Technical and Bibliographic Notes/Notes techniques et bibliographiques

The Institute has attempted to obtain the best original copy available for filming. Features of this copy which may be bibliographically unique, which may alter any of the images in the reproduction, or which may significantly change the usual method of filming, are checked below.

L'Institut a microfilmé le meilleur exemplaire qu'il lui a été possible de se procurer. Les détails de cet exemplaire qui sont peut-être uniques du point de vue bibliographique, qui peuvent modifier une image reproduite, ou qui peuvent exiger une modification dans la méthode normale de filmage sont indiqués ci-dessous.

<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
12X	16X	20X	24X	28X	32X

The copy filmed here has been reproduced thanks to the generosity of:

Library of the Public  
Archives of Canada

The images appearing here are the best quality possible considering the condition and legibility of the original copy and in keeping with the filming contract specifications.

Original copies in printed paper covers are filmed beginning with the front cover and ending on the last page with a printed or illustrated impression, or the back cover when appropriate. All other original copies are filmed beginning on the first page with a printed or illustrated impression, and ending on the last page with a printed or illustrated impression.

The last recorded frame on each microfiche shall contain the symbol  $\rightarrow$  (meaning "CONTINUED"), or the symbol  $\nabla$  (meaning "END"), whichever applies.

Maps, plates, charts, etc., may be filmed at different reduction ratios. Those too large to be entirely included in one exposure are filmed beginning in the upper left hand corner, left to right and top to bottom, as many frames as required. The following diagrams illustrate the method:

L'exemplaire filmé fut reproduit grâce à la générosité de:

La bibliothèque des Archives  
publiques du Canada

Les images suivantes ont été reproduites avec le plus grand soin, compte tenu de la condition et de la netteté de l'exemplaire filmé, et en conformité avec les conditions du contrat de filmage.

Les exemplaires originaux dont la couverture en papier est imprimée sont filmés en commençant par le premier plat et en terminant soit par la dernière page qui comporte une empreinte d'impression ou d'illustration, soit par le second plat, selon le cas. Tous les autres exemplaires originaux sont filmés en commençant par la première page qui comporte une empreinte d'impression ou d'illustration et en terminant par la dernière page qui comporte une telle empreinte.

Un des symboles suivants apparaîtra sur la dernière image de chaque microfiche, selon le cas: le symbole  $\rightarrow$  signifie "A SUIVRE", le symbole  $\nabla$  signifie "FIN".

Les cartes, planches, tableaux, etc., peuvent être filmés à des taux de réduction différents. Lorsque le document est trop grand pour être reproduit en un seul cliché, il est filmé à partir de l'angle supérieur gauche, de gauche à droite, et de haut en bas, en prenant le nombre d'images nécessaire. Les diagrammes suivants illustrent la méthode.

1.2

Though immediately and primarily written for the merchants, this Commercial Dictionary will be of use to every man of business or of curiosity. There is no man who is not in some degree a merchant; who has not something to buy and something to sell, and who does not therefore want such instructions as may teach him the true value of possessions or commodities. The descriptions of the productions of the earth and water which this volume contains, may be equally pleasing and useful to the speculatist with any other Natural History. The descriptions of ports and cities may instruct the geographer as well as if they were found in books appropriated only to his own science; and the doctrines of funds, insurances, currency, monopolies, exchanges, and duties, is so necessary to the politician, that without it he can be of no use either in the council or the senate, nor can speak or think justly either on war or trade.

We, therefore, hope that we shall not repent the labour of compiling this work, nor flatter ourselves unreasonably, in predicting a favourable reception to a book which no condition of life can render useless, which may contribute to the advantage of all that make or receive laws, of all that buy or sell, of all that wish to keep or improve their possessions, of all that desire to be rich, and all that desire to be wise.

JOHNSON, Preface to *Roll's Dict.*

## PREFACE

TO

THE EDITION OF 1869.

---

It has been well observed of M'Culloch's *Commercial Dictionary*, that though it must be continually re-edited, to meet the constant changes of our times, the work is so carefully founded on great principles that the necessity of completely remodelling it can scarcely arise.

The Author, after making the necessary preparations, had actually commenced a new Edition of the book a few months before his death; and in completing this task the Editor has, as far as possible, adhered to the Author's plan and arrangement of the work, and above all has respected, by preserving intact, the expressions of his well-considered and well-known opinions on the various subjects treated of in this Dictionary. For these opinions, however, the Author, and not the Editor, should be held responsible.

A few articles on subjects with regard to which science must necessarily be progressive, such as those on ACIDS and ALKALIES, have been entirely recast; and many subjects, such as PASSPORTS, PETROLEUM, TELEGRAPHS, TRANSIT, &c., are introduced to the reader's notice for the first time, under their appropriate heads.

It will be observed, by those familiar with former issues of this work, that much of the very small type has disappeared from the present impression; and, with a view to facilitate reference, this Edition has been printed throughout in double columns. As indicating the freshness of the new matter given in the following pages, it may be noted that extracts from the Russian Tariff of 1869 will be found under PETERSBURG; and that Mr. Lowe's Resolutions affecting the Customs and Inland Revenue are embodied in the article TARIFF, BRITISH, and referred to under TEA, WHEAT, &c.

In a work of such extent the Editor has necessarily been indebted to very many for aid, and to those more especially who have rendered gratuitous assistance he would offer his best thanks. Though it seems almost invidious to distinguish any, where all have so readily afforded valuable information and efficient help, he cannot refrain from expressing his heavier obligations to Mr. Robert Slater of Fore Street (unfortunately since deceased), Mr. Robin Allen, the Secretary, and Mr. John Inglis, Assistant-Secretary of the Trinity House; Mr. B. C. Stephenson, Secretary of Lloyd's; Mr. W. S. Lindsay, formerly M.P. for Sunderland; Mr. Thomson, of Messrs. Bell, Rannie & Co.; and to the Rev. G. W. Cox, M.A., Editor of Brande's Dictionary of Science, &c.

The Editor is bound also to acknowledge the aid he has derived from the various Commercial Reports of the British Consuls. But it is only just and right that M'Culloch's *Commercial Dictionary* should have the fullest benefit from this source of information—for it would appear that it was at the Author's suggestion that Lord Aberdeen called for these Reports in the form and detail which they now exhibit. And it may not be too much to say here, that the adoption of Mr. M'Culloch's plan has resulted in the production of that series of accurate, business-like, and instructive documents which have been thought worthy of being printed, and laid before Parliament.

The Editor, as son-in-law as well as Secretary to the Author, has had ample opportunities of being familiar with his views on many subjects, and as his Secretary acquired considerable experience in the mode of compiling this work by assisting Mr. M'Culloch more or less, from 1843 downwards, in its tabular and more mechanical portions.

## PREFACE

TO

THE EDITION OF 1859.

THOUGH in part a reprint, the edition of this Dictionary now laid before the reader, has undergone many alterations, and is, we trust, considerably improved. The extraordinary increase of manufactures and commerce in almost all countries,\* and the opening of various new and important channels of intercourse, have rendered changes necessary in most parts of the work. We had, for example, to notice the new arrangements with China and Japan; the abolition of the Sound Duties; the termination of the rule of the East India Company in India; the continued efflux of the precious metals to that continent and China; the introduction of several new articles, such as VEGETABLE WAX and SHEA BUTTER, into the list of imports; with an all but endless variety of other matters.

The rules and regulations, too, under which trade is carried on, have been materially modified within the last four or five years. The United States and Russia passed, in 1857, new and comparatively moderate tariffs. And we are glad to have to state that the greater number of the changes which we have had to notice in the commercial legislation of foreign countries, have been of a liberal character. It seems, also, reasonable to suppose that the freedom of trade and industry will be more and more diffused, according as nations and their rulers become better acquainted with the sound principles on which it is founded, and with the wonderful progress we have made, and are continuing to make, in industrial pursuits, since we shook off the shackles of the protective system.

The greater importance of some of the many topics we have had to discuss, has necessarily required for them the greatest share of our attention. We have not, however, neglected or slurred over the others, but have endeavoured to set the different matters treated of in the clearest point of view that the information at our disposal would permit. This, it is true, has sometimes been neither so ample, so recent, nor so precise, as might have been desired. But we have

\* There is, it must be admitted, one great exception to this statement. The fertile, well situated, and extensive countries subjected to Turkish misgovernment and oppression continue sunk in barbarism; or, if there be anywhere any symptoms of improvement, they are only to be found among the subjugated races. The Turks themselves have retrograded; and their religion, and the institutions and opinions to which it has given birth, are insuperable obstacles to anything like real progress. But it is not to be supposed, despite the support it will no doubt receive, that this worthless and superannuated system of misrule should exist much longer. And there can be no doubt that its overthrow, whether it be effected by the righteous rebellion of those it has so long trampled under foot, or by foreign force, will be a vast gain to humanity. It will do more than anything else that can be done to extend the sphere of civilisation and commerce.

done our best to obviate these defects by resorting to the quarters most likely to be well-informed. And on this, as on other occasions, those to whom we applied, have, with but few exceptions, evinced the greatest readiness, and even anxiety, to give us every assistance in their power. We have noticed some gentlemen to whom we have been indebted at the end of the articles to which they especially contributed; and among these and others, we may specify Sir James Emerson Tennent, and W. M. Bucknall, Esq., of the Board of Trade; Alfred Latham, Esq., Deputy Governor of the Bank of England; Andrew Jamieson, Esq., of the firm of Jamieson, Brothers & Co.; R. C. Crosbie, Esq., of Liverpool; Robert Slater, Esq., of Fore Street, London; Marmaduke Hornidge, Esq., of the East India House; W. S. Lindsay, Esq., M.P.; J. A. Messenger, Esq., Inspector-General of Imports and Exports; Dr. Strang, of Glasgow; John Crawford, Esq., late of Singapore; and the very learned bookseller, Nicholas Trübner, Esq., of Paternoster Row. It is only by the assistance of individuals having correct information at their disposal, and of those engaged in different lines of business, in different parts of the world, that a work of this sort can be rendered of any considerable value. No diligence of enquiry can acquire satisfactory information respecting most part of the subjects of which we have had to treat from books and statistical returns, even when these exist and are accessible, which is frequently not the case. It can only be acquired by comparing these, or, where they are wanting, supplying their place with the communications of intelligent individuals familiar with the matters referred to.

We would fain hope that there are fewer errors in this than in the previous impressions of this work, and that it will be found to be in various respects more complete and serviceable. No ordinary amount of labour has been expended upon it. And though the details incident to most part of the subjects which it embraces be perpetually changing, the principles by which it is pervaded are, we are well assured, of an enduring character, and will be no less applicable in the ages that are to come than at present.

\* \* We added to the preface to a former edition of this work the following brief notice of one of the most upright and patriotic statesmen that this country has ever produced. However defective it may be reckoned, the place, at least, was not inappropriate for its introduction. And whatever mutations this book may be destined to undergo, this notice will not, we hope, be displaced, unless it be to make room for one less unworthy of the subject.

‘We may, perhaps, be excused, if, before concluding this notice introductory to a work which he honoured with his approbation, we briefly advert to the irreparable loss which the United Kingdom, and the commercial world generally, have sustained since the publication of our last edition, in the premature death of Sir Robert Peel. There are but few of the more important topics treated of in this volume in which we have not had to refer to the enlightened and well-digested measures of that great statesman. The maintenance of our old monetary standard, and the sound and comparatively satisfactory state of our banking system, are mainly a consequence of his exertions. To say that he did more to promote the public well-being, by introducing enlarged and liberal principles into our economical policy, than any other minister, would be to say little or nothing; for he did more to forward these great ends than all our other ministers put together, from the Revolution down to the present times. Not

that we mean to say that we equally approve of all his measures, or think that some of them might not have been in some respects amended. But we refer to the spirit which pervaded his policy, its object, and its general influence. England was the centre of his solicitude; but the majority of the measures which he supported and carried, and his great example, have redounded, and will continue to redound, not to the advantage of this country only, but of the world. And hence the deep regret which his death excited in all but the most barbarous nations—“*Finis vitæ ejus amicis luctuosus, patriæ tristis, extraneis etiam ignotisque non sine cura fuit.*” \*

‘Though slow to change an opinion or system of policy, he had none of that miserable pride or partisan bigotry, which so often passes for principle, that disdains to profit by experience, and is above the acknowledgment of an error. He was at all times ready to inquire, and open to conviction. And whenever he had fully satisfied himself that it was necessary, to promote or secure the public welfare, that he should abandon an old or adopt a new course, he did so at once. The moment he was impressed with that conviction, all doubts and difficulties vanished from his mind. His duty to his country absorbed every other consideration. Neither the taunts of opponents nor the desertion of friends could influence his resolution. And he spared no efforts, and shrunk from no sacrifice, however unparalleled, to accomplish his patriotic purposes. Other ministers have equalled, and a few may perhaps have surpassed, Sir Robert Peel in ability. But he stands foremost among British statesmen for disinterestedness; and for a determination to support and advance, at whatever cost to himself, what he believed to be the lasting and real interests of the community.

\* Taciti Vit. Agricol. c. 43.

## PREFACE

TO

### THE SECOND EDITION.

THE first impression of this Dictionary, consisting of 2,000 copies, was entirely sold off in less than nine months from the date of its publication. We feel very deeply indebted to the public for this unequivocal proof of its approbation; and we have endeavoured to evince our gratitude, by labouring to render the work less undeserving a continuance of the favour with which it has been honoured. In the prosecution of this object, we have subjected every part of it to a careful revision; have endeavoured to eradicate the errors that had escaped our notice; to improve those parts that were incomplete or defective; and to supply such articles as had been omitted. We dare not flatter ourselves with the idea that we have fully succeeded in these objects. The want of recent and accurate details as to several important subjects, has been an obstacle we have not, in all cases, been able to overcome; but those in any degree familiar with such investigations will not, perhaps, be disposed severely to censure our deficiencies in this respect.

The changes in the law bearing upon commercial transactions have been carefully specified. Copious abstracts of the late Customs Acts are contained in the articles COLONIES AND COLONY TRADE, IMPORTATION AND EXPORTATION, NAVIGATION LAWS, REGISTRY, SMUGGLING, WAREHOUSING &c.

The abolition of the East India Company's commercial monopoly, and the great and growing interest\* that has in consequence been excited amongst all classes respecting the commercial capabilities and practices of India, China, and other Eastern countries, have made us bestow peculiar attention to this department. The articles BANGKOK, BATAVIA, BOMBAY, BUSHIRE, BUSSORAH, CALCUTTA, CANTON, COLUMBO, EAST INDIA COMPANY AND EAST INDIES, INDIGO, MACAO, MADRAS, MANILLA, MALIBAIN, MOCHA, MUSCAT, NANGASACKI, OPIUM, RANGOON, SINGAPORE, TATTA, TEA, &c. contain, it is believed, a greater mass of recent and well-authenticated details as to the commerce of the vast countries stretching from the Arabic Gulph to the Chinese Sea, than is to be found in any other English publication.

The article BANKING is mostly new. Besides embodying the late Act prolonging the charter of the Bank of England, and the more important details given in the Report of the Select Committee on the Renewal of the Bank Charter, this article contains some novel and important information not elsewhere to be met

\* The recent events in China have added greatly to this interest, and have made us enter, in this edition, into several additional details.

with. No account of the issues of the Bank of England has hitherto been published, that extends further back than 1777. But this deficiency is now, for the first time, supplied; the Directors having obligingly furnished us with an account of the issues of the Bank on February 28 and August 31, of each year, from 1698, within four years of its establishment, down to the present time. We have also procured a statement, from authority, of the mode of transacting business in the Bank of Scotland; and have been able to supply several additional particulars, both with respect to British and to foreign banks.

We have made many additions to, and alterations in, the numerous articles descriptive of the various commodities that form the materials of commerce, and the historical notices by which some of them are accompanied. We hope they will be found more accurate and complete than formerly.

The Gazetteer department, or that embracing accounts of the principal foreign emporiums with which this country maintains a direct intercourse, was, perhaps, the most defective in the old edition. If it be no longer in this predicament, the improvement has been principally owing to official co-operation. The sort of information we desired as to the great sea-port towns could not be derived from books, nor from any sources accessible to the public; and it was necessary, therefore, to set about exploring others. In this view we drew up a series of queries, embracing an investigation of imports and exports, commercial and shipping regulations, port charges, duties &c., that might be transmitted to any port in any part of the world. There would, however, in many instances, have been much difficulty in getting them answered with the requisite care and attention by private individuals; and the scheme would have had but a very partial success, had it not been for the friendly interference of Mr. Poulett Thomson. Alive to the importance of having the queries properly answered, he undertook to use his influence to get them transmitted to the Consuls. This was accordingly done; and answers have been received from the greater number of these functionaries. There is, of course, a considerable inequality amongst them; but for the most part they embody a good deal of valuable information, and some of them are drawn up with a degree of skill, and display an extent of research and a capacity of observation, that reflect high credit on their authors.\*

The information thus obtained, added to what we received through other but not less authentic channels, supplied us with the means of describing twice the number of foreign sea-ports noticed in our former edition; and of enlarging, amending, and correcting the accounts of such as were noticed. Besides much fuller details than have ever been previously published of the nature and extent of the trade of many of these places, the reader will, in most instances, find a minute account of the regulations to be observed respecting the entry and clearing of ships and goods, with statements of the different public charges laid on shipping, the rates of commission and brokerage, the duties on the principal goods imported and exported, the prices of provisions, the regulations as to quarantine, the practice as to credit, banking &c., with a variety of other particulars. We have also described the ports; and have specified their depth of water, the course to be steered by vessels on entering, with the rules as to pilotage, and the fees on account of pilots, light-houses &c. As it is very difficult to convey a sufficiently distinct idea of a sea-port by any description, we have given plans, taken from the latest and best authorities, of about a dozen of the principal foreign ports. Whether we have succeeded, is more than we can venture to say; but we hope we have said enough to satisfy

\* The returns furnished by the Consuls at Hamburg, Trieste and Venice, Naples, Dantzic, Bordeaux, Christiania, Amsterdam, Elsinore, New York, Charleston, &c. are particularly good.

the reader, that we have spared no pains to furnish him with authentic information in this important department.

The **TARIFF**, or Table of Duties on Imports, &c., in this edition, is peculiarly valuable. It is divided into three columns: the first containing an account of the existing duties payable on the importation of foreign products for home use, as the same were fixed by the Act of last year, 3 & 4 Wm. IV. c. 56; the next column exhibits the duties payable on the same articles in 1819, as fixed by the Act 59 Geo. III. c. 52; and the third and last column exhibits the duties as they were fixed in 1787 by Mr. Pitt's Consolidation Act, the 27 Geo. III. c. 13. The duties are rated throughout in Imperial weights and measures; and allowances have been made for differences in the mode of charging, &c. The reader has, therefore, before him, and may compare together, the present customs duties with the duties as they stood at the end of the late war, and at its commencement. No similar Table is to be met with in any other work. We are indebted for it to J. D. Hume, Esq., of the Board of Trade, at whose suggestion, and under whose direction, it has been prepared. Its compilation was a work of much labour and difficulty; and could not have been accomplished by any one not well acquainted with the Customs Acts, and the various changes in the mode of assessing the duties.

On the whole, we trust it will be found that the work has been improved throughout, either by the correction of mistakes, or by the addition of new and useful matter. Still, however, we are well aware that it is in various respects defective; but we are not without hopes that those who look into it will be indulgent enough to believe that this has been owing as much to the extreme difficulty, or rather, perhaps, the impossibility, of obtaining accurate information respecting some of the subjects treated of, as to the want of care and attention on our part. Even as regards many important topics connected with the commerce and manufactures of Great Britain, we have had to regret the want of authentic details, and been obliged to grope our way in the dark. The condition and habits of the English and Scotch are so very different from those of the Irish, that conclusions deduced from considering the trade or consumption of the United Kingdom *en masse*, are frequently of little value; and may, indeed, unless carefully sifted, be the most fallacious imaginable; while, owing to the want of any account of the cross-channel trade between the two great divisions of the empire, it is not possible accurately to estimate the consumption of either, or to obtain any sure means of judging of their respective progress in wealth and industry. As respects manufactures, there is a still greater deficiency of trustworthy details. But the articles relating to them in this work having been submitted to the highest practical authorities, we incline to think they are about as accurate as they can well be rendered.

The statistical Tables published by the Board of Trade embrace the substance of hundreds of accounts, scattered over a vast mass of Parliamentary papers. They seem to be compiled with great care and judgment, and are a very valuable acquisition. We have frequently been largely indebted to them. But their arrangement, and their constantly increasing number and bulk, make them quite unfit for being readily or advantageously consulted by practical men. Most part of the returns relating to the principal articles given in this work go back to a much more distant period than those published by the Board of Trade.

We have seen no reason to modify or alter any **PRINCIPLE OF COMMERCIAL POLICY** advanced in our former edition. In some instances, we have varied the exposition a little, but that is all. In every case, however, we have separated the practical, legal, and historical statements from those of a speculative nature; so that those most disposed to dissent from our theoretical notions will, we hope,

be re-

be ready to admit that they have not been allowed to detract from the practical utility of the work.

The maps given with the former edition have been partially re-engraved, and otherwise improved. Exclusive of the plans already referred to, the present edition contains two new maps: one, of the completed and proposed canals and railroads of Great Britain and Ireland; exhibiting, also, the coal-fields, the position of the different lighthouses, &c.: the other map exhibits the mouths of the rivers Mersey and Dee, and the country from Liverpool to Manchester, with the various lines of communication between these two great and flourishing emporiums. Care has been taken to render them accurate.

We are under peculiar obligations to many official, mercantile, and private gentlemen in this and other countries, who have favoured us with communications. We hardly ever applied to anyone, however much engaged in business, for any information coming within his department, which he did not readily furnish. We have seldom met with any mystery, concealment, or affectation of concealment. Most individuals seemed disposed to tell us all that they knew; and several gentlemen have taken a degree of trouble with respect to various articles in this work, for which our thanks make but a poor return.

## PREFACE

TO

### THE FIRST EDITION.

It has been the wish of the Author and Publishers of this Work, that it should be as extensively useful as possible. If they be not deceived in their expectations, it may be advantageously employed, as a sort of *vade mecum*, by merchants, traders, ship-owners, and ship-masters, in conducting the details of their respective businesses. It is hoped, however, that this object has been attained without omitting the consideration of any topic, incident to the subject, that seemed calculated to make the book generally serviceable, and to recommend it to the attention of all classes.

Had our object been merely to consider commerce as a science, or to investigate its principles, we should not have adopted the form of a Dictionary. But commerce is not a science only, but also an *art* of vast practical importance, in the prosecution of which a very large proportion of the population of every civilised country is actively engaged. Hence, to be generally useful, a work on commerce should combine practice, theory, and history. Different readers may resort to it for different purposes; and everyone should be able to find in it clear and accurate information, whether his object be to make himself familiar with details, to acquire a knowledge of principles, or to learn the revolutions that have taken place in the various departments of trade.

The following short outline of what this Work contains may enable the reader to estimate the probability of its fulfilling the objects for which it has been intended:—

I. It contains accounts of the various articles which form the subject matter of commercial transactions. To their English names are, for the most part, subjoined their synonymous appellations in French, German, Italian, Russian, Spanish &c.; and sometimes, also, in Arabic, Hindoo, Chinese, and other Eastern languages. We have endeavoured, by consulting the best authorities, to make the descriptions of commodities as accurate as possible; and have pointed out the tests or marks by which their goodness may be ascertained. The places where they are produced are also specified; the quantities exported from such places; and the different regulations, duties &c. affecting their importation and exportation, which have been carefully stated, and their influence examined. The prices of most articles have been given, sometimes for a lengthened period. Historical notices are inserted illustrative of the rise and progress of the trade in the most important articles; and it is hoped that the information embodied in these notices will be found to be as authentic as it is interesting.

II. The Work contains a general article on COMMERCE, explanatory of its nature, principles, and objects, and embracing an enquiry into the policy of restrictions intended to promote industry at home, or to advance the public interests by excluding or restraining foreign competition. Exclusive, however, of this general article, we have separately examined the operation of the existing restrictions on the trade in particular articles, and with particular countries, in the accounts of those articles, and of the great sea-port towns belonging to the countries referred to. There must, of course, be more or less of sameness in the discussion of such points, the principle which runs through them being identical. But in a Dictionary this is of no consequence. The reader seldom consults more than one or two articles at a time; and it is of infinitely more importance to bring the whole subject at once before him, than to seek to avoid the appearance of repetition by referring from one article to another. In this Work such references are made as seldom as possible.

III. The articles which more particularly refer to commercial navigation are AVERAGE, BILLS OF LADING, BOTTOMRY, CHARTERPARTY, FREIGHT, INSURANCE (MARINE), MASTER, NAVIGATION LAWS, OWNERS, REGISTRY, SALVAGE, SEAMEN, SHIPS, TONNAGE, WRECK &c. These articles embrace a pretty full exposition of the law as to shipping: we have particularly endeavoured to exhibit the privileges enjoyed by British ships; the conditions and formalities, the observance of which is necessary to the acquisition and preservation of such privileges, and to the transference of property in ships; the responsibilities incurred by the masters and owners in their capacity of public carriers; and the reciprocal duties and obligations of owners, masters, and seamen. In this department, we have made considerable use of the treatise of Lord Tenterden on the Law of Shipping—a work that does honour to the learning and talents of its noble author. The Registry Act and the Navigation Act are given with very little abridgment. To this head may also be referred the articles on the COD, HERRING, PILCHARD and WHALE fisheries.

IV. The principles and practice of commercial arithmetic and accounts are unfolded in the articles BOOK-KEEPING, DISCOUNT, EXCHANGE, INTEREST AND ANNUITIES &c. The article BOOK-KEEPING has been furnished by one of the official assignees under the new Bankrupt Act. It exhibits a view of this important art as actually practised in the most extensive mercantile houses in town. The tables for calculating interest and annuities are believed to be more complete than any hitherto given in any work not treating professedly of such subjects.

V. A considerable class of articles may be regarded as descriptive of the various means and devices that have been fallen upon for extending and facilitating commerce and navigation. Of these, taking them in their order, the articles BANKS, BROKERS, BUOYS, CANALS, CARAVANS, CARRIERS, COINS, COLONIES, COMPANIES, CONSULS, CONVOYS, DOCKS, FACTORS, FAIRS AND MARKETS, LIGHT-HOUSES, MONEY, PARTNERSHIP, PILOTAGE, POST-OFFICE, RAIL-ROADS, ROADS, TREATIES (COMMERCIAL), WEIGHTS AND MEASURES &c. are among the most important. In the article BANKS, the reader will find, besides an exposition of the principles of banking, a pretty full account (derived principally from official sources) of the Bank of England, the private banks of London, and the English provincial banks; the Scotch and Irish banks; and the most celebrated foreign banks: to complete this department, an account of Savings' Banks is subjoined, with a set of rules which may be taken as a model for such institutions.\* There is added to the article COINS, a Table of the assay, weight, and sterling value of the principal foreign gold and silver coins.

\* Some of the improvements made on this article are noticed in the Preface to the Second Edition.

deduced from assays made at the London and Paris Mints, taken, by permission, from the last edition of Dr. Kelly's *Cambist*. The article COLONIES is one of the most extensive in the work: it contains a sketch of the ancient and modern systems of colonisation; an examination of the principles of colonial policy; and a view of the extent, trade, population, and resources of the colonies of this and other countries. In this article, and in the articles CAPE OF GOOD HOPE, COLUMBO, HALIFAX, QUEBEC, SYDNEY, and VAN DIEMEN'S LAND, recent and authentic information is given, which those intending to emigrate will find worth their attention. The map of the British possessions in North America is on a pretty large scale, and is second to none, of those countries, hitherto published in an accessible form. The article COLONIES is also illustrated by a map of Central America and the West Indies. An engraved plan is given, along with the article DOCKS, of the river Thames and the docks from Blackwall to the Tower; and the latest regulations issued by the different Dock Companies here and in other towns, as to the docking of ships, and the charges on that account, and on account of the loading, unloading, warehousing &c. of goods, are given verbatim. The statements in the articles LIGHT-HOUSES and PILOTAGE have been mostly furnished by the Trinity House, or derived from papers printed by order of the Admiralty, and may be implicitly relied upon. In the article WEIGHTS AND MEASURES the reader will find tables of the equivalents of wine, ale, and Winchester measures, in Imperial measure.

VI. Besides a general article on the constitution, advantages, and disadvantages of Companies, accounts are given of the principal associations existing in Great Britain for the purpose of conducting commercial undertakings, or undertakings subordinate to and connected with commerce. Among others (exclusive of the Banking and Dock Companies already referred to) may be mentioned the EAST INDIA COMPANY, the GAS COMPANIES, the INSURANCE COMPANIES, the MINING COMPANIES, the WATER COMPANIES, &c. The articles on the East India Company is of considerable length; it contains a pretty complete sketch of the rise, progress, and present state of the British trade with India; an estimate of the influence of the Company's monopoly; and a view of the revenue, population &c. of our Indian dominions. We have endeavoured, in treating of insurance, to supply what we think a desideratum, by giving a distinct and plain statement of its principles, and a brief notice of its history; with an account of the rules and practices followed by individuals and companies in transacting the more important departments of the business; and of the terms on which houses, lives &c. are commonly insured. The part of the article which peculiarly respects marine insurance has been contributed by a practical gentleman of much knowledge and experience in that branch.

VII. In addition to the notices of the Excise and Customs regulations affecting particular commodities given under their names, the reader will find articles under the heads of CUSTOMS, EXCISE, IMPORTATION AND EXPORTATION, LICENSES, SMUGGLING, WAREHOUSING &c. which comprise most part of the practical details belonging to the business of the Excise and Customs, particularly the latter. The most important Customs Acts are given with very little abridgment, and being printed in small letter, they occupy comparatively little space. The article TARIFF contains an account of the various duties, drawbacks, and bounties, on the importation and exportation of all sorts of commodities into and from this country.—We once intended to give the tariffs of some of the principal Continental states; but, from the frequency of the changes made in them, they would very soon have become obsolete, and would have tended rather to mislead than to instruct. But the reader will notwithstanding

find a good deal of information respecting foreign duties under the articles CADIZ, HAVRE, NAPLES, NEW YORK, TRIESTE &c.

VIII. Among the articles of a miscellaneous description, may be specified ALIENS, APPRENTICE, AUCTIONEER, BALANCE OF TRADE, BANKRUPTCY, CONTRABAND, CREDIT, HANSEATIC LEAGUE, IMPORTS AND EXPORTS, IMPRESSMENT, IONIAN ISLANDS, MARITIME LAW, PASSENGERS, PATENTS, PAWN-BROKING, PIRACY, POPULATION, PRECIOUS METALS, PRICES, PRIVATEERS, PRUSSIAN OR GERMAN COMMERCIAL UNION, PUBLICANS, QUARANTINE, REVENUE AND EXPENDITURE, SLAVES AND SLAVE TRADE, TALLY TRADE, TRUCK SYSTEM &c.\*

IX. Accounts are given, under their proper heads, of the principal emporiums with which this country has any immediate intercourse; of the commodities usually exported from and imported into them; of their moneys, weights, and measures; and of such of their institutions, customs, and regulations, with respect to commerce and navigation, as seemed to deserve notice. There are occasionally subjoined to these accounts of the great seaports, pretty full statements of the trade of the countries in which they are situated, as in the instances of ALEXANDRIA, AMSTERDAM, BORDEAUX, BUENOS AYRES, CADIZ, CALCUTTA, CANTON, COPENHAGEN, DANTZIC, GALACZ, GALVESTON, HAVANNAH, HAVRE, LIMA, MONTEVIDEO, NAPLES, NEW YORK, ODESSA, PALERMO, PETERSBURG, RIO DE JANEIRO, SMYRNA, STOCKHOLM, TRIESTE, VALPARAISO, VERA CRUZ, &c.\* To have attempted to do this systematically would have increased the size of the Work beyond all reasonable limits, and embarrassed it with details nowise interesting to the English reader. The plan we have adopted has enabled us to treat of such matters as might be supposed to be of importance in England, and to reject the rest. We believe, however, that, notwithstanding this selection, those who compare this work with others, will find that it contains a much larger mass of authentic information respecting the trade and navigation of foreign countries than is to be found in any other English publication.

The reader may be inclined, perhaps, to think that it must be impossible to embrace the discussion of so many subjects in a single octavo volume, without treating a large proportion in a very brief and unsatisfactory manner. But, in point of fact, this single octavo contains about as much letterpress as is contained in two ordinary folio volumes, and more than is contained in Macpherson's Annals of Commerce, in four large volumes quarto, published at 8*l.* 8*s.*! This extraordinary condensation has been effected without any sacrifice of beauty or distinctness. Could we suppose that the substance of the book is at all equal to its form, there would be little room for doubt as to its success.

Aware that, in a work of this nature, accuracy in matters of fact is of primary importance, we have rarely made any statement without mentioning our authority. Except, too, in the case of books in every one's hands, or Dictionaries, the page or chapter of the works referred to is generally specified; experience having taught us that the convenient practice of stringing together a list of authorities at the end of an article is much oftener a cloak for ignorance than an evidence of research.

Our object being to describe articles in the state in which they are offered for sale, we have not entered, except when it was necessary to give precision or clearness to their description, into any details as to the processes followed in their manufacture.

Besides the maps already noticed, the work contains a map of the world, on Mercator's projection, and a map of Central and Southern Europe and the

\* Several of these articles have been inserted for the first time in this (the third complete) edition of the work; but we thought it most convenient to enumerate them with the others.

Mediterranean Sea. These maps are on a larger scale than those usually given with works of this sort; and have been carefully corrected, and compared with the best authorities.

Such is a rough outline of what the reader may expect to meet with in this Dictionary. We do not, however, flatter ourselves with the notion that he will consider that all that has been attempted has been properly executed. In a work embracing such an extreme range and diversity of subjects, respecting many of which it is exceedingly difficult, if not quite impossible, to obtain accurate information, no one will be offended should he detect a few errors. At the same time we can affirm that neither labour nor expense has been spared to entitle the Work to the public confidence and patronage. The author has been almost incessantly engaged upon it for upwards of five years; and he may be said to have spent the previous part of his life in preparing for the undertaking. He has derived valuable assistance from some distinguished official gentlemen, and from many eminent merchants; and has endeavoured, wherever it was practicable, to build his conclusions upon official documents. But in very many instances he has been obliged to adopt less authentic data; and he does not suppose that he has had sagacity enough always to resort to the best authorities, or that, amidst conflicting and contradictory statements, he has uniformly selected those most worthy of being relied upon, or that the inferences he has drawn are always such as the real circumstances of the case would warrant. But he has done his best not to be wanting in these respects. Not being engaged in any sort of business, nor being under any description of obligation to any political party, there was nothing to induce us, in any instance, to conceal or pervert the truth. We have, therefore, censured freely and openly whatever we considered wrong; but the grounds of our opinion are uniformly assigned; so that the reader may always judge for himself as to its correctness. Our sole object has been to produce a work that should be generally useful, particularly to merchants and traders, and which should be creditable to ourselves. Whether we have succeeded, the award of the public will show; and to it we submit our labours, not with 'frigid indifference,' but with an anxious hope that it may be found we have not misemployed our time, and engaged in an undertaking too vast for our limited means.

The following notices of some of the most celebrated Commercial Dictionaries may not, perhaps, be unacceptable. At all events, they will show that there is at least room for the present attempt.

The *Grand Dictionnaire de Commerce*, begun and principally executed by M. Savary, Inspector of Customs at Paris, and completed by his brother, the Abbé Savary, Canon of St. Maur, was published at Paris in 1723, in two volumes folio; a supplemental volume being added in 1730. This was the first work of the kind that appeared in modern Europe: and has furnished the principal part of the materials for most of those by which it has been followed. The undertaking was liberally patronised by the French government, who justly considered that a Commercial Dictionary, if well executed, would be of national importance. Hence a considerable, and, indeed, the most valuable, portion of Savary's work is compiled from Memoirs sent him, by order of government, by the inspectors of manufactures in France, and by the French consuls in foreign countries. An enlarged edition of the *Dictionnaire* was published at Geneva in 1750, in six folio volumes. But the best edition is that of Copenhagen, in five volumes folio; the first of which appeared in 1759, and the last in 1765.

More than the half of this work consists of matter altogether foreign to its

proper object. It is, in fact, a sort of Dictionary of Manufactures as well as of Commerce; descriptions being given, which are, necessarily perhaps, in most instances exceedingly incomplete, and which the want of plates often renders unintelligible, of the methods followed in the manufacture of the commodities described. It is also filled with lengthened articles on natural history, the bye-laws and privileges of different corporations, and a variety of subjects nowise connected with commercial pursuits. No one, however, need look into it for any development of sound principles, or for enlarged views. It is valuable as a repertory of facts relating to commerce and manufactures at the commencement of last century, collected with laudable care and industry; but it is pervaded by the spirit of a customs officer, and not of a merchant or a philosopher. *‘Souvent dans ses réflexions, il tend plutôt à égarer ses lecteurs qu’à les conduire, et des maximes nuisibles au progrès du commerce et de l’industrie obtiennent presque toujours ses éloges et son approbation.’*

The preceding extract is from the Prospectus, in one volume octavo, published by the Abbé Morellet, in 1769, of a new Commercial Dictionary, to be completed in five or probably six volumes folio. This Prospectus is a work of sterling merit; and from the acknowledged learning and talent of its author, and his capacity for laborious exertion, there can be no doubt that, had the projected Dictionary been completed, it would have been infinitely superior to that of Savary. It appears (Prospectus, pp. 353–373) that Morellet had been engaged for a number of years in preparations for this great work; and that he had amassed a large collection of books and manuscripts relative to national economy, and the commerce, navigation, colonies, arts, &c. of France and other countries. The enterprise was begun under the auspices of M. Trudaine, Intendant of Finance, and was patronised by Messrs. L’Averdy and Bertin, Comptrollers General. But whether it were owing to the gigantic nature of the undertaking, to the author having become too much engrossed with other pursuits, the want of sufficient encouragement, or some other cause, no part of the proposed Dictionary ever appeared. We are ignorant of the fate of the valuable collection of manuscripts made by the Abbé Morellet. His books were sold at Paris within these few years.

A Commercial Dictionary, in three volumes 4to, forming part of the *Encyclopédie Méthodique*, was published at Paris in 1783. It is very unequally executed, and contains numerous articles that might have been advantageously left out. The editors acknowledge in their Preface that they have, in most instances, been obliged to borrow from Savary. The best parts of the work are copied from the edition of the *Traité Général du Commerce* of Ricard, published at Amsterdam in 1781, in two volumes 4to.\*

The earliest Commercial Dictionary published in England was compiled by Malachy Postlethwayt, Esq., a diligent and indefatigable writer. The first part of the first edition appeared in 1751. The last edition, in two enormous folio volumes, was published in 1774. It is chargeable with the same defects as that of Savary, of which, indeed, it is for the most part a literal translation. The author has made no effort to condense or combine the statements under different articles, which are frequently not a little contradictory; at the same time that many of them are totally unconnected with commerce.

In 1761, Richard Rolt, Esq., published a Commercial Dictionary in one pretty large folio volume. The best part of this work is its Preface, which was contributed by Dr. Johnson. It is for the most part abridged from Postlethwayt; but

\* This, when published, must have been a very valuable work. It is now, however, in a great measure obsolete.

it contains some useful articles purloined from other works, mixed, however, with many alien to the subject.

In 1766, a Commercial Dictionary was published, in two rather thin folio volumes, by Thomas Mortimer, Esq., at that time Vice-Consul for the Netherlands. This is a more commodious and better arranged, but not a more valuable work than that of Postlethwayt. The plan of the author embraces, like that of his predecessors, too great a variety of objects; more than half the work being filled with geographical articles, and articles describing the processes carried on in different departments of manufacturing industry; there are also articles on very many subjects, such as architecture, the natural history of the ocean, the land-tax, the qualifications of surgeons, &c., the relation of which to commerce, navigation, or manufactures, it seems difficult to discover.

In 1810, a Commercial Dictionary was published, in one thick octavo volume, purporting to be by Mr. Mortimer. We understand, however, that he had but little, if any thing, to do with its compilation. It is quite unworthy of the subject, and of the epoch when it appeared. It has all the faults of those by which it was preceded, with but few peculiar merits. Being not only a Dictionary of Commerce and Navigation, but of Manufactures, it contains accounts of the different Arts: but to describe these in a satisfactory and really useful manner, would require several volumes, and the co-operation of many individuals: so that, while the accounts referred to are worth very little, they occupy so large a space that room has not been left for the proper discussion of those subjects from which alone the work derives whatever value it possesses. There is an article of twenty-two pages technically describing the various processes of the art of painting, while the general article on commerce is comprised in less than *two* pages. The articles on coin and money do not together occupy four pages, being considerably less than the space allotted to the articles on engraving and etching. There is not a word said as to the circumstances which determine the course of exchange; and the important subject of credit is disposed of in less than *two lines*! Perhaps, however, the greatest defect in the work is its total want of any thing like science. No attempt is ever made to explain the principles on which any operation depends. Every thing is treated as if it were empirical and arbitrary. Except in the legal articles, no authorities are quoted; so that very little dependence can be placed on the statements advanced.

In another Commercial Dictionary, republished within these few years, the general article on commerce consists of a discussion with respect to simple and compound demand, and simple and double competition: luckily the article does not fill quite a page; being considerably shorter than the description of the kaleidoscope.

Under these circumstances, we do think that there is room for a new Dictionary of Commerce and Commercial Navigation: and whatever may be thought of our Work, it cannot be said that in bringing it into the field we are encroaching on ground already fully occupied.

## BIOGRAPHICAL NOTICE.

---

JOHN RAMSAY McCULLOCH, author of *The Commercial Dictionary*, and many other well-known works, economical and statistical, was the eldest son of Mr. William McCulloch, and was born at Whithorn in Wigtownshire on March 1, 1789.

His father, the eldest son of Edward McCulloch of Auchengool, a small landed proprietor in the stewartry of Kirkcudbright, died in Mr. McCulloch's infancy, and the latter having succeeded to his paternal property at a very early age, was reared and partly educated by his maternal grandfather, the Rev. Dr. James Laing, minister of the parish of Glaserton in Wigtownshire. He has described his grandfather, Dr. Laing, as a good classical scholar, and one who had a high relish for the beauties of literature, ancient and modern. In his library, which was extensive and valuable, Mr. McCulloch early acquired that passion for books which remained with him throughout life.

His mother having remarried, Mr. McCulloch resided with her and her husband, Dr. Dempster, at Kinross, and attended a school in that town for a few years. About 1805 he removed to Edinburgh, and commenced his studies at the University in that city. Among other classes, he attended those of Sir John Leslie, and Dr. Thomas Brown the metaphysician. His acquaintance with Leslie ripened into a lasting friendship, and he describes Sir John (in his *Catalogue* afterwards alluded to) as 'liberal in his views, of a social disposition, good-tempered, and without either artifice or pretence;' but of Brown he speaks somewhat disparagingly: 'I attended a course of Brown's lectures, which were nearly identical with those that were afterwards published; and whoever looks into the latter may easily imagine of what use such a course would be to a parcel of young men, who were neither permitted to take notes nor examined to ascertain whether they knew anything of what they had heard. The proceeding, in truth, was little better than a farce. A few students of superior talent, or having a taste for metaphysical research, might perhaps derive some little advantage from their attendance on Brown; but nine-tenths of his hearers would have profited quite as much by the greater number of the lectures, had he delivered them in Greek.' It would seem that Mr. McCulloch was originally intended for, if he did not choose, the profession of the law, and (as is usual in Scotland under such circumstances, whatever may be the branch for which the legal student is in-

tended) he entered the office of a Writer to the Signet or solicitor, to acquire the necessary practical knowledge of forms and details. But he quickly evinced a distaste for these minutiae, which generally prove unattractive to the young. Speaking of himself, he confesses, 'I had early the advantage, or disadvantage, I do not venture to say which, of being left to follow those studies, and read those books which I preferred, and to chalk out pursuits for myself.' So he forsook the law for a more congenial study, and eventually gave his almost undivided attention to that branch of science which he has done so much to advance and illustrate.

Mr. McCulloch took an ardent interest in the politics of the day. It may be said of him, as Sydney Smith said of Francis Horner, 'He loved truth better than he loved Dundas, at that time the tyrant of Scotland.' For though Liberalism was by no means so safe or profitable a profession of faith as it has been in our time, and political courage in the North was, in the early part of the century, at a very low ebb, he unhesitatingly joined the party of progress, and was one of the most formidable assailants of the faction which then dominated over that part of the empire. The recollection of the party heat and bitterness prevalent about the commencement of his career, was often a fruitful source of anecdote and amusement to him in his latter days. In 1817 he became a contributor to and shortly afterwards editor of the *Scotsman* newspaper; and in it gave fearless and forcible expression to his views, chiefly in support of measures which, though really necessary for the safety of the country, were little to the taste of those in power at the time. The *Scotsman* soon after that period became famous also for its political economy. The papers on that subject were written by Mr. McCulloch, and were not only new in a provincial newspaper, but gave it fame and character throughout the country.

As the reader will very naturally prefer having this short sketch as autobiographical as possible, we give the following account, in Mr. McCulloch's words, of his connection with the *Scotsman*, which continued till 1827:—

At the time when this paper was set on foot, the newspaper press of Scotland was in the most degraded state imaginable—without talent, or even the pretence of independence. And, in truth, it was then no easy matter for a Scottish journalist to be independent, to criticise any act of the general Government, or to hint at a defect in the institutions or administration of Scotland. For, owing to the vicious constitution of the Criminal Court, than which indeed no tribunal could be worse, and the practice of packing juries, a prosecution at the instance of the Lord Advocate against the editor, printer, or proprietor of a paper, was all but certain, whatever might be the nature of the case, to terminate in his imprisonment, or in his being sent on a tour to the antipodes. The *Scotsman*, however, partly by good management and partly by good luck, escaped this danger, and speedily attained to a large circulation and great influence. I believe, indeed, that its establishment did infinitely more to liberalise public opinion north of the Tweed than any other event that has taken place in the course of this century. The overthrow of the Dundas dynasty, and of the abominable caricature of a representative system that formerly existed in Scotland, were greatly facilitated by the vigorous and continued exertions of the *Scotsman*.

