Deals from Germany pass as Norway deals; spruce deals are upwards of 20 feet in length; deals from Norway, above 7 feet long, are counted as whole deals; above 5 feet, and not above 7 feet in length,

are accounted as one whole.

The difference standard being ought to be times happen and Dram has Christiania has the others for which runs ve year. (Kordla Reports, &c.)

are accounted as half deals, and two of them pass as one whole deal.

The difference between the Christiania and Dram standard being nearly  $\frac{1}{11}$ , the freights to Dram ought to be varied proportionally. It has sometimes happened that ships both for Christiania and Dram have been in company, and those for Christiania have got up, loaded, and sailed, before the others for Dram have got over Dramstroom, which runs very strong down in the spring of the year. (Rordansz' *European Commerce; Consular Reports; &c.*)

**CHROMIUM.** This metal, which was discovered by Vauquelin in 1797, is brittle, of a greyish white colour, and very hard. It is scarcely affected by any acids. The metal has no economical value, but its salts are of the greatest importance as dyes and colours.

**CIUNAM.** The name given in India to lime. The best, obtained by the calcination of shells, is employed in the composition of BETEL, to prevent, it is said, its injuring the stomach.

**CIDER** or **CYDER** (Fr. cidre; Ger. zider, apfelwein; Ital. cidro; Russ. sidor; Span. sidra). The juice of apples expressed and fermented. The produce of the duty on cider and perry (the expressed and fermented juice of pears) amounted, in 1828, to 37,220L; which, as the duty was 10s. a barrel, shows that the quantity produced and brought to charge must have amounted to 71,440 barrels, exclusive of what might be clandestinely manufactured. The perry is supposed to have amounted to about a fourth part of this quantity. The duty was repealed in 1830. [APPLES.] Perhaps the total produce of cider and perry may now be estimated at from 100,000 to 110,000 barrels.

The manufacture of cider is also an important branch of industry in France, especially in the provinces of Normandy, Brittany, Picardy, and Artois. It is made from summer, autumn, and winter apples, which are not only distinguished by the time at which they reach maturity, but by the different quality of the beverage produced from them. Cider is also largely manufactured in Canada and the United States.

Good cider contains about 6 per cent. of proof spirit. Cider is sometimes adulterated with lead, with the object of masking tartness. This practice is exceedingly injurious, as lead is a dangerous poison. Common cider is also extensively used for the manufacture of spurious wine.

**CIGARS.** [TOBACCO.]

**CINNABAR** (Ger. zinnober; Dutch, einaber, verniljoen; Fr. cinnabre; Ital. cinabro; Span. cinabrio; Russ. kinowar; Chinese, chú shá; Lat. cinabrium).

1. *Native Cinnabar.*—A mineral substance, red, heavy, and brilliant. It is found in various places, chiefly in quicksilver mines, being one of the ores of that metal. The cinnabar of the Philippine Islands is said to be of the highest colour; but that of Almaden, in Spain, is the richest. It is also abundant in the central and western provinces of China. The best native cinnabar is of a high colour, brilliant, and free from earthy or stony matter. Only 24 cwts. of native cinnabar, valued at 336L, were imported in 1866.

2. *Artificial Cinnabar.*—When 2 parts of mercury and 1 of sulphur are triturated together in a mortar, the mercury gradually disappears, and the whole assumes the form of a black powder, formerly called *Ethiops mineral*. When this mineral is heated red hot, it sublimes; and if a proper vessel be placed to receive it, a cake is obtained of a fine red colour. This cake was formerly called cinnabar; and, when reduced to a fine

powder, is well known in commerce under the name of *vermilion*. Cinnabar, the ordinary ore of mercury, has been found in enormous quantities in California. [MERCURY.]

The production of cinnabar is considerably facilitated if the sulphur be previously melted. The pigment is prepared on a large scale in Holland, the sulphur being melted in a cast-iron vessel, and the mercury being finely divided, and also purified, by being squeezed through the pores of a chamois leather bag. As soon as the substances have combined, sublimation is allowed to begin. The larger the quantity of materials, the richer is the tint of the product. It is important also that both the sulphur and the mercury should be as pure as possible.

Enormous quantities of cinnabar are used in China. Red is the colour of rejoicing with the Chinese, and vermilion is therefore used in documents &c.

**CINNAMON** (Dutch, kaneel; Fr. cannelle; Ger. zimmt, kanehl; Ital. canella; Lat. cinnamomum, canella; Port. canella; Span. canela; Pers. and Hind. darclinee; Arab. darsini; Malay, kaimanis; Gr. Κίναμον; Chinese, jún kwei; Cingalese, karundu; Tamil, karua puttay). The inner bark of the cinnamon tree (*Laurus cinnamomum*), Nat. Order *Lauraceae*, a native of Ceylon, where it grows in great abundance, Cochin China, and perhaps of some other countries. It is brought home in bags or bales weighing 92 lbs. each; and, in stowing it, black pepper is mixed with the bales to preserve the cinnamon. The best cinnamon is thin and rather pliable: it ought to be about the substance of royal paper, or somewhat thicker; is of a light yellowish brown colour, approaching nearly to that of Venetian gold; it is smooth and shining; fractures splintery; has an agreeable, warm, aromatic flavour, and a mild, sweetish taste; when chewed, the pieces become soft, and seem to melt in the mouth; it is not so pungent but that it may be borne on the tongue without pain, and is not succeeded by any after taste. Whatever is hard, thick as a half-crown piece, dark-coloured or brown, or so hot that it cannot be borne, should be rejected. Particular care should be taken that it be not false packed, or mixed with cinnamon of an inferior sort. (Milburn's *Orient. Comm.*; *British Pharmacopœia*, 1867; Marshall's *Essay*, quoted below.)

The cinnamon of Cochin China grows in the dry sandy districts lying N. W. of the town of Faifoe, between 15° and 16° N. lat. It is preferred in China to the cinnamon of Ceylon: the annual imports into Canton and other ports vary from 250,000 to 300,000 lbs. There are no fewer than 10 varieties of this species in the market. It is not cured, like that of Ceylon, by freeing it from the epidermis. (Crawford's *Embassy to Siam* &c. p. 475.)

Besides the produce of the inner bark of the *Laurus cinnamomum*, the bark of the root affords a volatile oil which is similar in flavour to oil of cinnamon, but has also a camphorous pungency. Another kind of oil is distilled from the leaves. The cinnamon-leaf oil of commerce is of two kinds; one fatty and probably procured from the fruit, the other volatile and similar in taste and odour to oil of cloves or oil of pimento.

The principal cinnamon gardens of Ceylon are near Colombo. The seeds are planted so that the shrub should grow in clumps or clusters. The shoots which are decorticated are generally from 1 to 3 inches in diameter. The finer and thinner the bark, the more valuable is the product. The cinnamon harvest lasts from May to October.

Cinnamon is obtained from China, the Malabar

coast, Manilla, Java, Cayenne, the Leeward Islands, and the Isle of France. The produce of China is called *CASSIA*.

*Cinnamon Monopoly.*—Down to 1833 the cultivation of cinnamon in Ceylon was restricted to a few gardens in the neighbourhood of Colombo; the production and sale of the article being wholly monopolised by Government. Upon the transference of the island from the East India Company to the King's Government, the former agreed to pay 60,000*l.* a-year for 400,000 lbs. or 4,312½ bales of cinnamon; it being stipulated that if the quantity collected exceeded this amount, *the surplus was to be burned!* (See an article by H. Marshall, Esq., Staff Surgeon to the Forces in Ceylon, in Thomson's *Annals of Philosophy*, vol. x. p. 356.) But this agreement was afterwards broken off; and the cinnamon was sent to England by Government, and sold on its account at quarterly sales. The nett revenue derived from the cinnamon monopoly in 1831 is said to have amounted to 127,961*l.* As the monopoly could not be enforced except by confining the culture of cinnamon to certain districts, it necessarily led to the most oppressive interferences with the rights of individuals, to the creation of numberless imaginary offences, and the multiplication of punishments, forming a heavy drawback upon the prosperity of the island. A sense of these disadvantages led at length to the abolition of the monopoly system in 1833, when we ceased to be amenable to the charge of upholding, without improving, the worst part of the Dutch policy, and restored to the natives their right to cultivate cinnamon anywhere and in any way they think fit.

*Duties on Cinnamon.*—Unluckily, however, the abolition of the old monopoly system was accompanied by the imposition of the exorbitant duty of 3*s.* per lb. on all cinnamon exported, without distinction of quality, reduced in 1837 to 2*s.* 6*d.* on the 1st and 2nd qualities, and 2*s.* on the 3rd or lowest quality, and in 1841 to 2*s.* on all qualities. We took the liberty to animadvert as follows on this system in a former edition of this work:—'The natural cost of cinnamon does not, we believe, exceed 6*d.* or 8*d.* per lb.; but taking it at 1*s.*, the duty is no less than 200 per cent.! So enormous a tax, by confining the export of cinnamon within the narrowest limits, will go far to deprive the island of the advantages it would otherwise derive from the repeal of the monopoly, and will be, in all respects, most injurious. It is contended, in vindication of this oppressive tax, that Ceylon having a natural monopoly of cinnamon, it is sound policy to burden it with the highest duty it will bear, as the largest revenue is thus obtained at the least expense to the island. But, in addition to the cinnamon produced in Cochin China, and which it is more than probable will speedily find its way to the European markets, the extent to which cassia lignea is substituted for cinnamon shows that the monopoly possessed by Ceylon is of trifling importance. And though it were otherwise, though cassia lignea did not exist, and cinnamon were to be found nowhere but in Ceylon, we should not the less object to so exorbitant an export duty. So long as it is maintained, it will confine within the narrowest limits what might otherwise become an important branch of industry, and a copious source of wealth to the island.'

'Under the old system, the produce of cinnamon in Ceylon amounted to about 500,000 lbs.; and it is not at all probable that the exports will materially increase under the new system; but had the duty varied from about 6*d.* per lb. on the best, to 3*d.* or 4*d.* on the inferior sorts, we have little doubt, now that the culture is free, that the exports

would, at no very distant period, have amounted to 1,000,000 lbs. It is the high price of cinnamon—a price not caused by its scarcity or the difficulty of its production, but by the oppressive monopolies and duties to which it has been subjected—that has made it be regarded as a luxury attainable only by the rich.

'Should the exports of cinnamon from Ceylon under the new plan amount to 500,000 lbs. a-year, Government will receive from it an annual revenue of 50,000*l.*; and supposing them to amount to 600,000 lbs., the revenue will be 60,000*l.* And to secure the immediate payment of this trifling sum, every ulterior consideration of profit and advantage has been sacrificed. It is, however, pretty clear that this short-sighted rapacity will be, in the end, no less injurious to the revenue than to the industry and trade of the island. Were cinnamon allowed to be exported for a few years under a low duty, or till such time as the taste for it was fully diffused throughout this and other countries, it might then be easy, by gradually raising the duty, to obtain from it, without materially checking the consumption, a *large revenue*; at least two or three times more than it will ever produce under the present plan.

'Suppose that we had had the power effectually to monopolise the inventions by which Sir Richard Arkwright and others have so prodigiously facilitated the spinning of cotton, what would have been thought of the policy of those who should have proposed laying a duty on exported cotton equivalent to the peculiar advantages we enjoyed in their production? Had this been done, we should have got a *monopoly value* for our exports of cotton; but instead of amounting, as at present, to 30,000,000*l.* a-year, they would not, under such a plan, have amounted to 200,000*l.*; and instead of affording subsistence for some 1,300,000 or 1,400,000 individuals, the cotton manufacture would not have supported 50,000! And yet this is the mischievous nostrum—for it would be an abuse of terms to call it a principle—on which we have proceeded to regulate the export of the staple product of Ceylon.'

Experience has more than confirmed the truth of these statements. Instead of increasing, as they certainly would have done but for the exorbitance of the duty, the exports of cinnamon declined even below their amount during the monopoly. Notwithstanding the reduction of the duty in 1841 to 2*s.* per lb., the exports in that year amounted to only 323,461 lbs., producing a revenue of 33,111*l.*! This result was brought about, as we anticipated, partly by the high duty and its consequent high price restricting the demand for cinnamon; partly by the duty operating as a bounty to introduce the culture of the plant into other places; and partly and principally by its encouraging the use of *cassia lignea* and other substitutes in the place of the genuine article.

'It does not,' says Mr. Cook (formerly of the firm of Trueman and Cook, brokers), 'admit of a doubt, that unless the export duty of 2*s.* per lb. payable on the shipment of cinnamon at Ceylon be removed, the trade must speedily be annihilated. From 1798 to 1825 the cultivation was known in no other part of the world, and notwithstanding the impolicy even then of such an exorbitant charge, the trade was comparatively little affected; but in 1825 a successful attempt was made in Java by an experienced planter from Ceylon, and the shipments from that island, which, having since been annually increasing, were estimated (1842) at 117,000 lbs. at least, on which is levied a duty, on the value, of 4 per cent. only. The culture has also extended itself to Guiana and the West

Indies; and received from it can be said and that a confidently there being China, Malacca doubtless ere produce being charges. It namon can withstand the countries; and understood by trade would a man in its pro lon cinnamon, fluences, woul European mar lignea as a sub will no doubt e the cinnamon o as 100,000*l.*, or whereas in 18 47,000*l.* only; a even this much so that the lev proved as injuri to the prosperit

The duty on cinna

Indies; and, judging from a small parcel lately received from Jamaica, there can be no question it can be successfully produced in that quarter, and that a supply may at no distant period confidently be expected from thence, the duty there being only 2½ per cent. From Cochin China, Malabar &c. large quantities will also doubtless ere long find their way to Europe, their produce being comparatively free from fiscal charges. It is therefore evident that Ceylon cinnamon cannot, under existing circumstances, withstand the competition of that of other countries; and if the merits of the question were understood by the Government, this interesting trade would assuredly be no longer suffered to remain in its present anomalous state. Indeed, Ceylon cinnamon, independently of other adverse influences, would be very soon driven out of the European markets by the increased use of cassia lignea as a substitute. The question of revenue will no doubt engage the attention of Government, the cinnamon duty having yielded in 1833 as much as 160,000*l.*, or about half the revenue of the island; whereas in 1841 the governor estimated it at 47,000*l.* only, and it is doubtful if it will realise even this much—in fact it only realised 33,111*l.*; so that the levying an impost so oppressive has proved as injurious to the collection of revenue as to the prosperity of the trade.

Such conclusive statements could not be disregarded, and in 1844 the export duty on cinnamon was reduced to 1*s.* But even this was a great deal too high; and it soon became evident that the culture of the plant had taken such firm root in Java and elsewhere, and that the public taste had become so habituated to cassia and other substitutes, that the Ceylon planters would with difficulty maintain their ground, even if the duty were wholly repealed. And after being reduced to 4*d.* in 1848, and to 2*d.* in 1853, it was finally abolished in 1860. But it had continued long enough to inflict irreparable injury on the trade. The exports have, indeed, increased, though not very materially; but the quality of the spice has deteriorated, and now principally consists of the coarser and inferior varieties; so that, though the quantities exported are greater than formerly, their value is less. The consumption of the spice has not increased in the United Kingdom.

This brief notice of the legislation in regard to cinnamon affords an instructive and striking example of the risk attending the imposition of duties on the exportation of articles for which substitutes may be found, or that may be raised elsewhere. Had no duty been laid on the export of cinnamon in 1833, when the monopoly was set aside, it is all but certain that its production would have been incomparably greater than at present, and that it would have formed an important as well as interesting branch of Cingalese industry.

The imports of cinnamon from Ceylon into the United Kingdom have been:—

1815	-	624,556 <i>lb.</i>	1862	-	810,691 <i>lb.</i>
1820	-	658,237 <i>lb.</i>	1863	-	874,704 <i>lb.</i>
1825	-	692,125 <i>lb.</i>	1864	-	596,769 <i>lb.</i>
1830	-	721,672 <i>lb.</i>	1865	-	846,455 <i>lb.</i>
1837	-	686,875 <i>lb.</i>	1866	-	906,827 <i>lb.</i>
1861	-	752,240 <i>lb.</i>			

The years marked thus \* include a few pounds weight from other places than Ceylon, but they are inconsiderable. The total imports of cinnamon from all quarters into the United Kingdom in the last three years were as follow:—

1865	-	-	886,751 <i>lb.</i>
1860	-	-	932,729
1867	-	-	859,031

The duty on cinnamon from a British possession,

after being constant from 1840 at 3*d.* per *lb.*, was reduced in 1853 to 2*d.* per *lb.* The annual entries for consumption since the repeal of the duty in 1860 are not known. The average value of Cingalese cinnamon in 1866 was 1*s.* 9*d.* per *lb.* In the article *Colombo* we have given an account of the exports of cinnamon from Ceylon since 1810, and, for ample details on this subject, see Sir James Emerson Tennent's excellent work on Ceylon.

**CINQUE PORTS.** These are ancient trading towns, lying on the coast of Kent and Sussex, which were selected, from their proximity to France and early superiority in navigation, to assist in protecting the realm against invasion, and vested with certain privileges by royal charter.

The ports so privileged, as we at present account them, are Dover, Sandwich, Romney, Hastings, Hythe, and the two ancient towns of Winchelsea and Rye; although the two latter places appear to have been originally only members. The services which they were appointed to perform were either honorary, viz. assisting at the coronation and sending members to Parliament; or auxiliary to the defence of the realm, as furnishing a certain supply of vessels and seamen, on being summoned to that service by the king's writ.

In process of time the Cinque Ports grew so powerful, and by the possession of a warlike fleet so audacious, that they made piratical excursions in defiance of all public faith; on some occasions they made war, and formed confederacies as separate, independent states. It seems, however, that these irregularities were soon suppressed when the Government was strong, and sufficiently confident to exert its powers. So long as the mode of raising a navy by contributions from different towns continued, the Cinque Ports afforded an ample supply; but since that time their privileges have been preserved, though their separate or peculiar services have been dispensed with. Their charters are traced to the time of Edward the Confessor: they were confirmed by the Conqueror and by subsequent monarchs. William the Conqueror considering Dover Castle the key of England, gave the charge of the adjacent coast, with the shipping belonging to it, to the constable of Dover Castle, with the title of Warden of the Cinque Ports—an office resembling that of the Count of the Saxon coast (*Comes littoris Saxonie*) on the decline of the Roman power in this island. The lord warden has the authority of Admiral in the Cinque Ports and their dependencies, with power to hold a court of admiralty; he has authority to hold courts both of law and equity; is the general returning officer of all the ports—parliamentary writs being directed to him, on which he issues his precepts; and, in many respects, he was vested with powers similar to those possessed by the heads of counties palatine. At present the efficient authority, charge, or patronage of the lord warden is not very great; the situation is, however, considered very honourable, and the salary is 3,000*l.* He has under him a lieutenant and some subordinate officers; and there are captains at Deal, Walmer, and Sandgate Castles, Arcliff Fort, and Moats Bulwark.

There is an exclusive jurisdiction in the Cinque Ports (before the mayor and jurats of the ports), into which exclusive jurisdiction the king's ordinary writ does not run; that is, the court cannot direct their process immediately to the sheriff, as in other cases. In the Cinque Ports, the process is directed to the governor of Dover Castle, his deputy or lieutenant. A writ of error lies from the mayor and jurats of each port to the lord warden of the Cinque Ports, in his court of Shepway, and from the court of Shepway to the

King's Bench; a memorial of superiority reserved to the Crown at the original creation of the franchise; and prerogative writs, as those of habeas corpus, prohibition, certiorari, and mandamus, may issue, for the same reason, to all these exempt jurisdictions, because the privilege that the king's writ runs not, must be intended between party and party, and there can be no such privilege against the king.' (Chitty's *Commercial Law*, vol. ii. p. 12; Knocker's *Grand Court of Shepway*, &c., London, 1862.) The peculiar jurisdiction of the Cinque Ports was much modified by 18 & 19 Vict. c. 48, and other Acts, and the salary of the lord warden has been abolished.

**CITRON** (Ger. succade; Danish, sukkat; Ital. confetti di cedro; Span. neitron verde; Fr. citronat verd). An agreeable fruit, resembling a lemon in colour, smell, and taste. It is the *Citrus medica* of botanists, and is probably a mere variety of lemon. It is much larger than the lemon, of an ovoid shape, and with a very thick rind. The juice too is less acid than that of the lemon and lime. The cuticle of the rind is full of vesicles containing an essential oil, on which the flavour of the rind depends. The *Citrus medica* is a native of Asia, and was probably imported from Persia or Media, in the second century of our era. It is now cultivated in warm climates throughout the world. The candied rind is imported from Madeira, of the finest quality.

**CIVET** (Ger. zibeth; Dutch, civet; Fr. civette; Ital. zibetto; Span. galgala). A perfume derived from two animals—the *Viverra civetta* of Africa, and the *Viverra zibetha* of the East Indies. The substance is secreted in certain glands situated in the perineum of the animal. In order to obtain greater supplies, the civet cat has been domesticated, and the substance, the quantity of which may be increased by irritating the sac in which it is secreted, is collected.

Civet was once used as a medicine, but now solely as a perfume. Its odour is very strong, and even offensive when it is smelt in bulk or near; but when diluted and at a distance, it is considered to be very agreeable. When genuine it is worth 30s. or 40s. an ounce.

**CIVITA VECCHIA**. A fortified sea-port town of the Papal dominions, on the Mediterranean, lat. 42° 4' 38" N., long. 11° 41' 52" E. Population about 12,000.

**Harbour**.—The port of Civita Vecchia is artificial, and is formed by three large moles. Two of them projecting from the main land, inclined one to the north and the other to the south, form the sides of the harbour; while a third mole, or breakwater, constructed opposite to the gap between the other two, serves to protect the harbour from the heavy sea that would otherwise be thrown in by the westerly gales. There are 3 lights in this port: one, which revolves every 40 seconds, on Antemuzale, the S. end of the Breakwater; a second on Bicliese Mole; a third on the Lazaretto Mole. Vessels may enter either by the south or north end of the outer mole, but the southern channel is the deepest, having from 8 to 6 and 4 fathoms. Ships may anchor within the port in from 16 to 18 feet water; or between it and the outer mole, where the water is deeper. Within the port are a dock and an arsenal.

**Historical Notice**.—This harbour, which is by far the best on the western side of the Papal dominions, owes its origin to the Emperor Trajan, and affords the most unequivocal proof, not of his power merely, but of his sagacity and desire to promote the interests of commerce and navigation. There is in one of Pliny's Letters (lib. vi. epist. 31) a clear and interesting account of this great

work, which has obviously been planned and constructed with equal skill and judgment. The outer mole was mostly formed, precisely like the breakwater at Plymouth, by sinking immense blocks of stone into the sea, which became fixed and consolidated by their own weight, till by degrees it was raised above the waves. Originally it was called *Trajanus Portus*, and it is to be regretted that it did not always bear the name of its illustrious founder. But in the latter ages of the Roman empire it was called *Cantua Celva*, and in modern times *Civita Vecchia*. (Cellarii *Notitia Orbis Antiqua*, i. p. 731.)

**Money**.—Accounts are kept *Lerc*, and throughout the Papal States, in crowns or *scudi*, called *scudi Romani* and *scudi moneta*. 1 *scudo* = 10 *paoli*, and 1 *paolo* = 10 *bajocchi*. The *scudo* contains 403 grains of English standard silver, and is, consequently, worth 4s. 4d. sterling. Payments above 5 *scudi* are made in *cedole*, or schedules, a species of bank notes; but these not being payable in specie on demand, are uniformly at a discount.

**Weights**.—The *libra* or pound of 12 *onci*, or 6,192 *grani*, contains 5,234 English grains. Hence, 100 Roman pounds = 74,771 lbs. avoirdupois = 90,868 lbs. troy = 33,906 kilogrammes = 70,008 lbs. of Hamburg. There are three different cantaros or quintals; viz. of 100, 160, and 250 lbs. The *migliajo* = 1,000 lbs.

**Measures**.—The Roman foot = 11.72 Eng. in.; the *canna* = 78.34 Eng. in.; the *canna* used by builders = 87.96 Eng. in.; the *barrel* of wine = 12,841 imp. gals., and the barrel of oil = 12.64 imp. gals.; the *soma* of oil = 36.13 imp. do.; the *rubbio* of corn = 8.143 imp. bbls. (Kelly's *Cambist*; Nelkenbrecher, *Manuel Universel*.)

**Imports and Exports**.—Though the wealth and population of the country round Civita Vecchia be much fallen off in modern times compared with antiquity, it still continues to be the entrepôt of Rome, with which it is connected by a railway, and engrosses almost the entire trade of the Papal dominions on the side of the Mediterranean. The imports consist principally of cotton stuffs and yarn; woollens, silks, and linens; iron and hardware; coffee, sugar, cocoa, and other colonial products; salt and salted fish, coal, wines, jewellery, glass and earthenware &c. The exports consist of staves and timber, corn, wool, cheese, potash, pumice-stone, alum from Tolfa, in the vicinity, cream of tartar, rags &c. The total value of the imports may be reckoned at from 700,000L to 800,000L: inasmuch, however, as a considerable portion of these are on account of the strangers resident in Rome, the exports are by no means so great, and do not, indeed, exceed from 250,000L to 350,000L. Marseilles and Genoa have the largest share of the foreign trade of Civita Vecchia, and next to them England.

In addition to the ordinary sailing-vessels which frequent the port, it is now regularly visited by steam-packets from Malta, Marseilles, Genoa, Naples &c. by which from 10,000 to 12,000 passengers are annually conveyed on their way to and from Rome.

In 1866 the value of the exports of domestic produce from the United Kingdom (chiefly coal and iron) to the Papal dominions amounted to 15,293L, and in 1867 to 15,313L. Our imports from the Papal dominions amounted to 5,491L in 1866, and to 5,162L in 1867.

In 1864, 2,028 vessels, of 331,890 tons, entered, and 1,996 vessels, of 336,569 tons, cleared, the port of Civita Vecchia.

**Duties**.—Civita Vecchia is a free port; i.e. a port into which produce may be imported, and either consumed or re-exported, free of duty.

CLARET. A name of ancient origin, given in England to the red wines of Bordeaux. [BORDEAUX; WINE.]

CLEARING. In 1775 the London, or rather the 'City,' bankers established the 'Clearing-house.' This is a house to which each banker who deals with it is in the habit of daily sending a clerk, with him the various bills and checks in the possession of his house that are drawn upon other bankers; the practice formerly being to exchange them for the bills and checks in the possession of those others that were drawn upon his constituents, and to pay the balance, on the one side or the other, in cash or Bank of England notes. By this means the bankers connected with the clearing-house were enabled to settle transactions to the extent of several millions a day, by the employment of not more, at an average, than from 200,000*l.* to 500,000*l.* in cash or Bank of England notes.

Later, however, the arrangements connected with the clearing-house have been so much simplified and improved, that neither notes nor coins are any longer required in settling the largest transactions. The clearing-house itself, and the various banking firms and joint-stock companies connected with it, have accounts at the Bank of England; and the balances that were formerly settled by a money payment are now settled by transfers from one account to another. The economy of money in the adjustment of large transactions, occasioned by this and other contrivances, accounts for the fact that the proportion of notes of 20*l.* and upwards issued by the Bank has considerably declined of late years, while that of 5*l.* and 10*l.* notes, which are used in ordinary dealings, has been materially increased.

Originally the convenience of the clearing was permitted to the private bankers only, but after a lapse of time the private banks gave way, and admitted the joint-stock banks to share its advantages. Latterly, too, the clearing system has been extended to the country banks, through their London correspondents. These difficulties arose as to the admission of these country establishments:—The adoption of the system was likely to involve some inconvenience to the London bankers in the loss of time and additional trouble which the concession would involve. Then, again, it was impossible to grant the convenience, in case the country bank deducted, as they sometimes did, a small commission or percentage on checks drawn on their own house. And lastly, it was not always easy to accommodate the system to that rule of law which requires the person in whose favour a check is drawn to present it as early as possible for payment. The Post-office obviated to a great extent the last difficulty, and ultimately a plan proposed by Sir John Lubbock was accepted, and put into operation. (For the details of this plan, see the *Journal of the Statistical Society*, September 1865.)

There is another service, that of railways, to which the advantages of a clearing are obvious. Railways have often running powers over each other's lines; and even if they have no legal power to use any neighbouring or adjoining line, which may join their own, they constantly find it to be a convenience to the public, and therefore an advantage to themselves, to issue through tickets which will enable the purchaser to complete his journey without being put to the pains of procuring a second, or even several tickets; or

again to run their carriages on a neighbouring line, or receive carriages belonging to another company on their railroad; or lastly, to convey parcels through without a fresh booking and additional entries. But in order to balance their accounts readily, it is necessary to have a speedy settlement of these: hence they have established a *Railway Clearing*, the form of which is analogous to that established now nearly a hundred years by the London bankers.

CLEARING-HOUSE. The place where the operation termed clearing is carried on.

CLOCK, CLOCKS (Ger. *uhren*, *grosse uhren*, *wiandunrhe*; Dutch, *uren*, *uurwerken*, *horologien*; Fr. *horloges*; Ital. *orologi*, *orologi*; Span. *relojes*; Russ. *tachastl*). A kind of machine, put in motion by a gravitating body, and so constructed as to divide, measure, and indicate the successive portions of time with very great accuracy. Most clocks mark the hour by striking or chiming. It is a highly useful instrument, and is extensively employed for domestic and philosophical purposes. Clocks are made of an endless variety of materials and models, so as to suit the different uses to which they are to be applied, and the different tastes of their purchasers. Their price consequently varies from a few shillings to more than 100*l.* The Germans and Dutch are particularly celebrated for their skill in the manufacture of wooden clocks; while the English, French, and Genevese, especially the former, have carried the art of making metallic clocks, so as to keep time with the greatest precision, to a high degree of perfection.

The history of the invention, introduction, and successive improvements in the manufacture of clocks has been carefully investigated by some very learned and industrious antiquaries (see Beckmann's *History of Inventions*, vol. i. pp. 419-462, Eng. ed.; and Rees's *Cyclopaedia*); but, notwithstanding these researches, the subject is still involved in considerable obscurity. It seems, however, that the middle of the fourteenth century may be regarded as the epoch when clocks, having weights suspended as a moving power, and a regulator, began to be introduced. The period when, and the individual by whom, the pendulum was first applied to clockwork, have been subjects of much contention. Galileo and Huygens have disputed the honour of the discovery. But whoever may have been the inventor, it is certain that the invention never flourished till it came into the hands of Huygens, who insists that if ever Galileo thought of such a thing, he never brought it to any degree of perfection. The first pendulum clock made in England was in the year 1662, by one Fromantel, a Dutchman. (*Hutton's Mathematical Dictionary*.)

The clock manufacture is of considerable importance and value. It is carried on to a great extent in London.

Previously to 1842 an ad valorem duty of 25 per cent., which was then reduced to 10 per cent., was laid on all clocks when imported. In 1853 the duty was further reduced, and placed on a new footing. It was repealed in 1860. We subjoin

*An Account of the Numbers and Values of the Clocks Imported in 1866, specifying the Countries whence they came.*

Country	Number	Value
Holland - -	39,055	9,523
France - - -	30,177	190,291
United States -	134,210	54,355
Other parts - -	612	1,682
Total - - -	204,054	255,879

On the other hand in 1866 we exported 5,774 clocks, other than British, valued at 5,518*l.*, besides British clock and watch movements of the value of 15,818*l.*

Clockmakers are obliged to engrave upon the dial-plate of all clocks made by them their names and the place of their residence. It is illegal to import except in transit, and subject to such regulations as the Treasury may direct, clocks and watches of any metal impressed with any mark or stamp appearing to be or to represent any legal British assay mark or stamp, or purporting by any mark or appearance to be of the manufacture of the United Kingdom. (16 & 17 Vict. c. 107 s. 44.)

It is said, however, not to be an uncommon practice among the less reputable portion of the trade to engrave their names and 'London' on foreign clocks and watches, and to sell them to the public as English work. The fraud may be detected by referring to any respectable watchmaker.

By a Treasury order of Sept. 4, 1828, clocks and watches for private use, though not marked in the manner now specified, may be admitted on payment of the duty, on the parties making affidavit of their entire ignorance of the law in question.

Persons hired by, or in the employment of, clock and watchmakers, who shall fraudulently embezzle, secrete, sell &c. any metal, material, or precious stone, with which they may happen to be intrusted, shall, upon trial and conviction before a justice of the peace, forfeit 20*l.* for the first offence; and for the second, and every subsequent offence, they shall forfeit 40*l.*; and, in default of payment, they are to be committed to the house of correction. (27 Geo. II. c. 7 s. 1.) [WATCH.]

#### CLOTH. [LINES; WOOL; &c.]

CLOVER (Ger. klee; Dutch, klaver; Fr. trèfle, luzerne; Ital. trifoglio; Span. trebol; Russ. trislitnik; Lat. trifolium). A very important species of grass. Some of the species in cultivation are annual, others biennial or triennial, and others perennial. The seed used formerly to be principally imported from Holland, but that which is raised in this country is now said to be of a superior quality. (Loudon's *Encyclopædia of Agriculture*.) Culture for seed is, however, very precarious, and of uncertain profit.

We have been for a lengthened period in the habit of importing considerable quantities of clover seed; and there can be little doubt, despite the improvement of the home produce, that the imports would have been much greater but for the heavy duty of 20*s.* a cwt. with which foreign clover seed was formerly loaded. Such duty had the mischievous effect of tempting farmers to use seed of inferior quality, and fell with peculiar severity on Scotland and those parts of the country which grow no seed. We are, therefore, glad to have to state that after being reduced to 10*s.* a cwt. in 1842, and to 5*s.* per do. in 1846, the duty was finally repealed in 1853. In 1866 we imported 226,014 cwt. clover seed, valued at 726,004*l.*, of which nearly a half came from France, while our exports amounted to only 4,493 cwt. The price varied from 3*l.* 3*s.* to 3*l.* 7*s.* 6*d.* per cwt., that of France being 3*l.* 5*s.* In 1867 the imports were 150,968 cwts., valued at 503,669*l.*

CLOVES (Ger. nüglein, gewürznelken; Dan. nelliker, krudeneliker; Dutch, kruidnagelen; Pol. gozdrzik; Fr. clous de girofle, girofles; Ital. chiovi di garofana, garofani, garofoli; Span. clavos de especia, clavillos; Port. craros da India, craros girofes; Russ. gwosdika; Arab. kerentful; Malay, chankee; Chinese, ting hiang tsz' ting hiang).

The fruit, or rather cup, of the unopened flowers of the clove-tree, or *Caryophyllus aromaticus*, Nat. Order *Myrtaceæ*. It is not known when this spice was introduced into European markets. In the middle ages, however, it was brought by the Venetians and Genoese by the route over the highlands of Armenia, by that from Bagdad to Lyeia, and by the Red Sea and the Nile. It was by far the costliest of Eastern spices. In 1329 the fellows of Merton College, Oxford, bought cloves at the rate of 1*l.* 1*s.* 4*d.* per lb. (troy) in money of the time; that is, at not less than 12*l.* 12*s.* in modern value. In 1719 cloves were purchased at 12*s.* per lb.

The clove-tree is a native of the Moluccas. Though its natural range was limited, it grew abundantly in all the islands; but the Dutch, for reasons given below, succeeded in extirpating the plant in all the islands except Amboyna and Ternate. A Frenchman, however, one Poiret, the governor of Mauritius and Bourbon, contrived to export several trees to the islands under his government: thence they have spread to Cayenne and the West Indies, to Brazil, to Sumatra, and Zanzibar.

They were first introduced into the islands of Zanzibar and Pemba about 1830 from the Mauritius: they thrive, and the cultivation has now almost entirely superseded that of sugar and rice, formerly the chief products of those islands. The average crop of Zanzibar cloves is about 200,000 *faraslahs*, or about 7,000,000 lbs., valued at about 85,000*l.* Owing to the increased production, the price has fallen about 70 per cent. within a few years. In Colonel Pelly's Report for 1860, published in 1863, the value of the cloves exported from Zanzibar is stated as 55,666*l.*, the quantity having been 4,860,100 lbs. Export duties are not charged on the cloves shipped from Zanzibar.

Cloves are shaped like a nail; whence the name, from the French *clou*, nail; about 6 lines long, plump and heavy. They are imported from the Dutch settlements; the best in chests, and an inferior kind in bags. The best variety of the Amboyna cloves is smaller and blacker than the other varieties, very scarce, and, as a mark of pre-eminence, is termed the Royal clove. Good cloves have a strong, fragrant, aromatic odour; and a hot, acrid, aromatic taste, which is very permanent. They should be chosen large sized, perfect in all parts; the colour should be a dark brown, almost approaching to black; and, when handled, should leave an oily moisture upon the fingers. Good cloves are sometimes adulterated by mixing them with those from which oil has been drawn; but these are weaker than the rest, and of a paler colour; and whenever they look shrivelled, having lost the knob at the top, and are light and broken, with but little smell or taste, they should be rejected. As cloves readily absorb moisture, it is not uncommon, when a quantity is ordered, to keep them beside a vessel of water, by which means a considerable addition is made to their weight. Cloves contain a very large amount of volatile oil, the quantity being nearly 20 per cent. They are also, it is said, very rich in tannin. Every portion of the tree is aromatic, and has been subjected to distillation; but under existing circumstances the supply of this article, once so scarce and precious, is abundant. The use of cloves in cookery is familiar to every one, but they enter also largely into perfumery, and are used in the Pharmacopœias of this country and the United States. (Thomson's *Dispensatory*; Milburn's *Oriental Commerce*; *British Pharmacopœia*, 1867.)

*Policy of the Dutch as to the Trade in Cloves.*—From the expulsion of the English from Amboyna in 1623, the Dutch have, a few short intervals only excepted, enjoyed the exclusive possession of the Moluccas, or Clove Islands. In their conduct as to the clove trade they exhibited a degree of short-sighted rapacity which has been, we believe, seldom equalled even in the annals of monopoly. The object of the Dutch East India Company was not to encourage the growth and trade of cloves, but to confine both within the narrowest limits. They preferred deriving a large profit from a stunted and petty trade, to a moderate profit from a trade that might have afforded employment for a very large amount of capital; and to prevent their narrow and selfish projects from being counteracted by the operations of the natives, they subjected them to the most revolting tyranny. 'That they might,' says Mr. Crawford, 'regulate and control production and price just as they thought proper, the clove-trees were extirpated everywhere but in Amboyna, the seat of their power; and the surrounding princes were bribed by annual stipends to league with them for the destruction of their subjects' property and birthright. This plan was begun about the year 1551. The contracts are still in force, and an annual fleet visits the surrounding islands to suppress the growth of cloves, which in their native country spring up with a luxuriance which these measures of Satanic rigour, and of sacrifice towards bountiful nature, can scarce repress. By the plan on which the clove trade is now conducted—a plan carried into effect through so much iniquity and bloodshed—the country of spices is rendered a petty farm, of which the natural owners are reduced to the worst condition of predial slavery; and the great monopoliser and oppressor is that Government whose duty it should have been to insure freedom and afford protection. Human ingenuity could hardly devise a plan more destructive of industry, more hostile to the growth of public wealth, or injurious to morals, than this system framed in a barbarous age; and it reflects disgrace upon the character of a civilised people to persevere in it.

It is curious to remark how the monopolisers, in carrying the details of this system into effect, at once impose upon the natives and deceive themselves. The *nominal* price paid to the natives is actually above the natural price of the commodity, but they are cheated in the details. The cultivator brings his produce to the public stores, where it is subjected at once to a deduction of one-fifth for payment of the salaries of the civil and military officers. The price of the remainder is fixed at the rate of 9·6 Spanish dollars the picul: but before payment is made, another deduction of one-fifth is made; one-half of which is for the chiefs or *rajahs*, and the other for the native *elders*, who are overseers of the forced culture. The real price, therefore, paid to the grower is 8 Spanish dollars per picul, or 3½*d.* per lb. avoirdupois, instead of 11·520 Spanish dollars per picul, or 4½*d.*, which is pretended to be given.

When cloves have been sold on the spot, the price usually exacted has been about 64 Spanish dollars the picul, or 8 times the price paid to the cultivator. The average price in Holland, previously to the war of the French revolution, was about 6s. per lb., or 177·500 Spanish dollars per picul, being 2,122 per cent. advance on the real cost of the commodity in the place of its growth. When brought direct to England, they cost at an average 3s. 8*d.* the lb., making 108·94 Spanish dollars per picul, an advance on the natural export price

of 1,258 per cent.' (*Eastern Archipelago*, vol. iii. pp. 388–390.)

But it would be most unfair to the Government and people of Holland not to mention that this oppressive system has been entirely abolished. As respects the culture of cloves, it is now carried on upon nearly the same plan that has been adopted in Java in respect to the culture of coffee and most other articles, and is not very different from that under which opium is raised in Bengal. A certain extent of land is assigned to each village for the growth of spices; and the produce, which the villagers are bound to raise, is delivered to the Government at certain fixed rates. And provided these are reasonable, which we are assured is the case, we incline to think that this is the best plan that can be pursued. If left to follow their own views, it is all but certain that the natives would confine their attention to the culture of the few articles necessary for their subsistence, and that the production of spices would be either wholly neglected or prosecuted only to a trifling extent. (Temminck, *Possessions Néerlandaises dans l'Inde Archipelagique*, iii. pp. 202–241.)

It was supposed for a lengthened period that cloves were a product peculiar to the Moluccas, and that they could not be raised elsewhere; and this notion seems to have stimulated the Dutch East India Company to obtain the monopoly of the trade. This notion is, however, far from being so well founded as was at first supposed. It is true that the attempts to cultivate the clove-tree in Surinam have not been very successful, and that in Java, where its prospects were believed to be highly favourable, it has not answered. This, however, is not the case with the plantations that have been tried in other places. Those, for example, that have been formed in Prince of Wales Island (formerly *Pulo Penang*) have been singularly successful, and furnish considerable supplies of the finest cloves. (Thornton's *East India Gazetteer*, iv. 175.) They are also pretty extensively grown in the Isle de Réunion (*ci-devant* Isle de Bourbon), at Bencoolen, in Sumatra, and other places.

Of 900,057 lbs. cloves we imported in 1857, no fewer than 873,716 lbs. are said to have been supplied by the British East Indies; but of these, considerable quantities were no doubt derived indirectly from the Dutch possessions, and from the Isle de Réunion, the Mauritius &c.

The *Duty on Cloves* was considerably reduced in 1819; and there was, in consequence, a considerable increase in the consumption of the article, though not nearly so great as it would have been had it been supplied under a more liberal system. It was further reduced in 1842 to 6½*d.* per lb., and in 1853 to 2*d.* It was repealed in 1860. In 1866 we imported 1,213,467 lbs., valued at 18,845*l.*, and exported 1,441,817 lbs. In the London market, in June 1867, the price of cloves varied, Amboyna from 4½*d.* to 5½*d.* per lb.; Penang and Bencoolen from 9½*d.* to 1s. 0½*d.*; Zanzibar from 3*d.* to 3½*d.* per do.

COACHES. Vehicles for commodious travelling. They have sometimes two, and sometimes four wheels. The body of the coach is generally suspended, by means of springs, upon the framework to which the wheels are attached. They are usually drawn by horses, or impelled by steam. The forms and varieties of coaches are almost innumerable.

1. *Historical Notice.*—Beckmann has investigated the early history of coaches with his usual care and learning. It is certain that a species of coaches were used at Rome; but whether they were hung on springs, like those now made use of

is not certain. After the subversion of the Roman power, horseback was almost the only mode of travelling. About the end of the fifteenth century, however, covered carriages began to be employed by persons of distinction on great occasions. In 1550 there were at Paris only three coaches; one of which belonged to the queen; another to the celebrated Diana of Poitiers; and the third to a corpulent, unwieldy nobleman, René de Laval, lord of Bois-Dauphin. Coaches were seen for the first time, in Spain, in 1546. They began to be used in England about 1580, and were in common use among the nobility in the beginning of the seventeenth century. (*History of Inventions*, vol. i. pp. 111, 127, Eng. trans.)

2. *Manufacture of Carriages.*—This is a department of considerable value and importance. The best built and handsomest carriages are made in London, where only the trade of a coach carrier is carried on; but the carriages made at Edinburgh and some other places are also very superior. Down to 1825 a duty was laid on all carriages made for sale; and, supposing that at an average carriage may last for 10 years, an annual supply of from 29,000 to 30,000 new carriages would be required to keep up the stock of those that are now (1866) charged with duty, ex hackney carriages.

3. *Duties on Carriages.*—These duties have been long imposed, and have fluctuated considerably at different periods. The table on page 306 shows the number of four-wheeled and other carriages (exclusive of hackney coaches) charged with duties in 1856 and 1866.

4. *Stage Coaches, Travelling by.*—Owing to the improvement in the breed of horses and the building of carriages, but above all to the extraordinary improvements that were effected within the last half century in the laying out, construction, and keeping of roads, the ordinary rate of travelling by stage coaches, previously to their all but total extinction by railways, was seldom under 9 or 10 miles an hour, stoppages included, and, on some roads, was as much as 11 or 12. The stages having been shortened, this speed was not found to be materially more injurious to the horses than the slower rate at which they previously travelled. The surface of the roads being perfectly smooth, and most sharp turns or rapid descents having been got rid of, travelling even at this rate was comparatively safe; and it was surprising, considering the number of coaches, how few accidents occurred. They were occasioned, for the most part, by the misconduct of the drivers, and principally by their endeavouring to make up by increased speed for time lost at stoppages, or by their attempting to pass each other. It is, perhaps, needless to add that since the opening of railways between all the principal places of the country, travelling by stage coaches no longer exists, except in a few remote districts, and has become a matter of history.

*Law as to Stage Coaches.*—This is chiefly embodied in the Acts 2 & 3 Wm. IV. c. 120, and 3 & 4 Wm. IV. c. 48.

*Definition.*—A stage coach is any carriage travelling along the road at the rate of 3 miles or more an hour, without regard to form, provided the passengers pay separate fares for their places therein; but all carriages used wholly on a railway, or impelled by steam, are excepted from this definition. (2 & 3 Wm. IV. c. 120 s. 4.)

*Licenses, Duties &c.*—The license duties imposed by this Act, and the mileage, or duty on passengers travelling by stage carriages, were repealed in 1853, and the following license duties imposed in their stead, viz. :—

*Postmasters:—Licenses to Let Horses for Hire.*

The duty of 1s. 2d. per mile on every four passengers conveyed by railway, imposed by the 2 & 3 Wm. IV. c. 129, having been found to operate unequally and oppressively, was repealed in 1842 by the 5 & 6 Vict. c. 59. This Act imposed, at the same time, a duty of 5 per cent. on all receipts from passengers (restricted by the 7 & 8 Vict. c. 85 s. 9 to those paying more than 1d. per mile) by railways.

An important alteration in the excise laws regulating stage carriages was effected in 1863, 26 & 27 Vict. c. 32, which inter alia enacted that the duties then payable for the licenses and stage carriages thereafter described should be reduced, and in lieu of these duties there should be paid in Great Britain for every original license, to be taken out yearly, to keep a stage carriage to carry not more than 8 passengers at one time, the duty of 10s., and for every supplementary license for the same carriage, which shall be taken out in any case allowed by law during the period for which such original license was granted, the duty of 6d.

And for every mile which any such stage carriage shall be licensed to travel, the duty of 3d. Penalty on carrying more than 8 passengers 10l. Licenses may be granted (at the discretion of the Commissioners of Inland Revenue) for short periods.

For a carriage with	1 horse,	1 day	£	s.	d.
	2 horses,	"	3	0	0
	more than 2 horses,	"	10	0	0

If for longer than one day, half the above rates for each additional day, up to six days.

*Stage Coaches.*—The duties levied on stage coaches by the Act 29 & 30 Vict. c. 36 are as follow:—

For every mile which any stage carriage shall be licensed to travel in Great Britain, the excise duty of 3d. In the Eleventh Report of the Commissioners of Inland Revenue it is stated that the result of the reduction of the duty to 3d. was an increase in the mileage in the year ended June 30, 1867, to 34,054,798, or 1,179,000 over the return of the previous year; but the mileage duty fell from 130,085l. to 40,742l.

The following are the rates payable for horses &c. let to hire under this Act after July 6, 1866:—

Where the person taking out a license shall keep at one and the same time and let to hire 1 horse	£	s.	d.
or 1 carriage only	5	0	0
3 horses and 2 carriages	10	0	0
4 "	15	0	0

Exceeding 15 carriages	70	0	0
Exceeding 20 horses, then for each additional number of 10 horses, and for any additional number less than 10, over and above 20, or any other multiple of 10 horses, the further additional duty of	10	0	0

In lieu of the duties now payable on such licenses.

Stage carriage licenses expire on the first Sunday of November. Stage carriage licenses may be taken out for a quarter of a year. Each quarter to be deemed to commence on April 1, July 1, October 1, January 1, and the license payable being one-fourth of the annual sum due.

Stage carriage may be trans-

Wm. IV. c. 120 s.

Stage carriage licenses during their currency may be transferred by endorsement.

**Want of License &c.**—Keeping, using &c. any stage carriage without a license, or without plates, or with recalled plates, or contrary to their licenses, or with improper plates, are offences punishable each by a penalty of 20*l.* (& 3 Wm. IV. ss. 27, 28.)

**Penalty on Drivers of Coaches without Plates**, if not the owner, 10*l.*; if the owner, 20*l.* (Sec. 30.)

**Forging Plates**, a misdemeanour. (Sec. 32.)

**Names of Proprietors &c. to be painted outside**, in legible and conspicuous characters; the names of the extreme places between which such carriage shall be licensed to go; and also the greatest number of passengers licensed to be carried inside and outside. Penalty for neglecting this particular, 5*l.* (Sec. 35.)

**Certain Carriages not to carry Outside Passengers or Luggage**, viz. those the top or roof of which shall be more than 8 feet 9 inches from the ground, or the bearing of which on the ground, that is, the distance between the centres of the tracks of the wheels, shall be less than 4 feet 6 inches. Penalty, 5*l.* (Sec. 37.)

**Luggage on the Roof not to exceed a certain Height**, viz. 10 feet 9 inches from the ground on a carriage drawn by 4 or more horses; and 10 feet 3 inches from ditto if on a carriage drawn by 2 or 3 horses. Driver of any carriage where such offence is committed liable in a penalty of 5*l.* (Sec. 43.)

The clauses in the Act 2 & 3 Wm. IV. c. 120 relating to the distribution of outside passengers &c. have been repealed by the Act 3 & 4 Wm. IV. c. 48, which substitutes the following in their stead:—

**Number of Outside Passengers &c.**—Any licensed stage carriage with 4 wheels or more, the top or roof of which shall not be more than 8 feet 9 inches from the ground, and the bearing of which on the ground shall not be less than 4 feet 6 inches from the centre of the tracks of the wheels, if such carriage shall be licensed to carry any number not more than 9 passengers, shall be allowed to carry not more than 5 of such passengers outside; and if licensed to carry more than 9 and not more than 12 passengers, shall be allowed to carry not more than 8 of such passengers outside; and if licensed to carry more than 12 and not more than 15 passengers, shall be allowed to carry not more than 11 of such passengers outside; and if licensed to carry more than 15 and not more than 18 passengers, shall be allowed to carry not more than 12 of such passengers outside; and if licensed to carry any greater number than 18 passengers, shall be allowed to carry not more than 2 additional passengers outside for every 3 additional passengers which such carriage shall be so licensed to carry in the whole; provided that in no case a greater number of passengers shall be carried on the outside than is authorised by the license. If more be carried, driver to forfeit 5*l.* (Sec. 2.)

**Driver, Guard, and Children in lap** not to be counted as passengers; 2 children under 7 years reckoned as one passenger. (Sec. 3.)

**No person to sit on Luggage on the Roof**, nor more than 1 person besides driver on the box. Penalty 5*l.* (Sec. 14.)

**Justices, Road-surveyors, Toll-keepers &c.** authorised to cause stage carriages and luggage to be measured; any passenger authorised to require the driver to stop at a toll-gate and to require the gate-keeper to measure the carriage and luggage, and to count the number of inside and outside passengers. Penalty on driver refusing to stop, 5*l.*; on gate-keeper neglecting to provide a measure, or refusing to measure and count, 5*l.* (2 & 3 Wm. IV. c. 120 s. 45.)

**Conduct of Drivers &c.**—Drivers quitting the box before a proper person shall stand at the head of the horses; such person leaving the horses before some other person shall be placed in like manner, or have the command of the horses, or before the driver has resumed his seat on the box and taken the reins; driver allowing any passenger or other person to drive for him, or leaving the box without any reasonable occasion, or for a longer time than is absolutely necessary; concealing or displacing plates; guard discharging fire-arms unnecessarily; driver, conductor, or guard neglecting to take care of luggage; asking more than the proper fare; neglecting to account to his employer; or assaulting or using abusive language to any person having travelled, or about to travel, as a passenger, or to any person accompanying the same; shall in each and every such case forfeit 5*l.* (Sec. 47.)

**Drunkenness &c.**—Drivers, conductors, or guards leaving the care of any stage carriage, endangering through intoxication, negligence, or wanton and furious driving, the safety of any passenger or other person, or the property of the owner of such carriage or other person, shall each person so offending forfeit 5*l.* (Sec. 49.)

**Owners liable for penalties**, when driver or guard is not known or cannot be found. (Sec. 49.)

Mail coaches are under the regulations of the Postmaster-General; and the enactments in this Act as to plates, inscriptions, outside passengers, and luggage do not extend to them; but the other regulations as to the conduct of drivers, guards &c. do apply to them. Mail coaches have only four outside passengers: one on the box, and three immediately behind the box. No passenger allowed to sit beside the guard. The rate of travelling, the time allowed for stoppages, the quantity of luggage to be carried &c. are all regulated by the Postmaster-General.

**Rates of Duty on Carriages.**—These are fixed by the 16 & 17 Vict. c. 90 as follows, viz:—

	Annual Duty for each Carriage
	£ s. d.
For every such carriage with 4 wheels:—	
Where the same shall be drawn by 2 or more horses or mules	3 10 0
And where the same shall be drawn by 1 horse or mule only	2 0 0
For every carriage with 4 wheels, each being of less diameter than 30 inches:—	
Where the same shall be drawn by 2 or more ponies or mules, neither of them exceeding 15 hands in height	1 15 0
And where the same shall be drawn by 1 such pony or mule only	1 0 0
For every carriage with less than 4 wheels:—	
Where the same shall be drawn by 2 or more horses or mules	2 0 0
And where the same shall be drawn by 1 horse or mule only	0 15 0
And where the same shall be drawn by 1 pony or mule only, not exceeding 15 hands in height	0 10 0
And where any such carriage shall be kept and used solely for the purpose of being let for hire	One half of the above-mentioned duties respectively
For every carriage used by any common carrier principally and bona fide for and in the carrying of goods, wares, or merchandise, whereby he shall seek a livelihood, where such carriage shall be occasionally only used in conveying passengers for hire, and in such manner that the stage carriage duty or any composition for the same shall not be payable under any license by the Commissioners of Inland Revenue:—	
Where such last-mentioned carriage shall have 4 wheels	2 6 8
And where the same shall have less than 4 wheels	1 6 8

#### Rules for charging the said Duties.

1. The said duties to be respectively charged for every coach, Indian, chariot, chaise, sciable, caravan, curriole, chair, or car, and for every other carriage constructed for the like purposes, by

whatever name or names the same shall be called or known, and upon all such carriages hired by the year or any longer period, and upon all such carriages kept to be let out to hire.

2. The duty on carriages kept to be let out to hire to be paid by the person keeping the same for such purpose, and to be charged on the greatest number of such carriages which shall have been kept at any one time, and which shall have been actually let during the preceding year; provided that if a due return thereof shall not be made by the hirer of any such carriage, according to the directions of the Acts in force, stating therein the name and place of abode of the person letting the same to hire, such hirer shall be chargeable with the said duties.

*Numbers of Stage and Hackney Carriages.*—In the year ending March 31, 1867, 3,099 stage and hackney carriages paid Excise license duty in Great Britain, to the amount of 13,174*l.*, the proportion being about 36 in England for 1 in Scotland. The duty, for what reason it is not easy to divine, does not extend to Ireland. (For an account of HACKNEY COACHES, see the term; and Railway Carriages, see RAILWAYS.)

In 1866 we exported 798 carriages and carts, valued at 70,698*l.*, besides 1,057 railway passenger carriages of the value of 165,711*l.*, and 668 railway waggons and trucks worth 37,816*l.*

During the years ended April 5, 1856 and 1866, carriages were charged under Assessed Taxes, and produced as follows, viz. :—

	1856			1866						
	Articles Charged	Amount of Duty			Articles Charged	Amount of Duty				
Carriages with 4 wheels, drawn by 2 or more horses	24,735	£	85,182	15	0	32,375	£	110,721	5	0
with less than 4 wheels, drawn by 2 or more horses	47,761		84,796	10	0	79,538		144,890	10	0
Ditto, used by carriers	215		477	0	0	900		505	0	0
	147,030		165,476	7	6	178,811		126,197	5	0
Totals	6,471		9,119	13	4	6,772		11,525	6	8
	225,240		282,812	5	10	297,186		533,830	6	8

**COAL** (Dutch, steenkoolen; Fr. charbon de terre; Ger. steinkohlen; Ital. carboni fossili; Lat. lithanthrax; Port. carvoes de terra, ou de pedra; Russ. ngolj, kamennoe; Span. carbones de tierra, carbones de piedra; Swed. stenkol). This highly important mineral is recognised by mineralogists under three heads: 1. Lignite, brown or boghead coal; 2. Common or Bituminous Coal; 3. Anthracite. The second of these kinds contains an endless number of varieties.

*Lignite.*—Bovey coal, so called from its being worked at Bovey Tracey in Devonshire. It is of comparatively little importance, being used chiefly for pottery. Some of the varieties of lignite are of considerable value, as the boghead or brown canal of Scotland, and similar products in Prussia and Austria.

Bituminous coal is the commonest kind. It is very widely distributed in Great Britain, being worked from Somerset to Sutherlandshire.

The Somerset and Gloucester collieries are those of the Forest of Dean and the Bristol coal-field. The produce of this region in the year 1864 was, inclusive of the Devonshire anthracite of Bideford, nearly 2,000,000 tons. The Bristol coal-field contains about 50 square miles.

*South Wales Field.*—This district, which supplied nearly 7,000,000 tons of coal and anthracite during the year 1864, is of great extent and thickness. It has been computed by S. W. Logan and Sir H. de la Bèche that the thickness of these carboniferous strata is not less than 11,000 to 12,000 feet.

*Shropshire.*—This contains the Coalbrook-dale field. The total thickness of the coal is from 16 feet to 55. Produce in 1864, 1,150,000 tons.

*Stafford and Worcestershire.*—This coal-field, which has been described minutely by Mr. Beete Jukes (see the *Birmingham Hardware Industries*), contains a peculiar and important bed of thick coal. The area is about 130 square miles, and the coal of thick coal is about 30 feet in thickness. The produce of the coal in the two counties was 11,459,851 tons in the year 1864.

*Derbyshire and Nottinghamshire.*—The produce from the first-named county was in the same year 4,470,750, that from the latter 796,700.

*Leicestershire and Warwickshire.*—The best coal of this district is that at Ashby de la Zouch.

The produce of Leicestershire was in the same year 890,600 tons. The Warwickshire coal, between Tamworth and Coventry, supplied 754,000 tons.

*Yorkshire.*—This county comprises the important collieries of Barnsley, Halifax, Leeds, Bradford, Huddersfield &c. The produce was 8,809,600 tons.

*Lancashire.*—The area of this coal-field is about 250 square miles. In certain districts the aggregate thickness of the coal strata is 93 feet. It contains the thick and valuable seams of canal coal at Wigan. The produce was 11,530,000 tons.

*Cheshire.*—Produce in 1864, 822,750 tons. *Monmouthshire.*—Produce in 1864, 2,028,500 tons.

*Cumberland.*—This district is a narrow region about Whitehaven; the workings in some parts being carried under the sea. The produce in 1864 was 1,380,795 tons.

*Durham and Northumberland.*—This is the widest and most important area from which coal has been extracted, and that from which it has been longest obtained. The produce in 1864 was 23,248,367 tons.

*North Wales.*—This district comprises the coal measures of Flintshire and Denbighshire. In 1864 it supplied 1,987,060 tons.

*Scotland.*—There are three principal coal-basins in Scotland. 1, that of Ayrshire; 2, that of Clydesdale; 3, that of the valley of the Forth. It supplied 12,490,000 tons in 1864.

*Ireland.*—Although the Irish supply is at present very small, the island having produced only 125,000 tons in 1864, the area over which coal is distributed is very large. Anthracite is found in the Leinster and Munster districts, bituminous coal in Connaught and Ulster.

*Anthracite.*—This exceedingly important kind of fuel, which is a modification of coal, is extensively used in blast furnaces, for which it is especially fitted, for its great heating power. It contains very little volatile matter, and the best varieties have only a slight amount of ash. In fact, it is nearly pure carbon igniting with some difficulty, and giving out intense heat during combustion. Its localities in the United Kingdom are Bideford, the western division of the South Wales

coal-field, and considered to be thrown away. Anthracite as a fuel (*Dictionary*).

The total coal according to Mr. Hunt is 12,800 square miles of the whole surface. The proportion is still the same authority as in the coal-bearing stratum of the Permian system in America also 1:20. But it is believed that the coal-mines is three or four times as abundant as derived from all the other sources.

The following of coal in this country therefore stands to the editor by his next Professor of Oxford:—

\* Coal is found in systems of strata—very little, and that in the form of *boniferous rocks*, just mountain limestone, coal formation, and about 29,000 square of these strata may be 15,000 feet. In the and the southern part and worked in the stone strata, oceanic stone. In the North Tweed and the Trent, but nowhere abundant series.

But in general, in where coal is now obtained is from the upper part of the true coal formation. In miles of mountain limestone has only a few square near Kilkenny and sources of the Shannon castle. Scotland possesses in the British islands, a very rich both in coal and the limestone above, as series below.

The carboniferous system, between the Tweed and the Forth, is between 9,000 and 10,000 feet thick. The exceptions of the limestone in the Forth, and the coal in the Forth, and the really productive coal fields, to which are known to occur or very large in the eastern borders, in Durham and Nottinghamshire, about 1,000 square miles. Of the of the (the largest) is the 50 square miles. The of the coal-fields, the value of the coal, may be assumed to be very probably equal.

\* Thus we have for a great area actually known at the coal highly probable extent making a total of 5,400 square miles. Usually we may be Derbyshire, and Nottingham

coal-field, and Ireland. Fifty years ago it was considered to be incombustible refuse, and was thrown away. (For particulars as to the value of anthracite as a fuel for furnace purposes, see Ure's *Dictionary*.)

The total coal area of the British Islands, according to Mr. Hunt, the Keeper of Mining Records, is 12,800 square miles, and therefore amounts to  $\frac{1}{10}$  of the whole surface. In the United States the proportion is still higher, being according to the same authority  $\frac{2}{5}$  of the whole. In France the coal-bearing strata are 1-100 of the area, in Belgium 1-22, in Bohemia 1-20, in British North America also 1-20, in Spain 1-52, in Prussia 1-90, but it is believed that the produce of the British mines is three or four times as much as that derived from all these countries put together.

The following observations as to the supply of coal in this country, and the relation in which it therefore stands to industry, have been supplied to the editor by his friend Mr. Phillips, the eminent Professor of Geology in the University of Oxford:—

'Coal is found and worked in our islands in two systems of strata—the *oolitic rocks*, which yield very little, and that of small value; and the *carboniferous rocks*, justly so named, which include mountain limestone, millstone grit, and proper coal formation, and occupy in the British Isles about 29,000 square miles. The total thickness of these strata may be taken as not exceeding 15,000 feet. In the northern part of England, and the southern part of Scotland, coal is found and worked in the midst of the mountain limestone strata, occasionally with valuable ironstone. In the North of England, between the Tweed and the Trent, coal is found and worked, but nowhere abundantly, in the millstone grit series.

'But in general, in all parts of Great Britain where coal is now obtained in large quantity, it is from the upper part, called exceptionally the true coal formation. Ireland, with 16,000 square miles of mountain limestone and millstone grit, has only a few square miles of valuable coal beds, near Kilkenny and Castle Comer, about the sources of the Shannon, in Tyrone, and at Ballycastle. Scotland possesses the largest coal-field in the British islands, about 1,600 square miles in the basin of the Forth and Clyde. This field is very rich both in coal and iron—is productive in the limestone above, as well as in the sandstone series below.

'The carboniferous system of the north of England, between the Tweed and the Trent, occupies between 9,000 and 10,000 square miles. With the exceptions of the limestone districts of Derbyshire and Yorkshire, coal is found and has been worked at intervals throughout this large tract; but the really productive tracts do not exceed 1,000 square miles, to which we may add, for coal known to occur or very likely to be found on the eastern borders, in Durham, Yorkshire, Derbyshire, and Nottinghamshire, about 600 more; in all 2,200 square miles. Of the other coal-fields of Great Britain, the largest is that in South Wales, about 500 square miles. The remainder, in Anglesea, Flintshire, the vale of the Severn, and the midland coal-fields, may be assumed at 400 square miles, or, including very probable extensions, at 700 square miles.

'Thus we have for a grand total, of productive coal area *actually known* about 4,500 square miles, and *highly probable extensions* 900 square miles, making a total of 5,400 square miles.

'Conjecturally we may believe that in Yorkshire, Derbyshire, and Nottinghamshire, under the

plain of Cheshire, between the midland coal-fields, and in the valleys of the Severn and Avon, as much as 600 square miles of coal will be found workable. This makes in all 6,000 square miles of available British coal.

'The greatest total thickness of coal in any district of Britain probably occurs in South Wales—120 feet. In most parts of England it falls below 60 feet. The thickness is not to be assumed as equal over the whole area: in some parts the coal beds are in such condition as to fault, depth, and earlier workings as to be quite unworkable. Many of the beds are too thin to be workable. For these reasons we may take  $\frac{2}{3}$  of the total quantity existing as really attainable.

'Sixty feet of coal existing, our estimate of available thickness is 40 feet, from which  $\frac{1}{4}$  must be deducted for old workings and waste. 30 feet remain, which, on the usual calculation of 1,000 tons per acre for each foot in thickness, gives 30,000 tons per acre=19,200,000 tons per square mile=115,200,000,000, as the total quantity which according to reasonable estimates can ever be reached in these islands.  $\frac{1}{4}$  of this quantity (1,500 square miles) has been admitted as probable; the remainder may be regarded as certainly available, but at *prices continually growing higher and higher* as the depths of the works continually augment, and as coal beds less in value or more expensive in working come into demand.'

As to foreign coal-fields, Mr. Phillips says:—

'Most of the coal of Europe, excepting our own, lies in tracts of no great extent, at considerable distances from the sea. The valuable coal-field of Belgium continued across the Rhine to Elberfeld is one of the nearest to shipping. Coal in fact reappears on the same line at Boulogne; but whether there be a continuous deposit from the vicinity of Valenciennes to near this port is not known: if it be so, the depth would probably be found in most parts too great for working. The principal coal-field of France, St. Etienne, is covered with industrial establishments, and is limited to a small area, viz. 100 square miles.

'The coal-fields of Saarbrueck, Silesia, and Bohemia are all of considerable extent; Russia has several tracts of inferior coal south of Moscow; Poland a small basin of good thick coal; Spain some considerable tracts in the Asturias, and Portugal a small area on the Douro. The whole of these European fields would probably be found on strict enquiry not to contain so much coal as the coal-measures of Great Britain.

'In the Black Sea, at Heraclia, a small quantity of coal is known; in India several pretty large scattered tracts, some fairly productive. The coal of Borneo is used for steam purposes, and increased supplies will soon be drawn from New Zealand, Queensland, and New South Wales. Japan yields much coal, accessible from the sea; China contains coal far inland; Africa has coal on the Zambesi.

'British America has coal in the eastern provinces, especially in Nova Scotia and New Brunswick, the thickest beds being at Pictou. The United States possess tracts of productive coal-measures exceeding those of all the rest of the world, as at present known. The greatest fields of coal are on the western side of the Appalachian chain, a *thousand miles from the sea*; but a small tract of good coal appears on the eastern side of the range, near Richmond. Brazil, lately under examination by Agassiz, contains a large tract of coal in the interior.

'On the whole it appears that Britain, and the

islands under the control of Britain, must be looked to for exports of coal "dum stabit fortuna," and that we can never hope to feed our own furnaces and work our own looms by the aid of fuel from other parts of the world."

The great value of anthracite coal as a means for supplying heat is illustrated by the following results of Dr. Fyfe's experiments on the comparative powers of Scotch bituminous coal with anthracite:—

Fuel	Pounds burnt per hour	Duration of trial, hours	Temperature	Pounds of water evaporated from initial temperature by 1 lb. of coal	Pounds of water at 212° from 1 lb. of coal	Coal per hour on 1 sq. foot of grate	Time in seconds of consuming 1 lb. coal
Middlerig Scotch coal	81.33	9	450	6.55	7.74	10.00	41.27
Anthracite	47.94	8½	450	8.75	10.10	5.85	75.99

The number of collieries in existence in the year 1866 was 3,188, as contrasted with 2,397 in 1853. There are twelve inspectors of collieries: one for Northumberland, Cumberland, and the North division of Durham; one South Durham; one Yorkshire; one Derby, Notts, Warwick, Leicestershire; one Cheshire, Shropshire, North Stafford; one South Stafford; one North and East Lancashire; one St. Helen's and Wigan district in Lancashire, and for North Wales; one South-west of England and South-east Wales; one Glamorganshire and South-western Wales; one for the Western division of the Scotch field, and one for the Eastern. There is no inspector for Ireland.

*Origin of Coal. Phenomena of Combustion &c.*—Coal beds, or strata, lie among those of gravel, sand, chalk, clay &c., which form great part of the present surface of the earth, and have been evidently accumulated during remote ages by the agency of 'moving water,' similar to accumulations now in process of formation at the mouths of all great rivers, and in the bottoms of lakes and seas. When these strata had, by long contact and pressure, been solidified into a rocky crust to the earth, this crust, by subsequent convulsions of nature, of which innumerable other proofs remain, has been in various parts broken and heaved up above the level of the sea, so as to form the greater part of our dry or habitable land; in some places appearing as lofty mountains, in others as extended plains. In many situations the fracture of the crust exhibits the edges of the various distinct strata found in a given thickness of it. When the fracture has the form of a precipitous cliff, these edges appear one above another, like the edges of piled planks or books; but often also they are met with in horizontal succession along a plain, as the edges of a pile of books laid down upon a table; or they may be seen surrounding hills of granite, which protrude through them. Coal, and other precious minerals, were first discovered at the fractures of the strata above described, and by the continued digging of the strata or veins the vast excavations called mines have been gradually formed. When it was at last discovered that the mineral strata occur every where in nearly the same order or succession, so that the exposure of a portion of one stratum is a good indication of the other strata being near, the operations of the miner became of much surer result, and expensive boring through superior strata might be prudently undertaken, even where no specimen of the desired but more deeply buried substance had yet been seen.

Before the discovery of coal-mines, or the invention of cheap means of working them, wood was generally used as fuel; and in many countries where the arts have not much flourished, it continues to be principally employed as such. Coal, however, for many purposes, answers much better than wood; and, in fact, the two, although in appearance so different, are in their ultimate composition very nearly allied. They both have for

their basis or chief ingredient the substance called by the chemists *carbon*, and for their chief other ingredient the substance called *hydrogen*, which, when separated, exists in the form of air or gas. The hydrogen is easily driven away or volatilised from either coal or wood by heating in a close place; and when it is caught and preserved, it forms the gas now used to light our streets and public buildings. What remains of coal, after being so treated, is the substance called *coke*; and what remains of wood, similarly treated, is the substance called *charcoal*—both being nearly pure carbon, but differing as to the states of compactness. This kindred nature of coal and wood does not surprise when the fact is known that much of our coal is really transformed wood; many coal-mines being evidently the remains of antediluvian forests, swept together in the course of the terrestrial changes already alluded to, and afterwards solidified to the state now seen. In these mines, the species of the plants or trees which formed them are still quite evident in abundant specimens, mixed often with the remnants of the animals which inhabited the earth at the same time. The extensive peat-mosses now existing on the surface of the earth consist chiefly of vegetable remains in an early stage of the kind of change which terminates in the formation of coal.

A substance which, like coal or wood, cheaply answers the purpose of producing great heat and light is called fuel, and the phenomenon of that production is called combustion. Now, modern discovery has ascertained that, in every instance, combustion is merely an appearance which accompanies the mutual action, when very intense, of two substances in the act of forming an intimate or chemical union. Where that act is less energetic, the heat produced is less intense, and there is no light. Thus, water and sulphuric acid when mixing produce great heat, but no light. Water and quicklime produce still greater heat; sufficient, it is known, to set fire to a ship in which the mixture unfortunately occurs. It is an occurrence of the same kind when heat is evolved from an acid dissolving a metal; and it is still of the same kind when a mass of coal or wood in a fire-grate is, with the appearance of combustion, undergoing solution in the oxygen of the atmosphere. In this last case, however, the temperature of the fuel is, by the very intense action, raised so much that the fuel becomes incandescent or luminous; an appearance assumed by every substance, whether burning or not—of a stone, for instance, or piece of metal—when heated beyond the temperature indicated by 800° of Fahrenheit's thermometer. The inferior degrees of such incandescence are called *red heat*; the superior degrees, *white heat*. The reason why any strongly heated body throws out light we cannot yet explain. When a quantity of wood or coal has been burned to ash in a confined portion of air, the whole of the fuel, vanished from view, is held in solution by the air, as salt is held in water, and is again recoverable

by the art of common fire, fuel being of atmosphere. it as is true coke and charcoal of red-hot state as hydrogen, sums the form burning, and incandescence

by the art of the chemist. The phenomenon of common fire, or combustion, then, is merely the fuel being chemically dissolved in the air of the atmosphere. If the fuel has nothing volatile in it, as is true of pure carbon, and nearly true of coke and charcoal, it burns with the appearance of red-hot stones; but if there be an ingredient, as hydrogen, which, on being heated, readily assumes the form of air, that ingredient dilates before burning, and in the act produces the more bulky incombustible called flame.

The two great purposes which combustion serves to man are to give light and heat. By the former he may be said to lengthen considerably the duration of his natural existence; for he converts the dismal and almost useless night into what, for many ends, serves him as well as day; and by the latter, besides converting winter into any climate which he desires, he is enabled to effect most important mutations in many of the substances which nature offers for his use; and, since the invention of the steam-engine, he makes heat perform a great proportion of the work of society. From these considerations may be perceived the importance of having fire at command; and, as the cheapest means of commanding fire, of having abundance of coal.

As respects the supply of coal, Britain is singularly favoured; a large portion of the surface of the country having under it continuous and thick beds of this valuable mineral—vastly more precious to us than would have been mines of the precious metals, like those of Peru and Mexico; for coal, since it has been applied to the steam-engine, is really hoarded power, applicable to almost every purpose which human labour directed by ingenuity can accomplish. It is the possession of her coal-mines which has rendered Britain, in relation to the whole world, what a city is to the rural district which surrounds it—the producer and dispenser of the various products of art and industry.

The kinds or differences of coal depend on their comparative proportions of carbon and hydrogen, and of earthy impurities totally incombustible. While some species of coal contain nearly a third of their weight of hydrogen, others have not a fiftieth part. The former kinds are flaming coal, pleasing in parlour fires, and fit for the manufacture of gas. The other kinds—some of the Welsh stone coal, for instance—will only burn when in large heaps, or when mixed with more inflammable coal: they have no flame. When flaming coal is burned where a sufficiency of oxygen cannot pass through or enter above the fire, to combine with and consume the hydrogen as fast as it rises, a dense smoke is given out, consisting of hydrogen and carbon combined in the proportions which form a pitchy substance. The Welsh coal above mentioned can as little give out smoke as flame, and hence is now much used in great breweries, and in the steam-engine furnaces of towns, where smoke is a serious nuisance. The foliated or cubical coal, and slate coal, are chiefly used as fuel in private houses; the caking coals, for smithy forges; the slate coal, from its keeping open, answers best for giving great heats in a wind furnace, as in distillation on a large scale; and glance coal, found in Staffordshire, is used for drying grain and malt. The coals of South Wales contain less volatile matter than either the English or the Scotch; and hence, when employed in smelting the ore, produce a greater quantity of iron.

The following account of the produce of coal in England is taken from Mr. Hunt's *Mineral Statistics for 1866* :—

Summary of Coal Produce of the United Kingdom for 1866.

	Tons.		Tons.
Durham and Northumberland	25,194,550	Shropshire	1,220,700

*Profits of Coal-Mining. Coal-Owners' Monopoly* &c.—Instead of the business of coal-mining being, generally speaking, an advantageous one, it is distinctly the reverse. Sometimes, no doubt, large fortunes have been made by individuals and associations engaged in this business; but these are rare instances. The opening of a mine is a very expensive and hazardous operation, and of very uncertain result. Collieries are exposed to an infinite number of accidents, against which no caution can guard. The chances of explosion have, it is true, been a good deal lessened by the introduction of Sir Humphry Davy's lamp; and some mines are now wrought, that, but for the invention of this admirable instrument, must have been entirely abandoned. But besides explosions, which are still every now and then occurring, from the carelessness of the workmen and other contingencies, mines are very liable to be destroyed by creeps or by the sinking of the roof, and by drowning or the irruption of water from old workings through fissures which cannot be seen and consequently cannot be guarded against. So great, indeed, is the hazard attending this sort of property, that it has never been possible to effect an insurance on a coal-work against fire, water, or any other accident.

Mr. Buddle informed the committee of the House of Lords, in 1829, that 'although many collieries, in the hands of fortunate individuals and companies, have been, perhaps, making more than might be deemed a reasonable and fair profit, according to their risk, like a prize in a lottery; yet, as a trade, taking the whole capital employed on both rivers, he should say that certainly it has not been so.' (*First Report*, p. 56.) Again, being asked, 'What have the coal-owners on the Tyne and Wear, in your opinion, generally made on their capital employed?' he replied, 'According to the best of my knowledge, I should think that by no means 10 per cent. has been made at simple interest, without allowing any extra interest for the redemption of capital.' (p. 57.)

In addition to the vast expense attending the sinking of shafts, the erection of steam-engines

&c., and the risk of accidents, the coal, after being brought to the surface, has frequently to be conveyed 7 or 8 miles to the place of shipping; and those whose collieries are in that situation have to pay *way-leave* rents, amounting, in some cases, to 500*l.* a-year, for liberty to open a communication, or a railroad, through the properties lying between them and the shore.

Much has frequently been said of the monopoly of the coal-owners on the Tyne and the Wear; but we are satisfied, after a pretty careful investigation of the circumstances, that no such monopoly has ever existed; and that the high price of coal in the metropolis is to be ascribed wholly to the various duties and charges that have been laid upon it from the time that it has passed from the hands of the owner to the time that it is lodged in the cellar of the consumer. What means have the coal-owners of obtaining a *monopoly price* for their coal? They enjoy no exclusive privileges of any sort; they are a numerous body; and the trade is as open as any other to all capitalists to engage in. The number of places on the east and west coasts, both of England and Scotland, and the southern parts of Wales, from which coals are exported, render it quite visionary to suppose that any general agreement to keep up prices can take place amongst the various coal proprietors; and though such an agreement were entered into, it is impossible it could be maintained. The *power* of producing coal greatly exceeds the present demand; many new mines have been recently opened, and many others would be brought into activity were the price artificially enhanced. It is true that the coal-owners referred to, having experienced the ruinous effects of throwing a superabundant quantity of coal upon restricted and already glutted markets, have occasionally met together; and each having named the price he thinks his coal will command, and at which he intends to sell it, they have proceeded jointly to regulate, according to the probable demand, the quantity that each shall raise during any particular period. By means of this arrangement the supply and price of coal have been kept, during the

time it has existed, comparatively steady. Common prudence prompts and justifies such an arrangement; but it also suggests the necessity of reducing the price of coal to the lowest level that will afford the customary rate of profit. For were the price demanded by the northern coal-owners raised above this level, new mines would be opened in Durham and Northumberland; the imports from the Tees, whence a large supply of excellent coal is at present brought to the London market, would be augmented; and fresh competitors, from Swansea and other places, would come into the field and undersell them. Government should encourage and promote this fair competition; but it ought, at the same time, to do equal justice by all the competitors. It is not to lend assistance to, or remove burdens from, one set of adventurers, which it does not lend to or remove from others. It is no part of its duty to say *how* coals, or any species of produce, shall be carried to market. It is bound to give every reasonable facility for the opening of new channels or modes of conveyance between all parts of the country; but it would be glaringly unjust to lay a tax on the coals conveyed by a particular channel from which those conveyed by other channels were exempted.

The aggregate capital employed by the coal-owners on the Tyne amounts to about 4,500,000*l.*, exclusive of the craft in the river: and supposing this estimate to be nearly correct, it will follow, allowing for the value of the ships, that the total capital employed in the coal trade may be moderately estimated at from 20 to 25 millions; an immense sum to be almost wholly at the risk of the owners, without any insurance upon it.

*History of the Use of Coal. Duties and Regulations affecting it, particularly in the Port of London.*—There are no mines of coal in either Greece or Italy; and no evidence has been produced to show that the ancients had learned to avail themselves of this most useful mineral. No evidence has as yet been adduced as to the time at which sea-coal was first employed for economical purposes. The following is from Mr. Rogers's work on *Agriculture and Prices in England*, vol. i. p. 422: 'Its appearance at so distant a place as Dover in 1279, the earliest entry which has come under my observation, suggests that the coasting traffic in this article must have been familiar. It was purchased for the use of the castle, and must, of course, have been burned in a fire-place with chimney. Again it is used at Waleton and Weston, two places in Suffolk and Hert, which formed part of the estate of Roger Bigod, the great Earl of Norfolk. It is found at Southampton in 1298. It is quoted in the accounts of Clare Castle and Clarette, part of the possessions of the Earl of Gloucester. It is bought at Hexley in Kent and Hoton in Essex. It is found at Westbury in Wilts, probably from the Somersetshire measures. It may be added that among the various traders given in the taxing bill of Colchester, *Rot. Parl.*, vol. i., sea-coal dealers are mentioned at the close of the 13th century.' It occurs in a charter of Henry III., granting license to the burgesses of Newcastle to dig for coal. In 1281 Newcastle is said to have had a considerable trade in this article. About the end of this century, or the beginning of the fourteenth, coals began to be imported into London, being at first used only by smiths, brewers, dyers, soap-boilers &c. This innovation was, however, loudly complained of. A notion got abroad that the smoke was highly injurious to the public health; and in 1316 Parliament petitioned the king, Edward I., to prohibit the burning of coal, on the ground of its being an intolerable nuisance. His Majesty

issued a proclamation conformably to the prayer of the petition; but it being very little attended to, recourse was had to more vigorous measures; a commissioner of oyer and terminer being issued out, with instructions to enquire as to all who burned sea-coal within the city, or parts adjoining; to punish them for the first offence by 'pecuniary mulcts;' and upon a second offence to demolish their furnaces; and to provide for the strict observance of the proclamation in all time to come.

But notwithstanding the efforts that were thus made to prohibit the use of coal, and the prejudice that was long entertained against it, it continued progressively to gain ground. This was partly, no doubt, owing to experience having shown that coal smoke had not the noxious influence ascribed to it, but far more to the superior excellence of coal as an article of fuel, and the growing scarcity and consequent high price of timber. In the reign of Charles I. the use of coal became universal in London, where it has ever since been used to the exclusion of nearly all other articles of fuel. At the Restoration the quantity imported was supposed to amount to about 200,000 chaldrons. In 1670 the imports had increased to 270,000 chaldrons. At the Revolution they amounted to about 300,000 chaldrons, and have since gone on increasing with the growing magnitude and population of the city; being, in 1750, about 500,000 chaldrons; in 1800, about 900,000 chaldrons; and in 1866 about 600,000,000 tons. (Campbell's *Political Survey of Great Britain*, vol. ii. p. 30; Edington *On the Coal Trade*, p. 41; &c.)

It might have been supposed, considering that coal is, in this country, a prime necessary of life, and by far the most important of all the instruments of manufacturing industry, that it would have been exempted from every species of tax, and that every possible facility would have been given for its conveyance from the mines to the districts in the south of England, and other places in want of it. But such has not been the case. The coal trade of Great Britain was, for more than a century and a half, subjected to the most oppressive regulations. From a very early period the corporation had undertaken the task of weighing and measuring the coal brought to London, and had been accustomed to charge 8*d.* a ton for their trouble. In 1613 the power to make this charge was confirmed to the city by royal charter, it being at the same time ordered that no coal should be unladen from any vessel till the Lord Mayor had given leave. The right to charge this sum according to the chaldron of coal has since been confirmed to the city by Act of Parliament; and as the labouring meters, notwithstanding they have been very well paid, have received only 5*d.* out of the 8*d.*, the balance of 3*d.* per chaldron, which produced about 20,000*l.* a-year, went to the city treasury.

But besides the above, duties for civic purposes have been laid on the coal imported into London from the reign of Charles II. downwards. They were originally imposed in 1667, after the great fire, in order to assist in the rebuilding of churches and other public edifices; and have ever since been continued, to enable the corporation to execute improvements in the city; though it is probable most of our readers will be inclined to think that few improvements could be so great as a reduction in the price of so very important an article as coal.

Exclusive of the corporation duties, a duty payable to Government was laid on *all sea-borne* coal in the reign of William III., which only ceased in 1831. This duty was at once glaringly unjust

and oppressive. The duties were carried by the corporation, and amounted to the coal being long to 9*s.* 4*d.* 6*s.* in 1822, not confined to the empire. Even there it amounted to metropolitan, amounted to Ireland, while Scotland emptied from. Besides various trades were required being made small coal, species of coal being allowed wall, Devon distinctions 1830, and no lected in London. A small sum to London from. This coal was dross; but this. The regulation of coals were, if possible, still imposed on all coals imported, to observe the has given rise mathematicians Newcastle, was that, 'If one c (nearly equal a moderate size very small, it that the proportion depends upon counting by. The shippers upon the coal only; an ciple carried, was screened, over gratings, as much, how subsequent st been deliver interest of ev came before into smaller p of the retinue increase of m Mr. Brandlin coal-owner, s 1829 that, in are reduced they would b and subjected. The statement the nullity of sale of coal b these regula being, as th they would b as any disho

and oppressive; unjust, inasmuch as it fell only on those parts of the empire to which coals had to be carried by sea; and oppressive, inasmuch as it amounted to full fifty per cent. upon the price paid to the coal-owner for the coal. This tax, after being long stationary at 6s. per chaldron, was raised to 9s. 4d. during the late war, and was reduced to 6s. in 1824. But the inequality of the tax was not confined to its affecting those parts only of the empire to which coal had to be carried by sea. Even there its pressure was not equal; for, while it amounted to 6s. per chaldron, or 4s. per ton, in the metropolis and all the south of England, it only amounted to 1s. 7½d. per ton on coal carried by sea to Ireland, and to 1s. 8d. on that carried to Wales; while Scotland was for many years entirely exempted from the duty.

Besides this striking partiality and injustice, various troublesome Custom-house regulations were required in consequence of distinctions being made between the duties on large and small coal, between those on coal and culm (a species of coal), and coal and cinders, and of coal being allowed to be imported duty free into Cornwall, Devon &c. for the use of the mines. These distinctions were, however, wholly abolished in 1830, and no duties exist on coal except those collected in London and a few other ports, and appropriated to local purposes.

A small supply of coal was of late years brought to London from Staffordshire by canal navigation. This coal was charged with a duty of 1s. per chaldron; but this is now also repealed.

The regulations to which the sale and delivery of coals were subjected in the city of London were, if possible, still more objectionable than the duties imposed on them. Instead of being sold by weight, all coals imported into the Thames were, previously to 1831, sold by measure. It is curious to observe the sort of abuses to which this practice has given rise. It is stated by the celebrated mathematician Dr. Hutton, who, being a native of Newcastle, was well acquainted with the coal trade, that, 'If one coal, measuring exactly a cubic yard (nearly equal to 5 bolls), be broken into pieces of a moderate size, it will measure 7½ bolls; if broken very small, it will measure 9 bolls; which shows that the proportion of the weight to the measure depends upon the size of the coals; therefore accounting by weight is the most rational method.' The shippers were well aware of this, and insisted upon the coal-owners supplying them with large coal only; and to such an extent was this principle carried, that all coal for the London market was *screened*, as it is technically termed, or passed over gratings, to separate the smaller pieces. Inasmuch, however, as coals were sold in all their subsequent stages by measure, no sooner had they been delivered by the owner than it was for the interest of every one else into whose hands they came before reaching the consumer, to break them into smaller portions. In fact, the profit of many of the retailers in London arose chiefly from the increase of measure by the breakage of coal. And Mr. Brandling, a very intelligent and extensive coal-owner, stated to the Commons' committee of 1829 that, in consequence of the breakage, coals are reduced in London to a size inferior to what they would be were they put on board *unscreened*, and subjected to no additional breakage.

The statements now made sufficiently evince the nullity of all the regulations enforcing the sale of coal by correct measures; for even though these regulations had been enforced, instead of being, as they usually were, wholly neglected, they would have been of almost no use; inasmuch as any dishonest dealer was as able to cheat by

breaking his coals a little smaller than usual, as if he had sold them in deficient measures.

The loss occasioned by the useless process of screening has been very great. The quantity of coal separated by it has amounted in some cases to from 20 to 25 per cent. of the whole; and the greater part of this residue, containing a portion of the very best coal, is *burned on the spot*. 'I have known,' says Mr. Buddle, 'at one colliery, as many as from 90 to 100 chaldrons a day destroyed. If they were not consumed, they would cover the whole surface, and in the burnings of them they are extremely destructive; they destroy the crops a great way round, and we pay large sums for injury done to the crops, and for damage to the ground.' (*First Lords' Report*, p. 72.) The waste of coal has been in this way enormous; and the coal-owner has been obliged to charge a higher price upon the coal sold, in order to indemnify himself for the loss of so great a quantity, and for the mischief he does to others in burning.

The fact that so monstrous a system should have been persevered in for more than a century sets the power of habit in reconciling us to the most pernicious absurdities in a very striking point of view. Happily, however, the nuisance was at last abated; the sale of coal by weight taking away both the temptation to break coal, and the necessity of screening.

The duties of all sorts that were formerly paid to the corporation of the city of London were computed in 1830 for a duty of 1s. 1d. per ton, which produced in 1851 a gross revenue of 187,991l. 16s. 4½d. (*Parl. Paper* No. 29, Sess. 1852.)

Most of the coals for discharging into barges are now brought to the Pool by screw steamers. The cost of the best Wallsend put into barges in the Pool would now (1868) be 19s. 3d., made up as under:—

Prime cost, free on board, in the North	£	d.
Freight by screw steamers	-	12 0
City dues	-	5 0
Factor's charges, insurance, half metage &c.	-	1 1
	-	1 2
	19	3

To which must be added charges incurred for conveyance from the vessel to the cellar of the consumer:—

Lighterage (in any ordinary wharf between London and Yauxhall bridges)	£	d.
Wharfage &c.	-	0 10
Loading	-	0 6
Small, i. e. cost of screening and loss on difference of selling price of the small*	-	1 0
Cartage	-	2 0
	-	2 6
	6	10
	19	3

Average cost for the year 1867-68 - - - - - 25 7  
\* The loss by small is greater by screw steamers than by sailing vessels.

Steam ships are gradually superseding sailing vessels, as they can carry at a much cheaper rate.

There are many wharves *below bridge* where vessels unload alongside, and so save the cost of lighterage and reloading from the barges; but a different class of ship is required, the freight of which is dearer. The charges by this way would be:—

Cost of coal, free on board	£	d.
Freight	-	12 0
City dues	-	5 0
Factor's charges, insurance &c.	-	1 1
Wharfage, interest on outlay on machinery &c.	-	1 2
Loading, weighing &c.	-	0 9
Small (much less than by screw steamer)	-	0 4
Cartage (these wharves being necessarily below bridge, the average distance of delivery will be greater)	-	1 3
	5	0
	25	4

No doubt, however, the expenses attending the delivery of coal to the consumer might be farther, and very materially reduced, were quays constructed at which ships could lie alongside, and discharge their cargoes without the intervention of lighters, and without being subject to the

delays to which they are now exposed. It appears, also, that the practice of sending coals to the consumers in bags might in the great majority of cases be advantageously dispensed with. No such practice exists in Manchester, Liverpool, Glasgow, or other large towns; and, generally speaking, it seems to occasion not only a heavy, but a perfectly useless, expense. There is a very keen competition in the retail coal trade in London, and the individual who deals with a respectable coal merchant may be pretty well assured that he gets his coals at the lowest price at which, as matters now stand, they can be sold.

Eightpence per ton of the duty of 1s. 1d. would have ceased in 1862 but for the Act of 1861, which continued it in its entirety till 1872. By 26 & 27 Viet. c. 46 the duty to the extent of 1s. was further continued to 1882,  $\frac{1}{2}$  being mortgaged for the Thames Embankment, and  $\frac{1}{4}$  for the Holborn Hill improvements. Again, by 31 Viet. c. 17 it has been still farther extended to 1889—the  $\frac{1}{4}$  being diverted, however, to freeing certain suburban bridges from toll.

*Account exhibiting the Quantities of the various Descriptions of Coal imported into London by Sea in 1858, and specifying also the Number of Ships or Cargoes.*

*Regulations as to Sale in London.*—A seller's ticket is to accompany all coals sold within the city of London and its environs, specifying the species of coal, and the number of sacks and weight of coal sent. The coals may be either in bags containing 1 or 2 cwt., or in bulk. The earman is in all cases bound to carry a weighing machine with the coal, which machine is to be made

conformably to regulation; and, upon being desired, he is to weigh any one sack, or the whole sacks in his waggon. Penalty on refusing to weigh, or otherwise obstructing the weighing, 20l.—Penalty on non-delivery of ticket to purchaser, 20l. In the event of the weight being deficient, a penalty is imposed of 10l. or 50l. according to deficiency. Quantities of less than 560 lbs. may be sold without being weighed. (1 & 2 Wm. IV. c. 76.)

To save trouble in collecting the duties that still attach to coal in the port of London, the corporation is authorised to compound with the owner or master of any ship or vessel importing coal, for the tonnage upon which the duties are to be paid. A certificate of such composition, expressing the number of tons of coal, cinders, or culm agreed to be taken as the cargo of the ship or vessel compounded for, is to be given to the master or owner of the same, and to be taken as evidence of the quantity on board.

When no composition is entered into, the coal is to be weighed in the presence of an officer of the customs at the port of shipment; and the duties are to be paid upon the weight so shipped.

The shipment of coal in the Tyne is regulated by the Act 5 Geo. IV. c. 72, commonly called the *Turn Act*. The object of this Act is to make all ships engaged in the trade of the Tyne be loaded in the order in which they arrive. It prevents any preference being given to particular ships, and renders it nearly impossible for any coal-owner to give constant employment to any vessel in the trade which he may wish to employ. In some respects this Act is probably advantageous, but, on the whole, its policy seems very questionable. Why should a coal-owner be prevented from employing certain ships in preference to others? Under this Act, if more ships engage in the trade than can be profitably employed in it, the loss produced by detention in port, and waiting for a cargo, instead of falling, as it naturally would, were the trade free, on particular ships, and driving them from the business, falls equally on every ship employed, and represses the whole trade. There is no regulation of this sort on the Wear.

*Duty on Coal conveyed to London by Railway, Canal &c.*—The 8 & 9 Viet. c. 101 has imposed the same duties on coals conveyed to the metropolis by railway, canal, or other inland carriage, that are imposed on them when conveyed by sea. It has further enacted that 1d. per ton of the produce of such duties shall be accumulated from December 31, 1845, as a fund for the execution of improvements within the metropolis.

*Duties on Coal when exported.*—The question as to the policy of laying duties on the exportation of coal mainly depends (as the exhaustion of the mines need not be thought of) on the fact whether British coal be necessary or of considerable consequence to the progress of manufactures and arts in foreign countries. If it be, then certainly it will be good policy to preserve that superiority which we derive from the possession of coal by prohibiting its exportation, or burdening it when exported with a considerable duty; but if the possession of our coal be not necessary or of considerable importance to the foreigner, such prohibition or duty would encourage the working of foreign mines by discouraging the working of our own, without producing any corresponding advantage. It has been said that it is not easy to pronounce positively how the fact stands. On the whole, however, there does not appear to be much room for doubting that a supply of British coal, though it may not be indispensable to the foreigner, is of the greatest ser-

vice to him advantage not otherwise success. That of Eng successful of the world; of the Unit supplying of English coa 133,875 tons regarded the out coal when We ar would not ha of coal, at th a considerable membered) w

\* Best This table sets the on coals, and of the management of the t

vice to him, and enables him to carry on with advantage various undertakings in which he could not otherwise have engaged with much chance of success. The coal of Belgium is not so good as that of England, and is too far inland to come into successful competition with ours in the market of the world; and the same may be said of the coal of the United States. The latter, indeed, far from supplying others with coal, are large importers of English coal, having taken from us in 1865 134,875 tons. Such being the case, we have always regarded the repeal in 1845 of the duty of 4s. a ton on coal when exported as a most unwise proceeding. We are well convinced that its retention would not have materially affected the exportation of coal, at the same time that it would have yielded a considerable amount of revenue which (be it remembered) would have been wholly paid by the

foreigner. But British coal (the total exports of which in 1866 were 9,618,216 tons, valued at 4,870,019*l.*) is of incomparably more importance to the foreigner now than it was in 1845; and we think that the imposition of a duty of 5s. a ton on it when exported would be a highly expedient measure. It will be no holiday task to show how a revenue of upwards of 2,400,000*l.* a-year may be raised with less inconvenience.

The following is an account of the number of tons of coals imported into the port of London during each of the years from 1861 to 1866 inclusive, and of the gross and nett amount of revenue received in each of those years from the duty on coals; showing also the quantity of coals brought landwise into the city of London and its limits, and the amount of duty received thereon, in each of these years:—

Account of the Total Quantities of Coal brought by Sea, Rail, and Canal within the Limits of the London Coal Duty Radius, and the Nett Proceeds of the Duties thereon, in each of the Years from 1861 to 1866, both inclusive. (Parl. Paper No. 212 of 1867.)

\* Best Wall-end. † Eisecar.

This table sets the beneficial influence of the abolition of the duty on coals, and of the other alterations that have been made in the management of the trade, in a very striking point of view.

Return of the Quantity of Coals exported from the United Kingdom in the following Years.

Year	Coals	Year	Coals	Year	Coals
1828	357,861	1811	1,818,284	1854	4,509,255
1829	371,271	1812	1,899,501	1855	4,073,902
1830	504,119	1813	1,866,211	1856	5,879,779
1831	510,851	1814	1,751,171	1857	6,737,718
1832	588,116	1815	2,531,282	1858	6,599,483
1833	651,148	1816	2,531,108	1859	7,006,919
1834	615,225	1817	2,485,161	1860	7,321,832
1835	736,040	1818	2,783,290	1861	7,855,115

1838	1,513,709	1851	3,408,545	1864	8,809,928
1839	1,439,417	1852	3,649,191	1865	9,170,477
1840	1,606,315	1853	3,955,092	1866	4,870,019

In 1867 our exports of coals were 10,052,759 tons, while coals, cinders, and culm reached 10,124,886 tons, valued at 5,100,353*l.*

It is probable that coal will ere long be included among those articles that are reckoned contraband of war. Now that steam is destined to play an important part in naval warfare, the coal by which steam is produced is certainly entitled to a prominent place among *munitions de guerre*.

**COASTING TRADE.** The trade or intercourse carried on by sea between two or more ports or places of the same country.

It has been customary in most countries to exclude foreigners from all participation in the coasting trade. This policy began in England in the reign of Elizabeth (5 Eliz. c. 5), or, perhaps, the reign of remote æra; and it was perfected by the Act of Navigation passed in 1651 and 1660. A vast number of regulations have since been enacted having reference to this matter. And it was finally laid down in the Customs Consolidation Act of 1853 (16 & 17 Vict. c. 107 ss. 152, 191) that no goods or passengers should be carried coastwise from one part to another of the United Kingdom except in British vessels. But this restriction was repealed in the course of 1854 by the 17 Vict. c. 5, so that the coasting trade is now quite free.

**Policy of the Repeal of Restrictions on Coasting Trade.**—Much doubt has, for a considerable time, been entertained in regard to the policy of the monopoly of the coasting trade; and in 1849 it was proposed that it should be thrown open. It is not easy, indeed, to see any grounds on which this monopoly could be satisfactorily vindicated. In considering this question it is needless to refer to countries destitute of a commercial marine, for without the aid of foreigners they could have no coasting trade. And the shipowners of countries that have such a marine, and which also have any considerable facilities for carrying on navigation, have so many advantages on their side, that it is difficult to imagine that they should ever be superseded, in any considerable degree, by foreigners in carrying on the coasting trade. But while the admission of the latter to the privileges of entering in that trade hinders the native shipowners from availing themselves of any peculiar circumstances (such as existed in 1853 and 1854) to stances (such as existed in 1853 and 1854) to charge oppressive rates of freight, it at the same time subjects them to that wholesome competition by which alone their inventive energies are fully developed. The probability consequently is, that the introduction of a free system will be as advantageous in all that respects shipping and navigation as in most other things. Our naval pre-eminence is the result of our manufacturing and mercantile superiority, and of the greater facilities we enjoy for the construction of ships, and the breeding of sailors; and while the former will most likely be increased, the latter will not certainly be diminished, by the opening of the coasting trade to the ships of other nations.

Foreign ships engaged in the coasting trade are subjected in all respects to the rules and regulations (given below) laid on British ships engaged in the same trade. We subjoin an abstract of the Act admitting foreign ships to the coasting trade, the 17 Vict. c. 5.

**Repeal of the recited Enactments.**—Sections 152 and 191 of the Customs Consolidation Act, 1853, and 16 & 17 Vict. c. 107, shall be repealed from the passing of this Act: Provided, that it shall be lawful for her Majesty to exercise, in respect of foreign ships employed in the coasting trade as aforesaid, and of goods carried coastwise in such ships, such or the like powers as are conferred on her Majesty by the 16 & 17 Vict. c. 107 ss. 324, 325, & 326, in respect of foreign ships employed in the oversea trade, and of goods exported or imported in such ships. (Sec. 1.)

**Foreign Ships in Coasting Trade subject to same Rules as British Ships.**—Every foreign ship which after the passing of this Act is employed in carrying goods or passengers coastwise from one part of the United Kingdom to another, or from the Islands of Guernsey, Jersey, Alderney, Sark, or Man to the United Kingdom, or from the United Kingdom to any of the said islands, or from any of the said islands to any other of them, or from any of the said islands to any other part of the same, shall be subject, as to any other part of the same, shall be subject, as to stores for the use of the crew, and in all other respects, to the same laws, rules, and regulations as to which British ships when so employed are now subject. (Sec. 2.)

**Foreign Ships in Coasting Trade not subject to higher Rates than British Ships.**—No foreign ship which after the passing of this Act is employed in the coasting trade as aforesaid, nor any goods carried in any such ship, shall, during the time such ship is so employed, be subject to any higher rate of dock, pier, harbour, light, pilotage, or other rate of dues, duties, tolls, rates, or other charges whatsoever, or to any other rules or the employment of pilots, or any other rules or restrictions whatsoever, than British ships employed in like manner, or goods carried in such ships, any law, charter, special privilege, or grant to the contrary notwithstanding; nor shall any body corporate or person having or claiming any right or title to any such higher or other rates, dues, duties, tolls, or other charges as aforesaid be entitled to any compensation in respect thereof under any law or statute relating thereto, or otherwise howsoever. (Sec. 3.)

**Foreign Steam Vessels carrying Passengers Coastwise subject to 14 & 15 Vict. c. 79.**—And whereas it is expedient to provide for the safety of passenger steamers: be it enacted, that every foreign steam vessel carrying passengers from one place to another on the coasts of the United Kingdom and the Channel Islands shall be subject to the provisions of the Steam Navigation Act, 1851 (14 & 15 Vict. c. 79). (Sec. 4.)

**Regulations under which Coasting Trade is conducted.**—These, which have been very much simplified, are embodied in the Customs Consolidation Act, the 16 & 17 Vict. c. 107, and are as follows, viz.:

**All Trade by Sea from one part of the United Kingdom to another to be deemed Coastwise.**—All trade by sea from any one part of the United Kingdom to any other part thereof shall be deemed to be a coasting trade, and all ships while employed therein shall be deemed to be coasting ships, and no part of the United Kingdom, however situated with regard to any other part, shall be deemed in law, with reference to each other, to be pars beyond the seas; and if any doubt shall at any time arise as to what or to or from what parts of the coast of the United Kingdom shall be deemed a passage by sea, the Commissioners of the Treasury may determine and direct in what cases the trade by water from one port or place in the United Kingdom to another of the same shall or shall not be deemed a trade by sea within the meaning of this or any Act relating to the Customs. (Sec. 151.)

**Coasting Ship confined to Coasting Voyage.**—No goods shall be carried in any coasting ship, except such as shall be laden to be so carried at some port or place in the United Kingdom, and no goods shall be laden on board any ship to be carried coastwise until all goods brought in such ship from parts beyond the seas shall have been unladen; and if any goods shall be taken into or put out of any coasting ship at sea or over the

sea, or if any place over the unless forced by the master of a touched at an declare the ann collector or cor Kingdom when arrive, the mas sum of 100l. (5

**Times and P.** any goods be coastwise, or shipped to be holidays, or u authority of t or unless at appointed or pose, the same of the ship sh 154.)

**Master of C**—The master cause to be key of the ship, the belongs, and o each voyage, enter in such account of all ship, stating t the quantities therein, and t any goods ste respective shi particulars ar port of discla days on which out of such s parture from at every port on demand, p of any officer to make any examination book as conta not to contain contents, shal shall be fou entered in suc and if such

**Transire Arrival.**—W coasting ship any goods be of the place discharged t the collector on the date on board s

sea, or if any coasting ship shall touch at any place over the sea, or deviate from her voyage, unless forced by unavoidable circumstances, or if the master of any coasting ship which shall have touched at any place over the sea shall not declare the same in writing under his hand to the collector or comptroller at the port in the United Kingdom where such ship shall afterwards first arrive, the master of such ship shall forfeit the sum of 100*l.* (Sec. 153.)

**Times and Places for Landing and Shipping.**—If any goods be unshipped from any ship arriving coastwise, or be shipped or water-borne to be shipped to be carried coastwise, on Sundays or holidays, or unless in the presence or with the authority of the proper officer of the Customs, or unless at such times and places as shall be appointed or approved by him for that purpose, the same shall be forfeited, and the master of the ship shall forfeit the sum of 50*l.* (Sec. 154.)

**Master of Coasting Vessel to keep a Cargo Book.**—The master of every coasting ship shall keep or cause to be kept a cargo book, stating the names of the ship, the master, and the port to which she belongs, and of the port to which she is bound on each voyage, and shall at every port of lading enter in such book the name of such port, and an account of all goods there taken on board such ship, stating the descriptions of the packages and the quantities and descriptions of the goods therein, and the quantities and descriptions of any goods stowed loose, and the names of the respective shippers and consignees, so far as such particulars are known to him, and shall at every port of discharge of such goods note the respective days on which the same or any of them are delivered out of such ship, and the respective times of departure from every port of lading and of arrival at every port of discharge; and such master shall, on demand, produce such book for the inspection of any officer of Customs, who shall be at liberty to make any note or remark therein; and if upon examination any package entered in the cargo book as containing foreign goods shall be found not to contain such goods, such package, with its contents, shall be forfeited, or if any package shall be found to contain foreign goods not entered in such book, such goods shall be forfeited; and if such master shall fail correctly to keep

such cargo book, or to produce the same, or if at any time there be found on board such ship any goods not entered in such book as laden, or any goods noted as delivered, or if any goods entered as laden or any goods not noted as delivered be not on board, the master of such ship shall forfeit the sum of 20*l.* (Sec. 155.)

**Account previous to Departure to be delivered to Collector.**—Before any coasting ship shall depart from the port of lading, an account, with a duplicate thereof, in the form or to the effect following, and signed by the master, shall be delivered to the collector or comptroller; and the collector or comptroller shall retain the duplicate, and return the original account, dated and signed by him; and such account shall be the clearance of the ship for the voyage, and the TRANSIRE or PASS for the goods expressed therein; and if any such account be false, the master shall forfeit the sum of 20*l.*

Provided always that the Commissioners of Customs may, whenever it appears to them expedient, permit general transires to be given, under such regulations as they may direct, for the lading and clearance and for the entry and unloading of any coasting ship and goods, and the same may be revoked by notice in writing under the hand of the proper officer delivered to the master or owner of any ship, or any of the crew on board. (Sec. 156.)

**Account of the Number and Tonnage of British and Foreign Vessels (Sailing and Steam) Entered and Cleared, Coastwise, in 1866, with Cargoes only, at Ports in the United Kingdom, distinguishing the Vessels Employed between Great Britain and Ireland.**

	Entered						Cleared	
	British		Foreign		Total		British and Foreign	
	Vessels	Tons	Vessels	Tons	Vessels	Tons	Vessels	Tons
Employed between Great Britain and Ireland - - -	35,093	6,964,511	98	12,706	35,191	6,977,217	34,502	6,899,778
Other coasting vessels - - -	107,433	11,528,938	522	91,865	107,955	11,620,903	111,343	11,571,593
Total - - - - -	142,526	18,493,449	620	104,571	143,141	18,598,120	145,845	18,471,371

In 1867 the total tonnage of vessels (sailing and steam) entered with cargoes coastwise at ports in the United Kingdom was 18,445,981 tons, of which 18,348,998 were British, and 96,983 foreign.

**Transire to be delivered in 24 Hours after Arrival.**—Within 24 hours after the arrival of any coasting ship at the port of discharge, and before any goods be unladen, the transire, with the name of the place or wharf where the lading is to be discharged noted thereon, shall be delivered to the collector or comptroller, who shall note thereon the date of delivery; and if any of the goods on board such ship be subject to any duty of

excise, the same shall not be unladen without the authority or permission of the proper officer of excise; and if any goods on board any coasting ship arriving in Great Britain or Ireland from the Isle of Man shall be the growth or produce of that isle, or manufactures of that isle from materials the growth or produce thereof, or from materials not subject to duty in Great Britain or Ireland, or from materials upon which the duty shall have been paid and not drawn back in Great Britain or Ireland, the same shall not be unladen until a certificate be produced to the collector or comptroller, from the collector or comptroller at

the port of shipment, that proof had there been made in manner required by law that such goods were of such growth, produce, or manufacture, as the case may be; and if any goods shall be unladen contrary hereto, the master shall forfeit the sum of 20*l.*; and if any goods shall be laden on board any ship in any port or place in the United Kingdom, and carried coastwise, or, having been brought coastwise, shall be unladen in any such port or place contrary to this or any other Act relating to the Customs, such goods shall be forfeited. (Sec. 157.)

*Officer may go on board and examine any Coasting Ship.*—Any officer of the Customs may go on board any coasting ship in any port or place in the United Kingdom, or at any period of her voyage search such ship, and examine all goods on board, and all goods then loading or unloading, and demand all documents which ought to be on board such ship; and the collector or comptroller may require that all or any such documents shall be brought to him for inspection, and the master of any ship refusing to produce such documents on demand, or to bring the same to the collector or comptroller when required, shall forfeit and pay the sum of 20*l.* (Sec. 158.)

**COBALT** (Ger. kobalt; Dutch, kobal; Swed. kobolt; Fr. cobalt; Ital. cobalto; Russ. kobolt; Lat. cobaltum). A mineral of a grey colour, with a shade of red, and by no means brilliant. It has scarcely any taste or smell; is rather soft; specific gravity about 8*½*. Sometimes it is composed of plates, sometimes of grains, and sometimes of small fibres adhering to each other. The oxide of cobalt is extensively used as a means of dyeing glass, and for glazing and colouring porcelain. The principal ores of cobalt are the arsenates, called *arsenical cobalt* and *grey cobalt*. They are found in Sweden, Saxony, Saalfeld, Hessian, and in England in Cumberland and Cornwall. A very small amount of oxide is sufficient to tinge a large quantity of glass. [SMALT.] In 1866 3 cwts. of cobalt, 429 tons of ore, and 14 tons of oxide, of the aggregate value of 24,608*l.*, were imported into the United Kingdom.

**COCA.** A stimulating drug masticated by the Indians of the Peruvian and Bolivian Andes.

**COCCULUS INDICUS or INDIAN BERRY** (Fr. coque de Levant; Ger. kekkelkörner, fischkörner; Ital. galla di Levante; Sans. kakamari; Malay, tubanbidgi). The fruit or berry of the *Menispermum Cocculus*, Nat. Order *Menispermeaceae*, a strong climbing tree or shrub found on the Malabar coast, in Ceylon &c.

The berry is kidney-shaped, dark brown, about the size of a large pea; but when dried and imported it is shrivelled and smaller. The outer layer encloses a woody shell, containing a yellowish kernel. *Cocculus Indicus* is acrid and intensely bitter. In some parts of the East it is used, when formed into a paste with moistened rice, as a bait by fishermen and bird-catchers, but especially the former. Being thrown into the sea, or scattered on the ground, it is greedily devoured by the fish and birds, which it either kills or stupefies, so that they are easily captured. It is said not to render the flesh of such animals poisonous, as strychnine does. Its effects on man have not been accurately determined; but if taken in large doses it would, no doubt, be fatal. When added to malt liquors it increases their intoxicating power; and provided it be not administered in excess, or does not exceed 3 lbs. cocculus to 10 qrs. malt, its use in this way is not supposed to have any injurious influence. (Pereira's *Materia Medica*, 3rd ed. p. 2153; Thomson's *Materia Medica*; Ainslie's *Materia Medica*, p. 131; &c.)

Its use in adulterating beer is illegal, being prohibited, along with a number of other articles, by the 56 Geo. III. c. 58, under a penalty of 200*l.* upon the brewer and of 500*l.* on the seller of the drug, over and above the confiscation of the beer and brewing utensils. But a statute of this sort had much better be repealed. It is binding only on such tradesmen as choose to respect the law, and is no check on those of a different character. *Cocculus Indicus* is imported in bags of about 1 cwt. each. In 1866 there were but 394 cwts. imported, valued at 70*l.*; and 203 cwts. exported.

**COCHINEAL** (Ger. koschenille; Dutch, cochennille; Fr. cochenille; Ital. cocciniglia; Span. cochinilla, grana; Port. cochenilha; Russ. koseksnel). The female insect of the *Coccus cacti*, found in Mexico, Central America, and New Granada, the Canary Islands, Brazil &c. It has been introduced into Java, and promises to become an important product of that rapidly improving colony. Formerly it was in Mexico only that it was reared with care, and formed a valuable article of commerce; but its culture is now more or less attended to in many other places, and especially of late in the Canary Islands. Here its growth has been so very rapid that the exports, which amounted in 1832 to only 120 lbs., had increased in 1856 to no fewer than 1,511,716 lbs.!

(*Consular Reports*, 1857, p. 149.) It is a small insect, seldom exceeding the size of a grain of barley; and was generally believed, for a considerable time after it began to be imported into Europe, to be a sort of vegetable grain or seed. There are two sorts or varieties of cochineal: the best or domesticated, which the Spaniards call *grana fina*, or the grain; and the wild, which they call *grana sylvestra*. The former is nearly twice as large as the latter, probably because its size has been improved by the favourable effects of human care, and of a more copious and suitable nourishment, derived solely from the *Cactus cochinniflor*, during many generations. Wild cochineal is collected six times in the year; but that which is cultivated is only collected thrice during the same period. The insects, of which there are about 70,000 in a pound, being detached from the plants on which they feed by a blunt knife, are put into bags, and dipped in boiling water to kill them, after which they are dried in the sun. It is principally used in the dyeing of scarlet, crimson, and other esteemed colours. The watery infusion is of a violet crimson; the alcoholic, of a deep crimson; and the alkaline, of a deep purple, or rather violet hue. It is imported in bags, each containing about 200 lbs.; and has the appearance of small, dry, shrivelled, rugose berries or seeds, of a deep brown, purple, or mulberry colour, with a white matter between the wrinkles. In this state they suffer no change from length of keeping. Dr. Bancroft says that that cochineal is the best which is 'large, plump, dry, and of a silver-white colour on the surface.'

The species of cochineal called *granilla*, or dust, is supposed by Dr. Bancroft to be principally formed of *grana sylvestra*. The insects of which it consists are smaller than those composing the fine cochineal; and it does not yield more than a third part of the colouring matter that is yielded by the latter. The cochineal insect was introduced into India in 1795; but a very inferior sort only is produced. It has also been introduced into Java and Spain; but with what success remains to be seen. (Thomson's *Dispensatory*; Bancroft *On Colours*; &c.)

The duties on cochineal, after being reduced in 1842 to 1*s.* per cwt., were finally abolished in 1845. In 1866 the imports and exports of cochineal, including granilla and dust, were respectively

32,751 and 2 at 594,818*l.* estimated at

The price during the war, which it occasioned, and part of direct Government price of the berries, 39*s.*; and it has with hardly a down to from the war term under 12*s.* or 1*s.* some extent in this circumstance occasioned, no partly, perhaps been materially ever, has not a price, and it has continuance of low nation, but with they are quite sure of the article.

As. 10*l.* per lb.

COCOA, or, m Span. cacao; Ger. the cocoa tree (*Melastomaceae*, Jussieu) in the West Indies, America. It is a bear some resemblance to a young *blackberry*.

The introduction due to Columbus, a tion was carried o America and the V pean occupation of familiarly by the M attention of the E close of the 17th ce

The tree, if uncultivated, about 30 feet, and parallels, but flourishes, and at a height the level of the sea, and in clusters; the petals 5; stamens fruit is five-celled, oval pointed shape, inches in length, and marrow, only more the end; tough and yellow, according to red and it is very thick, but contained in each embedded in a soft (Maugin's excellent *de Chocolat*, Paris.

The shell of the nut brittle, and thin; and externally, brown equal portions adhere without much difficulty, and an unctuous and peculiar, but no should be chosen full any mustiness, and is by expression, a great cultivated only that preparation of the e the manufacture of c the principal ingredi

32,751 and 21,238 cwt.; the imports being valued at 594,818*l.* The consumption may, perhaps, be estimated at about 12,000 cwt., or 1,342,000 lbs.

The price of cochineal fluctuated very much during the war, partly on account of the obstacles which it occasionally threw in the way of importation, and partly on account of its being an article of direct Government expenditure. In 1811 the price of the best cochineal was as high as 3*6s.* and 3*9s.*; and it has since gone on regularly declining, with hardly a single rally, till, in 1850, it settled down to from 4*s.* to 6*s.* 4*d.* per lb. Previously to the war terminated in 1815, it had never been under 12*s.* or 13*s.* Lac dye has been employed to some extent in dyeing scarlet; but notwithstanding this circumstance, the consumption of cochineal, occasioned, no doubt, partly by its cheapness, and partly, perhaps, by some change of fashion, has been materially increased since 1835. This, however, has not had any material influence on its price, and it would appear, from the long continuance of low prices not only without any diminution, but with a large increase of imports, that they are quite sufficient to remunerate the growers of the article. (Teoke & Co. *On High and Low Prices*.) In October, 1866, the price of cochineal in the London market varied from 3*s.* 4*d.* to 4*s.* 10*d.* per lb.

COCOA, or, more properly, CACAO (Fr. and Span. cacao; Ger. kakao). The seed or nuts of the cocoa tree (*Theobroma cacao*), Nat. Order *Mulvaceae*, Jussieu; *Sterculiaceae*, Lindley; growing in the West Indies and in many parts of South America. It is said, by Mr. Bryan Edwards, to bear some resemblance, both in size and shape, to a young *blackheart cherry*.

The introduction of this article into Europe was due to Columbus, and for a long time the cultivation was carried on by the Spaniards in South America and the West Indies. Before the European occupation of the New World, it was used familiarly by the Mexicans. Cacao attracted the attention of the English in Jamaica before the close of the 17th century.

The tree, if unchecked, reaches the height of about 30 feet, and will grow between the 25th parallels, but flourishes best within the 15th parallels, and at a height of not less than 500 feet above the level of the sea. The flowers are very small, and in clusters; the calyx is composed of 5 sepals; petals 5; stamens 5, with double anthers. The fruit is five-celled, without halves, about 7 to 9 inches in length, and 3 to 4 in breadth, of an elliptical pointed shape, something like the vegetable marrow, only more elongated and pointed at the end; tough and quite smooth; the colour varying, according to the season, from bright yellow to red and purple. The rind of the fruit is very thick, but quite tasteless. The seeds contained in each pod number from 20 to 40, embedded in a soft, pinkish white acid pulp. (Maugin's excellent and valuable work, *Le Cacao et le Chocolat*, Paris, 1860.)

The shell of the nut is of a dark brown colour, brittle, and thin; the kernel is, both internally and externally, brownish, divided into several unequal portions adhering together, but separating without much difficulty; it has a light, agreeable smell, and an unctuous, bitterish, rather rough and peculiar, but not ungrateful taste. The nuts should be chosen full, plump, and shining, without any mustiness, and not worm-eaten. They yield, by expression, a great deal of oil; but they are cultivated only that they may be employed in the preparation of the excellent beverage cocoa, and the manufacture of chocolate, of which they form the principal ingredient. The finest cocoa is said

to be that of Xococho or Sonocuseo. The principal importations were formerly derived from the Caracas and Guayaquil, particularly the former, and now chiefly from the West India Islands, New Granada, Ecuador, and Brazil.

Von Humboldt estimated the consumption of cocoa in Europe, in 1806, at 23,000,000 lbs., of which from 6,000,000 to 9,000,000 were supposed to be consumed in Spain. The production of cocoa was languishing in the Caracas for several years previously to the commencement of the disturbances in South America; and latterly the cultivation of coffee seems to have been in most parts gaining; the ascendancy. (Humboldt, *Pers. Narrative*, vol. iv. pp. 236-247, Eng. trans.)

*Duties. Consumption in England.*—Down to a late period the consumption of cocoa in England was confined within very narrow limits; a result which we are inclined to ascribe to the oppressiveness of the duties with which it has been loaded, and not to its being unsuitable to the public taste.

It is now many years since Mr. Bryan Edwards declared that the ruin of the cocoa plantations, with which Jamaica once abounded, was the effect of 'the heavy hand of ministerial exaction' (*History of West Indies*, il. 363, ed. 1819); and, unaccountable as it may seem, this pressure was not materially abated till 1842, when the duties on cocoa from a British possession were reduced from 6*d.* to 2*d.* per lb. And such was the influence of this judicious measure, that the consumption of cocoa, which, at an average of the 3 years ending with 1831, amounted to 410,578 lbs. a-year, had increased, at an average of the 3 years ending with 1842, to 2,072,355 lbs.! The duty on foreign cocoa continued from 1830 down to 1842 to be (generally 6*d.* per lb.) three times as great as that on coffee from a British possession; and in consequence of this discrepancy, none of it was entered for home consumption under the duty, though it is worthy of remark that cocoa for the navy, paying no duty, was almost always taken from a foreign stock. In 1842 the duty on cocoa from a British possession was further reduced 1  $\frac{1}{2}$  *d.* per lb.; and it might have been expected that the ratio of protection in favour of plantation cocoa would then, also, have been diminished; but it was not till 1846 that the duty on foreign cocoa was reduced to 2  $\frac{1}{2}$  *d.* per lb.

In 1853 the duties were finally equalised, and fixed at 1*d.* per lb., and on paste or chocolate at 2*d.* per do. The duties on husks and shells were then, also, fixed at  $\frac{1}{2}$  *d.* per lb., but were reduced to 2*s.* per cwt. in 1855.

In 1866, 4,053,153 lbs. and in 1867, 4,235,917 lbs. of cocoa were retained for home consumption.

In 1866 the imports of cocoa from the British West Indies amounted to 5,366,853 lbs., of which 3,619,081 lbs. were supplied by Trinidad, and 1,511,904 lbs. by Grenada. In the same year we imported 1,263,252 lbs. from Ecuador, and 1,870,374 lbs. from New Granada: the total imports being 10,308,298 lbs., valued at 346,579*l.* In 1867 they were 11,954,802 lbs., valued at 346,869*l.*

No statement is made from the duty on cocoa on account of damage. (16 & 17 Vict. c. 107 s. 76.)

ships were employed in the Iceland fishery; which indulgence might arise from the marriage of James with a princess of Denmark.' (Pennant's *British Zoology*.)

Cod is prepared in two different ways: that is, it is either gutted, salted, and then barreled—in which state it is denominated green or pickled cod; or it is dried and cured—in which state it is called dried cod. Ready access to the shore is indispensable to the prosecution of the latter species of fishery.

**Cod Fishery, British.**—This fishery, including under the term not only that of common cod, but of haddock, ling, hake, torsk &c., is of very considerable value and importance. It consists of two grand departments, which may be respectively termed the *home*, and the *distant or colonial* fishery. The first is carried on in a great variety of places contiguous to the shores of the British islands; but the most productive and valuable of the adjacent fisheries are those in the neighbourhood of the Shetland and Orkney islands, and off the shores of Essex, Suffolk, Norfolk, Lincoln &c. Formerly the principal part of the cod brought to London was taken round the edges of the Dogger-bank, or rather in the hollows between it and the Well-bank; and the finest is still brought thence. But for a number of years the London market has been in great part supplied with cod taken

between Yarmouth and the Nore; and in consequence of its being procured so much nearer home, the average price of cod has fallen from 30 to 50 per cent. below what it was from 1815 to 1820. (*Report on the Channel Fisheries*, p. 85.) This change has occasioned a great increase in the number of fishing smacks belonging to Barking, Gravesend, and other ports on the Thames; while those belonging to Harwich and the more distant ports have been materially reduced. The cod taken by the fishermen of Shetland and the Western Isles is mostly cured dried, but it is partially also cured green or in pickle; and it is sometimes, though much seldomer now than formerly, conveyed alive in walled vessels to London. The haddocks taken on the Aberdeenshire coast, and cured at the village of Jinnan, near Aberdeen, are held in the highest estimation. The haddocks taken in Dublin Bay are the largest of any taken on the British coasts.

There are no means by which to form any estimate either of the number of fishing vessels, or of the quantity or value of the fish annually taken in the home cod fishery; by far the larger portion being landed without account or notice of any kind, and disposed of fresh. The following account contains such particulars only as have been brought under the notice of the Commissioners for the Improvement of the British Fisheries:—

Account of the Total Quantity of Cod, Ling, or Hake, cured, punched, or branded, and exported, from 1830 to 1866, in so far as the same has been brought under the Cognisance of the Officers of the Fishery Board.

\* Since this date for Scotland and the Isle of Man only.

† The branding and punching of cod and ling was discontinued on January 5, 1850, as well as the collection of returns for England.

N.B.—The books of the Fishery Board do not exhibit the total quantity of cod, ling, or hake cured till the year commencing April 5, 1825. The bounty from the commencement of this abstract to April 5, 1830, was near 4s. per cwt. for fish cured and dried, and 2s. 6d. per barrel for fish cured in pickle, taken by the crews of vessels or boats not on the tonnage bounty; while the bounty for vessels licensed for cod, ling, or hake fishery was 50s. per ton for tonnage and cargo to July 5, 1826; 45s. from thence to July 5, 1827; 40s. to July 5, 1828; and 35s. to April 5, 1830; when the bounties

ceased altogether, and have not since been renewed.

**Cod Fishery, Iceland.**—The large cod remain near the island during the winter, the chief station being Faxebay. The earliest and best fishings commence in February or March, and extend to May or June. The Icelanders capture the fish either by small driftnets, deep sea or hand lines, or the ordinary long lines. The line fishing is carried on in from 18 to 20 fathoms water; but it would be possible to fish successfully in deeper water, were the islanders wealthier and more adventurous.

The export of cod from Iceland in 1862 and 1865 was as follows:—

	1862	1865
Clipfish	5,621,424 lbs.	2,468,000
Stockfish	730,752 barrels	35,000
Liver oil	6,557	—
Roe	1,489	—

The export of an average year is—clipfish 3,250,000 lbs., of stockfish 1,408,000 lbs., of an abundant year, 5,280,000 lbs. clip, and 2,112,000 lbs. stockfish. In 1864, 62 decked boats, 1,190 open boats with 4 to 8 oars, 230 of from 8 to 12 oars, and 2,011 small boats were occupied by about 10,000 fishermen.

The French had in 1864, 260 vessels off the coast of Iceland, with an average burden of 90 tons. They are said to take about 30,000 cod per ship. (Consul-General Crowe's Report 1866.)

**Cod Fishery, Norway.**—These fisheries are carried on along the Norwegian coast from the Naze to the Varanger Fjord, near the Russian frontier, chiefly near the Loffodens. The fishery is a bank of from 20 to 30 fathoms in one part, of a 40 to 50 in another, and of 90 to 120 fathoms in the third terrace. The fishing commences in December, and the best months are January and February. The number of persons engaged in the fishery in 1866 was, according to a return made in accordance with the law, 25,756, in 5,723 boats. In 1866 about 21,000,000 fish were taken at the Loffodens. It takes about 400 fish to supply a barrel of liver oil. The yield of oil in 1866 was about 26,000 barrels; of roe, 18,000 barrels. The following gives the returns of fishings from 1860 to 1866:—

Year	Loffoden	Finnark	Romadal	Total catch
1861	20,000,000	5,000,000	5,500,000	28,500,000
1862	11,500,000	8,000,000	6,000,000	25,500,000
1863	17,500,000	5,000,000	4,000,000	24,500,000
1864	10,000,000	11,500,000	5,500,000	27,000,000
1865	19,000,000	9,000,000	9,500,000	37,500,000
1866	21,000,000	15,000,000	3,900,000	39,900,000

1866	—	—	—	—	—

The Norwegian 'pot,' or quart, is equal to 0.2124 gallon. The barrel is equal to 3.1862 bushels, or 0.3983 qrs.

The export of cod salted in bulk and bartered to the Russian traders of the White Sea cannot be accurately ascertained; it is computed to average

between 10,000 and 15,000 tons annually. The number of barrels above quoted is only the quantity cleared out from the custom-houses.

The chief exports of Norwegian fish are to the Mediterranean, Sweden, Holland, and Italy, which take together about 28,000,000 lbs. of stockfish; Spain, which consumes 45,000,000 lbs. of fish; the Hanse Towns and Holland, which clipfish; about 1,500,000 gallons of liver oil. (Consul-General Crowe's Report 1866.)

**Distant Cod Fishery.**—The great bank of Newfoundland, discovered by John or Sebastian Cabot in 1497, was long, and perhaps still is, the principal seat of the distant cod fishery. The extraordinary abundance of cod-fish on its banks having been speedily ascertained, the French, Portuguese, and Spaniards soon after engaged into the field. In English were later in coming into the fishery. The English had on the banks of Newfoundland 1578 France had on the banks of Portugal 50, and 150 vessels, Spain 120 or 130, Portugal 50, and England from 30 to 50. During the first half of last century the fishery was principally carried on by the English, including the Anglo-Americans, and the French; but the capture of Cape Breton, and of their other possessions in America, gave a severe blow to the fishery of the latter; that American war divided the British fishery; that portion of it which had previously been carried on from New England being thereafter merged in that of the United States. Still, however, we contrived to preserve the largest share. At an average of the 3 years ending with 1789 we are said to have had 402 ships, 1,911 boats, and 16,856 men engaged in the American fisheries. During last century the French being excluded from the fisheries, those of England attained to an extraordinary degree of prosperity; the total value of the produce of the Newfoundland fishery in 1814 having exceeded 2,800,000L. But since the peace the British fishery on the Newfoundland banks has rapidly declined, and can hardly, indeed, be said, at this moment, to exist. It is now carried on almost entirely by the French and the Americans; the facilities enjoyed by the latter for its prosecution being greater than those of any other people, and the former being tempted to engage in it by the extraordinary encouragements afforded by Government. At present the British fishery carried on by the inhabitants of Newfoundland is confined to the shore or beat fishery; but this, entirely to the shore or beat fishery; but this, though probably not so good a nursery of sailors as the bank fishery, is admitted to be the most productive of merchantable fish and oil. (M'Gregor's *British America*, 2nd ed. vol. i. p. 206.)

The average annual products of the fisheries of all sorts, including sea-salmon &c., exported from Newfoundland, during the 3 years ended with 1832, is said to have amounted to 516,417L. A considerable fishery is also carried on from the ports and harbours of Nova Scotia and Cape Breton, New Brunswick &c. But next to that of Newfoundland, the principal British fishery is carried on along the coast of Labrador. We borrow from the valuable work now referred to, the following statements with respect to it:—

During the fishing season from 280 to 300 schooners proceed from Newfoundland to the different fishing stations on the coast of Labrador, where about 20,000 British subjects are employed for the season. About one-third of the schooners make two voyages, loaded with dry fish, back to Newfoundland during the summer, and several merchant vessels proceed from Labrador with their cargoes direct to Europe, leaving, generally, full cargoes for the fishing vessels to carry to Newfoundland. A considerable part of the fish of

the second voyage and dried after or nine schooner having on board men. Some of Europe, and they carry animal oil, and salmon.

From Nova chiefly from the amount to 6,000, 1,200 seamen carry the principal green state.

One-third English, Irish, of the property also employ the catching seals constantly at

the second voyage is in a greer, or pickled state, and dried afterwards at Newfoundland. Eight or nine schooners from Quebec frequent the coast, having on board about 80 seamen and 100 fishermen. Some of the fish caught by them is sent to Europe, and the rest to Quebec; besides which, they carry annually about 6,000*l.* worth of furs, oil, and salmon to Canada.

From Nova Scotia and New Brunswick, but chiefly from the former, 100 to 120 vessels resort to Labrador. The burden of these vessels may amount to 6,000 or 7,000 tons, carrying about 1,200 seamen and fishermen. They generally carry the principal part of their cargoes home in a green state.

One-third of the resident inhabitants are English, Irish, or Jersey servants, left in charge of the property in the fishing rooms, and who also employ themselves, in the spring and fall, catching seals in nets. The other two-thirds live constantly at Labrador, as furriers and seal-

catchers on their own account, but chiefly in the former capacity, during winter, and all are engaged in the fisheries during summer. Half of these people are Jerseymen and Canadians, most of whom have families.

From 16,000 to 18,000 seals are taken at Labrador in the beginning of winter and in spring. They are very large; and the Canadians, and other winter residents, are said to feast and fatten on their flesh. About 4,000 of these seals are killed by the Esquimaux. The whole number caught produce about 350 tons of oil, value about 8,000*l.* (Vol. i. p. 185.)

The total produce of the Labrador fishery in 1832 was estimated by M'Gregor at 302,650*l.*; and he farther estimated the total produce of the British fisheries in the various seas and rivers of America, including seal oil and skins, at an average of the five years ending with 1832, at 857,210*l.* a-year. (Vol. ii. p. 596.) But it is now considerably greater. We subjoin

*An Account of the Quantities and Values of the Exports of the Produce of the Newfoundland Fishery (including that carried on at Labrador by Boats from Newfoundland) in 1863-5.*

\* \* \* The number of ships employed in the fisheries cannot be ascertained; the number of boats is about 7,000.

About eight-tenths of the dried fish exported from Newfoundland by British subjects are sent to Spain, Portugal, Italy, and other Continental nations; the rest goes to the West Indies and to Great Britain.

The Act 5 Geo. IV. c. 51 contains several regulations with respect to the Newfoundland fisheries. Aliens are prohibited from fishing on the coasts, or in the bays or rivers of Newfoundland, excepting, however, the rights and privileges granted by treaty to foreign states at amity with his Majesty.

All British subjects may take, cure, and dry fish, occupy vacant places, cut down trees for building, and do other things useful for the trade. (Sec. 5.)

Certificates should be granted to vessels clearing out for the fishery; and on arrival at Newfoundland a report should be made of such certificate, and registered; and on leaving the fishery the usual clearance shall be obtained. Vessels having on board any goods other than fish &c. to forfeit the fishing certificate. (Sec. 4.)

Persons throwing out ballast &c. to the prejudice of the harbours in Newfoundland shall be subject to a penalty. (Sec. 5.)

A contract in writing, specifying wages, and how to be paid, must be entered into with seamen and fishermen. (Sec. 7.)

A fisherman is prohibited receiving more than three-fourths of his wages during service; but the balance due to him is to be paid immediately upon the expiration of the covenanted time of service. No fisherman to be turned off, except for wilful neglect of duty or other sufficient cause, under a penalty, for each offence, of not less than 5*l.*, nor more than 50*l.*

In order to fulfil the conditions in any treaty with a foreign state, his Majesty may empower the governor of Newfoundland to remove any works erected by British subjects for the purpose of carrying on the fishery between Cape St. John and Cape Ray, and to compel them to depart to another place. (Sec. 12.)

Every person so refusing to depart shall forfeit 50*l.* (Sec. 13.)

The governor is empowered to sell or lease places within the island called Ship-rooms. (Sec. 14.)

For the regulations &c. as to the importation of fish into Great Britain, see FISUR.

It is doubtful whether the distant cod fishery may not have passed its zenith. Spain, Italy, and other Catholic countries have always been the great markets for dried fish; but the observance of Lent is every day becoming less strict; and the demand for dried fish will, it is most likely, sustain a corresponding decline. The relaxed observance of Lent in the Netherlands and elsewhere has done more than anything else to injure the herring fishery of Holland.

*Cod Fishery, American.*—The Americans have at all times prosecuted the cod fishery with great vigour and success. Their fishermen are remarkable for their activity and enterprise, sobriety and frugality; and their proximity to the fishing grounds, and the other facilities they possess for carrying on the fishery, give them advantages with which it would be very difficult to contend, even if they were not assisted by Government, which, however, is the case. In 1795 the Americans employed in the cod fishery about 31,000 tons of shipping; in 1807 they are said to have employed 70,306 tons; but it subsequently declined for several years, and was almost entirely suspended during the war ended 1815.

In the year ending June 30, 1858, the Americans had 110,896 tons shipping engaged in the cod fishery. During the same year they exported 161,269 quintals of dried, and 30,470 barrels and 3,375 kegs of pickled cod; their aggregate value being 684,448 dols. In 1864 they exported 192,505 cwt. of smoked and dried, and 73,756 cwt. of pickled fish, valued together at 1,476,486 dols. By far the larger portion of the dried and smoked fish went to Hayti, St. Domingo, and the Spanish West Indies.

M'Gregor and others: we believe, however, that they have materially over-rated its influence.

**COD LIVER OIL.** (Fr. huile de morue; Ger. stockfisch lebertran). The trade in this article illustrates the effect of a medical demand on an important branch of industry. This is a fixed oil extracted from the fresh liver of the common cod, but oil bearing this name is also procured from the ling, the coal-fish, the pollock, the hake, and the haddock.

The best cod liver oil is obtained by heating the livers, broken up into a mass, by means of steam, to a temperature not exceeding 180°. The livers should be as fresh as possible. This product is called *shore oil*, and is the purest. If the livers are left till putrefaction commences, oil rises to the surface, and if rapidly taken off, is of second quality, being known as *strait oil*. The residue left to putrefy and then boiled constitutes the *banks oil*, and is offensive both in taste and odour. Sometimes the oil is expressed, after heating the fresh livers: the product being filtered supplies a good variety of the oil.

Great use is made of cod liver oil, and especially of the coarser kinds, in the manufacture of shoe leather, which is most conveniently dressed with this substance. But its most important economical use is as a medicine. In what manner it operates is not determined, but it is said to be one of the most valuable alteratives and restoratives in cases of scrofula and consumption. In 1866 we imported 895 tons of this oil, valued at 65,979*l.*, the chief supplies coming from Hamburg, British North America, and Norway.

**Sorts of Cod Liver Oil.**—In consequence of its great value as a drug, the article is frequently adulterated with other fixed oils of animal origin, and sometimes with fixed vegetable oils. Exact chemical analysis might detect some of these adulterations, but unfortunately the process, if possible, is exceedingly delicate and uncertain. The following are, according to the best authorities, the most trustworthy tests:—

1. The specific gravity of genuine oil ranges between .915 and .9195 at 72°. Shark liver oil, which is said to be substituted for the genuine article, is reported to have the specific gravity of .866.