I had nothing to do with the establishment of this journal; but I became a contributor to it soon after its commencement, and was for a considerable time

its editor. I was succeeded in the latter capacity by Mr. Charles Maclaren, one of its projectors, an able writer, and an excellent person. Mr. Wm. Ritchie, a solicitor, one of its projectors, was a ready contributor and most zealous for its success. This has deservedly been very great.

To the *Edinburgh Review* he early became a contributor, and he has often been heard to express the delight with which he saw his first article in 'the Blue and Yellow.' This led to his friendship with Mr. (afterwards Lord) Jeffrey, and among the more intimate friends whose society he enjoyed during his residence in Scotland may be mentioned Leslie, Macevey Napier, Thomas Thomson, Adam Black, and Mr. James Gibson Craig.

From the interesting notices contained in his *Catalogue*, to which further reference will presently be made, is copied his own account of his connection with the *Review*.

I made my *debut* in the *Edinburgh Review* in 1818, by contributing to it an article on Ricardo's *Principles of Political Economy*. I was not previously acquainted with Jeffrey, the editor, and as the theories advanced in the article were subversive of many doctrines previously entertained, Jeffrey was a good deal blamed for giving a person, of whom he knew nothing, permission to bring them forward. He, however, being satisfied of their correctness, was in no degree influenced by this petty hostility, and I continued for about twenty years to write pretty regularly for the *Review*. I contributed almost all the economical articles that appeared in it during that period, with a few on other subjects. Jeffrey was an admirable person, and my intercourse with him was of the most satisfactory description, and so, also, was my intercourse with his successor in the editorship, Mr. Macevey Napier. It was not owing to any proceeding on the part of the latter that I finally withdrew from the *Review*. My contributions to it make, when collected, three thick octavo volumes.

In 1825 an Edinburgh professorship seems to have been the height of his ambition, and at this time, with a desire to realise his wishes, an attempt, but a fruitless one, was made by some of his friends to induce the Government to endow a chair of Political Economy in the northern capital.

Lord Cockburn, in his *Life of Jeffrey*, vol. i. pp. 277-78, gives a short account of the attempt and its failure:—

Political Economy is so recent a science that no provision for its being taught could be made by the constitution of old colleges. Accordingly, it was never taught in any Scotch college, except by Professor Mylne at Glasgow, and by Dugald Stewart, in his two short and very general courses, at the beginning of this century. Having now become the most important of all the practical moral sciences, an effort was made during this summer (1825) to obtain a Regius Professorship for it in Edinburgh, and to confer the office on Mr. John R. McCulloch, who had already given excellent lectures on this subject, and was rising into the position he has attained, as the first economist of the age. The scheme was at first warmly patronised by Mr. Wallace, the President of the Board of Trade, by Canning, Huskisson, and Lord Dudley. Mr. Huskisson recommended that a memorial should be got from Edinburgh, respectably, but not numerously signed, offering to endow the chair, and praying the Crown to erect it, which he engaged to lay before the Government. Jeffrey, who took a deep interest in the affair, both from his conviction of its utility, and from his regard for Mr. McCulloch, and his certainty of his friend's fitness, drew up the memorial, which was subscribed by thirty or forty excellent names, including those of five judges and twelve professors, who, 'or some of them,' engaged to secure an adequate endowment. But at this stage an unworthy obstacle was thrown in the way from Edinburgh, and the plan was defeated.

We find, however, that previously, for three successive years, he had delivered lectures in Edinburgh on a variety of politico-economical subjects; and in 1824, and for some years subsequently, he delivered similar lectures in London. These were numerous, and among his auditors were several statesmen since distinguished as Cabinet Ministers, and many of the leading bankers, merchants, and foremost men of the day, of all shades of politics. The celebrity he thus acquired, and his well-established reputation as one of our ablest writers on economical questions, doubtless led to the offer made to him, in 1827, of the Professorship of Political Economy in the University College of London. This offer he ultimately accepted, and towards the end of 1828 he removed with his family to the metropolis; but, not finding the appointment what he expected or could wish, he resigned the chair in 1832.

His articles in the *Edinburgh Review* show how early Mr. McCulloch dealt with some subjects of that class which he afterwards treated so clearly and concisely in his great digest of Trade and Navigation. As will be seen from the annexed list, his contributions were seventy-eight in all; and we find him writing on the Currency in 1818, urging free trade with France in 1819, and attacking the Corn Laws and restrictions on our foreign commerce in 1820; in 1823 denouncing the Navigation Laws, the discriminating duties on East and West India sugar, and the duty on foreign wool; in 1824 exposing the iniquity of the East India Company's monopoly of tea, and so on with regard to many kindred abuses, till 1837, when he finally laid down the pen of a reviewer. They all show, too, how heartily he recommended those commercial and financial reforms which he fortunately lived to see effected.

After spending well-nigh twenty years in accumulating materials, the author, in 1832, produced *The Commercial Dictionary*, one of the greatest boons of a literary kind ever conferred upon the commercial world. In the preface to the first edition of this work, he explains how he arrived at the conclusion that there was room for a new Dictionary of Commerce and Commercial Navigation. The public agreed with him that it was a desideratum, and that he supplied what was really very much wanted. The success of the Dictionary has been almost unexampled. Edition after edition has been called for, and many thousands have been sold. It has been republished in America, and translated into several languages, and is referred to for the adjustment of mercantile disputes in all quarters of the globe. Since its first publication it has greatly increased in bulk, and is, in truth, a gigantic work, for if printed like ordinary books it would make at least thirty volumes octavo. The author was naturally proud of its popularity and reputation; and here we cannot resist the temptation to repeat, by way of illustration, an anecdote told lately at a public meeting by a friend of his, now a learned lord and a Scotch judge.\* He said, speaking of Mr. McCulloch, "He asked me once, "Do you ever quote my *Commercial Dictionary* in Court?" I said, with some emphasis, "Never; we never quote it, and we never mention it. Sometimes," I said, "a set of papers come in upon us at night upon a mercantile

question that we know nothing about, and we go up to our shelves and take down the *Commercial Dictionary*, and find all we want there, and next morning we come out, to the astonishment of our clients, with better information upon the subject than they have themselves; but we never mention McCulloch's *Dictionary*." (Laughter and cheers.) And that pleased the old man, who had been rather vexed by my first observation, better than it was easily possible to please him.'

While it may be said, therefore, that the *Commercial Dictionary* is undoubtedly his *opus magnum*, and that by which he is best known, still it would be unjust, even in the most cursory notice of his labours, not to particularise his *Descriptive and Statistical Account of the British Empire*, which first appeared in 1837, and the *Geographical Dictionary*, first published in 1841. Their titles are sufficiently suggestive of enormous toil and research, and if he had done nothing else, these works would afford very remarkable proofs of his untiring industry and vigorous faculties.

In the article 'Whithorn' in his *Geographical Dictionary* he appears to have been unable to repress his strong attachment to his native place, which finds vent in these words: 'We may perhaps be excused, if, towards the close of this lengthened and laborious survey of so many countries and places, we have lingered for a moment over scenes once familiar, and still well remembered. The associations which the mention of this locality calls up are all redolent of joy and youth, and are too soothing and pleasing to be instantly dismissed.'

This *Dictionary*, however, was scarcely out of hand before his thirst for work found vent in another project, to which he alludes in a letter of November 12, 1840, to an intimate friend in Edinburgh. After stating that he was anxious for the conclusion of the *Geographical Dictionary* only that he might plunge into another, he adds:—

I am resolved, unless some unforeseen event occur, to commence a Dictionary of Politics and Political Economy, the instant I get this one out of the way. I shall not be satisfied with myself if I do not produce this work, and it is necessary I should lose no time in grappling with it, as unfortunately one gets old, and not so fond of or fit for hard work.

This project was never carried out.

Of his minor works the best known are his *Principles of Political Economy*, his *Principles and Practical Influence of Taxation and the Funding System*, and his book on Wages, all of which have gone through several editions; his *Treatises and Essays on Economical Policy*, containing biographies of Quesnay, Smith, and Ricardo, and a work on *Succession to Property vacant by Death*, which treats of the effect of primogeniture and compulsory partition of land &c. on the state of a nation.

Of his editorial labours, the most important is his edition of the *Wealth of Nations*. Francis Horner and Malthus, we believe, had projected editions of Smith, but neither of them realised his intentions. An edition worthy of the subject was thus reserved for Mr. McCulloch, whose studies and pursuits eminently qualified him for this duty. The first edition was published in 1828, in 4 vols. 8vo.; and ten years later it was condensed into one very thick volume. The last edition, published in 1863,

embodying the editor's Life of Smith, an Introductory Discourse and Supplemental Notes and Dissertations, forms a complete code of Political Economy. Towards the end of his career Mr. McCulloch thus characterised the *Wealth of Nations*: 'It is not in truth a book for one country or one age, but for all countries and all ages; and will always be regarded as a noble monument of profound thinking, various learning, and persevering research, applied to purposes of the highest interest and importance.'

Next to Adam Smith, the father of the science, Mr. McCulloch ranked David Ricardo as having done most to advance it. From 1816 to 1823, the year of Ricardo's death, they had corresponded frequently on subjects connected with Political Economy. In one of his letters Mr. Ricardo thus characterises one of Mr. McCulloch's early papers on Currency: 'It appears to me so able, so clear, so convincing, that I shall be puzzled to account for the obstinate prejudices of those who no doubt will continue to refuse their assent to doctrines so mathematically demonstrated.' In 1846 he published an edition of Ricardo's works, in 1 vol. 8vo. The admiration for that writer's talents, expressed in Mr. McCulloch's first contribution to the *Edinburgh Review*, was apparently never lessened, for in his *Catalogue* he pronounces Ricardo's works 'one of the most valuable volumes, if it be not the most valuable, to be met with in the wide range of Economical Literature;' and he adds, that 'what the researches of Locke and Smith did for the production of wealth, those of Ricardo have done for its value and distribution.' Personal friendship may, perhaps, have slightly tinged this eulogium, which must, at any rate, satisfy the most enthusiastic of Ricardo's admirers.

Mr. McCulloch's advocacy of Liberal measures, and his unquestionable fitness for public employment, gave him strong claims on the Whig Government; yet, while their harvest was being gathered, this sower of good seed was for a time overlooked, and certainly it was not till after many irritating disappointments, and years of hope deferred, that he was, in 1838, appointed by Lord Melbourne to the Comptrollership of the Stationery Office, a situation he held till his death. Here his enlightened and practical views enabled him at an early period to carry out extensive reforms, and to effect, for upwards of a quarter of a century, large annual savings of the public money. His energy in this direction was constant and irrepressible. The nature and extent of his services are recorded in the Parliamentary papers of his time: their value, too, was fully recognised in high quarters, and there are good grounds for saying that Mr. McCulloch was nowhere more respected and appreciated than at the Treasury, where his valuable qualities as a public servant were necessarily well known. The *Times* of May 4, 1861, in an article devoted to the Stationery Office, complimented him by saying, 'It is controlled, fortunately for the country, by Mr. McCulloch, and a sturdier guardian of the public purse it would be hard to find.' But while he did his best to promote economy in the public expenditure, he did not neglect the material interests of those associated with him in official duties. He was always most desirous that those who worked well should be paid well.

No occupation, however, diverted him long from the study of his

favourite science, and he was even wont to express a wish to return to this world some 300 years hence, to look for the solution of various problems, and see whether his doctrines and anticipations would prove true. Having expressed such a desire in a letter of December 9, 1842, to Jeffrey, we find the latter answering thus on the 12th: 'I quite sympathise with you in your wish that we could be allowed to see more than we are likely to do of the actual working of the causes that are now in operation, and the movements that are visibly begun. I am more modest, however, in my prayer for the gift of prescience than you are, and should be satisfied to have a clear vision of the condition of this country some time about the year 1900, before which, I feel persuaded, the problems we are puzzled about will all be substantially resolved. Indeed (if it were the same thing to the Power who can alone grant such prayers), I should prefer being *allowed to live and see the results* in their actual accomplishment, rather than wonder at them in a prophetic dream. But I should be glad to have either of the boons.\*'

The domain of Political Economy was no doubt that which Mr. McCulloch most assiduously cultivated, but he did not by any means give it his undivided attention. He was well read on a great variety of subjects, was possessed of much general information, and his classical attainments were not inconsiderable. He had also an extensive acquaintance with the literature of France, more especially those branches bearing on Political Economy and Biography. In 1843 he was elected a Foreign Associate of the French Institute, in the room of Sismondi, having 16 votes out of 18. As the other nominees were men of such mark as Hugo and Ranke, this unsolicited honour was highly prized by Mr. McCulloch, who did not set much value on literary distinctions that were common or easily attainable.†

By this time he occupied a conspicuous place in the public eye. Some of his doctrines might be disputed, but no one denied his great and unquestionable merits as the reformer of our commercial code. The well-known truths of free trade had been expounded in his writings and in his lectures long before their advocacy became a popular cry. In truth, no other writer had done so much to prepare the way for those memorable commercial reforms which signalised the administration of Sir Robert Peel. And he testified his respect for Mr. McCulloch's services by bestowing on him, in 1846, a pension of 200*l.* a-year. Few events in his life afforded him higher gratification than this. To a man with a numerous family, such an addition to his income was, doubtless, acceptable; but what he valued infinitely more was Sir Robert Peel's mode of giving it, and the high compliment paid to him by one for whom Mr. McCulloch had long entertained the highest regard. When he could not have had the remotest expectation of receiving such an honour from that statesman, Mr. McCulloch, in a pamphlet (*Observations on the State of the Country*), published anonymously in 1830, thus speaks of him:—

\* Cockburn's *Life of Jeffrey*.

† On March 4, 1865, Mr. Gladstone was elected Mr. McCulloch's successor in the French Institute.

Did popularity always attach to merit, Sir Robert Peel would be, at this moment, the most popular man in England. The country never has had, and never will have, a more upright and disinterested minister, and seldom one more able. He has made incomparably greater sacrifices than any man now in Parliament for the sake of the public.

Our author took the earliest opportunity of testifying his gratitude to Sir Robert for the substantial and unexpected benefit just referred to, by dedicating to him the third edition of the *Statistical Account of the British Empire*.

In the course of fifty years Mr. McCulloch amassed a very valuable library, consisting of about 10,000 volumes, and its gradual acquisition afforded him the highest gratification. He makes the following acknowledgment in the preface to his *Catalogue*: 'Their acquisition has been a business in which I have always taken the greatest interest; it has not palled upon me for a single moment; and their possession, besides the gratification it has afforded, has been so far useful that it has enabled me to finish works of much research and labour without either resorting to public libraries or borrowing books.' His love for books, particularly fine books, was certainly very great, and he defended his admiration of well-bound ones (if, indeed, any defence be necessary), by citing the example of his great chief, Adam Smith, who admitted he was a 'bean in his books.' For those that had only rarity to recommend them Mr. McCulloch cared nothing; but an English classic bound in old morocco gave him a delight which only the deeply initiated in such matters can either understand or appreciate. The only alloy to his pleasure seems to have been the belief that his library would be dispersed at his death. But his fears on this head proved to be ill-founded. His fine collection has been fortunately kept together, and acquired in its entirety by Lord Overstone, a friend for whom Mr. McCulloch entertained the very highest regard and respect.

In 1845, he published *The Literature of Political Economy*, a classified catalogue of select publications in the different departments of that science. In the preface he says:—

If we have succeeded in our object, this work will be in some measure a History of Political Economy, as well as a Critical Catalogue of the principal Economical works. It contains short notices of the rise of some of the principal theories, and of the circumstances which appear, at different periods, to have strongly determined public opinion upon economical questions and given birth to classes of books. Without such notices, indeed, no just estimate could be formed of the latter.

In 1856 he printed privately a *Catalogue raisonné* of the more important part of his library, which he afterwards elaborated and reprinted in 1862, under the title of *Catalogue of the Library of a Political Economist*. This abounds in curious and valuable information, critical, biographical, and bibliographical, but, being unpublished, is known only to his friends, by whom, however, it is much prized. Though some of his estimates of distinguished living writers are not free from prejudice, his critical opinions are generally sound and well-considered, and he has scattered through the work some autobiographical sketches, of which a few have been introduced into this notice.

He was an original member of the Political Economy Club, and selected for the press and wrote prefaces for two volumes of scarce and curious tracts on Money and Commerce, reprinted by that body in 1856.

His more extensive editorial services for Lord Overstone were performed, we believe, from personal friendship for his Lordship, between whom and Mr. McCulloch there existed complete agreement of opinion on some of the most important Economical questions. It was at Mr. McCulloch's suggestion that Lord Overstone agreed in 1857 to reprint, in a collected form, for distribution among his friends, the various tracts on the currency written by him at different times. It was at Mr. McCulloch's suggestion also that his Lordship reprinted privately in 1857-59 that collection of scarce tracts on trade, finance, currency &c., which, though limited in circulation, is well known to all who take an interest in such subjects. This collection consists of four large octavo volumes, and is of great value. Besides selecting the tracts to be reprinted, Mr. McCulloch wrote a preface and notes to each volume, and his having been instrumental in preserving and putting them into this shape was a source of great pride and satisfaction to him.

Dr. Johnson, in his *Life of Roger Ascham*, remarks that 'the incidents of a literary life are but seldom observed, and therefore seldom recounted.' While this apothegm is singularly inapplicable to Johnson himself, whose minutest sayings and doings have been so carefully chronicled by Boswell, it is appropriate enough to the subject of this brief memoir. The production of his several works and his literary successes formed the chief epochs of Mr. McCulloch's busy and useful life, which boasted none of those exciting episodes, that would in truth have been unsuitable to the position and studies of a philosopher.

In enumerating some of his more salient and good qualities it may be said, with great truth, that he was a warm and steady friend, and that in him the home affections and attachment to his family were particularly conspicuous. Sydney Smith says, 'Human excellence is so often inverted, and great talents considered as an excuse for the absence of obscure virtues.' This sarcasm, however, could not in the slightest degree be applied to the author of this *Dictionary*, for nowhere did he appear to so much advantage and so perfectly happy as in his own house, with all the members of it around him.

In a notice of his death given in the *Scotsman* (which in various parts bears the impress of his old friend and brother editor, the late Mr. Maclaren), some remarkable features in his character are well described in these terms:—

Endowed with an enormous capacity for the mastery of facts and figures; of great sagacity, and manly common sense; with a power of continuous application to the most arduous mental labour, that seemed absolutely exhaustless; with a vigour of will that led him readily into dogmatism; and an independence of judgment that occasionally revelled in arbitrary assertion and cherished prejudice, Mr. McCulloch, as compared with the milder literary stamp of our later day, had something almost Johnsonian in his intellectual aspect and style. In all his works this strong individuality of character from time to time asserts itself, sometimes oddly enough by the interjection perhaps of a strongly pronounced opinion in the midst of what seemed to be, and really ought to have been, only an unimpassioned statement of dry facts or abstract principles,

Mr. McCulloch was not a party politician, but he hailed good measures, especially for the enfranchisement of commerce, however they originated. So far as the Representation of the people in Parliament is concerned, he was not what is called an advanced reformer, inasmuch as he did not in the least sympathise with those who would commit a large share of political power to the million. What he inveighed against in his youth was the election of members of Parliament by the self-chosen town councils of the Scotch burghs, but he disliked and distrusted the opposite extreme quite as much.

We have heard it remarked that Mr. McCulloch possessed in a great degree the inflexibility of the old Roman character. But under an occasionally stern exterior there dwelt great simplicity of character, a good heart, and a most social and hospitable disposition. He was very decided both in his likes and dislikes, and in his expression of them he was pithy and unreserved. Most especially he hated all shams, from an inconvertible paper currency downwards. Very few objects claimed his admiration more than the merchant prince of high honour, who, having achieved a fortune, takes a creditable or distinguished part in the councils of the nation. On the other hand, he as cordially detested the merchant pirate, who under solvent colours preys on his fellows, and brings ruin on the ignorant and confiding. But Mr. McCulloch was quite enthusiastic in his praise of the upright man who strives, by self-denial and self-sacrifice, to do his duty to his neighbour. We have heard his own quote with emphasis and delight the well-known eulogy of Burns' poet on Heron of Kerroughtree, the banker, who, having been unsuccessful in business, gave up all, and lived in a cottage till he had paid every creditor to the utmost farthing.

And there will be trusty Kerroughtree,  
Whose honour was ever his law;  
If the virtues were pack'd in a parcel,  
His worth might be sample for a'.

*Burns's second Heron Ballad.*

Mr. McCulloch was tall and of strong constitution,\* on which, however, frequent attacks of bronchitis had made serious inroads during the last two years of his life.

He married early and most happily, and died at the Stationery Office, Westminster, on November 11, 1864 (the 53rd anniversary of his marriage), in the 76th year of his age. He was interred in the Brompton Cemetery on November 18, and there his widow, Isabella Stewart, was laid by his side in July 1867.

H. G. R.

May 1869.

\* Of the various portraits of Mr. McCulloch, those most worthy of notice are a kit-cat by Bewick, dated 1825, and a later full-length portrait by Macnæ. There are also two very good marble busts of him, the first by Joseph and the second by Slater.

AAM

AAM, AUM or AHM. A measure for liquids, used at Amsterdam, Antwerp, Hamburg, Frankfurt, &c. At Amsterdam it is nearly equal to 41 English wine gallons, at Antwerp to 36½ ditto, at Hamburg to 38½ ditto, and at Frankfurt to 39 ditto. It is principally used for wine and oil. The Amsterdam Aam of oil contains about 36 gallons.

ABACA. The Indian name of the hemp of the Philippine Islands. [HEMP MANILLAS.]

ABANDONMENT (Fr. *délaissement*). In Commerce and Navigation, this term is used to express the abandoning or surrendering of the ship or goods insured to the insurer.

It is held, by the law of England, that the insured has the right to abandon, and to compel the insurers to pay the whole value of the thing insured, in every case where, by the happening of any of the misfortunes or perils insured against, the voyage is lost, or not worth pursuing, and the projected adventure is frustrated; or where the thing insured is so damaged and spoiled as to be of little or no value to the owner; or where the salvage is very high; or where what is saved is of less value than the freight; or where further expense is necessary, and the insurer will not undertake to pay that expense, &c. (Marshall, book i. ch. xiii. s. 1.)

Abandonment is defined by Arnould (*Marine Insurance*) to be 'the act of cession by which in cases where the loss or destruction of the property though not absolute is highly imminent, or its recovery is too expensive to be worth the attempt, the assured, on condition of recovering at once the whole amount of the insurance, relinquishes to the underwriters all his property and interest in the thing insured as far as it is covered by the policy, with all the claims which may arise from its ownership and all the profits which may arise from its recovery.' (3rd edit. p. 852.)

The abandonment of the insured must be of his whole interest, in the thing insured, in so far as that interest is covered by the policy, the extent of the interest covered by the policy determining the maximum quantity which the underwriter can claim to have transferred to him. Hence the insured must discriminate in his policy the different subjects of insurance, for if ship and cargo are jointly insured, there cannot be a total abandonment. This is the law also in the United States, and is so held by Emerigon the French jurist

ABANDONMENT

(vol. ii. p. 215). But if different objects be insured for different sums, each may be insured by itself, and each abandoned by itself.

No one can abandon who has not at the time of the loss an absolute right of ownership. Hence one with whom a policy of insurance has been deposited as a security for a loan, has no implied authority to give notice of abandonment. That he should do so, requires the express authority of the owner. In the courts of the United States, it has been held that the assured after abandoning all his interests to one set of underwriters, cannot again make abandonment of the same interest to other underwriters. (13 *Mass. Rep.*)

Abandonment very frequently takes place in cases of capture: the loss is then total, and no question can arise in respect to it. In cases, however, in which a ship and cargo are recaptured *within such a time that the object of the voyage is not lost*, the insured is not entitled to abandon. The mere *stranding* of a ship is not deemed of itself such a loss as will justify an abandonment. If by some fortunate accident, by the exertions of the crew, or by any borrowed assistance, the ship be got off and rendered capable of continuing her voyage, it is not a total loss, and the insurers are only liable for the expenses occasioned by the stranding. It is only where the stranding is followed by *shipwreck*, or the ship is in any other way rendered incapable of prosecuting her voyage, that the insured can abandon.

It has been decided, that damage sustained in a voyage to the extent of forty-eight per cent. of the value of the ship did not entitle the insured to abandon. If a cargo be damaged in the course of a voyage, and it appears that what has been saved is less than the amount of freight, it is held to be a total loss. (*Park On Insurance*, ch. ix.)

When by the occurrence of any of the perils insured against the insured has acquired a right to abandon, he is at liberty either to abandon or not, as he thinks proper. He is in no case bound to abandon; but if he make an election, and resolve to abandon, he must abide by his resolution, and has no longer the power to claim for a partial loss. In some foreign countries specific periods are fixed by law within which the insured, after being informed of the loss, must elect either to abandon or not. In this country, however, no particular period is fixed for this purpose; but the

rule is, that if the insured determine to abandon, he must intimate such determination to the insurers within a *reasonable period* after he has got intelligence of the loss—any unnecessary delay in making this intimation being interpreted to mean that he has decided not to abandon. As short a period as five days after knowledge that the ship was condemned, was, however, held by Lord Ellenborough as too late a notice. (*Hunt v. Royal Exch. Assur. Co. 5 M. and Sel. 47.*)

No particular form or solemnity is required in giving notice of an abandonment. It may be given either to the underwriter himself, or the agent who subscribed for him. But it must be stated, whether orally or in writing, in unequivocal terms. Lord Ellenborough expressed an opinion that the word 'abandon' should be used in order to make it effectual. The notice ought also to contain a statement of the causes which have led to abandonment.

In some cases losses may be cumulative. Lord Ellenborough laid down, that 'there may be cases in which though *a priori* damages may be followed by a total loss, the assured may, nevertheless, have rights or claims in respect of that prior loss which may not be extinguished by any subsequent total loss. Actual payments for repairs made in consequence of injuries suffered at sea, and occurring prior to the total loss are of this character. It has been held by the Court of Common Pleas (*Le Cheminant v. Pearson, 4 Taunt. 367*) that a plaintiff might recover, in addition to a total loss, for sums so expended.

The effect of an abandonment is to make the owners trustees for the underwriters. Abandonment does not vest the property. The registry Acts prevent this from passing, except in a certain way. (Lord Tmro in the House of Lords, *Scottish Mar. Ins. Co. v. Turner*.) The latter become the legal owners of the ship, and as such are liable for all her future outgoings, and entitled to her future earnings. An abandonment, when once made, is irrevocable.

In case of a shipwreck or other misfortune, the captain and crew are bound to exert themselves to the utmost to save as much property as possible; and to enable them to do this without prejudice to the right of abandonment, our policies provide that, 'in case of any loss or misfortune, the insured, their factors, servants, and assigns, shall be at liberty to sue and labour about the defence, safeguard, and recovery of the goods, and merchandises, and ship, &c., without prejudice to the insurance, to the charges whereof the insurers agree to contribute, each according to the rate and quantity of his subscription.'

'From the nature of his situation,' says Mr. Serjeant Marshall, 'the captain has an implied authority, not only from the insured, but also from the insurers and all others interested in the ship or cargo, in case of misfortune, to do whatever he thinks most conducive to the general interest of all concerned, and they are all bound by his acts. Therefore, if the ship be disabled by stress of weather, or any other peril of the sea, the captain may hire another vessel for the transport of the goods to their port of destination, if he think it for the interest of all concerned that he should do so; or he may upon a capture, appeal against a sentence of condemnation, or carry on any other proceedings for the recovery of the ship and cargo, provided he has a probable ground for doing so; or he may, upon the loss of the ship, invest the produce of the goods saved in other goods, which he may ship for his original port of destination; for whatever is recovered of the effects insured, the captain is accountable to the

insurers. If the insured neglect to abandon when he has it in his power to do so, he adopts the acts of the captain, and he is bound by them. If, on the other hand, the insurers, after notice of abandonment, suffer the captain to continue in the management, he becomes their agent, and they are bound by his acts.

As to the sailors, when a misfortune happens, they are bound to save and preserve the merchandise to the best of their power, and while they are so employed they are entitled to wages, so far, at least, as what is saved will allow; but if they refuse to assist in this, they shall have neither wages nor reward.

The policy of the practice of abandonment seems very questionable. The object of an insurance is to render the insurer liable for whatever loss or damage may be incurred. But this object does not seem to be promoted by compelling him to pay as for a total loss, when, in fact, the loss is only partial. The captain and crew of the ship are selected by the owners, are their servants, and are responsible to them for their proceedings. But in the event of a ship being stranded, and so damaged that the owners are entitled to abandon, the captain and crew become the servants of the underwriters, who had nothing to do with their appointment, and to whom they are most probably altogether unknown. It is admitted that a regulation of this sort can hardly fail of leading, and has indeed frequently led, to very great abuse. We, therefore, are inclined to think that abandonment ought not to be allowed where any property is known to exist; but that such property should continue at the disposal of the owners and their agents, and that the underwriters should be liable only for the damage really incurred. The first case that came before the British courts with respect to abandonment was decided by Lord Hardwicke, in 1744. Mr. Justice Buller appears to have concurred in the opinion now stated, that abandonment should not have been allowed in cases where the loss is not total.

For further information as to this subject, see the excellent works of Mr. Serjeant Marshall (*book i. ch. xiii.*), of Mr. Justice Park (*ch. ix.*) *On the Law of Insurance, Annot. On Marine Insurance, Pritchard's Admiralty Digest*, Maude and Pollock's *Law of Merchant Shipping*, and Emérigon's *Traité des Assurances et des Contrats*. For *American Law*, see Duer, Parsons, Phillips.

**ABATEMENT or REBATE.** The name sometimes given to a discount allowed for prompt payment; sometimes for the difference between the value of an immature bill and the same instrument when arrived at maturity. It is also sometimes used to express the deduction that is occasionally made at the custom-house from the duties chargeable upon such goods as are damaged, and for loss in warehouses. All claims for abatement of customs' duties are regulated by the Customs Consolidation Act, 16 and 17 Vict. c. 107 (1853), ss. 76, 96 and 97. Goods derelict, &c., and droits of the Admiralty are treated as foreign goods. No abatement may exceed three-fourths of the duty to which such goods may be liable; and no abatement is allowed on *coculus indicus*, *nux-vomica*, rice, Guinea grains, lemons, spirits, corn, grain meal, flour, opium, sugar, cocoa, oranges, tea, coffee, pepper, tobacco, currants, raisins, wine and figs. The above are nearly all the articles still liable to customs' duty.

**ABSINTH.** *Wormwood.* Produced from the *Artemisia absinthium*. The plant is indigenous to Southern Europe, is bitter and aromatic, and is used in medicine, but is principally employed for distillation of a liqueur largely used on the Conti-

**ACACIA.** [*GUM ARABIC.*]

**ACAPULCO.** A celebrated sea-port on the western coast of Mexico, in lat. 16° 50' 29" N., long. 99° 46' W.

Before the emancipation of Spanish America, a galleon, richly laden, was annually sent from Acapulco to Manilla, and on her return a fair was held, much resorted to by strangers. This sort of intercourse is no longer carried on, the trade to Manilla and all other places being now conducted by private individuals. Acapulco is extremely unhealthy, and its commerce is inconsiderable. The moneys, weights and measures, are the same as those of Spain. [*CADIZ.*]

**ACIDS.** A class of bodies which are distinguished from all others by the following properties. They are generally possessed of a very sharp taste; redden the infusion of litmus and most organic blue or violet colouring matters; are often highly corrosive, and enter into combination with the alkalies, alkaline earths, and metallic oxides: forming compounds in which the characters of the constituents are totally destroyed and new ones produced, differing entirely from those previously existing. The last is the only one of these properties which can be considered essential to acids; indeed comparatively few acids possess them all.

The number of acids known is very great, but it is only those which are largely employed in the arts and manufactures that will be here treated of, as they only form articles of commerce. The most important acids of commerce are: arsenious, acetic, benzoic, boracic, carbolic, carbonic, citric, gallic, hydrochloric, hydrofluoric, hydrocyanic, malic, nitric, oxalic, pyrogallic, sulphurous, sulphuric, tannic, tartaric, uric, and the so-called fatty acids, stearic, margaric and oleic.

*Acetic or Pyroligneous Acid*—is obtained by the destructive distillation of dry hard woods, such as oak and beech, at a red heat. The distillation is conducted in an iron cylinder of large dimensions, to which a worm or condenser is attached; a sour water, a quantity of tar and much inflammable gas, pass over, leaving charcoal of excellent quality in the retort. The crude product is then purified by a second distillation, the first portion being collected apart for the sake of the methylic alcohol it contains, and the remainder is saturated with lime and concentrated by evaporation. When the acid is required for the fabrication of other compounds used in the arts and manufactures, where great purity is not essential, it is prepared direct from the crude lime-salt by distillation with hydrochloric or sulphuric acid. But when great purity is required, the lime-salt is first submitted to a moderate heat, whereby many of the impurities (oleaginous and tarry matters) are charred, and its solution is subsequently clarified by means of albumen. The lime-salt is then transformed into a soda salt by distillation with sulphuric acid, and saturation of the distillate with soda ash, instead of decomposing it as formerly by mixing it with sulphate of soda. From the acetate of soda, after it has been freed from the last traces of impurity by crystallisation, the pure acetic acid is obtained by distillation with sulphuric acid. The acid thus prepared is now extensively used for fortifying malt vinegar. The most recent improvement in the manufacture of pyroligneous acid, is that of using sawdust, spent dye woods, &c., instead of wood in the process of destructive

distillation. This is done by causing these substances to pass in continuous motion through heated retorts by means of suitable machinery. The greater portion of the pyroligneous acid prepared in this country is employed in the manufacture of the acetates, particularly acetate of lead for the use of dyers and calico printers, and only a small portion is purified for household and other purposes. Acetic acid is also extensively employed to preserve animal and vegetable substances, and the acid from wood is preferable for this purpose, on account of the traces of essential oils which it contains, and which increase its antiseptic properties. Vinegar is an impure and dilute acetic acid obtained by exposing either weak wines or infusions of malt to the atmosphere or other oxidising influences and a slow fermentation. In Germany the process is much expedited by allowing the alcoholic liquid to flow over wood shavings steeped in a little vinegar in a large cylindrical vessel, through which a current of air is made to pass. Pyroligneous or acetic acid is manufactured in England, France, Germany and Sweden on a large scale; also in other civilised countries where wood is abundant and a demand exists for the acetates used in dyeing. The strength or quality of acetic acid is determined by neutralising with a standard alkaline solution, but as the acid itself is volatile, the standard solution ought to be made with a caustic not a carbonated alkali.

*Arsenious Acid or White Arsenic.*—It formerly appeared in commerce in the form of a heavy white glassy looking substance with a smooth conchoidal fracture, but is now generally met with as a white powder. It is a weak acid, and sparingly soluble in cold water but readily soluble in hot hydrochloric acid; also in alkalies, forming arsenites. This substance is obtained as a product of the calcination of arseniferous tin and cobalt ores in Saxony and of certain copper ores in England, and the crude arsenious acid thus produced is purified by sublimation. It is chiefly employed in calico printing, also in glass making, to reduce the sesquioxide of iron to protoxide, and forms one constituent of the substances known as Scheele's or Schweinfurt green. It is a most violent poison and has a feeble sweetish and astringent taste, its antidotes being sesquioxide of iron and magnesia. The price of arsenious acid is very low, being about 1l. per ton.

*Benzoic Acid*—exists naturally, formed in the gum benzoin, and may be procured either by submitting the benzoin in fine powder to repeated sublimations, or by digesting it with lime and water, straining off the clear solution, and adding hydrochloric acid, which enters into combination with the lime, and the benzoic acid, being nearly insoluble in water, falls as a white powder. This may be further purified by a sublimation. Benzoic acid is of a beautiful pearly white colour when pure, has a very peculiar aromatic odour, and an acid, acid, and bitter taste; it is used in making pastilles and perfumed incense. This acid also occurs in the balsams of Tolu and Peru, and in the putrid urine of the horse and cow.

*Boracic Acid*—is found in an uncombined state in many of the hot springs of Tuscany, as also at Sessa in the Florentine territory, from whence it received the name of Sessolin. In Thibet, Persia, and South America, it occurs in combination with soda, and is imported from the former place into this country in a crystalline form, under the name of Tincal. These crystals are coated with a rancid, fatty substance, and require to be purified by repeated solutions and crystallisations; after which it is sold under the appellation of borax (bi-borate

of soda); from a hot solution of this salt the boracic acid is readily obtained, by the addition of sulphuric acid in slight excess; sulphate of soda is formed, and the boracic acid crystallises as the solution cools. When pure, these crystals are white, and have an unctuous greasy feel; they are soluble in alcohol, communicating a green tinge to its flame. When fused the acid forms a transparent glass, and has been found by Mr. Faraday to unite with the oxide of lead, producing a very uniform glass, free from all defects, and well adapted for the purpose of telescopes and other astronomical instruments. Borax is much employed in the arts, particularly in metallurgical operations as a flux; also in enamelling, and in pharmacy. [BORAX.]

**Carbolic Acid or Phenol**—an oily colourless liquid, with a burning taste and the smell of creosote, is found in considerable quantity in coal tar, and is easily extracted therefrom by heating the heavier coal tar oils—those boiling between 300° and 400° Fahr.—with a solution of soda or milk of lime. The aqueous liquid is then separated from the undissolved oil, decomposed by hydrochloric acid, and the oily product obtained purified by cautious distillation. Most of the commercial creosote is simply carbolic acid, mixed with more or less water. Carbolic acid is principally used as an antiseptic disinfectant, either for, or in combination with, lime and sulphate of soda and lime (McDougal's powder), also in the preparation of dyes; viz, phenol blue, or azuline, and picric, or carbazotic acid.

**Carbonic Acid**.—This acid occurs very abundantly in nature, combined with lime, magnesia, barytes, aerial acid, fixed air, mephitic acid: from any of these it is easily separated by the addition of nearly any of the other acids. In its uncombined form it is a transparent, gaseous fluid, having a density of 1.53, atmospheric air being unity; it is absorbed to a considerable extent by water, and when the water is rendered slightly alkaline by the addition of carbonate of soda, and a large quantity of gas forced into it by pressure, it forms the well-known refreshing beverage soda water. This gas is also formed in very large quantities during combustion, respiration, and fermentation. Carbonic acid gas is destructive of animal life and combustion, and from its great weight accumulates in the bottoms of deep wells, cellars, caves, &c., which have been closed for a long period, and numerous fatal accidents arise frequently to persons entering such places incautiously. The precaution should always be taken of introducing a lighted candle prior to the descent or entrance of anyone; for should the candle be extinguished, it would be dangerous to enter until properly ventilated. The combinations of carbonic acid with the alkalic, earths, and metallic oxides are termed carbonates.

**Citric Acid**—exists in a free state in the juice of the lemon, lime, and other fruits, combined, however with muckage, and sometimes a little sugar, which renders it, if required to be preserved for a long period, very liable to ferment; on this account the crystallised citric acid is to be preferred. It is prepared by saturating the lemon juice with chalk; the citric acid combines with the lime, forming an insoluble compound, while the carbonic acid is liberated; the insoluble citrate, after being well washed, is to be acted upon by dilute sulphuric acid, which forms sulphate of lime, and the citric acid enters into solution in the water; by filtration and evaporation the citric acid is obtained in colourless transparent crystals. The chief uses to which it is applied are as a preventive of sea scurvy, and in making re-

freshing acidulous or effervescent drinks; for which latter purposes it is peculiarly fitted from its very pleasant flavour. Selling price about 2s. per lb.

**Fatty Acids**.—These are certain constituents of fatty bodies, i.e. of oils and fats of different animals, which act the part of acids towards several bases forming salts which bear the generic name of *soaps*. Thus the saponification of oils and fats consists in the combination of the acids they contain with certain bases, chiefly the alkalies, potassa, and soda. These acids are three in number, viz, stearic, margaric, and oleic, and exist in variable proportions in different fatty bodies. Thus oleic preponderates in oils, stearic in the fat of herbivora, and margaric in the grease of carnivora. They are extracted by certain processes more or less complicated, which result in their separation from a neutral principle called glycerine; but the process now most generally adopted is to mix the oil or fat with about one sixth part of oil of vitriol in large copper vessels, and heat the mass to 350° Fahr. by superheated steam. The neutral principle, glycerine, is at this temperature decomposed and the fatty acids set free. The liberated acids are then distilled in a current of steam and heated to 500° or 600°, by transmission through a red-hot pipe, and run into pans to solidify. The acids have then the consistency of butter, and are subjected to pressure to squeeze out the more fluid oleic acid. The decomposition of fats by highly heated steam only has lately been carried to great perfection, and has the advantage of yielding the glycerine in a very pure state. Stearic and margaric acids are white and crystallisable. They are sometimes confounded in commerce with stearine and margarine, which however, differ somewhat from them, being combinations of these acids with glycerine. Oleic acid is liquid at the ordinary temperature, and is separated from the other two by pressure. Of the three acids, stearic is by far the most important, on account of its being the principal constituent of the well-known candles. It has a brilliant white appearance and crystallises in laminae of pearly lustre. Its point of fusion is 158° Fahr. and it burns with a clear white flame. Stearic acid of commerce contains invariably some margaric acid, and a small quantity of wax is usually added to it to impart a more homogeneous appearance and a pleasant odour. Margaric acid is only used mixed with steam, and in the manufacture of candles. Oleic acid of commerce always contains portions of stearic and margaric acids, and some foreign substances which give it a reddish-brown colour, and in the impure state as extracted in the manufacture of stearic acid, is used for the manufacture of soap. These fatty acids are manufactured in large quantities in England, France, Holland, Belgium, Germany, and Russia.

**Gallic Acid**.—This acid, together with tannic acid, is obtained from nut-galls, which are excrecences produced on the leaves of a species of oak, the *Quercus infectoria*, by the puncture of an insect. Fresh galls yield very little gallic acid, which is produced by the decomposition of tannic acid, and differs somewhat from it inasmuch as it does not precipitate gelatin. The simplest method of preparing this acid in quantity is to take powdered nut-galls, mix them with water to a thin paste, and expose the mixture to the air in a warm situation for the space of two or three months, adding water from time to time to replace that lost by drying up. The mouldy dark-coloured mass produced is strongly pressed in a cloth and the solid portion boiled. The solution contains abundance of gallic acid, which may be crystal-

lised if r

Used if required. When pure, gallic acid has a white and silky appearance, and a highly astringent and slightly acid taste.

The nut galls, which owe their properties to the gallic acid they contain, are employed very extensively in the arts, for dyeing and staining silks, cloths, and woods of a black colour; this is owing to its forming with the oxide of iron an intense black precipitate. Writing ink is made on the same principle; a very excellent receipt of the late Dr. Black's is, to take 3 oz. of the best Aleppo galls in fine powder, 1 oz. sulphate of iron (green vitriol), 1 oz. logwood finely rasped, 1 oz. gum arabic, one pint of the best vinegar, one pint of soft water, and 8 or 10 cloves; in this case the black precipitate is kept suspended by the gum.

The following receipt is taken from the Bursar's roll of New College Oxford, for the year 1418: 3lbs. galls, 3lbs. copperas (sulphate of iron), 1½lb. gum. This ink has stood for four and a half centuries.

**Hydrochloric Acid.**—It was formerly called *Muriatic Acid* or *Spirit of Salt*. It is next in importance to sulphuric acid on account of its varied applications in the arts and manufactures, and the large scale on which it is produced as a by-product of the manufacture of soda from common salt. Hydrochloric acid in its anhydrous state is a colourless gas of 1.247 density, having so strong an affinity for water that one volume of that liquid absorbs 480 times its volume of the gas, and when thus saturated the liquid acid has a density of 1.21. The commercial acid, however, generally varies from 1.10 to 1.18 in density, containing from 30 to 36 per cent. of the dry acid. The decomposition of chloride of sodium (common salt) by sulphuric acid in the first stage of the soda manufacture [ALKALI; SODA] evolves hydrochloric acid in enormous quantities, which gas is passed through large towers constructed of stone and filled with coke, through which a stream of water continually percolates. Owing to the great affinity for water above alluded to, this mode of condensation is exceedingly perfect, and of the 13,000 tons evolved per annum in the United Kingdom only 43 tons escape, and in many works not a trace even can be discovered in the exit pipes of the apparatus. The acid thus produced is of a slightly yellow colour, owing to the presence of a small quantity of iron, and may contain traces of sulphuric acid (indicated by chloride of barium) and of arsenic when pyrites has been employed in the preparation of the oil of vitriol. For the majority of the applications these impurities are not of any moment, and may be easily removed when necessary. Most of the acid produced is directly converted into bleaching powder or chloride of lime [BLEACHING POWDER] or bicarbonate of soda [ALKALIES], but it is also used in large quantities in the manufacture of chlorate of potassa, salts of ammonia, gelatine and glue; chloride of tin, oxychloride of lead, chloride of barium, for galvanising iron, and in the extraction of copper from poor silicious copper ores. The quantity produced in England is about 13,000 tons per annum, and the selling price from 10s. to 5l. per ton, according to the purity of the acid, and the distance from the seat of manufacture. It is produced in most manufacturing countries, but in none to so great an extent as in England.

**Hydrocyanic or Prussic Acid.**—The kernels of bitter almonds, apricots, plums, cherries; the blossoms of the peach, slue, and mountain ash, the leaves of the peach, cherry, and laurel; and many other vegetable substances, when soaked in water and distilled, yield hydrocyanic acid together with

bitter almond oil. It exists ready formed in the moister parts of these substances, but the greater portion is produced by a fermentation of the amygdalin contained in the plants. There are many methods of preparing this, and for the purposes of medicine and chemistry, but that most usually followed is to pass sulphide of hydrogen through a solution of cyanide of mercury so long as it is absorbed. The solution is separated by filtration from the sulphide of mercury; the excess of sulphide of hydrogen, if any, may be removed by carbonate of lead. Another method is to decompose ferrocyanide of potassium (yellow prussiate) by diluted sulphuric acid, the proportions being 10 parts finely-powdered ferrocyanide; 5 parts of sulphuric acid; and 14 parts of water. The distilled product is collected in a well-cooled receiver. This acid is the most virulent poison known, and may be easily recognised by its characteristic odour.

**Hydrofluoric Acid.**—It is found in the well-known mineral fluor spar in combination with lime: from which it is procured in the liquid form by distillation with dilute sulphuric acid in a leaden or silver retort; the receiver should be of the same material as the retort, and kept cool by ice or snow.

This acid is gaseous in its pure form, highly corrosive, and intensely acid; it is rapidly absorbed by water, communicating its properties to that fluid. Its chief use is for etching on glass, which it corrodes with great rapidity. For this purpose a thin coating of wax is to be melted on the surface of the glass, and the sketch drawn by a fine hard-pointed instrument through the wax; the liquid acid is then poured on it, and after a short time on the removal of the acid and coating, an etching will be found in the substance of the glass. A very excellent application of this property, possessed by fluoric acid, is in the roughing the shades for table lamps. All the metals, except silver, lead, and platinum, are acted upon by this acid.

**Nitric Acid or Aquafortis.**—This, which is one of the most useful acids, was formerly prepared by acting upon nitrate of potassa (saltpetre) with sulphuric acid, but now, owing to its comparative cheapness, and the greater yield of acid, nitrate of soda, or Chilian saltpetre, is generally substituted. The proportions best suited for the purpose, are 100 parts nitrate of potassa to 96 parts of oil of vitriol, or 100 nitrate of soda to 117 oil of vitriol, and 30 parts of water.

The distillation is generally conducted in a cast-iron retort or cylinder, the nitric acid passes over in the form of vapour, and is collected in earthenware vessels connected by tubes, and a bisulphate of potash or soda (Sal nixum) remains in the retort. Nitric acid of commerce has usually a dark, orange-red colour, giving off copious fumes and having a specific gravity of 1.500. It may be obtained perfectly colourless by a second distillation, rejecting the first portion that passes over. It is strongly acid and highly corrosive, attacking energetically all organic substances. It also dissolves most metals, disengaging yellowish red fumes, and is a powerful presiding agent. It is used in the manufacture of gun cotton, nitro-benzol and picric or carbazotic acid. It is much employed in the arts for etching on copper plates, for engraving, also in the assaying and refining of gold and silver. In pharmacy and surgery it is extensively used, and is employed for destroying contagious effluvia. Combined with hydrochloric acid it forms aqua regia, used as a solvent for gold, platinum, &c. The price of nitric acid is about 6d. per pound.

**Oxalic Acid.**—It occurs in combination with potassa as binonate of potassa in different varieties of sorrel, hence the name salt of sorrel. This acid was formerly prepared by the action of nitric acid on sugar or starch, but it is now manufactured on a large scale, and much more cheaply by treating sawdust with a mixed solution of potassa and soda. The mixture is kept for some hours at a temperature of 400° Fahr., care being taken to avoid charring. The product thus obtained is a grey powder, and is treated with water at about 60° Fahr., which leaves the oxalate of soda undissolved. The supernatant liquor is drawn off, evaporated to dryness, and heated in furnaces to recover the alkalis. The oxalate of soda is washed and decomposed by boiling with hydrate of lime, and the resulting oxalate of lime, again decomposed by sulphuric acid. The liquor decanted from the sulphate of lime is evaporated to crystallisation in leaden vessels, and the crystals of oxalic acid purified by recrystallisation.

It is sold in small transparent colourless prisms of a strongly acid taste. It is intensely poisonous. In cases of poisoning by this acid, lime, or chalk mixed with water to form a cream, should be immediately administered, the combination of oxalic acid with this substance being perfectly inert. It is employed principally in calico printing, and woollen dyeing, straw bleaching, also for whitening leather, removing ink stains, iron moulds, &c. from wood and linen, and for making binoxalate of potassa or salt of lemon. Oxalic acid may be very readily detected by adding sulphate of lime to its solution previously neutralised by ammonia. A white cloud is produced in a few minutes. Since the introduction of the new process the manufacture of oxalic acid has become nearly a monopoly of this country owing to the quantity of coal required, and its price has been very materially reduced. This ranges now from 10*d.* to 13*d.* per lb.

**Pyrogallic Acid.**—When gallic acid is heated at a temperature of 420° Fahr., or thereabouts, it is resolved into carbonic acid, and a volatile product which is termed pyrogallic acid. It is a powerful reducing or deoxidising agent, and on this account is much used in photography for the purpose of reducing the salts of gold and silver to a metallic state.

**Sulphuric Acid.**—Of all the acids this is the most extensively used in the arts, and consequently the most important; and of commerce, indeed, Baron Liebig very justly remarks that it is no exaggeration to say we may judge with great accuracy of the commercial prosperity of the country from the amount of sulphuric acid it consumes.

For many centuries sulphuric acid was manufactured from green vitriol or sulphate of iron, particularly at Nordhausen, in Germany; but since about the middle of the last century, it is directly prepared from the oxidation of sulphurous acid by means of water or steam and nitrous acid. If one views the gigantic scale on which the manufacture is carried on at the present day he must smile on looking back at the puny operations of former times. The sulphurous acid which used to be obtained exclusively by the burning of sulphur is now made by the calcination of various ores and compounds, containing sulphur, more particularly pyrites. For this purpose suitable apparatus, kilns or calciners for pyrites and iron plates, when sulphur is used, are employed. Once kindled the heat generated is sufficient to keep up the combustion, and a constant evolution of sulphurous acid gas takes place. This gas, together with nitrous acid (prepared by the decomposition of

nitrate of soda by sulphuric acid), is introduced into large leaden chambers the bottoms of which are covered with an inch or more of water. Into these chambers steam is introduced by a suitable arrangement of pipes connected with an ordinary steam boiler. Whatever may be the precise change that takes place in the chambers, all chemists agree that the nitrous acid serves simply as a carrier of the oxygen between the air and the sulphurous acid forming sulphuric acid which falls in a liquid state to the bottom of the chamber. This liquid acid, which usually has the density 1.50 and 1.55 is daily run into leaden pans, where it is concentrated by evaporation till it attains the density of 1.75. For many purposes this degree of concentration is sufficient, and the acid, called from its colour Brown vitriol, is run for sale into carboys or large globular bottles of green glass, protected by basket-work. If a further concentration is required, the brown acid is drawn off into retorts made of glass or platinum and evaporated until it has a density of 1.84 to 1.85. It has now the appearance of a white oily liquid, hence the name 'oil of vitriol,' and is transferred into carboys, in which form it is sold as rectified sulphuric acid. The sulphuric acid of commerce invariably contains lead, and, generally, nitrous compounds and traces of hydrochloric acid. When it has been prepared from pyrites, arsenic is nearly always present, but for many purposes to which it is applied these impurities are of no moment, and when it is requisite they may be easily removed. The quantity of sulphuric acid now manufactured may be roughly estimated, from the quantity of sulphur and sulphur ores consumed, at about 375,000 tons of 1.50 specific gravity. The greater portion produced, about 300,000 tons, is used in the manufacture of alkali, a very much greater and largely increasing quantity to the manufacture of superphosphate of lime for manure. The remainder is applied to the most various purposes in the manufacture of stearic, tartaric, acetic and other acids, in the preparation of sulphate of indigo, the purification of oils of every kind, and many other manufactures, for it is, as it were, the very key to most other chemical operations.

The selling price of the rectified sulphuric acid, specific gravity 1.84 and 1.85, varies from 3*d.* to 1*d.* per lb., that of the brown acid from 3*d.* 10*s.* to 5*d.* per ton.

**Sulphurous Acid.**—It is formed whenever sulphur is burnt in atmospheric air; it is a suffocating and pungent gas, strongly acid, bleaches vegetable colours with great rapidity, and is a powerful antiseptic. These properties render it useful in bleaching woollen goods and straws, and in arresting the process of vinous fermentation. Owing to its volatility and pungent odour, it is usually employed in combination with potassa and soda, or with lime.—These compounds are called sulphites. Its principal use, however, is in the manufacture of sulphuric acid.

**Tannic Acid or Gallotannic Acid.**—Tanning principle is contained in gall nuts of the *Quercus infectoria*, sumach, &c. Many other plants contain substances which resemble tannic acid, i.e. they precipitate albumen and gelatin from solution, and unite with animal membrane, forming a substance which resists putrefaction. It is on this principle that leather is manufactured, and the process is called tanning. All these substances are called tannic acids or tannin, although more exact investigations have shown them to differ in some essential properties from the gallotannic acid obtained from gall nuts.

an inlet of  
situation is a  
city; and it

by purifying the crust, which separates during fermentation of wines by solution and crystallisation. The purified bitartrate is dissolved in boiling water, and powdered chalk added as long as effervescence is excited, or the liquid exhibits an acid reaction; tartrate of lime and neutral tartrate of potassa result; the latter is separated from the former by filtration. The solution of tartrate of potassa is then mixed with excess of chloride of calcium, which throws down all the remaining acid in the form of a lime salt. The tartrate of lime thus obtained is treated with dilute sulphuric acid, sulphate of lime is then formed, and the tartaric acid enters into solution, and may be obtained by evaporation and crystallisation. This acid is manufactured largely in Austria and France, as well as in England, and is much employed in calico printing, also in making effervescing draughts and powders in pharmacy. Its selling price is about 1s. 6d. per lb.

*Uric Acid*.—It is found in the excrements of serpents and birds, and in guano as urate of ammonia. It is extracted from guano, by means of hot dilute hydrochloric acid. The principal use of this acid is for the purpose of making murexide, a beautiful purple dye, which some years since was manufactured on a large scale, but owing to the introduction of the aniline colours, the manufacture has gradually decreased.

For the above exhaustive account of commercial acids, we are indebted to the distinguished chemist and manufacturer Edmund Muspratt, Esq., of Liverpool.

**ACORNS** (Ger. eicheln, eekern; Fr. glands; Ital. ghiande; Span. bellotas; Russ. schedudli; Lat. glandes). The seed or fruit of the oak. Acorns, which are said to have formed part of the food of man in early ages (Virgil, *Georg.* i. 8, Ovid, *Met.* i. 106), are still used in some countries, in periods of scarcity, as a substitute for bread. With us they are now rarely used except for fattening hogs and poultry. They are said to make, when roasted, with the addition of a little fresh butter, one of the best substitutes for coffee. Their taste is astringent and bitter.

**ACRE**. A measure of land. The Imperial or standard English acre contains 4 roods, each rood 40 poles or perches, each pole 272½ square feet; and consequently each acre = 43,560 square feet. Previously to the introduction of the new system of weights and measures by the act 5 Geo. 4. cap. 74, the acres in use in different parts of England varied considerably from each other and from the standard acre; but these customary measures are now abolished. The Scotch acre contains 4 roods, each rood 40 fells, and each fell 36 ells; the ell being equal to 37.06 Imperial inches. Hence the Imperial is to the Scotch acre nearly as 1 to 1½, one Scotch acre being equal to 1.261 Imperial acres. The Irish acre is equal to 1 acre, 2 roods, and 10<sup>21</sup>/<sub>100</sub> poles; 30½ Irish being equal to 49 Imperial acres. [WEIGHTS AND MEASURES.]

**ADELAIDE**. A city of S. Australia, cap. of the British colony of that name, about 7 m. S.S.E. from its port, an inlet on the E. side of St. Vincent's Gulf, lat. 34° 57' S., long. 138° 38' E. Though founded so recently as 1844, and not well situated, this is a well-built, prosperous town. Some of the houses, and most part of the principal buildings, are of brick and stone. Pop. in 1855, 18,259; in 1861, 18,303.

The river Torrens, on which Adelaide is built, loses itself in a marsh before reaching the sea, so that the city is about 7 m. distant from its port, an inlet of St. Vincent's Gulf. This inland situation is a serious drawback on the trade of the city; and it would seem that a mistake was

committed in not building it on, or much nearer to, the coast. This, we are aware, has been denied, though, as we think, upon very unsatisfactory grounds. There appears, indeed, to be but little doubt that in no very lengthened period most part of the commerce of the town will be transferred to the port; and that it will be preferred as a residence by all commercial people. In the rainy season the Torrens is much flooded, though it seldom overflows its banks, which are steep and lofty; but in the dry season it has no current, its bed being then formed into a series of pools or tanks.

Port Adelaide, 7 m. N.N.W. from the city, in a low and marshy situation, consists of a number of dwelling-houses and warehouses, some of which are of stone with wharves, partly belonging to government, and partly to the South Australian Company. The inlet of the sea, forming the harbour, opposite the entrance to which a light vessel is moored, stretches from the gulf, from which it is separated by a narrow neck of land, for about 8 m. southward, surrounding Torrens Island. At its mouth is a sandy bar with 8 ft. water at ebb and 16 ft. at flood tide; this depth being considerably increased during S. and S.W. winds. Ships of 400 or 500 tons may, consequently, pass the bar in safety, and once over, there is depth enough for the largest ships to the head of the harbour. (Dutton, *S. Australia*, p. 112.) Large vessels are, however, obliged to lie in mid-channel: but projects were recently on foot for improving the harbour, either by carrying out piers into the deep water, or by establishing a new port about 2 m. nearer to the harbour's mouth, where the water in-shore is deeper, and the situation affords greater facilities for the accommodation of shipping. Port Adelaide has a custom-house; but vessels are exempted from all port charges in this and in the other ports of the colony.

*Sailing directions for Port Adelaide*.—After making Kangaroo Island, steer E. ½ N. through Investigator's Straits, between that island and Althorp Island. Should the wind be from the eastward, you will find no difficulty in beating through the straits, nor anything in the way more than is pointed out in Flinder's chart. If bound up Gulf St. Vincent, great care is requisite to avoid Troubridge shoal, situate on the west side of the entrance, as the flood tide through Backstairs passage sets strong (particularly on the change and fall of the moon) directly upon the shoal; therefore coming from the westward the course should not be altered until Point Marsden bears S.W. by W. ½ W.; when you will be about 10 miles from the highland, inside Cape Jervis, named in Flinder's chart North-West Bluff, when you may shape your course for the light-vessel N.N.E. 40 miles distant. For about six leagues up the gulf the land is high and bold, but above that the shore becomes very low with hummocks of sand upon it, and the same description of coast prevails to the head of the gulf. After passing the high coast land, the water shoals far out, and in some instances, when within the distance of 10 miles from the light, five fathoms will be found at a distance of four miles from the beach. Be careful of your soundings, particularly at night, and in running up to the light, keep as nearly as you can in between five and six fathoms water, not approaching inside five, as within that depth the water shoals suddenly; and if you keep outside six fathoms, you may pass to the westward of the light and not see it. In these soundings you will make the light ahead, which may be seen 12 miles from the deck of a ship. The shoal—called

the Bar—at the entrance of the port, bears N.E. one mile from the light-vessel. When you are within a proper distance, a boat will be sent to you from the light-vessel with a pilot and to receive all mails and letters. Should you sight the light in the early part of the night, you may anchor anywhere to the southward of it in six fathoms, or keep underweigh until daylight, taking care to be to the southward of the light, and as near it as possible in the morning, as the tide answers early. Where the light-vessel is moored, in lat. 34° 44' S., there anchorage is safe, but a good full scope of chain is required, never less than 50 fathoms, and, if it blow, a full chain. Never let go the second anchor if you can avoid it; rather give more chain, as your vessel will ride much easier with one anchor down than two.

When bound down the gulf steer from the light-vessel S.S.W., which will keep you in sight of the land on the east side of the gulf, and out of the influence of the tide through Backstairs passage, until you are to the southward of Troubridge shoal; but on no account shape a course that you may fancy will enable you to weather the shoals, thereby laying the ship's broadside exposed to a rapid tide running directly upon it, until you are sufficiently to the southward to shape your course down the strait.

In beating down the gulf never exceed a distance of 10 miles from the larboard shore (as the opposite side is shoal), and be careful when standing in to have a cast of the lead, as it is shoal a considerable distance off until you get down to the highland. In some places to the northward of Holdfast Bay there are not more than five fathoms, at a distance of four miles from the beach, and the water shoals very quickly within that depth; but where the highland fronts the sea the shore is steep except a reef that lies a mile off, about three miles to the southward of Holdfast Bay. The flag-staff at Holdfast Bay is in lat. 34° 58' 28" S. In moderate weather endeavour to be as close to the land as possible by sunset, when you will be certain of the wind off the land, which will lead you down the coast. Do not allow yourself to be thrown off until you are well down with Cape Jarvis, and to the southward of Troubridge shoal, which is an extensive flat, and only in the middle shows a patch of about 200 yards at high water.

Ships bound down Investigator's Straits, meeting a strong westerly wind, and wishing to anchor, will find good holding ground close in on the east side of Point Marsden, in six fathoms of water. Vessels coming from the eastward through Backstairs passage, and bound up the gulf, should not be approaching, must keep on the north side of the passage, and haul round Cape Jarvis, all that coast being quite bold. When the gulf is open shape a course N. by E. ½ E. for the light-vessel.

The trade of Adelaide is already extensive; and will continue to increase with the increase of the population and trade of the colony, of which it is the grand emporium. The colony is better suited for tillage than any other portion of the continent, and the exports of flour and grain are become of the first importance. The mines of copper, lead, &c., discovered in the vicinity of Adelaide, are of the richest description, and the ores furnished by them form a principal article of export. In 1852 the imports of copper ore into this country from South Australia, chiefly from the Burra-Burra mine, amounted to 8,582 tons. The discovery of the gold fields, by attracting many of the labourers from the copper mines, gave a serious check to the progress of the latter.

Harbour Dues.

For every additional ton	-	-	0 0 2

The same rates outwards.

Disabled steamers to pay on gross tonnage.

When two tugs are employed the above rates are to be increased by one third and the amount as augmented to be equally divided between the tugs employed, according to distance.

When two vessels are towed the rates are reduced one-third, and when more than two vessels are towed one-half, according to distance for each vessel towed.

Fees to Licensed Marine Surveyors.

	£	s.	d.
For surveying a ship's hatches and cargo, including attendance as required by the master	-	-	3 5 0
For each set of certificates as required by consignees or merchants, in triplicate	-	-	0 10 6
Survey of a ship for insurance, including report as required by underwriters or agents	-	-	2 2 0
Survey of a ship for repairs, including attendance during the progress of such repairs, and drawing up of report on repairs being completed	-	-	4 4 0

Wharves.—Lay days allowed at wharves at Port Adelaide. All vessels under 100 tons are allowed 6 days for the purpose of discharging, and all vessels above 100 tons the following number of days, Sundays not included: vessels from 100 to 300 tons, 10 days; 300 to 600 tons, 16 days; above 600 tons, 21 days. Vessels discharging cargo have preference at the wharves. Vessels exceeding the time allowed and remaining on berth without permission to be charged one penny per ton for every week such lay days shall be exceeded. Vessels loading or discharging at the wharves will be charged 3*d*. per ton register.

Wharfage Dues on Goods landed at or shipped from the Company's Wharf, Port Adelaide.

goods to be estimated at a fair average rate.		

### Wharfage Regulations.

No gunpowder, rubbish, or filth to be landed on the wharf.

No boats or casks to be placed, ballast landed, spars made, wood cut, or casks coopered on the wharf without permission.

No goods to be deposited on the wharf within fifteen feet from the Front Line.

Goods will be allowed to remain on the wharf 48 hours, after which time they will be liable to rent, and removed at the owner's expense.

The company will not be answerable for any goods that may be damaged whilst lying on the wharf, or what may be stolen from or plundered thereon.

Vessels loading or discharging coals, &c. must use tarpaulins to prevent them falling overboard.

No fires allowed on the wharf.

The line of rail must be kept sufficiently clear to allow the free passage of the truck.

**Banking.**—Five banks carried on business in Adelaide during 1864, and their operations were further extended by the opening of several new branches and agencies throughout the country districts. The increase in wealth and the soundness of the financial position of traders will be manifest on a comparison of the following statements of the aggregate assets and liabilities of the several banks for the three half years ending December, 1862, 1863, and 1864 respectively:—

### Liabilities.

	1862	1863	1864
Notes in circulation	£ 425,766	£ 232,181	£ 315,126
Bills in circulation	9,811	7,832	12,700
Balances due to other banks	17,171	24,901	11,715
Deposits	703,035	787,104	1,158,931
Total average liabilities	£ 955,823	£ 1,052,022	£ 1,498,472

### Assets.

	1862	1863	1864
Gold and bullion	£ 270,153	£ 326,875	£ 411,710
Government securities	4,600	4,600	4,600
Landed property and bank premises	56,461	55,185	60,808
Notes and bills of other banks	9,268	7,170	8,109
Balances due from other banks	47,211	82,561	131,512
Notes and bills discounted, and other debts due to banks not enumerated	1,512,806	1,603,561	1,721,750
Total average assets	£ 2,930,912	£ 2,079,555	£ 2,361,229

### Total Value of Imports and Exports, 1855-64.

Year.	Total Exports	Total Imports
1855	£ 988,215	£ 1,370,938
1856	1,665,740	1,366,329
1857	1,858,372	1,825,038
1858	1,512,182	1,769,351

\* Light Dues abolished October 31, 1860.

† Light Dues re-established on November 1, 1862.

Population of S. Australia on Dec. 31, 1865, 156,605. Revenue in 1864, 775,837. Expenditure in 1864, 626,688.

The revenue derived from the customs, the only source of taxation, the remainder having been acquired by land sales, &c., was, in the same year 203,349*l.*, being at the rate of 1*l.* 7*s.* 8*d.* per head of the population.

The governor of South Australia, in his report for the year 1864, mentions as indicative of the purchasing power of the community of that colony, that the sum paid per head for imported goods amounted in that year to 14*l.* 8*s.* per head of the whole population. Of British goods alone the consumption per head was 8*l.* 5*s.*

The value of the imports and exports from and to the United Kingdom were in the same years respectively:—

Imports	£	Exports	£
1860	939,515	1860	785,898
1861	1,104,252	1861	821,869
1862	1,178,903	1862	913,607
1863	1,177,796	1863	935,880
1864	1,217,568	1864	918,523

With regard to the amount of the export it is necessary to bear in mind that large quantities of South Australian produce, chiefly wool and minerals are shipped to the other Australian colonies for transhipment to the United Kingdom.

The principal produce of the colony consists in breadstuffs, wool and minerals (copper and copper ore); the table appended will show the percentage

ratio of the exports of each of these during the years specified.

Five Years ending with	Ratio of Average of Five Years' Exports of each Class to total Exports = 100			
	Breadstuffs.	Wool	Minerals	Miscellaneous
1855	per cent. 28 1/2	per cent. 28 1/2	per cent. 39 9	per cent. 6 1/4
1856	28 1/2	29 0	28 5	5 1/2
1857	40 1/2	30 8	24 6	4 2
1858	30 7	30 7	27 4	7 5
1859	39 3	31 5	27 1	2 1/2
1860	38 2	31 6	27 6	2 6
1861	39 0	32 5	26 7	2 8
1862	35 5	33 1	27 2	5 9
1863	35 2	35 9	27 0	3 9
1864	38 8	31 8	25 7	3 7

The relative values of the exports of each of these articles during the same year was as follows:—

Year	Breadstuffs, Grain, &c.	Minerals and Metals	Wool	
			Quantity	Value
1855	£26,400	£155,557	5,590,171	£284,479
1856	26,371	149,042	8,236,221	412,163
1857	755,810	458,839	9,935,293	501,520
1858	595,308	373,282	7,775,225	400,335
1859	654,265	411,018	9,496,715	481,977
1860	499,162	446,537	11,731,371	573,368
1861	713,789	459,172	15,164,701	635,007
1862	635,411	517,619	13,239,600	637,470
1863	747,116	542,393	15,666,787	715,935
1864	1,464,593	691,623	16,092,095	775,556

justify the following valuable extract from the colonial *blue book* for the year 1864 in regard to the extent and nature of the crop.

The acreage of the wheat crop amounted to 390,836 acres, or two thirds of the total cultivated land. In 1864 there were 335,758 acres under wheat, or sixty per cent. of the filled land; the increase this season has therefore amounted to six per cent. The total produce of the harvest was 4,252,949 bushels, compared with 4,691,919 bushels in the yield of the previous harvest, showing a decrease of 438,970 bushels—the average yield per acre being only eleven bushels as against fourteen bushels, and one bushel less than the average production of the past seven seasons.

On one occasion only during that period has the harvest been less productive, viz. in the year 1859-60, when only 9 bushels 38 lbs. per acre were reaped. The yield for each season, and other particulars respecting the cultivation of wheat during the septennial period just closed, is given in the following table. It will be seen that, in that short space of time, the growth of wheat has more than doubled.

Season	Acres cultivated	Acres under Wheat	Produce, Wheat		Average per Acre
			bushels	b. lbs.	
1858-59	261,162	188,703	2,109,511	11 11	
1859-60	361,883	218,216	2,103,111	9 58	
1860-61	428,316	275,772	3,276,333	12 4	
1861-62	486,667	310,656	5,110,756	10 59	
1862-63	491,511	329,169	5,811,821	12 0	
1863-64	525,908	375,758	6,643,919	14 0	
1864-65	587,775	390,836	4,252,949	11 0	

Seven-eighths of the wheat crop was reaped by machine, the area hand-reaped being less than last year, notwithstanding the increased cultivation. Out of 390,836 acres, 339,518 acres were gathered by machine, being an increase of 57,021 acres secured in that manner, whilst the quantity reaped by manual labour only amounted to 51,095 acres altogether. One, if not the most important

advantage the farmers possess over those of the sister colonies is the expedition and economy with which their crops can be secured, owing to the successful working of the reaping machines now universally used on all but hilly land, permitting of the grain being reaped, winnowed, cleaned, and bagged on the harvest field, and removed into store ere the day is closed.

*Minerals.*—The annexed table affords a comparison of the amounts of copper and copper ore exported from the colony during the periods indicated. The most important copper mines are those of Kapunda and Burra Burra.

Periods	Copper cwt.	Copper Ore tons
In the year 1855	12,255	4,939
1859	56,715	7,366
1864	134,035	5,717
Total in five years, 1855-59	218,009	35,516
1860-64	412,112	51,018
Average of five years, 1855-59	43,602	7,103
1860-64	82,422	6,201

The annexed is a statement of the shipping and tonnage entered at and cleared from South Australian ports since the year 1855.

Years	Inwards		Outwards	
	Number	Tonnage	Number	Tonnage
1855	561	114,982	540	110,911
1856	430	115,651	437	116,729
1857	486	140,725	381	101,979
1858	571	98,802	567	95,549
1859	402	111,426	290	101,692
1860	321	100,981	528	105,555
1861	401	103,196	557	96,155
1862	371	105,251	392	111,299
1863	440	127,667	416	127,826
1864	617	160,025	619	161,293

The following is a summary of the tonnage entered and cleared respectively in the foreign trade in 1863-4, from the various ports of South Australia, of which there are eight in addition to Adelaide.

Ports	Inwards				Outwards			
	Ships		Tonnage		Ships		Tonnage	
	1863	1864	1863	1864	1863	1864	1863	1864
Port Adelaide	555	455	105,774	124,256	511	418	167,535	128,575
Anguilla	1	5	298	479	5	6	2,196	5,055
Elliot	8	11	1,571	1,881	18	15	5,103	15,435
Macdonnell	51	38	1,717	4,751	23	58	1,890	4,553
Robe	5	15	5,255	5,223	6	15	5,226	4,098
Willaroo	55	69	10,735	17,275	10	39	5,617	8,031
Willunga	23	23	5,818	5,881	28	58	4,674	6,497
Yankalilla	9	15	1,553	2,256	13	18	2,207	5,409
Victor	—	9	—	1,552	—	15	—	1,915
Total	440	611	171,067	160,223	440	619	127,826	161,541

In addition to the above upwards of 4000 tons cleared at ports on the Murray, engaged in the river trade.

The entries and clearances from and to Great Britain, Victoria, and New South Wales, constitute the most important item of the tonnage. They were in the years 1863-4 as follow:—

	1863	1864
Great Britain, entered	28,265	29,918
cleared	14,465	11,677
Victoria, entered	25,934	26,111
cleared	34,169	54,173
New South Wales, entered	30,905	45,553
cleared	21,873	25,908

The immense progress the colony has made during the past ten years is very clearly shown in the above statement. In that period produce has been exported of the value of over 17,000,000 sterling; and, during the latter half of the period, the exports amounted to 10,500,000, as compared with 6,750,000, in the preceding five years, showing an increase of one-third, or 3,750,000.

nearby. The average of the quinquennial period ending 1859, was 1,337,312, per annum, and during that ended in 1864 2,089,269, annually. In 1855 the exports of produce amounted to 686,953; in 1859, to 1,502,165; and in 1865 they reached 3,015,537,—an advance of 100 per cent. during the last five years. In 1855 the exports of produce averaged 87 per head of the population; in 1859, 121 3s. per head; and in 1866, at the rate of 207 9s. per head of a population numbering about 150,000 souls.

N.B.—For changes in tariff, see *Colonial Possessions, Tariff of*, annually presented to parliament.

All imported goods not included in the above mentioned list, to which duties are attached, and not specified in the free list will pay an ad valorem duty of 5 per cent.

*Free List.*—Animals (living), baggage of passengers, bags and sacks, viz. corn sacks, ore bags, wool-packs; books (printed), bullion and coin, coals, coke, and other fuel; corn and flour, manures, plants and trees, green fruit, seeds and roots, potatoes, garden seeds, viz. lucern, clover-tares, and such like; skins and hides (raw), specimens of natural history, tallow, wool, unsmelted ores, shooks, and staves.

*Customs Tariff on Exports by the Murray River.* Proclamations dated December 3, 1857, and November 17, 1858, fix the subjoined tariff and drawbacks on goods intended for consumption in Victoria or New South Wales, and which have been agreed on by the governments of the said colonies. It is prescribed that the duties specified in the tariff shall be levied upon any goods imported into South Australia, and intended for consumption in either of the said colonies, or waterborne upon the river Murray for exportation into either of the said colonies. The drawbacks will be allowed for any duties which may have been paid on any such goods in accordance with any tariff for the time being in force in South Australia.

ADEN. A town and seaport of Arabia Felix, in the province of Yemen. Lat. 12° 45' N.; long. 45° 3' E. It was captured in 1849, and has been attached ever since as an outlying possession under the government of Bombay. The territory consists of a mountainous peninsula connected with the main land by a narrow isthmus nearly covered in spring tides. There is a splendid harbour, and the port is free, there being no customs levied. The site is unrivalled as an entrepot for commerce. Light-vessel, south side of channel, inner harbour, moored in 21 feet. Lat. 12° 47' N., long. 45° 15' E. The light is fixed, it is seen seven miles in clear weather, and is 35 feet above high water. It fires a gun and burns a blue light on a vessel entering. It is said to be a very bad light. The trade has considerably increased under British management. Its military position is one of great importance, and the fortifications are unassailable by any native force. The climate may be considered healthy and agreeable, the seasons are divided into hot and cold, the former prevailing from April to October and the latter during the remainder of the year. Rain falls occasionally during December, January, February, and April. The trade of Aden amounted in 1863-64 to 1,478,988L, and in 1864-65 to 1,538,293L, showing an increase of 59,305L. This is nothing taking into consideration the article coal, which is supplied exclusively for the steamers plying at this port. The principal articles of import appear to be cotton, cotton and silk piece goods, grain, live-stock, metals, provisions, seeds, and tobacco. The chief articles of export are coffee, dyes, ostrich feathers, gum, hides and skins, ivory, pearls. The principal external trade is carried on with Africa, Arabia, and Persia, America, China, Calcutta, and

Country craft	715	27,011	686	25,402
Grand total	945	290,213	902	254,660

The principal places with which the country craft trade is carried on are Bombay, and Malabar, Africa, Red-Sea ports, Arabian and Persian Gulf.

**ADJUSTMENT.** In Commercial Navigation, the settlement of a loss incurred by the insured.

In the case of a total loss, if the policy be an *open* one, the insurer is obliged to pay the goods according to their *prime cost*; i.e. the invoice price, and all duties and expenses incurred till they are put on board, including the premium of insurance. Whether they might have arrived at a good or a bad market, is held by the law of England to be immaterial. The insurer is supposed to have insured a constant and not a variable sum; and in the event of a loss occurring, the insured is merely to be put into the same situation in which he stood before the transaction began. If the policy be a *valued* one the practice is to adopt the valuation fixed in it in case of a total loss, unless the insurers can show that the insured had a colourable interest only, or that the goods were greatly over-valued. In the case of all partial losses, the value of the goods must be proved.

'The nature of the contract between the insured and insurer is,' says Mr. Justice Park, 'that the goods shall come safe to the port of delivery; or, if they do not, that the insurer will indemnify the owner to the amount of the value of the goods stated in the policy. Wherever then the property insured is lessened in value by damage received at sea, justice is done by putting the merchant in the same condition (relation being had to the prime cost or value in the policy) in which he would have been had the goods arrived free from damage; that is, by paying him such proportion of the prime cost or value in the policy as corresponds with the proportion of the diminution in value occasioned by the damage. The question then is, how is the proportion of the damage to be ascertained? It certainly cannot be by any measure taken from the prime cost; but it may be done in this way: Where anything, as a hogshead of sugar, happens to be spoiled, if you can fix whether it be a third, a fourth, or a fifth worse, then the damage is ascertained to a mathematical certainty. How is this to be found out? Not by any price at the port of shipment, but it must be at the port of *delivery*, when the voyage is completed and the whole damage known. Whether the price at the latter be high or low, it is the same thing; for in either case it equally shows whether the damaged goods are a third, a fourth, or a fifth worse than if they had come sound; consequently, whether the injury sustained be a third, fourth, or fifth of the value of the thing. And as the insurer pays the whole prime cost if the thing be wholly lost, so if it be only a third, fourth, or fifth worse, he pays a third, fourth, or fifth, not of the value for which it is sold, but of the value stated in the policy. And when no valuation is stated in the policy, the invoice of the cost, with the addition of all charge, and the premium of insurance, shall be the foundation upon which the loss shall be computed.'

Thus, suppose a policy to be effected on goods,

the prime cost of which, all expenses included, amounts to 1,000*l.*; and suppose further, that these goods would, had they safely reached the port of delivery, have brought 1,200*l.*, but that owing to damage they have met with in the voyage, they only fetch 800*l.*; in this case it is plain, inasmuch as goods that would otherwise have been worth 1,200*l.* are only worth 800*l.*, that they have been deteriorated *one third*; and hence it follows, conformably to what has been stated above, that the insurer must pay one-third of their *prime cost* (1,000*l.*), or 333*l.* 6*s.* 8*d.*, to be insured.

In estimating the value of goods at the port of delivery, the *gross* not the *net* proceeds of the sales are to be taken as the standard.

A ship is *valued* at the sum she is worth at the time she sails on the voyage insured, including the expenses of repairs, the value of her furniture, provisions, and stores, the money advanced to the sailors, and, in general, every expense of the outfit, to which is added the premium of insurance.

When an adjustment is made, it is usual for the insurer to indorse upon the policy 'adjusted this loss at (so much) per cent., payable in a given time, generally a month, and to sign it with the initials of his name. This is considered as a note of hand, and as such is *prima facie* evidence of the debt not to be shaken, but by proving that fraud was used in obtaining it, or that there was some misconception of the law or the fact upon which it was made. See, for a further discussion of this subject, the article MARINE INSURANCE. Park *On the Law of Insurance*, ch. vi.; Marshall, book i. ch. xiv.

## ADMEASUREMENT. [TONNAGE.]

**ADMIRALTY COURT.** This court is strictly that of the lord high admiral of England. The judge is styled his lieutenant. Since, however, the office of lord high admiral has been in commission, the judge has been appointed by the crown, and possesses jurisdiction in all maritime cases, both of a civil and criminal nature.

The high court of admiralty was formerly held at St. Margaret's Hall in Southwark. During the plague of London it was held at Jesus College, Oxford, the principal of this society, Sir Leoline Jenkins, having been judge of the court. But at, or about, that time it was transferred to the common hall of Doctors' Commons. It is a court of great antiquity, and is said as early as 26 Edw. I. to have existed time out of mind. The rules by which it was governed were the ancient laws, customs, and usages of the seas, including such selections from the laws of Rhodes and Oleron, the Waterrecht of Wisbuy, the Hanseatic ordinances, the Consolato del Mare, the marine ordinances of Louis XIV. (1681), and others which from their natural justice and sound policy obtained generally in the admiralty courts of Europe. (Fitchard's *Digest*, Preface.)

In ordinary cases, the Court of Admiralty is said to be general, in prize cases it is known by the name of Instance Court, and is called into existence from time to time, and as occasion arises, by a special commission under the great seal, at the commencement of each year. Appeals in prize cases are by a recent Act referred to the Judicial Committee of Privy Council.

**ADVANCE**—implies money paid before goods are delivered, or upon consignment. It is usual with merchants to advance from a half to two-thirds of the value of goods consigned to them, on being required, on their receiving invoice, bill of lading, orders to insure them from sea risk, &c.

**ADVERTISEMENT.** In its general sense, any information as to any fact or circumstance that has occurred, or is expected to occur; but, in

a commercial sense, it is understood to relate only to intimations with respect to the sale of articles, the formation and dissolution of partnerships, bankruptcies, meetings of creditors, &c.

Previously to 1833 a duty of 3s. 6d. was charged upon all advertisements, long or short, inserted in the *Gazette*, or in any newspaper, or literary work published in parts or numbers. This duty added about 100 per cent. to the cost of ordinary advertisements, and having been in consequence much objected to, it was reduced in the above-mentioned year to 1s. 6d. We ventured, at the time, to predict that this reduction would not be productive of any very serious injury to the revenue, and the result did not disappoint our expectations. In 1832, the last year of the high duty, the advertisement duty amounted to 170,650*l.*, whereas in 1852 it amounted to 181,966*l.*; and though a large portion of this increase must be ascribed to the increase of population and of the demand for advertisements in the interval, still there is no room or ground for supposing that it would have been nearly so great but for the reduction of the duty. But notwithstanding its diminution, the tax was a serious obstruction to the diffusion of information useful to all classes, and especially indispensable to commercial men. And it was, at the same time, unfair and unjust. What could be more partial and oppressive than to impose the same duty on the notice of the publication of a sixpenny pamphlet, or of a servant out of place, as on the intimation of the sale of a valuable estate? And as it was quite impossible to obviate this injustice while the duty was maintained, its repeal, in 1855, was at once a wise and a popular measure.

The best evidence of the enormous increase of advertising since that year, will be found in the increase of newspapers, the advertisements in which are one of the main sources of their profits. It was estimated by a writer in the *English Encyclopædia* in 1859, that the number of advertisements in the United Kingdom amounted to upwards of 4,000,000 annually. Since that period, however, owing to the vast increase in the number of newspapers, periodicals, and other vehicles for advertisement, the numbers must be considerably in excess of that estimate. To these advertisements in newspapers and other printed publications should be added, the numerous notices at Railway stations, and other places of public resort.

**ADVICE.** It is usually given by one merchant or banker to another *by letter*, informing him of the bills or drafts drawn on him, with all particulars of date, or sight, the sum, to whom made payable, &c. Where bills appear for acceptance or payment, they are frequently refused to be honoured for *want of advice*. It is also necessary to give advice, as it prevents forgeries: if a merchant accept or pay a bill for the honour of any other person, he is bound to advise him thereof, and this should always be done under an *act of honour* by a notary public.

**AGAR-AGAR** (Ch. hui tsai, *sea vegetable*). This term includes all sorts of edible seaweed, the prepared agar-agar is called *liang tsai* or cooling vegetable; *shih hua tsai* is the name of large sorts of seaweed. Agar-agar is the Malay name for the marine alga (*Plocaria* [*Fucus*] *tenax*) growing on the rocky shores of the Malayan islands, from which a glutinous jelly is prepared for the table by boiling; the name is likewise given to the jelly, and something very similar to it is also made from other species of seaweed, and applied to many useful purposes. The bamboo framework of lanterns is covered with paper saturated with this gum, which when dried is semi-transparent; it is also used by the paper and silk manufacturers

as an ingredient in sizing some varieties of their goods. It is incomparable as a paste, and is, moreover, not liable to be eaten by insects. Over 150,000 piculs were imported into Shanghai alone in 1859, and the amount at other ports is not small; the average price there was 6 dollars per picul, but it is got for 1½ to 2 dollars at the south. Its cheapness and admirable qualities as a paste render it worthy the attention of manufacturers in other countries. (Williams's *Chinese Com. Guide*.)

**AGATE**, popularly **CORNELIAN** (Ger. achat; Dutch, achaat; Fr. agate; Ital. agata; Russ. agat; Lat. achates). A genus of semi-pellucid gems, so called from the Greek *ἀγάτης*, because originally found on the banks of the river of that name in Italy. It is never wholly opaque like jasper, nor transparent as quartz-crystal: it takes a very high polish, and its opaque parts usually present the appearance of dots, eyes, veins, zones, or bands. Its colours are yellowish, reddish, bluish, milk-white, honey-orange, or ochre-yellow, flesh-blood, or brick-red, reddish brown, violet blue, and brownish green. It is found in irregular rounded nodules, from the size of a pin's head to more than a foot in diameter. The lapidaries distinguish agates according to the colour of their ground: the finer semi-transparent kinds being termed oriental. The most beautiful agates found in Great Britain are commonly known by the name of *Scotch pebbles*, and are met with in different parts of Scotland, principally on the mountain of Cairngorm; whence they are sometimes termed Cairngorms. The German agates are the largest. Some very fine ones have been brought from Siberia and Ceylon. They are found in great plenty at the eastern extremity of the settlement of the Cape of Good Hope; and are still met with in Italy. But the principal mines of agate are situated in the little principality of Rajpepla, in the province of Gujrat, fourteen miles distant from the city of Broach, where they are cut into beads, crosses, snuff-boxes, &c. They are exported in considerable quantities to other parts of India, and to this country: and hence, perhaps, the jewellers' term *brooch*.

The German agates are principally obtained from the mines of Oberstein, at Gulgenberg. There are several varieties of the agate, the principal of which known in commerce are chalcodony, the colours of which are in parallel bands, the onyx, the cornelian, the mocha stone, which is procured from the East, the moss agate, the jasp and opal agates, the plasma or heliotrope, or blood stone, the chrysoloprase, the sarlonyx, and the chrysolite or peredox, or olwin. This stone being porous, its colours are frequently heightened by artificial means; the process was long kept a secret in the East, but is now commonly known in Germany and elsewhere. Chalcodony is capable of being coloured to imitate the turquoise.

**AGENT.** [FACITUR.]

**AGIO.** A term used to express the difference, in point of value, between metallic and paper money; or between one sort of metallic money and another.

**AL ROOT** (*Moriada citrifolia*). The varieties of the *Moriada* grow freely throughout India, Malacca, Borneo, and Java. The bark and root of the *Moriada citrifolia* are used in dyeing, and furnish the dye used principally in dyeing the Madras red turbans. The colours thus obtained are very permanent, and are of three shades, bright red, pink red, and light red. Mr. Dashwood states, 'The al root is cultivated in the Banda Purgunnah. The Hummerpoor district is the great producing country for al, probably from there being facilities for irrigation. The plants come to maturity in

three years into three fibres, 7 and then for the d equal to 10 pared fibr umbellata of India, cured from one of the colour the bright (Catalogue 1862.)

**ALABAMA** Fr. albâtre kind of stone this name seems and distinct from the variety The former ish colour, ing a pol very easily polish equ heavier than marble, but good Polish statues are common and best alabaster beautiful with France and tables, vases

three years. The roots are then dug up and sorted into three kinds, according to the fineness of the fibres. The fibres are then cut, beaten down well, and then ground to powder, which latter is used for the dye. The proportion of prepared fibre is equal to the raw material. The cost of the prepared fibre is 1 rupee per manud. The *Morinda umbellata* produces one of the commonest red dyes of India, called *mungkuu*. The best dye is procured from the bark of roots three years old. It is one of the commonest red dyes of India; though the colour is dull yet it is considered faster than the brighter tints obtained from other substances. (*Catalogue of Indian Department of Exhibition of 1862.*)

**ALABASTER** (Ger. alabaster; Ital. alabastro; Fr. albâtre; Russ. alabastir; Lat. alabastrites). A kind of stone resembling marble, but softer. Under this name are confounded two minerals, the *gypseous* and *calcareous* alabasters; they are wholly distinct from each other when pure, but in some of the varieties are occasionally mixed together. The former, when of a white or yellowish or greenish colour, semi-transparent, and capable of receiving a polish, is employed for statuaries. It is very easily worked, but is not susceptible of a polish equal to marble. Calcareous alabaster is heavier than the former; it is not so hard as marble, but is notwithstanding susceptible of a good polish, and is more used in statuary. The statuaries distinguish alabaster into two sorts, the common and oriental. Spain and Italy yield the best alabaster. That produced at Montania, in the papal states, is in the highest esteem for its beautiful whiteness. Inferior sorts are found in France and Germany. Alabaster is wrought into tables, vases, statues, chimney-pieces, &c.

**ALBANY.** The capital of the state of New York, and the second most important city of that state. Albany is situated on the west bank of the Hudson, and is distant about 145 miles north of New York city. Pop. in 1860, 62,367. Its position is well adapted for commerce, more particularly that of the lakes, with which it communicates by means of canals. It has also communications with New York, New England, Canada, and the west, by 6 railways. It is the seat of an immense timber trade, and also possesses a large commerce in wool, corn, barley, and manufactured tobacco. The Erie canal enters the city at the north end, where a capacious basin has been formed by erecting a pier more than a mile in length, which cuts off and encloses a part of a bend in the river, forming a basin having an area of 32 acres, which affords a safe winter harbour for boats and vessels navigating the river and canals, and also commodious wharfing.