2. Genuine cod liver oil does not congeal at 14°.

3. The sulphuric acid test. A drop of this acid gives a centrifugal movement to the oil, and a fine violet colour, passing to a yellowish or brownish red. Sometimes the colour is red at once.

4. The nitric acid test. This acid when agitated with the oil gives a pinkish or rose red colour, afterwards becoming brown.

5. The sensible qualities of odour and taste. (*British Pharmacopœia*, 1867; and *Private information*.)

**COFFEE** (Ger. kofee, koffholmen; Dutch, koffy; koffitoonen; Dan. kaffe, kaffebønner; Swed. kofe; Fr. Ital. and Port. caffè; Span. café; Russ. kofé; Pol. kawna; Lat. coffea, caffen; Arab. bun; Malay, kawa; Persian, tochem, kawah; Turk. chaube). The berries of the coffee plant (*Coffea Arabica*, Linn.). They are generally of an oval form, smaller than a horse-bean, and of a tough, close, and hard texture; they are prominent on the one side and flattened on the other, having a deeply marked furrow running lengthwise along the flattened side; they are moderately heavy, of a greenish colour, and a somewhat bitterish taste.

**Historical Notice of Coffee.**—The coffee plant is a native of that part of Arabia called *Yemen*—*terris faba missa Sabæis*; but it is now very extensively cultivated in the southern extremity of India, in Java, the West Indies, Brazil &c. We

are ignorant of the precise period when it began to be roasted, and the decoction used as a drink, though the discovery is not supposed to date further back than the early part of the fifteenth century. No mention of it is made by any ancient writer, nor by any of the moderns previously to the sixteenth century. Leonhart Rauwolf, a German physician, is believed to be the first European who has taken any notice of coffee. His work was published in 1573, and his account is, in some respects, inaccurate. Coffee was, however, very accurately described by Prosper Aibinus, who had been in Egypt as physician to the Venetian consul, in his works *de Plantis Egypti*, and *de Medicina Egyptiorum*, published in 1591 and 1592.

A public coffee-house was opened for the first time, in London, in 1652. A Turkey merchant, of the name of Edwards, having brought along with him from the Levant some bags of coffee, and a Greek servant accustomed to make it, his house was thronged with visitors to see and taste this new sort of liquor; and, wishing to gratify his friends without putting himself to inconvenience, he allowed his servant to make and sell coffee publicly. In consequence of this permission, the latter opened a coffee-house in Newman's Court, Cornhill, on the spot where the Virginia Coffee-house now stands. Garraway's was the first coffee-house opened after the great fire in 1666. (See the learned and elaborate treatise of Mosley *On Coffee*, 5th ed. p. 15.)

Charles II. attempted, by a proclamation issued in 1675, to suppress coffee-houses, on the ground of their being resorted to by disaffected persons, who 'devised and spread abroad divers false, malicious, and scandalous reports, to the defamation of his Majesty's government, and to the disturbance of the peace and quiet of the nation.' The opinion of the Judges having been taken as to the legality of the proceeding, they resolved, 'That retailing coffee might be an innocent trade; but as it was used to nourish sedition, spread lies, and scandalise great men, it might also be a common nuisance.'

M. de la Roque mentions that the use of coffee was introduced into France between 1640 and 1660; and he further states that the first coffee-house for the sale of coffee in France was opened at Marseilles, in 1671. (*Voyage de 'u Syrie*, tom. ii. pp. 310-319.) It was hardly, however, known, except to a few travellers who had visited the East, till 1669, when it was introduced to the best society in Paris by Solyman Aga, ambassador from the Grand Seigneur to Louis XIV. It immediately became fashionable; and the taste for it having been quickly diffused, a coffee-house was opened for its sale in 1672, which, in no long time, had several competitors. (See the excellent work of Le Grand d'Aussy, *Vie privée des Français*, iii. 127, ed. 1815.)

Some time between 1680 and 1690 the Dutch planted in the vicinity of Batavia coffee beans they had procured from Mocha. In 1690 they sent a plant to Europe; and it was from berries obtained from this plant that the first coffee plantations in the West Indies and Surinam were derived.

**Progressive Consumption of Coffee in Great Britain.** *Influence of the Duties.*—In 1660 a duty of 4*d.* per gallon was laid on all coffee made and sold. Previously to 1732 the duty on coffee amounted to 2*s.* per lb.; but an Act was then passed, in compliance with the solicitations of the West India planters, reducing the duty to 1*s.* 6*d.* per lb.; at which it stood for many years, producing, at an average, about 10,000*l.* a-year. In conse-

quence, however, of the prevalence of smuggling, caused by the too great magnitude of the duty, the revenue declined, in 1783, to 2,8697. 10s. 10 $\frac{1}{2}$ d.; and it having been found impossible otherwise to check the practice of clandestine importation, the duty was reduced, in 1784, to 6*d.* The consequences of this wise and salutary measure were most beneficial. Instead of being reduced, the revenue was immediately raised to near three times its previous amount, or to 7,2007. 15s. 9*d.*, showing that the consumption of legally imported coffee must have increased in about a ninefold proportion!—a striking and conclusive proof, as Mr. Bryan Edwards has observed, of the effect of heavy taxation in defeating its own object. (*History of the West Indies*, vol. ii. p. 310, 8vo. ed.)

The history of the coffee trade abounds with similar and even more striking examples of the superior productiveness of low duties. In 1807 the duty was 1*s.* 8*d.* per lb.; and the quantity entered for home consumption amounted to 1,170,164 lbs., yielding a revenue of 161,245*l.* 11*s.* 4*d.* In 1808 the duty was reduced from 1*s.* 8*d.* to 7*d.*, and in 1809 no fewer than 9,251,847 lbs. were entered for home consumption, yielding, notwithstanding the reduction of duty, a revenue of 245,856*l.* 8*s.* 4*d.* The duty having been raised in 1819 from 7*d.* to 1*s.* per lb., the quantity entered for home consumption in 1824 was 7,993,041 lbs., yielding a revenue of 407,544*l.* 4*s.* 3*d.* In 1824, however, the duty being again reduced from 1*s.* to 6*d.*, the quantity entered for home consumption in 1825 was 10,766,112 lbs.; and in 1831 it had increased to 22,740,627 lbs., yielding a net revenue of 583,751*l.*

The rapid increase in the consumption from 1825 to 1832 must not, however, be wholly ascribed to the reduction of the duty. This, no doubt, had the greatest influence; but a good deal is also owing to the low price of coffee from 1824 to 1830, and also to the great reduction during the same period in the price of low brown sugar (fully 1 $\frac{1}{2}$ *d.* per lb.), a cheap and abundant supply of which is indispensable to the extensive use of coffee.

These statements, which are principally deduced from the accompanying account, No. I., refer to the consumption of Great Britain only; but the account No. II. includes the United Kingdom, and is brought down to 1867 inclusive. The most remarkable features in this account are the reduction of the duty on coffee from the East Indies and Ceylon to the same level as that on coffee from the West Indies, and the farther reduction of the duty on coffee from British possessions in 1842 to  $\frac{1}{2}$ *d.* per lb. The equalisation of the duty on East and West India coffee had become indispensable after the rapid decline in the supplies from the West Indies consequent on the emancipation of the slaves; for as foreign coffee was burdened with a high discriminating duty, the price of British coffee must otherwise have risen to such a height as materially to interfere with the consumption. The latter, indeed, has not increased since 1837 in the ratio that might have been expected from the increasing population and wealth of the country; and since 1847, when the consumption amounted to 37,441,373 lbs., it has declined, having been in 1866 only 27,849,694 lbs.

The produce of colonial coffee as indicated by the imports has risen considerably. When the last edition of this work was published the imports of colonial coffee were little more than 24,000 tons; they were in 1865 considerably more than double this amount.

The stationary or declining state of the consumption of coffee may, however, be easily explained. We have seen how rapidly the growth of

chicory has extended in this country [CHICORY]; and its substitution for coffee has no doubt prevented the increase of the latter. The adulteration of coffee with chicory was, indeed, authorised by a Treasury minute passed in 1840. But the well-founded objections made to this extraordinary attempt to legitimise a proceeding by which the revenue as well as the public was defrauded, led to the repeal of the minute referred to in 1852. The sale of coffee mixed with chicory was then prohibited. Inasmuch, however, as this prohibition could not be made effectual, a new minute was passed in 1853, permitting the sale of coffee intermixed with chicory, provided the parcels containing such compound be labelled MIXTURE OF COFFEE AND CHICORY. And we do not well see what more can be done in the matter. Dealers who supply chicory, or a mixture of coffee and chicory, to customers who order coffee, are swindlers who ought to be adequately punished; but if customers order chicory, or coffee alloyed with chicory, there neither is nor can be any good reason why they should not be supplied with the article they want.

Under such circumstances the best thing that can be done by those who have the opportunity, and who wish to make sure of getting genuine coffee, is to buy it before it is ground; and as a mill for grinding may be bought for a small sum, and coffee is sold really 'roasted,' there is, in this way, no great difficulty in obviating adulteration. Those who use ground coffee will also be pretty secure against fraud if they resort only to first-class shops.

It is seen, from the accompanying tables, that the duty on foreign coffee was reduced in 1841 to 6 $\frac{1}{2}$ *d.* per lb.; and, following up the example set in the case of the sugar duties, it was farther reduced in 1851 to 3*d.* per lb., that is, to the same rate of duty that was then laid on British colonial coffee. The duty on all descriptions of coffee, after being raised to 4*d.* per lb. in 1855, was again reduced in 1857 to 3*d.* A duty equal to that on coffee has also been imposed on chicory. [CHICORY.]

\* To March 31.

The table No. III. (p. 328) is interesting, inasmuch as it not only shows the sources whence we derive our supplies of coffee, but the estimation in which the products of different countries are held in the mercantile world.

The introduction of tea and coffee, it has been well remarked, 'has led to a wonderful change in the diet of civilised nations, a change highly im-

portant both in a moral and physical point of view. These beverages have the admirable advantage of affording stimulus without producing intoxication, or any of its evil consequences. Lovers of tea or coffee are, in fact, rarely drinkers; and hence the use of these beverages has benefited both manners and morals.' (Scotsman, Oct. 17, 1827.)

III. An Account exhibiting the different Sources whence the Coffee imported into the United Kingdom in 1866 was derived, with the Quantities imported from each, the Total Quantities retained for Home Consumption, and the Computed Value of the Imports and the Duty.

**Supply and Consumption of Coffee.**—Owing to the increasing consumption of coffee in this country, the Continent, and America, the great value of the article, the large amount of capital and labour employed in its production, and the shipping required for its transport, it has become a commodity of primary commercial importance. It deserves particular attention, too, inasmuch as there are few, if any, articles that exhibit such variations, not only of consumption, but also of growth and price. These are occasioned partly by changes of commercial regulations and duties, and partly also by the plant requiring 4 or 5 years before it comes to bear: so that the supply is neither suddenly increased when the demand increases, nor diminished when it falls off. St. Domingo used formerly to be one of the greatest sources of supply, having exported, in 1786, about 35,000 tons; and it is supposed that, but for the negro insurrection which broke out in 1792, the exports of that year would have amounted to 42,000 tons. The devastation occasioned by this event caused, for a series of years, an almost total cessation of supplies. They have again, however, increased, and were understood to amount, in 1866, to about 16,000 tons a-year. From Cuba the exports of coffee have, for some years, owing partly to the decline in its price and partly to the efforts of the planters having been more directed to the cultivation of sugar, greatly fallen off. They may at present amount, including Porto Rico, to 7,000 tons. In Java and Brazil the culture of coffee has increased with unprecedented rapidity [BATAVIA; RIO JANEIRO]. The exports from Java, which did not a few years ago exceed 18,000 tons, now (1867) amount to at least 55,000; while those from Brazil, which have increased in an equal degree, amount to above 140,000 tons. From Rio alone the exports in 1866 were 309,583,360 lbs. The growth of coffee in India and Ceylon has also been very greatly increased, especially in the latter, where the plantations have been so much extended that their produce is now equal to more than double the present consumption of the United Kingdom. There has, no doubt, been a serious decrease in the exports of coffee from the British West Indies; the imports into the United Kingdom having declined from 11,014 tons in 1832 to 2,015 in 1866; but when reference is

made to the whole supply, this diminution is inconsiderable. On the other hand, the exports of coffee from the East Indies have increased from 132,819 lbs. in 1857 to 785,102 lbs. in 1866.

According to Mr. Palgrave, 'very little, so little indeed as to be quite inappreciable, of the Mocha or Yemen berry ever finds its way westwards of Constantinople. Arabia, Syria, and Egypt consume two-thirds; the remainder goes to Turks and Armenians. Even that which is exported is of inferior quality, the best grains being carefully selected for home use.'

The Mocha coffee quits its native land by three main lines of export—that of the Red Sea to Egypt, that of the inner Hejaz to Syria, and that of Rasam to Nejed and Shimer.

The second species of coffee is the growth of Abyssinia. Its berry is larger.

Another, and the commonest kind in the East, is Indian coffee. Mr. Palgrave adds that American coffee, in the judgment of Orientals, holds the very last rank. (*Arabia*, vol. i. p. 425.)

The Cingalese region in which coffee is principally cultivated is that near Gampola. This cultivation received its first impetus from the decline of the coffee produce in the West Indies after the emancipation of the negroes. The exports from Ceylon, which had been only 1,792,448 lbs. in 1827, were 67,453,680 lbs. in 1857, and the imports thence into the United Kingdom in 1866 were 81,428,370 lbs. According to a report of Mr. Ferguson contained in Sir E. Tennent's work *On Ceylon* (vol. ii. p. 239), there were, in 1857, 403 estates in the district, containing 80,950 acres, of which 63,771 were in bearing condition; the average crop per acre being 5.5 cwt. The number of coolie labourers required during crop time was 129,200.

The consumption of coffee in the United States has increased with great rapidity since 1821, in which year it amounted to only 5,306 tons. Part of this increase is, no doubt, to be ascribed to the reduction of the duty, first from 5 to 2 cents per lb., and its subsequent repeal; part to the fall in the price of coffee; and a part, perhaps, to the increase of temperance societies. The consumption, however, has been checked since the war, in consequence of the reimposition of high duties.

Species of Coffee.

Jamaica, Ceylon, are deemed the best; the Rica, Dominica, Java, Martinique, and coffee is produced in being raised upon m soils. The most fer the growth of ver Edwards observes q frequently ameliorat luxuriant tree and which are large, and many years, rank a remark is made by

and disagreeable flavour. Sugar placed near coffee will, in a short time, so impregnate the berries and injure their flavour as to lower its value 10 or 20 per cent. Dr. Moseley mentions that a few bags of pepper, on board a ship from India, spoiled a whole cargo of coffee.

\*The roasting of the berry to a proper degree requires great nicety: the virtue and agreeableness of the drink depend upon it; and both are often injured by the ordinary method. Bernier says, when he was at Cairo, where coffee is so much used, he was assured by the best judges that there were only two people in that great city who understood how to prepare it in perfection. If it be under-done, its virtues will not be imparted, and, in use, it will load and oppress the stomach; if it be over-done, it will yield a flat, burnt, and bitter taste, its virtues will be destroyed, and, in use, it will heat the body, and act as an astringent.' (Moseley, p. 39.)

*Regulations with respect to Sale, Importation &c.*—Roasted beans and rye, reduced to powder, have frequently been used to adulterate ground coffee; and the possession of such substitutes for coffee was formerly an offence punishable by the forfeiture of the articles and a penalty of 100*l.* But by the Act 3 Geo. IV. c. 53, persons who are *not dealers in coffee* may take a license for roasting and selling corn, peas, beans, or parsnips, labelling the parcels with the names, and conforming to the various regulations prescribed in the Act.

No coffee can be imported in packages of less than 100 lbs. *nett* weight.

No abatement of duties is made on account of any damage coffee may have received.

Coffee cannot be entered as being the produce of any British possession in America or of the Mauritius until the master of the ship in which the coffee is imported deliver to the collector or comptroller a certificate of its origin, and declare that the coffee is the produce of such place. (8 & 9 Vict. c. 86 s. 38.)

**COINS.** Pieces of metal, most commonly gold, silver, or copper, impressed with a public stamp, and frequently made legal tender in payment of debts, either to a limited or an unlimited extent.

1. *Circumstances which led to the Introduction and Use of Coins.*—When the precious metals first began to be used as money, or as standards by which to measure the value of different articles, and the equivalents for which they were most commonly exchanged, they were in an unfashioned state, in bars or ingots. The parties having agreed upon the quantity of metal to be given for a commodity, the exact amount was then ascertained by weight. But it is obvious that a practice of this sort must have been attended with a great deal of trouble and inconvenience. There can, however, be little doubt that the greatest obstacle to the use of unfashioned metals as money would be found in the difficulty of determining their quality, or the degree of their purity, with sufficient precision. The operation of assaying is one of great nicety and difficulty, and could not be performed in the early ages otherwise than in a clumsy, tedious, and inaccurate manner. It is, indeed, most probable that when the precious metals were first used as money, their quality would be appreciated only by their weight and colour. A very short experience would, however, be sufficient to show the extreme inexactness of conclusions derived from such loose and unsatisfactory criteria; and the devising of some method by which the fineness of the metal might be easily and correctly ascertained

would very soon be felt as indispensable to the general use of gold and silver as money. Such a method was not long in presenting itself: it was early discovered that, to ascertain the purity of the metal, and also to avoid the trouble and expense of weighing it, no more was necessary than to mark each piece with a *stamp*, declaring its weight and fineness. This invention was made at a very early period; but the accounts which assign it to particular dates are mythical.

2. *Metal used in the Manufacture of Coins.*—Before the art of metallurgy was well understood, the baser metals were frequently used as money. Iron was the primitive money of the Lacedæmonians, and copper of the Romans. But both iron and copper deteriorate by being kept; and besides this defect, the rapid improvement of the arts, by lowering their price, rendered their bulk too great in proportion to their value to permit of their continuing to be used as money. Copper, indeed, is still used in the form of tokens, convertible into silver in very small payments. In this country copper or bronze pence and halfpence are rated at about 75 per cent. above their real value; but as their issue is exclusively in the hands of Government, and as they are only legal tender to the extent of one *shilling* in any one payment, this over-valuation is not productive of any bad effect. The use of copper in other countries is limited in much the same way; gold and silver being everywhere the only metals made use of in the manufacture of the coins used in considerable payments.

3. *Standard of Coins.*—By the standard of a coin is meant the degree of its purity, and its weight; that is, the fineness of the metal of which it is made, and the quantity of metal contained in it.

(1.) *Silver Coins.*—A pound troy, or 12 ounces, of the metal of which English silver coins are made, contains 11 oz. 2 dwts. pure silver, and 18 dwts. alloy. This pound is coined into 66 shillings; so that each shilling contains 80-727 grains fine silver, and 87-27 grains standard silver; and the *money pound*, consisting of 20 shillings, contains 1614-515 grains pure silver, and 1745-451 grains standard silver. From 1600 down to 1815 the pound weight of standard silver bullion was coined into 62 shillings. All the English silver coins have been coined out of silver of 11 oz. 2 dwts. fine, from the Conquest to this moment, except for the short period of 16 years, from the 34th Henry VIII. to the 2nd Elizabeth.

(2.) *Gold Coins.*—The purity of gold is not estimated by the weights commonly in use, but by an Abyssinian weight called a *carat*. The carats are subdivided into four parts, called grains, and these again into quarters; so that a *carat grain*, with respect to the common divisions of a pound troy, is equivalent to 2½ dwts. Gold of the highest degree of fineness, or pure, is said to be 24 carats fine. When gold coins were first made at the English mint, the standard of the gold put in them was of 23 carats 3½ grains fine, and ½ grain alloy; and so it continued, without any variation, to the 18th of Henry VIII., who, in that year, first introduced a new standard of gold of 22 carats fine, and 2 carats alloy. The first of these standards was called the old, and the second the new standard, or crown gold; because crowns or pieces of the value of 5*s.* were first coined of this new standard. Henry VIII. made his gold coins of both these standards under different denominations, and this practice was continued by his successors until 1633. From that period to the present the gold of which the coins of this kingdom have been made has been invari-

ably of the same of the variously to 16; when they went. (Livery

The purity fore, 11 parts sovereign, or 2 grains fine gold. The pound Troy is divided into 6*gr.* 12*ss.* sovereign standard price 1*l.* 14*s.* 6*d.* p. ounce.

The alloy in is allowed in a sense that would metals so as to degree of purity; is small, it has harder, and less. If the quantity would lessen the metals, and would the coins.

The standard may be learned Table of Coins see

4. *Variations of* sorts of property lions in almost all or hire, being ma that no change can money or coins with estimates and con portion of society portion, or vice versa all commodities (is) ments in the arts, or the discovery of can be selected to not vary in its real that the precious rial that could be exception of the es caused by the dis it seems to have other periods.

But in addition inherent in the valuations in the cost of made, their standa

Notwithstanding being universally compute the value equivalent for w changed, is by far measures used in quently, be prese there is none that The necessities or have forced them selves of the incur have almost unive graceful expedient is, of cheating the the extent of the every other debt same.

The ignorance facilitated this spe of the coins bec metal contained i would have been But, although the going perpetual, s ductions, their anc

riably of the *new* standard, or crown gold; though some of the coins made of the old standard, previously to 1633, continued to circulate till 1732, when they were forbidden to be any longer current. (Liverpool *On Coins*, p. 27.)

The purity of our present gold coins is, therefore, 11 parts due gold and 1 part alloy. The sovereign, or 20 shilling piece, contains 113.001 grains fine gold, and 123.274 grains standard gold. The pound Troy of standard gold is coined into 6.250 sovereigns, or into 46l. 11s. 6d. The mint standard price of gold is, therefore, said to be 37l. 10s. 6d. per lb. troy, or 3l. 17s. 10½d. per ounce.

The alloy in coins is reckoned of no value. It is allowed in order to save the trouble and expense that would be incurred in refining the metals so as to bring them to the highest degree of purity; and because, when its quantity is small, it has a tendency to render the coins harder, and less liable to be worn or rubbed. If the quantity of alloy were considerable, it would lessen the splendour and ductility of the metals, and would add too much to the size of the coins.

The standard of the coins of foreign countries may be learned at a glance by inspecting the *Table of Coins* subjoined to this article.

4. *Variations of the Standard.*—The value of all sorts of property being estimated, and the stipulations in almost all contracts for its purchase, sale, or hire, being made, in money or coins, it is plain that no change can take place in the value of such money or coins without virtually subverting these estimates and contracts, and enriching the debtor portion of society at the expense of the creditor portion, or vice versa. As the cost of producing all commodities is liable to vary from improvements in the arts, the exhaustion of the present or the discovery of new sources of supply, none can be selected to serve as money or coin that may not vary in its real value. It is believed, however, that the precious metals vary less than any material that could be suggested. And with the exception of the extraordinary fall in their value caused by the discovery of the American mines, it seems to have been remarkably constant at other periods.

But in addition to the fluctuations naturally inherent in the value of coins, arising from variations in the cost of the metal of which they are made, their standard has been repeatedly changed. Notwithstanding that money or coin, from its being universally used as a scale by which to compute the value of all commodities, and as the equivalent for which they are commonly exchanged, is by far the most important of all the measures used in society, and should, consequently, be preserved as invariable as possible, there is none that has been so frequently altered. The necessities or extravagance of governments have forced them to borrow; and to relieve themselves of the incumbrances thus contracted, they have almost universally had recourse to the disgraceful expedient of degrading the coin: that is, of *cheating* those who lent them money, to the extent of the degradation, and of enabling every other debtor in their dominions to do the same.

The ignorance of the public in remote ages facilitated this species of fraud. Had the names of the coins been changed when the quantity of metal contained in them was diminished, there would have been no room for misapprehension. But, although the weight of the coins was undergoing perpetual, and their purity occasional, reductions, their ancient denominations were almost

uniformly preserved; and the people who saw the same names still remaining after the substance was diminished—who saw coins of a certain weight and fineness circulate under the names of florins, livres, dollars, and pounds—and who saw them continue to circulate as such after both their weight and the degree of their fineness had been lessened, began to think that they derived their value more from the *stamp* affixed to them by authority of Government than from the quantity of the precious metals they contained. This was long a very prevalent opinion. But the rise of prices which invariably followed every reduction of the standard, and the derangement that was thereby occasioned in every pecuniary transaction, undeceived the public, and taught them and their rulers the expediency of preserving the standard of money inviolate.

The standard may be reduced by simply raising the denomination of the coin; by ordering, for example, that a half-sovereign should pass for a sovereign, and the latter for a double sovereign &c. If injustice be resolved upon, this is the least mischievous way in which it can be perpetrated, inasmuch as it saves all the trouble and expense of a recoinage. But as it renders the fraud obvious and glaring, it has rarely been resorted to; and most reductions have been effected either by diminishing the weight of the coins, or by increasing the proportion of alloy in the metal of which they are made, or both.

Originally the coins of all countries seem to have had the same denomination as the weights commonly used in them, and contained the exact quantity of the precious metals indicated by their name. Thus, the *talent* was a weight used in the earliest period by the Greeks, the *as* or *paulo* by the Romans, the *livre* by the French, and the *pound* by the English and Scotch; and the coins originally in use in Greece, Italy, France, and England bore the same names, and weighed precisely a talent, a pondo, a livre, and a pound. The standard has not, however, been preserved inviolate, either in modern or ancient times. It has been less degraded in England than any where else; but even here the quantity of silver in a pound sterling is less than the *third* part of a pound weight—the quantity it contained in 1300. In France, the *livre* current in 1789 contained less than *one sixty-sixth* part of the silver implied in its name, and which it had actually contained previously to 1103. In Spain, and some other countries, the degradation has been carried still further. (For an account of the degradation of the coins of the ancient and modern Continental nations, see the article 'Money,' in the Supplement to the old, or in the new edition of the *Encyclopaedia Britannica*.)

From 1296 to 1355 the coins of England and Scotland were of the same weight and purity; but at the last-mentioned epoch the standard of Scotch money was, for the first time, sunk below that of England; and by successive degradations the value of Scotch money, at the union of the crowns in 1600, was only a *twelfth* part of the value of the English money of the same denomination. It remained at this point till the union of the kingdoms cancelled the separate coinage of Scotland.

The gold and silver coins of Ireland have been for a considerable period the same as those of Great Britain; but, until 1825, they were nominally rated 8½ per cent. higher. This difference of valuation, which was attended with considerable inconveniences, was put an end to by the Act 6 Geo. IV. c. 79, which assimilated the currency throughout the empire.

be freely exported and imported without being liable to any charge or duty whatever; and they may be imported without being either reported or entered at the Custom-house. This regulation has rendered it next to impossible to ascertain the value of the bullion imported.

8. *Forgery of Coin. Issue of forged or spurious Coins.*—The forgery of coin is an offence that is practised more or less at all periods. The most effectual means of preventing it is to improve the fabric of the genuine coin, to cut the dies with great delicacy, and occasionally to vary the form of the coins. During the lengthened period from 1770 down to 1816 the genuine silver coins in circulation were so much worn and defaced that it was very difficult to distinguish between them and counterfeit, which, in despite of the severest penalties, were thrown into circulation in immense quantities. But since the issue of the new coins, in 1816, forgery has been comparatively rare. Sufficient time has not yet been afforded for determining the influence of the law exempting the offence of counterfeiting from the punishment of death.

9. *Law as to the counterfeiting &c. of Coin.*—The Acts as to this were consolidated and amended by the 2 & 3 Wm. IV. c. 34, of which the following is a brief abstract:—

Counterfeiting the gold or silver coin of the realm, transportation for life, or for not less than 7 years, or imprisonment for not exceeding 4 years; and every such offence shall be deemed to be complete although the counterfeiting be not finished. (Sec. 3.)

Colouring counterfeit coin, or any pieces of metal, with intent to make them pass for gold or silver coin, colouring or altering genuine coin with intent to make it pass for higher coin; transportation for life, or for any term not less than 7 years, or imprisonment for any term not exceeding 4 years. (Sec. 4.)

Impairing the gold or silver coin with intent to make the coin so impaired pass for gold or silver coin of full weight, transportation for not exceeding 14 nor less than 7 years, or imprisonment for not exceeding 3 years. (Sec. 5.)

Buying or selling &c. counterfeit gold or silver coin for lower value than its denomination, importing counterfeit coin from beyond seas, transportation for life, or for not less than 7 years, or imprisonment for not exceeding 4 years. (Sec. 6.)

Uttering counterfeit gold or silver coin, imprisonment for not exceeding 1 year; and uttering, accompanied by possession of other counterfeit coin, or followed by a second uttering within 10 days, imprisonment for not exceeding 2 years; every second offence of uttering after a previous conviction shall be felony: transportation for life, or for not less than 7 years, or imprisonment for not exceeding 4 years. (Sec. 7.)

Having 3 or more pieces of counterfeit gold or silver coin in possession, with intent to utter the same, imprisonment for not exceeding 3 years; second offence, transportation for life, or for not less than 7 years, or imprisonment for not exceeding 4 years. (Sec. 8.)

Making, mending, having possession of, or selling any mould &c., or coining tools, or any press or engine, conveying tools or moneys out of the mint without authority, felony; transportation for life, or for not less than 7 years, or imprisonment for not exceeding 4 years. (Secs. 10, 11.)

Counterfeiting any current copper coin, or making, mending, or possessing any coining tool, or buying, selling &c. any counterfeit copper coin

for lower value than its denomination, transportation for not exceeding 7 years, or imprisonment for not exceeding 2 years; and uttering any counterfeit copper coin, or having in possession 3 or more pieces of counterfeit copper coin, imprisonment for not exceeding 1 year. (Sec. 12.)

Gold or silver coin tendered to any person suspecting any piece to be counterfeit, may be broken by such person; and if it shall appear to be counterfeit, the person tendering shall bear the loss; but if it shall be of due weight, and appear to be of lawful coin, the person breaking it is to receive it at the rate it was coined for, and any dispute shall be finally determined by any justice; and the tellers of the Exchequer and the receivers-general of the revenue are to break or deface every piece of counterfeit coin tendered for payment. (Sec. 13.)

Any person discovering any counterfeit coin, gold, silver, or copper, or any coining tool, is to carry the same forthwith before some justice, and on reasonable cause to suspect any person of counterfeiting, or having such coin, or any tool &c., such justice may cause any place under the control of such suspected person to be searched, either in the day or night, and if any such coin or tool shall be found, to cause the same to be seized forthwith, and carried before a justice, who is to secure the same for the purpose of being produced in evidence, and afterwards of being delivered up to the mint. (Sec. 14.)

The necessity of the evidence of any officer of the mint to prove counterfeit coin dispensed with. (Sec. 17.)

The court may order hard labour or solitary confinement. (Sec. 19.)

The words 'king's coin' include all coin lawfully current in the United Kingdom; and lawfully having, in any dwelling-house or other building, lodging, apartment, field or other place, open or enclosed, whether belonging to or occupied by the accused or not, and whether for his own use or benefit, or for that of another, shall be deemed having in his possession within this Act. (Sec. 21.)

Persons acting in the execution of this Act protected in the usual manner, by requiring notice of action &c. and allowing tender of amends &c. (Sec. 22.)

10. *Convictions for Coining and Uttering.*—In the 7 years ending with 1818, 63 persons were convicted in England and Wales of the offence of counterfeiting the coin of the realm, of whom 1 was executed. In the next 7 years the convictions for coining were reduced to 14, but of these 5 were executed. In the last septennial period, ending with 1832, the convictions were 34, and the executions 7. The convictions for issuing forged coins in the first of the above periods were 21, in the second 9, and in the third 32.

#### TABLES RELATIVE TO THE COINS OF GREAT BRITAIN AND OTHER COUNTRIES.

No. I. *English Coins.*—The following table gives an account of the quantity of *fine* silver coined into 20s. or the pound sterling; the quantity of *standard* silver, of 11 oz. 2 dwts. fine and 11 dwts. alloy, contained in 20s. or the pound sterling in the different reigns from the time of Edward I. to the reign of William IV. A similar account with respect to gold. And an account of the proportional value of fine gold to fine silver, according to the number of grains contained in the coins. Calculated in grains and 1000th parts Troy weight.

No. III. *Scotch Coins*.—The annexed table gives the number of pounds, shillings, and pennies Scotch which have been coined out of one pound weight of silver at different times; with the degree of purity of such silver, or its fineness, from the year 1107 to the year 1601. (From Cardonnel's *Numismata Scotia*, page 24.)

Nos. VI. and VII. Gold and Silver Coins of different Countries.—The following tables contain the assays, weights, and values of the principal gold and silver coins of all countries, computed according to the mint price of gold in England, and from assays made both at London and Paris, which have been found to verify each other.

VI. Table showing the Legal Weight, Fineness, and Value of the Principal Gold Coins of all Countries, computed at the English Mint Price of 3*l.* 17*s.* 10*d.* per Ounce of Standard Gold.

By Mexican decree of November 28, 1867, certain changes are introduced into the standard of money then in use in the Republic based on the exclusive adoption of the decimal system of coinage. The dollar is retained as the unit of currency, and the gold coinage is to consist of pieces of the value of 20 dollars, 10 dollars, 5 dollars, 2 dollars, and 1 dollar respectively.

*Monetary Convention.*—The following is a translation of the Monetary Convention recently concluded between France, Belgium, Italy, and Switzerland:—

*Preamble.*—His Majesty the King of the Belgians, his Majesty the Emperor of the French, his Majesty the King of Italy, and the Swiss Confederation, being equally desirous of establishing a more complete harmony between their monetary legislation, to remedy the inconveniences which press upon the communications and transactions between the inhabitants of their respective states in consequence of the diverse values of their coined moneys, and to contribute by the formation of a Monetary Union to the progress of uniformity in weights, measures, and currency, have resolved to conclude a convention to that effect, and have agreed upon the following articles:—

Art. 1. Belgium, France, Italy, and Switzerland are constituted a Union as respects the weights, values, form, and currency of their respective coinages in gold and silver. No change is made at present in the legislation relating to the copper money of each of the states.

Art. 2. The high contracting parties engage not to coin, nor allow to be coined, bearing their impressions and designs, any gold moneys in any other forms than those of gold pieces of 100 francs, 50 frs., 20 frs., 10 frs., and 5 frs., fixed as to weight, value, allowance for loss and diameter as follows:—

Nature of pieces	Full weight	Allowance in weight at home and abroad	Standard	Allowance from Standard	Diameter
	grammes	1000th parts	1000th parts	1000th parts	milli-metres
francs 100	7.258.06	1	900	2	55
50	3.629.03	1	900	2	27
20	1.511.61	1	900	2	21
10	755.80	2	900	2	19
5	377.90	3	900	2	17

They shall receive without distinction into their public treasuries gold pieces coined according to the foregoing conditions in one or other of the four states, with the reservation, nevertheless, of excluding all coins whose weight shall have been reduced by wear to the extent of 1/2 per cent. below the allowances mentioned above, or where the stamped impressions shall have become effaced.

Art. 3. The contracting Governments bind themselves not to make, nor allow to be made, silver pieces of 5 francs except according to the conditions of weight, standard, allowance, and diameter fixed as follows:—

Full weight	Allowance	Full Standard	Allowance	Diameter
25 grammes	5/1000	1000	2/1000	37 milli-metres

They shall mutually receive the said coined pieces into their public treasuries, with the right of excluding those which shall have lost weight by

wear to a greater extent than 1 per cent. below the allowance above mentioned, or where the stamped impression shall have become effaced.

Art. 4. The high contracting parties henceforth shall not manufacture silver pieces of 2 frs., 1 fr., 50 centimes, and 20 centimes, except according to the conditions of weight, standard, allowance, and diameter as follows:—

Description	Full weight	Allowance in weight	Full standard	Allowance	Diameter
	grammes	1000th parts	1000th parts	1000th parts	milli-metres
francs 2	10	5	835	3	27
1	5	7			23
0.50	2.50	10			18
0.20	1	7			16

These pieces shall be recast by the Governments that issued them when they shall have become reduced by wear to the extent of 5 per cent. below the above-mentioned allowance, or when their stamped impressions shall have become effaced.

Art. 5. The silver pieces of 2 frs., of 1 fr., of 50 centimes, and of 20 centimes manufactured otherwise than according to the various conditions specified in the foregoing article shall be withdrawn from circulation before January 1, 1869. This period is extended until January 1, 1878, in respect of pieces of 2 frs. and 1 fr. issued in Switzerland by virtue of the law of January 31, 1860.

Art. 6. Silver pieces manufactured according to the conditions of Art. 4 shall have legal currency among private individuals in the state which has manufactured them to the extent of 50 frs. in a single payment. The state which has issued them shall receive them from its own countrymen without any limit of quantity.

Art. 7. The public treasuries of each of the four countries shall accept silver moneys coined by one or several of the other contracting states in conformity with Art. 4 to the extent of 100 frs. in each single payment to such mentioned treasuries.

The Governments of Belgium, France, and Italy shall receive upon the same terms until January 1, 1878, the Swiss pieces of 2 frs. and 1 fr. issued by virtue of the law of January 31, 1860, and which are assimilated in all respects during the same period to pieces manufactured in accordance with the conditions of Art. 4. The reservation in respect of wear mentioned in Art. 4 applies in all cases.

Art. 8. Each of the contracting Governments undertakes to receive back from individuals or from the public treasuries of the other states the old coinage which it has issued, and to exchange it for an equal value in current coin (gold pieces of 5 fr. pieces in silver) upon condition that the sum presented for exchange shall not be less than 100 frs. This obligation shall be prolonged for a period of 2 years from the date of the expiration of the present treaty.

Art. 9. Has been issued by the populations.

Art. 10. The stamped upon any of the four.

Art. 11. Has between the states.

Art. 12. The tion is reserved accept its obligation monetary system to gold and silver.

Art. 13. Has constitutional law to the execution.

Art. 14. The force until January that date notice been given, it shall for a further period for further purpose of notice.

Art. 15. Relative convention made in 1865.

Notes to the Tables above tables made accuracy, as in standards are not.

Art. 9. Has reference to the number of coins to be issued by each state according to the respective populations.

Art. 10. The date of colnago shall hereafter be stamped upon pieces of gold and silver struck in any of the four states.

Art. 11. Has reference to mutual communications between the states as to their issue of coins &c.

Art. 12. The right of acceding to this convention is reserved to any other state which shall accept its obligations, and which shall adopt the monetary system of the Union in whatever relates to gold and silver specie.

Art. 13. Has reference to the application of the constitutional laws in the four states with respect to the execution of this treaty.

Art. 14. The present convention shall remain in force until January 1, 1880. If one year prior to that date notice to determine it shall not have been given, it shall remain obligatory in full force for a further period of 15 years, and in like manner for further periods of 15 years in the absence of notice.

Art. 15. Relates to the ratification of this convention made in four parts at Paris December 23, 1865.

Notes to the Tables of Foreign Coins.—The intrinsic value of many coins enumerated in the above tables may not be stated with perfect accuracy, as in some countries the legal mint standards are not strictly adhered to; but those to

whom a knowledge of the exact value of gold and silver coins is more particularly essential are not likely to be misled by it.

The statements (reports) of the purity of gold and silver coins by English assayers are made in comparison with the fixed English standards, and the comparative difference is called their *betterness* or *worseness*, as the case may be.

*Betterness* means better than standard, and is expressed by the letter B; *worseness* means worse than standard, and is expressed by the letter W. Thus for a gold coin, B 1. 2 means 1 carat and 2 carat grains better than standard gold, and consequently contains 23 carats and 2 carat grains of pure gold and 2 carat grains of alloy.

For a silver coin, W 2. 2 means that it is 2 oz. 2 dwts. worse than standard silver, and consequently contains only 9 oz. of pure silver and 3 oz. of alloy.

The fineness of gold and silver coin in France is expressed in *millièmes* or thousandth parts: thus a gold or silver coin of  $\frac{950}{1000}$  fine means that it contains 950 parts of pure gold or silver and 50 parts of alloy.

Nos. VIII. and IX.—As they contain much curious and useful information, we reprint the tables of the gold and silver coins of different countries from Dr. Kelly's *Cambist*, that appeared in previous editions of the *Commercial Dictionary*.

VIII. Gold Coins of different Countries.—Table containing the Assays, Weights, and Values of the Principal Gold Coins of all Countries, computed according to the Mint Price of Gold in England, and from Assays made both at London and Paris, which have been found to verify each other.\*

\*. \* The publishers of this work purchased the right to publish this Table from Dr. Kelly, in the second edition of whose *Cambist* it originally appeared.

\* The London Assays in this Table were made by Robert Bingley, Esq. F.R.S., the King's Assay Master of the Mint, and those at Paris by Pierre Frédéric Bonjevy, Essayeur du Commerce, as published in his elaborate work on the Coins of all Nations. Specimens of all the foreign coins brought to London for commercial purposes have been supplied for this Table from the Bullion Office, Bank of England, by order of the Bank Directors, and have been selected by John Humble, Esq., the chief clerk of that office, who also examined the Tables in their progress. It may likewise be added, that the Mint Reports of the commercial coins are chiefly from average assays; and that all the computations have been carefully verified by different calculators.—(Note by Dr. Kelly to second edition of the *Cambist*, published in 1821.)

	Mohur of 1770 (1 in proportion)	Standard	18 6	18 6	487	14 7-65	

\* Much variation is found in the fineness of the Sicilian gold coins. Its weight was then reduced from 246 gr. pure gold to 232 do.; and hence, as the American eagle coined previously to 1834. Its weight was then reduced from 246 gr. pure gold to 232 do.; and hence, as the eagle is the equivalent of 10 dollars, the sovereign, which was previously worth 4 dots, 50 cents, has since been worth 4 dots, 87 cents. The reader will find in the art. New York in this work, full details in regard to the coins of the United States with the values of other coins rated in them.

IX. Silver Coins of different Countries.—Table containing the Assays, Weights, and Values of the Principal Silver Coins of all Countries, computed at the Rate of 6s. 2d. per Ounce Standard, from Assays made both at the London and Paris Mints.

\* By one of the articles made either in Prussia or in France, the value of the coin is nominally reckoned to be the same as that of the standard. The term 24 guineas is used to denote the value of the coin in London, and the value of the coin in Paris is denoted by the value of the coin in Paris. The value of the coin in London is denoted by the value of the coin in London, and the value of the coin in Paris is denoted by the value of the coin in Paris. The value of the coin in London is denoted by the value of the coin in London, and the value of the coin in Paris is denoted by the value of the coin in Paris.

\* By one of the articles of the Zollverein, or Customs-Union of Germany, it was stipulated that the settlements for the duties should be made either in Prussian dollars or in florins, at the rate of 7 florins for 4 Prussian dollars. These were, however, no florins in existence exactly of this value: but as the nearest approach to it was a valuation called the 24 guldenflorin, or florin-dout, these Zollverein florins were nominally reckoned to be in this rate, though the difference amounts to more than 2 per cent.

† The term 24 guldenflorin signifies that the mark weight of fine silver is rated at 24 gulden or florins. It was formed by giving to the coin minted or valued in 20 guldenflorin an increased value of one-fifth, as rating the 20 kreutzer piece at 24 kreutzers. At 100 per ounce standard, the value of this mark of fine silver is worth 40s. 7 1/2d. sterling, from which the value of the different florins... monetary integers is readily obtained: as reckoning 27 marks banco or 53 marks current of Hamburg, 14 dollars of Pa. 4s. 21/2d. florins of South Germany, 20 florins of Austria, and also 60 lire, a quadrato of Lombardy, to be of this amount.

‡ In order, therefore, to prevent the loss or inconvenience which would attend their adhering to this mode of valuation, a money convention was entered into on August 25, 1837, among the States forming the Union, by which it was agreed upon that a new basis of valuation should be adopted for their coins, under the term of Suddentscher Wahrung, or South German valuation, at the rate of 24 gulden or florins from the mark's weight of fine silver.

§ Bavaria, Württemberg, Baden, and Saxony have since issued their coins at this rate, and the other States of the Confederation are doing or preparing to do the same. Among them Frankfurt, in 1840, began the minting of coins of this value; and by a regulation of the Chamber of Commerce of this free city, all the rates of exchange, as well as the values of bullion and foreign coins, were ordered to be expressed in this Suddentscher Wahrung from the beginning of the present year (1843). One of these new and very exactly-minted florins was assayed by Messrs. Johnson and Cook of Hatton Garden, who reported it to be, full weight, 19 1/2 grains, or 5 1/2 grains more than the old florin, from which the value, at 60d. per ounce standard, is very exactly 19 1/2d. sterling, making the par of exchange with London 1208 florins in S. D. W. for 100 sterling.

¶ I have been thus particular in these explanations, partly because several persons imagine that the late alteration in the rate of exchange with Frankfurt was made in compliance with the wishes, or to suit the convenience, of one or more of our leading houses in exchange negotiations, but more particularly because it is maintained by many that the valuation of this rate is not merely nominally, but really, in 24 guldenflorin. This is a point of no small importance to the commercial world, for had it been so, the par of exchange with London would have been only 118 florins, and the difference between this and the 7 per cent price of 121 1/2 florins on Frankfurt would have exceeded 2 1/2 per cent. a variation which every practical capitalist well knows could not exist, except under very extraordinary circumstances, and with nearly corresponding differences in the other rates of exchange: neither of which causes is now in operation.—(Letter of William To, Esq., Author of 'The Comunist,' to the Times.)

N.B. It was ordered by a ukase, dated July 1, 1830, that this coin should be the standard of value in Russia. It is divided into 100 copecks; and the other silver coins are of the value of 25, 50, 25, and 10 copecks each. This same ukase enacts that 1 silver rouble shall henceforth be equal to 51 old paper roubles.

\* The Prussian coins having been debased at different periods, vary in their reports.  
 † This is the coin which is universally circulated under the name of the Spanish dollar.  
 ‡ For an account of the new Turkish coins, see CONSTANTINOPLE.

The sterling value of the foreign coins, in the foregoing tables, has been computed from the assays as follows:—Let it be required to assay the value, in sterling, of a French double Louis d'or coined since 1786, the assay master's report being as follows:—Weight, 9 dwts. 20 grs.; assay, W. 1½ grs.; t'rial 15, car. 18 grs., worse than the English standard. We proceed as under:—

From 2 car. 0 gr. the fineness of English standard gold † There remains 21 car. 2½ gr. Take 0 car. 1½ gr. Then, as 2 car. 21 gr. car. 2½ gr. :: 9 dwts. 20 grs. : 9 dwts. 16 grs., the standard gold contained in the Louis d'or; and hence, as 1 car. : 21. 17s. 10d. :: 9 dwts. 16 grs. : 11. 17s. 7½d., the value of the Louis in sterling money, and so for any of the other coins.

**Ancient Coins.**—We suitjoin, for the convenience of such of our readers as may at any time have occasion to consult works in which reference is made to ancient coins, the following tables of those that were principally current among the Jews, Greeks, and Romans. They are taken from the essay of the Rev. Robert Hussey, M.A., sometime Professor of Ecclesiastical History in the University of Oxford. This

author is the latest and best authority on the subject:—

COIR. A species of yarn manufactured out of the husk of cocoa nuts. The husks being steeped in water, the dry dusty substance mixed with the fibres is separated. These are afterwards spun into yarn, and manufactured into cordage that is deemed by some superior to that made of hemp. The goodness of coir depends on the fineness of the filaments, and on their being of a bright yellow colour.

The following are the exports of coir from

British India, according to the Report on Indian Products in the official Catalogue of the Great Exhibition of 1862:—

Year	Quantity	Value
1850-1	3,595 tons	21,5611
1851-2	3,472	11,699
1852-3	3,907	17,300
1853-4	4,213	25,611
1854-5	3,696	27,038
1855-6	3,393	29,919
1856-7	3,703	25,808
1857-8	4,297	33,181
1858-9	4,375	36,435
1859-60	4,825	41,801
1860-1	5,832	57,284

Coir cables are much used in merchant vessels, the coir rope having been employed in India for ages. The rope is so light that it floats on the water; and according to Dr. Gilchrist a coir hawser ought to be kept in every vessel, since if a small boat is attached to it, and let down when a man falls overboard, it gives him greater facilities for saving life than any other means. Fresh water is said to rot coir, and the rope snaps easily in frosty weather. Coir ropes are therefore unsuitable for low latitudes. The rope, however, in sea water and high latitudes is actually strengthened and rendered more elastic by exposure. Nothing, we are informed, can equal the ease with which a ship rides at anchor whose cables are of coir.

Coir is used in England to a very large extent for matting and coarse brushes.

A cocoa nut sawn in two across the grain of the coir forms an excellent implement for polishing wood, (Ure's Dictionary.)

About 2,500,000 lbs. weight of coir are annually exported from Ceylon, principally to Calcutta and other ports in the East Indies. It is also prepared in the Maldiv Islands, and many other places; and is very extensively used throughout the East. (Bertolacci's Ceylon; Bell's Commerce of Bengal; &c.)

In 1866 we imported, chiefly from India and Ceylon, 10,820 cwt. of coir (fibre), valued at 18,309l. and 12,317 cwt. of cordage and cables of coir, valued at 20,607l.

COLLISION (Fr. abordage), in a general sense, is the act of any two or more bodies coming forcibly together; but in commercial navigation it means the shock of two ships coming into sudden and violent contact at sea, by which one or both may be more or less injured.

From the great increase of navigation, the risk of accidents by collision at sea has been proportionally augmented; and it is, therefore, of much importance, 1, to adopt such measures as may be most likely to prevent their occurrence; and 2, to determine by whom a loss, when it does occur, should be borne.

In regard to the first and most essential of these objects, it is effected in part, at least, by whatever contributes to the general improvement and security of navigation. At common law, every master of a ship is bound to keep a proper watch

at sea, especially in channels much frequented by shipping, and to use every precaution to avoid coming into contact with other vessels. But this matter has been judged too important to be left wholly to depend on the good sense and care of individuals; and with a view to the securing of attention to the subject, and to the obviating of the confusion that would unavoidably arise were shipmasters left to follow their own ideas with respect to it, rules and regulations have been laid down in regard to the courses to be steered when ships are passing each other, the signals to be made during fogs, the number and description of the lights to be exhibited at night, and other particulars. In 1840 the Trinity House promulgated a rule of this sort; and though not in itself a law, masters not complying with its instructions were held to be guilty of unseamanlike conduct, and the owners were made responsible for the consequences. Regulations similar to those contained in the Trinity rule have since been enacted by the Legislature. The existing statute law on the subject is embodied in the Merchant Shipping Act, Amendment Act of 1862, the 25 & 26 Vict.

6. 63. The following are the regulations for preventing collisions at sea, appended to the Order in Council dated January 9, 1863, which apply to all ships belonging to the following countries and places, whether within British jurisdiction or not:—Australia, Argentine Republic, Belgium, Brazil, Bremen, Chile, Denmark Proper, Republic of the Equator, France, Great Britain, Greece, Hamburg, Hanover, Hawaiian Islands, Hayti, Italy, Lubeck, Mecklenburg-Schwerin, Morocco, Netherlands, Norway, Oldenburg, Peru, Portugal, Prussia, Roman States, Russia, Schleswig, Spain, Sweden, Turkey, United States (sea-going ships and inland waters), Uruguay.

*Preliminary.*—Art. 1. In the following rules every steam ship which is under sail and not under steam is to be considered a sailing ship; and every steam ship which is under steam, whether under sail or not, is to be considered a ship under steam.

*Rules concerning Lights.*—Art. 2. The lights mentioned in the following articles, numbered 3, 4, 5, 6, 7, 8, and 9, and no others, shall be carried in all weathers, from sunset to sunrise.

Art. 3. Sea-going steam ships when under weigh shall carry—

a. *At the foremast head*, a bright white light, so fixed as to show an uniform and unbroken light over an arc of the horizon of 20 points of the compass; so fixed as to throw the light 10 points on each side of the ship, viz. from right ahead to 2 points abaft the beam on either side; and of such a character as to be visible on a dark night, with a clear atmosphere, at a distance of at least 5 miles:

b. *On the starboard side*, a green light so constructed as to show an uniform and unbroken light over an arc of the horizon of 10 points of the compass; so fixed as to throw the light from right ahead to 2 points abaft the beam on the starboard side; and of such a character as to be visible on a dark night, with a clear atmosphere, at a distance of at least 2 miles:

c. *On the port side*, a red light, so constructed as to show an uniform and unbroken light over an arc of the horizon of 10 points of the compass; so fixed as to throw the light from right ahead to 2 points abaft the beam on the port side; and of such a character as to be visible on a dark night, with a clear atmosphere, at a distance of at least 2 miles.

d. The said green and red side lights shall be fitted with inboard screens, projecting at least 3

feet forward from the light, so as to prevent these lights from being seen across the bow.

Art. 4. Steam ships, when mast-head lights vertically shall carry 2 bright white lights, so as to distinctly, in addition to their side lights, so as to distinguish them from other steam ships. Each of these mast-head lights shall be of the same construction and character as the mast-head lights which other steam ships are required to carry.

Art. 5. Sailing ships under weigh, or being towed, shall carry the same lights as steam ships under weigh, with the exception of the white mast-head lights, which they shall never carry.

Art. 6. Whenever, as in the case of small vessels during bad weather, the green and red lights cannot be fixed, these lights shall be kept on deck, on their respective sides of the vessel, ready for instant exhibition; and shall, on the approach of or to other vessels, be exhibited on their respective sides in sufficient time to prevent collision, in such manner as to make them most visible, and so that the green light shall not be seen on the port side, nor the red light on the starboard side.

To make the use of these portable lights more certain and easy, the lanterns containing them shall each be painted outside with the colour of the light they respectively contain, and shall be provided with suitable screens.

Art. 7. Ships, whether steam ships or sailing ships, when at anchor in roadsteads or fairways shall exhibit a light which can best be seen, but at a height not exceeding 20 feet above the hull, a white light, in a globular lantern of 8 inches in diameter, and so constructed as to show a clear uniform and unbroken light visible all round the horizon, and at a distance of at least 1 mile.

Art. 8. Sailing pilot vessels shall not carry the lights required for other sailing vessels, but shall carry a white light at the mast-head, visible all round the horizon, and shall also exhibit a flare-up light every 15 minutes.

Art. 9. Open fishing boats and other open boats shall not be required to carry the side lights required for other vessels; but shall, if they do not carry such lights, carry a lantern having a green slide on one side and a red slide on the other side; and on the approach of or to other vessels, such lantern shall be exhibited in sufficient time to prevent collision, so that the green light shall not be seen on the port side, nor the red light on the starboard side.

Fishing vessels and open boats when at anchor, or attached to their nets and stationary, shall exhibit a bright white light.

Fishing vessels and open boats shall, however, not be prevented from using a flare-up in addition, if considered expedient.

*Rules concerning Fog Signals.*—Art. 10. Whenever there is fog, whether by day or night, the fog signals described below shall be carried and used, and shall be sounded at least every 5 minutes; viz.:

a. Steam ships under weigh shall use a steam whistle placed before the funnel, not less than 8 feet from the deck:

b. Sailing ships under weigh shall use a fog horn:

c. Steam ships and sailing ships when not under weigh shall use a bell.

*Steering and Sailing Rules.*—Art. 11. If two sailing ships are meeting end on or nearly end on so as to involve risk of collision, the helms of both shall be put to port, so that each may pass on the port side of the other.

Art. 12. When two sailing ships are crossing so as to involve risk of collision, then, if they have the wind on different sides, the ship with the wind on

the port side shall give way to the other; but if they are abreast of one another, the ship which is to windward shall give way to the other.

Art. 13. If two sailing ships are meeting end on or nearly end on, and the risk of collision is such that each may be obliged to give way to the other, the ship which is to windward shall give way to the other.

Art. 14. If two sailing ships are meeting end on or nearly end on, and the risk of collision is such that each may be obliged to give way to the other, the ship which is to windward shall give way to the other.

Art. 15. If two sailing ships are meeting end on or nearly end on, and the risk of collision is such that each may be obliged to give way to the other, the ship which is to windward shall give way to the other.

Art. 16. Every steam ship shall slacken her speed when necessary; and every sailing ship shall moderate her speed when necessary.

Art. 17. Every vessel shall keep her course, and shall not deviate therefrom, unless in order to avoid collision.

Art. 18. When two vessels are meeting end on or nearly end on, and the risk of collision is such that each may be obliged to give way to the other, the ship which is to windward shall give way to the other.

Art. 19. In order to avoid collision, every vessel shall keep her course, and shall not deviate therefrom, unless in order to avoid collision.

It may, however, be necessary to deviate therefrom in order to avoid collision, so that the green light shall not be seen on the port side, nor the red light on the starboard side.

When by doing so the vessel may be in the danger of collision, the vessel which is to windward shall give way to the other.

The conditions of the collision regulations shall apply to all collisions, whether they be the result of negligence or of accident, and shall be enforced by the courts of law.

With respect to collisions between sailing ships, the regulations shall apply to all collisions, whether they be the result of negligence or of accident, and shall be enforced by the courts of law.

the port side shall keep out of the way of the ship with the wind on the starboard side; except in the case in which the ship with the wind on the port side is close hauled and the other ship free, in which case the latter ship shall keep out of the way; but if they have the wind on the same side, or if one of them has the wind aft, the ship which is to windward shall keep out of the way of the ship which is to leeward.

Art. 13. If two ships under steam are meeting end on or nearly end on so as to involve risk of collision, the helms of both shall be put to port, so that each may pass on the port side of the other.

Art. 14. If two ships under steam are crossing so as to involve risk of collision, the ship which has the other on her own starboard side shall keep out of the way of the other.

Art. 15. If two ships, one of which is a sailing ship, and the other a steam ship, are proceeding in such directions as to involve risk of collision, the steam ship shall keep out of the way of the sailing ship.

Art. 16. Every steam ship, when approaching another ship so as to involve risk of collision, shall slacken her speed, or, if necessary, stop and reverse; and every steam ship shall, when in a fog, go at a moderate speed.

Art. 17. Every vessel overtaking any other vessel shall keep out of the way of the said last-mentioned vessel.

Art. 18. Where by the above rules one of two ships is to keep out of the way, the other shall keep her course, subject to the qualifications contained in the following article.

Art. 19. In obeying and construing these rules, due regard must be had to all dangers of navigation; and due regard must also be had to any special circumstances which may exist in any particular case rendering a departure from the above rules necessary in order to avoid immediate danger.

Art. 20. Nothing in these rules shall exonerate any ship, or the owner, or master, or crew thereof, from the consequences of any neglect to carry lights or signals, or of any neglect to keep a proper look-out, or of the neglect of any precaution which may be required by the ordinary practice of seamen, or by the special circumstances of the case.

It may, however, be proper to state that neither these nor any rules of the sort are to be regarded as inflexible, or to be followed at all hazards. The safety of the ship is the paramount consideration, and no master is justified in abiding by a rule when by doing so he plainly incurs danger. A ship may be in his proper course, but if by pursuing it he will run a great risk of coming into collision with B, who is upon a wrong course, he is bound to alter his course so as to avoid a collision. The fact of one master being ignorant, careless, or in fault, is no reason why another should not use every means in his power to provide for the safety of his ship, and consequently of the lives and property entrusted to his care.

The conditions under which cases of collision take place differ extremely. Thus—1, it may be merely accidental, or be occasioned by circumstances beyond the power of control, as by the violence of the wind or waves dashing or impelling the ships together, without blame being imputable to either party; or 2, it may be owing to the culpable negligence or misconduct of one party; or 3, both parties may be to blame. In adjudicating upon losses growing out of collisions that have taken place under such different circumstances, the conclusions must also be very different.

With respect to the first class of cases there is little apparent difficulty: wherever a loss is occasioned by a storm, a fog, or other accidental

circumstance, without any blame being ascribable to either party, it would appear to be equitable that it should be borne by the sufferer. And this principle having been embodied in the Roman law, was subsequently ingrafted into that of England. (Mershall *On Insurance*, ch. xii., s. 2.) But other authorities, to whom the greatest deference is due, contend that the loss arising from accidental collisions, however it may affect the parties, should be equally divided between them; and this, in fact, is the rule followed in most maritime states. (*Ordonnance* of 1781, lib. iii. tit. xii. art. 10, with the observations of Valin.)

It also is the rule sanctioned by the law of England in cases where both parties are to blame, but where the blame cannot be discriminated. Those cases in which the blame is clearly ascribable to either party present no difficulty.

The leading doctrines of the law of England with regard to collisions have been clearly and succinctly stated by Lord Stowell. 'In the first place,' says his lordship, 'a collision may happen without blame being imputable to either party, as when the loss is occasioned by a storm or any other *vis major*. In that case the misfortune must be borne by the party on whom it happens to light; the other not being responsible to him in any degree. Secondly, a misfortune of this kind may arise where both parties are to blame, where there has been a want of due diligence or of skill on both sides; in such a case the rule of law is, that the loss must be apportioned between them, as having been occasioned by the fault of both of them. Thirdly, it may happen by the misconduct of the suffering party only; and then the rule is, that the sufferer must bear his own burden. Lastly, it may have been the fault of the ship which ran the other down, and in this case the innocent party would be entitled to an entire compensation from the other.' (2 *Dodson's Admiralty Reports*, 83.)

We may add that the rule of the equal division of the damage where both vessels are to blame has been, since Lord Stowell's time, fully recognised and finally established by a decision of the House of Lords on an appeal from Scotland.

Various authorities have spoken disparagingly of the rule now referred to, and have called it a *judicium rusticorum*. And it would, no doubt, be very desirable in cases of collision where both parties are to blame, that the neglect or culpability of each should be accurately determined, and the damages assessed accordingly. But from the obscurity in which such cases are almost always involved, and the conflicting testimony brought forward by the different parties, the difficulties in the way of this being done are usually quite insuperable; and it is better to adopt a rule which, though perhaps less equitable in principle, is fairer in its application than any other that could be adopted. Of its expediency there can, indeed, be no reasonable doubt. The observations of Valin are, in this respect, quite conclusive. 'C'étoit,' says he, 'le moyen le plus propre à rendre les capitaines ou maîtres des navires extrêmement attentifs à éviter tout abordage, surtout ceux des bâtiments faibles et plus susceptibles d'être incommo-dés par le moindre choc, en leur rendant toujours présent la crainte de supporter la moitié du dommage qu'ils en pourroient recevoir. Et si l'on dit qu'il auroit été plus simple et plus court de laisser pour le compte particulier d'un chacun le dommage qu'il auroit reçu, comme provenant d'un cas fortuit; la réponse est qu'alors les capitaines des gros navires n'auroient plus craint de heurter les bâtimens d'une beaucoup moindre force que le leurs: rien donc de plus juste que la contribution par moitié.'

(*Commentaire sur l'Ordonnance de 1681*, li. 179, ed. 1776.)

In apportioning the damage in cases where both parties have been in fault, the question occurs whether the damage done to the cargo shall be taken into account or left out in the estimate on which the apportionment is to be made. This knotty point has been differently decided in different countries. But the rule which limits the liability of owners to the value of the ship and freight applies to cases of damage by collision. [OWNERS.] For further observations on this curious and important subject, in addition to Valin and the other authorities already referred to, the reader may consult the chapter on Collision added by the late Mr. Justice Shee to his edition of Lord Tenterden's work *On the Law of Shipping*, and the chapter on the same subject in Maude and Pollock's *Treatise on the Law of Merchant Shipping*.

*Number of Collisions at Sea.*—A statement has been prepared by Mr. John A. Rucker, underwriter, giving a classification of the number of collisions at sea, reported in Lloyd's Lists during the five years from 1845 to 1849 inclusive. It thence appears that the annual numbers were 603, 564, 639, 533, and 565; so that there was a decrease in 1849, notwithstanding the increased traffic of that year. The total collisions of the five years amounted to 3,064. Of these, 279 were cases in which a vessel was sunk, run down, or abandoned; 189 were cases in which there was serious damage; 686 in which the damage, although less, was still considerable; and 1,910 in which it was only slight. The average of steamers in contact with steamers during each year is about 11; of steamers in contact with sailing vessels about 37; of sailing vessels in contact with steamers 36; and of sailing vessels in contact with sailing vessels 533. [WRECK.]

**COLOCYNTHIS, COLOQUINTIDA, or BITTER CUCUMBER** (Ger. *kolokinten*, *colokinten*; *appel*; Dutch, *bitter-appelen*; Fr. *coloquintes*; Ital. *colocintida*; Span. *coloquintidas*; Arab. and Pers. *Hinnzil*). The produce of an annual plant (*Cucumis colocynthis*, Linn.; Nat. Order *Cucurbitaceae*) growing in Turkey, Nubia, India, and other places, much resembling the cucumber in herbage. When ripe, the fruit is peeled and the pulp is dried in a stove, and in this state is brought to England. It is inodorous, light, spongy, white or yellowish-white, and intensely bitter in taste. It is an exceedingly powerful drastic cathartic. When it is larger than a St. Michael's orange, and has black acute pointed ends, it is not good. (*British Pharmacopœia*, 1867; Ainslie's *Materia Indica*.)

**COLONIES—COLONY TRADE.** Colonies are establishments founded on foreign countries by individuals who either voluntarily emigrate from, or are forcibly sent abroad by, their mother country. The *colony trade* is the trade carried on between colonies and their parent states.

- I. ESTABLISHMENT OF COLONIES.
- II. INFLUENCE OF THE MONOPOLY OF THE COLONY TRADE.
- III. MAGNITUDE, POPULATION, TRADE ETC. OF BRITISH COLONIES.—DISPOSAL OF LAND IN THE COLONIES ETC.
- IV. REGULATIONS UNDER WHICH THE COLONY TRADE IS CONDUCTED.
- V. FOREIGN COLONIES.

#### I. ESTABLISHMENT OF COLONIES.

1. *Greek Colonies.*—Various motives have, in different countries and ages, led to the formation of colonies. Seneca has given, in a few words, a very clear and accurate statement of the different

motives that induced the ancients to found colonies: 'Nec omnibus eadem causa relinquendi quærendique patriam fuit. Alios exçidia urbium suarum, hostilibus armis elapso, in aliena, spoliato suis, expulerunt: Alios domestica seditio submovit: Alios nimia superfluentis populi frequentia, ad exonerandas vires, emisit: Alios pestilentia, ad frequens terrarum hiatus, aut aliqua intoleranda infelicitas soli eçecerunt: Quosdam fertilis oræ, et in majus laudate, fama corrupit: Alios alia causa exçivit domibus suis.' (*Cicero, ad Helviam*, c. 6.)

The Greek colonies of antiquity seem to have been chiefly founded by citizens whom the violence and fury of contending factions forced to leave their native land; but they were sometimes formed for the purpose of relieving the mother country of a redundant population, and sometimes also for the purpose of extending the sphere of commercial transactions, or of providing for their security. The relations between the mother country and the colony depended, in a great measure, on the motives which led to the establishment of the latter. When a colony was founded by fugitives forcibly expelled from their ancient homes; or when it was founded, as was frequently the case, by bodies of voluntary emigrants, who received no assistance from, and were in no respect controlled by, the parent state, it was, from the first independent; and even in those rarer cases in which the emigration was conducted under the superintendence of the parent city, and when the colony was protected by her power and influence, the dependence was, mostly, far from being absolute and complete. The great bulk of the Greek colonies were really independent states; and though they commonly regarded the land of their forefathers with stillal respect, though they yielded to its civil place of distinction at public games and solemnities, and were expected to assist in time of war, they did so as allies only, on fair and equal terms, and never as subjects. Owing to the freedom of their institutions, and their superiority in the arts of civilised life to the native inhabitants of the countries among whom they were generally placed, these colonies rose, in a comparatively short period, to a high pitch of opulence and refinement; and many among them, as Miletus and Ephesus in Asia Minor, Syracuse and Agrigentum in Sicily, and Tarentum and Locri in Italy, not only equalled, but greatly surpassed, their mother cities in wealth and power.

2. *Roman Colonies.*—The Roman colonies were, for the most part, founded by and under the authority of government; being intended to serve both as outlets for poor and discontented citizens, and as military stations, or garrisons, to secure the subjection of the conquered provinces over which they were scattered. The most intimate political union was always maintained between them and the mother city. Their internal government was modelled on that of Rome; and, while their superior officers were mostly sent from the capital, they were made to contribute their full quota of troops and taxes, to assist in carrying on the contests in which the Republic was almost constantly engaged.

3. *Spanish Colonies.*—The early colonies of most modern nations were founded by private adventurers, influenced either by the hope of gain, or by a desire to escape from religious persecution, without any wish to relieve the mother country of a surplus population or to bridle subjugated provinces. On their first institution, therefore, the modern colonies approached, though with some essential variations, more nearly to the Grecian than the Roman model; but the period of their

freedom was very soon in the measure supposed, those of the founders eagerly part in the view of the most exclusive countries; aboriginal arts of civilisation were

The Spaniards after its discovery the country gold and silver universally prising commodities instead of en which they n only to enrich and defence their possessions the most exas spread through rurers arrived, enquiry was, did, they rem country; if n other quarter, divertit is the porary writer of Grynæus, p Spanish colonies principally be and silver acce soon exhausted successive swar to pour into th to the unproduc of mining. freedom was of very limited duration. They were very soon subjected to laws and regulations framed in the metropolis, and calculated, as was to be supposed, rather to promote its interests than those of the colony. At a somewhat later period the foundation of colonial establishments was eagerly patronised by most European governments, in the view of extending commerce, and of enriching the mother country by securing to her the exclusive possession of the market of distant countries; and where, from the thinness of the aboriginal population, or their inferiority in the arts of civilised life, the colonists were enabled to amass fortunes with comparative rapidity.

The Spaniards who first resorted to America after its discovery had no intention of settling in the country or of colonising it. The idea that gold and silver alone constituted wealth was then universally prevalent; and the bold and enterprising companions and followers of Columbus, instead of engaging in industrious undertakings, which they neither understood nor relished, sought only to enrich themselves by plundering the feeble and defenceless natives of the gold and silver in their possession, and of the abundance of which the most exaggerated accounts were immediately spread throughout Europe. When new adventurers arrived on an unknown coast, their single enquiry was, whether it abounded in gold. If it did, they remained, for some time at least, in the country; if not, they immediately set sail for some other quarter. *Auri rubida sitis a cultura Hispanos divertit* is the expressive statement of a contemporary writer (Petrus Martyrus, in the *Novus Orbis* of Gryneus, p. 511). The slow progress of the Spanish colonies, after their first discovery, must principally be ascribed to this cause. The gold and silver accumulated by the natives were very soon exhausted; and the skill and energy of the successive swarms of adventurers, who continued to pour into the country, were principally directed to the unproductive and generally ruinous trade of mining. The few large fortunes that were made in this way, like the large prizes in a lottery, inflamed the avidity of the multitude, and gave an appearance of credibility to the fabulous accounts of the excessive productiveness of the mines. After the gambling spirit which had exclusively actuated the early adventurers had begun to subside, the colonists gradually betook themselves to agricultural and commercial pursuits; and the vast variety of valuable productions with which Mexico and the other Spanish colonies abound, the extreme richness of the soil, and their advantageous situation, would, had they been only tolerably well governed, have occasioned their rapid increase in wealth and civilisation. But a blind and intolerant despotism paralysed their energies, and fettered and retarded their progress. All the abuses and defects of the government of old Spain were transferred to, and multiplied in, the colonies. The whole property of those vast regions was considered as vested in the crown of Spain; and every law or regulation, whether of a local or general nature, affecting their government, emanated from the Council of the Indies, in which it was supposed the king was always present. We cannot stop to describe the sort of regulations to which the colonists were subjected with any degree of minuteness; but we may notice a few of them, to furnish the means of judging of their general spirit and probable effect. It was, for example, made a capital offence to carry on any intercourse with foreigners; and the inhabitants of the different colonies were even forbidden any intercourse with each other, unless under the strictest and most vexatious regulations. There were several arti-

cles, such as flax, hemp, and wine, which they were not permitted to cultivate; at the same time that the crown reserved to itself the monopoly of salt, tobacco, gunpowder, and some other less important articles. The alcavala, and other oppressive imposts, which had proved destructive of industry in old Spain, were rigorously levied as well on the exports as on the imports of the colonies. No situation of power or emolument could be filled except by a native of old Spain. The Catholic religion was established, to the exclusion of every other; and bishops, tithes, and the Inquisition followed in its train: while, in order still better to consolidate and strengthen the foundations of this monstrous despotism, the government endeavoured to make the colonists insensible of their degradation by procribing every species of instruction, and watchfully opposing the introduction and progress of all useful knowledge!

Under such circumstances we cannot be surprised that the Continental colonists, among whom the monopoly system was maintained in its greatest purity, should have languished for above two centuries in a state of sluggish inactivity. Though surrounded by all the means of producing wealth, they were not generally wealthy. Oppression rendered them indolent, and went far to deprive them not only of the power, but also of the wish, to emerge from poverty. The progress of the colonists who occupied the West India islands was not quite so slow. It is certain, however, that down to the middle of last century Spain reaped no greater advantage from the possession of Cuba, Hispaniola, and Porto Rico than England or France from the smallest of its dependencies. In proof of this we may mention that the noble island of Cuba, which could without difficulty supply all Europe with sugar, did not in 1750 produce a sufficient quantity even for the consumption of old Spain. But the combined influence of an arbitrary and intolerant government and of a degrading superstition could not balance the means of improvement which the fertility of the soil, and the command thence arising over most of the necessaries and many of the conveniences of life, gave to the colonists. Owing also to the total incapacity of old Spain to furnish her Transatlantic provinces with a sufficient supply of the articles she had forced them to import from Europe, and the consequent extension of the contraband trade carried on with them by the other European nations, she had been compelled gradually to relax the severity of her commercial monopoly. A new impulse was thus given to the spirit of industry. The colonists began to be more sensible of the natural advantages of their situation, and less inclined to submit to the blind and bigoted policy of the Spanish court. In 1781 a rebellion broke out in Peru, in consequence of an attempt made by the government to establish a new monopoly in that province, which threatened to end in the total dissolution of the connection between Spain and South America, and was not quelled without great difficulty and much bloodshed. But the spirit of liberty, when once excited, could not be suppressed. It continued to gain ground progressively, until the commencement of the late contest between France and Spain interrupted the communication with the mother country, and gave the colonists an opportunity of proclaiming that independence which, after a lengthened and bloody struggle, they happily succeeded in achieving.

4. *British Colonies.*—The English, who, like all the other nations of Europe, had been impressed with mingled feelings of admiration and envy by the extent and importance of the acquisitions

made by the Spaniards in the New World, speedily entered with enthusiasm and ardour into the career of discovery. Owing, however, to the bull which Ferdinand and Isabella had obtained from the Pope, conveying to them the ample donation of all the countries inhabited by infidels that the Spaniards had discovered, or might discover, the English, to avoid encroaching on the dominions of their rivals, directed their efforts farther to the north. Several attempts to found colonies on the coast of America were made in the reign of Elizabeth by Sir Humphrey Gilbert, Sir Richard Grenville, Sir Walter Raleigh, and others. But in consequence of their ignorance of the country, the deficiency of their supplies of provisions, the loss of time in fruitless searches after gold, and the various difficulties incident to the first settlement of a colony, none of these attempts proved successful; and it was not until 1607 that a small body of adventurers founded the first permanent establishment of the English in America, at James Town in Virginia. Letters patent were granted in 1609 by King James to the principal persons, resident in London, by whom the expense attending the formation of the colony was to be defrayed, incorporating them into a company, and establishing a council in England for the direction of their proceedings, the members of which were to be chosen by, and removable at the pleasure of, the majority of the partners of the company; permitting whatever was necessary for the support and sustenance of the colony for the first seven years to be exported free of duty; declaring that the colonists and their descendants were to be secured in all the rights and privileges of Englishmen, the same as if they had remained at home, or been born in England; and reserving only, as the stipulated price of these concessions, and in imitation of the policy of the Spaniards, *one fifth* part of the gold and silver ore to be found in the colonies, which was to be paid to his Majesty and his successors in all time to come. In virtue of these powers, the company issued in 1621 a charter or ordinance, which gave a legal and permanent form to the constitution of the colony. By this charter the supreme legislative authority was lodged, partly in the governor, who held the place of the sovereign, partly in a council of state named by the company, and partly in a general council or assembly composed of the representatives of the people, in which were vested powers and privileges similar to those of the House of Commons. It was not long, however, before the king and the company quarrelled. The latter were in consequence divested of all their rights, partly by open violence and partly under colour of law, without compensation, after having expended upwards of 150,000*l.* in founding the colony; and a governor and council of state appointed by the king succeeded to the powers of those appointed by the committee. (Robertson's *History of America*, book ix. *passim*; Jefferson's *Notes on Virginia*, p. 179.)

The founders of the colony in Virginia had been actuated solely by the hopes of gain; but the colonies that were soon after established in New England were chiefly planted by men who fled from religious and political persecution. The form of government in the New England colonies, though at first modified a good deal by the peculiar religious opinions entertained by the colonists, was in its leading principles essentially free. For a considerable period the colonists elected their own governors, coined money, and exercised most of the rights of sovereignty; while the English, wholly engrossed with the contest between freedom and prerogative at home, had no leisure to attend to their proceedings. Subse-

quently to the Restoration, however, the governments of most of the New England states were established nearly on the same footing as that of Virginia; which, indeed, became the favourite model, not only for the constitution of the colonies established on the Continent, with the exception of the proprietary governments of Pennsylvania and Maryland, but also for those that were established in the West India islands. But under every vicissitude of government and fortune the New England colonists were distinguished by the same ardent and enthusiastic love of liberty that had first induced them to quit their native land. Every thing relating to the internal regulation and administration of the different colonies was determined, in the colonial assemblies, by representatives freely chosen by the settlers. The personal liberty of the citizens was well secured and vigilantly protected. And, if we except the restraints on their commerce, the monopoly of which was jealously guarded by the mother country, the inhabitants of Virginia, Pennsylvania, and New England enjoyed nearly the same degree of freedom, when colonists of England, that they now enjoy as citizens of the powerful republic of North America. Their progress in wealth and population was in consequence quite unprecedented in the history of the world. The white population of the colonies had increased in 1776, at the commencement of the revolutionary war, to above 2,000,000, and the value of the exports from Great Britain to them amounted to about 1,300,000*l.* a year!

It is not difficult to discover the causes of the unexampled prosperity and rapid growth of our North American colonies, and generally of all colonies placed under similar circumstances. The North American colonists carried with them a knowledge of the arts and sciences practised by a civilised and polished people. They had been trained from their infancy to habits of industry and subordination. They were practically acquainted with the best and wisest form of civil polity that had been established in Europe; and they were placed in a situation that enabled them, without difficulty, to remedy its defects, and to try every institution by the test of utility. But the thinness of the aboriginal population, and the consequent facility of obtaining inexhaustible supplies of fertile and unoccupied land, must certainly be placed at the head of all the causes which have promoted the rapid increase of wealth and population in the United States, and in all the other colonies both of North and South America. On the first foundation of a colony, and for long after, each colonist gets an ample supply of land of the *best quality*; and having no rent, and scarcely any taxes, to pay, his industry necessarily becomes exceedingly productive, and he has every means, and every motive, to amass capital. In consequence he is eager to collect labourers from all quarters, and is both willing and able to reward them with high wages. But these high wages afford the means of accumulation, and, joined to the plenty and cheapness of the land, speedily change the more industrious labourers into proprietors, and enable them, in their turn, to become the employers of fresh labourers; so that every class participates in the general improvement, and capital and population advance with a rapidity hardly conceivable in old settled and fully peopled countries.

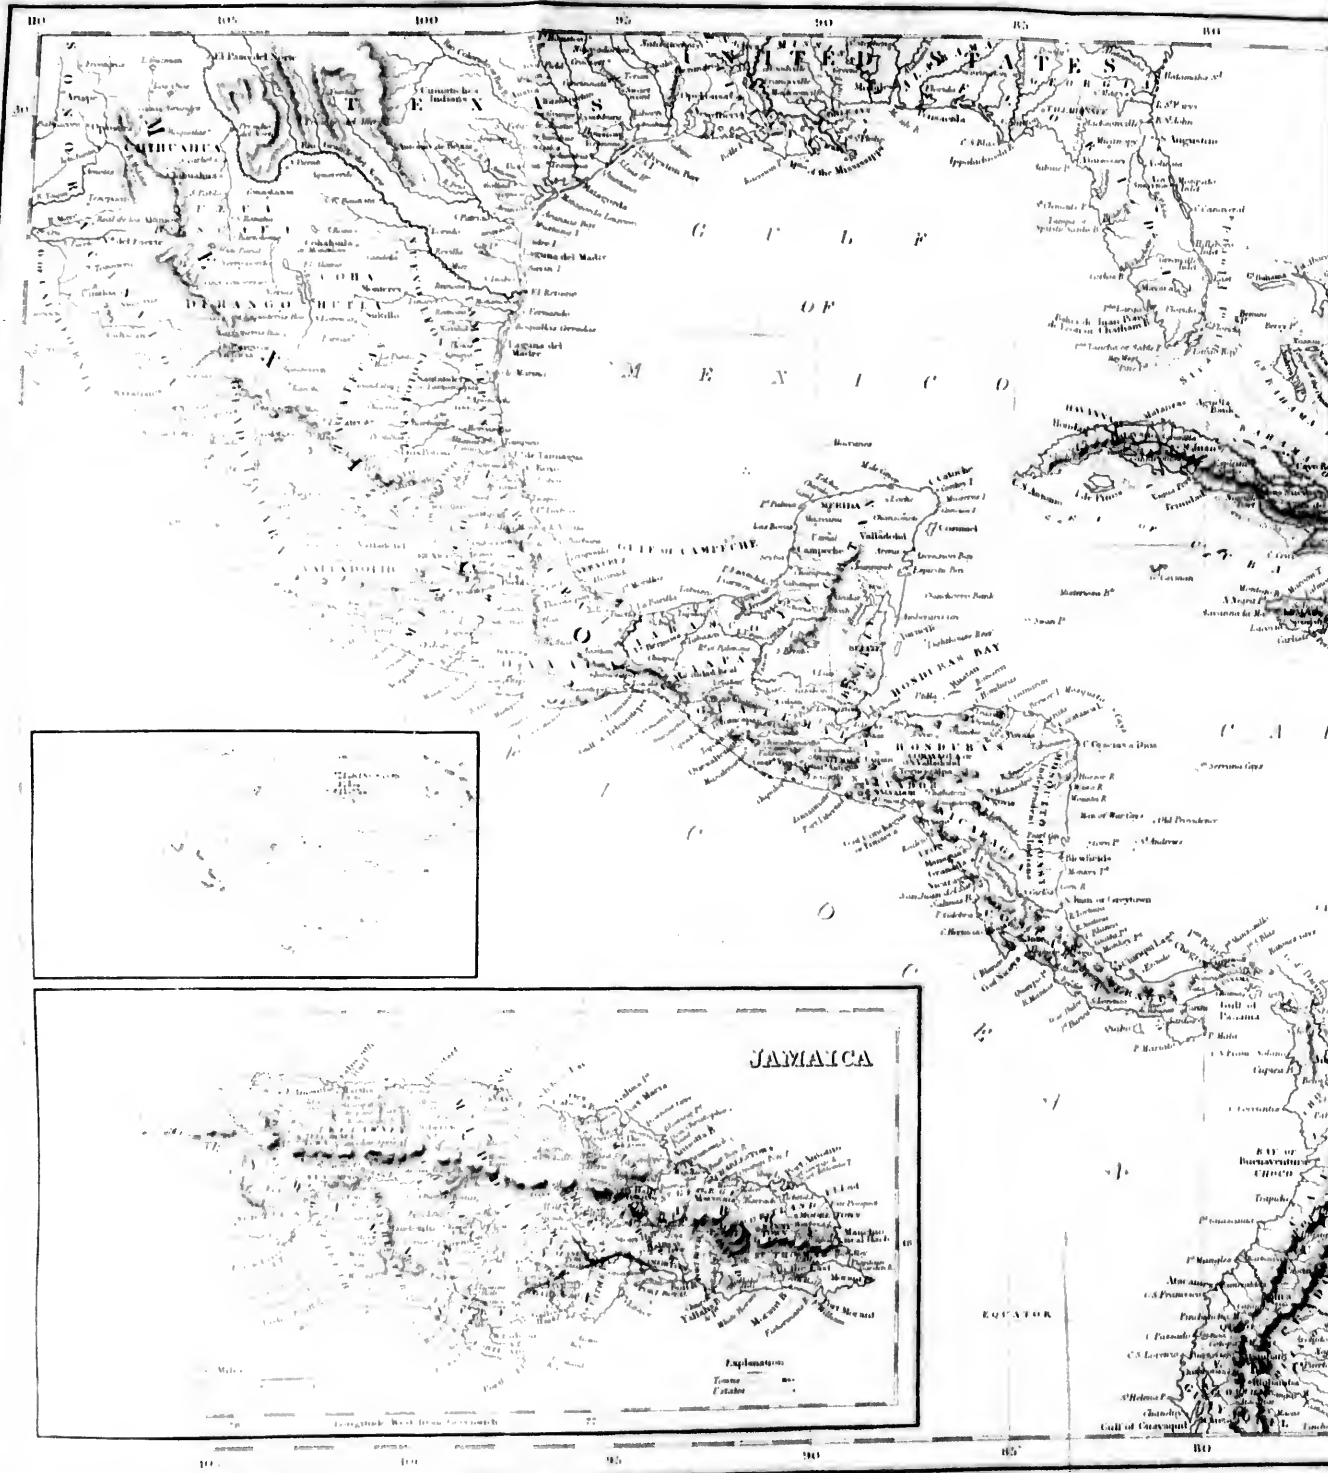

It has been frequently said that the establishment of our American and West India colonies was a device of the supporters of the exclusive mercantile system—that they founded them in the view of raising up a vast agricultural population

whose commerce should be confined entirely to an exchange of their raw products for our manufactured goods. There is, however, no truth in these assertions. On the contrary, the charters granted to the founders of the settlement in Virginia distinctly empower the colonists to carry on a direct intercourse with foreign states. Not were they slow to avail themselves of this permission; for they had, so early as 1620, established tobacco warehouses in Middleburg and Flushing (Robertson's *America*, book ix, p. 104); and the subsequent proceedings of the British Government, depriving them of this freedom of commerce, were the chief cause of those disputes which broke out in 1776, in an open rebellion of ominous and threatening import. (Robertson's *America*, p. 147.) It was not until the colonists had surmounted the difficulties and hardships incident to their first establishment, and had begun to increase rapidly in wealth, that their commerce became an object of importance, and that regulations were framed in the view of restricting its freedom, and of rendering it peculiarly advantageous to the mother country. The Act of 1650, passed by the republican Parliament, laid the first foundations of the monopoly system, by confining the import and export trade of the colonies exclusively

British or colony built ships. But the famous Navigation Act of 1660 (12 Chas. II. c. 18) went much further. It enacted that certain specified articles, the produce of the colonies, and since well known in commerce by the name of *enumerated* articles, should not be exported directly from the colonies to any foreign country, but that they should first be sent to Britain, and there unladen (the words of the Act are, *land upon the shores*), before they could be forwarded to their final destination. Sugar, molasses, ginger, fustic, tobacco, cotton, and indigo were originally enumerated, and the list was subsequently enlarged by the addition of coffee, hides and skins, iron, corn, lumber &c. In 1739 the monopoly system was so far relaxed that sugars were permitted to be carried directly from the British plantations to any port or place southward of Cape Finistere; but the conditions under which this indulgence was granted continued so strict and numerous down to 1803, when they were a good deal simplified, as to render it in a great degree nugatory (Edwards's *West Indies*, vol. ii, p. 152, ed. 1819); and with this exception, the oppressive and vexatious restrictions on their direct exportation to foreign countries were maintained on most of the other *enumerated* commodities of any importance down to a late period.

But besides compelling the colonists to sell their produce exclusively in the English markets, it was next thought advisable to oblige them to buy such foreign articles as they might stand in need of entirely from the merchants and manufacturers of England. For this purpose it was enacted, in 1663, that no commodity of the growth, production, or manufacture of Europe shall be imported into the British plantations but such as are laden and put on board in England, Wales, or Berwick upon Tweed, and in English built shipping, whereof the master and three-fourths of the crew are English. The preamble to this statute, which effectually excluded the colonists from every market for European produce except that of England, assigns the motive for this restriction to be "the maintaining a greater correspondence and kindness between the subjects at home and those in the plantations; keeping the colonies in a firmer dependence on the mother country; making them yet more beneficial to it, in the further employment and increase of English shipping, and the vent of

English manufactures and commodities; rendering the navigation to and from them more safe and cheap; and making this kingdom a staple, not only of the commodities of the plantations, but also of the commodities of other countries and places for their supply; it being the usage of other nations to keep their plantation trade exclusively to themselves."

It was also a leading principle in the system of colonial policy, adopted as well by England as by the other European nations, to discourage all attempts to manufacture such articles in the colonies as could be provided for them by the mother country. The history of our colonial system is full of efforts of this sort; and so essential was this principle deemed to the idea of a colony, that Lord Chatham did not hesitate to declare, in his place in Parliament, that "the British colonists of North America had no right to manufacture even a nail for a horse-shoe!" (Edwards's *West Indies*, vol. ii, p. 366.) And when such were the enactments made by the Legislature, and such the avowed sentiments of a great parliamentary leader and a friend to the colonies, we need not be surprised at a declaration of the first Lord Sheffield, who did no more, indeed, than express the opinion of almost all the merchants and politicians of his time, when he affirmed that "THE ONLY USE OF AMERICAN COLONIES OR WEST INDIA ISLANDS IS THE MONOPOLY OF THEIR CONSUMPTION, AND THE CARRIAGE OF THEIR PRODUCE!"

## II. INFLUENCE OF THE MONOPOLY OF THE COLONY TRADE.

1. It is not necessary to enter into any lengthened discussions with respect to this part of our subject. The rules by which we are to form our judgment upon it are unfolded in the article Commerce. Here it is sufficient to observe, in the first place, that, though it could be shown that restrictions on the colony trade were really advantageous to the mother country, that is not enough to prove that they should be adopted. In dealing with a colony, we are not dealing with a foreign country, but with an integral part of our own empire. And hence, in order to show that restrictions on the colony trade are advantageous, it must not merely be shown that they are beneficial to the mother country, but it must further be shown that they are beneficial, or, at all events, not injurious, to the colony. The advantage of one part of the empire is not to be purchased by the depression of some other part. The duty of Government is to promote the prosperity and to maintain the equal rights and privileges of all; not to enrich one class or one province at the expense of others.

This principle is decisive of the whole question. Owing to the identity of language, manners, and religion, the merchants of the mother country must always have very great advantages in the colony markets; and if the commodities which they have to sell be about as suitable for them, and as low priced, as those of others, none else will be imported into them; but if they be not, it would plainly be to the injury of the colony to compel her to buy from the mother country what she might procure cheaper from others. It will immediately be seen that such forced sale could be of no real advantage to the mother country; but whether that were so or not, its mischievous influence upon the colony is manifest. Were Jamaica, for example, obliged to import any article from England which cost her 100,000*l.* a year more than she could procure a similar article for elsewhere, she would manifestly lose this amount; and though it were true that every shilling of this sum found its way as *extra profit* into the pockets

of the merchants or manufacturers of England, that would be no sufficient justification of the policy of such a system. The protection due by a government to its subjects does not depend on the varying degrees of latitude and longitude under which they happen to live. It would not be more glaringly unjust to lay peculiar burthens on the Lothians for the sake of Middlesex, than it is to lay them on Jamaica for the sake of England.

In point of fact, however, the monopoly of the colony trade is of no real use, but the reverse, to the mother country. If, as has been already observed, she can supply her colonists with goods as cheaply as they can be supplied by others, she will have no competitors in their markets; and if she cannot do this, the monopoly is really hostile to her interests. Each country has some natural or acquired capabilities that enable her to carry on certain branches of industry more advantageously than any one else. But the fact of a country being liable to be undersold in the markets of her colonies shows conclusively that, instead of having any superiority, she labours under a disadvantage, as compared with others, in the production of the peculiar articles in demand in them. And hence, in providing a forced market in the colonies for articles that we should not otherwise be able to dispose of, we really engage a portion of the capital and labour of the country in a less advantageous channel than that into which it would naturally have flowed. We impress upon it an artificial direction, and withdraw it from those secure and really beneficial businesses in which it would have been employed, to engage it in businesses the existence of which depends only on the continuance of oppressive regulations, and in which we are surpassed by foreigners.

Even were it conceded that the possession of an outlet in the colonies for goods that could not otherwise be disposed of was an advantage, it is one that can exist in theory only. Practically it can never be realised. The interests of the colonists, and the dexterity and devices of the smuggler, are too much for Custom-house regulations. Cheap goods never fail of making their way through every obstacle. All the tyrannical laws and *guardacostas* of Old Spain did not hinder her colonies from being glutted with prohibited commodities; and we may be assured that the moment a competitor appears in the field capable of supplying the Canadians and people of Jamaica with cottons, woollens, hardware &c. cheaper than we can supply them, that moment will they cease to be our customers. All the revenue officers, and all the ships of England, supposing them to be employed for that purpose, would be unable to avert this result.

The consequences of the American war should have led to sounder opinions than those that are still current as to the value of the monopoly of the colony trade. Has the independence of the United States been in any respect injurious to us? So far from this, it is certain that it has redounded materially to our advantage. We have been relieved from the expense and trouble of governing extensive countries at a great distance from our shores, at the same time that we have continued to reap all the advantage that we previously reaped from our intercourse with them. It is visionary to imagine that we could have succeeded either in preventing them from establishing manufactures at home, or from importing products from abroad, had any one been able to undersell us. Our command of the American market depends, at this moment, on the very same principle—the comparative cheapness of our goods—in which it depended when we had a governor in

every state. So long as we preserve this advantage, we preserve the only means by which the monopoly of any distant market can be maintained, and the only means by which such monopoly is rendered of the least advantage.

Being integral parts of the empire, the trade with the colonies should, as far as circumstances will permit, be conducted on the footing of a coasting trade. The state of the revenue requires that moderate duties should be laid on sugar, coffee, and rum, when imported into Great Britain or Ireland; but the duties on cotton, cocoa, and most other colonial products might be repealed without injury to the revenue, and with advantage to all parties. Unfortunately, however, the system we pursued down to a late period was in most respects the reverse of what it should have been. By excluding the colonists from the cheapest markets for their food and lumber, we artificially raised the cost of their produce; and then, to protect them from the consequences of such shortsighted policy, we gave them a monopoly of the British market! It is thus that one unjust and vicious regulation is sure to give birth to others, and that those who depart from sound principle have nothing left but to endeavour to bolster up one absurdity by another. It is time, surely, that an end were put to every vestige of so ruinous a system. It is as much for the interest as it is the duty of England to remove all restrictions from the colonists, not essential for the sake of revenue, for this is the only means by which she can provide for their real prosperity, by turning their industry into those departments for the prosecution of which they are naturally fitted, and rid herself of those monopolies that form the heaviest drag upon her industry.

We could not, however anxious, exclude manufactured articles, and such foreign goods as are valuable without being very bulky, from our West India islands, provided they were offered cheaply to others. But such is not the case with lumber, provisions &c. They are too bulky to be easily smuggled, and may be, and indeed were very much raised in price by restrictions on their importation. For many years all direct intercourse between our West India colonies and the United States was interdicted; and, in consequence, the planters were compelled either to supply themselves with lumber, staves &c. by a distant voyage from Canada, or, which was by far the most common practice, from the United States, through the circuitous and expensive channel of St. Thomas and other neutral islands! In papers laid by the West India merchants and planters before the House of Commons (No. 129, Session 1831), the estimated increased expense they thus incurred on lumber, staves, flour, shingles, fish &c. at 10 per cent. of the entire value of these articles, or a-187,576*l.* a-year. And it will be observed that a part of this sum went into the pockets of any British merchant—it went wholly to indemnify the Americans and others for being obliged to bring their products round about by St. Thomas instead of direct from the States.

This system grew out of the American war, but it is due to Mr. Pitt to state that it received no countenance from him. On the contrary, he introduced a bill, in 1785, for reviving the beneficial intercourse that existed, previously to the war, between the United States and the West India islands. But being opposed by a powerful party in Parliament, and by the ship-owners and Canada merchants, he was obliged reluctantly to withdraw the bill. The following remarks of Mr. Bryan Edwards on this subject, written in 1794, are too interesting to be omitted:—

'This,' says he, 'is not a business of selfishness or faction; nor (like many of those questions which are daily moved in Parliament merely to agitate and perplex Government) can it be dismissed by a vote. It will come forward again and again, and haunt administration in a thousand hideous shapes, until a more liberal policy shall take place; for so folly can possibly exceed the notion that any measures pursued by Great Britain will prevent the American states from having, some time or other, a commercial intercourse with our West Indian territories on their own terms. With a chain of coast of 20° of latitude, possessing the finest harbours for the purpose in the world, all lying so near the sugar colonies and the track to Europe, with a country abounding in everything the islands have occasion for, and which they can obtain no where else—all these circumstances necessarily and naturally lead to a commercial intercourse between our islands and the United States. It is true we may ruin our sugar colonies, and ourselves also, in the attempt to prevent it; but it is an experiment which God and nature have marked out as impossible to succeed. The present restraining system is forbidding men to help each other; men who, by their necessities, their climate, and their productions, are standing in perpetual need of mutual assistance, and able to supply it.' (*Hist. West Indies*, Preface to 2nd ed.)

We also thought fit to interdict the West Indians from the refining, or, as it is technically termed, the *claying* of sugars. This is one of the few manufactures that might be advantageously set up in the islands. The process adds considerably to the value of sugar; and it might be carried on in the buildings, and by the hands, that are required to boil the cane or to prepare the raw or muscovado sugar. Instead, however, of being allowed to refine their sugars on the spot, and where it might be done for a third part of the expense that is required in England, the planters were prohibited from engaging in this branch of industry, and obliged to export all their sugars, either raw or crushed, to England. Nothing could exceed the oppressiveness of such a regulation; and what is most singular, it has not been enforced, like most regulations of the sort, in order to bolster up any of the leading interests of the country, but merely to give a factitious employment to a very small class—that of the sugar refiners, whose natural residence is in the West Indies. The planters and merchants estimated (in 1830) the loss caused by this preposterous regulation at 75,550*l.* a year; but this prohibition has at length been withdrawn.

The distillation of spirits from sugar, that used to be only occasionally, is now always allowed. The duties having been adjusted so as to give no advantage to the planters over the growers of barley, or to the latter over the former, the distillers have been permitted to distil indiscriminately from sugar, molasses, or grain. It was the business of Government to take care that the duties should be so arranged as to give no unfair advantage to one party over another; but, having done this, it could, with propriety, do nothing more. To prohibit distillation from sugar, that a forced market may be opened for grain; or distillation from grain, that a forced market may be opened for sugar; are interferences with the freedom of industry, for which no good reason has been, nor, we believe, can be assigned.

2. *Relaxation of the Monopoly.*—But though something still remains to be done, it is not to be denied that great progress has been made towards the adoption of a sound system of colonial policy since 1822, when measures for the relaxation of

the monopoly were introduced by Mr. Robinson (afterwards Lord Ripon). These measures were farther followed up by Mr. Huskisson in 1825, by the Act 6 Geo. IV. c. 114; and since his time by the 3 & 4 Wm. IV. c. 59, and more recently by the 5 & 6 Vict. c. 19, which came into operation in the West Indies on April 5, 1843. These Acts repealed several of the prohibitions that formerly existed against the importation of certain articles into the West Indian colonies and the Mauritius, and they also either repealed or very materially reduced the duties that were previously laid on others. For example, the barrel of American or other foreign flour, that down to 1843 paid a duty of 5*s.*, has since been imported on paying in some cases a much lower duty. Most other duties on articles of food have been reduced in the same proportion; and rice, wood, and lumber, articles of great importance in the colonies, which formerly paid high duties, may now be imported duty free. (See *post.*) We believe, indeed, that it would be sound policy to carry still farther this liberal system, by entirely repealing the duties on flour, salt, meat, and all other articles of provision. Jamaica and our other West Indian colonies may be viewed as immense sugar, rum, and coffee manufactories, which, though situated at a distance from England, belong to Englishmen, and are carried on by English capital. But to promote the prosperity of any manufacture without injury to others, there are no means at once so obvious and effectual as to give those engaged in it the means of carrying it on with the least outlay, and to keep the duties on its produce as low as possible. And, how much sorer we may feel in the last of these necessary conditions, we have now but little to reproach ourselves with in regard to the former. It were better, perhaps, that the duties on necessities imported into the colonies should be repealed; but if they are to be retained, those imposed by the late Act are as moderate as can well be desired.

Formerly, though American and other foreign flour could not be imported from a foreign country into the West India Islands without paying a duty of 5*s.* a barrel, it might be imported free of duty into Canada and our other possessions on the continent of N. America, and be thence exported in British ships to the islands free of duty. In consequence of this regulation a large proportion of the flour, lumber, and other articles required for the supply of the islands, instead of being shipped direct for them from New Orleans, Baltimore, and other American ports, was sent in the first instance to Canada, whence it was conveyed in British ships to its final destination. So that the influence of the duty was not so much to raise a revenue, or to open a market for the flour, provisions, and lumber of Canada, as to make the flour and other necessities supplied to the colonists by the United States be carried, at a heavy expense, a roundabout voyage of some 2,000 miles and transhipped, that employment might be found for a few thousand tons of British and colonial shipping! But this preposterous system is happily at an end. American flour is now (1848) charged with a duty of 25 cents per 100 lbs. in Canada; and, independently of this, the duties on foreign articles directly imported into the colonies are too low to give any encouragement to their indirect conveyance.

It was, however, not a little singular, that while the Imperial Legislature had thus endeavoured, by repealing and lowering the duties on most articles of foreign produce, to provide for the future prosperity of the colonies, the Legislature of Jamaica should have passed an Act imposing heavy

duties on the same articles. Luckily, this impolitic Act expired on December 31, 1843, and Government most properly directed the Governor to refuse his assent should it be attempted to renew it, or to propose any similar measure. (*Parl. Paper*, No. 292, Sess. 1843.)

For a lengthened period concession was entirely on the one side; and while we had all but emancipated the trade of the colonies, and allowed them to resort to all the markets of the world, we confined our demand for colonial produce exclusively to their markets. So long, indeed, as the colonists were compelled to take all that they wanted from us, it was but fair that we should be compelled to take the sugar and other articles with which they could supply us exclusively from them. But having liberated them from this obligation and permitted them to resort to whatever markets they thought most advantageous, there was neither justice nor policy in continuing to confine the people of the United Kingdom to their markets. Thus, of all possible cases, is that in which reciprocity would seem to be most desirable. If it be right, as no doubt it is, that the planters of Jamaica should, if they deem it most for their interest, be allowed to draw supplies of flour, provisions, and manufactured goods from New Orleans or Baltimore, on what pretence is the British manufacturer or merchant to be prevented from importing sugar from Rio, the Havannah, or Batavia?

Having done so much to abolish prohibitions on one side, we were bound to do as much for their abolition on the other. Having deprived the merchants and manufacturers of the United Kingdom of the monopoly of the colony market, we could not, without violating every principle of consistency and justice, refuse to deprive the colonists of the monopoly of the British markets. Indeed the ablest and most zealous defenders of the colony system have admitted that one part of it could not be supported independently of the rest, that it is of a piece, and must either stand or fall together. 'The British dominions,' says Lord Sheffield, 'are as much entitled to the markets of the British West Indies as the latter are entitled to those of the former; and whenever that monopoly is given up, it will be the highest absurdity not to open all the British ports to foreign raw sugars.' (*Observations on the Commerce of the American States*, p. 288.) Inasmuch, indeed, as the well-being and prosperity of the people of the United Kingdom is of incomparably more importance than that of the West Indian colonists, every argument that has been or that may be brought forward to show the impolicy of the restraints on the trade of the latter applies with tenfold force to those laid on the trade of the former.

*Influence of the Monopoly on the Sugar, Timber &c. imported into the United Kingdom.*—It appears from the official returns given in the *Parl. Paper* No. 226, Sess. 1843, that during the three years ending with 1842, 3,840,269½ cwt. sugar were annually retained for home consumption in the United Kingdom; and it farther appears, from the same return, that while the average price of British muscovado sugar during that period was 41s. 10½d. per cwt., the average price of Brazil sugar was only 29s. 2d. per cwt. Hence it follows that had the then prohibitory duty of 63s. per cwt. on foreign sugar been reduced to the same level (24s.) as that on British colonial sugar, we might have purchased the same supply of sugar for 29s. 2d. per cwt. that cost us 41s. 10½d., which, on the average quantity consumed during the three years referred to, would have been a total saving in this single

article of no less than 4,168,335s. a-year! But it may, perhaps, be said, that, had our ports been open to the free importation of Cuban and other foreign sugars, the price of the latter would have been raised; and so, probably, it would; though, considering the vast extent and productiveness of the field from which sugar may now be brought, we doubt whether this effect would have been very sensible. But supposing that the opening of our ports had raised the price of foreign sugar from 20s. 2d. to 25s. per cwt., still the saving would have amounted to 3,240,269s. 6s. a-year! [ST. GEORGE.]

We are, however, glad to say that this oppressive system has been abandoned. Foreign sugar is now admitted, without regard to its origin, on payment of reasonable duties, which were reduced in 1834 to the same level with those on limited colonial sugar. Probably, indeed, we have gone, in this case, from one extreme to another, by considering the difficulties under which the British colonists are placed from the want of supplies of compulsory labour, it may be doubted whether they were not entitled to a reasonable discriminating duty in their favour.

The extraordinary preference shown to colonial sugar was, on the whole, probably less objectionable than that shown to colonial timber, the latter having been, for a lengthened period, admitted into our markets at a nominal duty of 1s. per load, while Baltic and other foreign timber was subjected to a duty of 25s. per load! In 1851, however, the duties on foreign timber were reduced to 7s. 6d. per load, and in 1866 all the timber duties were repealed, the colonies and foreign countries having been put on the same level in 1864.

The expense of the colonies is, also, a very heavy item in the national expenditure—far more so than is generally supposed. Not only have we been subjected to discriminating duties on foreign articles, that similar articles from the colonies might enjoy the monopoly of our markets, but we have to defray a very large sum on account of their military and naval expenditure. There is no means by which to estimate the precise amount of this expense; but it is, notwithstanding, abundantly certain that Canada and the islands in the West Indies cost us annually, in military and naval outlays, upwards of a million and a half in time of peace, exclusive of the revenue collected in them; and if to this heavy expense be added the extraordinary sums their defence costs during war, the debtor side of a fairly drawn up colonial budget would attain to a very formidable magnitude, and one which we apprehend could not easily be balanced.

With the exception of the outlet which they afford to emigrants (which, however, is not so great as that afforded by the United States), it would be difficult to specify the peculiar advantage which we derive from our colonies in North America. They furnish but few, if any, articles which we might not import as cheaply, or cheaper, from elsewhere; and if we said that their occupation costs us directly and indirectly the sum of 2,000,000s. a-year, we are pretty confident we should be within rather than beyond the mark. Some, if not all, of our West India colonies are in the same, or nearly the same predicament. As, on the whole, it would appear to be probable that we should gain, rather than lose, by providing under judicious regulations, for the independence of our Transatlantic dominions.

In entertaining this opinion we are not singular. 'If,' said Lord Sheffield, 'we have not purchased our experience sufficiently dear, let us derive a lesson of wisdom from the misfortunes of other nations, who, like us, pursued the phantom of

foreign conquest and distant colonisation, and who, in the end, found themselves less populous, opulent, and powerful. By the war of 1739, which may be truly called an American contest, we incurred a debt of upwards of 31,000,000*l.*; by the war of 1755 we incurred a further debt of 71,500,000*l.*; and by the war of the revolt we have added to both these debts nearly 100,000,000*l.* more! And thus we have expended a far larger sum in defending and retaining our colonies than the value of all the merchandise we have ever sent them. So egregious has our impolicy been in rearing colonists for the sake of their custom! (*On the Commerce of the American States*, p. 219.)

We hope it will not be supposed, from anything now stated, that we consider the foundation of colonial establishments as, generally speaking, inexpedient. We entertain no such opinion. We do not object to the establishment of colonies, provided they be placed in advantageous situations; but we do object to the trammels that have been laid on their industry, the interference exercised by the mother countries in their domestic concerns, and the attempts to govern and coerce them after they have attained to maturity. Every individual should have full liberty to leave his native country; and occasions very frequently occur when governments may advantageously interfere to settle emigrants in foreign countries, and when the soundest policy dictates the propriety of their supporting and protecting them until they are in a situation to support and protect themselves. There can be no question that Europe has been prodigiously benefited by the colonisation of America. The colonists carried the arts, the sciences, the language, and the religion of the most civilised communities of the Old World to regions of vast extent and great natural fertility, occupied only by a few miserable savages. The empire of civilisation has in consequence been immeasurably extended; and while the experience afforded by the rise and progress of communities placed under such novel circumstances has served to elucidate and establish many most important and fundamental principles in government and legislation, Europe has been enriched by the vast variety of new products America has afforded to stimulate the inventive powers of genius, and to reward the patient hand of industry.

But whatever may have been the advantages hitherto derived from the colonisation of America, they are trifling compared to what they would have been had the European powers left the colonists at liberty to avail themselves of all the advantages of their situation, and avoided encumbering themselves with the government of extensive territories 3,000 miles distant. Fortunately, however, a new era has begun—*Novus sœclorum nascitur ordo!* The monopoly of the trade of America is destroyed, and her independence achieved. From Canada to Cape Horn, every port is ready to receive adventurers from Europe; and a boundless field has, in consequence, been opened for the reception of our surplus population, and for the advantageous employment of European arts, capital, and skill. The few remains of the old colonial system which still exist cannot be of long duration. Their mischievous operation is no longer doubtful, and they will disappear according as the knowledge of sound commercial principles is more generally diffused.

The colonisation of Australia will also contribute in no ordinary degree to extend the blessings of civilisation; and there can be no doubt that this newly discovered portion of the globe, the native inhabitants of which were still fewer in number

and more barbarous than those of America, is destined, at no very remote period, to be the seat of flourishing communities: and while they preserve the language and literature, it is to be hoped that they may also pursue the mild, liberal, and tolerant policy, of the illustrious people from whom it should ever be their proudest boast to have descended.

3. *Slavery.*—Since the publication of the first edition of this work a vast change has been effected in the condition of society in our West India colonies and the Mauritius, by the abolition of slavery, under the provisions of the Act 3 & 4 Wm. IV. c. 73. [SLAVES AND SLAVE TRADE.]

In the second edition of this work, published soon after the Act for the abolition of slavery had been passed, and before its provisions had been carried into effect, we ventured to speculate as follows on its probable results:—

Nothing but vague conjectures can, of course, be indulged in as to the future working of this measure in the colonies. We believe, however, that those who have contended that it will not be productive of any falling off in the industry of the blacks will be found to have taken a very erroneous view of the matter. Field labour in the West Indies has hitherto been always associated with slavery and degradation, and been enforced by the lash. The fair inference, consequently, is, that when the fetters are struck off the slave, and he is left to follow his own inclinations, he will be desirous of escaping from what he cannot fail to consider an ignominious occupation. Necessity, no doubt, will prevent him from becoming altogether indolent; but the effect will in this, as in other instances, be proportioned to its cause; and necessity in the West Indies is very different from necessity in Europe. Most articles that are here deemed indispensable would there be positive incumbrances, and those essential to subsistence may be procured with less, certainly, than half the labour hitherto exacted from the slaves. At some future period, perhaps, when the recollection of their degradation has begun to fade, and a taste for conveniences and gratifications has been introduced amongst them they may become more industrious; but this is a distant and a very uncertain prospect. We therefore look, at first, for a very considerable decline in the industry of the slaves, and a proportional falling off in the exports from the islands.

It will be seen, from the returns given in a subsequent part of this article, that these anticipations have been more than realised, and that there has been a most extraordinary falling off in the imports from these colonies. We confess, also, that we are a good deal more sceptical than formerly in our anticipations of their future increase. Industry, when carried on by free labourers, is presented only as a means by which they may acquire an adequate supply of necessaries and conveniences; and it is all but contradictory and absurd to suppose that a population with few wants, occupying a soil of great natural fertility, lying under a burning sun which unfits for exertion, should voluntarily engage in severe, and, to them, useless labour. We believe, indeed, that it will be found wholly impossible, except under peculiar circumstances, to carry on the culture of sugar on its present plan, in tropical countries, by the agency of *really* free labourers. Hayti, formerly the most important and productive of all the sugar colonies, does not now produce a single cwt. of sugar. Mexico is also fast relapsing into the most deplorable barbarism (*Geographical Dict.* art. 'Mexico'); and experience seems to show that some sort of modified slavery, or, which is the same thing, of

compulsory labour, is indispensable to the successful prosecution of industry in tropical countries. It is to this that the extraordinary increase of produce in Java is to be ascribed, and, how much so ever we may cry out against the slavery of the United States, there cannot, we apprehend, be a doubt that its existence, how objectionable soever in many respects, is necessary to the advantageous cultivation of the Southern States. It is the same in Cuba and Brazil. Were their slaves emancipated, may it not be fairly presumed that they would gradually, and not very slowly, sink into the state of Mexico and Hayti? and that instead of an extensive culture of sugar and other articles for foreign demand, the bulk of the population would be satisfied if they supplied themselves with those necessary for their subsistence? We need not, therefore, wonder that the projects for slave emancipation should have made but tardy progress among the Americans, Brazilians, and Cubans. Whether the West India colonies cease to produce sugar and cotton is a matter of excessively little importance to the people of Britain; but it is a matter of the very last importance to the white people of the Southern States of America, of Brazil, and of Cuba; and though the United States have abolished slavery, the two latter will be much to blame if they do not exercise extreme caution in legislating upon this most delicate matter. Perhaps the better policy will be for them gradually to relax the rigours of servitude, and to endeavour to improve the character and condition of the slaves, so as to fit them the better for emancipation, which may, probably, in the end be forced upon them, but they should carefully eschew all rash or precipitate measures.

### III. MAGNITUDE, POPULATION, TRADE, ETC. OF THE BRITISH COLONIES.

Notwithstanding the loss of the United States, the colonies of Great Britain, exclusive of India, exceed in number, extent, and value those of every other country. Previously, indeed, to the breaking out of the late contests, the colonial dominions of Spain far exceeded in extent and importance those of any other power. But Cuba, Porto Rico, and the Philippine Islands are now all that remain to her. These, indeed, are very valuable possessions, though inferior to those of England.

1. *North American Colonies.*—In North America we possess the provinces of Ontario (formerly Upper or West Canada), Quebec (formerly Lower or East Canada), Nova Scotia, and New Brunswick;—since the Act of 1867 (the Dominion of Canada), Newfoundland with Prince Edward's Island, and their dependencies, all on the east side of the North American continent, and British Columbia, including Vancouver's Island, on the west. The situation and boundaries of these provinces will be more easily learned from the inspection of the accompanying map than they could be from any description. The shores of Nova Scotia and New Brunswick are washed by the Atlantic Ocean; and the noble river St. Lawrence, by its communication with the great American lakes, gives to Canada all the benefits of a most extensive inland navigation; and forms a natural outlet for her surplus produce as well as for the surplus produce of that part of the United States which is washed by the lakes. There is every variety in the soil and climate of these regions. In Lower Canada the winter is very severe; the surface of the country is covered with snow for nearly half the year. From the beginning of December to the middle of April the St. Lawrence is frozen over, and affords

a smooth and convenient passage for the sledges by which it is then covered. But though severe, the climate is far from being unhealthy or disagreeable. The weather is generally clear and bracing; and the labour of artisans at their outdoor employments is rarely suspended for many days in succession. On the breaking up of the ice in the latter end of April or the beginning of May the powers of vegetation almost immediately resume their activity, and bring on the fine season with a rapidity that is astonishing to a stranger. The highest temperature in Lower Canada varies from 80 to 102° of Fahrenheit; but the purity of the atmosphere abates the oppressive heat that is felt in most countries where the mercury ranges so high; and the weather is, on the whole, decidedly pleasant.

That part of the province of Ontario, or Upper or West Canada, which stretches from Lakes Simcoe and the rivers Trent and Severn westward to Lake Huron, and the St. Clair River, and southward to Lake Erie, and part of Lake Ontario, has a soil of extraordinary fertility, capable of producing luxuriant crops of wheat, and every sort of grain. The climate, says Mr. Boicchette, late surveyor general of Lower Canada, is so particularly salubrious, that epidemic diseases either among men or animals are almost entirely unknown. Its influence on the fertility of the soil is more generally perceptible than it is in Lower Canada, and is supposed to be congenial to vegetation in a much superior degree. The winters are shorter, and not always marked with such rigour as in the latter. The duration of frost is always accompanied with a fine clear sky and a dry atmosphere. The sowing opens, and the resumption of agricultural labours takes place, from six weeks to two months earlier than in the neighbourhood of Quebec. The summer heats rarely prevail to excess, and the autumns are usually very friendly to the harvest and favourable for securing all the late crops. (Boicchette's *Topographical Description of Canada*, p. 393.) The ground on the shores of Lake Ontario and Lake Erie, as far west as the junction of the Thames with the St. Clair Lake, is laid out in townships, and partly settled; but the population is still very thin. To the north of the river Thames, along the banks of the St. Clair, and the shores of Lake Huron, round to the river Severn, and thence to the river that joins Lake Nipissing and Lake Huron, is a boundless extent of country that is almost entirely unoccupied. The interior of this space has hitherto been very imperfectly explored, though the banks of the St. Clair and the shores of Lake Huron afford the finest situations for settlements. The soil is in many places of the greatest fertility, the river and lake teem with fish, and every variety of the best timber is found in the greatest profusion.

The winters in the provinces of Nova Scotia, Prince Edward's Island, and New Brunswick are more severe than in Upper Canada, and they are a good deal infested with fogs and mists; but their proximity to England, and their favourable situation for the fishing business, give them considerable advantages.

The province of British Columbia comprises the territory lying between the Rocky Mountains and the Pacific. The average breadth of the territory is 250 miles; its length of coast line is 400. It includes Vancouver's Island (since the Act of 1866) as well as Queen Charlotte's Island &c.

Until 1858 British Columbia formed part of the territory of the Hudson's Bay Company, the license possessed by this company giving the proprietors an exclusive right of trade in the region. But in this year a great discovery of gold was

made here; and as a large immigration of gold-seekers took place, it became necessary, in order to protect life and property, to establish a Government. The trading license of the Hudson's Bay Company was revoked, and a colony established under 21 & 22 Vict. c. 99. Estimated population from 40,600 to 50,000, of whom all but 8,360 were natives.

Near British Columbia, and lying off its southern boundary, is Vancouver's Island. It has an extreme length of 275 miles, and a breadth varying from 40 to 50 miles. Its capital is Victoria, a free port. The area is estimated roughly at about 15,000 square miles. Vancouver's Island was erected into a British colony in 1859; and as coal is found here, it is probably destined to be of great significance as a trading station. Vancouver's Island is mountainous, the highest points reaching 10,000 feet. The soil is fertile, and the climate, though of the same character with that of southern England, nevertheless contrasts favourably with it. Estimated population in 1865 18,000, of which 10,000 were aboriginal Indians.

2. *North-west American Colonies.*—In addition to the above, we possess the Hudson's Bay Territory, a tract of vast extent, but situated in an inhospitable climate, and worth very little except as hunting grounds. We also possess the large islands of Newfoundland and Cape Breton, the latter being a dependency of Nova Scotia; but their soil is barren, and the climate severe and foggy; so that they are valuable principally as fishing stations.

The following table, taken from the *Colonisation Circular*, exhibits the estimated population of the different North American colonies in 1867:—

Colony	Population
Canada	3,090,936
New Brunswick	295,081
Prince Edward's Island	91,413
Newfoundland	130,900
Nova Scotia and Cape Breton	368,781
British Columbia and Vancouver's Island	61,761
Bermuda	11,151

Of the inhabitants of Lower Canada in 1844 no fewer than 518,565 were of French extraction, forming what is called the *Nation Canadienne*. In Upper Canada, on the other hand, the population is almost wholly of British origin.

*Number of Emigrants.*—There emigrated to the British Colonies in North America in

Year	Individuals	Year	Individuals	Year	Individuals

Total emigration of the 43 years, 1,501,523.

Of these the great majority have been destined for Upper Canada. (For the total emigration from the United Kingdom, see PASSENGERS.)

*Information for Emigrants.*—In January 1840, a board of Colonial Land and Emigration Commissioners' was appointed. It consists of three commissioners, whose proceedings are guided by instructions from the Secretary of State for the Colonies, and their practical duties may be divided under three heads, viz. the sale of colonial lands; the superintendence and promotion of emigra-

tion; and the diffusion of information in respect of the colonies.

1. The functions of the commissioners under the first head do not extend to the North American colonies. The Crown having placed the revenue derived from the sale of their waste lands at the disposal of the local Legislatures, these lands are, of course, disposed of by the authorities on the spot.

2. The board endeavours, in as far as possible, to protect poor emigrants from imposition, and from the effects of improvident arrangements on their parts, and takes care that the provisions of the Passengers' Acts are duly carried out and enforced.

3. The board publishes from time to time such authentic information as they may receive on matters connected with the settlement of waste lands in the colonies, the prices of the principal articles of colonial produce, the wages of labour, and such other matters as may appear to be useful to persons who propose to settle in the colonies. They likewise answer all applications from individuals, and afford them, as far as may be in their power, such information as may be adapted to their particular cases. The office of the commissioners is at No. 8, Park Street, Westminster.—Assistant-Secretary, R. B. Cooper, Esq.

No pecuniary assistance is afforded by Government to parties desirous of proceeding to the North American colonies; and emigrants after their arrival no longer receive grants of land, that being now wholly disposed of in the way stated below.

But though Government makes no gifts at the public expense to emigrants to North America, it maintains agents at the principal colonial ports, whose business is to protect emigrants from imposition upon their first landing, to acquaint them with the demand for labour in different districts, to point out the most advantageous routes, and to furnish them with useful advice upon the objects which they have had in view in emigrating, without making any charge for the same. Persons newly arrived should not omit to consult these agents, and should avoid detention in the ports, where they are exposed to all kinds of imposition, and pretences for keeping them at taverns till any money they may possess has been expended.

We subjoin a Table, extracted from the *Colonisation Circular* of the Emigration Commissioners, issued in 1868, showing the cost of a passage to the different colonies. (See p. 356.)

The conveyance of emigrants or passengers to parts of Europe is now (1868) regulated by the Passengers' Acts of 1855 and 1863, the 18 & 19 Vict. c. 119, and 26 & 27 Vict. c. 51, of which a full abstract is given under the art. PASSENGERS. The following Order in Council has been issued under the authority of the latter Act.

*Abstract of Order in Council (Jan. 7, 1864) for promoting Order and Health &c. in Passenger Ships to any of her Majesty's Possessions abroad.*

1. Every passenger to rise at 7 A.M., unless otherwise permitted by the surgeon; or, if no surgeon, by the master.
2. Breakfast from 8 to 9 A.M., dinner at 1 P.M., supper at 6 P.M.
3. The passengers to be in their beds at 10 P.M., except under permission of the surgeon, or if no surgeon, of the master.
4. Fires to be lighted by the passengers' cook at 7 A.M., and kept alight by him till 7 P.M.; then to be extinguished, unless otherwise directed by the master, or required for the use of the sick.
5. The master to determine the order in which

Charges for Children.—The general practice in charging for children is, to compute them according to the Passengers' Act, viz., Children from 1 to 12 years of age, half the price of adults; under 1, no charge.  
 \* Ifly Steamer.  
 Caution.—Emigrants to New Brunswick, Prince Edward Island, or Nova Scotia, should not proceed thither by way of Quebec.

each passenger or family of passengers shall be entitled to the use of the fires. The cook to take care that this order is preserved.

6. On each passenger deck 3 safety lamps to be lit at dusk, and kept burning all night, and such further number as shall allow 1 to be placed at each of the hatchways used by the passengers.

7. No naked light between deck or in the hold to be allowed at any time or on any account.

8. The passengers, when dressed, to roll up their beds, to sweep the decks (including the space under the bottom of the berths), and to throw the dirt overboard.

9. Breakfast not to commence till this is done.

10. The sweepers for the day to be taken in rotation from the males above 14, in the proportion of 5 for every 100 passengers.

11. Duties of the sweepers to be to clean the latrines, hospitals, round houses, and water-closets, pump water into the cisterns or tanks for the supply of the water-closets, to sweep the decks after every meal, and to dry, holystone, and scrub them after breakfast.

12. But the occupant of each berth to see that his own berth is well brushed out; and single women are to keep their own compartment clean in ships where a separate compartment is allowed to them.

13. The beds to be well washed and aired on deck, and the bottom boards, if not fixtures, to be removed, and dry-scrubbed and taken on deck at least twice a week.

14. Two days in the week to be appointed by the master as washing days, but no clothes on any account to be washed or dried between decks.

15. The cleaned every with water.

15. The coppers and cooking vessels to be cleaned every day, and the cisterns kept filled with water.

16. The scuttles and stern ports, if any, to be kept open (weather permitting) from 7 A.M. to 10 P.M., and the hatches at all hours.

17. On Sunday the passengers to be mustered at 10 A.M., when they will be expected to appear in clean and decent apparel. The day to be observed as religiously as circumstances will admit.

18. No spirits or gunpowder to be taken on board by any passenger. Any that may be discovered to be taken into the custody of the master till the expiration of the voyage.

19. No loose hay or straw to be allowed below.

20. No smoking to be allowed between decks.

21. All immoral or indecent acts or conduct, improper liberties or familiarities with the female passengers, blasphemous, obscene, or indecent language, or language tending to a breach of the peace, swearing, gambling, drunkenness, fighting, disorderly, riotous, quarrelsome, or insubordinate conduct, and also all deposits of filth or offensive acts of uncleanness in the between decks, are strictly prohibited.

22. Fire-arms, swords, and other offensive weapons, as soon as the passengers embark, to be placed in the custody of the master.

23. No sailors to remain on the passenger deck among the passengers except on duty.

24. No passenger to go to the ship's cook-house without special permission from the master, nor to remain in the fore-castle among the sailors on any account.

Besides the sea voyage from England, persons proceeding to Canada should be provided with the means of paying for the journey which they may have to make after their arrival at Quebec. The cost of their journey must, of course, depend upon the situation of the place where the individual may find employment, or where he may have previously formed a wish to settle. The Emigration Commissioners have (1868) published the following Hints to Emigrants to the North American Colonies:—

#### HINTS TO EMIGRANTS TO BRITISH NORTH AMERICA.

**Caution to keep Contract Tickets.**—Emigrants to every British colony ought to keep their contract tickets, as otherwise, if the ship is prevented by any accident from reaching her destination, or if the passengers, for any other reason, are not landed at the place named in the tickets, they may have a difficulty in obtaining a return of their passage money, to which, in that case, they would by law be entitled.

**Caution to provide means for subsistence and transport after arrival.**—Many emigrants having lately been found to rely on public funds for their assistance in the colonies, they are hereby warned that they have no claim of right on such funds, and that they should provide themselves with sufficient means of their own for their subsistence and conveyance into the interior from the port where they land.

In Canada a Colonial Law expressly prohibits relief from the Emigrant Tax Fund, excepting in cases of sickness on the part of destitute emigrants.

**Tools.**—It is not generally considered desirable that agricultural labourers should take out implements of husbandry, as these can be easily procured in the colonies; but artisans are recommended to take such tools as they may possess, if not very bulky.

**Time to arrive in North America.**—The best period is early in May, so as to be in time to take advantage of the spring and summer work, and to get settled before the winter sets in.

#### Average Length of Passage.

To	days
Quebec	26
Prince Edward Island (say)	36
Nova Scotia	34
New Brunswick	36
British Columbia, in a sailing ship round Cape Horn	150
via Panama	50

By the Passengers' Act, provisions and water are, however, required to be laid in for the first 4 colonies for 70 days, and in winter time for 80 days; and for British Columbia for 182 days.

The water of the river St. Lawrence is stated to have a strong tendency to produce bowel complaints in strangers. It should at first, therefore, be drunk as sparingly as possible. Emigrants should also avoid exposure to the great heat of the sun by day, and the dews and noxious vapours by night.

**Maintenance on arrival &c.**—Passengers are entitled by the Imperial Passengers' Act to be maintained on board in the same manner as during the passage for 48 hours after arrival, unless within that time the ship should quit the port in the prosecution of her voyage. As regards those bound to Quebec, the Canadian Passengers' Act, 15 & 16 Vict. c. 86 [1852], imposes a penalty on the master who compels passengers to leave before the expiration of 48 hours (except in cases where the vessel has a mail contract), and provides that they shall be landed free of expense, and between 6 in the morning and 4 in the afternoon.

#### ADVICE TO EMIGRANTS ARRIVING IN CANADA.

All emigrants who wish to know the distance to any part of the province, the way to get there, what it costs, and the best places to find work, should ask the Government Emigration Officer (who will board the ship they arrive in), or else go to the Emigration Office, Old Custom House Buildings, Quebec. Those arriving by steamer will land at Point Levi, where there is also a Government Office. Emigrants should not listen to the opinions or advice of persons hanging about the places of landing, whose business it is to make profit out of them. Many young females and unprotected persons have been deceived and suffered from acting on such advice. For the better protection and convenience of emigrants desiring to wash their clothes and obtain information as to their future journey, temporary accommodation has been provided at the Government Emigration Wharf, Quebec, where they will be allowed to remain for a period not exceeding 48 hours. Emigrants who go out to join friends or relations already settled in the country should go at once to their destination. Farm labourers will get plenty of work in the farming districts. The chief agent will not assist any one who loses his time by staying in the city, unless detained by sickness or other good reason. Any offer of work had better be at once accepted, even if the wages are not as much as the emigrant thought they would be, because, until he gets into the ways of the country, he is not of much use to the farmer, and has a great deal to learn.

The same advice must be given to clerks, shopmen &c., who are very little wanted in Canada, and have but a poor chance of employment, and also to mechanics.

Any complaints of bad treatment on the passage out should be made, upon landing, to the Chief Emigration Agent, who will at once attend to them.

**Caution.**—Newly arrived immigrants are frequently tempted by the promise of high wages held out by agents from the United States to leave Canada for the States. These promises should not be entertained without much caution and enquiry.

The Provincial Passenger Act, 25 Vict. c. 8, provides that no person without a license shall influence passengers in favour of any particular steam-boat, railroad, or tavern. Tavern-keepers are required to have posted in some conspicuous place a list of prices to be charged for board, lodging &c., and they are not allowed to have any lien upon the effects of a passenger for board and lodging beyond five dollars—about one pound sterling.

Emigrants arriving at Quebec, holding through tickets for their inland transport, and desiring to obtain information, may delay their journey for that purpose, as the railway or steamboat company to whom they are addressed will take charge of their luggage until they are ready to proceed.

#### Colonial Tax on Emigrants.

**CANADA.**—By a Colonial Law of June 30, 1858, the capitation tax is 5s. currency, payable by the master, for every passenger over the age of 1 year; and no part of the tax is remitted on emigrants going on to the United States. If embarked, however, without the sanction of her Majesty's Government, ascertained by a certificate from an officer of customs at the port of embarkation, the tax is 7s. 6d. currency for every passenger.

**NOVA SCOTIA.**—The Emigrant Tax Act of 1850 was repealed by an Act (No. 9) passed April 18, 1856. No tax is, therefore, now payable in respect of emigrants arriving in this colony.

**NEW BRUNSWICK.**—The tax imposed on emigrants was for many years 5s. per head; it was then reduced to 2s. 6d.; and in 1861 it was entirely abolished by the Colonial Act, 24 Vict. c. 4.

**PRINCE EDWARD ISLAND.**—The tax now levied under a Colonial Act, passed May 5, 1851, is 12s. currency (equal to about 10s. sterling) on each emigrant passenger arriving in the colony between the 1st of April and the 1st of October, but no payment is required for children under 18 months old. The tax is increased to 18s. currency if the emigrants arrive after the 1st of October. The master of the ship has to pay an additional tax if the vessel is put into quarantine.

In all of the colonies the tax is made payable by the master of the ship.

**NEWFOUNDLAND.**—No emigrants' tax in this colony.

**Personal Effects exempt from Duty.**—By a Canadian Act (8 & 9 Vict. c. 31), 'wearing apparel in actual use, and other personal effects not merchandise, implements and tools of trade of handicraftsmen used in the occupation or employment of persons coming into the province for the purpose of actually settling therein,' are exempt from customs' duties. A similar provision is in force in New Brunswick.

**Expense of erecting a log hut.**—The cost of a log hut, such as settlers usually erect, may be stated at from 5l. to about 12l.; but when the chief part of the work is performed by the emigrant: himself, the cost is much less. These huts, if properly constructed, are very warm and comfortable.

**VANCOUVER ISLAND.**—The expense of erecting a suitable dwelling for an agricultural labourer may be estimated at from 25l. to 30l.

The rent of a town lodging for mechanics and labourers is about 14s. per week.

**BRITISH COLUMBIA.**—The cost of such a building varies according to the rate of wages in the different parts of the colony; but a good hut can be built and fitted up by the immigrant at a cost of 10l., or 15l.

#### Value of the English Coins in Canada.

	Halifax Currency	Dollars	Cents
1 sovereign, sterling	7 4 4	4	85
1 crown	0 6 1	1	24
1 crown	0 3 0	0	60
1 shilling	0 1 3	0	24

In Upper Canada the English sixpence is generally called in retail dealings 'one York shilling' or a shilling; emigrants often believe one shilling sterling or currency is meant.

Emigrants should bring their money in gold, silver, or good Bills of Exchange. Bank notes are liable to heavy discounts.

**Route for Emigrants to Canada.**—Emigrants intending to settle in Canada will find it in all respects more advantageous to proceed by Quebec.

As there is often competition among the steam-boat and railway companies at Quebec and the forwarding companies at Montreal, emigrants should exercise caution before agreeing for their passage, and should avoid those persons who crowd on board ships and steam boats, offering their service to get passages &c.

Emigrants for Upper Canada should not pause at Quebec or Montreal, but proceed at once on their journey. If, however, they require advice or direction, they should apply *only* to the Government Agents, who will furnish gratuitously all requisite information.

**3. West India Colonies.**—In the West Indies we possess Jamaica, Barbadoes, St. Lucia, Antigua, Grenada, Trinidad, and some other islands, exclusive of Demerara and Berbice in South America. Jamaica, by far the largest of our insular possessions, is about 120 miles in length, and 40 in mean breadth, containing about 2,800,000 acres, of which from 1,100,000 to 1,200,000 are supposed to be in cultivation. Being situate within the Tropic of Cancer, the heat in the West Indies is intense, but is moderated by the sea breeze which blows regularly during the greater part of the day. The rains make the only distinction of seasons. They sometimes fall with prodigious impetuosity, giving birth to innumerable torrents, and laying all the low country under water; the trees are green the whole year round; they have no snow, no frost, and but rarely some hail. The climate is very humid; iron rusts and corrodes in a very short time; and it is this, perhaps, that renders the West Indies so unfriendly to European constitutions, and produces those malignant fevers that are so very fatal. The vegetable productions are numerous and valuable; but the sugar cane and the coffee plant are incomparably more important than the others, and constitute the natural riches of the islands.

The West Indies are occasionally assailed by the most dreadful hurricanes, which destroy in a moment the hopes and labours of the planters, and devastate entire islands. Whole fields of sugar canes are sometimes torn up by the roots, houses are either thrown down or unroofed, and even the heavy copper boilers and stills in the works have, in numerous instances, been wrenched from the ground and battered to pieces. The rain pours down in torrents, sweeping before it every-

thing that caused by so produce a very famine; and the severity of been material part of the from the Un Dominica as by a committ 15,000 negroes 1780 and the occasioned by importation from West Indies, v

The same rise of pri

thing that comes in its way. The destruction caused by such dreadful scourges seldom fails to produce a very great scarcity, and not infrequently famine; and we are grieved to have to add, that the severity of the distress has on several occasions been materially aggravated by a refusal on the part of the authorities to allow importation direct from the United States. This was the case at Dominica as late as 1817. It is stated in a report by a committee of the Assembly of Jamaica, that 15,000 negroes perished between the latter end of 1780 and the beginning of 1787, through famine occasioned by hurricanes and the prohibition of importation from the United States. (Edwards's *West Indies*, vol. ii. p. 515.)

Jamaica was discovered by Columbus in 1494, and continued in possession of the Spaniards till 1655, when it was wrested from them by the English. Although it had thus been for more than a century and a half under the power of Spain, such was the deadening influence of her colonial system, that it did not, when we conquered it, contain 1,500 white inhabitants, and these were immersed in sloth and poverty. Of the many valuable articles which Jamaica soon after produced in such profusion, many were then altogether unknown; and of those that were known such a supply only was cultivated as was required for the consumption of the inhabitants. 'The Spanish settlers,' says Mr. Bryan Edwards, 'possessed none of the elegancies of life; nor were they acquainted even with many of those gratifications which, in civilised states, are considered necessary to its comfort and convenience. They were neither polished by social intercourse, nor improved by education; but passed their days in gloomy languor, enfeebled by sloth, and depressed by poverty. They had been for many years in a state of progressive degeneracy, and would probably in a short time have expiated the guilt of their ancestors by falling victims themselves to the vengeance of their slaves.' (*Hist. West Indies*, vol. i. p. 297, 8vo. ed.)

For a considerable number of years after we obtained possession of Jamaica, the chief exports were cocoa, hides, and indigo. Even so late as 1772 the exports of sugar amounted to only 11,000 hogsheads. In 1774 they had increased to 78,000 hogsheads of sugar, 26,000 puncheons of rum, and 6,547 bags of coffee. The American war was very injurious to the West India settlements; and they may, indeed, be said to be still suffering from its effects, as the independence of America led to the enactment of those restrictions on the importation of food, lumber &c. that were so very hurtful to the planters. In 1780 Jamaica was visited by a most destructive hurricane, the devastation occasioned by which produced a dreadful famine; and other hurricanes followed in the immediately succeeding years. But in 1787 a new era of improvement began. The devastation of St. Domingo by the negro insurrection which broke out in 1792 first diminished, and in a few years almost entirely annihilated, the annual supply of 115,000 hogsheads of sugar which France and the Continent had previously been accustomed to receive from that island. This diminution of supply, by causing a greatly increased demand for, and a consequent rise in the price of, sugar raised in the other islands, occasioned an extraordinary extension of cultivation. So powerful in this respect was its influence, that Jamaica, which, at an average of the 6 years preceding 1799, had produced only 83,000 hogsheads, exported, in 1801 and 1802, upwards of 286,300 hogsheads, or 143,000 a-year!

The same rise of price which operated so power-

fully in Jamaica, occasioned a similar though less rapid extension of cultivation in our other islands, and in Cuba, Porto Rico, and the foreign colonies generally. The vacuum caused by the cessation of the supplies from St. Domingo being thus more than filled up, a reaction commenced. The price of sugar rapidly declined; and, notwithstanding a forced market was for a while opened to it by substituting it for malt in the distillery, prices did not attain to their former elevation. On the opening of the Continental ports, in 1813 and 1814, they, indeed, rose, for a short time, to an extravagant height; but they very soon fell, involving in ruin many of the speculators upon an advance. Prices, however, continued at a pretty high level down to 1818; but they sustained a material fall in the course of the following year, and were comparatively low from that period down to 1835, when the extraordinary falling off in the supplies of sugar consequent on the measures connected with the emancipation of the slaves, again occasioned a considerable rise of price. But, as already seen, this high price was entirely fictitious, being wholly caused by our excluding foreign sugar from our market. Now that the sugar of Brazil, Cuba, and Java is admitted on paying reasonable duties, prices are comparatively low. And from the extraordinary facility with which sugar may be raised in the countries referred to and elsewhere, we have no idea, provided they adopt no rash or ill-advised measure in relation to slaves, that its price in their markets would be likely to sustain any material or permanent increase, even though the demand for it were doubled or more. The imports of sugar from our West Indian colonies, which amounted to 4,103,800 cwts. in 1831, sunk, in 1841, to 2,151,217 cwts. In 1866 they amounted to 3,177,947 do.