**ALBANY.** [The port of West Australia. [FERRIL.] **ALCOHOL.** *Ardent Spirit* (Fr. esprit de vin; Ger. weingeist; Ital. spirito ardente, spirito di vino, alcool). The name given to the *pure spirit* obtainable by distillation, and subsequent rectification, from all liquors that have undergone the vinous fermentation, and from none but such as are susceptible of it. It is light, transparent, colourless; of a sharp, penetrating, agreeable smell; and a warm stimulating taste. It is quite the same, whether obtained from brandy, wine, whisky, or any other fluid which has been fermented. The specific gravity of alcohol when perfectly pure is nearly '838 at 30° Fahr., that of water being 1,000; but spirit of this strength cannot be obtained by mere distillation. Alcohol has not been frozen by any known degree of cold. It boils at 174°. It is the only dissolvent of many resinous substances; and is extensively used in medicine and the arts. (Drs. A. T. Thomson, Ure, &c.)

**ALDER.** The *Betula alnus* of botanists, a forest-tree abundant in England and most parts of Europe and N. America. The charcoal made from its wood is of an excellent quality, and is esteemed for the manufacture of gunpowder. The bark is sometimes used for tanning, and by the addition of coppers and other ingredients forms a dye for several colours. It thrives best in marshy grounds and on the banks of rivers. It rarely attains to a very great size; its wood is extremely durable in water or in wet ground; and hence it is much used for piles, planking, pumps, pipes, sluices, and generally for all purposes where it is kept constantly wet. It soon rots when exposed to the weather or to damp; and when dry, it is much subject to worm. The colour of the wood is reddish yellow, of different shades, and nearly uniform. Texture very uniform, with larger septa of the same colour as the wood. It is soft, and works easily. (Tredgold's *Principles of Carpentry.*)

**ALE AND BEER.** Well-known and extensively used fermented liquors, the principle of which is extracted from several sorts of grain, but most commonly from barley, after it has undergone the process termed malting.

1. *Historical Notice of Ale and Beer.*—The manufacture of ale or beer is of very high antiquity. Herodotus tells us, that owing to the want of wine, the Egyptians drank a liquor fermented from barley (lib. ii. c. 77). Xenophon during his retreat from Central Asia found it in use among the inhabitants of the Armenian Mountains. Mead, or metheglin, was probably the earliest intoxicating liquor known in the North of Europe. Ale or beer was, however, in common use in Germany in the time of Tacitus (*Morib. Germ.* c. 23). 'All the nations,' says Pliny, 'who inhabit the West of Europe have a liquor with which they intoxicate themselves, made of corn and water (*fruge nudida*). The manner of making the liquor is somewhat different in Gaul, Spain, and other countries, and it is called by many various names; but its nature and properties are everywhere the same. The people of Spain, in particular, brew this liquor so well that it will keep good for a long time. So exquisite is the ingenuity of mankind in gratifying their vicious appetites, that they have thus invented a method to make water itself intoxicate.' (*Hist. Nat. lib. xiv. ch. xxii.*) The Saxons and Danes were passionately fond of beer; and the drinking of it was supposed to form one of the principal enjoy-

ments of the heroes admitted to the hall of Odin. (Mallet's *Northern Antiquities*, ch. vi., &c.) The manufacture of ale was early introduced into England. It is mentioned in the laws of Ina, King of Wessex; and is particularly specified among the liquors provided for a royal banquet in the reign of Edward the Confessor. It was customary in the reigns of the Norman princes to regulate the price of ale; and it was enacted, by a statute passed in 1272, that a brewer should be allowed to sell two gallons of ale for a penny in cities, and three or four gallons for the same price in the country.

The use of hops in the manufacture of ale and beer seems to have been a German invention. They were used in the breweries of the Netherlands, in the beginning of the fourteenth century; but they do not seem to have been introduced into England till 200 years afterwards, or till the beginning of the sixteenth century. In 1530, Henry VIII. enjoined brewers not to put hops into their ale. It would, however, appear that but little attention was paid to this order; for in 1552 hop plantations had begun to be formed. (Beckmann's *Hist. Incent.* vol. iv. pp. 336—341. Eng. ed.) The addition of hops render ale more palatable, by giving it an agreeable bitter taste, while, at the same time, it fits it for being kept much longer without injury. Generally speaking, the English brewers employ a much larger quantity of hops than the Scotch.

The manufacture of malt liquors is by no means peculiar to this country. In 1865, a committee of three of the Brewers' Association of Philadelphia, inspected the breweries of Europe, and found that the consumption of beer was largely on the increase in, besides the United Kingdom, Belgium, Hesse Darmstadt, Nassau, Baden, Württemberg, Bavaria, Austria, Saxony, Prussia, Switzerland, France, Russia, Denmark, Sweden and Norway.

2. *Distinction between Ale and Beer or Porter.*—This distinction has been well elucidated by Dr. Thomas Thomson, in his article on Brewing, in the *Encyclopædia Britannica*: 'Both ale and beer are in Great Britain obtained by fermentation from the malt of barley; but they differ from each other in several particulars. Ale is light-coloured, brisk, and sweetish, or at least free from bitter: while beer is dark-coloured, bitter, and much less brisk. What is called *porter* in England is a species of beer; and the term '*porter*' at present signifies what was formerly called *strong beer*. The original difference between ale and beer was owing to the malt from which they were prepared. Ale malt was dried at a very low heat, and consequently was of a pale colour; while beer or porter malt was dried at a higher temperature, and had of consequence acquired a brown colour. This incipient charring had developed a peculiar and agreeable bitter taste, which was communicated to the beer along with the dark colour. This bitter taste rendered beer more agreeable to the palate, and less injurious to the constitution than ale. It was consequently manufactured in greater quantities, and soon became the common drink of the lower ranks in England. When malt became high-priced, in consequence of the heavy taxes laid upon it, and the great increase in the price of barley which took place during the war of the French revolution, the brewers discovered that a greater quantity of wort of a given strength could be prepared from pale malt than from brown malt. The consequence was that pale malt was substituted for brown malt in the brewing of porter and beer. We do not mean that the whole malt employed was pale, but a considerable proportion of it. The wort, of course,

was much paler than before: and it wanted that agreeable bitter flavour which characterised porter and made it so much relished by most palates. The porter brewers endeavoured to remedy these defects by several artificial additions. At the same time various substitutes were tried to supply the place of the agreeable bitter communicated to porter by the use of brown malt. Quassia, cocculus indicus, and we believe even opium, were employed in succession; but none of them was found to answer the purpose sufficiently. Whether the use of these substances be still persevered in we do not know; but we rather believe that they are not, at least by the London porter brewers.'

3. *Adulteration of Ale and Beer—Substitution of Raw Grain for Malt.*—The use of the articles other than malt, referred to by Dr. Thomson, has been expressly forbidden, under heavy penalties, by repeated Acts of Parliament. The Act 56 Geo. III. c. 58 has the following clauses:—

'No brewer or dealer in or retailer of beer shall receive or have in his possession, or make, or use, or mix with, or put into any worts or beer, any liquor, extract, calx, or other material or preparation for the purpose of darkening the colour of worts or beer; or any liquor, extract, calx, or other material or preparation other than brown malt, ground or unground, as commonly used in brewing; or shall receive, or have in his possession, or use, or mix with, or put into any worts or beer, any molasses, honey, liquorice, vitriol, quassia, cocculus indicus, grains of paradise, Guinea pepper, or opium, or any extract or preparation of molasses, honey, liquorice, vitriol, quassia, cocculus indicus, grains of paradise, Guinea pepper, or opium, or any article or preparation whatsoever for or as a substitute for malt or hops, upon pain that all such liquor, extract, calx, molasses, honey, vitriol, quassia, cocculus indicus, grains of paradise, Guinea pepper, opium, extract, article, and preparation as aforesaid, and also the said worts and beer, shall be forfeited, together with the casks, vessels, or other packages, and may be seized by any officer of excise; and such brewer or dealer in, or retailer of beer, so offending, shall for each offence forfeit 200*l.*

'No druggist or vender of or dealer in drugs, or chemist, or other person whatever, shall sell, send, or deliver to any licensed brewer or, or dealer in, or retailer of beer, knowing him to be so licensed, or reputed to be so licensed, or to any other person for, or on account of, or in trust for, or for the use of such brewer, dealer, or retailer, any colouring, from whatever material made, or any other material or preparation other than *unground brown malt*, for the purpose of darkening the colour of worts or beer; or any liquor or preparation heretofore or hereafter made use of for darkening the colour of worts or beer, or any molasses or other articles, as mentioned in the first section, for or as a substitute for malt or hops respectively; and if any druggist, or vender or dealer in drugs, or any chemist, or other person whatever, shall so do, all such liquor called colouring, and material or preparation for the purpose aforesaid, and liquor and preparation used for darkening the colour of worts or beer, molasses, and articles or preparation to be used as a substitute for malt or hops, shall be forfeited, and may be seized by any officer of excise; and the druggist, vender, dealer, chemist, or other person so offending, shall forfeit 500*l.*

By the Act 1 Wm. IV. c. 51, for the repeal of the ale and beer duties, it is enacted (s. 17) that no brewer shall have in his brewery, or in any part of his entered premises, or in any mill connected with

such brewer, grain; and shall be found in any such mixed, shall any officer, to in which such be contained, grain, and the same may tained; and offence forfeit 200*l.*

4. *Description of Ale and Beer.*—Previously to 1823 there were only two sorts of beer allowed to be brewed in England, viz. *strong beer*, that is, beer of the value of 16*s*. and upwards the barrel, exclusive of the duty; and *small beer* or beer of the value of less than 16*s*. a barrel, exclusive of the duty. In 1823, however, an Act was passed, (1 Geo. IV. c. 51) authorising the brewing, under certain conditions, of an *intermediate* beer. But this sort of beer was either not suited to the public taste, or, which is more probable, the restrictions laid on the brewers deterred them from engaging extensively in its manufacture.

This limitation and classification of the different sorts of ale and beer, according to their strength, originated in the duties laid upon them; and now that these duties have been repealed, ale and beer may be brewed of any variety or degree of strength.

The brewing of ale has long constituted a principal, or rather, perhaps, we might say the principal, manufacturing employment carried on in Edinburgh. The best Edinburgh ale is of a pale colour, mild, glutinous and adhesive. It is much stronger and more intoxicating than porter, from 4 to 5 bushels of malt being generally used in brewing a barrel of ale, with about 1 lb. of hops to a bushel of malt. At present (1853) the produce of the ale breweries of Edinburgh may be estimated at above 201,000 barrels a year. Very good ale is also made at Preston Pans, Allon, and other Scotch towns. Considerable quantities of Edinburgh ale are sent to London; though this trade has latterly been decreasing. Very good ale may be produced by brewers on a small scale, but it is doubtful whether this be the case with porter; at all events the best porter is all produced in very large establishments.

Formerly it was not supposed that really good porter could be made anywhere except in London. Of late years, however, Dublin porter has attained to high and not unmerited reputation; though we certainly are not of the number of those who consider it as nearly approaching to the best London porter.

Large quantities of a light, pale, and highly-hopped variety of ale have been for some considerable time past exported to the East Indies, where it is in high estimation; and it is now also very extensively used in summer in this country.

5. *Regulations as to the Manufacture of Ale and Beer.*—Since the abolition of the beer duties these regulations are very few and simple; and consist only in taking out a licence, entering the premises, and abstaining from the use of any article, other than malt, in the preparation of the beer. A brewer using any place, or mash-tun, for the purpose of brewing, without having made an entry thereof at the nearest excise office, forfeits for every such offence 200*l*.; and all the worts, beer, and materials for making the same together with the mash-tun, are forfeited, and may be seized by any officer.—Brewers obstructing officers for every offence forfeit 100*l*. (1 Wm. IV. c. 51, ss. 15, 16.)

6. *License Duties.—Number of Brewers.*—The license duties payable by brewers of ale and beer, and the numbers of such licenses granted during the year 1864-5 were as follows:—

*Account showing the Number of Licenses issued to Brewers in the Year 1864-5, with the Rates of Duty charged thereon (supplied by the Excise).*

N.B.—The barrel contains 36 gallons or 4 firkins of 9 gallons each, imperial measure. It is enacted (1 Wm. IV. c. 51, s. 7), that brewers shall pay their license duty according to the malt used by them in brewing, and that every brewer shall be deemed to have brewed *one* barrel of beer for every *two* bushels of malt used by such brewer.

It is enacted (1 Wm. IV. c. 51), that every person who shall sell any beer or ale in less quantities than four and a half gallons or two dozen reputed quart bottles, to be drunk elsewhere than on the premises where sold, shall be deemed a dealer in beer.

7. *Progressive Consumption of Ale and Beer.*—Malt liquor early became to the labouring classes of England what the inferior sorts of wine are to the people of France, at once a necessary of life and a luxury; the taste for it was universally diffused. There are, however, no means by which an estimate can be formed of the quantity actually consumed previously to the reign of Charles II. But duties, amounting to 2*s*. 6*d*. a barrel on strong, and to 6*d*. a barrel on small ale or beer, were imposed, for the first time, in 1660. These duties being farmed until 1684, the amount of the revenue only is known; and as there are no means of ascertaining the proportion which the strong bore to the small beer, the quantities that paid duty cannot be specified. But since the collection of the duty was entrusted to officers employed by government accurate accounts have been kept of the quantities of each sort of beer on which duty was paid, as well as the rate of duty and its amount. Now it appears, that at an average of the ten years from 1684 to 1693 inclusive, the amount of ale annually charged with duty was as follows:—

Strong ale	4,567,295	barrels.
Small do.	2,376,218	do.

Soon after the Revolution, several temporary duties were imposed on ale and beer: but in 1694 they were consolidated, the established duties being then fixed at 4*s*. 9*d*. a barrel on the strong, and at 1*s*. 3*d*. on the small beer, instead of 2*s*. 6*d*.

and 6d., which had been the rates previously to 1690. This increase of duty had an immediate effect on the consumption, the quantity brewed during the ten years from 1691 to 1703 being as follows:—

Strong ale	5,774,604 barrels.
Small do.	2,190,761 do.

The whole of this decrease must not, however, be ascribed to the increase of the beer duties only, the duty on malt and hops having been, at the same time, considerably increased, operated partly no doubt to produce the effect.

During the five years ending with 1750 the ale brewed amounted, at an average, to 3,803,580 barrels of strong, and 2,162,540 barrels of small. (Hamilton's *Principles of Taxation*, p. 255.)

The ale brewed in private families for their own use has always been exempted from any duty; and it may, perhaps, be supposed that the falling off in the consumption, as evinced by the statements now given, was apparent only, and that the decline in the public brewery would be balanced by a proportional extension of the private brewery. But though there can be no doubt that the quantity of beer brewed in private families was increased in consequence of the peculiar taxes laid on the beer brewed for sale, it is abundantly certain that it was not increased in anything like the ratio in which the other was diminished. This is established beyond all dispute, by the fact of the consumption of malt having continued *very nearly stationary*, notwithstanding the vast increase of population and wealth, from the beginning of the last century down to 1750, and, indeed, to 1830. [MALT.] Had the fact as to malt been different, or had the demand for it increased proportionally to the increase of population, it would have shown that the effect of the malt and beer duties had not been to lessen the consumption of beer, but merely to cause it to be brewed in private houses instead of public breweries; but the long continued stationary demand for malt completely negatives this supposition, and shows that the falling off in the beer manufactured by the public brewers had not been made up by any equivalent increase in the supply manufactured at home.

During the years 1787 to 1830 the tax levied on the barrel of strong beer varied. It was 8s. at the first mentioned date, was varied to 9s. 5d. in 1802, and to 10s. in 1804. It varied between 9s. to 9s. 10d. in 1826, and was finally repealed in 1830.

The gross amount of revenue received by the excise, varied little between 1801 and 1830, being about 3,000,000*l.* per annum.

The stationary consumption of malt and beer during the greater part of last century is, most probably, in great part ascribable to the introduction and rapid diffusion of a taste for tea and coffee, and to the consequent change that was effected in the mode of living of the middle and

upper classes. No doubt, however, the oppressive duties with which malt and beer were loaded in the latter part of last century and down to 1830 narrowed their consumption in an extraordinary degree. After various previous additions the duty on malt was raised in 1804 to 4s. 5d. per bushel, or 35s. 10d. a quarter, the beer duties being then also raised to 10s. per barrel (old measure); and as a quarter of malt produced about three or three and a half barrels of beer, it follows that the duty on malt used in breweries really amounted at that period to from 65s. 10d. to 70s. 10d. a quarter, making the duty on strong beer, exclusive of that on hops, about 20s. a barrel. The duty on malt continued at this exorbitant rate till 1816; and to show its influence it is only necessary to state that during the 12 years ending with 1816 the consumption of malt amounted to no more than 23,197,754 bushels a year, being, notwithstanding the vast increase of wealth and population in the interval, less than it had been a century previously, the consumption having amounted to 24,191,304 bushels a year during the twelve years ending with 1720! [MALT.] The duties had, in fact, been completely overdone; and besides hindering the consumption of malt and malt liquors, they had the mischievous effect of vitiating the public taste and stimulating the consumption of ardent spirits, especially of those made from raw grain. In 1816, however, the duty on malt was reduced to 2s. 5d. a bushel, and since 1823 it has amounted to 2s. 7d. a bushel, or 20s. 8d. a quarter; and the beer duty having been abolished in 1830, this has been the only duty with which malt liquor has since been affected. And though we are unable, from the want of subsequent returns, to state how much the consumption of beer has increased since 1830, the increase in the consumption of malt shows that it must be very considerable.

We subjoin—

An Account of the Quantities of Malt brewed by the Fourteen principal London Porter and Ale Brewers, during the 7 Years ending with 1852.

from their amount. They affected only that description of beer which was brewed for sale; and as all the higher classes brewed their own beer, the duty fell only on the lower and middle ranks of the community, and particularly the former. It is singular that a tax so grossly unequal and oppressive should have been so long submitted to.

But besides the obstacles to the consumption of beer arising from the oppressive duties with which it was burdened, the system formerly in force for granting licenses for its sale opposed obstacles that were hardly less formidable. Previously to 1830 no one could open a house for the sale of beer without first obtaining a license renewable annually from the magistrates; and as these functionaries were accustomed only to grant licenses to the occupiers of particular houses, the brewers naturally endeavoured, in order to ensure the sale of their beer, either to buy up those houses or to lend money upon them; and in many extensive districts a few large capitalists succeeded in engrossing most of the public houses, so that even the appearance of competition was destroyed, and a ready market and good prices secured for the very worst beer. We, therefore, look upon the abolition of the beer duties, and the granting of leave to all persons to retail beer on their taking out proper licenses, as highly advantageous measures. The conditions under which such licenses are taken out, and the sale of beer conducted, are fixed by the Acts 1 Wm. IV. c. 64, and the 4 & 5 Wm. IV. c. 85. Under the former the commissioners of excise, or other persons duly authorised, were bound to grant licenses, costing 2*l.* 2*s.* a year, to all persons not excepted in the act, empowering them to sell ale, beer, porter, cider, &c. to be drunk indifferently either on or off the premises. But in consequence of the complaints (whether well or ill founded it is now needless to inquire) of the increase and bad character of beer shops, the Act 4 & 5 Wm. IV. c. 85 makes the obtaining of a license to retail beer to be drunk on the premises contingent on the applicant being able to produce a certificate of good character, subscribed by certain persons rated at a certain amount to the poor; it also raised the cost of such license to 3*l.* 3*s.*, and reduced the cost of a license to sell beer not to be drunk on the premises to 1*l.* 1*s.* These licenses are now (1853) 6*l.*s. 13*d.* and 22*s.* 0*d.* We subjoin an abstract of the Acts.

*Persons applying for a License to sell Beer to be drunk on the premises, to deposit a Certificate of good Character, &c.*—Every person applying for a license to sell beer or cider by retail, to be drunk in the house or on the premises, shall annually produce to and deposit with the commissioners of excise, collector, or other person authorised to grant such license within the parish or place in which the person applying intends to sell beer or cider by retail, a certificate signed by 6 persons residing in and being and describing themselves to be inhabitants of such parish, place, &c., and respectively rated therein to the poor at not less than 6*l.*, or occupying a house therein rated to the poor at not less than 6*l.*, none of whom shall be maltsters, common brewers, or persons licensed to sell spirituous liquors or beer or cider by retail, nor owners or proprietors of any houses licensed to sell liquors, beer, or cider by retail, stating that the person applying for the license is of good character; and at the foot of such certificate one of the overseers of the parish, township, or place shall certify (if the fact be so) that such 6 persons are inhabitants respectively rated as aforesaid; and such certificate shall respectively be in the form of the schedule annexed to this Act: provided always, that in any parish, township, or district

maintaining its own poor, in which there are not 10 inhabitants rated to their relief to the amount of 6*l.* each or not occupying houses respectively rated to the poor at 6*l.* each (not being maltsters, common brewers, or persons licensed to sell spirituous liquors or beer or cider by retail), the certificate of the majority of the inhabitants of such parish, township, or district maintaining its own poor, as are rated to the amount of 6*l.* each, shall be deemed to be a sufficient certificate for the purposes of this Act. (4 & 5 Wm. IV. s. 2.)

*Penalty on Overseers.*—Any overseer who shall, without due cause, refuse to certify that the persons who have signed the certificate are respectively rated to the poor's rate as aforesaid to forfeit not more than 5*l.* (Sec. 3.)

*Beer drunk in sheds.*—Any person licensed under the Act 1 Wm. IV. c. 64 to sell beer, cider, &c. not to be consumed on the premises, who shall employ, permit, or suffer any person or persons to take or carry any beer, &c. from his house or premises, to be drunk or consumed for his benefit or profit, in any other house, tent, shed, &c. belonging to, or hired, used, or occupied by such licensed person, such beer, &c. shall be held to have been consumed on the premises, and the person selling the same shall be subject to the like forfeitures and penalties as if it had been actually drunk or consumed in a house or upon premises licensed only for the sale thereof. (Sec. 4.)

*Billeting.*—Provisions for billeting soldiers under Mutiny Acts to extend only to those licensed to sell beer or cider to be drunk in the house or on the premises, and not to extend to those licensed to sell beer not to be consumed on the premises. (Sec. 5.)

*Justices to regulate the Opening and Closing of Houses.*—Justices in petty sessions are authorised to fix the hours at which houses and premises licensed to sell beer under this Act shall be opened and closed; but any person thinking himself aggrieved by any such order may appeal at any time, within 4 months from its date, to the justices in quarter sessions, on giving the justices making the order 14 days' notice of his intention; and the decision of the justices in quarter sessions shall be final: provided, however, that the hour to be fixed for opening any house shall not in any case be earlier than 5 o'clock in the morning, nor for closing the same later than 11 o'clock at night, or before 1 o'clock in the afternoon on Sunday, Good Friday, Christmas Day, or any day appointed for a public fast or thanksgiving; and the hours so fixed by the justices, with reference to the districts within their jurisdictions, shall be taken to be the hours to be observed and complied with under this Act as fully as if the same had been specially appointed by it. (Sec. 6.)

*Constables, &c. to visit licensed Houses.*—All constables and officers of police are authorised to enter into all houses licensed to sell beer or spirituous liquors to be consumed upon the premises whenever they shall think proper; and if any person licensed as aforesaid, or any servant or person in his employ or by his direction, shall refuse to admit such constables, &c. into such house or premises, the person having the license shall for the first offence forfeit and pay any sum not exceeding 5*l.*, together with the costs of conviction, to be recovered within 20 days before 1 or more justices; and it shall be lawful for any 2 or more justices, upon any person being convicted of such offence for the second time, to adjudge (if they think fit) that such offender be disqualified from selling beer, ale, porter, cider, or perry, by retail, for 2 years after such conviction, or for such shorter space as they may think proper. (Sec. 7.)

**Penalty for making or using false certificates.**—Persons certifying any matter having reference to this Act as true, who know the same to be false, or using any certificate, knowing the same to be forged, shall, on conviction of such offence before 2 or more justices, forfeit and pay the sum of 20*l.*; and every license granted to any person making use of any certificate to obtain the same, such persons knowing such certificate to be forged, or the matters certified therein to be false, shall be void to all intents and purposes; and any person using such certificate shall be disqualified for ever from obtaining a license to sell beer or cider by retail. (Sec. 8.)

**No License to be granted without a Certificate.**—No license for the sale of beer or cider by retail to be consumed or drunk in the house or on the premises shall be granted, except upon the certificate hereby required: provided, that in all extra-parochial places the certificate required by this Act may be signed and given by inhabitants rated in the poor at 6*l.* in any adjoining parish or parishes. (Sec. 9.)

**Retailers to produce their Licenses on Requisition of 2 Magistrates.**—In case any complaint be laid before 2 justices against any licensed person for an offence against the tenor of his license, or against this Act or the Act 1 Wm. IV. c. 64, the said justices may require such person to produce his license before them for their examination; and if he shall fully neglect or refuse so to do, he shall forfeit for such offence any sum, not exceeding 5*l.*, the said justices shall think proper; and such person may be convicted, proceeded against, and dealt with for such offence in the same manner, *mutatis mutandis*, as is directed by the Act 1 Wm. IV. c. 64, with regard to persons guilty of a first offence against said Act; and the penalty imposed for such offence is to be applied in the manner that a penalty for a first offence against said Act is directed to be applied. (Sec. 10.)

**Continuance of Powers, &c.**—The powers, provisions, and penalties of 1 Wm. IV. c. 64, to apply to persons licensed under this Act, and to their sureties, &c. (Sec. 11.)

**Duties on Beer Licenses.**—There shall be paid upon the licenses hereby authorised to be granted the duties following; viz.

For and upon every license to be taken out by any person for the sale of beer by retail, not to be drunk or consumed in or upon the house or premises where sold, the annual sum of 1*l.* 1*s.*

For and upon every license to be taken out by any person for the sale of beer by retail, to be drunk or consumed in or upon the house or premises where sold, the annual sum of 3*l.* 3*s.* (Sec. 13.)

The duties to be under the management of commissioners of excise, and to be recovered and accounted for under the provisions of the Act 1 Wm. IV. c. 64. (Sec. 14.)

**Not to affect Duty on Licenses to retail Cider and Perry.**—Nothing in this Act shall affect the amount of duty payable under the 1 Wm. IV. c. 64, on licenses to retail cider and perry; but every such license shall specify whether it be granted for the sale of cider and perry by retail not to be drunk in the house or premises where sold, or for the retail of the same to be drunk in the house or premises where sold. (Sec. 15.)

**Licenses under this Act not to authorise Persons to sell Wine.**—No license granted under the Act 1 Wm. IV. c. 64 and this Act, shall authorise any person to take out or hold any license for the sale of wine, spirits, or sweets or made wines, or mead or metheglin; and if any person licensed under the Act 1 Wm. IV. c. 64 and this Act, shall permit

or suffer any wine, spirits, &c. to be brought into his house or premises to be drunk or consumed there, or shall suffer them to be drunk or consumed in his house or premises, he shall, over and above any excise penalties to which he may be subject, forfeit 20*l.* (Sec. 16.)

**Penalty on unlicensed Persons.**—Such persons selling beer and cider by retail to be drunk off the premises, 10*l.*; to be drunk on the premises, 20*l.* (Sec. 17.)

**Board over the Door.**—Every person licensed to sell beer, cider, or perry, by retail, under the authority of the Act 1 Wm. IV. c. 64 and this Act, shall, on the board required by the former Act to be placed over his door, paint and keep thereon, after the words 'licensed to sell beer or cider by retail,' the additional words, 'not to be drunk on the premises,' or 'to be drunk on the premises,' as the case may be, on pain of forfeiting the penalty imposed by such Act for not having such board over the door. (Sec. 18.)

**What is retailing of Beer, &c.**—Every sale of beer or of cider or perry, in any less quantity than 4½ gallons shall be deemed and taken to be a sale by retail. (Sec. 19.)

**Penalties for selling Spirits or Wine without a License.**—Persons licensed to sell beer or cider under the Act 1 Wm. IV. c. 64 and this Act, who sell spirits or wine, sweets, &c. without being licensed, are liable to the penalties imposed by the laws of excise for selling spirits or wine, sweets, &c. without license. (Sec. 20.)

**Certificate not to be required for Houses in certain Situations, if Population exceed 5,000.**—The before-mentioned certificate shall not be required as to any house situated within the cities of London and Westminster, or within any parish or place within the bills of mortality, nor within any city or town corporate, nor within the distance of 1 mile from the place used at the last election as the place of election or polling place of any town returning a member to parliament, provided that the population, determined according to the last parliamentary census taken in such city, town, &c. shall exceed 5,000, provided that no license for the sale of beer, ale, porter, cider, or perry by retail on the premises in the cities of London and Westminster, or in any parish within the bills of mortality, or in any such city or town corporate, or town returning a member to parliament as before mentioned, shall be granted after the 5th day of April, 1836, unless the house or premises specified as those in which beer or cider is intended to be sold shall be of the value of 10*l.* per annum. (Sec. 21.)

#### Form of Certificate referred to in Sec. 2.

We, the undersigned, being inhabitants of the parish [or township as the case may be] of \_\_\_\_\_ and respectively rated to the poor at not less than 6*l.* per annum, and none of us being maltsters, common brewers, or persons licensed to sell spirituous liquors, or being licensed to sell beer or cider by retail, do hereby certify, That A. B., dwelling in \_\_\_\_\_ street [here specify the street, lane, &c.] in the said parish [or township, &c.] is a person of good character.

[Here insert the day of signing the certificate.]

## C. D.

[Overseer of the parish or township, &c.]  
Date

In addition to the above the following clauses of the Act 1 Wm. IV. c. 64, are still in force:—

Persons trading in partnership and in one house shall not be obliged to take out more than one license in any one year, provided also, that no one license shall authorise any person to sell beer, in any other than the house mentioned in such license. (Sec. 10.)

In cases of riot or expected riot or tumult, every person licensed under this Act, and keeping any house situate within their jurisdictions, shall close his house at any time which the justice or justices shall direct; and every such person who shall keep open his house at or after any hour at which such justices shall have so ordered or directed such house to be closed, shall be deemed to have not maintained good order and rule therein, and to be guilty of an offence against the tenor of his license. (Sec. 11.)

Every person licensed to sell beer by retail, shall sell (except in quantities less than a half pint) by the gallon, quart, pint, or half-pint measure, sized according to the standard; and in default thereof, he shall for every such offence forfeit the illegal measure, and pay not exceeding 4*s.*, together with the costs of the conviction, to be recovered within thirty days next after that on which such offence was committed, before two justices; such penalty to be over and above all penalties to which the offender may be liable under any other Act. (Sec. 12.)

Every seller of beer by retail, having a license under this Act, who shall permit any person to be guilty of drunkenness, or disorderly conduct, in the house mentioned in such license, shall forfeit the sums following: for the first offence, not less than 4*s.* nor more than 5*l.*, as the justices, before whom such retailer shall be convicted, shall adjudge; and for the second offence, any sum not less than 5*l.* nor more than 10*l.*; and for the third offence, any sum not less than 20*l.* nor more than 50*l.*; and it shall be lawful for the justices, before whom any such conviction for such third offence shall take place, to adjudge, if they shall think fit, that such offender shall be disqualified from selling beer by retail for the space of two years next ensuing such conviction, and also that no beer shall be sold by retail by any person in the house mentioned in the license of such offender; and if any person so licensed shall, knowingly, sell any beer, ale, or porter, made otherwise than from malt and hops, or shall mix, or cause to be mixed, any drugs or other pernicious ingredient with any beer sold in his house, or shall fraudulently dilute, or in any way adulterate, any such beer, such offender shall for the first offence forfeit not less than 10*l.* nor more than 20*l.*, and for the second such offence such offender shall be adjudged to be disqualified from selling beer, ale, or porter, by retail, for the term of two years, or to forfeit not less than 20*l.* nor more than 50*l.*, and shall be subject to a like penalty at every house where he shall commit such offence; and if any person shall during any term in which it shall not be lawful for beer to be sold by retail on the premises of any offender, sell any beer by retail on such premises knowing that it was not lawful to be sold, such offender shall forfeit not less than 10*l.* nor more than 20*l.*; every person suffering the conditions of the license to be infringed to be deemed guilty of disorderly conduct. (Sec. 13.)

Retailers' houses not to be open before four in the

morning, nor after ten in the evening: nor between the hours of ten in the forenoon and one in the afternoon, nor at any time between the hours of three and five in the afternoon on any Sunday, Good Friday, Christmas-day, or any day appointed for a public fast or thanksgiving: and any person offending herein shall forfeit 40*s.* for every offence; every separate sale to be deemed a separate offence. (Sec. 14.)

All penalties under this Act, except for selling beer by any person not duly licensed, shall be recovered, upon the information of any person before two justices in petty sessions; and every such penalty shall be prosecuted for within three calendar months next after the offence; and every person licensed under this Act, who shall be convicted before two justices, shall, unless proof be adduced to the satisfaction of such justices that such person had been theretofore convicted before two justices, within the space of twelve calendar months next preceding, be adjudged by such justices to be guilty of a first offence against this Act, and to forfeit and pay any penalty by this Act imposed for such offence, or if no specific penalty be imposed, then any sum not exceeding 5*l.*, together with the costs of the conviction; and if proof be adduced to the satisfaction of such justices that such person had been previously convicted, within the space of twelve calendar months next preceding, of one such offence only, such person to be adjudged guilty of a second offence against this Act, and to forfeit and pay any penalty by this Act imposed for such offence, or if no specific penalty be so imposed, then any sum not exceeding 10*l.*, together with the costs of conviction; and if proof shall be adduced that such person had been previously convicted, within the space of eighteen calendar months next preceding, of two such separate offences, and if proof be adduced that such person so charged is guilty of the offence charged against him, such person shall be adjudged to be guilty of a third offence against this Act, and to forfeit and pay any penalty imposed by this Act, in respect of such offence, or if no such specific penalty shall be imposed, then to forfeit and pay the sum of 50*l.*, together with the costs of conviction. (Sec. 15.)

The party, convicted of any such third offence, may appeal to the general sessions, or quarter sessions then next ensuing, unless held within twelve days after conviction, and in that case, to the then next subsequent sessions; and, in such case, the party convicted shall enter into a recognisance, with two sureties personally to appear at the said general or quarter sessions, to abide the judgment of the court; and to pay such costs as shall be by the court awarded; or, in failure of the party convicted entering into such recognisance, such conviction shall remain good and valid; and the said justices who shall take such recognisance are also required to bind the person who shall make such charges to appear at such general or quarter sessions, then and there to give evidence against the person charged, and, in like manner, to bind any other person who shall have any knowledge of such offence; and it shall be lawful for the said general or quarter sessions to adjudge such person to be guilty of such third offence against this Act, and such adjudication shall be final; and it shall be lawful for such general or quarter sessions to punish such offender by fine, not exceeding 100*l.* together with the costs of such appeal, or to adjudge the license to be forfeited, or that no beer be sold by retail in the house for the term of two years, and if such license shall be adjudged to be forfeited, it shall henceforth be void; and whenever, in such case, the license of such offender shall be adjudged to be void, such offender shall be deemed incapable

of selling beer, ale, or porter, by retail, in any house, kept by him, for the space of two years, to be computed from the time of such adjudication; and any license granted to such person during such term shall be void. (Sec. 16.)

In default of payment of penalties, proceedings may be had against the sureties. (Sec. 19.)

Any person summoned as a witness who shall neglect or refuse to appear, and not make such reasonable excuse for such neglect, &c., as shall be admitted by such justices of sessions, or who, appearing, shall refuse to be examined, shall, on conviction, forfeit not exceeding 10*l.* (Sec. 20.)

Offenders refusing or neglecting, within seven days after conviction, to pay the penalty imposed, and any costs assessed, such justices may issue their warrant to levy the amount by distress and sale, together with the costs of distress and sale; and in every such case, such offenders, if in custody, shall be forthwith discharged; but if the goods and chattels are not sufficient, such justices may commit the offender to the common gaol or house of correction for not exceeding one calendar month, if the penalty shall not be above 5*l.*; for not exceeding three calendar months, if the penalty shall be above 5*l.* and not more than 10*l.*; and for not exceeding six calendar months, if the penalty shall be above 10*l.*; provided, that whenever such offender shall pay to the gaoler or keeper, or to whomsoever such justices shall have appointed, the penalty and costs, together with all the costs of apprehension and conveyance to gaol, at any time previous to the expiration of the time for which such offender shall have been committed, such offender shall be forthwith discharged. (Sec. 21.)

No conviction under this Act, nor any adjudication made upon appeal therefrom, shall be quashed for want of form, nor removed by *certiorari*. (Sec. 27.)

Every action against any justice, constable, or other person, for anything done in execution of his duty under this Act, to be commenced within three calendar months, and not afterwards; and if any person be sued, he may plead the general issue, and give the special matter in evidence. (Sec. 23.)

This Act not to affect the two universities, nor the vintners' company in London; nor to prohibit the sale of beer at fairs, as heretofore.

11. *Scotch Ale and Beer Duties.*—The duties on ale and beer in Scotland have been for a lengthened period the same as in England.

At the union in 1707, the English duties on ale and beer were introduced into Scotland. But besides strong and small beer, the Scotch had an intermediate species, which they called *two-penny*, and which was their favourite beverage. The duty on this description of beer was fixed at the union at 2*s.* 1*d.* a barrel. For thirty years after its imposition, the quantity of two-penny that paid duty was always above 400,000, and sometimes exceeded 500,000 barrels a year. But in 1760 the duty on two-penny was increased to 3*s.* 4*d.*, and the consumption immediately fell off to between 100,000 and 200,000 barrels! The quantity that paid duty in 1800 amounted to 143,803 barrels. The manufacture of this species of beer ceased entirely in 1802.

*The Exportation of Beer and Ale*—has increased very rapidly of late years, and has become an important branch of our foreign trade. It was checked for a while by the difficulty of fixing a drawback proportioned to the duty on the malt and sugar employed in the manufacture. Down to 1817 only two rates of drawback were allowed, viz. 5*s.* per barrel if 2 bushel malt had been used to the barrel, and 7*s.* 6*d.* if 3 bushels were used. But since this epoch the mode of ascertaining the drawback has

been greatly improved, and no fewer than seven different rates, varying by  $\frac{1}{2}$  bushel each, are now allowed. The result of these and other changes has been, that whereas only 177,999 barrels were exported in 1850, the exports amounted in 1864-5 to 582,583 barrels, of the declared value of 2,148,326*l.* We subjoin

*An Account of the Exports of Ale and Beer, in Barrels, for the ten years 1856-65.*

1856	-	-	410,352	1861	-	-	378,161
1857	-	-	435,354	1862	-	-	461,827

1859	-	-	611,156	1864	-	-	493,981
1860	-	-	534,827	1865	-	-	561,566

The chief consumption of British ale and beer is in Australia and British India, to which countries more than 60 per cent. of the exports are sent.

ALEXANDRIA. So called from its illustrious founder, Alexander the Great. The principal seaport of Egypt, on the coast of the Mediterranean, about 14 miles W.S.W. of the Canopic mouth of the Nile; the lighthouse being in lat. 31° 11' 43" N., long. 29° 51' 40" E. The light, which is fixed, is visible 20 miles in clear weather. The situation of this famous city was admirably chosen. Until the discovery of the route to India by the Cape of Good Hope, Egypt formed the centre of the commerce between the eastern and western worlds; and Alexandria was placed in the most favourable position in Egypt for an emporium, being the only port on its northern coast where there is, at once, deep water, and security for shipping throughout the year. The ports of Rosetta and Damietta, the former on the west, and the latter on the eastern arm of the Nile are both difficult of entrance, each having a bar, upon which there is always a dangerous surf. Ships bound for Alexandria avoid this serious inconvenience; and by means of an artificial navigation, stretching from the city to the western branch of the Nile, it has almost the same facilities for internal navigation that are enjoyed by the cities referred to.

It may be proper, however, to mention that this artificial communication with the Nile has not always been open. It existed in antiquity, but fell into decay during the barbarism of more modern times. After being shut up for some centuries, it was reopened by Mehemet Ali, who dug the Mahmoudieh canal from Alexandria to Atfeh on the Nile, about 27 miles above Rosetta. This important work is 44 miles in length, 90 feet in breadth, and from 15 to 18 feet deep. It was opened in 1819, but owing partly to the nature of the ground, partly to some defects in its construction, and partly to the mud deposited by the water of the Nile, it is difficult to keep in repair; and can only be navigated by boats that draw little water, and are not suitable for the navigation of the Nile. But, with all its defects, the construction of this canal has been of great advantage, not to Alexandria only, but to Egypt and even Europe. Now (1859), however, that a railway has been constructed from Alexandria to Cairo, the canal has become of less importance.

*Ports, &c.*—The ancient city was situated a little more inland than the modern one, opposite to the small island of Pharos, on which was erected the lighthouse, so celebrated in antiquity. (Caesar, *De Bello Civili*, lib. iii. c. exii.) This island was, partly by artificial means, and partly by natural causes, gradually joined to the land by a mound, and on this the modern town is principally built. The isthmus and island have now the form of a T, its head being N.E. and S.W. A square castle or tower, built on a small islet or

rock, at the extremity of a mole projecting from the north-east angle of the city, is still called the Pharos, and may, perhaps, occupy the site of the ancient lighthouse: a light was exhibited on it down to 1842, when it ceased. On each side of which there is a port. That on the western, or African side, called the Old Port, the *Ecnastos* of the ancients, is by far the larger and better. It stretches from the town westwards to Marabout about 6 miles, and is about  $\frac{1}{2}$  mile in width. It is bounded on the north partly by the western tongue or angle of the island on which the city is partially built, at the extremity of which is the new lighthouse, and partly by rocks and sand banks. It has three entrances. The first, or that nearest the city, having 17 feet water, is about 13 miles S.W. from the lighthouse; but it is too narrow and difficult to be attempted by any one not thoroughly acquainted with the port. The *eastern* side of the second or middle entrance is marked by buoys which lie about  $2\frac{1}{2}$  miles S.W. from the lighthouse; it is about a quarter of a mile wide, and has, where shallowest, 27 feet water. The third or western entrance has its *western* boundary within about three-eighths of a mile from the east end of Marabout island; it is about half a mile wide, and has from 25 to 27 feet water in its shallowest places. This last is the best entrance. Ships, when in, may anchor close to the town in from 22 to 40 feet water, and there is good anchorage in deep water all along the shore. Foreigners were formerly excluded from this port; but this prohibition no longer exists, and it is now principally resorted to by the shipping frequenting the port.

What is called the New (though it be really the oldest) or Asiatic harbour is on the eastern side of the town. A rock called the Diamond lies a little to the east of the Pharos tower; and ships entering the port ought to have this rock about a cable's length on the right. If they get much further to the left they will come in contact with a shoal which stretches westward from the Pharos, or little tower, on the east side of the Pharos. The water immediately within the port S.W. from the Pharos is from 30 to 40 feet deep; but the space for anchorage is very limited, and is exposed to the northerly gales; and the ground being foul and rocky, hempen cables are very apt to chafe, and several accidents have happened in consequence to ships unprovided with iron cables. Ordinary tides rise 2 feet; but during the overflow of the Nile the rise is 4 feet. Variation  $13^{\circ}$  west. (See *Plan of Alexandria*, by Lieut. Falbe.)

*Lighthouse*.—The new lighthouse, on the most westerly point of the island (an. *Pharos*), on which the city is partly built, was erected in 1812. It exhibits a fixed light, elevated 180 feet above the level of the sea, and is visible in clear weather at a distance of nearly 20 miles. This light must, of course, be kept on the left by those entering the great or western harbour, and on the right by those entering the small or eastern harbour. We may mention that a British vessel was totally lost in attempting to enter the W. harbour by a chart which identified the lighthouse with the old tower at the entrance to the E. harbour. But the light on the latter has, as already stated, ceased to be exhibited since 1812, and all charts should be corrected accordingly.

*Ancient and Modern City*.—Under the Ptolemies and Romans, Alexandria was the first commercial city in the world. It suffered greatly by its reduction by the Saracens in 640; but it continued to be a place of considerable commercial importance till the despotism of the Mamelukes and

Turks, and the discovery of the route to India by the Cape of Good Hope, completed its ruin. Under the Ptolemies, the population is believed to have amounted to about 300,000, and the city was adorned by a vast number of magnificent structures. The population in 1863, including troops and artisans in the arsenal, was estimated at 150,000. The rapid increase, which is still going on, dates from the opening of the Mahmoudieh canal. The appearance of the modern town used to be most unpromising. It may be justly said, that in the new city of Alexandria we find a poor orphan, whose sole inheritance has been the venerable name of his father. The vast extent of the ancient city contracted in the new to a little neck of land between the two ports. The most superb temples are changed into plain mosques; the most magnificent palaces into houses of a bad structure; the royal seat is become a prison for slaves; and a number of foreign traders, and to a small number of people have given way to a multitude of wretches, that are the servants of those on whom they depend: a place, formerly so famous for the extent of its commerce, is no longer anything more than a mere place of embarking; in time, it is not a phoenix that revives from its own ashes; it is, at most, a reptile, sprung from the dirt, dust, and corruption with which the Alcoran has infected the whole country. (Norden's *Travels*, Eng. trans. 8vo. ed. p. 57.) But this striking description, though accurate at the time when it was written (1737), is quite inapplicable to the present state of the city. The vigorous government of Mehemet Ali and his successors, by introducing comparative security and good order into Egypt, revived the commerce of Alexandria, which has again become a place of great importance in the trading world. Many new warehouses and other buildings have been constructed; and its appearance much improved.

*Trade of Alexandria*.—The imports consist of cotton stuffs and yarn, iron and hardware, copper plate and plated ware, machinery, coal, ammunition, books, &c. principally from England; with woollen and silk manufactures; timber, corlidge, indigo and other dyeing materials, sugar, glass, &c. The exports consist principally of raw cotton; wheat, beans, barley and maize; linseed and flaxseed; gum arabic and other gums; wool; scum, and other drugs; ivory and tortoiseshell; nitre, with opium, pearls, dates, soda, ostrich feathers, linen cloth, coffee, and a great variety of minor articles. It may be necessary to bear in mind that the nominal greatly exceeds the real exports and imports, on account of the many articles, especially bullion and silk, that pass through Egypt *in transitu*, from the W. to the E. and conversely. The exports of grain and pulse declined for a while in consequence of the superior encouragement given by the government to the raising of cotton; but they still largely increased. Latterly, the impulse given to the cultivation of cotton, consequent on the American war, and the extension of corn supply to America, have reduced the Egyptian corn trade to a minimum. At present the chief exports of Egypt are cotton and silk. On the whole the trade has considerably increased of late years, and may be said to be in a flourishing condition.

Cotton has been grown in Egypt from a very remote period; previously, however, to the ascendancy of Mehemet Ali it was but little cultivated, and that little was of inferior quality, short-stapled, and closely resembled 'Surats,' under which name the small quantities exported from the country were usually sold. But, in 1820, a Frenchman

of the name of Jumel accidentally observed a very valuable variety of long-stapled cotton, raised from seeds brought from Dongola and Sennar, growing in the garden of Mahé Iley at Cairo, Jumel having represented its superiority to the Pacha, its cultivation was undertaken on a large scale on account of the latter; and has succeeded so well, that Mahé or Makko cotton has been for a lengthened period by far the principal article of export from Egypt. At a later period seeds of the Sea-island cotton were introduced; and for a while it also answered remarkably well; its produce, which in Egypt was called Sennar, and in England 'Egyptian Sea-island,' ranking next in the estimation of the manufacturers to genuine 'sea-island.'

The course of the Egyptian cotton trade has been peculiar. The reader will find the amount imported from Egypt in the following page. In 1866, the supply from Egypt fell to 636,000 cantars, after a fluctuation from 365,108 cwts. in 1861, to 1,578,912 cwts. in 1865.

N.B.—The gross weight of a bale of Egyptian cotton at Alexandria averages 230 rottoli or 228.7 lbs.; and allowing 12 rottoli as tare for sacking and cordage, the net weight of the bale will be about 219 lbs. The cantar of cotton was fixed in 1836 at 100 rottoli. Exclusive of the cotton shipped from Egypt, about 30,000 cantars a year are supposed to have been annually wrought up in the Pacha's cotton factories at an average of the 10 years ending with 1838; but owing to the failure of most of these establishments, the quantity is now much less. (See the valuable

Treat of George R. Gliddon, Esq. *On the Cotton of Egypt.*)

We doubt, however, whether the encouragement given to the culture of cotton has not been really injurious to Egypt. At all events, we apprehend that the cotton of that country will have great difficulty in finding a profitable vent in the European markets in competition with American cotton, considering the extremely low price at which the latter can be sold. We have alluded to the degeneracy of the Sea-island cotton in Egypt, and it is alleged that the Mahé is also degenerating. But in the culture of wheat, beans, barley, and rice, Egypt has nothing to fear from any rivalry. In this department of industry she is, if not superior to every other country, inferior to none. In 1858 we imported 341,360 cwts. of cotton from Egypt; our imports being usually about two-thirds of the entire exports.

The fact that any great change in that which has been the staple product of Egypt, viz. wheat and other kinds of grain, for common, a precarious crop, to be sent to a precarious market, would be a serious evil, has been anticipated by the viceroy, when he told Dr. Forbes, who was sent on the part of the Cotton Supply Association to beg the viceroy to further the cultivation of cotton, that prices would be a sufficient stimulus, and that he depreciated the change. The anticipation was verified, for of late years, Egypt has had to import grain, &c. for the subsistence of her people.

We subjoin an account which shows the principal articles, and their estimated values, exported from Alexandria in 1866.

Exports from Alexandria, 1866.

Constantinople and the islands of the Archipelago are great markets for the wheat and other grain exported from Egypt. The supplies are, however, extremely uncertain. Everything in Egypt depends on the Nile; and when it does not rise to the usual height, the crops are very much below an average. Beans are extensively cultivated, and have sometimes been brought to England, but rarely, if ever, with advantage to the importers. They are inferior to English beans, and are peculiarly subject to the worm. No oats are raised in Egypt, the horses being entirely fed upon barley. Silk is grown to some extent. The date-palm thrives in every part of Egypt, and the fruit is largely exported. It is singular, that notwithstanding the luxuriance of many of its vegetable productions, Egypt should be entirely destitute of timber.

Money.—Here, as at Constantinople, the current money consists in part of new gold and silver coins of 100, 50, 20, 10, and 5 piastres; and in part also of a great variety of European coins.

Accounts are kept in piastres of 40 paras or medins. Considerable sums are reckoned by the *his* or purse of 500 piastres. The exchange with England is generally about 100 piastres to 1*l*.

Weights and Measures.—The yard, or *pik*, = 26.8 English inches; hence 100 *piks* = 73.438 English yards. The measures for corn are the *rhubeh*, and the *quillat* or *kisloz*; the former = 4.364 English bushels, the latter = 4.729 ditto. The *cantar* or *quintal* = 100 rottoli, but the rottoli has different names and weights: 1 rottoli *forjara* = 93.47 lb. avoirdupois; 1 rottoli *zaidino* = 133.5 lb. ditto; 1 rottoli *zauro* or *zuro* = 2.97 lbs. ditto; 1 rottoli *mina* = 1.67 lb. ditto. (*Manuel Universel de Nelkenbrecher.*)

Duties.—With the exception of the arbitrary principles on which the government sometimes fixes the prices of commodities, there is nothing objectionable in their policy as to commerce. The duties on imports are only 3 per cent. We believe, however, that a small increase of the customs duty would compensate the government for the

abolition of other oppressive charges, and there can be little doubt that the country would be materially benefited by the change.

**Pilotage.**—The pilotage paid by ships of war for being brought into the W. harbour is 5 dollars, and 4 dollars for being taken out of do. Merchant-vessels pay 3 dollars both on entering and clearing. The pilot-service, though not exempted from defects, is tolerably well conducted. It would be convenient were pilots stationed nearer the entrance of the port, at Marabout Island for example, or at the watering-place.

**Quarantine.**—Merchant-vessels coming with foul bills of health perform 15 days' quarantine, whether with or without cargo. When the bills are 'suspected,' the quarantine is 15 days, if with cargo, and 10 days if in ballast. But a vessel may be admitted to free-pratique 10 days after the total discharge of her cargo. The period of quarantine for goods is 20 days. Ships of war, bringing foul bills, perform 12 days; with 'suspected' bills, 7 days.

The quarantine charges are—

- For 2 guards, 10 piast. each per diem, and board.
- For guard boat, 15 piast. per diem.
- For disinfecting goods, 1 to 15 piast. per bale, according to size.
- For dues, 1 to 35 piast. per diem, according to tonnage.
- For the interrogatory, from 2 to 20 piast. according to tonnage.
- Bills of health for vessels bound to the Levant, 1 to 21 piast. according to size of vessel.

Travellers in Lazaretto pay for the guard 10 piast. per day, and 15 piast. for the whole term, as rent of room, and price of fumigations.

**Usages of the Port.**—The general usage of the port in loading and unloading vessels, when no clause of the charterparty exists to the contrary, is that inward cargoes are landed into the Custom-house, at the ship's expense. As regards outward cargoes, cotton is taken from the Shoona (warehouse) at the cost of the merchant, and is delivered to the shipmaster on the quay. The charges for portage, marking, sacking and commission, come to 1½ piast. per bale. The ship's subsequent outlay for pressing, lighterage, stowage, &c. is 7½ or 8 piast. per bale.

Corn seeds, &c. are shipped at the charge of the merchant, at the cost of 27 paras per ardeb.

Flax is delivered by the merchant on the quay, and his outlay is much the same as on cotton. This article is not pressed, and the ship's expenses for lighterage and stowage are about 2 piast. per bale.

The charge of lighters is 9 or 10 piast. per diem. Arabs working on board in stowing, &c. are paid 6 piast. per do.

It often occurs that lighters left in the charge of vessels whilst loading meet with injury. In that case the Arab owners apply against the master, and recover.

Most cargoes of corn, &c. are taken from the Pacha's Shoona, and a clause in the charterparties generally obliges the ship to conform to its distribution. That is effected by the receivers being classed and drawing lot for priority.

There is a time claimed against vessels that discharge their ballast into the harbour, instead of causing it to be taken on to a place appointed.

The following are the charges on business at Alexandria:—

### On Selling.

	per cent.
Freights, 20s. to 20s. per ton of 10 feet, and 10s. primage, say	2-3
Customs duties	5
Porterage and camel hire, piast. 12 to 15 per package.	
Shroffage	1
House and street brokerage	4
Commission for effecting sale	3
Ditto for attending sale	2
Ditto if proceeds are remitted by bill or in specie exclusively of 1 per mil. brokerage	5
Del. Credits, if required	3
Warehouse rent	1

### On Buying.

Customs duties	12
House and street brokerage	4-1
Commission on purchasing	5
Commission on drafts	3
Brokerage 1 per mil. on ditto	

Warehouse rent never incurred on government produce, which is shipped from the Shoona. When other produce is stored, the rent depends on the time and on the bulk of the goods. Shipping charges:—

- On Government cotton, piast. 1½ per bale.
- Private ditto, 1 piast. 30 paras, do.
- Government corn, 27 paras per ardeb.
- Private ditto, piast. 2 per ardeb.
- Government flax, piast. 1½ per cent.
- Private ditto, piast. 2 per cent.
- Gums, barrels, 18 to 19 piast.
- Other charges, 1 piast. 20 paras.

**Policy of Mehemet Ali.**—It is much to be regretted Mehemet Ali, who was in many respects one of the most extraordinary men of his age, should have had no just conception of the principles by the adoption of which his plans of improvement might have been perpetuated, and industry established on a solid foundation. He interfered with everything, and left as little as possible to the discretion and enterprise of individuals. He may, indeed, be said to have been the sole proprietor, manufacturer, farmer-general, and wholesale merchant in his dominions. It was no doubt stipulated in the treaty concluded between this country and the Turkish government in 1838, that the monopolies which previously existed in the different parts of the Turkish empire should all be abolished, and that, in future, all parties should be at liberty to buy and sell all descriptions of produce at such prices and in such a way as they thought fit. This stipulation has, however, been of little consequence in Egypt; for as the largest and best portion of the land has become the property of the Pacha or his dependents, and the taxes are mostly all paid in produce, the government continues, in effect, in possession of its old monopoly of the produce of the country, and has power to determine the price at which it shall be sold. A system of this sort is injurious alike to the interests of the producers and merchants; inasmuch as they are both liable to have their plans and speculations deranged by the caprices and regulations of those in authority. It is difficult, however, to suggest any means by which this inconvenience might be avoided; and it is much to be regretted that, when the European powers dictated the terms on which the Pacha and his family should hold the country, they did not make some stipulations in favour of the rights of the population; which, had they been properly devised, would have been as much for the advantage of the Pachas as of their subjects.

**Ancient Trade of Alexandria.**—As already remarked, Alexandria was, for a long series of years—first under the Greek successors of Alexander, and subsequently under the Romans—the principal entrepôt of the ancient world. Most part of the traffic between Asia and Europe that had at a more early period centred at Tyre, was gradually diverted to this new emporium. An intercourse

between and those subsisted Egypt an carried on Red Sea along the Rasselgat India near was the co Ptolemies been annexed commande having obs winds, ven from the S Atlantic O a prosperous part of In Malabar co of Indian p with the ecovery was the name of which had and how tr appear, those compass by owing to th imperfect st ancients sold in seas with will be forw daring were that ho was v contemptorie From the e periodically fr products of Eg Indian goods and Berenice v Coptos (the n they were pu Alexandria, wh the western w conveyed to M same route. 2 shore of the A north of the C from it to Copt miles. Berenice south, being n built by Ptolem Coptos is stated the different res terminated by the about 12 days. this station to carriage to Copt greater proximit and its lessening Pliny says the modities brought was increased a h by the expense however, that th meaning merely terially enhanced. like that mention the imposition of could not possibly mere expenses of lib. vi. cap. xxxiii.; tiens, pp. 161—170, note 20, &c.) In th Indian commoditie by way of Alexan

between the ports on the eastern coast of Egypt, and those on the opposite coast of Arabia, had subsisted from a very early period. That between Egypt and India was more recent. It was at first carried on by ships, which having sailed down the Red Sea from Myos Hormos and Berenice, coasted along the Arabian shores till they reached Cape Bassigate, whence a short course brought them to India near the mouth of the river Indus. This was the course followed during the dynasty of the Ptolemies; but about 80 years after Egypt had been annexed to the Roman empire, Hippalus, the commander of an Egyptian ship trading to India, having observed the regular shifting of the trade winds, ventured to sail with the western monsoon from the Straits of Babelmandeb right across the Atlantic Ocean; and was fortunate enough, after a prosperous voyage, to arrive at Musiris, in that part of India now known by the name of the Malabar coast. Having taken on board a cargo of Indian produce, Hippalus returned in safety with the eastern monsoon to Egypt. This discovery was deemed of so much importance, that the name of the discoverer was given to the wind which had carried him across the Ocean to India; and how trifling soever this voyage may now appear, those who consider that Hippalus had no compass by which to direct his course, and that, owing to this circumstance, and the otherwise imperfect state of the art of navigation, the ancients seldom ventured out of sight of land, even in seas with which they were well acquainted, will be forward to admit that his enterprise and daring were no wise inferior to his success; and that he was well entitled to the gratitude of his contemporaries, and the respect of posterity.

From the epoch of this discovery, fleets traded periodically from Egypt to Musiris, conveying the products of Europe to India, and conversely. The Indian goods having been landed at Myos Hormos and Berenice were thence conveyed by caravans to Coptos (the modern Kéné), on the Nile, where they were put on board lighters and sent to Alexandria, whence they were distributed all over the western world. The goods sent to India were conveyed to Myos Hormos and Berenice by the same route. Myos Hormos was situated on the shore of the Arabian gulph, about a degree to the north of the modern port of Cossire. The distance from it to Coptos, in a straight line, is about 70 miles. Berenice was situated a good way farther south, being nearly under the tropic. It was built by Ptolemy Philadelphus. Its distance from Coptos is stated by Pliny at 258 Roman miles; the different resting-places on the road were determined by the wells, and the journey occupied about 12 days. Ptolemy seems to have preferred this station to Myos Hormos, though the land carriage to Coptos was so much farther, from its greater proximity to the Straits of Babelmandeb, and its lessening the voyage up the Red sea.

Pliny says that the cost of the Indian commodities brought to Rome through Alexandria was increased a hundred fold (*centuplicato venant*) by the expense of carriage, &c. We suspect however, that this is a rhetorical exaggeration, meaning merely that their price was very materially enhanced. If the increase was anything like that mentioned, it must have been owing to the imposition of oppressive tolls and duties, for it could not possibly have been occasioned by the mere expenses of conveyance. (Plin, *Hist. Nat.* lib. vi. cap. xxiii.; Amcillon, *Commerce des Egyptiens*, pp. 161—176, &c.; Robertson's *Ancient India*, note 20, &c.) In the sixteenth century, the cost of Indian commodities brought to Western Europe by way of Alexandria and Aleppo was about three

times the cost of those brought by the Cape of Good Hope. [EAST INDIA COMPANY.] But Egypt was then occupied by the Mamelukes and Turks, who threw every sort of obstacle in the way of commerce, and loaded it with the most oppressive exactions.

Besides this important traffic, which supplied Rome and the western world with the silks, spices, precious stones, and other products of Arabia and India, a great trade in corn was carried on from Alexandria to Rome. Egypt, for a lengthened period, constituted the granary from which Rome, and afterwards Constantinople, drew the principal part of their supplies; and its possession was, on that account, reckoned of the utmost consequence. Augustus employed merchantmen of a larger size than any that had previously traded in the Mediterranean to convey the corn of Egypt to Ostia. They were escorted by ships of war. The fleet received the names of *sacra* and *felix embolæ*; and enjoyed several peculiar privileges. The ships belonging to it were the only ones authorised to hoist the small sail called *sapparum*, when they drew near the coasts of Italy. Some of the fast-sailing vessels attached to the fleet were sent on before, to give notice of its approach; and a deputation of senators went down to Ostia to receive the ships, which anchored amid the acclamations of an immense number of spectators. The captains were obliged to make oath that the corn on board their ships was that which had been delivered to them in Egypt, and that the cargoes were entire as shipped. (Huet, *Commerce et Navigation des Anciens*, cap. xlviij.; Seneca *Epist.* cap. lxxvii.; and the chapter on the Commerce of the Romans in the volume of *Treatises* by the author of this work, 2nd ed. 1859.)

*Intercourse with India through Alexandria.*—These few details will, perhaps, serve to give a faint idea of the importance of Alexandria in the commerce of antiquity. It is impossible, indeed, for any one to glance at a map of the world, or of the ancient hemisphere, and not to perceive that Egypt is the natural *entrepôt* of the commerce between Europe and all the vast countries stretching E. from Arabia to China. The discovery of the route to India by the Cape of Good Hope, in 1498, must, no doubt, have, under any circumstances, diverted a considerable portion of the trade with the western states of Europe, and in the heavier and bulkier class of articles, into a new channel. It is, however, abundantly certain, that had the same facilities for conducting the trade with the East existed in Egypt in the sixteenth and seventeenth centuries that existed in it in antiquity, she would have continued to be the centre of the trade for all the lighter and more valuable products, and the route of the greater number of the individuals passing between Europe and Asia. But the lawless and arbitrary dominion of the Mamelukes, who loaded all individuals passing through the country with oppressive exactions, at the same time that they treated all foreigners, and especially Christians, with insolence and contempt, put an entire stop to the intercourse so long carried on by this shortest, most direct, and most convenient route. Happily, however, a new era has begun, and Egypt has once more become the grand thoroughfare of the eastern and western worlds. After good order and a regular government had been introduced into Egypt by Mehemet Ali, it was seen that it might be again made the channel of communication with India; and the importance of facilitating the intercourse with that continent forcibly attracted the attention of the British government and the East India Company. The establishment of a

steam communication between Europe and Southern Asia, by way of Alexandria and Suez, and the construction of a railway between these towns, are among the most striking and important events in recent times. They have shortened the journey to India from England more than a half, and rendered it comparatively safe and expeditious.

Steam-ships conveying the mails leave Southampton for Gibraltar, Malta, and Alexandria, on the 4th, 12th, 20th, and 27th of every month. They generally arrive at Gibraltar in about 5 days; and after a few hours' stay proceed to Malta, which they reach in about 3 days more, arriving at Alexandria in about 13 days from Southampton. Those passengers who proceed by Marseilles, embark at that port on board steamers which convey them to Malta, where they join the steamers for Alexandria. On arriving at the latter, passengers are now (1868) conveyed by rail-

way to Cairo, where they usually remain over night, and thence by railway to Suez. From the latter they are conveyed by steam-ships to Bombay, Ceylon, Madras, and Calcutta, or to Singapore and China. Another line of steamers sail from Aden to the Mauritius, and thence to Melbourne and other ports in Australia.

The existing (1868) rates of charge in the ships of the Peninsular and Oriental Steam Packet Company are as follows, viz. :—

I. Rates from Southampton.

To	1st class, single passage	Children, 3 years and under 10	3rd class, and passengers' servants
Gibraltar	£ 15	£ 6	£ 9
Malta	20	10	12
Alexandria	50	15	19

One child under three years of age, if with the parent, free.

II. Rates of Passage, including the amount paid by the Company to the Egyptian Transit Administration, for Conveyance of Passengers through Egypt.

From England to	Egypt										King of the Soudan, Khartoum, (for Alexandria) Melbourne and Sydney	
	Aden	Bombay	Ceylon	Madras	Calcutta	Penang	Singapore	Hong Kong	Shanghai	Manilla		Mauritius
Gentlemen or ladies travelling singly, for one berth in a general cabin	£ 70	95	95	100	105	105	110	150	150	150	100	120

One child under 3 years (no berth provided)*	Free	Free	Free	Free	Free	Free	Free	Free	Free	Free	Free	Free
Servants, European	35	45	45	50	50	50	55	60	70	70	50	60
native in face cabin	20	25	25	30	30	30	40	45	50	50	50	—

\* Except transit expenses through Egypt, if above 2 years.

First-class passengers are allowed 3 cwt. of personal baggage free of freight, and children (above three years) and servants 1½ cwt. each.

A passenger taking a whole cabin will be entitled to take in the steamers, free of freight, 4½ cwt.; and a married couple, paying for reserved accommodation, will be entitled to take 9 cwt.

The charge for conveyance of extra baggage, should there be room in the vessel, will be at the rate of 1s. per cwt. between Southampton, Gibraltar, Malta, or Alexandria; 2s. per cwt. between Suez and India, and 3s. per cwt. between Suez, Mauritius, Australia, the Straits, and China.

Passengers passing through Egypt will have to pay the Egyptian Transit Administration, 14s. per cwt., for conveyance of baggage through, should it exceed, for first-class passengers, 3 cwt. each, and children and servants, 1½ cwt. each. This amount is collected on board the company's steamers for the convenience of passengers.

**Canal between the Nile and the Red Sea.**—It is affirmed, that had it not been for the hostilities in which the late Pacha was almost always engaged, he would have attempted to reopen the famous canal that formerly connected the Red Sea and the Nile. According to Herodotus, this canal was commenced by Necho, king of Egypt, and finished by Darius (lib. ii. s. 158, iv. s. 39). Under the Ptolemies, by whom, according to some authorities, it was completed, this canal became an important channel of communication. It joined the E., or Pelusiac branch of the Nile at Bubastis, the ruins of which still remain; it thence proceeded E. to the bitter or natron lakes of Temrah and Cheik-Aneded, whence it followed a nearly S. direction to its junction with the Red Sea at Arsinoe, either at or near where Suez now stands. It is said by Strabo (lib. xvii. p. 805) to have been 1000 stadia (122 m.) in length; but if we measure it on the best modern maps, it could hardly have exceeded from 85 to 95 miles. Hero-

dorus says that it was wide enough to admit two triremes sailing abreast. This great work having fallen into decay after the downfall of the Ptolemæic dynasty, was renovated either by Trajan or Adrian; and it was finally renewed by Amrour, the general of the caliph Omar, the conqueror of Egypt, anno 639 (Herodote, par Larcher, iii. 450). The French engineers traced the remains of this great work for a considerable distance; and but for the construction of a railway from Suez to Cairo, it would probably have been reopened.

The project of cutting a canal between the Red Sea and the Mediterranean has been seriously attempted by M. de Lesseps. Undoubtedly the success of this experiment would be of great commercial value. In addition to this, it would be a matter of the highest political significance to the government of this country, because it would expedite the access to Hindostan; provided of course always that large ships could easily pass such a canal, and the navigation of the Red Sea (now better known perhaps than that of any other sea) was artificially improved. At present indeed we are far from arriving at the results which the projectors of the canal propose, we are not satisfied that the entrance from the Mediterranean could be kept clear, that the canal could be maintained, or that the difficulties attending the Red Sea passage could be permanently obviated. On the whole it seems, that just as the philosopher's stone was the delusion which occupied the minds of the mediæval chemists, so the Suez canal and Red Sea passage is a similar *ignis fatuus* to continental engineers. No one we are convinced would be better pleased than the English would be to see the plan successful, and none could be more willing to acknowledge themselves in error than English engineers would be, if the result corresponded to the sanguine theories of M. de Lesseps.

ALGIERS

ALGIERS. A city and port, the capital of the French territory of Algeria. Pop. in 1862, 58,315, of whom 37,145 were Europeans. This city is situated 36° 47' 20" N. lat., long. 3° 4' 32" E. The bay, of a regular crescent shape, is exposed and somewhat dangerous in winter. A port in course of construction has already cost upwards of 20,000,000 francs, it consists of a sheltered sheet of about 220 acres of water. The lighthouse on the Ilet de la Marine has a revolving light visible at 15 miles. Its partial eclipses being at intervals of half a minute, and total eclipse every two minutes, the light is catoptric, of the third order. There are besides two fixed lights on the mole head; that on the N, is red, and that on the S, green.

The value of the exports from Algerian ports to France in 1858 amounted to 28,461,697 francs, and in 1863 to 52,710,176. The value of the imports from France into Algeria was, in 1858, almost all the trade consisting of national produce, almost all the trade consisting of national produce. The articles exported from Algeria to France are chiefly minerals (copper, lead, iron ores, and cast-iron), casks, wool, tobacco, cereals, skins, animals, cotton, wool, and coral. The French government are making great efforts artificially to stimulate the production of the later article. The principal commodities exported from France to Algeria in return consist of textile goods, wines, and general articles of consumption.

The cultivation of tobacco in Algeria, since 1851, has made very great progress, as may be seen from the following table, which exhibits the quantity bought on account of the imperial manufacturers in France, viz.:-

Years	Quantity	Value
1851	5,279	4
1852	17,794	8,156
1853	30,004	15,002
1854	32,289	16,144
1855	37,838	18,919
1856	67,815	33,907
1857	57,621	28,810
1858	89,108	44,554
1865	65,700	32,850

in addition to tobacco consumed annually in Algeria.

Minerals, such as copper, iron, lead, zinc, antimony, and mercury, are found in Algeria. The most considerable are those of copper, near Tenes, and of mouzania, near Blidah, in the province of Algiers, from which a considerable quantity is exported annually to Swansea; but it may be well to observe, that all other exports are almost exclusively for France, 82,777 cwt. of iron, of the value of 8,110*l.*; 27,861 cwt. of iron, of the value of 5,661*l.*; and 136,782 cwt. of copper, of the value of 67,493*l.*; were exported during 1857.

There exists near Tleuclia, in the province of Oran, a quarry of translucent marble, which has been much admired, and another near the Cap de Fer, betwixt Philippeville and Bona, which resembles the white Ferrara marble. Specimens of this article, and of ornamental statuary manufactured from it, were exhibited at the International Exhibition of 1862, and attracted great attention. Since that period it has been considerably employed. It sells at from 1,500 to 3,000 francs per cubic metre.

The cultivation of cotton has not been attended with the same success in the province of Algiers as in the province of Constantina, and more especially in the province of Oran at the Sigs, where the situation is particularly favoured by climate and the soil, so that nearly four-fifths of the cotton raised in Algeria is the produce of that province.

The south of Algeria and the Ziban would produce, with proper irrigation, cotton as good, in every respect, as any grown in America, but it is rare in these districts. However, Artesian wells have been made of late, with invariably success, in these parts of the country, and luxuriant vegetation is the necessary consequence. Some fine specimens of cotton grown in Algeria were shown at the International Exhibition of 1862, but judging from its cost of production as compared with the cotton of India and of other countries, there is little probability of Algerian cotton being able to stand competition with the cotton of India. (See *Rapports du Jury International*, tom. ii, p. 55 *et seq.*)

The most important ports of Algeria are Algiers, Mers-el-Kebir, Oran, Bona, Stora and Philippeville, Mostaganem and Tenez.

The following table exhibits the total amount of shipping, French and foreign, which entered and cleared at Algerian ports in 1863.

	Entered	Number	Tonnage

		1,870	131,717

The number of vessels which entered the United Kingdom from Algerian ports in 1863 was 69 and the tonnage 11,630 tons; in the same year, 92 vessels, 13,978 tons, cleared.

The commerce between France and Algeria is regarded as a coasting trade, and is still reserved to vessels of French register only.

*Port Dues.*—The treaties of commerce at present existing between Great Britain and France do not apply to Algeria. Thus, when British ships arrive in the ports of this colony, loaded with any cargoes, except grain or dry provisions, they are subjected to a fixed duty of 4 francs per ton, from whatever country they arrive or load more than one port of the colony, the duty is only paid once for cargoes of this description.

British ships, as well as all others, enjoy the privilege of exemption from the payment of a duty of 4 francs a ton, if they come from northern ports loaded with timber, and depart with a cargo of French or Algerine produce. Should the cargo, however, not be a full cargo, but not less than three-quarters, tonnage dues will be exacted from like regulations exist in leaving with a cargo of not less than half of French or Algerine produce.

French ships arriving in Algeria are completely exempted from tonnage dues, and the duties on some articles imported in French vessels are less than those on British or foreign vessels.

Art. 18 of the treaty of January 23, 1860, provides that the stipulations of that treaty, prohibiting the exportation of produce, and the importation of British goods, shall be applicable to Algeria. Consequently, in the direct trade, British commerce enjoys the same privileges as that of France.

British vessels are, however, still subject to the navigation dues, and, if occasion should arise, to the additional flag taxes; it is to be hoped, however, that the contemplated reforms in the French navigation laws will abolish or greatly reduce these charges. See *Lajoukair Tariff des Douanes de France (Algérie, pp. 74, 89)*.

10

dock or port dues, is 5 centimes per ton for French vessels, and 10 centimes per ton for all other vessels, unless coming from ports out of Europe, when it is fifteen centimes.

*Pilotage.*—The charge for piloting all vessels in and out of port is 16 centimes per ton.

*Quarantine.*—A charge of 3 centimes per ton a-day is made on vessels in quarantine.

*Cooking of Provisions.*—A regulation was promulgated on March 30, 1857, prohibiting the cooking of provisions, or the melting of tar, on board merchant vessels, or on the quays, except in the public kitchens or fire-places established on shore. The charge is 15 centimes, or 1½*d.* for each fire-place used for each meal, and 50 centimes, or 5*d.*, for each cauldron of pitch, tallow, or tar melted in the fire-place.

Merchant, steam or sailing, vessels, are now allowed to have provisions cooked on board by having a guard, at the rate of 3 francs a-day.

Ballast is furnished at the rate of 1 franc and 15 centimes a ton to all vessels.

No dues are charged for lighthouses. In obtaining the immunities of the French flag for foreign vessels in Algeria, it was necessary formerly to pay one-fourth of the value of the vessel; now one-tenth only is required.

All materials, as iron and wood, for the construction of vessels, are admitted free of duty.

Brokers' charge for clearing out a British, American, or Swedish vessel, fifty francs on account of interpretation, and sixty and one hundred francs have been charged in clearing out very large British steam ships.

Brokerage is at the rate of four per cent, per ton for obtaining a cargo, and one-half per cent, for collecting freight.

The following Tables represent the trade of Great Britain with Algiers for the five years 1861-5:—

**ALICANTE.** This city gives its name to the province. According to the report of Colonel Barre, the British consul at Alicante, it contained 31,200 inhabitants in 1863. The harbour is formed by a mole projecting into the sea, of 720 metres, and a counter-mole is in construction, of which 250 metres are laid down. In April 1863, a fixed white light was established at Altea in lat. 38° 33' 30" N.; long. 0° 8' 18" E., which is raised 112 metres above the sea, and is seen at 9 miles' distance. The work of deepening the harbour has been carried on for the last few years, in which operation two large steam dredges and a small one are employed. Those works and the deepening of the harbour will, it is hoped, be concluded this year (1867). The depth of water alongside the mole varies from 1 metre to 5·30 metres in the first third part, and to 6·40 metres in the last two thirds, so that vessels from 800 to 1,000 tons are enabled to discharge their cargoes there. Pilots are required in order to bring in and to moor the vessels.

The following are the port charges paid by Spanish and foreign vessels:—

Anchorage dues . . . . .	2 rials per Castilian ton.
Light dues . . . . .	ditto.
Sanitary dues . . . . .	1/2 " from Europe and 1/3 from America.

Discharge of cargo . . . . .	1 rial for every quintal or cwt.
Landing of cargo . . . . .	ditto.
Captain of port . . . . .	from 2 to 8 rials according to tonnage.

Since 1852 no differential dues are levied on British ships in Spanish ports.

The shipping dues, which were formerly anchorage dues, 1 rial per ton; light dues, ditto; health dues, 1/2 rial per ton; cargo loaded or discharged, 5 rials per ton, were doubled from January 1, 1861, in order to defray expenses of improving the port.

*Pilotage dues.*

Vessels not exceeding 500 tons in and out . . . . .	5 dollars.
Vessels beyond 500 tons . . . . .	13 "
Each movement up to 300 tons . . . . .	13 "
beyond 500 tons . . . . .	13 "

In 1864 the imports, in 163 British vessels, amounted to 261,830*l.* and, in 348 foreign vessels, to 529,722*l.* Those in steamers under Spanish flag cannot be computed, as all goods for Madrid are forwarded from the mole in sealed waggons, to be there examined and the duties imposed; and it is calculated that about two-fifths of those landed here are thus sent to Madrid. The principal articles of importation in British and foreign vessels are coals, iron and railway material, which are free from duty, and timber from the Baltic,

most of Spanish duties in

most other articles of commerce being brought in Spanish vessels in order to avoid the differential duties imposed on foreign shipping.

The exportation at this port, in British and foreign vessels, amounted to 207,888*l.* in the same year, consisting of wine, almonds, liquorice, lead, and latterly esparto (9,000 tons of which were exported in the same year to Great Britain). The trade, however, in 1866, fell to 57,781*l.* The change is ascribed to the superior advantages of land carriage by the northern railway. In 1866, the number of ships visiting the port was 673, with a tonnage of 156,710 against 1069 ships of 247,222 tons in 1864. In the immediate ports of Denia and Jávea raisins and almonds to the value of 179,544*l.* were exported in 1864, and to the same extent in 1866; and from Torrevieja the exportation of salt, principally for the Baltic, and fruits and wine for Algeria, was valued at 83,437*l.*

The ordinary wine of this province is of good sound quality, and remarkably cheap, being shipped in the year 1865 at from 4*l.* 4s. to 4*l.* 10s. per pipe of 100 imperial gallons, free on board, pipe included. Of late years large tracts of land were planted with vines, in consequence of the prospect of a great opening of trade by the reduction of duties on wine in England, but these being imposed according to the strength, and not *ad valorem*, the duties amount nearly to prohibition.

The only manufactory of any importance is that of cigars, a government monopoly, in which upwards of 4,000 women are employed, the tobacco used being from the United States, Cuba and the Philippine Islands. A branch of the Bank of Spain has been established here for some years, affording considerable facilities to commerce.

The exportation of esparto grass is one of the most notable in the returns of Alicante. The plant has long been used for making rope, matting and baskets. Fifteen miles from Alicante, at the town of Crevillente, there are 40 manufactories of matting and imitation carpets, which are sent to all parts of Spain, which give employment to 4,000 persons, consume annually 10,000 tons of esparto, and produce 175,000 pieces each of 40 to 50 yards in length. About 8,000 tons of this grass are annually exported from Alicante, and more could be carried if freights were lower.

After the opening of the railway to Madrid in 1857, the trade of Alicante was immensely increased, and the population, which was, twenty years ago, 17,000, has nearly doubled; but the opening of several other railroads to the capital having caused the monopoly to cease, it is found that the amount of commerce is proportionally diminishing, though, from the excellence of the harbour, and the railway being the shortest and cheapest, this port will always be preferred for heavy goods.

An electric telegraph has been for some years in operation between this and all the towns of importance of Spain, and consequently of Europe.

**Custom House Regulations.**—A manifest of the cargo, the ship's tonnage and number of crew, must be presented within twenty-four hours after *pratique* is given, together with a sealed register of cargo from the Spanish consul at the port of loading, when one or two officers are occasionally put on board to prevent smuggling. The consignees then make entry of the articles consigned to them, and obtain an order to discharge from the collector. To load the whole or part of an outward cargo, the master reports his intention to the collector, who gives his order permitting goods to be shipped, and the shippers make their specific entries. When the vessel is loaded the waiting officers make their return to the collector, who on receiving the port, sanitary, and consumption dues,

grants his clearance, upon which a bill of health is obtained and the vessel is clear for sea.

Alicante is not a favourable place for repairing ships.

**Warehousing System.**—The permission of the government to bond or deposit goods for one year, not having been taken advantage of by merchants, and a useless expense incurred, the order was rescinded after a trial of two years.

Vessels with foul bills of health, or coming from an infected or suspected place, though with clean bills, are usually ordered to the Lazaretto of Puerto Mahon; but vessels coming with clean bills obtain under ordinary circumstances immediate *pratique*.

Accounts are kept in rials vellon of twenty to the dollar, and in centimes of a rial. The official nomenclature for taxes and expenditure has recently been changed into escudos of ten rials or half a dollar.

**Weights and Measures.**—The cargo 2½ quintals or 10 arrobas; the Valencian arroba contains 24 lbs. of 18 ozs. or 36 of 12 ozs. At the custom house the Castilian quintal, containing 4 Castilian arrobas of 25 lbs. of 16 oz. each, which is nearly 10 per cent. less than the English cwt., and the new metrical system, are alone admitted.

The wine measure is the cantaro of 16 michetas. A pipe contains 40 cantaros or 100 imperial gallons. The yard or vara divided into 4 palms is 29·96, or very nearly 30 English inches.

(We are indebted for the above article to Colonel Barrie, H.M. consul at Alicante.)

**ALIENS.** According to the strict sense of the term, and the interpretation of the common law, all individuals born out of the dominions of the crown of England (*alibi natus*) are aliens or foreigners.

It is obvious, however, that this strict interpretation could not be maintained without very great inconvenience; and the necessity of making exceptions in favour of the children born of native parents resident in foreign countries was early recognised. The 25 Edw. III. stat. 2, enacts, that all children born abroad, provided both the parents were at the time of their birth in allegiance to the king, and the mother had passed the seas by her husband's consent, might inherit as if born in England. And this relaxation has been carried still further by several modern statutes; so that all children born out of the king's allegiance, whose fathers, or grandfathers by the father's side, were natural-born subjects, are now deemed to be themselves natural-born subjects; unless their ancestors were outlawed, or banished beyond sea for high treason, or were, at the birth of such children, in the service of a prince at enmity with Great Britain.

**Naturalisation of Aliens.**—Aliens may be naturalised by Act of Parliament, which puts them in exactly the same condition as natural-born subjects, except that they are incapable of being members of the privy council, of being elected to serve in parliament, or of holding any office of trust under the crown.

A *denizen* is an alien born, who has obtained letters patent, *ex donatione regis*, to make him an English subject. He occupies a kind of middle station between a natural-born subject and an alien. He may acquire lands by purchase or devise, but not by inheritance; and may transmit such lands to his children born after his denization, but not to those born before. (Blackstone's *Com.* book 1. ch. x.)

An alien may also be naturalised by serving on board any of his Majesty's ships of war, in time of war, for three years, or, if a proclamation has been issued to that effect, for two years. (6 Geo. IV. c. 109, ss. 16, 17.)

*Influence of the Residence of Aliens.*—There can be no doubt that, generally speaking, the resort of foreigners to a country, and their residence in it, are highly conducive to its interests. Those who emigrate in order to practise their calling in an old settled country are pretty uniformly distinguished for activity, enterprise, and good conduct. The native inhabitants have so many advantages on their side, that it would be absurd to suppose that foreigners should ever come into anything like successful competition with them, unless they were acquainted with some branch of trade or manufacture of which the others were ignorant, or possessed superior skill, industry, or economy. But whether aliens practise new arts, or introduce more perfect processes into the old, or display superior economy, &c., their influx cannot fail to be of the greatest advantage. They practically instruct those among whom they reside in what it most concerns them to know, that is, in those departments of art and science in which they are inferior to others; and enable them to avail themselves of whatever foreign sagacity, skill, or practice has produced that is most perfect. It is not easy, indeed, to overrate the benefits conferred on most countries by the resort of aliens. Previously to the invention of printing, there was hardly any other way of becoming acquainted with foreign inventions and discoveries; and even now it is far easier to learn any new art, method, or process, from the example and instruction of those familiar with its details, than from the best possible descriptions. The experience, indeed, of every age and country shows that the progress of nations in the career of arts and civilisation depends more on the freedom of commerce, and on the liberality with which they have treated foreigners, than on almost anything else.

*English Legislation as to Aliens.*—But, notwithstanding what has been stated above, an antipathy to resident foreigners seems to be indigenous to all rude and uncivilised nations. Whatever is done by them appears to be so much taken from the employment, and, consequently, from the subsistence of the citizens; while the advantages resulting from the new arts or improved practices they introduce, for the most part manifest themselves only by slow degrees, and rarely make any impression on the multitude. Hence the jealousy and aversion with which foreigners are uniformly regarded in all countries not far advanced in civilisation. The early Greeks and Romans looked upon strangers as a species of enemies, with whom, though not actually at war, they maintained no sort of friendly intercourse. 'Hostis,' says Cicero, 'apud majores nostros is dicebatur, quem nunc peregrinum dicimus.' (*De Off.* lib. i. c. xii.) It may, therefore, be considered as a striking proof of the good sense and liberality of those by whom it was framed, that a clause is inserted in *Magna Charta* which has the encouragement of commerce for its object; being to the effect, that 'all merchants (if not openly prohibited before) shall have safe and sure conduct to depart out of and to come into England, to reside in and go through England, as well by land as by water, to buy and sell without any manner of evil tolls, by the old and rightful customs, except in time of war; and if they be of a land making war against us, and such be found in our nation at the beginning of the war, they shall be attached without harm of body or goods, until it be known unto us, or our chief justice, how our merchants be entreated in the land making war against us; and if our merchants be well entreated there, shall be so likewise here.'

But until the era of Edward I. the stipulation in the Great Charter as to foreign merchants

seems to have been little attended to. It is doubtful whether, previously to his reign, they could either hire houses of their own, or deal except through the medium of some Englishman. But this intelligent prince saw the advantage that would result to the trade and industry of his subjects from the residence and intercourse of Germans, Flemings, Italians, and other foreigners, who, at that time, were very superior to the English in most branches of manufactures and commerce. He, therefore, exerted himself to procure a repeal of some of the more oppressive restrictions on aliens, and gave them a charter which conveyed considerable privileges. This charter was confirmed by Edward III. in 1328. Among other clauses, it has the following: viz. 1. That on any trial between foreigners and Englishmen the jury shall be half foreigners; 2. That a proper person shall be appointed in London to be justiciary for foreign merchants; and 3. That there shall be but one weight and measure throughout the kingdom. (Anderson, *anno* 1302.) Down, however, to the reign of Edward III., it continued to be customary to arrest one stranger for the debt, and even to punish him for the crimes and misdemeanours of others! It may appear extraordinary that the gross injustice of this barbarous regulation ever permitted it to be adopted; and yet it was probably, at one period, the common law of most European states. As soon, however, as the foundations of good order and civilisation began to be laid its operation was seen to be most pernicious. In 1325, Edward II. entered into a convention with the Venetians, in which it was expressly stipulated that they should have full liberty to come to England to buy and sell commodities, without being liable for the debts or crimes of others. Conventions to the same effect were entered into with other foreigners. At length, in 1353, this disgraceful practice was put an end to by 27 Edw. III. st. 2, c. 17; it being provided in this statute, not only that no stranger shall be impeached for the trespass or debt of another, but that, in the event of a war breaking out with any foreign power, its subjects, residing amongst us, shall be warned thereof by proclamation, and be allowed forty days to arrange their affairs, and to depart out of the kingdom; and that, under special circumstances, this term may be extended. There are few acts in the statute-book that reflect more credit on their proposers, or that have been more advantageous than this.

In consequence of the encouragement given by Edward III. to such of the woollen manufacturers of Flanders as chose to immigrate to England, a good many came over; and it is from their immigration that we may date the improvement and importance of the woollen manufacture in this country. [WOOLLEN MANUFACTURE.] But this policy, however wise and judicious, was exceedingly unpopular. The foreigners were openly insulted, and their lives endangered, in London and other large towns; and a few of them in consequence returned to Flanders. Edward, however, was not to be driven from his purpose by an unfounded clamour of this sort. A proclamation was issued, in which every person accused of disturbing or attacking the foreign weavers was ordered to be committed to Newgate, and threatened with the utmost severity of punishment. In a parliament held at York, in 1355, an Act was passed for the better protection and security of foreign merchants and others, by which penalties were inflicted on all who gave them any disturbance. This seems to have had the effect, for a while at least, of preventing any outrages.

great towns, have been at all times the principal enemies to the immigration of foreigners. Perhaps, indeed, they were not more hostile to them than to such of their own countrymen, belonging to another part of the kingdom, as should have attempted to settle amongst them without being free of their corporation. But in denouncing foreigners they had the national prejudice on their side; and their attempts to confirm and extend their monopolies by their exclusion were regarded as the noblest efforts of patriotism! Edward III. was fully aware of the real motives by which they were actuated, and steadily resisted their pretensions. But in the reigns of his successors they succeeded better: some of these were feeble and unfortunate, whilst others enjoyed the crown only by a disputed title, and in defiance of powerful competitors. The support of the great towns was of the utmost consequence to such princes, who, whatever might be their own opinion as to its policy, could hardly venture to resist the solicitations of such powerful bodies to exclude strangers, and to impose restrictions on commerce. From the death of Edward III. to the reign of Elizabeth, the progress made by the country was not inconsiderable, but it was little promoted by legislative enactments. Throughout the whole of this period, the influence of corporations seems to have predominated in all matters relating to trade and the treatment of foreigners; and our legislation partook of the selfish, monopolising character of the source whence it was principally derived. Were the Acts and proceedings as to aliens the only memorials of our policy from 1377 to 1560, we should certainly seem to have retrograded materially during the interval. Some of these Acts were passed with so little consideration, and were so very absurd, that they had to be immediately repealed. Of this sort was the statute of the 8 Henry VI. c. 24, to the effect 'that no Englishman shall within this realm sell, or cause to be sold, hereafter, to any merchant alien any manner of merchandises, but only for ready payment in hand, or else in merchandises for merchandises, to be paid and contented in hand, upon pain of forfeiture of the same.' But as an enactment of this sort was very speedily found to be more injurious to ourselves than to the foreigner, it was repealed in the following session.