The devastation of St. Domingo gave the same powerful stimulus to the growth of coffee in the other West Indian colonies that it did to the growth of sugar; and owing to the extraordinary increase in the demand for coffee in this and other European countries, the supply went on increasing till it was checked by the influence of the measures relating to slavery. In 1752, for example, only 60,000 lbs. of coffee were exported from Jamaica; in 1775 the export amounted to 440,000 lbs.; in 1797 it had increased to 7,931,621 lbs.; and in 1832, when it had attained its maximum, the exports to England only amounted to 19,405,933 lbs. Such, however, and so rapid has been their subsequent decline, that in 1858 the exports to England from Jamaica amounted to only 2,091,607 lbs., and in 1866 to 4,132,222 lbs.

We have already seen that when Jamaica was taken from the Spaniards, it only contained 1,500 white inhabitants. In 1673 the population amounted to 7,768 whites and 9,594 slaves. It would have been well for the island had the races continued to preserve this relation to each other; but, unfortunately, the black population has increased more than 15 times as rapidly as the white; the latter having only increased from 7,768 to 13,816, while the former has increased from 9,594 to about 316,374, exclusive of persons of colour, numbering 81,704.

The real value of the exports to Jamaica amounted in 1866 to 721,471*l.*, being about  $\frac{1}{4}$  of the exports to the West Indian colonies. It was formerly much more; but then a large portion of the articles sent to Jamaica, and some of the other colonies, were only sent there as to an entrepôt; being subsequently exported to the Spanish main. During the ascendancy of the Spanish dominion in Mexico and South America, this trade, which was then contraband, was car-

ried on to a great extent. It is now much fallen off, and is principally carried on from St. Thomas and Honduras.

Barbadoes was the earliest of our possessions in the West Indies. It is the most easterly of the Caribbee Islands; Bridge Town, the capital, being in long. 59° 41' W. Barbadoes is by far the best cultivated of all the West Indian islands. It contains about 105,000 acres, having (in 1861) a population of about 16,000 whites, 15,000 people of colour, and 120,000 blacks. Of late years it has exported from 500,000 to 750,000 cwts. of sugar. Barbadoes had attained the acmé of its prosperity in the latter part of the seventeenth century, when the white population is said to have amounted to about 50,000, though this is probably an exaggeration. But it is only as compared with itself that it can be considered as having fallen off; for, compared with the other West Indian islands, its superiority is manifest. It raises nearly as much food as is adequate for its supply.

The islands next in importance are St. Vincent, Grenada, Trinidad, Antigua &c. It is unnecessary to enter into any special details with respect to them; their population and trade being exhibited in the annexed tables.

During the late war we took from the Dutch the settlements of Demerara, Berbice, and Essequibo, in Guiana, which were definitively ceded to us in 1814. The soil of these settlements is naturally very rich; and they have, in this respect, a decided advantage over most of the West Indian islands. For a time their prosperity seemed to be on the decline. The export of coffee became scanty; that of cotton fell to nothing. Other countries were more favourably situated both as regarded labour and natural capacity for these products. But to compensate these, the supply of sugar increased enormously, and the cultivation of the cane, aided by the importation of coolie labour, became very successful. During the year 1866 the value of the exports of British Guiana to the United Kingdom amounted to 1,689,814*l.*, of which sugar, in quantity 1,233,720 cwt., was worth 1,320,760*l.* and rum, 3,694,171 gallons, was worth 286,354*l.*

Exclusive of the above, we possess the settlement of Belize on the Bay of Honduras. This is of importance, as affording a means of obtaining abundant supplies of mahogany; but it is of more importance as an entrepôt for the supply of Guatemala and Central America with English manufactured goods.

The exports from this country to our West Indian colonies consist of coarse cottons, linens, checks, hats, and other articles of negro clothing; iron and steel, wrought and unwrought; leather, including saddlery and harness; glass; beer and ale; soap and candles; stationery; hardware and earthenware; staves, hoops, coal, lime, paint, lead; Irish provisions, herrings, and other salt fish; along with furniture, wine, beer, medicines, and, indeed, almost every article which a great manufacturing country can supply to one situated in a tropical climate, which has very few mechanics and hardly any manufactures. Since the opening of the ports on the Spanish main to ships from England, the exports to the West Indies have decreased both in quantity and value; this decrease being, however, more than balanced by the increased shipments to Mexico, Columbia &c. The value of our total exports to the British West Indies and Guiana amounted in 1865 to 3,006,584*l.*, and in 1866 to 2,563,670*l.*, while in 1867 the exports of British produce alone to the same colonies were valued at 2,336,900*l.*

*Money.*—What used to be called West India currency was an imaginary money, and had a different value in different colonies. The value it bore, as compared with sterling money, was supposed to represent the corresponding value of the coins in circulation in the different islands at the time the proportion was fixed: these coins being for the most part mutilated and otherwise worn and defaced, currency was in all cases less valuable than sterling. The following are the old values of 100*l.* sterling, and of a dollar, in the currencies of the different islands:—

	Steel. Curr.	Do. Curr.
Jamaica	100 <i>l.</i> = 140 <i>l.</i>	1 <i>l.</i> = 6 <i>s.</i> 9 <i>d.</i>
Barbadoes	100 <i>l.</i> = 135 <i>l.</i>	1 <i>l.</i> = 6 <i>s.</i> 3 <i>d.</i>
Windward Islands (except Barbadoes)	100 <i>l.</i> = 175 <i>l.</i>	1 <i>l.</i> = 8 <i>s.</i> 5 <i>d.</i>
Leward Islands	100 <i>l.</i> = 200 <i>l.</i>	1 <i>l.</i> = 9 <i>s.</i> 6 <i>d.</i>

But latterly these currencies have been in great measure superseded by the introduction of sterling money, current at the same rates as in England, and of the Spanish dollar.

By an order in council of March 23, 1825, British silver money was made legal tender throughout all British colonial possessions, at the same nominal value as in England; and bills for the same are given on the Treasury of London, of 100*l.* each bill for 103*l.* such silver money. By this order, also, the value of the Spanish dollar was fixed at 4*s.* 4*d.* British silver money throughout all the colonies where it is current; but this value was farther reduced on September 21, 1838, to 4*s.* 2*d.* The value of the doubloon was then, also, fixed at 6*s.*

4. *Australian Colonies.*—This group of colonies, though founded in a very distant part of the world, and at a comparatively recent epoch, will, probably, at no very distant period, surpass the others in magnitude and importance. The countries in which they are situated, including the great Australian continent, formerly called New Holland, with Van Diemen's Land or Tasmania, New Zealand &c., are of vast extent, and differ in many respects from each other. The results of recent explorations seem to show that this great division of the globe has no great rivers, or, at least, none that reach the sea. Indeed it seems, speaking generally, to be a law in this new world, that rivers are largest near their source; and that they gradually diminish as they proceed, and most commonly dwindle into insignificance, or lose themselves in marshes, before they reach the ocean.

In consequence, perhaps, of this singular constitution of its river system, it is found that in Australia the best land is not at the mouths, but towards the sources, of the rivers. There are, no doubt, exceptions to this rule; but it appears to hold in the greater number of instances. Generally, also, the extent of fine land appears to be comparatively limited; and in so far as the continental portion of the country has been explored, it appears to be much better adapted for pasturage than for tillage.

*Gold Deposits.*—But the land, the pasturage, the sheep, the copper and other ordinary minerals, which are found in abundance in various parts of Australia, have all been rendered, for the present at least, of no importance compared with the gold deposits with which the continent is so largely endowed. These, which were discovered so late as 1851, are of extraordinary richness. They equalled or exceeded in productiveness not only the gold fields of California, but every thing of which any idea could previously have been entertained. Australia, in consequence, became an object of earnest and universal attention. An almost unparalleled amount of emigration was directed to her

shores. Her population and her trade increased with gigantic strides; and her gold influenced the wnges, the prices, and the industry of every civilised people. [PRECIOUS METALS.]

A License Duty of 30s. a month, charged on all individuals who engaged in the search for gold, was much, and we think justly, objected to. We observed in a previous edition of this work, 'that

18

10

license duties are essentially unfair, except when they are proportioned to the extent of business carried on by those who pay them. But the business of the gold diggers is, to all intents and purposes, a lottery. So that while the tax presses with greatest severity on the great bulk of those at the "diggings," it is hardly felt by the few who carry off the great prizes. The better plan would be to make the license duty next to nominal, and to impose a moderate customs' duty on gold when exported. The tax would then cease to be felt as a burden by individuals, while it would yield quite as great a revenue to Government. And we are glad to have to state that this course has been nearly adopted. A duty of 2s. 6d. per oz. laid on gold when exported was in 1867 reduced in Victoria to 6d. per oz., and the export became free in that colony on Jan. 1, 1868; and though the license duty has not been wholly repealed, it has been reduced to the moderate charge of from 5s. to 20s. a-year.

It were idle to indulge in speculations in regard to the period when the exhaustion of the Australian gold fields may be expected; there are no data on which to hazard even a conjecture on such a subject. But whether the supplies from them be destined to be of long or short duration, they have already been, and, no doubt, will continue to be, of great advantage. We do not mean by this to say, or insinuate, that the good resulting from the influx of gold from Australia and California has been unaccompanied by any drawbacks. The gambling and dissipation to which it has given rise are obvious. Yet these, though considerable, are but a trifling deduction from its many advantages; from the powerful stimulus it has given to industry and civilisation, from the new channels it has opened to commerce, and from its greatly ameliorating the condition of the labouring classes in this and most other countries.

The northern portion of Australia, including, perhaps, about a third part of the entire continent, lies between the tropics; the other portion of the continent, with the adjacent islands of Van Diemen's Land and New Zealand, being in the south temperate zone. The climate of the different parts of the continent must therefore, it is obvious, differ very widely. We, however, know but little of the climate of intertropical Australia, except that it is within the range of the Indian monsoon; that the temperature along the coast is rapidly raised by a wind from the south, which has been supposed to afford a strong presumption of the existence of sandy deserts in the interior; and that the air is so very moist that during the season of the dry monsoon iron articles are with the utmost difficulty preserved from rusting.

It is commonly said that the climate of extra-tropical Australia, and especially of New South Wales, assimilates closely to that of Southern Italy. But this statement must be taken with considerable limitation; for, 1st, the atmosphere is very decidedly denser; 2nd, the extremes of temperature are infinitely greater; 3rd, the average heat is rather less; and 4th, the temperature appears to decline more rapidly by increase of elevation. The grand defect in the climate of extra-tropical Australia appears to consist in the periodical recurrence of wet and dry seasons. Sometimes hardly a single drop of rain falls for an entire year or more; and though, happily, dews are in such seasons peculiarly abundant, they form no adequate substitute for rain. During long-continued droughts crops of all kinds are destroyed; and herbage, except in a few favoured spots, suffers severely.

Hence, as already stated, all the eastern parts

of extra-tropical Australia, and perhaps also the southern, would seem to be much better fitted for pasturage than for husbandry. The droughts are exceedingly injurious to the latter, and they would necessarily involve any large population that depended principally on the indigenous products of the soil in extreme privations. Certainly no country seems to be better fitted for grazing, or rather for the growth of sheep and wool. A dry climate is especially suitable to the latter; and though the pastures be far from luxuriant, their boundless extent compensates for every other deficiency. Sheep are not native to the country, a small flock of 29 head having been introduced for the first time by the original English settlers in 1788. For a while, however, their value was not appreciated; but the importance of sheep farming and its suitability to the country having been demonstrated by John M'Arthur, Esq. (to whom the colony is under the greatest obligations), it has since increased with unprecedented rapidity. In proof of this, it is only necessary to mention that while the import of wool from Australia amounted, in 1822, to only 152,880 lbs., it had increased in 1825 to 411,600 lbs., in 1830 to 899,750 lbs., and in 1866 to the enormous amount of 113,772,694 lbs.

Tasmania, or Van Diemen's Land, being less subject to droughts than New South Wales, husbandry is carried on in it to a greater extent, and with more advantage; but there also sheep-farming is the principal and, perhaps, the most advantageous employment. [VAN DIEMEN'S LAND.]

New Zealand, which has only been resorted to by regular colonists since 1840, is better fitted for agriculture than either Australia or Van Diemen's Land, and its climate is more like that of England. The ground in it is, however, rather difficult to clear; the natives are also much more formidable; and it is not so suitable for sheep-farming, though its rich mines have latterly made it very attractive. [AUCKLAND.]

The first of the Australian colonies, that in New South Wales, founded so late as 1788, and that in Van Diemen's Land, founded in 1808, were originally intended to serve as penal settlements; and great numbers of convicts have been carried to them. These colonies had also, notwithstanding their distance, become, even before the discovery of the gold fields, a favourite resort of free settlers, consisting partly of voluntary emigrants, and partly of emigrants carried out at the public expense; and since their discovery the emigration to Australia from this country, China, California &c., has been quite unprecedented. The facility with which supplies of compulsory labour were obtained tended at first to reconcile the free colonies to the abuses of the convict system, but they gradually became such as to occasion the greatest dissatisfaction in New South Wales; and since 1843 no fresh convicts have been sent to it. They still, however, continued to be sent to Van Diemen's Land, but it also has ceased to be a receptacle for them. No convicts have ever been sent to the important and flourishing settlement of South Australia, founded in 1834 [ADELAIDE], nor to New Zealand. The settlements in the latter have recently made a rapid progress, and it promises, at no very remote period, to be a peculiarly thriving colony.

Passage.—The cost of a passage to the Australian colonies, including provisions, is for the

Cabin, from 4*l.* to 5*l.*  
Intermediate, from 1*l.* to 2*l.*  
Steerage, " 14*l.* to 20*l.*

The average length of the voyage is about four months; and at whatever season of the year it

4. Disposal of Land in old settlements as to the best occupied lands in colonies is one of our concerns. Land in old settlements, for the most part, being for the most part possession bringing in and influencing wealth, colonists ar

may be made, the passengers have to pass through both very hot and very cold weather, and should, therefore, be prepared accordingly with suitable clothing. The prices of cabin and intermediate passages to New Zealand are about the same as to the Australian colonies; but a steerage passage is rather higher.

Account of the Declared or Real Value of the Exports of British Produce and Manufactures from the United Kingdom to each British Colony and Possession during each of the 6 Years ending with 1867, and the Imports from each Colony during the same time.

A. Disposal of Land in the Colonies.—The question as to the best method of disposing of the unoccupied lands in colonies planted in unsettled countries is one of considerable nicety and difficulty. Land in old settled and fully occupied countries being, for the most part, very valuable, and its possession bringing along with it great consideration and influence, and frequently also great wealth, colonists are very apt, wherever they have

the opportunity, to appropriate a much larger extent of land than they have the means of cultivating, or of turning to any useful account. Not only, however, are settlers disposed to act in this way, but speculators, who have no thought of emigrating, and persons having influence with Government, endeavour to obtain large tracts of land, in the view of holding them till, in consequence of the increase of population in the vicinity, they acquire a considerable value. It has been usual also to reserve large tracts for ecclesiastical and other public purposes. And these extensive tracts of unoccupied and reserved lands being interposed between the settled parts of a colony, render it in all cases more difficult, and sometimes all but impossible, to form roads and other means of communication; so that the settlers are thus frequently cut off from a market for their produce, and are less able to combine for municipal or such like purposes, and for the establishment of schools and churches, and the undertaking of such public works as require co-operation.

The improvident manner in which large tracts of land have been granted in Canada, and the great extent of the clergy and other reserves in that colony, have materially retarded its prosperity; and the same circumstances have had a similar operation in our other North American possessions, in Western Australia, and elsewhere. But there are various ways in which an abuse of this sort might be prevented. One of the most obvious of these is to impose such a moderate price on the land as might, without crippling the means of the settlers, hinder them from seeking unduly to extend their possessions; and making all the land held by individuals, whether occupied or not, contribute according to its extent to the construction of roads and other public works. Perhaps, however, the better plan would be to apportion the land according to the available capital of the settlers, it being stipulated that no individual should obtain above

a certain number of acres; and that it should revert back to the public unless certain improvements were effected upon it within a specified time after the grant was made.

But, not satisfied with attempting to prevent abuses like those noticed above, we were lately told that all the difficulties incident to colonisation originated in the too great dispersion of the colonists, and that to obviate them, and to insure to all new colonies the acmé of prosperity, we had merely to compel the colonists to keep close together by exacting a high price for the surrounding waste or unoccupied land—in other words, by making the colony as like an old settled country as possible! And this precious nostrum was trumpeted forth as a great discovery. It is obvious, however, that if, on the one hand, the price set on waste land were inconsiderable, it would not (without a limitation of quantity) prevent the purchase of large tracts of land on speculation, and the entailing on the colony all the disadvantages that have resulted from the making of injudicious grants; and if, on the other hand, the price demanded for the land were high, it would go far to oppose an insuperable obstacle to the progress of the colony, at least if it were to be founded by voluntary emigrants. Rich men do not leave their native country to expose themselves to the inconveniences and hardships attending the establishment of new settlements in the wilderness. This, if it be done at all, must be done in time to come, as in time past, by individuals in straitened circumstances, and anxious to improve their fortunes. But to exact a high or considerable price for land from such persons would, by sweeping away the whole or a considerable portion of their capital, deprive them of the means of clearing and cultivating the land, and proportionally retard their progress and that of the colony. The plan of letting lands by fine is admitted by every one who knows anything of agriculture to be one of the worst that can be devised; and this colonisation project was bottomed on the same principle, and has been quite as pernicious.

It is said that, in consequence of the exacting of a price for the land, and the concentration of the colonists, their employments, being more combined and divided, will be prosecuted with a great deal more success than at present. All this, however, proceeds on the false and exploded assumption that the colonists are not, like other individuals, the best judges of what is for their own advantage. Adam Smith says truly, that it is the highest impertinence for kings and ministers to attempt to direct private people *how* they should employ their capitals. But it is, if possible, a still greater impertinence to attempt to direct them *where* they shall employ them. A regard to their own interest will draw people sufficiently together. And to enact regulations in the view of concentrating them still more, is in every respect as contradictory and absurd as it would be to set about increasing the public wealth by regulating the sort of employments to be carried on, and the countries with which, and the commodities in which, to deal.

Of late years the English Government has disposed of all ungranted colonial lands by sale; and though we incline to think, as already stated, that the preferable plan would be to distribute them according to the capital or means of the settlers, still if the price at which land is sold be reasonable, the quantity that may be held by individuals be limited, and the lots put up to sale be of sizes suited to the means of the various classes of purchasers, we do not know that the plan is open to any very good objection. But the price charged

for land in most of our colonies, and especially in Australia, where the minimum (except in Western Australia, Tasmania, and New Zealand) is 20s. an acre, is much too high, and has led to the most mischievous results. At the same time we must bear in mind the distinction between founding a colony with a view principally to the interests of the colonists, and founding it not only with a view to their interests, but in an especial degree for the relief of the mother country. For it is not to be denied that the plan of exacting a pretty high (but not an oppressive) price for colonial lands, and applying that price to defray the cost of carrying out emigrants, may (how injurious soever to voluntary emigrants) be made to assist in relieving the mother country of those who might otherwise have had to be supported at the public expense. Inasmuch, too, as an extraordinary quantity of labour is thus supplied to the colony, the injury done to the capitalists by making land artificially dear is, in some degree at least, compensated by its making labour artificially cheap. The emigration to the Australian colonies in the 4 years ending with 1847 was mainly a consequence of the principle now stated, a very large proportion of the emigrants having been carried out at the public expense. But it is to be borne in mind, that when the revenue derived from the sale of land in the Australian colonies was at its maximum, its price was only 12s. an acre. After it had been raised to 20s., the sales, down to the era of the gold discoveries, were comparatively trifling.

It would obviously be the extreme of folly for an agriculturist intending to emigrate who has a little, but not a great deal of capital, to think of establishing himself in a colony where a high price is set upon land. At all events, he must not expect in such a colony to become a landowner, or to be independent, but must make up his mind to be a hired labourer; whereas, if he emigrate to a colony where land is sold at a low price, or given away on condition of certain improvements being effected upon it within a given time, he may at once acquire an estate, and exchange the condition of a hired servant for that of landowner.

Seeing that the Americans sell the best lands in the valley of the Mississippi at about a dollar an acre, it was not easy to discover the principle on which we proceeded for many years to exact 6s. 7d. an acre for the worst land in Upper Canada. If this regulation were meant to divert the current of voluntary emigration from Canada to the United States, nothing could be found to say against it; but otherwise it was alike contradictory and absurd. At present (1868) in Canada West the minimum price per acre is 2s. 1d., and the maximum 4s. 2d. sterling, while in Canada East the prices range from 10d. to 2s. 6d. Notwithstanding the facilities of getting out to Quebec in timber ships, the direct emigration to the United States greatly exceeds that to British North America, the emigrants to the former being also of a superior description and having a greater command of capital. And there can be no doubt that the United States are in no inconsiderable degree indebted for this influx of comparatively valuable immigrants to the fact of the public lands having for many years been sold at a less price than ours. It is population alone which imparts value to land; and a more effectual method could not be devised for preventing an influx of inhabitants into Upper Canada, and drawing away many of those already settled, than Government adhering to the present prices of land. America, p. 365.) But since Canada has been in great measure self-governed, the price of land has been reduced, as already explained.

*Regulations for the Sale and Management of the Public Lands, approved by his Excellency the Governor General in Council, and dated January 13, 1859.*

1. That the lands in townships which have already been delineated, or shall hereafter be delineated on survey by the exterior lines only, may be offered for sale on block on the following terms, viz. :—

2. That the price shall be one half-dollar per acre, payable at the time of sale.

3. That the purchaser shall cause the lands to be surveyed at his own expense into lots comprising either 100 or 200 acres of land in each lot; and on the north shore of Lake Huron into quarter sections of 160 acres each, except in spots where the configuration of the township may render such exact quantities impracticable, and then as near to those allotments as possible.

4. That such survey shall be made by a duly licensed provincial land surveyor, approved of by the Commissioner of Crown Lands, and acting under his instructions, who shall make his return with field notes &c. in the usual method observed by surveyors, to be also approved of by the Department.

5. That one-third of the quantity of land in the township shall be settled upon within two years from the time of sale; one-third more settled upon within the following five years—that is, seven years from the time of sale; and the residue within the further period of three years—or ten years from the date of sale; the settlement required being that there shall be at least one bona fide settler in authorised occupation for every 200 acres of land; all land not so settled at the expiration of ten years from the time of sale to become forfeited and revert to the Crown absolutely, except such portions thereof as shall be found unfit for settlement, or such portions as are of a very inferior quality, and by reason thereof have remained unoccupied, in respect to which the Governor in Council may, upon application, dispense with the forfeiture, and cause the same to be conveyed to the original purchaser or his assignee.

6. A contract or sale to be made with the purchaser from the Crown subject to the foregoing and following conditions; but patents for the land to issue only to the occupants of the lots purchased deriving claim under the vendee of the Crown, or to the assignees claiming under such purchasers and occupants who shall have complied with the conditions of settlement hereinafter mentioned, upon a certificate or other evidence that they have paid such vendee or his assignee, or complied with the contract with him, for or in regard to such particular lot; and upon evidence that the party applying, or some one under whom he claims, has been a resident on the same lot for at least two years continuously, and that upon the same (not exceeding 200 acres) at least 10 acres for each 100 acres have been cleared and rendered fit for cultivation and crop, and have been actually under crop, and that a habitable house, in dimensions at least 16 by 20 feet, is erected thereon, and upon payment of the sum of 4 dols. as patent fees, to cover expenses &c. The nature and description of proof above referred to to be settled and prescribed by the Commissioner of Crown Lands.

7. All lands which shall under the foregoing conditions revert to the Crown shall be exposed

to sale at public auction at such times and places, and on such upset price, as the Commissioner of Crown Lands shall fix.

8. That in townships which have been surveyed and laid out into lots, and where lands are now offered for sale at 4s. per acre, or where no lands have as yet been offered for sale, and in townships under survey or yet to be surveyed in lots, lands to be sold under the following regulations, to wit :—

9. That lands be sold for cash at 70c. per acre, and on time upon the following terms—viz. 1 dol. per acre; one-fifth to be paid at the time of the sale, and the remaining four-fifths in four equal annual instalments, with interest on the purchase-money unpaid.

10. That when the lands in a township have remained open for sale for one year after public notice thereof, the lands unsold at the expiration of that period shall, at a time to be fixed, and after reasonable notice given by the Commissioner of Crown Lands, be offered for sale by public auction at the upset price fixed for their sale as above, or at such other upset price as under special circumstances may be named by the Commissioner of Crown Lands; and that such public sales of all lands which shall remain unsold in the mean time shall take place semi-annually, at times to be named therefor by the Commissioner of Crown Lands, until the whole of the lands in the township shall have been disposed of; the lands remaining unsold after any such public sale to continue open for private sale at the said upset price until the period of one week next before the time at which the next public sale shall take place.

11. That all lots of land which shall have been offered as 'Free Grants,' and shall not have been located and occupied at the expiration of one year from the time the same shall have been so offered, shall no longer remain as 'Free Grants,' but shall be open for private sale, or shall be exposed to public sale by auction as part of the lands in the township in which the same are situate, and upon the same terms as other lands therein.

12. That all lands (except those now exempt) shall be subject to settlement duties, and no patent in any case (even though the land be paid for in full at the time of purchase) shall issue for any such land to any person who shall not by himself, or the person or persons under whom he claims, have taken possession of such land within six months from the time of sale, and shall from that time continuously have been a bona fide occupant of, and resident on the land for at least two years, and have cleared and rendered fit for cultivation and crop, and had under crop within four years at farthest from the time of sale of the land, a quantity thereof in the proportion of at least 10 acres to every 100 acres, and have erected thereon a house habitable, and of the dimensions at least of 16 by 20 feet.

13. That all other lands not embraced in the foregoing category be exposed to sale by public auction annually, or, in the discretion of the Commissioner of Crown Lands, half-yearly, for cash, at such times and places and at such upset prices as the Commissioner of Crown Lands shall fix.

14. That the lands known as 'Clergy Reserves' be sold on the same terms and in the same manner as other public lands in the townships in which they respectively lie.

15. That prompt payment in all cases be made of the essence of the contract, and any default to be on pain of forfeiture of all previous payments and of all right in the lands.

16. That in the cases of sales already made payment of arrears be required, and that public

notice be given in the 'Official Gazette,' and through the usual channels, that unless such arrears be paid within 12 months from the 1st of January, 1859, the land in respect of which default shall continue will be resumed by the Crown and resold, and that in regard to all purchase moneys and interest hereafter to fall due, prompt payment will be exacted.

#### Squatters.

17. That the system of recognising unauthorised occupation of land, commonly known as 'squattling,' be discontinued, subject to the following provisions, viz. :—

That public and general notice be given by the Crown Lands Department, that no claim to pre-emption by reason of such occupation will be entertained after the 1st day of September next; and that no claim to such pre-emption not now in a state to be admitted can be made good by any act of the party hereafter; and that therefore his labour will be thrown away.

That the prices above fixed for lands shall apply to Upper Canada only.

The prices of lands in Lower Canada shall be regulated by Orders in Council from time to time.

*Nova Scotia.*—The public lands are here also sold at a fixed price, of 1s. 9d. sterling per acre, payable at once. The smallest regular farm lot contains 100 acres. Any less quantity of land may be had, but the cost would be the same as for 100 acres, viz. 8l. 15s., the minimum sum for which a deed of grant is issued.

*New Brunswick.*—There are two modes of selling Crown lands in this province, and it is optional whether the intending settler shall pay for his land in money or in labour. It may be purchased at the auction sales in each county on the first Tuesday of every month, at the upset price of 3s. currency (2s. 6d. sterling) per acre, with an addition of 2½d. sterling for the survey of the same. If the money be paid down at these sales, there is a discount of 20 per cent. Thus those disposed to pay become the possessors of 100 acres of land for 12l. 10s. currency or 10l. 6s. sterling. Another mode is by paying one quarter down, and the remainder by three annual instalments.

In all cases, however, where British subjects of 18 years of age and upwards desire to become settlers, they are entitled to 100 acres of land wherever they may choose the same, for 3s. currency (2s. 6d. sterling) per acre, without competition at auction; and may either pay for it in money, to be expended on the road, or work out the worth of the money in labour, at an estimated rate, and under the direction of Commissioners appointed for the purpose, and will be allowed five years to complete the payment. The sons of emigrants, 18 years of age and upwards, can each secure a lot of 100 acres adjoining the lot held by the father; they are not required to reside on the lot, but will be required to pay the money value of the land in labour on the roads at the rate of 2s. 6d. sterling per acre, with a period of 5 years to complete the same.

In all cases of sales by auction or otherwise grants under the great seal of the province are issued, conveying the land to the purchaser and his heirs and assigns for ever, as soon as may be after payment; but in all cases where Crown lands are sold without competition, either for money or labour on the road, no grant will be issued until the party, in addition to payment, has resided one year on the land, and cleared and cultivated at least 5 acres.

If not less than six persons apply to any of the emigration officers in the United Kingdom, stating

that they wish to obtain land in New Brunswick for actual settlement, and name an agent in the province to select it, such agent, on his name being reported by the emigration officer to the Colonial Government, will be authorised to select not exceeding 100 acres for each of the applicants, and the land will be reserved for them for one year.

*Prince Edward Island.*—With the exception of between 2,000 and 3,000 acres, the whole of the Crown lands in this colony were alienated in one day. But by Colonial Acts of 1853, 16 Vict. c. 18, and of 1857, 20 Vict. c. 20, the local Government is authorised to repurchase from proprietors their unsold lands and to resell them to the present tenants or otherwise. 80,000 acres were thus repurchased in 1854. These may now be obtained at the Land Office at from 4s. to 8s. sterling per acre, according to locality and quality. About 35,000 acres of these lands remained undisposed of in 1866, for which the late proprietors demanded from 10s. to 20s. sterling per acre.

Most of the Crown lands (i. e. those not repurchased under the Act of 1857) have been sold. There is, however, a small number of town lots for sale in Princeton. These lots are chiefly sought for at present as qualifications for electors of members to serve in the General Assembly; but may become valuable hereafter, being situated in front of one of the best harbours in this island, from which the fisheries might be prosecuted.

*Newfoundland.*—By a Colonial law Crown lands are to be sold by auction, at an upset price to be fixed by the Governor at not less than 2s. per acre. Land exposed to auction more than once may afterwards be sold, without further competition, at the last upset price.

*British Columbia.*—That part of British territory on the north-west coast of North America, previously known as New Caledonia, was, by an Act passed August 2, 1858 (21 & 22 Vict. c. 99), erected into a colony, under the name of 'British Columbia.' It is bounded on the south by the frontier of the United States (i. e. the 49th degree of north latitude), on the east by the main chain of the Rocky Mountains, on the north by Simpson's River and the Finlay branch of the Peace River, and on the west by the Pacific Ocean. It includes Queen Charlotte's Island and all other adjacent islands; and Vancouver Island, by the 29 & 30 Vict. c. 67, has been incorporated with British Columbia.

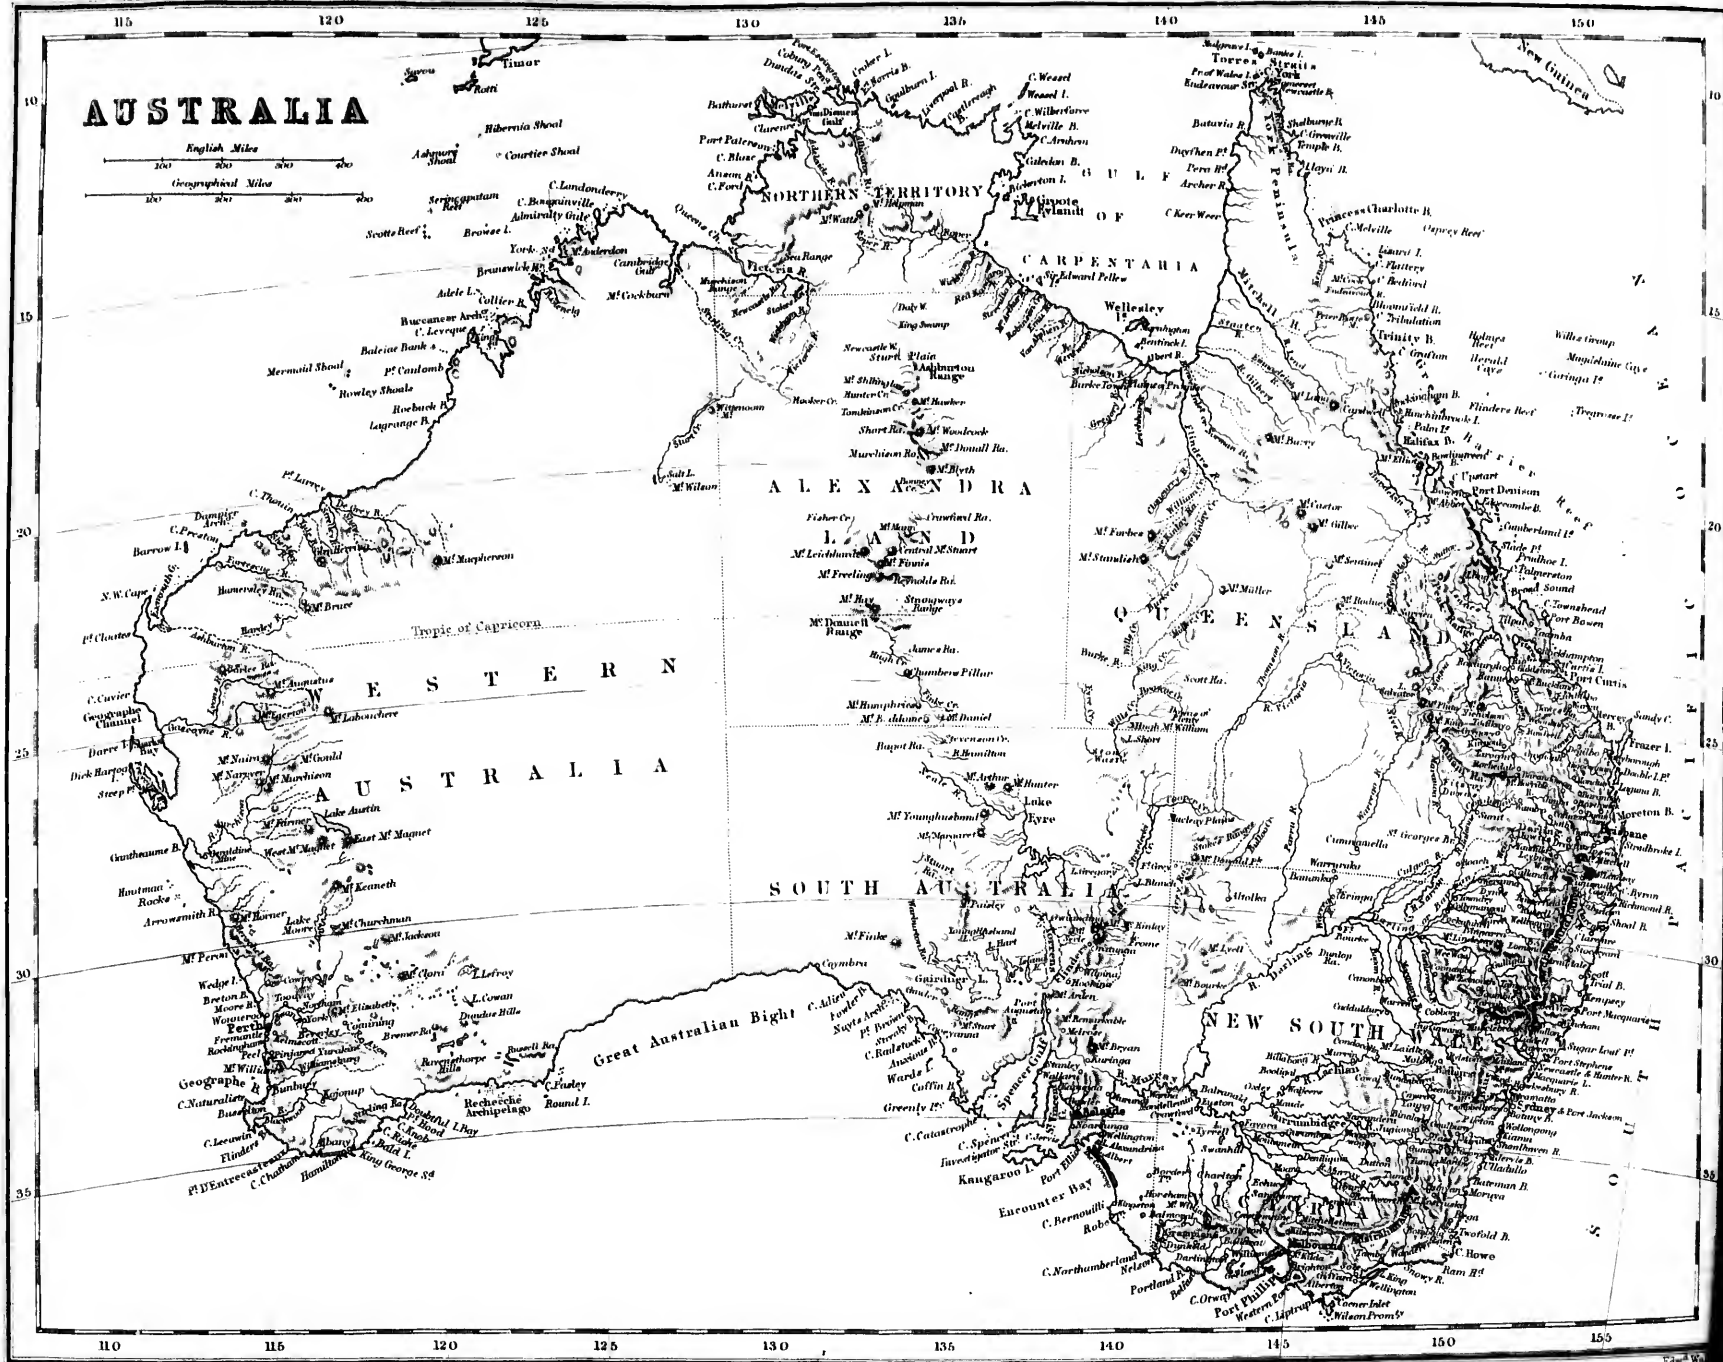

*Extent of Colony.*—British Columbia possesses, exclusive of Vancouver Island, an extent of about 500 miles of sea coast, stretching from the point where the 49th parallel of latitude first strikes the sea coast to the line of the Russian possessions in Portland Canal.

The area of the colony, including Queen Charlotte's Island, is computed by Mr. Arrow-smith to contain about 200,000 square miles.

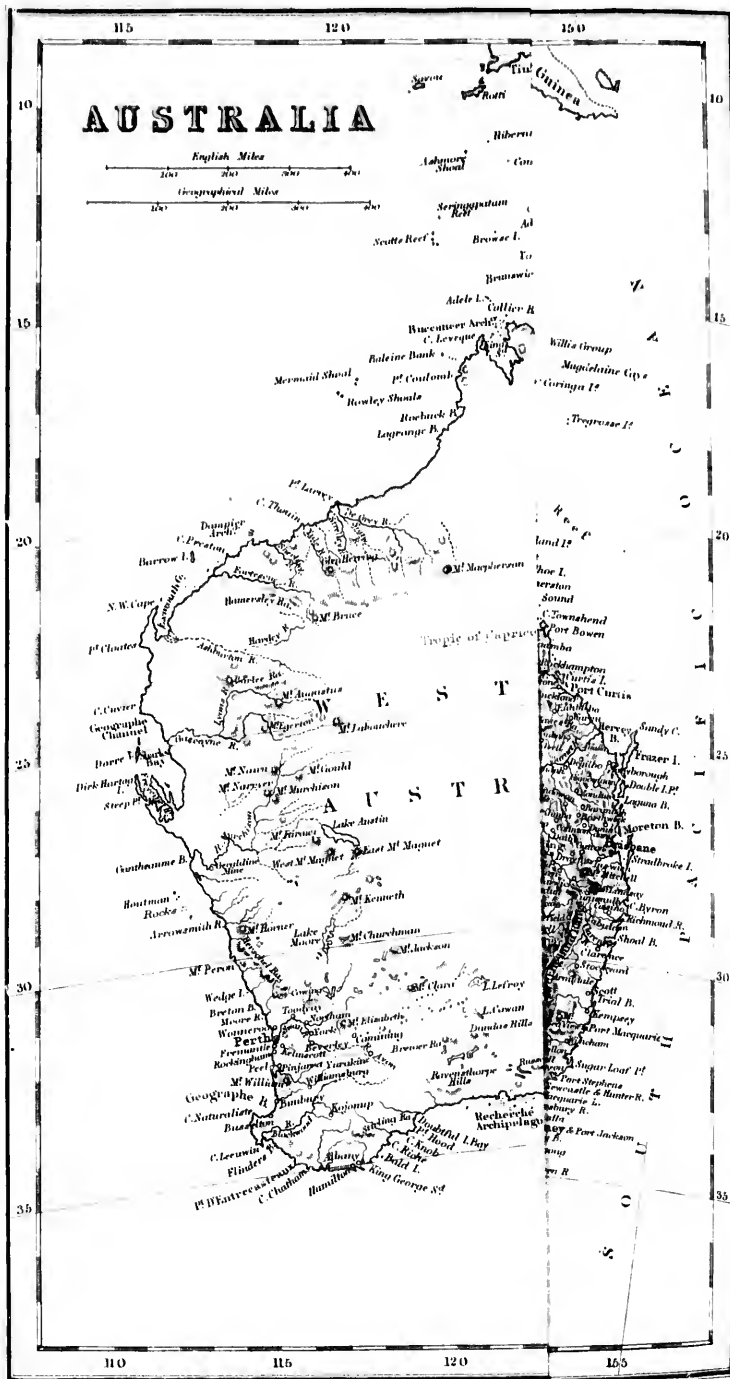

The disposal of the public lands in this colony is now regulated by Ordinances No. 27 of 1865, and No. 13 of 1866.

Ordinance No. 27 of 1865 makes a difference in the mode of dealing with surveyed and unsurveyed country lands: the former can only be acquired by purchase at auction, or if not sold at auction, by private contract, at the upset price fixed in the Ordinance, viz. 4s. 2d. an acre. The latter may be acquired by what is termed 'pre-emption.' Under this system any person may take possession of any unsurveyed, unoccupied, and unreserved country land, not exceeding 160 acres, and not being the site or proposed site of a town, or auriferous or argentiferous lands, or an Indian reserve, provided he first obtains a license for the purpose from the magistrate of the district.

Within seven days of the date of the receipt of the fee of 8s. 4d., the Governor shall grant a 'reconveyance' of all previous claims. Government surveyors shall be empowered to survey any land (if he shall have been previously surveyed by a magistrate of the district) made permanent in value of 10s. an acre, if there has been a purchase of the land, to purchase it, and the purchaser may also purchase it for not exceeding 480 acres, and the purchase money may be paid down of 2s. 6d. per acre, and the balance may be paid by instalments, not exceeding 2s. 6d. to be paid quarterly. Provision is made for the redemption of claims, and the right of British subjects, and of persons who have taken the oath of allegiance, to purchase pre-empt lands.

New provisions are made relating to the mode in which water for irrigation and for enabling the Government to grant pastoral leases or purchases; and to the mode in which the Government may purchase pastoral leases that may be subject, without the consent of the holder, to the reservation of a portion of the land for the use of the Government, and of any person during the term of the lease, of being properly stocked, and of the holder being a British subject.

By the 55th section of the Ordinance, the Governor is empowered to receive and publish the names of the holders of Majesty's Government grants of land, and to grant partially free grants of land, subject to such restrictions, and privileges, as may be deemed expedient.

The Governor is empowered to grant pastoral leases for a term not exceeding seven years, and not to be renewed, unless in special circumstances, and with the sanction of the Secretary of State, and with the approval of the regulations previously approved by the Governor.

The Ordinance of 1865, No. 13 of 1866, which relates to the chartering of ships, and to the incorporation of companies, shall be entitled to the special written permission of the Governor, and that land pre-empted under the Ordinance may be included in the requirements of the Ordinance.

**Vancouver Island.**—Under the provisions of the Act of 1867 it now forms one colony. The laws of each colony shall be such as may be enacted, unless otherwise provided. It has an extreme length of 140 miles, and a breadth varying from 40 to 60 miles. The public lands in the colony are regulated by a proclamation of 1862, directing all land for sale to be sold at an upset price not to exceed 4s. 2d. per acre. If not sold at the upset price, and country land is afterwards purchased by private parties, the payment of instalments to the Government shall be at the rate of 4s. 2d.

Within seven days after, and on payment of fee of 8s. 1d., the magistrate records the claim, and grants a 'record certificate, which is a bar to all previous claims to the same land. When the Government survey extends to the land thus 'pre-empted,' the claimant, his heirs or devisees, or (if he shall have obtained from the stipendiary magistrate of the district a certificate that he has made permanent improvements thereon to the value of 10s. an acre) his assigns, becomes entitled, if there has been a continuous occupation of the land, to purchase it at 4s. 2d. per acre. A pre-emptor may also pre-empt an additional tract not exceeding 480 acres of contiguous land, upon payment down of 2s. 1d. an acre, leaving the remaining 2s. 1d. to be paid when the land is surveyed. Provision is made for the case of disputed claims, and the right to pre-empt is confined to British subjects, and to those aliens who may have taken the oath of allegiance. Aliens who have not taken that oath can purchase, but cannot pre-empt lands.

New provisions are also introduced for regulating the mode in which the right to appropriate water for irrigation and other purposes is required, and for enabling the Governor, in his discretion, to grant pastoral leases to *bonâ fide* pre-emptors or purchasers; and to issue timber-cutting licenses. The Ordinance fixes no limit to the term of the pastoral leases that may be granted, but it makes them subject, without compensation, to the right of reserve, and of pre-emption and purchase by any person during the term, and to the condition of being properly stocked within six months, as the stipendiary magistrate may direct.

By the 55th section the Governor is empowered, on receiving and publishing the assent of her Majesty's Government thereto, to make free or partially free grants of land for the encouragement of immigration, subject to such provisions, restrictions, and privileges as he may think advisable.

The Governor, however, has been instructed not to grant pastoral leases for a longer term than seven years, and not to insert in them any right of renewal. Neither is he to make any free grants under the 55th section except under special circumstances, and with the previous approval of the Secretary of State, or in virtue of general regulations previously approved by the Secretary of State.

The Ordinance of 1865 was amended by Ordinance No. 13 of 1866, which provides that neither chartered nor incorporated companies nor aborigines shall be entitled to pre-empt land without the special written permission of the Governor; and that land pre-empted before the date of the Ordinance may be included when the General Survey comes up to it, although its boundaries may not have been laid out in strict accordance with the requirements of the Land Ordinance of 1865.

*Vancouver Island.*—Under the 29 & 30 Vict. c. 67 it now forms one colony with British Columbia. But the laws of each are to remain in force unless otherwise provided by lawful authority. It has an extreme length of 275 miles, and a breadth varying from 40 to 50 miles. The disposal of the public lands in this colony is now regulated by a proclamation dated September 6, 1862, directing all land for sale, whether town, suburban, or otherwise, to be put up to auction, at an upset price not to exceed, for country land, 4s. 2d. per acre. If not sold at auction, it may be afterwards purchased by private contract at the upset price, and country land forfeited for non-payment of instalments to be sold by auction at upset price of 4s. 2d.

#### AUSTRALIAN COLONIES AND TASMANIA.

By the Imperial Acts 18 & 19 Vict. c. 56 (July 16, 1855), the Land Sales Acts, 5 & 6 Vict. c. 56, and 9 & 10 Vict. c. 104, are repealed, and the Crown in Western Australia and the local Legislatures in the other Australian colonies are left at liberty to alter the land regulations which existed at the time of the passing of the first-mentioned Act, 18 & 19 Vict. c. 56.

New South Wales, Victoria, Queensland, South Australia, Tasmania, and Western Australia have accordingly passed laws to regulate the disposal of their public lands.

#### NEW SOUTH WALES.

The disposal of the public lands in this colony is now regulated by two Acts, Nos. 1 & 2 of 25 Vict. 1861. The first enacts that all Crown lands shall be sold either by way of conditional sale without competition or by auction.

*Classification of Lands.*—Crown lands are divided into four classes, viz.:—'town lands,' being those in or set apart as a site for any city, town, or village; 'suburban lands' (declared in the 'Gazette' to be such); 'first-class settled districts,' and 'second-class settled districts.'

*Auction.*—Town lands and suburban lands without improvements are to be sold by public auction only, at upset prices of not less than 8*l.* per acre for the former and 2*l.* for the latter; the upset price of other Crown lands intended to be sold without conditions of residence and improvement is not to be less than 1*l.* per acre. If no sale is effected at the first auction the lands may again be put up to auction, and, with the exception of town and suburban lands, may in the interim be purchased at the upset price, if not previously withdrawn from sale by the Government. (Secs. 23, 24, 25.)

*Mode of Payment.*—One-fourth of the purchase money is to be paid at the time of sale, and the remainder within three months. (Sec. 26.)

*Conditional Sale.*—By the plan of 'conditional sale' any one may, on certain notified days, make to the land agent of the district a written application for the conditional purchase of not less than 40, nor more than 320 acres, accompanied by a deposit of one-fourth of the purchase money, at the rate of 1*l.* an acre. He will then be declared the conditional purchaser, unless there be more than one application for the same land or any part of it, in which case the successful candidate is to be determined by lot. The lands to be selected under this system must, however, not be town or suburban lands, nor within a proclaimed gold field, unless unoccupied for gold mining purposes, and must not be within certain distances of towns or villages, varying from 10 to 2 miles, according to the population of the place, nor reserved for town sites or other public purposes. (Secs. 13 and 14.)

At the expiration of three years and three months the purchaser has the option of paying the balance of the purchase money, and receiving a conveyance in fee, or of deferring the payment indefinitely by paying interest at the rate of 5 per cent. per annum on the amount, within three months after January 1 in each year. The purchaser, however, must in either case prove to the satisfaction of the Minister of Public Lands that he has made improvements to the extent and value required by the Act, that he has *bonâ fide* resided continuously either by himself or his alienees on the land, and that he has not alienated it until after at least one year's *bonâ fide* residence thereon.

There are some other minor provisions for

effecting conditional purchase, under mining conditions (other than gold mining), when the price is to be 40s. an acre, and for determining values and matters in dispute by appraisal and arbitration.

Under the Land Acts of 1861 no privileges are now granted in the acquisition of land to naval and military settlers.

#### QUEENSLAND.

The land granting system of Queensland is now regulated by an Act passed by the Colonial Legislature in September 1860, 24 Vict. No. 15, entitled 'An Act to provide for the Alienation of Crown Lands;' and by the 'Agricultural Reserves Act, 1863,' 27 Vict. No. 23; and the 'Leasing Act of 1866,' passed Oct. 11, 1866, which repeals 29 Vict. No. 21, and provides that Crown lands situate beyond two miles of any town and remaining unsold after being offered at auction, are open to lease for eight years at not less than 2s. 6d. per acre rent. After eight payments the land is to be granted to the lessee in fee simple.

The main principle of the Act, 24 Vict. No. 15, is the same as that in the repealed Imperial Land Sales Act, viz.: that Crown lands are to be sold by auction at not less than 1*l.* an acre, but that lands once put up to auction and not sold may be sold by private contract, with prompt payment in both cases. The novelty in the Act is a provision for what are called Agricultural Reserves, in which the lands are not subject to auction, but may be bought or leased on special conditions.

(N.B. A new Land Act, 'The Crown Lands Alienation Act of 1868,' has been passed by the Colonial Legislature, but has not yet officially reached the home authorities. Under it from 40 to 640 acres of agricultural land can be bought at 15s. an acre, payable in ten annual instalments of 1*s.* 6d. per acre; but to entitle the purchaser to a deed of grant he must prove that he has resided not less than two years, and expended not less than 10*s.* an acre on the land.)

The following is an abstract of the Act 24 Vict. No. 15:—

**Public Reserves.**—The Governor, with the advice of the Executive Council, may proclaim lands as reserves for town or village sites, and may make grants for public purposes specified in the 'Unoccupied Crown Lands Occupation Act' of 1860, or sanctioned by the Legislature. (Secs. 3 and 4.)

**Minimum Price.**—No land is to be sold for less than 1*l.* an acre, nor until it has been surveyed and mapped. (Sec. 5.)

**Auction.**—All Crown lands must be offered for sale by public auction, duly notified in the Government Gazette, not less than one or more than three months before the auction. (Sec. 6.)

**Classification of Lands.**—The lands are to be divided into three classes—town, suburban, and country lots. Town lots are those within the actual boundaries of towns. Suburban lots are to comprise all lands (except such as the Government may think fit to exclude) within two miles from the nearest boundary of any town. Country lots are to comprise all other lands, and the Governor in Council may, from time to time, fix the upset price of any lot not lower than 1*l.* per acre. (Sec. 7.)

**Sales by Private Contract.**—Lands which have been offered for sale at auction, and not sold, may afterwards be sold by private contract at the upset price; but such lands may be withdrawn from private sale and again offered for sale by auction. (Sec. 8.)

**Payment of Purchase Money.**—In the case of

sales by private contract the whole of the purchase money must be paid down at the time of purchase. In the case of auction, a deposit must be made of not less than one-tenth of the purchase money; the remainder must be paid within one month, or the deposit will be forfeited. (Sec. 9.)

**Agricultural Reserves.**—'The Selectors' Relief Act' (29 Vict. No. 21) enables the Governor in Council to remit forfeitures (if the condition of residence has been complied with) of land selected under the Agricultural Reserves Act of 1863. The Governor in Council is also empowered to proclaim and set apart from time to time what are called 'Agricultural Reserves,' the lands in which are to be sold, not by auction, but at a fixed price of 20*s.* per acre. Such reserves are to contain available land, open to selection, at no time less than 50,000 acres, upon shores of the principal bays or navigable waters; and also 2,500 acres, to be available for selection within 7 miles of all towns containing inhabitants exceeding 500 in number. The Governor in Council may, however, by proclamation withdraw and deal with such lands as country lands.

**Conditions of Purchase.**—Any person wishing to occupy land within an 'agricultural reserve' must pay in advance to the land agent for the district 20*s.* an acre for the lots he may wish to select; and twelve months thereafter, upon his making a declaration, and producing in support thereof satisfactory evidence that he has resided upon the land for a period of six months, and cultivated one-tenth thereof, he will become entitled to a deed of grant of the land.

**Leases of Agricultural Reserves.**—Owners of farms within 'agricultural reserves' may obtain leases for five years of contiguous unoccupied land not exceeding three times the extent of the purchased land in the farm, nor in the whole 320 acres (including the farm), at a rent of 6*d.* per acre, payable annually in advance, with a right of pre-emption during the currency of the lease. Default of 30 days in payment of rent, or failure within 18 months to fence off the land, makes void the lease. No lease must be held by an agent, or pledged as security for money lent.

**Size &c. of Farms.**—Farms within agricultural reserves must be selected in one or in continuous lots, and must not be less than 18 nor more than 320 acres in all in the same reserve.

**Commonage.**—All unenclosed lands in any such reserve are to be subject to the rights of commonage of land purchasers, and of the residents in any adjacent townships.

**Sale of Improved Lands.**—Land within the boundaries of any township or village on which improvements may have been made may be sold to the owners without competition, if application be made within twelve months of the passing of the Act as regards existing towns or villages, or within twelve months after the proclamation of any new town or village.

**Closing of Roads.**—Sections 16 and 17 provide for the closing and alienation of unnecessary roads, and the sale of the land without competition to the holders of the adjacent lands.

**Military and Naval Settlers.**—Privileges to Military and Naval Settlers abolished in Queensland by Colonial Act, 28 Vict. No. 17 (1864).

**Bounty on Cotton.**—To encourage the growth of cotton, the Governor in Council may issue land orders during the three years next after the passing of the Act to the extent of 10*l.* and during the two following years to the extent of 5*l.* for every bale weighing 300 lbs. of good clean Seg island cotton, not damaged or discoloured, grown in the colony, and exported to Great Britain.

One half these premises common descriptions of Mineral Lands.—They shall not exceed 640 acres, and shall be held by a company, at 20*s.* an acre, and shall be disposed of other than for coal. Governor to make Rules in Council is authorised to publish in the Gazette for carrying out the Act. He laid before the Colon

#### VICTORIA.

The disposal of Crown land regulated by two Acts: June 18, 1862; and an Act 27, passed March 23, consolidates and amends the sale and occupation of the public lands that have been except free grants and grants will be found the principle (but not before survey) of pre-emption payments, and payment of settlement duties, for commonage, for meeting of industries seeking development, and for checking monopoly, land for the purposes of speculation, and for the purpose of immigration by the fixed year-fourths of the land revenue.

The amending Act repeals Section 1 in Part II. of the first Act, in secs. 12 to 37, both inclusive, and 40th sections. It also repeals Section 1 in Part III. and the 68th. It substitutes other provisions and introduces other amendments. It is to be co-extensive with the principal Act.

The new feature in this law now is obtained of land in agricultural purposes, as well as for pastoral purposes.

The principal Act of 1862 is amended, and omitting the repealed Act, which regulate the mode of sale of the agricultural areas (making other provisions on that point) is an abstract of its leading provisions.

It repeals all former laws except the Gold Fields Act, No. 1 in Council and regulations affecting itself to expire on December 1, 1863. It empowers the Governor to reserve from sale, either temporarily or permanently, any Crown lands for any purpose (sec. 5), and enables the Governor to escheat or forfeit lands, or to have a moral though not a legal right in them.

Part 3 relates to leases and licenses for agricultural or pastoral purposes. It grants mining leases, for 30 years without restriction, and with a right of pre-emption, after 10 years, at 1*l.* per acre (sec. 48). The mining leases are regulated by an Order in Council. The extent of area is not to exceed 100 acres, and the value of the mineral or metal at the time of the lease.

Leases of three acres, for a term of 20 years, may also be granted for other purposes—such as sites for

One half these premiums are to be given for the common descriptions of cotton. (Sec. 21.)  
*Mineral Lands.*—The Governor in Council may sell not exceeding 640 acres to any one person or company, at 20s. an acre, lands for mining purposes other than for coal or gold. (Sec. 22.)  
*Governor to make Regulations.*—The Governor in Council is authorised to make and alter, and for carrying out the Act, which regulations are to be laid before the Colonial Parliament.

VICTORIA.

The disposal of Crown lands in Victoria is now regulated by two Acts: 25 Vict. No. 145, passed June 18, 1862; and an amending Act, 28 Vict. No. 27, passed March 23, 1865. The former Act consolidates and amends all previous laws relating to the sale and occupation of Crown lands. It combines nearly all the modes of dealing with public lands that have been tried in any colony; will be found the principle of selection at a fixed price (but not before survey) over certain agricultural districts—of auction over other districts—of prompt payments, and payments by instalments—and of settlement duties. It contains provisions for commonage, for meeting the cases of all kinds of industries seeking development in the colony, and for checking monopoly, and the acquisition of land for the purposes of speculation, and promotes immigration by the fixed yearly appropriation of one-fourth of the land revenue.

The amending Act repeals so much of Subdivision 1 in Part II. of the first Act as is comprised in secs. 12 to 37, both inclusive, and in the 39th and 40th sections. It also repeals the 47th section in Part III. and the 68th section in Part IV. It substitutes other provisions for those repealed, and introduces other amendments in the law. Its duration is to be co-extensive with that of the principal Act.

The new feature in this law is that leases may now be obtained of land in small quantities for agricultural purposes, as well as in large quantities for pastoral purposes.

The principal Act of 1862 is divided into six parts; and omitting the repealed sections in Part II. which regulate the mode of alienating the lands in the agricultural areas (the amending Act making other provisions on that subject), the following is an abstract of its leading provisions:—

It repeals all former laws (six in number), except the Gold Fields Act, No. 32, and all Orders in Council and regulations affecting public lands, and is itself to expire on December 31, 1870 (secs. 1 and 155). It empowers the Governor in Council to reserve from sale, either temporarily or permanently, any Crown lands for any public purpose whatever (sec. 5), and enables him (sec. 10) to deal with escheated or forfeited lands in favour of persons having a moral though not a legal claim on them.

Part 3 relates to leases and licenses for other than agricultural or pastoral purposes. The Governor may grant mining leases, except for gold, for 50 years without restriction as to number, and with a right of pre-emption, after the first five mining leases are regulated by an Order in Council. The extent of area is not to exceed 640 acres, and the size is to be 2s. an acre, and 2 per cent. on the value of the mineral or metal at the mouth of the mine.

Leases of three acres, for a term not exceeding seven years, may also be granted for various useful purposes—such as sites for inns, stores,

bakeries, bathing houses, factories, quays, ship building &c. But these leases are voidable at any time if not used for the purposes for which they were granted. (Secs. 50 & 51.)

Annual licenses may also be granted for any of the purposes specified in sec. 58, subject to such fees and conditions as the Governor in Council may prescribe. (Sec. 54.)

Part 4 relates to commons, of which there are to be four classes; viz. municipal commons, gold fields commons, town commons, and farmers' commons.

The commons may be proclaimed by the Governor in Council, in localities within five miles of any municipal district, or gold field, or town (not in a municipal district), or agricultural area, of which one-fourth has been selected. (Sec. 65.) The persons entitled to free commonage are house-holders, holders of 'miners' rights' or business licenses, resident selectors in agricultural areas, and land owners resident within five miles of a commons 'farmers' commons.' (Sec. 67.) The lands in these commons may however be sold, or selected, or time alter or abolish any common; and the right of depasturage (except in the case of farmers' commons) is restricted to four head of cattle for each commoner. (Sec. 77.)

Part 5 relates to pastoral licenses. It is with this branch of the subject that the great difficulty has hitherto been found in dealing with the land question.

The 80th section of the Act empowers the Governor to issue to the licensed occupiers of existing years yearly licenses of their runs for the next eight years only, commencing from January 1, 1863; but it expressly provides that the license is not to prevent the run or any part of it from being sold, leased, proclaimed a common, or otherwise dealt with under the present or any future law.

Instead of an assignment as heretofore on the stock actually fed on the run, a rent is to be paid on the number of cattle (at the rate of 8d. for each sheep, or 2s. for each head of cattle) which the run may be capable of carrying, to be determined by the Board of Land and Works, or, in case their decision is disputed, by arbitration. (sec. 83); but the rent may be increased within the first twelve months if the Board have reason to believe that it has been fixed too low, subject to an appeal on the part of the squatter. (Secs. 96 & 97.)

With regard to new runs, they are to be sold by auction, the rent being fixed by the Board of Land and Works, and the biddings being on the premiums. If there are no bidders at the auctions, the Board may reduce the rent and put up the run again, and so from time to time until it is sold by auction. The purchaser is to receive a license of occupation (which is to be deemed a transferable chattel interest, secs. 107-8) for 14 years, and the size of the run is limited to an extent sufficient in the estimation of the Board to carry all the year round 5,000 sheep, or 1,250 head of cattle (secs. 98, 99, 100, and 101). If the rent, which is payable half-yearly (sec. 113), is suffered to fall into arrear, 2l. a day are to be added to it by way of penalty; and if it continue in arrear more than two months, the run is liable to forfeiture. (Secs. 116-7.)

The Governor in Council may make reserves for sale to the extent of one-fourth of the run, but no more than three months' notice given to the licensee, and the remainder of his run is made subject to being leased or occupied under a 'miners' right' or license for other than pastoral purposes (sec. 102). Runs taken up in 1860 and 1861 under the last Land,

Act, No. 117, may within 12 months be surrendered, and licenses in exchange obtained under the present Act. (Sec. 103.)

Licensees are prohibited from cultivating their runs for purposes of sale or barter; but they may make improvements on them, and dig for stone, and take timber for domestic uses; and if the run be not within an agricultural area, the licensee is entitled to compensation if that part of the run is taken from him on which he may have made a substantial fence or permanent reservoir of water, provided he had previously obtained permission to effect the improvement and had it duly registered. A deduction, however, is to be made of one-tenth of the value for each year he may have had the use of the improvement (sec. 110). Compensation (not exceeding 500*l.*) is also to be granted to the occupiers of new runs for the loss of buildings and yards, or they may be allowed instead to purchase, at 1*l.* per acre, 320 acres of the land on which the improvements stand (sec. 111).

Lastly, no occupier of land for pastoral purposes is to be entitled to any compensation by reason of the Act being repealed or altered (sec. 121).

The privilege of public officers and holders of 'miners' rights' prospecting for gold to depasture their cattle on Crown lands is preserved (secs. 78, 79).

Part 6 relates to trespasses and penalties.

**Assisted Passages.**—There remains one important provision which immediately affects the poorer classes of this country. By the 38th section one-fourth of the nett revenue received in each year after 1862 from the sale or leasing of land, or for licenses for the use thereof, is to be appropriated to the purposes of immigration under regulations to be made by the Governor in Council, and submitted to both houses of the Colonial Parliament. The immigrants, during the first nine months of each year, are to be selected from England, Scotland, Ireland, and Wales, in proportion to the population of those divisions respectively of the United Kingdom according to the last census.

**Act of 1865.**—The following extracts from a memorandum drawn up by Mr. J. M. Grant, the Minister of Crown Lands and Survey, dated Melbourne, October 23, 1865, will show such of the leading features of the amending Act of 1865 as are likely to interest intending emigrants from this country:—

Under the amending Land Act of 1865 the occupation of land for agricultural purposes, except when obtained under certificate, is in the first instance acquired by lease, the fee simple being purchaseable under certain conditions at the rate of 1*l.* per acre; and until such purchase is effected, a rent of 2*s.* per acre per annum, equivalent to 10 per cent. on the upset price of the land, is exacted. This tenure under rent may be continued for seven years, but at the expiry of that period purchase is compulsory at the rate of 1*l.* per acre, should the tenant desire to secure his improvements, otherwise they become forfeited to the State.

The conditions of lease are as follow:—

1. The lease cannot be assigned during a period of three years from the commencement of the term, nor at any time until certain improvements have been effected by the tenant.
2. Improvements to the value of 1*l.* per acre in the area leased must be effected by the lessee within two years from the commencement of the lease.
3. When the above improvements have been made, the lessee may, at the expiry of three years, require his leasehold to be exposed to auction with the value of his improvements added to the upset price of 1*l.* per acre; and the amount of such valuation will be paid by the purchaser to the lessee should the latter be outbid at the auction.

4. If, however, the lessee reside three years on the land leased, and effect the stipulated improvements, he will at the termination of that period be entitled to demand and obtain a grant of his leasehold in fee simple on payment of 1*l.* per acre.

As a peculiar feature of this Act, it is to be noted that the interest of the lessee cannot be taken under execution, nor does it pass to the official assignee of his estate, should he be so unfortunate as to become insolvent; in fact, the lessee cannot be disturbed in his occupation till the expiry of the three years allowed for the completion of his improvements.

The restrictions and limitations of the area of land that may be leased by any one individual under the amending Land Act remain as set forth in the Land Act of 1862, the extent being limited to 640 acres in any one year.

Although the ten million agricultural area of the Land Act 1862 included the lands intrinsically most valuable and suitable for agricultural settlement, which is vouched for by the fact that the pastoral occupation of that area yielded to the State 107,000*l.* per annum, while the twenty million of acres under pastoral occupation beyond the limits of the ten million agricultural area yielded only 119,000*l.*; the range of selection now in the power of intending agriculturists is limited only by the discretion of the Department of Lands and Survey in selecting the position of agricultural areas, which may be surveyed throughout the entire colony.

For bringing the amending Land Act of 1865 into operation, 29 land offices have been established throughout the colony; 188 agricultural areas have been proclaimed open for selection, embracing an aggregate area of 3,251,292 acres, of which 1,670,739 have been selected by 6,126 certificate-holders and lessees. 561,416 acres have been withdrawn from selection chiefly on the presumed unprofitable character of the country; and 1,634,865 remained, Oct. 23, 1865, open for selection by the first applicant at the several land offices where these areas were proclaimed open for selection.

Lithographic plans of each area have been prepared on a scale of 1½ inch to one mile; showing the acreage, the numbering and boundary lines of the several allotments into which the area has been subdivided, the roads surveyed, and the natural features of the country.

The surveys of 450,000 acres are now in the office, the lithographic plans of which are being rapidly prepared, with a view to the proclamation of that extent of land in agricultural areas within a few weeks. By the 10th sect. of the Act not less than 4,000,000 acres are to be open for selection or purchase within 3 months after the passing of the Act, and at least 2,000,000 are to be constantly kept open in the proclaimed areas.

In order to provide additional facilities for the acquisition of land and for the settlement of the population, the Board of Land and Works is empowered to allow lessees to subdivide their allotments into two or more portions, and to grant separate leases for such purposes to persons named by the original applicant. Under this provision the attendance of one person at a land office suffices to secure land for himself and others who he may wish to have as neighbours; and members of the same family are thus enabled to obtain farms adjoining each other.

In order to discourage the employment of agents the Board of Land and Works is empowered to disallow applications for land at any time within thirty days from the date of their receipt.

The provisions of the Land Act of 1865, which effectual management of the land in effecting local waste lands by the Land Act 1862, the rental to the Crown lands, and the Land and Works, as mentioned in the Government Gazette of October 23, 1865, runs then in occupation. Auction.—By the Act, all Crown lands except those in agriculture for selection (sec. 10) by auction, at an upset price, and reservations may direct.

### SOUTH AUSTRALIA

The Waste Lands Act No. 3, of 1857, as passed that year. The following:

**Abstract of South Australia, Secs. 1 and 2.**—Waste land not to be alienated except by Act.

**Sec. 3. Reserves.**—Governor may, however, make reserves for safety, convenience, health, or for churches.

**Sec. 4. Surveys and Size of Lots.**—All lands to be surveyed in lots not exceeding 640 acres.

**Sec. 5. Deed of Grant.**—Governor may convey lands to the Crown, to convey lands to the Crown, to convey lands to the Crown, to convey lands to the Crown.

**Sec. 6. Auction.**—Except as provided, land is to be sold by auction after publication of notice for not more than 3 months.

**Sec. 7. Classification of Land.**—Land is to be classified into town, suburban, or rural.

**Sec. 8. Upset Price.**—Lowest price for which land is to be sold.

**Sec. 9. Government may acquire land.**—Government may acquire land for town lots and for special purposes, and for special country lots on which improvements have been lawfully made.

**Sec. 10. Sale by Private Contract.**—Land may be sold only by auction, but may be sold by private contract if it has been exposed to sale at auction and withdrawn for future sale.

**Sec. 11. Private Contract.**—Land may be sold by private contract at the upset price, and not sold, if it has been exposed to sale at auction and not sold.

The provisions relating to commonage in the Land Act of 1862 remain unaltered in the amending Act, which, however, provides for the more effectual management of the commons and the expenditure of the surplus fees derivable therefrom in effecting local improvements.

The conditions of the pastoral occupation of the waste lands by the squatters remain unaltered up to December 31, 1870 (the period limited by the Land Act 1862). Under the provisions of that Act, the rental to be charged for the occupation of the Crown lands was assessed by the Board of Land and Works, and published in the Government Gazette of December 1862, the number of runs then in occupation being 1,122.

**Auction.**—By the 32nd section of the amending Act, all Crown lands in Victoria, wherever situated, except those in agricultural areas proclaimed open for selection (sec. 10), are to be sold, in fee simple, at an upset price of 1*l.* per acre, or such higher upset price and subject to such conditions and reservations, as the Governor in Council may direct.

**SOUTH AUSTRALIA.**

The Waste Lands Act for this colony (21 Vict., No. 5, of 1857) was passed on the 19th November of that year. The following is an abstract of the Act:

**Abstract of South Australia Waste Lands Act, Secs. 1 and 2.**—Waste lands of the Crown not to be alienated except by sale as prescribed by Act.

**Sec. 3. Reserves.**—Governor in Council may, however, make reserves for purposes of public safety, convenience, health, or enjoyment (except for churches).

**Sec. 4. Surveys and Size of Lots.**—Except pastoral lands, all lands to be surveyed and mapped in lots not exceeding 640 acres before they are sold.

**Sec. 5. Deed of Grant.**—Governor, on behalf of the Crown, to convey lands sold under the public seal of the province.

**Sec. 6. Auction.**—Except pastoral, all lands to be sold by auction after public notice of not less than 1 nor more than 3 months.

**Sec. 7. Classification of Lands.**—Lands to be classified into town, suburban, and country.

**Sec. 8. Upset Price.**—Lowest upset price, 1*l.* per acre.

**Sec. 9. Government may fix a higher upset price for town lots and for special country lots, and country lots on which improvements may have been lawfully made.**

**Sec. 10. Sale by Private Contract.**—Town lots to be sold only by auction, but country lots which have been exposed to sale at auction may (if withdrawn for future sale by auction) be sold by private contract at the upset price, or if not sold at auction and not sold, then at the price bid.

**Sec. 11. Payment of Purchase Money.**—In the case of private sales, the whole of the purchase money to be paid down. At auctions 20 per cent. down, and the remainder within 1 calendar month.

**Sec. 12. Pasture Leases.**—The Governor may, without auction, grant to the first discoverer or pastoral occupier of waste lands, leases of 14 years for pastoral purposes; but no second lease is to be granted unless first put up to auction; the bidding to be on the rent. Annual leases of land within hundreds may be granted without being put up at auction. By an Act (22 Vict.) No. 20 of 1858, an annual assessment is imposed of 2*l.* a head for each sheep which the demised land is estimated to be capable of grazing.

**Sec. 13. Mineral Leases.**—The Governor may also grant leases of 14 years for mining purposes of lots not exceeding 80 acres, at a rent of 10*s.* an acre, with a right of renewal for 14 years more on paying a fine of not less than 1*l.* an acre, subject to future regulations.

**Sec. 14. Regulations.**—The Governor in Council may make regulations from time to time for pastoral leases, to be officially published.

**Sec. 15.** All regulations made by Governor under the Act are to be laid before the provincial Parliament within 14 days.

**Sec. 16. Mineral and Timber Licenses.**—The Governor in Council may grant licenses of 12 months' duration to search for gold and other metals, and to cut timber on the unsurveyed waste lands.

By an Act No. 18 of 1858 (22nd Victoria, passed December 24, 1858, to amend the above 'Waste Lands Act') the Governor is empowered, when any lease for pastoral purposes shall have been determined by reason of the land being included in any to the lessee or his assigns during the residue of his term.

The Governor is also empowered to make regulations affecting and defining the issue of depasturing, gold, timber, and mineral licenses; and to fix a higher upset price for suburban land than the lowest upset price fixed for waste lands.

'The Waste Lands Appropriation Act, 1862' (25 & 26 Vict. No. 17 of 1862) repeals sec. 19 of the Waste Lands Act of 1857, and appropriates two-thirds of the gross proceeds of the sale of waste lands to the payment of the principal and interest of the public debt, and to the making of roads, bridges, railways, and other public works, and the remaining third towards defraying the expenses of the passages of immigrants from the United Kingdom under the provisions of the Immigration Act No. 4 of 1857.

By an Act 25 & 26 Vict., No. 24 of 1862, sec. 13 of the 'Waste Lands Act' of 1857 is repealed, and other provisions made for granting mineral leases.

By an Act of 29 Vict., No. 8 of 1865-6, sec. 3 of No. 18 of 1858 is repealed, and penalties are imposed for the unauthorised occupation and use of Crown lands, or for unlawfully depasturing cattle thereon, or for making a false declaration of commonage; and by an Act, No. 10 of the same year, entitled 'The Mineral Leases Act, 1865-6,' the Governor may demise Crown lands for the purpose of mining coal in allotments not exceeding 20 acres, and for a period not exceeding 14 years, and prescribed in regulations which the Governor and Executive Council are therein empowered to lay down.

By an Act, No. 16 of 1865-6, certain pastoral tenants, whose names are specified in three schedules,

Lanncston, and agricultural and pastoral lands unsold at auction, to be advertised in Gazette and sold by private contract at the upset price to the first applicant within one year after auction, and before the lands are again put up to auction, unless there be simultaneous applications for the same lot, when it is to be again put up to auction.

**Secs. 19, 20, 21, 22, 25, & 26. Fixed Price.**—Any person may, on paying the expense of survey, select from unoccupied land not being town lands or lands reserved for sale, or under lease, and purchase by private contract at the fixed price of 1*l.* per acre, 320 acres in one or more adjoining lots of not less than 40 acres each. In the case of what are termed 'unsettled lands' the price is 10*s.* an acre, and the size of the lot not greater than 640 acres. (Sec. 70.) Any land obtained in contravention of this restriction is to be forfeited. The land thus selected to be subject to all rules to be prescribed as to form or figure of such lots, and must be surveyed before grant issued.

**Secs. 27 to 34. Payment of Purchase Money.**—Purchasers may elect at time of purchase to buy on credit, or for prompt payment (i. e. at auctions one-fifth down and the residue within one month; at private sale the whole down). Where *credit* is chosen, whether the purchase be at auction or by private contract, one-fifth of the price is to be added by way of premium, and one-fifth of the aggregate sum is to be paid down, and the residue by annual instalments of one-tenth. On failure in payment of any instalment within 60 days, the land is to be put up again to sale by auction; and if the overdue instalment is not paid 14 days previous to the day fixed for the sale, then the deposit and all previous instalments are to be forfeited, and the land is to revert to the Crown to be sold by auction for not less than the balance due. If sold for more than the balance due and deposit, the excess to be paid to the original purchaser. Instalments may be paid off at any time, and in that case the credit premium is to be proportionately reduced. No land is to be sold on credit where the price is less than 1*l.*

**Secs. 36 & 37. Transfer.**—No purchaser can transfer his land without the written consent of the Commissioner, until the whole purchase money is paid; but it will pass to his devise, or in case of intestacy to his personal representative, i. e. executor or administrator.

**Secs. 41 to 49. Leases.**—The Commissioner must advertise, from time to time, lands for leases not exceeding 14 years, fixing the rent according to the best estimate he is able to form; provided that if the land has been previously let or occupied under a depasturing license within one year prior to such notice, the annual rent is not to be less than 1*l.* per 100 acres; but if the land has not been so occupied, then the annual rent is not to be less than 10*s.* per 100 acres.

**Railways &c.**—The Governor in Council may lease lands for railways or tramways at a peppercorn rent.

**Pastoral Leases.**—The Commissioner may, without advertisement, lease for any term not exceeding 10 years, and at an annual rent of not less than 1*l.* per 100 acres, pastoral lands not previously occupied within a year. The lots are to contain not less than 500 nor more than 2,500 acres. The rent of every lease is to be payable half yearly in advance, and the lease is to be determinable if the rent is not paid within a month, also upon a six months' notice given with the consent of the Governor in Council if the land is required for sale. In this latter case the lessee is to be entitled to compensation (to be fixed by valuation) for

permanent improvements. If the land be not sold, the lessee is to have the option of continuing his lease.

The Amending Act, No. 4 (1867), provides (secs. 3 to 7) for the proclamation and leasing of agricultural areas, for securing their occupation by the lessee or some member of his family, and for raising money by debentures for the construction of roads and bridges within them. It makes provision (secs. 10 to 18) for the lease of lands for mining purposes. It extends (sec. 19) the provisions of the Act of 1863, which appropriates one-fourth of the nett receipts from the sale or lease of land to the construction of roads; (sec. 20) and of other public works also. It fixes (sec. 21) the lowest upset price of land at 20*s.* an acre, subject to a reduction with approval of the Governor in Council to not less than 10*s.* an acre if the land is not sold within three months of the auction. It also makes (sec. 20) provision for the leasing of Crown reserves, and (sec. 26) for the grant of land to municipalities for municipal purposes.

The Act No. 27 of 1867 was passed with reference to a contemplated immigration of Europeans from India, and authorises the Governor to reserve for three years an area not exceeding 50,000 acres at Castra in the county of Devon, and allows a remission of purchase-money to any persons who may arrive as expected. When 5,000 acres have been selected the Governor is to expend a sum not exceeding 10*s.* an acre, to be raised by debentures, in constructing roads and bridges in the tract so selected.

#### NEW ZEALAND.

This colony is divided into nine provinces, with a separate Government in each. There is also a General Government over the whole. In the five provinces of Nelson, Marlborough, Canterbury, Otago, and Southland (formerly part of Otago, but now created a new province), the Crown has extinguished by purchase the native title over all the lands. In the other four provinces, which are situated in the Northern Island, viz. Auckland, Wellington, Taranaki (formerly New Plymouth), and Hawke's Bay, this result has only been partially effected, and the native title still exists over large tracts.

An Act (26 Vict. No. 42) has been passed by the General Assembly, enabling natives to sell their lands to private individuals. Previously they were prohibited from alienating their lands, except to the Crown.

The management of the Crown lands throughout the colony has, by the Imperial Act 15 & 16 Vict. c. 72, granting the colony a Constitution, been vested in the General Assembly. The General Assembly, in its session of 1858, accordingly passed an Act, No. 75, to regulate the disposal and administration of the waste lands of the Crown in New Zealand. This Act (called 'The Waste Lands Act, 1858') gives validity to all regulations for the disposal of the waste lands of the Crown previously in force in the different provinces, except so far as they may be inconsistent with the Act.

The following are two of the principal provisions of this Act:—

Not more than 320 acres shall be put up to sale by auction in one lot, and the upset price shall in no case be less than 5*s.* an acre. After the 1st of August 1860, no land shall be sold upon credit except what may be lawfully set apart for special settlement by expected immigrants. Priority of choice for the same piece of land shall, in no case, be decided by lot, but by auction, at which only

the applicants for the lot shall be allowed to bid. This provision not to extend to applications heard before the Waste Lands Board at Canterbury. (Sec. 1.)

The Governor in Council may, upon the representation of the superintendent and council of any province, augment the price at which the Crown lands in that province shall be offered for sale. (Sec. 2.)

## WEST INDIES.

Crown lands and forests may under Act No. 14 of 1861 be sold by auction at an upset price of not less than 1*l.* per acre.

**Antigua and Dominica.**—The smallest lot sold is 40 acres, except in certain localities for villages.

**British Guiana.**—The disposal of Crown lands is now regulated by Act No. 14 of 1861, which saves the rights of the owners of plantations who, under the old regulations of their High Mightinesses the States of Holland, are entitled to second or other depths of 250 acres as soon as two-thirds of the first grant are in cultivation.

It is not the practice in British Guiana to open on survey any lands for settlement until after application has been made to the Government for some particular tract.

**Trinidad.**—The price of Crown land is 2*l.* per acre. All limitations as to the number of acres have fallen into desuetude. Lagoon or swampy land is sold at a lower rate, and building lots are higher, depending on competition.

**Bahamas.**—The mode of sale is by auction, but the Governor is from time to time to name the upset price, which is never to be less than 6*s.* per acre. Land once exposed to auction may, in the discretion of the Governor, be afterwards sold by private contract, at not less than the upset price of such land. The ordinary size of the lots in the Bahamas is to be 20 acres, but lots of 5 acres may, if thought expedient, be disposed of.

**Jamaica.**—There are no regulations in force in this island for the disposal of public lands, pasture licenses &c.

## CAPE OF GOOD HOPE.

The conditions and regulations relative to the disposal of Crown lands in this colony are contained in Acts No. 2 of 1860, No. 19 of 1864, and Nos. 4 and 12 of 1867; and in future all waste and unappropriated Crown lands will be sold subject to an annual quit rent on each lot, and at a reserved price sufficient to defray the costs of inspection, erection of beacons, survey, and title deed.

**Natal.**—1. The unappropriated Crown lands in this colony are sold in freehold, and by public auction only.

2. Unless it is otherwise notified, the upset price will be 4*s.* per acre, but the Governor for the time being will have the power to fix such higher upset price as the locality or other circumstances may render expedient, of which due notice will always be publicly given. Lands not sold at auction may at any time within three years afterwards be purchased by private contract at the upset price.

## MAURITIUS.

The Crown lands, with the exception of portions reserved for special purposes, shall be sold in perpetuity or leased at the discretion of the Governor, but may not be alienated from the Crown by free grants.

## CEYLON.

Crown lands are sold by auction at an upset price fixed by the Governor, at not less than 1*l.* per acre. They must be previously surveyed by the Government and duly advertised.

## HONG KONG.

The Crown lands are disposed of only on leases by public auction for a premium or bonus at a fixed rental.

## LABUAN.

The method here is similar to that in Hong Kong.

## Summary of Modes of Sale, and Prices, in the Principal Land-Selling Colonies.

Colony	Mode of Sale	Price per Acre
<b>NORTH AMERICAN COLONIES:—</b>		
Canada (West)	Fixed price for a whole township, and for lots in townships, till public notice of auction; afterwards, and for all other lands, auction.	For a whole township 2 <i>s.</i> 6 <i>d.</i> currency, 2 <i>s.</i> 1 <i>d.</i> sterling. For lots in townships 2 <i>s.</i> 6 <i>d.</i> currency, 2 <i>s.</i> 1 <i>d.</i> sterling. For all other lands upset price 2 <i>s.</i> currency, 2 <i>s.</i> 2 <i>d.</i> sterling.
Canada (East)	Ditto	1 <i>s.</i> 6 <i>d.</i> 3 <i>d.</i> , ditto, according to situation, 10 <i>d.</i> to 2 <i>s.</i> 6 <i>d.</i> sterling.
Nova Scotia	Fixed price	1 <i>s.</i> 6 <i>d.</i> sterling.
New Brunswick	Auction and fixed price for actual settlement.	2 <i>s.</i> 6 <i>d.</i> sterling upset price, with 20 per cent. discount for ready money.
Prince Edward Island	Auction	2 <i>s.</i> 6 <i>d.</i> 3 <i>d.</i> , according to situation.
Newfoundland	Auction. Lands not sold after second auction may be bought at the upset price.	Upset price, 2 <i>s.</i> currency, 1 <i>s.</i> 8 <i>d.</i> sterling.
British Columbia	Auction. Afterwards upset price to be fixed price.	Upset price for country lands, 4 <i>s.</i> 2 <i>d.</i> If town lots (66 by 132 feet) upset price 10 <i>s.</i> Upset price 4 <i>s.</i> 2 <i>d.</i>
Vancouver Island	Ditto	
<b>AUSTRALIAN COLONIES:—</b>		
New South Wales	Auction. Country lands not sold at auction may afterwards be bought at the upset price.	Upset price 1 <i>l.</i> sterling.
Queensland	Ditto	Ditto, in 'Agricultural Reserves' secured without competition.
South Australia	Ditto	Ditto.
Victoria	1. By selection at fixed price. 2. By auction	1. Lots leased for 7 years at 2 <i>s.</i> an acre. Upset price not less than 1 <i>l.</i> an acre. Prompt payment. 10 <i>s.</i>
Western Australia	Fixed price for agricultural lands. Auction for town, suburban, and mineral.	Upset price for town and suburban, to be fixed by Governor, for mineral lands, 20 <i>s.</i>
Tasmania	Auction and private sales at 1 <i>l.</i> per acre.	Upset price to be fixed by Government, but not lower than 10 <i>s.</i> an acre.
New Zealand (Crown lands)	Auction, for town and suburban lands. Fixed price generally for country lands.	Fixed price in 4 provinces 10 <i>s.</i> In the remaining 3 from 5 <i>s.</i> to 40 <i>s.</i>
Falklands	Auction. Country lands not sold at auction may afterwards be bought at the upset price.	Upset price, 5 <i>s.</i> sterling.
Sierra Leone	Ditto	Ditto, 4 <i>s.</i> 2 <i>d.</i>
Bahamas	Ditto	Ditto, 10 <i>s.</i>
Fiji's Island and Calcut.	Ditto	Ditto, 4 <i>s.</i>
British Guiana	Fixed price	10 dollars.
Trinidad	Auction	Upset price, 2 <i>l.</i>
Other West India Colonies.	Ditto	Upset price, 1 <i>l.</i>
Honduras	Ditto	Minimum upset price, 20 <i>s.</i>
Cape of Good Hope	Auction, subject to a quit-rent.	No fixed upset price.
Natal	Auction	Upset price, 4 <i>s.</i> sterling.
Mauritius	Ditto	No fixed upset price.
Ceylon	Ditto	Upset price, to be fixed by Governor, but not to be less than 5 <i>s.</i> sterling.
Hong Kong	Auction. Only leases granted.	The lowest fixed rental for building, not farms, lots is 2 <i>s.</i> per acre. Highest ditto, 10 <i>l.</i>
Labuan	Auction. Leases for 999 years. Fixed rent and bidlings on the premium for the lease.	Upset annual rental of Marine lots, generally 160 dollars per acre. Land unsold at auction not purchasable at upset price.

\* The total area of Upper Canada, within the watershed of the St. Lawrence and the Lakes, is 77,606,450 acres, and of Lower Canada 134,000,000; total area of Canada, 211,606,450.

† Includes 1,222,365 acres, sold conditionally. The colony of Queensland having been separated from New South Wales in the year 1859, the area so taken has been deducted in compiling this statement.

‡ The grazing leases extend over 2-3ds of the colony. It is only partially surveyed. Numerous portions of surveyed land are available for immediate purchase.

§ The estimated area of Victoria is about 55,600,000 acres, or 86,875 square miles.

¶ Within the limits of Western Australia, open to selection.

\*\* Boundaries of British Guiana still undefined.

†† The second column includes 'loan places,' missionary institutions, commonages, land long since surveyed, the Kat River Settlement, *maatschap van Koro* (desert) lands &c.; and is given only approximately from the estimated area of the colony, 117,503,000 acres. The 3rd and 4th columns cannot, therefore, be filled in till after a general survey.

‡ About 70 lots in different parts of the colony, varying from 1,500 to 2,000 acres.

§ No limit can be placed on the amount of land that can be made available for sale in Kowloon, or in Victoria, by reclamation from the sea.

¶ Granted at lease.

\*\* Much of the land is mountainous.

RIGHTS OF COMMONAGE AND LEASES OF PASTURE LANDS IN AUSTRALIA.

New South Wales.—The following is the substance of the principal provisions of the Crown Lands Occupation Act, No. 2 of 25 Vict., 1861. For the purposes of the Act the Crown Lands are divided into three classes; viz. 'First-class Settled Districts,' 'Second-class Settled Districts,' and 'Unsettled Districts.' It repeals the Acts of Council, 11 Vict. No. 61 and 16 Vict. No. 29, and the Orders in Council and Regulations issued under the Imperial Act, 9 and 10 Vict. c. 104, saving all rights already acquired under them. It empowers the Governor, with the advice of the Executive Council, to proclaim any part of the

unsettled districts to be within the Second-class Settled Districts, but so as not to affect existing leases. (Sec. 3.)

It prohibits the renewal of existing leases, except under the provisions of the Act, and enables the Government to withdraw from any runs lands required for town or village sites, for internal communications, or for any public purpose whatever. (Secs. 4 & 5.)

It then provides that Crown lands not comprised within 'old runs' (that is, runs under leases or licenses granted or contracted to be granted before February 22, 1858, in the second-class settled or unsettled districts) or not comprised within certain distances of towns or villages, and not being public reserves, may be leased, subject to the provi-

sions of the Gold Fields Act (20 Vict., No. 29) and without competition, for pastoral purposes, for 1 year if in the first-class settled districts—and for 5 years if within the second-class settled districts or the unsettled districts—or if required for ferries, bridges, wharves, machinery for saw-mills &c.—and for 14 years if for mineral purposes other than gold mining. (Sec. 10.)

Leases of runs in the first-class settled districts are to contain not less than 1 square mile, and are all to expire on December 31, with the right, however, of renewal annually, by payment of a rent for the ensuing year, at the rate of 2*l.* per square mile, or such higher rate as the lessees may be paying, subject nevertheless to the right of the Government to withdraw the lands for sale or for any public purpose. The holders of land in fee simple may also acquire, without competition, at the rent of 2*l.* per square mile, leases of adjoining land to the extent of three times their purchased land. Competitors for the same tract of land are to have it divided between them by arbitration. Crown lands not previously under lease, or subject to a pre-emptive right of lease, are to be sold by auction after 1 month's notice of sale in the 'Gazette,' at an upset price of 1*l.* per square mile, or of 10*s.* if half the current year should have expired, and the whole of the purchase money is to be paid at the time of sale. If not sold at auction, the land may be afterwards purchased by private contract at the upset price; but the sale by the Government of any portion of the land under lease is to cancel so much of the lease as relates to the land sold and to 3 times the adjoining area. (Secs. 2 & 12.)

With regard to lands in the 'Second-class Settled Districts' or in the 'Unsettled Districts,' the Governor, with the advice of the Executive Council, may grant leases, subject to the following conditions:—1. Existing leases of runs may be converted into leases for 5 years under the Act, by payment, within 2 months of the 'Gazette' notice, of a rent to be determined by appraisalment of the fair annual value (exclusive of improvements) of the lands for pastoral purposes; and on such conversion the runs cease to be liable to assessment under the Act 22 Vict. No. 17. 2. Leases of 'old runs' may, on their expiration, be in like manner converted into leases for 5 years. 3. After the first year the rent is to be payable on December 31, with a fine of 8 per cent. if in arrear not more than 3 months, and of 10 per cent. if more than 3 months; and if in arrear 6 months the lease to be forfeited. 4. These leases are not to confer any right to purchase pre-emption. 5. The Crown may resume without compensation (except a return of a proportionate part of the rent) any of the lands under lease required for town or village sites, or for any public purpose whatever; but the lessee has then the option of surrendering the lease if he thinks fit, and obtaining a re-fund of the full balance of the rent. (Sec. 13.)

The additional regulations, dated April 28, 1865, provide more effectually for the appraisalment of the fair annual value of runs prior to their conversion into leases for 5 years under the Act, more particularly as to the mode of making the appraisalments, which are required to be determined in open Court at a place proclaimed for the purpose, upon due enquiry and consideration of any evidence submitted to the appraisers, and taking into account every natural advantage or element of value possessed by a run (exclusive of improvements), whether made available by the lessee or not.

Forfeited leases are disposed of by auction. (Sec. 17.)

Each run is put up at a minimum upset rental, and the lease sold to the person who may offer the highest premium for the purchase thereof. The purchaser is required to pay down at the time of sale a deposit equivalent to 25 per cent. of the premium, if any offered, for the lease, together with the upset rent for the year, and the balance of the purchase money must be paid into the Treasury within three months of the day of sale, or in default the sale becomes void, and the amounts paid by way of deposit are forfeited. Runs of which the leases may remain unsold after having been twice offered for sale at auction may be obtained on application at the rent at which they were last offered.

The Governor, with the advice of the Executive Council, may proclaim pastoral districts in the 'second-class settled' or in the 'unsettled districts,' to be open for the formation of runs. The area of these runs not, in ordinary cases, to exceed 25 square miles, unless that extent be insufficient in average seasons to depasture 4,000 sheep or 800 cattle. In such case the area may be enlarged to not exceeding 100 square miles. The runs are to be tendered for in a form prescribed for the purpose, and, in case of competition, leased to the highest tenderer. If the run be not stocked with not less than 200 head of cattle or 1,000 sheep within 6 months, or where water is to be provided by artificial means within 18 months, the run is to be forfeited, and may then be leased by auction. A receipt from the Colonial Treasurer, showing the deposit of 25 per cent. of the rent offered, must accompany each tender; and the money is to be retained or returned according as the tender is accepted or rejected. Pending appraisalment of the fair annual value of land for pastoral purposes, runs may be held from year to year subject to a rent of 10*l.* per annum, and to assessment under the Act 27 Vict. No. 17. (Sec. 14.)

If a lessee by artificial means increases to a certain extent the permanent depasturing capacity of the land, he will be entitled to an extension of his lease to 10 years. (Sec. 15.)

The owners in fee simple of lands within the unsettled and second-class settled districts have the same right of pre-emptive leases of adjoining Crown lands as are granted to fee simple proprietors of lands in the first-class settled districts; and, as in the case of lands in those districts, a sale cancels a lease as regards the land sold and three times the adjoining area. (Secs. 16 & 18.)

A limited right of depasturing stock, travelling over leased lands, and also the right to duly authorised persons to cut timber or to search for minerals, are reserved. (Secs. 19 & 21.)

**Mining Leases.**—The Government may grant mining leases (except for gold), not exceeding 320 acres for coal, nor exceeding 80 acres for other minerals, for a period not exceeding 14 years, with the right of renewal for another 14 years, subject to a rent of 5*s.* per acre, payable annually in advance; and to the condition of expending at the rate of 5*l.* per acre on the land within the first 3 years. The lessee may determine the lease on giving 3 months' notice, but is not entitled to any refund of the rent. To renew the lease, the lessee must give notice in writing to the Government during the 13th year; and the fine to be paid on renewal is to be determined by appraisalment, but is in no case to be less than 2*l.* 10*s.* per acre. (Sec. 22.)

There are certain other minor and formal provisions in the Act, including those for regulating

the appointment and duties of appraisers and arbitrators; but the foregoing abstract embraces the leading features of the measure.

**Timber Licenses** are granted annually, terminating on December 31, on payment of a fee, for cutting any kind of timber or bark 6*l.*, for cutting land wood or bark only 2*l.*, and for quarrying stone &c. 4*l.*

#### SOUTH AUSTRALIA.

**Depasturing Regulations.**—The holder of any purchased land within any hundred not being within the limits of a District Council is entitled, under the proclamation of April 2, 1862, should there be sufficient commonage available, to a depasturing license over the unappropriated waste lands of the Crown within such hundred, for two head of great cattle or twelve head of small cattle, for every five acres of purchased land.

The license must be applied for to the Commissioners of Crown Lands, not later than 1st June in each year, and has a currency of 12 months from 1st July in each year. The fee payable is 4*s.* for every head of great cattle, or six head of small cattle.

Regulations of District Councils are subordinate to these regulations.

Pastoral leases are also granted, for 14 years, of lands out of hundreds.

By an Act, No. 20, of 22 Vict. (1858), Crown lands for pasturage are to be divided into two classes, the lowest of which is to be assessed at 100 sheep per square mile, and the highest at 250 sheep. But by an Act, No. 20, of 24 & 25 Vict. (1861), this division of land into classes and the fixed standard of grazing capability are done away with, and all land leased for pasture is in future to be assessed according to its grazing capabilities and situation. By a later Act, No. 22, of 1862, the waste lands are divided, for purposes of assessment, into three classes, with certain boundaries: 1st class paying assessment according to valuation under former Act; 2nd class paying one-half such assessment, and exempted from it for 7 instead of 4 years; 3rd class exempted altogether until Parliament shall otherwise direct.

By an Act, No. 13, of 1863, the assessment on pastoral lands may be reduced by the Governor with the consent of the Executive Council on the report of the valuator of runs, if application for the purpose be made within 12 calendar months of the publication of the assessment.

Under Act 20 of 1858 leases are renewable, on expiry of first term of 14 years, for a further period of five years at a valuation; and Act No. 8 of 1864 provides that the value of useful and substantial improvements effected by lessees shall be allowed to them by a reduction in the amount of rent payable under such valuation.

**Timber Licenses** are granted annually, terminable on 31st December, on payment of a fee of 5*l.* Half-yearly licenses are issued on payment of a fee of 3*l.*; quarterly licenses to remove timber 2*l.* Pasture licenses are also granted in Western Australia, Queensland, and New Zealand.

Considering that it may, speaking generally, be laid down that in New South Wales from 3 to 4 acres are required to depasture a single sheep, it is obvious that the plan of selling such land at a *minimum* price of 12*s.* or 20*s.* an acre would effectually prevent its being bought for pastoral purposes; and, in point of fact, incomparably the greater number of the sheep belonging to the colony are depastured on what has been called the *squatting system*. A capitalist intending to become a wool grower formerly took out an annual license, for which he

paid 10*l.*, authorising him to depasture a *run*, or tract of land, of no definite magnitude, but usually varying in size from 3,000 or 4,000 to perhaps 25,000 or 30,000 acres, under the important proviso (which, however, has not been enforced) that he should pay in addition an annual rent of 1*l.* for every head of sheep and of 3*d.* for every head of cattle depastured on the run. This system having been acted upon for a lengthened period, the runs began to be regarded as a sort of *quasi* property; and those in preferable situations were disposed of by one holder to another for considerable sums. In the end, however, Government was forced to interfere with this system; and the Act 9 & 10 Vict. c. 104 empowered the authorities to eject persons unlawfully occupying waste lands, provided they had not held them without interruption for 21 years previously to the passing of the Act. If they had done this, their title was secured. From the passing of this Act, a new and complicated system has been adopted for the disposal of waste lands. Under its operation vast tracts have been let, of what were at the time *unsettled* districts, for 14 years with a right of pre-emption, without competition, at 1*l.* per acre. But, in the mean time, portions of the land so disposed of, being found to contain deposits of gold, have suddenly become of the greatest value; while other and far more extensive portions in the vicinity of the 'diggings' are urgently required for agricultural purposes. Under such circumstances we need not be surprised that the question in regard to the lands held, or alleged to be held, under 14 years' leases with a right of pre-emption should have become of equal importance and difficulty. Owing to the want of surveys and defined boundaries, few of the occupiers of waste lands have obtained leases; and while, on the one hand, they insist on the fulfilment of their contracts, they are opposed, on the other, by the great bulk of the population, who justly object to the waste of the public property, and to the all but irreparable injury that would be done to the colony by handing over to a few individuals a vast extent of what is now become very valuable land. The idea that the leases, if granted, would be effectual, is, in the present state of the colony, quite preposterous. It is, in truth, all but contradictory to suppose that in a country like Australia, with a population increasing in numbers and wealth with unparalleled rapidity, millions of acres of the best situated lands should be engrossed, at a mere nominal rent, by a handful of individuals. If a system of this sort be not put an end to by the interference of Government, it will, no doubt, be forcibly suppressed by the colonists themselves. It is too flagrant an absurdity to be tolerated, and the better way would be to come, while it is yet time, to some sort of compromise; that is, to give some compensation to the lessees for claims which were conceded to them in ignorance, and which they cannot, in the existing state of things, maintain or make good.

**Gold Fields and Miners' Rights.**—Besides their great pastoral and agricultural capabilities, the Australian colonies possess vast mineral resources. South Australia has already become noted for her copper mines, and New South Wales and Victoria (late Port Phillip) and New Zealand for their gold fields.

By law all mines of gold and all gold in its natural place of deposit, whether on the lands of the Crown or of private individuals, belong by prerogative to the Crown; and whoever takes away gold metal or ore containing gold, or digs for or disturbs the soil on the waste lands of the Crown in search of gold metal or ore, without having been first duly authorised so to do, is liable to be pro-

seized both criminally and civilly, and the gold may be seized by the Crown.

In South Australia, however, the Crown has given up its right to minerals.

In Tasmania no gold regulations have been issued, as no profitable gold fields have yet been discovered.

In New South Wales, Victoria, and New Zealand

Acts have been passed by the local Legislatures regulating the right to dig for gold, and imposing a duty on its export.

The following statement, laid on the council table at Sydney May 22, 1849, shows the enormous extent to which the squatting system of which the leasing system is an off-shoot had been carried :—

	Number of Persons holding Licenses	Number of Licenses	Money paid for Licenses	Land held, in Acres
When less than 25,000 acres are held by each person -	339	317	£ 5,370	4,599,594
Not above 50,000 -	153	180	1,800	5,300,911
100,000 -	103	162	1,620	7,141,497
150,000 -	33	32	320	3,996,109
200,000 -	16	31	310	2,640,959
250,000 -	5	16	160	1,091,638
300,000 -	74	11	110	1,063,905
400,000 -	13	10	100	1,079,120
450,000 -	* 1	5	50	408,383
450,000 -	1	5	50	1,274,000
850,000 -	1	1	10	815,000
	660	820	8,200	29,161,240

\* Eleven persons holding 1,570,108 acres in a colony under an inflexible specific for preventing the accumulation of land in the hands of a few individuals.

#### NEW SOUTH WALES.

A Colonial Act, 30 Vict. No. 8, 'The Gold Fields Act of 1866,' empowers the Governor to proclaim Crown lands to be gold fields, and to grant 'miners' rights' at a fee of 10s. between January 1 and June 30, and 5s. after that date, subject to certain regulations to be prescribed by the Governor in Council. All miners' rights are to terminate on December 31 in each year. (Sees. 3, 4, & 5.)

The Governor in Council may also grant 'Business Licenses,' which must terminate on December 31 in each year, the fee for which is 1l. if granted between January 1 and June 30, and 10s. if granted after June 30. (Sec. 6.)

Lenses of auriferous lands may be obtained in accordance with the laws in force for the time being. The rent is to be fixed by the Governor in Council. (Sec. 7.)

The escort of gold from the principal gold fields is undertaken by Government, at a charge of 8d. per ounce.

The duty on gold exported from New South Wales, whether by sea or land, is now fixed at 2s. 6d. the troy oz., but the customs duty is not to be leviable on gold which has paid duty at the Mint.

#### QUEENSLAND.

Four gold fields have been already discovered and proclaimed in this colony, viz. at Clermont (on the Peak Downs), at Talgai (on the Darling Downs), near the town of Gladstone (Port Curtis), and near the town of Roehampton.

#### VICTORIA.

Under the 'Mining Statute, 1865,' 29 Vict. No. 291 (passed November 28, 1865), 'Miners' Rights' are issued for any number of years not exceeding 15, at the rate of 5s. for every year. Consolidated 'Miners' Rights' are issued for the like period on the application of the manager, or any trustee or trustees of any company of persons who shall have agreed to work in partnership any claims registered under the Act, on payment of a sum at the prescribed rate, multiplied by the number of 'miners' rights' which the same is to represent.

The 'miners' rights' entitle the holders to take possession for gold mining purposes, and for residence, of so much of the Crown lands as may be prescribed by the bye-laws of the Local Mining Board of the district within which the land is situated.

From June 1, 1855, to December 31, 1865, the number of miners' rights issued was 454,908.

'Business Licenses' are issued at the following rates, entitling the holders to occupy and carry on business on the gold fields on such portions of the Crown lands, not exceeding one quarter of an acre, as may be prescribed by the Local Mining Board :—

For six months -	£ s. d.
For twelve months	2 1 0
	5 0 0

Lenses of auriferous lands are granted under the provisions of the 'Mining Statute, 1865,' for any term not exceeding 15 years.

Rent.—The rent fixed is at 1l. per acre per annum.

The total number of auriferous lenses granted down to December 31, 1866, was 3,098 for 50,018 acres.

The Export Duty on Gold during 1867 was 6d. per ounce troy, and on January 1, 1868, the export of gold became duty free.

The Gold Fields of Victoria are divided into six principal districts. These are again divided into mining divisions or sub-districts, as occasion may require, and are each placed under the supervision of a warden. There is also a mining surveyor and registrar for each division or subdivision. The districts now embrace the total area of the colony save a small portion in the immediate vicinity of the city of Melbourne.

This Table is taken as regards New South Wales from the annual Statistical Register of the colony and as regards Victoria from official Colonial reports :—

Year	New South Wales		Victoria	
	Quantity exported	Value	Quantity exported	Value
	oz.	£	oz.	£
1851	144,190	468,336	143,137	434,777
1852	982,973	3,600,175	1,980,696	6,135,719
1853	548,032	1,781,171	2,421,723	8,644,329
1854	237,010	773,009	2,149,689	8,233,549
1855	64,584	209,450	2,751,553	10,944,049
1856	19,463	128,907	2,985,991	11,043,430
1857	253,591	983,850	2,162,460	10,807,201
1858	254,907	991,969	2,508,478	10,076,888
1859	435,995	1,698,078	2,380,950	9,172,037
1860	485,012	1,875,949	2,128,466	8,313,966
1861	486,203	1,890,808	1,678,861	7,013,813
1862	899,566	3,715,037	1,664,419	6,097,016
1863	605,722	2,361,949	1,627,066	6,000,896
1864	731,207	2,951,671	1,545,449	6,068,014

In each of the six mining districts there is a legislative body termed a Mining Board. These boards are empowered to make bye-laws applicable to the district generally, with respect to mining affairs and occupation under business licenses. Each of these boards consists of ten members, four of whom retire from each board annually by rotation.

Each district has its separate Court of Mines, one of the Judges of the Supreme Court is appointed to act as chief judge of the Court.

The quantity of gold produced at the mines in New South Wales cannot be accurately ascertained; but the preceding table shows the quantity and estimated value of gold exported from New South Wales and Victoria since the commencement of discoveries in May and October, 1851.

The establishment of a Mint at Sydney will account for the small amount of gold exported in 1855 and 1856.

The following table shows the quantity of gold obtained in Victoria from the first discovery of the gold fields in 1851 to 1866:—

Year	Per Cent of	Exported	Value at 40s. per oz.	Average yearly earnings per man per annum
1851*	104,153	145,116	591,544	£ s. d.
1852	2,272,076	2,078,789	8,275,124	30 11 7-60
1853	2,065,903	2,276,345	9,079,361	29 15 0-91
1854	1,082,607	2,156,730	8,699,261	150 16 4-98

\* 3 months in 1851.  
The escorts from Castlemaine, Sandhurst, and Ballarat were discontinued on March 31, 1864, and since that date the only escorts arriving in Melbourne are those from the Beechworth and Woods' Points Districts: therefore the returns being incomplete are omitted.

List of the Principal Gold Mining Districts in Victoria, Sept. 30, 1867.

Ballarat District	Castlemaine Dist.	Maryborough Dist.	Ararat District.	Sandhurst District.	Beechworth Dist.	Gipps Land Dist.
Ballarat. Bun-yong. Siegitz. Smith's Dale. Creek. Blackwood. Gooden. Blue Mt. South.	Castlemaine. Fryer's Creek. Hepton. Maklun. Taradale. Raint. Andrews. Kyneton. Blue Mt. North.	Maryborough. Ararat. Amherst. Dunolly. St. Arnaud N. St. Arnaud S. Redbank. Korong.	Ararat. Pleasant Creek. Barkly. Haglan.	Sandhurst. Hearthouse and Waranga South. Waranga North. Kilmore. Raywood.	Beechworth. Yackandandah. Buchland. Indigo. Jamieson. Stanley. Sandy Creek. Gulliver's Creek. Wool's Point. Blue River. Mitta Mitta.	Omse. Mitchell River. Crooked River. Jericho. Dunnolly's Creek. Stringer's Creek. Russell's Creek.

NEW ZEALAND.

Gold fields exist, and are worked, in the provinces of Auckland, Nelson, and Otago. The law regulating gold fields and gold mining in this colony is contained in 'The Gold Fields Act, 1867' (30 Vict. No. 32), and the two amending Acts (Nos. 68 & 69 of 31 Vict.) of 1867. In their leading features they follow the legislation of Victoria.

The quantity and value of gold exported from New Zealand from April 1, 1857, to September 30, 1867, were as follows:—

Produce of Gold Fields in the Province of	Total exported to September 30, 1867	
	Quantity	Value
Auckland	ozs.	£
Nelson	22,974	67,527
Wellington	437,792	1,784,598
Canterbury	35,717	129,790
Otago	864,933	3,266,632
Southland	2,117,596	8,119,034
Total	3,564,189	15,816,935

Otago.—The area of the proclaimed gold fields has been calculated at 2½ millions of acres, distributed as follows:—

Tuapeka gold field	acres
Mount Beniger	398,260
Dunstan	18,816
Wairarapa	199,680
Nelson	1,351,680
Mount Ida	281,600
Total	330,000

CANADA.

Precious Metals.—Mining for the precious metals is regulated by the 'Gold Mines Act,' 27 & 28 Vict. c. 5, passed June 30, 1864; amended by 29 Vict. c. 9 (1865). Under these laws, two gold mining divisions have been established; one called 'Chaudière,' the other 'St. Francis,' in Canada East; but these have not been very productive. The governor may appoint officers; and two inspectors have been appointed, one for each division.

No person to mine without a license. There are two kinds of licenses—one 'Crown lands gold license,' 2 dols. per month, for unsold Crown land, and the other 'private lands gold license,' 1 dol. per month, for private lands, the miner first obtaining the consent of the proprietor.

BRITISH COLUMBIA.

Gold was known to exist in Queen Charlotte's Island in 1850, but it was not until April 1856 that Governor Douglas reported to the Secretary of State that considerable quantities of gold had been found in the Upper Columbia River. It was subsequently discovered in its natural state of deposition in the districts of Fraser River and of Thompson's River, commonly known as the Quantan, Couteau, and Shuswap countries. Rich and extensive gold fields were in the summer of 1865 discovered in that portion of the Columbia River known as the 'Big Bend,' lying between 51° and 52° North latitude.

The gold mining regulations are contained in an Ordinance, No. 14, March 28, 1865;—an Ordinance to amend and consolidate the Gold Mining Laws.

Mining leases may be granted by the Gold Commissioner for mining purposes only, on payment of a deposit of 25l.; but the lease cannot be assigned or sub-let, and is not, in general, to be for a longer term than 10 years, or for a larger area than:—

- In dry diggings, 10 acres.
  - In bar diggings unworked, ½ mile in length along the high-water mark.
  - Do. worked and abandoned, 1 ½ mile.
  - In quartz reefs unworked, 1 ½ mile.
  - Do. worked and abandoned, ½ mile in length.
- An assay office has been established at New Westminster. A duty on gold was imposed in 1865, amounting to 2s. per oz. But gold which is assayed at the Government office is charged only 1s. 6d. per oz.

The table on the preceding page embodies within a brief space a good deal of important information respecting our colonies in all parts of the world.

#### VANCOUVER ISLAND.

The discovery in 1864 of a gold field in the district of Sooke, within 18 miles of Victoria, will prove an additional inducement to immigration, more especially when it is known that the cost of living at the mines scarcely exceeds that in Victoria.

#### IV. REGULATIONS UNDER WHICH COLONY TRADE IS CONDUCTED.

These are embodied in the Customs Consolidation Acts, the 16 & 17 Vict. c. 107, 18 & 19 Vict. c. 96, 20 & 21 Vict. c. 62, and 25 & 26 Vict. c. 63, and are as follows; though some, such as those referring to sugar, are virtually superseded by subsequent colonial tariffs [TARIFFS], viz.—

**Absolute Prohibitions, Restrictions &c.**—Gunpowder, ammunition, arms, or utensils of war, except from the United Kingdom or any British possession, and base or counterfeit coin, are hereby absolutely prohibited to be imported or brought, either by sea or inland carriage or navigation, into the British possessions in America and the Mauritius.

Sugar (not being refined in bond in the United Kingdom) and molasses until July 5, 1854, and rum, such sugar, molasses, and rum being the produce or manufacture of any British possession within the limits of the East India Company's charter (except as hereinafter provided), or being of foreign produce or manufacture, are hereby prohibited to be imported or brought into any of the British possessions in the continent of South America or in the West Indies (the Bahama or Bermuda islands not included), or into the Mauritius except to be warehoused for exportation only, and may also by her Majesty's order in council be prohibited to be imported into the Bahama and Bermuda islands; and if any goods shall be imported or brought into any of the British possessions in America or the Mauritius contrary hereto, the same shall be forfeited: provided always, that it shall be lawful to import into any British possessions in the West Indies and South America, and into the Mauritius, any sugar or rum the produce of any British possession within the limits of the East India Company's charter into which the importation of sugar or rum the produce of any foreign country, or of any British possession into which foreign sugar or rum may be legally imported, has been prohibited; provided that no such sugar or rum shall be so entered unless the master of the importing ship shall deliver to the proper officer of customs a *certificate of origin* under the hand of the proper officer at the place where the same shall have been taken on board, stating the name of the district in which such sugar or rum was produced, the quantity and quality or strength thereof, as the case may be, the number and denomination of the packages containing the same, and the name of the ship in which they were laden, and of the master thereof, and of the officer giving the same; the shipper of such sugar or rum shall likewise certify that there had been produced a certificate under the hand and seal of the collector or assistant collector of the land or customs revenue of the district within which such sugar and rum were produced, that such sugar or rum was the produce of such district, and that the importation into such district of foreign sugar and rum, or sugar and rum the growth of any British possession into which any foreign sugar or rum can be legally imported, is prohibited, and the master shall subscribe a declaration that such cer-

tificate was received by him at the place where the goods were taken on board, and that they are the goods therein mentioned.—16 & 17 Vict. c. 107. (Sec. 159.)

The Islands in the *Bay of Honduras* called the *Bay Islands* shall be deemed and taken to be excepted or excluded from the operation of Section 159 of the 'Customs Consolidation Act, 1853,' to the same extent as the *Bahamas* or *Bermuda* Islands are thereby excepted or excluded.—18 & 19 Vict. c. 96 s. 17.

**Foreign Reprints of Books under Copyright prohibited.**—Any books wherein the copyright shall be subsisting, first composed or written or printed in the United Kingdom, and printed or reprinted in any other country, shall be and are hereby absolutely prohibited to be imported into the British possessions abroad: provided always, that no such books shall be prohibited to be imported as aforesaid unless the proprietor of such copyright, or his agent, shall have given notice in writing to the Commissioners of Customs that such copyright subsists, and in such notice shall have stated when the copyright will expire; and the said commissioners shall cause to be made, and to be publicly exposed at the several ports in the British possessions abroad, from time to time, printed lists of books respecting which such notice shall have been duly given, and all books imported contrary thereto shall be forfeited; but nothing herein contained shall be taken to prevent her Majesty from exercising the powers vested in her by the 10 & 11 Vict. c. 93, to suspend in certain cases such prohibition.—16 & 17 Vict. c. 107. (Sec. 160.)

**Foreign Manufactures with British Marks.**—If any articles of foreign manufacture, and any packages of such articles, bearing any names, brands, or marks being or purporting to be the names, brands, or marks of manufacturers resident in the United Kingdom, be imported into any of the British possessions abroad, the same shall be forfeited. (Sec. 161.) [COPYRIGHT.]

**Sugar &c., though British, deemed Foreign in certain Cases.**—All sugar and molasses, until July 5, 1854, and rum (although the same may be of British plantations), exported from any of the British possessions in America into which the like goods of foreign production can be legally imported, shall, upon subsequent importation from thence into any of the British possessions in America or the Mauritius into which such goods being of foreign production cannot be legally imported, or into the United Kingdom, be deemed to be of foreign production, and shall be liable on such importation respectively to the same duties or the same forfeitures as articles of the like description being of foreign production would be liable to, unless the same shall have been duly warehoused, and exported from the warehouse direct to such other British possession, or to the United Kingdom as the case may be. (Sec. 162.)

**Coasting Trade of the British Possessions.**—No goods or passengers shall be carried from one part of any British possession in Asia, Africa, or America to another part of the same possession, except in British ships. (Sec. 163.)

**Ship and Cargo to be reported on Arrival.**—The master of every ship arriving in any of the British possessions in America or the Channel Islands, whether laden or in ballast, shall come directly, and before bulk be broken, to the custom-house for the port or district where he arrives, and there make a report in writing to the proper officer of customs, in the same form and manner as hereinbefore provided on the arrival of any ship in the United Kingdom [IMPORTATION & EXPORTATION] so far as the same may be applicable; and

if any goods be unladen from any ship before such report be made, or if the master fail to make such report, or make an untrue report, or do not truly answer the questions demanded of him, he shall forfeit the sum of 50*l.*; and if any goods be not reported, such goods shall be forfeited. (Sec. 164.)

*Entry outwards of Ship or Cargo.*—The master of every ship bound from any British possessions abroad, except the territories subject to the Government of the presidencies of Bengal, Madras, and Bombay, shall deliver to the proper officer of customs an entry outwards under his hand of such ship, and also subscribe and deliver to such officer a content of the cargo of such ship, if any, or state that she is in ballast, as the case may be, and answer such questions concerning the ship, cargo, if any, and voyage, as shall be demanded of him, in the same manner, as nearly as may be, as is prescribed to be observed on the entry and departure of any ship from the United Kingdom, and thereupon the proper officer shall give to the master a certificate of the clearance of such ship for her intended voyage; and if the ship shall depart without such clearance, or if the master shall deliver a false content, or shall not truly answer the questions demanded of him, he shall forfeit the sum of 50*l.* (Sec. 165.)

*Entry of Goods Inwards and Outwards.*—Any person entering goods shall deliver to the proper officer a bill of entry thereof, containing the name of the ship and of the master, and of the place to or from which bound, and the particulars of the quality and quantity of the goods, and the packages containing the same, stating whether such goods be the produce of the British possessions in America or not, and the proper officer shall thereupon grant his warrant for the lading or unlading of such goods. (Sec. 166.)

*Entry of Goods to be laden or unladen &c.*—No goods shall be laden or water-borne to be laden on board any ship, or unladen from any ship, in any of the British possessions in America or in the Channel Islands, until due entry be made of such goods, and warrant granted for the lading or unlading of the same; and no goods shall be so laden or water-borne or so unladen in the said Channel Islands, except at some place at which an officer of the customs is appointed to attend the lading and unlading of goods, or at some place for which a sufferance shall be granted by the proper officer of customs for the lading and unlading of such goods, and in the presence or with the permission of such officer; but the Commissioners of Customs may make such regulations for the carrying coastwise of any goods, or for the removing of any goods for shipment in the said islands, as to them shall appear expedient; and all goods laden, water-borne, or unladen contrary hereto, or to any regulations to be so made, shall be forfeited. (Sec. 167.)

*Goods not stated to be Produce of British Possession to be deemed of Foreign Production.*—No goods shall be stated in such certificate of clearance of any ship from any British possessions to be the produce of such possession, unless such goods shall have been so expressed in the entry outwards of the same; and all goods not expressly stated in such certificate of clearance to be the produce of such possession shall, at the place of importation in any other such possession, or in the United Kingdom, be deemed to be of foreign production. (Sec. 168.)

*If no Officer of Customs resident at the Port of Shipment &c.*—Where there is no officer of customs, the principal officer in the civil service of her Majesty, or his representative, shall be deemed to be the proper officer for the performance of all such duties with respect to such goods as are hereby re-

quired to be performed by the collector or other officer of customs. (Sec. 169.)

*Dues in Canada on American Boats.*—The same tonnage duties shall be paid upon all ships or boats of the United States of America importing any goods into either of the provinces of Upper or Lower Canada as are or may be for the time being payable in the United States of America on British vessels or boats entering the harbours of the State from whence such goods shall have been imported. (Sec. 173.)

*Certain Produce of the State of Maine to be treated as Produce of New Brunswick.*—The treaty concluded between her Majesty and the United States of America, August 9, 1842, stipulates that all the produce of the forest in logs, lumber, timber, timber boards, staves, or shingles, or of agriculture, not being manufactured, grown on any of those parts of the State of Maine watered by the river St. John or by its tributaries, of which fact reasonable evidence shall, if required, be produced, shall have free access into and through the said river and its said tributaries, having their source within the State of Maine, to and from the seaport at the mouth of the river St. John, and to and round the hills of the said river, either by boats, rafts, or other conveyance, and that within the province of New Brunswick the said produce shall be dealt with as if it were the produce of the said province; and it being the intention of the high contracting parties to the said treaty that the aforesaid produce should be dealt with as if it were the produce of the province of New Brunswick, the produce in the said recited treaty and hereinafter described shall, so far as regards all laws relating to duties, navigation, and customs in force in the United Kingdom or in any of her Majesty's dominions, be deemed and taken to be and be dealt with as the produce of the province of New Brunswick; provided, that in all cases in which declarations and certificates of production or origin and certificates of clearance would be required in respect of such produce if it were the produce of New Brunswick, similar declarations and certificates shall be required in respect of such produce, and shall state the same to be the produce of those parts of the State of Maine which are watered by the river St. John or by its tributaries. (Sec. 174.)

*Newfoundland Fishing Certificates in lieu of Clearance during Fishing Season.*—Whenever a ship shall be cleared out from any port in Newfoundland or in any other part of her Majesty's dominions for the fisheries on the banks or coasts of Newfoundland or Labrador or the dependencies thereof, without having on board an article of traffic (except only such provisions, nets, tackle, and other things as are usually employed in and about the said fishery, and for the conduct and carrying on of the same), the master of any such ship shall be entitled to demand from the principal officer of customs at such port a certificate under his hand that such ship hath been specially cleared out for the Newfoundland fishery, and such certificate shall be in force for the fishing season for the year in which the same may be granted, and no longer; and upon the first arrival in any port in the said colony of Newfoundland or its dependencies of any ship having on board any such certificate as aforesaid, a report thereof shall be made by the master of such ship to the principal officer of customs at such port; and every ship having such certificate which has been so reported, and being actually engaged in the said fishery, or in carrying coastwise, to be landed or put on board any ship engaged in the said fishery, any fish, oil, salt, provisions, or other necessaries for the use and purposes thereof, shall be exempt from all obligation to make an

entry at or obtain house at Newfoundland from any of the ports or its dependencies fishing season for been granted; and hence at the end of of such ports, the up the beforement officer of the custom that in case any during the time th said fishery any g other than fish, sea provisions, and oth or usually employe shall forfeit the sa thenceforth become such and the same tions as ships in g (Sec. 175.)

*another Colony.*—Before  
ing as any benefit attac

entry at or obtain any clearance from any custom house at Newfoundland, upon arrival or departure from any of the ports or harbours of the said colony or its dependencies, during the continuance of the fishing season for which such certificate may have been granted; and previously to obtaining a clearance at the end of such season for any voyage at any of such ports, the master of such ship shall deliver up the beforementioned certificate to the principal officer of the customs of such port: provided always, that in case any such ship shall have on board during the time the same may be engaged in the said fishery any goods, or merchandise whatsoever other than fish, seals, oil made of fish or seals, salt, provisions, and other things, being the produce of or usually employed in the said fishery, such ship shall forfeit the said fishing certificate, and shall thereupon become and be subject and liable to all such and the same rules, restrictions, and regulations as ships in general are subject or liable to. (Sec. 175.)

*Certificate of Production for Sugar or Spirits.*—Before any spirits or sugar, so long as any benefit attach to the distinction, shall be shipped for exportation in any British possession in America, or in the island of Mauritius, as being the produce of such possession or of the said island, the proprietor of the estate on which such goods were produced, or his known agent, shall make and sign a declaration in writing before the proper officer of customs at the port of exportation, or before one of her Majesty's justices of the peace residing in or near the place where such estate is situated, declaring that such goods are the produce of such estate, and such declaration shall set forth the name of the estate, and the description and quantity of the goods, and the packages containing the same, with the marks and numbers thereon, and the name of the person to whose charge at the place of shipment they are to be sent; and any justice of the peace or other officer aforesaid shall subscribe his name to any writing purporting to be such a declaration, unless the person purporting to make the same shall actually appear before him, and shall declare to the truth of the same, such justice of the peace or officer aforesaid shall forfeit and pay for any such offence the sum of 50*l.*; and the person entering and shipping such goods shall deliver such declaration to the proper officer of customs, and shall make and subscribe a declaration before him that the goods which are to be shipped by virtue of such entry are the same as are mentioned in such first-mentioned declaration; and the master of the ship in which such goods shall be laden shall, before clearance, make and subscribe a declaration before the proper officer of customs, that the goods shipped by virtue of such entry are the same as are mentioned and intended in such first-mentioned declaration, to the best of his knowledge and belief; and thereupon the proper officer of customs shall sign and give to the master a certificate of production, stating that proof has been made in manner required by law that such goods (describing the same) are the produce of such British possession or of the said island, and setting forth in such certificate the name of the exporter and of the exporting ship, and of the master thereof, and the destination of the goods; and if any spirits or sugar be imported into any British possession in America as being the produce of some other such possession or of the said island, without such certificate of production, the same shall be forfeited. (Sec. 176.)

*Certificate of Production on re-exportation from another Colony.*—Before any sugar or spirits, so long as any benefit attach to the distinction, shall

be shipped for exportation in any British possession in America as being the produce of some other such possession, the person exporting the same shall in the entry outwards state the place of production, and refer to the entry inwards and landing of such goods, and shall make and subscribe a declaration before the proper officer of customs to the identity of the same; and thereupon, if such goods shall have been duly imported with a certificate of production within 12 months prior to the shipping for exportation, the proper officer of customs shall sign and give to the master a certificate of production founded upon and referring to the certificate of production under which such goods had been so imported, and containing the like particulars, together with the date of such importation. (Sec. 177.)

*Certificate of Production of East India Sugar.*—The shipper of any sugar the produce of some British possession within the limits of the East India Company's charter, about to be exported from any place in such possession, may go before the chief officer of customs at such place, or, if there be no such officer, before the principal officer of such place, or the judge or commercial resident of the district, and make and sign a declaration before him that such sugar was really and bonâ fide the produce of such British possession, to the best of his knowledge and belief; and such officer, judge, or resident is hereby required to grant a certificate thereof, stating therein the name of the ship in which the sugar is to be exported, and the destination of the same. (Sec. 178.)

*Certificate of Production of Wine.*—The shipper of any wine, the produce of any British possession abroad, which is to be exported from thence, may go before the chief officer of customs, and make and sign a declaration before him that such wine was really and bonâ fide the produce of such British possessions; and such officer is hereby required to grant a certificate thereof, stating therein the name of the ship in which the wine is to be exported, and the destination of the same. (Sec. 179.)

*Certificate of Production of Goods in Guernsey &c.*—Any person who is about to export from the Channel Islands to the United Kingdom or to any of the British possessions in America or the Mauritius any goods of the growth or produce of any of those islands, or any goods manufactured from materials which were the growth or produce thereof, of the United Kingdom, or of materials duty free in the United Kingdom, or whereupon the duty has been there paid, and not drawn back, may go before any magistrate of such islands, and make and sign before him a declaration that such goods, describing the same, are of such growth or produce, or of such manufacture, and such magistrate shall administer and sign such declaration; and thereupon the governor, lieutenant-governor, or commander-in-chief of the island from which the goods are to be exported shall, upon the delivery to him of such declaration, grant a certificate under his hand of the proof contained in such declaration, stating the ship in which, and the port to which, the goods are to be exported; and such certificate shall be the proper document to be produced at such port in proof that the goods mentioned therein are of the growth, produce, or manufacture of such island respectively. (Sec. 180.)

*Officers may board Ships.*—The officer of customs may go on board any ship in any port in any British possession in America, and rummage and search such ship for prohibited goods, and if there be any goods on board prohibited to be imported into such possession they shall be forfeited. (Sec. 181.)

*Seized goods, if unclaimed for a Month, to be condemned, and dealt with accordingly.*—All vessels, boats, goods, and other things which shall have been or shall hereafter be seized as forfeited in or near any of the British possessions abroad, under this or any Act relating to the customs, shall be deemed and taken to be condemned, and may be dealt with in the manner directed by law in respect to vessels, boats, goods, and other things seized and condemned for breach of any such Act, unless the person from whom such vessels, boats, goods, and other things shall have been seized, or the owner of them, or some person authorised by him, shall, within one month from the day of seizing the same, give notice in writing to the person or persons seizing the same, or to the chief officer of customs at the nearest port, that he claims the vessel, boat, goods, or other things, or intends to claim them. (Sec. 182.)

*Penalties and Forfeitures, how to be recovered in British Possessions abroad.*—Whenever any penalty or forfeiture shall have been incurred in any of the British possessions abroad, under this or any other Act relating to the customs, such penalty or forfeiture shall and may be sued for, prosecuted, recovered, and disposed of in the Court of Record or of Vice-Admiralty having jurisdiction in any British possession where the same may have been incurred or forfeited; but in case there shall be no such court at such British possession, such penalty or forfeiture shall and may be sued for, prosecuted, recovered, and disposed of in the Court of Record or of Vice-Admiralty having jurisdiction in some British possession near to that where such penalty or forfeiture may have been incurred; and all such penalties and forfeitures shall be deemed to be sterling money of Great Britain, and paid accordingly. (Sec. 183.)

*Application of Penalties.*—All penalties and forfeitures recovered in the Channel Islands or in any of the British possessions abroad under this or any Act relating to the customs shall be paid into the hands of the collector, comptroller, or other proper officer of the port or place where the same shall have been recovered, and shall be divided, paid, and applied as follows; (that is to say,) after deducting the charges of prosecution from the produce thereof,  $\frac{1}{4}$  of the nett produce shall be paid to or for the use of her Majesty,  $\frac{1}{4}$  to the governor or commander-in-chief of the colony or plantation, and the other  $\frac{1}{2}$  to the seizer, informer, and prosecutor; excepting such penalties and forfeitures as are from seizures made at sea by the commanders or officers of her Majesty's ships of war duly authorised to make seizures, one moiety of which, first deducting the charges of prosecution from the gross produce, shall be paid as aforesaid to and for the use of her Majesty, and the other moiety to the seizer, informer, and prosecutor, subject nevertheless to such distribution of the produce of the seizures so made at sea, as well with regard to the moiety hereinbefore granted to her Majesty as with regard to the other moiety given to the seizer, informer, or prosecutor, as her Majesty shall think fit to direct by order in council or by proclamation. (Sec. 184.)

*Bail may be given for Seizures.*—If any goods or any ship or vessel shall be seized as forfeited under this or any Act relating to the customs, and detained in any of the British possessions in America, the judge or judges of any court having jurisdiction to try and determine such seizures may, with the consent of the chief officer of customs, order the delivery thereof, on security by bond, with two sufficient sureties, to be first approved by such officer, to answer double the value of the same in case of condemnation; and

such bond shall be taken to the use of her Majesty in the name of the officer of customs in whose custody the goods or the ship or vessel may be lodged, and such bond shall be delivered and kept in the custody of the officer; and in case the goods or the ship or vessel shall be condemned, the value thereof shall be paid into the hands of such collector or officer, who shall thereupon cancel such bond. (Sec. 185.)

*Suits to be commenced in Name of Officers.*—No suit shall be commenced for the recovery of any penalty or forfeiture in the Channel Islands, or in any of the British possessions abroad, under this or any Act relating to the customs, except in the name of such officer of the customs or navy, or other person employed as hereinbefore mentioned, or of her Majesty's advocate or attorney-general for the place where such suit shall be commenced; and if a question shall arise whether any person is an officer of the customs or navy, or such other person as aforesaid, vivâ voce evidence may be given of such fact, and shall be deemed legal and sufficient evidence. (Sec. 186.)

*Limitation of Appeals.*—No appeal shall be prosecuted from any decree or sentence of any of her Majesty's courts in America touching any penalty or forfeiture imposed by this or any Act relating to the customs, unless the inhibition shall be applied for and decreed within 12 months from the time when such decree or sentence was pronounced. (Sec. 187.)

*Security to abide an Appeal from Vice-Admiralty.*—If any proceedings shall have been or shall hereafter be instituted in any court of Vice-Admiralty or any other competent court in any of her Majesty's possessions abroad against any ship, vessel, boat, goods, or effects for the recovery of any penalty or forfeiture under this or any Act relating to the customs, the execution of any sentence or decree restoring such ship, vessel, boat, goods, or effects to the claimant thereof, which shall be pronounced by the said Vice-Admiralty Court in which such proceedings shall have been had, shall not be suspended by reason of any appeal which shall be prayed and allowed from such sentence; provided that the party or parties appellants shall give sufficient security, to be approved of by the court, to render and deliver the ship, vessel, boat, goods, or effects concerning which such sentence or decree shall be pronounced, or the full value thereof, to be ascertained either by agreement between the parties, or, in case the said parties cannot agree, then by appraisement under the authority of the said court, to the appellant or appellants, in case the sentence or decree so appealed from shall be reversed, and such ship, vessel, boat, goods, or effects be ultimately condemned. (Sec. 188.)

*Persons authorised to seize under 5 Geo. IV. c. 113 to have Benefit of this Act.*—All persons authorised to make seizures under the Act 5 Geo. IV. c. 113 shall, in making and prosecuting any such seizures, have the benefit of all the provisions granted to persons authorised to make seizures under this Act; and all penalties and forfeitures created by the said Act, whether pecuniary or specific, shall (except in cases specially provided for by the said Act) go and belong to such persons as are thereby authorised to make seizures, in such shares, and shall and may be sued for and prosecuted, tried, recovered, distributed, and applied, in such and the like manner, and by the same ways and means, and subject to the same rules and directions, as any penalties and forfeitures incurred in Great Britain and in the British possessions in America respectively now go and belong to, and may be sued, prosecuted, tried, recovered,

and distributed the said possess

Act. (Sec. 189.)

*Colonial Laws void.*—All laws, this time or whi or endeavoured practice, in any America, which an Act, or to any A trade and naviga relate to the said null and void to a ever. (Sec. 190.)

*Trade with the passengers shall b into the United Islands, nor shall pported or carried t the said islands, no be carried from any other of them, nor fr islands to another British ships; and i brought, imported, e contrary hereto, all and the muster of th so brought, imported forfeit the sum of 100*

No tobacco, cigars, into the Channel Isl one of the said isla

one part of any of the of the same, unless in fifty tons, except from ships of not less than trading from thence to packages each contain pounds nett weight of s live unless the provisio like sort of goods may the United Kingdom of tobacco, cigars, or sm island or carried, ship hereto, or which shall have been on board any league of the coasts t together with the ship c. 96 s. 18.

*Spirits from and to th of 50 Tons and Casks*

(except rum of the I be imported into or ex Islands or any of them one to any other of the coastwise from any on of any one of the said i in order to be so remo other than of the bur wards, or in any cask containing liquids not b of twenty gallons not b ported, exported, remo water-borne to be so s riel, contrary hereto, s with the ship, and any l removing, or carrying t that nothing herein con spirits imported in any as part of the cargo, r really intended for the e and passengers of such and net being more in s for that purpose, nor t exported from the Uni not less than forty ton trollers to those islands

and distributed respectively in Great Britain or in the said possessions, under and by virtue of this Act. (Sec. 189.)

*Colonial Laws repugnant to Acts of Parliament.*—All laws, byelaws, usages, or customs at this time or which hereafter shall be in practice, or endeavoured or pretended to be in force or practice, in any of the British possessions in America, which are in anywise repugnant to this Act, or to any Act relating to the customs or to trade and navigation, so far as the same shall relate to the said possessions, are and shall be null and void to all intents and purposes whatsoever. (Sec. 190.)

*Trade with the Channel Islands.*—No goods or passengers shall be brought, imported, or carried into the United Kingdom from the Channel Islands, nor shall any passengers or goods be exported or carried from the United Kingdom to the said islands, nor shall any goods or passengers be carried from any one of the said islands to any other of them, nor from one part of any of the said islands to another part of the same, except in British ships; and if any goods or passengers be brought, imported, exported, or carried coastwise contrary hereto, all such goods shall be forfeited, and the master of the ship in which the same are so brought, imported, exported, or carried shall forfeit the sum of 100*l.* (Sec. 191.)

No tobacco, cigars, or snuff shall be imported into the Channel Islands, nor be carried from any one of the said islands to another of them, or from one part of any of the said islands to another part of the same, unless in ships of not less burden than fifty tons, except from the United Kingdom in ships of not less than forty tons burden regularly trading from thence to those islands, nor unless in packages each containing not less than eighty pounds nett weight of such tobacco, cigars, or snuff, nor unless the provisions in and under which the like sort of goods may be legally imported into the United Kingdom are complied with; and all tobacco, cigars, or snuff imported into the said island or carried, shipped, or removed contrary hereto, or which shall be found or discovered to have been on board any ship or boat within one league of the coasts thereof, shall be forfeited, together with the ship or boat.—18 & 19 Vict. c. 96 s. 18.

*Spirits from and to the Channel Islands in Ships of 50 Tons and Casks of 20 Gallons.*—No spirits (except rum of the British Plantations) shall be imported into or exported from the Channel Islands or any of them, or be removed from any one to any other of the said islands, or be carried coastwise from any one part to any other part of any one of the said islands, or shall be shipped in order to be so removed or carried in any ship other than of the burden of fifty tons or upwards, or in any cask or other vessel capable of containing liquids not being of the size or content of twenty gallons at the least; and all spirits imported, exported, removed, carried, shipped, or water-borne to be so shipped, removed, or carried, contrary hereto, shall be forfeited, together with the ship, and any boat importing, exporting, removing, or carrying the same: provided always, that nothing herein contained shall extend to any spirits imported in any such ship in glass bottles as part of the cargo, nor to any spirits being really intended for the consumption of the seamen and passengers of such ship during their voyage, and not being more in quantity than is necessary for that purpose, nor to any warehoused goods exported from the United Kingdom in ships of not less than forty tons burden, being regular traders to those islands, nor to any boat of less

burden than ten tons for having on board at any one time any foreign spirits of the quantity of ten gallons or under, such boat having a license from the proper officer of Customs at either of the islands of Guernsey or Jersey for the purpose of being employed in carrying commodities for the supply of the island of Sark, which license such officer is hereby required to grant without fee or reward; but if any such boat shall have on board at any one time any greater quantity of spirits than ten gallons, unless in casks or packages of the size and content of twenty gallons at the least, such spirits and boat shall be forfeited.—20 & 21 Vict. c. 92 s. 19, modified by 23 & 24 Vict. c. 129 s. 3.

When any of the terms mentioned in sec. 357 of 'The Customs Consolidation Act, 1853,' are used in this or any other Act relating to the customs, the terms so used shall have the same interpretation and meaning as are given to them in the said section; and the term 'British-built ships' shall be deemed to mean and include any ship built in her Majesty's dominions.—20 & 21 Vict. c. 92 s. 20.

Whereas doubts have arisen whether the several sections of 'The Customs Consolidation Act, 1853,' other than those containing particular provisions relating thereto, as also 'The Supplemental Customs Consolidation Act, 1855,' are applicable to the British possessions abroad: be it enacted, that the said recited Acts and the several clauses therein and in this Act contained shall and the same are hereby declared to extend to and be of full force and effect in the several British possessions abroad, except where otherwise expressly provided for by the said Acts, or limited by express reference to the United Kingdom or the Channel Islands, and except also as to any such possession as shall by local Act or ordinance have provided, or may hereafter, with the sanction and approbation of her Majesty and her successors, make entire provision for the management and regulation of the Customs trade and navigation of any such possession, or make in like manner express provisions in lieu or variation of any of the clauses of the said Act for the purposes of such possession.—20 & 21 Vict. c. 62 s. 1*o.*

*Malta deemed to be in Europe.*—The island of Malta and its dependencies shall be deemed to be in Europe. (Sec. 194.)

*Connection of the Planter and Home Merchant. Mode of transacting Business in England.*—The mode of transacting West India business is as follows: A sugar planter forms a connection with a mercantile house in London, Bristol, Liverpool, or Glasgow; stipulates for an advance of money on their part; grants them a mortgage on his estate; and binds himself to send them annually his crop, allowing them the full rate of mercantile commissions. These commissions are  $2\frac{1}{2}$  per cent. on the amount of sugar sold, and of plantation stores sent out; along with  $\frac{1}{2}$  per cent. on all insurances effected. During the war, when prices were high, the amount of these commissions was large: but, like other high charges, the result has, in nine cases out of ten, been to the injury of those who received them; they led the merchants to undertake too much, and to make too large advances to the planters, for the sake of obtaining their business. At that time it was usual to allow a permanent loan at the rate of 3,000*l.* for the assured consignment of 100 hogsheds of sugar; but that ratio was very often exceeded by the planter, the 3,000*l.* becoming 4,000*l.*, 5,000*l.*, 6,000*l.*, and, in very many cases, still more, in consequence of unforeseen wants and too sanguine calculations on his part.

Persons resident in the West Indies are almost

always bare of capital, and for obvious reasons. A climate of such extreme heat, and a state of society possessing so few attractions to persons of education, offer no inducement to men of substance in Europe to go thither. Those who do go must trust to their personal exertion and the support of others; and when, after a continued residence in the West Indies, they have made some progress in acquiring a competency, and have become accustomed to the climate, they hardly ever consider themselves as settled there for life; their wish and hope is, to carry their acquisitions so far as to be enabled to pass the remainder of their days comfortably at home. The readiest means, in the view of the planter, for accomplishing this, used to be the extension of his undertakings; which he could do only by borrowing money. Hence a continual demand on his mercantile correspondents at home for fresh advances; the consuming effect of heavy commissions, and of the interest on borrowed money, being overlooked in his ardent speculations. But when prices fell, as they have done of late years, to a comparatively low level, the planters found themselves embarrassed with debts contracted under a different state of things, which in but few instances they could expect to discharge; hence their ruin, and hence also the ruin of many of the merchants and mortgagees connected with the planters.

For a number of years the West India trade has been extremely depressed; and it is, perhaps, impossible to point out any means of effectual relief. The planters need not build expectations on such doubtful, or rather improbable, events as the stoppage of distillation from malt, or an insurrection or emancipation of the negroes in rival countries, such as Cuba or Brazil. Of a bounty on exportation it is idle to speak; so that their only rational ground of hope seems to be in the introduction of improved processes, and a reduction in the cost of producing sugar and other staples.

The sale of West India articles takes place through the medium of produce brokers, who in London reside chiefly in Mincing Lane and Tower Street. Samples of sugar and rum are on show in their respective sale rooms during four days of the week, viz. Tuesday, Wednesday, Thursday, and Friday, from 11 to 1 o'clock; during which time the sugar refiners, wholesale grocers, and other dealers in produce, call in, observe the state of the market, and buy what they require. The term of credit is short; only 1 month for coffee and rum, and 2 months for sugar. Coffee is generally sold by public auction, sugar and rum by private contract. The brokers' commission is usually  $\frac{1}{2}$  per cent. on the amount; but in the case of coffee, as they guarantee the buyers, their charge amounts to 1 per cent. The brokers have no correspondence or connection with the planters; they are employed by the merchants; and their sales, though for large amounts, being very simple, a brokerage house of consequence generally does the business of a number of merchants. Neither merchant nor broker see, or are in the least under the necessity of seeing, the bulky packages containing the different articles of produce of which they effect the sales: all is done by sample; the packages remaining in the bonded warehouse from the time of landing till they are sold; after which they pass to the premises of the refiner, wholesale grocer, or whoever may be the purchaser.

The allowances made to the buyer in respect of weight consist, first of the tare, which is the exact weight of the cask; and, in the second place, of a fixed allowance of 5 lbs. per cask in the case of coffee, called tret, and of 2 lbs. per cask on sugar, under

the name of draft. (See *Account Sales* of both, art. BOOKKEEPING.)

The shipping stores from England to the plantations is also a very simple transaction. West India merchants in London, Liverpool, or Bristol, receive from the planters, in the autumn of each year, a list of the articles required for the respective estates: these lists they divide, arrange, and distribute among different wholesale dealers in the course of September and October, with instructions to get them ready to ship in a few weeks. November and December are the chief months for the despatch of outward-bound West Indianmen, as the plantation stores ought, properly, to arrive about the end of December, or in the course of January. That is a season of activity, and generally of health, in the West Indies; the comparatively cool months of November and December having cleared the air, and the produce of the fields having become ripe and ready to carry. Crop time lasts from January to the end of July, after which the heavy rains put a stop to field work in the islands. Demerara, being so near the Line, experiences less difference in the seasons, and it is customary there to continue making sugar all the year round.

The arrivals of West Indianmen in England with home-ard cargoes begin in April and continue till October; after which, with the exception of occasional vessels from Demerara and Berbice, they cease till the succeeding April. This corresponds with the time of carrying and loading the crops; for it would be quite unadvisable, on the score of health as well as of the interruptions to work from the heavy rains, to attempt loading vessels in the sugar islands during the autumn months.

The unloading of West Indianmen in London usually takes place at the West India Docks; and did so uniformly from the autumn of 1802, when the docks were first opened, till August 1822, when the dock monopoly expired. Cargoes are discharged very speedily, the time seldom exceeding 3 days. The dock dues have been materially reduced of late years; and the whole exhibits a striking example of the advantage attendant on transacting a mass of business on one spot—an advantage which can be enjoyed only in great sea-ports, such as London, Liverpool, or Amsterdam. [Docks.]

The rates of freight during the war were, on sugar from 7s. to 8s. per cwt., and on coffee from 10s. to 11s.; whereas they now amount, the former from 1s. 6d. to 2s. 6d. and the latter from 3s. to 3s. 6d.; the shipowners, from the improvements that have been effected, being better paid now than formerly.

*Selection of Sites for Colonial Establishments.*—Nothing can be more unwise than the plan, if so we may call it, hitherto followed in the selection of places at which to found colonies. The captain of a ship, without any knowledge whatever of the nature of soils or the capacities of a country in an agricultural point of view, falls in after a long cruise with a river or bay, abounding with fish and fresh water, and surrounded with land that looks fertile and is covered with herbage. He forthwith reports all these circumstances, duly embellished, to the Admiralty, strongly recommending the situation as an admirable one at which to found a colony; and, in nine cases out of ten, this is all the information that is required in taking a step of such infinite importance! No wonder, therefore, that many fine schemes of colonisation should have ended only in loss and disappointment, and that situations which the colonists were taught to look upon as a species of paradise have proved to be anything but what they

were represented by Captain Cook world, had to be sent out to instead of being sandy swamp. I attempt would have in so pestilential Leone if the proper make? The colored as another in pure confidence in really without the timote of the vario be attended to in fo

were represented. Botany Bay, though described by Captain Cook as one of the finest places in the world, had to be abandoned by the colonists that were sent out to it; as the country round it, instead of being favourable for cultivation, is a mere sandy swamp. Is it possible to suppose that any attempt would have been made to establish a colony in so pestilential a climate as that of Sierra Leone if the proper enquiries had been previously made? The colony on Swan River may be adduced as another instance of misplaced or premature confidence in the reports of those who were really without the means of forming a correct estimate of the various circumstances necessary to be attended to in forming a colony.

We therefore hope that an end may be put to this system—a system which is in no common degree injurious to the public interests, and is highly criminal towards those who embark as colonists. The founding of a colony should be looked upon in its true point of view—as a great national enterprise. It is not an adventure to be entrusted to presumptuous ignorance, but should be maturely weighed, and every circumstance connected with it carefully investigated. Above all, the situation in which it is proposed to found the colony should be minutely surveyed; and its climate, soil, and capacities of production deliberately enquired into by competent persons employed for the purpose. Were this done, Government and the public would have the best attainable grounds upon which to proceed; and neither party would have much reason to fear those disappointments which have hitherto so often followed the exaggerated representations of those to whom the important and difficult task of selecting situations for colonies has been delegated. [ADELAIDE; CAPE TOWN; COLUMBO; HONG KONG; MELBOURNE; PORT LOUIS; QUEBEC; TARIFFS, COLONIAL; &c.]

V. FOREIGN COLONIES.

1. *Spanish Colonies.*—Spain, whose colonial possessions, previous to 1810, extended from the frontiers of the United States to the Straits of Magellan, is not, at present, possessed of a foot of ground in the whole American continent. Still, however, her colonial possessions are of great value and importance. In the West Indies, she is mistress of Cuba and Porto Rico; the former by far the largest and finest of the West Indian Islands, and the latter also a very valuable possession. In the East, Spain is mistress of the Philippine Islands, which, were they in the hands of an enterprising people, would speedily become of very great commercial importance. [HAVANNAH; MANILLA; PORTO RICO.]

2. *Dutch Colonies.*—Java is the principal Dutch colonial possession, and it is one of which it is not easy to exaggerate the value and importance. [BATAVIA.] In the East the Dutch also possess the Moluccas, Bencoolen on the coast of Sumatra, Macassar, and the eastern coast of Celebes, Banda &c. They have several forts on the Gold Coast in Africa; in the West Indies they possess the islands of Curaçao and St. Eustatius, Saba, and part of St. Martin; and on the continent of South America they are masters of Dutch Surinam. Curaçao and St. Eustatius are naturally barren, but they have been both highly improved. From being very conveniently situated for maintaining a contraband traffic with the Caracas and other districts in South America, Curaçao was formerly a place of great trade, particularly during war; but since the independence of South America, it has ceased in great measure to be an em-

trepôt; the goods destined for the continent being now, for the most part, forwarded direct to the places of their destination.

That district of Surinam ceded to the British in 1814, comprising the settlements of Demerara, Berbice, and Essequibo, formed the most valuable portion of Surinam, or Dutch Guiana. The district which still belongs to the Dutch lies to the south of Berbice. It contains about 38,000 square miles, and a population of about 53,000. The value of the exports of sugar from this colony in 1861 was estimated at 2,654,480 florins, and in 1862 at 2,752,683 florins.

3. *French Colonies.*—Previously to the negro insurrection that broke out in 1792, St. Domingo was by far the most valuable colony in the West Indies. But this disastrous event, having first devastated the island, terminated in the establishment of the independent black republic of Hayti. [PORT AU PRINCE.] Having also sold Louisiana to the Americans, and ceded the Mauritius to the English, without making any new acquisition, the colonial dominions of France (for Algeria cannot be reckoned amongst them) are, at this moment, of very limited extent. The most important are Martinique and Guadeloupe in the West Indies, the former with (in 1863) a population of 135,353, and the latter of 138,380. The exports of these islands were in 1863 as follows:—

Articles	Martinique	Guadeloupe	Réunion
Sugar - kilos.	30,115,920	34,588,611	41,687,557
Molasses - litres	3,981,325	1,811,720	4,028,286

Vanilla - "	—	375	17,663

The emancipation of the slaves was injurious to these islands; but the deficiency of labour thence arising has been, in part at least, supplied by immigrants. The other French colonies consist of the small islands of Marie-Galante and Desenda, in the West Indies; Cayenne, in South America; Senegal and Goree, in Africa; the Isle de Réunion (Isle de Bourbon), in the Eastern Ocean, the exports of which are given in the table above; St. Marie, in Madagascar; and Pondicherry and Chandernagore, with a very small surrounding territory, in the East Indies.

Of these the Isle de Réunion is the most important, and the exports from it have latterly increased very rapidly. At an average of 1849 and 1850, for example, she only sent to France 18,681,530 kilogrammes a-year of sugar, whereas, in 1863, she sent thither no fewer than 69,141,663 kilogrammes. This extraordinary increase has been wholly owing to the importation of labourers from India, Africa, and Madagascar, and to the extensive employment of guano as manure.

4. *Danish Colonies.*—In the West Indies, these consist of the islands of St. Croix, St. Thomas, and St. John, having together, in 1860, a population of 38,130. St. Croix contains about 100 square miles, and is fertile and well cultivated. The principal productions were at one time sugar, rum, and coffee. The exports formerly amounted to about 25,000,000 lbs. a-year, but the cultivation of sugar has been abandoned in consequence of the emancipation of the slaves in 1847. St. Thomas, which has about 15,500 inhabitants, has long been, and though latterly much fallen off, still continues to be, one of the principal emporiums in the West Indies. It owes this distinction partly to its convenient situation as a packet station, partly to its spacious and safe harbour at St. Thomas, on the south side of the island, and partly and principally to the moderation of the import duties, which vary

from 1 to 1½ per cent. St. Thomas has, in consequence, become as it were a depôt for the supply of the neighbouring islands; goods being sent to it to be warehoused till opportunity offers for conveying them to their final destination. In the *Consular Report for 1866* it is stated that this branch of trade is likely now to decline gradually, as merchants &c. in the neighbouring islands are making direct importations from the United Kingdom. The great articles of importation are manufactured goods, principally from England, but partly also from other countries of Europe, with provisions, lumber &c. from the United States.

The value of our exports to the 3 islands now referred to, being for St. Thomas, amounted in 1866 to 765,521*l.*, of which cottons made 361,317*l.*, licens 136,982*l.*, coal &c. 51,931*l.*, and iron 40,650*l.* The Danes have, however (1868), sold these islands to the United States.

In India the Danes formerly possessed Tranquebar, near Madras; and Serampore, near Calcutta; but these they sold, in 1845, to the East India Company.

5. *Swedish Colonies.*—The Swedes possess one colony—the small island of St. Bartholomew, in the West Indies. It is only about 25 square miles in extent, but is very fertile. It has no springs, nor fresh water of any sort, except such as is supplied by the rain. Population between 8,000 and 9,000.

COLUMBA or CALUMBA ROOT (Dutch, Colombo wortel; Fr. racine de Colombo; Ger. Colombo-wurzel; Ital. radice di Colombo; Port. raiz di Columba; Span. raiz di Columba; Mosamb. kalumb). The root of the plant of that name; the *Coccolus palmatus* of DeCandolle; Nat. Order, *Menispermaceæ*. It is not cultivated, but grows wild in the forests between Ibo and the Zambesi, and being dug up by the natives, is exported by the Portuguese. It is brought to us dry, in transverse sections from ¼ to ½ in. thick, from 1 to 2½ in. diameter. Bark wrinkled and thick, of a brownish colour without, and a brightish yellow within; pith spongy, yellowish, and slightly striped; when fresh, its smell is rather aromatic; it is disagreeably bitter, and slightly pungent to the taste, somewhat resembling mustard that has been too long kept. Choose the largest pieces, fresh, of a good colour, as free from worms as possible, rejecting that which is small and broken. It is used in the materia medica, and is a valuable tonic. Freight 16 cwt. to a ton. A decoction when cold is blackened by the solution of iodine. (*Pharmacopœia of the Medical Council*, ed. 1867.)

COLUMBO or COLOMBO. The modern capital of Ceylon, on the S.W. coast of the island; lat. 6° 56' 6" N., long. 79° 49' 48" E. It is defended by a very strong fort nearly surrounded by the sea, in which is a lighthouse 97 feet high. Population of the town and fort, in 1865, perhaps 60,000. The houses, generally only 1 storey high, are of stone, clay, and lime; and the town has more of a European appearance than any other in India. The inhabitants are principally Cingalese. The temperature is remarkable for its equality; and though very humid, the climate may, on the whole, be esteemed salubrious and temperate. There is no harbour at Colombo for large vessels, but only an open roadstead. A projecting rock, on which 2 batteries are erected, affords shelter to a small semicircular bay on the north side of the fort, having a wooden quay to facilitate the loading and unloading of boats. The depth of water is not sufficient to allow sloops or large dhonies to come alongside the quay; those exceeding 100 tons burden lying at about a cable's length from it. A bar of sand, on some parts of which the water is not more than 7 feet deep, extends from the pro-

jecting rock across this bay. The channel where it may be crossed by the larger class of ships is liable to shift; and it is only in the fine weather of the safe season that they venture within the bar. The outer road affords secure anchorage for half the year, from the beginning of October to the end of March, during the prevalence of the N.E. monsoon, when the wind blows off the land; during the other, or S.W. monsoon, when the wind blows from the sea on shore, the road is very far from safe; and the ships that frequent it are sometimes obliged to slip their cables and stand out to sea. (*Milburn's Orient. Comm.*; *Hamilton's Gazetteer*; &c.)

As respects its harbour, Colombo is, therefore, very inferior to Trincomalee, the harbour of which is accessible at all times, and one of the best in India, and it is also inferior to the harbour of Point de Galle. The country in the vicinity of Colombo has, no doubt, an extensive internal navigation; but as the cinnamon plantations near the town have lost much of their former importance, and as the central provinces adapted to the growth of coffee, now the great staple of the island, may be as easily reached from the other harbours as from Colombo, the decline of the commercial preponderance of the latter is far from unlikely.

*Money.*—The six dollar = 1*s.* 6*d.* has become obsolete, and the currency now consists of silver rupees = 2*s.*, in which, or in dollars = 4*s.* 2*d.*, accounts are kept.

*The Bank of Ceylon*, noticed in the last edition of this work, is extinct. There are, however, in Colombo, a branch of the Oriental Bank Corporation, head-office London; and a branch of the Mercantile Bank of India, London, and China, head-office Bombay.

*Weights, Measures &c.*—The weights are divided into ounces, pounds &c., and are the same as in Great Britain. The candy or bahar = 500 lbs. avoirdupois, or 461 lbs. Dutch troy weight. The principal dry measures are *seers* or *parrahs*. The former is a perfect cylinder, of the depth and diameter under-mentioned:—

Seer	depth	diameter
	4.75 inches	4.35 inches

The parrah is a perfect cube, its external dimensions being every way 11.57 inches.

The liquid measure consists of gallons, and their multiple and sub-multiples, 150 gallons = 1 leaguer or legger.

The bale of cinnamon consists of 92½ lbs. very nearly.

#### Native Dry Measures.

4 cut chundoo	= 1 seer
4 4.5 seers	= 1 coornie
2 1.2 coornies	= 1 manaal
½ manaal	= 1 parrah
8 parrahs	= 1 amunam
9.5-8 amunams	= 1 last

The English bushel is equal to 31 seers or 1 parrah and 10 seers.

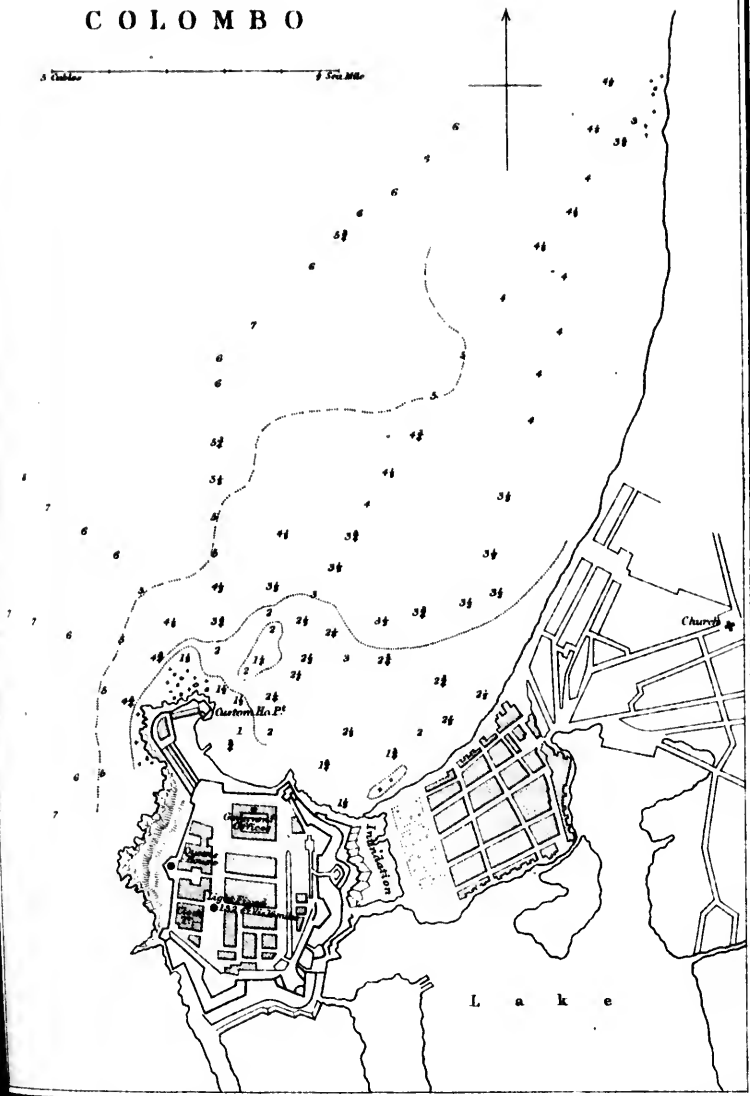

*Ceylon Native Land Measure.*—8 lahar = 1 coornie, 10 coornies = 1 peyla, 4 peylas = 1 amunam.

Among the natives the value of land is fixed by the quantity of seed required to sow it, computed as the amunam and its sub-divisions: thus an amunam of fertile soil will measure, in regard to produce, sometimes twice as much as the same number of square feet of inferior soil.

The great articles of export from Ceylon are coffee, cocoa-nut oil, areca nuts, cinnamon, pepper, bago, coir, arrack, tobacco, pearls, chanks &c. The island is peculiarly suitable for the culture of coffee, the growth of which has rapidly increased since the reduction, in 1835, of the duty on coffee from Ceylon to the same level as that on coffee from the West Indies, the imports into the United

Kingdom from Ceylon in the former year having been only 1,870,143 lbs., whereas in 1866 they amounted to 81,428,370 lbs., valued at 2,702,352*l.*, of which 21,537,082 lbs. were entered for home consumption, and the supply appears to be susceptible of an indefinite increase. The exports of coconut oil, coir, and arrack might also be greatly increased; and it will be seen in the article CINCINNATI how the growth of that important staple was restricted by the duty laid on its exportation. The total value of our imports from Ceylon in 1867 was 3,224,512*l.*

*Sailing Directions and Remarks on the Port of Colombo, by James Donnan, Esq., Master Attendant.*

The coast of Ceylon about Colombo is low, and not visible from seaward more than 10 miles. About 1 mile to the northward of the fort, near Mutwal, there are some lofty fir trees, which are generally seen when approaching from seaward before the lighthouse or flagstaff. They afford a good landmark for Colombo, as when viewed from seaward they appear considerably elevated above the surrounding coconut trees, and seem as one top rather thinly planted. No other part of the coast either north or south of Colombo affords a similar mark to this.

There are some isolated hills at a distance in the country, and the high mountain lying on it is a sharp cone called Adam's Peak bears from Colombo E.  $\frac{1}{2}$  S. distant 46 miles. It rises 7,420 feet above the level of the sea, and in clear weather has been seen at a distance of 30 leagues. In the N.E. monsoon it is generally seen in the morning, and sometimes throughout the day, but is rarely seen in the S.W. monsoon through the humid atmosphere which prevails in that season.

A bright fixed light is exhibited every night from the clock tower, a square grey looking building that is situated in the centre of the fort, in latitude  $6^{\circ} 56' 13''$  N. and longitude  $79^{\circ} 56' 13''$  E. The light is elevated 133 feet above the level of the sea, and may be seen in clear weather from a ship's top 18 to 20 miles.

The only danger in approaching the roadstead from the southward is the Drunken Sailor, a ledge of rocks with only 6 feet water over the shallowest part which bears from the light tower S.  $70^{\circ}$  W. and is distant off shore 800 yards, or say  $\frac{1}{2}$  mile. This danger is clearly defined during the S.W. monsoon by a constant break of the sea, but during the N.E. monsoon with smooth water there is no break; it is then prudent not to come under 9 fathoms water when in the vicinity of these rocks, there are 8 fathoms close outside of them; but more prudent course would be not to approach the shore within  $\frac{1}{2}$  mile until the light tower is sighted to bear to the eastward of E. by N., then stand in for the shipping, as no advantage can be gained by steering close to these rocks at any time. The approach from the westward is quite clear, and also from the northward with the exception of a ledge of rocks that stretches along shore to the northward from Mutwal; but this ledge is only about  $\frac{1}{2}$  mile off shore, and so much out of the usual track of shipping that it is scarce worthy of note as a danger.

Vessels bound to Colombo during the S.W. monsoon from south of the Equator should not cross to the eastward of  $78^{\circ}$ , as between  $3^{\circ}$  north and the west of Ceylon a strong current sets to the eastward, and the wind frequently hangs from west of the Gulf of Manaar is entered, thus making it difficult to fetch the port if not well to windward. The coast for 30 miles south of Colombo may be approached with safety to a distance of 2 miles.

The roadstead of Colombo, although exposed to the S.W. monsoon, is a safe one for vessels well found in ground tackle; vessels generally ride out the monsoon at single anchor with a long scope of chain. A gale of wind may occur about the changes of the monsoon in the months of May, June, and November, and even as late as December; though a gale of wind in the latter month is very rare, and several years sometimes pass away without any beyond a stiff monsoon breeze.

These gales are seldom violent, and it is only during them that casualties occur to the shipping. Only 5 vessels have been wrecked within the last 32 years.

Communication between the shore and shipping is seldom interrupted, although there are occasional spills of squally weather and high sea during the S.W. monsoon, which make the passage over the bar difficult and dangerous, especially for small boats.

A vessel may anchor anywhere in the outer roads with the flagstaff bearing from S.  $5^{\circ}$  E. to S.  $55^{\circ}$  E. in from  $6\frac{1}{2}$  to  $9\frac{1}{2}$  fathoms water, and distant off the north bastion of the fort from  $\frac{1}{2}$  to 1 mile. The best anchorage is with the flagstaff bearing about S.  $30^{\circ}$  E. in 8 fathoms water. Vessels arriving during the S.W. monsoon, or about the changes of the monsoon, should not anchor nearer the north bastion of the fort than  $\frac{1}{2}$  mile, or bring the rocky point at Mutwal (which is about  $\frac{1}{2}$  mile to the northward of the fort) to bear to the northward of N.E.  $\frac{1}{2}$  E.; and they are recommended to ride with not less than 80 fathoms cable to the hawse, and to have all the shackles looked to and the small pins well secured before coming to an anchor. The constant pitching motion which vessels are subjected to causes the cables at some distance from the hawse to beat and chafe on the ground, and the shackle pins frequently work out, if not well secured. The small pins should be of iron with large heads, and the other ends well clinched over a ring; if not clinched, they invariably loosen, and work out.

The inner road or harbour is mostly occupied by the native coasting vessels; it is considerably sheltered from the S.W. monsoon by the north bastion of the fort and bar, and affords good and safe anchorage for vessels drawing not over 11 feet. The bar is a shifting sand-bank extending from the north bastion in a line with Mutwal Point for about  $1\frac{1}{2}$  cable length, on which there is from 7 to 12 feet water beyond it, and inside of it there is  $3\frac{1}{2}$  fathoms. Strangers should not enter the inner roads without a pilot. As the sea sometimes breaks on the bar during the S.W. monsoon, and several lives have been lost by boats being swamped, strangers should not use their own boats in landing, but employ one of the outrigger canoes, which are always available, until they become acquainted with the passage over it.

The ballast ground during the S.W. monsoon is in 15 fathoms water with the flag staff bearing about E., and during the N.E. monsoon in the same depth of water with the flag staff about E.S.E., where vessels may discharge their ballast overboard.

The current of Colombo, and in the Gulf of Manaar, is subject to considerable variation, particularly about the changes of the monsoon, when it is the strongest; but generally speaking it sets with the monsoon, and is never so strong as to inconvenience shipping making the roads. The greatest difference between high and low water recorded at Colombo is not more than 2 feet 10 inches. In the S.W. monsoon, when the mean level of the ocean is the lowest, the difference between high and low water is from 5 to 15 inches.

namon, 800 lbs.; cocoa-nut oil, 17 cwt.; coffee in sapan wood, 20 cwt.; horns and pepper, 16 cwt.; bags, 18 cwt.; ditto in casks, 16 cwt.; coir and cardamoms, 12 cwt.; cotton, 50 cubic feet; ebony and measurement goods, 50 cubic feet; plumbago, 20 cwt.

Extent, Population, Revenue &c. of Ceylon.—The area of Ceylon and its dependent isles is estimated at 24,500 square miles. Its population, according to a census taken in 1866, amounted to 2,088,927, of whom about 17,545 were whites. The population has increased very largely since the last census.

The revenue of 1866 was about 962,873*l*. That of 1865 was 978,492*l*. (*Blue Book for 1867*.)

Public Debt.—The public debt of the colony in 1865 amounted to 450,000*l*, raised on debentures bearing 6 per cent. Of this, the sum of 100,000*l*, which is payable on November 15, 1868, is the balance raised for the purpose of paying the debt due by the Ceylon Government to the railway company, and the sum of 350,000*l*, is a part of 1,000,000*l*, proposed to be raised on debentures under ordinances of 1862 and 1864. 46 miles of the Ceylon Railway were open for general traffic on Nov. 1, 1866, and on Aug. 1, 1867, it was opened for passengers to Kandy. The Electric Telegraph established in the island is worked profitably.

COMMANDITE (PARTNERSHIPS EN). [COMPANIES.]

COMMERCE (from *commutatio mercium*). As its name imports, commerce is simply the exchange of commodities for commodities.

- I. ORIGIN OF COMMERCE.—MERCANTILE CLASSES.
- II. HOME TRADE.
- III. FOREIGN TRADE.
- IV. RESTRICTIONS ON COMMERCE.

I. ORIGIN OF COMMERCE.—MERCANTILE CLASSES.

(1.) The *Origin of Commerce* is coeval with the first dawn of civilisation. The moment that individuals ceased to supply themselves directly with the various articles and accommodations they made use of, that moment must a commercial intercourse have begun to grow up amongst them. For it is only by exchanging that portion of the

produce raised by ourselves that exceeds our own consumption, for portions of the surplus produce raised by others, that the division of employments can be introduced, or that different individuals can apply themselves in preference to different pursuits.

Not only, however, does commerce enable the inhabitants of the same village or parish to combine their separate efforts to accomplish some common object, but it also enables those of different provinces and kingdoms to apply themselves in an especial manner to those callings for the successful prosecution of which the district or country which they occupy gives them some peculiar advantage. This territorial division of labour has contributed more, perhaps, than anything else to increase the wealth and accelerate the civilisation of mankind. Were it not for this, we should be destitute of a vast number of the necessaries, comforts, and enjoyments which we now possess; while the price of the few that would remain would, in most instances, be very greatly increased. But whatever advantages may be derived—and it is hardly possible to exaggerate either their magnitude or importance—from availing ourselves of the peculiar capacities of production enjoyed by others, are wholly to be ascribed to commerce as their real source and origin.

We do not mean to say anything in this article with respect to the practical details connected with the different departments of commerce. These will be found under the various titles to which they refer. Our object, at present, is merely to show the nature and influence of commerce in general, and the restrictions that have sometimes been imposed upon it. We shall begin by endeavouring, first of all, to give some account of the nature of the services performed by the individuals by whom commercial undertakings are usually carried on. In the second place, we shall consider the influence of the home trade, or of the intercourse subsisting amongst individuals of the same country. In the third place, we shall consider the

influence of for which subsists different countries discussed, we shall have been termed principles involved in different times in government and (2.) Mercantile of different produce themselves, they deal of time, and a Were there no men his crop would be seek for customers, nearly as possible in the demands of the to buy it; and after next be obliged to perhaps, remote places wanted to get in its exposed to a world his attention would be the labours of his fa things, the work of p employment, would b terruptions, and man are successfully earn country; would not be The establishment of effectively obviates th a set of dealers erect w purchase and sale of dities, every producer, of seeking customers, where he may at all tim products as he requires and energies to his pr renation of merchants gi interrupted motion to d Were the class of tra springs of industry wo numberless difficulties th effecting exchanges wo family to endeavour to they had occasion for: thrown back into primar nance; the divisions of labo and the desire to rise in the condition would decline, a more difficult to gratify, rural management could b who had to manufacture th their own shoes? influence of *foreign* trade, or of that intercourse which subsists amongst individuals belonging to different countries. After these topics have been discussed, we shall offer a few remarks on what has been termed the restrictive system, or on the principles involved in the regulations enacted at different times in this and other countries for the government and direction of commerce.

(2.) *Mercantile Classes.*—While the exchange of different products is carried on by the producers themselves, they must unavoidably lose a great deal of time, and experience many inconveniences. Were there no merchants, a farmer wishing to sell his crop would be obliged, in the first place, to seek for customers, and to dispose of his corn as nearly as possible in such quantities as might suit the demands of the various individuals inclined to buy it; and after getting its price, he would next be obliged to send to 10 or 20 different and, perhaps, remote places, for the commodities he wanted to get in its stead. So that, besides being exposed to a world of trouble and inconvenience, his attention would be continually diverted from the labours of his farm. Under such a state of things, the work of production, in every different employment, would be meeting with perpetual interruptions, and many branches of industry that are successfully carried on in a commercial country would not be undertaken.

The establishment of a distinct mercantile class effectually obviates these inconveniences. When a set of dealers erect warehouses and shops for the purchase and sale of all descriptions of commodities, every producer, relieved from the necessity of seeking customers, and knowing beforehand where he may at all times be supplied with such products as he requires, devotes his whole time and energies to his proper business. The intervention of merchants gives a continuous and uninterrupted motion to the plough and the loom. Were the class of traders annihilated, all the springs of industry would be paralysed. The numberless difficulties that would then occur in effecting exchanges would lead each particular family to endeavour to produce all the articles they had occasion for: society would thus be thrown back into primeval barbarism and ignorance; the divisions of labour would be relinquished; and the desire to rise in the world and improve our condition would decline, according as it became more difficult to gratify. What sort of agricultural management could be expected from farmers who had to manufacture their own wool, and make their own shoes? And what sort of manufacturers would those be who were every now and then obliged to leave the shuttle for the plough, or the anvil for the anvil? A society without that distinction of employments and professions resulting from the division of labour, that is, *without* commerce, would be totally destitute of arts or sciences of any sort. It is by the assistance each individual renders to and receives from his neighbours, by every one applying himself in preference to some peculiar task, and combining, though probably without intending it, his efforts with those of others, that civilised man becomes equal to the most gigantic efforts, and appears endowed with almost omnipotent power.

The mercantile class has generally been divided into two subordinate classes—the wholesale dealers and the retail dealers. The former purchase the various products of art and industry in the places where they are produced, or are least valuable, and carry them to those where they are more valuable, or where they are more in demand; and the latter, having purchased the commodities of the wholesale dealers, or the producers, collect

them in shops, and sell them in such quantities and at such times as may best suit the public demand. These classes of dealers are alike useful; and the separation that has been effected between their employments is one of the most advantageous divisions of labour. The operations of the wholesale merchant are analogous to those of the miner. Neither the one nor the other makes any change on the bodies which he carries from place to place. All the difference between them consists in this—that the miner carries them from below ground to the surface of the earth, while the merchant carries them from one point to another on its surface. Hence it follows that the value given to commodities by the operations of the wholesale merchant may frequently exceed that given to them by the producers. The labour or expense required to dig a quantity of coal from the mine does not exceed what is required for its conveyance from Newcastle to London; and it is a far more difficult and costly affair to fetch a piece of timber from Canada to England than to cut down the tree. In this respect there is no difference between commerce and agriculture and manufactures. The latter give utility to matter by bestowing on it such a shape as may best fit it for ministering to our wants and comforts; and the former gives additional utility to the products of the agriculturist and manufacturer by bringing them from where they are of comparatively little use, or are in excess, to where they are of comparatively great use, or are deficient.

If the wholesale merchant were himself to retail the goods he has brought from different places, he would require a proportional increase of capital; and it would be impossible for him to give that exclusive attention to any department of his business which is indispensable to its being carried on in the best manner. It is for the interest of each dealer, as of each workman, to confine himself to some one business. By this means each trade is better understood, better cultivated, and carried on in the cheapest possible manner. But whether carried on by a separate class of individuals or not, it is obvious that the retailing of commodities is indispensable. It is not enough that a cargo of tea should be imported from China, or a cargo of sugar from Jamaica. Most individuals have some demand for these articles; but there is not, perhaps, a single private person, even in London, requiring so large a supply for his own consumption. It is clear, therefore, that they must be *retailed*; that is, they must be sold in such quantities and at such times as may be most suitable for all classes of consumers. And since it is admitted, on all hands, that this necessary business will be best conducted by a class of traders distinct from the wholesale dealers, it is impossible to doubt that their employment is equally conducive as that of the others to the public interest, or that it tends equally to augment national wealth and comfort.

## II. HOME TRADE.

The observations already made serve to show the influence of the home trade in allowing individuals to confine their attention to some one employment, and to prosecute it without interruption. But it is not in this respect only that the establishment of the home trade is advantageous. It is so in a still greater degree by its allowing the inhabitants of the different districts of the empire to turn their labour into those channels in which it will be most productive. The different soils, different minerals, and different climates of different districts fit them for being appropriated, in preference, to certain

species of industry. A district like Lancashire, where coal is abundant, which has an easy access to the ocean, and a considerable command of internal navigation, is the natural seat of manufactures. Wheat and other species of grain are the natural products of rich arable soils; and cattle, after being reared in mountainous districts, are most advantageously fattened in meadows and low grounds. Hence it follows that the inhabitants of different districts, by confining themselves to those branches of industry for the successful prosecution of which they have some peculiar capability, and exchanging their surplus produce for that of others, will obtain an incomparably larger supply of all sorts of useful and desirable products than they could do were they to apply themselves indiscriminately to every different business. The territorial division of labour is, if possible, even more advantageous than its division among individuals. A person may be what is commonly called *Jack of all trades*; and though it is next to certain that he will not be well acquainted with any one of them, he may nevertheless make some sort of rude efforts in them all. But it is not possible to apply the same soils or the same minerals to every different purpose. Hence it is that the inhabitants of the richest and most extensive country, provided it were divided into small districts without any intercourse with each other or with foreigners, could not, how well soever labour might be divided among themselves, be otherwise than poor and miserable. Some of them might have a superabundance of corn, at the same time that they were wholly destitute of wine, coal, and iron; while others might have the largest supplies of the latter articles, with but very little grain. But in commercial countries no such anomalies can exist. Opulence and comfort are there universally diffused. The labours of the mercantile classes enable the inhabitants of each district to apply themselves principally to those employments that are naturally best suited to them. This superadding of the division of labour among different provinces to its division among different individuals renders the productive powers of industry immeasurably greater; and augments the mass of necessities, conveniences, and enjoyments in a degree that could not previously have been conceived possible, and which cannot be exceeded except by the introduction of foreign commerce.

'With the benefit of commerce,' says an eloquent and philosophical writer, 'or a ready exchange of commodities, every individual is enabled to avail himself, to the utmost, of the peculiar advantage of his place; to work on the peculiar materials with which nature has furnished him; to humour his genius or disposition, and betake himself to the task in which he is peculiarly qualified to succeed. The inhabitant of the mountain may betake himself to the culture of his woods and the manufacture of his timber; the owner of pasture lands may betake himself to the care of his herds; the owner of the clay-pit to the manufacture of his pottery; and the husbandman to the culture of his fields, or the rearing of his cattle. And any one commodity, however it may form but a small part in the accommodations of human life, may, under the facility of commerce, find a market in which it may be exchanged for what will procure any other part or the whole; so that the owner of the clay-pit, or the industrious potter, without producing any one article immediately fit to supply his own necessities, may obtain possession of all that he wants. And commerce, in which it appears that commodities are merely exchanged and nothing produced, is nevertheless in its effects

very productive, because it ministers a facility and an encouragement to every artist in multiplying the productions of his own art; thus adding greatly to the mass of wealth in the world in being the occasion that much is produced.' (Ferguson's *Principles of Moral Science*, vol. ii. p. 424.)

The roads and canals that intersect a country, and open an easy communication between its remotest extremities, render the greatest service to internal commerce, and also to agriculture and manufactures. A diminution of the expense of carriage has, in fact, the same effect as a diminution of the direct cost of production. If the coals brought into a city sell at 20s. a ton, of which the carriage amounts to a half, or 10s., it is plain that in the event of an improved communication, such as a more level or direct road, a railway, or a canal, being opened for the conveyance of the coals, and that they can, by its means, be imported for half the previous expense, their price will immediately fall to 15s. a ton; just as it would have done had the expense of extracting them from the mine been reduced a half.

Everyone acquainted with the merest elements of political science is aware that employments are more and more subdivided, that more powerful machinery is introduced, and the productive powers of labour increased, according as larger masses of the population congregate together. In a great town like London, Glasgow, or Manchester, the same number of hands will perform much more work than in a small village, where each individual has to perform several operations, and where the scale of employment is not sufficiently large to admit of the introduction of extensive and complicated machinery. But the great towns with which England is studded could not exist without our improved means of communication. These, however, enable their inhabitants to supply themselves with the bulky products of the soil and of the mines almost as cheaply as if they lived in country villages; securing to them all the advantages of concentration, with but few of its inconveniences. Roads and canals are thus productive of a double benefit; for while, by affording comparatively cheap raw materials to the manufacturers, they give them the means of perfecting the divisions of labour, and of supplying proportionally cheap manufactured goods; the latter are conveyed by their means, and at an extremely small expense, to the remotest parts of the country. The direct advantages which they confer on agriculture are not less important. Without roads, it would not be possible to carry to a distance sufficient supplies of lime, manure, and other light and heavy articles necessary to give luxuriance to the crops of rich soils, and to render those that are poor productive. Good roads and canals, therefore, by furnishing the agriculturists with cheap and abundant supplies of manure, reduce, at one and the same time, the cost of producing the necessities of life, and the cost of bringing them to market.

In other respects, the advantages resulting from improved communications are probably even more striking. They give the same common interest to every different part of the most widely extended empire; and put down, or rather prevent, any attempt at monopoly on the part of the dealers of particular districts, by bringing them into competition with those of all the others. Nothing is so state enjoying great facilities of communication is separate and unconnected. All is mutual, reciprocal, and dependent. Every man naturally goes into the precise situation that he is best fitted to fill; and each, co-operating with every other, else, contributes to the utmost of his power, to

extend the limits [Roads.]

Such being the advantages derivable from the duty of proper encouragement, however, or duty is rather neglected, less in the removal of obstacles in matters that have done too little too much. It will encourage certain producers of certain goods to others has disadvantage. In to observe that the dent and enlighten industry will equally and will be especially every thing that is freedom of commerce to engage in different nations, whatever be the to prevent the circulation of the empire to the part of the empire to the of employments and the emulation, and must amount of produce. prompts to open roads canals should lead every statute book every restraints or fetters the open the free disposal of capital the freedom of internal interrupted by impassable or by oppressive tolls the effect is equally per the common law and England are decidedly the granting of powers individuals to furnish duties. Lord Coke distinguished concerning trade the liberty and freedom Charter, and divers others are good commentaries Inst. 63.) And he affirms 'Commercium jure gentium non in monopolium, quæstionem convertendum, mittere, alius inhiere non potest. But, notwithstanding common and statute law of the freedom of industry Crown was by its prerogative with any law to the effect monopolies, became fast lawyers, and was acted test during the arbitrary house of Tudor. Elizabeth so much dissatisfied Elizabeth as the multiplicity notwithstanding the Crown, and the Court of grievance became at length give rise to the famous statute 18, by which all monopolies, and licenses, for the patent, and making of goods and by an act of the Legislature 'altogether contrary to the and of none effect.' This statute of the greatest advantage, contributed more

extend the limits of production and civilisation.

[Roads.]

Such being the nature and vast extent of the advantages derived from the home trade, it is obviously the duty of the Legislature to give it every proper encouragement and protection. It will be found, however, on a little consideration, that this duty is rather negative than positive; that it consists less in the framing of regulations than in the removal of obstacles. The error of governments in matters of trade has not been that they have done too little, but that they have attempted too much. It will be afterwards shown that the encouragement which has been afforded to the producers of certain species of articles in preference to others has uniformly been productive of disadvantage. In the mean time it is sufficient to observe that the encouragement which a prudent and enlightened government bestows on industry will equally extend to all its branches; and will be especially directed to the removal of every thing that may in any respect fetter the freedom of commerce, and the power of individuals to engage in different employments. All regulations, whatever be their object, that operate either to prevent the circulation of commodities from one part of the empire to another, or the free circulation of labour, necessarily tend to check the division of employments and the spirit of competition and emulation, and must, in consequence, lessen the amount of produce. The same principle that prompts to open roads, to construct bridges and canals, should lead every people to erase from the statute book every regulation which either prevents or fetters the operations of the merchant, and the free disposal of capital and labour. Whether the freedom of internal commerce and industry be interrupted by impassable mountains and swamps, or by oppressive tolls or restrictive regulations, the effect is equally pernicious.

The common law and the ancient statute law of England are decidedly hostile to monopolies, or to the granting of powers to any particular class of individuals to furnish the market with commodities. Lord Coke distinctly states 'that all monopolies concerning trade and traffic are against the liberty and freedom granted by the Great Charter, and divers other Acts of Parliament which are good commentaries upon that charter.' (2 Inst. 63.) And he affirms, in another place, that 'Commercium jure gentium commune esse debet, et non in monopolium et privatum paulhorum questum convertendum. Iniquum est aliis permittere, aliis inhibere mercaturam.'

But, notwithstanding this concurrence of the common and statute law of the country in favour of the freedom of industry, the notion that the Crown was by its prerogative entitled to dispense with any law to the contrary, and to establish monopolies, became fashionable among the court lawyers, and was acted upon to a very great extent during the arbitrary reigns of the princes of the house of Tudor. Few things, indeed, occasioned so much dissatisfaction in the reign of Elizabeth as the multiplication of monopolies; and notwithstanding the opposition made by the Crown, and the Court party in Parliament, the grievance became at length so intolerable as to give rise to the famous statute of 1624 (21 Jas. I. c. 3), by which all monopolies, grants, letters patent, and licenses, for the sole buying, selling, and making of goods and manufactures, not given by an act of the Legislature, are declared to be 'altogether contrary to the laws of this realm, void, and of none effect.' This statute has been productive of the greatest advantage; and has, perhaps, contributed more than any other to the

development of industry, and the accumulation of wealth. With the exception of the monopoly of printing Bibles, and the restraints imposed by the charters of bodies legally incorporated, the freedom of internal industry has ever since been vigilantly protected; full scope has been given to the principle of competition; the whole kingdom has been subjected to the same equal law; no obstacles have been thrown in the way of the freest transfer of commodities from one country or place to another; the home trade has been perfectly unfettered; and though the public have not been supplied with commodities at so low a price as they might have obtained them for, had there been no restrictions on foreign commerce, they have obtained them at the lowest price that would suffice to pay the *home producers* the cost of producing and bringing them to market. It is to this freedom that the comparatively flourishing state of industry in Great Britain is mainly to be ascribed.

### III. FOREIGN TRADE.

What the home trade is to the different provinces of the same country, foreign trade is to all the countries of the world. Particular countries produce only particular commodities, and, were it not for foreign commerce, would be entirely destitute of all but such as are indigenous to their own soil. It is difficult for those who have not reflected on the subject to imagine what a vast deduction would be made, not only from the comforts, but even from the necessities, of every commercial people, were its intercourse with strangers put an end to. It is not, perhaps, too much to say that in Great Britain we owe to our intercourse with others a full half or more of all that we enjoy. We are not only indebted to it for the cotton and silk manufactures, and for supplies of wine, tea, coffee, sugar, the precious metals &c., but we are also indebted to it for most of the fruits and vegetables that we now cultivate. At the same time, too, that foreign commerce supplies us with an immense variety of most important articles, of which we must otherwise have been wholly ignorant, it enables us to employ our industry in the mode in which it is sure to be most productive, and reduces the price of almost every article. We do not misemploy our labour in raising sugar from the beet-root, in cultivating tobacco, or in foreign vines; but we employ ourselves in those departments of manufacturing industry in which our command of coal, of capital, and of improved machinery gives us an advantage; and obtain the articles produced more cheaply by foreigners, in exchange for the surplus produce of those branches in which we have a superiority over them. A commercial nation like England avails herself of all the peculiar facilities of production given by Providence to different countries. To produce claret here is perhaps impossible; and at all events it could not be accomplished unless at more than 100 times the expense required for its production in France. We do not, however, deny ourselves the gratification derivable from its use; and to obtain it, we have only to send to France, or to some country to which France is indebted, some articles in the production of which we have an advantage, and we get claret in exchange at the price which it takes to raise it under the most favourable circumstances. One country has peculiar capacities for raising corn, but is at the same time destitute of wine, silk, and tea; another, again, has peculiar facilities for raising the latter, but is destitute of the former; and it is impossible to point out a single country which is abundantly supplied with any considerable variety of commo-

as advantageous to our foreign customers as to ourselves. Commerce has caused the blessings of civilisation to be universally diffused, and the treasures of knowledge and science to be conveyed to the remotest corners. Its humanising influence is, in this respect, most important; while, by making each country depend for the means of supplying a considerable portion of its wants on the assistance of others, it has done more than any thing else to remove a host of the most baleful prejudices, and to man's mankind regard each other as friends and brothers, and not as enemies. The dread, once so prevalent, of the progress of other nations in wealth and civilisation is now universally admitted to be as absurd as it is illiberal. While every people ought always to be prepared to resist and avenge any attack upon their independence or their honour, it is not to be doubted that their real prosperity will be best secured by their endeavouring to live at peace. 'A commercial war, whether crowned with victory or branded with defeat, can never prevent another nation from becoming more industrious than you are; and if they are more industrious they will sell cheaper; and consequently your customers will forsake your shop and go to theirs. This will happen though you covered the ocean with fleets, and the land with armies. The soldier may lay waste; the privateer, whether successful or unsuccessful, will make poor; but it is the eternal law of Providence that "the hand of the diligent can alone make rich."' (Tucker's *Four Tracts*, p. 41, 3rd ed.)

Mr. Hume has beautifully illustrated the powerful and salutary influence of that spirit of industry and enterprise resulting from the eager prosecution of commerce and the arts. 'Men,' says he, 'are then kept in perpetual occupation, and enjoy, as their reward, the occupation itself, as well as those pleasures which are the fruits of their labour. The mind acquires new vigour; enlarges its powers and faculties; and, by an assiduity in honest industry, both satisfies its natural appetites, and prevents the growth of unnatural ones, which commonly spring up when nourished with ease and idleness. Banish those arts from society, you deprive men both of action and of pleasure; and, leaving nothing but indolence in their place, you even destroy the relish of indolence, which never is agreeable but when it succeeds to labour, and recruits the spirits, exhausted by too much application and fatigue.'

Another advantage of industry and of refinements in the mechanical arts is, that they commonly produce some refinements in the liberal; nor can the one be carried to perfection without being accompanied in some degree with the other. The same age which produces great philosophers and politicians, renowned generals and poets, usually abounds with skilful weavers and shipwrights. We cannot reasonably expect that a piece of woollen cloth will be wrought to perfection in a nation which is ignorant of astronomy, or where ethics are neglected. The spirit of the age affects all the arts; and the minds of men, being roused from their lethargy, and put into a fermentation, turn themselves on all sides, and carry improvements into every art and science. Ignorance is totally banished; and men enjoy the privilege of rational creatures, to think as well as to act, to cultivate the pleasures of the mind as well as those of the body.

The more these refined arts advance, the more noble do men become; nor is it possible that a man enriched with science, and possessed of a liberal conversation, they should be contented to remain in solitude, or live with their fellow-citizens

in that distant manner which is peculiar to ignorant and barbarous nations. They flock into cities; love to receive and communicate knowledge; to show their wit on their breeding; their taste in conversation or living, in clothes or furniture. Curiosity allures the wise, vanity the foolish, and pleasure both. Particular clubs and societies are every where formed; both sexes meet in an easy and sociable manner; and the tempers of men, as well as their behaviour, refine apace. So that beside the improvements they receive from knowledge and the liberal arts, it is impossible but they must feel an increase of humanity from the very habit of conversing together, and contributing to each other's pleasure and entertainment. Thus *industry, knowledge, and humanity* are linked together by an indissoluble chain; and are found, from experience as well as reason, to be peculiar to the more polished, and what are commonly denominated the more luxurious ages.' (*Essay of Refinement in the Arts*.)

Most commercial treatises, and most books on political economy, contain lengthened statements as to the comparative advantages derived from the home and foreign trade. But these statements are almost always bottomed on the most erroneous principles. The quantity and value of the commodities which the inhabitants of an extensive country exchange with each other, is far greater than the quantity and value of those they exchange with foreigners; but this is not, as is commonly supposed, enough to show that the home trade is proportionally more advantageous. Commerce, it must be borne in mind, is not a direct but an indirect source of wealth. The mere exchange of commodities adds nothing to the riches of society. The influence of commerce on wealth consists in its allowing employments to be separated and prosecuted without interruption. It gives the means of pushing the divisions of labour to the furthest extent, and supplies mankind with an infinitely greater quantity of necessaries and accommodations of all sorts than could have been produced, had individuals and nations been forced to depend upon their own comparatively feeble efforts for the supply of their wants. And hence, in estimating the comparative advantageousness of the home and foreign trades, the real questions to be decided are, which of them contributes most to the division of labour? and which of them gives the greatest stimulus to invention and industry? These questions do not, perhaps, admit of any very satisfactory answer. The truth is, that both home trade and foreign trade are most prolific sources of wealth. Without the former, no division of labour could be established, and man would for ever remain in a barbarous state. Hence, perhaps, we may say that it is the most indispensable; but the length to which it could carry any particular country in the career of civilisation would be limited indeed. Had Great Britain been cut off from all intercourse with strangers, there is no reason for thinking that we should have been at this day advanced beyond the point to which our ancestors had attained during the Heptarchy! It is to the products and the arts derived from others, and to the emulation inspired by their competition and example, that we are mainly indebted for the extraordinary progress we have already made, as well as for that we are yet destined to make.

Adam Smith, though he has satisfactorily demonstrated the impolicy of all restrictions on the freedom of commerce, has, notwithstanding, endeavoured to show that it is more for the public advantage that capital should be employed in the home trade than in foreign trade, on the ground

that the capitals employed in the former are more frequently returned, and that they set a greater quantity of labour in motion than those employed in the latter. But we have elsewhere endeavoured to show that the ratio of profit which different businesses yield is the only test of their respective advantages. (*Principles of Political Economy*, 3rd ed. pp. 165-181.) Now, it is quite evident that capital will not be employed in foreign trade unless it yield as much profit as could be made by employing it at home. No merchant sends a ship to China, if it be in his power to realise a larger profit by sending her to Dublin or Newcastle; nor would any one build a ship unless he expected that the capital so laid out would be as productive as if it were employed in agriculture or manufactures. The more or less rapid return of capital is a matter of very little importance. If the average rate of profit be 10 per cent., an individual who turns over his capital 10 times a-year will make one per cent. of profit each time; whereas if he turns it only once a-year, he will get the whole 10 per cent. at once. Competition reduces the rate of nett profit to about the same level in all businesses; and we may be quite certain that those who employ themselves in the departments in which capital is most rapidly returned do not, at an average, gain more than those who employ themselves in the departments in which the returns are most distant. No one is a foreign merchant because he would rather deal with foreigners than with his own countrymen, but because he believes he will be able to employ his capital more advantageously in foreign trade than in any other business; and while he does this, he is following that employment which is most beneficial for the public as well as for himself.

#### IV. RESTRICTIONS ON COMMERCE.

The statements already made, by explaining the nature and principles of commercial transactions, are sufficient to evince the inexpediency of subjecting them to any species of restraint. It is obvious, indeed, that restrictions are founded on false principles. When individuals are left to pursue their own interest in their own way, they naturally resort to those branches of industry which they reckon most advantageous for themselves; and as we have just seen, these are the very branches in which it is most for the public interest that they should be employed. Unless, therefore, it could be shown that a Government can judge better as to what sort of transactions are profitable or otherwise than private individuals, its regulations cannot be of the smallest use, and may be exceedingly injurious. But any such pretension on the part of Government would be universally scouted. It is undeniably certain that a regard to our own interest is, if not an unerring guide to direct us in such matters, at least incomparably better than any other. If the trade with a particular country or in a particular commodity be a losing one, or merely a less profitable one than others, it is quite as unnecessary to pass an Act to prevent it from being carried on, as it would be to interfere to prevent individuals from selling their labour or their commodities below the market price. It appears, therefore, that all regulations affecting the freedom of commerce, or of any branch of industry, are either useless or pernicious. They are useless, when they are intended to protect the interest of individuals by preventing them from engaging in disadvantageous businesses; and pernicious, when they prevent them from engaging in those that are advantageous.

The self-interest of the parties concerned is the only safe principle to go by in such matters. When the acts of the Legislature are in unison with it, there is nothing to object to in them save only that they might as well not exist; but whenever they are inconsistent with it—that is, whenever they tend to divert capital and industry into channels into which individuals, if left to their own discretion, would not have carried them—they are decidedly injurious.

No one denies that it is possible to confer, by means of a restrictive regulation, an advantage on a greater or less number of individuals. This, however, is no proof that it is advantageous in a public point of view; and it is by its influence in this respect that we are to decide concerning it. If the exclusion of an article imported from abroad in order to encourage its manufacture at home, raise its price in the home market, that circumstance will, for a while at least, be advantageous to those engaged in its production. But it is not clear that all that is thus gained by them is *lost by those who purchase the article?* To suppose, indeed, that the exclusion of commodities that are comparatively cheap, to make room for those that are comparatively dear, can be a means of enriching a country, is equivalent to supposing that a people's wealth might be increased by destroying their most powerful machines, and throwing their best soils out of cultivation.

But it is contended, that though this might be the case in the instance of commodities produced at home, it is materially different when the commodity excluded came to us from abroad. It is said, that in this case the exclusion of foreign produce increases the demand for that produced at home, and consequently contributes to increase the demand for labour; so that the rise of price it occasions is, in this way, more than balanced by the other advantages which it brings along with it. But the fact is, that though the demand for one species of produce may be increased by a prohibition of importation, the demand for some other species is sure to be at the same time equally diminished. There is no jugglery in commerce. Whether it be carried on between individuals of the same country, or of different countries, it is in all cases bottomed on a fair principle of reciprocity. Those who will not buy need not expect to sell, and conversely. It is impossible to export without making a corresponding importation. We get nothing from the foreigner gratuitously; and hence, when we prevent the importation of produce from abroad, we prevent, by the very same act, the exportation of an equal amount of British produce. All that the exclusion of foreign commodities ever effects is the substitution of one sort of demand for another. It has been said that 'when we drink beer and porter we consume the produce of English industry, whereas when we drink port or claret we consume the produce of the industry of the Portuguese and French, to the obvious advantage of the latter, and the prejudice of our countrymen!' But, how paradoxical soever the assertion may at first sight appear, there is not at bottom any real distinction between the two cases. What is it that induces foreigners to supply us with port and claret? The answer is obvious:—We either send directly to Portugal and France an *equivalent in British produce*, or we send such equivalent, in the first place to South America for bullion and then send that bullion to the continent to pay for the wine. And hence it is as clear as the sun at noon-day, that the Englishman who drinks only French wine, who eats only bread made of Polish wheat, and who wears only Saxon cloth, gives, by occasioning the exportation of a

corresponding amount of British cotton, hardware, leather, or other produce, the same encouragement to the industry of his countrymen that he would give were he to consume nothing not immediately produced at home. A quantity of port wine and a quantity of Birmingham goods are respectively of the same value; so that whether we directly consume the hardware, or, having exchanged it for the wine, consume the latter, must plainly, in so far as the employment of British labour is concerned, be altogether indifferent.

It is absolutely nugatory, therefore, to attempt to encourage industry at home by restraining importation from abroad. We might as well try to promote it by interdicting the exchange of shoes for hats. We only resort to foreign markets, that we may supply ourselves with articles that cannot be produced at home, or that require more labour to produce them here than is required to produce the equivalent exported to pay for them. It is, if any thing can be, an obvious contradiction and absurdity to attempt to promote wealth or industry by prohibiting an intercourse of this sort. Such prohibition, even when least injurious, is sure to force capital and labour into less productive channels, and cannot fail to diminish the foreign demand for one species of produce quite as much as it extends the home demand for another.

It is but seldom, however, that a restriction on importation from abroad does no more than substitute one sort of employment for another. Its usual effect is both to alter the distribution of capital and to increase the price of commodities. A country rarely imports any commodity from abroad that may be as cheaply produced at home. In the vast majority of instances, the articles bought of the foreigner could not be directly produced at home without a much greater outlay of capital. Suppose that we import 1,000,000*l.* worth of any commodity, that its importation is prohibited, and that the same quantity of produce cannot be raised in this country for less than 1,200,000*l.* or 1,500,000*l.*: in a case of this sort—and this is actually the case in 99 out of every 100 instances in which prohibitions are enacted—the prohibition has the same effect on the consumers of the commodity as if, supposing it not to have existed, they had been burdened with a peculiar tax of 200,000*l.* or 500,000*l.* a-year. But, had such been the case, what the consumers lost would have gone into the coffers of the treasury, and would have afforded the means of repealing an equal amount of other taxes; whereas, under the prohibitory system, the high price, being occasioned by an increased difficulty of production, is to our advantage to any one. So that, instead of gaining any thing by such a measure, the public incurs a dead loss of 200,000*l.* or 500,000*l.* a-year.

We have said that a prohibition of importation may be productive of immediate advantage to the home producers of the prohibited article. It is essential, however, to remark that this advantage cannot continue for any considerable time, and that it must be followed by a period of distress. Were the importation of foreign silks put an end to, that circumstance, by narrowing the supply of silk goods, and raising their prices, would, no doubt, be, in the first instance, advantageous to the manufacturers, by elevating their profits above the common level. But the consequence would be, that those already engaged in the trade would immediately set about extending their concerns; and at the same time that not a few of those engaged in other employments would enter a business which presented such a favourable prospect: nor would this transference of capital to the silk

manufacture be stopped till such an increased supply of silks had been brought to market as to occasion a glut. This reasoning is not founded upon hypothesis, but upon the widest experience. When a business is carried on under the protection of a restriction on importation, it is limited by the extent of the home market, and is incapable of further extension. It is, in consequence, particularly subject to that fluctuation which is the bane of industry. If, owing to a change of fashion, or any other cause, the demand be increased, then, as no supplies can be brought from abroad, prices suddenly rise, and the manufacture is rapidly extended, until a reaction takes place, and prices sink below their usual level; and if the demand decline, then, as there is no outlet abroad for the superfluous goods, their price is ruinously depressed, and the producers are involved in inextricable difficulties. The businesses deepest entrenched behind ramparts of prohibitions and restrictions, such as the silk trade previously to 1825, the West India trade, and agriculture since 1815, have undergone the most extraordinary vicissitudes, and have been at once more hazardous and less profitable than the businesses carried on under a system of fair and free competition.

A prohibition against buying in the cheapest markets is really, also, a prohibition against selling in the dearest markets. There is no test of high or low price except the quantity of other produce for which an article exchanges. Suppose that, by sending a certain quantity of cottons or hardware to Brazil, we might get in exchange 150 hhd*s.* of sugar, and that the same quantity, if sent to Jamaica, would only fetch 100 hhd*s.*, is it not obvious that by preventing the importation of the former, we force our goods to be sold for *two-thirds* of the price they would otherwise have brought? To suppose that a system productive of such results can be a means of increasing wealth is to suppose what is evidently absurd. It is certainly true that a restrictive regulation, which has been long acted upon, and under which a large amount of capital is employed, should not be rashly or capriciously repealed. Every change in the public economy of a great nation ought to be gone about cautiously and gradually. Adequate time should be given to those who carry on businesses that have been protected, either to withdraw from them altogether, or to prepare to withstand the fair competition of foreigners. But this is *all* that such persons can justly claim. To persevere in an erroneous and oppressive system merely because its abandonment might be productive of inconvenience to individuals, would be a proceeding inconsistent with every object for which society is formed, and subversive of all improvement.

It may, perhaps, be supposed that in the event of commodities being imported from abroad, after the abolition of a protecting regulation, that were previously produced at home, the workmen and those engaged in their production would be thrown upon the parish. Such, however, is not the case. We may, by giving freedom to commerce, change the *species* of labour in demand, but it is not possible that we should thereby change its *quantity*. If, in consequence of the abolition of restrictions, our imports were increased 4,000,000*l.* or 5,000,000*l.*, our exports, it is certain, must be augmented to the same extent; so that whatever diminution of the demand for labour might be experienced in certain departments would be balanced by a corresponding increase in others.

The pressure of taxation has often been alleged as an excuse for restrictions on commerce; but it is not more valid than the rest. Taxation may

be heavy, and even oppressive; but so long as it is impartially and fairly assessed, it equally affects all branches of industry carried on at home, and consequently affords no ground whatever for the enactment of regulations intended to protect any particular business. And to propose to protect all branches of industry from foreign competition is, in effect, to propose to put a total stop to commerce; for if nothing is to be imported, nothing can be exported. The imposition of moderate duties on foreign commodities, for the sake of revenue, is quite another thing. Several of these commodities are among the very best subjects of taxation; and when the duties on them are confined within proper bounds—that is, when they are not so high as to exert any injurious influence over trade, or to occasion smuggling and fraud—they cannot fairly be objected to.

It is sometimes contended, by those who assert, on general grounds, that restrictions are inexpedient, that it would be unwise, on the part of any country, to abolish them until she had obtained a security that those imposed by her neighbours would also be abolished. But the reasons that have been alleged in favour of this statement are not entitled to the least weight. It is our business to buy in the cheapest and sell in the dearest markets, without being, in any degree, influenced by the conduct of others. If they consent to repeal the restrictions they have laid on commerce, so much the better. But whatever others may do, the line of policy we ought to follow is clear and well defined. To refuse, for example, to buy claret, brandy &c. from the French, because they lay restrictions on the importation of British hardware, cottons &c., is not to retaliate upon them, but upon ourselves. The fact that we do import French wine and brandy shows that we do export to France, or to some other country to which France is indebted, an equivalent in some sort, of British produce. The fear of being glutted with foreign products, unless we secure beforehand a certain outlet for our own, is the most unfounded that can be imagined. The foreigner who will take nothing of ours, can send us nothing of his. Though our ports were open to the merchants of all the countries of the world, the exports of British produce must always be equal to the imports of foreign produce; and none but those who receive our commodities, either at first hand or second hand, could continue to send anything to us.

‘Les étrangers ne peuvent demander ni désirer rien mieux que la liberté de vous acheter et de vous vendre chez vous et dans vos colonies. Il faut la leur accorder, non par foiblesse et par impuissance, mais parcequ'elle est juste en elle-même, et qu'elle vous est utile. Ils ont tort sans doute de la refuser chez eux; mais cette faute d'ignorance, dont, sans le savoir, ils sont punis les premiers, n'est pas une raison qui doive vous porter à vous nuire à vous-même en suivant cet exemple, et à vous exposer aux suites et aux dépenses d'une guerre pour avoir la vaine satisfaction d'user des représailles, dont l'effet ne peut manquer de retomber sur vous, et de rendre votre commerce plus désavantageux.’ (Le Trosne, *De l'Ordre Social*, p. 416.)

There are some, however, who contend, that though restrictions on importation from abroad be unfavourable to opulence, and the advancement of individuals and nations in arts and civilisation, they may, notwithstanding, be vindicated on other grounds, as contributing essentially to independence and security. The short and decisive answer to this is to be found in the reciprocity of commerce. It does not enrich one individual or

nation at the expense of others, but confers its favours equally on all. We are under no obligations to the Portuguese, the Russians, or any other people with whom we carry on trade. It is not our advantage, but *their own*, that they have in view in dealing with us. We give them the full value of all that we import; and they would suffer quite as much inconvenience as we should do were this intercourse put an end to. The independence at which those aspire who would promote it by laying restrictions on commerce is the independence of the solitary and unsocial savage; it is not an independence productive of strength, but of weakness. ‘The most flourishing states, at the moment of their highest elevation, when they were closely connected with every part of the civilised world by the golden chains of the successful commercial enterprise, were, according to this doctrine, in the most perfect state of absolute dependence. It was not till all these connections were dissolved, and they had sunk in the scale of nations, that their true independence commenced! Such statements carry with them their own refutation. There is a natural dependence of nations upon each other, as there is a dependence of individuals upon each other. Some soils, some climates, some situations, are productive exclusively of some peculiar fruits, which cannot elsewhere be profitably produced. Let nations follow this as their guide. In a rich and rising community, the opulent capitalists may be as dependent upon the poor labourers as the poor labourers upon the opulent capitalists. So it is with nations. The mutual dependence of individuals upon each other knits and binds society together, and leads to the most rapid advancement in wealth, in intelligence, and in every kind of improvement. It is the same, but on a far larger scale, with the mutual dependence of nations. To this alone do we owe all the mighty efforts of commerce; and what lights, what generous feelings, and multiplied means of human happiness has it not every where spread!’ (*North American Review*, No. 57.)

The principles of commercial freedom, and the injurious influence of restrictive regulations, were set in a very striking point of view by Adam Smith, in his great work; and they have been since repeatedly explained and elucidated. Perhaps, however, the true doctrines upon this subject have seldom been better stated than in the petition presented by the merchants of London to the House of Commons on May 8, 1820. This document afforded a convincing proof of the progress of liberal and enlarged views. It was subscribed by all the principal merchants of the metropolis who expressed their conviction that the repeal of every protective regulation would be for the public advantage. Such an address, confirming, as it did, the conclusions of science, by the approval of the best informed and most extensive merchants of the world, had a powerful influence over the Legislature. It paved the way for the reforms introduced by Mr. Huskisson; and the advantages of which they were found to be productive helped to forward the still greater and more comprehensive reforms carried through Parliament by Sir Robert Peel. These were so very extensive that they left but little for others to accomplish; and little having been since effected, our commercial policy is of the most liberal description. The time anticipated by the poet has already come

When, free as sea or wind,  
Unbound'd Thames shall flow for all mankind,  
Whole nations enter with each swelling tide,  
And seas but join the regions they divide.  
For'st Windsor Forest, &c.

And while this change vast advantage to this the prejudices of others, some extent at least, a course of policy.

The petition now referred to is omitted in a work of the late Thomas Tooke, valuable work on Prices, ‘To the Honourable Petition of the Merchant

Sheweth, ‘That foreign commerce to the wealth and progress enabling it to import the production of which the industry of other countries and to export, in payment of its own situation is better

‘That freedom from give the utmost extension the best direction to the country.

‘That the maxim of market, and selling in the every merchant in his strictly applicable as the of the whole nation.

‘That a policy founded would render the commutability of mutual advantage increase of wealth and inhabitants of each state.

‘That, unfortunately, a of this has been and is acted upon by the Government other country; each trying well-meant design of enclosures; thus inflicting subjects, who are consumed submitting to privations in of commodities; and thus to be the source of mutual among states, a constantly jealousy and hostility.

‘That the prevailing protective or restrictive system the erroneous supposition of foreign commodities occur discouragement of our own same extent: whereas it may that although the particular duction which could not stand foreign competition would be no importation could be con of time without a correspond or indirect, there would ment, for the purpose of that other production to which or better suited; thus affording probably a greater, ar beneficial, employment to e labour.

‘That of the numerous protective duties of our commerce that, while all operations on the community at large ultimate benefit to the cl were originally instituted of the less occasions

‘That among the other evi protective system, not the protection of one branch production against foreign ground of claim by other

And while this change has been productive of vast advantage to this country, it has weakened the prejudices of others, and made them enter, to some extent at least, on the same enlightened course of policy.

The petition now referred to is too important to be omitted in a work of this sort. It was written by the late Thomas Tooke, Esq., author of the valuable work on Prices, and is as follows:—

‘To the Honourable the Commons, &c. The Petition of the Merchants of the City of London, ‘Sheweth,

‘That foreign commerce is eminently conducive to the wealth and prosperity of a country, by enabling it to import the commodities for the production of which the soil, climate, capital, and industry of other countries are best calculated, and to export, in payment, those articles for which its own situation is better adapted.

‘That freedom from restraint is calculated to give the utmost extension to foreign trade, and the best direction to the capital and industry of the country.

‘That the maxim of buying in the cheapest market, and selling in the dearest, which regulates every merchant in his individual dealings, is strictly applicable as the best rule for the trade of the whole nation.

‘That a policy founded on these principles would render the commerce of the world an interchange of mutual advantages, and diffuse an increase of wealth and enjoyments among the inhabitants of each state.

‘That, unfortunately, a policy the very reverse of this has been and is more or less adopted and acted upon by the Government of this and every other country; each trying to exclude the productions of other countries, with the specious and well-meant design of encouraging its own productions; thus inflicting on the bulk of its subjects, who are consumers, the necessity of submitting to privations in the quantity or quality of commodities; and thus rendering what ought to be the source of mutual benefit and of harmony among states, a constantly recurring occasion of jealousy and hostility.

‘That the prevailing prejudices in favour of the protective or restrictive system may be traced to the erroneous supposition that every importation of foreign commodities occasions a diminution or discouragement of our own productions to the same extent: whereas it may be clearly shown, that although the particular description of production which could not stand against unrestrained foreign competition would be discouraged, yet, as no importation could be continued for any length of time without a corresponding exportation, direct or indirect, there would be an encouragement, for the purpose of that exportation, of some other production to which our situation might be better suited; thus affording at least an equal, and probably a greater, and certainly a more beneficial, employment to our own capital and labour.

‘That of the numerous protective and prohibitory duties of our commercial code, it may be proved that, while all operate as a very heavy tax on the community at large, very few are of any ultimate benefit to the classes in whose favour they were originally instituted, and none to the extent of the loss occasioned by them to other classes.

‘That among the other evils of the restrictive or protective system, not the least is, that the artificial protection of one branch of industry or source of production against foreign competition is set up on a ground of claim by other branches for similar

protection; so that if the reasoning upon which these restrictive or prohibitory regulations are founded were followed out consistently, it would not stop short of excluding us from all foreign commerce whatsoever. And the same train of argument, which, with corresponding prohibitions and protective duties, should exclude us from foreign trade, might be brought forward to justify the re-enactment of restrictions upon the interchange of productions (unconnected with public revenue) among the kingdoms composing the union, or among the counties of the same kingdom.

‘That an investigation of the effects of the restrictive system at this time is peculiarly called for, as it may, in the opinion of your petitioners, lead to a strong presumption that the distress which now so generally prevails is considerably aggravated by that system, and that some relief may be obtained by the earliest practicable removal of such of the restraints as may be shown to be most injurious to the capital and industry of the community, and to be attended with no compensating benefit to the public revenue.

‘That a declaration against the anti-commercial principles of our restrictive system is of the more importance at the present juncture, inasmuch as, in several instances of recent occurrence, the merchants and manufacturers of foreign countries have assailed their respective Governments with applications for further protective or prohibitory duties and regulations, urging the example and authority of this country, against which they are almost exclusively directed, as a sanction for the policy of such measures. And certainly, if the reasoning upon which our restrictions have been defended is worth any thing, it will apply in behalf of the regulations of foreign states against us. They insist upon our superiority in capital and machinery, as we do upon their comparative exemption from taxation, and with equal foundation.

‘That nothing would tend more to counteract the commercial hostility of foreign states than the adoption of a more enlightened and more conciliatory policy on the part of this country.

‘That although, as a matter of mere diplomacy, it may sometimes answer to hold the removal of particular prohibitions, or high duties, as depending upon corresponding concessions by other states in our favour, it does not follow that we should maintain our restrictions in cases where the desired concessions on their part cannot be obtained. Our restrictions would not be the less prejudicial to our own capital and industry because other Governments persisted in preserving impolitic regulations.

‘That, upon the whole, the most liberal would prove to be the most politic course on such occasions.

‘That independent of the direct benefit to be derived by this country on every occasion of such concession or relaxation, a great incidental object would be gained, by the recognition of a sound principle or standard, to which all subsequent arrangements might be referred; and by the salutary influence which a promulgation of such just views, by the Legislature and by the nation at large, could not fail to have on the policy of other states.

‘That in thus declaring, as your petitioners do, their conviction of the *impolicy and injustice of the restrictive system*, and in desiring every practicable relaxation of it, they have in view only such parts of it as are not connected, or are only subordinately so, with the public revenue. As long as the necessity for the present amount of revenue subsists, your petitioners cannot expect so important a branch of it as the customs to be given up

nor to be materially diminished, unless some substitute less objectionable be suggested. But it is against every restrictive regulation of trade not essential to the revenue, against all duties merely protective from foreign competition, and against the excess of such duties as are partly for the purpose of revenue and partly for that of protection, that the prayer of the present petition is respectfully submitted to the wisdom of Parliament.

‘May it therefore, &c.

For an account of the doctrines with respect to the *balance of trade*, and the importation and exportation of the precious metals, see **BALANCE OF TRADE, and EXCHANGE.**

For an account of the articles imported into and exported from Great Britain, see **IMPORTS AND EXPORTS.**

**COMPANIES.** In Commerce or the Arts, a company is a number of persons associated for the purpose of carrying on some commercial or industrial undertaking. When there are only a few individuals associated, it is most commonly called a *copartnership*; the term company being usually applied to large associations, like the East India Company, the Bank of England, the Railway Companies &c., who conduct their operations by means of agents acting under the orders of a board of directors.

Companies have generally been divided into two great classes—exclusive or joint-stock companies, and open and regulated companies.

1. *Exclusive or Joint-Stock Companies.*—By an institution of this sort is meant a company having a certain amount of capital, divided into a greater or smaller number of transferable shares, managed for the common advantage of the shareholders by a body of directors chosen by and responsible to them. After the stock of a company of this sort has been subscribed, no one can enter it without previously purchasing one or more shares belonging to some of the existing members. The partners do nothing individually; all their resolutions are taken in common, and are carried into effect by the directors and those whom they employ.

According to the common law of England, all the partners in a joint-stock company are jointly and individually liable, to the whole extent of their fortunes, for the debts of the company. They may make arrangements amongst themselves, limiting their obligations with respect to each other; but unless established by an authority competent to set aside the general rule, they are all indefinitely responsible to the public. Parliament sometimes limits the responsibility of the shareholders in joint-stock companies established by statute, to the amount of the shares they respectively hold; and the 6 Geo. IV. c. 96 empowers the Crown to grant charters of incorporation by which the members of corporate bodies are made individually liable, to such extent, and subject to such regulations and restrictions, as may be deemed expedient. Hence charters are now frequently granted for the purpose merely of enabling companies to sue and be sued in courts of law, under the names of some of their office-bearers, without in any respect limiting the responsibility of the shareholders to the public. This limitation cannot be implied in a charter any more than in an Act of Parliament, and is held not to exist unless it be distinctly set forth.

In a private copartnership, no partner, without the consent of the company, can transfer his share to another person, or introduce a new member into the company. Each member, however, may, upon proper warning, withdraw from the copartnership, and demand payment from them of his share of the common stock. In a joint-stock company,

on the contrary, no member can demand payment of his share from the company; but each member may, without their consent, transfer his share to another person, and thereby introduce a new member. The value of a share in a joint-stock is always the price which it will bring in the market; and this may be either greater or less, in any proportion, than the sum which its owner stands credited for in the stock of the company. (*Wealth of Nations*, p. 333.)

The law in regard to the formation and constitution of joint-stock companies was for many years principally determined by the 7 & 8 Vict. c. 119; the 7 & 8 Vict. c. 111 having been passed at the same time to facilitate their dissolution and winding up. These Acts and others were repealed by the 25 & 26 Vict. c. 89 (except sec. 47 of 7 and 8 Vict. c. 113, and part of sec. 12 of 20 & 21 Vict. c. 49), which is now (1868) the governing statute in regard to these companies. The powers given to different associations, though in some respects the same, differ widely in others, according to the special purposes for which they are organised. But it would be idle to attempt to specify in this place the peculiar rules and regulations affecting these institutions. Full information respecting most questions connected with the constitution and working of joint-stock companies may, however, be found in Thring's treatise on the law relating to these associations; and to it we beg to refer the reader.

2. *Utility of Joint-Stock Companies.*—Whenever the capital required to carry on any undertaking exceeds what may be furnished by an individual, it is indispensable, in order to the prosecution of the undertaking, that an association should be formed. In all those cases, too, in which the chances of success are doubtful, or where a lengthened period must necessarily elapse before an undertaking can be completed, an individual, though ready enough to contribute a small sum in connection with others, would, generally speaking, be very little inclined, even if he had the means, to encounter the whole responsibility of such enterprises. Hence the necessity and advantage of companies or associations. It is to them that we are indebted for the canals and railways by which every part of the country is intersected, for the formation of so many noble docks and warehouses, for the institution of our principal banks and insurance offices, and for many other establishments of great public utility carried on by the combined capital and energies of large bodies of individuals.

3. *Branches of Industry for the prosecution of which Joint-Stock Companies may be advantageously established.*—In order to ensure a rational prospect of success to a company, the undertaking should admit of being carried on according to a regular systematic plan. The reason of this is sufficiently obvious. The business of a great association must be conducted by factors or agents; and unless it be of such a nature as to admit of their duties being clearly pointed out and defined, the association would cease to have any effectual control of them, and would be, in great measure, at the mercy. An individual who manages his own affairs reaps all the advantage derivable from superior skill, industry, and economy; but agents, and even directors, of joint-stock companies, labour, in most cases, entirely or partially for the advantage of others; and can, therefore, however conscientious, have the same powerful motives to act with energy, prudence, and economy. ‘Like,’ says Adam Smith, ‘stewards of a rich man, they are apt to condescend to small matters as not for their most

honour, and ver-  
pensation from his  
sion, therefore, m  
in the management  
pany.’ It also n

honour, and very easily give themselves a dispensation from having it. Negligence and profusion, therefore, must always prevail more or less in the management of the affairs of such a company.' It also not infrequently happens that they suffer from the bad faith as well as the carelessness and extravagance of their servants; the latter having in many instances endeavoured to advance their own interests at the expense of their employers. Hence the different success of companies whose business may be conducted according to a nearly uniform system—such as dock, canal, railway, insurance, and banking, companies—and those whose business does not admit of being reduced to any regular plan, and where much must always be left to the sagacity and enterprise of those employed. All purely commercial companies, trading upon a joint-stock, belong to the latter class. Not one of them has ever been able to withstand the competition of private adventurers; they cannot subject the agents they employ to buy and sell commodities in distant countries to any effectual responsibility; and from this circumstance, and the abuses that usually insinuate themselves into every department of their management, no such company has ever succeeded, unless when it has obtained some exclusive privilege, or been protected from competition.

And even with these advantages, such is the negligence, profusion, and peculation inseparable from the management of great commercial companies, that those that have had the monopoly of the most advantageous branches of commerce have rarely been able to keep out of debt. It will be shown in the article EAST INDIA COMPANY, that that association lost by its trade; and that, had it not been for the aid derived from the revenues of India, it would long since have ceased to exist. To buy in one market; to sell with profit in another; to watch over the perpetually occurring variations in the prices, and in the supply and demand of commodities; to suit with dexterity and judgment the quantity and quality of goods to the wants of each market; and to conduct each operation in the best and cheapest manner; requires a degree of unremitting vigilance and attention which it would be visionary to expect from the directors or servants of a great joint-stock association. Hence it has happened, over and over again, that branches of commerce which proved ruinous to companies have become exceedingly profitable when carried on by individuals.

'The spirit of monopolists,' to borrow the just and forcible language of Gibbon, 'is narrow, lazy, and oppressive. The work is more costly and less productive than that of independent artists; and the new improvements so eagerly grasped by the competition of freedom are admitted with slow and sullen reluctance in those proud corporations, above the fear of a rival, and below the confession of an error.' (*Memoirs of his own Life, Miscellaneous Works*, i. p. 49, ed. 1814.)

We stated in the first edition of this work that the circumstances now mentioned opposed all but insuperable obstacles to the success of the companies established in this country for the prosecution of mining in America. 'This business does not admit of being reduced to a regular routine system. Much must always depend on the skill and probability of the agents employed at the mines; and it must plainly be very difficult, if not quite impossible, for directors resident in London to exercise any effectual surveillance over the proceedings of those who are at so great a distance. Hence it is not at all likely that these establishments will ever be so productive to the undertakers

as if they had been managed by the parties themselves.' And every one knows that the history of the undertakings has more than verified the truth of these statements.

The Abbé Morellet has given in a tract published in 1789 (*Examen de la Réponse de M. A.*, pp. 35–38) a list of 65 joint-stock companies, for the prosecution of various branches of foreign trade, established in different parts of Europe subsequently to 1600, every one of which had failed, though most of them had exclusive privileges. Most of those that have been established since the publication of Morellet's tract have had a similar fate.

But notwithstanding both principle and experience concur in showing how very ill fitted a large association is for the purpose of prosecuting commercial undertakings, there are cases in which they cannot be prosecuted except by associations of this sort, and when it may be expedient to grant them certain peculiar privileges. When, owing either to the disinclination or inability of Government to afford protection to those engaged in any particular department of trade, they are obliged to provide for their own defence and security, it is obviously necessary that they should have power to exclude such individuals as may refuse to submit to the measures, or to bear their due share of the expense, required for the common protection of all. The Russian Company, the East India Company, the Levant or Turkey Company, and most of the other great trading companies which have existed in this country, seem principally to have grown out of a real or supposed necessity of this sort. It was not believed that any safe or advantageous intercourse could be carried on with barbarous countries without the aid of ships of war, factories, interpreters &c.; and as Government was not always able or willing to afford this assistance, the traders were formed into companies or associations, and vested with such peculiar privileges as appeared to be necessary for enabling them to prosecute the trade without any extrinsic support. 'When,' says Smith, 'a company of merchants undertake, at their own risk and expense, to establish a new trade with some remote and barbarous nation, it may not be unreasonable to incorporate them into a joint-stock company, and to grant them, in case of success, a monopoly of the trade for a certain number of years. It is the easiest and most natural way in which the state can recompense them for hazarding a dangerous and expensive experiment, of which the public is afterwards to reap the benefit. A temporary monopoly of this kind may be vindicated upon the same principles upon which a like monopoly of a new machine is granted to its inventor, and that of a new book to its author. But upon the expiration of the term, the monopoly ought certainly to determine; the forts and garrisons, if it was found necessary to establish any, to be taken into the hands of Government, their value to be paid to the company, and the trade to be laid open to all the subjects of the state.' (*Wealth of Nations*, p. 339.)

It may be doubt-ly, however, whether it be really necessary, even in such a case as that now mentioned, to establish a joint-stock company with peculiar privileges, and whether the same thing might not be more advantageously effected by the establishment of an open or regulated company.

4. *Open or Regulated Companies.*—The affairs of such companies or associations are managed by directors appointed by the members. They do not, however, possess a common or joint stock. Each individual pays a fine upon entering into the

company, and most commonly an annual contribution: a duty applicable to the business of the company is also sometimes charged upon the goods imported and exported from and to the countries with which they trade. The sums so collected are applied by the directors to fit out ambassadors, consuls, and such public functionaries as may be required to facilitate commercial dealings, or to build factories, maintain cruisers &c. The members of such companies trade upon their own stock, and at their own risk. So that when the time, or sum payable on admission into a regulated company, is moderate, it is impossible for its members to form any combination that would have the effect of raising their profits above the common level; of raising the same keen and close competition amongst them that there is amongst other classes of traders. A regulated company is, in fact, a device for making those engaged in a particular branch of trade bear the public or political expenses incident to it, at the same time that it leaves them to conduct their own business with their own capital, and in their own way.

Should, therefore, Government at any time refuse, or be unable to afford, that protection to those engaged in any branch of trade which is necessary to enable them to carry it on, their formation into a regulated company would seem to be the most judicious measure that could be adopted, inasmuch as it would obtain for them that protection which is indispensable without encroaching on the freedom of individual enterprise.

The African, the Levant, and some other branches of trade were for a long time conducted by open or regulated companies. These, however, have been abolished; the African Company by the Act 1 & 2 Geo. IV. c. 28; and the Levant Company by the Act 6 Geo. IV. c. 33. The Russia Company still exists. [RUSSIA COMPANY.]

5. *Constitution of Companies.*—When application is made to Parliament for an Act to incorporate a number of individuals into a joint-stock company for the prosecution of any useful undertaking, care should be taken not to concede to them any privileges that may be rendered injurious to the public. If a company be formed for the construction of a dock, a road, or a canal, it may be necessary, in order to stimulate individuals to engage in the undertaking, to give them some peculiar privileges; but if other persons for a certain number of years; but if other persons be permanently hindered from constructing new docks, or opening new lines of communication, a lasting injury may be done to the public. It may be highly expedient to incorporate a company for the purpose of bringing water into a city; but supposing there were no springs in the vicinity other than those to which this company has acquired a right, they might, unless restrained by the Act incorporating them, raise the price of water to an exorbitant height, and make large profits for themselves at the expense and to the injury of the public. In all cases of this sort, and in the case, indeed, of all joint-stock companies established for the formation of canals, railways &c., it would be sound policy not only to limit the rates charged for their services, or on account of the water, ships, goods &c. conveyed by their means, but also to limit the dividends, or to fix a maximum beyond which they should not be augmented; enacting that if the rates charged by the company produce more than sufficient to pay the maximum rate of dividend, and to defray the wear and tear of the aqueduct, canal &c., they should be allowed to reduce them till they only yield this much; and, in the event of their declining to do so, that the whole surplus above paying the dividend shall be applied to purchase up the stock of

the association, so that ultimately the charges on account of dividends may be entirely abolished. Had this principle been acted upon when canals first began to be formed in England, the carriage of goods conveyed by some of the most important lines of communication would now have cost almost nothing; and this desirable result might have been accomplished in the way now suggested, without, we believe, diminishing in any degree the number of those undertakings. Probably, however, the better way in such cases would be for the Legislature to reserve to itself, when it institutes such companies, power periodically to revise their rates of charge, or to purchase up the undertakings. There are few who, at the time they engage in such enterprises, suppose that they will yield more than 10 or 12 per cent.; and vast numbers will always be disposed to engage in them if there be any reasonable prospect of their yielding this much. Now when such is the case, is it not the duty of Government to provide, in the event of the undertaking becoming in an unexpected and unusual degree profitable, that the public should derive some advantage from it? This is not a case in which competition can reduce profits to the common level. The best, perhaps the only practicable, line for a canal or railway between any two places will be appointed by those who are first in the field; who thus, in fact, obtain a natural monopoly of which they cannot be deprived; and hence the advantage of limiting the charges and dividends. Without discouraging enterprise, it affords a security that private individuals shall not reap an unusual and unlooked-for profit at the expense of the public.

In all those cases in which companies are formed for the prosecution of undertakings that may be carried on with equal advantage to the public by individuals; or where there are no very considerable difficulties to overcome, or risks to encounter; they ought to enjoy no privileges whatever, but should be regarded, in every point of view, as if they were mere individuals.

For accounts of the principal joint-stock and regulated companies established in this country, see BANK OF ENGLAND; DOCKS; EAST INDIA COMPANY; ISSUANCE; RUSSIA COMPANY; &c.

6. *Companies with Limited Liability.*—These, which are denominated by the French partnership *en commandite*, may be constituted in a great variety of ways. Thus, the liability may be limited to the amount of the sums which each partner has contributed to the capital of the partnership; or it may extend to some multiple of such sum; or the liability of the manager (*Fr. gérant*) of the concern is usually unlimited; but this, of course, may or may not be the case.

It is said that the establishment of such companies would be productive of many advantages; that at present the principle of association is obstructed, and that many important undertakings are neglected from the extreme risk which attaches to joint-stock speculations; and that capital of a partnership with limited responsibility would be publicly declared, there would be no risk of bankruptcy and fraud in dealing with partnerships as now constituted, and similar arguments are entitled to much, or, indeed, to no weight. There are, as already seen (and in this article), certain classes of undertakings, the construction and management of docks, ways, gas and waterworks, banks and insurance offices on a large scale, and other concerns of the same kind, which may be and are advantageously carried on by companies with limited liability.

And there can be no good of a company being organized to give them a charter, if the responsibility of the shareholders. But this does not concern this classification to others of a total, that is, to partnerships for or department of manufacturing industry, or of domestic cases the cost of articles which they are supplied, and a thousand other circumstances constantly changing, so that it cannot be conducted on require the most vigilant and adopted measures suited to arise. Now the question is, how prudently and skillfully *all* is responsible for those whose responsibility (perhaps a small one) of whom, consequently, their matter of comparative indistinctly evidently admits but a too obvious to require being doubt, that notwithstanding liability under which the partnerships or partnerships not display an inexcusable degree. But if parties will do this, they have it staked on the they not do if they could speculate, or it may be, gamely without any fear of the result, certain, and our experience that, under such circumstances, and bankruptcy would extraordinary degree; and that the intensity of those motives which are productive of so many very largely augmented.

But we have been assured that, in the case, inasmuch as the *en commandite* is public, it may be made to deceive and mislead, and a partnership begins business to amount to 10,000l. security have we that such a side paid in and will be had supposing that we have s applicable only to the outcasts a year or a couple of years, if they be so disposed, to file among themselves some, when, perhaps, they have? And yet the association of the public with such a nature, continue to enjoy the credit that it did at the beginning; it is true, no doubt, that it is prohibited the partners or company any share in their management exclusively in the matter of the policy of such prohibitions, is very questionable. The question into which we need not wholly knows that the prohibition, unless it be to make the and underhand manner which be done publicly and openly do this without, in so far as, and weakening their sense of rectitude.

And there can be no good objection, in the event of a company being organised for any such object, to give them a charter, if they require it, limiting the responsibility of the partners to the amount of their shares. But the question now before us does not concern this class of companies, but has relation to others of a totally different description, that is, to partnerships for carrying on some branch or department of manufacturing or agricultural industry, or of domestic or foreign trade. In these cases the cost of articles, the conditions under which they are supplied, the extent of the demand, and a thousand other circumstances, are perpetually changing, so that their production and sale cannot be conducted on a routine system, but require the most vigilant attention to vary and adopt measures suited to emergencies as they arise. Now the question is, will such partnerships be more prudently and skillfully managed by those whose *all* is responsible for their proceedings, or by those whose responsibility is limited to some part (perhaps a small one) of their fortune, and to whom, consequently, their success or failure is a matter of comparative indifference? Such a question evidently admits but of one answer, which is too obvious to require being stated. It is true, no doubt, that notwithstanding the heavy responsibility under which the partners in ordinary associations or partnerships now act, they too often display an inexcusable degree of foolhardiness. But if parties will do this when everything that they have is staked on the result, what would they not do if they could limit their liabilities and speculate, or it may be, gamble on a great scale without any fear of the result? It was all but certain, and our experience in 1866 has proved, that, under such circumstances, reckless speculation and bankruptcy would be increased in an extraordinary degree; and that the numbers and the intensity of those mercantile convulsions which are productive of so much misery would be very largely augmented.

But we have been assured that such would not be the case, inasmuch as the capital of all societies *en commandite* is publicly notified! But we take leave to say that such notification merely operates to deceive and mislead the public. Suppose a partnership begins business with a capital of amount to 10,000, or 100,000, what security have we that such capital has been actually paid in and will be really available? And supposing that we have such security, it can be applicable only to the outset of the enterprise, for a year or a couple of years the capital may be wholly dissipated. What is to hinder the partners, if they be so disposed, from conspiring to divide among themselves some 10 or 20 per cent. each, when, perhaps, they have not made sixpence? And yet the association may, from the ignorance of the public with respect to its real situation, continue to enjoy the same degree of credit that it did at the beginning.

It is true, no doubt, that it is customary, where companies with limited liability are established, to prohibit the partners or *commanditaires* from having any share in their management, which rests exclusively in the manager or *gérant*. The policy of such prohibition, were it made general, is very questionable. This, however, is a question into which we need not enter; for everybody knows that the prohibition is good for nothing, unless it be to make that be done in a secret and underhand manner which would otherwise be done publicly and openly. And it can be done thus without, in so far, corrupting the partners, and weakening their sense of honour and rectitude.

Let it not be supposed that it is possible to obviate these abuses of partnerships *en commandite* by obliging them to publish an annual balance sheet. Such a return would be worse than useless. Even if a partnership intended to make an honest return, it would frequently make one that was false, from its inability to calculate the debts owing to it at their just value; and if it wished to dress up a return, to make a rickety or bankrupt concern appear to be flourishing and wealthy, it would have every means and facility for doing so. The fraud might or might not be eventually detected; but if it were, it would not be till it had served its purpose, and enabled a concern, destitute alike of character and stock, to enter into speculations that could hardly fail to ruin many unsuspecting parties.

A system of this sort enables a man to escape from that responsibility which naturally attaches to all his actions, and is the grand security for their being fair and honourable. It tempts him to engage in desperate adventures, of which, if successful, he reaps all the advantage, and of which, if unsuccessful, he eludes most part of the loss. It is not easy to see how such a system can be productive of any good result. Something, perhaps, might be found to say in its favour if individuals were with difficulty found to engage in partnerships accompanied with the usual risks. But there is no such difficulty. On the contrary, every outlet, whatever may be the hazard attending it, that opens any field for the employment of capital with the prospect of even a moderate return is immediately filled up. Why, then, should we offer such parties a bonus? Why relieve them of their natural responsibility to make them engage in pursuits into which they are ready and willing to engage without any extraordinary stimulus?

But it is said that it is unjust to interfere to hinder A, B, and C from engaging in a partnership with limited liability; that the terms on which the partnership is to be conducted being declared, everybody is put on his guard; and that there can be no more risk in dealing with it than with any other association. But in cases of this sort justice is identical with public or general utility, and not with any abstract or imagined right. Society is founded on the principle that every man and set of men shall be responsible, in the widest sense of the term, for his or their proceedings. And this principle should be enforced in all cases, unless when it can be clearly shown that the public interests would be promoted by its suspension. But we deny that this has been or can be shown by the advocates for the general introduction of partnerships *en commandite*; for we have seen, 1st, that in all ordinary cases such partnerships are wholly unnecessary; and, 2nd, that, when organised, they unavoidably occasion a vast increase of fraud and of reckless speculation. There was consequently no ground for their introduction; but, on the contrary, now that they have been introduced, there are sufficient grounds why they should be suppressed forthwith.

It is sometimes said that by making the manager or *gérant* act under an unlimited responsibility, we should secure the advantages of both systems, that is, of unlimited liability, and of the new system of limited liability introduced by the 19 & 20 Vict. c. 47 and subsequent Acts. But it is plain that it would do nothing of the sort. If the security of the public is to be augmented by making the manager indefinitely responsible, that security would, it is obvious, be still further augmented by extending the same indefinite responsibility to all the members of the association. Under the proposed plan the *gérant* may be a man of straw.

He may be, and the probability is that whenever it is thought desirable he will be, selected, not because he deserves the confidence of the public, but because he may be depended upon for carrying out the secret objects of the association or ing into its leaders. Do what you will, it is impossible to hinder him from combining with his partners to defraud the public. Provided they keep their own counsel, how is the fraud to be discovered? And supposing it to be ultimately discovered, what advantage will thence result to those who have in the mean time been swindled out of their property?

In dealing with firms or associations constituted on the principle of unlimited liability, people trust, or believe they may trust, to the reputation for skill and integrity, and to the presumed wealth, of one or more of the parties. Such parties have a character to lose; and as they at the same time act under the heaviest responsibility, the chances are ten to one that they will act discreetly, fairly, and honorably. But a partner in a society *en commandite* has no such guarantees for his conduct. Instead of being responsible, he is all but irresponsible. And it would be contradictory alike of principle and common sense to suppose that the one association should be as carefully and as honestly conducted as the other.

These reasonings might be indefinitely extended, but they have already encroached too much on our limits. And yet, though brief, we incline to think that they are enough to show, even if the ruinous experience of 1866 had not put it beyond all doubt, that the establishment of very great *en commandite* would be productive of very great disadvantages unaccompanied by a single countervailing advantage. (See further under PARTNERSHIPS WITH LIMITED LIABILITY.)

7. *Civic Companies, or Corporations.*—Exclusive of the companies previously mentioned, a number of ancient companies or corporations exist in this and most other European countries, the members of which enjoy certain political as well as commercial privileges. When the feudal system began to be subverted by the establishment of good order and regular government in the towns, the inhabitants were divided into certain trades or corporations, by which the magistrates and other functionaries were chosen. The members of these trades or corporations, partly to enhance the value of their privileges, and partly to provide a resource, in case of adversity, for themselves, acquired or usurped the power of enacting by-laws regulating the admission of new members, and at the same time set about providing a fund for the support of such as accident or misfortune might reduce to a state of indigence. Hence the origin of apprenticeships, the refusal to allow any one not a member of a corporation to carry on any business within the precincts of any town or borough, and the various regulations that had to be submitted to, and the fees that had to be paid, by the claimants for enrolment in corporations. For a lengthened period these privileges and regulations were very oppressive; but within the last century their influence has been progressively diminishing. In France, where the abuses inseparable from the system had attained to a very great height, it was entirely swept off by the Revolution; and though corporations still exist in this country, they have been stripped of several of their peculiar franchises; and should now, for the most part, be regarded more, perhaps, in the light of charitable than of political institutions. It would be well were they reduced entirely to the former character; and were the few political and commercial privileges

which they still enjoy, communicated to the rest of the citizens. At their first institution, and for some time after, corporations, considered as political bodies, were probably useful; but such is no longer the case; and in so far as they now possess any special immunities, they tend to obstruct that free competition which is so advantageous.

The following extract from a *Report on the Commerce and Manufactures of the United States*, then secretary drawn up by Albert Gallatin, Esq., then secretary to the Treasury, and laid before Congress in 1816, sets the superior advantages resulting from the unrestricted freedom of industry in a very striking point of view. 'No cause,' says he, 'has, perhaps, more promoted in every respect the general improvement of the United States than the absence of those systems of internal restriction and monopoly which continue to disfigure the state of society in other countries. No laws exist here, directly or indirectly, confining men to a particular occupation or place, or excluding any citizen from any branch he may, at any time, think proper to pursue. Industry is, in every respect, free and unfettered; every species of trade, commerce, and manufacture, being equally open to all, without requiring any regular apprenticeship, admission, or license. Hence the improvement of America has not been confined to the improvement of her agriculture, and to the rapid formation and settlement of new states in the wilderness; but her citizens have extended their commerce to every part of the globe, and carry on with complete success even those branches for which a monopoly had heretofore been considered essentially necessary.'

There is in Rees's *Cyclopaedia*, article 'Company,' a list of the different civic companies belonging to the city of London, in which the periods of their incorporation, and various other particulars with respect to several of them, are specified.

COMPASS (Ger. ein kompass; Dutch, zee-compass; Dan. søekompass; Fr. boussole, compas de mer; Ital. bussola; Span. aguja de marcar; Port. compasso de marcar; Russ. kompass korabelnii) or MARINER'S COMPASS. An instrument composed of a needle and card, by which the ship's course is directed. The needle, with little variation, always points towards the north; and hence the mode of steering by the compass.

The common opinion is that the compass was invented by Flavio Gioia, a citizen of the famous republic of Amalfi, very near the beginning of the fourteenth century. Dr. Robertson has adopted this opinion, and regrets that contemporary historians furnish no details as to the life of a man to whose genius society is so deeply indebted. (*History of America*, vol. i. p. 47, was indebted.) But though Gioia may have made improvements on the compass, it has been shown that he has no claim to be considered as its discoverer. Passages have been produced from writers who flourished more than a century before Gioia, in which the polarity of the needle when touched by the magnet is distinctly pointed out. Not only, however, had this singular property been discovered, but also its application to the purposes of navigation, long previously to the fourteenth century. Old French writers have been quoted (Macpherson's *Annals of Commerce*, anno 1500) as establishing the fact. But whatever doubts may exist with respect to them cannot affect the passages which the learned Spanish antiquary, Don Antonio de Capmany (*Questiones Criticas*, p. 73-182), has

given from a work of the famous Raymond Lully (*De Contemplatione*) published in 1272. In one place Lully says, 'as the needle when touched by the magnet naturally turns to the north' (*sicut acus per naturam vertitur ad septentrionem dum sit tacta a magnetē*). This is conclusive as to the author's acquaintance with the polarity of the needle; and the following passage from the same work—'as the nautical needle directs mariners in their navigation' (*sicut acus nautica dirigit marinarios in sua navigatione, &c.*) is no less conclusive as to its being used by sailors in regulating their course. There are no means of ascertaining the mode in which the needle Raymond Lully had in view was made use of. It has been sufficiently established (see the authorities already referred to, and Azuni, *Dissertation sur l'Origine de la Boussole*) that it was usual to float the needle, by means of a straw, on the surface of a basin of water; and Capmany contends that we are indebted to Gioia for the card and the method now followed of suspending the needle—improvements which have given to the compass all its convenience, and a very large portion of its utility. But this part of his *Dissertation*, though equally learned and ingenious, is by no means so satisfactory as the other. It is difficult to conceive how mariners at sea could have availed themselves of a floating needle; but, however this may be, it seems most probable that Gioia had considerably improved the construction of the compass; and that, the Amalitanians having been the first to introduce it to general use, he was with excusable partiality, represented by them, and subsequently regarded by others, as its inventor.

The statements which have sometimes been put forward in regard to the antiquity of the Chinese compass have been treated with very little respect by some great authorities, and are much too questionable to warrant any stress being laid on them. (Capmany, p. 76 &c.) The learned Mr. Forster, who is any thing but inclined to underrate the obligations we are under to the Arabs, admits that they were ignorant of the compass. (*Machometanism Unveiled, &c.* ii. 223.) The Chinese have never been in the habit of making distant voyages; but had the needle been used in their trading vessels, the Indians, with whom they came in contact, would no doubt have eagerly availed themselves of so valuable an invention; and they would, in all probability, have communicated it to the Arabs; but there is no evidence to show that the compass was used by the Indians previously to the voyage of De Gama. (Azuni, *De la Boussole*, pp. 118—122.) And there are no good grounds for thinking that the Arabs had any knowledge of the instrument, or that it was ever used by them, till after the period when they might have learned it from the Venetians, the Amalitanians, and other European traders. The notion that we are indebted to them for the compass appears, indeed, to have little to recommend it, except that it began to become known when the Saracens became powerful in the Mediterranean. Still this is to weak a ground on which to found a claim. And though it be impossible to speak with perfect confidence on such a subject, the fair conclusion seems to be that the compass was a European invention; that it was discovered in the 12th or 13th century, and brought into use in some of the countries bordering on the Mediterranean.

The reader will not consider these details out of place in a work on commerce, which the compass has done so much to extend. 'Its discovery,' says the language of Mr. Macpherson, 'has

given birth to a new era in the history of commerce and navigation. The former it has extended to every shore of the globe, and increased and multiplied its operations and beneficial effects in a degree which was not conceivable by those who lived in the earlier ages. The latter it has rendered expeditious, and comparatively safe, by enabling the navigator to launch out upon the ocean free from the danger of rocks and shoals. By the use of this noble instrument the whole world has become one vast commercial commonwealth, the most distant inhabitants of the earth are brought together for their mutual advantage, ancient prejudices are obliterated, and mankind are civilised and enlightened.' (Vol. i. p. 366.)

COMPOSITION. In Commerce, commonly implies the divided or sum paid by an insolvent debtor to his creditors, and accepted by them in payment for their debts. [BANKRUPTCY; INSOLVENCY AND BANKRUPTCY.]

CONEY WOOL (Ger. kaninchenwolle; Dutch, konynhair; Fr. poil de lapin; Ital. pelo di coniglio; Span. conejuna). The fur of rabbits. This article is extensively used in the hat manufacture; and besides the large supplies raised at home, a great deal is imported. The imports in 1866 amounted to 34,715 lbs., valued at 14,754*l.* These are exclusive of 841,334 coney skins, furs, and pelts imported in the same year.

CONFECTIONERY (Lat. bellaria; Fr. bonbons; Ital. confittura; Span. confitura; Germ. confect). Sweetmeats. In 1866 we imported 1,135,681 lbs. of foreign confectionery, valued at 42,588*l.*, of which 231,019 lbs. were entered for home consumption, while we exported 1,850,992 lbs. of British and 956,109 lbs. of foreign confectionery; the whole being valued at 118,406*l.* Australia was our chief market. For an account of the confectionery of the ancients we refer the reader to Apicius; and as an authority on the sweetmeats of the old English we would cite Warner's *Antiquitates Culinarie*.

CONSTANTINOPLE (Turk. STAMBOL). A famous city of South-eastern Europe, formerly the metropolis of the Eastern, as it still is of the Turkish empire, on a triangular point of land, on the European side of the Sea of Marmara (Propontis), at the point where it unites with the Bosphorus, or channel leading to the Black Sea, lat. 41° 0' 12" N., long. 28° 59' 2" E. Population variously estimated at from 650,000 to 1,075,000, but believed, by the best authorities, to be about 750,000. The situation of this renowned city is, in a commercial point of view, one of the finest imaginable. Standing on the narrow straits uniting the Mediterranean and Euxine Seas, she at once commands, and is the entrepôt for, the commerce between them. The harbour is most excellent. It consists of an extensive inlet, or arm of the sea, stretching along the north-east side of the city, which it divides from the suburbs of Galata and Pera. It has sufficient depth of water to float the largest ships, and can accommodate more than 1,000 sail. The strong current that sets through the Bosphorus into the Sea of Marmara strikes against Seraglio Point (see plan); a part of the water, being in consequence forced into the harbour, runs along its south-western side in the direction marked by the arrows—(see plan), till, arriving at its extremity, it escapes by the opposite side. In the middle the water is still. On leaving the port, it is necessary to keep well over to the northern side; for otherwise the ship might be taken by the current, and driven on Seraglio Point. It may be worth while, however, to remark, that notwith-

standing this inconvenience, the current has been of signal service to the city by scouring the harbour, and carrying away the filth and ballast by which it must otherwise have been long since choked up. The distance across from Seraglio Point to the opposite suburb of Scutari, on the Asiatic coast, is rather more than an English mile. Within less than  $\frac{1}{4}$  mile of the latter is a rocky islet, upon which is a tower and lighthouse, known by the name of the Tower of Leander. Foreigners reside in Galata, Pera, and the suburbs on the eastern side of the harbour; and it is there, consequently, that the principal trade of the place is carried on. The quays are good, and ships lie close alongside.

The Bosphorus, or channel of Constantinople, runs in a N.E. by N. direction about 15 miles, varying in breadth from  $1\frac{1}{2}$  to  $\frac{1}{2}$  mile. It is swept by a rapid current, which it requires a brisk gale to stem, and has throughout a great depth of water. The Hellespont, or strait of the Dardanelles, leading from the Archipelago to the Sea of Marmara, is about 13 leagues in length. Its direction is nearly N.E. Where narrowest, it is little more than a mile across. It also is swept by a strong current, and has deep water throughout.

The accompanying plan of part of Constantinople and its port is copied, without reduction, from the beautiful plan of the city and Bosphorus, drawn and engraved by M. Merzoff Robert of Munich, and published by Mr. Wylde of this city.

Nothing can be more imposing than the appearance of the city when seen from the sea, but on landing the illusion vanishes. The streets are narrow, dark, ill-paved, and irregular. Owing to the want of any effective system of police, and of the most ordinary attention to cleanliness, they are extremely filthy; and are infested with herds of dogs and with rats, which perform the functions of scavengers. The houses are mostly built of wood, and fires are very frequent. Most of these happen designedly; the burning of a few hundred houses being deemed the readiest and most effectual means of making the Government aware of the public dissatisfaction, and of procuring a change of ministers, or a redress of grievances!

**Money and Banks.**—Owing to successive degradations, the value of the Turkish coin has been so much reduced that the piastre, once worth about 4s., has fallen as low as  $\frac{3}{4}$ d. (See Mr. Secretary of Embassy Barron's Report of 1867 on Turkish Finance.) But the pernicious consequences of this continued tampering with the standard of value were at last discerned by the Turkish authorities, and an attempt has been made to arrest the evil. In this view the old coins were called in and replaced by new ones, issued in 1844, called *Medjidie*, from the late Sultan's name. The designations and values of these coins are given in the following table:—

New Money of Sultan Abdul Medjid.

Coins	Value in Piastras	Weight in Grammes	Purity	Value in Francs
Gold: The Juslik, Sarra Juslik (yellow piece) or piece of -	100	7.216	.916	22.50
The Ekkik, or piece of -	50	3.608	.916	11.25
Piece of 10 piastras -	10	0.722	.916	2.25
Piece of 5 piastras -	5	0.361	.916	1.12
Silver: The Medjidie, or piece of -	0	23.055	.830	4.55
The Onik, or piece of -	10	12.055	.830	2.27
The Bechlik -	5	6.013	.830	1.13
The Jekilik -	2	2.405	.830	0.443
Copper: The Bech paras -	5 paras	5.562	—	0.027
The Ilir para -	1 para	1.071	—	0.005

Unluckily, however, the supply of new coins, amounting to only about 200,000,000 of piastras, was quite inadequate to fill the place of the old coins, and they either circulated at an agio in their favour, or were exported. To obviate the inconveniences of this state of things, *caimés*, or paper notes, were issued. And to maintain the latter in circulation, and the piastre at a stationary value (108 piastras to the 1l. sterling), the Bank of Constantinople was founded in 1818. But, having failed to accomplish the objects for which she was intended, and incurred a heavy loss, she was wound up in 1853, and the Ottoman Bank established in her stead. The functions of the latter are in part political, and in part commercial. She has a capital of 200,000,000 piastras, in shares of 2,000 each; and is bound to withdraw from circulation old coins of the value of 497,000,000, and to replace them by new coins; to receive such *caimés* as bear interest (132,000,000 at par; and to receive those which do not bear interest (45,000,000) at par, to the amount of  $\frac{1}{2}$  in the payments made to her. In return for these services she is chartered for 30 years, and is to receive an annual pension of 30,000,000, with a bonus of 30,000,000 at the expiration of the charter. In addition to the functions now specified she transacts all sorts of ordinary banking business. (See the excellent and instructive work of Ubicini, *Lettres sur la Turquie*, i. pp. 312—325, 2nd ed.)

It would be hazardous to speculate on the future of the Ottoman Bank. Much, of course, must depend on the regular payment of the pension of 30,000,000; and that, we should think, was not a little uncertain.

Besides the new moneys, the old coins of former sultans, and also foreign coins, continue in circulation. But all large payments are made by the *kitze*, or purse of gold, of 30,000 piastras, and the *his*, or purse of silver, of 500 ditto. It may be worth while to mention that Ottoman coins are not marked with the effigy of the sovereign, but merely with his cypher, *toughra*.

**Weights and Measures.**—The commercial weights are—176 drams=1 rottolo; 2.272 rottoli=1 oko; 6 okes=1 batman; 7 $\frac{1}{2}$  batmans=1 quintal or cantaro=124.457 (124 $\frac{1}{2}$  very nearly) lbs. avoirdupois=56.437 kilogrammes=116.327 lbs. of Hamburg. The quintal of cotton is 45 okes=127 $\frac{1}{2}$  lbs. avoirdupois.

The pik, or pike, is of two sorts, the greater and the less. The greater, called *halkebi* or *arschin*, used in the measurement of silks and woollens, is very near 28 inches (27.9). The lesser, called *endese*, used in the measuring of cottons, carpets, &c.=27 inches. Hence 100 long piks=77.498 English yards, and 100 short piks=75.154 do. But in ordinary commercial affairs, the pik is estimated at  $\frac{3}{4}$  of an English yard.

Corn is measured by the *hisloz* or *killow*=0.91 of a Winchester bushel; 8 $\frac{1}{2}$  kisloz=1 quartal. The *fortin*=4 ki. loz.

Oil and other liquids are sold by the *alma* or *meter*=1 gallon 3 pints English wine measure. The *alma* of oil should weigh 8 okes. (Nellebrecher and Dr. Kelly.)

**The Port Charges** on account of English vessels in the harbours of the Ottoman empire are fixed by treaty at 300 aspers, neither more nor less.

**Trade &c.**—Owing to the vicious institutions of the Turks, and the disorganised state of the empire, the trade of Constantinople is very far from being so extensive as might be supposed

from its situation, consist of corn, wool, iron, cutlery, white leather, indigo, other European articles imported from the bottoms. Sugar, but principally of the most important articles. But the less than the import to Constantinople return cargoes at Smyrna, Salon, frequently procure for the largest part of the hands of Greek inferior skill, industry with whom they sustained their European competitors (Armenians only had the competition of negotiated by Jewish rich.

If we formed an establishment in this port is visited, is greater than it really is, the circumstance of almost the Mediterranean to the latter to the former, sometimes discharge and cargoes. We subjoin

Steam Navigation.—visited by steamers from Trieste, Odessa, other places, and its commerce, has in consequence, the steamers

from its situation and population. The imports consist of corn, timber, tallow, and furs, principally from the Black Sea; and of cotton stuffs and yarn, iron, coal, tin, tin plates, woollens, silks, cutlery, watches and jewellery, paper, glass, furniture, indigo, cochineal &c. from England and other European countries. Corn and coffee are imported from Alexandria; but considerable quantities of Brazil and West India coffee are also imported, particularly in British and American bottoms. Sugar is partly imported from the East, but principally from the West Indies. The exports consist of silk from Brussa, which is much the most important article, carpets, hides, wool, Angola goats' hair, yellow berries, copper, box-wood, opium, galls, leeches, specie, and a few other articles. But the exports are always very much less than the imports; and ships carrying goods to Constantinople either return in ballast, or get return cargoes at the ports on the Black Sea, or at Smyrna, Salonica &c., on which places they frequently procure bills at Constantinople. By far the largest proportion of the trade of this city, and of the Levant generally, is in the hands of Greek merchants, who by their superior skill, industry, and knowledge of those with whom they have to deal, have completely distanced their English, French, and other European competitors (denominated Franks). The Armenians only have been able to withstand the competition of the Greeks. Bargains are negotiated by Jew brokers, some of whom are rich.

If we formed an estimate of the trade of Constantinople from the number of vessels by which its port is visited, it would appear to be much greater than it really is. This arises from the circumstance of almost all the vessels passing from the Mediterranean to the Black Sea, and from the latter to the former, calling here, where they sometimes discharge and take on board part of their cargoes. We subjoin

An Account of the Number and Tonnage of the Foreign Ships that entered at, and cleared out from, Constantinople, in 1864, specifying the Countries to which they belonged, and the Number and Tonnage of those belonging to each.

Steam Navigation. — Constantinople is now visited by steamers from London, Liverpool, Marseilles, Trieste, Odessa, the Danube, Smyrna, and other places, and its commerce, as well as that of the empire, has in consequence been materially promoted. The steamers belonging to the *Lloyd*

*Austriaco* at Trieste, and the Danube Steam Company, are said to reflect great credit on these associations.

*Commercial Policy of the Turks.*—It is singular that as respects commerce, the policy of the Turkish Government, whether originating in design or carelessness, is entit'ed to the highest praise. 'No restrictions,' says Mr. Thornton, 'are laid on commerce, except in the instance of a general prohibition of exporting the articles necessary for the support of human life to foreign countries, especially from the capital, where alone it is rigorously enforced; and this impolitic restraint will no doubt be removed when the Turkish Government shall become sensible that what is intended as the means of securing abundance is in fact the sole cause of that scarcity which is sometimes experienced. With this one exception, commerce is perfectly free and unfettered. Every article of foreign or domestic growth or manufacture is conveyed into every port, and over every province, without any interference on the part of the magistrates, after payment of the duties. On this subject I speak from actual experience, and may appeal to every foreign or native merchant in Turkey for its general truth.' (*Present State of Turkey*, vol. i. p. 82.)

The duties on importation are extremely moderate, being only 5 per cent., viz. 3 per cent. on goods when landed, and 2 per cent. on their being admitted to consumption. But the duties on exports of native produce amount to 12 per cent., whereof 9 per cent. is paid when the goods arrive at the port whence they are to be exported, and 3 per cent. on their being shipped. This 3 per cent. is not unfrequently represented as being the entire duty on exports. (*Ubcieni sur la Turquie*, i. 281.) It is needless to dwell on the impolicy of a general export duty of this amount; and the better plan would be to raise the duty on imports to 10 or 12 per cent., and to reduce the duty on exports to the 3 per cent. paid on embarkation. But despite the 12 per cent. charged on exports, Turkey is entitled, in all that relates to trade, to read a lesson to most European powers, and this she did in a very able manner, in an official paper published in the *Moniteur Ottoman*, in September 1832. We extract a few paragraphs from this interesting document.

'Good sense, tolerance, and hospitality have long ago done for the Ottoman empire what the other states of Europe are endeavouring to effect by more or less happy political combinations. Since the throne of the sultans has been elevated at Constantinople, commercial prohibitions have been unknown; they opened all the ports of their empire to the commerce, to the manufactures, to the territorial produce of the Occident, or to say better of the whole world. Liberty of commerce has reigned here without limits, as large, as extended as it was possible to be.

'Here every object of exchange is admitted, and circulates without meeting any obstacle other than the payment of an infinitely small portion of the value to the Custom-house. The chimera of a balance of trade never entered into heads sensible enough not to dream of calculating whether there was most profit in buying or selling. Thus the markets of Turkey, supplied from all countries, refusing no objects which mercantile spirit puts into circulation, and imposing no charge on the vessels that transport them, are seldom or never the scenes of those disordered movements occasioned by the sudden deficiency of such or such merchandise, which, exorbitantly raising prices, are the scourges of the lower orders, by unset-

1866	5	50	56,363,630	—	56,363,630	1,787,270	315,434	2,072,704
General	—	—	75,300,850	2,110,100	69,112,250	5,679,258	1,137,104	4,807,342

But Mr. Barron states significantly in page Induce sheet of the Ottoman Treasury is an im-  
 to that to give anything like a trustworthy possibility.

*Regulations of the Port of Constantinople.*—1. Such ships as arrive and anchor at an improper place, on being advised by their respective harbour-masters to heave anchor, or loosen their cables, and proceed to another anchorage, will be bound to weigh, and move in the space of 3 hours.

2, 3, 4. Such as remain after the expiration of the allotted time will have to pay 1 gold medjidie for every day they remain, counting from the first.

5. The captains of such ships as require to throw a plank ladder on shore in order to discharge coals or anything else, or to receive a cargo from the shore, will bestow great care to see that such plank ladder is well fastened at both its ends, on board their ship as well as on shore.

6. Such captains as take their ships through the Bridge of Karakeny without procuring a Teskeré from the Liman Oglasy will have to pay the penalty of 10 gold medjidies.

7. As the authorities of the bridge will be present without fail whenever it opens for the purpose of admitting or letting out ships, such captains as do not exhibit to these authorities their Teskerés of admission or exit will have to pay the penalty of 1½ gold medjidies.

8. All steam tugs or steamers carrying passengers either into the Golden Horn or in the Bosphorus are forbidden to move from 1 hour after sunset up to ½ hour before sunrise.

9. Such as disregard this regulation will have to pay the penalty of 20 gold medjidies; and moreover, should they, whilst thus disregarding this regulation, damage any other ship, or a lighter, or boat, or anything else, they will have to give compensation for that damage according to its evaluation. In any case instituted for the recovery of damages done whilst running after hours, no plea of manœvre or rule will be admitted. The hour of the occurrence alone will be considered.

10. Ships bound for the Black Sea on coming to the Kavak of Anatoli will send their boat for the special purpose of exhibiting to the authorities their firman and lighthouse ticket. The ship will halt as long as is necessary; such captains as do not observe this rule will have to pay 3 gold medjidies as fine. Likewise all ships going through the Dardanelles will have to show their lighthouse ticket in the same way that they show their other papers. Such as do not will have to pay the above fine.

11. Such ships as arrive laden with gunpowder exceeding 15 oke, after having anchored at the place pointed out by the harbour-masters, will have to report to the Custom-house the quantity of gunpowder on board, and they will have to hoist on their foremast a red signal in order that they may be known. They will fly this signal until the discharge of the gunpowder or their departure for some other place. Such as do not observe this rule will have to pay 10 piastres for every oke of gunpowder they have on board, and suffer confiscation of their gunpowder. This rule will be observed in all ports.

*Quarantine.*—Vessels arriving in Turkish ports from foreign ports are bound to produce a bill of health from the authorities of the last port of departure. No consular bills of health are recognised. Any irregularity connected with bills of health is visited with a fine amounting to 10*l.* 16*s.* on steamers, and 9*l.* on sailing vessels.

Vessels bound to Constantinople must take pratique either at Tchanak-Kalassi (town of the Dardanelles) or at Gallipoli, and again on their

arrival at Constantinople or at Buyukdéré, Vessels proceeding from one Turkish port to another must be provided with a Turkish bill of health.

Vessels arriving from the Black Sea are bound to take pratique at Kavak or Buyukdéré under the same penalty as mentioned above.

The following is the quarantine tariff:—

#### 1. License Fees.

Ships	1 kilo. to	1,000	-	-	piastres	viva
	1,001	3,000	-	-	2	3
	3,001	5,000	-	-	6	5
	5,001	7,000	-	-	12	8
	7,001	10,000	-	-	16	8
	10,001	12,000	-	-	20	10
	above this amount	-	-	-	24	12

#### 2. Examination Fees.

	1 kilo. to	3,000	-	-	piastres	2
	3,001	8,000	-	-	2	5
	8,001	10,000	-	-	1	11
	10,001	and above	-	-	1	20

#### 3. Fees from Ships in Quarantine.

	1 kilo. to	1,000	per day	-	-	piastres
	1,001	3,000	-	-	-	8
	3,001	5,000	-	-	-	10
	5,001	7,000	-	-	-	15
	7,001	10,000	-	-	-	20
	10,001	12,000	-	-	-	25
	above	-	-	-	-	35

#### 4. Fees from Travellers.

Each garde de santé, besides his food, per day	-	10
Lodging for disinfectants	-	40

#### 5. Disinfecting Goods.

Hales from 1 oke to 20, each	-	1
41 " 80 "	-	2
81 " 120 "	-	3
121 and upwards	-	4
Animals, large	-	2
small	-	1
poultry	-	20 para
1 para	-	1 para

All ships arriving at Constantinople are liable to the 2nd of these charges. Captains of vessels are liable to the charges. All ships except of war, whether Turkish or foreign, are liable to the condition of quarantine, and the fees payable.

#### Harbour and other Dues at Constantinople.

Anchorage dues	-	-	pres.
Health office fee	-	-	10
Firman fee (if bound to Black Sea)	-	-	20
Kavak fee (if bound to Black Sea)	-	-	7
Turkish bill of health (if bound to a Turkish port):	-	-	2
For sailing vessels	-	-	10
For steamers	-	-	20
Light dues for vessels arriving from the Mediterranean and discharging or receiving cargo at Constantinople, and vice versa, per ton	-	-	1
Light dues for vessels bound from the Mediterranean to the Black Sea in ballast, and vice versa, per ton	-	-	1
Light dues for vessels bound from Constantinople to the Black Sea, and vice versa	-	-	0

The above light rates are applied to vessels under 800 tons burden; beyond that size ½ the above rates are charged.

These dues are levied both on entrance and clearance of a ship.

There are no pilotage regulations at Constantinople.

*Exchange.*—110 piastres = 1*l.*; 1 piastre = 2*d.* We are indebted for these particulars to private information, kindly afforded by Mr. Legé, Majesty's Consul-General, Constantinople.

*CONSUL.* In Commerce, an officer appointed by competent authority to reside in foreign countries, in the view of facilitating and extending commerce carried on between the subjects of the country which appoints him, and those of the country or place in which he is to reside.

*Origin and Appointment of Consuls.*—The office of consul appears to have originated in Spain about the middle of the 12th century. Since that time, the French and other Christian nations

trading to the liberty to appoint frequently by the ever the interest and determine commercial affairs practice was gradually, and in the established all over *Droit des Gens*, see Crown, upon the companies, or of the trade with a part they are now direct without requiring though it, of course, made.

The right of sending countries depends either in different states. In extensive jurisdiction state which appoints jurisdiction is not disputed cases, be regulated either between the state appointing the consul, or the British Government with other powers for its consuls. Turkey to this remark. English country several peculiar ancient treaties, and at the Dardanelles in 1840 and agreed upon—

'That if there happen any dispute, among the decision thereof shall be referred to the judge or other government settling therein.

'That if an Englishman that nation, shall be involved in any affair connected with the judge shall not hear the ambassador, consul, or present; and all suits excepters shall be heard at some other place.

'That the consuls appointed by their merchants, shall not be imprisoned, nor taken for themselves sent away; and in which they may be presented to our Sublime Majesty will answer for them.

'That in case any Englishman, should happen to die in any city and other officers of its not being known to the consuls, interpose any opposition or seizing the effects of the deceased, they shall be obliged to leave them to the heirs, or if they have died intestate, then to the next of kin, or to the representative who may be there; there be no consul or consuls, they shall be registered by the delivering up the who shall be sent by the consuls.

'That if there happen any dispute, among the decision thereof shall be referred to the judge or other government settling therein.

trading to the Levant began to stipulate for liberty to appoint consuls to reside in the ports frequented by their ships, that they might watch over the interests of their subjects, and judge and determine such differences with respect to commercial affairs as arose amongst them. The practice was gradually extended to other countries, and in the 16th century was generally established all over Europe. (Martens, *Précis du Droit des Gens*, sec. 147.)

British consuls were formerly appointed by the Crown, upon the recommendation of great trading companies, or of the merchants engaged in the trade with a particular country or place; but they are now directly appointed by Government, without requiring any such recommendation, though it, of course, is always attended to when made.

The right of sending consuls to reside in foreign countries depends either upon a tacit or express convention. Hence their powers differ very widely in different states. In some they exercise a very extensive jurisdiction over the subjects of the state which appoints them; but the extent of this jurisdiction is not discretionary, and must, in all cases, be regulated either by an express convention between the state appointing and the state requiring the consul, or by custom. Consuls established in England have no judicial power; and the British Government has rarely stipulated with other powers for much judicial authority for its consuls. Turkey, however, is an exception to this remark. English consuls enjoy in that country several peculiar privileges conferred by ancient treaties, and confirmed by that signed at the Dardanelles in 1809. It is there stipulated and agreed upon—

'That if there happen any suit, or other difference or dispute, among the English themselves, the decision thereof shall be left to their own ambassador or consul, according to their custom, without the judge or other governors, our slaves, intermeddling therein.

'That if an Englishman, or other subject of that nation, shall be involved in any lawsuit, or other affair connected with law (with a Turk), the judge shall not hear nor decide thereon until the ambassador, consul, or interpreter shall be present; and all suits exceeding the value of 4,000 aspers shall be heard at the Sublime Porte, and nowhere else.

'That the consuls appointed by the English ambassadors in our sacred dominions, for the protection of their merchants, shall never, under any pretence, be imprisoned, nor their houses sealed up, nor themselves sent away; but all suits or differences in which they may be involved shall be represented to our Sublime Porte, where their ambassador will answer for them.

'That in case any Englishman or other person subject to that nation, or navigating under its flag, should happen to die in our sacred dominions, our fiscal and other officers shall not, upon pretence of its not being known to whom the property belongs, interpose any opposition or violence, by taking or seizing the effects that may be found at his death, but they shall be delivered up to such Englishman, whoever he may be, to whom the deceased may have left them by his will; and should he have died intestate, then the property shall be delivered up to the English consul, or his representative who may be then present; and in case there be no consul or consular representative, they shall be registered by the judge, in order to be delivered up the whole thereof whenever any ship shall be sent by the ambassador to receive them.'

Conformably to these capitulations, and the by-laws of the Levant Company, Nos. 39, 40, and 41, the consuls were authorised to administer justice in all cases of contention amongst British subjects within the Turkish dominions; and they were further authorised to send to England, in safe custody, any British subject resident in Turkey who should decline their jurisdiction, or appeal from them to the courts of the Grand Signior or of any other potentate. And the Act 6 Geo. IV. c. 33 s. 4 (slightly modified by the 6 & 7 Vict. c. 94), for the abolition of the Levant Company, expressly provides for the continuance to the consuls appointed by his Majesty of the same rights and duties of jurisdiction over British subjects in Turkey that were enjoyed by the consuls appointed by the company.

At present, therefore, consuls in Turkey enjoy extensive judicial powers; but owing to the freedom of Turkish commerce, and the simplicity of the regulations under which it is carried on, their other functions, with the exception of furnishing statistical details, are not very onerous. Mr. Urquhart, whose opinion as to all that respects Turkey is deservedly of considerable weight, seems to think that the judicial powers enjoyed by the European consuls in that country have been productive of much mischief. Still, however, we doubt whether they could be entirely dispensed with in a country so peculiarly situated. But there can be no doubt that it is highly necessary that the greatest care should be taken in the selection of the individuals to whom such powers are intrusted.

Other States have occasionally given to consuls similar powers to those conceded to them in Turkey. Thus, in the treaty between Sweden and the United States of America, ratified July 24, 1818, it is stipulated that the consuls appointed by either Government to reside within the dominions of the other, or their substitutes, 'shall, as such, have the right of acting as judges or arbiters in all cases of differences which may arise between the captains and crews of the vessels of the nation whose affairs are intrusted to their care. The respective Governments shall have no right to interfere in these sorts of affairs, except in the case of the conduct of the crews disturbing public order and tranquillity, in the country in which the vessel may happen to be, or in which the consul of the place may be obliged to call for the intervention and support of the executive power in order to cause his decision to be respected; it being, however, well understood that this sort of judgment or arbitration cannot deprive the contending parties of their rights of appealing on their return to the judicial authorities of their country.'

*Duties of Consuls.*—The duties of a consul, even in the confined sense in which they are commonly understood, are important and multifarious. It is his business to be always on the spot, to watch over the commercial interests of the subjects of the state whose servant he is; to be ready to assist them with advice on all doubtful occasions; to see that the conditions in commercial treaties are properly observed; that those he is appointed to protect are subjected to no unnecessary or unjustifiable demands in conducting their business; to represent their grievances to the authorities at the place where they reside, or to the ambassador of the sovereign appointing him at the court on which the consulship depends, or to the Government at home; in a word, to exert himself to render the condition of the subjects of the country employing him, within the limits of his consulship, as comfortable, and their transactions as advantageous and secure, as possible.

The following more detailed exposition of the general duties of a British consul is taken from Mr. Chitty's work *On Commercial Law*—

'A British consul, in order to be properly qualified for his employment, should take care to make himself master of the language used by the court and the magistracy of the country where he resides, so as to converse with ease upon subjects relating to his duties. If the common people of the port use another, he must acquire that also, that he may be able to settle little differences without troubling the magistracy of the place for the interposition of their authority; such as accidents happening in the harbour by the ships of his nation running foul of and doing damage to each other.

'He is to make himself acquainted, if he be not already, with the law of nations and treaties, with the tariff or specification of duties on articles imported or exported, and with all the municipal ordinances and laws.

'It is also his duty to protect from insult or imposition British subjects of every description within his jurisdiction. If redress for injury suffered is not obtained, he is to carry his complaint by memorial to the British minister residing at the court on which the consularship depends. If there be none, he is to address himself directly to the court; and he is, in an important case, his complaint be not answered, he is to transmit the memorial to his Majesty's secretary of state. (Beawes, *Warden*, &c.)

'When insult or outrage is offered by a British subject to a native of the place, and the magistrate thereof complains to the consul, he should summon and in case of disobedience may by armed force and in case of disobedience may by armed force to bring before him the offender, and order him to give immediate satisfaction; and if he refuse, he resigns him to the civil jurisdiction of the magistrate, or to the military law of the garrison; nevertheless always acting as *counsellor or advocate at his trial*, when there is question of life or property.

'But if a British subject be accused of an offence alleged to have been committed at sea, within the dominion or jurisdiction of his sovereign, it is then the duty of the consul to claim cognisance of the cause for his sovereign, and to require the release of the parties, if detained in prison by the magistracy of the place on any such accusation brought before them, and that all judicial proceedings against them do instantly cease; and he may demand the aid of the power of the country, civil and military, to enable him to secure and put the accused parties on board such British ship as he shall think fit, that they may be conveyed to Great Britain, to be tried by their proper judges. If, contrary to this requisition, the magistrates of the country persist in proceeding to try the offence, the consul should then draw up and transmit a memorial to the British minister at the court of that country; and if that court give an evasive answer, the consul should, if it be a sea offence, apply to the Board of Admiralty at London, stating the case; and upon their representation the matter before the king, who will cause the ambassador of the foreign state, resident in England, to write to his court abroad, desiring that orders may immediately be given by that Government that all judicial proceedings against the prisoner be stayed, and that he be released. (Case of *Horseman and his Crew*, Beawes, vol. ii. p. 422.)

'It is the duty also of a British consul to relieve all distressed British mariners, to allow them the daily for their support, to send them home in the first British vessels that sail for England, and to

keep a regular account of his disbursements, which he is to transmit yearly, or oftener if required, to the Navy Office, attested by two British merchants of the place: this is provided for by positive enactment. (1 Geo. II. s. 2, c. 11 s. 12.) He is also to give free passes to all poor British subjects wishing to return home, directed to the captains of the king's packet boats or ships of war, requiring them to take them on board.

[SEAMEN.]

'The consul is not to permit a British merchant ship to leave the port where he resides without his passport, which he is not to grant until the master and crew thereof have satisfied all just demands upon them; and for this purpose he ought to see the governor's pass of a garrisoned town, or the burgomaster's; unless the merchant or factor to whom the ship was consigned will make himself responsible. (Beawes, *Lee Merc.* vol. ii. p. 423.)

'It is also his duty to claim and recover all wrecks, cables, and anchors, belonging to British ships, found at sea by fishermen or other persons, to pay the usual salvage, and to communicate a report thereof to the Navy Board.

'The consuls and vice consuls of his Majesty are, by express enactment (46 Geo. III. c. 39 s. 9) empowered to administer oaths in all cases respecting quarantine, in like manner as if they were magistrates of the several towns or places where they respectively reside. It is also laid down that a consul is to attend, if requested, all arbitrations where property is concerned between masters of British ships and the freighters, being inhabitants of the place where he resides.' (Chitty *On Commercial Law*, vol. i. pp. 58-61, and the numerous authorities there quoted.)

Any individual, whether he be a subject of the state by which he is appointed or of another, may be selected to fill the office of consul, provided he be approved and admitted by the Government in whose territory he is to reside. In most instances, but not always, consuls are the subjects of the state appointing them.

Much, however, of the peculiar duties of a consul must always depend on the nature of the intercourse with the country to which he is sent, and of the instructions given him. British consuls are regularly supplied with copies of all Acts relating to trade and navigation, quarantine, slave trade suppression, emigration, &c., and with the treaties between this and other countries, and must of course shape their conduct accordingly. They are strictly forbidden from corresponding with private parties on public matters. We subjoin an extract from the *General Instructions for British*

*Consuls* :—

'He will bear in mind that it is his principal duty to protect and promote the lawful trade and trading interests of Great Britain by every fair and proper means, taking care to conform to the laws and regulations in question; and whilst he is supporting the lawful trade of Great Britain, he will take special notice of all prohibitions with respect to the export or import of specified articles, as well on the part of the state in which he resides as of the Government of Great Britain, so that he may caution all British subjects against carrying on an illicit commerce to the detriment of the revenue, and in violation of the laws and regulations, of either country; and he will not fail to give to this department immediate notice of any attempt to contravene those laws and regulations.