The more tyrannical their conduct in other respects, the more were our princes disposed to humour the national prejudice against foreigners. If not a cheap, it was, at least, an easy method of acquiring popularity. In the very first parliament after the accession of Richard III., a statute was passed full of the most ridiculous, contradictory, and unfounded allegations as to the injury sustained by the influx of foreigners, and laying them under the most oppressive restraints. Considering, indeed, the sort of treatment to which aliens were then exposed, it may excite surprise that they should ever have thought of visiting the country; and, in point of fact, it appears that the resort of foreign merchants to our ports was materially impaired by the statutes referred to, and others of the same description. This is evident from the Act 19 Henry VII. c. 6, where it is stated that 'woollen cloth is not sold or uttered as it hath been in divers parts, and that 'foreign commodities and merchandises are at so dear and exceeding high prices that the buyer cannot live thereon.' But in despite of this authoritative exposition of the mischiefs arising from the restraints on aliens, and on trade, they were both increased in the reign of Henry VIII. And it was not till the reign of Elizabeth that the pretensions of the corporations seem to have been disregarded, and an

attempt made to act, not by starts, but consistently, on the policy of Edward III.

The influx of foreigners during the reign of Elizabeth was occasioned chiefly by the persecutions of the Duke of Alva and the Spaniards in the Low Countries. The friends of the reformed religion, which, at the time, was far from being firmly established, and the government, were glad to receive such an accession of strength; and from the superiority of the Flemings in commerce and manufactures, the immigrants contributed materially to the improvement of arts in England. It would seem, however, that the ministers of Elizabeth contented themselves, perhaps that they might not excite the public prejudice, with declining to enforce the laws against aliens, without taking any very active steps in their favour.

In the reign of James I. the corporation of London renewed with increased earnestness their complaints of aliens. In 1622 a proclamation was issued, evidently written by James himself, in which, under pretence of keeping 'a due temperment' between the interests of the complainants and those of the foreigners, he subjects the latter to fresh disabilities.

Since the revolution, more enlarged and liberal views as to the conduct to be followed with respect to aliens have continued to gain ground: several of the restraining statutes have fallen into disuse, while others were so much modified by the interference of the courts, which have generally been inclined to soften their severity, that their more offensive provisions became inoperative. In 1708, an Act was passed, notwithstanding the strenuous opposition of the corporations, for the general naturalisation of all foreign protestants; but the prejudice against them was still so powerful that it was repealed within about three years. Some attempts were afterwards made to carry a similar measure. One of these, about the middle of last century, occasioned the publication by Dr. Tucker of two excellent pamphlets in which the policy of a Naturalisation Act is ably vindicated and the arguments against it successfully exposed. (Historical Remarks on the late Naturalisation Bill, 1751; Queries occasioned by the late Naturalisation Bill, 1752.)

But, notwithstanding these efforts, nothing effectual was done to relieve aliens from the disabilities under which they laboured till 1844, when the 7 & 8 Viet. c. 66 was passed. This Act authorises the secretary of state for the home department, on his receiving such evidence as he may think necessary in regard to any application by an alien for a certificate of naturalisation, to grant, if he think fit, such certificate. If granted, the certificate conveys to the alien (unless some special reservation be made in it) all the rights and privileges of a natural born British subject, except that he cannot be a member of either house of parliament, or a privy councillor. Probably this is as good a law as could be enacted in regard to this matter.

The following regulations have been issued by the secretary of state in reference to the grant of certificates in pursuance of stat. 7 & 8 Viet. c. 66.

1. Upon an application to the secretary of state for the grant of a certificate of naturalisation, it will be necessary that the applicant should present to one of her Majesty's principal secretaries of state a memorial praying for such grant, stating the age, profession, trade, or other occupation of the memorialist, the duration of his residence within the United Kingdom, and of what friendly state he is a subject; whether he intends to continue to reside within this kingdom, and all other grounds on which he seeks to obtain any of

the rights and capacities of a natural-born British subject.

2. That the memorialist should make an affidavit before a magistrate, or other person authorised by law to administer an oath, verifying all the statements in his memorial.

3. That a declaration should be made and signed by four householders at least, vouching for the respectability and loyalty of the memorialist, verifying also the several particulars stated in the memorial as grounds for obtaining such certificate; and that this declaration should be made in 'due form, before a magistrate, or other person authorised by law to receive such declaration, in pursuance of the Act 5 & 6 Wm. IV.

*Policy of the Laws as to Aliens.*—The reason assigned by Mr. Justice Blackstone and others for preventing aliens from acquiring fixed property seem to be very unsatisfactory. In small states there might be grounds, perhaps, for fearing lest the easy admission of aliens to the rights of citizenship should give them an improper bias; but in a country like England such apprehensions would be quite futile. In this respect the example of Holland seems quite decisive. Notwithstanding the comparatively limited population of that country, it was 'the constant policy of the republic to make Holland a perpetual, safe, and secure asylum for all persecuted and oppressed strangers; no alliance, no treaty, no regard for, no solicitation of, any potentate whatever has at any time been able to weaken or destroy, or make the state recede from protecting, those who have fled to it for their own security and self-preservation.' (*Proposals for amending the Trade of Holland*, printed by authority. Lond. 1751.)

A short residence in the country, and a small payment to the state, was all that was required in Holland to entitle a foreigner to every privilege enjoyed by a native. And it is of importance to remark, that it has not been so much as insinuated that this liberal conduct was in any instance productive of a mischievous result. On the contrary, all the highest authorities consider it as one of the main causes of the extraordinary progress made by the republic in wealth and commerce. It is said in the official paper just quoted, that 'throughout the whole course of all the persecutions and oppressions that have occurred in other countries, the steady adherence of the republic to this fundamental law has been the cause that many people have not only fled hither for refuge, with their whole stock in ready cash, and their most valuable effects, but have also settled and established many trades, fabrics, manufactures, arts, and sciences in this country; notwithstanding the first materials for the said fabrics and manufactures were almost wholly wanting in it, and not to be procured but at a great expense from foreign parts.' (*Ibid.*)

With such an example to appeal to, we are warranted in affirming that nothing can be more idle than to suppose that any number of foreigners which it is at all likely should ever come to England under the most liberal system for industrial purposes, or to escape religious or political persecutions in their own countries, should occasion any political inconvenience. But it should always be understood that their residence here is to depend on the propriety of their conduct. If they abuse the privileges accorded to them, and come among us not for the sake of an asylum, or for the prosecution of industrious pursuits, but that they may make this country a theatre for carrying on plots and hatching conspiracies against the governments of countries with which we may be in amity, in such case they forfeit all claim to hospitality, and cannot justly complain if they be

(as they ought to be) deprived of their certificates and compelled to quit our shores. The 10 & 11 Viet. c. 83 refers to aliens in British colonies and dependencies.

**ALKALI** (derived from the Hebrew *Kalah*, to burn, similar to Arabic, to fry; Arabic, *al kala*, the burnt). The term *alkali* originally applied to the ashes of the burnt plants. The plant most used was then called after the name of the burnt ash. The name has now become generic, and is used in commerce to designate potash, soda, and ammonia; which are respectively distinguished by the terms vegetable, mineral, and volatile alkali. Lithia, caesia and rubidia are also alkalies. The distinguishing characteristics of these bodies are, a strong acrid and powerfully caustic taste, and a corrosive action upon all animal matter, destroying its texture with considerable rapidity. Exposed to the atmosphere when in their caustic state, they rapidly absorb carbonic acid, and become carbonated or milk, and by passing carbonic acid over them, they become bicarbonated or milder. Their action upon vegetable colours affords us means by which the presence of an uncombined or carbonated alkali may be detected; the yellow colour of turmeric is changed to brown; the blue colour of litmus, after being reddened by an acid, is restored; the violet infusion of red cabbage is changed to green, as also many other purple vegetable colours. Litmus paper, reddened by carbonic acid, is, however, the most delicate test of the presence of alkalies: they combine with acids, neutralising their acid properties, and forming a very important and extensive class of compounds called *salts*; a salt being any compound formed by the union of an acid with an alkali or other metallic oxide. The most important of the alkaline salts will be noticed below. Lime, magnesia, baryta and strontia have a similar action on vegetable colours, and are called *alkaline earths*.

The fixed alkalies are all oxides of metals, lighter than water. The caustic alkaline earths are oxides of metals still light, but heavier than water; the names of the metals ending in *um*, that of the caustic bodies chiefly in a *sodium* *soda*.

*Soda or Mineral Alkali.*—In part, the nitrum or natrum of the ancients, terms also applied to potash; the two alkalies, potash and soda, not being then recognised as distinct substances. Soda is believed to be mentioned by Solomon in Proverbs xxv. 20, 'as vinegar upon nitre,' and by Jeremiah, ch. ii. 22, 'although thou wash thee with nitre.' Soda was formerly prepared from barilla and kelp; 'barilla' being the name given to the ashes of plants which grew on the sea shore, and 'kelp' being the ashes of sea-weeds. These ashes are not now of any importance as sources of soda, however, they are of great value on account of the iodine salts they contain. Soda and its salts are now almost entirely manufactured directly or indirectly from common salt.

*Sodium*, the metal, is prepared by exposing to a white heat, in iron cylinders or retorts, a mixture of dry carbonate of soda and charcoal dust, a little chalk being added to keep the mixture in a pasty condition. The metal sodium distils over, and is condensed in a copper receiver, which must be well rolled and should be surrounded with ice, and must contain rock oil or naphtha. Sodium has a bluish white colour exposed to the air, it is quickly oxidised, when dropped into cold water it decomposes a portion of it, extricating hydrogen, and if the water be previously heated, the gas takes fire and burns with a bright yellow flame.

Sodium is manufactured on a commercial scale, and is extensively used in the preparation of aluminium or aluminium.

*Chloride of Sodium, muriate of soda or common soda*—is found in immense quantities in the earth as rock salt. The mines of Cheshire and Worcestershire in this country, and those of Poland, Hungary, Spain, and many other places, may be said to be inexhaustible. Actual mining of salt is little practised with us. The water near the salt is saturated brine, which is purified up and evaporated in pans 30 to 60 feet long. The soil around Northwich is in many places much depressed by this, and the town itself is a constant succession of risings and fallings. It is also obtained in large quantities by the evaporation of sea water. In warm countries this is carried on in pits dug in the beach by the heat of the sun's rays, leaving the common salt, mixed with various salts of magnesia and lime, as a white incrustation. In colder climates the evaporation is conducted in iron pans on the sea shore, by the aid of fuel. The salt crystallises out, the crystals are then drained from the mother liquor, which is called *bittern*, and are ready for the market. Basket salt is made by placing the crystals obtained in the above process in conical baskets, and washing them with a saturated solution of salt, which dissolves and carries off any magnesia or lime salts.

In Cheshire, the mine salt has been sold, in 1863, at the pit mouth at even less than half-a-crown per ton. The large crystals used for soda are obtained from the pans at 4s. a ton. That salt which is rapidly evaporated with the fire is fine, and sold as salt. It contains a little sulphate of lime. The coarser salt is formed less rapidly, and the very large crystals, which appear ornamental rather than useful, are formed singly in quiet portions of the pan. They are in reality the purest.

Pure salt should not become sensibly moist on exposure to the air; it decrepitates when suddenly heated. Salt is employed extensively in the production of sulphate of soda, to be afterwards converted into carbonate of soda by Le Blanc's process. At the present time (1865), 350,000 tons of salt are annually consumed in this country in this one branch of industry. It is also largely used in many other chemical and metallurgical operations, and for the preservation of animal food. Common salt is an excellent antiseptic.

*Sulphate of Soda or Glauber's Salts.*—This is prepared by heating together a mixture of sulphuric acid and common salt; muriatic or hydrochloric acid is evolved and condensed in Wolfe's bottles on a small scale, or in vessels filled with coke or bricks on a large scale, while sulphate of soda remains in the retort. Sulphate of soda is also obtained as a residue in the preparation of nitric acid from nitrate of soda, and is found pretty extensively in various parts of the world, more particularly in Spain and South America. It exists in almost all waters; the mineral springs of Cheltenham and Leamington owe their purgative properties to its presence. Crystallised sulphate of soda is often found as an efflorescence upon plaster and brick-work in damp situations.

Sulphate of soda, when in crystals, is remarkably efflorescent, losing the whole of its water of crystallisation, at ordinary temperatures, on mere exposure to the atmosphere.

A convenient freezing mixture may be made by pouring five parts commercial hydrochloric acid upon eight parts of the crystallised sulphate.

*Carbonate of Soda.*—This is found native in several localities; in some places, Egypt, and for instance Hungary, being left as an incrustation when the so-called 'soda lakes' dry up in the summer; in other places, Hungary &c. it exudes from the ground. A considerable quantity of carbonate of soda was formerly, and indeed still

is, obtained from *Barilla*, the ashes of plants growing on the seashore; the ashes of the *Salsola clavifolia* yielding about 46 per cent., and the *Salsola soda* about 41 per cent. of their weight of this salt. *Kelp*, the ashes of sea-weeds, contains a notable proportion of carbonate of soda, but is valuable only as a source of iodine and potash. However, the quantity annually derived from these sources is very trifling when compared with the quantity manufactured from common salt.

The process now generally employed for the manufacture of carbonate of soda from common salt is substantially that recommended by Le Blanc in 1792, and consists first in the decomposition of the salt by sulphuric acid, as described above, and afterwards roasting the sulphate of soda so obtained in reverberatory furnaces with a mixture of lime or chalk and small coal, the proportions being two parts of sulphate of soda, two parts limestone or chalk, and one part small coal; the mixture melts into a pasty mass termed 'black ash,' which on being withdrawn from the furnace, cooled, and lixiviated with cold water, yields a solution containing principally carbonate of soda. The insoluble residue consists of a sulphate of calcium mixed with carbonate of lime &c., and is known as *blue waste, vat refuse, or soda waste*.

The solution containing carbonate of soda is evaporated to dryness; mixed with a small proportion of sawdust, and calcined at a moderate temperature. The product thus obtained is called *soda ash*, and contains from 44 to 50 per cent. of alkali.

*Soda Crystals or Washing Soda.*—This is obtained by dissolving the soda ash in water, evaporating, and crystallising in iron pans.

Carbonate of soda is also manufactured from *Cryolite*, a mineral found in West Greenland and also in the Ural mountains; it is a double fluoride of aluminium and sodium. The mineral is ground to powder, mixed with its own weight of lime, and either calcined, or mixed with as much water as will form a milk, and boiled for some time. Fluoride of calcium remains insoluble while aluminate of soda is dissolved by the water. On passing carbonic acid gas through the liquid the alumina is precipitated, and carbonate of soda is formed and may be obtained in crystals on evaporation. One ton of cryolite will yield from 1½ to 2 tons of soda crystals. The quantity of cryolite annually obtained from Greenland is stated to be about 3,000 tons, the greater portion of which is sent to Copenhagen, and the remainder to Boston, U. S.; at both of which places the above processes are carried on.

Carbonate of soda has also been obtained from soda felspar, but not to any considerable extent.

Soda ash and soda crystals are both very largely used in many industrial and chemical operations, more particularly in the manufacture of soap, and in dyeing and scouring.

In this country upwards of 300,000 tons of carbonate of soda are annually made. It is exported largely.

*Bi-carbonate of Soda.*—This is procured by exposing the crystallised carbonate to an atmosphere of carbonic acid. The crystals absorb the carbonic acid, and at the same time lose their water of crystallisation, crumbling down into a white powder. It is used in medicine, in the production of effervescent drinks, baking powders &c. On being subjected to a red heat it loses half of its carbonic acid, and is converted into the anhydrous simple carbonate.

*Caustic Soda.*—This may be prepared from the soda ash of commerce by boiling with an excess of fresh slaked lime. Insoluble carbonate of lime is formed, and caustic soda remains in solution; the

clear liquid is decanted, evaporated, fused, and, while still liquid, is run into iron casks, and when cold is ready for market.

The mother liquors from the manufacture of soda crystals are now generally used for the production of caustic soda. As they always contain a considerable amount besides carbonate, they are well suited for the purpose.

Caustic soda is daily becoming of more importance in the arts; large quantities are used for making soap, and for bleaching, scouring, dyeing. The commercial product generally contains from 60 per cent. to 70 per cent. of alkali.

*Nitrate of Soda, Cubic Nitre, or Chili Saltpetre*—is largely imported into this country, and is used as a source of nitric acid, also in the manufacture of nitrate of potash by double decomposition with chloride of potassium, and in manure. It is somewhat deliquescent. When heated to 591° Fahr. it fuses, and on exposure to a higher temperature suffers decomposition.

The following interesting account of the production of the nitrate beds in South America is extracted from the report of Mr. Salidán, late her Majesty's consul at Lima:—

Iquique is the centre of the nitrate of soda trade, and to this article alone it owes its present position. The population of the province is estimated at 15,000, four-fifths of whom are more or less interested in it. Large and apparently inexhaustible beds of this and other salts are found in the pampa or plain of Iamarugal, say between the Valley of Camarones on the north, and the river Lox (the boundary line of Peru and Bolivia) on the south, a distance of over 150 miles, lying principally towards the Western side, distant from the shipping port from 6 to 12 leagues. The beds of nitrate, or calisheras, are insulated deposits, very irregular, some on the plain, others on the rising ground, varying much in size and shape, and in depth, beneath the surface crust of earth and clay, from 1 inch to many feet, and in thickness from 6 inches to as many feet. Amongst the other salts found in their vicinity may be enumerated carbonate and sulphate of soda, borates of lime and soda, magnesium-alum, chloride of sodium. Traces of iodine exist in the nitrate, and in most of the waters in the plain have been discovered traces of boracic acid.

Its cost at the works varies from 6½ reales to 8½ reales per quintal, according to the aptitude of the labourers, and the distance they may have to send for water and fuel. The rate of carriage to the coast also varies from 5½ to 7½ reales per quintal.

The average rate now paid for nitrate placed on the beach is 14 reales, and this would give the makers ¾ reale per quintal profit. Nitrate of soda is always sold deliverable alongside the ship's launch outside the surf. The merchant has to bag and embark it, which costs him about 1¾ reale per quintal, therefore selling at 17 reales would yield him 1½ per quintal profit.

The wages now given are, to the barretero (miner) and fondador (boiler of the nitrate) 1 real of the quintal produced, each; to the acendrador (who breaks the nitrate and separates the refuse) ½ real per 2 quintals; to other labourers from 1 dollar 4 cents, to 2 dollars per day.

The principal shipping places are Iquique, Paitillos, Mexillones, and Pisagua.

The total amount exported since the year 1830, when the trade was commenced, is:—

	quintals
1830—1834, inclusive	361,385
1835—1839	761,349
1840—1844	1,592,306
1845—1849	3,060,595
1850—1854	3,260,473
<b>Total</b>	<b>8,036,108</b>

The amount of exports in British ships, in 1864, were, 31,098 tons, of the value of 865,465 dollars.

*Sulphite of Soda or Antichlor.* It is prepared by passing sulphurous acid gas, obtained by the combustion of sulphur in air, into a solution of carbonate of soda, and crystallising. This salt was formerly used for removing the last traces of chlorine from the bleached pulp in the manufacture of paper, but is now to a great extent superseded by hyposulphite of soda.

*Hyposulphite of Soda.*—This may be readily prepared by digesting the above-mentioned salt with flowers of sulphur, evaporating, and crystallising. It may also be prepared from the *soda waste* produced in the manufacture of soda ash. Hyposulphite of soda is largely used by photographers for dissolving the undecomposed salts of silver. It is calculated that the quantity used in England alone for this purpose is not less than 200 tons per annum, while a far larger quantity is used by the paper manufacturers.

*Phosphate of Soda.*—Common tribasic phosphate of soda is prepared on a scale of some magnitude by treating powdered bone ash with dilute sulphuric acid, rendering slightly alkaline with carbonate of soda, filtering from the insoluble carbonate, phosphate and sulphate of lime, and crystallising. This salt is used in medicine. It also enters into the composition of the *dinging liquors*, used by calico printers. There are several other phosphates of soda, but they are of no importance in commerce.

*Bi-borate of Soda or Borax* (Sohaga, Tinenl, Indian names)—obtained in large quantities in the valley of Puga, in Ladakh, and at Thibet, is collected on the borders of the lakes as the water dries up; it is then smeared with fat to prevent loss by exportation, and transferred across the Himalayas on the backs of sheep and goats. It is refined at Umritsur and Lahore by washing with lime water. It is employed medicinally by the natives as a tonic, deobstruent, and diuretic. It is also obtained in California. It is obtained in the crude state by the evaporation of the waters of the lake whence it is derived, and is purified by dissolving in water, rendering slightly alkaline with carbonate of soda (to precipitate earthy salts), filtering and crystallising. Artificial borax is prepared largely by dissolving the boracic acid obtained from the lagoons of Tuscany in carbonate of soda or caustic soda, filtering, and crystallising slowly. In some works the crude boracic is mixed with soda potash and calcined at a low heat; the fritted mass is then lixiviated with water, and the clear solution evaporated and crystallised.

A native borate of lime and soda is found in large quantities in Peru; it is used for the preparation of boracic acid and borax.

Borax is obtained crystallised in two varieties, octahedral and prismatic, the former containing 30·8 per cent. water, and the latter 47·2 per cent. Both varieties, when exposed to the action of heat, lose the whole of their water, and melt below redness to a transparent colourless glass, which possesses the property of dissolving many of the metallic oxides, often with characteristic colours; hence it is much used in the laboratory as a blowpipe reagent. Borax is used in the arts as a flux, and by the refiner in the melting of gold and silver; it is also valuable for facilitating the soldering and welding of metals. In making enamels it is frequently added for the purpose of rendering the compound more fusible, and it is largely employed in fixing colours on porcelain; borax is also used in medicine.

*Silicate of Soda or Water Glass.*—is prepared by igniting 45 lbs. powdered quartz with 23 lbs.

anhydrous carbonate of soda and 3 lbs charcoal; or, according to Buelmer, it may be prepared more cheaply from sulphate of soda, and in the proportion of 100 parts quartz, 60 parts anhydrous sulphate of soda, and 15 to 20 parts charcoal dust. After cooling, the vitreous mass is broken up and boiled with water for three or four hours, the water being replaced as it evaporates. When the whole is dissolved the solution is concentrated till it attains the specific gravity of from 1.24 to 1.26. In this state it is sufficiently liquid to be used for some purposes, for others it may be evaporated to a syrupy consistence.

The most important uses of silicate of soda are for hardening and preserving stones, preparing artificial stones, cement, &c. and for the preparation of colours for mural painting; it is also used by calico printers and paper makers, and in the preparation of printing ink, &c.

**Aluminate of Soda.**—This is used as a mordant for fixing madder colours in calico printing. It is generally prepared by adding caustic soda to a solution of alum until the precipitate at first formed is re-dissolved; prepared in this manner it contains a large quantity of sulphate of soda. It is obtained tolerably pure as an intermediate product in the manufacture of carbonate of soda from cryolite.

**Stannate of Soda.**—It is extensively used in dyeing and calico printing; it is prepared in a great variety of ways, generally by fusing tin or tin-ore with soda or a salt of soda.

**Arsenate of Soda.**—This is also used largely in calico printing 'dunping liquor.' One method is to heat arsenic with nitrate of soda.

**Tungstate of Soda.**—Prepared by fusing the ore with carbonate or sulphate of soda. Tungstate of soda is used in dyeing, as a mordant, in the same manner as stannate of soda: it has lately acquired considerable importance as a medium for rendering linen, cotton and other fibrous substances non-inflammable; for this purpose it is used in solution, either alone or in conjunction with phosphate of soda.

**Fluoride of Sodium and Aluminium.**—This is found native as *Cryolite* in Greenland, and in the Ural mountains; used as a source of carbonate of soda, also of aluminium.

**Acetate of Soda**—is prepared in large quantities during the purification of acetic acid; the crude acid obtained by the distillation of wood is neutralised by carbonate of soda or soda ash, and the salt thus obtained purified by crystallisation.

**Potash or Vegetable Alkali.**—Extensively distributed in the vegetable and mineral kingdoms; it is also present in animal juices, and in all fertile soils.

**Potassium.**—The metal of which potash is an oxide is prepared precisely in the same manner as sodium, substituting for the carbonate of soda the corresponding salt of potash. This metal is not nearly of as great importance in commerce as sodium, and is much more expensive. The properties of both are very similar.

**Chloride of Potassium.**—Large beds of this salt have been lately discovered at Stassfurt in Prussia, along with common salt and chloride of magnesium. It is also extracted in considerable quantity from 'kelp,' the ashes of sea-weeds, and is used largely in the manufacture of potash alums, in the preparation of the other salts of potash, and in manure.

**Bi-Sulphate of Potash.**—Obtained on a large scale as a residuary product in the manufacture of nitric acid from nitrate of potash; it is the *sal enisum* of the older writers. It is very soluble in water, the crystals fuse below a red heat, and on prolonged ignition are converted into the simple sulphate. The bisulphate is sometimes used as a

flux in cases where the action of an acid at a high temperature is required.

**Potash alum**—is a double sulphate of potash and alumina.

**Carbonate of Potash, Potashes, and Pearlashes.**—Carbonate of potash is obtained in large quantities for commercial purposes by lixiviating wood-ashes, evaporating and crystallising; the mother liquor, containing the carbonate of potash, is evaporated to dryness, yielding the *potashes* of commerce, and these when calcined constitute what is known as *pearlash*. Commercial potashes generally contain from 50 to 60 per cent. of alkali. Carbonate of potash is also obtained by decomposing the chloride and sulphate, as in the preparation of carbonate of soda from common salt; and from felspar, by exposing an intimate mixture of 100 parts, with about 150 parts lime, to a white heat, boiling the mass with water, and saturating the solution so obtained with carbonic acid, to precipitate silica and alumina; the clear liquid contains the mixed carbonates of potash and soda; on evaporation the carbonate of soda crystallises out, leaving the carbonate of potash in solution. Mr. F. O. Ward heats the felspar with fluor spar and lime. It has been found remunerative to extract potash from the grease taken from the wool of sheep; 1000 lbs. of wool yield about 80 lbs. carbonate of potash free from soda; also from the juice of the sugar beet in France.

Carbonate of potash is largely used in the arts, particularly in the manufacture of soap and glass, and for preparing caustic potash and its salts.

**Bi-carbonate of Potash** is prepared by passing a current of carbonic acid gas through a strong solution of the carbonate of potash; crystals of the bicarbonate are deposited. This salt is consumed medicinally in considerable quantities.

**Caustic Potash** is procured from its carbonate in precisely the same manner as caustic soda.

**Nitrate of Potash, Saltpetre, or Nitre.**—The principal supply of this important salt is derived from various districts in the East Indies, where it occurs sometimes as an efflorescence, at other times disseminated through the soil itself. For its formation it is necessary that the soil should contain felspar or other mineral yielding much potash. The nitre is extracted from the soil by lixiviation with water; evaporating the solution so obtained, removing any common salt which may fall, and crystallising; the crystals being purified by repeated re-crystallisations.

Nitre may be also made artificially in beds of decaying vegetable or animal substances, mixed with old mortar, or other refuse calcareous earth; these are watered occasionally, too much moisture being hurtful; after a certain period, depending on the rapidity with which the process has gone on, the whole is submitted to lixiviation together with wood-ashes; which contain carbonate of potash, and which decompose any nitrate of lime formed, of which there is generally a considerable quantity. After the lixiviation is complete, which takes some time, the solution is separated and boiled down; the common salt separates as in the other process, and the nitre is then crystallised. It was from this source that the whole of the nitre, nearly employed by the French during the long protracted war with the continental powers was obtained, as in former times in this country when the obnoxious Petreemen collected it.

Nitre is now manufactured largely from nitrate of soda, by double decomposition with chloride of potassium; chloride of sodium and nitrate of potash are formed, and are separated by crystallisation. 85 of nitrate of soda are mixed with 74 of chloride of potassium.

Nitre has a cold, penetrating, and nauseous taste; enters into ligenous fusion at a gentle heat, and is then moulded into round cakes called sal prunella. It is employed in the manufacture of gunpowder, which is composed of 75 parts by weight of nitre, 16 of charcoal, and 9 of sulphur (the nitre for this purpose should be of great purity); as a flux it is one of the most powerful we possess; it is also used for the preservation of animal food, and in making frigorific mixtures; 1 oz. of nitre dissolved in 5 oz. of water lowers its temperature 15 degrees of Fahrenheit's thermometer. It was formerly used for procuring nitric acid and for giving nitrous fumes to the vitriol chambers, but the nitrate of soda has now taken its place in these operations. [SALTPETRE.]

*Chlorate of Potash*—is generally prepared by passing chlorine gas into a mixture of 300 parts caustic lime, 154 parts chloride of potassium, and 100 parts water, the operation being conducted in close leaden tanks, heated by steam, and provided with agitators; when the mixture is saturated with chlorine, the liquid is filtered off and evaporated nearly to dryness, and the resulting mass redissolved in hot water, and set aside to crystallise, the crystals being afterwards slightly washed and drained. In this process 154 parts chloride of potassium yield fully 200 parts chlorate of potash. The chlorate of potash of the best makers is a nearly pure product.

Chlorate of potash is extensively used in the preparation of lucifer matches, and in pyrotechnical mixtures. It enters into the composition used for filling percussion caps, &c., and is a convenient source of oxygen gas; 1 oz. of the salt yielding nearly 2 gallons of oxygen.

As an oxidising agent, chlorate of potash is used by the calico printer for heightening the intensity of 'steam colours;' and in the laboratory it is in constant request. Finally, it is of value in pharmacy, being sometimes administered in considerable doses by the physician.

*Hyposulphite of Potash, Silicate of Potash, Aluminate of Potash, Stannate of Potash, Tungstate of Potash.*—These salts are prepared exactly in the same manner as the corresponding salts of soda, substituting for the salt of soda, used in the preparation, a similar salt of potash. Their uses are also identical with the corresponding soda salts.

*Bichromate of Potash.*—A great many processes have been devised for the preparation of this salt. When the native chrome-iron ore is calcined with an alkaline hydrate or carbonate, in presence of an oxidising agent, the oxide of chromium in the ore is converted into chromic acid and unites with the alkali; thus by fusing the chrome-iron ore with half its weight of nitre for several hours, with frequent stirring, a mass is obtained which, on lixiviation with water and evaporation, yields crystals of neutral chromate of potash. By dissolving the chromate of potash so obtained in water, and adding a strong mineral acid, generally nitric acid, it is converted into the bichromate; and by evaporating the solution to the crystallising point, mechanically separating the crystals of bichromate from those of the nitrate (or other potash salt), formed at same time, and recrystallising several times, the bichromate is obtained pure—a large orange-red rectangular tables.

The above process of preparing the chromate may be rendered more economical by substituting carbonate of potash for a portion of nitre, and still more by dispensing with the nitre altogether, and effecting the oxidation by means of air admitted into the furnace. The addition of lime is found to facilitate the oxidation. Some manufac-

turers dispense with potash in the calcination altogether, using only lime, and afterwards decomposing the chromate of lime formed by carbonate of potash.

Bichromate of potash is extensively used in dyeing and calico-printing, in preparing pigments, and in bleaching tallow, palm oil, &c. It is soluble in ten times its weight of cold water.

*Iodide of Potassium*—is obtained by dissolving iodine in caustic potash, evaporating to dryness, gently igniting the mass, to decompose iodate of potash, redissolving in water or alcohol, and crystallising. It may also be obtained by digesting 2 parts iodine and one part iron filings in a stoppered vessel with ten parts water; under these circumstances iodide of iron is formed by the direct union of the metal with the iodine: the liquid is then boiled, and a solution of carbonate of potash is added in small quantities so long as a precipitate is formed, the solution is filtered from the insoluble carbonate of iron and set aside to crystallise.

Liebig has recently proposed the following process for the preparation of iodide of potassium: 1 part of phosphorus is placed in a basin with 40 parts hot water, to which 20 parts iodine are gradually added, with frequent agitation. The resulting colourless liquid, containing phosphoric and hydriodic acids, is poured off, and milk of lime added till the mixture is alkaline; it is then filtered and boiled down to half its bulk with 12 parts sulphate of potash, and allowed to cool. A small quantity of pure carbonate of potash is then added to precipitate any lime, and the filtered solution yields on evaporation crystals of pure iodide of potassium.

Some manufacturers employ an excess of caustic alkali in order to give the crystals a certain degree of opacity; others dip the crystals into a solution of carbonate of soda, and afterwards dry them in a stove.

*Bromide of Potassium.*—This is prepared in a precisely similar manner to iodide of potassium. Both salts are employed in photography to a considerable extent, and in medicine.

*Ferrocyanide of Potassium or Yellow Prussiate of Potash.*—This important salt is formed when azotised matters are heated to redness with carbonate of potash and iron. It is manufactured on a large scale by heating dried blood, horns, parings of hides, and other animal matters containing nitrogen, with an equal weight of carbonate of potash, and about one-third their weight of iron filings stirred in an iron pot. The mass when treated with water yields a solution containing ferrocyanide of potassium. On evaporation the salt is obtained in large lemon-yellow crystals, which are soluble in about 4 parts of cold water and in 2 parts of boiling water.

Ferrocyanide of potassium is manufactured in large quantities for use in dyeing and calico-printing. It produces a beautiful bright blue colour, which, however, will not bear washing with alkalies or soap. It is also used in the preparation of Prussian blue. It is the source from which prussic acid, and other compounds of cyanogen, are usually obtained, but is not itself poisonous. It has a saline, bitter taste.

*Ferridcyanide of Potassium or Red Prussiate of Potash.*—Obtained by passing chlorine gas through a solution of the preceding salt, until the liquid ceases to give a blue precipitate with perchloride of iron. The solution on evaporation yields magnificent ruby-red crystals, which are soluble in 2½ parts cold water, and in 1½ part of boiling water. Red prussiate may also be obtained by exposing powdered yellow prussiate to the action of a current of chlorine gas. Red prussiate is

used by dyers and calico printers for discharging the blue colour of indigo from calico; also for dyeing blue colours.

**Cyanide of Potassium**—may be prepared by heating to dull redness, in a covered iron crucible, a mixture of 8 parts dry yellow prussiate with 3 parts dry carbonate of potash, until the fused mass has lost its yellow colour, and ceases to give off bubbles of gas. After the particles of iron have subsided to the bottom of the crucible, the fused cyanide is poured on a cold slab, and solidifies on cooling to a milk-white mass. This salt is very deliquescent, has an alkaline reaction, and when moist emits the odour of hydrocyanic (prussic) acid. It is very poisonous. Cyanide of potassium is a powerful reducing agent, and as such is constantly used in the laboratory. Large quantities are used for the purpose of dissolving the salts of gold and silver in the processes of electrotyping; also in photography.

**Tartrate and Bitartrate of Potash**.—Bitartrate of potash, or cream of tartar, is, when in its crude and impure state, called argol, and is deposited in the interior of wine casks during fermentation, and from this source the whole of the cream of tartar is obtained. It is generally of a very dark brown colour, but may be purified and rendered perfectly white by solution and crystallisation. It is employed very extensively in dyeing, hat-making, and in the preparation of tartaric acid, and many of the compounds of tartaric acid, as tartar emetic, soluble tartar, boro-tartrate of potash; when heated to redness it is converted into carbonate of potash and charcoal; mixed with half its weight of nitre and thrown into a red hot crucible it forms the black flux, and with its own weight of nitre the white flux, both of which are very much employed in metallurgical operations. The tartrate is made by the addition of carbonate of potash to a solution of the bitartrate until perfectly neutral: it is used in medicine as a mild purgative.

**Rochelle Salt**.—A double tartrate of potash and soda.

**Binoxalate of Potash or Salt of Sorrel**.—Abundant in the juice of the common sorrel (*Rumex acetosa*), of the wood sorrel (*Oxalis acetosella*), and in the leaf stalks of the common rhubarb. It is principally used for removing ink spots and iron stains from cloth.

**Ammonia, Spirits of Hartshorn, or Volatile Alkali**—in its uncombined form, an elastic gaseous body, having a very pungent and suffocating odour, destroys animal life, converts the yellow of turmeric paper to a brown, which, from the volatility of the alkali, is again restored by a gentle heat to its original colour. This gas is rapidly absorbed by water, which takes into solution 727 times its volume at 59° Fahr., and 1050 times its volume at 32° Fahr., forming the *liquor ammonie* of commerce.

**Chloride of Ammonium or Sal Ammoniac**.—So called from the circumstance of its first having been procured near the temple of Jupiter Ammon in Libya, from the soot produced by burning camels' dung (there used as fuel). It is now, however, prepared in this country from the ammoniac liquor of the gas-works, by saturating it with muriatic acid, evaporating and crystallising; or by distilling the liquor, and conducting the distillate into muriatic acid. The crystals are purified by sublimation. Sublimed chloride of ammonium forms semi-transparent fibrous masses, very soluble in water, with great reduction of temperature; hence it is a common ingredient in freezing mixtures. Used in soldering and galvanising iron, with iron filings as cement for iron, &c.

**Sulphate of Ammonia**.—It is procured from gas liquor in some manner as the chloride, by substituting sulphuric acid for muriatic. It cannot be purified by sublimation, but may be purified by recrystallisation. It is soluble in twice its weight of cold water. Sulphate of ammonia is sometimes applied to muslins and other fabrics for the purpose of preventing them from burning with flame, should they accidentally take fire. The finished goods are dipped into a solution containing 10 per cent. of the crystallised salt, and dried in a centrifugal machine.

**Liquor Ammoniac**.—This is prepared from either of the two preceding salts by mixing them with slaked lime, heating the mass in iron retorts, and conducting the gas evolved into water. The most concentrated solution of ammonia has a specific gravity of .875, water being equal to 1.000.

**Carbonate of Ammonia**.—This is prepared by mixing the chloride, or sulphate, with twice its weight of chalk, and heating the mass in iron retorts. The vapours of carbonate of ammonia are conducted into large leaden chambers, termed *balloons*, where they are condensed; the salt thus obtained is purified by slow sublimation in iron pots having conical leaden covers. As met with in commerce carbonate of ammonia is a semi-transparent, fibrous mass, having the pungent odour of ammonia. It is used largely by confectioners in the preparation of light pastry. It is entirely dissipated during the baking, so no ill effect can arise from its use. It is also used for smelling-salts.

**Tungstate of Ammonia**.—It is used for rendering linen, cotton, and other fabrics non-combustible.

All the salts of ammonia are characterised by the following properties; viz. they are volatile at most at a low red heat; the fixed alkalis and alkaline earths decompose them, uniting with the acid and liberating the ammonia, which may be recognised by its odour and by its alkaline reaction on vegetable colours.

Ammonia is always formed when organic matters containing nitrogen are submitted to destructive distillation; a considerable quantity is formed during the distillation of bones in the preparation of *Dippel's oil*.

The salts of ammonia are valuable as ingredients in manures, but their chief use is in the production of *ammonia alum*, which is a double sulphate of ammonia and alumina.

Ammonia, being a highly elastic gas, has been used in place of steam or compressed air to give motion to portable machinery; the compressed gas not only gives motion to the piston by virtue of its elastic force, but after passing the cylinder, may be absorbed by water, thus causing a partial vacuum, and assisting the piston on its return stroke. Owing to these properties it may also be used as a refrigerator, and water frozen by it. To effect this, two strong closed metallic vessels are connected by a pipe. One of these is partly filled with a strong solution of ammonia in water, the other is empty. If now heat be applied to the former, while the latter is kept cool, the ammonia is driven from the water which dissolved it and compressed in the cooler vessel. On the removal of the heat the ammonia returns, to be with great rapidity dissolved in the water again, and in so doing causes a sudden evaporation in the other vessel, and so great an absorption of heat as to freeze a vessel of water in which it may be immersed.

**Lithia**.—Until very lately supposed to exist only in four minerals, but, by the aid of spectrum analysis, it is now proved to be very extensively distributed in nature in small quantities. It is found

in many minerals, as *lepidolite*, *spodumene*, *petalite*, &c., in the ashes of plants, particularly the tobacco plant, and in mineral waters, and in some of the pits of Cornwall in considerable quantity.

**Carbonate of Lithia.**—The only salt of this alkali of any commercial importance; it is used in the preparation of artificial mineral waters and in medicine for gout.

**Cesia and Rubidia.**—Lately discovered and very rare alkalis; they occur in minute quantities in some mineral waters, and in a very few minerals, *lepidolite* for instance. They are of no commercial importance.

Richardson and Watt's *Chemical Technology*—the principal store of information on alkalis—has been freely used.

**Alkaloids or Vegeto-Alkalies**—may be divided into two classes, natural and artificial, the former being found ready formed in plants; the latter known only as the result of chemical manipulation.

Amongst the natural alkaloids the following are the principal:—aconitine, atropine, brucine, cinchonine, codeine, opium, daturine, digitaline, hyoscyamine, meconine, morphine, narcotine, nicotine, quinine, strychnine, theine, veratrine, &c.

The artificial alkaloids are too numerous to mention here; amongst those known to commerce are aniline, toluidine, naphthylamine, &c.

We are indebted to Dr. Angus Smith, the eminent chemist, and the government inspector of alkali works, for the above article.

**ALKANET or ANCHUSA** (Ger. orkanet; Dutch, alkanna; Fr. orcanette; Ital. anusa; Span. alcaneta). A species of bugloss (*Anchusa tinctoria*, Linn.; *Lithospermum tinctorium* (Dec.). It has been cultivated in England; but is found of the finest quality in Siberia, Spain, and more particularly in the South of France, in the vicinity of Montpellier. The roots of the plant are the only parts that are made use of. When in perfection, they are about the thickness of the finger, having a thick bark of a deep purplish red colour. This, when separated from the whitish woody pith, imparts a fine deep red to alcohol, oils, wax, and all unctuous substances. To water it gives only a dull brownish hue. It is principally employed to tint wax, pomatum, and unguents, oils employed in the dressing of mahogany, rose-wood, &c. The alkanet brought from Constantinople yields a more beautiful but less permanent dye than that of France. (Lewis's *Mat. Med.*; Magnien, *Dictionnaire des Productions*.)

The duty, which was previously very oppressive, was reduced in 1832 to 2s. a cwt.; was reduced (1842) to 1s. a cwt. and is now repealed. The imports are inconsiderable. The price varies from 27s. to 32s. a cwt.

**ALLOWANCES, TARES, &c.** In selling goods, or in paying duties upon them, certain deductions are made from their weights, depending on the nature of the packages in which they are inclosed, and which are regulated in most instances by the custom of merchants, and the rules laid down by public offices. These allowances, as they are termed, are distinguished by the epithets, *Draft*, *Tare*, *Tret*, and *Clough*.

**Draft** is a deduction from the original or gross weight of goods, and is subtracted before the tare is taken off.

**Tare** is an allowance for the weight of the bag, box, cask, or other package, in which goods are weighed.

**Real or open tare** is the actual weight of the package.

**Customary tare** is, as its name implies, an established allowance for the weight of the package.

**Computed tare** is an estimated allowance agreed upon at the time.

**Average tare** is when a few packages only among several are weighed, their mean or average taken, and the rest tared accordingly.

**Super-tare** is an additional allowance, or tare where the commodity or package exceeds a certain weight.

When tare is allowed, the remainder is called the *nett weight*; but if tret be allowed, it is called the *suttle weight*.

**Tret** is a deduction of 4 lbs. from every 104 lbs. of *suttle weight*.

This allowance, which is said to be for dust or sand, or for the waste or wear of the commodity, was formerly made on most foreign articles sold by the pound avoirdupois; but it is now nearly discontinued by merchants, or else allowed in the price. It is wholly abolished at the East India warehouses in London; and neither tret nor draft is allowed at the Custom House.

**Clough**, or *Clough*, is another allowance that is nearly obsolete. It is stated in arithmetical books to be a deduction of 2 lbs. from every 3 cwt. of the *seconduttle*; that is, the remainder after tret is subtracted; but merchants, at present, know clough only as a small deduction, like draft, from the original weight, and this only from two or three articles. (Kelly's *Combiat*, art. 'London.')

For an account of the tares and allowances at London, see *Tare*; for the tares and allowances at the great foreign trading towns, see their names.

**ALMONDS** (Ger. mandel; Dutch, amandelen; Fr. amandes; Ital. mandorli; Span. almendras; Port. amendoas; Russ. mandal; Lat. amygdala; amare, dulces). A kind of medicinal fruit, contained in a hard shell, that is enclosed in a tough sort of cotton skin. The tree (*Amygdalus communis*) which produces this fruit nearly resembles the peach both in leaves and blossoms; it grows spontaneously only in warm countries, as Spain, and particularly Barbary. It flowers early in the spring, and produces fruit in August. Almonds are of two sorts, sweet and bitter. They are not distinguishable from each other but by the taste of the kernel or fruit. The Valencia almond is sweet, large, and flat-pointed at one extremity, and compressed in the middle. The Italian almonds are not so sweet, smaller, and less depressed in the middle. The Jordan almonds come from Malaga, and are the best sweet almonds brought to England. They are longer, flatter, less pointed at one end and less round at the other, and have a paler cuticle than those we have described. The sweet almonds are imported in mats, casks, and boxes; the bitter arrive in boxes. (Thomson's *Dispensatory*.)

Previously to 1832 almonds were grossly over-taxed; but the duties were then considerably reduced, and they were also still further reduced in 1842 and 1853. The duty on all varieties (inc. Jordan) of sweet almonds was fixed in the last mentioned year at 10s. a cwt., that on bitter almonds having been previously repealed. That on sweet almonds was repealed in 1860. In 1865, 32,037 cwts. were imported chiefly from Spain and Morocco, valued at 103,900l. The Morocco almonds are mostly shipped at Mogadore.

**ALMONDS, BITTER OIL OF.** [Oils.]

**ALMONDS, DIKA.** The fruits of the *Mangifera gabonensis*, which grows on the west coast of Africa. They yield on pressure from 65 to 70 per cent. of a grease resembling the butter of cocoa, which is stated to be fitted for the manufacture of soap.