'The consul will give his best advice and assistance, when called upon, to his Majesty's trading subjects, quieting their differences, promoting peace, harmony, and good-will amongst them, and

conciliating as much as possible the two countries upon which may fall under the event of any attempt being made, either in their right or wrong, to uphold their rights, or to secure to them by the same time, be careful in the proper office of mildness and moderation with the public authorities, and to urge claims, or to defend, if redress cannot be obtained, or if it is not within their jurisdiction, to his Majesty's minister, if the country wherein he resides may make a representative claim, or take such other steps as may be thought proper; and the consul is to be governed by the instructions with which he is furnished by the minister or consul-general.

*Emoluments of Consuls.*

The emoluments of consuls, in these few years, principal ones, depending on the voyages &c. of the British vessels; out of the limits of the mode of remuneration, as changed by the Act of 1802, is considerable; but the deficit, at least, compensated by Government.

At present British consuls are permitted to carry on other business, which they are interdicted to do with it. The principle of this distinction is made does not seem to be in the least at the great ports, and ports, principally in the interests, from trading; and the public duties of the consul sufficient wholly to engage their attention, as they are of such a kind as are well suited for those employed in mercantile pursuits; in the class of ports, but little frequent, and where the consuls have functions to discharge, the necessity for prohibiting trade on their own account, however, we are clearly of opinion in all cases be better not to engage, either directly or indirectly, in any industrial undertaking, the purpose of their institution is to interfere with the nation in the furtherance of such objects, on occasions to communicate information in their power, matters, not only to the Government, but to such of its subjects as their advice and assistance, and advantageous publicity may be necessary ways be extremely of the consul considered important; and when his public duty are set in opposition to discover which way. Hence the fair practice of a consul will rather be peculiar information his

conciliating as much as possible the subjects of the two countries upon all points of difference which may fall under his cognisance. In the event of any attempt being made to injure British subjects, either in their persons or property, he will uphold their rightful interests, and the privileges secured to them by treaty, by due representation in the proper official quarter. He will, at the same time, be careful to conduct himself with mildness and moderation in all his transactions with the public authorities, and he will not upon any account urge claims, on behalf of his Majesty's subjects, to which they are not justly and fairly entitled. If redress cannot be obtained from the local administration, or if the matter of complaint be not within their jurisdiction, the consul will apply to his Majesty's consul-general, or to his Majesty's minister, if there be no consul-general in the country wherein he resides, in order that he may make a representation to the higher authorities or take such other steps in the case as he may think proper; and the consul will pay strict attention to the instructions which he may receive from the minister or consul-general.

*Emoluments of Consuls. Prohibition of Trading.*—The emoluments of our consuls were, until these few years, principally derived from certain fees, depending on the tonnage, length of the voyages &c. of the British ships entering and clearing out of the limits of their consulships. But this mode of remunerating them was materially changed by the Act of 6 Geo. IV. c. 87. The fees payable under this Act (see *post*) are inconsiderable; but the deficiency has been, partly at least, compensated by salaries allowed by Government.

At present British consuls are in some instances permitted to carry on trade, while in others they are interdicted from having anything to do with it. The principle on which the distinctions made does not seem very obvious. But if this distinction must be kept up, the preferable plan would seem to be to interdict all consuls resident at the great ports, and those resident at other ports, principally in the character of political agents, from trading; and to permit it to others. The public duties of the former are either quite sufficient wholly to engross their attention, or they are of such a kind as would make it very inexpedient for those employed in them to be occupied in mercantile pursuits; in the case of the smaller class of ports, but little frequented by British ships, and where the consuls have no peculiar political functions to discharge, there is a less urgent necessity for prohibiting them from carrying on business on their own account. At the same time, however, we are clearly of opinion that it would in all cases be better not to allow consuls to engage, either directly or indirectly, in any sort of industrious undertaking. The main end and purpose of their institution is the facilitating of commerce with the nation in which they reside; and the furtherance of such object they ought on all occasions to communicate the fullest and earliest information in their power touching commercial matters, not only to the Government that appoints them, but to such of its subjects as may apply for their advice and assistance. But, however advantageous publicity may be to others, it may in various ways be extremely hostile to the interests of the consul considered in his capacity of a merchant; and when his own advantage and his public duty are set in opposition, it requires little sagacity to discover which will have the ascendancy. Hence the fair presumption is, that a trading consul will rather endeavour to profit by the peculiar information his situation may enable

him to obtain than to communicate it to others. His interests as a merchant must frequently also, even when such is not really the case, appear to be in opposition to those of the parties for whose benefit he is said to be appointed; and under such circumstances his proceedings, however fair, will always be liable to the suspicion of partiality. It is material also to observe that mercantile consuls labour under peculiar disadvantages in the obtaining of information. If a consul, not engaged in business, make a proper application to a public functionary or merchant for information as to any subject with which they may be acquainted, he will, in most instances, learn all that they know; but it is obvious on general principles, and we have been assured of the fact by some of the most intelligent officers of the class, that if a trading consul make the same application, the chances are 10 to 1 he will either learn nothing, or nothing that is not false or misleading. The enquiries of the former excite no jealousy, those of the latter invariably do. The former is known to be actuated only by a feeling of liberal curiosity, or by a wish properly to discharge his public duties; but the latter, being engaged in business, gets credit only for selfish and interested motives, and is believed to be seeking the information merely that he may turn it to his own account. A mercantile consul is, therefore, uniformly the object of the suspicions of all parties, both of his countrymen and of the foreigners amongst whom he resides. Instead of being, as he ought to be, an independent public functionary, he necessarily gets entangled in the cabals and intrigues of those whose differences it is his province to conciliate. He is tempted also to engage in smuggling adventures, contrary to his duty, and highly injurious to the character of his nation. And though he should be proof against temptations of this sort, he is, like all other individuals, subject to misfortune and bankruptcy; and may, in this way, bring discredit and embarrassment on the Government that appoints him. These reasons seem to be far more than sufficient to vindicate the policy of interdicting consuls from trading. But were it otherwise, it is enough to decide the question to state, that if they be made properly to perform the functions of their office, it will occupy every moment of their time. To the argument in favour of the existing system derived from economical considerations we do not attach the smallest weight. To attempt to save a few thousand pounds by allowing an important class of public functionaries to engage in avocations inconsistent with their duty, and destructive of their utility, would be something the very reverse of economy.

*Cost of the Establishment. Improvements made in it.*—We had occasion, in the former edition of this work, to complain of the cost and inadequacy of our consular establishment. But its expense has since been very much, and, in some instances perhaps, too much, reduced; at the same time that measure have been taken for increasing the duties of the consuls by making them furnish details as to the trade, manufactures, duties, prices &c. of the districts in which their consulships are situated. Hitherto this important department of what ought to be the peculiar duty of a consul has been most strangely neglected; but if it be properly attended to, it will occupy a large portion of the consul's time, and will be a field for the display of superior talents. Some of the answers made by the consuls to the *Circular Queries* prepared for the former edition of this work were drawn up with great care and intelligence, and reflected much credit on their

authors. There were a good many certainly of a very inferior description; but this is not to be wondered at—it being hardly possible for those who have not given a good deal of their time to such subjects, to make a proper reply to queries relating to them. And if the system is to be perfected to the degree of which it is susceptible, the salaries allowed to the consuls ought to be such as to afford a sufficient remuneration for the services of gentlemen of character, familiar with the principles of public law, commerce, and statistics; and such only ought to be nominated to consular situations. We subjoin that part of the *General Instructions for the Consuls* that has reference to statistical enquiries:—

'The consul will forward to the Secretary of State, in duplicate, so soon as the information he can collect will enable him so to do, but at any rate within a period of 6 months from the date of his arrival at his residence, a general report on the commerce of the place and district, specifying the commodities, as well of the export as import trade, and the countries which supply the latter, together with the increase or decline in late years, and the probable increase or decline to be expected, and the causes in both cases. He will state the general regulations with respect to trade at the place where he is resident, and their effects. He will give the average market prices within the year of the several articles of export and import; he will particularise what articles, if any, are absolutely prohibited to be imported into the country wherein he resides; what articles are prohibited to be imported from any other place than from the place of their growth or production; whether there be any privileges of importation, and what those privileges are, in favour of ships and that are of the build of, or belonging to, the country wherein he resides; whether there be any difference in the duty on goods when imported into that country in a foreign ship, and if so, whether it be general, or applicable only to particular articles; what are the rates of duty payable on goods imported into the said country; whether there be any tonnage duty or other port dues, and what payable on shipping entering at, or clearing from, the ports of that country; whether there be any (and, if so, what) ports in that country wherein goods may be warehoused on importation, and afterwards exported with or without payment of any duties, and under what regulations.'

He is also to transmit an annual statement of the trade with the principal ports of his consularship, and quarterly returns of the prices of corn &c. Mr. Macgregor's Tariffs have been mostly compiled from these returns.

The following are the provisions of the Act 6 Geo. IV. c. 87 (modified by 4 & 5 Wm. IV. c. 24) with respect to the salaries and charges of consuls:—

**Salaries to Consuls.**—'Whereas the provision which hath hitherto been made for the maintenance and support of the consuls general and consuls appointed by his Majesty to reside within the dominions of sovereigns and foreign States in amity with his Majesty is inadequate to the maintenance and support of such consuls general and consuls, and it is expedient to make further and due provisions for that purpose; it is therefore enacted, that it shall be lawful for his Majesty, by any orders to be issued by the advice of his privy council, to grant to all or any of the consuls general or consuls appointed by his Majesty to reside within any of the dominions of any sovereign or foreign state or power in amity with his Majesty, such reasonable salaries as to his Majesty shall seem meet, and by such advice

from time to time to alter, increase, or diminish any such salaries or salary as occasion may require. (6 Geo. IV. c. 87 s. 1.)

**Terms on which Salaries shall be granted. Leave of Absence.**—Such salaries shall be issued and paid to such consuls general and consuls without fee or deduction; provided that all such salaries shall be granted during his Majesty's pleasure, and not otherwise, and be held and enjoyed by such consuls general and consuls so long only as they shall be actually resident at the places at which they may be so appointed to reside, and discharging the duties of such their offices: provided nevertheless, that in case his Majesty shall, by any order to be for that purpose issued through one of his principal Secretaries of State, grant to any such consul general or consul leave of absence from the place to which he may be so appointed, such consul general or consul shall be entitled to receive the whole, or such part as to his Majesty shall seem meet, of the salary accruing during such period of absence. (Sec. 2.)

**Salaries in lieu of Fees formerly paid. Consuls not to take other than the Fees hereinafter mentioned.**

—The salaries so to be granted shall be taken by the consuls general and consuls as a compensation for all salaries heretofore granted, and all fees of office and gratuities heretofore taken by them from the masters or commanders of British vessels, or from any other person, for any duties or services by such consuls general or consuls done or performed for any such persons; and no such consul general or consul shall from January 1, 1826, be entitled on account of anything by them done in the execution of such their office, or for any service by them rendered to any masters or commanders of British vessels, or to any other person in the execution of such their office, to ask or take any fees, recompense, gratuity, compensation, or reward, or any sum of money, save as hereinafter is excepted. (Sec. 3.)

**Certain Fees still allowed to be taken.**—It shall be lawful for all consuls general and consuls appointed by his Majesty, and resident within the dominions of any sovereign, or any foreign state in amity with his Majesty, to accept of the several fees particularly mentioned in the tables to this present Act annexed, marked with the letters A and B, for the several things and official acts and deeds particularly mentioned in the said schedules; and it shall be lawful for his Majesty, by any orders to be by him made by the advice of his privy council, from time to time as occasion may require, to diminish or wholly to abolish all or any of the fees aforesaid, and to establish and authorise the payment of any greater or smaller or new additional fees for the several things mentioned in the said schedules, or for any other thing to be done by any such consul general or consul done in the execution of such his office. (Sec. 4.)

**Penalty on Consuls demanding more Fees than specified in the Schedule.**—In case any consul general or consul appointed by his Majesty aforesaid shall, by himself or deputy, or by any person authorised thereto in his behalf, ask or accept, for anything by him done in the execution of such his office, or for any service or duty by him rendered or performed in such his office, for any remuneration than is specified in the schedule, more than shall be sanctioned and specified in or by such order in council, the person so offending shall be liable to pay to his Majesty a sum of sterling British money, not exceeding the amount of the salary of such person for 1 year, less than the 12th part of such annual salary, at the discretion of the court in which such person

may be recovered; and upon conviction for any such offence, and for ever answering his Majesty in the law. (Sec. 5.)

**Table of Fees to be exacted.**—A printed copy of the schedule annexed to this Act, or which may be substituted therefor by any order to be made in pursuance of this Act, by his Majesty in council, shall be deposited in the Custom-houses in the several ports, harbours, and inland navigation, of the United Kingdom and Ireland; and printed copies of the same shall be deposited in the Custom-houses in all such ports and harbours, and in the offices of the collector or other chief officers of the Customs, and in the offices of the master of any vessel clearing out of port or harbour, and demurrage. (Sec. 6.)

**Table of Fees to be exacted.**

—A copy of the schedule annexed to this Act, or which may be substituted therefor by any order to be made in pursuance of this Act, by his Majesty in council, shall be deposited in the Custom-houses in the several ports, harbours, and inland navigation, of the United Kingdom and Ireland; and printed copies of the same shall be deposited in the Custom-houses in all such ports and harbours, and in the offices of the collector or other chief officers of the Customs, and in the offices of the master of any vessel clearing out of port or harbour, and demurrage. (Sec. 6.)

**Superannuation.**—'And where his Majesty shall be pleased to appoint any consul general and consul, or to award a meritorious pension, or to grant a gratuity, it is further enacted, that all such consuls general and consuls, and all such persons to whom any such pension or gratuity shall be granted, shall be entitled to receive, in addition to the salary of office, a superannuation allowance, to be paid to them at the discretion of his Majesty, in such manner as he shall think fit. (Sec. 7.)'

**Allowances during War.**—'In case of any war, or of any other event, which may hereafter arise between any sovereign or foreign state or power, in amity with his Majesty, and any such consul general or consul, or any person to whom any such pension or gratuity shall be granted, it is further enacted, that he shall be entitled to receive, in addition to the salary of office, a superannuation allowance, to be paid to him at the discretion of his Majesty, in such manner as he shall think fit. (Sec. 8.)'

**Penalty on Consuls demanding more Fees than specified in the Schedule.**—In case any consul general or consul appointed by his Majesty aforesaid shall, by himself or deputy, or by any person authorised thereto in his behalf, ask or accept, for anything by him done in the execution of such his office, or for any service or duty by him rendered or performed in such his office, for any remuneration than is specified in the schedule, more than shall be sanctioned and specified in or by such order in council, the person so offending shall be liable to pay to his Majesty a sum of sterling British money, not exceeding the amount of the salary of such person for 1 year, less than the 12th part of such annual salary, at the discretion of the court in which such person

may be recovered; and shall moreover upon a second conviction for any such offence forfeit such his office, and for ever become incapable of serving his Majesty in the same or the like capacity. (Sec. 5.)

**Table of Fees to be exhibited at Custom-houses.**  
—A printed copy of the table of fees allowed by this Act, or which may be sanctioned or allowed by any order to be made in pursuance of this Act by his Majesty in council, shall be exhibited in a conspicuous manner, for the inspection of all persons, in the Custom-house in the port of London, and in all other Custom-houses in the several ports and harbours of the United Kingdom of Great Britain and Ireland; and printed copies thereof shall, by the collector or other chief officer of customs in all such ports and harbours, be delivered gratuitously, and without fee or reward, to every master of any vessel clearing out of any such port or harbour, and demanding a copy thereof. (Sec. 6.)

**Table of Fees to be exhibited at Consuls' Offices.**  
—A copy of the schedule or table of fees to this present Act annexed, or which may be established and authorised by any such order in council, shall be hung up and exhibited in a conspicuous place in the public offices of all consuls general or consuls appointed by his Majesty, in the foreign places to which they may be so appointed, for the inspection of all persons interested therein; and any consul general or consul omitting or neglecting to exhibit any such copy of the schedules in such his public office, or refusing to permit the same to be inspected by any person interested therein, shall for every such offence forfeit and pay a sum of British sterling money not exceeding one half the amount of the salary of such person for 1 year, or less than the 12th part of such annual salary, at the discretion of the court in which such penalty may be recovered. (Sec. 7.)

**Superannuation.**—And whereas it is expedient that his Majesty should be enabled to grant to the said consuls general and consuls, appointed as aforesaid, allowances in the nature of superannuation or reward for meritorious public services; it is further enacted, that all the regulations contained in 39 Geo. III. c. 117, 3 Geo. IV. c. 113, 6 Geo. IV. c. 104, respecting superannuation allowances, are hereby extended to the said consuls general and consuls, so far as such regulations can be applied to the cases of such several persons respectively, as fully to all intents and purposes as if the same were repeated and enacted in this present Act. (Sec. 8.) This is modified by the superannuation Act of 4 & 5 Wm. IV. c. 21.

**Allowances during War.**—If it shall at any time happen that by reason of any war which may hereafter arise between his Majesty and any sovereign, or foreign state or power, within the dominions of whom any such consul general or consul shall be appointed to reside, he shall be prevented from residing, and shall in fact cease to reside, at the place to which he may be so appointed, it shall be lawful for his Majesty, by any order to be issued by the advice of his privy council, to grant to any such consul general or consul, who may have served his Majesty in that capacity for any period not less than 3 years, nor more than 10 years next preceding the commencement of any such war, a special allowance not exceeding the proportion of their respective salaries to which such consuls general and consuls should be entitled under the provisions of the said Act of 3 Geo. IV. in case the period of their respective service had exceeded 10 years and had not exceeded 15 years: provided that in case any such consul general or consul shall have served

in such his office for the space of 10 years and more, it shall be lawful for his Majesty, by any such order in council as aforesaid, to grant to him such a proportion of his salary, which by the said Act is authorised to be granted, as a superannuation allowance, according to the several periods of service exceeding 10 years, in the said Act. (6 Geo. IV. c. 87 s. 9.)

**Tables of Fees allowed to be taken by Consuls General and Consuls, substituted by Orders in Council of May 1, 1855, and July 27, 1863, for those appended to the Act of 6 Geo. IV. c. 87.**

**PART I.**

**Fees to be taken in respect of matters in which the Consul's interposition is required by Law.**

	£	s.	d.
For every declaration made before the consul in Forms B, C, F, G, H, and I, in the Schedule to the Merchant Shipping Act 1851, with a view to the registry, transfers, and transmission of ships, interests in ships, or mortgages on ships	0	5	0
For endorsing a memorandum of change of master upon the certificate of registry	0	3	0
For granting a provisional certificate of registry (this fee to be exclusive of fees on declarations)	0	10	0
For recording a mortgage of a ship or shares in a ship made under a certificate of mortgage	0	10	0
For recording the transfer of a mortgage of a ship or shares in a ship made under a certificate of mortgage	0	7	0
For recording the discharge of a mortgage of a ship or shares in a ship made under a certificate of mortgage	0	7	6
For every sale of a ship or shares in a ship made before the consul under a certificate of sale	0	10	0
For inspection of the register book of transactions in ships	0	1	0
For every seaman engaged before the consul	0	2	0
For every alteration in agreements with seamen made before the consul	0	2	0
For every seaman discharged or left behind with the consul's sanction	0	2	0
For every desertion certified by the consul	0	2	0
For finding a seaman's will	0	2	0
For examination of provisions or water, to be paid by the party who proves to be in default	0	10	0
For every salvage bond made in pursuance of 17 & 18 Vict. c. 101, sec. 18, to be paid by the master or owner of the property saved	2	0	0
On disbursements in respect of distressed seamen, a commission of			24 per cent.

**PART II.**

**Fees to be taken in respect of matters in which the Consul's interposition is to be given only when required by the parties interested.**

	£	s.	d.
For noting a protest with certified copy if required	0	5	0
For order of survey	0	5	0
For extending a protest or survey	1	0	0
And if it exceeds 200 words, for every additional 100 words	0	2	6
For preparing and attesting bottomry or arbitration bond	1	0	0
For attesting bottomry or arbitration bond not prepared by consul	0	5	0
For attendance out of consular office at a shipwreck, or for the purpose of assisting a ship in distress, or of saving wrecked goods or property, over and above travelling expenses, per diem	1	1	0
For attending valuation of goods if under 200 <i>l.</i> in value	0	10	6
For attending valuation of goods if 200 <i>l.</i> and upwards in value, for every day's attendance during which the valuation continues	1	1	0
For attending sale of goods if the purchase money is under 200 <i>l.</i>	1	1	0
For attending the sale of goods if the purchase money is 200 <i>l.</i> or upwards, for every day during which the sale continues	2	2	0
Certificate of due landing of goods exported from the United Kingdom	0	9	0
Bill of health	0	10	0
Visé of passport	0	2	0
Obtainment of bill of a British subject not being a seaman	1	1	0
Management of property of a British subject not being a seaman dying intestate, a commission of			24 per cent.
Registration of documents or other matters	0	2	6
And if exceeding 100 words, for every additional 100 words	0	0	6
For every certified copy of a document not before mentioned	0	2	6
And if it exceeds 100 words, for every additional 100 words	0	0	6
For administering an oath or declaration, including attestation of signature if required	0	2	0
For attesting a signature	0	2	0
For annexing the seal of office and signature to any document not mentioned in or otherwise provided for by this table	0	5	0

**Note 1.**—No fee is to be taken for the custody of or enforcement on ships' articles and papers deposited with the consul in pursuance of the Merchant Shipping Act 1851, sec. 373.

**Note 2.**—Where any fee is fixed by the foregoing tables for any particular act or transaction, no additional fee is to be demanded for signature, attestation, or annexing seal of office.

**Note 3.**—The above fees, if not paid in English money, are to be calculated at the current rate of exchange.

**Note 4.**—Abolished, so far as regards the Ottoman dominions, by Order in Council of July 27, 1863, and the following fees substituted in lieu thereof:—In respect of every British ship on each occasion of her entering or clearing at any port in the Ottoman dominions, viz. on her entry inwards 5*s.*, and on her clearance outwards (including a bill of health if required) 5*s.*

For an account of the duties devolving on our Consuls under the Merchant Shipping Act, see *Instructions to Consuls* prepared by the Board of Trade and approved by the Secretary of State for Foreign Affairs, 1855, and *Supplementary Instructions*, 1868.

**CONTRABAND.** In Commerce, a commodity prohibited to be exported or imported, bought or sold.

**CONTRABAND** is also a term applied to designate that class of commodities which neutrals are not allowed to carry during war to a belligerent power. [**NEUTRALITY.**]

**CONVOY.** In Navigation, the term applied to designate a ship or ships of war, appointed by Government, or by the commander-in-chief on a particular station, to escort or protect the merchant ships proceeding to certain ports. Convoys are mostly appointed during war; but they are sometimes also appointed during peace, for the security of ships navigating seas infested with pirates.

Individuals have not always been left to themselves to judge as to the expediency of sailing with or without convoy. The Governments of most maritime states have thought proper, when they were engaged in hostilities, to oblige their subjects to place themselves under an escort of this sort, that the enemy might not be enriched by their capture. Acts to this effect were passed in this country during the American war and the late French war. The last of these Acts (43 Geo. III. c. 57) enacted that it should not be lawful for any ship belonging to any of his Majesty's subjects (except as therein provided) to depart from any port or place whatever unless under such convoy as should be appointed for that purpose. The master was required to use his utmost endeavours to continue with the convoy during the whole voyage, or such part thereof as it should be directed to accompany his ship; and not to separate therefrom without leave of the commander, under very heavy pecuniary penalties. And in case of any ship departing without convoy contrary to the Act, or wilfully separating therefrom, all insurances on the ship, cargo, or freight, belonging to the master, or to any other person directing or privy to such departure or separation, were rendered null and void. The customs officers were directed not to allow any ship that ought to sail with convoy to clear out from any place in the United Kingdom for foreign parts without requiring from the master bond with one surety, with condition that the ship should not depart without convoy, nor afterwards desert or wilfully separate from it. The regulations of this Act did not extend to ships not requiring to be registered, nor to those licensed to sail without convoy, nor to those engaged in the coasting trade, nor to those belonging to the East India Company &c.

It is very common, during periods of war, to make *sailing or departing with convoy* a condition in policies of insurance. This, like other warranties in a policy, must be *strictly* performed. And if a ship warranted to sail with convoy, sail without it, the policy becomes void, whether this be imputable to any negligence on the part of the insured, or the refusal of Government to appoint a convoy.

There are five things essential to sailing with convoy: viz. *first*, it must be with a regular convoy, under an officer appointed by Government; *secondly*, it must be from the place of rendezvous appointed by Government; *thirdly*, it must be a convoy for the voyage; *fourthly*, the master of the ship must have sailing instructions from the

commanding officer of the convoy; and *fifthly*, the ship must depart and continue with the convoy till the end of the voyage unless separated by necessity.

With respect to the third of these conditions we may observe that a warranty to sail with convoy generally means a convoy *for the voyage*; and it is not necessary to add the words 'for the voyage' to make it so. Neither will the adding of these words in some instances make the omission of them, in any case, the ground of a different construction. A warranty to sail with convoy does not, however, uniformly mean a convoy that is to accompany the ship insured the entire way from the port of departure to her port of destination, but such convoy as Government may think fit to appoint as a sufficient protection for ships going the voyage insured, whether it be for the whole or only a part of the voyage.

Sailing instructions, referred to in the fourth condition, are written or printed directions delivered by the commanding officer of the convoy to the several masters of the ships under his care, that they may understand and answer signals, and know the place of rendezvous appointed for the fleet in case of dispersion by storm, or by an enemy &c. These sailing instructions are so very indispensable, that no vessel can have the full protection and benefit of convoy without them: hence, when, through the negligence of the master, they are not obtained, the ship is said to have sailed with convoy; and a warranty in a policy of insurance to that effect is held not to be complied with. If, however, the master be all in his power to obtain sailing instructions, but is prevented from obtaining them by any insuperable obstacle, as the badness of the weather; or if they be refused by the commander of the convoy, the warranty in the policy is held to be complied with.

For further information as to convoy, see *Abbott on the Law of Shipping*, part iii. ch. iii.; *Marshall on Insurance*, book 1. ch. ix. sec. 5; and the Act 43 Geo. III. c. 57 &c.

**COPAIVA.** [**BALSAM.**]

**COPAL**, improperly called Gum Copal, is a valuable and singular kind of resin, that naturally exudes from different large trees, and is imported partly from America, and partly from the East Indies. The best copal is hard and brittle, rounded lumps of a moderate size, easily reducible to a fine powder, of a light lemon yellow colour, beautifully transparent, but often, like amber, containing parts of insects and other small extraneous bodies in its substance. Its specific gravity varies from 1.045 to 1.139. It has neither solubility in water common to gums, nor its solubility in alcohol common to resins, at least any considerable degree. It may be dissolved by digestion in drying linseed oil, and other vegetable menstrua. This solution forms a beautiful transparent varnish, which, when properly applied and slowly dried, is very hard and very durable. Copal varnish was first discovered in France, and was long known by the name of *varnis marbre*. It is applied to snuff-boxes, tea-boards, and other utensils. It preserves and gives lustre to paintings; and contributes to restore the deep colours of old pictures, by filling up cracks, and rendering the surface capable of reflecting light more uniformly. Copal is liable to be confounded with *gum anime*, when the latter is very clear and good. But it is of importance to distinguish between them, as the anime, though valuable for varnish, is much less so than the finest copal; and the varnish with the former being darker colour and not so hard. Besides the external appearance

of each, which is the solubility in alcohol, the anime being brittle between the teeth, while the copal is also brittle between the teeth, but softens in the mouth. [**Dictionary**; &c.]

Gum copal is dug from a tree of Africa, a few miles from the island of Zanzibar; an information, and the prodigious indulgence of the negroes, is enough to supply the demand chased from the diggers residing on the coast. In 1806, it was exported from Zanzibar valued at 37,166*l.* In 1807, it was valued at 37,166*l.* It is equal to about 1000 *l.* of sugar during the dry season in the wet.

In 1806 the imports of the fleet, valued at 37,250*l.* The Philippine Islands, Settlements, and Portugal, export from Zanzibar, equal to about 1000 *l.* of sugar during the dry season in the wet.

The best comes from Bombay.

of each, which is pretty distinct to a practised eye, the solubility in alcohol furnishes a useful test—the animé being readily soluble in this fluid, while the copal is hardly affected by it; copal is also brittle between the teeth, whereas animé softens in the mouth. (Rees's *Cyclopaedia*; Ure's *Dictionary*; &c.)

Gum copal is dug from the earth on the coast of Africa, a few miles inland, opposite the island of Zanzibar; an inferior sort is also found on the island. The supply is supposed to be inexhaustible, and the production only limited by the indolence of the negroes, who will merely dig up enough to supply their daily wants. It is purchased from the diggers by the Indian Banians residing on the coast. Colonel Pelly in his *Report on Mascat* for 1860, published in 1863, states the export from Zanzibar to amount to 875,875 lbs., valued at 37,166*l*. It is usually sold by the *harachah*, equal to about 55 lbs. avoirdupois. That dug during the dry season is inferior to that obtained in the wet.

In 1866 the imports of gum copal were 12,911 cwt., valued at 37,250*l*. The chief sources are the Philippine Islands, Sierra Leone, the Straits Settlements, and Portugal. The average price of copal from the Philippines is only 1*l*. 12*s*. 7*d*. per cwt.; that from other sources is about 3*l*. 10*s*. The best comes from Bombay, and is worth 5*l*. the cwt.

**COPENHAGEN.** The capital of Denmark, on the E. coast of the island of Zealand, in the channel of the Baltic called the Sound; lat. 55° 41' 31" N, long. 12° 35' 46" E. Population, according to census of 1860, 155,143; estimated in 1866 at 165,000. It is a well-built, handsome city. In going into Copenhagen, the course is between the bay on the Stubbén Bank to the left, and the bay on the Middle-grounds, and those in advance of the three Crowns batteries on the right, W.S.W. by compass. From the three Crowns to the rocks the course is S.S.W. The water in the channel is from 6 to 4 fathoms deep; but it is narrow, and the navigation rather difficult. There is no obligation to take a pilot on board; but if a vessel wish for one, she may leave to abreast of the battery, when he will come to her. Vessels not intending to come into harbour bring up in the shoals at from  $\frac{1}{2}$  to  $\frac{3}{4}$  mile from shore, in about 4 fathoms, the town bearing S.S.W. In the harbour, within the boom, the water is from 17 to 18 feet deep. Vessels in harbour load and unload alongside the quay. The anchorage in the roads is good and safe.

**Money.**—Accounts are kept in rixdollars of 6 marks, or 96 skillings; the rixdollar being formerly worth about 4*s*. 1*d*. sterling. But in 1813 a new monetary system was adopted, according to which the new or *Rigsbank* dollar is worth  $\frac{1}{2}$  rixd., being half the value of the old specie dollar, and  $\frac{1}{3}$  of the old current dollar. The new is generally used in commercial transactions as bank money. The *par* of exchange, estimated at the Rigsbank dollar, would be 8 dollars 7*¢* 6 millings per pound sterling.

**Weights & Measures.**—The commercial weights are: 16 pounds = 1 hispound; 20 hispounds = 1 ship-pound; 100 lbs. = 110*½* lbs. avoirdupois = 134 lbs. = 100 lbs. of Amsterdam = 103 of Hamburg. The liquid measures are, 4 ankers = 1 alm or alm;  $\frac{1}{2}$  alm = 1 hogthead; 2 hogheads = 1 alm; 2 pipes = 1 quarter. The anker = 10 (very nearly) English wine gallons. A *Fuder* of wine = 12 alm; and 100 pots = 25*½* wine gallons. The dry measures are, 4 viertels = 1 scheffel; 8 scheffels = 1 fünde or ton; 12 tons = 1 last = 17*½* scheffels bushels. The last of oil, butter, her-

rings, and other oily substances should weigh 221 lbs. nett.

The measure of length is the Rhineland foot = 12*½* inches very nearly. The Danish ell = 2 feet; 100 ells = 68*¾* English yards.

The following comparative table of Danish and English Weights and Measures is given in a *Report* of Jan. 25, 1868, by Mr. Strachey, our Chargé d'Affaires at Copenhagen:—

Danish.	English.
Pond . . . . .	1.1025 lbs. avoirdupois.
Qsint (1. 100 lb.) . . . . .	0.9110 "
Qrt (1. 1000 lb.) . . . . .	0.90011 "
Cwtier (100 lbs.) . . . . .	110.2312 "
Tünde:—	
Of corn . . . . .	5.8270 bushels.
Beer . . . . .	0.80159 gallons.
Butter . . . . .	2.69179 lbs. avoirdupois.
Coal . . . . .	4.6775 bushels.
Pot . . . . .	0.9126 gallons.
Viertel . . . . .	1.5011 "
Alm (ell) . . . . .	0.6864 yard.
Fod (foot) . . . . .	1.0237 feet.
Cubikfod . . . . .	1.0915 cubic feet.
Commerechest . . . . .	2 tons.
Rigsdaler = 6 marks = 96 skillings . . . . .	2 <i>½</i> <i>s</i> .

A new law has just (1868) passed the Rigsdag enacting that in future the French 'gramme' system of weights shall be used by the Danish medical faculty and veterinary doctors in prescribing medicines, and likewise by apothecaries in retailing drugs for medical purposes.

**Trade of Copenhagen.**—This is not very considerable; nor is it rapidly increasing—a result mainly of the late war, and the consequent diminution of the territory and resources of Denmark. But it is to be hoped that the stationary state of her trade may not last long. The improvement of agriculture, occasioned in part by the formation of railways, but far more by the repeal of our corn laws and of the prohibition against importing live stock, by insuring to the Danes a convenient and advantageous market for all sorts of produce, has been and should continue to be nearly as advantageous to them as to ourselves. Timber, pitch, and tar are chiefly imported from Sweden and Norway; flax, hemp, masts, sail-cloth, and cordage from Russia; sugar chiefly from the West Indies and South America; coffee and tobacco from America; wines and brandy from France; coal, iron and machinery, cotton-twist, tea, hardware and earthenware, are the principal articles of direct importation from England. Of coal, we sent to Denmark (principally to Copenhagen), in 1866, 529,565 tons, and of iron about 20,000 ditto. Owing to the erroneous policy of the Danish Government, which has attempted, at a great public loss, to raise and bolster up manufactures, the direct imports of woollens and cottons are inconsiderable. These articles are not, however, prohibited. Down to 1811 they were admitted on condition of their being stamped and put up to auction by the custom-house, which, after retaining 30 per cent. of the gross produce of the sale, paid over the surplus to the importer. In the above year, the duty, in imitation of the German plan, was ordered to be assessed, partly according to the description of the goods and partly according to their weight; so that the existing duty varies on cotton goods, from 3*l*. 15*s*. to 22*l*. 10*s*. per 100 lbs. Danish (equal to 110 lbs. English); on finer woollens, from 3*l*. 15*s*. to 5*l*. 16*s*. 8*d*. per 100 lbs. Danish; and on white silks, 4*s*. 6*d*. per lb. But, though disadvantageous in some respects, this change was mischievous in others; for while it facilitated the collection of the duties, and reduced those on the finer descriptions, it added materially to those on the coarser and most essential fabrics. Hence we need not be surprised that there is an extensive illicit importation of these articles by the Elbe and Holstein frontier. The exports con-

Statement of the Shipping that cleared in and out of Copenhagen in the official Year 1866-7.

	Cleared in		Cleared out	
	Ships	Tons	Ships	Tons
Sailing ships	7,606	317,706	7,191	75,088
Steamers	4,774	106,511	3,276	85,192
Total	10,580	424,217	10,477	160,280

The above figures do not include the numerous steamers that only call for coaling or other purposes.

The number of British vessels that entered and left the port of Copenhagen during that year was 78 ships, of a total tonnage of 181,579 tons: thus Great Britain had the most important share of the foreign trade at this port.

The Danish Parliament has passed two important laws which came into operation in October 1867. One relates to the registration of vessels, and the qualifications which will enable them to sail under Danish colours, and the conditions under which they may maintain their nationality in foreign ports. The second, relating to the measurement of tonnage, is in effect the adoption of our Merchant Shipping Act, and so gives uniformity to the method of ship measurements, and consequent ease to the reckoning and payment of port charges &c. Thus, the tonnage is taken at the same weight and capacity as the English register ton, i. e. 100 English cubic feet = 91.50 Danish cubic feet = 1 register ton; the parts of the ship available for mercantile purposes being determined on exactly the same principles as those adopted in the measurement of British ships.

It is now (1868) proposed at once to exempt British vessels from re-measurement in Danish ports, in such wise that in future British certificates of registry (measure bills) will have the same validity as similar Danish documents; and dues will be paid in Danish ports according to the tonnage denoted therein. (Mr. Vice-Consul A. de C. Crowe's Reports for 1866 and 1867.)

**Port Charges.**—The charges on shipping at this port are as follows:—48 skillings (about 1s. 1½d.) per commercial last (5,200 lbs.) of goods actually discharged. In no case can dues be levied on more than the actual registered tonnage of the ship; and allowance is made for coals and provisions for ship's use, and deductions for engine-room, machinery &c.

40 skillings for harbour dues on each commercial last of goods discharged.

8 skillings per commercial last on goods loaded in harbour for export, but double that sum when the ship lies in the roads.

16 skillings per commercial last for bulwark or pier dues, on ships which only put in for coaling.

Pilotage is charged from the inner roads to the fairway as follows, according to the ship's draught:—

	Summer		Winter	
	Rigsdol.	skil.	Rigsdol.	skil.
8 to 10 feet	7	72	7	51
11 15 "	7	10	9	35
11 15 "	8	41	11	16
16 "	9	78	12	93
17 18 "	11	16	14	75
19 20 "	12	50	16	54

which includes all charges for landing pilot &c.

**Lights &c.**—For a long and most valuable list of new lights, marks, and buoys placed on the Danish coast and waters in 1867, see Mr. Vice-Consul Crowe's Report for that year.

**Banks, Banking.**—The National Bank of Denmark, established in 1818, has its head office in

Copenhagen, with branches at Odensee and Flensburg. It issues notes of 100, 50, 20, and 5 rix-dollars, payable in specie on demand, and transacts all sorts of banking business. In 1856 a private joint-stock bank was established, with a capital of 2,000,000 rix dollars. It is to the credit of the Danish merchants that they passed through the crises of 1857 and 1866 with comparatively few failures of any importance.

**Colonial Trade.**—In the West Indies, the Danes possess still (August 1868) the islands of St. Croix, St. Thomas, and St. John, which, though small, are fertile and well cultivated. But a treaty for selling these islands to the United States of America has been concluded, and only now (see Times, July 23, 1868) waits for ratification at the next meeting of Congress.

St. Thomas has been selected as a mail packet station for the West India mails. It owes this distinction to its port, which is one of the best in the region, being landlocked, easy of egress and ingress, and at once central to the West Indies and near Europe. In the year 1866, 628 British vessels visited St. Thomas, the tonnage being 100,950. Besides these, ships of war and mail packets, the latter to the amount of 25,000 tons annually, visit this harbour. It has one drawback, that it is not very healthy.

The port charges at St. Thomas are as follows: Vessels in ballast 4 dols. 8 cents per 100 tons register. Those bringing and taking cargo pay 57 dols. 12 cents per 100 tons register. Those bringing only coals for the steam packet companies or merchants' account, and leaving in ballast, pay 32 dols. 61 cents per 100 tons register. Vessels with entire cargoes of coals for the Royal Mail Steam Packet Company are by Royal grant and charterparty free of port charges. No charges are levied on vessels arriving in distress. There is a fixed fee on all vessels in ballast or loaded, called the 'port pass,' of 80 cents for schooners, 1 dol. 28 cents for brigs; 2 dols. 56 cents for barques or ships. The import duties are 14 per cent. on the invoice value of importation, coals being admitted duty free.

Lighters without men are from 3 to 5 dols., labour 1 dol. 25 cents per diem; water for shipping 1 to 2 cents per 9 gallons from water boats, free alongside of vessel. Stone ballast, 75 cents to 1 dol. per ton of 2,210 lbs. British weight, free alongside of vessel. Pilotage not compulsory, but vessels signalling for a pilot pay by draught of water, 10 dols. for 16 feet. In 1866 the cargoes from Great Britain to St. Thomas were worth 2,707,404 dols., besides coals to the value of 221,985 dols., equal to 600,000l. The consumption of coal is very considerable, having amounted in the year 1866 to 90,251 tons. A floating dock is in process of construction, and will be capable of taking up vessels of 3,000 tons burden. (Mr. Consul James's Report, 1867.)

Since 1833, when the restrictions on the colonial trade were abolished, St. Croix has sometimes sent considerable quantities of sugar to the United States; but latterly these have decreased, and the produce is now mostly brought to Denmark. The entire imports of sugar, the foreign as well as colonial, into Copenhagen amounted in 1866 to 32,313,400 lbs.—about 90 per cent. of the whole Danish imports. The imports of coffee into Copenhagen are considerable: in 1866 they amounted to 13,250,400 lbs. About three-fourths of the trade with the West Indies is engrossed by Copenhagen, and the rest by Flensburg. The settlements of Tranquebar and Serampore in the East Indies were sold, in 1845, to the East India Company.

The trade to India and China, formerly a monopoly in the hands of a joint-stock company, was opened to the public in 1810. Several vessels have since been fitted out for the trade; but it is doubtful, from the want of produce suitable for the Eastern markets, whether it can ever attain to any considerable importance.

**Credit.**—Goods imported into Copenhagen are commonly sold on credit; 3 months is the term generally allowed on most sorts of goods, and in a few instances 6 months. The discount for ready money is 4 per cent. Bankruptcy is of rare occurrence.

**Commission** on purchases is generally 2 per cent., and on sales 3 per cent., including 1 per cent. *del credere*.

**Insurance.**—Marine assurance is effected, on liberal terms, by a company established in 1746. A good many risks are, however, insured at Amsterdam and Hamburg.

**Careening, Ship's Stores &c.**—Copenhagen has good building-yards, and is in all respects an eligible place for the repair of small ships, and for supplying provisions.

**Repairs.**—The want of a dry dock suitable for repairing vessels of large tonnage has been much felt in Copenhagen, for hitherto this class of vessels has been forced to go over to Sweden or elsewhere to have their repairs effected, with loss to the port and great inconvenience to shipowners. It has now, however, been decided to give up the old Government Dock at Christianshavn; and it is proposed to spend 218,000 rix-dollars to turn it into a suitable slip for commercial vessels.

**General Remarks.**—As already stated, the Danish Government exerted itself for a lengthened period to bolster up a manufacturing interest by laying oppressive duties on most species of manufactured articles. Even under the most favourable circumstances, such conduct, though it may benefit a few individuals, is sure to be productive of great national loss. But in the case of Denmark, the circumstances were such as to render the restrictive system peculiarly injurious. All, or nearly all, the branches of industry carried on in the kingdom were subject to the government of guilds or corporations; no person could engage in any line of business until he was authorised by its peculiar guild; and as the sanction of this body was rarely obtained without a considerable sacrifice, the real effect of the system was to fetter competition and improvement, and to perpetuate monopoly and routine. Even the Danish writers acknowledge that such was the influence of the late regulations. 'Nos ouvriers,' say they, 'sont chers, travaillent lentement, et souvent mal et sans goût; leur éducation est négligée. On ne les forme point à penser, et l'apprenti suit machinalement ce qu'il voit faire au maître.' (Catteneau, *Tabl. des Etats Danois*, tome ii, p. 260.) Within the last few years this system has been quite changed. Industry has been emancipated from many troublesome regulations, and moderate duties have been substituted for prohibitions. Still, however favourably situated in other respects, it would be idle to expect that a country without waterfalls, and without coal, should be able to manufacture cottons, woollens &c. at so cheap a rate as they may be imported from others enjoying greater natural facilities for their production. The staple business of Denmark, her agricultural and rural economy, has been most materially improved of late years; and, as already seen, her exports of raw produce are now of great value and importance. (We are indebted for much of the valuable information in this article to the *Report* for 1868 of

Mr. Strachey, our Chargé d'affaires, and those of Mr. Vice-Consul Crowe for 1867 and 1868.)

**COPPER** (Ger. Kupfer; Dutch, koper; Dan. kobber; Swed. koppar; Fr. cuivre; Ital. rame; Span. cobre; Port. cobre; Russ. мѣд, krasnoi мѣд; Pol. miedz; Lat. cuprum; Arab. nehass; Sans. tamra). A well-known metal, so called from its having been first discovered, or at least wrought to any extent, in the island of Cyprus. It is of a fine red colour, and has a great deal of brilliancy. Its taste is styptic and nauseous; and the hands, when rubbed for some time on it, acquire a peculiar and disagreeable odour. It is harder than silver; its specific gravity varies according to its state, being, when quite pure, near 9-000. Its malleability is great; it may be hammered out into leaves so thin as to be blown about by the slightest breeze. Its ductility is also considerable. Its tenacity is so great, that a copper wire 0-078 of an inch in diameter is capable of supporting 302-25 lbs. avoirdupois without breaking. Its liability to oxidation from exposure to air or damp is its greatest defect. The rust with which it is then covered is known by the name of verdigris, and is one of the most active poisons. (Thomson's *Chemistry*.)

If we except gold and silver, copper seems to have been more early known than any other metal. In the first ages of the world, before the method of working iron was discovered, copper was the principal ingredient in all domestic utensils, and instruments of war. Even now it is applied to so many purposes as to rank next, in point of utility, to iron.

**Alloys of Copper** are numerous and of great value. Those of tin are of most importance. Tin added to copper makes it more fusible, less liable to rust, or to be corroded by the air, and other common substances harder, denser, and more sonorous. In these respects the alloy has a real advantage over unmixed copper: but this is in many cases more than counterbalanced by the great brittleness which even a moderate portion of tin imparts; and which is a singular circumstance, considering that both metals are separately very malleable.

Copper alloyed with from 1 to 5 per cent. of tin is rendered harder than before; its colour is yellow, with a cast of red, and its fracture granular: it has considerable malleability. This appears to have been the usual composition of many of the ancient edged tools and weapons, before the method of working iron was brought to perfection. The χαλκός of the Greeks, and perhaps the *as* of the Romans, was nothing else. Even their copper coins contain a mixture of tin. The ancients did not, in fact, possess (as has been often contended) any peculiar process for hardening copper, except by adding to it a small quantity of tin. An alloy in which the tin is from 0-1 to  $\frac{1}{4}$  of the whole is hard, brittle, but still a little malleable, close grained, and yellowish white. When the tin is as much as  $\frac{1}{2}$  of the mass, it is entirely brittle, and continues so in every higher proportion. The yellowness of the alloy is not entirely lost till the tin amounts to 0-3 of the whole.

Copper (or sometimes copper with a little zinc) alloyed with as much tin as will make from about 0-1 to  $\frac{1}{4}$  of the whole, forms an alloy, which is principally employed for bells, brass cannon, bronze statues, and various other purposes. Hence it is called *bronz* or *bell metal*; and is excellently fitted for the uses to which it is applied, by its hardness, density, sonorousness, and fusibility. For cannon, a lower proportion of tin is commonly used. According to Dr. Watson, the metal employed at Woolwich consists of 100 parts of copper

and from 8 to little malleability it would be well alloy being more give a louder resonance for bell metal: some artists antimony, and some which add to the [BELL METAL:] When, in an metal amounts to a beautiful composition steel, and susceptible well adapted for purposes, and is the idea the above a little arsenic, zinc an alloy similar to of mirrors, is of great Pliney, who says they were reckoned copper mixed (see the xxxiii, s. 9.) For the alloys articles BRASS, PING Chemistry; Rees's Chemical Essays, vol. iv. British Copper Trade copper mines, in &c., but particularly long before, the Corn wrought with much steel 1720 to 1733 they produced 2-73 of pure copper from 1506 to 1775 the 2,650 tons. In 1798 tons; and in 1866 anno

#### Account of the Quantities

plates, cakes, and slabs  
in sheets, nails, bars, rods  
and of yellow metal  
the weight

During 1865 the price market rose from 86l. a ton, to 116l., per ton. In 1866 it fell from 10 January 1, to 80l. on August 1866 were, to British 4,730 tons, Egypt 2,276 tons, Italy 2,423 tons, Hanse 1,000 tons. In consequence of the thus obtained, England, nearly dependent on foreign for her supplies of this metal. Previously to 1793, one of the supply of others the vastly increased demand for the sheathing purposes, the exports of the imports to diminish to balance the increase made up for the falling price.

**Foreign Copper.**—Copper is produced in Sweden, Russia, Japan, Bolivia &c. Near Falun in Sweden, in the same name,

and from 8 to 12 of tin; hence it retains some little malleability, and, therefore, is tougher than it would be with a larger portion of tin. This alloy being more sonorous than iron, brass guns give a louder report than iron guns. A common alloy for bell metal is 80 parts of copper and 20 of tin; some artists add to these ingredients zinc, antimony, and silver, in small proportions; all of which add to the sonorosity of the compound. [Bell Metal; Bronze.]

When, in an alloy of copper and tin, the latter metal amounts to about  $\frac{1}{4}$  of the mass, the result is a beautiful compound, very hard, of the colour of steel, and susceptible of a very fine polish. It is well adapted for the reflection of light for optical purposes, and is therefore called *speculum metal*. Besides the above ingredients, it usually contains a little arsenic, zinc, or silver. The application of an alloy similar to the above, to the construction of mirrors, is of great antiquity, being mentioned by Pliny, who says that formerly the best mirrors were reckoned those of Brundisium, of tin and copper mixed (*stanno et are mistis*). (*Hist. Nat. lib. xxxvii. s. 9.*)

For the alloys of copper with zinc, see the articles BRASS, PISCHEBECK. See also Thomson's *Chemistry*; Rees's *Cyclopædia*; Dr. Watson's *Chemical Essays*, vol. iv.; &c.

**British Copper Trade.**—Great Britain has various copper mines, in Cornwall, Devonshire, Wales &c., but particularly in the first. Though known long before, the Cornish copper mines were not wrought with much spirit till last century. From 1726 to 1755 they produced at an average about 700 tons a-year of pure copper. During the ten years from 1766 to 1775 they produced at an average 2,559 tons. In 1798 the produce exceeded 5,000 tons; and in 1866 amounted to 6,551½ tons, worth

600,770*l.* In 1768 the famous mines in the Parys mountains, near Amlweb, in Anglesea, were discovered. The supplies of ore furnished by them were for a long time abundant beyond all precedent; but for many years past the productiveness of the mines has been declining, and they are now almost exhausted. In 1866 the mines of Anglesea, and other parts of Wales, did not furnish 650 tons of copper. Those of Devonshire yielded 2,248 tons; the quantity produced in the other parts of England being quite inconsiderable. The Irish mines produced in 1866 above 1,335 tons. Those of Scotland never were productive, and have been almost entirely abandoned. Owing to the want of coal in Cornwall, the ores are not smelted on the spot, but are all sent to Swansea; it being found cheaper to carry the ores to the coal than the contrary.

We subjoin an account, compiled by Mr. Robert Hunt of the Mining Record Office, on which every dependence may be placed, of the quantities and values of the copper ore and copper produced in the United Kingdom in 1866:—

	No. of Mines	Ore tons	Copper tons	Value of Ore	Value of Copper
				£	£
England and Wales	165	1,060,010	9,218	661,223	901,731
Ireland	8	11,568	1,335	91,893	117,151

Other sorts	27,516	21,160	15,037	167,256	156,992	87,816

During 1865 the price of copper in the London market rose from 86*l.*, at which it stood in September, to 116*l.*, per ton, the value in November. In 1866 it fell from 106*l.*, at which it stood on January 1, to 80*l.* on August 1. The chief exports in 1866 were, to British India 9,319 tons, France 4,730 tons, Egypt 2,276 tons, Holland 2,047 tons, Italy 2,423 tons, Hanse Towns 1,158 tons.

In consequence of the larger supplies of copper thus obtained, England, instead of being, as formerly, dependent on foreigners for the greater part of her supplies of this valuable metal, became, previously to 1793, one of the principal markets for the supply of others; and notwithstanding the vastly increased demand for copper during the war for the sheathing of ships and other purposes, the exports continued to increase and the imports to diminish: the greater productiveness of the Cornish mines has sufficed not only to balance the increased demand, but also to make up for the falling off in the supplies from Anglesea.

**Foreign Copper.**—Copper ores are abundant in Sweden, Russia, Japan, Australia, Chili, Cuba, Bolivia &c. Near Fahlin, in the province of Bohuslän, in Sweden, is the celebrated copper mine of the same name, supposed to have been

wrought nearly 1,000 years. For a long time it was extremely productive, yielding, towards the beginning of the seventeenth century, an annual produce of about 8,000,000 lbs. of pure metal; but it has since greatly declined; and it is most probable that at no distant period it will be wholly abandoned. (Thomson's *Travels in Sweden*, p. 221.) There are copper mines in other parts of Sweden; but the entire export of copper from that country did not in 1866 exceed 2,100 tons, of a quality inferior to that of England. The produce of the copper mines of Russia has been estimated at 250,000 pounds, or 4,661 tons (Eng.) a-year. (Tegoborski, *Forces Productives de la Russie*, i. 300.) The copper mines of Japan are said to be among the richest in the world. The Dutch and Chinese export considerable quantities of their produce, which is spread all over the East, and is regularly quoted in the price currents of Canton, Calcutta, and Singapore. It is uniformly met with in the shape of bars or ingots; and when the copper of South America is worth in the Canton market from 15 to 16 dollars per picul, that of Japan is worth from 18 to 20 per ditto. Copper the produce of the Persian mines is imported into Bombay and Calcutta from Bashire and Bussorah.

But, in a commercial point of view, the copper

mines of Chili, Cuba, Spain, and Australia are, after those of England, by far the most important. The working of the mines of Cuba, which had been abandoned for a lengthened period, has been resumed successfully. Large quantities both of Chilian and Cuban ore are brought to Swansea to be smelted.

The imports of copper ore and *regulus*, in 1866, were principally derived as follows, viz. :—

Countries	Ore	Regulus
	tons	tons
Sweden	2,995	—
Norway	1,634	—
France	1,879	—
Portugal	1,621	—
Spain	1,635	—
Italy	1,499	—
Cuba	11,234	612
United States	8,679	—
Peru	2,016	1,119
Botcha	7,597	1,991
Chili	21,795	30,829
South Africa	1,138	—
Australia	12,571	—
Other parts	4,888	966
Total	91,660	31,887

The price of ore rose from 5*l.* per ton to 17*l.* 15*s.* 7*d.*, that of *regulus* from 5*l.* 15*s.* 8*d.* to 3*l.* 7*s.* 8*d.*

There was a very extraordinary increase in the supplies of copper from Australia during the 4 or 5 years preceding the discovery of the gold fields. The produce of the Barra Barra mine, for example, which in 1816 was 6,359½ tons ore, had swelled in 1850 to 18,692 tons. But since then some of the mines have been abandoned, and the progress of the others checked, so that, as seen above, the again increasing imports from Australia amounted in 1866 to only 17,311 tons. Foreign copper imported into this country, and the copper obtained from the smelting of foreign ore, were, previously to 1842, wholly, or almost wholly, re-exported; the duty on the copper ore when it was taken or smelted for home use being so very heavy as to make it be altogether exported in an unwrought state. But in 1842 the duty on copper ores and unwrought copper was very materially reduced; and it was wholly repealed in 1853. Hence the great increase in the imports of ore for smelting, and the application of the copper thence derived indifferently to home use or exportation.

Copper is in extensive demand all over India, being largely used in the dockyards, in the manufacture of cooking utensils, in alloying spelter and tin &c. The funeral of every Hindoo brings an accession to the demand, according to his station; the relatives of the deceased giving a brass cup to every Brahmin present at the ceremony: so that 5, 10, 50, 100, 1,000, and sometimes more than 10 times this last number, are dispensed upon such occasions. (Bell's *Commerce of Bengal*.)

**COPPERAIS.** The kernels of the cocoa nut. [COCOA NETS.]

**COPPERAS.** A term employed by the older chemists, and popularly as synonymous with vitriol. There are three sorts of copperas: the *green*, or sulphate of iron; the *blue*, or sulphate of copper; and the *white*, or sulphate of zinc. Of these, the first is the most important.

Sulphate of iron is distinguished in common by a variety of names, as Martial vitriol, English vitriol &c. When pure, it possesses considerable transparency, and has a fine bright, though not very deep, grass-green colour, and a nauseous astringent taste, accompanied with a kind of sweetness. Its specific gravity is 1.834. It uniformly reddens the vegetable blues. This salt was well known to the ancients; and is mentioned by Pliny (*Hist. Nat.* lib. xxxiv. sec. 12) under the names of *misgorsy*, and *calchantum*. It is not made in the direct way, because it can be obtained at less charge from the decomposition of pyrites on a large scale

in the neighbourhood of collieries. It exists in two states; one containing oxide of iron, with 0.22 of oxygen, which is of a pale green, not nitro-red by gallic acid, and giving a white precipitate with prussiate of potass. The other, in which the iron is combined with 0.30 of oxygen, is red, not crystallisable, and gives a black precipitate with gallic acid, and a blue with prussiate of potass. In the common sulphate, these two are often mixed in various proportions.

Sulphate of iron is of great importance in the arts. It is a principal ingredient in dyeing; in the manufacture of ink, and of prussian blue: it is also used in tanning, painting, medicine &c. Sulphuric acid, or oil of vitriol, was always manufactured from sulphate of iron. Now only one kind is produced in this way, viz. the fuming acid, or acid of Nordhausen.

Sulphate of copper, or *blue vitriol*, is a crystalline salt of an elegant sapphire blue colour, hard, compact, and semitransparent; when perfectly crystallised, of a lattish, rhomboidal, decahedral figure; its taste is extremely nauseous, styptic, and acrid; its specific gravity is 2.1913. It is used for various purposes in the arts, and also in medicine.

Sulphate of zinc or *white vitriol* is found native in the mines of Goslar and other places. Sometimes it is met with in transparent pieces, but more commonly in white efflorescences. These are dissolved in water, and crystallised into large irregular masses, somewhat resembling fine sugar, having a sweetish, nauseous, styptic taste. Its specific gravity, when crystallised, is 1.912; when in the state in which it commonly occurs in commerce, it is 1.3275. Sulphate of zinc is prepared in the large way from some varieties of the native sulphuret. The ore is roasted, wetted with water, and exposed to the air. The sulphur attracts oxygen, and is converted into sulphuric acid; and the metal, being at the same time oxidised, combines with the acid. After some time the sulphate is extracted by solution in water; and the solution being evaporated to dryness, the mass is run into moulds. Thus, the white vitriol of the shops generally contains a small portion of iron, and often of copper and lead. (*British Pharmacopœia*, 1867; Lewis's *Materia Medica*; Ure's *Dictionary*; Rees's *Cyclopædia*; Thomson's *Chemistry*; &c.)

**COPROLITES.** Organic remains discovered in the upper green sand. They were first commented on by Professor Henslow and Dr. Buckland. They are of great value as manures, in consequence of the phosphates which they contain. The deposit is so considerable in some parts of Cambridgeshire, that a sum equal in value to the fee simple of the land has been paid for the privilege of digging them, the person renting the right stipulating to restore the surface.

*Quantities and Values of Coprolites raised in the Years 1860, 1861.*

	Tons	Value
Cambridge	1860 30,000	£10,000
Hertford	1861 37,500	75,000
Suffolk		

**COPYRIGHT.** *Copyright in Books.* [BOOKS.] *Copyright in Dramas and Musical Compositions.*—This form of copyright rests on 3 & 4 Wm. IV. c. 15, and 5 & 6 Vict. c. 45. The right may be assigned, but must be in writing. The assignment need not be attested, though formerly, it seems, two witnesses were necessary to the instrument.

*Copyright in Engravings.*—The earliest Act in favour of these works of art was that of 8 Geo. II. c. 13. The Act is called Hogarth's Act, for this artist obtained it for his own protection. The

protection of the Act person complaining, which he had also been refused Justice Keating the Act was not to pavers, but to vest

The Act 8 Geo. I. c. 38; by 17 Geo. I. c. 12. An assignee piracy. Photographic processes for multiplying however, of paintings had no copyright in sculpture 28 Geo. III. c. 71, and the latest Act being 38 Geo. III. c. 71, and there are no decisions

*Copyright in Designs.* ornament is maintained 7 Vict. c. 65; 13 & 14 c. 20; 21 & 25 Vict. are protected by 6 & 7 c. 14; and 21 & 22 V. The law defines the material is metal, to be made to three years, in case of which it lasts months.

The designs must be signed by a particular remedy for piracy by 1 to 20*l.*, recoverable by proceedings, provided that they do not exceed 100*l.*; an act and an injunction in equity.

There is a registrar of designs for registration before Parliament, making rules and regulations with registration and the persons effecting registration c. 104, designs may be for a very trifling fee, which for a year from its registration

*Copyright in Trade-Marks.* to denote the workman's mark is very ancient Herentiaunum have supplied practice in bakers' and of civilisation similar marks

for instance in textile fabrics extant are those of paper invention of paper from watermarks were introduced designs serving, no doubt, to try from which the paper time the process has become mark has become a recognition of trade, by which a purchaser, and a legitimate manufacturer.

Nor is relative to the individual consumer, but it affects country; for it has been a great many occasions destroyed commerce altogether. The fraudulent consignment of the Western States of America were found to be worthless such importations, and them a local manufacture.

protection of the Act was ruled not to extend to a person complaining of piracy of a drawing or design which he had merely procured to be made. It has also been ruled by Chief Justice Erle and Justice Keating that the object of this and similar Acts was not to protect the reputation of engravers, but to vest a commercial property in them.

The Act 8 Geo. II. was extended by 7 Geo. III. c. 38; by 17 Geo. III. c. 57; and 15 & 16 Vict. c. 12. An assignee may maintain an action for piracy. Photographic copies of an engraving are piracies, and indeed all mechanical and scientific processes for multiplying engravings. Authors, however, of paintings, drawings, and photographs had no copyright prior to July 29, 1862. Copyright in sculpture has its beginning in 51 Geo. III. c. 71, amended by 51 Geo. III. c. 56; the latest Act being that of 13 & 14 Vict. c. 101. Still, though these provisions have been made, there are no decisions on the subject.

**Copyright in Designs.**—The right in designs for ornament is maintained by 5 & 6 Vict. c. 100; 6 & 7 Vict. c. 65; 13 & 14 Vict. c. 104; 21 & 22 Vict. c. 70; 21 & 25 Vict. c. 73. Those for utility are protected by 6 & 7 Vict. c. 65; 13 & 14 Vict. c. 104; and 21 & 22 Vict. c. 70.

The law defines the duration of the right, when the material is metal, to five years, in other materials to three years, with some exceptions, in the case of which it lasts from two years to nine months.

The designs must be registered, and may be assigned by a particular form. The Act provides remedies for piracy by penalties varying from 30*l.* to 50*l.*, recoverable by action or summary proceedings, provided that the aggregate penalty does not exceed 100*l.*: an action for damages also lies, and an injunction in equity.

There is a registrar of *useful* designs, and directions for registration have been issued by the Board of Trade, who may, after laying the same before Parliament, make, alter, or revoke the rules and regulations with respect to the mode of registration and the particulars to be furnished by persons effecting registration. By 13 & 14 Vict. c. 104, designs may be *provisionally* registered, for a very trifling fee, which secures the copyright for a year from its registry.

**Copyright in Trade-Marks.**—The use of marks to denote the workmanship of certain manufacturers is very ancient, for the discoveries at Merculaneum have supplied examples of the practice in bakers' and other shops. In modern civilisation similar marks have been adopted, as for instance in textile fabrics—though the earliest extant are those of paper. Very soon after the invention of paper from the pulp of linen rags, watermarks were introduced into the fabric, such designs serving, no doubt, to denote the manufactory from which the paper was issued. Since this time the process has become general, and the trade-mark has become a recognised part of the system of trade, by which a guarantee is given to the purchaser, and a legitimate protection afforded to the manufacturer. Nor is the trade-mark system relative to the individual only, be he producer or consumer, but it affects the commerce of the country; for it has been often found that fraudulent imitations of goods in demand have not only seriously injured the honest dealer, but have on many occasions destroyed some branches of commerce altogether. Thus, for example, a fraudulent consignment of axes from Sheffield to the Western States of America, when the articles were found to be worthless, completely put a stop to such importations, and developed in place of them a local manufacture.

The mischievous effects of permitting an unchecked imitation of trade-marks were often commented on by chambers of commerce in manufacturing towns. At last the attention of the Legislature was effectually called to the practice, and during the session of 1861 two bills were introduced into the House of Commons—the Merchandise Marks Bill, by Mr. Milner Gibson (then President of the Board of Trade), and the Trades-Marks Bill, by Messrs. Roebuck and Haughton. After these bills had both been referred to a select committee, the former, with certain modifications, was accepted. The Act contains 26 sections.

1. The definition and construction of words. The word person to include individuals, companies, and bodies corporate; mark, any name, signature, word, letter, device, emblem, figure, sign, seal, stamp, diagram, label, ticket, or other mark of any other description; and trade-mark to include any such symbol lawfully used to denote any chattel, or in Scotland any article of trade, manufacture, or merchandise; and the word misdemeanor to include crime and offence in Scotland.

The trade-mark must be lawfully used. It has been held that the use of the word 'patent' when the article is not patented takes the article out of the protection of the court.

2. Forging a trade-mark is a misdemeanor.

3. Applying a forged or counterfeit trade-mark a misdemeanor, or a genuine mark &c. to a counterfeited article.

4. Penalties after December 31, 1863, to be equal in value to the article sold, with a further fine of not more than 5*l.* or less than 10*l.*

5. Alterations and additions to trade-marks with intent to defraud treated as forging and counterfeiting.

6. Persons selling articles having false trade-marks are bound to give information as to the place at which they were procured. Penalty on refusal 5*l.*

7. False indication of quantity with intent to defraud. Same penalties as in Sec. 4. This section does not prevent a person being indicted also, if he has committed an offence punishable by law as it at present stands.

8. Same penalties on sellers of false quantities.

9. Provision that it shall not be construed as an offence under the Act if a person applies to any chattel a word generally used to indicate such chattel or article to be of some particular class or description of manufacture only (as for instance Brussels carpet, Meeldin lace &c.), where the goods have a name which, though not strictly accurate, is one of reputation.

10. The trade-mark and forged mark to be described in the indictment.

11. Conviction not to affect any right or civil remedy.

12. Attempt to defraud any particular person need not be alleged or proved in the indictment.

13. Persons aiding or abetting to be guilty.

14. Punishment of misdemeanors under the Act may be imprisonment with or without hard labour for not more than two years, or fine, or both, or imprisonment till the fine, if any, be paid or satisfied.

15. Process for recovering penalties.

16. Summary proceedings before justices under 11 & 12 Vict. c. 43.

17. In actions, penalties to be accounted for as other moneys payable to the Crown, and plaintiffs to recover full costs of suit.

18. Limitation of actions.

19. After Dec. 31, 1863, the vendor of an article with a trade-mark to be deemed to contract that the mark is genuine.

official buttons and beads. The inferior kind is mostly manufactured into ear and finger rings. Its price varies from 20 dols. to 100 dols. per picul, according to quality. The finer sorts range from 1,500 dols. to 3,300 dols. per picul. Fine red Mediterranean coral also obtains a good market in China. The use of false coral beads in China is very considerable; they are made from resinous matters mixed with red colouring dyes surrounding a core of tin foil and gum. The price is about 10 dols. per canty. (Dr. Williams's *Chinese Guide*, (2d. ed.)

The manner of fishing coral is nearly the same every where. That which is most commonly practised in the Mediterranean is as follows:—7 or 8 men go in a boat, commanded by the proprietor; the master throws his net, if we may so call the machine which he uses to tear up the coral from the bottom of the sea; and the rest work the boat, and help to draw in the net. This is composed of two beams of wood tied crosswise, with leads fixed to them to sink them; to these beams is fastened a quantity of hemp, twisted loosely round, and intermingled with some loose netting. In this condition the machine is let down into the sea; and when the coral is pretty strongly entwined in the hemp and nets, they draw it up with a rope, which they unwind according to the depth, and which it sometimes requires half a dozen boats to draw. If this rope happens to break, the fishermen run the hazard of being lost. Before the fishers go to sea, they agree for the price of the coral; and the produce of the fishery is divided, at the end of the season, into 13 parts; of which the proprietor has 4, the master 2, and the other 6 men 1 each; the 13th belongs to the company for payment of boat-hire, &c. (Ainslie's *Materia Indica*; Rees's *Cyclopædia*; *Encyclopædia Metropolitana*; Bell's *Commerce of Bengal*; Prunaudais, *Commerce de l'Inde*.)

(CORDAGE (Ger. tauwerk; Dutch, touwwerk; Fr. manœuvres, cordage; Ital. caulame; Span. jarcia, cordaje). A term used to denote all manner of cords or ropes, how much soever they may differ in size, but especially those used in the rigging of ships. The term *cord* is usually employed to distinguish cordage of small size, that is, of small circumference; *rope*, to distinguish the larger descriptions of cordage; and *cable*, to distinguish the largest of all, or the cordage used in the anchoring of ships.

Cordage may be made of an infinite variety of materials—of every thing, in fact, which is slender, flexible, and moderately tenacious, such as the fibres of various descriptions of vegetables; hair, wool, and silk; leathern thongs, wire &c. In Europe it has been mostly formed of the fibres of hemp and flax, particularly the former. But in some parts of the East, coir, or the fibres of the husk of the cocoa nut, is extensively used in the manufacture of the larger descriptions of cordage. (Cours, &c.)

The best cordage is that, of course, which is made of the best material and in the most approved manner. It must neither be too much nor too little twisted. Ropes consist of more or fewer strands according to their thickness. At an average the fibres of hemp used in making ropes lose about one-third of their length by twisting; but in the case of coir the loss is greater.

Ropes are sometimes made of iron wire; and when properly manufactured they have been found to answer much better than might have been anticipated. Chains are now also frequently substituted for various descriptions of ropes; and every body knows that hempen cables have

been all but wholly superseded by iron chains. [CABLES.]

The use of foreign cordage in English ships was formerly prohibited except under peculiar circumstances, but this prohibition has latterly been repealed; and our ship-owners and ship-builders may now use either native or foreign cordage, whichever they prefer. In 1866, 149,222 cwt. of cordage, valued at 412,729*l.*, were exported from the United Kingdom, chiefly to Australia and British North America.

According to Professor Robinson, if you square the circumference of a rope in inches,  $\frac{1}{4}$  the product will be the number of tons weight which it will bear. Very little dependence can, however, be placed on a rule of this sort; for the strength of a rope will depend as much on the material of which it is made, and on its make, as on its circumference. (Rees's *Cyclopædia*; *Penny Cyclopædia*; &c.)

CORIANDEE (Fr. coriandre; Ger. koriander; Ital. coriandro; Span. cilantro). The fruit of the *Coriandrum sativum*, Nat. Order *Apiaceæ*. It is an annual plant, a native of Italy; but is cultivated in Britain and many other countries. The seed when dried is nearly as large as white pepper, is yellowish-brown, and has an agreeable aromatic odour and flavour. Coriander seeds are used in medicine and confectionary. (*British Pharmacopœia*, 1867.)

CORK (Ger. kork; Dutch, kork, kurk, vlothout; Fr. liège; Ital. sughero, suvero; Span. corcho; Port. cortica (de Soveriro); Russ. korkowoe derewo; Lat. suber). The thick and spongy bark of a species of oak (*Quercus Suber*, Linn.), abundant in dry mountainous districts in the south of France, and in Spain, Portugal, Italy, and Barbary. The tree grows to the height of 30 feet or more, has a striking resemblance to the *Quercus Ilex*, or evergreen oak, and attains to a great age. After arriving at a certain state of maturity, it periodically sheds its bark; but this valuable product is found to be of a much better quality when it is artificially removed from the tree, which may be effected without any injury to the latter. After a tree has attained to the age of from 26 to 30 years, it may be barked; and the operation may be subsequently repeated once every 8 or 10 years, the quality of the cork improving with the increasing age of the tree. The bark is taken off in July and August; and trees that are regularly stripped are said to live for 150 years or more. Beckmann (vol. ii. p. 115, Eng. ed.) says that 'when the tree is 15 years old it may be barked, and this can be done successively for 8 years.' This erroneous statement having been copied into the article 'Cork' in Rees's *Cyclopædia*, has thence been translated to a multitude of other works. (Poiret, *Hist. Philosophique des Plantes*, tom. vii. 419.)

Cork is light, porous, readily compressible, and wonderfully elastic. It may be cut into any sort of figure, and, notwithstanding its porosity, is nearly impervious to any common liquor. These qualities make it superior to all other substances for stoppers for bottles, in the manufacture of which it is principally made use of. It is also employed as buoys to float nets, in the construction of life-boats, the making of water-proof shoes, and in various other ways. It was imported into England in order to be used as floats to nets, as early as the beginning of the fourteenth century. Before being manufactured into stoppers, the cork is charred on each side; this makes it contract, lessens its porosity, and consequently fits it the better for cutting off all communication between the external air and the liquid

CORK

in the bottle. Spanish black is made of calcined cork.

The Greeks and Romans were both well acquainted with cork. They seem also to have occasionally used it as stoppers for vessels (*Cadorum obturamentis*, Plin. *Hist. Nat.* xvi. 8); but it was not extensively employed for this purpose till the seventeenth century, when glass bottles, of which no mention is made before the fifteenth century, began to be generally introduced. (Beckmann's *Hist. Invent.* vol. ii. pp. 114-127, Eng. ed.)

Cork trees abound in various parts of Algeria, particularly in the province of Constantine and in Kabylia. In the latter the bark is used as a covering for houses. The Government of Algiers has made special concessions of land to encourage the cultivation of cork trees.

The manufacture of bottle corks is a considerable source of wealth in the province of Gironde, which produces annually about 125,000 quintals of cork. To supply the demand of the manufacture, which annually consumes 155,000 quintals, 30,000 quintals of rough cork are imported, principally from Andalusia, Estramadura, and the district of Arenys de Mar in the province of Barcelona. The annual production amounts to 1,283,000,000 bottle corks, valued at about 15,500,000 francs. The value of the raw material may be estimated at 3,000,000 francs. Corks are made chiefly in San Felice

CORN LAWS AND CORN TRADE

de Guixois, Palafurgell, Palajos, Darnius, and Junquera. In Catalonia the annual manufacture of bottle corks varies from 15,000 to 20,000 hales, of from 25,000 to 30,000 corks each.

The chief seats of the production of cork in Portugal are the provinces of Alentejo and Algarve. The exportations are chiefly to Great Britain, Belgium, Holland &c.

The British import duty on unmanufactured cork was abolished in the year 1815, and in the year 1860 the duties on corks ready made and cork squared for rounding, which had been fixed in 1853 at 6d. per lb. and 8s. per cwt. respectively, were repealed. The policy of the abolition of these duties was questioned, as export duties were levied on cork in Spain and Portugal, the producing countries. The result, as was anticipated, has been that the trade in the manufactured article has very materially increased, whilst the imports of the raw material have remained comparatively stationary. We extract from the annual statement of Trade and Navigation the following figures of the imports of both kinds in 1859 and 1866:—

Year	Cork, unmanufactured		Corks, ready made	
	Quantities	Values	Quantities	Values
1859	tons 5,717	£ 185,115	hls. 537,682	£ 35,601
1866	6,211	203,516	2,684,128	147,599

Quantities and Value of Rough Cork, and of Corks cut, exported from Spain in each Year from 1860 to 1865, distinguishing the Exportations to France and the United Kingdom.

CORN (Ger. corn, getreide; Dutch, graanen, koren; Dan. korn; Swed. and, spannal; Fr. blés, grains; Ital. biade, grani; Span. granos; Russ. chjeb; Pol. zboze). The grain or seed of plants separated from the spica or ear, and used for making bread &c. Such are—BARLEY; MAIZE; OATS; PEAS; RYE; WHEAT; &c.

CORNELIAN. [CARNELIAN.]  
CORN LAWS AND CORN TRADE. From the circumstance of corn forming, in this and the most other countries, the principal part of the food of the people, the trade in it, and the laws by which the trade is regulated, are justly looked upon as of the highest importance. But this is upon as the highest importance. But this is upon as the highest importance that renders it necessary to enter at some length into the discussion of this subject. Its difficulty is at least equal to its interest. The enactments made at different periods with respect to the corn trade, and the opinions advanced as to their policy, have been so various and contradictory, that it is indispensable to submit them to some examination, and, if possible, to ascertain the principles which ought to pervade this department of commercial legislation.

- IV. FOREIGN CORN TRADE.

I. HISTORICAL SKETCH OF THE CORN LAWS.

For a long time the regulations with respect to the corn trade were principally intended to promote abundance and low prices. But though the purpose was laudable, the means adopted for accomplishing it had, for the most part, a directly opposite effect. When a country exports corn, it seems, at first sight, as if nothing could do so much to increase her supplies as the prevention of exportation; and even in countries that do export, its prohibition seems to be a prudent measure, and calculated to prevent the supply from being diminished, upon any emergency below its natural level. These are the conclusions that immediately suggest themselves upon the subject; and it requires a pretty extensive experience, an attention to facts, and a habit of reasoning upon such topics, to perceive the fallacy. These, however, were altogether wanting

when the regulations began to be introduced in other countries. They were with what were supposed common sense; and the large supply of the possible, its exportation, or forbidden above certain limits.

The principle of absolute liberty has been steadily a turbulence of the period. Conquest to the year 1815; but at the last was passed, authorising, whenever the home price (equal in amount to present money) per quarter home price did not exceed an additional benefit was agriculture by prohibiting home price exceeded a case. But the effect prevented these regulations into full effect, and, in great measure inoperative.

In addition to the restriction, it has been commonly attempted to increase the home price by admitting its unrestrained, but by holding out encouragement to the import, not, however, been more. During the 500 years in which importation was means; and during the last, for the most part, restrictions.

Besides attempting to exportation, our success then by proscribing the dealers. This most successful upon with suspicious agriculturists concluded to sell their produce at a price, were the corn while the consumers could the dealers were made ascribed the dearths that entirely to the practices of buying up corn and withholding it from the market. These notions, which degree of influence, led particularly in the reign which the freedom of trade entirely suppressed, the buying of it in one it again in another, was able by imprisonment the was allowed to carry another without a license which was confided by the quarter sessions, commerce came to be the policy of these restraints more obvious. They were in 1621; and in 1663 the declared to be legal so exceed 48s. per quarter, which, as Adam Smith with all its imperfections, twenty than any other in 1773 the last remnants restraining the corn dealers was entirely grossing of corn had

when the regulations affecting the corn trade began to be introduced into Great Britain and other countries. They were framed in accordance with what were supposed to be the dictates of common sense; and their object being to procure as large a supply of the prime necessary of life as possible, its exportation was either totally forbidden, or forbidden when the home price was above certain limits.

The principle of absolute prohibition seems to have been steadily acted upon, as far as the turbulence of the period would admit, from the Conquest to the year 1436, in the reign of Henry VI.; but at the last-mentioned period an Act was passed, authorising the exportation of wheat whenever the home price did not exceed 6s. 8d. (equal in amount of pure silver to 12s. 10<sup>3</sup>/<sub>4</sub>d. present money) per quarter, and barley when the home price did not exceed 3s. 4d. In 1463 an additional benefit was intended to be conferred on agriculture by prohibiting importation until the home price exceeded that at which exportation ceased. But the fluctuating policy of the times prevented these regulations from being carried into full effect, and, indeed, rendered them in a great measure inoperative.

In addition to the restraints laid on exportation, it has been common in most countries to attempt to increase the supply of corn, not only by admitting its unrestrained importation from abroad, but by holding out extraordinary encouragement to the importers. This policy has not, however, been much followed in England. During the 500 years immediately posterior to the Conquest, importation was substantially free; but it was seldom or never promoted by artificial means; and during the last century and a half it has, for the most part, been subjected to severe restrictions.

Besides attempting to lower prices by prohibiting exportation, our ancestors attempted to lower them by proscribing the trade carried on by corn dealers. This most useful class of persons were looked upon with suspicion by every one. The agriculturists concluded that they would be able to sell their produce at higher prices to the consumers, were the corn dealers out of the way; while the consumers concluded that the profits of the dealers were made at their expense; and ascribed the dearths that were then very prevalent entirely to the practices of the dealers, or to their buying up corn and withholding it from market. These notions, which have still a considerable degree of influence, led to various enactments, particularly in the reign of Edward VI., by which the freedom of the internal corn trade was entirely suppressed. The *engrossing* of corn, or the buying of it in one market with intent to sell it again in another, was made an offence punishable by imprisonment and the pillory; and no one was allowed to carry corn from one part to another without a license, the privilege of granting which was confided by a statute of Elizabeth to the quarter sessions. But as the principles of commerce came to be better understood, the impolicy of these restraints gradually grew more and more obvious. They were considerably modified in 1624; and in 1663 the engrossing of corn was declared to be legal so long as the price did not exceed 48s. per quarter (15 Ch. II. c. 7); an Act which, as Adam Smith has justly observed, has with all its imperfections done more to promote plenty than any other law in the statute book. In 1773 the last remnant of the legislative enactments restraining the freedom of the internal corn dealers was entirely repealed. But the engrossing of corn has, notwithstanding, been

since held to be an offence at common law; and, so late as 1800, a corn dealer was convicted of this imaginary crime. He was not, however, brought up for judgment; and it is not very likely that any similar case will ever again occupy the attention of the courts.

The Acts of 1436 and 1463, regulating the prices when exportation was allowed and when importation was to cease, continued, nominally at least, in force till 1562, when the prices at which exportation might take place were extended to 10s. for wheat and 6s. 8d. for barley. But a new principle—that of imposing duties on exportation—was soon after introduced; and in 1571 it was enacted that wheat might be exported, paying a duty of 2s. per quarter, and barley and other grain a duty of 1s. 4d., whenever the home price of wheat did not exceed 20s. per quarter, and barley and malt 12s. At the Restoration the limit at which exportation might take place was very much extended; but as the duty on exportation was, at the same time, so very high as to be almost prohibitory, the extension was of little or no service to the agriculturists. This view of the matter seems to have been speedily taken by the Legislature; for in 1663 the high duties on exportation were taken off, and an ad valorem duty imposed in their stead, at the same time that the limit of exportation was extended. In 1670 a still more decided step was taken in favour of agriculture; an Act being then passed which extended the exportation price to 53s. 4d. per quarter for wheat, and other grain in proportion, imposing at the same time prohibitory duties on the importation of wheat till the price rose to 53s. 4d., and a duty of 8s. between that price and 80s. But the real effects of this Act were not so great as might have been anticipated. The extension of the limit of exportation was rendered comparatively nugatory in consequence of the continuance of the duties on exportation caused by the necessities of the Crown; while the want of any proper method for the determination of prices went far to nullify the prohibition of importation.

At the accession of William III. a new system was adopted. The interests of agriculture were then looked upon as of paramount importance; and to promote them, not only were the duties on exportation totally abolished, but it was encouraged by the grant of a *bounty* of 5s. on every quarter of wheat exported, while the price continued at or below 48s.; of 2s. 6d. on every quarter of barley or malt, while their respective prices did not exceed 24s.; and of 3s. 6d. on every quarter of rye, when its price did not exceed 32s. (1 Wm. & Mary c. 12.) A bounty of 2s. 6d. per quarter was subsequently given upon the exportation of oats and oatmeal, when the price of the former did not exceed 15s. per quarter. Importation continued to be regulated by the Act of 1670.

Much diversity of opinion has been entertained with respect to the policy of the bounty. That it was intended to raise the price of corn is clear, from the words of the statute, which states 'that the exportation of corn and grain into foreign parts, when the price thereof is at a low rate in this kingdom, hath been a great advantage not only to the owners of land, but to the trade of the kingdom in general; therefore, &c. But admitting this to have been its object it has been contended that the low prices which prevailed during the first half of last century show that its real effect was precisely the reverse; and that, by extending tillage, it contributed to reduce prices. It will be afterwards shown that this could not really be the case; and the fall of prices may be sufficiently

50s. a prohibiting duty of 24s. 3d. was exigible. The bounty continued as before, and exportation without bounty was allowed to 46s. It was also enacted that foreign wheat might be imported, stored under the king's lock, and again exported free of duty; but if sold for home consumption, it became liable to a warehouse duty of 2s. 6d. in addition to the ordinary duties payable at the time of sale.

In 1797, the Bank of England obtained an exemption from paying in specie; and the consequent facility of obtaining discounts and getting a command of capital, which this measure occasioned, gave a fresh stimulus to agriculture, the efficacy of which was most powerfully assisted by the scarcity and high prices of 1800 and 1801. Inasmuch, however, as the prices of 1804 would not allow the cultivation of the poor soils, which had been broken up in the dear years, to be continued, a new corn law was loudly called for by the farmers, and passed in 1804. This law imposed a prohibitory duty of 24s. 3d. per quarter on all wheat imported when the home price was at or below 63s.; between 63s. and 66s. a middle duty of 2s. 6d. was paid, and above 66s. a nominal duty of 6d. The price at which the bounty was allowed on exportation was extended to 50s., and exportation without bounty to 54s. By the Act of 1791 the maritime counties of England were divided into 12 districts, importation and exportation being regulated by the particular prices of each; but by the Act of 1804 they were regulated, in England, by the aggregate average of the maritime districts, and in Scotland by the aggregate average of the 4 maritime districts into which it was divided. The averages were taken 4 times a year, so that the ports could not be open or shut for less than 3 months. This manner of ascertaining prices was, however, modified in the following session; it being then fixed that importation, both in England and Scotland, should be regulated by the average price of the 12 maritime districts of England.

In 1805 the crop was very considerably deficient, and the average price of that year was about 22s. per quarter above the price at which importation was allowed by the Act of 1804. As the depreciation of paper compared with bullion was at that time only four per cent., the high price of that year must have been principally owing to the new law preventing importation from abroad till the home price was high, and then fettering mercantile operations, and to the formidable obstacles which the war threw in the way of importation. In 1806, 1807, and 1808, the depreciation of paper was nearly 3 per cent.; and the price of wheat in those years being generally from 66s. to 75s., the importations were but small. Several impolitic restraints had been for a long time imposed on the free importation and exportation of corn between Great Britain and Ireland, but they were wholly abolished in 1806; and the Act of that year (46 Geo. III. c. 97), establishing a free trade in corn between the two great divisions of the empire, was not only a wise and proper measure in itself, but has powerfully contributed to promote the general advantage. From autumn 1808, to spring 1811, the depreciation of the currency was unusually great; and several crops in that interval being likewise deficient, the price of corn, influenced by both causes, rose to a surprising height. At that time no vessel could be laden in any continental port for England without purchasing a license, and the freight and insurance were at least five times as high as during peace. But the detection of Napoleon's anti-commercial system, in the autumn of 1813, having increased the

facilities of importation, a large quantity of corn was poured into the kingdom; and in 1811 its *bullion* price fell below the price at which importation was allowed.

Before this fall of price, a committee of the House of Commons had been appointed to enquire into the state of the laws affecting the corn trade, and recommended in their Report (dated May 11, 1813) a very great increase of the prices at which exportation was allowable, and when importation free of duty might take place. This recommendation was not, however, adopted by the House; but the fact of its having been made when the home price was at least 112s. per quarter displayed a surprising solicitude to exclude foreigners from all competition with the home growers.

The wish to lessen the dependence of the country on foreign supplies formed the sole ostensible motive by which the committee of 1813 had been actuated in proposing an alteration in the Act of 1804. But after the fall of price in autumn 1813, and in the early part of 1814, it became obvious, on comparing our previous prices with those of the continent, that without an alteration of the law in question this dependence would be a good deal increased; that a considerable extent of such poor lands as had been brought into cultivation during the high prices would be again thrown into pasture; and that rents would be lowered. These consequences alarmed the landlords and occupiers; and in the early part of the session of 1814 a series of resolutions were voted by the House of Commons, declaring that it was expedient to repeal the bounty, to permit the free exportation of corn whatever might be the home price, and to impose a graduated scale of duties on the importation of foreign corn. Thus, foreign wheat imported when the home price was at or under 61s. was to pay a duty of 24s.; when at or under 65s. a duty of 23s.; and so on till the home price should reach 86s., when the duty was reduced to 1s., at which sum it became stationary. Corn imported from Canada, or from the other British colonies in North America, was to pay  $\frac{1}{2}$  the duties on other corn. As soon as these resolutions had been agreed to, two bills founded on them—one for regulating the importation of foreign corn, and another for the repeal of the bounty, and for permitting unrestricted exportation—were introduced. Very little attention was paid to the last of these bills; but the one imposing fresh duties on importation encountered a very keen opposition. The manufacturers, and every class not directly supported by agriculture, stigmatised it as an unjustifiable attempt artificially to keep up the price of food, and to secure excessive rents and large profits to the landlords and farmers at the expense of the consumers. Meetings were very generally held, and resolutions entered into strongly expressive of this sentiment, and dwelling on the fatal consequences which, it was affirmed, a continuance of the high prices would have on manufactures and commerce. This determined opposition, coupled with the indecision of ministers, and perhaps, too, with an expectation on the part of some of the landholders that prices would rise without any legislative interference, caused the miscarriage of this bill. The other bill, repealing the bounty, and allowing an unlimited freedom of exportation, was passed into a law.

Committees had been appointed in 1814, by both Houses of Parliament, to examine evidence and report on the state of the corn trade; and, in consequence, a number of the most eminent agriculturists were examined. The witnesses were unanimous in this only: that the protecting prices in the Act of 1804 were insufficient to enable the farmers to make good the engagements into which

## CORN LAWS AND CORN TRADE

432

they had subsequently entered, and to continue the cultivation of the inferior lands lately brought under tillage. Some of them thought that 120s. should be fixed as the lowest limit at which the importation of wheat free of duty should be allowed; others varied from 90s. to 100s., from 80s. to 90s., and a few from 70s. to 80s. The general opinion, however, seemed to be that 80s. would suffice; and as prices continued to decline, a set of resolutions founded on this assumption were submitted to the House of Commons by Mr. Robinson; of the Board of Trade (afterwards Lord Ripon); and having been agreed to, a bill founded on them was, after a very violent opposition, carried in both Houses by immense majorities, and finally passed into a law (55 Geo. III. c. 20). According to this Act, all sorts of foreign corn, meal, or flour might be imported at all times free of duty into any part of the United Kingdom, in order to be warehoused; but foreign corn was not permitted to be imported for home consumption, except when the average prices of the several sorts of British corn were as follows; viz. wheat, 80s. per quarter; rye, peas, and beans, 53s.; barley, bear, or bigg, 40s.; and oats, 26s.; and all importation of corn from any of the British plantations in North America was forbidden except when the average home prices were at or under—wheat, 67s. per quarter; rye, peas, and beans, 44s.; barley, bear, or bigg, 33s.; and oats, 22s.

The agriculturists confidently expected that this Act would immediately raise prices, and render them steady at about 80s. But, for reasons which will be afterwards stated, these expectations were entirely disappointed; and a more ruinous fluctuation of prices took place during the period of our re-existence than in any previous period of our recent history. In 1821, when prices had sunk very low, a committee of the House of Commons was appointed to enquire into the causes of the depressed state of agriculture, and to report their observations thereon. This committee, after examining a number of witnesses, drew up a report, which, though not free from error, is a valuable document. It contains a forcible exposition of the pernicious influence of the law of 1815, of which it suggested several important modifications, which it suggested were not adopted; and as the low prices, and consequent distress of the agriculturists, continued, the subject was brought under the consideration of Parliament in the following year. After a good deal of discussion, a new Act was then passed (3 Geo. IV. c. 60), which enacted that after prices had risen to the limit of free importation fixed by the Act of 1815, that Act was to cease and the new statute to come into operation. This statute lowered the prices fixed by the Act of 1815, at which importation could take place for home consumption, to the following sums, viz.:

	For Corn not of the British Possessions in North America	For Corn of the British Possessions in North America
	per quarter	per quarter
Wheat	71s.	29s.
Rye, peas, and beans	46s.	20s.
Barley, bear, or bigg	35s.	20s.
Oats	22s.	20s.

But, in order to prevent any violent oscillation of prices from a large supply of grain being suddenly thrown into the market, it was enacted that a duty of 17s. per quarter should be laid on all wheat imported from foreign countries, during the first 3 months after the opening of the ports, if the price was between 70s. and 80s. per quarter, and of 12s. afterwards; that if the price was between 80s. and 85s., the duty should be 10s. for the first 3 months, and 5s. afterwards; and that if the price

should exceed 85s., the duty should be constant at 1s.; and proportionally for other sorts of grain.

This Act, by preventing importation until the home price rose to 70s., and then loading the quantities imported between that limit and the limit of 85s. with heavy duties, was certainly more favourable to the views of the agriculturists than the Act of 1815. But, unluckily for them, the prices of no species of corn, except barley, were sufficiently high, while this Act existed, to bring it into operation.

In 1825 the first approach was made to a better system by permitting the importation of wheat from British North America, without reference to the price at home, on payment of a duty of 5s. per quarter. But this Act was passed with difficulty, and was limited to 1 year's duration.

Owing to the drought that prevailed during the summer of 1826, there was every prospect that there would be a great deficiency in the crops of that year; and, in order to prevent the disastrous consequences that might have taken place, had importation been prevented until the season was too far advanced for bringing supplies from the great corn markets in the north of Europe, his Majesty was authorised to admit 500,000 quarters of foreign wheat on payment of such duties as the order in council for its importation should declare. And when it was ascertained that the crops of oats, peas, &c. were greatly below an average, ministers issued an order in council, on their own responsibility, on September 1, authorising the immediate importation of oats on payment of a duty of 2s. per bushel; and of rye, peas, and beans on payment of a duty of 3s. 6d. per quarter. A considerable quantity of oats was imported under this order, the timely appearance of which had undoubtedly a very considerable effect in mitigating the pernicious consequences arising from the deficiency of that species of grain. Ministers obtained an indemnity for this order on the subsequent meeting of Parliament.

Nothing could more strikingly evince the policy of the Acts of 1815 and 1822 than the necessity, under which the Legislature and Government had been placed, of passing the temporary Acts and issuing the orders referred to. It is very intelligent portion of the agriculturists became at length, to perceive that the corn laws were really calculated to produce the advantages they had anticipated; and a conviction that increased facilities should be given to importation became general throughout the country. This conviction made considerable progress in the House of Commons; so much so, that several members who supported the measures adopted in 1815 and 1822 expressed themselves satisfied that the principle of exclusion had been carried too far, and that a more liberal system should be adopted. Ministers having participated in these sentiments, Mr. Canning moved a series of resolutions, in favour of the effect that foreign corn might always be admitted, free of duty, in order to be warehoused; and that it should always be admissible for home consumption upon payment of certain duties. Thus, in the instance of wheat, it was proposed that, when the home price was at or above 70s., a duty of 2s. should be imposed; when the price was at 60s., the duty on importation was to be 2s., when at 68s., the duty was to be 4s., and so on. The limit at which the constant duty of 1s. per quarter was to take effect in the case of barley was originally fixed at 40s., but was subsequently raised to 40s., the

increasing by 1s. 6d. for every fall below that limit. The constant duty of 1s. per quarter in the case of oats was also increasing at the rate of 1s. per quarter, so that the price fell below the duty on colonial wheat was not when the home price was constant at 5s.; the duties on colonial grain were similar, and were agreed to by a large majority on them was submitted to the House of Commons. A change of ministers, which occurred several years, originating in some, even, who saw reason to become opponents; and a clause of Wellington, interdicting foreign corn until the home price had been carried in the bill, justly considering it as entirely subversive of its object. A new set of resolutions were brought forward in 1837 (afterwards Lord Grey) founded on the same principle, but had been rejected during the session. The duty was not made to be 1s. per bushel, as in Mr. Canning's resolutions, when the price was 60s., it being 23s. per bushel; the Imperial duty was 60s., and 1s. only when the price was 68s. After a good deal of deliberation were carried, and enacted (Geo. IV. c. 60).

The crops having been depressed, there was a large importation in these years, its average price being about 65s. per quarter. In 1836 having been more abundant, importation almost wholly ceased, the price of wheat sunk in 1835 to 50s., less than it had been in 1817. In consequence of the low harvests and low prices, the Government was obliged to take public attention, and an impression was made that the improvement was very rapid, that, despite the depression, and the existence of the law, the prices would fall to about the level of the present. But the cycle of the law having terminated in 1837, the succeeding 5 years were so much so that the price fell to 40s. per quarter, the importation during years being also very low. In the price of corn, the state of the commerce was in the pecuniary revolution, and other causes, again attracted attention to the corn laws, the magnitude and injurious operation being very strongly animadverted upon in the manufacturing classes. An association, denominated the Corn Law League, originally formed in 1837, which subsequently extended to most parts of the country, the express purpose of keeping the agitation against the corn laws, and the force of the measures of the Government, and the subject at

creasing by 1s. 6d. for every 1s. when the price fell below that limit. The limit at which the constant duty of 1s. per quarter was to take place in the case of oats was originally fixed at 28s.; but it was subsequently raised to 33s., the duty increasing at the rate of 1s. per quarter for every shilling that the price fell below that limit. The duty on colonial wheat was fixed at 6d. per quarter when the home price was above 65s.; and when the price was under that sum the duty was constant at 5s.; the duties on other descriptions of colonial grain were similar. These resolutions were agreed to by a large majority; and a bill founded on them was subsequently carried through the House of Commons. Owing, however, to the change of ministers, which took place in the interim, several peers, originally favourable to the bill, and some, even, who assisted in its preparation, saw reason to become amongst its most violent opponents; and a clause moved by the Duke of Wellington, interdicting all importation of foreign corn until the home price exceeded 66s., having been carried in the Lords, ministers gave up the bill, justly considering that such a clause was entirely subversive of its principle.

A new set of resolutions with respect to the corn trade were brought forward in 1828 by Mr. Charles Grant (afterwards Lord Glenelg). They were founded on the same principles as those which had been rejected during the previous session, but the duty was not made to vary equally, as in Mr. Canning's resolutions, with every equal variation of price; it being 23s. 8d. when the home price was 61s. the Imperial quarter, 16s. 8d. when it was 69s., and 1s. only when it was at or above 80s. After a good deal of debate, Mr. Grant's resolutions were carried, and embodied in the Act Geo. IV. c. 60.

The crops having been deficient in 1829 and 1830, there was a large importation of corn in these years, its average price being at the same time about 65s. per quarter. But the crops from 1831 to 1836 having been more than usually abundant, importation almost wholly ceased, and the price of wheat sunk in 1835 to 39s. 4d. per quarter, less than it had been in any previous year since 1776. In consequence of this succession of low harvests and low prices, the corn laws ceased to attract any considerable portion of public attention, and an impression began to prevail that the improvement of agriculture was proceeding so very rapid, that, despite the increase of population, and the existence of the corn laws, the price would fall to about the level of those of the Continent. But the cycle of favourable seasons having terminated in 1837, the crops of that and the succeeding 5 years were considerably deficient, so much so that prices rose in 1839 to 70s. per quarter, the importations in that and the following years being also very large. This increase in the price of corn, combined with the depressed state of the commerce of the country, arising in the pecuniary revulsion in the United States and other causes, again attracted a great attention to the corn laws; and the oppressive and injurious operation of the duties were very strongly animadverted upon at public meetings in the manufacturing towns and elsewhere. An association, denominated the Anti-Corn Law League, originally founded in Lancashire, which subsequently extended its ramifications to most parts of the country, was set on foot for the express purpose of keeping up an agitation against the corn laws, which, in consequence of these concurring circumstances, proceeded with greater bitterness than ever. The persistence of the subject at length forced it

on the attention of Government, and in 1841 ministers, actuated partly by a sense of the mischievous influence of the sliding scale, and partly also by a wish to strengthen their declining popularity, brought forward a plan for remodelling the corn laws, by repealing the sliding scale and imposing in its stead a constant duty of 8s. per quarter on wheat, and in proportion on other grain. But, having no majority in Parliament, ministers were obliged to resort to a dissolution; and their proposal having, notwithstanding its moderation, excited the greatest apprehensions among the agriculturists, without being very warmly supported by the other classes, a new Parliament was returned, which gave a decided majority to the opposition. It was, nevertheless, felt on all hands to be necessary to make some considerable change in the existing law, and in 1842 a measure was introduced in that view by Sir Robert Peel, which was subsequently passed into a law, 5 Vict. 2nd sess. c. 14.

Unfortunately, however, this measure, like that by which it was preceded, was bottomed on the principle of making the duties vary with the variations in the price of corn; and though the duties were decidedly less oppressive than those imposed by the 9 Geo. IV. c. 60, still they were in no ordinary degree objectionable, as well from their too great magnitude as from their adding to the natural insecurity of the corn trade, and increasing the chances and severity of fluctuations. It is not, therefore, to be wondered at that the new measure gave but little satisfaction. Instead of being abated, the agitation and clamour against the corn laws continued progressively to gain strength; and the conviction began at the same time gradually to extend itself among many of those by whom these laws had hitherto been supported, that farther modifications would have to be made in them, and that they might be made without inflicting any very serious injury upon agriculture.

This conviction was greatly strengthened by the result of the important changes made by Sir Robert Peel in the tariff in 1842, and more especially by those which had reference to the importation of live cattle and fresh provisions. These had previously been prohibited; but the minister proposed that this prohibition should be repealed, and that their importation should be permitted under reasonable duties. This proposal, when first brought forward, excited the greatest apprehensions among the farmers and graziers, and was followed by an immediate fall in the price of cattle. Happily, however, the measure was carried, and it was speedily discovered that there was no such difference between the prices of cattle of the same quality here and in the adjacent parts of the continent as had been supposed; and that the fears entertained by the agriculturists of the approaching ruin of the businesses of breeding and grazing were altogether visionary and unfounded. The experience afforded by the reduction and subsequent abolition of the duty on wool was exactly similar. Instead of being injured, the interests of the British sheep farmers have been most materially promoted by these measures; the demand for home-grown wool having been rendered comparatively steady, and its price considerably increased by the powerful stimulus which the change in the duty on foreign wool gave to the woollen manufacture.

In the following year, that is, in 1843, a measure was adopted which made a wide breach in the corn laws. In 1842 the Legislature of Canada passed a law imposing a duty of 3s. per quarter on all wheat imported into the province, unless from

the United Kingdom, stating in the preamble to this Act that it was passed in the expectation and belief that a corresponding reduction would be made in the duties on wheat and wheat-flour imported into the United Kingdom from Canada. And conformably to this anticipation, the Act 6 & 7 Vict. c. 29, passed in the course of 1843, reduced the duty on wheat imported from Canada to 1s. per quarter, and proportionally on wheat-flour. This Act met with much opposition from a part of the agricultural interest in this country, who contended that it would lead to the introduction of unlimited supplies of corn from the United States at a duty of only 4s. per quarter, or, allowing for smuggling, at perhaps only  $\frac{1}{2}$  that amount. But experience showed that these anticipations were not likely to be realised; for, though the imports from Canada were materially increased, the obstacles in the way of the importation of corn from the United States into Canada, and the danger and expense of the voyage from Montreal or Quebec to England, must necessarily have prevented the importation through this channel from ever becoming of much importance. Still, however, the measure was in so far an abandonment of the corn laws; and if we were justified in admitting the produce of the United States to our markets in this indirect way, it was not easy to discover satisfactory grounds on which to exclude the produce of other states.

The success of the measures adopted in 1842 encouraged Sir Robert Peel to attempt still more considerable changes in 1845, when he totally abolished the customs duties on a few (not 420 different articles, some of which were of very considerable importance. The measures then adopted were equivalent, in fact, to the virtual abandonment of the protective system; and under such circumstances it could not be expected that the corn laws, on which so serious an inroad had been made by the Canada Act, would be able to maintain their place on the statute book for any very lengthened period.

They might, however, have been continued for some time longer, had not the unsatisfactory corn harvest, and the failure of the potato crop of 1845, made it necessary to adopt measures for averting the anticipated deficiency in the supplies of food. Under the critical circumstances in which the population was then believed to be placed, the temporary suspension of the corn laws could hardly have been avoided; but if once suspended, their re-enactment would have been all but impossible, and it was better by at once providing for their repeal to make an end of the system, and of the dissatisfaction and agitation to which it had given birth, than to endeavour to continue it in any modified shape. Such was the view of the matter taken by Sir Robert Peel, and he fortunately succeeded, despite difficulties that none else could have overcome, in carrying the Act 9 & 10 Vict. c. 22, for the immediate modification of the corn laws, and for their total repeal at the end of 3 years, or on February 1, 1849. (See *post*.)

## II. PRINCIPLES OF THE CORN LAWS.

1. *Internal Corn Trade.*—It is needless to take up the reader's time by endeavouring to prove by argument the advantage of allowing the free conveyance of corn from one province to another. Every one sees that this is indispensable, not only to the equal distribution of the supplies of food over the country, but to enable the inhabitants of those districts that are best fitted for the raising and fattening of cattle, sheep &c. to add themselves to these or other necessary occupations not

directly connected with the production of corn. We shall, therefore, confine the few remarks we have to make on this subject to the consideration of the influence of the speculations of the corn merchants in buying up corn in anticipation of an advance. Their proceedings in this respect, though of the greatest public utility, have been the principal causes of that odium to which they have been long exposed.

Were the harvests always equally productive, nothing would be gained by storing up supplies of corn; and all that would be necessary would be to distribute the crop equally throughout the country and throughout the year. But such is not the order of nature. The variations in the aggregate produce of a country in different seasons, though not perhaps so great as are commonly supposed, are still very considerable; and experience has shown that two or three unusually luxuriant harvests seldom take place in succession; or that when they do, they are invariably followed by those that are deficient. The speculators in corn anticipate this result. Whenever prices begin to give way in consequence of an unusually luxuriant harvest, speculation is at work. The more opulent farmers withhold either the whole or a part of their produce from market; and the more opulent dealers purchase largely of the corn brought to market and store it up in expectation of a future advance. And thus, without intending to promote any one's interest but their own, speculators in corn become the benefactors of the public. They provide a reserve stock against those years of scarcity which are sure at no distant period to recur; while, by withdrawing a portion of the redundant supply from immediate consumption, prices are prevented from falling so low as to be injurious to the farmers, or at least are maintained at a higher level than they would otherwise have reached; provident habits are maintained amongst the people; and that waste and extravagance are checked which always take place in plentiful years, but which would be carried to a much greater extent if the whole produce of an abundant crop were to be consumed within the season.

It is, however, in scarce years that the speculations of the corn merchants are principally advantageous. Even in the richest countries, a very large proportion of the individuals engaged in the business of agriculture are comparatively poor, and are totally without the means of withholding their produce from market in order to speculate upon any future advance. In consequence the markets are always most abundantly supplied with produce immediately after harvest; and in countries where the merchants engaged in the corn trade are not possessed of large capitals, or where their proceedings are fettered and restricted, there is then, almost invariably, a heavy fall of prices. But as the vast majority of the people buy their food in small quantities, or from day to day, as they want it, their consumption is necessarily extended or contracted according to the price at the time. Their views do not extend to the future; they have no means of judging whether the crop is or is not deficient. They live, as the phrase is, from hand to mouth, and are satisfied if, in the mean time, they obtain abundant supplies at a cheap rate. But it is obvious, that were there nothing to counteract this improvidence, the consequence would very often be fatal in the extreme. The crop of one harvest must support the population till the crop of the other harvest has been gathered in; and if that crop should be deficient—in, for instance, it should only be adequate to afford

the usual rate of 10 months' provision, unless the price after harvest as to were the whole most dreadful famine, to the examination the account of the grain in England. Fleetwood and Sir abundant proofs of have been stated. In the farmers were generally withholding their corn, the trade of a corn almost improvidence—consumption of grain.

few years in which a experienced immediately in which there was an excess of price exceeding can now form an idea of other grain being 4 or 5 July as in September or even, to the increase of large farmers and dealers to the operations of the lower exposed to speculation. Whenever the dealers, who are the means of information with the real state of the of years find the harvest they raise the price of the lowest, and bid against which the farmers are the consequence of this rise orders, but especially the consumers of corn, find greater economy, and to and wasteful consumption, this immediately put under the pressure of the scarcity throughout the year; and was formerly the case, in the case, in seasons of became altogether deficient, without resource to and pestilence, the speculators warn us of our danger against it.

It is not easy to suppose of the corn merchants should the public. It has been shown they are not disposed to buy purchased to market until a without price, and that the price is thus often very much advanced no real ground for any such increase amount of capital required which it is liable, render most as soon as they can real every extensive country in which it is to be formed amongst were formed, it could not be formed. A large proportion of the small holders of corn are circumstances, more particularly has not occurred so soon as they are consequently anxious to sell as soon as prices rise, and to stock on their hands. Occasional individuals are found who retain a long period, or until a rise begins to decline. But

the usual rate of consumption, a supply of 9 or 10 months' provisions instead of 12—it is plain that, unless the price were so raised immediately after harvest as to enforce economy, and put, as it were, the whole nation on short allowance, the most dreadful famine would be experienced previously to the ensuing harvest. Those who examine the accounts of the prices of wheat and other grain in England, collected by Bishop Fleetwood and Sir F. M. Eden, will meet with abundant proofs of the accuracy of what has now been stated. In those remote periods when the farmers were generally without the means of withholding their crops from market, and when the trade of a corn dealer was proscribed, the utmost improvidence was exhibited in the consumption of grain. There were then, indeed, very few years in which a considerable scarcity was not experienced immediately before harvest, and many in which there was an absolute famine. The fluctuations of price exceeded every thing of which we can now form an idea; the price of wheat and other grain being 4 or 5 times as high in June and July as in September and October. Thanks, however, to the increase of capital in the hands of the large farmers and dealers, and to the freedom given to the operations of the corn merchants, we are no longer exposed to such ruinous vicissitudes. Whenever the dealers, who, in consequence of their superabundance of information, are better acquainted with the real state of the crops than any other class of persons, find the harvest likely to be deficient, they raise the price of the corn they have warehoused, and bid against each other for the corn which the farmers are bringing to market. In consequence of this rise of prices, all ranks and orders, but especially the lower, who are the great consumers of corn, find it indispensable to use greater economy, and to check all improvident and wasteful consumption. Every class being thus immediately put upon short allowance, the pressure of the scarcity is distributed equally throughout the year; and instead of indulging, as was formerly the case, in the same scale of consumption as in seasons of plenty, until the supply became altogether deficient, and then being exposed without resource to the attacks of famine and pestilence, the speculations of the corn merchants warn us of our danger, and compel us to provide against it.

It is not easy to suppose that these proceedings of the corn merchants should ever be injurious to the public. It has been said that in scarce years they are not disposed to bring the corn they have purchased to market until it has attained an exorbitant price, and that the pressure of the scarcity is thus often very much aggravated; but there is no real ground for any such statement. The immense amount of capital required to store up any considerable quantity of corn, and the waste to which it is liable, render most holders disposed to sell as soon as they can realise a fair profit. In every extensive country in which the corn trade is free, there are infinitely too many persons engaged in it to enable any sort of combination or concert to be formed amongst them; and though it were formed, it could not be maintained for an instant. A large proportion of the farmers and other small holders of corn are always in straitened circumstances, more particularly if a scarce year has not occurred so soon as they expected; and they are consequently anxious to relieve themselves, as soon as prices rise, of a portion of the stock on their hands. Occasionally, indeed, individuals are found who retain their stocks for a long period, or until a reaction takes place, and prices begin to decline. But instead of joining

in the popular cry against such persons, every one who takes a dispassionate view of the matter will perceive that, inasmuch as their miscalculation must, under the circumstances supposed, be exceedingly injurious to themselves, we have the best security against its being carried to such an extent as to be productive of any material injury or even inconvenience to the public. It should also be borne in mind that it is rarely, if ever, possible to determine beforehand when a scarcity is to abate in consequence of new supplies being brought to market; and had it continued a little longer, there would have been no miscalculation on the part of the holders. At all events, it is plain that by declining to bring their corn to market, they preserved a resource on which, in the event of the harvest being longer delayed than usual, or of any unfavourable contingency taking place, the public could have fallen back; so that, instead of deserving abuse, these speculators are most justly entitled to every fair encouragement and protection. A country in which there is no considerable stock of grain in the barn-yards of the farmers, or in the warehouses of the merchants, is in the most perilous situation that can easily be imagined, and may be exposed to the severest privations, or even famine. But so long as the sagacity, the miscalculation, or the avarice of merchants and dealers retain a stock of grain in the warehouses, this last extremity cannot take place. By refusing to sell it till it has reached a very high price, they put an effectual stop to all sorts of waste, and husband for the public those supplies which they could not have so frugally husbanded for themselves.

We have already remarked that the last remnant of the shackles imposed by statute on the freedom of the internal corn dealer was abolished in 1773. It is true that engrossing, forestalling, and regrating [*Engrossing &c.*] are still held to be offences at common law; but there is very little probability of any one being in future made to answer for such ideal offences.

2. *Exportation to Foreign Countries.*—The fallacy of the notion so long entertained, that the prevention of exportation was the surest method of increasing plenty at home, is obvious to every one who has reflected upon such subjects. The markets of no country can ever be steadily and plentifully supplied with corn unless her merchants have power to export the surplus supplies with which they may be occasionally furnished. When a country without the means of exporting grows nearly her own average supplies of corn, an abundant crop, by causing a great overloading of the market and a heavy fall of price, is as injurious to the farmer as a scarcity. It may be thought, perhaps, that the greater quantity of produce in abundant seasons will compensate for its lower price; but this is not the case. It is uniformly found that variations in the quantity of corn exert a much greater influence over prices than equal variations in the quantity of almost any thing else offered for sale. Being the principal necessary of life, when the supply of corn happens to be less than ordinary the mass of the people make very great, though unavailing, exertions, by diminishing their consumption of other and less indispensable articles, to obtain their accustomed supplies of this prime necessary: so that its price rises much more than in proportion to the deficiency. On the other hand, when the supply is unusually large, the consumption is not proportionally extended. In ordinary years the bulk of the population is about adequately fed; and though the consumption of all classes be somewhat greater in unusually plentiful years, the extension is consi-

derable only among the lowest classes, and in the feeding of horses. Hence it is that the increased supply at market, in such years, goes principally to cause a glut, and consequently a ruinous decline of prices. These statements are corroborated by the widest experience. Whenever there is an inability to export, from whatever cause it may arise, an unusually luxuriant crop is uniformly accompanied by a very heavy fall of price, and severe agricultural distress; and when two or three such crops happen to follow in succession, the ruin of a large proportion of the farmers is completed.

If the mischiefs resulting from the want of power to export stopped here, they might, though very great, be borne; but they do not stop here. It is idle to suppose that a system ruinous to the producers can be otherwise to the consumers. A glut of the market, occasioned by luxuriant harvests and the want of power to export, cannot be of long continuance; for, while it continues, it can hardly fail, by distressing all classes of farmers and causing the ruin of many, to give a check to every species of agricultural improvement, and to lessen the extent of land in tillage. When, therefore, an unfavourable season recurs, the reaction is, for the most part, appalling. The supply, being lessened, not only by the badness of the season, but also by a diminution of the quantity of land in crop, falls very far below an average; and a severe scarcity, if not an absolute famine, is most commonly experienced. It is therefore clear, that if a country would render herself secure against famine and injurious fluctuations of price, she must give every possible facility to exportation in years of unusual plenty. If she act upon a different system—if her policy make exportation in such years impracticable or very difficult—she will infallibly render the bounty of Providence an injury to her agriculturists; and two or three abundant harvests in succession will be the forerunners of scarcity and famine.

3. *Bounty on the Exportation of Corn.*—In Great Britain, as already observed, we have not only been allowed to export for a long series of years, but from the Revolution down to 1815 a bounty was given on exportation whenever the home prices were depressed below certain limits. This policy, however, erred as much on the one hand as a restriction on exportation errs on the other. It causes, it is true, an extension of the demand for corn: but this greater demand is not caused by natural, but by artificial means; it is not a consequence of any really increased demand on the part of the foreigner, but of our furnishing the exporters of corn with a *bounty*, in order that they may sell it abroad below its natural price! To suppose that a proceeding of this sort can be a public advantage is equivalent to supposing that a shopkeeper may get rich by selling his goods below what they cost. [BOUNTY.]

4. *Importation from Foreign Countries.*—If a country were, like Poland or Russia, uniformly in the habit of exporting corn to other countries, a restriction on importation would be of no material consequence: because, though such restriction did not exist, no foreign corn would be imported unless its ports were so situated as to serve for an entrepôt. A restriction on importation is sensibly felt only when it is enforced in a country which, owing to the greater density of its population, the limited extent of its fertile land, or any other cause, would either occasionally or uniformly import. It is familiar to the observation of every one, that a total failure of the crops is a calamity that but rarely occurs in an extensive kingdom;

that the weather which is unfavourable to one description of soil is generally favourable to some other description; and that, except in anomalous cases, the total produce is not very different. But what is thus generally true of single countries, is always true of the world at large. History furnishes no single instance of a universal scarcity; but it is uniformly found that when the crops in a particular country are unusually deficient, they are proportionally abundant in some other quarter. It is clear, however, that a prohibition of importation excludes the country which enacts it from profiting by this beneficial arrangement. She is thrown entirely on her own resources. Under the circumstances supposed, she has nothing to trust to for relief but the reserves in her warehouses; and should these be inadequate to meet the exigency of the crisis, there are apparently no means by which she can escape experiencing all the evils of scarcity, or, it may be, of famine. A country deprived of the power to import is unable to supply the deficiencies of her harvests by the surplus produce of other countries; so that her inhabitants may starve amidst surrounding plenty, and suffer the extreme of scarcity when, but for the restrictions on importation, they might enjoy the greatest abundance. If the prohibition be not absolute, but conditional—if, instead of absolutely excluding foreign corn from the home markets, it be merely loaded with a duty, the degree in which scarcity will depend on its magnitude. If the duty be constant and moderate, it may not have any very considerable effect in discouraging importation; but if it be fluctuating and heavy, it will, by falsifying the speculations of the merchants, and making a corresponding addition to the price of the corn imported, be proportionally injurious. In whatever degree foreign corn may be excluded in years of deficient crops, to the same extent must prices be artificially raised, and the pressure of the scarcity rendered so much the more severe.

Such would be the disastrous influence of a restriction on importation in a country which, were there no such obstruction in the way, would sometimes import and sometimes export. But its operation would be infinitely more injurious in a country which, under a free system, would uniformly import a portion of her supplies. The restriction in this case has a twofold operation. By preventing importation from abroad, and forcing the population to depend for subsistence on corn raised at home, it compels recourse to comparatively inferior soils; and thus, by increasing the cost of producing corn above its cost in other countries, adds proportionally to its average price. The causes of fluctuation are, in this way, increased in a geometrical proportion; for, while the prevention of importation exposes the population to the pressure of want whenever the harvest happens to be less productive than usual, it is sure, at the same time, by raising average prices, to hinder exportation in a year of unusual plenty, until the home prices fall ruinously low. It is obvious, therefore, that a restriction of this sort must be alternately destructive of the interests of the consumers and producers. It injures the former by making them pay, at an average, an artificially increased price for their food, and by exposing them to scarcity and famine whenever the home crop proves deficient; and it injures the latter by depriving them of the power to export in years of unusual plenty, and by overloading the market with produce, when, under a free system, would have met with the advantageous sale abroad.

The principle of impossibility of prices by means of the same time may trace the natural distress experience. The real was to keep up a quarter; but to be able not only that when prices were markets should be produced at home principle already should in ordinary population, it may year, be more than when, in such a case, the market, it can average prices being of those of the ruinous depression, situation of this country partly to the difficulties in the depreciation of the extraordinary elevated price such a stimulus in 1812 and 1813, supply. And such being our ports had been importation from abroad crop must have over prices. It is the excel of foreign corn that this exclusion that has in this country, in scarce unnatural level, and the exportation in favourable out such a fall of prices farmer. It may be men now stated, that the England and Wales in 1 and in 1815 it had fallen prices would not indeed poorest lands brought previous high prices, the quishing their cultivation of them had been convey had been generally redu to decline; but the Leg tional restrictions on th com, the operation of th justment was unfortunate price of 1816 rose to 78s. 6d. insufficient to occasi and as foreign corn was tracts of bad land had be tion, the supply was so notwithstanding the in money, prices rose in th consequence of the bad year, to 96s. 11d.; and in high prices had their nat the drooping spirits of th that the Corn Law was, produce the effects anti the golden days of 1812. 1800, 6d. per quarter, wer this prosperity carried in future mischief. The inc occasioned a fresh exten was again applied to the and this increase of th favourable seasons and t importation, sunk prices to s

The principle thus briefly explained shows the impossibility of permanently keeping up the home prices by means of restrictions on importation, at the same time that it affords a clue by which we may trace the causes of most part of the agricultural distress experienced in this country since the peace. The real object of the corn law of 1815 was to keep up the price of corn at about 80s. per quarter; but to succeed in this, it was indispensable not only that foreign corn should be excluded when prices were under this limit, but that the markets should never be overloaded with corn produced at home: for it is clear, according to the principle already explained, that if the supply should in ordinary years be sufficient to feed the population, it must, in an unusually abundant year, be more than sufficient for that purpose; and when, in such a case, the surplus is thrown upon the market, it cannot fail, in the event of our average prices being considerably above the level of those of the surrounding countries, to cause a ruinous depression. Now, this was the precise situation of this country at the end of the war. Owing partly to the Act of 1804, but far more to the difficulties in the way of importation, and the depreciation of the currency, prices attained to an extraordinary elevation from 1809 to 1811, and gave such a stimulus to agriculture, that we grew, in 1812 and 1813, sufficient corn for our own supply. And, such being the case, it is clear, though our ports had been hermetically sealed against importation from abroad, that the first luxuriant crop must have occasioned a ruinous decline of prices. It is the exclusion, not the introduction, of foreign corn that has caused the occasional distress of the agriculturists since 1815; for it is this exclusion that has forced up the price of corn in this country, in scarce and average years, to an unnatural level, and that, consequently, renders exportation in favourable seasons impossible without such a fall of prices as is most disastrous to the farmer. It may be mentioned, in proof of what is now stated, that the average price of wheat in England and Wales in 1814 was 71s. 4d. per quarter, and in 1815 it had fallen to 65s. 7d. But as these prices would not indemnify the occupiers of the poorest lands brought under tillage during the previous high prices, they were gradually relinquishing their cultivation. A considerable portion of them had been converted into pasture; rents had been generally reduced, and wages had begun to decline; but the Legislature having laid additional restrictions on the importation of foreign corn, the operation of this natural principle of adjustment was unfortunately counteracted, and the price of 1816 rose to 78s. 6d. This rise was, however, insufficient to occasion any new improvement; and as foreign corn was now excluded, and large tracts of bad land had been thrown out of cultivation, the supply was so much diminished that, notwithstanding the increase in the value of money, prices rose in 1817, partly, no doubt, in consequence of the bad harvest of the previous year, to 96s. 11d.; and in 1818 to 86s. 3d. These high prices had their natural effect. They revived the drooping spirits of the farmers, who imagined that the Corn Law was, at length, beginning to produce the effects anticipated from it, and that the golden days of 1812, when wheat sold for 126s. 6d. per quarter, were about to return! But this prosperity carried in its bosom the seeds of future mischief. The increased prices necessarily occasioned a fresh extension of tillage; capital was again applied to the improvement of the soil; and this increase of tillage, conspiring with favourable seasons and the impossibility of exportation, sunk prices to such a degree, that they

fell, in October, 1822, so low as 38s. 1d., the average price of that year being only 41s. 7d.

It is thus demonstrably certain that the recurrence of periods of distress, similar to those which have been experienced by the agriculturists of this country since the peace, cannot be warded off by restricting or prohibiting importation. A free corn trade is the only system that can give them that security against fluctuations that is so indispensable. The increased importation that necessarily takes place, under a free system, as soon as any considerable deficiency in the crops is apprehended, prevents prices from rising to an oppressive height; while, on the other hand, when the crops are unusually luxuriant, a ready outlet is found for the surplus in foreign countries, without its occasioning any very heavy fall. To expect to combine steadiness of prices with restrictions on importation is to expect to reconcile what is contradictory and absurd. The higher the limit at which the importation of foreign corn into a country like England is fixed, the greater is the oscillation of prices. If we would secure for ourselves abundance, and avoid fluctuation, we must renounce all attempts at exclusion, and be ready to deal in corn, as we ought to be in every thing else, on fair and liberal principles.

That the restrictions imposed on the foreign corn trade down to 1816 should not have been productive of more disastrous consequences than those that have actually resulted from them, is partly and principally to be ascribed to the unparalleled improvement of tillage in Great Britain during that period, and partly also to the great increase that has taken place in the imports from Ireland. Previously to 1806, when a perfectly free corn trade between Great Britain and Ireland was for the first time established, the yearly imports did not amount to 400,000 quarters, whereas in 1806 they amounted to 1,523,460; and any one who has ever been in Ireland, or is aware of the wretched state of its agriculture, and of the fertility of the soil, must be satisfied that a slight improvement would occasion a great increase in the imports from that country; and it is not improbable that the check that has been given to the pernicious practice of splitting farms, to the potato culture, and consequently to the increase of a pauper population, may eventually lead to material improvements. Hence it is by no means improbable, seeing the fall that has already taken place, that the rapid spread of improvement at home, and the growing imports from Ireland, may, at no distant period, reduce our prices to the level of those of the Continent, and even render us an occasionally exporting country. These, however, are contingent and uncertain results; and supposing them to be ultimately realised, the corn laws, had they been maintained on their old footing, would, in the mean time, have been productive of great inconvenience, and would have materially aggravated the misery inseparable from bad harvests.

Nothing but the great importance of the subject could excuse us for dwelling so long on what is so very plain. To facilitate production, and to make commodities cheaper and more easily obtained, are the grand motives which stimulate the inventive powers, and which lead to the discovery and improvement of machines and processes for saving labour and diminishing cost; and it is plain that no system of commercial legislation deserves to be supported which does not conspire to promote the same objects; but a restriction on the importation of corn into a country like England, which has made a great comparative advance in population and manufacturing industry, is diametrically

opposed to these principles. The density of our population is such, that the exclusion of foreign corn has obliged us to resort to soils of less fertility than those that are under cultivation in the surrounding countries; and, in consequence, our average prices are comparatively high. The impolicy of this conduct is obvious. If we could, by laying out 1,000,000, on the manufacture of cottons or hardware, produce a quantity of these articles that would exchange for 500 quarters of American or Polish wheat; and if the same sum, were it expended in cultivation in this country, would not produce more than 400 quarters; the prevention of importation occasions an obvious sacrifice of 100 out of every 500 quarters consumed in the Empire: or, which is the same thing, it occasions an artificial advance of 20 per cent. in the price of corn. We do not mean to say that this statement exactly represents the amount of injury that was inflicted by the late corn laws: but, at all events, it clearly illustrates the principles which they embodied. But though plainly injurious to the public, it may seem, at first sight, as if this system were advantageous to the landlords. The advantage is, however, merely apparent; at bottom there is no real difference between the interests of the landlords and those of the rest of the community. It would be ridiculous, indeed, to imagine for a moment that the landlords could be benefited by a system in which those fluctuations of prices, so subservive of all agricultural prosperity, were inherent: but though these could have been got rid of, the result would have been the same. The prosperity of agriculture must always depend upon, and be determined by, the prosperity of other branches of industry; and any system which, like the corn laws, is injurious to the latter, cannot but be injurious to the former. Instead of being publicly advantageous, high prices are in every case distinctly and completely the reverse. The smaller the sacrifice for which any commodity can be obtained, so much the better. When the labour required to produce, or the money required to purchase, a sufficient supply of corn is diminished, it is as clear as the sun at noon-day that more labour or money must remain to produce or purchase the other necessities, conveniences, and amusements of human life, and that the sum of national wealth and comforts must be proportionally augmented. Those who suppose that a rise of prices can ever be a means of improving the condition of a country might, with equal reason, suppose that it would be improved by throwing its best soils out of cultivation, and destroying its most powerful machines. The opinions of such persons are not only opposed to the plainest and best established principles, but they are opposed to the obvious conclusions of common sense, and the universal experience of mankind.

It would, however, be unjust not to mention that there has always been a large and respectable party amongst the landlords, opposed to all restrictions on the trade in corn, and who have uniformly thought that their interests, being identified with those of the public, would be best promoted by the abolition of restrictions on importation. A protest expressive of this opinion, subscribed by 10 peers, was entered on the Journals of the House of Lords, against the corn law of 1815. It is said to have been written by the late Lord Grenville, distinguished as an enlightened advocate of sound commercial principles. His reasoning is so clear and satisfactory, that we are sure we shall gratify our readers, as well as strengthen the statements previously made, by laying it before them.

*Dissentient.*—I. Because we are adverse in principle to all new restraints on commerce. We think it certain that public prosperity is best promoted by leaving uncontrolled the free course of national industry; and we wish rather, by well-considered steps, to bring back our commercial legislation to the straight and simple line of wisdom than to increase the dereliction by subjecting additional and extensive branches of the public interest to fresh systems of artificial and injurious restrictions.

II. Because we think that the great practical rule, of leaving all commerce uncontrolled, applies more peculiarly, and on still stronger grounds of justice as well as policy, to the corn trade than to any other. Irresistible indeed must be that necessity which could, in our judgment, authorise the Legislature to tamper with the satisfaction of the people, and to impede the free purchase of that article on which depends the existence of so large a portion of the community.

III. Because we think that the expectations of ultimate benefit from this measure are founded on a delusive theory. We cannot persuade ourselves that this law will ever contribute to plenitude, cheapness, or steadiness of price, so long as it operates at all, its effects must be the opposite of these. *Monopoly is the parent of scarcity, of dearth, and of uncertainty.* To cut off any of the sources of supply can only tend to lessen the abundance; to close against ourselves the cheap market for any commodity must enhance the price at which we purchase it; and to confine the consumer of corn to the produce of his own country is to refuse to ourselves the benefit of the provision which Providence itself has made for equalising to man the variations of climate and seasons.

IV. But whatever may be the future consequences of this law at some distant and uncertain period, we see with pain that these hopes must be purchased at the expense of a great and present evil. To compel the consumer to purchase dearer at home than it might be imported from abroad is the immediate practical effect of this law. In this way alone can it operate. Its present protection, its promised extension of agriculture, must result (if at all) from the profits which it creates by keeping up the price of corn to an artificial level. These future benefits or the consequences expected, but, as we confidently believe, erroneously expected, from this bounty to the grower of corn by a tax laid on its consumer.

V. Because we think the adoption of any permanent law for such a purpose required the fullest and most laborious investigation. Nor would it have been sufficient for our satisfaction, could we have been convinced of the general policy of a hazardous experiment. A still further enquiry would have been necessary to persuade us that the present moment is fit for its adoption. In such an enquiry we must have had the means of satisfying ourselves what its immediate operation will be, as connected with the various and pressing circumstances of public difficulty and distress with which the country is surrounded; with the state of our circulation and currency, of our agriculture and manufactures, of our internal and external commerce, and above all with the condition and reward of the industrious and labouring classes of our community.

On all these particulars, as they respect the question, we think that Parliament is almost wholly uninformed; on all we see reason for the utmost anxiety and alarm from the operation of this law.

Lastly, Rec principle and p no sufficient fo The evidence fou set as it is, seen to support the p as the standard o mole by which And on all these our dissent from course, and, as w quences?

'Lastly. Because, if we could approve of the principle and purpose of this law, we think that no sufficient foundation has been laid for its details. The evidence before us, unsatisfactory and imperfect as it is, seems to us rather to disprove than to support the propriety of the high price adopted as the standard of importation, and the fallacious mode by which that price is to be ascertained. And on all these grounds we are anxious to record our dissent from a measure so precipitate in its course, and, as we fear, so injurious in its consequences.'

Attempts have sometimes been made to estimate the pecuniary burden which the restrictions on importation entailed in ordinary years upon the country. This, undoubtedly, is a subject with respect to which it is not possible to obtain any accurate data. But supposing the total quantity of corn annually produced in Great Britain and Ireland to amount to 50,000,000 quarters, every shilling added to its price by the corn laws was equivalent to a tax on corn of 2,500,000*l.*; and estimating the average rise on all sorts of grain previously to 1846 at 3*s.* per quarter, the total rise would be 750,000*l.* So great a quantity of corn is, however, consumed by the agriculturists themselves, as feed in seed, the keep of horses &c., that not more than a half, perhaps, of the whole quantity produced is brought to market. If we are nearly right in this hypothesis, and in the previous estimates, it will follow that the restrictions cost the classes not engaged in agriculture no less than 375,000*l.* a-year, exclusive of their other pernicious consequences. Of this sum a fifth, probably, or 75,000*l.*, went to the landlords as rent; and this is all that the agriculturists can be said to have gained by the system, for the additional price received by the farmer on that portion of the produce which is exclusive of rent was no more than the ordinary return for his capital and labour. His profits, indeed, like those of all other capitalists, instead of being increased by this system, were diminished by it; and though, nominally at least, it somewhat increased the rents of the landlords, it is, notwithstanding, abundantly certain that it was anything but advantageous to them. It would require a far larger sum to have balanced the injury which fluctuations of price occasioned to their tenants, and the damage done to their estates by overcropping when prices were high, than all they derived from the restrictions.

3. *Duties on Importation.*—A duty may be equitably imposed on imported corn, for two objects; that is, either for the sake of revenue, or to balance any excess of taxes laid on the agriculturists over those laid on the other classes. (*Treatise on Taxation* by the author of this work, 2nd ed. pp. 193-203.) With respect, however, to a duty imposed for the sake of revenue, it may be doubted whether corn be a proper subject for taxation. At all events, a duty on such an object should be exceedingly moderate. It would be most inexpedient to attempt to add largely to the revenue by laying heavy duties on the prime necessary of life.

If it be really true that agriculture is more heavily taxed than any other branch of industry, the agriculturists are entitled to demand that a duty be laid on foreign corn when imported corresponding to the excess of burdens affecting them. It has been doubted, however, whether they are in this predicament. But though the question be not quite free from difficulty, it would be easy to show, were this a proper place for such enquiries, that, owing to the various local and other direct and indirect burdens laid on the

land, those occupying it are really subjected to heavier taxes than any other class. It is difficult, or rather, perhaps, impossible, to estimate with any degree of precision what the excess of taxes laid on the agriculturists beyond those laid on manufacturers and merchants may amount to; but we have elsewhere shown, that if we estimate it as making an addition of 5*s.* or 6*s.* to the quarter of wheat, we shall probably be beyond the mark. (*Treatise on Taxation*, ubi supra.)

When a duty is laid on the importation of foreign corn, for the equitable purpose of countervailing the peculiar duties laid on the corn raised at home, an *equivalent drawback* should be allowed on its exportation. 'In allowing this drawback, we are merely returning to the farmer a tax which he has already paid, and which he must have, to place him in a fair state of competition in the foreign market, not only with the foreign producer, but with his own countrymen who are producing other commodities. It is essentially different from a bounty on exportation, in the sense in which the word bounty is usually understood; for by a bounty is generally meant a tax levied on the people for the purpose of rendering corn unnaturally cheap to the foreign consumer; whereas what I propose is, to sell our corn at the price at which we can really afford to produce it, and not to add to its price a tax which shall induce the foreigner rather to purchase it from some other country, and deprive us of a trade which, under a system of free competition, we might have selected.' (*Ricardo On Protection to Agriculture*, p. 53.)

A duty accompanied with a drawback, as now stated, would not only, under the circumstances supposed, have been an equitable arrangement, but it would have been highly for the advantage of the farmers, without being injurious to any one else. The radical defect, as already shown, of the system followed from 1815 down to 1846, in so far, at least, as respected agriculture, was, that it forced up prices in years when the harvest was deficient, while it left the market to be glutted when it was abundant. But while a constant duty of 5*s.* would have secured to the home growers all the increase of price which the regard due to the interests of others should allow them to realise in a bad year, the drawback of 5*s.*, by enabling them to export in an unusually plentiful year, would have prevented the markets from being overloaded, and prices from falling to the ruinous extent that they have occasionally done. Such a plan would have rendered the businesses of the dealers in and growers of corn comparatively secure, and would, therefore, have provided for the continued prosperity of both. It is surprising the agriculturists did not take this view of the matter. If they were really entitled to a duty on foreign corn on account of their being more heavily taxed than the other classes of their fellow-citizens (and they had no title to it on any other ground), they were also entitled to a corresponding drawback. And it admits of demonstration, that *their interests*, as well as those of the community, would have been better promoted by such a duty and drawback than they ever could have been by any system of mere duties, how high soever they might be carried.

### III. BRITISH CORN TRADE.

1. *Quantity of Corn consumed in Great Britain.*—Attempts have sometimes been made to estimate the quantity of corn raised in a country from calculations founded on the number of acres in tillage, and on the average produce per acre; but

it is plain that no perfectly accurate account can ever be framed of the extent of land under cultivation. It is perpetually changing from year to year; and the amount of produce varies not only with the differences of seasons, but also with every improvement of agriculture. This method, therefore, is now rarely resorted to, and the growth of corn is generally estimated from the consumption. The conclusions deduced from this criterion must indeed be subject to error, as well from variations in the consumption occasioned by variations in the price of corn as from the varying extent to which other food is used. But supposing the prices of corn to be reduced to an average, if the consumption of a considerable number of persons, of all ranks and orders, and of all ages and sexes, were accurately determined, we should be able, supposing the census of the population to be nearly correct, to make a pretty close approximation to the total consumption of the country. Mr. Charles Smith, the well-informed and intelligent author of the *Tracts on the Corn Trade*, made many curious investigations with a view to discover the mean annual consumption of corn; and reducing it to the standard of wheat, he found it to be at the rate of about a quarter for each individual, young and old. This estimate has been confirmed by a variety of subsequent researches; and among others, by enquiries made during the scarcity of 1795 and 1796, by the magistrates of Suffolk, in 42 different parishes, in the view of ascertaining the average consumption of each family, which they found to correspond very closely with Mr. Smith's estimate. It is also worthy of remark, that M. Faucet, the intelligent author of the *Métrologie*, estimates the mean annual average consumption, in France, when reduced to the standard of wheat, at about 10 bushels for each individual; and as the French consume me more bread and less animal food than the English, this estimate affords a strong proof of the correctness of that of Mr. Smith.

Having taken the population of England and Wales in 1765 at 6,000,000, Mr. Smith reckoned

the consumers of each kind of grain, the quantity consumed by each individual, and hence the whole consumed by man, to be as follows:—

Estimated Population of England and Wales	Average Consumption of each Person	Consumed by Man
3,750,000	consumers of wheat, at 1 quarter each	3,750,000
739,000	" barley, at 1 1/2 "	1,108,500
888,000	" rye, at 1 1/2 "	999,000
625,000	" oats, at 2 1/2 "	1,562,500
	Consumed by man	7,558,500
	In addition to this, Mr. Smith estimated the wheat &c. (illud, made into starch &c.	90,000
	Barley used in malting &c.	541,700
	Rye for hogs &c.	417,900
	Oats for horses &c.	2,467,200
	Total of home consumption	13,555,300
	Add excess of exports over imports	598,624
	Add seed (one tenth)	1,502,175
	Total growth of all kinds of grain in England and Wales in 1765	15,656,100

This estimate, it will be observed, does not include either Scotland or Ireland; and later enquiries have rendered it probable that Mr. Smith underrated the population of England and Wales by nearly 1,000,000. The most eminent agriculturists seem also to be of opinion that the allowance for seed ought to be stated as high as a sixth or a seventh.

Mr. Chalmers, availing himself of the information respecting the numbers of the people furnished under the Population Act of 1800, estimated the total consumption of the different kinds of grain in Great Britain at that epoch at 27,185,300 qrs., whereof wheat constituted 7,676,100 qrs. The crops of 1800 and 1801 being unusually deficient, the importation in these years was proportionally great; but excluding these scarcities, the total average excess of all sorts of grain imported from Ireland and foreign countries into Great Britain over the exports had previously amounted to about 1,000,000 qrs., which, deducted from 27,185,300, leaves 26,185,300, to which if we add one sixth as seed, we shall have 30,519,516 qrs. as the average growth of Great Britain in 1800.

According to Dr. Colquhoun, the consumption of corn in Great Britain and Ireland in 1814

Species of Grain	Estimated Average of the Population of Great Britain and Ireland	Each Person averaged	Consumed by Man	Consumed by Animals	Used in Beer and Spirits	Used in various Manufactures	Total Quarters
Wheat	5,000,000	1	5,000,000	—	—	—	5,000,000
Barley	4,500,000	1 1/2	6,750,000	210,000	4,250,000	17,000	11,210,000
Oats	4,500,000	2 1/2	11,250,000	10,200,000	—	—	21,450,000
Rye	500,000	1 1/2	750,000	50,000	—	1,000	801,000
Beans and peas	500,000	1	500,000	1,500,000	—	—	2,000,000
Total	16,000,000	—	18,750,000	11,260,000	4,250,000	18,000	34,308,000

amounted to about 35,000,000 quarters. We give his estimate.

But though this estimate be compiled with greater care and is entitled to more confidence than most of those put forth by its author, it is in some respects extremely inaccurate. There can, for example, be no manner of doubt that the consumption of oats is underrated by at least 2,250,000 quarters, or by 1/2 quarter in the quantity assigned to each of the 4,500,000 individuals Dr. Colquhoun supposed were fed on them. And besides underrating the consumption of oats, Dr. Colquhoun has made no allowance for seed, though it be unnecessary to say that the expenditure of corn as seed is as indispensable, and its consumption as effectual, as if it were employed in the feeding of men or of horses. Adding, therefore, to the 37,250,000 quarters which Colquhoun's estimate should have amounted to, 1/2 for seed, we have on his data 43,458,000 quarters for the total consumption of corn in the United Kingdom in 1814.

But instead of a population of 16,000,000, which is assumed as the basis of the above estimate, the United Kingdom had, in 1861, a population of above 29,000,000. If, therefore, the estimate of Dr. Colquhoun were accurate, and the consumption, as compared with the population, were about the same as in 1814, it should now amount to above 78,000,000 quarters. But during the last 30 years the proportion of wheat used as food has been materially increased; and at present the consumers of barley certainly amount to nothing like 1,500,000 individuals; probably to not more than 500,000. The consumption of oats has also increased very materially, partly and principally from the great increase in the number of horses and their better keep, and partly also from the increase of population in Ireland; but it is abundantly certain that the expenditure of corn on the lower animals, and in breweries, distilleries &c., does not now amount to anything like twice the quantity at which it was estimated by Colquhoun.

*Agricultural Statistics.*—In a former edition the following opinion of these statistics was stated: "Perhaps we may be excused for adding that the advantages to be derived from what are called 'Agricultural Statistics' have been ridiculously exaggerated. The extent of land under different crops may be learned with tolerable precision; but it is the merest hallucination to imagine that the producer of any harvest can ever be known with anything approximating to accuracy till it be thrashed out. Supposing, however, that it were otherwise, and that it was officially announced in September that the wheat crop was (say) 2,000,000 quarters under an average; the first effect of this announcement would be to raise the price of wheat in every foreign port; and where is the gain to set off against this disadvantage? The return would give no additional security to the speculations of the importers; for, though A knows that 2,000,000 quarters are required to make up the stated deficiency, he cannot know how much has been or may be ordered by B, C, D, and his 10,000 other competitors here and abroad. The existing system is in all respects preferable. At present the great merchants are in the habit of sending intelligent agents through the country to examine into and report on the state of the crops. If they see reason to apprehend an unusual deficiency, their principals purchase accordingly. But they are not such simpletons as to communicate their peculiar information to the public. That might be a very generous, but it would at the same time be a very foolish proceeding. And yet this communication of information useful to the producer would be the first and principal result of such official statements as to the state of the crops as were of any authority."

Since the above was written the Government has collected the facts, both as regards the amount of live stock and the cultivation of the soil. The value of the statistics, however, which have been supplied for corn and green crops must be exaggerated or misunderstood. It is manifest that no certain inference can be obtained as to the quantity produced, however exact may be the reckoning of the acres under tillage; and in the absence of any materials for the former infer-

ence, the attempt to reduce the acreage to quantities of corn would be an arithmetical fallacy. But as successive annual accounts are given, there is an inference of some importance, in the comparison between the amount of corn sown and in the quantities imported for consumption, which will enable persons to arrive at an estimate of the average annual deficiency in the supply of home-grown corn. We do not think that agricultural statistics will enable farmers and corn dealers to determine future prices, but they will be of some aid to such a result, and will certainly supply the public with some information as to the measure of its dependence on the growth of foreign countries.

The largest imports of foreign corn and meal hitherto introduced into this country were those of 1862, when 70,987,228 cwts., equal to more than 27,000,000 quarters, were imported. Of this quantity a very small amount was re-exported. The wheat and flour alone amounted to more than 11,500,000 quarters. In the seven years 1859-1865 inclusive, the total entries of foreign wheat and flour amounted to 51,759,296 quarters, giving an average of 7,392,899 quarters as the amount of wheat and flour needed for the inhabitants of Great Britain and Ireland, as estimated for the seven years in question. During the seven years ending with the year 1858, the average annual consumption of foreign grain was 4,595,801 quarters. During the seven years ending with the year 1850, the average annual consumption was 3,973,053 quarters. These facts are of the highest significance, showing as they do the increasing dependence of this country on foreign supplies of wheat and flour, and indicating what on an average estimate is the general demand of this country on the bread-stuffs of foreign regions—a demand which has more than doubled during the space of fourteen years only.

Returns as to the acreage under corn and other crops have been made from Ireland and Scotland for some years past, but no such return was obtainable from England and Wales till 1866. In this year, however, such an account was published by the Board of Trade. The most important facts of this return are printed below.

If we assume the acreage of each kind of grain to be an average of the amount annually under cultivation, and take 30 bushels an acre as the average produce of wheat, the amount of wheat produced annually in the United Kingdom will reach nearly 14,000,000 quarters. Taking again barley and oats at 40 bushels to the acre, the produce of these two kinds of grain will be about 31,000,000. Rye, beans, and peas, reckoned at 30 bushels, will produce about 3,480,000 quarters; and the total produce 51,380,000 quarters of different kinds of corn. It may be observed that the Author in previous calculations, based chiefly upon hypothetical premises, estimated the total annual average growth of the United Kingdom at about 50,000,000 quarters, an amount which pretty closely agrees with the estimate taken from the returns elaborated by the Board of Trade.

Regulations under which the Corn Trade of the United Kingdom was conducted previously to 1816. — These regulations were embodied in the Act 5 Vict. 2 sess. c. 14, some clauses of which still continue in force (see post). This Act imposed a scale of duties on wheat and other descriptions of corn when imported from a foreign country, which varied inversely according to their prices, being greatest when prices were lowest, and least when prices were highest. (See a Table of the duties in the former editions of this work.)

From the extreme difficulty of forming anything like correct conclusions in regard to the state of the crops at any given period in an extensive country, and still more of estimating the

supply and probable price of corn at any future period, though but a little remote, the risk attending the corn trade is proverbially great. Under such circumstances, if Government interfere at all, it should certainly be to lessen such hazards; and, at all events, it should take especial care to do nothing to increase them. Hence, if a duty be imposed on importation, it should be constant, so that its influence may always be estimated beforehand; for if the amount of duty depend on accidental circumstances, or on anything so fluctuating and incapable of precise estimation as the prices in the home market, it must necessarily, by increasing the hazard of all speculations in corn, tend to augment those inequalities in its supply and price that should, as far as possible, be diminished. To show the direct influence of such duties, it may suffice to mention that if, under the above law, a merchant had commissioned a quantity of wheat when the home price was between 64s. and 65s. per quarter he would, in the event of the price falling to 60s. before the importation took place, have lost 4s. per quarter by the transaction, viz. 4s. per quarter by the fall of price, and 8s. per quarter by an increase of duty.

It may, perhaps, be said that if, on the other hand, the late scale of duties was injurious to the merchant when prices were falling, and when importation was consequently either unnecessary or of less advantage, it was, on the other hand, equally advantageous to him when prices were rising, and when the public interests required that

importation: on the view of the order are always a fair profit: an supposing the trade such an extent, increase his import possible to devise the losses incurred by making a profit profits of such a w thing, perhaps, mig But the system we ceed on quite oppo not to diminish ri added to the loss ful, and to the pro speculation!

There are other e the pernicious oper still more striking iminance of unfavo harvest, and a dete rise, and the duty f now suppose that t that the anticipatio and observe what, t the operation of the prices immediately consequent increas corn warehoused in every contiguous fore for consumption, and ket! With no duty, merchants distribute the the best estimate the and accessories of the of a shilling-scale goe silarious. Besides trade, it tempts merch to holt back, in the e enter their corn at a r the other hand, a fall market, as already see rminously depressed b it to escape the increa nately injurious to t agricultural classes; e tions on the former, withhold their corn f attains to a ruinous latter, by making the market which is already low prices of 1821 an and 1835, were, no do the excess of the forei arising out of the circ

Now that our ports a whether of native or d furnished when necess necessity; and when p large proportion of the anticipation of a futur was no room for cons everything had to be be by fit and starts. We bushel of wheat from t but our prices having f fallen still more rapid demand for all the cor being expected, no b for meeting such su demands; and prices ro make our presence in t to every one, except th to have on hand stocks that a commerce condu

importation could be encouraged; but the prices in the view of the merchant when he gives an order are always such as he supposes will yield a fair profit; and if they rise, this rise will, supposing the trade free or the duty constant, yield such an extra profit as will make him increase his imports to the utmost. If it were possible to devise a system that should diminish the losses incurred in unfavourable speculations by making a proportional deduction from the profits of such as were unusually successful, something, perhaps, might be found to say in its favour. But the system we acted upon of late years proceeded on quite opposite principles: its effect was not to diminish risks, but to increase them; it added to the loss resulting from an unsuccessful, and to the profit resulting from a successful speculation!

There are other considerations that serve to set the pernicious operation of a fluctuating duty in a still more striking point of view. Should a continuance of unfavourable weather occur before harvest, and a deficient crop be anticipated, prices rise, and the duty falls to next to nothing. But now suppose that the weather becomes fine, and that the anticipations of a short crop are dispelled, and observe what, under such circumstances, is the operation of the sliding-scale. In such a case prices immediately give way, and, to avoid the consequent increase of duty, every bushel of foreign corn warehoused in the country, and, indeed, in every contiguous foreign port, is forthwith entered for consumption, and thrown upon a falling market! With no duty, or with a fixed duty, merchants distribute the supply of corn according to the best estimate they can form of the real wants and necessities of the people. But the operation of a sliding-scale goes far to exclude such considerations. Besides doubling the hazards of the trade, it tempts merchants, when prices are rising, to hold back, in the expectation of being able to enter their corn at a reduced duty; and when, on the other hand, a fall of prices is anticipated, the market, as already seen, is overloaded, and prices ruinously depressed by the supplies forced upon it to escape the increase of duty! It is thus alternately injurious to the manufacturing and the agricultural classes; entailing the severest privations on the former, by making the importers withhold their corn from market till the price attains to a ruinously high level; and on the latter, by making the same parties throw it on a market which is already depressed. The extreme low prices of 1821 and 1822, and of 1833, 1831, and 1835, were, no doubt, in part occasioned by the excess of the foreign entries for consumption arising out of the circumstances now mentioned.

Now that our ports are constantly open, supplies, whether of native or of foreign growth, are only furnished when necessary, and are limited by the necessity; and when prices are low, or falling, a large proportion of the imports are warehoused in anticipation of a future rise. But formerly there was no room for consideration or combination; everything had to be done on the moment, and by the end starts. We might not have brought a bushel of wheat from the Baltic for a year or two; but our prices having risen, and the duty having fallen still more rapidly, we had an instantaneous demand for all the corn that could be had! Not being expected, no provision could be made for meeting such sudden and capricious demands; and prices rose to such a degree as to make our presence in the foreign markets hateful to every one, except the few who might happen to have on hand stocks of corn. It is plain, too, that a commerce conducted in this way could not

be carried on by an interchange of goods for corn, as it would have been had the ports been constantly open. We had a demand one year for perhaps ten times the quantity of Polish corn that we required another year; but the Poles could not reciprocate by taking off corresponding quantities of our cottons, woollens, and hardware. Under ordinary circumstances an increase of imports is always accompanied by a corresponding increase of exports; but, to bring this about, the increase must neither be sudden nor excessive; for, if so, the chances are ten to one that the foreign demand for our products will not increase to an equal extent. Corn is the principal means which the Poles and Russians have of paying for English goods; and, as we frequently shut it wholly out, their imports from England were unavoidably below even the average amount of their exports; so that when we have had an extraordinary demand for corn, the greater part of the excess had to be paid for in bullion; and, instead of being benefited by its occurrence, our commercial and manufacturing interests were deeply injured.

But it is unnecessary to dwell on what is so well known. Fortunately we did not require to import any foreign corn in 1835 and 1836; for no one, either in the Bank of England or out of it, acquainted with the circumstances, can doubt that, had it been then necessary to make the same payments for foreign corn we had to make in 1830 and 1831, and in 1838 and 1839, the Bank must have stopped payments; and a shock would have been given to the credit and financial interests of the country from which they would not easily have recovered. The severe pressure on the money market in 1839 mainly originated in the same circumstances; and that pressure was productive of far greater loss and inconvenience to the agriculturists than any advantage they gained by the rise of prices in that year.

It must not, however, be supposed, from anything now said, that we mean to state or insinuate that it is possible, by any contrivance, or by the utmost possible degree of freedom, to avert all fluctuations in the supply and price of corn. Any such idea would be alike chimerical and absurd. Variations of the harvests, in so rich and populous a country as Great Britain, must always, and under any circumstances, have a powerful influence over prices, not only here, but also in those foreign markets whence we are in the habit of drawing a portion of our supplies. But it admits of demonstration, that importation without any, or with constant duties, is the best means by which to mitigate the influence of variations of harvests, and to secure the greatest steadiness of price. Under the existing system, the merchants of this and other countries are able to form their plans without the fear of their being overturned by accidental or contingent circumstances; and the fact that we every now and then require a large supply of foreign corn makes capitalists, here and elsewhere, warehouse, in abundant years, large supplies, in anticipation of the demand when a deficiency occurs. The merchant has now to deal only with real wants and necessities; and these it is comparatively easy to provide against.

Besides its mischievous operation in other respects, the late corn law was highly inimical to the public interests from the convenient handle which it afforded for all sorts of agitation, misrepresentation, and abuse. Its deleterious influence was greatly exaggerated; and it seemed to be supposed that its repeal would be a sovereign panacea for all sorts of grievances. But though, for the reasons previously stated, the new system has given us greater steadiness of prices, and has, in

consequence, been of much public advantage, its influence in the reduction of prices has not been so great as has been expected, both by the agriculturists and by the other classes. The extraordinarily favourable seasons and productive harvests that prevailed, both in Europe and America, in 1848 and 1849, led to an unusually large importation, and consequently, also, to a considerable fall of prices. But this fall not having been by any means so great as might have been anticipated from the magnitude of the imports, shows that the greater portion, at least, of the latter had been required to meet the increased demand of the country. In 1852 the price of wheat amounted to 40s. 9d. per quarter; and we incline to think that this will prove to be about the lowest point in the descending scale, and that the probability is that prices will be considerably higher. There must, no doubt, be in all cases much uncertainty in prospective estimates of prices. We are still, however, disposed to abide by our former conclusion, that the probable future average price of wheat in this country, under the new system, may be estimated at about 48s. or 50s. per quarter; and if so, agriculture will not be affected by the change.

Should it turn out differently, and should there be at any time so very abundant a season in this country and in the north of Europe as to threaten such a fall of prices as might give a serious shock to the industry of the husbandman, the crisis may be averted or mitigated by some temporary expedient. But it is not very probable that it will be necessary to interpose in this way. Instead of being unfavourable to the agriculturists, they have already gained, and the chances are that they will continue to gain, by the new system; they have greater capital, skill, and industry than those of any other country; and being aware that they must now wholly rely on them to preserve their place in society, and not on Custom-house regulations and parliamentary majorities, the continued improvement of agriculture may be confidently expected; and, apart from this powerful stimulus, the existing system has the further advantage that it gives the agriculturists increased security, and identifies their interests in opinion, as well as in fact, with those of the public.

At the same time we are ready to admit that, had it been practicable, we should have preferred seeing this great question settled by the adoption of a measure for opening the ports, under a fixed duty of 5s. or 7s. per quarter on wheat, accompanied with a corresponding drawback. We make this statement on general grounds, and without any reference to the peculiar burdens that affect the agriculturists, though these should neither be forgotten nor overlooked. It would be easy to show that in scarce years a duty of this amount would fall wholly on the foreigner, without affecting prices or narrowing importation; while, in years of unusual plenty, the drawback would facilitate exportation, and would, consequently, tend to hinder prices from falling so low as to injure the farmer and obstruct improvement. And in a matter of such immense importance it is the part of a wise Government to be cautious how they take any step, of the consequences of which they are not fully assured, or which may expose any great interest to serious vicissitudes. But, even if our limits permitted, it would be to little purpose to insist on these or any similar considerations. The pertinacity with which the agriculturists opposed every approach to a more liberal system roused a spirit which would not be satisfied with anything short of a complete abandonment of restrictions. The time for compromise and arrangement being allowed to go by, Government had to deal with an

unreasonable necessity: 'Cum ventre humano nihil negotium est, nec rationem patitur, nec equitatem mitigatur, nec ulla prece floctitur equitatis' (Seneca, *de Brev. Vitæ*, c. 18.) What was practicable became of more consequence than what was either just or proper. And even had it been possible to effect an arrangement of the question in the way now stated, the pernicious trade of agriculture would most likely have continued to flourish; the object and influence of the duty would have been misrepresented; and neither landlords nor farmers would have felt any confidence in the permanency of the new arrangements. Under these circumstances, their unconditional repeal was, if not really, at all events practically, the best, or rather the only safe course that could be adopted in dealing with the corn laws.

*Duties payable down to Feb. 1, 1849, under the Act 9 & 10 Viet. c. 22.*—On all corn, grain, meal, and flour imported into the United Kingdom or the Isle of Man from parts beyond the seas, and entered for home consumption, viz.—

*If imported from any Foreign Country.*

*Rye, Pease, and Beans.*  
For every quarter a duty equal in amount to the duty payable on a quarter of barley.

*Wheat Meal and Flour.*  
For every barrel being 196 lbs. a duty equal in amount to the duty payable on 40 gallons of wheat.

*Barley Meal.*  
For every quantity of 217½ lbs. a duty equal in amount to the duty payable on a quarter of barley.

*Oatmeal and Groats.*  
For every quantity of 181½ lbs. a duty equal in amount to the duty payable upon a quarter of oats.

*Rye Meal and Flour.*  
For every barrel being 196 lbs. a duty equal in amount to the duty payable upon 40 gallons of rye.

*Pea Meal and Bean Meal.*  
For every quantity of 272 lbs. a duty equal in amount to the duty payable on a quarter of pease and beans.

*If the Produce of, and imported from, any British Possession out of Europe.*

Wheat, barley, bear or bigg, oats, rye, pease, and beans, the duty shall be, per qr. . . . .	1 0
Wheat meal, barley meal, oatmeal, rye meal, pea meal, and bean meal, the duty shall be, per cwt. . . . .	0 4

But the above duties ceased on February 1, 1849; and on, from, and after the said February 1,

1849, the following 1, 1864) charge viz.—

Upon all wheat, bar, and so in proportion

Regulations embodied in the & 28 Vict. c. 1

Clause 4 of the average prices according to 5 & the duties thereby.

Clause 5 repeals c. 14 which prohibits United Kingdom corn ground.

At present (1864) of 3d. per cwt. is in rate of 1s. per quart to be equivalent to We subjoin an a 5 & 6 Vict. 2 sess in the 8 & 9 Vict. force.

Regulations to be any British Possession 1, 1864) charge viz.—

any such possession or shipper thereof before the collector at the port of shipment specifying the quantity of grain, meal, or flour, produce of some British owner or proprietor of from the collector of customs of the said signature, of the quantity of such corn, grain, meal, or flour, or place in the United Kingdom, the master of the ship produce and deliver to the officer of customs of the true and accurate copy of the collector and other the port of shipment made, together with the said collector, or other the quantity of corn so and such master shall before the collector or officer at the place of importation that the several meal, or flour on board shall be entered under the name of the same that are in the declaration and certificate without any admixture person shall in any such quantity make any fals place of which any such was the produce, or respectively corn, grain, meal, or flour, and become liable the sum of 100l., and the to such persons belonging

each notice shall be so delivered shall, and he or she is hereby required to comply therewith, and to declare and set forth in such his or her return, or in a separate statement in writing, the several particulars aforesaid. (Sec. 25.)

**Inspectors to enter Returns made to them in a Book &c.**—The inspector of corn returns for the city of London, the city of Oxford, and the town of Cambridge, and every officer of excise acting as inspector of corn returns for the several other cities and towns aforesaid, and every continuing inspector of corn returns for any of such other cities or towns as aforesaid, shall duly and regularly enter in a book, to be by him provided and kept for that purpose, the several accounts of the quantities and prices of corn returned to him by such persons respectively as aforesaid; and every inspector of corn returns for any of the cities and towns enumerated in the said schedule shall in each and every week return to the comptroller of corn returns an account of the weekly quantities and prices of the several sorts of British corn sold in the city of London, or in the city or town for which he shall be or act as inspector, according to the returns so made to him as aforesaid, and in such form as shall be from time to time prescribed and directed by the said comptroller of corn returns; and the said returns shall be so made to the said comptroller by the inspector of corn returns for the city of London on Friday in each week, and by the respective inspectors of corn returns for the city of Oxford and the town of Cambridge, and by the respective officers of excise acting as inspectors of corn returns, and by the respective continuing inspectors of corn returns for the several other cities and towns aforesaid, within three days next after the first market day holden in each and every week in any such city or town. (Sec. 26.)

Sec. 27 enacts that inspectors shall not include returns until they have ascertained that the persons making them have taken the declaration required.

**Average Prices to be made up and published every Week.**—The average prices of all British corn by which the rate and amount of the said duties shall be regulated, shall be made up and computed on Thursday in each week, in manner following; (that is to say,) the said comptroller of corn returns shall on such Thursday in each week, from such returns as shall be received by him during the week next preceding, ending on and including the Saturday in such preceding week, add together the total quantities of each sort of British corn respectively appearing by such returns to have been sold, and the total prices for each the same shall thereby appear to have been paid, and shall divide the amount of such total prices respectively by the amount of such total quantities of each sort of British corn respectively, and the sum produced thereby shall be added to the sums in like manner produced in the 5 weeks immediately preceding the same, and the amount of such sums so added shall be divided by 6, and the sum thereby given shall be deemed and taken to be the aggregate average price of each such sort of British corn respectively, for the purpose of regulating and ascertaining the rate and amount of the said duties; and the said comptroller of corn returns shall cause such aggregate weekly averages to be published in the next succeeding Gazette, and shall on Thursday in each week transmit a certificate of such aggregate average prices of each sort of British corn to the collector or other chief officer of the customs at each of the several ports of the United Kingdom, and to the said functionary at the port of Douglas in the Isle of Man; and shall also cause the rate and amount of the duties to be paid under

the provisions of this Act shall from time to time be regulated and governed at each of the ports of the United Kingdom by the aggregate average prices of British corn at the time of the entry for home consumption of any corn, grain, meal, or flour chargeable with any such duty, as such aggregate average prices shall appear and be stated in the last of such certificates received by the collector or other chief officer of customs at such port. (Sec. 28.)

**How Quantities of Corn are to be computed.**—In the returns to be made as aforesaid to the comptroller of corn returns, and in the publications to be made from time to time in the London Gazette, and in the certificate to be transmitted by the said comptroller of corn returns to collectors or other chief officers of customs, the quantities of each sort of British corn respectively shall be computed and set forth by, according, and with reference to the imperial standard gallon, as the same is declared and established by the Act 5 Geo. IV. c. 74, amended or altered by the Act 6 Geo. IV. c. 12, and by the Act 5 & 6 Wm. IV. c. 63. (Sec. 29.)

**Until sufficient Number of Returns are made, Comptroller may use the present Averages.**—Until a sufficient number of weekly returns have been received by the said comptroller of corn returns under this Act to afford such aggregate average prices of British corn as aforesaid, the weekly average prices of British corn published by him immediately before the passing of this Act shall be used and referred to in making such calculations as aforesaid, in such manner as if the same had been made up and taken under this Act. (Sec. 30.)

**What shall be deemed British Corn.**—All corn or grain the produce of the United Kingdom shall be deemed and taken to be British corn for the purposes of this Act. (Sec. 31.)

**Any Corn Returns believed fraudulent may be omitted in the Computation.**—If the said comptroller of corn returns shall at any time see cause to believe that any return made to any inspector of corn returns is fraudulent or untrue, the said comptroller is hereby required, with all convenient expedition, to lay before the Lords of the Committee of Privy Council (for Trade) a statement of the grounds of such his belief; and if upon consideration of any such statement the said Lords of said Committee shall direct the comptroller to omit any such return in the computation of such aggregate weekly average price, then and in that case, but not otherwise, the said comptroller of corn returns shall be authorised to omit such return in the computation of such aggregate weekly average price. (Sec. 32.)

Sec. 33 enacts that corn dealers having made the declaration previous to this Act shall transmit returns, and comply with the rules hereby required.

**Comptroller to issue Directions respecting the Inspection of Books of Inspectors.**—The comptroller of corn returns is hereby authorised from time to time, in pursuance of any instructions which he shall receive in that behalf from the Lords of the Committee of Privy Council (for Trade), to issue to the inspectors of corn returns for the city of London, the city of Oxford, and the town of Cambridge respectively, any general or special directions respecting the inspection by any person or persons of the books so directed as aforesaid to be kept by such inspector of corn returns; and no such inspectors for the city of London, the city of Oxford, or the town of Cambridge shall permit or suffer any person to inspect any such book, or to peruse or transcribe any entry therein, except in compliance with some such general or special di-

rections from the said comptroller of corn returns. (Sec. 34.)

*Copy of last Return to be affixed on Market Place on each Market Day.*—The inspector of corn returns for every city or town other than the city of London shall and is hereby required, on each and every market day, to put up or cause to be put up in the market place of the city or town for which he shall act as inspector, or if there shall be no market place, then in some other conspicuous place therein near to where the corn market is usually held, a copy of the last return made by him to the comptroller of corn returns, omitting the names of the parties who may have sold and bought the said corn; and every such officer or inspector shall also again put up such account on the market day immediately following that on which it shall first have been put up, in case the same shall from accident or any other cause have been removed, and shall take due care that the same shall remain up for public inspection until a new account for the ensuing week shall have been prepared and set up. (Sec. 35.)

Secs. 36, 37, 38 relate to the payment of comptrollers and inspectors.

Sec. 39 imposes a penalty on corn dealers who do not make declarations or returns.

Sec. 40 relates to the recovery and application of penalties.

Secs. 41, 42 relate to the penalties to be imposed on witnesses for non-attendance, and the punishment to be inflicted on those who make false returns.

Sec. 43 declares that the Act shall not affect the practice of measuring or privileges of the city of London.

*Substitution of Wheat Flour or Biscuit for bonded Wheat.*—Our readers are, no doubt, generally aware that of late years efforts were occasionally made in the House of Commons to get a law enacted authorising the delivery of bonded wheat from the warehouse, on the substitution in its stead of a proportional quantity of wheat flour or biscuit. But this proposal encountered the hostility of the more zealous partisans of the corn laws, principally on the alleged ground that it would open a door to fraud, and lead to the clandestine introduction of large quantities of foreign wheat. In the course, however, of 1842, the project was again introduced by Mr. Gladstone, and, having been supported by Government, was passed into a law, 5 & 6 Vict. c. 92. It enabled millers, bakers, and others in this country to take advantage of such openings in the home and foreign markets as may offer for the manufacture and sale of flour and biscuit, and to make such changes in the nature of their stocks as may be thought most advantageous. There do not seem to be any very good grounds for thinking that it afforded any considerable facilities for the commission of fraud by the introduction of wheat without a counter-weighing deposit of flour; but supposing it did, no one was injured by such introduction. We subjoin an abstract of the Act now referred to.

*Warehoused Wheat to be delivered Duty Free upon substituting an equivalent Quantity of Wheat Flour or Biscuit.*—Whereas it will be of advantage to the trade and commerce of the country that wheat may be delivered duty-free from the warehouse or from the vessel, upon the deposit in the warehouse, or due exportation therefrom, of an equivalent quantity of wheat flour and biscuit: be it therefore enacted, that it shall be lawful for the principal officer of customs having charge of any warehouse in which wheat may be warehoused without payment of duty upon the first entry thereof, to deliver any quantity thereof

duty-free upon there being deposited in warehouse in lieu thereof fine wheat flour or biscuit, as under:—

For every 96 lbs. of kiln-dried wheat, or for every 100 lbs. of wheat not being kiln-dried, not less than 78 lbs. of fine wheat flour, or 68 lbs. of captain's biscuit, or 80 lbs. of biscuit of the standard of the biscuit supplied to her Majesty's navy, or 118 lbs. of common ship's biscuit: and so in proportion for any less quantity than 96 lbs. of kiln-dried wheat, or 100 lbs. of wheat not kiln-dried; such flour or biscuit having been manufactured in the United Kingdom, or such flour having been duly imported and the duty thereon having been paid. (Sec. 1.)

Sec. 2 enacts that fine wheat flour and biscuit may be deposited in warehouse, and certificate of such deposit granted, to entitle the holder to an equivalent quantity of warehoused wheat duty-free any time within six weeks of the date thereof.

Sec. 3 enacts that persons making deposits of flour and biscuit be entitled to have equivalent quantities of wheat entered duty-free from the vessel.

Sec. 4 orders that three days' notice in writing be given to the collector of the quantity of wheat required to be delivered from the warehouse and of the day of delivery.

Sec. 5 orders that no wheat shall be delivered duty-free until the substituted article has been deposited and the certificate duly examined.

Sec. 6 enacts that substituted flour and biscuit shall be subject to the warehousing laws, but shall not be taken out for home consumption.

The relative values of wheat, barley, and oats are found to subsist with slight variation through a long period of years. Thus during the 13th and 14th centuries the prices of barley and oats, wheat being taken at 100, are represented by the numbers 73-14 and 42-05 respectively. In the ten years ending with 1864, the same numbers being taken for wheat, the relative quantities are 70 and 45-95.

In the following tables of the price of wheat &c., the first table gives the prices of wheat in the ancient Winchester bushel, as found in the work of Mr. Rogers *On Agriculture and Prices in England*, between 1209 and 1400.

I. Prices of Wheat per Winchester Bushel.

Year	Price	Year	Price	Year	Price	Year	Price

from this year inclusive the account of the Act, c. 30 s. 82.

The following account of prices corrects the accuracy of the returns in the table above, be so implicitly corrected above. Bishop Fleetwood

Quantities of Wheat and Y

Countries	1850
Northern Ports	685,000
Southern Ports	2,951,000
Wales and the Duchies	1,531,000
France	3,345,000
Germany (other parts)	660,000
Spain	555,000
Italy	8,124,000
Russia and Moldavia	10,150,000
Other countries, not otherwise specified	131,500
Total	21,497,000

The second table contains the price of wheat the Winchester bushel for 1582 to 1826. The first portion, from 1582 to 1645 inclusive, is taken from the Oxford Register of Corn Prices,

the last portion from the audit books of Eton; the Windsor bushel of nine gallons in the original being reduced to that of Winchester, containing eight.

II. Account of the Prices of Middling or Mealing Wheat per Quarter, at Windsor Market, as ascertained by the Audit-books of Eton College, reduced to Winchester Bushels of 8 Gallons.

From this year inclusive the account at Eton College has been kept according to the bushel of 8 gallons, under the provisions of the Statute, III. c. 30 s. 22.

The account of prices commenced in 1595: the accuracy of the returns in the first years cannot however, be so implicitly relied on as those above. Bishop Fleetwood and Sir F. M. Eden have collected with great industry almost all the existing information respecting the state of prices in England during the last six hundred years.

CORN LAWS AND CORN TRADE

IV. FOREIGN CORN TRADE.

**Polish Corn Trade.**—Dantzie has hitherto supplied us with large quantities of the finest wheat; and as it will most probably continue to be one of the principal sources of our imports in time to come, it is of importance to ascertain the cost of wheat in that emporium, and the expense of its importation into this country.

According to the data collected by Mr. Jacob in his *Report on the Agriculture and Corn Trade of the North of Europe*, the ordinary price of wheat at Dantzie free on board would amount to about 40s. per quarter, made up as follows:—

	Per quarter	s. d.
Cost of wheat at Wars.w		28 0
Conveyance to the boats, and charges for loading and stowing, and securing it with mats		0 6
Freight to Dantzie		5 0
Loss on the passage by pilfering, rain &c.		5 0
Expenses at Dantzie in turning, drying, screening, warehousing, and loss of measure		2 0
Profit or commission, as the case may be, to the merchant in Dantzie		1 6
Cost at Dantzie, exclusive of shipping charges, which amount to about 10d. per quarter		40 0

Now, if to this we add 7s. or 10s. per quarter for the expense of importing the wheat into England, including the profit of the importer, it is plain that it could not, supposing Mr. Jacob's estimate that it could be nearly accurate, be sold in London, free of duty, for less than 47s. or 50s. per quarter.

It has, no doubt, been alleged that the cost of wheat in Dantzie is overrated in the above estimate; and in seasons when there is little or no demand for corn from abroad, this allegation is not certainly well founded. But this estimate is not meant to apply to such years, but to those when there is some considerable foreign demand; and whenever this is the case, it will be found, though some of the items which go to make up the cost may vary, that the result is nearly correct; and that there are really no good grounds for supposing that corn could, in the seasons in question, be shipped from Dantzie for less than about 40s. per quarter.

In further corroboration of this statement we may mention that owing to the deficient harvest of 1845, the average price of wheat in January 1846, in Warsaw, exceeded 40s. per quarter, and it is stated in a despatch from the consul in that city, that at an average of the 20 years ending with 1845 prices had been as follows, viz.: wheat with 1845 prices had been as follows, viz.: wheat from 26s. 6d. to 30s. per imp. quarter; barley from 17s. 10d. to 20s. 6d. per do.; and oats 8s. 6d. to 10s. per do. It is plain, therefore, that Mr. Jacob's estimate of the cost of wheat at Warsaw is but little, if it be in any degree, overstated; and we are well assured that this also is the case with his estimate of the expense of conveying it down the Vistula to Dantzie.

Mr. Grade, of Dantzie, furnished the Agricultural Committee of 1831 with the following Table of the average prices of corn in that city, free on board, in decennial periods from 1770 to 1820.

Average Price from Ten to Ten Years of the different Species of Corn, free on board, per Quarter, in Sterling Money, at Dantzie.

	Wheat		Rye		Barley		Oats	
	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.
From 1770 to 1779	33 9	22 8	16 1	11 1	12 4	12 4	12 4	12 4
1780 — 1789	35 10	22 1	17 11	12 6	13 1	13 1	13 1	13 1
1790 — 1799	43 8	26 3	19 5	13 0	14 0	14 0	14 0	14 0
1800 — 1809	60 0	31 10	25 1	20 4	18 0	18 0	18 0	18 0
1810 — 1819	55 4	31 1	26 0	20 4	18 0	18 0	18 0	18 0
Aggregate average price of 50 years	45 4	27 2	20 10	15 10	15 10	15 10	15 10	15 10

It appears from this table that at an average of the 20 years ending with 1819 the price of corn

in Dantzie was no less than 57s. 8d. per quarter. But it is to be observed that these prices were powerfully influenced by the scarcity and high price in this country in 1800 and 1801, and by the obstructions which the war threw in the way of agriculture, and of the conveyance of corn to Dantzie. But the prices of wheat at this great emporium have not since 1819 been subject to any such disturbing influences. The countries whence Dantzie draws her supplies of corn have enjoyed an all but uninterrupted tranquillity during the last 40 or 50 years; and though during some of these years we have made large importations, we have not, in others, brought away a single bushel of corn; so that the average prices of the period of 11 years stated below may be taken as pretty correctly representing the prices of corn in Dantzie in seasons when the export is rather under a medium.

Account exhibiting the Lowest, the Highest, and the Average Prices of Wheat in Dantzie, in each Sterling Money, per Imperial Quarter, in each of the Eleven Years from 1831 to 1841, both inclusive, with the Averages for the whole Period.

Year	Lowest prices per quarter		Highest prices per quarter		Average price per quarter
	s. d.	s. d.	s. d.	s. d.	
1831	41 1	45 7	51 6	46 3	46 3
1832	32 5	32 9	49 11	38 6	38 6
1833	25 1	29 11	35 7	27 6	27 6
1834	21 0 1/2	26 2 1/2	31 5 1/2	24 1 1/2	24 1 1/2
1835	22 3	26 7	31 5 1/2	24 1 1/2	24 1 1/2
1836	21 9	26 7	31 5 1/2	24 1 1/2	24 1 1/2
1837	26 6 1/2	31 9	36 9	29 1 1/2	29 1 1/2
1838	21 9	26 7	31 5 1/2	24 1 1/2	24 1 1/2
1839	20 0	26 9	31 5 1/2	24 1 1/2	24 1 1/2
1840	45 9	57 0	62 9	50 1 1/2	50 1 1/2
1841	45 9	57 0	62 9	50 1 1/2	50 1 1/2
Average of 11 Years from 1831 to 1841	30 8 1/2	45 2	57 1 1/2	37 1 1/2	37 1 1/2

It appears from this table that the average price of wheat in Dantzie during the 11 years ending with 1841 was 37s. 1 1/2d. per quarter; making, with the addition of 10d. per quarter for shipping charges, its average price, free on board, 38s. 1 1/2d. per quarter. Now if to this last sum we add 7s. 10s. for the expense of its importation and delivery to the millers in London, it is plain, judging from the experience of these 11 years, that the average cost of Dantzie wheat in England, independent of duty, may be estimated, in round numbers, from 45s. to 50s. per quarter.

It is material, however, to bear in mind that a very large quantity could be shipped at the above prices. They represent only average years; and whenever there is any unusual demand for corn or when from 200,000 to 300,000 quarters are wanted for this country, the price immediately rises, as seen above, to from 45s. to 50s. per quarter and upwards. During the course of 1846 the average prices of the wheat shipped at Dantzie exceeded 48s. per quarter.

That the charges on importation into England, warehousing here, and then delivering to the millers, exclusive of duty and profit, would amount to about 10s. per quarter, appears from the following statements. The first was furnished by Messrs. Richard Birkett and Sons to the Agricultural Committee of 1827 by the price of foreign corn the other was obligingly furnished by Mr. Ingleton, in 1841.

According to the statement for 1868, the cost of importation at Dantzie being 50s., the cost of importation would be 6s. 11d. per quarter; but to this has been added an allowance for waste and for profit.

We are well convinced that it is not possible successfully to controvert these statements; such being the case, we are entitled to say

N.B.—Loss on remeasuring not considered. Freight and insurance are taken in this statement at an average, being sometimes higher and sometimes lower.

machine can be more perfectly unfounded than the... so prevalent in this country as to the... extreme cheapness of corn in Dantzie. The... truth is, that no considerable quantity of corn can... be derived from her without resorting to Galicia... and other provinces from 500 to 700 miles inland. The... corn is thence conveyed to the city in boats... related to the navigation of the rivers; but, owing... to the uncertain supply of water in the latter, the... communication is sometimes entirely broken off... and it is always very tedious and expensive. In... proof of this, we may mention that, in November... 1838 when wheat sold in Dantzie for 41s. 6d. per... quarter, it was selling in Lemberg, the principal... corn market of Galicia, for 15s.; the difference... amounting to 26s. 6d., being the measure of the... cost and risk of conveyance from Lemberg to... Dantzie! It is, in fact, quite nugatory to suppose... that any large supplies should be furnished by... Dantzie, were the shipping price under 30s. or 40s... per quarter, supposing that we could in ordinary years... ship considerable supplies for 34s., still it is pretty... obvious it could not be sold in London, with a... profit, for less than 45s. or 47s., or perhaps 48s. per... quarter.

It is difficult to draw any conclusions on which... would be safe to place much reliance as to the... supplies of corn that may be obtained from... Dantzie and Prussia generally, now that our... ports are constantly open under a nominal duty. Mr... Jacob states that the lengthened period of... 7 years ending with 1825 gives an 'annual... report of what and rye of 279,794 quarters.'... This surplus may, he thinks, be 'fairly con-... sidered as the nearest approach that can be made... to the existing materials, to what is the usual... consumption of the produce of bread corn above the... ordinary circumstances occur to excite or check... variation.' (Report, p. 49.)... But there can be no doubt that Mr. Jacob... has underrated the capabilities of improvement... in the countries traversed by the Vistula, the... &c. And while our ports are open with a

duty of 1s., we may, supposing our average prices... not to fall below 45s. or 55s. per quarter, safely... reckon upon getting from Dantzie an annual... supply of from 250,000 to 350,000 quarters. It... should, however, be observed that Mr. Meek, who... visited the north of Europe in the latter part of... 1841 and early in 1842, concurs with Mr. Jacob in... thinking it improbable that any considerable... increase of exportation would take place from... Dantzie under any modification of our corn laws. (Parl. Paper No. 7, Sess. 1842, p. 31.) It was... difficult to believe that such should be the case. Down to a comparatively late period, owing to the... fluctuating and capricious nature of our demand, it... proved of little advantage to the Polish culti-... vators; nor was much corn raised in the expecta-... tion of its finding its way to England. Now that... our ports are always open, it is quite a different... matter. The supply of our markets has become an... object of importance to the Polish agriculturists, who... are endeavouring to extend and improve their... tillage, and the means of bringing corn to market. At... the same time it is right to observe that the... stimulus given to Polish agriculture, and to the... tillage of foreign countries generally, by the change in... our corn laws, must wholly depend on the extent... of our demand; and if it should, in ordinary seasons, be... more limited than is commonly supposed, it will... have proportionally less influence. We subjoin an

For an account of the shipments &c. of wheat from Dantzic in 1866, see DANTZIC.

**Quality of Dantzic Wheat.**—The price of wheat in Dantzic is usually about 7s. per quarter above its average price in Hamburg, and about 2s. above the average of Amsterdam. This difference is entirely owing to the superior quality of the Dantzic wheat. Though small grained, and not so heavy as several other sorts, it is remarkably thin-skinned, and yields the finest flour. Some of the best white, or, as it is technically termed, 'high mixed' Dantzic wheat, is superior to the very best English; but the quantity of this sort is scanty, and the average quality of all that is exported from Dantzic is believed to approach very nearly to the average quality of English wheat. Allowing for its superior quality, it will be found that wheat is, speaking generally, always cheaper in Dantzic than in any of the Continental ports nearer to London. The stock of wheat in Dantzic was only 4,500 Prussian lasts on January 1, 1867. There are very few seasons, indeed, in which Dantzic wheat is not largely imported into Amsterdam; and it frequently also finds its way into Hamburg. But it is quite impossible that such should be the case, unless, taking quality and other modifying circumstances into account, it were really cheaper than the native and other wheats met with in these markets. When there is any considerable importation into England, it is of every-day occurrence for merchants to order Dantzic wheat in preference to that of Holstein, or of the Lower Elbe, though the latter might frequently be put into warehouse

here for 18s. per quarter less than the former! It is, therefore, quite indispensable, in attempting to draw any inferences in regard to the comparative prices of corn in different countries, to make the requisite allowances for differences of quality. Unless this be done, whatever conclusions may be come to can hardly fail of being false and misleading; and when they happen to be right, they can only be so through the mere accident.

Dantzic being by far the greatest port for the exportation of wheat in the north of Europe, its price in her market may be assumed as the general measure of the price in the other shipping ports. At all events, it is certain that when Dantzic is exporting, wheat cannot be shipped, taking quality into account, at a cheaper rate from any other place. The importer invariably resorts to what he believes to be all things considered, the cheapest market; and it is a contradiction and an absurdity to suppose that he should burden himself with a comparatively high freight and other charges for wheat in Dantzic, provided he could buy an equally good article in so convenient a port as Hamburg at the same or a lower price. If, therefore, we are right in estimating the lowest price at which wheat may be profitably imported from Dantzic free of duty, in ordinary years, at about 4s. of 48s., we may be assured that this is the lowest importation price. The greater cheapness of the imports from other places is apparent only, and is uniformly counterbalanced by a corresponding inferiority of quality. [DANTZIC; KÖNIGSBERG; &c.] We subjoin an

Account of the Quantities, in Cwts., of the different Varieties of Corn imported into the United Kingdom from Prussia in each of the 5 Years ending with 1866.

**Russian Corn Trade.**—Russia exports large quantities of wheat, rye, oats, and meal. The wheat of the northern provinces is of various qualities; but the greater portion is small-grained, coarse, brown, and badly dressed. The hard, or Kulanka, is the best; it keeps well, and is in considerable demand for mixing with other wheats that are old or stale. Russian oats are thin; but being dried in the straw, they weigh better than could be expected from their appearance, and are reckoned wholesome food. Our imports from Russia in 1839 amounted to 371,633 quarters wheat, 316,823 do. oats, and 14,000 do. rye. But though this was far above the then average importation, it has since been greatly exceeded, principally in consequence of the extraordinary increase of the exports from the southern provinces. In 1866, for example, we imported 8,937,199 cwt. of wheat from Russia, exclusive of 195,387 cwt. of meal and flour. In 1865 we imported 7,219,834 cwt. from Russian ports on the Black Sea. During 1866 we received from all parts of the empire 3,169,549 cwt. of oats, and 910,154 cwt. of barley. (The reader will find notices of the North Russian corn trade under the articles ANCHANGEL, PETERSBURG, and RIGA. For an account of the corn trade of the Black Sea, see post, and the articles GALACZ, ODESSA, and T. GAZAROG.)

**Danish Corn Trade.**—The export of wheat from Denmark Proper, that is, from Jutland and the

islands, especially the latter, has, within the last 10 or 20 years, been much increased, and the quality of the grain greatly improved. Considerable quantities of wheat, barley, and other grain, as well as of butter, cheese, beef &c., are exported from Schleswig and Holstein. But, as already stated, the wheat of the latter is inferior; for, though it looks plump, it is coarse and damp. Kiel was formerly the chief Danish port for shipping corn; but large quantities are now shipped from Holtenau and other ports in the islands. In 1866 we imported from Denmark 506,236 cwt. of wheat, 1,446,376 cwt. of barley, 396,888 cwt. of oats, and considerable quantities of peas and beans and bean-meal. The quantities and values of the entire corn, flour, beans &c. exported from Denmark and the Duchies, in 1865, were as follows:—

Articles	Quantity	Value
Wheat	895,152	4,700,250
Barley	1,518,491	511,000
Oats	1,095,210	375,700
Peas and beans	57,169	150,000
Wheat flour	45,616	29,000
		1,350,000

**Corn Trade of the Elbe &c.**—After Hamburg is one of the greatest corn markets in the north of Europe, but is not, as formerly, a port for large quantities of corn, as these are here shipped chiefly by the Elbe and the Berlin Canal for immediate shipment. The exports of wheat

from Hamburg in 1866, years ending with 1866, the price of wheat in Hamburg is altogether less in Hamburg than in the north of Europe. Wheat from the Bohemian wheat river to Hamburg;

**Dutch Corn Trade.**—The depot for foreign corn is found there. On the assumption is supplied to the market that the prices in it are the same as those at which it is sold in Dantzic, Kiel, Hamburg, &c. The corn trade conducted under a license, however, a sliding scale was adopted, according to the prices, was adopted. In 1865, when the price of wheat here as well as in the north of Europe, was 18s. 4d. per quarter on an average, the price of wheat on oats. It was found that this scale should be revised, and a sliding scale of operation having been adopted, the Government has decided which it has been permitted to be 3 years ending with 1866, wheat 18s. 4d., oats 12s. 6d. per imp. quarter. Rotterdam is a very important port for the warehousing foreign corn, and the warehouse price is 2d. or 2 1/2d. per quarter.

Account of the Quantities of the various House Towns ending with 1866.

**French Corn Trade.**—The quantity of wheat given by Garnier in his translation of the *Wheat and Flour of France* is published in the *Annuaire* (p. 226) published in 1866 at 18 fr. the hectolitre of the subjoined table France, at an average price of 18 fr. 50 c. with 1850, amounted

from Hamburg amounted, at an average of the 11 years ending with 1841, to 210,871 quarters a-year. The price of wheat, as already stated, is frequently less in Hamburg than in Dantzic; but this lowness of price is altogether ascribable to the inferiority of the Holstein and Hanover wheats, which are generally met with in great abundance in Hamburg. Wheat from the Upper Elbe is of a better quality; Bohemian wheat is occasionally forwarded by the river to Hamburg; but the heavy charges attend-

ing its conveyance from Prague prevent its being sent down, except when the price is comparatively high. In 1849 the shipments of wheat from Hamburg amounted to 286,209 quarters, of which 226,864 were for England. The supply for export in 1866 was 30,025 lasts or 324,600 quarters, and in 1867 it was 43,819 lasts or 473,727 quarters; the price per last being, in 1866, 152 Hamburg dollars of 3 marks cur.; and in 1867, 212½ dols. We subjoin an

Account of the Quantities of Wheat and other Varieties of Corn and Wheat Flour imported from the Hanse Towns (principally from Hamburg) into the United Kingdom during each of the 5 Years ending with 1866.

**Dutch Corn Trade.**—Amsterdam is an important depot for foreign corn, every variety of which may be found there. Only a small part of its consumption is supplied by corn of native growth; so that the prices in it are for the most part dependent on those at which corn may be brought from Dantzic, Kiel, Hamburg, and other shipping ports. The corn trade of Holland was formerly conducted under a low fixed duty. In 1835, however, a sliding scale of duties, varying inversely according to the fluctuations of the home prices, was adopted. This scale continued in force till 1845, when the potato rot, which made its appearance here as well as in Ireland, occasioned its repeal, and the imposition of fixed duties of 1s. 6d. per quarter on wheat, 1s. 1d. per quarter on rye, 10d. per quarter on barley, and 9d. per quarter on oats. It was provided, in 1847, that this scale should be revised in 1850-51. And its practical operation having been found to be highly satisfactory, Government introduced a bill by which it has been perpetuated. At an average of the 3 years ending with 1850 the prices in the Netherlands were, wheat 86s. 11d., rye 23s. 10d., barley 18s. 4d., oats 12s. 10d., and buck-wheat 8s. 3d. per imp. quarter.

Rotterdam is a very advantageous port for purchasing foreign corn, being conveniently situated, and the warehouse-rent low, not exceeding 2d. or 2½d. per quarter per month. We subjoin an

**French Corn Trade.**—It appears, from the reports given by Garnier in the last edition of his translation of the *Wealth of Nations*, that the price of the hectolitre of wheat in the market of Paris amounted, at an average of the 19 years ending with 1819, to 20 fr. 53 cents. And Chaptal, in his valuable work *Sur l'Industrie Française* (l. p. 226) published in 1819, estimated the average price of wheat throughout France at 18 fr. the hectolitre. But it is seen in the subjoined table that the price of wheat in France, at an average of the half century ending with 1850, amounted to 20 fr. 20 cents, the

hectolitre, equivalent to 45s. 7d. the imperial quarter. The hectolitre is equal to 2·7512 imperial bushels, and the quarter to 2·82 hectolitres.

Average price of the entire period, 20 francs 20 cents. the hectolitre.

Owing to the deficient harvest of 1846, prices were occasionally higher in France than in England; and considerable quantities of wheat were taken out of bond in London and other British ports for shipment to France. The various expenses attending the importation of a quarter of French wheat into London and its delivery to the millers may be taken, at a medium, at about 7s. per quarter. France had formerly but little surplus produce to dispose of; so that it would have been impossible for us to import any considerable quantity of French corn without occasioning a great advance of price; but, as will be immediately seen, a decided change has taken place in this respect of late years, and when the harvests are abundant, France has latterly sent us large supplies.

The mean of the different estimates framed by Vauban, Quesnay, Expilly, Lavoisier, and Arthur Young, gives 61,519,672 septiers, or 32,810,000 quarters, as the total average growth of the different kinds of grain in France. (Pecher, *Statistique Elémentaire*, p. 290.) We, however, took occasion formerly to observe (*Supp. to Encey. Brit. art. 'Corn Laws'*) that there could not be a doubt that this estimate was a great deal too low; and the more careful investigations of late French statisticians fully confirm this

remark. The annual produce of the harvest of France was estimated in 1843, from returns obtained under official authority, at 69,558,000 hectolitres of wheat, and 112,958,000 hectolitres of other sorts of grain; making in all 182,517,000 hectolitres, or 62,740,000 imperial quarters. Of this quantity it was supposed that about 16 per cent. was consumed as seed, 19 per cent. in the feeding of different species of animals, and 2 per cent. in distilleries and breweries.

The reader will not fail to observe that, according to this statement, the consumption of corn in France, which had in 1862 a population of about 37,382,225, is not more than equal to that of the United Kingdom, the population of which may be taken at 29,000,000. And we have no doubt that such is the fact; for, though the consumption of corn in France materially exceeds its proportional consumption in Ireland, it is far below the proportional consumption of Great Britain. The corn expended in this country in the keep of horses and in distilleries would, of itself, suffice to feed a third part of the people of France.

The foreign corn trade of France was formerly regulated by a law which forbade exportation, except when the home prices were below certain limits, and which restrained and absolutely forbade importation except when they were above certain other limits. The prices regulating importation and exportation differed in the different districts into which the kingdom was divided. Latterly, however, importation was at all times allowed under graduated duties, which, like those recently existing in this country, became prohibitory when the prices sank to a certain level. The frontier departments were divided into 4 separate districts, the prices in each district governing the duties on importation into it, so that it sometimes happened that corn warehoused in a particular port, where it was not admissible except under a high duty, was carried to another port in another district, and admitted at a low duty. An official announcement was usually issued on the last day of each month, of what the duties were to be in each district during the succeeding month. But the law was sometimes suspended for longer or shorter periods. At present (1868) the French import duty on wheat till December 31 next is 50 cents.

per 100 kilogrammes; barley, oats, rye, buckwheat, and maize being free.

Account of the Quantities of Wheat and Wheat Flour respectively imported from France into the United Kingdom during each of the 36 Years ending with 1866.

1848	216,324	362,202			
1849	451,331	1,066,258			

The increase in the interval between 1818 and 1866 of the imports of wheat and flour, but more especially the latter, is quite unprecedented. It was occasioned, at first, in part at least, by the superior quality of French flour; for, how singular soever it may appear, the business of grinding corn was then better understood and in a more advanced state in France than in England. This may, perhaps, be accounted for by the mill-stones of La Brie, which are in common use in France, being better suited to their work than those commonly employed in England, and by the greater hardness of the French wheat, and the greater care taken in the sorting of the flour into various qualities. Latterly, however, very great improvements have been effected in the English mills.

But by far the greater part of the extraordinary increase in the imports of French wheat and flour in the period referred to is, no doubt, to be ascribed to the very low prices that they ruled in France. And the regular succession in this country for many years past of cycles of 3 or 6 years of scarcity and abundance is a very striking phenomenon. In proof of this, we beg to submit the following

Account, compiled from Official Documents, of the Excess of the Imports over the Exports, and of its Exports over the Imports, of Wheat into and from France, and of its Price per Hectolitre, in Periods of Scarcity and Abundance, from 1816 to 1856 inclusive.\*

	Excess of Imports over Exports		Excess of Exports over Imports		Average Price per Hectolitre
	hect.	fr. c.	hect.	fr. c.	
6 years of scarcity (1816-21)	6,218,000	—	—	—	25 22
6 " abundance (1822-27)	—	—	1,250,000	—	15 65

5 " abundance (1848-52)	—	—	16,237,000	—	15 45
4 " scarcity (1853-56)	—	—	20,207,000	—	27 54
41 years	55,805,000	—	18,432,000	—	—

\* From the *Revue Commerciale* of Messrs. Cominck of Havre for 1858: a valuable and trustworthy publication.

Hence, in these 41 years, here have been imported 55,805,000 hectolitres, and exported 18,432,000; leaving an excess of imports of 37,373,000 hectolitres.

Inasmuch, however, as the imports are made when prices are high, and the exports when they are low, the excess of the value of the former over that of the latter is greater than in proportion to the difference of their quantities, and is estimated, for the above period, at 1,160,000,000 frs. And this deficit in the amount of the harvests will not certainly be filled up by clinging to the worst parts of the protective system, that is, by allowing

importation, and preventing or fettering exportation, and such like expedients. But it will speedily get rid of when a really free trade in corn is established, and the agriculturists permitted to buy their tools and implements wherever they find them cheapest and of the best quality. No doubt, also, a modification of the existing law of succession would be very desirable; for, in addition to the stimulus which it gives to subdivision, the obstructions which it throws in the way of the consolidation of properties and the increase of farms make it a formidable barrier to the progress of agriculture.

According to a law passed in November 1858, the bakers in all the principal towns of the empire are bound to keep on hand a stock of grain or flour equal to three months of their ordinary consumption. But it is not to be supposed that an Act of this sort should be really carried out: it will either fall into desuetude, or degenerate into a mere instrument of abuse.

**Spanish Corn Trade.**—The exportation of corn from Spain was formerly prohibited under the severest penalties. But in 1820 grain and flour were both allowed to be freely exported; and in 1823 this privilege was extended to all productions (*frutos*) the growth of the soil. There is now, in fact, no obstacle whatever, except the expense of carriage, to the conveyance of corn to the sea-ports, and thence to the foreigner. Owing, however, to the corn-growing provinces being principally situated in the interior, and to the extreme badness of the roads, which renders carriage to the coast both expensive and difficult, the exports are reduced within comparatively narrow limits: the same difficulty of carriage frequently gives rise to very great differences in the prices in markets, in all parts of the country, only a few leagues distant. Were the railway system widely extended, and other means of communication improved, and anything like security given to the husbandman, Spain would, in no long time, become one of the principal exporting countries of Europe. Old Castille, Leon, Estremadura, and that part of Andalusia to the south and east of Seville, are among the finest corn countries of Europe, and might be made to yield immense supplies. But owing to the disturbed state of the country, and the want of a market for their produce, they can hardly be said to be at all cultivated. And yet such is their natural fertility, that in good seasons the peasants not only reap those fields nearest to the villages!

The imports of wheat and wheat-flour into this country from Spain in the 5 years ending with 1856 have been—

**Corn Trade of Odessa.**—Odessa, on the Black Sea, is one of the principal corn shipping ports of Southern Europe. Inasmuch, however, as but little of the corn sent from Odessa is raised in the province of Kherson in her neighbourhood, the exports depend in great degree on the price; a comparatively high price being necessary to pay the cost of conveying corn from Podolia and Galicia, whence only large supplies can be derived to the port. The navigation of the Dnieper, which intersects these provinces, and would otherwise be a most important channel of communication, is unluckily interrupted in the lower part of its course by cataracts, so that a very large portion of the corn brought at present to Odessa is conveyed to it in carts drawn by oxen; and the supply depends almost as much on the number of cattle that may be employed for this purpose as on the productiveness of the harvests. A portion also, though but a small one, of the supplies for Odessa is brought by coasters from the Sea of Azof, and from some of the smaller ports on the Black Sea.

The following table shows the extraordinary increase that took place in 1834-49 in the supplies of corn brought to Odessa. The exports in 1847 amounted to 2,016,672 quarters, being, we believe, the largest quantity of wheat ever shipped in a single season from a single port.

It appears from an official statement published in Odessa, that the total quantity of wheat brought to the town in the undermentioned years was—

Year	Chets.*	Year	Chets.	Year	Chets.
1833	691,000	1840	690,430	1847	1,981,920
1835	378,700	1841	720,372	1848	2,281,385
1836	878,700	1842	865,422	1849	2,575,857
1837	950,498	1843	1,170,215	1848	2,039,097
1838	1,841,000	1844	1,315,500	1849	1,714,744
1839	1,150,000				

\* A chetwert is about 5½ bushels.

During the three years ending with 1840, the average price of the best Odessa wheat, which, however, is inferior to English, was 34s. 6d. on the spot; and the better samples only are fitted for distant voyages, and for our markets. The crops for 1865 were generally bad and poor. Owing to the length and tediousness of the voyage from Odessa, and the risk of the grain heating on the passage, the charges attending its importation, including insurance &c., amount to from 14s. to 15s. per quarter. It is plain, therefore, that the Odessa wheat brought to England during the above three years must, speaking generally, have cost the importer about 50s. per quarter, exclusive of profit; and, supposing the price of the best wheat in Odessa to be reduced under a system of free intercourse to from 25s. to 30s. per quarter (its price in 1849), it could not be sold in London for less than from 40s. to 45s. per quarter. And though in 1853 the imports of wheat from Southern Russia amounted to 818,930 quarters, they are usually much less. In 1857 they were only 409,469 quarters. Constantinople, Genoa, Marseilles, and other Mediterranean ports are the great markets for the wheat of the Black Sea.

The shipments of grain, other than wheat, from Odessa, are generally inconsiderable. In 1847, 210,390 quarters of rye were exported. Indian corn is raised in Bessarabia, but not in quantities to admit of any great exportation.

From Taganrog also the shipments of grain are very considerable, as is apparent from the following extract from a table given in Mr. Consul Carruthers' Report for 1866, which shows the exports of the 5 years ending with 1866—

	1862	1863	1864	1865	1866
Wheat	qrs. 1,058,962	qrs. 1,019,557	qrs. 953,295	qrs. 961,386	qrs. 1,183,888

Barley	115,104	40,439	54,553	16,218	70,511
Oats	—	—	15,121	15,552	75,584

For farther details as to the corn trade of Southern Russia, and of the countries on the Lower Danube, see the articles GALATZ; ODESSA; TAGANROG.

Both soft and hard wheat are exported from Odessa; but the former, which is by far the most abundant, is only brought to England. Despite the preference given to English wheat in this country, in the Mediterranean Odessa wheat is more esteemed, and fetches a higher price.

The hard wheat brought from the Black Sea comes principally from Taganrog. It is a very fine species of grain, being full 10 per cent. heavier than British wheat, with not more than half the bran; latterly, however, 'ghirka' or soft wheat has been exported both to France and this country, the price per quarter, free on board, being from 33s. to 34s. 9d. The hard wheat is used in Italy for making macaroni and vermicelli, and things of that sort; very little of it has found its way to England.

The voyage from Odessa to Britain is of uncertain duration, but generally very long. It is essential to the importation of the wheat in a

## CORN LAWS AND CORN TRADE

458

good condition that it should be made during the winter months. When the voyage is made in summer, unless the wheat be very superior, and be shipped in exceedingly good order, it is almost sure to heat; and has sometimes, indeed, been injured to such a degree as to require to be dug from the hold with pickaxes. Unless, therefore,

means be devised for lessening the risk of damage during the voyage, there is little reason to think that Odessa wheat will ever be largely imported in ordinary seasons into Britain. (See the evidence of J. H. Lander, Esq., and J. Schneider, Esq., before the Lords' Committee of 1827, on the price of foreign corn.) We subjoin a

*Statement of the Probable Cost of Importing 2,000 Chetwerts or 1,453 Quarters of Wheat from Odessa to London. (1868.)*

	£	s.	d.	£	s.	d.
<i>Charges in London</i>	78	7	6			
Insurance				78	15	6
Policy duty						
Commission do. $\frac{1}{2}$ per cent.	508	11	0			
Freight on 1,453 quarters wheat at 7s. per quarter				519	1	0
Primage, 10 per cent.				11	10	0
Gratification				21	4	4
Charterparty, 11; custom-house entries, 10s.				51	9	4
Metage, lillage, and lassage, 1s. 7d. per last				11	17	10
Lighthouse of 1,453 quarters at 1d.				12	2	2
Landing, unloading, hoisting, and delivering, at 6d.				78	11	1
Rent, insurance, and turning, 4 weeks, at 5s. 6d. per 100 quarters per week

Duty about 1s. 10. per qr.						
				Or per quarter		
					0	10
					0	2
					0	12

And in addition to the above, the charge for probable damage on the voyage may be estimated at 1s. per quarter.  
And the factorage in London at 1s. per quarter.

**American Corn Trade.**—The prices of wheat at New York and Philadelphia may be taken, at an average, at from 35s. to 40s. per quarter; and as the cost of importing a quarter of wheat from the United States into England amounts to from 10s. to 12s., it is seen that no considerable supply could be obtained from thence, were our prices under 45s. or 50s. It should also be remarked that prices in America are usually higher than in the Baltic; so that but little can be brought in from the former except when the demand is sufficient previously to take off the cheaper wheats of the Northern ports.

Formerly the exports of wheat from the United States were comparatively trifling; it being in the shape of flour that most of their exports of that grain were made. From the annexed table it will be seen that in 1863 upwards of 36,000,000

bushels of wheat were exported from the United States, and upwards of 4,000,000 barrels of wheat flour. The shipments of this important article from Baltimore, Philadelphia, New York, New Orleans, and other ports, have occasionally been very large, though down to 1839 they had been for some years rather decreasing. In a few instances, indeed, considerable quantities of corn and flour have been sent from Europe to the United States. In 1837, for example, 3,921,259 bushels of foreign wheat were imported into the United States, of which 792,675 bushels were from England. This, however, was a rare occurrence; and in years when there is at once an extraordinarily abundant crop in the States and an unusually large demand, the exports are very large, especially if prices in Europe be high.

*Account showing the Quantities of Wheat, Wheat-Flour, Indian Corn, and Indian Meal Exported from the United States during the Years 1863-4, specifying the Countries to which they were sent, and the Quantities and Values of the Supplies sent to each.*

It has been doubted whether this exportation can be maintained. Speaking generally, agriculture is little known as a science in any part of America, and but imperfectly understood as an

art; and it could not rationally be expected that it should be otherwise. In all those countries which, as in the greater part of America, part of fertile and uncultivated land may be obtained

little more than a no practice is, after clearing of land, to subject it to cropping; and when in some other tract of which has been abandoned of the *vis medicata* parts of the Eastern or been long settled, and scourging system can be followed: and there, of agriculture has been tion of crops, and the tised sometimes with r less success. Still, it is best farmed districts agri- sate; and, except where a very superior quality, deal, compared with w country. In illustration leg to subjoin an

*Account of the Average Corn Crops in the States, taken in a Report by the Society, in Contrast with the Produce of similar*

	Produce
Wheat - - - - - bushels per acre	—
Rye - - - - - "	—
Indian corn - - - - - "	—

Results from this statement are about twice as great as in New York, which has some of the best land in the Union. In the most productive results are similar, the production in being respectively 1 bushel. It is true, no doubt, that the increase; but this can be employed of greater culture of the land. And in New York farmers and those states have to withstand their neighbours in the north, the Mississippi and Missouri subjected to the scourging of the soil. But in these states are cheap, the produce is very small. In Michigan, from a return published in 1849, that the average did not exceed 10 bushels per acre while in the world further appear from the information on the subject, the produce of the New States is 16 bushels per imperial bushel but beyond the main very difficult and, perhaps, to cope with any degree of the ultimate result in what degree it may be by future discoveries and in the mean time, disperse Johnston in thinking of the powers of the United States exaggerated; but we are able to exaggerate their produce of Indian corn. (Notes on Agricultural, Economical, and Social, see also Mr. Russell's *U.S. Agriculture and its Prospects* &c. The latter is a valuable work that has 1

little more than a nominal price, the invariable practice is, after clearing and breaking up a piece of land, to subject it to a course of continuous cropping; and when it is exhausted, to resort to some other tract of new ground, leaving that which has been abandoned to recover itself by the aid of the *vis medicatrix nature!* But in those parts of the Eastern or Atlantic States that have been long settled, and are fully occupied, this scourging system can no longer be advantageously followed: and there, consequently, a better system of agriculture has been introduced; and a rotation of crops, and the manuring of land, are practiced sometimes with more and sometimes with less success. Still, it is certain that even in the best farmed districts agriculture is in a backward state; and, except where the land is naturally of a very superior quality, the produce is scanty indeed, compared with what is obtained in this country. In illustration of what is now stated we beg to subjoin an

Account of the Average Produce per Acre of the Corn Crops in the State of New York, as published in a Report by the State Agricultural Society, in Contrast with what is believed to be the Produce of similar Crops in this Country.

Produce	New York	England
Wheat - bushels per acre	11	30 or 32
Barley - "	16	32
Oats - "	26	40
Indian corn - "	25	--

Results from this statement that the returns per acre are about twice as great in this country as in New York, which has some of the best corn growing land in the Union. In Ohio, which is supposed to be the most productive of all the States, the results are similar, the produce of wheat and barley in it being respectively 15½ and 24 bushels per acre. It is true, no doubt, that these returns may be increased; but this can only be done by the employment of greater capital and skill in the culture of the land. And in the mean time the New York farmers and those of the other Atlantic States have to withstand the competition of their neighbours in the newly-formed States on the Mississippi and Missouri, where the best land is subjected to the scourging treatment already referred to. But in these States, though the land is cheap, the produce per acre is, in most cases, very small. In Michigan, for example, it appears, from a return published by the State Legislature in 1849, that the average produce of wheat per acre did not exceed 10½ bushels, being less than 9 bushels per acre when seed is deducted! It would further appear from the best attainable information on the subject, that if we take the produce of the new States generally at 15 to 16 bushels per imperial acre, we shall not be far from the mark. And though it is very difficult and, perhaps, impossible, to argue with any degree of confidence what will be the ultimate result of this infertility, yet in what degree it may be defeated or modified by future discoveries and improvements, we leave to the mean time, disposed to concur with Johnston in thinking that the wheat-producing powers of the United States have been exaggerated; but we doubt whether it be possible to exaggerate their capacities for producing Indian corn. (*Notes on North America, Agricultural, Economical, and Social*, i. 172, ii. 40; see also Mr. Russell's work on *North America, its Agriculture and Climate*, pp. 92, 123, 150 &c. The latter is the most important and valuable work that has hitherto appeared on

that continent. The statements it embodies with regard to slavery have shed a new and powerful light on all that relates to that momentous and difficult subject.)

In the course of 20 years from this date (1868) the population of the Union will most likely amount to or exceed 60,000,000; and what with this enormous increase in the demand for corn, and the unwise treatment to which the land is subjected, the fears so generally entertained in regard to the injury to be inflicted on the agriculture of Europe, and especially on that of England, by the importation of American corn, have, perhaps, no good foundation. The importations of maize or Indian corn from America have decidedly increased, that for 1866 nearly reaching 7,000,000 of cwts.; the only other important source of supply being European Turkey, which furnished over 4,500,000 cwts. in the same year. The presumption is that it will rarely be imported in large quantities for food except when the potato is deficient, or to supply those who have no means of obtaining the higher-priced varieties of corn. But a great demand has arisen for it to be used in distilleries, and there seems a probability of a growing increase in the use of Indian corn for that purpose. In no other country can Indian corn be produced at less cost or with greater certainty than in the United States, and there is a far greater probability of a rapid increase in the importations of that grain to this country than of any other kind of corn. Chicago on Lake Michigan, from its ready means of communicating with the Mississippi and St. Lawrence, has naturally become the great storehouse of the western or corn-producing States of the Union. It contains huge warehouses capable of holding millions of bushels of grain, and its extraordinary advance in population is worthy of remark. In 1840 it had but 4,853 inhabitants; in 1860, 109,260; and now (1868) their number may be estimated at from 140,000 to 150,000.

All sorts of flour, whether made of wheat, rye, Indian corn &c., exported from the United States, must previously be submitted to the inspection of officers appointed for that purpose. The law further directs that the barrels in which it is shipped shall be of certain dimensions, and that each barrel shall contain 196 lbs. of flour, and each half barrel 98 lbs. The inspector, having ascertained that the barrels correspond with the regulations as to size, weights &c., decides as to the quality of the flour, and brands it accordingly. Flour for home consumption is not subjected to inspection. The inspection must take place at the time and place of exportation, under a penalty of 5 dols. per barrel. Persons altering or counterfeiting marks or brands forfeit 100 dols.; and persons putting fresh flour into barrels already marked or branded, or offering adulterated wheat flour for sale, forfeit in either case 5 dols. for each barrel. Every barrel of wheat flour imported is deemed equivalent to 38½ gallons of wheat, and, under the old law, was charged with a corresponding duty.

The usual price of wheat in Canada, when there is a demand for the English market, is about 30s. per quarter; and adding to this 10s. per quarter for the expenses of carriage and warehousing, it will make its price in Liverpool, when delivered to the consumer, 40s.; and being spring wheat, it is not so valuable by 5s. per quarter as English wheat.

Mr. Reuss (p. 120) gives the following *pro forma* account of the expense of importing a cargo of 5,000 bushels of wheat from New York, supposing it to cost 1 dol. 12 cents per bushel:—

The manufacture of cotton has been carried on in Hindostan from the remotest antiquity. Herodotus mentions (iii. 106) that in India there are wild trees that produce a sort of wool superior to that of sheep, and that the natives dress themselves in cloth made of it. Similar statements are made by Strabo (lib. xv. sec. 10), Arrian (*Tactic.* c. xvi.), and Mela (lib. iii. c. viii.). But though certainly referring to cotton, it is evident that the authors of these statements had no very distinct ideas either in regard to the wool itself or its manufacture. The latter obtained no footing worth mentioning in Europe till last century. The plant was, it appears, introduced into southern Europe before the conclusion of the thirteenth century, and the wool was used in the first instance for the manufacture of paper. Its employment for textile fabrics is, as far as Europe is concerned, of not much more than a century's growth.

**1. Rise and Progress of the British Cotton Manufacture.**—The rapid growth and prodigious magnitude of the cotton manufacture of Great Britain are, beyond all question, the most extraordinary phenomena in the history of industry. Our command of the finest wool naturally attracted our attention to the woollen manufacture, and paved the way for that superiority in it which we long since attained; but when we undertook the cotton manufacture, we had comparatively few facilities for its prosecution, and had to struggle with the greatest difficulties. The raw material was produced at an immense distance from our shores; and in Hindostan and China the inhabitants had arrived at such perfection in the arts of spinning and weaving, that the lightness and delicacy of their finest cloths emulated the web of the gossamer, and seemed to set competition at defiance. Such, however, has been the influence of the stupendous discoveries and inventions of Hargreaves, Arkwright, Crompton, Cartwright, and others, that we have overcome all these difficulties—that neither the extreme cheapness of labour in Hindostan, nor the excellence to which the natives had attained, has enabled them to withstand the competition of those who buy their cotton, and who, after carrying it 5,000 miles to be manufactured, carry back the goods to them. This is the greatest triumph of mechanical genius; and what perhaps is most extraordinary, our superiority is not the late result of a long series of successive discoveries and inventions: on the contrary, it has been accomplished in a very few years. Little more than a century has elapsed since the British cotton manufacture was in its infancy; and it now forms the principal business carried on in the country, affording an advantageous field for the accumulation and employment of millions upon millions of capital, and of thousands upon thousands of workmen! The skill and genius by which these astonishing results have been achieved have been one of the main sources of our power: they have contributed in common degree to raise the British nation to the high and conspicuous place she now occupies. Nor is it too much to say that the skill and energy derived from the cotton manufacture powerfully assisted in carrying us triumphantly through the tremendous struggle with revolutionary France, at the same time that it generally contributes to that strength by which we are able, without difficulty, to sustain burdens which would have crushed our fathers, and could be supported by any other people.

The precise period when the manufacture was introduced into England is not known; but it is probable that it was some time in the early

part of the 17th century. The first authentic mention of it is made by Lewis Roberts, in his *Treasure of Traffic*, published in 1641, where it is stated: 'The town of Manchester, in Lancashire, must be also herein remembered, and worthily for their encouragement commended, who buy the yarne of the Irish in great quantity, and weaving it, returne the same again into Ireland to sell. Neither doth their industry rest here; for they buy cotton wool in London that comes first from Cyprus and Smyrna, and at home worke the same, and perfect it into fustians, vermillions, dimities, and other such stufles, and then return it to London, where the same is vented and sold, and not seldom sent into foreign parts, who have means, at far easier termes, to provide themselves of the said first materials.' (Orig. ed. p. 32.) It is true, indeed, that mention is frequently made by previous writers, and in Acts of the Legislature passed at a much earlier period, of 'Manchester cottons,' 'cotton velvets,' 'fustians' &c.; but it is certain that these articles were wholly composed of wool, and had most probably been denominated cottons from their having been prepared in imitation of some of the cotton fabrics imported from India and Italy. In an Act of 5 & 6 Edw. VI. (1552), entitled 'For the true making of WOOLEN cloth,' it is ordered, 'That all cottons called Manchester, Lancashire, and Cheshire cottons, full wrought for sale, shall be in length' &c. This proves incontestably that what were then called cottons were made wholly of wool.

From the first introduction of the cotton manufacture into Great Britain down to 1773, the warp or transverse threads of the web, only, were of cotton; the warp, or longitudinal threads, consisting wholly of linen yarn, principally imported from Germany and Ireland. In the first stage of the manufacture the weavers, dispersed in cottages throughout the country, furnished themselves as well as they could with the warp and weft for their webs, and carried them to market when they were finished; but about 1760 a new system was introduced. The Manchester merchants began about that time to send agents into the country, who employed weavers, whom they supplied with foreign or Irish linen yarn for warp, and with raw cotton, which being carded and spun, by means of a common spindle or distaff, in the weaver's own family, was then used for weft. A system of domestic manufacture was thus established; the junior branches of the family being employed in the carding and spinning of the cotton, while its head was employed in weaving the linen and cotton yarn into cloth. This system, by relieving the weaver from the necessity of providing himself with linen yarn for warp and raw cotton for weft, and of seeking customers for his cloth when finished, and enabling him to prosecute his employment with greater regularity, was an obvious improvement on the system that had been previously followed; but it is at the same time clear that the impossibility of making any considerable division among the different branches of a manufacture so conducted, or of prosecuting them on a large scale, added to the interruption given to the proper business of the weavers by the necessity of attending to the cultivation of the patches of ground which they generally occupied, opposed invincible obstacles to its progress, so long as it was conducted in this mode.

It appears from the Custom House returns that the total quantity of cotton wool annually imported into Great Britain at an average of the five years ending with 1705 amounted to only 1,170,881 lbs. The accounts of the imports of cotton from 1705 to 1770 have been imperfectly preserved;

but until the last half-dozen years of that period the manufacture increased very slowly, and was of very trifling amount. Dr. Percival, of Manchester, who had the best means of being accurately informed on the subject, states that the entire value of the cotton goods manufactured in Great Britain, at the accession of George III. in 1760, was estimated to amount to only 200,000*l.* a-year, and the number of persons employed was quite inconsiderable; but in 1767 James Hargreaves, a carpenter of Blackburn in Lancashire, invented the *spinning-jenny*. At first this admirable machine enabled sixteen to thirty threads to be spun with the same facility as one; and it was subsequently brought to such perfection, that a little girl was able to work no fewer than from eighty to one hundred and twenty spindles.

The jenny was applicable only to the spinning of cotton for weft, being unable to give to the yarn that degree of firmness and hardness which is required for the longitudinal threads or warp; but this deficiency was soon after supplied by the introduction of the *spinning-frame*—that wonderful piece of machinery which spins a vast number of threads of any degree of fineness and hardness, leaving to man merely to feed the machine with cotton, and to join the threads when they happen to break. It is not difficult to understand the principle on which this machine is constructed, and the mode of its operation. It consists of two pairs of rollers, turned by means of machinery. The lower roller of each pair is furrowed or fluted longitudinally, and the upper one is covered with leather, to make them take a hold of the cotton. If there were only one pair of rollers, it is clear that a carding of cotton passed between them would be drawn forward by the revolution of the rollers, but it would merely undergo a certain degree of compression from their action. No sooner, however, has the carding, or *roving* as it is technically termed, begun to pass through the first pair of rollers, than it is received by the second pair, which are made to revolve with (as the case may be) 3, 4, or 5 times the velocity of the first pair. By this admirable contrivance the roving is drawn out into a thread of the desired degree of tenacity; a twist being given to it by the adaptation of the spindle and fly of the common flax-wheel to the machinery. Arkwright gave his machine the name of 'water-frame.'

Such is the principle on which Sir Richard Arkwright constructed his famous spinning-frame. It is obvious that it is radically and completely different from the previous methods of spinning, either by the common hand-wheel or distaff, or by the jenny, which is only a modification of the common wheel. Spinning by rollers was an entirely original idea; and it is difficult which to admire most—the profound and fortunate sagacity which led to so great a discovery, or the consummate skill and address by which it was so speedily perfected and reduced to practice.

The question as to the merit of Arkwright as an original discoverer is still undecided. Recently, however, it has been ascertained that a patent for spinning by rollers, revolving with different degrees of velocity, was taken out by Messrs. Wyatt and Paul, so early as 1738. (*History of the Cotton Manufacture*, by Edward Baines, Esq.) But it does not appear that the inventors had been able to give effect to their happy idea, and all traces of the invention seem to have been lost. The statements in the case printed by Sir Richard Arkwright and his partners in 1782 show that he was aware of the attempts made in the reign of George II. to spin by machinery; but there is no evidence to prove that he was ac-

quainted with the principle on which these attempts had been made, or that he had seen the patent referred to. The probability seems to be that he had. But admitting this to be the case, it detracts very little from the substantial merit of Sir Richard Arkwright. If the idea of spinning by rollers did not spring up spontaneously in his mind, he was, at all events, the first who made it available in practice, and showed how it might be rendered a most prolific source of wealth.

Since the dissolution of Sir Richard Arkwright's patent, in 1785, the progress of discovery and improvement in every department of the manufacture has been most rapid. The *mule-jenny*—so called from its being a compound of the jenny and the spinning-frame—invented by Mr. Crompton, and the *power-loom*, invented by the Rev. Mr. Cartwright, are machines that have had the most powerful influence over the manufacture; and in consequence of their introduction, and of innumerable other inventions and improvements, the prices of cotton cloth and yarn have gone on progressively diminishing. But as the demand for cottons has been, owing to their extraordinary cheapness, extended in a still greater degree, the value of the goods produced, and the number of persons employed in the manufacture, are now decidedly greater than at any previous period.

2. *Imports of Cotton Wool. Countries whence it is Imported. Prices, Duties &c.*—The following Tables have been partly taken from official documents, and partly from the accounts of merchants of great experience. We believe they may be relied on as approaching as near to accuracy as is possible to attain to in such matters.

Cotton Wool Imported into, Exported from, and Entered for Consumption in the United Kingdom from 1820 to 1811, stated in lbs.

Year	Quantity Imported lbs.	Quantity Exported lbs.	Quantity Entered for Consumption lbs.
1820	151,672,675	6,021,038	157,693,713
1821	132,539,650	14,589,197	147,950,453

Previously to 1790 North America did not supply us with a single pound weight of raw cotton. A little had, indeed, been raised in some Southern States, for domestic use, before the commencement of the American revolutionary war, but the quantity was quite inconsiderable. In 1791 it began, for the first time, to be exported; the tripling quantity of 1890

having been shipped and 138,328 lbs. in feeble beginning. There is nothing in the growth of the man-

It was for many years the only cotton wool imported into this country, and it is indispensable that it should be kept at a low rate. Previously to 1831 it amounted to 6 per cent. ad valorem, in part at least, for the duty on the repeal of the duty on cotton wool was raised in that year. Such a duty would have had the effect of raising the price of coarse goods, and was justly objected to in 1832. 11*d.* per cwt. Bu

having been shipped in the course of that year, and 138,328 lbs. in 1792. Such was the late and feeble beginning of the American cotton trade. There is nothing in the history of industry to compare with its subsequent increase unless it be the growth of the manufacture in this country.

in the staple, of an even, silky texture, and is easily separated from the seed. Unluckily, it can be raised only in certain situations; so that its quantity is limited, and has not, in fact, been increased since 1805. The upland, of which the supply may be considered as unlimited, though of varying qualities, is all short-stapled; and its separation from the seed is so very difficult, that if it be done by the hand, the cotton is hardly worth the labour. This, however, was the only way in which it could be made available for home use, or exportation, previously to 1793; and had anyone then ventured to predict that 10,000,000 lbs. of upland cotton would ever be exported, he would have been looked upon as a visionary dreamer. But the genius of Eli Whitney did for the planters of the Southern States what the genius of Arkwright and Watt did for the manufacturers of England. He invented a machine by which the wool of the upland cotton is separated from the seed with the greatest facility and expedition, and by so doing laid the foundation of a new and most important branch of industry, and doubled the wealth and means of employment of his countrymen! (Pittkin's *Statistics of the United States*, p. 109, ed. 1835.) Whitney's invention came into operation in 1793; and in 1794, 1,601,760 lbs. and in 1795, 5,276,300 lbs. of cotton were exported. And so astonishing has been its growth in the interval, that the exports of cotton from the United States in 1858 amounted to the prodigious aggregate of 1,118,624,012 lbs. of which only 12,101,058 lbs. were Sea-Island. The value of this vast quantity is estimated in the official accounts at 131,386,661 dol. being nearly half the entire exports (293,758,279 dol.) of the United States during the same year.

American cotton, which is of two kinds, is generally known by the names of *sea-island* and *upland*. The first, which is the finest cotton imported into Great Britain, grows on the small sandy islands and along the low sandy shores of South Carolina, Georgia, and Florida. It is long

was for many years the practice to levy a duty on cotton wool when imported. The policy which a duty is, however, very questionable; it is indispensable that, if imposed at all, it will be kept at a low rate. For a number of years previously to 1831 it amounted (on foreign wool) to 6 per cent. ad valorem; but, in order to pay, in part at least, for the loss of revenue by the repeal of the duty on printed cottons (1800) it was raised in that year to 5s. 10d. per cwt. Such a duty would have materially affected the imports of the inferior species of cotton and the price of coarse goods; and being, in appearance, justly objected to, it was reduced to 2s. 11d. per cwt. But the imposition of

any duty on the raw material of so important a manufacture being deemed objectionable, it was finally abolished in 1815. It had previously produced between 600,000l. and 700,000l. a-year. The subjoined table shows in a very striking manner the progress of the manufacture in this country, and the fall in the price of cotton wool. The manufacture declined in 1847, but that was wholly owing to the decrease in the supplies of raw cotton from the United States in 1846-47, and the consequent rise in its price. The decline during the Civil War was still more remarkable. We are glad to find that under 31 & 32 Vict. c. 33 (1868) provision is made for the collection and periodical publication by the Board

3. Proportion of Coarse to Fine Goods.—During the 20 years ending with 1816 the cotton manufacture underwent a singular change in respect of the average fineness of its products. As successive improvements were made in the construction and management of machinery, and in the ex-

perience and manual skill of the work-people, the proportion of fine to coarse yarns and fabrics might have been expected to make a corresponding increase, whereas it was, on the contrary, very greatly diminished. During the period referred to the consumption of cotton increased nearly four-fold; but the quantity of fine yarn produced (i.e. of yarn above sixty hanks to the pound), instead of keeping pace with the increased consumption of cotton, really underwent a positive and by no means inconsiderable reduction. For a number of years no new establishments for the production of line yarns were formed: but in Manchester alone about 20 mills that had been employed chiefly or entirely in fine spinning were given up, or devoted to the production of coarse yarns. To some extent, no doubt, the diminution of producing from this cause was counteracted by an increase in the speed of the machinery at work; but after making all reasonable allowances on that score, there can be no doubt that the total produce of line yarn was materially decreased. This conclusion is strengthened by the falling off which took place in the imports of Sea Island cotton, which is used almost exclusively in the production of very fine yarn.

Account of the Produce of the Cotton Crops of the United States in the United Years, from 1827-8, downwards.

Year	Total Crop	Year	Total Crop	Year	Total Crop
1827-28	bales	1844-45	bales	1856-57	bales
1830-31	1,038,448	1845-46	2,100,537	1857-58	3,115,317
1831-32	1,254,328	1846-47	1,778,651	1858-59	4,202,285
1832-33	1,360,725	1847-48	2,537,153	1859-61	2,562,878
1833-34	1,822,930	1848-49	3,728,596	1861-62	4,500,000
1834-35	1,801,197	1849-50	3,036,707	1862-63	1,500,000

1839-40	2,578,875	1854-55	2,847,393		
1840-41	2,030,409	1855-56	3,597,815		

\* Estimates.

This change in the average fineness of cotton fabrics could not be ascribed to foreign competition, for fine spinning is precisely that branch of the trade in which English cotton-spinners most

excel their rivals. Foreign countries, including coarse sometimes attracted changes of taste, operate disadvantageously pursuing and proceeded to so accounted for that powerful nation operation, others could not have the fineness of the year by no means obviated that the reduction price of silk, and sentiments which have notions of worsted fabric influence in cottons. The main be found in the greater in the price of raw ending with 1816, cheapness of stout this conclusion has since 1816. The situation 1850 were at once depressed. The cost of obtain comparatively less subsequently rose in a proportion. The spinners effects, partly by coarsest fabrics, and by the fineness of their yarn what an extent they rise of prices. It is 1/2d. per pound, and invariably 5 hanks in the average the year per pound.

4. Value of the British different periods. Amount of Persons employed in able to be able to form a of the present value of the number of persons departments; but the decrease founded being necessary to arrive at any steps, however the following very wide of the market. In 1817 Mr. Kennedy in a paper published Transactions, estimated 110,769; the aid of lines as equal to the present number of spindles. Mr. Kennedy further stated that the quantity of cotton at 500, 179 tons. Statement for the year 1866 converted into yarn in Great Britain, and in spinning estimated at 1 1/2 lbs. per spindle.

Quantity of yarn produced in Great Britain, taking the average number of spindles employed, and supposing to produce 2 hanks per spindle in the year.

Number of persons employed in spinning in Great Britain, equal in value of cost estimated to produce 1 lb. of cotton equal to 1 horse power.

But the cotton manufacture has since 1817. Mr.

COTTON

466

shall have (dividing 16,625,000 by 32) nearly 520,000 as the total number of persons directly employed in the different departments of the manufacture.

We should mistake, however, if we supposed that this number, great as it certainly is, comprised the whole number of persons to whom the cotton manufacture furnishes subsistence, excluding the capitalists, and the sum set apart as the profit of the capitalists, and the wear required to furnish coal, and to defray the wear of machinery &c., a large proportion of must annually be laid out in paying the wages of miners, masons, bricklayers &c. It is not easy to say what this proportion may amount to; but taking it at 3,000,000*l.*, and supposing the rate of wages of each individual to average 50*l.* a-year, the total number employed in the various capacities alluded to will be (3,000,000 divided by 50) 60,000; and a sum of 13,625,000*l.* will remain to cover the profits of the capital employed in the various branches of the manufacture, to repair the different parts of the machinery and buildings as they wear out, and to buy coal, flour, drugs &c. This is a much more important item than might be at first supposed. Flour is indispensable in the dressing of webs; and we are well assured that its consumption in this way is not less than 300,000 barrels a-year! The account will, therefore, stand as under:—

Total value of every description of cotton goods annually manufactured in Great Britain	£ 52,000,000
Raw material, 750,000,000 lbs. at 6 <i>d.</i> per lb.	18,750,000
Wages of 520,000 weavers, spinners, bleachers &c. at 5 <i>l.</i> a-year each	2,600,000
Wages of 60,000 engineers, machine makers, smiths, masons, joiners &c. at 50 <i>l.</i> a-year each	3,000,000
Profits of the manufacturers, wages of superintendents, sums to purchase the materials of machinery, coals &c.	13,625,000
	52,000,000
The capital employed may be estimated as follows:—	4,000,000
Capital employed in the purchase of the raw material	8,000,000
Payment of wages	40,000,000
Invested in spinning-mills, power and hand-looms, workshops, warehouses, stocks on hand &c.	£52,000,000

Now, this sum of 52,000,000*l.*, supposing the interest of capital, inclusive of the wages of superintendence &c., to amount to 10 per cent., will yield a sum of 5,200,000*l.*; which being deducted from the 13,625,000*l.* profits &c., leaves 8,425,000*l.* to defray the waste of capital, the flour required for dressing, the coals necessary in the employment of the steam engines, to effect insurances, to purchase printing, dyeing, and bleaching drugs, and to meet all other outgoings.

The aggregate amount of wages, according to

I. Estimate of the Quantities of Raw Cotton consumed in the chief Manufacturing Countries from 1850 to 1857 inclusive.

Countries	1850	1852	1853	1851	1855	1856
	lbs.	lbs.	lbs.	lbs.	lbs.	lbs.
Great Britain	581,000,000	715,000,000	731,000,000	780,000,000	835,000,000	923,000,000
Russia, Germany, Holland, and Belgium	135,000,000	172,000,000	185,000,000	190,000,000	144,000,000	256,000,000
France	142,000,000	193,000,000	191,000,000	201,000,000	191,000,000	211,000,000
Spain	29,000,000	41,000,000	42,000,000	43,000,000	45,000,000	48,000,000
Countries bordering on the Adriatic	55,000,000	55,000,000	45,000,000	45,000,000	31,000,000	59,000,000
United States of North America	45,000,000	55,000,000	265,000,000	215,000,000	236,000,000	265,000,000
Sundries, Mediterranean &c.	185,000,000	257,000,000	250,000,000	37,000,000	62,000,000	56,000,000
Total	1,152,000,000	1,411,000,000	1,503,000,000	1,539,000,000	1,553,000,000	1,795,000,000

It is seen from this table that Great Britain continued to maintain her customary ascendancy in this department with little variation from 1850 to 1857. In truth and reality, however, our progress was a good deal greater in that period than it appears to have been from the above

statement, is 19,625,000*l.*; but there are not many departments of the business in which wages have to be advanced more than 6 months before the article is sold. We therefore incline to think that 8,000,000*l.* is a sufficient (perhaps too great) allowance for the capital employed in the payment of wages.

It may be said by some that this estimate is under, and by others that it is overated; but we believe it will be found to be nearly correct, though, if anything, it may, perhaps, be a little in excess. Mised by Mr. Huskisson's authority, we estimated in a former edition of this work, the value of the cotton stuffs and yarn produced in the United Kingdom in 1834, at 31,000,000*l.*; but farther enquiry has convinced us that that estimate was beyond the mark; and it is to be borne in mind, that though the consumption of raw cotton has vastly increased since 1834, there has been in the interval a very considerable fall in its price, and in the value of the manufactured articles. The declared value of the cotton goods and yarn exported in 1857 amounted to 39,073,420*l.*; and deducting this (52,000,000*l.*), we have 13,000,000*l.* for the value of the cottons consumed at home. And we are inclined to think that this is pretty near the mark. It has been said that the value of the home consumption does not amount to 1/4 of the exports; and though, if we refer only to the weight of cotton exported and retained at home, this assertion may be nearly correct, it is to be borne in mind that the great bulk of the goods for home use are of a superior fabric, and more costly than those sent abroad. On the whole, therefore, we are disposed to believe that in estimating the present (1858) value of the products of the British cotton manufacture at 52,000,000*l.* a-year, which leaves 13,000,000*l.* for the value of those consumed at home, we shall not commit any very serious error; and moderate as this estimate may appear, as compared with others put forth on the same subject, it strikingly evinces the value and importance of the manufacture, (in a paper read before the British Association in 1858) of Manchester, estimated at 1858, the value of the cottons consumed at home was 24,000,000*l.*, making the entire value of the manufacture 68,000,000*l.* or 64,000,000*l.* But, despite the deference due to such an authority, we have no doubt that this in 1858 was a great aggragation.

We borrow from a circular of Messrs. B. and Co., of Manchester, one of the most valuable published in the empire, the following statement in regard to the cotton trade of this and other countries.

statement, for the object of our manufacture in late years has very generally been to produce those of a coarser description, and a larger quantity of the raw material in proportion to their value.

Annexed is a table of the consumption of cotton

II. Consumption

Consumption	1846-50	1846-50
Great Britain	1,152,000,000	1,152,000,000
France	142,000,000	142,000,000

Value in 1866-7.—Messrs. Ellison and Haywood, the well-known cotton brokers of Liverpool, have made, for the years 1859-66, the following calculations as the value of the British cotton manufacture. These calculations are based upon liberally certain elements. We know the cost of all the cotton imported. We know the value of all the yarn and piece goods exported. The pro-

portion of waste to raw material is a matter of easy estimate with those who are familiar with the quality of different staples. Nor is it difficult to arrive at a very close estimate of the home consumption. The weight of exports is known, the remainder must, on an average of years, represent the home consumption.

III. An Estimate of the Weight and Value of the Total Production of Cotton Manufactures in Great Britain, with the Cost of Production, and the Balance Remaining for Interest of Capital and Profits, for the Years 1859-66.

	1859	1860	1861	1862	1865	1864	1865	1866
	lbs.	lbs.	lbs.	lbs.	lbs.	lbs.	lbs.	lbs.

Balance left for interest of capital and profits	11,516,000	18,078,000	10,766,000	1,172,000	3,416,000	5,165,000	12,159,000	19,517,000

Allowance being made for old and infirm persons, children &c., dependent on those actually employed in the various departments of the cotton manufacture, and in the construction, repair &c. of machinery and buildings required to carry it on, we find from 1,000,000 to 1,200,000 persons! And this new and most prolific source of wealth we imputed partly and principally, as already mentioned, to the extraordinary genius and talent of individuals; but in a great degree, also, to the security of property and freedom of industry which give confidence and energy to all who employ industrious undertakings, and to that universal diffusion of intelligence which enables those engaged in any work to press every power of their own into their service, and to avail themselves of the capacities of which a less instructed class would be wholly ignorant.

The effect that the sudden opening of so vast a field for the employment of capital labour has had on the population of the districts of Lancashire and Lanarkshire, the two where the cotton manufacture is principally carried on, has been most striking. In 1771, for example, the townships of Manchester and Salford were estimated to contain 27,216 inhabitants—a

number which was swelled in 1831 to 182,812; the entire population of the boroughs of Manchester and Salford having amounted in that year to 227,808, and in 1861 to 460,428. The population of Preston, in 1780, is said not to have exceeded 6,000; whereas it amounted in 1861 to 82,985. In like manner the population of Blackburn increased from 11,980 in 1801, to 63,126 in 1861; that of Bolton increased in the same period from 17,416 to 70,395; that of Wigan from 10,989 to 37,658 &c. But the progress of Liverpool is most extraordinary, and can be matched only by the progress of one or two cities in the United States. Liverpool is not properly one of the seats of the cotton manufacture; but she is, notwithstanding, mainly indebted to it for the unparalleled rapidity of her growth. She is the grand emporium of the cotton district—the port where almost all the raw cotton, and the various foreign articles required for the employment and subsistence of the persons engaged in the manufacture, are imported, and whence the finished goods are exported to other countries. She has, therefore, become a place of vast trade, and is now, in that respect, superior even to London. In 1700, according to the best accounts that can be obtained, the population of Liverpool amounted to only 5,145; in 1750 it had increased

COTTON

to 18,450; in 1770 it amounted to 34,050. The cotton manufacture now began rapidly to extend, and in consequence, the population of Liverpool increased, in 1801, to 77,653; in 1821, to 118,972; in 1831, to 165,175; in 1851, to 375,955; and in 1861, to 443,938. The progress of population in Lanarkshire and Renfrewshire has been equally striking. In 1780 the city of Glasgow contained only 42,832 inhabitants; in 1801 that number had increased to 77,385; in 1821 to 274,563; in 1851 to 417,001; and in 1861 to 394,861.

Though command of power and readiness of access be powerful requisites to the success of most manufactures, the localities in which peculiar businesses are established would seem to depend as much on accident as on anything else. Why, for example, should Manchester be the great seat of the cotton, Birmingham of the hardware, Bradford of the worsted, and Leeds of the cloth trade? We apprehend that no better answer can be given to this question than that, from accidental or inappreciable circumstances, the businesses referred to happened to be early established in these towns, and that their situation having been found to be peculiarly well fitted for the improved processes of later times, they have preserved their early superiority. Had they been situated in districts without coal, or comparatively inaccessible, their

early proficiency, though it might have enabled them to struggle for a while with the greater advantages enjoyed by their competitors in other districts, would not have been sufficient to secure their continued lead, or even existence. They must, like the iron works which were formerly carried on in Kent, have been in the end abandoned. But having the good fortune to possess, in addition to early and peculiar skill in their respective trades, all the means and appliances required to secure their further advancement, their progress has been continuous and extraordinary, and their supremacy is at present more undisputed than at any former period.

Of 2,016 cotton factories which existed in England and Wales in 1856, no fewer than 1,180 were situated in Lancashire; Manchester being the metropolis of the trade. The remaining factories were principally situated in the West Riding of Yorkshire, Cheshire, and Derbyshire.

The cotton trade of Scotland, which at the epoch referred to had 152 factories, is mostly restricted to the counties of Lanark and Renfrew, and that of Ireland (which is trifling) to Antrim. But while the business has of late years been very greatly extended in England, it has been nearly stationary in Scotland, and has fallen off in Ireland, in which, indeed, it never had any considerable footing.

IV. Account of the Total Quantities and Declared Values of British Cotton Manufactured Goods, Twist, and Yarn exported from the United Kingdom in each Year from 1820 to 1867, both inclusive.

Year	Cotton Manufactures			Cotton Twist and Yarn		Total Declared Value of Cotton Manufactures, Twist, and Yarn Exported
	Entered by the Yard		Hosiery, Lace, and Small Wares	Quantities	Declared Value

The embroidery of muslins, a branch of the cotton trade which is highly deserving of attention, was commenced in Scotland about 1825, and is almost wholly carried on by Glasgow houses. It is now of much importance, its increase not having been surpassed by that of any other branch of industry, and equalled by very few. In all, about fifty houses are engaged in the trade; and the

total sum paid as wages to females in the west parts of Scotland, and in Ireland, may amount to from 700,000, to 750,000, a-year. The embroidery is entirely executed by hand, and attempts to execute it by machinery having either been found to be too expensive, or the work to be embroidered pass between engraved cylinders driven by steam engines, which mark in

lines the embroidery are then sent to agents among the peasantry, or job. It is not easy to give any idea of the extent of this employment, the webs are returned to Glasgow and dressed into different articles, goods are exported to Canada.

Exports of Cotton Goods.—Down to 1820 cotton goods, or rather raw cotton, was so little exported that it hardly attracted the attention of our commercial writers. In 1821, however, the exports began to increase rapidly. At the commencement of the century they were nearly confined to woollens, the produce of the manufacture of the country. Since 1800, that of cotton goods has increased so much that it now amounts to about three times the amount of woollens, indeed, above the value of the total exports of the United Kingdom.

Nothing can set in a better light the astonishing fall in the price of cotton goods since 1800, than a comparison of the value of our exports of woollen goods in 1800, with those of cotton goods in 1867. In 1800, their value was £12,000,000; whereas in 1867 it had increased to £25,000,000, or more than twice the amount. Hence, supposing 100 in 1800 to be the price of a yard of cotton goods, it would be worth only 50 in 1867. This extraordinary reduction has been strikingly before the public eye, and has been brought about partly by the extension of the cotton trade in other parts of the world, and partly by the extension of the cotton trade in this country, and partly by the extension of the cotton trade in other parts of the world, and partly by the extension of the cotton trade in this country.

lines the embroidery to be executed, and they are then sent to agents, who distribute them among the peasantry, who are paid by the piece or job. It is not easy to exaggerate the advantages resulting to the female part of the population from this employment. After being embroidered, the webs are returned to Glasgow, where they are bleached and dressed, and sometimes made up into different articles. A large proportion of the goods are exported to the United States and Canada.

**Exports of Cotton Goods and Yarn.** *Fall of Prices &c.*—Down to 1750 the exportation of cotton goods, or rather of goods consisting partially of cotton, was so very inconsiderable that they hardly attracted the least attention from any of our commercial writers. But after the invention of Arkwright began to come into general operation, the exports increased with unrecalled rapidity. At the commencement of the present century they were nearly as large as the exports of woollens, the produce of the old and staple manufacture of the country. But though the export of woollen goods has increased considerably since 1800, that of cotton goods and yarn has increased so much more that it was in 1865 about three times the amount of the other; and constitutes, indeed, above one-third part of the total exports of the United Kingdom.

Nothing can set in a clearer light than this table the astonishing fall that has taken place in the price of cotton goods since 1820. In that year our exports of wove cotton fabrics amounted to 25,000,000 yards, their declared value being 13,200,000*l.*; whereas in 1866 the exports of wove fabrics had increased to 2,575,698,158 yards, and their declared value to 57,903,200*l.* It appears, therefore, that while the exports of wove cottons are more than 10 times as great—having increased 90 per cent.—their value has only increased in the ratio of about 13·2 to 57·9, that is, about 338 per cent. Hence, supposing 100 yards calico to have cost 13*s.* 2*d.* in 1820, 250 yards may now be had for little more than 13*s.* 6*d.*

This extraordinary reduction—which, however, was more striking before the cotton famine—has been brought about partly by the heavy fall that has taken place in the price of cotton wool (the price of the famine being abnormal and exceptional), partly by the public taste setting more in favour of coarser fabrics, and partly and principally by the wonderful improvements made in the manufacture. In consequence of these concurring circumstances, cotton goods are now so cheap, that there is hardly an individual so very poor as to be unable to supply himself or herself abundantly with them. This has improved the dress and added to the comfort of the great mass of the female part of the population, not only of this, but also of other countries, in consequence and to an extent not easily to be imagined: cotton goods are not only readily procurable by the people of this country, but are exported to countries where no European had till now ever been seen. In the interior of Africa, the most common cotton cloth form, according to the accounts of Speke and Livingstone, a kind of currency, in which values are expressed, and means made.

It should farther be borne in mind that it is to be observed in the price of its products that the unimpeded extension of the manufacture in this country is to be ascribed; and it is satisfactory to know that, notwithstanding the fall of prices, the wages and profits of those engaged in the business have been diminished, while their means have been prodigiously augmented.

**V. Account of the Official Value of the Cotton Manufactures exported, in different Years, from Great Britain, from 1697 to 1797.**

Year	Official Value of Exports	Year	Official Value of Exports
1697	£ 5,915	1786	915,016
1701	23,453	1787	1,101,177
1710	5,698	1788	1,452,240
1720	16,200	1789	1,331,537
1730	13,524	1790	1,662,509
1741	29,709	1791	1,875,010
1751	45,986	1792	2,021,768
1761	59,754	1793	1,735,807
1765	218,318	1794	2,576,027
1766	290,759	1795	2,435,531
1780	553,060	1796	3,211,029
1785	863,710	1797	2,036,568

The following table (VI.), compiled from the returns of the Board of Trade, shows the distribution of British cotton manufactures over the world, the total quantity of such manufactures reckoned when possible by the yard, and the total value of all cotton goods, including twist and yarn. The quantity, though not materially different from that stated in the preceding edition of this work, is largely increased in value, owing to the for a time greatly enhanced price of the raw material. This is still more manifest in the case of cotton twist and yarn, the quantity of which was 158,801,538 lbs. in 1866, as compared with 181,565,805 lbs. in 1856, while the value of the first-named quantity is returned at 13,685,627*l.*, though the greater amount of 1856 is reckoned at 7,988,575*l.* only.

Such being the vast extent and importance of the cotton manufacture, the probability of our preserving our ascendancy in it becomes a very interesting topic of enquiry. But it is obvious that a great deal of conjecture must always insinuate itself into our reasonings with respect to the future state of any branch of manufacturing industry. They are all liable to be affected by so many contingent and unforeseen circumstances, that it is impossible to predicate, with anything like certainty, what may be their condition a few years hence. It is not to be denied that a business which depends in so great a degree on foreign demand, and which may, consequently, be materially influenced, not only by foreign legislation and foreign discoveries and inventions, but also by the mutations of fashion at home and abroad, is in rather a perilous situation; and that those dependent on it must necessarily be exposed to the most trying vicissitudes. These, no doubt, are natural to all businesses of this description, and may not be of a kind to shake the stability of the manufacture, or to endanger our superiority in it, provided they do not disturb tranquillity at home. But when a vast number of persons depend on a manufacture, the privations to which many of them are not unfrequently exposed, and the efforts that are made to inflame their prejudices by representing their sufferings (which in nine out of ten instances spring from accidental or uncontrollable causes) as the result of vicious legislation, the tyranny or selfishness of their masters, and bad institutions, may easily lead them to commit outrages. And if that feeling of security which has led to the investment of such immense sums in mills and machinery should once be seriously impaired, the fall of the manufacture might be even more rapid than its rise. Anything that tends to keep alive and encourage disaffection and agitation is the bane of every country, but especially of one so deeply engaged in manufactures as this; and while, therefore, it is the bounden duty of Government to endeavour, by modifying or suppressing prohibitions, and

COTTON

repealing all unjust or partial laws, to give freedom to industry, and to take away all good cause for agitation, every individual interested in the public welfare should endeavour, by every means in his power, to discourage the efforts of those who, to advance their own unworthy ends, endeavour to keep alive a spirit of discontent among the labouring classes, that cannot fail, in the long run, to be subversive alike of good order, industry, and prosperity.

But, abstracting from the influence of such considerations, and of national struggles and commotions, which can neither be foreseen nor estimated, we do not think that there is anything in our state, or in that of the different commercial and manufacturing countries of the world, to justify the gloomy forebodings of those who contend that the cotton manufacture of England has reached its zenith, and that it must now begin to decline. The natural capabilities we possess for carrying on the business of manufacturing are, of all things considered, decidedly superior to those of any other people. But the superiority to which we have already arrived is, perhaps, the greatest

advantage in our favour. Our master manufacturers, engineers, and artisans are more intelligent, skilful, and enterprising than any other country; and the extraordinary improvements they have already made, and their familiarities with all the principles and details of the business, will not only enable them to perfect the processes already in use, but can hardly fail to lead to the discovery of others. Our establishments for spinning, weaving, printing, bleaching &c. are infinitely more complete and perfect than any that exist elsewhere; the division of labour in them is carried to an incomparably greater extent; the workmen are trained from infancy in industrious habits, and have attained the most dexterity and sleight of hand in the performance of the separate tasks, that can only be acquired by long and unremitting application to these employments. Why, then, having all these advantages on our side, should we not keep abreast with we have already gained? Every other people that attempt to set up manufactures must obviously labour under the greatest difficulties compared with us. Their establishments cannot

at first, be sufficient of employments to the extent, at the manipulation and processes, can only such new beginning competition of the a very high degree be immediately difficult to the aid derived the prohibitions will destruction of their where they are seen.

at first, be sufficiently large to enable the division of employments to be carried to any considerable extent, at the same time that expertness in manipulation and in the details of the various processes, can only be attained by slow degrees. It appears, therefore, reasonable to conclude that such new beginners, having to withstand the competition of those who have already arrived at a very high degree of perfection in the art, must be immediately driven out of every market equally accessible to both parties; and that nothing but the aid derived from restrictive regulations and prohibitions will be effectual to prevent the total destruction of their establishments in the countries where they are set up.

The cotton manufacture of this country has lately passed, as our readers are well aware, through a period of great depression. It is probable, indeed, that at the outbreak of the civil war in the United States both spinners and weavers were over-stocked, and that had this event not occurred, there would have been some stagnation in the trade, due to over production, and that, therefore, the severity of the pressure was not felt so fully by the employers as it was by the labourers, on whom the calamity fell with crushing weight. It is sufficient to point to one of the preceding tables in which the deficiency of American cotton is to be recognised. The imports of the raw material, which had been nearly 12,500,000 cwts. in 1860, fell to little more than 4,500,000 cwts. in 1862, the period in which the cotton famine, as it was naturally and strikingly called, was inflicting its heaviest miseries on those who were engaged in the manufacture.

This is not the place in which to comment on the circumstances which attended this calamity. It is sufficient to observe that the patience of the operatives, and the courage with which they bore those sufferings, which were due to causes over which they had no control, were acknowledged by all. The manufacturers and landowners in the district acted with energy in the crisis. The nation came forward also to aid the suffering, and great sums were gathered throughout the kingdom. The people of the United States, too, and of our colonies, gave their contributions to lighten the Lancashire distress. The subscriptions amounted to nearly 1,500,000*l.*

The losses consequent on the cotton famine were thus estimated by Dr. Watts of Manchester, in his work on the *Facts of the Cotton Famine* :—

Employers' losses, 3 years at 9,500,000 <i>l.</i>	- - -	98,500,000
Workpeople's do. at 11,000,000 <i>l.</i>	- - -	33,000,000
Shoekes' per' do. on wages at 10 per cent.	- - -	3,300,000
Do. on half employers' profits	- - -	1,225,000
Total loss ca 3 years	- - -	£136,225,000

Messrs. Ellison and Haywood, in their *Cotton Circular* for January 1866, set down the money losses at from 65,000,000*l.* to 70,000,000*l.*

The scarcity may be estimated again by the rise in the price of the raw material. Egyptian cotton, valued at 3*l.* 15*s.* 6*d.* per cwt. in 1860, rose to 12*l.* 5*s.* 3*d.* in 1864; that of the United States from 3*l.* 0*s.* 4*d.* to 13*l.* 11*s.*; and that of British India from 1*l.* 17*s.* to 12*l.* 18*s.* 1*d.*; and that of British India from 1*l.* 17*s.* to 8*l.* 9*s.* As is always the case when a serious exaltation of prices ensues upon scarcity, the greatest rise is found in that which was cheapest before the dearth.

Wide-spread and alarming as the distress was which ensued on the cotton famine, the result was yet not entirely without its benefits. The manufacturers had been forced to depend on one source for the supply of the raw material. The article produced in this region was, with the exception of Sea Island, of no better quality than

that procurable from Egypt and some other countries. It could not of course be expected that those who were purchasers of raw material should take into account the contingency which few observers failed to predict would at no remote period ensue—the occurrence, namely, of an attempted disruption between the Northern and Southern States of the American Union. But the manufacturers always looked anxiously at the course of American politics, and welcomed any promised supply of cotton from other countries. The urgent demand for the article did produce the effect of developing the exports of the fibre from new localities. Thus China, Japan, and Mexico appear among the countries which contributed to the supply after the dearth commenced. A great impetus was given to exports from Egypt, the Mediterranean, the British West and East Indies, though of course these enlarged imports from certain places were far from filling up the deficiency.

There is no plant perhaps which has a wider geographical range than cotton. It can be grown in the tropics as a perennial, and it can be cultivated as an annual over an area as far north as the basin of the Mediterranean. Practically the field for its produce is boundless. The cultivation of the plant, though requiring some care in its early growth, is by no means toilsome, the chief demand for labour arising when the crop has to be gathered, and the wool has to be cleansed from the seeds which it envelops. But notwithstanding the width of the area of production, competition against the American producer, in the period preceding the war, though it was anxiously desired was all but hopeless, and the deficiency could not be supplied to any satisfactory extent when the dearth in America first occurred.

The absence of any ready response to the urgent demand for cotton during this crisis was the effect of several causes. In the first place, the influential classes in this and some other European countries miscalculated the future of the civil war in America. It was predicted that the war would be speedily ended, and that the suspension of supply must be of very short duration; it being assumed erroneously that the Southern States possessed large stores of cotton, and that these would be poured into the market when their independence was established. There can be no doubt that this checked the disposition to engage in the cotton culture. Again, among the inhabitants of those countries in which cotton can be grown, the necessary capital for production on so large a scale is wanting. These countries are poor, or misgoverned, or barbarous—generally affected by all these untoward conditions. Cotton might be produced in almost unlimited quantities in Turkey and Asia Minor; but these regions are cursed by a Government which has made the fairest part of the earth sterile and unproductive. Still it will be seen that even under these adverse circumstances a great impulse was given to production in Egypt and India.

The Lancashire spinners for a long time had devoted their attention to the matter, and the Cotton Supply Association especially had done its best to further the ends of its establishment. It collected samples, employed agents, and welcomed intelligence of every kind, as far as lay in its power.

*Prospects of the Cotton Manufacture.*—The events of the five years previous to 1866 have been a serious trial of the powers possessed by this branch of British industry. Nothing could have tested its vigour, its elasticity, its continuance more effectually. It is not too much to say that it has passed through the trial with much less injury than could have been anticipated. The markets

Chamber of Commerce, embodies (pp. 22-3) a memorial to Congress protesting against the tax on cotton, which is calculated (Dec. 1867) to be 20 per cent. on its gross value. The abolition of the tax is called for on the grounds of its injustice, its oppressiveness, its discouragement of native and encouragement of foreign productions, and because it is a detriment to the shipping, commercial, and trading interests, and an obstruction to the cultivation of land and the employment of labour.

Little as we have to fear from American, we have still less to fear from Swiss or Saxon competition. America has some advantage over England in the greater cheapness of the raw material; but Switzerland and Saxony, situated almost in the centre of Europe, can only draw their supplies of raw cotton by a distant land carriage, by way of Hamburg, Marseilles, and Genoa; and we have the best authority for affirming that a bale of cotton may be conveyed at a less expense from Charleston to Manchester, than from Genoa, Amsterdam, or Hamburg to Switzerland or Saxony. Switzerland is altogether destitute of coal: all that she does is done by water-power, and that is said to be nearly exhausted. It is not, however, to be wondered at that the Swiss and Saxons should have succeeded in supplying their own markets, and some of those immediately contiguous, with certain species of yarn; or that they should export hosiery and such other articles as they can manufacture on a small scale, at their outposts; but it is idle to suppose that they should ever be able to do much more than

It was stated before a committee of the House of Commons in 1833 that the French cotton manufacture had increased, between 1812 and 1826, in the ratio of 310 per cent., while in England its increase was only 270 per cent. This statement was, we believe, accurate as far as it went; and yet it was hastily calculated, though, no doubt, without any good intention, to mislead. In 1812, and for several years previously, it was hardly possible to export cotton wool into France, and its price was excessive. When, therefore, the manufacturers got wool after the return of peace at an ordinary price, it was impossible, seeing that foreign cottons are excluded from France, but the manufacture should increase with extraordinary rapidity, until the home demand was well supplied. An advance of this sort is hardly no proof of the capacity of any country to prosecute the manufacture with advantage, or to export cottons without the aid of a bounty. The manufacture gone on increasing in the ratio down to the present time, the circumstances might have justly excited attention; but it has not been the case. No doubt it has made considerable progress in the interval; but not so much as might have been expected, seeing the increase of wealth and population in France, and the peculiar facilities which the French enjoy for smuggling cotton stuffs and prohibited products across the Pyrenees mountains, where they are taken off in large quantities. The truth is, that until the French Government reduces or repeals the duties on iron and other articles indispensable to the cheap construction of cotton factories, it is idle to suppose that the French should be formidable competitors in the production of cotton goods.

It is supposed by some that the competition is to be feared from the Continent does not depend so much in the spinning as in the weaving; and that the probability is that our exports will increase, and our exports of manu-

factured goods will diminish. We do not, however, imagine there is much in this. Our power-looms are superior to those of any other country; and there is not, in fact, with the exception of the dyes, a single particular connected with the cotton manufacture in which we have not a manifest superiority over the Swiss, Saxons, French, Prussians, and every continental nation. Certainly, however, we are inferior to some of them in the brilliancy and durability of their dyes; and this circumstance has occasioned a considerable demand for German and Swiss printed cottons in many parts of the East, where vivid colours are held in the highest estimation. But even there the greater cheapness of our goods is proving an overmatch for the greater brilliancy of those of our rivals.

Mr. Fane, Secretary of the British Embassy at Paris, in his *Report* No. 1 of 1867 gives the following table, showing the value of the exports of French cotton manufactures in the 6 years 1859-64:—

France		France	
1859 -	- 67,200,000	1862 -	- 63,300,000
1860 -	- 69,600,000	1863 -	- 88,200,000
1861 -	- 56,100,000	1864 -	- 95,700,000

Thus, the cotton exports of France during the year 1864 amounted to less than 4,000,000*l.* in value. Those of any other country were absolutely trivial. Many countries of course import cotton yarn which is used for home manufacture, and there is some Eastern trade possessed by Russia; but the total amount of foreign cotton stuffs competing with British produce is quite unimportant. Again, in sunnier climates, more brilliant colours can be imparted to cotton cloth; but the great element in production is cheapness in the fabric, and as yet the industry of this country, to judge from results, is practically without a rival.

On the whole, therefore, we see no reason to think that the British cotton manufacture has reached, much less passed, its zenith. But it can hardly be necessary to observe, considering the vast importance of the trade, that while, on the one hand, nothing should be left undone that may serve to strengthen its foundations and to promote its prosperity, on the other nothing should be attempted that may, by possibility, have an opposite effect. The subsistence of more than a million of people is not to be endangered on slight grounds. The abuses even of such a business must be cautiously dealt with, lest, in eradicating them, we shake or disorder the whole fabric. No doubt the state of children employed in the cotton factories called fairly for legislative interference; and we believe that the regulations that have been enacted, carried out, as they have been, under the superintendence of the inspectors, have been productive of much good.

#### 7. STATUTORY REGULATIONS IN REGARD TO THE EMPLOYMENT OF CHILDREN IN FACTORIES.

No statutory restrictions respecting the employment of children in the mills and factories of the United Kingdom existed until 1802, when the 42 Geo. III. was passed for the preservation of the health and morals of apprentices and others employed in cotton and other factories, and directing the local magistrates to report whether the factories were conducted according to law, and to adopt such sanitary regulations as they might think fit. This Act was followed, in 1816, by the Act generally called Sir Robert Peel's Act, imposing various regulations on the employment of children in cotton-mills.

Both of these Acts were repealed in 1831 by the 1 & 2 Wm. IV. c. 39, commonly called Sir

John Hobhouse's Act, which provided that in cotton factories, to which it alone related, no child could legally be employed till it had attained the age of 9 years; that no person under 18 years should be permitted to remain in the factories more than 12 hours in one day; and that on Saturdays they should only be employed in the factories for 9 hours.

Sir John Hobhouse's Act was repealed in 1833 by the 3 & 4 Wm. IV. c. 103; and this last-mentioned statute, with the 7 & 8 Vict. c. 15, the 10 & 11 Vict. c. 29 (commonly called the Ten Hours Act), 13 & 14 Vict. c. 54, 16 & 17 Vict. c. 104, 19 & 20 Vict. c. 83, enact the following provisions relative to persons employed in all processes incident to the manufacture of cotton, wool, hair, silk, flax, hemp, jute, or tow, separately or mixed together, or mixed with any other material, or any fabric made thereof, with the exception of factories used solely for the manufacture of lace, hats, or paper, or solely for bleaching, dyeing, printing, or calendering.

1. That no person under 18 years of age shall be allowed to work in the night, i.e. from  $\frac{1}{2}$  past 8 in the evening to  $\frac{1}{2}$  past 5 in the morning, nor on Saturday for any purpose after  $\frac{1}{2}$  past 4 in the afternoon, the hours to be regulated by a public clock, specified in a notice put up in each factory.

2. That no child under 8 years of age shall be employed, and that no child between 8 and 13 years old shall be employed more than 6 hours and 30 minutes in any one day, unless the dinner-time of the young persons from 13 to 18 years old in the factory shall begin at 1 o'clock; in which case the children beginning to work in the morning may work for 7 hours; but any child above 11 years of age employed solely in the winding and throwing of silk may work for 10 hours a day. And any occupier of a factory restricting the labour of young persons between 13 and 18 years old to 10 hours a day, may, on certain conditions, employ any child 10 hours on 3 alternate days of every week, provided that such child shall not be employed in any manner in the same or any other factory on 2 successive days.

3. That no child under 13 years of age shall work in the night for any purpose.

4. That every child under 13 years of age must have a surgical certificate of age, and must attend some school on 5 days of every week for certain specified periods, and obtain a weekly certificate of attendance from the schoolmaster, which may be annulled by the inspector on account of the infirmity of the schoolmaster.

5. That no young person of the age of 13, and under the age of 18, shall be allowed to work for more than 10 hours in any one day, nor more than 58 hours in any one week.

6. That every young person under 16 years of age must have a surgical certificate of age.

7. That no female above the age of 18 years shall be employed in any factory save for the same time and in the same manner as young persons in factories, i.e. for 10 hours in the day and 58 hours in the week, and under the above conditions as to night work, certificates of age not, however, being necessary for females above 18 years of age.

8. That in factories in which any part of the machinery is moved by water, and time lost by stoppages from want of water or too much water, children or young persons may, under certain conditions, be employed one hour additional, except on Saturday; and that when from the same causes any part of the manufacturing machinery driven by the water-wheel has been during any part of a day stopped, the young persons who would have

been employed at such machinery may under certain conditions recover such lost time during the night following the said day, unless the said day be Saturday.

9. That the inspector of the district, one of the four inspectors appointed under the Acts, shall have power to appoint a sufficient number of certifying surgeons to examine the children and young persons, and to give certificates of age to children and young persons under 16 years of age according to certain forms and directions, but which certificate may be annulled by the inspectors or sub-inspectors appointed under the Acts, provided they believe the real age of the persons mentioned in the certificates to be less than that mentioned in them, or provided the certifying surgeon of the district deems such persons to be of deficient health or strength at the time when the certificates are annulled.

10. That not less than  $\frac{1}{2}$  hour shall be allowed every day for meals to every young person, to be taken between  $\frac{1}{2}$  past 7 A.M. and  $\frac{1}{2}$  past 7 P.M., and 1 hour at least before 3 P.M.; and that no child or young person shall be employed more than 9 hours before 1 P.M. without an interval for meal-time of at least 30 minutes, and that all the young persons shall have the meal-times at the same period of the day.

11. That all children and young persons shall have not fewer than 8 half-holidays in the year of such half-holidays between March 15 and October 1, and that no child or young person shall be allowed to work in any factory on Christmas Day or Good Friday in England or Ireland, and in Scotland on any day the whole of which is apart by the Church of Scotland for the observance of the sacramental fast in the parish in which the factory is situated.

By 21 & 25 Vict. lace manufactories were included under the Factory Acts, but youths may be employed in lace factories between 4 A.M. and 10 P.M. provided the youths be not employed more than 6 hours a day.

By 27 & 28 Vict. the Factory Acts were extended to persons engaged in fusian cutting, manufacturing cartridges, and paper staining, also to persons engaged in the manufacture of earthenware, except bricks, and tiles not being ornamental tiles, lucifer matches, and percussion caps.

The Factories Act Extension Act of 1864 (30 & 31 Vict. c. 103), applies almost exclusively to those factories unconnected with the manufacture of cotton.

The Factory Acts embody other regulations respecting the appointment of inspectors to enforce these provisions &c.; but these, though of importance to the parties interested, by whom they must be carefully attended to, being of little public importance, need not be inserted in this place.

**COTTON SEED OIL CAKE.** Considerable quantities of oil cake from cotton seeds are annually imported into this country, the substance being used, like other kinds of oil cake, for cattle. In the year 1866, 10,528 tons were imported, chiefly from Belgium, the average being a little less than 57, the ton. In the year 1867, 93,957 tons of cotton seeds were imported, the value being about 77, 13s. the ton.

**COWHAGE or COWITCH** (Hm. kiwao; pois à grater; Ger. kuh krütze). The fruit of a perennial climbing plant (*Dolichos pruriens* Linn.). It is a native of India, as well as of other Eastern countries, and of America. The pod is about 4 or 5 inches long, a little flattened, and contains from 3 to 5 oval and flattened seeds. The outside is thickly covered with short, brown hairs, which, if incautiously touched

to the skin, and (Annie's *Materia* (COWRIES (Ger. cauris, bouges, habo zimbo). The small univalve shells of the Maldives, the Eastern Archipelago, and Africa. They have been used as a currency in the chief countries which inhabit the island. The nominal exchange rate is at the rate of 640 r. This rupee is the single cowry is worth. In Siam they value is far higher—at of course these rates of the cowry ships used partly, so that occasional every trade into a gamb since the abolition of of cowries has become a small importance. In 18 valued at 14,691/12. (CRANBERRIES, or BERRIES. The fruit of a mo process of Linneus. That the size of currant in different parts of Scotland; they were once common in the northern parts of England. They have been drained and met with. Cranberry, and a sharp, acid, and easily preserved, and under tart. They are very common in the northern part being of a superior quality every fine ones have been in New South Wales. In imported, valued at 1,77 (CRÈPE (Fr. crêpe; Ger. the, sopillo; Russ. floor transparent stuff, in many silk gammed and twisted without crossing. It is named. Crêpe was originally superior to any manufacture is said to have been by one Jacques Dupré of the seventeenth century, chiefly manufactured at Lyons (called, according to M. (Thomas), crêpe au lisse. China, was originally manufactured the process for a long time in France. The secret was discovered by M. Dugas. In 1816, 816 kilogrammes of French. The British exports of TARTAR. [EDIT. The term used to be placed by one individual assigns him money, or without stipulating for the party who lend and the party who borrow and Nature of Credit of society; credit is in a This arises partly from little capital being then from Government not hav

to the skin, and occasion intolerable itching. (Linnaeus's *Materia Indica*.)

**COWRIES** (Ger. *kauris*; Dutch, *kauris*; Fr. *coques*, *kauris*, *boques*; Ital. *cori*, *porcellane*; Span. *coques zimbos*). The shell of the *Cypræa moneta*, a small univalve found abundantly on the shores of the Maldives, Borneo, and the various islets of the Eastern Archipelago, as also on the eastern coasts of Africa. For many ages this shell has been used as a currency in parts of Hindostan and Africa, and the cowry fishery was and perhaps still is the chief occupation of most of the natives who inhabit the islands where it is found.

The nominal exchange of the cowry in Bengal is at the rate of 640 to the anna, or 3,840 to the rupee. This rupee is worth 22-2/3d. sterling, and the single cowry is worth about 26-10,000ths of a farthing. In Siam they are still cheaper. But their value is far higher—at least ten times—in Africa. Of course these rates are variable, and the delay of the cowry ships used in India to raise the price greatly, so that occasion was taken to turn the cowry trade into a gambling transaction.

Since the abolition of the slave trade the supply of cowries has become a matter of comparatively small importance. In 1865, 7,789 cwts. were imported, valued at 14,691*l*.

**CRANBERRIES** or **RED WHORTLEBERRIES**. The fruit of a moss plant, the *Vaccinium oxococcos* of Linnaeus. The berries are globular, about the size of currants; are found in mossy bogs in different parts of Scotland, but not in great numbers: they were once common in Lincolnshire and the northern parts of Norfolk; but since the bogs have been drained and cultivated, they are rarely met with. Cranberries have a peculiar sour, and a sharp, acid, agreeable taste; they are easily preserved, and are extensively used in making tarts. They are very abundant in North America and in the northern parts of Russia; the best being of a superior quality. It is said that the very fine ones have recently been brought from New South Wales. In 1866, 33,433 gallons were imported, valued at 1,702*l*.

**CRAPE** (Fr. *crêpe*; Ger. *flohr*, *krausflohr*; Ital. *vevillia*, *sopillo*; Russ. *flior*; Span. *cr espon*). A transparent stuff, in manner of gauze, made of fine silk gummed and twisted on the mill and woven without crossing. It is principally used in making. Crape was originally manufactured in Lyons; but that made in this country is now considered superior to any made in Italy. The manufacture is said to have been introduced into France, by one Jacques Dupuis, at or about the middle of the seventeenth century. French crapes are chiefly manufactured at Lyons, and are of two kinds, called, according to M. Bezon (*Dictionnaire de la mode*), *crêpe an lisse*. China crape, as its name implies, was originally manufactured in China, the process for a long time baffled all attempts at imitation. The secret was, however, at last discovered by M. Dugas. In 1864 France exported 48,816 kilogrammes of French manufactured crapes. The British exports of crape seem to be of great importance.

**TEAM OF TARTAR.** [**ARGAL.**]

**CREDIT.** The term used to express the trust or confidence placed by one individual in another, who assigns him money, or other property in advance, or without stipulating for its immediate return. The party who lends is said to give credit, and the party who borrows to obtain credit. **Origin and Nature of Credit.**—In the earlier stages of society, credit is in a great measure unnecessary. This arises partly from the circumstance that little capital being then accumulated, and the Government not having the means, or

not being sufficiently careful, to enforce that punctual attention to engagements so indispensable to the existence of confidence and credit. But as society advances, capital is gradually accumulated, and the observance of contracts is enforced by public authority. Credit then begins to grow up. On the one hand, those individuals who have more capital than they can conveniently employ, or who are desirous of withdrawing from business, are disposed to lend, or to transfer, a part or the whole of their capital to others, on condition of their obtaining a certain stipulated premium or interest for its use, and what they consider sufficient security for its repayment; and, on the other hand, there are always individuals to be met with, disposed to borrow, partly (and among merchants principally) in order to extend their business beyond the limits to which they can carry it by means of their own capital, or to purchase commodities on speculation, and partly to defray debts already contracted. These different classes of individuals mutually accommodate each other. Those desirous of being relieved from the fatigues of business find it very convenient to lend their capital to others, while such as are anxious to enlarge their businesses obtain the means of prosecuting them to a greater extent.

It is plain that to whatever extent the power of the borrower of a quantity of produce or a sum of money, to extend his business, may be increased, that of the lender must be equally diminished. The same portion of capital cannot be employed by two individuals at the same time. If A transfer his capital to B, he necessarily, by so doing, deprives himself of a power or capacity of production which B acquires. It is most probable, indeed, that this capital will be more productively employed in the hands of B than of A; for the fact of A having lent it shows that he either had no means of employing it advantageously, or was disinclined to take the trouble; while the fact of B having borrowed it shows that he conceives he can advantageously employ it, or that he can invest it so as to make it yield an interest to the lender, and a profit to himself. It is obvious, however, that except in so far as credit contributes, in the way now mentioned, to bring capital into the possession of those who, it may be fairly presumed, will employ it most beneficially, it conduces nothing to the increase of wealth.

The most common method of making a loan is by selling commodities on credit, or on condition that they shall be paid for at some future period. The price is increased proportionally to the length of credit given; and if any doubt be entertained with respect to the punctuality or solvency of the buyer, a further sum is added to the price, in order to cover the risk: that the seller or lender runs of not receiving payment, or of not receiving it at the stipulated period. This is the usual method of transacting where capital is abundant, and confidence general; and there can be no manner of doubt that the amount of property lent in Great Britain, the Netherlands, and most other commercial countries, in this way, is infinitely greater than all that is lent in every other way.

When produce is sold in the way now described, it is usual for the buyers to give their bills to the sellers for the price, payable at the period when the credit is to expire; and it is in the effects consequent on the negotiation of such bills that much of that magical influence that has sometimes been ascribed to credit is believed to consist. Suppose, to illustrate this, that a paper-maker, A, sells to a printer, B, a quantity of paper, and that he gets his bill for the sum, payable at 12 months after date: B could not have entered into the transac-

tion had he been obliged to pay ready money; but A, notwithstanding he has occasion for the money, is enabled, by the facility of negotiating or discounting bills, to give the requisite credit without disabling himself from prosecuting his business. In a case like this, both parties are said to be supported by credit; and as cases of this sort are exceedingly common, it is contended that half the business of the country is carried on by its means. All, however, that such statements really amount to is, that a large proportion of those engaged in industrious undertakings do not employ their own capital, but that of others. In the case in question, the printer employs the capital of the paper-maker, and the latter employs that of the banker or broker who discounted the bill. This person had most likely the amount in spare cash lying beside him, which he might not well know how to invest; but the individual into whose hands it has now come will immediately apply it to useful purposes, or to the purchase of the materials, or the payment of the wages of the workmen employed in his establishment. It is next to certain, therefore, that the transaction will have been advantageous. But still it is essential to bear in mind that it will have been so, not because credit is of itself a means of production, or because it can give birth to capital not already in existence; but because, through its agency, capital finds its way into those channels in which it has the best chance of being profitably employed.

The real advantage derived from the use of bills and bank notes as money consists, as has been already shown, in their substituting so cheap a medium of exchange as paper, in the place of one so expensive as gold, and in the facilities which they give to the transacting of commercial affairs. If a banker lend A a note for 100*l.* or 1,000*l.*, the latter will be able to obtain an equivalent portion of the land or produce of the country in exchange for it; but that land or produce was already in existence. The issue of the note did not give it birth. It was previously in some one's possession; and it will depend wholly on the circumstance of A's employing it more or less advantageously than it was previously employed, whether the transaction will, in a public point of view, be profitable or not. On analysing any case of this kind, we shall invariably find that all that the highest degree of credit or confidence can do is merely to change the distribution of capital—to transfer it from one class to another. These transfers are occasionally, too, productive of injurious results, by bringing capital into the hands of spendthrifts: this, however, is not, except in the case of the credit given by shopkeepers, a very common effect; and there can be no doubt that the vast majority of regular loans are decidedly beneficial.

*Abuses of the present Credit System in Great Britain. Means of obviating them.*—The previous observations refer rather to the credit given to individuals engaged in business, who mean to employ the capital which they borrow in industrious

undertakings, than to that which is given to individuals not so engaged, and who employ the advances made to them in supporting themselves and their families. In neither case is credit of advantage unless it be granted with due discrimination, and with reference to the character, condition, and prospects of those receiving it. In this country, however, these considerations have been in a great measure lost sight of, in the granting of credit by shopkeepers and tradesmen of all descriptions. Owing to the competition of such persons, their extreme eagerness to secure customers, and the general indolence of opulent persons, which disinclines them to satisfy every small debt when it is contracted, the system of selling upon credit has become almost universal. Few among us think of paying ready money for anything; seven tenths of the community are in the constant practice of anticipating their incomes; and there is hardly one so bankrupt in character and fortune as to be unable to find grocers, bakers, butchers, tailors &c. ready to furnish him upon credit with supplies of the articles in which they respectively deal. We look upon this facility of obtaining accommodations as a very great evil. They are not, in one case out of five, of any real advantage to the parties receiving them, while they are productive of very pernicious results. The system tempts very many, and sometimes even the most considerate individuals, to indulge in expenses beyond their means; and thus becomes the most fruitful source of bankruptcy, insolvency, and bad faith. To guarantee themselves from the extraordinary risk to which such proceedings expose them, tradesmen are obliged to advance the price of their goods to a most exorbitant height; so that those who are able, and who really mean, to pay the debts they contract, are in fact, obliged to pay those of the hosts of solvents and swindlers maintain'd by the present system. Many tradesmen consider themselves fortunate if they recover from two-thirds to three-fourths of the sums standing in their books, at the distance of several years.

The extraordinary extent to which the practice is carried may be learned from the reports of the Parliamentary Committee on National Debts. It appears from them, that hatters, shoemakers &c. in the metropolis have often 40*l.* and upwards on their books in debts below value; and that five sixths of their book debts are irrecoverable; but owing to the artificial enhancement of prices, those that are good are sufficient to indemnify the traders for the loss of the balance.

It is not easy, we think, to imagine any system better fitted to generate improvidence and fraud. The vast majority of those who become insolvent or are imprisoned for debt, consist of labouring artisans, half-pay officers, clerks in public offices, annuitants &c.—persons who prudent shopkeeper would ever allow to get immanently into his debt. The following exhibits some of the effects resulting from the present system:—

In consequence of a  
prisonment for debt,  
21 & 25 Vict. c. 131  
imprisoned has been  
time certainly; that so  
to put an end to such  
system that sent 1,929

In consequence of alterations in the law of imprisonment for debt, such as 22 & 23 Vict. c. 57, 24 & 25 Vict. c. 134 &c., the number of persons imprisoned has been greatly reduced. It was time, certainly, that something effectual was done to put an end to such flagrant abuses — to a system that sent 1,929 persons to a single prison for debts under 20*l*.! We do not mean to say or insinuate that credit may not frequently be given to the labouring classes with the best effects; but it is of its abuse that we complain — of its being indiscriminately granted to every one; to those whom it encourages to continue in a course of idleness and profligacy, as well as to those industrious and deserving persons to whom it may occasionally be of the greatest service. To secure the advantages of credit to the public, free from the enormous evils that result from its abuse, is an object of the highest importance; and few, we believe, would do so much to secure it as the taking from creditors the power to arrest and imprison for debt. [BANKRUPTCY.]