**ALMONDS, SWEET OIL OF.** [Oils.]

**ALOES** (Dutch aloë; Fr. aloës; Ger. and Lat. aloë; Russ. sabir; Sp. aloë; Arab. mucibar). A bitter, gummy, resinous, inspissated juice, obtained

in the gra

from the leaves of the plant of the same name. There are four sorts of aloes met with in commerce; viz. *Socotrine*, *Hepatic*, *Caballine*, and *Cape*.

1. *Socotrine*.—So called from the island of Socotra, in the Indian Ocean, not very distant from Cape Guardafui, where the plant (*aloe spicata*), of which this species is the produce, grows abundantly. It is in pieces of a reddish brown colour, glossy as if varnished, and in some degree pellucid. When reduced to powder it is of a bright golden colour. Its taste is extremely bitter; and it has a peculiar aromatic odour, not unlike that of the russet apple decaying. It softens in the hand, and is adhesive, and yet is sufficiently pulverulent. It is imported by way of Smyrna and Alexandria, in chests and casks, but is very scarce in England.

2. *Hepatic*.—The real hepatic aloes, so called from its liver colour, is believed to be the produce of the *Aloe perfoliata*, which grows in Yemen in Arabia, from which it is exported to Bombay, whence it finds its way to Europe. It is duller in the colour, bitterer, and has a less pleasant aroma than the Socotrine aloes, for which, however, it is sometimes substituted. Barbadoes aloes, which is often passed off for the Hepatic, is the produce of the *Aloe vulgaris*. It is brought home in calabashes, or large gourd shells, containing from 60 to 70 lbs. It is casier in its line than the Bombay, or real hepatic aloes, and the taste is more nauseous, and intensely bitter. The colour of the powder is a dull olive yellow.

3. *Caballine or Horse Aloes*.—This seems to be merely the coarsest species or refuse of the Barbadoes aloes. It is used only in veterinary medicine, and is easily distinguished by its rank fetid smell.

*Cape Aloes*.—The produce of the *Aloe spicata*, which is found in great abundance in the interior of the Cape Colony, and in Meliada. The latter furnishes the greater part of the extract sold in Europe under the name of Socotrine aloes. The odour of the Cape aloes is stronger and more disagreeable than that of the Socotrine; they have, also, a yellower hue on the outside; are less glossy, softer, and more pliable; the colour of the powder is more like that of gamboge than that of the true Socotrine aloes. (*Ainslie's Mat. Indica*; Thomson's *Dispensatory and Mat. Medica*.)

975,456 lbs. of aloes, chiefly from the Cape and Bombay, were imported in 1865. Duties repealed in 1845.

**ALOF WOOD** (Ger. aloeholz; Dutch, aloëhout, paradyshout; Fr. bois d'aloës; Ital. legno di aloè; Span. aloë chino; Sans. aguru; Malay, agila; Siam, k'sna). The produce of a large forest-tree, to be found in most of the countries between China and India, from the 24th degree of north latitude to the equator.

Dr. Mason says with relation to this subject (see Mason's *Burma*, London, Trillner 1860): 'It is imported into Mergui by the Selungs, who, as they profit from the trade, endeavour to keep all in ignorance of the tree from which they obtain it.'

Sir J. Bowring states that only one species of the tree possesses the odorous element, and that the dark wood, which alone is valuable, is sold at about 10s. per lb. Every Christian family in the district where it grows is bound to pay to the King of Siam a tribute of 2 lbs. of eagle wood. It is principally found in the islands situated in the Gulf of Cambodia. (Bowring's *Siam*, p. 204.)

It seems to be the result of a diseased action confined to a small part of a few trees, of which the rest of the wood is wholly valueless. It appears to be more or less frequent according to soil and climate, and from the same causes to differ materially in quality. It is produced both in the greatest quantity and perfection in the

countries and islands of the east coast of the Gulf of Siam. This article is in high repute for fumigations, and as incense, in all Hindu, Mohammedan, and Catholic countries. It formerly brought a very high price, being at one time reckoned nearly as valuable as gold. It is now comparatively cheap, though the finest specimens are still very dear. The accounts of this article in most books, even of good authority, are singularly contradictory and inaccurate. This is more surprising, as La Londe has distinctly stated that it consisted only of 'certains endroits connus dans des arbres d'une certaine espèce. Toute arbre de cette espèce n'en a pas; et ceux qui en ont, ne les ont pas tous en même endroit.' (*Royaume de Siam*, t. i, p. 45, 12mo, ed.) The difficulty of finding the trees which happen to be diseased, and of getting at the diseased portion, has given rise to the fables that have been current as to its origin. The late Dr. Roxburgh introduced the tree which yields this production into the Botanical Garden at Calcutta, from the hills to the eastward of Sylhet, and described it under the name of *Aquilaria Agalocha*.

**ALPACA, LLAMA, AND VICUNA WOOLS.** These wools are derived from various quadrupeds of the genus *Lama* inhabiting the Cordillera of the Andes, below the line of perpetual snow. They are found principally in Peru and Chili, and exist also, but rarely, in Columbia and Paraguay. The race represents the camel of the new world (*Auchenia camelus paco*, Cuv.), and constitutes, according to Dr. Gray and others, four varieties, the guanaco, llama, alpaca, and vicuña. The wool of the two former animals is principally used in the manufacture of coarse native fabrics; that of the latter is fine and beautiful, and is rapidly becoming employed in Europe in the manufacture of dress. The first references to these animals are in *Garcilasso*, quoted by John de Laet (folio, Leyden, 1633), and the manufacture of their wool is mentioned by Acosta (*Historia Naturalis Moral de las Indias*), 'This wool the barbarians clean, spin, and weave into garments.' According to Hill (*Travels in Mexico and Peru*, vol. 1, p. 104), the guanaco, or huanaco, the largest of the llama species, is about 3 feet 6 inches in height, and its wool, which is of a light brown colour, is inferior to that of the llama.

The llama is about three feet in height; the male is usually employed in carrying burdens, and is able to perform a day's journey with a weight varying from 100 to 150 lbs. The wool is generally of a dirty brown colour, and occasionally is speckled grey. The wool of the female is finer than that of the male.

The vicuña, which is most highly prized for its wool, is smaller than the llama, and is about 2 feet 9 inches high. The wool is fine, short, and curly. The colour of the greater part of the body is reddish-yellow with a white breast. Their skins are worth, according to Mr. Hill, about 4 dollars each, and are stated to belong to the priests.

Various unsuccessful attempts have been made to introduce these animals into Europe. It was considered possible to introduce them into the Australian colonies; and recently Mr. Charles Ledger (notwithstanding the Peruvian edict intended against their exportation) succeeded, after immense difficulties, in shipping a flock from Copiapo in Chili for Sydney. For some time the experiment was thought likely to be successful, but later accounts are unfavourable. See an able paper read by Mr. C. Ledger before the Society of Arts (*Jour. of Soc. of Arts*, vol. ix, p. 212).

The number of hands employed by Mr. Salt, of

Saltaire, near Bradford, is about 3,000, and of these about two-thirds are engaged in the various processes by which alapa and mohair are made into cloth.

Some of the goods supplied by this great manufactory are woven from pure alapa and mohair yarns; some have mixed alapa, mohair, and wool. Mohair and alapa cloths have always a warp of either cotton or silk, never of wool. In some instances mohair yarns are mixed with silk, in others with a vegetable substance called *Rhe. fibre*. The yarn made for the Velours and Utrecht trade is mostly pure mohair.

#### Alapa Imports.

1856-1859	-	-	-	-	569,000 lbs.
1851	-	-	-	-	2,186,100 "
1861	-	-	-	-	2,968,100 "

Price 10*d.* per lb. in 1836—3*s.* 1*d.* per lb. in 1862.

#### Mohair Imports.

1851	-	-	-	-	1,011,780 lbs.
1851	-	-	-	-	1,215,280 "
1861	-	-	-	-	3,756,800 "

Price 1*s.* 10*d.* per lb. in 1851—3*s.* 6*d.* per lb. in 1863.

*Weight.*—In many districts the packages have to be carried by mules, in which case they are generally from 60 to 80 lbs. each. In other districts, where better roads or railways are available, the packages vary from 125 to 200 lbs., but few are so heavy as the greater weight.

*Quality.*—The indications of the best qualities are, length of staple, fineness and evenness of quality, softness and brilliancy of colour. The colours are black, white, brown, grey, and parti-colours. These colours are packed separately, each shipment containing a proportion of all; but no difference is made in the price of the respective colours. The average weight of a fleece of alapa is from 3lbs. to 4lbs., that of a llama from 5lbs. to 6lbs.

*Length.*—The ordinary length of a staple of good alapa is about 6 inches. The average length of a staple of llama is about 7 to 8 inches, and the fibres of the wool are not so regular, and are mixed with a coarse hair which renders it much less valuable than the true alapa.

*Price.*—The average value of alapa may be quoted about 2*s.* 6*d.* per lb., and of llama 1*s.* per lb.

ALUM (Ger. alun; Dutch, alun; Fr. alun; Ital. allume; Span. allumbre; Russ. kwasszë; Lat. alumen; Arab. sheb). A salt of great importance in the arts, consisting of a ternary compound of *alumina*, or pure argillaceous earth, potass, and sulphuric acid. Alum is sometimes found native; but by far the greater part of that which is met with in commerce is artificially prepared. The best alum is the Roman, or that which is manufactured near Civita Vecchia, in the Papal territory. It is in irregular, octahedral, crystalline masses, about the size of a walnut, and is opaque, being covered on the surface with a farinaceous efflorescence. The Levant, or Roch alum, is in fragments, about the size of the former, but in which the crystalline form is more obscure; it is externally of a dirty rose-colour, and internally exhibits the same tinge, but clearer. It is usually shipped for Europe from Smyrna; but it was anciently made at Roeha, or Edessa, in Syria; and hence its name Roch alum. English alum is in large, irregular, semi-transparent, colourless masses, having a glassy fracture; not efflorescent, and considerably harder than the others. It is very inferior to either the Roman or Roch alum. The principal use of alum is in the art of dyeing, as a mordant for fixing and giving permanency to colours which otherwise would not adhere at all, or but for a very short time; but it is also used for a great variety of other purposes.

Beckmann has shown (*History of Inventions*, vol. i. art. 'Alum') that the ancients were unacquainted with alum, and that the substance which they designated as such was merely vitriolic earth. It was first discovered by the Orientals, who established alum works in Syria in the thirteenth or fourteenth century. The oldest alum works in Europe were erected about the middle of the fifteenth century. Towards the conclusion of the reign of Queen Elizabeth, Sir Thomas Chaloner established the first alum work in England, in the vicinity of Whitby, in Yorkshire, where the principal works of the sort in this country are still carried on; the shipments of alum from Whitby in 1811 amounted to 3,237 tons. There is, also, a large alum work at Hurllett, near Paisley, the produce of which may be estimated at about 1,200 tons a-year. Alum is largely manufactured in China, and is thence exported to all the western Asiatic countries.

Of alum and vitriolic schist the produce in Austria is about 40,000 cwts.; it is chiefly procured from Bohemia, Styria, and Moravia. In Spain about 80,000 kilogrammes are obtained from the province of Murcia. In Prussia about 425,000 cwts. of alum ore were produced in 1861.

Alum is both largely produced in, and exported from, China to India, and other Eastern countries. As an indication of the extent of this branch of Chinese industry and commerce, we extract the following from the sixth edition of Dr. Williams's valuable *Chinese Commercial Guide*: 'Alum is exported to India and the Archipelago, where it is regarded as superior to the native product. About 75,000 piculs have been annually exported. It is found in argillaceous schist, or, *alum shale*, in the provinces of Ngánhwi, Húnán, and Chekiáng, and finds its way chiefly to Ningpo and Shanghai; the markets of Swatow and Amoy also furnish large quantities drawn from neighbouring districts.

The mineral is extensively worked in the Sungyang hills in the district of Pingyang in Wanchau fi, near the borders of Fuhkien, and not far from Pihwan harbour. The supply seems to be inexhaustible, and the daily product was estimated by a visitor, in 1853, at 18 tons of alum, which would amount to not less than 6,000 tons per annum. This alum is equal to the best Roman. It is chiefly employed by the Chinese for bleaching purposes.

In 1862 there were exported from the port of Tien-tsin 951 piculs (1 pic=133½ lbs. avoird.), valued at 1,902 taels (1 tael=6*s.* 2*d.* sterling). From the port of Tamsuy the exports in the same year were 1000 piculs, and from the port of Amoy 186,666 lbs., and 891 piculs from the port of Hankow. The Chinese market price in the same year was from 9*s.* 10*d.* to 10*s.* per picul.

The imports of alum into Great Britain are not large; they amounted in 1863 to 10,355 cwts., value 3,007.

AMBER (Ger. bernstein; Dutch, barnsteen; Dan. bernsteen, Rav.; Fr. ambre jaune; Ital. ambragialla; Span. ambar; Russ. jautar; Pol. burszyn; Lat. succinum, electrum). A brittle, light, hard substance usually nearly transparent, sometimes nearly colourless, but commonly yellow, or even deep brown. It has considerable lustre. Specific gravity, 1.065. It is found in nodules or rounded masses, varying from the size of coarse sand to that of a man's hand. It is tasteless, without smell, except when pounded or heated, when it emits an fragrant odour. It is highly electric. Amber is undoubtedly of vegetable origin, and, as is clear from the insects, &c. often preserved in it, was originally exuded in a fluid state from some extinct species of pine.

On the Prussian coast of the Baltic, between Königsberg and Memel, amber is more abundant than in any other known locality, and the Prussian government are stated to derive a revenue of about 3,500*l.* per annum from its collection. The chief amber beds in the north of Prussia are near New Kechren, Brusterort and Lapöhen. In the United States it is found principally at Amboy, New Jersey; at Gayhead and at Cape Sable in Maryland.

Amber is used in the manufacture of various kinds of varnish, dissolved with drying linseed oil, asphaltum, and resin; it is used as a coach-maker's varnish, and the spirit varnishes, which are prepared from the solution of amber in alcohol or ether, are used for photographic purposes. (*Ure's Dict. of Arts &c.* by Hunt.)

The quantities of amber imported into the United Kingdom in 1863 were:

	Cwts.	Value.
Amber, rough	70	62 <i>l.</i>
Manufactures not enumerated	-	87 <i>l.</i>

Amber has been recently discovered in the Lake of Ausserche, in the duchy of Courland, and in other parts of the district. It is mostly transparent, and some pieces have been discovered of considerable size.

Amber is also found in considerable quantities on the shores of several islands of the Indian Archipelago and on the eastern shores of Africa, and at one period constituted a considerable article of export from Aken. It is largely in demand for court beads in China, where the transparent lively yellowish brown variety is most prized, foul and opaque pieces being almost valueless. The price in China varies from 8 dollars to 14 dollars per catty. False amber, brought from India, is also largely used, and is sold at Canton for prices nearly equal to those of the genuine article. (*Dr. Williams's Chinese Guide.*) See an interesting account of the ideas entertained by ancient Eastern nations, in *Asiatic Researches*.

**AMBER GRIS or AMBER GREASE** (*Ger.* amber; *Dutch.* amber; *Fr.* ambergris; *Ital.* ambrogria; *Span.* anbar gris; *Lat.* ambrā, *ambra grisea*). A solid opaque, generally ash-coloured fatty, inflammable substance, variegated like marble, remarkably light, rugged, and uneven in its surface, and has a fragrant odour when heated; it does not effervesce with acids, melts freely over the fire into a kind of yellow resin, and is hardly soluble in spirits of wine. It is found on the sea-coast, or floating on the sea near the coasts of India, Africa and Brazil, usually in small pieces, but sometimes in masses of 50 or 100*lbs.* weight. 'Various opinions have been entertained respecting its origin; but it is now well established that it is a concretion formed in the stomach or intestines of the *Physeter macrocephalus*, or spermæcti whale.' (*Thomson's Chemistry.*) Ambergris ought to be obtained in large pieces, of an agreeable odour, entirely grey on the outside, and grey with little black spots within. The purchaser should be very cautious, as this article is easily counterfeited with gums and other drugs.

'Persons engaged in the whale fishery look for Ambergris in the intestines of the spermæcti whale, and are most successful in finding it in those that appear torpid, sick, and lean; from whence it would appear that it is the product of disease. The lumps of it are from 3 inches to a foot in diameter, and from 1 *lb.* to 30 *lbs.* in weight; its value in this country is about 16*s.* per oz.'

**AMETHYST** (*Ger.* eisenkeisel; *Fr.* amethyste; *Ital.* amatista; *Span.* ametisto; *Lat.* amethystus). A precious stone, of which there are two species differing widely in quality and value.

According to Mr. Emanuel (*Diamonds and Precious Stones*), 'the Oriental amethyst is a ruby or sapphire possessing an amethyst colour, which may be distinguished from the ordinary amethyst by its superior brilliancy and play, as well as by its hardness, &c. It is a gem of rare occurrence, and even Jewellers frequently confound it with the ordinary amethyst. There are some fine specimens in the Grüne Gewölbe at Dresden, and there are also in the Vatican one or two engraved intaglios of this stone of very early date.'

The common or Occidental amethyst is a violet coloured quartz. It is, according to the same authority, found in India, Ceylon, the Brazils, Persia, Silesia, Hungary, Saxony, Spain, and also at Reboyn in Ireland. 'Many years ago,' says Mr. Emanuel, 'such amethysts were of considerable value, ranking next to the sapphire, and worth as much as 30*s.* the carat when very fine. Large quantities, however, were sent from Brazil, and the stone declined in public estimation. The taste, however, is still reviving. A fine deep-coloured amethyst of the size of a two-shilling piece is worth from 10*l.* to 15*l.*; smaller pieces and in poorer qualities are sold from 2*s.* to 5*s.* The best cutting of amethyst is in a brilliant form, with the table slightly domed. Most amethysts are cut in Germany, owing to the price of labour being cheaper in that country than in England.' (*Emanuel On Diamonds &c.* 114, 156, 39*g.*)

**AMIANTHUS, ASBESTOS or MOUNTAIN FLAX** (*Lat.* amianthus-abeustum; *Ger.* asbert; *Fr.* amiante; *Span.* asbesto, alumbre de pluma; *Port.* asbestos; *Ital.* asbesto). A mineral of which there are several varieties, all more or less fibrous, flexible, and elastic. It is inconsumable by a high degree of heat; and in antiquity the art was discovered of drawing the fibres into threads, and then weaving them into cloth. Pliny says that he had seen napkins made of this substance, which, when soiled, were thrown into the fire, and that they were better cleaned by this means than they could have been by washing! Hence it obtained from the Greeks the name of *Amiantos* (*undefiled*). Its principal use, as stated by Pliny, was to wrap round the bodies of the dead previously to their being exposed on the funeral pile, that the ashes of the corpse might not be mixed with those of the wood. And in corroboration of this statement we may mention, that in 1702 a skull, some calcined bones, and a quantity of ashes were found at Rome, in a clod of amianthus nine Roman palms in length by seven in width. Its employment in this way was, however, confined to a few of the very richest families, incombustible cloth being very scarce, and bringing an enormously high price. *Rarum inventum, difficile textu propter brevitatem. Cum inventum est, sequit prætia excellentium margaritarum.* (Pliny, *Hist. Nat.* lib. xix. ch. 1.) The disuse of the practice of cremation, or of burning the dead, caused the manufacture of amianthine cloth to be neglected.

In the Tarentaise of Savoy a variety of amianthus exists, of which the threads are entirely separated and of a brilliant whiteness, and capable of being elongated to upwards of ten times their original length. Cloths and even lace have been prepared from the amianthus derived from this locality, and there exists in the Institute of France a work printed entirely on paper made from this material.

There are several varieties of amianthus: the twisted asbestos, which is of a dirty grey or whitish yellow colour, sometimes exists in thick spongy pieces, and is then vulgarly called *fossil flesh*; sometimes it resembles and is called *fossil cork*; occasionally, when of a hard mem-

braneous character, it is called *fossil leather*, and the thinner and more flexible kinds of the same character are termed *fossil paper*. The woody asbestos is of a reddish brown colour, and resembles splinters of wood.

Asbestos is now employed to a considerable extent for burning in gas stoves. (*Bulletin du Musée de l'Industrie*.)

According to M. Bezon (*Dictionnaire général des Tissus*), the art of making cloth from amianthus was, in modern times, revived by Madame Candida Lena Perpoint (*Journal de la Société d'Encouragement des Arts et des Sciences*, Milan, No. 30). She attempted to render the fibre flexible by treating it with oil and water, but finding the former means not so efficacious as the latter, she made her future experiments with water, and succeeded in getting filaments of such length and tenacity as were available for spinning and weaving. Her first successful attempt was the manufacture of a pair of gloves. The amianthus was supplied from the Vultureline. She also made paper of excellent quality, and, in order to supply an ink which should be equally indestructible, used a fluid containing  $\frac{1}{2}$  sulphate of iron to  $\frac{3}{4}$  black oxide of manganese.

Laterly, however, the manufacture of this article into a fabric has been revived a M. Aldini having succeeded in manufacturing it without the aid of any foreign substance: the cloth is made loose in its fabric, and the threads are about the fifteenth part of an inch in diameter. Asbestos is found in Piedmont, Savoy, Saltzburg, the Tyrol, Dauphiné, Hungary, Silesia, Corsica, at Staaten Island in New York Harbour, St. Kevern in Cornwall, and in various parts of the north of Scotland, the Cape of Good Hope, and at Metchursk in Siberia.

AMMONIAC, SAL. [ALKALIES (*Muriate of Ammonia*).]

AMMONIACUM (Fr. *gomme ammoniacque*; Ital. *gomma ammoniaca*; Spyn. *goma ammoniaca*; Lat. *ammoniaca*; Arab. *fesluok*). A concrete resinous juice obtained from the *Dorena ammoniacum*, a plant resembling fennel, found in the north of Africa, Arabia, Persia, the East Indies, &c. The name is supposed to be corrupted from Armeniacum, and to indicate the route by which the drug was originally imported into Europe. Pliny says that it derived its name from its being produced in the vicinity of the temple of Jupiter Ammon in Africa. (*Hist. Nat. lib. xii. c. xxxiii.*) It has a faint but not ungrateful smell, and a bitter, nauseous, sweet taste. The fragments are yellow on the outside and white within, brittle, and break with a vitreous fracture; their specific gravity is 1.207. The best ammoniacum is brought from Persia by Bombay and Calcutta, packed in cases and chests. It is in large masses, composed of small round fragments or tears; or in separate dry tears, which is generally considered a sign of its goodness. The tears should be white internally and externally, and free from seeds or other foreign substances. Reject that which is soft, dark-coloured, and foul. It is used principally in the materia medica, and the quantity imported is but small. (*United States Dispensatory*.)

AMMUNITION. A term expressive of the various implements used in war.

Sec. 45 of the Customs Consolidation Act of 1854 (16 & 17 Vict. c. 107) provides that the importation of arms, ammunition, gunpowder or any other goods, may be prohibited by proclamation or order in council, and by sec. 150, that by the same means such articles, and all military and naval stores may be prohibited to be exported or carried coastwise under penalty of forfeiture; and

sec. 159 declares that 'gunpowder, ammunition, arms, or utensils of war, except from the United Kingdom or any British possession, are hereby absolutely prohibited to be imported or brought either by sea or inland carriage, or navigation, into the British possessions in America and the Mauritius.'

The exportation of ammunition and arms has largely increased since the American Civil war.

Since the year 1853 the number of small fire arms exported from Great Britain has been—

1859	-	-	171,329	1863	-	-	437,812

[GUNPOWDER.]

AMOY. A Chinese port open to commerce with the United Kingdom, situated in the Fukien province, lat. 24° 40' N., long. 118° E. The town, which contains about 300,000 inhabitants, is on an island called Iliu Mun.

The town of Amoy was visited soon after the Europeans became acquainted with China. In 1544, the Portuguese resorted thither, but were forcibly expelled by the authorities, in consequence, it is said, of their misconduct towards the native traders. The Dutch traded at the port in 1624. Up to 1730 it appears that the English visited Amoy; but at this time the Spaniards were alone permitted to make use of this port, all other foreign trade having been centred at Canton. Amoy was captured in 1841 by Gough and Parker, and was thrown open to foreign trade by the treaty of Nanjing.

According to Dr. Williams, Amoy is the most accessible of all the consular ports in China, no pilots being required on entering or departing, though boatmen often board the ship to offer assistance. Some regulations were once issued requiring British merchantmen to engage pilots to and from the Chan Chat rocks, but their use is now optional. The water communication with the interior is not, however, equal to that enjoyed by the other ports.

The harbour is a bay, and an inner harbour. The inner harbour is one of the best on the coast. There is good holding ground in the outer harbour, and vessels can anchor in the inner, within a short distance of the beach, and be perfectly secure. The tide rises and falls from 14 to 16 feet. The western side of the harbours, from 375 to 840 yards wide, is formed by the island of Kulangsu.

The channel round the island of Amoy is so narrow and winding that directions would be useless, the chart being the best guide. Besides the excellent shelter that this harbour affords, the Chinese have docks for repairing and building their largest junks.

Native emigration from Amoy is considerable. The arrangements are under the management of the British West Indian Emigration Agency, and the official supervision of the British consul.

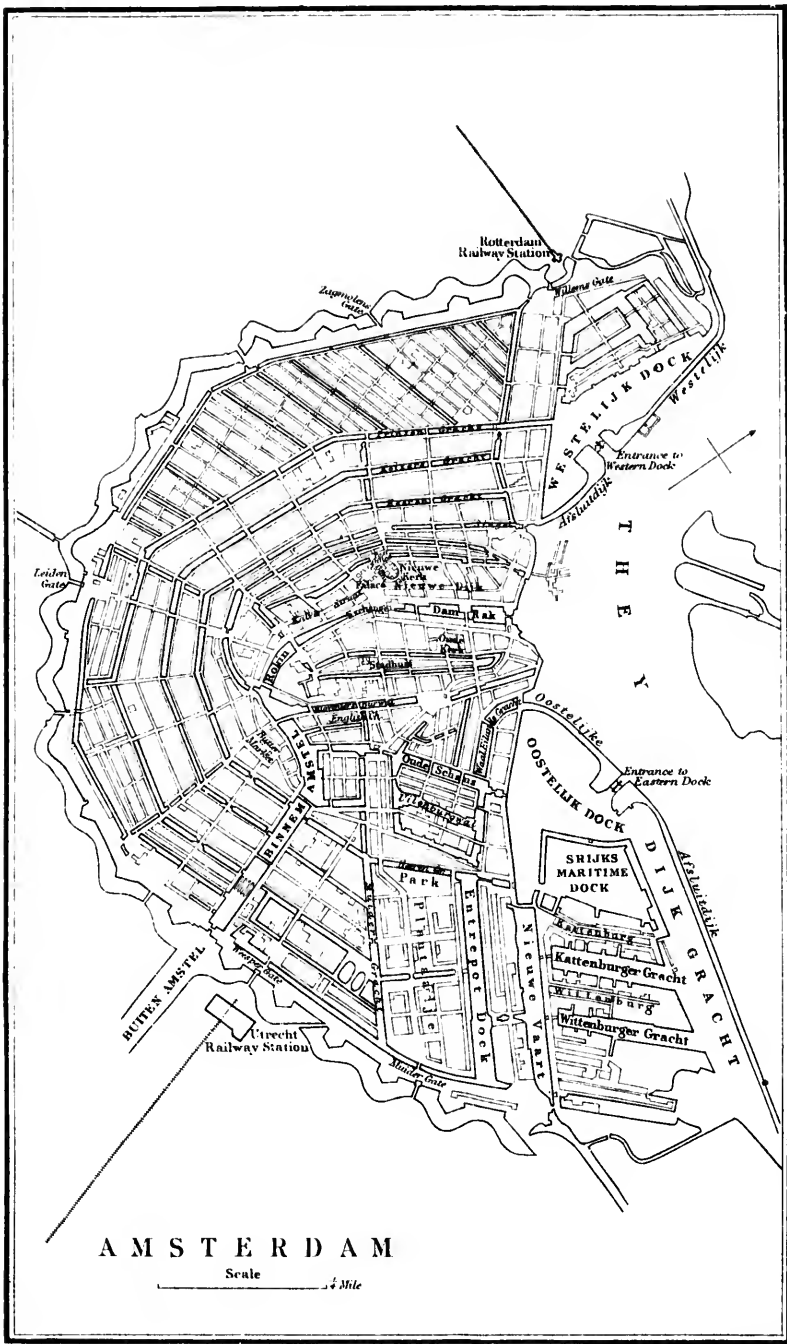

The docks of Amoy are worthy of notice. Vessels of almost any size can obtain anything necessary for repairs. The company's large granite dock is 286 feet long on the blocks, and at average springs can take vessels drawing from 16 to 17 feet. The dock is fitted with a caisson gate, and with a centrifugal steam pump of great power, ensuring despatch at all states of the tide.

*Customs Regulations.*—The limits of the port are defined within lines drawn from the southernmost point of Amoy island, south-eastward to the nearest island, and thence, in the direction of the high pagoda, to the point of Lam-tai-hoo hill, and from the northernmost point of Amoy island to the opposite point on the mainland.

The shipment and discharge of cargo can be

only carried on in the inner harbour between Kulang-su and Amoy, northern and southern limits. The authorised customs' jetties for the examination, landing, and shipment of goods, are those known as the Taou-mei-ma-tau, Kang-nh-kow, Sin-lo-tow, and Sai-long wharves.

Masters of merchant vessels must deposit their ships' papers and import manifest with their consul (if they have no consul, with the customs) within 48 hours after entering the port.

The import manifest must contain a true account of the cargo on board, and must be handed to the customs before any application to break bulk can be attended to.

The landing and discharging of cargo must be carried on within the limits of the inner-anchorage, and can only take place between sunrise and sunset, and cannot go on, without special provision, on Sundays and holidays. Cargo boats employed for the shipment and landing of merchandise cannot make use of other jetties than those specified above.

When ready to discharge cargo, the consignee must send to the customs an application in Chinese and English, giving full particulars of the cargo to be discharged, when he will be furnished with a permit to insure his consignment from the ship by which imported, and to place the same in a cargo boat. The cargo boat must then repair to one of the authorised jetties, in order that the goods may be examined and assessed for duty. A customs 'memo.' will thereupon be issued, to be taken to the bank by the consignee, who, upon payment of the duty therein noted, will be supplied with a 'duty receipt;' upon the presentation at the office of customs of the duty receipt, a duty-paid order will be issued. The goods imported may be removed from the customs jetty, and placed in the merchants' godown.

In the case of goods to be shipped, the shipper must send to one of the authorised jetties for examination, with an application in Chinese and English for a permit to ship, containing all necessary particulars. The goods will then be examined, and a customs memo. issued, and on the production at the office of the 'duty receipt,' a 'duty-paid order' will be issued authorising the shipment.

Cargo for which a shipment permit has been issued, but which cannot be received on board, must be brought to one of the authorised jetties for examination before being reloaded.

No transhipment can take place without special written permission.

Drawback exemption, or coast-trade duty certificates will be issued simultaneously with the permit for the shipment of goods covered by them; exemption or coast-trade duty certificates for goods imported must be presented simultaneously with the consignee's application for the permit to land.

Before application is made for the 'customs clearance,' the export manifest must be handed in. All dues and duties having been paid, the clearance will be issued.

Cargo boats must be registered at the customs, and must have their respective numbers conspicuously painted on them in English and Chinese characters. No cargo can be transhipped, shipped, or landed, without special permission, except in duly registered cargo boats.

For further particulars on the trade, &c. of Amoy, see Dr. Williams's *Chinese Commercial Guide* (1863) and Messrs. Mayers, Denny's, and Kings' *Treaty Ports of China and Japan* (1867). Both these works are published at Shanghai.

AMSTERDAM. The principal city of Holland,

situated on the Y, an arm of the Zuyder Zee, in lat. 52° 23' 17" N., long. 4° 53' 15" E. From 1580 to 1750, Amsterdam was, perhaps, the first commercial city of Europe; and though her trade has experienced a great falling off since the last-mentioned epoch, it is still very considerable. In 1785, the population is said to have amounted to 235,000; in 1815 it had declined to 180,179; but in December 1863 it had risen, according to the *Almanach de Gotha*, to 266,679. The harbour is spacious and the water deep; and it has recently been much improved by the construction of docks, two of which are already completed, and a third in a very advanced state. Owing, however, to a bank (the Pampus) where the Y joins the Zuyder Zee, large vessels going or coming by that sea are obliged to load and unload a part of their cargoes in the roads. The navigation of the Zuyder Zee is also, by reason of its numerous shallows, very intricate and difficult; and as there were no hopes of remedying this defect, it became necessary to resort to other means for improving the access to the port. Of the various plans suggested for this purpose, the preference was given to the scheme for cutting a canal capable of admitting the largest class of merchantmen, from the north side of the port of Amsterdam to Newdiep, opposite to the Texel, and a little to the east of the Helter. This canal has fully answered the views of the projectors, and has proved of signal service to Amsterdam, by enabling large ships to avoid the Pampus, as well as the difficult navigation of the Zuyder Zee, where they were frequently detained for three weeks, and to get to and from Newdiep without any sort of risk in less than 24 hours. The canal was begun in 1819, and completed in 1825. It has 5 sluices large enough to admit ships of the line; the dues and charges on account of towing, &c. being at the same time very moderate. At Newdiep the water is deeper than in any other port on the coast of Holland, and ships are there in the most favourable position for getting expeditiously to sea. This canal having been found insufficient in depth of water for large steamers, it was resolved to make a more direct communication between Amsterdam and the North Sea at Wky au Zee, by draining a portion of the river Y, and cutting a canal through the sandhills. This was begun by the Amsterdam Canal Company in 1865, and its completion is expected in about seven years. [CANALS.] The imports principally consist of sugar, coffee, spices, tobacco, cotton, tea, indigo, cochineal, wine and brandy, wool, grain of all sorts, timber, pitch and tar, hemp and flax, iron, hides, linen, cotton and woollen stuffs, hardware, rock salt, tin plates, coal, dried fish, &c. The exports consist partly of the produce of Holland, partly and principally of the produce of her possessions in the East and West Indies, and other tropical countries, and partly of commodities brought to Amsterdam, as to a convenient *entrepôt* from different parts of Europe. Of the first class are cheese and butter (very important articles), madder, clover, rape, hemp, and linseeds, rape and linseed oils, Dutch linen, &c. Geneva is principally exported from Schiedam and Rotterdam; oak bark and cattle principally from the latter. Of the second class are spices, coffee, and sugar, principally from Java, but partly also from Surinam, Brazil, and Cuba; indigo, cochineal, cotton, tea, tobacco, and all sorts of Eastern and colonial products. And of the third class, all kinds of grain, linsens from Germany, timber and all sorts of Baltic produce; Spanish, German, and English wools; French, Russian, and Hungarian wines, brandy, &c. The trade of Amsterdam may, indeed, be said to comprise

<b>Total</b> - - -	1,011. 90

Equivalent to about 87½ at 12 fl. per fl.

Ships are also towed by horses through the canal, which is far cheaper, but the wear and tear of ropes make the steamer preferable.

If a ship clear in ballast, and does not draw more than 9½ or 10 feet water, she can depart through the Zuider Zee, and in that case her expenses from Amsterdam to sea would amount to about 4l. or 5l. Ballast costs in Amsterdam 70 cents per ton, and 15 to 20 cents per ton for putting it on board.

Taking in ballast whilst in the canal, and putting it on board, cost 50 cents per ton.

Loading and stowing a general cargo cost from

55 to 60 cents per ton; discharging the same, from 35 to 40 cents per ton.

Ships laden from Great Britain, the Baltic, and north of the Canaries pay 9½ cents per ton for lights and beacons, and 3 cents per ton for bound; ships in ballast pay half of the dues for inward and beacons, and half of the canal dues instances (when laden and in ballast) the clearance at the custom-house is reduced to 3 fls.

Ships laden with timber or coals pay only half of the canal dues, and 8 cents per ton for dock and sluice dues, and half the towage dues across the river. Pilotage is likewise a little less when steam tugs are employed.

No ships are exempted from pilotage.

**Quarantine.**—The quarantine station is at the island of Wierengen, near the Helder.

**Commission.**—The usual rate of the commission or brokerage on the purchase or sale of goods is 2 per cent, and on bill transactions ½ and ⅓ per cent, according to their nature.

Provisions of all sorts are abundant at Amsterdam, and reasonably cheap. The wages of Amstercarpenters vary from 1 flcr. 20 cents to 1 flcr. 80 cents; that is, from about 2s. to 3s. a day.

For an account of the corn trade of Amsterdam, see CORN TRADE AND CORN LAWS.

**Custom-house Regulations.**—Captains of ships are bound to make, within 24 hours of their arrival at Amsterdam, or any Dutch port, their declaration in writing of the goods of which their cargo consists. If the captains be not acquainted with the goods of which the cargo consists, they must make their declaration under the general term of *merchandise*, and exhibit the bills of lading along with the declaration. The custom-house officers are instructed to inform the captains of almost all formalities required by law.

AMSTERDAM

East Indian possessions being a government monopoly is erroneous. As landlord of the greater part of Java the Dutch government obtains a large proportion and in some articles the whole of the government produce, except the very small portion sold in the island, is exclusively exported by the Netherlands Trading Society. This company having the monopoly of the export of the crown ment institution, but has had no concern in the government of the colony or any other connection with the state than as a mere agent of the Dutch joint stock company with limited liability. It has its head office in Amsterdam and its principal factory in Batavia, with agencies at the chief ports in Java, and in other parts of Netherland India.

The company was established at Amsterdam in 1821. Its original capital was 37,000,000 florins, or 3,000,000 sterling. This capital was reduced in 1827 to 24,000,000 florins, and in 1835 to 23,000,000. The company's first charter was for a term of 25 years, and an interest of 4 1/2 per cent. per annum was guaranteed by King William I. of Holland, who was himself one of the largest shareholders. The early adventures of the company appear not to have been successful. In 1827 part, and in 1830 the whole, of the guaranteed interest had to be paid by the King. It was in this year that the new Java culture system was introduced by General Van den Bosch, and from this period dates the prosperity of the company.

In return for the advances made by the society, the government was appointed the sole agent of the government supplies, and in exporting the government produce from Java and selling it in Holland. (The above is abridged from ch. viii, vol. i. of M. Money's excellent work on Java.) [BATAVIA.] An abridged and clearly defined tariff has long been wanting, and has at length been obtained. The law of August 15, 1862, unites the dispositions necessary for a tariff of duties, and all former laws are annulled.

The new tariff is so far distinct that almost all duties are made ad valorem. Only those articles are excepted which cannot be taxed as by measure, the duty on these being calculated so as not to surpass 5 per cent., the maximum fixed in the tariff. The articles not mentioned are duty free, and those articles which are not classed, but which are of use for manufacture, have to pay from 2 to 3 per cent. Only a few articles of luxury are higher charged. The 15 additional cents on the duty are abolished.

In the new tariff all the export-duties are repealed, except 5 guilders per 100 lbs. of rags. The fee for registering to naturalise foreign ships, before 4 per cent., is reduced to 2 per cent.

The difference of duties on importation of some tropical products from the Dutch colonies is annulled, likewise the distinction of flags, fixed by the law of August 8, 1850, relative to the navigation between the colonies and the Dutch harbours.

It is known that in 1850 the duty on transit was abolished. In 1851 (Law of September 2) the navigation taxes on the Maese were abolished; and a royal resolution of February 7, 1852, decreases the rates of pilotage. These liberal measures were followed by the suppression of the tonnage-taxes for sea-ships (Law of July 14, 1853).

The Dutch government also assimilates foreign ships with national ships, as well for direct as for indirect navigation. They have only to pay in

Dutch harbours the common duty, for lighthouses, buoys, &c.

[The above has been taken from an English translation of the Dutch tariff published at the Hague in 1862, and the London Gazette.]

The following are the principal articles of the Netherlands Customs law above referred to:—  
Art. 2.—No duty is to be paid on articles not mentioned in the tariff, except that they could be classed, according to their nature or destination, under one of the articles of merchandise mentioned in the list.

Art. 3.—No import-duty is to be paid on:  
a. Merchandise, re-landed within two years from Dutch colonial possessions, after being exported from the Netherlands.

b. Merchandise of certified Dutch origin, re-landed within two years, after being exported to foreign markets.

c. Merchandise re-landed, after being exported from the Netherlands to places where they cannot be imported in consequence of prohibition or augmentation of import-duty, which could not be known when exported.

Art. 4.—When merchandise mentioned by Art. 3 is exported from the Netherlands, with drawback allowed, it cannot be re-landed before the drawback is repaid.

Art. 5.—No import-duty is to be paid on provisions and victuals for consumption on board of inward-bound ships, save merchandise as declared as such, and this must not surpass the quantity fixed by the Law.

When they exceed the fixed quantity, freedom of import-duty will be granted, when they are to be exported in the same ship. In this case they must remain, until the exportation, under the care of the custom-house.

These articles are free of excise.  
Art. 6.—No import-duty is to be paid on:  
a. Utensils and cartages belonging to and used on rafts of wood descending the rivers, save that this use must be duly stated by an inventory when imported;

b. Goods belonging to ambassadors of Foreign States in the Netherlands, but only for those States where the goods of Dutch ambassadors are also exempted from duty;

c. Carriages wherewith Dutchmen return from a journey, or wherewith foreigners enter the country to make a journey;

d. Luggage for the use of travellers;

e. Furniture in use;

g. Empty bags, barrels, baskets, and objects used for the transport of merchandise when exported;

Art. 8.—For the calculation of the import-duty, the parts of the pound, the litre, the cubic ell or the florin, shall be counted for the whole.

Fractions of cents are counted for whole cents.  
Art. 9.—The import-duty is at least five cents for every declaration, however trifling the quantity or value may be.

Art. 10.—For merchandise, of which the tare is not fixed by the tariff, the following tare may be subtracted from the gross weight:  
a. For merchandise packed in barrels, or wooden boxes, fifteen per cent.;

b. For merchandise packed in leather, mats, baskets, canisters, linen, or such objects, eight per cent.

Art. 11.—When the importers are not content with the tare, as fixed by the preceding article, then they may pay the import-duty of the net weight, which shall be determined by the custom-officers at the expense of the importers.

Art. 12.—When there is a great number of barrels, casks, baskets, canisters, bales or packets

of the same size and sort, then the tare may be determined by weighing the empty objects, which shall be indicated by the custom-officer. The tare shall be fixed then according to the result.

*Art. 13.*—When ad-valorem goods are packed with those whereof duty is to be paid according to the weight, then the net weight can be determined by the custom-officers at the expense of the importer.

*Art. 14.*—For the determination of the import-duty for liquids which do not pay excises, the following deduction will be allowed for leakage.

*a.* When imported by sea, from the harbours of the North Sea and Baltic, of France, Portugal and Spain, from this side of the Strait of Gibraltar six per cent.; *b.* when imported from elsewhere twelve per cent.

*Art. 15.*—When the importer is not content with the deduction as fixed by the preceding article, he may pay duty for the real quantity, to be determined at his own expense.

*Art. 16.*—When liquids which do not pay excise, and which are charged according to the measure, are imported by land or by the rivers, no deduction will be allowed.

The duty is to be paid for the whole contents of barrels, except when the importer should prefer to have the real contents determined by the custom-officers, at his own expense.

*Art. 19.*—Imports prohibited are:

*a.* Reprints of books, the copyright of which exists in the Netherlands or in foreign states with which they have concluded copyright treaties.

*b.* Copper coin and plates for copper coin.

Copper-plates for coin, however, may be imported for the use of the mint, by paying the import duty as fixed by the tariff for beaten copper, leaves or plates.

*Art. 20.*—An export duty of 5 guilders per 100 lbs. shall be paid on linen and cotton rags, including old useless paper, torn or not, linen and cotton, worn clothes of linen and cotton, sold by weight, likewise pulp for paper, and all those objects when they are mixed with woollen rags.

An export duty of 5 guilders 50 cents per 100 lbs. shall be paid on unmixed woollen rags.

The following is the Royal resolution of October 6, 1862, for the execution of the Law of August 15, 1862, concerning the freedom of import-duty for ships' victuals and provisions.

*Art. 1.*—The quantity of ship-victuals and provisions for the consumption on inward-bound ships, which are, according to Art. 5 of the said Law, free of import duty or excises, is fixed:

*a.* For sailing-ships arriving along sea-side or by the rivers and for rafts per head of the crew: 5 ounces salt, 1 litre wine,  $\frac{1}{2}$  litre spirits, 2 litres beer, 5 ounces soap,  $\frac{1}{4}$  litre vinegar, 5 ounces sugar, 10 pounds pit-coals,  $\frac{1}{2}$  pound meat.

*b.* For every sea and River-steamer at once: 5 pounds salt, 10 litres wine, 20 litres beer, 5 pounds soap, 3 litres vinegar, 5 pounds sugar, 20 pounds meat, 5 pounds pit-coals per horse-power of the engine and per hour distance from the first office or the first expedition-office till the unloading place;

*c.* For other goods, which are imported by sailing-vessels, steamers, or rafts, at a quantity whereof the duty is no more than one guilder.

*Art. 2.*—The captain has to give a declaration at the first office of the quantity and sort of the victuals and provisions which are on board, with indication of the barrels, chests, and other packages.

*Art. 3.*—The captain has the disposal of the quantity of victuals and provisions, as said by Art. 1.

*Art. 4.*—When the victuals or provisions surpass the quantity fixed by Art. 1, then the custom-officers may apply such measures, either by mentioning on the general declaration, or by guarding or sealing, that the arrival on the unloading-place is secured.

When the goods arrive along the rivers, and no general declaration is made, then the captain is obliged to follow the prescriptions as fixed by Art. 1 of this resolution for the surpassing quantity. In that case shall be mentioned on the documents that those goods belong to victuals or provisions.