It was stated in the House of Commons (February 19, 1827) that in the space of 2½ years 20,000 persons were arrested in and about London, at an expense to the parties, it may be estimated, of between 150,000*l*. and 200,000*l*.! In 1827, in the metropolis and two adjoining counties, 23,515 warrants to arrest were granted, and 11,317 bailiwick processes were executed. Hence it may be concluded that in this single year, within the above limits, no fewer than 12,000 persons were deprived of their liberty, on the mere allegation of debts without any proof that they owed them a farthing! Well might Lord Eldon say that 'the law of arrest is a permission to commit acts of greater oppression and inhumanity than are to be met with in slavery itself,' and that the redress of such a grievance would not be attended with any fatal consequences to the country.\*

The following table, which shows that 1,078 persons were committed to Horsemonger Lane Prison, in 1842, for debts, amounting in all to only 232*l*. 16*s*. 9*d*., being at an average no more than 2*l*. 3*s*. 8*d*., each, proves that the dispositions which had previously taken place with respect to the law of arrest and imprisonment had, in any material degree, lessened its mischievous operation. Whatever else might be dear in England, the fact that thousands of people were annually imprisoned for such miserable trifles shows that personal liberty was at all events not so cheaply sold.

The following is a return from Horsemonger Lane Gaol of the number of debtors committed to the said gaol, on process out of courts of request, during the year ending January 1, 1843; stating the aggregate amount of debts and the period of confinement, in classes, the number confined for less than 10 days, for 10 days and less than 20, 30, 70, and 100 days; and stating also the amount paid out of the county or other rates for the maintenance and support of such prisoners, as far as possible.

We defy anyone to show that the law of arrest and imprisonment has a single good consequence to be placed as a set-off against the evils of which it is productive. Tradesmen depend, as is clearly evinced by the above statements, upon the despotical power which it puts in their hands, to get them out of scrapes; and believe that the fear of being subjected to arrest will stimulate even the most suspicious portion of their debtors to make payment of their accounts. The records of our prisons, and of our insolvent and other courts, show how miserably these expectations are disappointed. We believe, indeed, that we are warranted in affirming that the more respectable classes of shopkeepers and tradesmen are now generally satisfied that the system required some very material modifications. The law of arrest and imprisonment is, in fact, advantageous to none but knaves and swindlers, and the lowest class of attorneys, who frequently buy up small accounts and bills, that they may bring actions upon them, and enrich themselves at the expense of the poor, by the magnitude of their charges. Such oppressive proceedings are a disgrace to a civilised country. Were the law in question repealed, credit would be granted to those only who deserved it; for, generally speaking, tradesmen, supposing they had nothing to trust to but their own discretion, would not deal, except for ready money, with those of whose character and situation they were not perfectly informed; and the difficulty under which all idle and improvident persons would thus be placed of obtaining loans would do much to wean them from their vicious courses, and to render them industrious and honest. 'Those,' says Dr. Johnson, 'who have made the laws, have apparently considered that every deficiency of payment is the crime of the debtor. But the truth is, that the creditor always shares the act, and often more than shares the guilt, of improper trust. It seldom happens that any man imprisons another but for debts which he suffered to be contracted in hope of advantage to himself, and for bargains in which he proportioned his profit to his own opinion of the hazard; and there is no reason why one should punish another for a contract in which both concurred.'

The power of taking goods in execution for debts is also one that requires to be materially modified. It seems to us quite clear that some limits should be set to this power; and that such articles as are indispensable either to the subsistence or the business of any poor man ought to be exempted from execution, and, perhaps, distress. The present practice, by stripping its victims of the means of support and employment, drives them to despair, and is productive only of crimes and disorders.

A petition against imprisonment for small debts, subscribed by many of the most eminent merchants, manufacturers, bankers &c. of the city of Glasgow, was presented to the House of Commons in 1833. It contains so brief, and at the same time so forcible an exposition of the evils resulting from the system, that we shall take the liberty of laying it before our readers.

'Your petitioners have been long and seriously impressed with the belief that very great evils have arisen and do arise from the imprisonment of debtors in Scotland, especially for small sums.

'The petitioners will not here question the policy of the existing laws which authorise the imprisonment of debtors for considerable sums, nor do they intend to object to the creditor retaining the fullest power over the property and effects of his debtor; but they are humbly of opinion that, in so far as these laws give creditors

the power to imprison debtors for small sums, such as for 8*l.* and under, they are not only injurious to the public, and ruinous to the debtor, but even hurtful to the creditor himself.

It would be a waste of time to dwell upon the hardship of subjecting debtors to imprisonment for small debts, contracted sometimes certainly under circumstances of real distress, but more frequently from the improper use of credit, with which they are too readily supplied. The creditor takes care that his profit shall be commensurate with his risk; and the debtor is induced to purchase freely, and at any price, that which he is not immediately called upon to pay: the creditor coolly and cruelly calculates upon the power which the law has granted him over the person of his debtor if he fail to discharge his debt to him, while the debtor forgets that, by the credit so imprudently afforded him, he is preparing the way for his own ruin, and that of all who have any dependence upon him.

The total number of debtors imprisoned in the gaol of Glasgow alone, for debts of 8*l.* and under, was in the year 1830, 353; in 1831, 419; and in 1832, 437; while the whole number of incarcerations in that gaol for sums of every description were, in the year 1830, 557; in 1831, 630; and in 1832, 696; the proportion of sums of 8*l.* and under being nearly  $\frac{1}{3}$  of the whole on the average of these 3 years.

To remedy these evils, your petitioners humbly submit that means should be adopted for the repeal of the laws at present in force, in so far as they sanction the recovery of small debts by imprisonment; reserving their effect in every other respect; the result of which would be, that credit for small sums would be greatly limited, if not entirely extinguished, and the poorer classes rendered more provident; and by purchasing with money at a cheaper rate what they now buy at an extravagant price, they would be enabled to procure for themselves additional comforts, from the more economical employment of their small incomes.

May it therefore please your Honourable House to take this matter into your consideration, and to adopt such means as you in your wisdom shall see proper, to prevent the incarceration of debtors for sums under 8*l.*, and thereby remove or greatly mitigate the evils of improvidence on the part of the debtor, and of oppression on the part of the creditor, which necessarily arise under the present system.

So reasonable a proposal, supported by such conclusive statements, could not fail to make a deep impression; and a bill was soon after introduced, and passed into a law (stat. 6 & 7 Wm. IV. c. 70), taking away the power of imprisonment in Scotland for debts under 8*l.* 6*s.* 8*d.* and above interest and expenses, except in cases of fraud. This bill is admitted to have been eminently beneficial; and it is to be hoped that the advantages of which it has been productive may lead to the extension and general application of its principle.

*Propriety of placing all small Debts beyond the Pale of the Law.*—The taking away the power of arrest and imprisonment, except in the case of fraudulent bankruptcy, would certainly be a material improvement upon the existing system. But we are satisfied that it does not go far enough; and that by far the most desirable and beneficial reform that could be effected in this department would be to take away all action for debts under a given sum, as 50*l.* or 100*l.* The only exception to this rule should be in the case of claims for wages, or labour done under executory contracts. To prevent the measure from being defeated, no

action should be granted on bills under 50*l.* or 100*l.*, except upon those drawn by or upon regular bankers. This would be a radical change certainly; but we are fully satisfied that it would be highly advantageous to every class of the community, and most of all to labourers, retail dealers, and small tradesmen. It would protect the former from oppression, at the same time that it would tend powerfully to render them more provident and considerate; it would teach the latter to exercise that discretion in the granting of credit which is indispensable; and it would be publicly beneficial, by strengthening the moral principle, and making the contraction of debts for small sums, without the means of paying them, at once difficult and disgraceful.

We agree entirely in opinion with those who think that it is to no purpose to attempt to remedy the defects now pointed out, by multiplying courts and other devices for facilitating the speedy recovery of small debts. This is beginning at the wrong end; or rather it is attempting to obviate the influence of one abuse by instituting another. No wise statesman will ever be easily persuaded to fill the country with petty local courts; for these, when not absolutely necessary, are the merest nuisances imaginable; and he would, at all events, exert himself, in the first instance, to do away, in so far as possible, with the circumstances that make individuals resort to them. But it is certain that  $\frac{2}{3}$  of the cases in county courts originate in questions as to simple contract debts under 50*l.*; and were such debts placed, as they ought to be, beyond the pale of the law, the courts would be wholly unnecessary. Our object ought not to be to provide means for enforcing the payment of trifling debts, but to prevent their contraction. We believe, indeed, that, instead of lessening the multiplication of district courts will materially aggravate, all the evils of the present credit system. The belief that they may readily enforce their claims by resorting to them will make shopkeepers and tradesmen still more disposed than at present to give credit, while the unprincipled, the inconsiderate, and the necessitous will eagerly grasp at this increased facility. What there is of caution amongst our retail dealers is in no inconsiderable degree owing to the want of those petty tribunals so many are anxious to have universally established. The more they are increased, the less will caution prevail. But instead of diminishing this virtue, for such it really is, it cannot be too much increased. Nothing will ever deter those who ought not to obtain credit from taking it while in their power; but those who give it may be made to exercise greater discretion; they may be made to know that it is a private transaction between themselves and those to whom they grant it; and that in the case of petty debts they have only their own sagacity to look to, such transactions not being cognisable by law. The measure of the sort here proposed would not, some appear to imagine, annihilate credit. It would, no doubt, annihilate that spurious, and discriminating species of credit that is as readily granted to the spendthrift and prodigal as to the frugal and industrious individual; but to the extent that it deprived the former of the means of obtaining accommodation, it would extend those to the latter. Nothing short of this, nothing but placing all small debts beyond the pale of the law, will ever fully impress tradesmen with a caution of the vast advantages that would result to themselves from their withdrawing their confidence from courts and prisons, and preventing everyone from getting upon their books of who, and, under the Natur

aware; nor will to eradicate the present credit system is the sor

One of the w thousands of la whom the impro originally led int have the shops to they dare not the goods offered to Dr. Johnson has once owes more th to bribe his credit debt. aware; nor will anything else be able completely to eradicate the flagrant abuses inherent in the present credit system, and which have gone far to render it a public nuisance.

One of the worst consequences of the present system is the sort of thralldom in which it keeps thousands of labourers and other individuals, whom the improper facilities for obtaining credit originally led into debt. Such persons dare not leave the shops to which they owe accounts; and they dare neither object to the quality of the goods offered to them, nor to the prices charged. Dr. Johnson has truly observed, that 'he that once owes more than he can pay, is often obliged to bribe his creditor to patience by increasing his debt. Worse and worse commodities at a higher and higher price are forced upon him; he is impoverished by compulsive traffic; and at last overwhelmed in the common receptacles of misery by debts which, without his own consent, were accumulated on his head.' By taking away all right of action upon s. and debts, this system of invisible but substantial coercion would be put an end to. The tradesman would take care who got, in the first instance, upon his books; and instead of forcing articles upon him, would cease to furnish him with any unless he found he was regular in making his payments; while the customer to whom credit was of importance would know that his only chance of obtaining it would depend upon his character and reputation for punctuality. The abuses of the sort now alluded to, that grow out of what has been denominated the truck system, justly occasioned its abolition; but these were trifling compared with those that originate in the banking of petty debts within the pale of the law. (See a pamphlet, entitled *Credit Pernicious*, published in 1823; and *Treatise on the Police &c. of the Metropolis*, by the Author of the *Cabinet Lawyer*, pp. 114-134.)

(CREW. The company of sailors belonging to any ship or vessel. Formerly no British ship could be navigated except by a crew  $\frac{3}{4}$  of which were British subjects, besides the master; and every ship of 80 tons burden and upwards had to carry to sea a certain number of apprentices in proportion to her tonnage. But these regulations have been abandoned. [NAVIGATION LAWS.] The crews of British ships may now consist wholly of Englishmen, or wholly of foreigners, or they may be mixed together in any proportion; and it is no longer necessary to carry to sea a single apprentice. The duties and rights of seamen are explained under the articles SEAMEN and MERCANTILE MARINE ACT in this work. Ready obedience to the lawful orders of their superiors, ability to discharge their duties, and alacrity in their performance, at all times and under the most perilous circumstances, are the distinguishing characteristics of good seamen.

(CROTON OIL. The expressed oil from the seeds of the *Croton tiglium*, a small tree growing in Hindostan, Ceylon, and the Moluccas, and belonging to the Natural Order *Euphorbiaceae*. The plant contains an acrid, purgative principle. Its seeds have been known in Europe from the beginning of the 17th century, under the name of *Molucca* and *grana tiglia*. Unlike most fixed oils, croton oil is soluble in alcohol. It is used in medicine. It is slightly viscid; colour brownish yellow, taste acrid, odour faintly nauseous. (Pharmacopœia of the Medical Council.)

(CUBEBS (Ger. kubeben; Fr. cubèbes; Ital. cubebi; Span. cubebas; Russ. kubcbit; Arab. kubeh; Javan. kumunkus; Hin. cubab-chinie). The produce of a plant, the *Piper cubeba* of Linnaeus, and, under the Natural System, a species of

*Piperavea*. It is cultivated in Java, and grows also in Penang and other parts of the East Indies. Specimens of cubebs from Ceylon were shown in the Exhibition of 1862. It is a small urripe fruit, dried like a pepper-corn, but somewhat longer. Cubebs have a hot, pungent, aromatic, slightly bitter taste, and a characteristic odour. They should be chosen large, fresh, sound, and the heaviest that can be procured. When cubebs have been kept long, especially in powder, they lose a portion of their volatile oil, on which, it appears, their medicinal properties depend. They are said to be adulterated with Guinea grains and pimento. A duty on their importation, after being reduced in 1842 from 6d. to 1d. per lb., was repealed in 1845. Of 222,931 lbs. of cubebs imported into the United Kingdom in 1866, 89,721 lbs. came from Holland, i.e. was the produce of the Dutch East India colonies; 128,394 lbs. from the Straits Settlements, and 4,816 lbs. from other localities. The price varied from 3*l.* 10*s.* 4*d.* to 4*l.* 1*s.* 10*d.* per cwt. (Pharmacopœia of the Medical Council.)

(CUCUMBER. A tropical plant, of which there are many varieties, largely cultivated in hothouses in England.

(CUDBEAR. A purple or violet coloured powder used in dyeing violet, purple, and crimson, prepared from a species of lichen (*Lecanora tartarea*), or crustaceous moss, growing commonly on limestone rocks in Sweden, Scotland, the north of England &c. About 130 tons of this lichen are annually exported from Sweden. It commonly sells in the port of London for about 20*l.* per ton; but to prepare it for use, it must be washed and dried; and by these operations the weight is commonly diminished a half, and the price, in effect, doubled. Though possessing great beauty and lustre at first, the colours obtained from cudbear are so fugitive that they ought never to be employed but in aid of some other more permanent dye, to which they may give body and vivacity. In this country it is chiefly used to give strength and brilliancy to the blues dyed with indigo, and to produce a saving in that article; it is also used as a ground for madder reds, which commonly incline too much to yellow, and are made rosy by this addition. The name cudbear was given to this powder by Dr. Cuthbert Gorlon, who, having obtained a patent for the preparation, chose in this way to connect it with his own name. (Bancroft, *Philosophy of Permanent Colours*, vol. i. pp. 300-304.)

(CUMMIN SEED (Ger. kumin; Fr. cumin; Ital. comino, cumino; Span. comino; Arab. kumun). The seeds of an annual plant (*Cuminum Cuminum*, Linn.), a native of Egypt, but extensively cultivated in Sicily and Malta. They have a strong, peculiar, heavy odour, and a warm, bitterish, disagreeable taste. This seed, which formed a favourite ingredient in the cookery of our forefathers, has been supplanted by more agreeable condiments. It was employed in medicine, is still used in farriery, and is reported to enter into the composition of artificial food for cattle.

(CURRANTS (Fr. raisins de Corinthe; Ger. korinthen; Ital. uve passe di Corinto; Lat. passule Corinthiæ; Russ. korinka, oppek; Span. pasas de Corinto). A small species of grape, largely cultivated in Zante, Cephalonia, and Ithaca, of which islands they form the staple produce; and in the Morea, in the vicinity of Patras. The plant is delicate; and as 6 or 7 years must elapse, after a plantation has been formed, before it begins to produce, its cultivation requires a considerable outlay of capital. The crop is particularly liable to injury from rains in harvest, and is altogether

CURRENTS

of a very precarious description. After being dried in the sun, the currants are exported packed in large butts. They are in extensive demand in this country; and, when mixed with flour and suet, make a dish peculiarly acceptable to the lower classes. But, as if it had been intended to put them beyond the reach of all except the richest individuals, they were burdened down to 1831, with the exorbitant duty of 41s. *d.* per cwt. In that year, however, the duty was reduced a half, or to 22s. 2*d.* per cwt., and their importation was in consequence very materially increased. We observed in a former edition of this work that as the price of currants in bond varied from 20s. to 35s. per cwt., a duty of 22s. 2*d.* per cwt. was a great deal too high; and that it was, no doubt, owing to its amount that the consumption of currants was not materially greater. Sir Robert Peel took this view of the matter, and in 1841 reduced the duty to 15s. per cwt. The result was such as might have been anticipated. At an average of the 3 years ending with 1842, 183,836 cwt. currants were annually entered for consumption, producing an annual revenue of 212,894*l.* But at an average of the years 1849 and 1850 no fewer than 419,846 cwt. were entered for consumption, while the annual revenue was increased to 330,247*l.* and notwithstanding the farther great reduction of the duty to 7s. in 1860, yielded a revenue of 265,448*l.* This, therefore, is one of the most memorable instances of the advantage of a judicious reduction of an excessive duty on an article in extensive demand. Besides increasing the comforts of the public and the amount of the revenue, it has given a considerable stimulus to the trade with Greece and the Ionian Islands, the currants being the principal product which they export.

In 1867, 1,002,366 cwt. were imported, valued at 909,578*l.* The price of currants in 1866 varied from 17s. 6*d.* to 20s. 2*d.*, the best as well as the largest quantity having been exported from Greece.

Currants are subject to an ad valorem export duty, which varies according to the crop. The average is about 13 per cent. By far the largest part of the currants exported are consigned to this country for home consumption.

Currants, like other kinds of grape, suffered severely by the oidium.

No abatement of duties is made on account of any damage received by currants. A Treasury letter of March 30, 1816, directs the following rates to be allowed, with liberty to the

merchant and officers to take the actual rate when either party is dissatisfied.—Currants in casks from Zante 13 per cent., Leghorn 10 per cent., Trieste 10 per cent.

**CUSTOM HOUSE.** The house or office where commodities are entered for importation or exportation; where the duties, bounties, or drawbacks payable or receivable upon such importation or exportation are paid or received; and where ships are cleared out &c.

For information as to the proceedings necessary at the Custom House on importing or exporting commodities, see the article IMPORTATION AND EXPORTATION.

The principal British Custom House is in London; but there are Custom Houses subordinate to the latter in all considerable sea-port and a few inland towns.

**CUSTOMS.** Duties charged upon commodities on their being imported into or exported from a country.

Customs duties seem to have existed in every commercial country. The Athenians laid a tax of 10 per cent. on the corn and other merchandise imported from foreign countries, and also on several of the commodities exported from Attica. The *portoria*, or customs payable on the commodities imported into, and exported from, the different ports in the Roman empire, formed a very ancient and important part of the public revenue. The rates at which they were charged were fluctuating and various, and little is now known respecting them. Cicero informs us that the duties on corn exported from the ports of Sicily were, in his time, 5 per cent. Under the Imperial Government, the amount of the *portoria* depended as much on the caprice of the prince as on the real exigencies of the state. Though sometimes diminished, they were never entirely omitted, and were much more frequently increased. Under the Byzantine emperors they were as high as 12½ per cent.

Customs duties existed in England previously to the Conquest. They appear to have derived their name from having been immemorably or customarily charged on certain articles, as within the principal ferries, bridges &c. within the kingdom, and on these and other articles of national and foreign produce when exported from or imported into the kingdom. In 1206 the customs revenue of England, including that derived from tolls and fairs, was only 1,958*l.* It is not, therefore, true, as has sometimes been stated, that the king's first claim to the customs was established in the reign of Edward I; but that able and politic prince, by rendering the levy of the old duties more effectual, and procuring the sanction of Parliament to the imposition of new duties, was the first who made the customs revenue of any material importance. The duties were, at first, principally laid on wool, woollen (sheep-skins), and leather when exported by sea; were also extraordinary *parva customa*, to which were denominated *parva customa*, to distinguish them from the former, or *magna customa*. The duties of tonnage and poundage, as they are mentioned is so frequently made in English history, were customs duties; the first being paid on every customs duty; latter being an ad valorem duty of so much a pound on all other merchandise. When these duties were granted to the crown they were denominated *subsidies*; and as the duty of poundage had continued for a lengthened time at the rate of 1s. a pound, or 5 per cent., it came, in the language of the customs, to be denominated *ad valorem* duty of 5 per cent. The new duties granted in the reign of William III were denominated of 5 per cent. to the duties on mer-

ported commodities. (2) the author of this work, 2 The various customs d the first time, in a book o reign of Charles II.; a again published in the rei exclusive of the duties cu many more had been imp to the accumulation emp and regulations to were productive of the g The evil was increased by which new duties were ad ceptage being sometimes a while at other times the co bre new standard of bulk, w and charged with an additio nference to the duties form sation arising from these so augmented by the special a the duties, and the consequ calculation for each, fasion inseparable from a preed a serious injury to many frauds and abuses, The Customs Consolidat Mr Pitt in 1787, did much convenience. ported commodities. (*Treatise on Taxation*, by the author of this work, 2nd ed. p. 231.)

The various customs duties were collected, for the first time, in a book of rates published in the reign of Charles II.; a new book of rates being again published in the reign of George I. But, exclusive of the duties entered in these two books, many more had been imposed at different times; so that the accumulation of the duties, and the complex and regulations to which they gave rise, were productive of the greatest embarrassment. The evil was increased by the careless manner in which new duties were added to the old; a percentage being sometimes added to the original tax; while at other times the commodity was estimated by a new standard of bulk, weight, number, or value, and charged with an additional impost, without any reference to the duties formerly imposed. The confusion arising from these sources was still further augmented by the special appropriation of each of the duties, and the consequent necessity of a separate calculation for each. The intricacy and confusion inseparable from such a state of things proved a serious injury to commerce, and led to many frauds and abuses.

The Customs Consolidation Act, introduced by Mr. Pitt in 1787, did much to remedy these inconveniences. The method adopted was, to abolish the existing duties on all articles, and to substitute in their stead one single duty on each article, equivalent to the aggregate of the various duties by which it had previously been loaded. A more simple and uniform system was, at the same time, introduced into the business of the Custom House. These alterations were productive of the best effects. But the many changes in the customs duties and regulations which took place during the strengthened struggle terminated in 1815 having again introduced a great deal of complexity into the business of the Custom House, a new consolidation was effected in 1825. The numerous statutes relating to the customs, amounting, including parts of statutes, to about 450, were repealed and compressed into some half dozen statutes of a reasonable bulk, and drawn up with a commendable degree of perspicuity.

The numerous reforms effected by Sir Robert Peel occasioned further changes; and these, and the various reforms effected by Mr. Gladstone, made it necessary again to consolidate the customs laws. This was accomplished by the Customs Consolidation Act of 1853, the 16 & 17 Viet. c. 107. This statute, which was drawn up under the direction of the late James Wilson, Esq., Secretary to the Treasury, is at once brief, comprehensive, and clear as to be level to the comprehension of those not acquainted with such matters. This, though repealed by various subsequent Acts and especially the Customs Consolidation Act of 23 & 24 Viet. c. 110, comprises the whole law respecting importation, exportation, warehousing, smuggling, &c. of goods, with the regulations to be observed in the coasting and colonial trades &c. This, however, is only a part of its merit; for, by condensing and simplifying the various customs laws, it introduced some most important improvements. It, for instance, made an end, in at least as the customs is concerned, of the most vexatious regulation which, by exempting the Crown from the payment of costs, obliged a party in a suit with the commissioners, even when successful, to pay his own expenses. It also relieved all parties from the allegation of their not having paid the proper duty, from seizure on the importer's behalf, and from the amount claimed by the customs authorities should be enquired into and properly paid, when, if the customs were found to have

made an overcharge, a corresponding part of the sum deposited should be returned to the merchant, with interest at the rate of 5 per cent., and the expenses of suit. The Act further provided that an importer who considered himself aggrieved by a decision of the Board of Customs might, if he chose, have the case enquired into in open court before a commissioner, where he might meet the officer making the accusation face to face, and learn by examination and otherwise the nature of the evidence by which it was supported, and the real facts of the case. The commissioner who conducts an enquiry of this sort reports the evidence so taken to the Board, who may, thereupon, confirm or modify their decision; it being optional with the merchant either to abide by it or to carry the case before a competent tribunal. And in the event of the duty or penalty claimed being under 100*l.*, or of the case being of a simple kind, it may be tried before magistrates, county courts, and other inferior tribunals, so that the public will no longer be debarred from asserting their rights by the heavy expense attending trials in the Exchequer Court and at the assizes. The most important portions of this statute are given under the various heads to which it refers (COASTING TRADE; COLONIES AND COLONY TRADE; IMPORTATION AND EXPORTATION; SMUGGLING; &c.); but every merchant will do well to supply himself with the statute, and to make its provisions the subject of careful study.

Customs duties, like all duties on particular commodities, though advanced in the first instance by the merchant, are ultimately paid by those by whom they are consumed. When a Government lays a duty on the foreign commodities which enter its ports, the duty falls entirely on such of its own subjects as purchase these commodities; for the foreigners would cease supplying its markets with them if they did not get the full price of the commodities exclusive of the tax; and for the same reason, when a Government lays a duty on the commodities which its subjects are about to export, the duty does not fall on them, but on the foreigners by whom they are bought. If, therefore, it were possible for a country to raise a sufficient revenue by laying duties on exported commodities, such revenue would be wholly derived from others, and it would be totally relieved from the burden of taxation except in so far as duties might be imposed by foreigners on the goods it imports from them. Care, however, must be taken, in imposing duties on exportation, not to lay them on commodities that may be produced at the same, or nearly the same, cost by foreigners; for the effect of the duty would then be to make the market be supplied by others, and to put an entire stop to their exportation. But in the event of a country possessing any decided natural or acquired advantage in the production of any sort of commodities, a duty on their exportation would seem to be the most unexceptionable of all taxes. If the Chinese chose to act on this principle, and had the power, they might derive a considerable revenue from a duty on exported teas, which would fall entirely on the English and other foreigners who buy them. The coal and tin, and perhaps also some of the manufactured goods produced in this country, seem to be in this predicament.

The revenue derived from the customs duties in 1590, in the reign of Elizabeth, amounted to no more than 50,000*l.* In 1613 it had increased to 148,075*l.*; of which no less than 109,572*l.* were collected in London. In 1660, at the Restoration, the customs produced 421,582*l.*; and at the Re-

olution, in 1688, they produced 781,987*l*. During the reigns of William III. and Anne the customs revenue was considerably augmented, the net revenue being established in 1712 being payments into the exchequer by the Peace of Paris in 1763, the net produce of the customs revenue of Great Britain amounted to nearly 2,000,000*l*.; in 1792 it amounted to 4,407,000*l*.; in 1815, at the close of the war, it amounted to 11,360,000*l*.; and in 1852 it amounted to 20,048,744*l*. 1*l*. 4*d*., and including Ireland, to 22,137,120*l*. 1*l*. 11*d*.

Within the years 1851-1865 customs duties reported to produce more than 14,000,000*l*. have been repealed, and others, reckoned at about 3,250,000*l*., have been imposed. But the customs revenue has fairly kept pace with the reductions—the amount received within this period varying from 21,000,000*l*. to 24,000,000*l*. And though, when great reductions have been made, the revenue has doubtlessly lost on some particular article, it has gained on the general consumption of duty-paying articles.

Astonishing, however, as the increase of the customs revenue has certainly been, it is not quite so great as it appears. Formerly the duties on some considerable articles, such as sugar, brandy, wine &c. imported from abroad, were divided partly into customs duties charged on their importation and partly into excise duties on their being taken into consumption. But these duties have since been wholly transferred to the customs; the facilities afforded by means of the warehousing system, for paying the duties in the way most convenient for the merchant, having obviated the necessity of dividing them into different portions.

It will be seen from various articles in this work [BRANDY; GENEVA; SMUGGLING; TEA; TOBACCO; &c.] that the exorbitant amount of the duties which have been laid on various articles imported from abroad leads to much smuggling and fraud; and requires, besides an extraordinary expens in many departments of the customs service, which might be avoided were these duties reduced within more reasonable limits. This, however, is the business of Government, and not of those intrusted with the management of the customs; and it would be unjust to the latter not to mention that this department has been essentially improved, during the present century, in respect of economy; whatever may be thought of its efficiency. The following extracts from a letter to the Right Hon. H. Goulburn, from a former chairman of the Board of Customs (R. B. Dorr, Esq.), give a brief but satisfactory view of the improvements that have been effected:—

As regards the department of customs in 1792, the principal officers engaged in the receipt of the duties in the port of London were patent officers.

The first Earl of Liverpool was collector inwards.

The late Duke of Manchester, collector outwards.

The Duke of Newcastle, and afterwards the Earl of Guilford, comptroller inwards and outwards.

Lord Stowell, surveyor of subsidies and petty customs.

These noblemen took no part in the official duties, but merely exercised the right of appointing deputies and clerks.

Both principals and deputies were remunerated by fees. The patentees received the fees denominated patent, and the deputies retained the fees

called the fees of usage for their own use. In addition to these fees, both deputies and clerks received fees for despatch.

The same system prevailed throughout the whole department. The salaries of the officers were nominal; and the principal proportion of all official income was derived from fees. These fees were constantly varying both in rate and amount, and formed a continual source of dispute and complaint between the merchant and the officer.

This system (after having been repeatedly objected to by various commissions of enquiry, and finally by the Committee of Finance in 1797) was put an end to in the year 1812 by the Act 5*t* Geo. III. c. 71, by which all patent offices and fees were abolished, and compensation allowances granted to the patent officers, and fixed salaries established.

The additional salaries granted under this arrangement amounted to about 200,000*l*., and the temporary compensation allowances to about 40,000*l*. per annum.

The fees abolished, and from which the public were relieved, amounted to about 160,000*l*. per annum.

In addition to the amount of fees from which the public were relieved, various allowances made by the Crown to officers for quarantine, seal poundage, poundage on seizures, and many other incidental allowances, which did not appear on the establishment, were also abolished, and the salaries of every officer placed at one view upon the establishment.

The effect of these salutary measures has been to give a great apparent increase to officers' salaries since 1791; and, upon a mere comparison of the establishment of 1792 with 1890, without the above explanation, it would appear that the pay of the officers had been most materially augmented. Whereas, in point of fact, the difference is in the mode of payment; and the incomes of the officers at the present period (as compared with 1792) are in general less; and, consequently, the public are less taxed for the performance of the same duties now than in 1792.

In the year 1792 the warehousing system had not been established. Officers were admitted of all ages, and there was no system of classification or promotion. The officers at the out-ports and in London were generally appointed through influence, and were too often persons who had failed in trade, or had been in menial services, who regarded their situations rather as a comfortable provision for their families than as offices for which efficient services were required. The superintendence and powers of the Board were cramped and interfered with by circumstances and considerations which prevented the enforcement of wholesome regulation. The whole system was so imperfect, so far back only as 1818, that a special commission was appointed to enquire into the department; and, upon the recommendation of that commission, various regulations have been adopted.

The age of admission has been limited, a system of classification and promotion of officers and a graduated scale of salaries, established throughout the whole department; and by means local interference in the promotion of officers has been abolished; the attendance of officers increased, regulated, and strictly enforced; holidays reduced from 46 in the year to 36 on Good Friday, the King's birthday, and Christmas day; useless oaths, and bonds, and forms of payments of various kinds discontinued; and facility and despatch afforded to the merchant

business; the accounts and returns of all kind reduced; and various establishments; the whole remoulded, and the commerce of the country improved.

In Ireland the number of the ports in the year 1818; and within that number and expense a reduction of two thirds of the officer's salary and charges had been effected, in 1818, an annual reduction in the amount having been, in 1818, 113,394*l*. (103,313*l*. of which was nearly equal, in 1823, notwithstanding the cross Channel duties, 30,000*l*. per annum, a period.

Inducement is no longer held out in many cases where it used to be, and in which the merchant might have been at once abandoned to arrangements by which very intelligent and his whose offices had been a rendered available with the public.

By an order from the Secretary, of February 20, 1818, commissioners, and of course prospectively reduced, to revise the whole establishment, that order, with a view to the reduction.

Defects and Improvements.—The above arrangement reflect credit alike on the Board of Customs, and on the public, who, notwithstanding, been less extensive. Some years ago, extensive frauds had been committed in the port of London, for a large quantity of silks, gloves, and articles, through the connivance of the officers. The origin, no doubt, was the same as in most similar frauds, may be traced to the then existing temptation which was consequent upon the part of the officers, in the receipt of the duties.

At the same time, abuses were corrected by the Board, and by the superior officers, these frauds were not so long, or to the same extent, as in the case of the commissioners could not be of so common magnitude as in the case of the officers. The Board assured them that such a system was not to be established to the conviction of the public, by comparing the amount of the duties in each custom-house of the country, &c. from France, &c. of the same in our country, as the duty of the country, and extraordinary discrepancies were immediately entered into a register, and not to have

business; the accounts kept in the different offices, and returns of all kinds, revised, simplified, and reduced; and various minor regulations of detail established; the whole machinery of the department remodelled, and adapted to the trade and commerce of the country.

In Ireland the number of officers employed at all the ports in the year ended Jan. 5, 1830, and the salaries and charges, did not much exceed the number and expense at the port of Dublin alone in 1818; and within the space of 11 years nearly two thirds of the officers employed at the ports in Ireland have been discontinued; the number having been, in 1818, 1,755; in 1829, 514, and an annual reduction in salaries and charges has been effected to the extent of 173,724*l.*; the amount having been, in 1818, 285,115*l.*; in 1829, 111,391*l.* (103,313*l.* of that amount having been reduced between the years 1823 and 1829), upon an expenditure of 285,115*l.*; and the receipts were nearly equal, in 1827, to those of 1818 and 1823, notwithstanding the total repeal of the cross Channel duties, amounting to about 340,000*l.* per annum, subsequent to the latter period.

Influence is no longer allowed to prevail; and in many cases which have recently occurred, and in which the patronage of Government might have been fairly exercised, it has been at once abandoned in order to give way to arrangements by which the services of some very intelligent and highly respectable officers, whose offices had been abolished, could be again rendered available with a material saving to the public.

By an order from the Lords of the Treasury, of February 20, 1830, the salaries of the commissioners, and of other officers, have been prospectively reduced, and directions given to revise the whole establishment in the spirit of that order, with a view to every possible reduction.

*Defects and Improvement of the Customs Establishment.*—The above are great improvements, and reflect credit alike on the Government and the Board of Customs. But the latter has, notwithstanding, been less efficient than might have been expected. Some years ago it was found that extensive frauds had been carried on in the port of London, for a lengthened period, in the case of silks, gloves, and other highly taxed articles, through the connivance of the customs officers. The origin, no doubt, of these, as of most similar frauds, may be traced to the exorbitance of the then existing duties, and to the consequent temptation which they held out to smuggling on the part of the importers and the corruption of the officers. But, admitting this, it is at the same time, abundantly clear that had anything like an efficient supervision and check been exercised by the commissioners and their inferior officers, these frauds could not have been carried on so long, or to such an extent. The commissioners could not but be aware that frauds of so common magnitude were taking place in the case of goods in the Thames. Private parties assured them that such was the case; and, independently of this, the fact must have been established to the conviction of every reasonable person by comparing the accounts given by the Board of Customs of the exportation of silks, gloves &c. from France for England, with the returns of the same in our customs returns. And as the duty of the commissioners, on seeing such an extraordinary discrepancy, to have themselves immediately entered into a searching enquiry into the origin, and not to have devolved that duty on

others, or waited till the frauds were discovered by the confessions of some of those engaged in carrying them on.

We hope it will not be supposed, from anything now stated, that we have any wish to extenuate the guilt of the officers who participate in the plunder of the revenue; but, how much and how deservedly soever we may blame them, we need not be surprised, considering their situation in life, the smallness of their salaries, and the carelessness of their superiors, that they should sometimes yield to the powerful temptations to which they are exposed.

In 1851 the Commissioners of Customs were so ill-advised as to institute numerous actions, some of them of a very paltry description, against two of the principal London Dock Companies. We mentioned in a former edition of this work that these actions, even if the Commissioners were successful, would most probably do little more than establish some irregularity or neglect of duty on the part of the Dock Companies, whose interests, in as far as the collection of the revenue is concerned, are, in effect, identical with those of the Government. The result has more than justified these anticipations. The proceedings against the Companies, which were of a most vexatious, costly, and oppressive character, terminated in their substantial acquittal. The irregularities (for they amounted to nothing more) of which they were convicted were venial in the extreme, and, in truth, quite unworthy of public notice.

This, however, is a case in which good was educed out of evil. The extraordinary proceedings now referred to, coupled with the delays and other annoyances experienced by merchants in transacting business with the Customs, rendered that department extremely unpopular. A very general demand was in consequence made for an effectual reform of the practices followed in the Custom House, and for a reconstruction of the Board. The subject was carefully investigated by a committee of the House of Commons; and the most important object, or the simplification of the business conducted by the Customs, and the placing it on a more equitable footing, was in great measure effected by the Consolidation Act to which we have already referred. The Board was not indeed amended; but there are fewer Commissioners now than formerly, so that the responsibility attaching to each is increased, though the general opinion seems to be that they are still too numerous. It is believed that in future, when new Commissioners are appointed, they will be selected, more frequently than hitherto, from among the officers of the establishment, and the mercantile body; and this, notwithstanding the contrary opinion of the Commissioners, would probably be an improvement.

It is possible that smuggling is still carried on to some extent, and if so, that the articles of tobacco and spirits are the chief objects of this illicit trade. But we are persuaded that the practice is declining, and that it is looked on as dishonest and disreputable by almost all classes of the community, not only to break the revenue laws, but to deal with those who do so. [SMUGGLING.]

For Tariff of the United Kingdom, see TARIFF.

The following table gives an account of the Customs duties received on various duty-paying articles in the year 1865. Since this time, however, the duties on pepper and timber have been repealed, and that on tea has been reduced. The duties also on wines in bottle have been equalised to those on wine in wood.

\* Abolished.

N. B.—The Board of Customs has issued twelve annual Reports on the state of the Customs Department, which embody a great deal of useful information. The first Report, which gives an account of the history and progress of the department, is especially interesting.

The following clauses of the Customs Consolidation Act, the 16 & 17 Vict. c. 107, refer to the appointment of customs officers.

Appointment of Officers.—It shall be lawful for the Commissioners of the Treasury, or under their authority, the Commissioners of Customs, to appoint proper persons for the management and collection of the customs, and the performance of all duties connected therewith, under the control and direction of the Commissioners of Customs, and to grant to such persons such salaries or allowances, or to permit them to receive such emoluments for or to permit them to receive their respective offices, as executing the duties of their respective offices, as may be proper, and to require of such persons such securities for their good conduct as the said Commissioners of the Customs shall deem necessary; and such persons shall hold their offices during the pleasure of the Commissioners of the Treasury or of the Commissioners of Customs; and all salaries or allowances granted to any officer or other person in the service of the Customs shall be paid without any deduction on account of any duties imposed by any Act of Parliament, unless expressly charged thereon; and when any sum of

money shall have been or shall be granted annually or otherwise to any person who has been or shall have been employed in the service of the Customs as a superannuation allowance upon the retirement of such person from such service, or as a compensation for past services, it shall not be lawful for the grantee of such allowance or compensation to assign or dispose of the same to any person or persons whomsoever, and any such assignment or disposition shall be void to all intents and purposes, and shall not be enforced in any court of law or equity. (Sec. 1.)

Persons employed on Service of the Customs as deemed Officers for such Service.—Every person employed on any duty or service relating to customs, trade, or navigation, either in the Kingdom, the Channel Islands, or any of Her Majesty's possessions abroad, by the orders or concurrence of the Commissioners of Customs (whether previously or subsequently expressed) shall be deemed to be the officer for that duty or service; and every act required by law to be done by or with any particular officer nominated for such purpose, if done by or with any person appointed by the Commissioners of Customs to act as such particular officer, shall be deemed to be done by or with such particular officer; and every act required by law to be done at any place within any port, if done at any place within the port appointed by the Commissioners of Customs

for such purpose, shall be deemed to be done at that particular place so required, deputations, to any officers of the Customs, or the commencement of this Act, the same had been granted.

Declaration on Admission to Office.—Every person who shall be appointed to any office or employment in the Customs, under the control and direction of the Commissioners of Customs, shall on his admission thereto make the following declaration.

I, A. B. do declare that I will be true and faithful in the execution, to the best of my knowledge and power, of the trust committed to me, and in inspection in the service of her Ma-

jesty's Customs; and that I will not require, take, or receive any fee, perquisite, gratuity, or reward, whether pecuniary or of any sort or description whatever, either directly or indirectly, for any service, act, duty, matter, or thing done or performed or to be done or performed in the execution or discharge of any of the duties of my office or employment, on any account whatever, other than my salary and what is or shall be allowed me by law, or by any special order of the Com-

missioners of her Majesty's Treasury, or the Commissioners of her Majesty's Customs for the time being.' (Sec. 4.)

*Hours of Attendance &c.*—The Commissioners of the Treasury may by their warrant from time to time appoint the hours of attendance of the Commissioners and officers of Customs, and of other persons in the Customs service; and the Commissioners of Customs may appoint the times during such hours at which any particular parts shall be performed. (Sec. 5.)

*Holidays.*—No day shall be kept as a public holiday by the Customs except Christmas Day and Good Friday, and such other days as may be appointed to be so kept by authority of the General Assembly, and also such days as shall have been or may be appointed for the celebration of the birthdays of her Majesty and her successors, and such days shall be kept as public holidays by the officers and servants of the dock companies in the United Kingdom. (Sec. 6.)

*Officers of Customs not to serve in public Offices.*—No commissioner, officer, clerk, or other person acting in the management or collection of the Customs shall be compelled to serve in the militia or on any jury or inquest, or to assume the office of a mayor or sheriff, or to act in any corporate, parochial, or other public office. (Sec. 7.)

*Office of Inspector General of Imports and Exports.*—The office of inspector general of imports and exports was established in 1696. The accounts of the trade and navigation of the country, annually laid before Parliament, are furnished by this office; and from the ability of the officers, and the improved manner in which these accounts are now made out, they have become of great public importance. Their accuracy must, of course, depend on the accuracy of the entries; but as respects articles on which the duties are reasonable or low, and in which, consequently, there is no great temptation to clandestine importation, they may be regarded as nearly accurate. It is now usual to give statements of the quantities of the principal articles exported and imported, as well as of their declared or real values; which is a great improvement.

**CUTLERY.** A term used to designate all manner of sharp and cutting instruments made of iron or steel, as knives, forks, scissors, razors, shears, and scythes &c. Sheffield is the principal seat of cutlery manufacture; but the small quantity of knives and other articles made in London are said to be of superior quality.

The Act 59 Geo. III. c. 7 gives the manufacturers of cutlery made of wrought steel the privilege of marking or stamping them with the figure of a hammer; and prohibits the manufacturers of any articles of cutlery, edge tools, or hardware, cast or formed in a mould, or manufactured otherwise than by means of a hammer, from marking or impressing upon them the figure of a hammer, or any symbol or device resembling it, on pain of forfeiting all such articles, and 5*l.* for every dozen. A penalty of 10*l.* per dozen, exclusive of forfeiture, is also imposed upon every person having articles of cutlery in his possession for the purpose of sale marked with the words *London* or *London made*,

unless the article so marked have been really manufactured within the city of London or a distance of 20 miles from it.

Cutlery is included in the customs returns under the same head as hardware, which comprises stoves, fenders, fire-irons, with a long list of other articles. The declared value of the exports of both descriptions of articles amounted in 1866 to 4,366,300*l.*, and in 1867 to 3,933,734*l.*

**CYPRESS.** A forest tree of which there are many varieties, the species denominated the evergreen cypress (*Cupressus sempervirens*) and the white cedar (*Cupressus Thyoides*) being the most celebrated.

The cypress is indigenous to the southern parts of Europe, and several parts of Asia, and to America. It grows to a great size, and is a most valuable species of timber. It is never attacked by worms, and exceeds all other trees, even the cedar, in durability. Hence the Athenians, when desirous to preserve the remains of their heroes and other great men, had them enclosed in cypress coffins, and hence, also, the external covering of the Egyptian mummies is made of the same enduring material. The cypress is said to live to a great age; and this circumstance, combined with its thick dark green foliage, has made it be regarded as the emblem of death and the grave.

In his *Geography and History of the Western States of America*, Mr. Timothy Flint has given the following account of the cypress trees found in the southern parts of the valley of the Mississippi:—'These noble trees rise their straight columns from a large cone-shaped buttress, whose circumference at the ground is, perhaps, 3 times that of the regular shaft of the tree. This shaft rises from 6 to 10 feet, with a regular and slender taper, and from the apex of the cone towers a perpendicular column, with little taper after it. Below the top it begins to throw out multitudinous horizontal branches, which interlace with those of the adjoining trees, and when bare of leaves has the appearance of desolation and death, more easily than described. In the season of vegetation the leaves are short, fine, and of a verdure so deep almost to seem brown, giving an indescribable air of funeral solemnity to this singular tree. The cypress forest, when viewed from the adjacent hills, with its numberless interlaced arms covered with this dark brown foliage, has the appearance of a scaffolding of verdure in the air. It grows in deep and sickly swamps, the haunts of loathsome and ferocious animals, that are far from the abodes of man, and seems a common cause with nature against him. The cypress loves the deepest, most gloomy, and inaccessible swamps; and south of 33° is generally found covered with sable festoons of long hanging, like shrouds of mourning, almost to the ground. It seems to flourish when water covers its roots for half the year. Unpromising as are the places and circumstances of its growth, no tree of the country where it is found is so extensively useful. It is freely knotted, is easily wrought, and makes excellent planks, shingles, and timber of all sorts, very durable, and incomparably the most valuable tree in the southern country of this valley.' (p. 62.)

## D

**DAMAGED GOODS.** In the language of the Customs, goods, subject to duties, that have received some injury either in the voyage home or in the bonded warehouses.

It is enacted by the 16 & 17 Vict. c. 107 that no claim for any abatement of duty in respect of any goods imported into the United Kingdom shall be allowed on account of damage unless such claim be made on the first examination thereof, and in such form and manner as the Commissioners of Customs shall direct, nor unless it be proved to the satisfaction of the Commissioners of Customs or their officers that such damage was sustained after such goods had been shipped in the importing ship, and before the landing thereof in the United Kingdom; and all goods derelict, jetsam, flotsam, and wreck brought or coming into the United Kingdom, and all droits of admiralty sold in the United Kingdom, shall at all times be subject to the same duties as goods of the like kind on importation into the same part of the United Kingdom are subject to, unless it shall be shown to the satisfaction of the Commissioners of Customs that such goods are the growth, produce, or manufacture of any country or place by virtue whereof the same may be entitled to be admitted at less than the foreign duty, or duty free, or that the same, if liable to duty, are entitled to an abatement in respect of such damage; and the damage sustained by such goods, whether so imported or derelict, jetsam, flotsam, or wreck as aforesaid, shall be assessed by the officers of the Customs, if competent thereto, but if not, or if the Commissioners of Customs, or the collector or comptroller of the port into which the same shall be imported or brought as aforesaid, shall entertain doubt as to the amount of such damage, they may call upon two indifferent merchants to examine the goods, and certify to what extent, in their judgment, the same are lessened in value by such damage, whereupon the officers of the customs may make an abatement not exceeding  $\frac{1}{3}$  of the duty originally chargeable thereon; but no allowance shall be made for damage on cocculus indicus, auz vomica, rice, guinea grains, lemons, spirits, corn, grain, meal and flour, opium, sugar, cocoa, oranges, tea, coffee, pepper, tobacco, currants, raisins, wine, and figs. (Sec. 76.)

**DAMAR.** A kind of indurated pitch or turpentine exuding spontaneously from various trees indigenous to most of the Indian islands. Different trees produce different species of resin, which are designated according to their colour and consistence. One is called *Damar-batu* in Malay, or *Damar-selo* in Javanese, which means hard or stony resin; and another in common use, *Damar-Pitch*, or white resin, which is softer. The trees which produce the damar yield it in amazing quantity, and generally without the necessity of making incisions. It exudes through the bark; and is either found adhering to the trunk or branches in large lumps, or in masses on the ground under the trees. As these often grow near the sea-side, or on the banks of rivers, the damar is frequently floated away, and collected in distant places as drift. It is exported in large quantities to Bengal and China, and is used for the purposes to which we apply pitch, but principally in paying the bottoms of ships. By a previous arrangement

almost any quantity may be procured at Borneo, at the low rate of  $\frac{1}{2}$  dollar per picul.' (Crawford, *East. Archip.* vol. i. p. 455; vol. iii. p. 420.)

**DAMASK** (Ger. damasten tafelzeug; Dutch, damaskwerk; Fr. venise, damas; Ital. tela damaschina; Span. tela adamasada; Russ. Камсчатнүүт салфики). A species of table linen. [**LINEN.**]

**DANGEROUS GOODS.** By sec. 329 Merchant Shipping Act, 17 & 18 Vict. c. 104, it is enacted that no person shall be entitled to carry in any ship, or to require the master or owner of any ship to carry therein, any aqua fortis, oil of vitriol, gunpowder, or any other goods which, in the judgment of the master or owner, shall be of a dangerous nature, and provides that notice shall be given of the character of such goods under a penalty not exceeding 100*l.* (Stevens *On Stowage*, 186 seq.)

**DANTZIC.** One of the principal emporiums of the north of Europe, in West Prussia, lat. 51° 20' 48" N., long. 18° 38' E. Population, according to census of 1864, 90,334. [**GERMANY.**] It is situated on the left or western bank of the Vistula, about 4 miles from its embouchure. The harbour, Neufahrwasser, at the mouth of the river, is defended on each side by pretty strong forts. The town is traversed by the small river Motlau, which has been rendered navigable for vessels drawing 8 or 9 feet water.

**Roads, Port &c.**—The road or bay of Dantzic is covered on the west side by a long, narrow, low, sandy tongue of land, extending from Reserhoff Point (on which is a light-house), in lat. 54° 50½', long. 8° 23' 15", upwards of 20 miles in an east by south direction, having the small town of Hecla, or Heel, near its termination. A light-house, elevated 123 feet (Eng.) above the level of the sea, has been erected within about  $\frac{1}{2}$  mile of the extremity of this point. The flashes of the light, which is a revolving one, succeed each other every  $\frac{1}{2}$  minute. Dantzic lies about S.  $\frac{1}{2}$  W. from the Heel; its port being distant about 4 leagues. There is good anchorage in the roads for ships of any burden; but they are exposed, except immediately under the Heel, to the north and north-easterly winds. There are harbour lights at the entrance to the port. All ships entering the Vistula must heave to about a mile off the port, and take a pilot on board; and pilots must always be employed in moving ships in the harbour, or in going up and down the river. The usual depth of water at the mouth of the river is from 12 to 13 feet (Eng.); in the harbour, from 12 to 14 feet; at the confluence of the Motlau with the Vistula, from 9 to 9½ feet; and in town, from 8 to 9 feet. Moles have been erected on both sides of the entrance to the harbour: that on the eastern side, which is most exposed, is constructed of granite; the other is partly of stone and partly of timber.

**Trade of Dantzic.**—Next to Petersburg and Stettin, Dantzic is the most important commercial city in the north of Europe. The average annual value (1862-65) of its exports is 3,063,460*l.*, and of its imports 808,174*l.* It owes its distinction in this respect to its situation; the Vistula, with its important tributaries the Bug, Naraw &c., giving it the command of a great internal navi-

gation, and rendering it the entrepôt where the surplus products of West Prussia, Poland as far as Hungary, and part of Lithuania, are exchanged for those imported from the foreigner. The exports of wheat from Dantzic are generally greater than from any other port, Odessa excepted. There are four sorts of wheat distinguished here; viz. *white, high-mixed, mixed, and red*, according as the white or red predominates. The quality of Dantzic wheat is for the most part excellent; for, though small in the seed, and not so heavy as many other sorts, it is remarkably thin skinned, and yields the finest flour. The white Polish wheat exported here is the best in the Baltic. Rye is also very superior, being both clean and heavy: the exports are comparatively inconsiderable, and the qualities but indifferent. Very fine white peas are exported. Next to grain, timber is the most important article of export from Dantzic, but latterly the supply has been diminishing, and the quality is said not to be so good as formerly. (Meek.) The principal supply of fir timber, masts &c. is brought by the river Narew, which, with its branches, rises in Old Prussia and Lithuania, and falls into the Bug near the confluence of the latter with the Vistula. Oak planks, staves &c. are brought down from the higher parts of the Vistula, and the tributary streams of Dunajetz, Wipreż &c. Salted pork, weed ashes, linseed and rapeseed, mats, bones, zinc, spruce beer, feathers &c. are also exported.

The following is an account of the shipments of grain from Dantzic in 1866:—

**Oil Seeds.**—These are chiefly rape. Of these were exported to the United Kingdom in 1865, 427 lasts, to Belgium 500, to Denmark 33, to France 205, to Holland 122, to Prussian ports 381, to Sweden 90. Total 1,758 lasts, valued at 425,400 thalers. In 1864 the value was 1,332,400 thalers. Considerable quantities of oil are also exported.

**Timber.**—The following is the quantity of timber exported from Dantzic in 1865:—

	Quantity	Value		Stock
		Thalers	—	
Pieces of full-sized square fir	253,067	1,910,900	351,485	—

Total	25,142,000	16,691,065	20,532,100	—

The exports to the United Kingdom in 1865 were valued at:—

Grain	1,650,000
Timber	400,000
Other articles	310,000
Total	2,360,000

The principal imports are coals from the North British ports, metals, fish (chiefly herrings) from Norway, drugs, dye stuffs, and hides. The total value is reckoned in 1866 at 6,026,324 thalers, which with the imports represents a trade of 3,693,948l.

The annual imports from the United Kingdom were, on an average of 1861-3, 410,000l.; in 1864, 367,000l.; in 1865, 591,000l.

The merchants of Dantzic are but little given to speculation; and the value of the imports into the city seldom exceeds half the value of the exports.

In addition to the Royal or Government Bank, mentioned in a subsequent part of this article, a private joint-stock bank was established in 1857.

**Shipping.**—The average number and tonnage of arrivals during the 7 years 1853-9 was 1,618 of 185,000 lasts burden; during the 5 years 1860-4, 2,728, of 281,229 lasts burden. In 1862 there were 3,200, of 327,184 lasts, which departed from the port. Some large and fine ships are built at Dantzic. Steamers from Hull and London arrive here almost every week, and steamers are now to be found in all the navigable parts of the Vistula.

The number and tonnage of the vessels that arrived at Dantzic in 1866, according to their nationality, were as follows:—

Under what Flag	Number of Vessels			Tonnage		
	With Cargoes	In Ballast		Cargoes	In Ballast	
		Total	lasts		lasts	lasts
British	233	115	748	31,676	25,873	51,549

Total	1,027	1,036	2,063	113,598	110,613	224,211

During the three years 1861-3 the British shipping had been 22½ per cent, but during the Danish war it rose to 35 per cent. The value of the cargoes bound for ports of the United Kingdom was estimated at the sum of 2,050,000l., the whole being 1,500,000l.

**Freights in 1865.**—Coals: per keel from Newcastle to Dantzic, to be delivered in town, 6l. 7s. 10s. Wheat, per quarter of 500 lbs. weight: London, 2s. to 4s. 6d.; to Liverpool and Ireland, 3s. 3d. to 5s.; to the east coast of England and Scotland, 1s. 6d. to 4s. 6d.; to the coal ports, 1s. to 3s. 9d. Timber, per load of fir or oak of cubic feet: to London, 16s. 6d. to 19s. 6d.;

London and Ireland, Scotland, 13s. to 21s. 3d.

The freights were money per last (1-9) Upper Vistula and from the Lower Vistula sent up the river to Prussian center to Vistula, and from 15

**Money.**—Accounts used formerly to be wholly kept in guildens, guilders, or florins of 30 groschen. The rixdollar = 3 florins = 90 groschen = 270 schillingen = 1,620 pennings. The florin or guilder = 9d. sterling, and the rixdollar = 2s. 3d.

A new system was, however, introduced into all parts of the Prussian dominions, conformably to the decrees of September 30, 1821, and of June 21, 1832.

The Cologne mark (containing 3,609 Eng. grains) is the weight at present used in the Prussian mint in weighing the precious metals. The fineness of the coins is not determined, as previously, by carats or loths, but the mark is divided for this purpose into 288 grains. Accounts are now kept in the public offices in thalers or dollars (R.), silver groschen, and pennings; 1 thal. = 30 sil. gr. = 12 pf.

The only silver money now coined are dollars and 1/2 dollar pieces; but smaller coins are in circulation, of former coinages.

The Prussian silver coins have 1/4 of alloy; and the mark is coined into 14 dollars, each should contain 257.68 Eng. grains pure silver, and be worth about 2s. 1 1/2d. sterling; but the assays do not always strictly coincide with the mint valuation.

The gold coins are Frederick d'ors, double, single and half pieces. The mark of 288 grains, being 260 grains of fine gold, is coined into 35 d'ors. The Fred. d'or is worth from 5 dol. sil. gr. to 5 dol. 22 sil. gr., according to the market.

**Weights and Measures.**—The commercial weights are—

32 loths	= 1 ounce.
16 ounces	= 1 pound.
16 pounds	= 1 he-pound.
20 pounds	= 1 small stone.
32 pounds	= 1 large stone.

1 1/2 centner, 3 centners = 1 shippond (330 lbs.); 100 lbs. of avoirdupois = 46.85 kilog. = 917 lbs. of Amst. = 96.6 lbs. of Hamburg.

1 cent of 40 centals = 1-9684 ton measured or shipping last = 1/3 register ton = 110.2317 lbs. avoirdupois.

100 cental = 5-2904 scheffels. 100 Prussian = 1-512 bushel. 100 Prussian = 0.925 of an English acre. 100 Prussian = 160 scheffels of imported grain = 156 1/2 " of exported "

The liquid measures are, for beer—

5 quarts	= 1 anker.
4 ankers	= 1 ohm.
1/2 ohm	= 1 hhd.
2 hhd.	= 1 hoh.
2 hoh	= 1 fuder.
1 fuder	= 1 last = 620.4 Eng. wine gallons.

The measure, which is less than beer measure, is called = 30 3/4 Eng. gallons. The pipe = 2 ahms.

The last of corn = 5 1/2 malters = 60 scheffels = 240 viertels = 960 metzen; and weighs 4,680 lbs. Dantzic weight in rye. The scheffel = 5.47 of a hectolitre = 1.552 Winchester bushel. Hence the last of 60 scheffels = 11 quarters 3 bushels; the last of 56 1/2 scheffels = 10 quarters 7 bushels.

The Dantzic foot = 11 1/3 Eng. incl. or 100 Dantzic feet = 94.16 Eng. feet. The ell is 2 feet Dantzic measure. The Rhineland or Prussian foot = 3138 French metres, or 12.556 Eng. inches; hence 100 Prussian = 102.8 Eng. feet. The Prussian or Berlin ell has 25 1/2 Prussian inches = 26.256 Eng. ditto. 100 Berlin ells = 72.93 Eng. yards; and 137.142 Berlin ells = 100 Eng. yards. 14 1/2 Prussian miles are equal to 15 geographical miles.

Oak planks, deals, and pipe staves are sold by the schock of 60 pieces; wheat, rye &c. are sold by the last of 56 1/2 scheffels. (Kelly's *Cumbist*; Nelkenbrecher, *Manuel Universel*.)

**Corn Trade of Dantzic.**—The reader will find under the head **CORN LAWS AND CORN TRADE** a pretty full account of the Polish corn trade; but the importance of the subject will excuse our giving a few additional details. Grain is almost wholly brought to Dantzic by water, in flat-bottomed boats suited to the navigation of the Vistula, Bug &c. Mr. Consul Gibson estimated the expense of the conveyance of wheat and rye hither, including the duty at Thorn and the charges of turning on the river till put into the granary, as follows:—

	per imp. qr.
From the upper provinces on the Bug, a distance of 700 to 500 miles	9 2 to 7 10
From the provinces of Cracow, Sandomir, and Lublin, 350 to 330 miles	6 6 5 4
From Warsaw and its neighbourhood, about 210 miles	4 9 3 11
From Wlaczawek and its neighbourhood, about 110 miles	4 2 3 5
From Grandentz, a distance of about 70 miles, no duty at Thorn, and when not turned on the river	0 10 0 9

N. B.—These are the ordinary charges; but they are higher when there is any unusual demand for exportation.

The Bug has many windings, and its navigation, which is tedious and uncertain, can only be attempted in the spring, when the water is high. It is the same, though in a less degree, with some of the rivers that fall into the Vistula before it reaches Warsaw; and towards Cracow the Vistula itself is frequently unnavigable, especially in dry seasons, except in spring, and after the mid-summer rains, when the snow melts on the Carpathian mountains. The navigation of the Polish rivers in some seasons is more than usually bad. The corn from the upper provinces does not reach Dantzic till from 2 to 4 months later than usual, and is burdened with a very heavy additional expense. In fact, the supplies of grain at Dantzic depend quite as much on the abundance of water in the rivers, or on their easy navigation in summer, as on the goodness of the harvests.

'There are,' says Mr. Jacob, 'two modes of conveying wheat to Dantzic by the Vistula. That which grows near the lower parts of the river, comprehending Polish Russia, and part of the province of Plock, and of Masovia, in the kingdom of Poland, which is generally of an inferior quality, is conveyed in covered boats, with shifting boards that protect the cargo from the rain, but not from pilfering. These vessels are long, draw about 15 inches water, and bring about 150 quarters of wheat. They are not, however, so well calculated for the upper parts of the river. From Cracow, where the Vistula first becomes navigable, to below the junction of the Bug with that stream, the wheat is mostly conveyed to Dantzic in open

flats. These are constructed on the banks, in seasons of leisure, on spots far from the ordinary reach of the water, but which, when the rains of autumn, or the melted snow of the Carpathian mountains in the spring, fill and overflow the river, are easily floated.

Barges of this description are about 75 feet long, and 20 broad, with a depth of 2½ feet. They are made of fir, ruddely put together, fastened with wooden treenails, the corners dovetailed and secured with slight iron clamps—the only iron employed in their construction.

A large tree, the length of the vessel, runs along the bottom, to which the timbers are secured. This roughly cut keelson rises 9 or 10 inches from the floor, and hurdles are laid on it, which extend to the sides. They are covered with mats made of rye-straw, and serve the purpose of damming; leaving below a space in which the water that leaks through the sides and bottom is received. The bulk is kept from the sides and ends of the barge by a similar plan. The water which these ill-constructed and imperfectly caulked vessels receive is dipped out at the end and sides of the bulk of wheat.

Vessels of this description draw from 10 to 12 inches water, and yet they frequently get aground in descending the river. The cargoes usually consist of from 180 to 200 quarters of wheat.

The wheat is thrown on the mats, piled as high as the gunwale, and left uncovered, exposed to all the inclemencies of the weather, and to the pilfering of the crew. During the passage the barge is carried along by the force of the stream, oars being merely used at the head which are numerous and shifting, and to direct the vessel in passing under the several bridges. These vessels are conducted by 6 or 7 men. A small boat precedes, with a man in it, who is employed sounding, in order to avoid the shifting shoals. This mode of navigating is necessarily very slow; and during the progress of it, which lasts several weeks, and even months, the rain, if any fall, soon causes the wheat to grow, and the vessel assumes the appearance of a floating meadow. The shooting of the fibres soon forms a thick mat, and prevents the rain from penetrating more than an inch or two. The main bulk is protected by this kind of covering, and, when that is thrown aside, is found in tolerable condition.

The vessels are broken up at Dantzic, and usually sell for about ¼ of their original cost. The men who conduct them return on foot.

When the cargo arrives at Dantzic or Elbing, all but the grown surface is thrown on the land, spread abroad, exposed to the sun, and frequently turned over, till any slight moisture it may have imbibed is dried. If a shower of rain falls on the as during the night, the heaps of wheat on the shore are thrown together in the form of a steep roof of a house, that the rain may run off, and are covered with a linen cloth. It is thus frequently covered with a long time after the wheat has reached Dantzic before it is fit to be placed in the warehouses.

The warehouses (*speichers*) are very well adapted for storing corn. They consist generally of 7 storeys, 3 of which are in the roof. The floors are about 9 feet asunder. Each of them is divided by perpendicular partitions the whole length, about 4 feet high, by which different parcels are kept distinct from each other. Thus the floors have 2 divisions, each of them capable of storing from 150 to 200 quarters of wheat, and leaving sufficient space for turning and screening it. There are abundance of windows on each floor, which are always thrown open in dry weather to ventilate the corn. It is usually turned over 3 times a

week. The men who perform the operation throw it with their shovels as high as they can, and thus the grains are separated from each other, and exposed to the drying influence of the air.

The whole of the corn warehouses now left (for many were burnt during the siege of 1814) are capable of storing 500,000 quarters of wheat, supposing the quarters to be large enough to fill each of the two divisions of the floors with a separate heap; but as of late years it has come down from Poland in smaller parcels than formerly, and of more various qualities, which must of necessity be kept distinct, the present stock of the whole of those warehouses which are in repair, or are advantageously situated for loading the ships. Ships are loaded by gangs of porters with great despatch, who will complete a cargo of 500 quarters in about 3 or 4 hours. (*First Report.*)

Mr. Meek gives, in his excellent *Report on the Prices of Corn and other Articles in the North of Europe*, the following details with respect to Dantzic:—

Wheat of moderate quality in ordinary seasons cannot be brought from Poland and delivered at Dantzic at less than 35s. per quarter, and that only when no excitement exists in the foreign markets. Some time since a very large accumulation of grain had in the course of several years taken place in the granaries at Dantzic; but the great export which has occurred during the last 2 or 3 years has so reduced the magazines, that the stock at the close of the present season (1814) was not expected to exceed from 80,000 to 100,000 quarters. The demand has been so great during the last 2 or 3 years, that every effort has been made to collect in Poland all the supplies that were available, and to bring them to Dantzic for exportation. If the corn trade in England was modified as to be constantly open at a moderate duty, it is not likely, under such circumstances, that shipments of wheat from Dantzic would exceed that of the last 2 or 3 years. Not more than 5,000 quarters are consumed annually in Dantzic by a population of 60,000 persons, the people generally preferring and living upon rye bread. Of the corn exported from Dantzic, one-third comes from that part of Poland which belongs to Prussia, and the remaining two-thirds from the Russian territory. Apprehensions were expressed here, as in other places, of the competition of Odessa and America in the event of any material reduction of the duty on corn in England. The party making the observation, who is a leading corn merchant in Dantzic, said he had at that moment a cargo of Odessa corn in London which stood him in 49s. per quarter, and that he could purchase there Odessa wheat of similar quality at 48s. per quarter. The same apprehensions were expressed by others as to Odessa, exports from which place having already been largely made to Italy and other parts of the Mediterranean; and recently, it was added, several cargoes had been shipped to England. On pressing one of the most intelligent merchants in Dantzic to state what price was paid to the landed proprietor or farmer in Poland for a quarter of wheat on the estate where it was grown, he replied that it was generally bought by the Jews upon the estates from the landowners or their agents, and afterwards sold by the former to the merchants at Dantzic, deliverable at Dantzic; but in some instances the princes and great landowners sent their own commissioners to Dantzic to effect sales to the merchants; that a Russian prince, who had 10,000 serfs, had acted upon the

principle very recently; that under such circumstances it would not be right to take less than 35s. per quarter as the price at which wheat, when there was a fair average crop, could be delivered at Dantzie, from which, deducting 12s. per quarter for the expense of bringing it from the place of growth to Dantzie, including waste, which is generally very considerable, cost of the boats, which are broken up and sold for a trifle compared with their original cost (amounting, perhaps, to 400 or 500 thalers, whereas they are only sold for about 40), the expense of the peasants and other persons navigating them for a voyage, sometimes of 3 or 4 months, and returning back to Poland on foot, there would be left 23s. per quarter as the price paid to the proprietor at the place of growth; out of which he had to bear the expense of cultivation, to pay the interest and redeem the capital of any mortgage which might exist, the residue being what would remain for rent and interest of capital embarked in the soil. He added that this was generally considered as an average estimate of the expenses; but that they would vary a little, dependent upon the distance, either greater or less from which the corn was brought. A considerable quantity of bones are exported from Dantzie to Great Britain, many of which are collected and sent down from Cracow. Complaint was made to the Consul by the merchant chiefly employed in this trade, that a heavy transit duty of 2s. per cwt. had recently been levied for the nominal purpose of repaving the turnpike road, that it was a heavy tax in proportion to the value, and that a representation from England was alone necessary to obtain its repeal.

Of the timber and staves shipped at Dantzie, nearly the whole comes from Russian Poland. Prussian timber is becoming scarce; and even that from the Russian territory, that is of good quality, is much reduced, and has of late not been so good as formerly. This is owing, principally, to most of the good timber that could be conveniently got afloat having been felled. There is, it is said, but little of good quality now to be had without going much farther back from the shipping places, which the discouragement given by the present timber duties prevents. It will hence be obvious that whenever any alteration takes place either in the corn trade or timber duties, Prussia will be much more benefited than Prussia, so far as relates to the export of corn and timber from Dantzie.

**Timber Trade, Brack.**—Fir timber is usually brought down in its natural state, and is squared to logs, or sawn into planks, in winter, when the broucers cannot be otherwise employed. The staves shipped here are carefully assorted, and are reckoned superior to those of America.

The expenses of the water conveyance of squared timber, including duty at Thorn, are—

		Per piece.			
		s.	d.	q.	d.
From the Bug	-	6	0	5	9
Wiprez (above Warsaw)	..	4	6	4	4
Vistula (above ..)	..	3	0	2	4

higher when the demand is unusually great, or when hands are scarce. At Dantzie, as well as at PETERSBURG, Riga, and several other Baltic ports, sworn inspectors (brackers) are appointed by authority to examine certain articles intended for exportation, and to classify them according to their qualities. Staves and timber of all sorts, with the exception of pine wood, are subjected to the brack. Prime quality is branded *Krohn* or *Crown*; second quality, *Brack*; and the third or lowest quality, *Bracks Brack*. All unmerchantable articles are

rejected by the brackers, and are not allowed to be exported.

The gauge for crown pipe staves, which the bracker has always in his hand, is 4½ inches broad, 1½ thick, and 64 inches in length, which they must be at least; but they are expected to be larger in every respect.

Pipe staves are from 64 to 68 inches long; 6, 5, and 4½ at least, broad; and from 1½ to 3 inches thick.

Brandy staves are at least 54 to 58 inches long, as thick and broad as pipe staves.

Hoghead staves are 42 to 45 inches long, as thick and broad as pipe staves, all English measure.

The quality is ascertained by marks, to distinguish each sort, as follows:—

- Crown pipe staves, stamped at the end, K. brack, in the middle, 1.
- Bracks brack, 11.
- Hoghead crown, at the end, O K. brack, in the middle, 1.
- Bracks brack, 11.
- Brandy hoghead crown, at the end, H K. brack, in the middle, 2.
- Bracks brack, 22.

Oak planks are assorted in the same manner. Crown plank is marked in the middle, C. Brack, in the end and middle, B. Bracks brack, B B.

To distinguish 1½ from 2, and 2½ from 3 inches, the 1½ are marked with I, and 2½ with 2.

At the end, in rough strokes, with coloured paint, brack is yellow I; bracks brack, white II; Crown, red III.

Staves are subjected to the brack. The calcined are opened and the crust taken off; others are not examined unless there be any suspicion of their quality, or the staves of the hoghead be supposed to be too thick. Every cask of potashes is opened.

SHIPPING CHARGES AND DUTIES.

Charges upon the Shipment of 1,000 Quarters of Corn at Dantzie in English Money.

Metage in granary	-	-	-	£	5	0	0
Delivery	-	-	-	-	1	4	6

Feathers	-	..	2 0	

N.B.—The Prussian pound is about 3½ per cent. heavier than the English pound. The expenses

of sending goods down are taken at about an average rate; but if the whole or the greater part of the cargo were loaded in the Fairwater or roads, the expenses would be somewhat more.

**Port Charges.**—The charges on a ship of 200 lasts, or about 300 tons burden, are—

	R. s. d. pf.
Harbour money	5 20 5
Ditto in gold (say in Fred. d'ors, reckoned at 5 r., in which this must be paid)	11 5 8
River money	0 0 0
Commercial contribution	3 10 0
Expedition rapen	13 10 0
Captain's allowances &c. expenses on shore	16 20 0
Tracking the ship into the harbour (Fairwater)	2 0 0
Ballast money &c.	10 24 0
Pilot to the ballast wharf	4 0 0
Ditto moving the ship in Fairwater	2 15 0
Police passport	5 5 0
Clearing the vessel in and out	16 20 0
Making 2 r. 6 d. sterling, at the exchange of 6 r. 25 s. gr.	175 17 4

The charges on the ships of all countries having reciprocity treaties with Prussia (which is generally the case) are the same, only Dantzic captains receive no allowance for shore expenses. River or stream money is only paid by vessels that bring goods to town, or load in the Motlau (above the blockhouse): if a ship remain in the Fairwater or Vistula, the river money is levied on the craft carrying the goods, and falls on the latter.

Mr. Consul White, in his *Report* for 1866, gives reason to hope that the Dantzic harbour dues will be forthwith reduced.

Dantzic is a favourable place for ships creening and repairing, and for obtaining supplies of all sorts of sea stores at a reasonable rate.

There belonged to the port, January 1, 1867, 13 steamers and 130 sailing vessels, measuring in all 38,357 Prussian lasts. Most of them are employed in foreign trade. The port has no fishery, and no coasting trade worth mentioning. The wages of Dantzic seamen vary from 30s. to 32s. per man per month.

**Custom House Regulations.**—The shipmaster must, within 24 hours after arrival in port, make a declaration of the cargo on board, and of the ship's provisions, and he incurs a severe penalty if the declaration do not prove correct. The ship's hatches (if goods are on board) are sealed on arrival, and an additional declaration is accepted before they are unsealed; but no *later* declaration supplementary or explanatory of the first, and no submitting the goods to investigation by the officers, is received or allowed. If the shipmaster be unable to make a complete declaration on arrival, a Custom House officer is put on board, who remains until the ship is unloaded, at an expense to her of about 2s. per day and night. The cargo can only be discharged in presence of a customs officer.

The shipmaster, and not the receiver of the goods, is made responsible if the contents of the packages do not correspond with his declaration; and he is only exonerated from this by solemnly averring, on making the declaration, that the contents are unknown to him. An evident mistake or oversight is treated as rigorously as an intentional fraud.

On commencing to load, the shipmaster receives a blank loading list, in which he must daily note the articles he takes on board, or he is liable to fine; but this regulation is not very rigidly enforced. On clearing out, this list is compared with the goods entered by the vessel, when the sea passport is given.

Ballast can be discharged only at stated places, on pain of the shipmaster being fined.

It is material, however, to observe that the whole Custom House business of the shipmaster is conducted by Custom House brokers, so that he is never at a loss, being informed by the one he

selects what he has to do. Alterations are frequently made in the Custom House regulations.

The shipmaster receives, on arrival, from the pilot commodore, a copy of the harbour regulations, in his own language, with instructions how to act as to ballast.

**Warehousing.**—Such goods as pay a higher duty than  $\frac{1}{2}$  a dollar per centner (about 1s. 5d. for about 113 lbs. English) may be placed in the king's stores (nowhere else), and remain there for 2 years without payment of duty. No allowance is made for waste or damage in these stores. Other goods, not capable of being changed, may be placed in private stores, under the king's lock; but not elsewhere, without permission. No rent is charged for goods in the king's stores during the first 3 months; afterwards about 1 $\frac{1}{2}$ d. monthly rent is charged for the first, and about 3d. monthly for the second year, per centner of about 113 lbs. English.

In private warehouses, the monthly rent for 10 quarters of wheat or other grain is from about 3 $\frac{1}{2}$ d. to 7d., or more, according as warehouse room is abundant or otherwise. Other goods do not usually pay by the piece, but part of a store is hired for them, and the rent generally comes somewhat higher in proportion.

The cost of rent and turning grain is from 1s. 2d. to 1s. 6d. monthly, for 10 quarters, according to the season of the year and other circumstances; but more when granary room is scarce, and wages high.

**Banking Establishments.**—There is none such here, excepting a branch of the Royal or Government Bank of Berlin. This was founded partly in the view of receiving deposits of money under litigation in the courts of the province; money the property of minors and charitable institutions, the former until disposable or placed on good security; and moneys belonging to individuals not merchants, and at times also those of the latter. Interest is paid on such deposits as follows:—

3 per cent. on sums belonging to minors, charitable institutions, churches, and sums deposited by the courts of justice, and 2 per cent. on all other deposits.

The principal is de mandable at pleasure, unless otherwise stipulated. The bank makes advances on grain and some other kinds of goods at 5 per cent. interest; discounts bills with 3 signatures, not having more than 2 months to run, at 6 per cent., and sometimes, when money is plentiful, at a lower rate. It also makes advances at 4 per cent. on deposits of Frederick d'ors and certain foreign moneys; and it occasionally buys bills for account of, and sells bills on, the Berlin Bank. It does not issue notes. The amount of its capital is not fixed; but Government guarantees its transactions. It is relieved from the payment of postage on money, and it is not required to use the stamp fixed by law on bills for its deposit transactions, but only those of 10 s. gr. (about 11 $\frac{1}{2}$ d.); while individuals must use stamps for such bills of 5 r. gr. for every 400 r. of not longer date than 3 months, and for every 200 r. of longer date.

On negotiable bills, however, the bank must use the stamps fixed by law, say of 5 s. gr. (about 5 $\frac{1}{2}$ d.) for sums of 50 dols. to 400 dols., and at the same rate for every additional sum between 100 dols. and 400 dols.

Bills from and on foreign places, negotiated at Dantzic, are not subject to the stamp duty.

The affairs of the bank are not made public. Being a Government concern, there are no dividends. It is not supposed to be very profitable, although enjoying the advantages of exemption from postage of moneys, and paying less stamp

duty. It is the case of the borrower.

**Credit.** Brokers signed from a rarely turn to sell for cash, credit, or longer payments, which is convenient, but it varies or otherwise.

however, generally

duty. It is true, however, that the direct advantage of the lower stamp duty is enjoyed by the borrower.

Credit, Brokerage &c.—Very few goods are consigned from abroad for sale, for such consignments rarely turn to good account. Imports are seldom sold for cash, but generally at 1, 2, and 3 months' credit, or longer. The discount allowed for cash payments, when sold on time, is usually 6 per cent. but it varies according as money is plentiful or otherwise.

Any person being a burgher of the town (which any one of good character may become) may transact business as a commission merchant or factor; but brokers must be chosen by the elders of the Corporation of Merchants, approved by the regency of the province, and sworn in by the magistracy of the town.

The usual rates of commission are—

3 per cent. on wood articles exported.
2 " " other goods "
2 " " goods imported.
and from 1 to 2 per cent. on do. for del credere or guarantee of debts.

The corn factor receives r. 1.7 (about 4s. 9d. sterling) per last (of 60 scheffels) of all grain from the buyer, and 1 per cent. from the seller.

The rates of brokerage are—

1/2 a gr. (nearly 1s. 2 1/2 d.) per 100 l.
3/4 " " " " " " " "
1 per mille for bills on Berlin, Warsaw, and Paris.
1 per cent. on moneys placed at interest, for a period not less than 6 months, from the borrower, and
1 per mille from the lender.
1 per cent. usually for short discounts, from both parties.
1 per cent. on the actual or the computed amount of transactions in public funds, from both parties.
1 per cent. usually (sometimes more or less) for merchandise, (to be paid by the seller, the broker being recently fixed at 1 per cent. on the sale of the goods, the buyer refunding to him 5 s. gr. per last of scheffels.

Burghers, being merchants, may act as brokers, without direct authority, in the purchase from, and sale of goods to, Poles, receiving 1 per cent. on goods bought, and 1 to 2 per cent. on goods sold, according to circumstances.

Bankruptcies are not of frequent occurrence here. Their most prevalent sources at present are speculations in grain. Bankrupts cannot obtain a discharge except by private composition, without which they always remain responsible to each individual creditor, who can attach them at any time, if he can show that they possess property, although their affairs have been settled by judicial authority. This, and the tediousness of settlements in court, make both debtor and creditor desirous of settling by composition; and hence few insolvents are made bankrupt by their affairs being brought into court. It is to be observed that creditors, having claims by bills in force, must by law be paid to the full, before those with only book claims receive anything; but to avoid the tardiness of the court, bill creditors here generally agree to let book creditors receive half as much in composition as they themselves get. It is, however, difficult to arrange a composition, as each creditor can make his own terms; and those who hold out generally get more, at least privately, than the ostensible rate of composition offered by the debtor.

If a private composition cannot be effected, and the insolvent is regularly made bankrupt by his affairs being put into court, the law prescribes that a small portion of the creditors will not accept the dividend with which the greater portion are satisfied, the latter can require the former to consent, or become responsible for the estate producing as much finally; but so many objections may be made, that this compulsive measure is very seldom resorted to. A private composition is, however, generally preferred by all parties,

more particularly by the debtor, as being the only means by which he can become entirely free, and get a general discharge.

Honest bankrupts, whose affairs are brought into court, may be freed from personal arrest by faithfully delivering up all their property. Dishonest ones, upon conviction, are punished by being sent to the House of Correction; but they often escape punishment, from the too great laxity in enforcing the laws in criminal matters.

The creditors of a bankrupt estate brought into court rank under 8 different classes, each prior class enjoying a precedence of claim over those following, to the full amount. The 2 most considerable classes, in general, are the 6th and 7th, the former being that of the bill, the latter that of the book creditors.

Tares &c.—The duties are in general payable on the gross weight; a fixed allowance being made, in many cases, according to the packages; in others there is no allowance. The tariff specifies the particular regulations on this point. The tare on goods in single sacks is 4 lbs. per centner (about 113 lbs. English), it being left to the option of the receiver to have the nett weight ascertained.

In trade there are fixed rates of tare only on the following goods; viz.—

Potatoes, 6 per cent., when sold by a merchant.
Dye-wood, ground, 8 to 11 per bale.
Currants 11 per cent.
" 16 " "
" 19 " "
Figs and raisins 10 " "
Olive oil 16 " "
" 18 to 20 " "
" 16 " "
Sewal oil; latterly the tare is ascertained.
Pepper, English, in double bags, 7 lbs.
" Danish, in bags and mats, 11 lbs.
Orange and lemon peel, 6 per cent., or tare ascertained.
Rice from England or Hamburg; the tare as on the casks, less 2 lbs. per cask on that from England, and in proportion to the weight on that from Hamburg. Danish should give 10 per cent. tare, but the buyers are in general not satisfied with this.
Tallow, 10 per cent., or nett tare.
Tea, Danish boxes, 7 1/2 lbs. if in linen and mats.
" 2 1/2 lbs. in chests above 100 lbs.
" 2 1/2 lbs. in chests of about 80 lbs.
Most frequently the tare is ascertained.
Vivial, 10 per cent.
Raw sugar, 12 to 16 per cent. according to the size of the chests.
Candied sugar, tare by invoice, adding in that proportion for the allowance in the weight, usually heavier.
Syrup, in whole casks, 10 per cent.
" in 4 do. and barrels, 12 per cent.
On the sale of imports, 1 per cent. on the nett weight (called good weight) is allowed in favour of the buyer.

Insurance.—There are no insurance companies nor private insurers here; but there are agents of insurance companies in Hamburg for ships, and of those of London and other places for houses and lives.

Wages of common Labourers in Dantzie vary from 9d. to 11d. a day, and those of carpenters, masons &c. from 1s. 6d. to 2s. Wages in all the large Prussian towns are higher than in the small towns of the country, from the price of flour, bread, and butchers' meat being higher in them. This is occasioned partly by the latter being subject to octrois or excise duties on entering the great towns, from which the country districts and smaller towns are exempted. The king receives 1/3 of these duties, and the towns the other 2/3. This burden is a great obstacle to the free intercourse of the country.

(We have derived these details from different sources, but principally from Consular Returns, and information supplied by the Prussian Government.)

DATES (Ger. datteln; Fr. dattes; Ital. datteri; Span. datiles). The fruit of the palm tree (Phoenix dactylifera, Linn.). This tree is abundant in Egypt, Barbary, Arabia, Persia, and the adjacent countries, particularly on the confines of the desert, and wherever there is sufficient moisture. It is a tall, majestic tree; and repeated references are made to it in the sacred writings (Eccles. xiv. 14), and

in the Koran. Mohammed, in one of his sayings, beautifully compares the upright and generous man to the palm tree: 'He stands erect before his Lord; in his every action he follows the impulse received from above, and his whole life is devoted to the welfare of his fellow-creatures.' But the veneration in which the palm tree is held in the East is to be ascribed more to its utility than to its beauty. Dates form the principal part of the subsistence of the inhabitants of many parts of Arabia and Barbary, and they are held in the highest estimation wherever they are met with. 'They are,' says Burekhardt, 'by far the most essential article of food for the lower classes of Medina; their harvest is expected with as much anxiety, and attended with as much general rejoicing, as the vintage in the south of Europe; and if the crop fails, which often happens, as those trees are seldom known to produce abundantly for 3 or 4 successive years, or is eaten up by the locusts, universal gloom overspreads the population, as if a famine were apprehended.' (*Travels in Arabia*, vol. ii, p. 214.)

There is an endless variety of dates. Generally, however, they may be described as being somewhat in the shape of an acorn, but usually larger, consisting of a thick, fleshy substance, including and freely separating from an oblong stone or kernel, having a furrow on the one side. Their taste is agreeably sweet, accompanied with a slight astringency. The new fruit is called by the Arabs *rutab*. When the dates are allowed to remain on the tree till they are quite ripe, and have become soft and of a high red colour, they are formed into a hard solid paste or cake called *adjuce*. This is formed by pressing the ripe dates forcibly into large baskets, each containing about 2 cwt. 'In this state,' says Burekhardt, 'the Bedouins export the adjone: in the market it is cut out of the basket, and sold by the pound. It forms part of the daily food of all classes of people; in travelling it is dissolved in water, and thus affords a sweet and refreshing drink. During the monsoon, the ships from the Persian Gulf bring adjone from Bussorah to Djidda for sale in small baskets weighing about 10 lbs. each: this kind is preferred to every other. Ships bound from Arabia for India take with them a considerable quantity of adjone, which is readily disposed of amongst the Mohammedans of Hindostan.' (*Travels in Arabia*, vol. i, p. 57.)

The Arabians and Egyptians use the leaves of the tree in the preparation of bags and baskets; the boughs, the outer and inner bark of the trunk, and the fleshy substance at the root of the leaves, when they spring from the trunk, have all their respective uses; and besides this, the kernels of the fruit, notwithstanding their hardness, are used as food for cattle; they are soaked for two days in water, when they become softened, and are given to camels, cows, and sheep, instead of barley: they are said to be much more nutritive than that grain. There are shops at Medina in which nothing else is sold but date kernels; and the beggars are continually employed in all the main streets in picking up those that are thrown away. (Burekhardt, vol. ii, p. 212.)

In 1866, 37,833 cwt. were imported, the largest portion coming from Turkey. But the quality of these was inferior, they being worth only 16s. 8d. per cwt., while those exported from Gibraltar and Malta were worth 2l. 8s. or more. In stowage, the Bengal, Madras, and Bombay ton is 20 cwt. wet, 16 cwt. dry.

All the refinements of Arabian cookery are exhausted in the preparation of dates; and the Arabs say that a good housewife will daily supply her

lord for a month with a dish of dates differently dressed.

Palm trees are raised by shoots; and Dr. Shaw mentions that they arrive at their vigour in about 30 years, and continue so 70 years afterwards, bearing yearly 15 or 20 clusters of dates, each of them weighing 15 or 20 lbs.: after this period they begin to decline. (*Travels in the Levant*, p. 142, &c. ed.)

The best dates imported into Great Britain are said to come from Tunis, but they are most commonly brought from Smyrna and Alexandria. They should be chosen large, softish, not much wrinkled, of a reddish yellow colour on the outside, with a whitish membrane betwixt the flesh and the stone. Those that are dry and hard are of little value.

**DEAD FREIGHT.** A technical term applied to certain kinds of heavy merchandise shipped as cargo. If more cargo might have been properly shipped on board a vessel than was actually put on board, the shipowner is entitled to a redress for *dead freight*. (*Nichol v. Ellis*, July 2, 1851.)

**DEALS or DEAL BOARDS** (Ger. *dielen*; Dutch, *deelen*; Dan. *deeler*; Swed. *tillor*; Fr. *planches mines*; Ital. *tavole*, piano; Russ. *dorskij*; Pol. *tarceje*). A thin kind of fir planks, much used in carpentry; they are formed by sawing the trunk of a tree into longitudinal divisions, of greater or less thickness, according to the purpose they are intended to serve. They are imported from Dantzic, Petersburg, Narva, and many other ports in the Baltic, and from North America; but those from Christiania, the capital of Norway, are the best, and bring the highest price. They are distinguishable from those produced in the contiguous provinces of Norway: their superiority has been said to depend principally on their being more perfectly sawed, and really depends on the greater care with which the sap-wood and other defective portions of the timber are cut away, and on the quality of the timber. [TIMBER.]

A Russian standard deal is 12 feet long, 11 inches wide, and 1½ inch thick; 400 feet of 1½ inch plank make a load.

A Christiania standard deal is 11 feet long, 9 inches wide, and 1½ inch thick.

There is another standard of Norway deals at Dram, 10 feet long, 9 inches wide, and 1½ inch thick. [CHRISTIANIA.]

**DEBENTURE.** A term used at the Custom-house to signify the *certificate* subscribed by the customs officers, and given to the exporter of goods on which a drawback is allowed, bearing that the exporter has complied with the required regulations, and that he is entitled to such drawback.

It is enacted by the 16 & 17 Viet. c. 107, that the person entitled to any drawback on any goods duly exported, or his agent authorised by him for that purpose, shall make and subscribe a declaration upon the debenture that the goods mentioned therein have been actually exported, and have not been re-landed, and are not intended to be re-landed in any part of the United Kingdom, and that such person at the time of entry and shipping was continued to be entitled to the drawback thereon, and the name of such person shall be stated in the debenture, which shall then be delivered to such person or his agent, and the receipt of such person on the debenture, countersigned by the holder of such debenture, if the same shall have been transferred in the mean time, shall be the discharge of such drawback when paid. (Sec. 131.)

No debenture for any drawback allowed upon the exportation of any goods shall be paid after the expiration of 2 years from the date of the shipment of such goods. (Sec. 132.)

For these and the other clauses in the Act relating to debentures, see **IMPORTATION AND EXPORTATION**.

A stamp duty is laid on debentures of 1s. when the drawback to be received does not exceed 10%; of 2s. 6d. when it exceeds 10%, and does not exceed 50%; and of 5s. whenever it exceeds 50%.

For debenture in Railways, see **RAILWAYS**.

**DECIMAL SYSTEM.** [COINS; WEIGHTS AND MEASURES.]

**DELFT or DELF** (Ger. fayence, unachtes porzellan; Dutch, Jelfs poreelyn; Fr. fatence). A coarse species of porcelain originally manufactured at Delft, whence its name. It is now rarely used in this country.

**DEMURRAGE.** In Commercial Navigation, an allowance made to the master or owners of a ship by the freighter, for detaining her in port longer than the period agreed upon for her sailing. It is usually stipulated in charterparties and bills of lading that a certain number of days, called running or working days, shall be allowed for receiving or discharging the cargo, and that the freighter may detain the vessel for a further specified time, or as long as he pleases, on payment of so much *per diem* for such over-time. When the contract of affreightment expressly stipulates that so many days shall be allowed for discharging or receiving the cargo, and so many more for over-time, such limitation is interpreted as an express stipulation on the part of the freighter, that the vessel shall in no event be detained longer, and that if detained he will be liable for demurrage. This holds even in cases where the delay is not occasioned by any fault on the freighter's part, but is inevitable. If, for example, a ship be detained, owing to the crowded state of the port, for a longer time than is allowed by the contract, demurrage is due; and it is no defence to an action for demurrage, that it arose from port regulations, or even from the unlawful acts of the Custom-house officers. Demurrage is not, however, claimable for a delay occasioned by the hostile detention of the ship, or the hostile occupation of the intended port; nor is it claimable for any delay wilfully occasioned by the master, or owners, or crew of the vessel. The claim for demurrage ceases as soon as the ship is cleared out and ready for sailing, though she should be detained by adverse winds or tempestuous weather. (Chitty's *Commercial Law*, vol. iii. pp. 426-431.)

**DENARIUS.** A Roman coin, estimated by Dr. Buhnott to have been worth  $7\frac{3}{4}d.$ ; but its value differed at various periods.

**DENIER.** A small French coin, of which there were 12 to a sol.

**DIAMOND** (Ger. Dntch, Dan. and Fr. diamant; Ital. Span. and Port. diamante; Russ. almas; Pol. diament; Lat. almas; Hind. hira). A precious stone which has been known from the remotest ages. It has been found in different parts of India, and in Borneo, Sumatra, Java, Australia, the Ural Mountains, occasionally in North America, but especially in Brazil. The Indian diamond, according to Mr. Emanuel, is generally found in octahedral, the Brazilian in dodecahedral crystals. The specific gravity of the diamond is about 3.5. The diamond owes its brilliancy to its capability of refracting light, its power being, in comparison with common glass, as 2.487 to 1.526. It was from this refractive power that Newton concluded that the diamond was combustible. Apart from its value for purposes of ornament, it has an important one in the art of glass cutting, for it is the only substance which will cut this material. But to effect this purpose, the stone must have an angle which

is naturally acute. The glaziers' stones, as these are called, are worth, according to Mr. Emanuel, 10l. the carat.

The diamond mines of India have been nearly exhausted. Diamonds are found in small quantities in Sumbhulpore, where the trade of diamond washing is hereditary in certain families. But the lustre of the Indian diamond is higher than that of Brazil, and the old diamonds are more valuable than those of late discovery. Brazilian diamonds come from various localities in that country, and chiefly in alluvial soil, but sometimes in a conglomerate, found in the tops of the highest mountains in the diamond-producing district. The trade in the Brazilian diamonds dates from about the middle of the eighteenth century. The quantity produced is very large. Mr. Emanuel, though he states that the yield is decreasing, reckons the annual produce at 240,000 carats, and assigns it a value of 1,000,000l. sterling.

The labour of searching for diamonds is described with great liveliness by the gentleman whose work has been referred to. On an average of 10,000 stones, there will not be one of eighteen carats found. The largest diamond ever found in the Brazils is the Star of the South, which, when rough, weighed 254 carats.

**Tests of Diamonds. Cutting, &c.**—To ascertain whether any specimen is a true diamond or not, a fine file may be used; and if the surface of the stone be the least abraded or scratched by its action, it is not a diamond. The difference will also appear upon close examination without this instrument; the rays of light easily pass through other gems, but in the diamond they are refracted to the surface, which occasions its superior brilliancy.

On account of the extreme hardness of the diamond, the art of cutting and polishing it was for a long time unknown in Europe; but in 1456 a young man of the name of Louis Berghen, a native of Bruges, is said to have constructed a polishing wheel for the purpose, which was fed with diamond powder instead of *corundum*, which the Chinese and Hindoos had been long accustomed to employ. Berghen was led to this discovery by observing the action produced by rubbing two rough diamonds together.

Diamonds are cut into various shapes. Those enumerated by Mr. Emanuel are the double cut brilliant, the single cut brilliant, the table diamond, the rose, and the brilliolette or briolet.

**Commercial Value of Diamonds.**—The value of a rough diamond is calculated at half its weight, as it is thought likely to lose half in cutting, and the cost of cutting is reckoned at 15s. the carat. The value depends on the colour, size, and form of the crystals, and, for stones under two carats in weight, ranges from 2l. 10s. to 5l. per carat. Great caution is necessary in purchasing rough diamonds.

The valuation of polished diamonds is taken in the trade from the tables made by Jeffries in 1750, which are based on the assumption that a diamond increases in value in proportion to its weight, in the ratio of the square of its weight, i.e. supposing the value of a one-carat stone be 8l., one of two carats will be worth  $2 \times 2 \times 8 = 32l.$ , this calculation being continued up to stones of 100 carats. These tables, however, do not represent present values. The production of the gem has diminished, and the number of wearers has increased, so that the price during the last twenty years has risen enormously on all stones below five carats in weight. For obvious reasons, it is impossible to give any estimate of stones above five carats.

When diamonds are of any decided colour, as blue, red, green, they often fetch enormous prices. Such stones exist. Mr. Hope had one of 44½ carats, of a bright sapphire blue. In the Russian treasury there is a brilliant red diamond, weighing 10 carats. There is a green diamond at Dresden, which once belonged to Augustus the Strong, king of Poland, which weighs 48½ carats. A green diamond weighing five grains, which, if white, would have been worth no more than 28*l.*, has been sold for 320*l.* These coloured diamonds are called fancy stones. Mr. Emanuel has given three comparative tables of the price of diamonds, one of which is his own calculation of the value to be at present assigned to perfectly white and pure brilliants, and which ranges from stones weighing ¼ a carat and worth 5*l.* 10*s.* to those of 5 carats, which he values at 320*l.*; another table is that of Jeffries, composed in 1750, where the range is from 3 grains worth 6*l.*, to 5 carats worth 200*l.*; while a third is that of a Venetian merchant, who reckoned their values in the year 1606. In this table a 3-grain brilliant is valued at 15*l.* 3*s.* 4*d.*, and one of 5 carats at 346*l.* 13*s.* 4*d.* It appears that the last-named table is a record of actual sales. (See for further particulars Emanuel's *Diamonds and Precious Stones*.)

Diamonds may be landed without report, entry, or warrant. (3 & 4 Wm. IV. c. 52 s. 2.)

The carat grain used in weighing diamonds is different from the troy grain, 5 diamond grains being only equal to 4 troy grains.

DIAPER (Ger. drell; Dutch, drel; Fr. linge ouvré; Ital. tela tessuta a opere; Span. manteles alemaniscas; Russ. salfetotsschnoe). A sort of fine flowered linen, commonly used for table-cloths, napkins &c., originally manufactured at Ypres, whence its name; brought to the highest perfection in the manufactories in the north of Ireland, in Germany, and Scotland.

DICE (Ger. würfel; Dutch, taarlingen; Fr. dés à jouer; Ital. dadi; Span. dados; Russ. kosti). Cubical pieces of bone or ivory, marked with dots on each of their sides from 1 to 6, according to the number of the face.

The regulations as to the manufacture and sale of dice are the same as those with respect to CARDS. Every pair of dice is to pay a duty of 2*s.* All pieces of ivory, bone, or other matter used in any game, having letters, figures, spots, or other marks denoting any chance, marked thereon, to be adjudged dice; and if more than 6 chances are signified on any one piece, then such piece to be charged with the full duty of a pair of dice. (9 Geo. IV. c. 18.)

In 1865 only 6 pair paid the duty.

DIMITY (Fr. basin; Ital. dobletto; Span. dimite). A species of cross-barred stuff entirely composed of cotton, similar in fabric to fustian. It was originally manufactured in Sicily, its name being of Greek origin.

DISCOUNT. An allowance paid on account of the immediate advance of a sum of money not due till some future period. It is usually said to be of two kinds—viz. discount of bills, and discount of goods; but they are essentially the same.

When a bill of exchange is presented at a banker's for discount, it is the practice to calculate the simple interest for the time the bill has to run, including the days of grace, which interest is called the *discount*; and this being deducted from the amount of the bill, the balance is paid over to the presenter of the bill. This is the method followed by the Bank of England, the London and provincial bankers, and by commercial men in general. But it is, notwithstanding, inaccurate.

The true discount of any sum for any given time is such a sum as will in that time amount to the interest of the sum to be discounted. Thus, if interest be five per cent., the proper discount to be received for the immediate advance of 100*l.* due 12 months hence is not 5*l.*, but 4*l.* 15*s.* 2½*d.*; for this sum will, at the end of the year, amount to 5*l.*, which is what the 100*l.* would have produced. Those, therefore, who employ their money in discounting, make somewhat more than the ordinary rate of interest upon it; for a person discounting 100*l.* due at the end of a year, advance*s*, supposing interest to be 5*l.* per cent., only 95*l.*; so that, as this 95*l.* produces 100*l.* at the period in question, the interest received has really been 5*l.* 5*s.* 3¾*d.* per cent.

The rule for calculating discount on correct principles is as follows:—

As the amount of 100*l.* for the given rate and time is to the given sum or debt; So is 100*l.* to the present worth, or So is the interest of 100*l.* for the given time To the discount of the given sum.

Mr. Smart has calculated, on this principle, a table of the discount of 1*l.* for any number of days, at 2, 2½, 3, 3½ &c. to 10 per cent., to decimal places. But the simple interest of the sum being the only thing looked for in practice such tables are hardly ever referred to.

Bills in the highest credit are discounted on the lowest terms; the discount increasing according to the suspicions entertained of the punctuality solvency of the parties subscribing the bill. During the continental war, the rate of interest, or, which is the same thing, of discount, was comparatively high; for some time afterwards it was seldom above 4, and often as low as 3 and even 2½ per cent.

During the ten years 1856-1865 the average rate of discount was 4½ per cent.

Discount on merchandise takes place when after making a purchase of goods at a fixed rate of credit, the buyer finds means to make payment before the expiration of that term, receiving from the seller a discount or allowance which is commonly a good deal above the current rate of interest. The discount on goods varies, of course, according to the interest of money. During the late war, the loans to Government were so large, and the facility of investing money was such, that the discount on goods was often high as 5 per cent. for 6, and 10 per cent. for 12 months. Now, however, the discount on goods has fallen, with the fall in the rate of interest, to 7 or 7½ per cent. for 12 months; being double the current interest arising from the property; or the discount of good mercantile bills.

Long credits and discounts upon goods for a lengthened period, been usual in England. This arose from a variety of causes, but principally, perhaps, from the magnitude of our exports to the United States, Russia, and other countries where there is a great demand for capital; but in every cause it originated, it has latterly been carried to what seems to be an injurious extent. [CREDIT.] In France and Germany, the factors, in general bare of capital, are obliged to stipulate with the merchants for short credits. In Holland, the *usage* of the exporting merchant has been to pay either in ready money, or at a date as to put discounting out of the question, the manufacturer setting at once the lower price on his goods.

DIVI DIVI. The commercial name of the *Cesalpinia coriaria*, a leguminous tree found in low, marshy situations in the north

of South America and Venezuela, and India. It is used but chiefly for the bark, which is from 2 to 3 inches and when in perfect maturity contains a few small resinous particles, easily pulverized, and which covers the outer skin and the inner bark, and contains a large quantity of resin, which is imported into Liverpool in 1866 amounting to 137.5*s.* per ton. Divi Divi is used by the physicians on the principle which it contains of springing qualities as it is at present used in medicine, which is a great high price of the bark in tanning it according to the appearance. (Private DIVIDEND. The name given to creditors out of the annual interest payable on the stocks, and other public funds, and other joint stock companies. A town of the same name is situated about 21 miles from Mecca in Arabia, in lat. 21° 29' N., and long. 37° 30' E. It is built on a hill, and the streets are very narrow and dirty; the houses high and built of mud, the most part of madreperla shells. The supply of water is very indifferent. Small boats are used in the quays; but large boats are used in the roads, about 200 in number, being by means of light sails, and the navigation is difficult, and should be done by a pilot. Djidda is of great commercial importance. It is situated in the centre of the greater peninsula of Arabia, between India, Egypt, and Africa. It possesses large capital, and is estimated to be worth as much as from 150,000*l.* to 200,000*l.* It is the most considerable port on the Persian Gulf, and is the most hazardous. The trade is very hazardous, and is very safe. The trade is very considerable. Djidda is situated on the Persian Gulf, and Massouah, on the Red Sea. The imports from the Gulf are slaves, gold, tobacco, and butter (of which immense quantities are used in Arabia), mats, and the Africans receive Indian goods, dresses and ornaments, and dates (which are not raised in Arabia), iron &c. The exports from Cossir is wheat, and the whole Hedjaz, is almost entirely dependent on the coffee. Business is transacted by means of an expedition. The number of ships to the port is estimated to be 100, and the quantity of timber, none of which belongs to it but is imported from Bombay or Muscat, or Suez. For a considerable time before and after the festival of the town is thronged with pilgrims, and the trade of mercantile business

of South America, principally in New Granada and Venezuela, and in some parts of the West Indies. It is used both for dyeing and tanning, but chiefly for the latter purpose. The pod is from 2 to 3 inches in length by 3/4 inch in breadth, and when in perfection is of a rich brown colour. It contains a few small seeds, but the only valuable portion is a resinous matter of a bright yellow colour, easily pulverised, which lies betwixt the outer skin and the husk that encloses the seed, and contains a large quantity of tannin. The imports in 1866 amounted to 4,269 tons, worth about 137. 5s. per ton. By far the greater portion is imported into Liverpool.

Divi Divi is used by dyers, not for the colouring principle which it contains, but for its strong astringent qualities as a mordant. For this purpose it is at present used to some extent instead of cochineal, which is scarce and dear, and hence the high price of the article.

It is used in tanning it accelerates the process, and imparts to the leather a clean and healthy appearance. (*Private information.*)

**DIVIDEND.** The name given to the payment made to creditors out of the estate of a bankrupt; to the annual interest payable upon the national debt, and other public funds; to the divisible profits of railways, and other joint-stock undertakings.

**DJIDDA.** A town of Arabia, on the Red Sea, about 21 miles from Mecca, of which it is the sea-port, in lat. 21° 29' N., long. 39° 14' E. It is well built; the streets are unpaved, but spacious and airy; the houses high, and constructed, for the most part, of madrepores and other marine shells. The supply of water is scanty, and its price indifferent. Small vessels approach close to the quays; but large vessels are obliged to anchor in the roads, about 2 miles off, loading and unloading by means of lighters. The entrance to the bay is difficult, and should not be attempted without a pilot. Djidda is a place of considerable commercial importance. It is the entrepôt in Arabia, Egypt, and Arabia.

Many of its merchants possess large capitals—some of them as high as from 150,000*l.* to 200,000*l.* The trade here brought from Mocha and other ports in the Red Sea is the most considerable, but it is said also to be the most hazardous. The returns are generally made in cash. The trade with India is very considerable. Djidda has also a good trade of intercourse with the ports of Cosseir, Suez, and Massouah, on the opposite coast of the Red Sea. The imports from the last two principally consist of slaves, gold, tobacco, dhourra or barley, and butter (of which immense quantities are imported from Arabia), mats &c.; in return for which the Africans receive Indian goods suitable for their markets, dresses and ornaments for their wives, dates (which are not produced in any part of Arabia), iron &c. The principal article imported from Cosseir is wheat; and not only wheat, but the whole Heljaz, or Holy Land of Arabia, is almost entirely dependent upon Egypt.

Coffee is the principal article sent in return. Business is transacted at Djidda with great expedition. The number of vessels arriving to the port is estimated at 250. Owing to the scarcity of timber, none of them are built at Djidda, those belonging to it being either purchased at Bombay or Muscat, or at Mocha, Aden, or Suez. For a considerable period before and after the feast of Ramadhan, pilgrims come from all quarters to visit the town is thronged with strangers, and a great deal of mercantile business is transacted.

Djidda is at present, and has been for a number of years, under the government of the Pacha of Egypt. The *moneys, weights, and measures* of the latter country [ALEXANDRIA] are now generally used in Djidda, the commerce of which has been much improved and extended in consequence of the comparative security and good order enforced by the pacha. (We have gleaned these details from the different works of Burckhardt, particularly from his *Travels in Arabia*, vol. i. pp. 1-100.)

**DOCKS.** Artificial basins for the reception of ships. The term has been supposed by some to be derived from the Greek δέχομαι, to receive; but it is obviously no other than the Teutonic dock, originally perhaps derived from *dekken*, to cover, to enclose, or protect.

Docks are of two sorts, *wet* and *dry*. Wet docks are generally constructed with gates to retain the water. Ships are admitted at high water; and when the gates being shut, they are kept constantly afloat. A dry dock is intended for the building, repairing, or examination of ships. The ships to be repaired or examined are admitted into it at high water; and the water either ebbs out with the receding tide, or is pumped out after the gates are shut.

**Utility of Docks.**—The construction of wet docks has done much to facilitate and promote navigation. A large vessel, particularly if loaded, could not be allowed to come to the ground, or to lie on the beach, without sustaining considerable injury, and perhaps being destroyed; and even the smaller class of vessels are apt to be strained, and otherwise hurt, if they are left dry, unless the ground be very soft. Hence, when large vessels have to be loaded or unloaded where there are no docks, and where the water close to the shore is not sufficiently deep, the work can only be carried on during a particular period of each tide: it being necessary, in order to keep the vessel afloat, that she should leave the shore with the ebbing tide. Attempts have sometimes been made to obviate this inconvenience by running jetties or piers to such a distance into the sea that there might always be a sufficient depth of water at their heads; but this can only be done in peculiar situations, and it requires that the ship's position should be frequently changed. It is in most cases, too, impossible properly to protect the cargoes of ships loading or unloading at quays, or on the beach, from depredation. Previously to the construction of wet docks on the Thames, the property pillaged from ships was estimated at 500,000*l.* a-year, though this is probably much exaggerated.

## DOCKS

## I. DOCKS ON THE THAMES.

It is singular that notwithstanding the obvious utility of wet docks, and the vast trade of this sort on the north side of the Thames till nearly a century after a wet dock had been constructed at Liverpool. The Commercial Dock appears to have been opened so early as 1660. (Post.) The inconvenience arising from the crowded state of the river at the periods when fleets of merchantmen were accustomed to arrive, the insufficient accommodation afforded by the legal quays and sufferance wharves, the necessity under which many ships were placed of unloading in the river into lighters, and the insecurity and loss of property thence arising, had been long felt as almost intolerable grievances: but so powerful was the opposition to any change, made by the private wharfingers and others interested in the then existing order of things, that it was not till 1793 that a plan was projected for making wet docks, on anything like an adequate scale, for the port of London; and 6 years more elapsed before the Act for the construction of the West India Docks was passed.

1. *West India Docks, now conjoined with the East India Docks.*—The West India Docks were the first, and continue to be the most extensive, of the great warehousing establishments formed in the port of London. Their construction commenced in February 1800, and they were partially opened in August 1802. They stretch across the isthmus joining the Isle of Dogs to the Middlesex side of the Thames. They originally consisted of an Import and Export Dock, each communicating, by means of locks, with a basin of 5 or 6 acres in extent at the end next Blackwall, and with another of more than 2 acres at the end next Limehouse: both of these basins communicated with the Thames. To these works were added, in 1829, the South Dock, formerly the City Canal, which runs parallel to the circuit-navigable by enabling ships to avoid the circuitous course round the Isle of Dogs. It was, however, but little used for that purpose, and is now appropriated to the wood trade, for the greater accommodation of which a pond of 19 acres has been formed on the south side for the reception of bonded timber. The Export Dock, or that appropriated for ships loading outwards, is about 870 yards in length by 135 in width; so that its area is near 25 acres: the North or Import Dock, or that appropriated for ships entering to discharge, and is of the same length as the Export Dock, and 166 yards wide; so that it contains nearly 30 acres. The South Dock, which is appropriated both to import and export vessels, is 1,183 yards long, with an entrance to the river at each end; both the locks, as well as that into the Blackwall Basin, being 45 feet wide, are large enough to admit ships of 1,200 tons burden. At the highest tides, the depth of water in the docks is 24 feet; and the whole will contain, with ease, 600 vessels of from 250 to 500 tons. The separation of the homeward-bound ships, which is of the utmost importance for preventing plunder, and giving additional security to the revenue and the merchant, was, for the first time, adopted in this establishment. The Import and Export Docks are parallel to each other, being divided by a range of warehouses, principally appropriated to the reception of rum, brandy, and other spirituous liquors. There are smaller warehouses and sheds on the quays of the Export and South Docks, for the reception of goods sent down for exportation.

The warehouses for imported goods are on the quays of the Import Dock. They are well-trived, and of great extent, being calculated to contain 160,000 hogsheads of sugar, exclusive of coffee and other produce. There have been deposited, at the same time, upon the quays, in the sheds, and in the warehouses belonging to these docks, 148,563 hogsheads of sugar, 70 casks and 433,648 bags of coffee, 85,158 pipes of rum and pipes of Madeira wine, 14,021 logs of malogany, 21,350 tons of logwood &c. The area occupied by the docks, warehouses &c. includes about 295 acres; and the most effectual precautions are adopted for the prevention of pilfering.

This spacious and magnificent establishment was formed by subscription, the property vested in the West India Dock Company, an affair of which were managed by 21 directors a body corporate.

The West India Docks proved a very successful undertaking, and have been highly beneficial to the original shareholders as well as to the port. All West India ships frequenting the Thames were obliged to use them for a period of 20 years from their completion. The dividend of the Company's stock was limited to 10 per cent. and after making dividends to the full amount in 1819 an accumulated fund of near 400,000. But they then diminished their charges, and by the suggestion of a committee of the House of Commons; and having been since still more considerably reduced, the surplus has been absorbed, the nearest dock-gate is at Limehouse, and the about  $\frac{1}{2}$  mile farther from town.

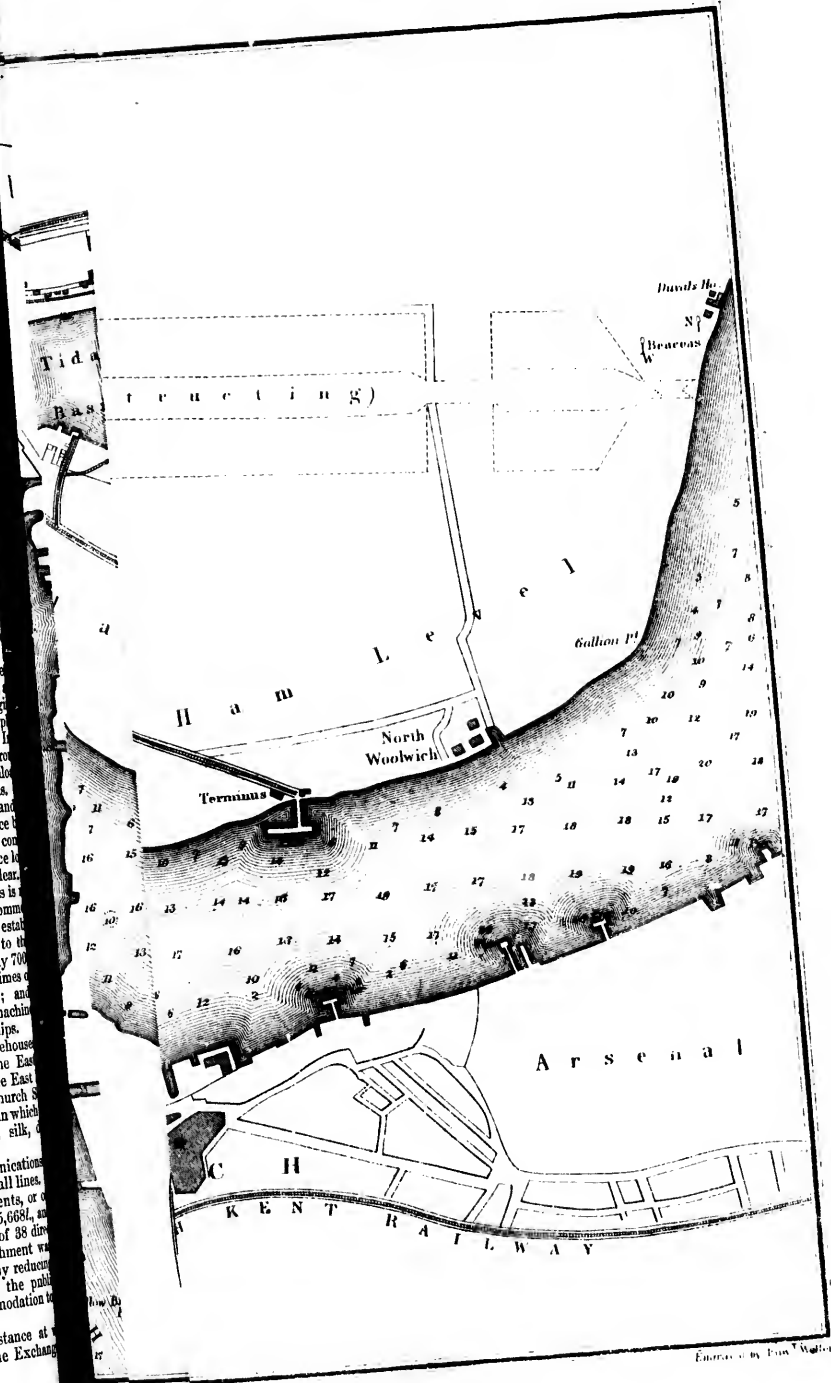

The *East India Docks*, united with those described in 1838, are situated at Blackwall,  $3\frac{1}{2}$  miles from the Exchange, and were originally intended for the accommodation of ships employed by the East India Company, or in the East India trade; but they are now open to vessels for all parts; There are 2 docks; 1 for ships unloading inwards, and 1 for those loading outwards. The Export Dock contains about 18 acres, and the Import Dock about 9 acres. The entrance to which connects the docks with the river, contains about  $2\frac{1}{2}$  acres; the length of the entrance is 210 feet, the width of the gates 48 feet clear depth of water in the East India Docks is less than 23 feet; so that they can accommodate ships of greater burden than any other establishment on the river. There is attached to the splendid quay fronting the river, nearly 700 in length, with water sufficient at all times of tide to float the largest steam ships; and the Export Dock is furnished with a machine for masting and dismasting the largest ships.

Exclusive of the magnificent warehouses attached to the West India Docks, the East India Dock Company possess the East India warehouses in Billiter Street, Fenchurch Jewry Street, and Crutched Friars; in which warehouse and show tea, indigo, silk, spices &c.

These docks have railway communication to the North London and the Blackwall lines. The capital of both establishments, or of the United Company, amounts to 2,065,668, and the management is vested in a board of 38 directors. The consolidation of the establishment was advantageous to the shareholders by reducing the expense of management, and to the public by giving a greater choice of accommodation to vessels frequenting the docks.

been in a great degree obviated by the opening of the railways referred to, and by the exhibition of samples in the Company's upper warehouses. Still, however, the charge on account of cartage is a little heavier on goods warehoused at the docks of this Company than on those warehoused farther up the river; but, on the other hand, ships entering the East India or West India Docks avoid a considerable extent of troublesome, if not dangerous navigation, that must be undertaken by those bound for the London and St. Katharine Docks.

**RULES AND REGULATIONS TO BE OBSERVED, AND RATES TO BE PAID, BY SHIPPING IN THE EAST AND WEST INDIA DOCKS.**

The docks and works of this Company are the East India Import and Export Docks and Basin, called the Eastern Docks; the West India Import and Export Docks, and the Blackwall and Limehouse Basins, called the Western Docks; and that (formerly the City Canal) called the South Dock.

*Regulations for Shipping to be observed by Masters, Pilots, and other persons having the charge of Ships, Vessels, Lighters, or Craft coming into, lying in, and going out of, the East and West India Docks, pursuant to Act 2 Wm. IV. c. 52.*

*The Company's Moorings.*—The moorings in the river, within 200 yards of each of the entrances at Blackwall, and that into Limehouse Basin, and within 150 yards of the Limehouse entrance of the South Dock, are reserved for the exclusive use of vessels entering into, or which have recently come out of, the docks.

Pilots must not attempt to place ships inside the buoys, if other ships have previously brought up, but bring them to their berths in due succession on the outside, unless they shall be expressly ordered by the dock-master to take a berth inside the tier for the convenience of docking.

**VESSELS ABOUT TO ENTER AND LEAVE THE DOCKS.**

*Signals.*—A blue flag will be kept flying at each entrance the whole time proper for docking and undocking; at high-water mark the flag will be struck, after which no pilot must sheer his vessel in, unless directed so to do by the dock-master.

*Preparing Ships for Admission.*—No time should be lost in getting the anchors properly secured and stowed, sails furled, quarter boats lowered down, guns unloaded, gunpowder put out.

All ships are required to send down top-gallant masts and strike top-gallant masts, and to have their jib and mizen booms rigged close in, bombards, martingales, and all outriggers unshipped, and the yards well topped up whenever ordered by the dock-master.

*Order of Admission.*—The dock-masters have, under the Dock Acts, full powers to direct the mooring, unmooring, moving, or removing, all ships, vessels, or craft within the Company's docks, and will direct the docking of vessels usually in the order in which they arrive; but no vessel shall attempt to gain admittance contrary to the directions given by the dock-master, the owner, and the master, pilot, or other person in charge, must be responsible for all consequences.

*Entering.*—The ship must be ready to send down and sufficient warps to each pier, when directed by the dock-master.

When within the piers, proper ropes will be sent on board when requisite to guide and haul the vessel through the lock; the vessel must be hauled ahead by her own warps, and they

are on no account to be cast off unless ordered by the dock-master.

Every pilot must bring his boat into the Basin, or South Dock, as it is a most essential part of his duty to moor the ship.

*Vessels about to Leave the Docks.*—Export vessels should be hauled down in sufficient time to be at the river locks, at Blackwall, at low water, to prevent inconvenience during the time that other vessels are requiring admission, which must have the preference.

Vessels can only be let out after high water upon the special request of the officers in charge of them.

Ships going into the river must use their own ropes, as they are out of the dock-master's charge when clear of the outer gates.

*Ships' Boats.*—The Company take no charge of ships' boats, and are not responsible for them: it therefore rests with the owner of the ship to take such measures as will ensure their safety.

*Discharging.*—Two true copies of the manifest of the cargo must be delivered into the general office, at the Dock House, in Billiter Square, within twelve hours after every vessel shall enter the docks, or after the cargo shall have been reported at the Custom House, whichever shall first happen. Penalty for refusal or neglect, any sum not exceeding 5*l.* (2 Wm. IV. c. 52 s. 84.)

No ships can be allowed to break bulk until their cargoes are duly entered.

All baggage or presents should be sent as promptly as possible to the Baggage Warehouse, where an authority from the master for the delivery thereof must be lodged.

Packages of bullion or specie (whether cargo or private property) must be delivered by the captain, under his own responsibility.

The delivery of goods overside will also rest with the master, and he must take such steps as he may think necessary to protect his owners in respect to their freight.

**EASTERN AND WESTERN IMPORT AND EXPORT DOCKS, THE BASINS, AND SOUTH DOCK.**

All vessels entering or lying in these docks and basins continue in charge of the masters and owners.

It is the duty of the pilots, or officers and crews, to transport their respective vessels, except otherwise provided for by the table of rates, under their own responsibility, to or from the river, and to or from any part of the docks or basins, as directed by the dock-master.

Light ships, on entering from the river, must be provided with sufficient hands to dock and transport them, and should move in due time into the dock; otherwise they will be removed by the dock-master, and the owners charged with the expense.

Ships taking in cargoes will be moored at the quays in due rotation. Light ships not taking in goods must be moored in either of the docks or basins, as the dock-master may judge convenient.

While ships are lying at or moving to or from the quay, all outriggers should be got in and made snug; and sails are by no means to be loose while so moving, or after daylight.

No ship must be removed from her berth without notice being given to the dock-master, and his assent as to the time of removal being obtained.

Craft must be fastened to the ships from which they are receiving, or to which they may be delivering goods.

Convenient receptacles on the quays are provided, wherein all dust, ashes, and other refuse mat-

ters are to be deposited, and which shall be cleared by the person appointed by the Company, and by no one else.

No vessel can be permitted to take in ballast after daylight, or before daybreak.

Ships' provisions or stores cannot be permitted to pass the gates without an order signed by the owner, or an officer of the ship.

Neither caulking nor plumbers' work can be allowed without special permission, to be obtained from the Principal of Police.

**Fire and Candle.**—Special licenses will be granted to use fire and candle in all the docks and basins, on application to the Principal of the Police, made by the master or owner of the vessel, specifying the names and capacity of the persons in charge of the ship, and engaging to be responsible for their attention to the regulations.

Every such license will express the place in which fire may be kept, and the circumstances under which it may be used: upon the slightest infringement of the conditions, the penalty prescribed by law will be rigidly enforced.

**Opening and Shutting the Gates.**—The gates will be opened at 6 o'clock in the morning, and shut at 8 o'clock in the evening, from March 1 to November 10; and from November 11 to the last day of February, opened at 7 in the morning, and shut at 7 in the evening.

Captains and chief mates may be furnished with tickets upon applying at the Police Office, at the Eastern or Western Import Dock, which will entitle them to admission till 9 o'clock P.M., but no person whatever can be allowed to go out after the hour for closing the gates.

**Hours of Attendance.**—The hours of attendance are, from March 1 to October 31 inclusive, eight in the morning to four in the afternoon: from November 1 to the last day of February, inclusive, nine in the morning to four in the afternoon; and there is to be no intermission of business during these hours.

No holidays are kept, except Sundays, Christmas Day, Good Friday, East Days appointed by Royal Proclamation, and the King's or Queen's Birth Days.

TONNAGE RATES.

Sailing Vessels Inwards Discharged by the Company.

For docking, mooring, and removing within the docks and basins, unloading the cargo, and the use of the docks for four weeks from the final discharge, viz.

	Per ton register.
Laden with sugar, otherwise than after-mentioned, or other goods packed in bales, bags, baskets, serons, casks, cases, chests, or similar packages (except oil direct from the fisheries, tallow, or ashes), metal in pigs, bars, rods, plates, or similar pieces, wood in billets, such as dye wood &c.	1 6
And in addition, for every load or ton of blue gum wood, and the like; or oil in iron tanks	0 6
Laden with chests of sugar, 5 cwt. and upwards, including ship's coverage	2 0
Laden entirely, or in part, with hogsheads, and tierces of sugar or molasses from the West Indies, including ship's coverage	2 6
Laden with mahogany, cedar, or other furniture wood, in logs or planks	2 6
Laden entirely with hemp or goods in bulk, or oil direct from the fisheries	1 9
And in addition for every ton of oil in tanks	0 6
Laden entirely with tallow	1 3
For every ton of hemp	2 0
For every ton of tallow or ash	1 3
For every ton in bulk, except guano	1 9
The total number of tons charged not to exceed the register tonnage.	
Laden with wool, the growth of the North of Europe, or the North American Colonies, viz.:	
Entirely with deals, staves, lath, or fire-wood	1 9
Entirely, or in part, with timber	1 9
And in addition, for every load of hardwood or masts	0 6
For every load of pine or fir timber	0 3

\* When the discharge by the Company of any vessel is postponed by desire of the owner, six weeks only are allowed free of rent. The expense of labour incurred, and of materials broken or injured, in the discharge of rutch or gambler, and other packages when they adhere together, will be charged in addition.

Per ton register.

Laden with timber from Africa, or the East Indies, or like timber cargoes	3 0
And, in addition, for every load discharged over side	1 0
Laden with timber and spars from Vancouver Island, or similar cargoes	3 9
Laden with guano	1 9

Note.—Vessels which discharge the whole or greater part of their cargoes into lighters will be subject to such rates for discharging as shall be agreed upon between the ship-owner or master and the Company.

Sailing Vessels Inwards Discharged by their own Crews.

For the use of the docks\* for any period not exceeding four weeks from the date of entrance—

	Per ton register.
Arriving from any port or place not otherwise specified	0 9
Arriving from any port in the United Kingdom or European port outside the Baltic, between the North Cape and Ushant	0 6
Delivering part of a cargo, and not remaining beyond one week, per ton delivered	0 6

Exceptions.

	Per ton register.
Sloops and craft consisting, with bricks, and vessels with broken granite, or paving stones, not remaining beyond one week	0 3
Colliers entering to await the sale of their cargoes, not remaining beyond two weeks	0 3

Other vessels than colliers, coastwise, on landing goods in the docks equal to one-third of their register tonnage, will be exempted from payment of the tonnage rate, but rent to commence after ten clear days from the final landing of the goods.

Vessels entirely corn-laden, discharged in the docks, in case of tonnage rate, not remaining beyond two weeks—

	£	s.	d.
If 50 and .. 100	1	11	6
100 .. 150	2	2	0
150 .. 200	3	3	0
200 .. 250	4	4	0
250 .. 300	5	5	0
300 .. 350	6	6	0
350 .. 400	7	7	0
400 .. 450	8	8	0
450 .. 500	9	9	0

and 2d. 2s. for every additional 50 tons register or less.

If corn vessels quit without unloading, rent to commence after one clear day from the date of entrance.

Vessels two-thirds laden with corn will be charged the usual tonnage rates on the other part of their cargoes, in proportion to their register tonnage.

If vessels to which the above exceptions apply load outwards, they will be charged the usual rate of 3d. per ton register.

Sailing Vessels Outwards, or Light Vessels, other than Steam Vessels.

	Per ton register.
Entering to load or lay up, not having discharged their import cargoes in the docks—	
The use of the docks for any period not exceeding four weeks from the date of entering	0 9

Vessels Entering to Load from the Import Warehouses or from Vessels Discharging Overseas.

	Per ton on the gross weight shipped.
For the use of the docks for one week—	
If from import warehouses	0 0
If from vessels overseas	0 0

The number of tons charged not to exceed the register tonnage.

Exceptions.

Vessels under 100 tons register coming in to load corn or deal, timber, and like wood goods, wholly from the Company's wharves, yards, or ponds—free. Rent to commence after one week.

Steam Vessels.

	Per ton register.
Entering to lay up, or to repair or fit their machinery—	
For the use of the docks for any period not exceeding four weeks from the date of entering	0 0
Entering to load or discharge cargo, the same dock rates as sailing vessels.	

\* The expense of mooring, unmooring, and removing is included.

† If such vessels load outwards, 3d. per ton additional charged.

‡ The expense of mooring, unmooring, and removing is included.

any article warehoused in packages, or for the whole quantity of a bulk, as imported, or for any allotment of such bulk, on payment of the expense of separating it into distinct and corresponding parcels.

That the course of business may be fully understood, the attention of importers and purchasers of produce is particularly requested to the following memoranda:—

Warrants for goods which are usually sold without lotting will be made out for such quantities as have been found generally convenient to the importers.

For goods which are lotted, made merchantable &c., the warrants will be made out as soon as the operations are performed. When directions from the importer are required, notice will be given on the landing accounts, or otherwise.

The first warrants or cheques will be issued to the order of the importers or their assigns (provided there is no stop upon the goods for freight or otherwise), upon payment of the prime rates or landing charges.

Such payments must include all charges incurred to the time of passing the order or issuing the warrants or cheques, excepting rent; charges accruing subsequently, and the rent, must be paid by the holders of the warrants before delivery of the goods. The proprietors of goods may, however, clear the rent and incidental charges to any desired date, and have new warrants or cheques accordingly.

Weight or gauge notes, corresponding to the warrants, will be furnished, when required, at the charge of twopence each.

The landing and consolidated rates are received at the Dock House; rent and extra charges by the receivers at the docks, at the Clearing Office at Fenchurch Street warehouse, and at the Billiter Street and Jewry Street warehouses, in whichever place the goods may be lodged.

When the assignment or removal of part of the goods only is intended, the warrants or cheques should be divided at the Dock House in London, as hereafter provided. If the quantity to be assigned must be weighed or measured, to separate it from the bulk, the division cannot be made until the whole quantity has been reweighed or re-measured.

If the delivery of the whole of the contents is directed, and the goods are not removed within two days, a new warrant or cheque for the remainder of the parcel must be taken out.

When the holders of warrants or cheques are desirous of assigning part of their contents, without delivery, reweighing, rehousing &c., new documents will be given in exchange, on lodging the originals, duly indorsed. The indorsement should specially direct the manner in which the contents are to be divided, and state the names of the parties in whose favour the warrants or cheques are to be issued, in the following form: 'Please to divide the within;' or, when part is to be delivered: 'Deliver to Bearer [state how many packages], and grant new one for [state how many packages] in favour of \_\_\_\_\_ one for, &c.'

Warrants may be exchanged or divided, without assigning the goods, when desired by the holder, at the same rate of charge.

Original warrants will be granted free of charge, beyond that of the stamp; but for other warrants the charge will be as follows, with the stamp in addition:—

For each warrant—

1 or 2 packages or quantities	4
3 or 4 "	5
5 to 7 "	6
8 to 10 "	7
11 to 15 "	8
16 to 20 "	9
21 to 25 "	10
26 to 30 "	11
31 to 35 "	12
36 to 40 "	13
41 to 45 "	14
46 and upwards "	15
(Goods in bulk, per ton)	16
For every new cheque granted	2

If, from the nature of the contract between the seller and buyer, reweighing &c. may be necessary, new warrants, if desired, will be issued on depositing the warrants, indorsed with directions to that effect, containing the landing weights and reweights, as soon as the operations are completed.

When any alterations, such as repacking &c. are to be made (except when preparatory to immediate delivery), the warrants must be lodged, and others, representing the goods correctly, issued in the same manner.

In the case of casks of liquids used to fill up others, the warrant must be lodged, and the proprietor may either have a new warrant for the remainder, or it may be delivered (if not required to be used again in the same way) to his order.

The warrants must likewise be lodged, on giving orders to vat; but if immediate shipment is not intended, new warrants will be issued as soon as the casks are refilled.

In the four last-mentioned cases, the charges for performing the operations include the expense of the new warrants.

When warrants or cheques are lost or mislaid, the Company require that they should be advertised in the *Public Ledger*, the paper containing the advertisement, and an engagement to indemnify the Company by bond or otherwise to be enclosed with the application for duplicates. The new documents will not be issued (unless the original shall be found and delivered up) until seven clear days shall have elapsed from the date of notice by advertisement. Upon notice of the loss, the goods will be stopped, and the original document can on no account be acted upon unless first presented at the Secretary's Office.

Irregularities in the indorsements lessen the security of the proprietors of goods, and render the documents incomplete as authorities. The attention of the holders is therefore particularly called to that point, to prevent the impediments which must otherwise arise to the regular despatch of business; but they must not attempt to remove such impediments by indorsing any warrant, order, or cheque, without due authority.

Forms on which persons may be authorised to sign for others may be obtained in the General Office at the Dock House; and as no signature but that of the party named on the warrant, delivery order, or cheque can be acted upon, when goods are made deliverable to order, persons so authorised should adhere to the following form:—

'For (Name or firm),  
(Signature of the person authorised).'

**Deposit Accounts.**—To facilitate passing orders and paying the charges due upon goods, the Company will open deposit accounts, upon request from the merchants, with such deposits as they think proper: when the balance is reduced below ten pounds, a further deposit must be made, ten pounds being the smallest sum which can be received at a time.

Parties having deposit accounts with the Company must transmit a note of advice on the proper form with each deposit, and it will be necessary

that they should

that they should invariably state on their order or warrants whom the charges are to be paid by, thus:—

'Charges to the (date) to our account,'  
(Signature.)  
Or 'Charges to be paid by the holder,'  
(Signature.)

By opening such accounts, the business of merchants with the Company, particularly where goods are upon rent, is much facilitated. The proper forms and pass books may be obtained on application at the Dock House.

**Orders for Extra Work.**—The charges for re-packing, or preparing for exportation, and all work not comprised in these tables, will be fixed from time to time, with reference to the cost of labour and materials. No such work, however, can be done but by the order of the proprietors of the goods, or parties duly authorised by them.

The charges under this head must be paid by the parties giving the order, or clearing the goods.

**Goods prepared for Shipment.**—When goods are prepared for shipment, and are not taken away within the fixed number of days, they will be charged repiling or rehousing, and any additional rent which may have accrued.

The time allowed to elapse before repiling or rehousing is as follows: Mahogany and other measured wood, four clear working days; dyewoods, seven clear working days; and all other goods, three clear working days. When the export vessel loads in the docks, the time will be extended to the date of her departure.

**Explanation of the Table of Rates and Charges on Goods Inwards.**—The landing rate is charged upon the gross weight, and includes landing, or receiving by land, wharfage and housing, or piling on the quay, or loading from the landing scale; weighing or gauging at landing, and furnishing landing weights, tales or gauge accounts, and strength of spirits, as ascertained by the Customs. Goods taken away by water from the landing scale

will be charged, in addition for 'Shipping,' one-third the 'Delivery by Water' rate.

Three working days (except in cases specially provided for in the table of rates) from the final weighing, gauging, or examination of each mark of goods landed under a duty-paid entry, or bill of sight, will be allowed to the proprietor to remove such goods from the quay; a like period will be allowed in other cases, provided notice in writing of such intended removal shall be given prior to the weighing, gauging, or examination; but in the absence of notice, the goods will be immediately housed or piled, and charged accordingly.

The consolidated rate is charged upon the nett weight, and includes (except where otherwise specially provided) landing or receiving by land, wharfage, housing, and weighing or gauging at landing; ordinary cooping or mending for housing; sampling; furnishing landing weights or gauge accounts; strength of spirits, as ascertained by the Customs; certificates of damage; rent for twelve weeks from the date of the importing ship breaking bulk, or first landing from craft; weighing for actual delivery, and delivery by land or water. This rate is charged on all goods to which it is affixed, unless notice be given by the importers, previous to the final weighing or gauging, of their desire to have them placed under the landing rate.

The management rate is charged on the gross weight, and applies only to cinnamon, cochineal, indigo, lac dye, seed lac, shellac, stick lac, East India and China silk, and tea.

Rent in all cases is chargeable on the gross weight, and commences on the day of the importing ship breaking bulk, or from the first date of landing from craft.

In the case of goods being unplied, or broken out for any operation, and subsequently repiled or rehousing, the charge for unpling, when not included in the rate for such operation, is the same as repiling.

*Warrants and Transfers* (see preceding page).

Table of Rates and Charges on Goods.

The Rates in these Tables are chargeable on all Goods imported or received into the Docks on and after 1865, the date of the Hook used by the Company; and from that date, on all Goods which may remain in the Warehouses or on the Quays, as far as regards rent and future operations, but they are not retrospective.

## SCHEDULE OF RATES AND CHARGES ON WINES AND SPIRITS IN CASKS OTHER THAN RUM.

The Landing Rate includes landing, wharfage, and gauging, watching, cooper's attendance at landing and while on the quay; agents of landing gauges, warrants, if required, each of spirits, as ascertained by the Customs, first samples. Wines and spirits will be allowed to remain on the quay, subject to a weekly rent for one calendar month from the commencement of the ship's discharge, or first landing from the quay, after the expiration of which the housing and coopering rate will become chargeable.

B.—When wines or spirits have been cleared from the Customs, and delivery orders have been issued with the Company within the calendar month as above, a further period, not exceeding ten days, will be allowed for clearing from the quay, on payment of the charge for delivery

from the vault in lieu of that for delivery from the quay.

The Housing and Coopering Rate includes housing and coopering, cooper's attendance at housing, and superintendence in the vaults, for the first eighteen months, regauging, and sampling at delivery; and is applicable to all wines and spirits not cleared from the quay. Goods chargeable with this rate are subject to rent from the date of the ship's breaking bulk, or first landing from the craft, and to cooper's superintendence after eighteen months.

Racking.—When racking is necessary, forty-eight hours' notice will be given to the proprietor, with the option of sending his own casks. No charge will be made when the casks are racked for preservation in the vault, within twelve months from the date of the ship breaking bulk; those for exportation or coastwise excepted.

Tasting can be permitted only under the pro-

connected with the Blackwall Railway, communicate by railway with all parts of the kingdom.

The Company was created by Act of Parliament in 1850. By this and subsequent Acts it is authorised to raise a share capital of 1,200,000*l.*, and to borrow 300,000*l.*, making its total powers of raising money 1,500,000*l.*

The undertaking was leased to Messrs. Peto, Betts, and Brassey for 21 years from January 1853, they paying as rent 5 per cent. on all capital up to 700,000*l.*, and 6 per cent. on all beyond that amount; also 2,000*l.* per annum for the expenses of the Company's offices and management, with half the profits which may arise from the working of the undertaking after payment of rent. The lessees were bound to lodge security to the extent of 150,000*l.* for the performance of the provisions of the lease; but, as already explained, the Victoria Docks have been transferred to the management of the London and St. Katharine Dock Company.

**SYNOPSIS OF THE ROUTINE OF PUBLIC BUSINESS, WITH AN ABSTRACT OF THE PRINCIPAL REGULATIONS APPLICABLE TO GOODS IN THE LONDON, ST. KATHARINE, AND VICTORIA DOCKS.**

Bills of lading must be produced before goods can be delivered to parties claiming the same, in all cases where such goods are entered by the Company for want of entry by the merchant; as also when goods have been landed from places to the eastward of the Cape of Good Hope, with the exception of Van Diemen's Land and New South Wales. They will also be required for goods from the West Indies or United States of America, when entered by parties other than the consignees. Particular attention is necessary to the regularity of the endorsements of bills of lading, as the Company's officers cannot pass any bill on which the authority from the shipper to the holder is not deduced by a complete and accurate chain of endorsement.

Every bill of lading should be *specialy* endorsed, so as to clearly designate the party to whose order the contents are to be delivered.

In all cases of informality in bills of lading, want of endorsement &c., or of their being lost, application must be made to the secretary by letter, stating the circumstances, and *enclosing any documents which will show the title to the goods.* In every such case the applicant must engage to indemnify the Company, by bond or otherwise, as the Court may direct.

Orders for transfer or delivery, unless the goods are to be delivered from the landing scale, cannot be accepted until the goods *have been landed.*

The payment of the landing rates, whenever retained, on the whole of each mark or parcel of goods, will be required previously to the transfer or issue of warrants, or delivery of any part thereof. Charges upon goods must be paid, carried to a deposit account, previous to an order for transfer being received by the Company. Orders for delivery cannot be acted upon unless made by the party in whose name the goods are in the Company's books, or by a person duly authorised to sign them; and should any interpolation, erasure, or alteration have been made in an order, it can only be accepted with the signature or initials of the party set against such alteration.

When goods lodged in the custody of the Company have been stopped for freight, the proprietor may liberate them by making a deposit of the amount claimed with the Company, according

to the provisions of the 'Merchant Shipping Acts Amendment Act,' 1862.

**Warrants and Transfers.**—Warrants for goods in general are issued, on written application at the dock, in favour of such person as the party in whose name they stand in the Company's books may direct. The first are issued free of expense, except for the stamp, as required by law; on all subsequent warrants and transfers the charges are as follows (stamp in addition):—

For each warrant or transfer containing—

Goods in bulk, per ton	-	-	0 2
For every new cheque granted	-	-	0 2

The contents of *one warrant* may be divided into others for smaller quantities, *at the will of the holder.*

Goods for which the Company's warrants have been issued are not subject to detention for freight or landing-charges. The warrant also supersedes a certificate of transfer, is preferable in point of security, and a saving in expense. It is the only document issued by the Company entitled to be considered a legal symbol of the goods therein described, and is transferable, by an endorsement, without being produced at the dock office, thus obviating the trouble and expense of transfers; but transfers may nevertheless be effected in the books of the Company by the holder of a warrant, if desired, on its lodgment at the dock.

No warrant will be issued until the rates on the goods are paid, nor until the stop for freight (if any) has been removed, or a deposit equal to the amount claimed on account of such stop made with the Company.

Merchants' orders for delivery or transfer may be exchanged for warrants at the dock office, on written instructions being previously lodged.

If, from the nature of the contract between the seller and buyer, re-weighing &c. may be necessary, new warrants, if desired, will be issued, on depositing the warrants, endorsed with directions to that effect, containing the landing-weights and re-weights, as soon as the operations are completed.

When any alterations, such as re-packing &c., are to be made (except when preparatory to immediate delivery), the warrants must be lodged, and others, representing the goods correctly, issued in the same manner.

In the event of warrants being lost, they must be advertised in such public newspaper as may be directed by the Company, and 7 days elapse subsequently to the advertisement, and the Company be indemnified, before any delivery can be effected; but whenever the delivery of the goods is pressing, the parties may obtain it immediately, upon depositing the estimated value. Under no circumstances will duplicate warrants be issued.

Weight notes, at usual charge, are issued, on authority in writing of the owner of the goods, at any time on or before the day of prompt, entitling the holder to inspect and sample the goods.

**Authority to Sign Orders.**—Proprietors of goods desiring to authorise their clerks to sign orders on their behalf must lodge an instruction in writing to that effect with the Company. Printed forms for that purpose may be obtained.

Brokers possessing general authorities in writing

## DOCKS

520

from merchants to inspect their goods, or draw samples, should produce the same for registry with the Company.

**Inspection.**—Inspection or examination of goods may take place immediately upon presenting the warrant, weight-note, or an order from the proprietor.

**Tasting or Sampling Wines.**—Tasting of wine, and sampling of wine or spirits, will be allowed on presenting at the vault-keeper's office an order from the proprietor of the goods. When warrants have been issued, the number of the warrants must be stated on the order; and if third or subsequent samples are required, the charge for subsequent samples must be paid before delivery.

**Tares.**—With respect to goods subject to allowances for trade or customs tares, importers may lodge a general order with the Company, authorising them to act on their behalf; but when this is not done, the merchant's clerk, with a view to prevent delay, ought to make an immediate appointment with the proper officer, to settle the tares, as the landing accounts cannot be furnished until they are adjusted.

**Landing and Gauge Accounts.**—Landing and gauge accounts, with the amount of the landing-rates specified thereon, also accounts of the strengths of spirits, re-weights, re-gauge, and delivery weight of goods, will be delivered at the counting-houses of the proprietors in the City without any charge. Similar accounts to parties residing out of the City will be transmitted by post, unless countermanded. Applications relative to all such accounts must be made at the proper offices at the docks.

**Samples.**—When samples are required which can only be safely taken after the goods have been worked sampling will not be performed previously without specific directions from the owner.

**Goods worked for Sale.**—The Company will proceed to the working for sale of all goods immediately on their being landed, unless notice to the contrary be given by the owner or consignee.

Goods withdrawn from sale, after being shown, will be subject to an extra charge on being again shown.

Empty casks and packages, if not removed from the dock within seven days from the date of their becoming empty, are sent to the stores, and sold by the Company.

Deposit accounts may be opened with the Company, which will materially facilitate the merchant's business and expedite deliveries; and perfect security in the payment of charges; but such accounts must not be overdrawn.

The Dock Company will not be answerable for deficiencies in merchandise produced by natural causes, nor for other deficiencies, or liable to make good any losses, unless ascertained previously to the goods being removed from the premises of the Company.

No person is permitted to be employed in any work and labour to be performed within the dock premises, whether on board of ship, in lighter, or on shore (except the servants of the Company, or lightermen in the craft), without permission in writing from the superintendent.

The delivery of goods afloat will be the act of the captain or officer in charge of the vessel.

The inward rates upon goods landed at the London and St. Katharine Docks are classed under separate heads:—landing rate, landing and housing rate, consolidated rate, and management rate, viz.:

**The Landing Rate** is charged upon the gross weight, and includes landing, or receiving by land, wharfage, weighing or gauging, and housing

or piling on the quays, or loading therefrom; original warrants, accounts of landing weights, re-weights and delivery weights, or gauges and re-gauges, and strengths of spirits.

Goods taken away by water from the landing scale will be charged in addition for 'shipping,' one-third of the 'delivery by water' rate.

Three working days (except in cases specially provided for in the table of rate-) from the final weighing, gauging, or examination by the revenue, of goods of the same mark or parcel, landed under a duty-paid entry or bill of sight, will be allowed a duty-paid entry or bill of sight, will be allowed to the proprietors to remove such goods from the quay. A like period will be allowed in other cases, provided notice in writing of such intended removal shall be given prior to the weighing, gauging, or examination; but in the absence of notice the goods will be immediately housed or piled.

If, at the expiration of the respective periods, the housing of the goods shall be prevented by any informality or delay of the proprietors, or at their request (with the consent of the Company), watching will be charged, in addition to weekly rent, until the goods are removed from the quay.

Rent on goods housed under this rate is chargeable from the date of the importing ship, breaking bulk, or from the first landing from craft.

**The Consolidated Rate** is charged upon the nett weight, and will attach on all goods to which that rate applies in the table, unless the proprietors shall, previously to the final weighing or gauging, give notice that the landing rate is to be charged thereon. It includes landing, or receiving by land, wharfage, housing, weighing or gauging, ordinary coopering and mending for housing, sampling, marking, furnishing landing weights, or gauge accounts, strengths of spirits, original warrants, certificates of damage, rent for twelve weeks from the date of the importing ship breaking bulk, or first landing from craft, weighing for actual delivery, and delivering, by land or water.

Goods cleared otherwise than for town delivery will be subject to a charge for any necessary coopering or mending performed.

Further warehouse rent will be charged from the expiration of the twelve weeks above mentioned.

**The Management Rate** is charged on the gross weight. The only articles to which this rate has been applied are indigo, silk, tea, cinnamon, lac dye, seed lac, stick lac, shellac, and cochineal.

Rent commences on the day of the importing ship breaking bulk, or first landing from craft.

**General Rules.**—Rent in all cases is charged from the day on which the importing vessel breaks bulk, or from the first landing from craft, is payable on the gross weight, and a week's rent will be charged for a fraction of a week.

When goods are prepared for shipment, and not taken away within the under-mentioned periods, they will be charged re-piling or re-housing, and any additional rent which may be accrued:—

Dye wood, 7 clear working days.  
Mahogany and other furniture, or miscellanea wood, 4 clear working days.

Other goods, 3 clear working days.  
In the case of goods being unplied or broken out for any operation, and subsequently re-plied or re-housed, the charge for unpling, or re-plied or re-housed, the charge for such operation, is included in the rate for such operation, at the same as re-piling.

The table of rates generally is subject to revision, from time to time, as shall be deemed expedient by the Dock Company.

(Materials in addition.)	
Watching and turning (on quantity done)	1 6
Rent per week	0 6
Delivery by land from quay or warehouse	1 6
Delivery by water from quay or warehouse	2 6

The rates are applicable to goods brought in by cart or carriage.

Wharfage and shipping includes rent for three tiers (except on bullion, specie, jewellery, plate, &c.) from the date of reception, and during the period the vessel into which the goods are shipped is in the course of loading—any intermediate rent being chargeable.

Goods transferred from ship to ship will be subject to rent from the expiration of the three tiers above mentioned until the date of clearance of the vessel into which the goods are ultimately landed; such charge for rent, and for any trucking or reworking that may be necessary, to be paid at the time of lodging the transfer order.

Goods intended for exportation, but received in London or ordered to be housed, will be subject to extra charge for housing and unhousing, with wharfage, from the date of reception, until cleared for shipment into which they are shipped.

Water-borne goods landed at the request of the importer, or for the examination of the searchers, will be subject to the charges of landing and wharfage, wharfage and portorage.

Provisions and stores for the use of the ship's company (not being bonded or drawback goods) will be subject to the charge for wharfage or portorage.

The Dock Company take no cognisance of, nor are they responsible for, goods received into or discharged from a vessel in the docks by lighter, or by the Company do not undertake to lower goods from the hold of a vessel.

Consignment in charge of goods sent to the docks for sale must come provided with regular invoices, specifying their mark, quality, and quantity; also the name of the ship, master, and whether the goods are intended for; and when for more than one vessel, a separate note must be

sent for each. These notes are to be delivered to the export foreman at the respective departments.

The duty of clearing goods devolves on the proprietors or shippers, who are responsible for all consequences arising from their not being duly cleared.

When goods cannot be shipped, either from want of room in the vessel, any informality in the document, or other cause, the order of the party in whose name the goods have been received will be necessary before they can be otherwise disposed of.

Accounts of charges on goods for shipment will be made out at the respective departments where the vessels are loading, and must be paid before the goods are put on board.

The master or mate of each vessel will be required to give a receipt to the Dock Company's officer for all goods delivered to his vessel by the Dock Company.

Registers of vessels loading outwards, and where stationed, are placed at the Superintendent's Office, London Docks; Long Room, St. Katharine Docks; Superintendent's Office, Victoria Docks.

The rate for landing, wharfage, shipping, housing, unhousing, is, in each case, one half the charge inserted in the column for wharfage and portorage, unless otherwise stated, and is charged on the gross weight of the package, except when it is otherwise specified.

#### TABLE OF RATES AND CHARGES ON WINES AND SPIRITS (OTHER THAN RUM) LANDED IN THE LONDON AND ST. KATHARINE DOCKS.

Wines and spirits (rum and British spirits excepted) landed in the docks will be chargeable with the following rates:—

**The Landing Rate,** which includes landing, wharfage, laying up to gauge and gauging, accounts of landing gauges and of strengths of spirits, first samples on the quay, warrants if required (but not the stamp upon the same), watching, cooper's attendance at landing whilst remaining on the quay, and at delivery by land or water from the quay.

Wines and spirits will be allowed to remain on the quay, subject to a weekly rent, for one

## Docking and Undocking—continued.

Coasting Vessel—	s. d.
per 1 week, per week	0 1
Under 200 tons register, landing goods in the Docks, and use of the Docks for 1 week	0 5
After 1 week, per week	0 1
Laden with bricks, broken granite, or paving stones: per use of the Docks for 1 week	0 3
After 1 week, per week	0 1
Vessels discharging their cargoes in the Island, Russia, or West or North, wholly for the Canal with the use of the Docks for 1 week	Free
After 1 week, per week	0 1

Vessels wholly or partly laden, in lieu of the preceding tonnage rates, will be charged for docking and undocking as follows:—

Under 100 tons register	s. d.
100 tons and under 200 tons register	2 0
200 " 250 "	3 0
250 " 300 "	4 0
300 " 350 "	5 0
350 " 400 "	6 0
400 " 450 "	7 0
450 " 500 "	8 0

and 1 guinea for every additional 50 tons, or less.  
Rent of above vessels to commence after 11 days from date of clearance per week, per ton register

If such vessels leave the dock without unloading, rent to commence after one clear day from date of entrance, in addition to the charge of docking and undocking.

N.B. Vessels laden with flour, seeds, or oil cake are not included in the last-mentioned rates.

Vessels laden with mixed cargoes will be charged the same tonnage or dockage rates.

Vessels loading outwards, excepting those previously exempted, will be charged, in addition to the rates before mentioned, the outward rate of 1d. per ton register if fully laden; or if partly laden, 1d. per ton on the quantity of goods taken

Steam vessels coming in to lie up, or to fit machinery, for a period not exceeding 1 week

After 1 week, per ton, per week, d. s. 0 1  
All fire or steam vessels will be charged on the gross tonnage per register.

The foregoing rates do not include the expense of mooring, unmooring, and removing.

## DISCHARGING RATES ON SHIPPING.

Per ton register	s. d.
Vessels laden with wood, from Europe or the North American Colonies	0 3
And in addition for every load of hard wood, masts, or pitch pine	1d.
For every load of fir timber or bark	2d.
Laden with timber from Africa or the East Indies, or the like cargoes	2 5
And in addition for every load discharged overboard	1s.
Laden with mahogany or other furniture-wood in logs or staves	1 9
Laden with guano, cotton seed, sulphur, hemp, flax, or wool on bulk	1 0
Laden with rice	0 9
Laden entirely with tallow	0 6
Laden with mixed cargoes, tallow, hemp, flax, ashes, or goods on bulk	s. d.
For every ton of hemp or flax	1 2
" of tallow or ashes	0 6
" of other goods in bulk	1 0
Laden entirely with goods not previously mentioned, packed in bales, bags, baskets, cases, casks, chests, or other similar packages (each package or piece not exceeding 5 cwt.), and metal in pigs, bars, rods, plates, or similar pieces	0 9

Vessels have not proper convenience for discharging, or if their cargoes are of extra dimension or weight, additional rates will be charged.

Surveying ships, for storage &c., and furnishing a certificate for water supplied to ships, per 100 gals. 21

Office.—It is the duty of the ship's officer in charge to see that a safe gangway is made on board or over a vessel, and that it is properly secured whenever it is necessary to shift the same for the moorings, as the ship's officer is responsible for the safety and security of the gangway.

General Information.—Vessels and craft are

docked and undocked, before and after high water according to circumstances. Deliveries from the warehouses and yards of the Company, by land or water, commenced before four o'clock, and capable of being completed before half-past four, will be proceeded with, if desired.

6. Mill Wall Dock.—The Mill Wall Dock Company have no published list of charges for ships or goods; but if any person wish to bring into this dock either ships or goods, the manager is ready to make favourable arrangements for transacting any business, which can be done at the Dock House Railway place close to the Terminus of the Blackwall Railway, Fenchurch Street.

In 1863 a Company was incorporated for constructing docks, warehouses &c. in the parish of Battersea, and its powers were extended by Parliament in 1864 and 1865.

7. London Port Dues; Charges on account of Lights, Pilotage &c. in the Thames; Shipping &c. of London.—It is highly desirable that expert pilots, brilliant lights, and every other means that it is possible to devise, should be afforded to render navigation safe and expeditious. But to secure these advantages, it is indispensable that the charges on their account should be moderate. If they be otherwise, navigators are not unfrequently tempted to resort to what are less expensive, though less secure, channels. This principle has not, however obvious, been always kept sufficiently in view either in this or in other countries. During the latter years of the war, and down to 1825, the charges on account of docks, lights, pilotage &c. on ships in the Thames, and most other British ports, were exceedingly heavy, and would, no doubt, had they been maintained, have materially injured our commerce. Instead, also, of encouraging the resort of foreign ships to our ports, a contrary policy was adopted; the charges laid on them being usually about double those laid on British ships. This regulation was intended to promote the employment of the latter; but, as it led to reprisals in other countries, its real influence is believed to have been quite different; while, by driving away foreigners, it injured the trade of the country, and prevented our ports from becoming, what they are so well fitted to be, the emporiums of the world. We are glad, however, to have to state that the circumstances now alluded to have been materially, or rather wholly, changed. In 1825 the various dock monopolies expired; and a very great reduction has since been made in the charges on account of the docks, which, as already seen, are now very moderate indeed.

Exclusive of the dock duties, certain port or tonnage duties were imposed on ships frequenting the port of London, by the Acts 39 Geo. III. c. 69, 43 Geo. III. c. 124 &c. partly to pay the harbour-masters, provide mooring chains &c., and partly to create a fund for the improvement of the port, and in particular for defraying the cost of making a navigable canal across the Isle of Dogs. But this canal having been sold for 120,000l. to the West India Dock Company, under the 10 Geo. IV. c. 130, and the sums advanced by the public for the improvement of the port having been repaid, it was judiciously resolved to reduce the port duties to the lowest rates capable of defraying the necessary expenses. This was effected by the 4 & 5 Wm. IV. c. 32, which imposes the following tonnage duties on vessels in the port:—

per ton, d.  
1st. Class.—For every ship or other vessel trading coastwise between the port of London or any port or place in Great Britain, Ireland, the Orkneys, Shetland, or the Western Islands of Scotland, there shall be paid for every voyage in and out of the said port

2nd Class.—For every ship &c. entering inwards or clearing outwards from or to Denmark, Norway, or Lapland (on this side of the North Cape), or from Helsing, Hamburg, Bremen, or any other part of Germany bordering on or near the Germanic Ocean, or from or to Holland, or any other of the United Provinces, or Brabant, Antwerp, Flinders, or any other part of the Netherlands, or from or to France (within 150 miles thence), Jersey, Alderney, Sark, or the Isle of Man, there shall be paid for every &c. as above . . . 4

3rd Class.—For every ship &c. entering inwards or clearing outwards from or to Lapland (beyond the North Cape), Finland, Russia (without or within the Baltic Sea), Livonia, Courland, Island, Prussia, Sweden, or any other country or place within the Baltic Sea, there shall be paid for every &c. as above . . . 3

4th Class.—For every ship &c. entering inwards or clearing outwards from or to France (between Oshant and Spain), Portugal, Spain (without the Mediterranean), or any of the Azores, Madeira, or Canary Islands, or any of the United States of America, or of the British colonies or provinces in North America or Florida, there shall be paid for every &c. as above . . . 2

5th Class.—For every ship &c. entering inwards or clearing outwards from or to Greenland, Gibraltar, France, or Spain (within the Mediterranean), or any country, island, port, or place within or bordering on or near the Mediterranean or Adriatic Sea, or from the West Indies, Louisiana, Mexico, South America, Africa, East India, China, or any other country, island, port, or place within or bordering on or near the Pacific Ocean, or from any other country, island, port, or place whatsoever, to the southward of 25° of north latitude, there shall be paid &c. as above . . . 2

**Exemptions.**—Ships of war, and ships of the property of her Majesty or any of the Royal Family. Any vessel coming to or going coastwise from the port of London, or to any part of Great Britain, unless such vessel shall exceed 45 tons. Any vessel bringing corn coastwise, the principal part of whose cargo shall consist of corn. Any fishing smacks, lobster and oyster boats, or vessels for passengers. Any vessel or craft navigating the

Thames above and below London Bridge as far as Gravesend only. Any vessel entering inwards or outwards in ballast.

Owing to the distance of London from the sea, and the rather intricate navigation at the mouth of the river, the charges on account of lights and pilotage must necessarily be comparatively heavy. They have, however, been very materially reduced of late years. The charges on account of the lights under the management of the Trinity House have been diminished, in almost every instance, as much as a half, and sometimes even more, since 1823. [LIGHT-HOUSES.] The practice of imposing discriminating light dues on foreign vessels no longer exists. For the rates of pilotage, see PILOTAGE.

The oppressive and troublesome charges in the port of London, imposed on alien goods under the names of package, scavage &c. [PACKAGES] were put an end to in 1833. At present, therefore, we believe we are warranted in affirming that, considering its distance from the sea, the public charges on shipping in the port of London are quite as reasonable as in any other port of the empire, or of the world. But we are inclined to think that further reductions may still be effected, particularly in the article pilotage.

The following statement shows the nature and amount of the various charges that are at present (1866) incurred by vessels in the port of London:—

*Account of Charges that were Paid on a Ship of about 480 Tons (from China) Entering and Departing the Port of London, Laden both Ways, everything being conducted with strict Economy, and excluding any Charge on account of Extraordinary Despatch or Superior Accommodation; and that would be Paid by a Ship of 1,000 Tons under the like Circumstances.*

	Inward	480 Ton Ship	1000 Ton ship

Landing pilot	1 0 0	1 0 0	1 0 0
Towage (depending on distance)	3 3 0	3 3 0	3 3 0
Clearing out and victualling bill	26 0 0	54 5 4	54 5 4
Shevcliffe, 1s. 1d. per ton, taken on board	40 6 9	54 11 0	54 11 0

**Mem.**—The charge for tonnage entry is usually 5s. Dock rent after 4 weeks, from date of entrance if the cargo be discharged by crew, and from final date of discharge if the cargo be discharged by the Dock Company, 1d. per register ton per week. Dock rates, tonnage rate, 9d. per register ton. Discharging cargo, 9d. per register ton. (No charge made for excess above register tonnage.) Dower dues are 13d. per ton, but only on vessels under 500 tons register; and the Ramsgate dues, under 500 tons, 1d. per ton. Lights.—Should the vessel call at Southampton, an extra charge is made of 1/2d. per 100; if at Plymouth, 1d. per ton. There is also a charge on each ship varying from 1s. to 5s., according to the tonnage, upwards only.

*Arrivals and Clearances Coastwise of Sailing and Steam Vessels at the Port of London in 1866.*

	Sailing		Steam		Total
	Vessels	Tons	Vessels	Tons	
Arrivals	9,815	1,143,781	4,999	1,895,425	14,814
Clearances	5,784	209,912	1,783	779,165	7,567
Total	15,599	1,353,693	6,782	2,674,590	22,381

**Amount of Shipping &c. belonging to the Port of London.**—According to the official accounts, there belonged to this port on December 31, 1866, 2,558 sailing vessels; of these, 1,748, of the aggregate burden of 814,906 tons, were respectively above 50 tons register, while 810, of the aggregate burden of 28,248 tons, were respectively under 50 tons register. There then also belonged to the port 229 steam vessels, of the burden of 305,591 tons. In 1819 the gross customs duty collected in the port of London amounted to 7,749,463*l.*; in 1832 it amounted to 9,431,85*l.*; and in 1858 it had in-

increased to 11,465,988! while in 1866, notwithstanding great reductions and remissions of duties, the revenue amounted to 10,550,063*l*. Exceeding the New York and Liverpool, so vast an amount of shipping and commerce was never previously concentrated in any single port. London may be truly said to be *universi orbis terrarum emporium*. May her prosperity be as lasting as it is great!

*Charges on a Vessel of 500 Tons Register, entering the Port of London in Ballast, and leaving in same state, being in Dock a Fortnight.*

Reporting at Custom-House	£	s.	d.
Downs to Gravesend	16	6	0
Putting pilot on board (including pilotage from Dungeness to the Downs)	5	19	0
Gravesend to London	2	10	0
Wharves			0 15 8
Ramsgate harbour dues, <i>½d.</i> per ton (Tonnage per agreement)			16 4 8
Dock dues, <i>½d.</i> per ton (Victoria Dock, <i>½d.</i> per ton per week; Surrey Commercial and London Docks, <i>½d.</i> per ton per week, if from north of Europe; and all others, <i>½d.</i> per ton)

Butter	" " 386,656
Cheese	" " 255,189
Eggs	" great hundreds 650,419
Lard	" cwt. 2,432
Rags, and other materials, for making paper	" tons 11,088
Rice, raw in the husk	" cwt. 997,098
Sulphate and calcie nitre	" " 129,768
Seeds: Clover	" " 83,762
Flaxseed and linseed	" qrs. 271,584
Rapeseed	" " 307,510
Silk, raw	" lbs. 730,367
Thrown	" " 39,016
Silk manufactures of Europe:	
Broad stuffs	" " 780,939
Ribbons	" " 141,863
Silk manufactures of India:	
Bandannas, corahs, choppas, muscote cloths, rumals, and mittans	" pieces 56,752
Spices: Pepper	" lbs. 11,723,628
Pinnetto	" cwt. 134,090
Spirits: Rum	" gallons 5,175,169
Brandy	" " 5,201,781
Geneva	" " 59,210
Sugar, unrefined:	
Equal to white clayed	" cwt. 61,121
Not equal to white, but equal to brown clayed	" " 1,580,274
Equal to brown muscovado	" " 1,707,510
Not equal to brown muscovado	" " 988,578
Total of sugar, unrefined	" 4,537,295
Sugar, refined, and sugar candy	" " 135,571
Tallow	" lbs. 56,051
Muscades	" " 756,832
Tea	" lbs. 136,774,661
Tobacco:	
Strained	" " 10,710,517
Unstrained	" " 21,163,435
Manufactured, cigars and snuff	" " 1,888,765
Wine:	
Red	" " 4,864,918
White	" " 5,598,217
Total of wine	" " 10,463,135
Wool and timber:	
Not sawn or split, or otherwise dressed, except hewn	" loads 246,099
Doals, battens, boards, feet, sawn or split	" " 593,910
Slaves	" " 31,192
Wool, sheep and lambs' and alpacas and llamas'	" lbs. 151,796,249
Woolen manufactures	" value 2768,160

The value of the imports into the port of London in ordinary years considerably exceeds double the value of the exports.

DOCKS

Account of the Number and Tonnage of British and Foreign Ships which arrived with cargoes and in Ballast at the Port of London in 1866, specifying the Countries whence they arrived, and the Number and Tonnage of the Ships from each.

## II. SOUTHAMPTON DOCKS, SHIPPING &amp;c.

Southampton, at the embouchure of the Itchen, on the E. side of the large inlet of the sea called Southampton Water, opposite to the Isle of Wight, lat. 50° 53' 59" N., long. 1° 24' W., may be regarded as one of the outports of the metropolis. It is situated about 70 miles (direct distance) W.S.W. from London, the journey between them being performed by means of the South-Western Railway in from 2 to 3 hours. Southampton Water affords entrance at all times of tide, and secure anchorage in all weathers to any number of the largest merchant ships, being completely protected from the seas that would otherwise be thrown in by south-easterly gales by the Isle of Wight, its natural breakwater. Ships resorting to this port, or anchoring in Spithead Roads, or in the channel between the Isle of Wight and the mainland, may get to sea, in almost every wind, with comparative facility. Hence it is usual for ships from London bound for the Mediterranean, India, the West Indies, or America, to touch at Cowes, opposite to Southampton Water, to take on board passengers, who thus avoid the lengthened and difficult navigation round by the Forelands and Beachy Head, while at the same time they are all but certain of being immediately able to proceed on their voyage; and hence, also, Southampton is the station of the mail steamers to Alexandria, India, Cape of Good Hope, New Zealand and Australia by Panama, the West Indies &c. Latterly, too, the great natural advantages of its situation have been, and are in the course of being, most materially improved. The channel of the Itchen has been deepened; the docks connected with it have been completed on a large scale, and with every suitable accommodation, by the Dock Company incorporated in 1856.

The docks are excavated on a tongue of land rising about 175 acres, close to the terminus of the South-Western Railway. The first consists of an open dock or basin containing 16 acres water. It has a depth of 18 feet at low water, the average rise of the tide being 13 feet; its frontage extends to 3,300 feet, and it is flanked by extensive bonded warehouses, sheds, and cellars. A second or close dock (the first of a series) is designed to comprise three others of still larger dimensions; it contains a water area of 10 acres, and an average permanent depth of 28 feet water, surrounded, like the open dock, by bonded warehouses, sheds, vaults, and numerous cranes. It is connected on lines from the adjacent railway to the quays, and from the quays, alongside of which the ships are berthed. In the open dock are the powerful sheers, tested to the weight of

50 tons, for the shifting of boilers or other heavy machinery, for masting ships &c.

Attached to the wet docks are three large graving or dry docks of the following dimensions, viz:—

	Eastern	Middle	Western
Length from gates to head	538	382	316
Length on blocks	445	333	343
Width of gates	80	51	66
Depth of water over blocks, at ordinary springs	25	11	20
Neap	21	10	16

Large ships of from 1,000 tons in the smallest up to 5,000 tons in the largest of these docks can be docked and undocked with a facility unknown in most other ports.

Four steam engines are employed in pumping out the water from these graving docks, the engines each raising 120 tons of water per minute.

*Tides at Southampton.*—There is a double high water at this port, the knowledge of which is most important to the mariner. The first high water at the full and change of the moon is at 10h. 30m., the second high water at 12h. 45m., and low water at 4h. The rise at springs is 18 feet, and at neaps 8 feet. To ships using the graving docks this double tide is very advantageous, as the water remains nearly stationary for 2 hours; thus, without risk, allowing vessels to come out of dock, and others to enter, without losing a tide.

This double high water is probably caused by the tide at Spithead; for as long as it runs strong to the westward, the water is kept up at Southampton, and there is no fall of consequence until the tide begins to slack at Spithead; but when the tide makes to the eastward at that point, the water falls rapidly at Southampton.

After low water the tide rises pretty steadily for 7 hours, giving the first or proper high water; it then ebbs for an hour about 9 inches, at the end of which time it again commences to rise, and in about 14 h. reaches its former level, and sometimes higher: this is called the second high water.

The following are the charges at the Dry Docks:—

*Rates to be Charged for every Ship or Vessel on the Gross Tonnage.*

For each working day (not exceeding 100 tons), 1l.  
(for every 50 tons above 100 tons), 2s.  
The day (24 hours) to end at noon, and each fractional part of a day to be charged as one day.

It lies exclusively with the Dock Company to determine into which of the three docks a vessel shall be taken; and, with a view to the general accommodation of all parties requiring the use of the dry docks, it is ordered that no ship be allowed to remain longer than fourteen days in either of the dry docks, unless under special agreement.

DOCKS

528

In addition to the foregoing rate per day for occupation of the dock, every vessel will be charged as follows, viz:—  
For docking, pumping, and undocking, including use of stages, shores and shore ropes, saw pits, smithy, and pitch furnace:—

For vessels not exceeding 500 tons	2
500 "	15
700 "	20
1,000 "	25
1,500 "	35
2,000 "	40
2,500 "	50
3,000 "	60
3,500 "	70
4,000 "	80
4,500 "	90
5,000 "	100

In the case of extra pumping being required by the captain or owners for the sake of despatch, an additional charge will be made. Caps, and fixing the same, not exceeding 5 inches thick, each 2s. 6d.; exceeding 5 inches, per inch additional 6d.

The following Special Charges to be paid (when incurred) in addition to the foregoing Rates:—For caps split out, if 2½-inch, 2s. 6d. each; 3-inch, 3s.; 4-inch, 4s.; and so on in proportion.

For shores cut, in docking or hanging the ship, 1s. to 2s. 6d. each, according to injury.  
The use of the joiner's shop, lock up warehouse, counting-house and store (with copper milling-machine when required) to be charged for in addition.

For the use of the steam-kiln, 10s. per day. Fuel for this service, as also for heating pitch, to be charged according to consumption.

N.B.—No ship will be allowed to enter the dry docks with gunpowder on board.

Southampton is distant by rail from London 80 miles, and from Birmingham 140, Manchester 216, and Liverpool 229, by way of Basingstoke, Reading, Oxford, Banbury, and Warwick. By the Coast-line of Railway it is distant from Portsmouth 16 miles, Brighton 60, and from Dorchester (to the west) 60 miles.

By sea it is distant from Havre 102 miles; and by means of a combination with the Havre and Paris Railway, a system of through rates has been introduced, by which all the towns on the continent connected by railway with Paris may send the goods to Southampton for trans-shipment, or for the supply of the London and Birmingham markets. This, as already noticed, is the point of departure and arrival of the packet ships belonging to the steam companies which carry on the mail packet service, and the general trade with Australia, Ceylon, the East Indies, and China; with Australia, America, including the West Indies, Brazil; and with the Peninsula, Mediterranean, Constantinople, and the Levant generally.

A new service by steam has been opened with Hamburg, New York, and the Havannah; and Southampton is daily becoming of more importance as a great continental entrepôt. In 1866 the declared value of the exports of the produce of the United Kingdom from Southampton amounted to 3,718,975l.; the customs revenue for 1866 collected at the port being 116,609l.

The rates and charges which the Dock Company levy are generally a modification of those of the principal docks of the port of London.

Vessels Inwards		Vessels Outwards.		
Arriving from	Per Ton Register	Privilege	Sailing for	Per Ton Register
1st Class.—Any port of the United Kingdom, Isle of Man, Jersey, Guernsey, and their dependencies, or European ports outside the Baltic, between the North Cape and the Straits of Gibraltar	6d. ## II. LIVERPOOL AND BIRKENHEAD DOCKS, SHIPPING &c.

The rapid rise of the port of Liverpool to its present consequence, though no doubt principally owing, like that of the town itself, to the astonishing increase of manufactures and population in the extensive district of which it is the grand emporium, is also, in part, owing to the facilities that have been given to navigation and commerce by the construction of its wet and dry docks. The entrance to the estuary of the Mersey is a good one, unencumbered with sand-banks, and the channel crossed by a bar, which, however, has at low water a depth of 21 ft. at neap, and 31 ft. at spring tides, there is water for the largest ships: the channels, too, being well indicated by light-ships and light-ships, and marked with buoys, there is no difficulty in making the port. In fact, since the opening of the Victoria and Queen's canals, vessels of the largest size cross the bar at low water.

But the land around being low, ships in the river are exposed to risk from gales of wind; and to obviate this inconvenience, and to facilitate the loading and unloading, the docks have been constructed, which constitute the great glory of the town. The second wet dock in the British Empire was constructed here under an Act (8 Anne, c. 12) passed in 1709, and another about half a century after, since which period, and especially in late years, many new docks and basins have been constructed, some of which are on a very magnificent scale, with entrances capable of admitting ships requiring a width of 100 feet, and furnished with all sorts of conveniences. The area of the docks in use in 1867 amounted to more than 239 acres, and that of the basins to more than 19 acres. The quay space is of the enormous extent of above 16 miles. The dry docks contain a total length at bottom of 10,136½ feet.

The docks are defended on the side next the sea by a sea-wall above 5 miles in length, which, if taken into account the difficulties attending the construction, will be found to be one of the greatest works of modern times. It averages 11 feet in thickness, and 40 feet in height from the foundation; all the more modern part being faced with Scotch granite. Every precaution is taken to prevent the accumulation of mud in the docks by the use of steam dredging-machines; and the rules, enforced by vigilant police, are established to maintain good order, and prevent fire and depredation.

The docks are all constructed on property belonging to the Mersey Docks and Harbour Board, in whom is vested the dock estate, which is managed solely for the benefit of the public. In consequence of this result, the board consists of 28 members, of whom 24 are chosen by parties who themselves pay 25% each of said dues, and who are nominated by the conservators of the Mersey, that is, by the First Lord of the Admiralty, the Chancellor of the Duchy of Lancaster, and the Chief Commissioner of Woods

and Forests for the time being. There were in 1858, 1,451 dock-rate payers on the register; and they only have a voice in the administration of the dock affairs. (Baines's *Liverpool in 1859*, p. 79.) Whenever there is any considerable surplus revenue after providing for current expenses and the interest of money borrowed, it is applied to the reduction of the dock rates. The bonding and long to the dock estate, but are, for the most part, private property. Most of them are in the immediate vicinity of the docks, but some are at a considerable distance; and there is not in these cases, the same security against fire and depredation, the warehouses being built along the dock-quays, goods are loaded and unloaded with the greatest possible facility, and are subsequently under efficient protection. But in this respect there has latterly been a great improvement. For the numerous and destructive fires which formerly took place in private warehouses have led to the adoption of certain stringent rules for their management, which have proved so effectual that no fire of any consequence has occurred for several years, and the premium of insurance on goods lodged in warehouses conducted according to the established regulations has been reduced from 35s. per cent. per annum, to 4s. per cent. on certified warehouses under private management, and to 3s. 6d. per cent. on dock warehouses.

The board have built corn warehouses on either side of the river, which are large enough to contain from 300,000 to 400,000 quarters of grain.

In 1866, 12,622 vessels, with a burden of 3,749,428 tons, entered Liverpool. A new observatory was completed at Bidston; and a sea wall, commenced in 1865 by the Weaver Navigation Company, was completed in 1866. Two new docks were finished in 1867.

Liverpool has two gridirons of 822½ lineal feet, and four landing stages, the combined length of which is 3,347½ feet.

The half tide and graving docks on the Herkulaneum estate were completed and opened for use on March 16, 1866.

And in addition to those belonging to private parties, warehouses belonging to the Dock Trust, on the London plan, have been built round the quays of the Albert Dock, Stanley Dock, New Wapping Dock &c. All the dock quays have open sheds for the temporary deposit of goods alongside the ships, some of which are really magnificent structures. And besides these, there are also upon some of the dock quays, as in the Prince's Dock, Nelson Dock &c., what are termed transit sheds, of one storey, substantially built, and perfectly secured, into which ships can be discharged with unusual rapidity; the goods being removed to the proper warehouses at convenience.

**Loading and Unloading of Ships.**—In London this is effected by the servants of the different dock companies, whereas in Liverpool, except where the London system is introduced, it is effected by other parties under a plan introduced by the 9 & 10 Vict. c. 109, which has been found to answer extremely well. The owner of the ship, or the master in his behalf, unloads the cargo; and as the labour to accomplish this object depends on a variety of circumstances, such as the nature of the cargo, the magnitude of the ship, her proximity to the quay &c., the charge is regulated accordingly. The practice is for the shipowner or master to make a special agree-

the other founders and improvers of the cotton manufacture, has been, though not so direct, quite as powerful in the docks and warehouses of Liverpool as in the mills of Manchester. Liverpool also exports large quantities of iron from the mining districts of Staffordshire and Wales, of earthenware from the Potteries, and of coal from the adjoining coal districts.

Four-fifths of the trade between the United Kingdom and the United States centres in Liverpool; and she has a large share of the trade with South America and the West Indies. She also carries on a considerable trade with the East Indies and China, though in this department she is surpassed by London. Indeed, the ships and products of Liverpool are to be found in every port, in every part of the world accessible to merchantmen.

In her earlier days Liverpool took an active part in privateering, and was also largely connected with the slave trade from the Bight of Biafra. But the estimate formed of that trade previously to 1807 was very different from what it is now; and Liverpool has made the best reparation possible for the part she took in it; for she established in its stead, and has followed up with zeal and perseverance, the trade in palm-oil, till it has become of the first importance. In proof of this statement it is enough to say that in 1866 no fewer than 785,751 cwt. of palm-oil, worth 1,579,385*l.*, were imported from the west coast of Africa into the United Kingdom; and that of these, 476,374 cwt. were imported to Liverpool. We are glad to have an opportunity of mentioning a circumstance of

this sort, not so much on account of the credit which it reflects on the enterprising merchants by whom the trade has been established, as because it will, if anything can, introduce civilisation among the blacks, and impress them with a just sense of the advantages of industry and commerce.

Liverpool is the greatest port, not in the United Kingdom only, but in the world, for the shipment of emigrants. The numbers of emigrants from Liverpool during the three years 1865-67 were 121,109, 123,414, and 115,707, out of totals applicable to the United Kingdom, for the same years, of 209,801, 204,882, and 195,958. The great majority went to the United States.

The principal imports into Liverpool in the year 1866 are as follows:—

Articles	Quantities
Cocoa - - - - -	lbs. 2,824,323
Coffee - - - - -	9,281,822
Corn and meal - - - - -	cwt. 9,560,472
Cotton - - - - -	11,298,088
Tanned and dressed hides - - - - -	lbs. 1,197,448
Palm oil - - - - -	cwt. 476,374
Provisions. [Eaux.] - - - - -	1,037,903
Rice - - - - -	1,217,319
Salt-petre - - - - -	666,891
Pepper - - - - -	lbs. 2,781,013
Sulphur - - - - -	gallons 2,587,571
Sugar - - - - -	cwt. 2,601,559
Tea - - - - -	lbs. 2,717,617
Tobacco - - - - -	19,655,912
Wine - - - - -	gallons 1,462,145
Wool - - - - -	lbs. 58,268,117

The export of cattle, sheep, and swine from Ireland to Great Britain, the estimated value of which, in 1866, was 8,193,018*l.* (see *Thom's Almanach* for 1868), is carried on to a great extent through the port of Liverpool.

Quantities of Principal Duty-paying Articles Imported in Warehouse on December 31, 1865; Received into and Delivered from Warehouse in 1866; and Remaining in Warehouse on December 31, 1866, at the Port of Liverpool.

Articles	In Warehouse Dec. 31, 1865	Received in Warehouse, 1866	Delivered from Warehouse, 1866	In Warehouse Dec. 31, 1866

the vast preponderance of Liverpool in the trade will be obvious from an examination of the following statement, which is

taken from the comprehensive and valuable tables published by Messrs. George Holt and Co., cotton brokers:—

Imports of Cotton Wool into Liverpool in Packages, 1866.

	Jan.	Feb.	Mar.	April	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.	Total in 1866	Total in 1865

It is extremely difficult, or rather, we should say, quite impossible, to form any correct estimate of the total amount of the trade of Liverpool. In 1866 the real or declared value of the produce and manufactures of the United Kingdom exported from the port to foreign parts amounted to 87,186,497l., as seen in the following statement.

Account of the Quantities and Values of the Principal Articles of British and Irish Produce Exported from Liverpool in 1866, with the Total Value of the Exports, and the Amount of Customs Duty collected at the Port in the same Year.

Articles	Quantities	Value
Alkali soda - cwt.	1,397,616	813,671
Apparel - value	-	6,217,112
Arms and ammunition - no.	88,202	105,220
Fire arms (small) - no.	88,202	105,220
Gunpowder - lbs.	3,833,965	59,417
Flint and steel - barrels	192,970	59,417
Butter - cwt.	32,012	12,012
Candles, tapers, &c.	469,145	12,012
Cups, chafins, and eulin tins	729,823	12,012
Cotton yarn	47,601,578	4,130,207
Cotton manufactures:	-	-
Piece goods - yards	1,696,475,616	37,511,500
Hosiery and small wares - value	-	1,915,011
Drugs and chemical products - value	-	190,117
Earthenware and porcelain - packages	186,295	1,471,077
Fish, herrings - barrels	5,761	5,761
Glass of all kinds - value	-	-
Haberdashery and millinery - value	-	2,415,200
Hardware and cutlery, of all sorts - value	-	2,190,188
Leather, tanned, unwrought - cwt.	6,079	3,000
Leather, wrought - value	-	87,300
Saddlery and harness - lbs.	11,728,591	84,300
Linen yarn - lbs.	183,402,851	6,217,112
Linen manufactures:	-	-
Piece goods - value	-	1,397,616
Threads, tapes, and small wares - value	-	1,397,616
Machinery and millwork - value	-	1,397,616
Metals:	-	-
Iron pig, bar, bolt, wire, and cast - ton	219,628	1,471,077
Zincrod - ton	71,079	1,471,077
Steel, unwrought - ton	130,995	1,471,077
Copper, unwrought - cwt.	24,293	26,516
Copper, wrought - cwt.	135,519	61,713
Lead, unwrought - tons	5,800	18,600
Tin, unwrought - cwt.	97,613	12,012
Plates - value	19,535,333	4,130,207
Oil, seed - gallons	1,907,100	3,000
Painters' colours - value	-	3,000
Paper (except hanging) - cwt.	49,587	10,572
Salt - tons	530,634	26,516
Silk, thrown, and yarn - lbs.	85,625	61,713
Spirits, British and Irish - gallons	202,770	186,000
Sugar, refined - cwt.	97,232	186,000
Wool, sheep and lamb's - lbs.	185,591	3,000

The mercantile marine of Liverpool is only to that of New York. There belonged to the port on December 31, 1866, 2,998 ships, of 2,569 were sailing vessels of the aggregate tonnage of 1,326,317 tons, and 429 steamers of the aggregate burden of 205,664 tons.

The gross customs revenue of Liverpool amounted in 1866 to 2,867,601l., while London, in the same year, amounted to 10,200,000l. But it would be an error to suppose that the value of the metropolis exceeded that of Liverpool in this proportion. Cotton wool, and other materials for manufactures, on which no duty is levied, form the principal part of the foreign imports to Liverpool; whereas London imports commodities

the above, about half are supposed to be in the Irish trade.

**of Packets.**—Few things have conduced to the progress of the trade of Liverpool, and to the extension of the establishment in which no duty is levied on the foreign imports, than the establishment of regular communication by means of packet

ships between this great emporium and other British and foreign ports. These sail to almost all parts of the world. Besides no fewer than 5 great lines of steam packets which maintain a regular intercourse with New York and Boston, in the United States, and Halifax, Nova Scotia, Quebec,

*Abstract of chief Bye-Laws (issued 1866) made under Dock Consolidation Act, 1858 &c.*

When any delay shall take place in loading or discharging, the board may employ persons for that purpose, and masters of vessels are to assist in such work by clearing deck, and stowing away. Penalty on default, 5*l*.

Masters of vessels to obey directions of dock officers in relation to the manner of coming in or going out of dock, and not to offer any obstruction to the opening or shutting of gates. Penalty, 20*l*.

No person to open or shut, or attempt to open or shut, any dock gate, sluice, or clog: penalty, 100*l*. Nor any swing-bridge: penalty, 20*l*.

No ship to enter or be within any dock under sail. Penalty, 5*l*.

Masters of vessels in the river, near to dock entrances, to remove same when required by dock officers. Penalty, 10*l*; and the expense of removal by the board to be also paid by such masters.

Masters and owners of vessels to obey the directions of, and to offer no obstruction to, dock officers, as to the mooring, unmooring, moving, or removing any vessel from one part of any dock to another part, or to any other dock; or in the regulating the position, loading, and discharging of such vessels, and the quay space to be occupied by such vessels. Penalty, 10*l*; and all expenses incurred by dock officers in carrying out this enactment to be also paid by such masters or owners.

Dock officers may employ riggers &c. for working vessels in and out of dock, at the expense of the masters or owners.

The board, in exercise of their authority to run docks dry for repair &c., may remove vessels at the expense of the owners.

All vessels in dock to be kept so loaded or ballasted as to be safely removed. Penalty, 50*l*.

Unserviceable vessels encumbering the docks may be sold by the board at the end of four months. (Sec. 58.) Board may also remove wrecks in dock or elsewhere at the owner's expense, and sell same to recover expenses.

No vessel to be brought into dock, or alongside docks &c. contrary to any order of dock officers. Penalty, 20*l*.

No vessel to be brought in any entrance, basin, dock, when the signal is hoisted that the dock fall. Penalty, 20*l*.

Penalty on master for giving to dock officers false report as to draught of water, 100*l*.

No ballast, rubbish, dust, ashes, shingle, stone, or other refuse, or things, to be thrown into any dock. Penalty, 50*l*.

No ballast, stone, shingle, cinders, ashes, lime, dung, rubbish, dust, or refuse of any kind to be laid upon any quay or pier within three fathoms from margin of the dock or river, and if so laid to be removed within twenty-four hours. Penalty, 5*l*; and there is an additional penalty of 5*l*. for every further day the same shall remain removed.

Masters of vessels loading or discharging ballast, ashes, shingle, coals, cinders, ashes, limestones, tiles, dung, rubbish, dust, or any other matter or thing, to use for such purpose as may be directed by the board, to the satisfaction of the dock master. Penalty, 5*l*.

Goods (except timber, as to which there are other regulations) permitted to remain on any quay or pier beyond 4 o'clock p.m. of the second day after landing or depositing thereon, will incur a quay rent of 5*s*. per hour, and which is doubled in the event of goods being left to remain over the third day, subject to

certain powers of the board to mitigate the same. And in addition thereto, if permitted to remain thereon, so as, in the judgment of the harbour master, dock master, or traffic manager, to be an obstruction to business, the consignee will incur a penalty of 5*l*., and the board or their officers may warehouse and sell the goods.

Vessels damaging any of the works of the board may be detained until damage paid for or deposit made.

Penalty for offering bribes to dock officers and on the latter for receiving the same, 20*l*. each. (N.B.—If either of the parties giving or accepting such bribes shall, before proceedings are commenced, give information and discovery of such offence, he will be excused from the penalty.)

No person to assault, resist, obstruct, or impede any dock officer in the execution of his duty, or disobey his lawful orders, or use abusive or offensive language, or aid or incite others to do so. Penalty, 10*l*.

No ballast, ashes, or other bulky substance, or rubbish, to be thrown into the river, or any of the sea channels, or from any pier or quay. Penalty, 10*l*.

If any vessel shall load or discharge any portion of her cargo, without the previous consent of the board, in any part of the river north of an imaginary straight line from Rock Ferry Slip to the southern basin of Harrington Dock, the master or owner of such vessel will be liable to pay to the board double tonnage and dock rates; and if such vessel shall afterwards enter the docks, she will be further liable to the usual tonnage and other rates.

Persons wilfully or carelessly injuring any lightship, beacon, or buoy, landmark, lifeboat-house, or lifeboat, will incur a penalty of 20*l*., and be moreover required to make good the damage.

No vessel to be made fast to buoys other than mooring buoys. Penalty, 20*l*.

Timber alone to be placed on land exclusively appropriated for timber. Penalty, 5*s*. per hour.

No timber to be discharged into docks without consent of harbour master: penalty, 10*l*. And if so discharged by consent, and not removed within 24 hours afterwards, there is a further penalty of 5*s*. per hour.

Owners of timber permitting the same to remain on the quays or timber dépôt beyond the time prescribed by the bye-laws after the same has been passed by the Customs officers, will incur a quay rent of 5*s*. per hour, and 10*s*. per hour, respectively as above mentioned with respect to other goods left unduly on the quays. Note.—The time now allowed is prescribed by bye-law No. 97.

The board are authorised to sell any timber unlawfully laid on any quay or other place, or which may remain beyond the time within which the same is required to be removed.

As to the use of fires and lights on board ships in the docks, the following penalties are also imposed, viz. :—

For using a fire or light on board any vessel in any dock or basin not set apart or appointed by the board for that purpose, 100*l*.

For using a fire or light on board any vessel in a dock or basin set apart or appointed by the board for that purpose, but in a manner not authorised by the bye-laws, 20*l*.

For disobedience to any order given by an officer of the board, or by any police constable or watchman, for extinguishing any fire or light used in contravention of the bye-laws, or for obstructing an officer in boarding or searching any vessel for fires and lights, 10*l*.

mean's Bay Head and southern coast in Mulling Head east of Ireland, &c. from Liverpool within the United Kingdom, or the coast of the Cape of Cape Horn, &c. and from Liverpool eastward of the Cape of Cape Horn, &c. from sunrise to sunset N.W. in white, &c. head; and in the night or day, &c. to prevent vessels.

For smoking tobacco or other substance within any shed, warehouse, or dock, or on any pier, or on board a vessel in any dock, 5*l*.

No aqua-fortis, oil of vitriol, or other goods of dangerous quality, to be placed on any quay unless distinctly marked as such outside the package, and without giving notice to the dock officers. Penalty, 20*l*. And if such goods are not removed both from the quays and vessels within two hours after notice from the dock officers, there is a further penalty of 20*l*. for every hour such goods &c. remain. And if not so removed, the board may remove them at the cost of the owner. And such goods must be watched from one hour before sunset to one hour after sunrise by the owners of such goods or the master of the vessel: penalty, 5*l*., and the board may watch the same at the owner's expense.

No persons to bring gunpowder into any dock or into vessels lying therein; and no masters of vessels having gunpowder on board to suffer such vessels to be brought or lie within the buoys moored off the docks, or within 300 yards of any dock or pier. Penalty, 100*l*.

The board are empowered to appropriate two places on the estate, on each side of the river, at which gunpowder may be landed; and the places at present allowed by this Act, and by the by-laws for the regulation of gunpowder under the Act c. 1865, for shipping or discharging gunpowder, are—the slip at the north side of the entrance of Toxteth Dock; one berth on the south side of the Harrington Basin; the Pier Head, outside of the Egerton Dock in Toxteth Park; the Magazines landing place at Bromborough, and the Ferry Slip at Tranmere; and by the 8th bye-law for the regulation of gunpowder, quantities not exceeding 25 lbs. in weight may be embarked from the north end of the Prince's Landing Stage on notice being previously given to the stage master.

Her Majesty's ships are exempt from the above prohibitions as to gunpowder, but any person claiming such exemption without being entitled to it will incur a penalty of 10*l*.

Persons falsely claiming to be liable to harbour rates only, will incur a penalty of 50*l*.

Masters or owners of vessels neglecting or refusing to pay harbour rates will incur double rates and a penalty of 20*l*. in respect of each refusal.

Persons not making a true report as to a ship's destination on payment of rates will incur a penalty of 10*l*.

Masters or owners of vessels entering and departing in ballast, not leaving the collector's certificate with the dock master, will incur double rates and a penalty of 20*l*.

Masters of vessels refusing to produce books &c., or giving false answers to the collector of rates on goods, will incur a penalty of 10*l*.

Masters or owners of vessels and goods evading or neglecting payment of dock rates will incur double rates and a penalty of 20*l*. in each case.

Masters or owners of importing vessels not signing and leaving at the dock office, within fourteen days after discharge, a full and accurate list of all goods imported, stating the quantities and distinguishing the nett weight and contents of such goods (according to the bills of lading), or the names of the persons actually paying the freight for the same; and the owner, charterer, consignee, broker, or agent of every exporting vessel not preparing a full and accurate list of all goods so exported by such vessel from the bills of lading and freight list thereof, and not signing and leaving at the dock office within fourteen days after clearance a correct transcript

of such list, distinguishing therein the names of the several shippers of such goods, according to the bills of lading, will incur a penalty of 20*l*. in each case.

The penalties under Secs. 261 and 262 apply equally to principals and clerks or servants.

Masters of vessels giving false answers to dock officers as to the dimensions or draught of water of vessels going into the graving dock, or doing any act therein by which the draught of such vessels shall be increased while in the graving dock, will incur a penalty of 10*l*. and be liable to all damages to the board consequent thereupon.

Masters of vessels to be answerable for the acts of their crew or persons employed about such vessels, but may recover from such persons penalties incurred by their default.

Persons cutting or defacing any mooring rope or chain, or injuring any buoy, buoy-rope, or cable belonging to any lost anchor, will incur a penalty of 10*l*. and be required to pay the amount of damage.

**PILOTAGE RULES AND REGULATIONS.**

Any person acting as a pilot in the port of Liverpool, without a license, to forfeit 20*l*.

Pilots refusing to conduct ships, or assist ships in distress, to forfeit 10*l*. and lose their license.

No coasting vessel, inward or outward bound of the burden of 100 tons or upwards (unless she be in ballast), is to refuse a pilot, as the master or owner &c. must pay the full pilotage if one be offered. No vessel is deemed a coaster unless she has been 6 months in that trade, or sailed from Liverpool on a coasting voyage.

Masters of vessels forcibly taking pilots beyond the limits of the port shall pay a forfeit not exceeding 20*l*., nor less than 5*l*.

Pilots misbehaving to have their license recalled; and if they act afterwards, to be liable to the same penalties as if they were not pilots.

That the master or commander of any ship or vessel inward-bound to the port of Liverpool, which shall be liable to pay pilotage, shall, on coming within the pilots' stations, display or keep flying the usual signal for a pilot to come on board, and every master or commander shall omit so to do shall forfeit and pay any sum not exceeding 5*l*.

Masters of vessels inward or outward-bound refusing to take the first pilot who offers, to be liable to full pilotage.

Rewards for pilots assisting ships in distress to be settled by the pilot committee.

Compensation to be made to pilots for taking vessels out of port which have been forced to be fixed by the committee.

Every master to give the pilot a true account of the draught of his ship, and pilot authorized to measure.

No pilot to be allowed to lay a vessel aground without a written order from the master or owner, penalty 5*l*.

Every master sending a pilot to take charge a vessel exceeding that for which he is licensed excepting in cases of necessity, shall be fined a sum not exceeding 5*l*.

Second-class pilots are limited to vessels exceeding 500 tons, and 16 feet draught of water.

Third-class pilots, formerly 12 feet, are limited to pilot vessels not exceeding 250 tons registered and 12 feet draught of water.

In consequence of a practice now too prevalent it appears that persons not licensed, but representing themselves as such, are in the habit of taking charge of vessels as pilots: it is earnestly recommended that masters of vessels demand of

sons so re charge of is only in license. When it boarding a should be s the yards b under the l board. sons so representing themselves as pilots to take charge of vessels, to produce their license, which is only in force 12 months from the date of such license.

When it blows so strong as to prevent the pilots boarding a vessel with their small boat, the vessel should be steered with the wind on the quarter, the yards braced by, when the large boat sheers under the lee quarter, and the pilot jumps on board.

**Stations of the Pilot-Boats.**—The boat having the turn to board displays a large red and white flag at the mast-head by day, and exhibits lights in accordance with art. 8 of the Merchant Shipping Amendment Act of 1862.

The two western boats cruise off Point Lynas, or to the northward and eastward of it as wind and weather may permit, and as far to the westward as the Middle Mouse, and to the eastward until Priestholm Island bears S.S.W. by compass. The third western boat cruises to the eastward of Point Lynas, to board any vessels that may pass the first and second boats, but not farther eastward than the west end of Great Head bears S.S.W. by compass.

The fourth western boat cruises as far west as the eastern limit of the third boat, and eastward until Talargoch Chimney (on the west end of the mainland) bears S.S.W. by compass.

The fifth, or first Hoylake boat, cruises to the eastward, so as to be within 5 miles of the North Lightship.

The sixth, or second Hoylake boat, to take pilots from vessels outward-bound, and to supply pilots to all vessels to the eastward of a line from the Point of Ayr to the Bell Beacon of the Horsa Channel.

The seventh boat follows outward-bound vessels, to receive their pilots, and bring them to Liverpool.

N.B. The pilot committee recommend to the merchants &c. that when a pilot conducts a ship or vessel into the port to their satisfaction, the same pilot be employed to take the said vessel out again; but if he should be absent on duty, that one belonging to the same boat be employed.

**The Liverpool Pilots' Committee.**—This board, composed of some of the first shipowners of the port, formerly acted under a special Act of Parliament, but since January 1859 they are under the Consolidated Mersey Docks and Harbour Act; and their proceedings are submitted weekly, for confirmation, to the general board of the Mersey Docks and Harbour.

**Liverpool Life Boats.**—The dock trustees have established 5 life-boat stations, viz. at Liverpool, on Waterloo pierhead, 2 boats; Magazines, 2 boats; Hoylake, 2 boats (Hoylake 1 boat, Hilbre Island, 1 boat); Point of Air, 2 boats; Formby, 1 boat. The crews of the Liverpool and Magazines boats consist of a master and 10 men each; the boats on the other stations have a master and 12 men. The entire establishment is well conducted and efficient.

**Dock Rates to be paid on the Principal Goods, Wares, and Merchandise Imported into the Port of Liverpool from Foreign Countries, or British Colonies, Plantations, or Settlements; or brought Caskwise from Ports or Places in the United Kingdom, including the Islands of Jersey, Guernsey, Alderney, Sark, and Man; or Exported from the said Port to Foreign Countries and British Colonies, Plantations, or Settlements. (Extracted from Table in use 1868.)**

N.B. Books containing a complete list of the articles charged with dock rates may be had at the docks for a mere trifle.

In compiling this article we have derived considerable assistance from the elaborate work of Mr. Thomas Baines, entitled *A History of the Commerce and Town of Liverpool*, published in 1852; and from *Liverpool in 1853*, a smaller but very useful work of the same author. But we have been indebted for the most valuable part of our information to communications obligingly sent us by some of the most intelligent merchants belonging to the town.

IV. BRISTOL DOCKS, SHIPPING, ETC.

The city and seaport of Bristol is situated (lat. 51° 27' N., long. 2° 35' W.) on the river Avon, at about 6½ miles above its junction with the Severn, or upper part of the Bristol Channel.

The great range of tide peculiar to this locality enables some of the largest class of sailing vessels to come up the river to the town. Formerly vessels took the ground at low water; but to obviate the risk and damage frequently arising from this cause, an undertaking was projected and carried out by a private company between 1804 and 1809, by which about 3 miles of the then tidal river running through the city was converted into a floating harbour, a new channel for the tide being cut to the south of the town. The harbour or dock thus formed comprises about 55 acres of water space available for large vessels, while the total area floated and kept at one level is about 130 acres.

The area of watershed supplying this large float by the river Avon and its tributaries is upwards of 800 square miles. These docks are provided with two half tide basins for the temporary accommodation of vessels entering or leaving the port, viz. Cumberland Basin with an area of about 4 acres and entrance locks 54 feet and 45 feet wide, and Bathurst Basin with an area of about 2 acres and entrances 36 feet wide: there is also a single lock for barges and small craft bound inland.

The public quays occupy a length of about 2,000 yards, while the total length of frontage

available in that part of the harbour appropriated to masted ships is about 7,000 yards. The finished accommodation on the public quays has largely been much increased, and a system of transhipments for bonded goods provided, which much facilitates the unloading of customable goods.

Ship building has always been carried on to a fair extent in the port, and there are several convenient graving docks, leaving-up slip &c. &c. repairs.

The docks of Bristol have been since 1858 the property of the city, the corporation of which with a view to giving increased accommodation to larger steamers and to improve the navigation in the river, have obtained an Act of Parliament giving them power to provide larger and deeper entrance locks at Cumberland Basin, and to remove some of the most objectionable points or bends in the river. There are also railway courses of construction down both the right and left banks of the river, terminating at floating or landing stages at the roadstead at Kingswood.

A private company has also obtained an Act for the construction of a new dock near the river mouth.

Bristol early possessed and continues to enjoy a large share of the trade with the West Indies. Among her foreign imports the most important are sugar, timber, grain of all sorts, flour, hemp, hides, oils, tallow, tea, tobacco, dye, brandy, wine, rum &c.

The exports consist principally of the produce of the various manufactures of the city, comprising refined sugar, brass and copper articles, glass, earthenware &c., with iron, salt, coal, culm the produce of the neighbourhood, cotton, linen, and woollen goods. Bristol is also on an extensive and growing trade with France from which she imports corn, butter, bacon, hams, tallow, and other provisions, and she sends in return tea, raw and refined sugar, iron, tin plates, copper, glass, leather &c.

The imports coastwise consist mostly of tin, coal, salt, agricultural produce and foreign produce brought from other ports under bond

V. HULL DOCKS, SHIPPING &c.

There are five docks in Hull, occupying, their basins, a water area of 43½ acres, viz.:

Name	Year	Area	
		Opened for business	Area
Old Dock	1778	10	1
Humber Dock	1809	9	3 ¾
Junction Dock	1829	6	0 5
Railway Dock	1846	2	0 9
Victoria Dock	1850	20	1 3

A timber pond of 9 acres was constructed in 1853. A considerable quantity of shipping is accommodated within that part of the river that constitutes the old harbour, which may be computed at 10 acres of tidal water.

The docks are spacious, and are entirely surrounded with warehouses and deal yards. Hull is the principal entrepôt of the Baltic trade on the east coast of Great Britain, and as the third port in the kingdom, the value of exports being inferior only to those from Liverpool and London; although, from the circumstance of her staple articles of import being subject to duties or altogether free, her customs revenue is smaller than that of less important ports. In her exports amounted to 16,730,711, and her customs revenue to 839,463.

The following tables exhibit the principal features and progress of the trade of Hull during undermentioned years ending with 1867:—

Account of the Number of Coasting Vessels and their Tonnage, distinguishing those employed between Great Britain and Ireland from other Coasters, which have Entered Inwards at Bristol during the following Years.

Shipping.—There belonged to the port on January 1, 1867, 510 sailing vessels, whereof 341 the aggregate burden of 13,161 tons did not, and 159 of the aggregate burden of 30,027 tons exceeded 50 tons each. At the same date there belonged to the port 107 steamers, whereof 14 the aggregate burden of 248 tons did not, and of the aggregate burden of 42,822 tons did, and 90 tons each.

The following are the Dock and Harbour Dues payable to the Hull Dock Company for every vessel trading between the port of Kings- ton-Hull and the undermentioned ports and places:—

	Per registered ton	s. d.
any port to the northward of Yarmouth, in Norfolk, or any port to the southward of the Holy Island; and any of the above rates, as applies to Fetney Haven, Hull, and Hedon	abolished	0 1
any port or place within the above limits	0 2	
any port or place between the North Foreland and Shetland, on the east side of England, except as above	0 3	
any port or place in Great Britain, not before de- scribed	0 5	
any port or place in Denmark, Sweden, or Norway, betw- een any port or place in Germany, Holland, Prussia, France to the westward of Calcutt, Ireland, the islands of Guernsey and Jersey	0 6	
any port or place in the Baltic seas, and all other ports or places to the westward of the Sound	1 0	
any port or place in Europe, to the westward of the Straits of Gibraltar	1 0	
any port or place in the West Indies, North or South America, Africa, Greenland, or any place to the east- ward of the Cape of Norway. All places within the Straits of Gibraltar, and all islands and places in the West Indies to the westward of Cape St. Vincent, not here- inbefore named	1 4s	
any port or place in the East Indies, Australia, all islands and places in the Pacific Ocean, the North and South Pacific Oceans, the Great Southern Ocean, the Indian Ocean, and all other places in Africa, Asia, or America, to the eastward of the Cape of Good Hope, and the westward of Cape Horn	1 4s	

For every foreign ship or vessel (belonging to a port not in reciprocity with Great Britain) trading to or going with merchandise from any of the above-named ports or places, double the rates, charges, or duties before-mentioned, unless the ships belong to British owners.

B. One-half of the foregoing rates will be levied under the following circumstances, upon application in writing being made to the directors, when they are satisfied that each case is bona fide and such as calls for a mitigation thereof,

Vessels taking refuge during winter, or in time of war, in the port, and entering any of the docks and basins of the Company, and not loading or discharging any part of their cargo other than

merchandise not bound to Hull, but which may be taken to the port in distress, leaky or requiring re- pair, and enter into any of the docks or basins, provided they are not taken on board any additional cargo (other than stores), or discharged any portion of their cargo within the said docks or basins.

Vessels driven into port by stress of weather, or other emergency, are not liable to rates or duties unless they make use of the docks or basins.

Charter hire on vessels, payable only after 10 days' occupancy of the dock,  $\frac{1}{2}$ d. per registered ton per week.

Wharfage rates fixed at a scale, being at an average of about 40 per cent. below the rates levied in London, are charged only on such vessels as actually pass over the dock quays either to or from the docks; and such rates are payable in respect of the same goods, if in their original state. No charge accrues on goods put on board into craft, unless for labour actually per- formed; and all work on board ship or upon the goods may be performed either by the Company or by merchants, as the latter may elect. No charge is made for river craft or lighters using the

Depth of Water.—The access to the docks is either from the river Hull or from the river Hum- ber. The lock from the Humber into the Victoria Dock is capable of admitting at spring tide vessels drawing 28 feet, and at neap tides 22 feet. The width of entrance is 60 feet.

The Water Bailiff dues hitherto payable to the corporation of Hull, on certain goods imported and exported, were all permanently abolished on March 21, 1853.

#### DUES PAYABLE TO THE CORPORATION OF HULL.

##### On Vessels entering Inwards and Outwards.

**Anchorage.**—Alien vessels under 100 tons bur- den, 1s. 6d.; 100 and under 200 tons, 2s.; 200 and upwards, 3s.

**Jettage.**—Under 100 tons, 13s. 6d.; if loads out more, 3s. 6d.; 100 and under 200 tons, 17s.; if loads out more, 5s.; 200 tons and upwards, 12; if loads out more, 7s.

**Hostage.**—For each pound sterling of the freight inwards, 2d.; and among the officers, per ship, 3s.

**Ballast.**—For each ton taken outwards, 2d.

Freemen are exempt from anchorage, but free- men as well as non-freemen pay jettage. The charge for jettage is not made unless with goods landed or taken in at Hull, or within the har- bour.

British ships pay no hostage, and nothing for ballast.

	An- chorage		Jettage

Ships and vessels belonging to aliens to pay 2s. 6d. per foot in addition to the above rate.

Ships and vessels drawing less than 10 feet water to pay for 10 feet.

**Buoyage.**—British vessels under 20 tons, 2s.; 20 tons and under 30, 2s. 6d.; and 6d. additional for every 10 tons. Foreign vessels under 65 tons, 11s.; 65 tons and under 135, 14s.; 135 tons and under 170, 17s.; 170 tons and under 180, 12; and 1s. additional for every 10 tons.

**Primage Rates.**—The old primage rates of 3d. per ton weight or measurement of 40 cubic feet, payable to the Trinity House at Hull, upon all goods imported and exported, have been reduced to 2d. per ton, with the exception of the following articles; viz. coal, coke, cotton, chalkstone, and salt, the primage upon which is now only 1d. per ton.

It is generally believed that, on the whole, the losses on the trade have fully counterbalanced the gains. The steam navigation of the port is again on the increase, as seen in the third table applicable to Hull; and many iron steamers and sailing vessels continue to be added to the shipping of the port. These, with the reductions in the dock rates and port charges, the increased facilities afforded for the shipment and warehousing of goods, and the intimate communications with the interior of the kingdom, and even with foreign countries, have given an extraordinary impulse to the trade of the port, and this, no doubt, will be maintained and increased if the peace of Europe should happily be preserved.

It is believed by many that the trade of the town and the well-being of its inhabitants would be much promoted by purchasing up the docks from their present proprietors, and placing them under trust for the benefit of the town, as at Liverpool and Bristol; and this, we are assured, might be accomplished with but little difficulty. (We are indebted for the greater part of the foregoing information to the obliging kindness of the able secretary to the docks.)

**VI. GREAT GRIMSBY DOCKS &c.**

Grimsby is a borough and seaport, in the county of Lincoln, on the south side of the estuary of the Humber, which at this point is about 1 mile across, 7 miles W. from the lighthouse on Spurn Head, which is in lat. 53° 34' 44" N., long. 0° 7' 9" E. Population, in 1861, 15,060. The wharf, long, narrow, hooked tongue of land which terminates in the Head protects a capacious roadstead, with good holding ground, extending to within a mile of the new works at Grimsby, and well known as a harbour of refuge to those who navigate the North Sea. The entrance to the river is marked by the lighthouse on Spurn

Head, and by two light-ships in the Channel. Grimsby has, in consequence, the double advantage of a secure roadstead and of proximity to the open sea. The utility of this new harbour is evident from the scarcity of ports along this portion of the coast of England; for, if we except the leading port of Hull, which also lies on the Humber, 15 miles farther inland, there is no other port pool in Durham and King's-Lynn in Norfolk, a distance of fully 160 miles.

Grimsby is a borough of considerable antiquity, and was formerly a port of such importance that in the reign of Edward III. it sent 11 ships to the siege of Calais. Owing, however, to the gradual filling up of its harbour, it laterly sunk into comparative insignificance. In 1802 a new harbour was constructed; but being accessible only at high water, it was not productive of all the advantages that were expected. But, in 1846, a new harbour, on a larger scale, accessible at all times of the tide, was commenced; and in anticipation of its being finished, Grimsby was made the terminus of two important railways.

The old dock or floating basin, constructed in 1801-2, measures about 19 acres; but being placed at the high-water margin of a flat shore, and being consequently accessible only towards high water, it is of very limited utility.

To secure a proper depth of water at the entrance of the new works was an object of the first importance; and to attain it they have, under the Act of 1845, been projected  $\frac{3}{4}$  mile into the estuary in advance of the old dock, reclaiming at the same time and enclosing 130 acres of land.

The new works comprise a wet dock of upwards of 25 acres in extent, with two entrance locks, having in front a tidal basin of 15 acres. The latter, formed by two piers, together about 2,000 feet in length, is provided with landing quays of masonry. It has a depth of 9 feet at low water springs, and of 12 $\frac{1}{2}$  feet at low water neaps; the rise of tide at the former being about 18, and at the latter about 12 feet. The facility of ingress and egress afforded by this basin is especially useful to steamers, which, as they usually convey passengers or light merchandise, do not require to enter a dock. Here they lie afloat alongside the piers at all times of the tide.

The new dock, opened in May 1852, is entered from the basin by two locks of massive masonry, furnished with double sets of gates for ebb and flood tides, the larger of which, constructed by special agreement with the Government) to admit the largest class of war steamers, is of the following dimensions, viz.—Length between the gates 300 feet; breadth from wall to wall 70 feet; depth of water on sill, at low water spring tide, 7 feet; depth of water on sill, at low water neap tides, 10 $\frac{1}{2}$  feet; depth of water on sill, at high water spring tide, 25 $\frac{1}{2}$  feet; depth of water on sill, at high water neap tides, 22 $\frac{1}{2}$  feet. At half tide the average depth of water on the sill of this lock is 16 to 17 feet, and at three-quarters tide 20 to 22 feet.

The smallest or second lock is designed for general purposes. Its length between the gates, 200 feet; breadth, from wall to wall, 45 feet; and its sill being 9 inches below that of the large lock, it has, at half tide, a depth of 17 to 18 feet water; and, at three quarters tide, of 21 to 22 feet. The lock gates, worked by hydraulic machinery, are opened and closed with ease and rapidity.

The water area of the new dock amounts, as already stated, to upwards of 25 acres, including a timber pond at its upper end; it has never less than 25 feet depth of water at its entrance, shoaling gradually to 20 feet at the timber pond. The

dock is filled with fresh water—a circumstance of considerable advantage to steamers. Wharfs or quays extend on both sides of the docks, upwards of 3,600 feet in length. They are traversed by railways, so that trains may be at once loaded from the ships, and the goods forwarded to their destination. The covered sheds and bonding warehouses, with suitable jetties, cranes, and other machinery, erected close to the quays, are extensive and convenient.

There is also a fish craft dock of about 6 acres, situated on the east side of the new dock. It is 80 feet long by 20 feet wide, with a depth of water on the sill at high water spring tides of 15 feet, and has a timber wharf 400 feet long and 35 feet wide partly roofed, with ice-houses, curing establishments &c. adjoining.

From the proximity of Grimsby to the mouth of the Humber, both sailing and steam vessels can get to sea from it with the greatest facility. It would seem, indeed, to be well fitted, not only for a commercial port, but also for a station for government steamers and other ships of war in the event of our being engaged in hostilities with any of the Northern Powers. Grimsby is 190 miles from Rotterdam, with which it has regular steam communication, and 220 miles from Antwerp.

In connection with the wet dock, a graving dock for the repair of ships was opened in 1858. It has an entrance of 70 feet wide, and an average depth of 19 to 20 feet on the sill. It is further intended to open a channel of communication between the old and the new dock, which will add greatly to the utility and value of the former.

But, after all, the value of Grimsby as a commercial port will principally depend on its facilities of communication with the interior. And these are of the most extensive description. A direct branch of the Great Northern Railway, from Peterborough, passing through Boston and the east parts of Lincoln, and thus opening a rich agricultural country, brings Grimsby within 154 miles distance, or 4 or 5 hours' travelling, of London. The line of the Manchester, Sheffield, and Lincolnshire Railway Company, who are the proprietors of the works at Grimsby, unites it with Manchester (distance 117 miles) and Sheffield. It intersects in its course two trunk lines to the North, viz. the Midland and the Great Northern.

The agricultural district of Lincolnshire and the Midland counties, the manufacturing and mineral districts of Lancashire and Yorkshire, and the metropolis, are thus brought into direct and easy communication with a port that offers especial advantages for the trade with Holland, the Elbe, and the Baltic; and which is, indeed, extremely well situated for traffic, whether east, north, or south.

The number of vessels entered at this port during 1866 are as under:—

	No.	Tonnage
Inwards from Foreign Ports	1,016	250,271
Outwards - - - - -	1,033	268,483
	<b>Coasting.</b>	
Inwards - - - - -	122	7,681
Outwards - - - - -	366	48,863

Amount of Customs' duties received at Grimsby in 1866, 15,709l.; value of exports from the port in 1866, 8,205,807l.

The following table shows the rates and duties charged by the Manchester, Sheffield, and Lincolnshire Railway Company, at the Grimsby Docks, on vessels trading between the port of Grimsby and any of the after-mentioned places, and on vessels entering the docks for shelter or repairs:—

For every vessel trading between the Port of Grimsby and any port or place in Denmark, Sweden, or Norway, below Elsinore, or in Germany, Holland, Flanders, France to the eastward of Ushant Inland, the Island of Guernsey, and Jersey

For every vessel trading between the Port of Grimsby and any port or place in the Baltic Seas, and all other ports or places above the Sound, or between the said port and any island or place in the West Indies, North and South America, Africa, Greenland, or any place in the eastward of the North Cape of Norway, all places within the Straits of Gibraltar, and all islands and places in the ocean to the southward of Cape St. Vincent, not before named

For every vessel trading between the Port of Grimsby and any port or place in the West Indies, North and South America, Africa, Greenland, or any place in the eastward of the North Cape of Norway, all places within the Straits of Gibraltar, and all islands and places in the ocean to the southward of Cape St. Vincent, not before named

For every vessel entering into the docks in ballast to be laid up (such vessel not having made the last preceding voyage from the said Port of Grimsby, and paid duty accordingly upon her departure from the said docks, and not being regularly employed in the trade of the said ports), for every ton the sum of

For every vessel which shall remain more than 6 weeks, the further charge per ton per week of

For every vessel exceeding 50 tons burden, entering the said docks for repairs, shelter from storms, or from any other accidental cause

For every such vessel, if remaining more than seven days, the further sum per ton per week of

For every vessel not exceeding 50 tons burden, so moored at the said docks, the sum of

For each such vessel remaining in the docks more than twenty-four hours, the further sum per ton per week of

The following are the rates and duties charged at the Grimsby Docks on the cargoes of coasting vessels, and vessels navigating the Humber, and rivers or canals communicating therewith:—

	Inwards	Outwards
Wool, fleeces, spotted, woollen yarn, and dried jute	per ton	0 6 1 1/2
Slates, tiles, iron, and bark	per chaldron	0 3 0 3/4
Lime	per ton	0 3 0 3/4
Coals, slack, cinders, culm, coke, charcoal, or bricks	per ton	0 3 0 3/4
Timber, wood, deals, plank, battens &c.	per 100 ft.	0 6 1 1/2
Groceries	per quarter	1 0 1 1/2
Grain, ratches, and lentils	per quarter	0 1 0 1/2
Dung, compost, manure (unpacked)	per ton	5 0 1 1/2
Hay (packed)	per ton	6 0 1 1/2
Goods not before specified	per ton	0 6 1 1/2

\* If shipped from railway waggons, free.  
N.B.—Vessels making use of the Grimsby Docks are not subject to corporation dues of any kind.

Rates to be charged on the Registered Tonnage

For	Vessels under 100 tons	And for private purposes
One day	2 2 0	0 1 0
Two days	2 15 0	0 8 0
Three "	3 10 0	0 6 0
Four "	4 4 0	0 4 0
Five "	5 12 0	0 8 0
Six "	5 12 0	0 8 0
Seven "	6 6 0	0 4 0

DOCKS

intended for repair in the Graving Dock must be entered, and the sum of 1 guinea paid at the time of such entrance. The said sum of 1 guinea will be allowed as part of the dockage, if the same be paid within ten days after the bill is delivered out; if not so paid, it will be forfeited. The entrance-money will also be forfeited if the vessel does not take her turn at the time specified at the time of entry, provided the dock is ready to receive her.

2. No changing of turns to be allowed, except in the case of a vessel having received damage by accident; and relief is to be given in such cases to vessels either inward or outward bound, according to the judgment and by the authority of the Harbour Master.

3. Any vessel staying in the Graving Dock more than 7 days must allow the gates to be turned or turns may require, and must be responsible for its own shoring.

4. No vessel will be allowed to remain longer than 14 days in the Graving Dock, except under special agreement.

5. No vessel will be permitted to be broken up in the Graving Dock without the consent of the directors, under the hand of their secretary for the time being.

6. Ground blocks and horizontal shores only are to be provided by the Company; and if any of them are let adrift, lost, or negligently or wilfully damaged, the same must be made good by the owners of the vessel occasioning the loss or damage; and any vessel requiring to remove or take out blocks must replace the same; and if it is necessary to pump dock dry for that purpose, the vessel must pay an additional 5*l.* for pumping.

7. Every person who shall cut, destroy, or be guilty of wilful or negligent injury to any of the blocks, shores, machines, stoves, water-cisterns or pipes, pitch-pots, cranes, tackle, or other appendages, belonging to the Graving Dock or the property of the Company, or shall throw down heavy timber or other things upon the steps or stonework instead of using the slides or sledges provided for that purpose, shall not only make good the damage or injury done, but shall, over and above, forfeit the sum of ten shillings for each such offence. The damage to be computed and assessed by the Harbour Master.

8. No work of any description will be allowed to be done in the Graving Dock on Sunday, except upon proved emergency, and only by the express permission in writing of the Harbour Master.

9. No vessel will be allowed to enter the Graving Dock with gunpowder on board.

10. The Graving Dock must be cleaned out each year, at the expense of the vessel or vessels occupying it, to the satisfaction of the Harbour Master.

VII. NEWCASTLE DOCKS &c.

Previously to 1857, the port of Newcastle-on-Tyne, although by far the most important of the northern ports, possessed no dock accommodation. Under the Tyne Improvement Act, 1852, however, the 'Northumberland Dock' was constructed in a place called 'Hayhole,' on the north side of Tyne, and was opened on September 1, 1857. Its area is 55 acres, and that of the tidal water is 23, and the least 18½ feet. The accommodation provided at first was principally for an open dock for coals; and communication by wharves has been opened with a considerable number of collieries, but the import trade carried on at the dock is annually increasing; and more extensive accommodation has been constructed to meet each increase. The number of

vessels which entered the docks in 1861 was 4,961; and in 1864, 5,032; and the amount of tonnage has since that date considerably increased.

The following is a schedule of the present rates and tolls on vessels and goods carried in vessels using the Northumberland Dock, Leviable by order of the Tyne Improvement Commissioners, under the Tyne Improvement Act, 1852.

Tonnage Rates.

For every ship clearing for any port in the United Kingdom or the Isle of Man	Rate
For every ship clearing for any port in the United Kingdom or the Isle of Man	per registered ton 2
For every ship clearing for any port in the United Kingdom or the Isle of Man	per registered ton 2
For every ship clearing for any other port and place than above specified	per registered ton 4
For every ship entering the dock for the sole and exclusive purpose of delivering or unloading ballast, gravel, or sand	per registered ton 1
For every ship entering and leaving the dock without delivering or loading a cargo	per registered ton 2
For every ship with a cargo from any port in the United Kingdom or the Isle of Man	per registered ton 2
For every ship with a cargo from any port or place in Europe of the Baltic Sea, or from any port in the Islands of Guernsey and Jersey	per registered ton 4
For every ship with a cargo from any other port or place	per registered ton 6

For the above rates any ship may remain in the dock for any time not exceeding 4 weeks, and after the expiration of that time a further sum of 3*d.* per registered ton per week shall be payable in respect of such vessel.

River Craft will be charged at the rate of 8*d.* for a load of 8 chaldrons, or 20 tons, and in like proportion for a greater or less load.

Rates or Tolls on Goods.

For every ton of large or uncreased coals put on board any vessel in the dock for export, whether coastwise or foreign	Rate
For every ton of small coals put on board any vessel in the dock for export, whether coastwise or foreign	2
For every ton of coals, culm, or cluders, put on board any vessel in the dock	1
For every load of timber, each load containing fifty cubic feet, received or delivered from any vessel in the dock	3
And in case such timber shall continue in the dock for a longer period than one month, then for each week beyond such month	3
For every ton weight of goods or merchandise of every other description received or delivered from any vessel in the dock	10
Or, at the option of the Commissioners, for every ton measurement of such goods and merchandise, each ton measurement containing forty cubic feet	4
And for every package or parcel of goods less than a ton, either of weight or measurement, the same sum as is payable in respect of a ton.	6

And for every package or parcel of goods less than a ton, either of weight or measurement, the same sum as is payable in respect of a ton.

VIII. TYNE, SOUTH SHIELDS DOCK, &c.

The Tyne Dock, opened on March 3, 1859, is designed for the accommodation of ships of the largest burden, and is connected by railway with all parts of the kingdom.

There are two coal and coke shipping jetties with 22 spouts, where the largest description of vessels can be loaded afloat. Coals from the Northumberland and Durham coal-fields can be shipped to any extent.

There are nine warehouses capable of storing grain, fibre, hemp, tallow, and general merchandise. Steam travelling and hydraulic cranes are provided in different parts of the dock.

Sheer legs capable of lifting 60 tons are now erected and are in use. There is also extensive timber accommodation on land and water.

Remarks.—The anchorage off Penarth Head is excellent. The Cardiff and Penarth Flats and East and West Mud are composed of a thick stratum of soft alluvial clay and mud, on which the largest vessels loaded lie aground with perfect

or unloading, the above dues, rates, or tolls are exacted, but wharfage and other charges payable, and information as to the same may be obtained on application to the collector at dock office, or to the Company's goods manager, Newcastle.

The following are payable whether the animal be transferred to and from vessels or craft in docks, or loaded or unloaded at the quays, wharves, or jetties:—

	Rates per head, s. d.
Horses	1 6
Oxen, cows, and bulls	1 0
Ponies, mules, and asses	0 6
Cattle and deer	0 2
Lambs, sheep, goats, and pigs	0 1

The highest tide ever known in the Tyne Dock was 27 1/2 feet on the dock sills. The rise is frequently to 25, 25 1/2, 26, and 26 1/2. The average height of spring tides is 24 1/2 feet on the sills. At no time is there less than 20 feet in the dock when the gates are closed, or less than 8 feet outside the dock. The number of vessels which enter the port of South Shields alone, in 1865, was 499 with a tonnage of 148,852, of which 67 were steam vessels with a tonnage of 34,979.

IX. CARDIFF DOCKS &c.

Cardiff, situated on the river Taff, and having in 1861 a population of 32,954, has, in consequence of its connection by rail and canal with Merthyr Tydvil and the chief mining districts of South Wales, risen to very considerable importance. This has been much enhanced by the accommodation it offers in the Docks constructed at vast expense by the late Marquis of Bute.

The Taff River is navigable for small vessels up to near the South Wales Railway.

**Glamorgan Canal.**—The approach to this canal is by the river Taff. Width of gates of Sea Lock 27 feet; length of Sea Lock 103 feet; depth of water on sill of inner gates 13 feet; length of canal for loading and discharging vessels 3,112 feet; average width 100 feet; depth of water in canal 13 to 9 feet.

PENARTH DOCK.

Basin, 400 ft. x 330 ft.; lock, 270 ft. long; dock, 2,000 x 370 ft.; water, 35-8 ft. high tide, and 25-7 lowest, being 4 ft. more water than East Bute Dock, and 7 ft. more than West Bute Dock. Gates 60 ft. wide.

safety. Penarth Head, being about 200 ft. above high water mark, not only affords perfect shelter from the boisterous west wind, but generally most desirable as a place of shelter and anchorage for the large and valuable vessels which frequent

the port. Steam-tugs are in attendance at every tide. There are also steamers plying between these docks and the ports of Liverpool, Cork, Whitehaven, Burnham, Bristol &c. By the Rhymney Railway and the Newport, Abergavenny, and Hereford Railway, there is a direct and unbroken narrow gauge communication between Cardiff, London, Birmingham, Chester, Liverpool, Manchester, and the North. The South Wales Railway (broad gauge) affords a communication between this port and Milford Haven, Carmarthen, Swansea, Neath, Newport, Chepstow, Gloucester, and London.

The Port of Cardiff is the outlet for the large mineral and manufactured produce of the central portion of the South Wales Mineral Field, in which are the populous districts of Merthyr, Rhymney, and Aberdare, with which this port is connected by the Taff and Rhymney Railways, and Glamorgan Canal.

8 and upwards	1 1

**Additional Rates.**—For the use of barges, if required, 4d. per ton on the quantity discharged.

For discharging ballast by night, 3d. per ton on the quantity so discharged.

For trimming ballast to within 15 ft. of any hatchway from which the ballast is to be discharged, 2d. per ton; or the captain can employ his crew for this purpose.

Application for barges, night work, and trimming of ballast, to be made at the Ballast Office.

#### X. GLASGOW DOCKS, SHIPPING &c.

Glasgow, the commercial capital of Scotland, on both sides the Clyde, lat. (Observatory) 55° 51' 32" N., long. 4° 17' W. (population, 1861, including suburbs, 446,395), is indebted for her present greatness to her advantageous situation on a fine river, in one of the richest coal and mineral districts of the empire. Originally the Clyde was much encumbered by fords and shallows, and for a lengthened period it served rather to excite and disappoint expectation than to confer any real commercial advantage on the city. In 1662, after several other schemes had failed, the magistrates of Glasgow purchased the ground on which Port Glasgow (16 miles lower down the river) now stands, where they formed a harbour and a graving dock, the first work of its kind in Scotland. For a considerable period the intercourse between Glasgow and its newly acquired port was principally carried on by land carriage; but from 1667 attempts were every now and then made to deepen the river. In 1688 a quay was formed at the Broomielaw; but even so late as 1775 no vessel drawing 6 ft. water could reach Glasgow except at spring tides. At length a plan, proposed in 1769 by Mr. Golburn, engineer, of Chester, for deepening the river to 7 ft. at neap tides, was adopted, and since then, by the continued use of numerous dredging machines, a depth of from 18 to 21 ft. water at neaps has been obtained. In 1864, of 46 vessels over 1,000 tons, 13, that drew more than 20 ft. water, came safely to the Broomielaw, while one of the largest steam vessels afloat, the Persia, of 3,600 tons burden, was launched in 1856 into the river about one mile below Glasgow, and came up to the harbour to receive its machinery. The river for 7 miles below the city is very much widened, and forms nearly a straight line; the sloping banks, formed of whinstone, being constructed in imitation of ashlar. The accommodation for shipping at the Broomielaw, or harbour, is now also very greatly extended. The quays extend upwards of 2 1/2 miles in length, varying from 120 to 200 yards in width, and are amply furnished with sheds for goods, cranes, and other appliances for working a first-rate harbour. The quay has the important advantage of being directly connected, by means of the General Terminus Line, with the various railways that centre in the city. The Parliamentary trustees for managing the river have also acquired ground north of the harbour, on which they have power to construct docks.

That part of the Clyde which lies between Glasgow Bridge and the mouth of the river Kelvin forms the harbour of Glasgow. The area of its water space is 124 acres, of which 70 are occupied by shipping. The total length of quays on both sides of the harbour in 1867 was 4,577 yards, but 830 lineal yards of quay space must be added for the wet dock at Windmillcroft on the south side of the harbour.

Vessels of 21 ft. draught of water can lie alongside the quays; and as dredging operations are continually carried on, vessels of greater draught

Vessels proceeding empty for a cargo, or returning empty having discharged a cargo to or from any place beyond the limits of the harbour, shall not be liable to pay any rates for the empty trip, under Article 7.

Vessels passing to or from any place on the river Clyde above Hutcheson Bridge, through that portion of the river which is embraced within the limits of the harbour, shall not be liable for any of the rates specified in this schedule unless they shall use any of the said docks or tidal basins or any of the quays or other works constructed by the trustees on the banks of the river, within the limits of the harbour, or unless they shall take in or discharge their cargo or any part thereof within the said limits, or shall remain therein longer than may be necessary for passing through the same.

#### Rates for use of Ordinary Cranes.

	s.	d.
Each hogshead of sugar and hoists, not exceeding 12 cwt.	0	3
from 12 to 15 "	0	4
from 15 to 20 "	0	6
Each ton of hemp	0	6
Ditto machinery and other timber rated in the first column of schedule (11) at 2s. per ton	0	6
Ditto other timber	0	4
marble	1	0

#### Rates for Weighing.

	s.	d.
Each cart, wagon, or other carriage load or weigh not exceeding 12 cwt.	0	1
exceeding 12 cwt.	0	2

Weighing duties to be paid by the owners, shippers, or importers of goods, if required by the collector or other officer appointed by the trustees for ascertaining the rates, provided the weight specified by the owner, shipper, or importer of the goods be found less than the real weight; but if equal to, or greater than, the real weight, the weighing duties are not to be exigible.

Weighing duties for coals to be paid only when weighed on the application of the owner or shipper.

#### Rates for the use of Planks, Stages, and Rhones.

	s.	d.
1. For planks or stages for loading or discharging vessels: for each . . . . .	1	0
2. For rhones for each wagon of coal loaded therewith	0	1

One shilling extra on each cargo for removing the rhone to and from the vessel.

#### Rates for use of Water.

	s.	d.
For the supply of water in vessels entering and using the harbour at docks	0	8

Dut rates shall not be leviable unless water shall be actually supplied to vessels.

#### Charges on a Ship of 500 Tons Register arriving at Glasgow with Cotton, and clearing out laden with Iron.

6 "	8	0	0
8 "	10	0	10
10 "	12	0	0
12 "	15	0	0
15 "	20	0	0
20 "	25	0	0
25 "	30	0	0
30 "	35	0	12
35 "	40	0	15
40 "	45	0	17
45 "	50	0	20
50 "	60	0	25

All necessary use of the crane, from the lifting of a piece of machinery off its carriage until stowed or adjusted in the vessel, or from the lifting of a piece of machinery from the vessel until placed on its carriage, shall be included in one hoist.

Putting on board machinery, engines and boilers, including fitting up when the vessel is new and fitted out for the first time, per horse power of engine as per contract, 2s. 6d.; or per ton, 3s.

Taking out boilers and machinery for repairs, per horse power of engine, as per contract, 2s.; or per ton, 2s. 6d.

Putting on board boilers and machinery after being repaired, including fitting up, per horse power of engine as per contract, 1s. 6d.; or per ton, 2s.

Putting in or taking out boilers, per horse power of engine, as per contract, 1s.; or per ton, 3s.

The above rates to be charged per horse power of engine, or per ton, in the option of the trustees.

General repairs or jobbing, not included in the above, to be charged at the rate per day of 5l. 5s.

In addition to the rates for cranes, specified in this schedule, 6d. per hour to be paid for wages to cranemen attending while the crane is being worked.

**Ballast.**—The Clyde trustees remove ballast from vessels on either side the harbour, at a rate not exceeding 1s. per ton, and supply clean stone ballast at 1s. per ton.

The river Clyde is divided into three stages, and the following are the Tonnage Dues exigible upon each, viz. —

The first stage extends from Hutcheson's Bridge to the Old Ferry at Renfrew, being about 600

yards to the east of the present ferry, and the dues on goods carried or conveyed thereon are two-thirds of the tonnage dues exigible by the trustees.

The second stage extends from the Old Ferry at Renfrew to the mouth of Dalnuir Burn; and the dues exigible thereon are one-sixth of the tonnage dues; and

The third stage extends from Dalnuir Burn to Newark Castle; and the dues exigible thereon are one-sixth part of the tonnage dues.

*Charges for Lights from the Clyde.*

America and West Indies by North.	4 4-16 and 6d. per 50 tons if from a port south of Cape Cod.
91. 7s. 5d.	4 4-16 and ditto if from a port north of Cape Cod.
By South.	10 2-16 and 6d. per 50 tons.

The charge for unloading and taking in a cargo is per agreement with licensed lumpers or porters who ply on the quay for hire. There are no fixed rates, but the following charges may be considered pretty near the mark: unloading cotton about 6d. per ton, and for taking in iron 9d. per ton. The other items of charge of a public kind affecting the ship are, towing up and down the river, planks and stages for discharging and loading the cargoes, supplying the ship with water and the removal of ballast if any on board, and ships loaded with cotton usually have ballast.

*Entrance to the River.*—As a guide to mariners, it may be mentioned that vessels of 19 ft. draught of water can arrive at the harbour of Glasgow, and that vessels drawing 17 ft. are considered regular traders. Vessels drawing 15 to 16 ft. may always arrive and depart without touching the bottom. At the entrance to the river vessels are placed under the charge of pilots acquainted with the channel, which is well marked with beacons and buoys. A ship on reaching the mouth of the river at Newark had best commence ascending as soon after half-flood as possible. There are no particular usages connected with the harbour of Glasgow beyond those adopted in most other rivers and harbours. Lights are permitted in the harbour from 6 A. M. to 10 P. M.

Glasgow may be said to be cosmopolitan in her commerce and manufactures, uniting within herself the businesses and trades of almost every other town and city in the United Kingdom. Hence it follows that while one branch of manufacture or trade may be dull, another may be prosperous; and accordingly Glasgow seldom feels any of those general depressions which so frequently occur in places which have only one or two branches of manufacture or commerce. The great industrial occupations of Glasgow are its cotton spinning and weaving; its collieries and iron manufactures; its iron ship building and machine making; and its chemical, porcelain and glass manufactures. According to Dr. Strang, the consumption of raw cotton in Glasgow in 1854 was above 1,900 bales per week, of from 430 to 440 lbs. each; and the number of power looms dependent on Glasgow was from 26,000 to 27,000, producing daily about 700,000 yards cloth. In the west of Scotland, of which Glasgow is the central mart, there were, in 1866, 6,275,000 tons of coals drawn from the pits, of which 1,036,541 tons were shipped, exclusive of the quantities sent beyond the boundaries by railways, leaving the larger proportion for the conversion of iron and the manufacturing consumption and domestic use of the Glasgow district. Of the produce of pig iron in the counties of Lanark and Ayr (1866), 139,408 tons were shipped from Glasgow alone direct to foreign

countries, exclusive of the quantities sent away by railways. During the same year there were exported from Glasgow 49,488 tons of railroad and 12,737 tons of other kinds of malleable iron. The value of the whole coal and iron businesses to the district in 1854 was reckoned at about 4,872,000*l.*, of which 1,973,000*l.* was paid in wages to 83,900 persons. As to iron ship building and marine engine making, it may be stated that in 1864, 242 vessels were made, including both steam and sailing, having an aggregate tonnage of 178,505, for which also marine engines were made or had been made. In 1863 there were launched 150 iron vessels of 112,605 tons. Of these, 31 were iron sailing vessels of 26,762 tons, and 67 iron screw steamers of 26,299 tons, and 38 paddle steamers of 26,147 tons; and on May 1, 1865, there were building 177 vessels of all kinds. The chemical products of Glasgow are multifarious, consisting of sulphuric, muriatic, nitric and acetic acids and their various salts; bleaching powder, soda, soap, cudbear, bichromate of potash, sugar of lead, iodine, salts of ammonia, alum, prussiate of potash, naphtha, pitch, oil, animal charcoal, bone tar, cream of tartar &c. &c. The works of St. Rollox, situated in the north-east quarter of Glasgow, constitute perhaps the largest chemical establishment in the world. They cover about 12 acres of ground, employ above 1,000 men, consuming annually about 20,000 tons of common salt, and 80,000 tons of coal, and producing of soda, bleaching powder, sulphuric acid, soap &c. about 25,000 tons: 81,163 cwt. of soda were exported from Glasgow to foreign parts in 1866. The lofty chimneys of St. Rollox are among the curiosities of the city, one of them being 450 feet high, 50 feet diameter at the base, and 14 ft. at top. There are eight large potteries engaged in the manufacture of all kinds of china, porcelain, Parian, and other ware, 4 flint glass manufactories, and 12 bottle houses. The total produce of the business, which employs 2,000 people, may be fairly estimated at 120,000*l.*, while the quantity exported in 1866 from Glasgow amounted to 17,167 packages. The value of the exported produce of the flint glass manufactories of Glasgow in 1866 was 90,109*l.* The bottle houses produce about 13 millions of bottles, nearly half of which are exported from the Clyde. In the manufacture of tobacco pipes 600 persons are employed, who work up about 2,740 tons of clay, and who daily manufacture, finish, and pack about 200 gross pipes. The rapid progress which this general pursuit have made in Glasgow may be entirely attributed to the demand which the foreign trade of the Clyde has created for bulky freight.

*Accounts of the Customs Duties collected at Glasgow, and of the Number and Tonnage of the Ships belonging to the Port, in the undetermined Years.*

Years	Duties	No. of Ships	Tonnage
1798	£ 125	..	..
1806	1,327	..	..
1815	8,308	59	4,39
1820	11,000	85	6,60
1830	39,615	233	40,94
1840	46,974	351	71,53
850	640,366	507	157,000
859	805,356	610	178,919
1-55	795,203	815	349,813
1866	801,123	807	337,233
1867	1,022,219	..	..

Nearly half the customs paid in Scotland are collected at Greenock. Glasgow now ranks as the 4th exporting port in the empire, being in this respect surpassed only by Liverpool, London, and Hull.

Dundee is under the jurisdiction of a board, composed jointly of the trustees of the Harbour of Dundee and the Corporation of the Fraternity of Masters and Seamen of Dundee. Certain rates of pilotage are exigible under the Dundee Harbour Acts, but the pilotage is not compulsory. The establishment has two pilot cutters, with necessary tenders; and one of the cutters is always at sea, cruising outside the buoy of Tay, unless driven in by stress of weather. There is a pilot master at the port, with an ordinary staff of 15 licensed pilots.

10. All vessels loaded with coals, lime, or manure only, from any port in Scotland	0 1 1/2	0 1 1/2
11. All vessels employed in the River Tay, carrying goods and entering the precincts of the port or harbour of Dundee	0 1 1/2	0 1 1/2
12. All steam vessels from any port in Great Britain, or places enumerated in No. 8, carrying passengers and their luggage exclusively	0 2	0 2
13. All steam-vessels employed in the River Tay, carrying passengers and their luggage exclusively, and vessels trading from the harbour, or carrying passengers to any part within the precincts	0 1	0 1
14. All steam vessels carrying goods and passengers to pay the same rates as sailing vessels	-	-

There belonged to the port, on January 1, 1867, 9 sailing vessels of less, and 170 of more, than 50 tons; the aggregate burden of the former being 287, and of the latter 39,548 tons: there then also belonged to the port 24 steamers, aggregate burden 7,046 tons. Latterly there has been a considerable extension of the carrying trade by steam from this port. Besides steamers to London and

Hull weekly, there are regular sailing ships during the season to Hamburg and St. Petersburg; and two large screw steamers were (in 1859) fitted out for Davis' Straits and the Greenland seas, and now (1868) the number has increased to 10.

VII. LEITH DOCKS, SHIPPING &c.

Leith, which may be called the port of Edinburgh, has 3 wet docks, containing about 200 acres of water room. Two of these, opened 1806 and 1817, are for the accommodation of vessels ordinarily frequenting the port. The other, finished in 1852, is intended for the steamers. Leith has also 2 graving and 10

docks. These docks have cost large sums; and to the harbour drying at low water, large sums have also been expended in the extension of the old, and the formation of a new pier. The new pier, consisting partly of stone, and partly of wood intermixed, is of very great length, and the new, or western pier, which is nearly parallel to the other, is also of great length, and has a landing stage near its extremity, and a breakwater. The object in carrying out the pier was to form a harbour, which, at their extremity, should

water sufficient for the landing stage. The object has not had, we should outlay upon it. The truth is, the Leith are entire where they are, situated at the west from Leith, the extremity of the harbour, necessary already constructed extension of the breakwater, which is the shipping.

The harbour at Leith, as been slowly but in a limited trade. The West Indies, the United States; but the Holland and the no articles of export and linen yarn, broad cloth, cottons and c. from the latter, salt-fish, ale, now connected by the extension of its leading articles: sugar and oil, spirits, dye, the articles trading with Leith vessels trading to Greenock, Glasgow, Orkney, Shetland, communication by class steamers that entire year; but in winter. The steam with Newcastle, Strirling twice a several times a day with every imp from Leith, to Berwick, to Leith, formerly sent 8 or 9 vessels, but the business that sh

Dock Rates on Ves

from Asia or Africa, and Hope, including the West Indies, West Coast of Greenland and Davis Straits of Gibraltar, the Baltic all above the Cape of Good Hope, or C. Umsey, Portugal, the Straits of Gibraltar, the Azores, Sweden, Denmark, Holland, and Flan and no farther south than in Great Britain and the Baltic. The rate between Leith and the north of Firth, the Great G. down to Greenock

water sufficient to enable vessels to come to the landing stage at all times of the tide. But this object has not been fully attained; and though it had, we should have been inclined to regard the outlay upon it as little better than thrown away. The truth is, that the docks and new harbour at Leith are entirely misplaced. Instead of being where they are, the docks should have been constructed at Trinity or Granton, about  $\frac{1}{2}$  or 1 mile west from Leith, being, however, nearer to it than the extremity of the new pier. And a deep water harbour, accessible at all times, having been already constructed at Granton, the outlay on the extension of the piers at Leith seems not a little preposterous.

The harbour at Granton has been formed by the Duke of Buccleugh. A pier, constructed in the most approved manner, projects into the sea about 1,700 ft. It is shaped like a T with its head to the north, and has harbours and landing places on both sides. It has been open for some years; but hitherto it has been principally resorted to by steamers. The Duke has also constructed a breakwater, which adds much to the security of the shipping.

The commerce of Leith is very considerable, and has been slowly but steadily improving. It carries on a limited trade with Australia, the East and West Indies, the Mediterranean, Canada, and the United States; but its chief foreign trade is with Holland and the north of Europe. The principal articles of export consist of linen manufactures and linen yarn, brought from Fifeshire and Dundee; cottons and cotton yarn from Lanarkshire; wool from the latter; with woollens and worsteds, salt, salt-fish, ale, spirits &c.; and as the port is now connected by branches with the leading railway lines that centre in Edinburgh, a considerable extension of its trade may be anticipated. The leading articles of import consist of corn and sugar; flax and hemp; hides, guano, and provisions; and other colonial products; wool, spirits, dye stuffs &c. With regard to its mercantile trade, there are companies which have vessels trading with Hull, Newcastle, Liverpool, Greenock, Glasgow, Aberdeen, Montrose, Kirkcaldy, Orkney, Shetland, Dundee, Stirling &c. Communication with London is kept up by class steamers that sail twice a week during the entire year; but more vessels sail in summer than in winter. There is also a communication by steam with Newcastle and Hull twice a week; with Stirling twice a day; the opposite coast of several times a day; and a regular communication with every important place on the east of Scotland, from Leith in Shetland, and Kirkwall in Orkney, to Berwick-upon-Tweed. The steamers come from Leith and some from Granton. Formerly sent 8 or 10 vessels to the Greenock whale fishery, but such has been the decline of that business that she no longer sends a single

only 2s. 6d. for attendance of boat and men, besides the pilotage.

The rates of pilotage &c. outwards are one-half of those inwards.

Where a vessel takes a steam tug, either in or out, the pilotage and charges for pilot boats and crews shall be one third less than the rates above specified.

In 1866 Granton, formerly a creek in the port of Leith, was made an independent port.

### XIII. CORK DOCKS.

There are no wet docks in Cork, but at the city, situate on the river Lee, 10 miles from the mouth of the harbour, there are excellent quays, giving a frontage of 13,580 ft., to which vessels drawing 16 ft. of water can approach. There are large bonded warehouses and good storage, with facilities for landing goods &c. Vessels of larger tonnage discharge at West Passage, 7 miles down the river, and 3 miles from the harbour's mouth, where there is an average depth of water of 38 ft.

The harbour affords safe anchorage in all weather for the largest merchant ships. It is a port of call for the American mail steamers, and for vessels arriving from the Mediterranean &c. for orders.

The port enjoys a large coasting trade between London, Liverpool, Bristol, and Glasgow in goods under bond; exporting corn, butter, cattle, whisky, and fish. The foreign imports consist of grain, wine, sugar, brandy, and wood.

The only port charges that ships are liable to are the harbour dues on tonnage and goods landed.

There are 4 graving docks here—2 at Cork, 1 at West Passage, and 1 at Monkstown Ferry, where there is large accommodation for the repair of ships.

### Revenue of the Port for the 5 Years ended March 31.

Year	£
1861	589,361
1862	298,467
1863	302,687
1864	302,977
1865	297,511

The exports from Cork in the year 1866 amounted in value to 110,703L. The principal article was butter. The customs collected in 1867 amounted to 319,783L. There belong 1 to Cork in 1866 180 sailing vessels of a burden of 50 tons and under, giving a total tonnage of 4,497; over 50 tons 177, tonnage 26,497; steam vessels 39, tonnage 7,289.

DOG (Fr. chien; Ger. hund; Ital. cane; Lat. canis familiaris). Of this quadruped, emphatically styled 'the friend and companion of man,' there is a vast number of varieties. But to attempt to give any description of an animal so well known would be quite out of place in a work of this kind; and we mention it for the purpose principally of laying the following accounts before our readers, with a remark or two with respect to Asiatic dogs.

Cuvier, the great French naturalist, says, 'The dog is the most complete, the most remarkable, and the most useful conquest ever made by man: every species has become our property; each individual is altogether devoted to his master, assumes his manners, knows and defends his goods, and remains attached to him until death; and all this proceeds neither from want nor constraint, but solely from true gratitude and real friendship. The swiftness, the strength, and the scent of the dog have created for man a powerful ally against other animals, and were perhaps, necessary to the establishment of society.'

It is the only animal which has followed man through every region of the earth.'

It is singular, however, that neither Cuvier, nor any one of those by whom his statements have been copied, should have mentioned that this account is applicable only to Europe. All Mohammedan nations regard the dog as impure, and will not touch it without an ablution. The same is also the case with the Hindus. From the Hellespont to the confines of Cochín-China, dogs are unappropriated, and have no master. They prowl about the towns and villages; and though they are naturally more familiar, they are in no respect more domesticated, than the carrion crows, kites, vultures &c. which assist them in performing the functions of scavengers. In China and Cochín-China the dog is eaten as food; its flesh being, with the exception of that of the bear, the most common in their markets.

The changes in the law effected by 30 Vict. c. 5 were, first, a reduction of the duty for each dog from 12s. to 5s.; secondly, the abolition of the exemption of dogs used in tending or driving cattle or sheep; and, thirdly, the collection of the duty by means of a license for each dog, under the management of the officers of excise, instead of an assessment made by the persons appointed by the district commissioners of taxes for each parish.

The effect of these changes may be seen from the following statement of the

### Number of Dogs charged to Assessed Taxes in the Year ended April 5, 1866, together with the Amount of Duty charged.

	Number charged to Assessed Taxes	Amount of Duty charged
England	3,917,2	£14,027
Scotland	36,365	1,075
Great Britain	3,953,5	£15,102

### Number of Excise Dog Licenses granted between April 1 and November 15, 1867, or about 8 months, and Amount of Duty charged.

	Number of Licenses granted	Amount of Duty charged
England	791,519	£15,000
Scotland	96,169	2,411
Great Britain	887,688	£17,411

The unnecessary multiplication of dogs, particularly in large cities, is a very great nuisance coming, as they often do, into the possession of those who are without the means of providing for them, they are frequently left to wander about the streets; and from ill usage, want of food, and of proper attention, are apt, during hot weather, to become rabid. In several places the nuisance has attained to a formidable height; and it is singular, considering the numerous fatal occurrences that have taken place, that no effort should sooner have been made to have it abated. It has grown to its present excess, partly from many exemptions having been granted from the duty, and partly from a want of care in its collection. The number of the former has now been lessened; and besides more rigidly enforcing the latter, it would be proper to enact that all dogs found wandering in the streets without masters should be impounded.

DOLLAR (Ger. thaler; Dan. and Swed. daler). No unit of monetary value has a wider circulation than this. It is used in Northern Germany, the Scandinavian Kingdoms, China and the East Archipelago, and in the North-western coast of America. It is rapidly becoming the unit

the currency in the colonies of British North America, and great part of South America.

According to Mr. Yates (*Current Coins of All Countries*) the dollar originally contained an ounce of silver. This accomplished numismatist adds that at about the beginning of the sixteenth century a Count Schlick, who possessed some silver mines at Joachimsthal in Bohemia, contracted to supply silver coins weighing an oz. to the Emperor and various German princes. It was from an abbreviation of the name Joachimsthaler that, according to Mr. Yates, the name thaler or dollar originated.

The following are the weights of the several dollars current in various countries as given by Mr. Yates:—

	grains.		grains.
American	37	Trussian	21.95
Central America	37		19.5

calculated at the rate of 62d. per oz. English standard silver. (COINS.)

For the above we are indebted to Mr. C. Trübner. DYN (Ger. dunen, flaumfedern; Dutch, dons; French, Ital. penna matta, plumini; Spanish, plumazo; Russ. puch; Lat. plumæ). The feathers from the breasts of several birds, particularly those of the duck kind. That of the duck is the most valuable. These birds are taken from their breasts, and line their nests with it. Mr. Pennant says that it is so very soft, that a quantity of it weighing only 1/2 of an ounce more than fills the crown of the largest hat. That found in the nest is most valued, and is called *line down*; it is much more elastic than that taken from the dead bird, which is com-

paratively little esteemed. The eider duck is found on the western islands of Scotland, but the Iceland is principally imported from Norway and portland. In 1865, 23,875 lbs. of down were imported. In 1866 only 2,895 lbs. were imported.

DRAGON'S BLOOD. [BALSAM.]  
DRAWBACK. A term used in Commerce to signify the remitting or paying back of the duties previously paid on a commodity on its being exported.

A drawback is a device resorted to for enabling a commodity affected by taxes to be exported and sold in the foreign market on the same terms as if it had not been taxed at all. It differs in this from a bounty—that the latter enables a commodity to be sold abroad for less than its natural cost, at its natural cost. Drawbacks, as Adam Smith has observed, do not occasion the exportation of a greater quantity of goods than would have been exported had no duty been imposed. They do not tend to turn towards any particular employment a greater share of the capital of the country than would go to that employment of its own accord, but only to hinder the duty from driving away any part of that share to other employments. They tend not to hinder the duty from driving which naturally establishes itself among all the various employments of the society, but to hinder it from being overturned by the duty. They tend not to destroy, but to preserve, what it is in most cases advantageous to preserve—the natural division and distribution of labour in the society. (p. 221.)

Were it not for the system of drawbacks, it would be impossible, unless when a country enjoyed some very peculiar facilities of production, to export any commodity that was more heavily taxed at home than abroad; but the drawback obviates this difficulty, and enables merchants to export commodities loaded at home with heavy duties, and to sell them in the foreign market on the same terms as those fetched from countries where they are not taxed.

Most foreign articles imported into this country may be warehoused for subsequent exportation. In this case they pay no duties on being imported, and, of course, get no drawback on their subsequent exportation.

Sometimes a drawback exceeds the duty or duties laid on the article; and in such cases the excess forms a real bounty of that amount, and should be so considered.

The Act 16 & 17 Vict. c. 107 has the following clauses in relation to drawbacks:—

No drawback of excise shall be allowed upon any goods cleared for exportation unless the person intending to claim such drawback have given due notice to the officer of excise, and have produced to the searcher, at the time of clearing such goods, a proper document under the hand of the officer of excise, containing the description of such goods; and if such goods be found to correspond with the particulars of the goods contained in such document, and be duly shipped and exported, the searcher shall, if required, certify such shipment upon such document, and shall transmit the same to the officer of excise. (See 122.)

No drawback to be allowed upon the exportation of any goods entered for drawback or as stores which shall be of less value than the amount of the drawback claimed; and all such goods so entered shall be forfeited, and the person who caused such goods to be entered shall forfeit the sum of 200l., or treble the amount of drawback

claimed in such case, at the election of the Commissioners of Customs. (Sec. 123.)

No drawback to be allowed on any tobacco not wholly manufactured from tobacco on which the duty on importation shall have been paid, nor on any tobacco mixed with dirt, rubbish, or other substance; and every person who shall enter or ship, or cause to be entered or shipped, any tobacco contrary hereto, shall, over and above all other penalties which he may thereby incur, forfeit treble the amount of the drawback sought to be obtained, or 200*l.*, at the election of the Commissioners of Customs, and all such tobacco shall be forfeited. (Sec. 124.)

If any goods which have been cleared to be exported for any drawback be not duly exported to parts beyond seas, or be unshipped or reloaded in any part of the United Kingdom (such goods in any part being duly reloaded or discharged as not having been duly reloaded or discharged), short-shipped under the care of the proper officers, or be carried to any of the Channel Islands (not having been duly entered, cleared, and shipped to the same shall be forfeited, together with any ship, boat, or craft which may have been used in such unshipping, reloading, landing, or carrying such goods from the ship in which the same were shipped for exportation; and the master of such ship, and any person by whom or by whose orders or means such goods shall have been so unshipped, reloaded, landed, or carried, or who shall aid, assist, or be concerned therein, shall forfeit a sum equal to treble the value of such goods, or a penalty of 100*l.*, at the election of the Commissioners of Customs. (Sec. 135.)

**Beer Exported on Drawback.**—When the original gravity of a sample is found to be less than that declared by the exporter, confirmatory experiments are in every case performed to remove all doubt as to the accuracy of the result. The barrels of beer represented by samples in 1865 were 421,565 in number; and in 1866, 353,320. (Appendix to Eleventh Report of Inland Revenue Commissioners, p. xxiii.)

[DEBENTURE; IMPORTATION AND EXPORTATION.]

**DUBBER.** A leathern vessel, bottle, or jar, used in India to hold oil, ghee &c. Barrels, as already observed [BARRELS], are entirely a European invention. Liquids, in Eastern countries, are for the most part packed for exportation in leathern vessels. Dubbers are made of thin untanned goat skins; and are of all sizes, from a quart up to nearly a barrel.

[DUNDEE DOCKS, SHIPPING &c. [DOCKS.]

**DUNNAGE.** In Commercial Navigation, loose wood, consisting of pieces of timber, boughs of trees, faggots &c. laid in the bottom and against the sides of the ship's hold, either, first, by raising the cargo when she is loaded with heavy goods, to prevent her from becoming too stiff [BALLAST]; or, secondly, to prevent the cargo, from being susceptible of damage by water, from being injured in the event of her becoming leaky. A ship is not reckoned seaworthy unless she be provided with proper and sufficient dunnage. (Lord Stowell's *On the Law of Shipping*, part iii. c. 3; *Tenterden On the Law of Shipping*, art. 'Dunnage.')

[DYES AND DYE STUFFS. Materials that afford different colours, which the dyer extracts and imparts to other articles.

Mankind in their rudest as well as their

most advanced state admire certain colours in preference to others; and when their clothes, or other things, do not naturally possess the colours which they prefer, they endeavour to have them supplied artificially. And hence the art of dyeing has been in use from the remotest ages. We may safely suppose that at first it would be practised in a very rude manner, by immersing the linens, woollens, cottons, or other articles to be dyed, in a solution of the colouring matter, or by some such simple process. But, though sometimes very brilliant, the colours imparted in this inartificial manner are, for the most part, of the most fugitive description. And yet it is sufficiently certain that a lengthened period must have elapsed, and many trials have taken place, before the happy, and, most probably, accidental discovery was made of fixing colours, or rendering them permanent, by the use of mordants. (*Gougeon's Origine des Loix* &c. i. 130, English translation; and Bancroft *On Colours*, i. Introduction.) In modern times the arts of dyeing and calico printing have been greatly improved, and their products are now as remarkable for their cheapness as for their splendour.

We have given notices of the following articles under their respective heads; but it may be interesting to have their imports brought together in one point of view.

Account of the Quantities of the Principal Dyes and Dyeing Stuffs Imported into the United Kingdom during each of the 3 Years ending with 1866.

	1864	1865	1866

The various dye stuffs &c. may be arranged under the colours they produce, viz:—

**Red.**—Madder, and its derivatives (*gamboge, alizarine, flowers of madder*), yielding shades of red, amongst which Turkey red, purple, chocolate, pink &c.; orchilla, or purple, cochineal and lac dye, scarlet; Brazilian reds (*magenta, agalaine, roseine*); aniline reds (*magenta, azuline, roseine*); **Blue.**—Indigo; Prussian blue; logwood; ultramarine; coal tar blues (*azuline, chromatic de Paris, bleu de Mulhouse, taludine blue*); **Yellow.**—Weld; fustic; quercitron; berries; turmeric; chromai; of lead; pink chrysaniline.

**Compound Colours.**—Softflower (red and violet) (orange); archil or orchil (reds, mauves &c.); French purple; murexide (purple); aloes (maroons, pinks) (to 'ao); chrome violetine; Chinese green (green); emeraldine (aniline green); sandalwood (maroon &c.); gall nuts and shumac (black, olive &c.); catechu (black, red, drab &c.); iron oxide, manganese, pyroligneous (browns, greys &c.); logwood (black, lilac &c.).

**EARNEST.** In advanced by the buyer to the seller to the effect enacted by the 17th of Frauds, 29 Chas. the sale of any good for the prices of 10*l.* allowed to be good, part of the goods so same, or give some bargain, or in part memorandum in writing and signed by each contract, or their authorized.

As to what amount blackstone lays it down is paid down, if the price of the goods is binding. To contract, and it should be given as a contract, and it should be given. (Chitty's 280.)

After earnest and be the price, it appears to be, subject only to the *rental Law*, p. 485. **ARTHWARE** (Ceramics); Fr. vaisselle; Sic. terraglio; Sp. chetchnie passolli; rocky, as it is some sort of household used in the fire.

and, of very considerable improvements that have been made of late years, especially to its extension to the comfort of

there is scarcely, it is a manufacture which is in its gradual progress, as that of earthenware is so beautiful a union of art with the common life. Chemistry assisting the several arts, and giving as well their progress as the respective compositions required, and the progress of antiquity, and even more exquisite by which they have been provided in order to suit every state of the art. It is to be seen in every house, and in many of the countries of Europe, and the less cleanly we are, and, by its cheapness, means of our progress, substances originating has induced in the created skill of su

E

**EARNEST.** In Commercial Law, the sum advanced by the buyer of goods in order to bind the seller to the terms of the agreement. It is enacted by the 17th section of the famous Statute of Frauds, 29 Chas. II. c. 3, that 'no contract for the sale of any goods, wares, and merchandises, for the prices of 10l. sterling or upwards, shall be allowed to be good, except the buyer shall accept part of the goods so sold, and actually receive the same, or give something in earnest to bind the bargain, or in part payment, or that some note or memorandum in writing of the said bargain be made and signed by the parties to be charged by such contract, or their agents thereunto lawfully authorised.'

As to what amounts to sufficient earnest, Blackstone lays it down, that 'if any part of the price is paid down, if it is but a penny, or any part of the goods is delivered by way of earnest, it is binding.' To constitute earnest, the thing must be given as a token of ratification of the contract, and it should be expressly stated so by the giver. (*Chitty's Commercial Law*, vol. iii. 283.)

After earnest and before the payment of the whole price, it appears that the property is in the vendee, subject only to the vendor's lien. (*Smith's Realty Law*, p. 485.)

**EARTHENWARE** (Ger. irdene waaren; Dutch, geogeed; Fr. vaisselle de terre, poterie; Ital. liglie, terraglio; Span. loza de barro; Russ. chetschnie passolli; Pol. gliniane naczynia), crockery, as it is sometimes termed, comprises every sort of household utensil made of clay and fired in the fire. Its manufacture is, in all ages, of very considerable importance, and its improvements that have been made in it since the middle of last century have contributed fully to its extension, and have added to the comfort and convenience of all

countries; it has been well observed, that the manufacture which is so interesting to countries as that of earthenware, presenting, as it does, a beautiful union of science and art, in the application of the comforts and ornaments of daily life. Chemistry administers her part, by pointing out the several species of earths, and showing as well their most appropriate compositions as the respective degrees of heat which they require. Art has studied the various degrees of antiquity, and produced from them even more exquisite in form than the nature has been provided in such gradations of beauty to suit every station from the highest to the lowest. It is to be seen in every country, and in every house, through the whole of America, in many parts of Asia, and in the countries of Europe. At home it has been made in the less cleanly vessels of pewter and tin, and, by its cheapness, has been brought to the means of our poorest housekeepers. It is from substances originally of no value, and which have induced labour of such various degrees, and created skill of such various degrees,

that nearly the whole value of the annual produce may be considered as an addition made to the mass of national wealth. The abundance of the ware exhibited in every dwelling-house is sufficient evidence of the vast augmentation of the manufacture, which is also demonstrated by the rapid increase of the population in the districts where the potteries have been established. (*Quarterly Review*.)

For the great and rapid extension of the manufacture we are chiefly indebted to the late Mr. Josiah Wedgwood, whose original and inventive genius enabled him to make many most important discoveries in the art, and who was equally successful in bringing his inventions into use. The principal seat of the manufacture is in Staffordshire, where there is a district denominated the Potteries, comprising a number of small towns and villages, and a population which is now (1868) estimated at over 140,000, by far the greater portion of which is engaged in the manufacture. There are no authentic accounts of the population of this district in 1760, when Mr. Wedgwood began his discoveries; but the general opinion is, that it did not at that time exceed 20,000. The village of Etruria, in the Potteries, was built by Mr. Wedgwood. The manufacture has been carried on at Burslem, in the same district, for several centuries.

The canals by which Staffordshire is intersected have done much to accelerate the progress of the manufacture. Pipe-clay from Dorsetshire and Devonshire, and flints from Kent, are conveyed by water carriage to the places where the clay and coal abound; and the finished goods are conveyed by the same means to the great shipping ports, whence they are distributed over most parts of the globe.

The earthenware manufacture has increased considerably since 1814, but it is not possible to state the exact ratio. The prices of the different sorts of earthenware are said to have fallen 25 per cent. during the last 30 years. Wages have not fallen in the same proportion; but we are assured that a workman can, at the present day, produce about four times the quantity he did in 1790. We subjoin an

Account of the Value of the Earthenware and China Exported from the United Kingdom in 1866, specifying the Countries to which it was principally sent, and the Values sent to each.

Countries	Value
Russia	£ 21,963
Hamburg	46,131
Holland	13,437
United States	796,608
Brazil	79,862
France	43,535
Cuba	37,868
British East Indies	55,299
Australia	101,761
British North America	100,310
Total value of above and of the exports to all other countries	1,630,019

The above account sets the preponderance of the United States as a market for earthenware in a very striking point of view. We have been

insured that it is necessary to add  $\frac{1}{4}$  to the declared value of the exports, to get their true value.

It is estimated that the value of the various sorts of earthenware produced at the Potteries may amount to about 2,000,000*l.* a-year; and that the earthenware produced at Worcester, Derby, and other parts of the country, may amount to about 1,000,000*l.* more; making the whole value of the manufacture 3,000,000*l.* a-year. The consumption of gold at the Potteries is about 1,200*l.* a-week, and of coal about 13,000 tons a-week.

The export trade in earthenware, i.e. red pottery and brown stone ware, common earthenware, and porcelain, has somewhat declined of late years, though the value of the shipments in 1866 is considerably in excess of that of the shipments in the previous year.

**EAST INDIA COMPANY.** A famous association, originally established for prosecuting the trade between England and India, which they acquired a right to carry on exclusively. Since the middle of last century, however, the Company's political have become of more importance than their commercial concerns.

**EAST INDIES,** a popular geographical term not very well defined, but generally understood to signify the continents and islands to the east and south of the river Indus, as far as the borders of China, including Timor and the Moluccas, but excluding the Philippine Islands, New Guinea, and New Holland. China and the Philippine Islands were, however, included within the limits of the East India Company's peculiar privileges.

- III. EAST INDIES (EXTENT, POPULATION, MILITARY FORCE, REVENUE &c. OF BRITISH).

#### I. EAST INDIA COMPANY (HISTORICAL SKETCH OF).

The persevering efforts of the Portuguese to discover a route to India, by sailing round Africa, were crowned with success in 1497. And it may appear singular, that, notwithstanding the exaggerated accounts that had been prevalent in Europe, from the remotest antiquity, with respect to the wealth of India, and the importance to which the commerce with it had raised the Phœnicians and Egyptians in antiquity, the Venetians in the middle ages, and which it was then seen to confer on the Portuguese, the latter should have been allowed to monopolise it for nearly a century after it had been turned into a channel accessible to every nation. But the prejudices by which the people of most European states were actuated in the sixteenth century, and the peculiar circumstances under which they were placed, hindered them from embarking with exuberance and ardour which might have been expected in this new commercial career. Soon after the Portuguese began to prosecute their discoveries along the coast of Africa, they applied to the Pope for a bull, securing to them the exclusive right to the possession of all countries occupied by infidels which the Portuguese either had discovered, or which they discovered to the south of Cape Non, on the west coast of Africa, in 27° 54' north latitude; and the Pontiff, desirous to display, and at the same time to extend, his power, immediately issued a bull to this effect. Nor, preposterous as a proceeding of this sort would now appear, did any one

then doubt that the Pope had a right to issue such a bull, and that all states and empires were bound to obey it. In consequence, the Portuguese were, for a lengthened period, allowed to prosecute their conquests in India without the interference of any other European power; and it was not till a considerable period after the beginning of the war, which the blind and brutal bigotry of Philip II. kindled in the Low Countries, that the Dutch navigators began to display their flag on the Eastern Ocean, and laid the foundations of their Indian empire.

The desire to comply with the injunctions in the Pope's bull, and to avoid coming into collision, first with the Portuguese, and subsequently with the Spaniards, who had conquered Portugal in 1580, seems to have been the principal cause that led the English to make repeated attempts, in the reigns of Henry VIII. and Edward VI., and the early part of the reign of Elizabeth, to discover a route to India by a west or north-east passage—channels from which the Portuguese would have had no pretence to exclude them. But these attempts having proved unsuccessful, and the Pope's bull having ceased to be of any effect in this country, the English merchants and navigators resolved no longer deterred by the imaginary rights of the Portuguese from directly entering upon what was then reckoned by far the most lucrative and advantageous branch of commerce. Captain Stephens, who performed the voyage in 1582, was the first Englishman who sailed to India by the Cape of Good Hope. The voyage of the famous Francis Drake contributed greatly to diffuse the spirit of naval enterprise, and to render the English better acquainted with the newly discovered route to India. But the voyage of the captain Thomas Cavendish was, in the latter respect, the most important. Cavendish sailed to England in a little squadron, fitted out at his expense, in July 1586; and having explored a greater part of the Indian Ocean, as far as the Philippine Islands, and carefully observed the most important and characteristic features of people and countries which he visited, returned to England, after a prosperous navigation, in September 1588. But perhaps nothing contributed so much to inspire the English with a desire to embark in the Indian trade as the capture that were made about this period from the Spaniards. A Portuguese East India carrack, captured by Sir Francis Drake on his expedition to the coast of Spain, induced the cupidity of the merchants by the richness of her cargo, at the same time that the papers on board gave specific information respecting the traffic in which she had been engaged, and the more important capture of the same vessel made in 1593. An armament, fitted out for the East Indies by Sir Walter Raleigh, and commanded by Sir John Borroughs, fell in, near the mouth of the Amazon, with a Portuguese carrack, with the largest of all the Portuguese ships of 1,600 tons burden, carrying 700 men, 36 brass cannon; and, after an obstinate struggle, carried her into Dartmouth. She was the first vessel that had been seen in England; and her cargo, consisting of gold, spices, calicoes, pearls, drugs, porcelain, ivory &c., excited the ardour of the English to engage in so new a commerce.

In consequence of these and other causes, an association was formed in London in 1599 for prosecuting the trade to India. Adventurers applied to the Queen for a charter of incorporation, and also for power to employ other English subjects, who had not

license from them, from carrying on any species of traffic beyond the Cape of Good Hope or the Straits of Magellan. As exclusive companies were then very generally looked upon as the best instruments for prosecuting most branches of commerce and industry, the adventurers seem to have had little difficulty in obtaining their charter, which was dated December 31, 1600. The corporation was entitled 'The Governor and Company of Merchants of London trading into the East Indies.' The first governor (Thomas Smythe, Esq.) and 24 directors were nominated in the charter; but power was given to the Company to elect a deputy-governor, and in future to elect their governor and directors, and such other office-bearers as they might think fit to appoint. They were empowered to make by-laws; to inflict punishments, either corporal or pecuniary, provided such punishments were in accordance with the laws of England; to export all sorts of goods free of duty for 4 years; and to export foreign coin or bullion to the amount of 30,000*l.* a-year, 6,000*l.* of the same being previously coined at the mint; but they were obliged to import, within 6 months after the completion of every voyage except the first, the same quantity of silver, gold, and foreign coin that they had exported. The duration of the charter was limited to a period of 15 years; but with and under the condition that, if it were found for the public advantage, it might be renewed at any time upon 2 years' notice being given. Such was the origin of the British East India Company, the most celebrated commercial association of ancient or modern times, and which in course of time extended its sway over the whole of the Mogul empire.

It might have been expected that, after the charter was obtained, considerable eagerness would have been manifested to engage in the trade, such was not the case. Notwithstanding the most calls and threats of the directors, many of the adventurers could not be induced to come forward to pay their proportion of the charges incident to the fitting out of the first expedition. As the directors seem either to have wanted to enforce their resolutions, or thought it expedient not to exercise it, they formed a subordinate association, consisting of such members of the Company as were really willing to defray the cost of the voyage, and to bear all the risks and losses attending it, on condition of their having the exclusive right to whatever profits might arise from the voyage by such subordinate associations that were conducted during the first 13 years of the Company's existence.

The first expedition to India, the cost of which was defrayed by the five ships, included, to 69,091*l.*, the cost of five ships, the largest being 600, and carrying 130 tons burthen. The goods put on board were principally bullion, iron, tin, broad cloths, cutlery, glass &c. The chief command was entrusted to Captain James Lancaster, who sailed from England on February 13, 1601. Being very imperfectly acquainted with the seas and countries to be visited, they did not arrive at their destination, Acheen in Sumatra, till June 5, 1602. The voyage was, on the whole, not only tedious, but only prosperous. Lancaster entered into treaties with the kings of Acheen and Borneo, and having taken on board a valuable quantity of pepper and other produce, he was forced, in his way home, to fall in with a Dutch vessel, in concert with a Dutch vessel, a quantity of 900 tons burthen, richly laden with pepper, which Lancaster returned to the Downs on September 1603. (*Modern Universal History*, vol.

x, p. 16; Macpherson's *Commerce of the European Powers with India*, p. 81.)

But notwithstanding the favourable result of this voyage, the expeditions fitted out in the years immediately following, though sometimes consisting of larger ships, were not, at an average, materially increased. In 1612 Captain Best obtained from the court at Delhi several considerable privileges; and amongst others, that of establishing a factory at Surat, which city was henceforth looked upon as the principal British station in the west of India, till the acquisition of Bombay.

In establishing factories in India, the English only followed the example of the Portuguese and Dutch. It was contended that they were necessary to serve as depôts for the goods collected in the country for exportation to Europe, as well as for those imported into India, in the event of their not meeting with a ready market on the arrival of the ships. Such establishments, it was admitted, are not required in civilised countries; but the peculiar and unsettled state of India was said to render them indispensable there. Whatever weight may be attached to this statement, it is obvious that factories formed for such purposes could hardly fail of speedily degenerating into a species of forts. The security of the property deposited in them furnished a specious pretext for putting them in a condition to withstand an attack; while the agents, clerks, warehousemen &c. formed a sort of garrison. Possessing such strongholds, the Europeans were early emboldened to act in a manner quite inconsistent with their character as merchants, and but for a very short time elapsed before they began to form schemes for monopolising the commerce of particular districts, and acquiring territorial dominion.

Though the Company met with several heavy losses during the earlier part of their traffic with India, from shipwrecks and other unforeseen accidents, and still more from the hostility of the Dutch, yet, on the whole, the trade was decidedly profitable. There can, however, be little doubt that their gains at this early period have been very much exaggerated. During the first 13 years they are said to have amounted to 132 per cent. But then it should be borne in mind, as Mr. Grant has justly stated, that the voyages were seldom accomplished in less than 30 months, and sometimes further extended to 3 or 4 years; and it should be remarked, that, on the arrival of the ships at home, the cargoes were disposed of at long credits of 18 months or 2 years; and that it was frequently even 6 or 7 years before the concerns of a single voyage were finally adjusted. (*Sketch of the History of the Company*, p. 13.) When these circumstances are taken into view, it will immediately be seen that the Company's profits were not, really, by any means so great as has been represented. Still it may not be uninteresting to remark that the principal complaint that was then made against the Company did not proceed so much on the circumstance of its charter excluding the public from any share in an advantageous trade, as in its authorising the Company to export gold and silver of the value of 30,000*l.* a-year. It is true that the charter stipulated that the Company should import an equal quantity of gold and silver within 6 months of the termination of every voyage; but the enemies of the Company contended that this condition was not complied with, and that it was, besides, highly injurious to the public interest, and contrary to all principle, to allow gold and silver to be sent out of the kingdom. The merchants and others interested in the

support of the Company could not controvert the reasoning of their opponents without openly impugning the ancient policy of absolutely preventing the exportation of the precious metals. They did not, however, venture to contend, if the idea really occurred to them, that the exportation of bullion to the East was advantageous on the broad ground of the commodities purchased by it being of greater value in England; but they contended that the exportation of bullion to India was advantageous because the commodities thence imported were chiefly re-exported to other countries from which a much greater quantity of bullion was obtained than had been required to pay for them in India. Mr. Thomas Mun, a director of the East India Company, and the ablest of its early advocates, ingeniously compares the operations of the merchant in conducting a trade with the operations of the agriculturist. 'If we ride on by the exportation of gold and silver to the seed-time and harvest of agriculture. 'If we behold,' says he, 'the actions of the husbandman in the seed-time, when he casteth away much good corn into the ground, we shall account him rather a madman than a husbandman; but when we consider his labours in the harvest, which is the end of his endeavours, we find the worth and plentiful increase of his actions.' (*Treasure by Foreign Trade*, p. 50, ed. 1664.)

We may here remark that what has been called the mercantile system of political economy, or that system which measures the progress of a country in the career of wealth by the supposed balance of payments in its favour, or by the estimated excess of the value of its exports over that of its imports, appears to have originated in the excuses now set up for the exportation of bullion. Before this epoch, the policy of prohibiting the exportation of bullion had been universally admitted; but it now began to be pretty generally allowed that its exportation might be productive of advantage, provided it occasioned the subsequent exportation of a greater amount of raw or manufactured products to countries whence bullion was obtained from them. This, when compared with the previously existing prejudice (for it hardly deserves the name of system) which wholly interdicted the exportation of gold and silver, must be allowed to be a considerable step in the progress to sounder opinions. The maxim *ce n'est que le premier pas qui compte* was strikingly verified on this occasion. The advocates of the East India Company began gradually to assume a higher tone, and at length boldly contended that bullion was nothing but a commodity, and that its exportation should be rendered as free as that of anything else. Nor were these opinions confined to the partners of the East India Company—they were gradually communicated to others; and many eminent merchants were taught to look with suspicion on several of the previously received dogmas with respect to commerce, and were, in consequence, led to acquire more correct and comprehensive views. The new ideas ultimately made their way into the House of Commons; and in 1663 the statutes prohibiting the exportation of foreign coin and bullion were repealed, and full liberty given to export them in unlimited quantities.

But the objection to the East India Company, or rather the East India trade, on the ground of its causing the exportation of gold and silver, admits of a more direct and conclusive, if not a more ingenious reply. How compendious soever the ancient intercourse with India by the Red Sea and the Mediterranean, it was unavoidably attended with a good deal of expense. The productions of the remote parts of Asia, brought to