*Art. 5.*—The captain when arrived on the unloading place is obliged to put the victuals and provisions which he has not at his disposal, under the management of the custom-officers. The goods can be sealed by them on board of the ship or in bond, till they are exported again. When this cannot be done the captain is obliged to submit the goods to the usual formalities of the in and export or transit.

*Art. 6.*—This resolution takes effect on the 1st November 1862.

The business of insurance is extensively practised at Amsterdam: the premiums are moderate, and the security unexceptionable. The high duty formerly imposed in this country on policies of insurance contributed to the increase of this business in Holland.

*Credit, Discount, &c.*—The credit allowed on most articles is 3 months; some articles, however, are always sold for ready money; a discount is generally given in prompt payments; but the terms of credit on most articles and the discount allowed for ready money have been fixed by usage, and are regarded as essential conditions in every bargain. Some of the more important of these terms and discounts are specified in the following table. In consequence of the preference given in Holland to ready-money transactions, it is not a country in which adventurers without capital have much chance of speedily making a fortune. 'Rien, en effet, de plus facile que de s'établir à Amsterdam; mais rien de plus difficile que s'y soutenir sans des grandes ressources. Dans

cette ville, où l'argent abonde, où on le prête contre des sûretés à si bon marché, il est pourtant impossible de s'en procurer à crédit; et sans argent il n'y a plus de possibilité d'y travailler, que de trouver quelqu'un qui veuille de se charger d'un papier nouveau qui ne seroit pas appuyé d'un crédit que l'opinion, la protection, ou des effets réels feroient valoir à la bourse. Les Hollandois suivent là-dessus des maximes très-austères, même à l'égard des maisons d'une certaine considération.' (*Encyclopédie Méthodique de Commerce*, t. ii. p. 650.) But this *austerity* is not a disadvantage, but the reverse. It prevents commerce from degenerating, as it has too often done in other places, into gambling adventures, and puts it on a comparatively solid foundation. And it should be mentioned to the honour of the Dutch, and as a proof of the excellence of this system, that notwithstanding the distress and loss of trade occasioned by the invasion and occupation of their country by the French, the bankruptcies in 1795 and subsequent years were not, comparatively, so numerous as in England in ordinary seasons! The regulations in the Code Napoléon as to bankruptcy are enforced in Holland.

It has long been the practice in Holland to make, on selling articles, considerable deductions from their weight, particularly from those of large bulk, as compared with their value. These tare and drafts, as they are termed, are now fixed by ancient usage, and the most important amongst them are here specified.

The above allowances & deductions with import-duties upon goods excepted as are in 8 per cent. for mats, baskets &c. Exception: ing 55 kilos of chests weighing more. In case the tare fixed as a pay the duty on goods, in such custom-house & importers. In case there of packages of can be fixed by casks &c., to be

Tares and Allowances on the principal Articles sold at Amsterdam.

AMSTERDAM

Articles	Tares and Allowances	Discount
Coffee	3 per cent.	cash 1 per cent.; Neth. Trading Comp., 1 1/2 per cent.
Rice: in bales	5 kilos. per bale, 1 1/2 per cent. and 2 per cent.	2 per cent. and 1 per cent. for cash.
casks	2 1/2 kilos. per cask, and 1 1/2 per cent.	ditto.
half casks	2 1/2 kilos. per half cask, and 1 1/2 per cent.	ditto.
Tobacco: Maryland	nett weight, 1 per cent., 2 per cent., and 3 per cent.	1 per cent. and 1 per cent. for cash.
Virginia	3 per cent.	ditto.
Kentucky	ditto	ditto.
Java	2 kilos. per bale	ditto.
other kinds	according to agreement	1 per cent. for cash.
Butter: Erieland	7 kilos. per irkin	none.
N. & S.	8 kilos. per irkin, and 1 irkin	none.
Holland	4 1/2 kilos. per half irkin	none.
Cheese: Holland and Leyden	1 per cent.	1 per cent. for cash.
Edam	2 per cent.	ditto.
Gouda	1 per cent.	ditto.
Indigo	1 per cent. and 2 per cent.	ditto.
Cochineal	real tare	2 per cent. and 1 1/2 per cent. for cash.
Fustic	12 kilos. per mille, 2 per cent. and 3 per cent.	2 per cent. and 1 per cent. for cash.
Logwood	ditto	ditto.
Gums	and tare, 1 per cent. and 2 per cent.	ditto.
Madder	real tare, and 5 kilos. per cask. Casks are charged in account at about 5s. each	ditto.
Raw sugar: casks	15 per cent.	1 per cent. and 1 1/2 per cent. for cash.
cases	18 per cent.	2 per cent. and 1 per cent. for cash.
bags	8 per cent.	ditto.
baskets	1 per cent. and 12 per cent.	ditto.
Molasses	1 per cent.	1 per cent. and 1 1/2 per cent. for cash.
Tin plates	1 per cent. and 18 per cent.	2 per cent. and 1 per cent. for cash.
Herrings	—	ditto.
Cotton: Surat, Bengali, American, and Surinam	6 per cent.	ditto.
Japan and Chinese	nett weight	ditto.
Gin	—	cash.
Flax	—	ditto.
Hemp	2 per cent.	ditto.
Liquorice	nett tare, 1 kilo. for rope, and 1 per cent.	1 per cent. and 1 per cent. for cash.
Pepper	—	2 per cent., 1 per cent., and 1 per cent. for cash.
Cinnamon	5 kilos. per bale	2 per cent. for cash.
Claves, pimento, mace, and nutmeg	13 kilos. per bale, and 1 per cent.	1 1/2 per cent. for cash.
Ginger	nett weight	ditto.
Saltpetre	9 1/2 kilos. per case	1 per cent. for cash.
Wool: Cape	3 per cent.	2 per cent., 1 per cent., and 1 per cent. for cash.
Buenos Ayres	6 kilos. per bale	1 per cent.
Kurrachee	4 1/2 per cent.	ditto.

officers, and the tare for the whole quantity will then be reckoned according to the average weight.

When goods on which the duty is to be paid according to their weight, are packed together with goods taxed according to their value, the nett weight of the first can be taken by the custom-house officers at the expense of the importers.

For all liquids free or excisable, rated by the measure, on importation by sea, a reduction is granted for leakage as follows:—

Coming from ports in the North and Baltic Sea, France, Portugal, and Spain on this side of the Straits of Gibraltar, 6 per cent.; from other ports, 12 per cent.

If the importers think that this reduction for leakage is insufficient, or if they should assert a claim to a reduction in those cases in which the law does not grant it, they will be at liberty to pay duty according to the actual quantity, which is to be determined by the custom-house officers at the expense of the importers.

**Money.**—Accounts are kept in *guldens* and *cents*, of which 5 cents are equivalent to 1 *stiver*, and 100 cents, or 20 *stivers*, to 1 *guilder* or *florin*. The florin is equal to 1 *sd.* sterling par of exchange. Generally speaking, however, the rate of exchange is below par, varying from 11 florins 65 cents to 11.95. The coins in circulation are the *rijksdaalder*, or 250 cents, the *guilder*, or 100 cents, the *halve guilder*, or 50 cents, the *leucut guilder*, or 25 cents, the *dubbeltje*, or 10 cents, the *stuiver*, or 5 cents, the *cent* and the *halve cent*, all of which are of silver excepting the two last named, which are of copper. The bank notes in circulation are those of 1,000, 300, 200, 100, 60, 50, 40, 25 and 10 *gulden*. There is no gold coinage. Formerly gold and a great variety of silver coins were in circulation, but these have been called in.

**Weights and Measures.**—In 1820 the French system of weights and measures was introduced into the Netherlands, the names only being changed.

The *pond* is the unit of weight, and answers to the French *kilogramme*. Its divisions are the *ons*, *lood*, *wigtje*, and *korrel*. 1,015 *kilogrammes*, or *Netherlands' lbs.*, are equal to 2,240 *English lbs.* or 50 1/2 *kilogrammes* are equal to 1 *cwt*.

The *ell*, which is the unit or element of *long* measure, equals the French *metre*. Its decimal divisions are the *palm*, *duim*, and *streep*; and its decimal multiples, the *roede* and *mijle*.

The *vierkante ell*, or square ell, is the unit of superficial measure; and answers to the *centiare* or *metre carré* of France. Its divisions are the *vierkante palm*, *vierkante duim*, and the *vierkante streep*; and its multiples, the *vierkante roede* and *vierkante hunder*.

The *kubicke ell* is the unit of measures or capacity; and equals the French *stère*. Its divisions are the *kubicke palm*, *kubicke duim*, and *kubicke streep*.

The term *wisse* is given to a *kubicke ell* of firewood.

The *hop* is the unit of measures for dry wares, and is the cube of the palm; answering to the French *litre*. Its division is the *maatje*, and its multiples the *schepel* and *mudde*; the latter is also called the *zak*, and equals the French *hectolitre*. 30 *mudden* make 1 *last*.

The *kan* is the unit for liquid measure, and is the cube of the palm; it corresponds to the French *litre*. Its divisions are the *maatje* and *vingerhoel*, and 100 *kans* make a *vat* or *cask*, which equals the French *hectolitre*.

The apothecary's new lb. is 12 oz., 96 dr., 288 scr., or 5,760 gr.; and answers to 375 *gramm.* or 5,787 *English grains*.

The above are the customary tares and other allowances made by the merchants in their transactions with each other. But in paying the import-duties at the custom-house, the tare upon goods paying duty by weight is, with the exception undermentioned, fixed at 15 per cent. for such as are in casks or cases made of wood, and at 8 per cent. for such as are in packages, canisters, mats, baskets, leather, linen, &c.

**Exception: Tea.**—Of ordinary tea-chests weighing 55 kilos or more, 18 per cent.; ordinary tea-chests weighing less than 55 kilos, 25 per cent.

In case the importers are not satisfied with the tare fixed as above by the law of 1862, they can pay the duty according to the nett weight of the goods, in such a way as it shall be settled by the custom-house authorities, at the expense of the importers.

In case there are a great number of casks, cases, or packages of the same kind and size, the tare can be fixed by weighing a part of the empty casks &c., to be pointed out by the custom-house

By the old method of calculating, which is not yet entirely superseded, the lb. of Amsterdam was = to 1.09 lbs. avoirdupois, or 100 lbs. Amsterdam = 108.223 lbs. avoirdupois.

The last or measure for corn = 30 mudden = 10 11-10ths quarters Winchester measure. The *aan* 1 quid measure = 4 ankers = 8 steekans = 21 viertels = 64 stoops or stoppen = 281 mingles = 256 pints = 41 English wine gallons.

The stoop contains 5 1/2 pints English measure. 100 mingles are equal to 32 English wine gallons, or 26 1-5th English beer gallons, or 26 2/3 imperial gallons.

French wine is sold per hoghead of 180 mingles. Spanish and Portuguese wine per pipe of - - - - - 349 ditto.

French brandy, per hoghead of - 30 viertels. Beer, per barrel (equal to the *aam*) of - - - - - 128 mingles.

Vegetable oils, per *aam*, of - - - 120 ditto. Whale oil, per ditto - - - 16 ditto.

Rum is sold per *anker* of 2 steekans = 10 1/2 English wine gallons.

The foot of Amsterdam = 11 1-7th English inches. The Rhineland foot = 12 ditto. The *elk*, cloth measure = 27 1-12th ditto.

Rock salt is sold per hondert of 404 maaten, making 20 tons, or 4,000 lbs. Dutch.

Pit coal is sold per hooed of 38 maaten; 9 hooeds are 5 chaldrons of Newcastle, or 6 hooeds are 5 chaldrons of London.

Butter is sold per barrel; the barrel of Leyden is 320 lbs. nett—that of Friesland 28 lbs. nett—and the common Dutch barrel 336 lbs. gross.

A last of herrings is reckoned at 12, 13, or 14 barrels.

A last of pitch is 12 barrels. A last of tar, 13 Winchester quarters.

A bag of seed = 2 1/2 Winchester quarters. 8 hogsheds (or *oxhofs*) of wine }  
12 barrels of pitch } are reckoned  
13 barrels of tar } as one last  
20 chests of lemons, &c. } in settling  
4,000 lbs. of iron, copper, and co- } the freight  
lonial produce } of ships.  
4,000 lbs. of almonds  
2,000 lbs. of wool or feathers

A last of wheat is considered 10 per cent. higher than one of rye, and the latter 20 1/2 per cent. higher than oats, and 12 per cent. higher than seed. A last of ballast is only 2,000 lbs.—These details have been derived from the answers by the British consul to the circular queries; in the *Dictionnaire du Commerce (Ency. Method.)*, tom. ii. pp. 651-650; Kelly's *Cambist, private information*, &c.

A last for freight is 2,000 kilogrammes, equivalent to about 1 ton, 19 cwts. 1 qr. 18 lbs. English.

According to the tariff of the Netherlands' Trading Company the last, in settling freights from the Netherlands' East Indies, varies as follows:—

For Arrack	It equals	kilos.	For Gum benzoin	It equals	kilos.
Cochineal	"	1,500	Gum copal	"	1,500
Sugar	"	2,000	Gold dust	"	2,000
Coffee, in bags	"	1,800	Gutta percha	"	1,100

*Magnitude of the Commerce of Holland in the Seventeenth Century: Causes of its Prosperity and Decline.*—We believe we need make no apology for embracing this opportunity to lay before our readers the following details with respect to the commerce and commercial policy of Holland. It forms one of the most instructive topics of investigation; and it is to be regretted that so little attention should have been paid to it in this country.

Previously to the commencement of the long-continued and glorious struggle made by the Dutch to emancipate themselves from the blind and brutal despotism of Old Spain, they had a considerable marine, and had attained to distinction by their fisheries and commerce; and the war, instead of being injurious to the trade of the republic, contributed powerfully to its extension. After the capture of Antwerp by the Spaniards, in 1585, the extensive commerce of which it had been the centre was removed to the ports of Holland, and principally to Amsterdam, which then attained to the distinction she long enjoyed, of the first commercial city of Europe.

In 1602 the Dutch East India Company was formed; and notwithstanding the pernicious influence of that association, the Indian trade increased rapidly in magnitude and importance. Ships fitted either for commercial or warlike purposes, and having a considerable number of soldiers on board, were sent out within a few years of the establishment of the company. Amboyna and the Moluccas were first wrested from the Portuguese, and with them the Dutch obtained the monopoly of the spice trade. Factories and fortifications were in no long time established, from Bussorah, near the mouth of the Tigris, in the Persian Gulf, along the coasts and islands of India as far as Japan. Alliances were formed with several of the Indian princes; and in many parts, particularly on the coasts of Ceylon, and in various districts of Malabar and Coromandel, they were themselves the sovereigns. Batavia, in the large and fertile island of Java, the greater part of which had been conquered by the Dutch, formed the centre of their Indian commerce; and though unhealthy, its port was excellent, and it was admirably situated for commanding the trade of the Eastern Archipelago. In 1651 they planted a colony at the Cape of Good Hope, which had been strangely neglected by the Portuguese.

Every branch of commerce was vigorously prosecuted by the Dutch. Their trade with the Baltic was, however, by far the most extensive and lucrative of which they were in possession. Guicciardini mentions that the trade with Poland, Denmark, Prussia, &c., even before their revolt was so very great, that fleets of 300 ships arrived twice a year at Amsterdam from Dantzic and Livonia only; but it increased prodigiously during the latter part of the sixteenth and the beginning of the seventeenth centuries. The great population of Holland, and the limited extent and unfruitful nature of the soil, render the inhabitants dependent on foreigners for the greater part of their supplies of corn. The countries round the Baltic have always furnished them with the principal of those supplies; and it is from them that they have been in the habit of bringing timber, iron, hemp and flax, pitch and tar, tallow ashes, and other bulky articles required in the building of their houses and ships, and in various manufactures. Nothing, however, redounds so much to the credit of the Dutch, as the policy they have invariably followed with respect to trade in corn. They have, at all times, had

large capital embarked on this business. The variations which are perpetually occurring in the harvests, early led them to engage very extensively in a sort of speculative corn trade. When prices low, they bought and stored up large quantities of grain, in the expectation of profiting by the advance that was sure to take place on the occurrence of an unfavourable year. Repeated efforts prevail on the government to prohibit exportation; but they steadily refused to interfere. In consequence of this enlightened policy, Holland has long been the most important European entrepôt for corn; and her markets have on all occasions been furnished with the most abundant supplies. Those scarcities which are so very disastrous in countries without commerce, or where the trade in corn is subjected to fetters and restraints, have not only been totally unknown in Holland, but became a copious source of wealth to her merchants, who then obtained a ready and advantageous vent for the supplies accumulated in their warehouses. 'Amsterdam,' says Sir Walter Raleigh, 'is never without 700,000 quarters of corn, none of it of the growth of Holland; and a dearth of only one year in any other part of Europe enriches Holland for seven years. In the course of a year and a half, during a scarcity in England, there were carried away from the ports of Southampton, Bristol, and Exeter alone, nearly 200,000; and if London and the rest of England be included, there must have been 2,000,000, more.' (*Observations touching Trade and Commerce with the Hollander*, Miscel. Works, vol. ii.)

The very well-informed author of the *Richesse de la Hollande*, published in 1778, observes in allusion to these circumstances, 'Que la disette de grains règne dans les quatre parties du monde; vous trouverez du froment, du seigle, et d'autres grains à Amsterdam; ils n'y manquent jamais.' (Tome i. p. 376.)

The Bank of Amsterdam was founded in 1609. The principal object of this establishment was to obviate the inconvenience and uncertainty arising from the circulation of the coins imported into Amsterdam from all parts of the world. The merchants who carried coin or bullion to the Bank obtained credit for an equal value in its books; this was called bank-money; and all considerable payments were effected by writing it off from the account of one individual to that of another. This establishment continued to flourish till the invasion of the French in 1795.

Between the years 1651 and 1672, when the territories of the republic were invaded by the French, the commerce of Holland seems to have reached its greatest height. De Witt estimates at Munster in 1643, to 1669, at fully a half. He lost the greater part of her naval power; that since the peace, the Dutch had obtained most of the trade to that country, which had been previously carried on by the Hanseatic merchants and the English; that almost all the coasting trade of Spain was carried on by Dutch shipping; that Spain had even been forced to hire Dutch ships to sail to her American possessions; and that so great was the exportation of goods from Holland to Spain, that all the merchandise brought from the Spanish West Indies was not sufficient to make returns for them.

At this period, indeed, the Dutch engrossed, not by means of any artificial monopoly, but by the greater number of their ships, and their superior

skill and economy in all that regarded navigation, almost the whole carrying trade of Europe. The value of the goods exported from Flanders in Dutch bottoms, towards the middle of the fourteenth century, exceeded 40,000,000 livres; and the commerce of England with the Low Countries was, for a very long period, almost entirely carried on in them.

The business of marine insurance was largely and successfully prosecuted at Amsterdam; and the ordinances published in 1551, 1563, and 1570 contain the most judicious regulations for the settlement of such disputes as might arise in conducting this difficult but highly useful business. It is singular, however, notwithstanding the sagacity of the Dutch, and their desire to strengthen their industrious habits, that they should have prohibited insurance upon lives. It was reserved for England to show the advantages that might be derived from this beautiful application of the science of probabilities.

In 1690 Sir William Petty estimated the shipping of Europe at about 2,000,000 tons, which he supposed to be distributed as follows: viz. England, 500,000; France, 100,000; Hamburg, Denmark, Sweden, and Dantzic, 250,000; Spain, Portugal, and Italy, 250,000; that of the Seven United Provinces amounting according to him, to 900,000 tons, or to nearly one half of the whole tonnage of Europe! No great dependence can, of course, be placed upon these estimates; but the preponderance in favour of Holland would have been greater than it appears to be; for the official returns to the circulars addressed in 1701 by the commissioners of customs to the officers at the different ports, show that the whole mercantile navy of England amounted at that period to only 261,222 tons, carrying 27,196 men. (*Mempherson's Annals of Commerce*, anno 1701.)

It may, therefore, be fairly concluded that during the seventeenth century the foreign commerce and navigation of Holland was greater than that of all Europe besides; and yet the country which was the seat of this vast commerce had no native produce to export, nor even a piece of timber fit for ship-building. All had been the fruit of industry, economy, and a fortunate combination of circumstances.

Holland owed this vast commerce to a variety of causes: partly to her peculiar situation, the industry and economy of her inhabitants, the comparatively liberal and enlightened system of civil as well as of commercial policy adopted by the republic; and partly also to the wars and disturbances that prevailed in most European countries in the sixteenth and seventeenth centuries, and prevented them from emulating the successful career of the Dutch.

The ascendancy of Holland as a commercial state began to decline from about the commencement of last century. After the war terminated by the treaty of Aix-la-Chapelle, the attention of the government of Holland was forcibly attracted to the state of the shipping and foreign commerce of the republic. The discovery of the means by which their decline might be arrested, and the trade of the republic, if possible, restored to its ancient flourishing condition, became a prominent object in the speculations of everyone who felt interested in the public welfare. In order to procure the most correct information on the subject, ing queries to all the most extensive and intelligent merchants, desiring them to favour him with their answers:—

1. What is the actual state of trade? And if

the same should be found to be diminished and fallen to decay, then, 2. To enquire by what methods the same may be supported and advanced, or, if possible, restored to its former lustre, repute, and dignity?

In discussing these questions, the merchants were obliged to enter into an examination, as well of the causes which had raised the commerce of Holland to the high pitch of prosperity to which it had once attained, as of those which had occasioned its subsequent decline. It is stated that, though not of the same opinion upon all points, they, speaking generally, concurred as to those that were most important. When their answers had been obtained, and compared with each other, the Stadtholder had a dissertation prepared from them, and other authentic sources, on the commerce of the republic, to which proposals were subjoined for its amendment. Some of the principles advanced in this dissertation apply to the case of Holland only; but most of them are of universal application, and are not more comprehensive than sound. We doubt, indeed, whether the benefits resulting from religious toleration, political liberty, the security of property, and the freedom of industry, have ever been more clearly set forth than in this dissertation. It begins by an enumeration of the causes which contributed to advance the commerce of the republic to its former unexampled prosperity: these the authors divide into three classes, embracing under the first those that were natural and physical; under the second, those they denominated moral; and under the third, those which they considered adventitious and external; remarking on them in succession as follows:—

‘I. The natural and physical causes are the advantages of the situation of the country on the sea and at the mouth of considerable rivers; its situation between the northern and southern parts, which, by being in a manner the centre of all Europe, made the republic become the general market, where the merchants on both sides used to bring their superfluous commodities, in order to barter and exchange the same for other goods they wanted.

‘Nor have the barrenness of the country, and the necessities of the natives arising from that cause, less contributed to set them upon exerting all their application, industry, and utmost stretch of genius, to fetch from foreign countries what they stand in need of in their own, and to support themselves by trade.

‘The abundance of fish in the neighbouring seas put them in a condition not only to supply their own occasions, but with the overplus to carry on a trade with foreigners, and out of the produce of the fishery to find an equivalent for what they wanted, through the sterility and narrow boundaries and extent of their own country.

‘II. Among the moral and political causes are to be placed, the unalterable maxim and fundamental law relating to the free exercise of different religions; and always to consider this toleration and connivance as the most effectual means to draw foreigners from adjacent countries to settle and reside here, and so become instrumental to the peopling of these provinces.

‘The constant policy of the republic to make this country a perpetual, safe, and secure asylum for any persecuted and oppressed strangers. No alliance, no treaty, no regard for or solicitation of any potentate whatever, has at any time been able to weaken or destroy this law, or make the state recede from protecting those who have fled to it for their own security and self-preservation.

‘Throughout the whole course of all the persecutions and oppressions that have occurred in other countries, the steady adherence of the republic to this fundamental law has been the cause that many people have not only fled hither for refuge, with their whole stock in ready cash and their most valuable effects, but have also settled, and established many trades, fabrics, manufactories, arts, and sciences in this country, notwithstanding the first materials for the said fabrics and manufactories were almost wholly wanting in it, and not to be procured but at a great expense from foreign parts.

‘The constitution of our form of government, and the liberty thus accruing to the citizen, are further reasons to which the growth of trade, and its establishment in the republic, may fairly be ascribed; and all her policy and laws are put upon such an equitable footing, that neither life, estates, nor dignities depend on the caprice or arbitrary power of any single individual; nor is there any room for any person, who, by care, frugality, and diligence, has once acquired an affluent fortune or estate, to fear a deprivation of them by any act of violence, oppression, or injustice.

‘The administration of justice in the country has, in like manner, always been clear and impartial, and without distinction of superior or inferior rank, whether the parties have been rich or poor, or were this a foreigner and that a native; and it were greatly to be wished we could at this day boast of such impartial quickness and despatch in all our legal processes, considering how great an influence it has on trade.

‘To sum up all, amongst the moral and political causes of the former flourishing state of trade may be likewise placed the wisdom and prudence of the administration, the intrepid firmness of the councils, the faithfulness with which treaties and engagements were wont to be fulfilled and ratified, and particularly the care and caution practised to preserve tranquillity and peace, and to decline instead of entering on a scene of war, merely to gratify the ambitious views of gaining fruitless or imaginary conquests.

‘By these moral and political maxims were the glory and reputation of the republic so far spread, and foreigners animated to place so great a confidence in the steady determinations of a state so wisely and prudently conducted, that a course of them stocked this country with an augmentation of inhabitants and useful hands, whereby its trade and opulence were from time to time increased.

‘III. Amongst the adventitious and external causes of the rise and flourishing state of our trade may be reckoned—

‘That at the time when the best and wisest maxims were adopted in the republic as the means of making trade flourish, they were neglected in almost all other countries; and anyone reading the history of those times may easily discover that the persecutions on account of religion, throughout Spain, Brabant, Flanders, and many other states and kingdoms, have powerfully promoted the establishment of commerce in the republic.

‘To this happy result, and the settling of manufacturers in our country, the long continuance of the civil wars in France, which were afterwards carried on in Germany, England, and divers other parts, has also very much contributed.

‘It must be added, in the last place, that during our most burdensome and heavy wars with Spain and Portugal (however ruinous that period was for commerce otherwise), these powers had both neglected their navy; whilst the navy of the re-

(The Dissertation was translated into English, and published at London in 1751. We have quoted from the translation.)

We believe our readers will agree with us in thinking that these statements reflect the greatest credit on the merchants and government of Holland. Nothing, as it appears to us, could be conceived more judicious than the account they give of the causes which principally contributed to render Holland a great commercial commonwealth. The central situation of the country, its command of some of the principal inlets to the Continent, and the necessity under which the inhabitants have been placed, in consequence of the barrenness of the soil and its liability to be overflowed, to exert all their industry and enterprise, are circumstances that seem to be in a great degree peculiar in Holland. But though there can be no doubt that their influence has been very considerable, no one will pretend to say that it is to be compared for a moment with the influence of those free institutions which, fortunately, are not the exclusive attributes of any particular country, but have flourished in Phœnicia, Greece, England, and America, as well as in Holland.

Many dissertations have been written to account for the decline of the commerce of Holland. But, if we mistake not, its leading causes may be classed under two prominent heads: viz. first, the natural growth of commerce and navigation in other countries; and, second, the weight of taxation at home. During the period when the republic rose to great eminence as a commercial state, England, France, and Spain, distracted by civil and religious dissensions, or engrossed wholly by schemes of foreign conquest, were unable to apply their energies to the cultivation of commerce, or to withstand the competition of so industrious a people as the Dutch. They, therefore, were under the necessity of allowing the greater part of their foreign, and even of their coasting trade, to be carried on in Dutch bottoms, and under the superintendency of Dutch factors. But after the accession of Louis XIV. and the ascendancy of Cromwell had put an end to internal commotions in France and England, the energies of these two great nations began to be directed to pursuits of which the Dutch had hitherto enjoyed almost a monopoly. It was not to be supposed that when tranquillity and a regular system of government had been established in France and England, their active and enterprising inhabitants would submit to see one of their most valuable branches of industry in the hands of the foreigners. The Dutch ceased to be the carriers of Europe, without any fault of their own. Their performance of that function necessarily terminated as soon as other nations became possessed of a mercantile marine, and were able to do for themselves what had previously been done for them by their neighbours.

Whatever, therefore, might have been the condition of Holland in other respects, the natural advance of rival nations must inevitably have stripped her of a large portion of the commerce she once possessed. But the progress of decline seems to have been considerably accelerated, or, rather, perhaps, the efforts to arrest it were rendered ineffectual, by the extremely heavy taxation to which she was subjected, occasioned by the unavoidable expenses incurred in the revolutionary struggle with Spain, and the subsequent wars with France

and England. The necessities of the state led to the imposition of taxes on corn, on flour when it was ground at the mill, and on bread when it came from the oven; on butter, and fish, and fruit; on income and legacies; the sale of houses; and, in short, almost every article of either necessity or convenience. Sir William Temple mentions that in his time—and taxes were greatly increased afterwards—one fish sauce was in common use, which directly paid no fewer than *thirty* different duties of excise; and it was a common saying at Amsterdam, that every dish of fish brought to table was paid for *once* to the fisherman, and *six* times to the state.

The pernicious influence of this heavy taxation has been ably set forth by the author of the *Richesse de la Hollande*, and other well-informed writers; and it has also been very forcibly pointed out in the Dissertation already referred to, drawn up from the communications of the Dutch merchants. 'Oppressive taxes,' it is there stated, 'must be placed at the head of all the causes that have co-operated to the prejudice and discouragement of trade; and it may be justly said, that it can only be attributed to them that the trade of this country has been diverted out of its channel and transferred to our neighbours, and must daily be still more and more alienated and shut out from us, unless the progress thereof be stopped by some quick and effectual remedy: nor is it difficult to see, from these contemplations on the state of our trade, that the same will be effected by no other means than a *diminution of all duties*.'

'In former times this was reckoned the only trading state in Europe; and foreigners were content to pay the taxes, as well on the goods they brought hither, as on those they came here to buy; without examining whether they could evade or save them, by fetching the goods from the places where they were produced, and carrying others to the places where they were consumed: in short, they paid us our taxes with pleasure, without any further enquiry.'

'But, since the last century, the system of trade is altered all over Europe: foreign nations, seeing the wonderful effect of our trade, and to what an eminence we had risen only by means thereof, they did likewise apply themselves to it; and, to save our duties, sent their superfluous products beside our country, to the places where they are most consumed; and in return for the same, furnished themselves from the first hands with what they wanted.'

But, notwithstanding this authoritative exposition of the pernicious effects resulting from the excess of taxation, the necessary expenses of the state were so great as to render it impossible to make any sufficient reductions. And, with the exception of the transit trade carried on through the Rhine and Meuse, which is in a great measure independent of foreign competition, and the American trade, most of the other branches of the foreign trade of Holland, though still very considerable, continue in a comparatively depressed state.

In consequence principally of the oppressiveness of taxation, but partly, too, of the excessive accumulation of capital that had taken place, while the Dutch engrossed the carrying trade of Europe, profits in Holland were reduced towards the middle of the seventeenth century, and have ever since continued extremely low. This circumstance would of itself have sapped the foundations of her commercial greatness. Her capitalists, who could hardly expect to clear more than 2 or 3 per cent. of net profit by any sort of undertaking carried on

at home, were tempted to vest their capital in other countries, and to speculate in loans to foreign governments. There are the best reasons for thinking that the Dutch were, until very lately, the largest creditors of any nation in Europe. It is impossible, indeed, to form any accurate estimate of what the sums owing them by foreigners previously to the late French war, or at present, may amount to; but there can be no doubt that at the former period the amount was immense, and that it is still very considerable. M. Demeunier (*Dictionnaire de l'Economie Politique*, tom. iii. p. 720) states the amount of capital lent by the Dutch to foreign governments, exclusive of the large sums lent to France during the American war, at seventy-three millions sterling. According to the author of the *Richesse de la Hollande* (ii. p. 292), the sums lent to France and England only, previously to 1778, amounted to 1,500,000 livres tournois, or 60,000,000*l.* sterling. And besides these, vast sums were lent to private individuals in foreign countries, both regularly as loans at interest, and in the shape of goods advanced at long credits. So great was the difficulty of finding an advantageous investment for money in Holland, that Sir William Temple mentions, that the payment of any part of the national debt was looked upon by the creditors as an evil of the first magnitude. 'They receive it,' says he, 'with tears, not knowing how to dispose of it with interest with such safety and ease.'

Among the subordinate causes which contributed to the decline of Dutch commerce, or which have, at all events, prevented its growth, we may reckon the circumstance of the commerce with India having been subjected to the trammels of monopoly. De Witt expresses his firm conviction, that the abolition of the East India Company would have added very greatly to the trade with the East; and no doubt can now remain in the mind of anyone, that such would have been the case. (For proofs of this, see the article on the commerce of Holland in the *Edinburgh Review*, No. CII., from which most of these statements have been taken.) The interference of the administration in regulating the mode in which some of the most important branches of industry should be carried on, seems also to have been exceedingly injurious. Every proceeding with respect to the herring fishery, for example, was regulated by the orders of government, carried into effect under the inspection of officers appointed for that purpose. Some of these regulations were exceedingly vexatious. The period when the fishery might begin was fixed at five minutes past twelve o'clock of the night of June 21! and the master and pilot of every vessel leaving Holland for the fishery were obliged to make oath that they would respect the regulation. The species of salt to be made use of in curing different sorts of herrings was also fixed by law; and there were endless regulations with respect to the size of the barrels, the number and thickness of the staves of which they were to be made; the gutting and packing of the herrings; the branding of the barrels, &c. &c. (*Histoire des Pêches &c. dans les Mers du Nord*, tom. i. ch. xxiv.) These regulations were intended to secure to the Hollanders that superiority which they had early attained in the fishery, and to prevent the reputation of their herrings from being injured by the bad faith of individuals. But their real effect was precisely the reverse of this. By tying up the fishers to a system of routine, they prevented them from making any improvements; while the facility of counterfeiting the public marks opened a much wider door to fraud than would have been opened

had government wisely declined interfering in the matter.

In despite, however, of the East India monopoly, and the regulations now described, the commercial policy of Holland has been more liberal than that of any other nation. And in consequence, a country not more extensive than Wales, and naturally not more fertile, conquered, indeed, in great measure from the sea, from the irruptions of which it is defended by immense dykes, constructed and kept up at a vast expense, had accumulated a population of upwards of two millions; has maintained wars of unexampled duration with the most powerful monarchies; and besides laying out immense sums in works of utility and ornament at home, has been enabled to lend hundreds of millions to foreigners. To those who consider what intelligence, industry, and perseverance have done for Holland, the ingenious epigram of Piteairn will not appear extravagant—

Tellurem fecere Dii, sua littora Beldas,  
Immensaque fuit molis uterque labor.  
Dii v'cano spem, glomerant æthere terras,  
Nil ubi quod capitis possit obesse fuit.  
At Beldas maria, et credis, natusque terram  
Obstitit; obstantes hi domière Deos.

(*Selecta Poemata Piteairni*, Edinburgi, 1727, p. 2. Though he has not copied Piteairn, no doubt, that he has his recollection the famous epigram of Sannazarus on Venice: see the article on that city.)

During the occupation of Holland by the French, first as a dependent state, and subsequently as an integral part of the French empire, her foreign trade was almost entirely destroyed. Her colonies were successively conquered by England; and, in addition to the loss of her trade, she was burdened with fresh taxes. But such was the vast accumulated wealth of the Dutch, their prudence, and energy, that the influence of these adverse circumstances was far less injurious than could have been imagined; and, notwithstanding all the losses she had sustained, and the long interruption of her commercial pursuits, Holland continued, at her emancipation from the yoke of the French in 1814, to be the richest country in Europe! Java, the Moluccas, and most of her other colonies were then restored, and she is now in the enjoyment of a large foreign trade. Her connection with Belgium was an unfortunate one for both countries. The union was not agreeable to either party, and was injurious to Holland. Belgium was an agricultural and manufacturing country; and was inclined, in imitation of the French, to lay restrictions on the importation of most sorts of raw and manufactured produce. A policy of this sort was directly opposed to the interests and the ancient practice of the Dutch. But though their deputies prevented the restrictive system from being carried to an extent that materially affected the trade of Holland. Whatever, therefore, may be the consequences as to Belgium, there can be little doubt that the separation of the two divisions of the kingdom of the Netherlands will redound to the advantage of Holland. It must ever be for the interest of England, America, and all trading nations, to maintain the independence of a state by whose means their productions find a ready access to the great continental markets. It is to be hoped that the Dutch, profiting by past experience, will adopt such a liberal and conciliatory system towards the natives of Java, as may enable them to avail themselves to the full of the various resources of that noble island. they do this, and freely open their ports, with as few restrictions as possible, to the ships and commodities of all countries, Holland may still be the centre of a very extensive commerce, and may continue to preserve a respectable place among the mercantile nations. Even at this moment, after all the vicissitudes they have undergone, the Dutch are, beyond all question, the most opulent and industrious of European nations. And their present, no less than their former state, shows that a free system of government, security, and the absence of restrictions on industry, can overcome almost every obstacle; can convert the barren rock with verdure, and make the desert smile with flowers.

**ANCHORAGE or ANCHORING GROUND.** Good anchoring ground should neither be too hard nor too soft; for, in the first case, the anchor is apt not to take a sufficient hold, and in the other to drag. The best bottom is, and in the and next to it a firm sand. In a rocky bottom, the flukes of the anchor are sometimes torn away, and hepen cable are liable to chafe, and be cut through. It is also essential to a good anchorage that the water be neither too deep nor too shallow. When too deep, the pull of the cable, being nearly perpendicular, is apt to jerk the anchor out of the ground; and when too shallow, the ship is exposed to the danger, when riding in a storm, of striking the bottom. Where a ship is in water that is land-locked, and out of the tide, the nature of the ground is of comparatively little importance.

In most harbours and roadsteads the places where ships may anchor are pointed out, and all masters are bound, except when compelled by stress of weather to act otherwise, to obey the directions that may be given them in respect to anchoring by the harbour-master or other parties in authority. In some roadsteads peculiar localities is appropriated for the use of Her Majesty's ships, and merchant ships are generally prohibited, under considerable penalties, from anchoring in such locality.

Anchorage also means a duty laid on ships for the use of the port or harbour.

**ANCHORS AND CABLES** (Fr. ancre; Lat. anchora; Gr. ἀγκυρα; Ger. anker; Span. ancla-ancora; Port. ancora; Ita. ancori.) Are used in mooring ships. The common anchor consists of a *main piece* or *shank* crossed at the lower end by the *arms*, and at the upper end by the *stock* and the *arms* are placed at right angles to each other, and a *ring* is *shot* or riveted to the end of the stock. To this ring the cable is attached. This instrument is of great antiquity. The old Admiralty anchor differs but little from the anchor described by Pliny. *Swivel* anchors, such as Porter's and Trotman's, are of comparatively recent date.

**Law and practice respecting anchors.**—Every manufacturer of anchors shall, in case of each anchor which he manufactures, mark in legible characters on the crown and also on the shank under the stock his name and initials, with the addition of a progressive number and the weight of such anchor; and if he makes default in doing so he shall for each offence incur a penalty not exceeding 5*l.* (*Merchant Shipping Act, 1845, s. 483.*)

No ship is deemed seaworthy unless she be provided with suitable anchors and cables; and any deficiency in this respect has the same legal effect as if it were in the hull or rigging.

Vessels anchoring in a river or other narrow channel are bound to mark the situation of their

anchors by buoys; for if they do not, and other vessels be injured by coming in contact with them, they will have to make good the damage. (Abbott by Shee, p. 307, ed. 1854.)

When cables are cut or anchors cast away to avoid imminent danger, they become the subjects of general average.

The most important provisions of the Chain Cables and Anchors Act, 1864, 27 & 28 Vict. c. 27, are the following:

Sec. 2. Licenses to be granted by Board of Trade to persons called testers.

Sec. 7. Testers to be subject such anchors, &c. to the same trials as those to which similar implements in the navy are put, and stamp them.

Sec. 8. Certain charges for the service.

Sec. 11. From July 1, 1865, anchors, &c. must be tested before sale. Penalty, 50*l.*

Sec. 12. Penalties on fraud not more than 2 years, with or without hard labour, or with or without solitary confinement.

The following are the general conditions to be complied with by owners of proving establishments in order to obtain licenses under the Act.

1. The machine shall be constructed to test not more than 15 fathoms at one time.

2. In hydraulic machines the cylinder shall be sufficiently long to allow of 15 fathoms of chain fresh hold to complete the necessity for taking a

3. The apparatus shall be provided with levers and dead weight sufficient to test the accuracy of the machine and the strain actually applied to the cable. In hydraulic machines these levers and dead weight shall range to 25 per cent. of the full power of the machine, and shall be fitted in addition to the gun metal plunger and pressure gauges ordinarily fitted. In other than hydraulic machines the levers and dead weight shall range to the full power of the machine.

4. In hydraulic machines an indicator shall be fitted to show the strain at which a chain

5. An examining bench of proper height shall be provided in a light place for the purpose of examining the chains after they are tested, and before they are blacked.

6. The machine shall be so arranged that the workmen employed at and near to it shall be in no danger from the fragments of links that fly about when a cable breaks.

7. Where there is more than one machine in an establishment, the whole of them must be licensed if one of them is.

Although the Board of Trade will not refuse to license any machine simply on account of the proportions of the levers and knife edges named below not being observed, they recommend that in all future machines those proportions should be adopted.

8. The leverage of the lever apparatus to be attached to hydraulic machines (referred to in paragraph 3 above) should not exceed the proportion of 100 to 1.

9. In the lever apparatus to be attached to hydraulic machines (referred to in paragraph 3 above) the distance between the two centres of each lever should not be less than 4 inches in machines for testing up to 100 tons, and not less than 8 inches in machines for testing up to 200 tons, and not less than 12 inches in machines for testing up to 300 tons.

10. The length of the knife edges should not be less than at the rate of one inch for every five tons of pressure upon them, and the form of the knife edge should be in conformity with a pattern approved by the Board of Trade.

**ANCHOVY** (Fr. *anehois*; Ital. *acciughe*; Lat. *encrasicolus*). A small fish (*Clupea encrasicolus*, Lin.), common in the Mediterranean, resembling the sprat. Those brought from Gorgona in the Tuscan Sea are esteemed the best. They should be chosen small, fresh pickled, white outside and red within. Their backs should be round. The sardine, a fish which is flatter and larger than the anchovy, is frequently substituted for it. About 120,000 lbs. were entered for consumption in 1852. But being then subject to a duty of 2s. 10d. per lb., repealed in 1863, the imports have increased to 783,419 lbs. in 1865.

**ANGELICA** (Lat. *Archangelica officinalis*). A large umbelliferous plant, with hollow jointed stalks, of which there are several varieties. It grows wild, and is cultivated in moist places near London, and in most European countries from Lapland to Spain. Its roots are thick, fleshy, and resinous, have a fragrant agreeable smell, and a bitterish pungent taste, mixed with a pleasant sweetness glowing on the lips and palate for a long time after they have been chewed. To preserve them they must be thoroughly dried, and kept in closely stopped bottles. The other parts of the plant have the same taste and flavour as the roots, but in an inferior degree. The leaves and seeds do not retain their virtue when kept. The London confectioners make a sweetmeat of the tender stems. The faculty used to direct that none but the root of Spanish angelica roots are sometimes used as bread, and in Iceland the stalks are eaten with butter. Here the plant is used only in confectionary and the materia medica. (Lewis's *Mat. Med.*; Rees's *Cyclopaedia*, &c.)

A duty of 4s. per cwt. on angelica was repealed in 1845.

In Commerce, the wild angelica (*Angelica sylvestris*) is sometimes substituted for the cultivated variety, which has much more taste and odour.

**ANILINE**, formerly called Crystalline. A derivative from coal tar, largely used in the preparation of mauve and magenta dyes. It is a colourless oil-like liquid, of a strong odour and a hot aromatic flavour. The value of the exports of aniline in 1865 was, however, but 1,914l. (Watt's *Dictionary of Chemistry*; Ure's *Dictionary of Manufactures*.)

**ANISEED** (Fr. *anis*; Ital. *anise*; Lat. *anisum*). A small seed of an oblong shape. It is cultivated in Germany, but the best comes from Alicant in

## ANNATTO

59

Spain. It is also a product of China, whence it is exported. It should be chosen fresh, large, plump, newly dried, of a good smell, and a sweetish aromatic taste.

A duty of 5s. per cwt. on aniseed was repealed in 1845. In 1865, 2,257 cwts. were imported, the exports during the same year being 1,503 cwts.

**ANISEED STARS** (Fr. *badiane*; Chinese syn. *tú hurie* and *páh-kioh*, i.e. *eight horns*; the broken is known as *páh-kioh-chá*). This name is given to the fruit of a small evergreen tree, *Illicium anisatum*, which grows in Fukkien and the neighbouring provinces, in Japan and the Philippines. They are prized for their aromatic taste resembling anise. The name of *star* is applied to them on account of the manner in which they grow, the pods being in small clusters formed together at one end and diverging in six or seven rays. The husks have a more aromatic flavour than the seeds, but are not so sweet. Those which are bruised or mouldy should be rejected. They are chiefly exported to England and the continent of Europe. The average value in China is 15 dollars per picul.

*Oil of Aniseed* (Chinese, *páh-kioh-yú*).—This is made by distilling the pods and seeds. A picul of the raw material produces about 7 cetties of oil. It is put up in tin cases inclosed in wood, and exported chiefly to Europe and the United States. The average export is about 250 piculs annually, and the value 150 dollars per picul. It is used in perfumery, medicine, and confectionary. (Extracted from 6th edit. of Dr. Williams's *Chinese Guide*.)

**ANKER**. A liquid measure at Amsterdam. It contains about 10 1/2 gallons English wine measure.

**ANNATTO** or **ARNATTO** (Fr. *rocou*; Ger. *orlean*; Ital. *oriana*). A species of red dye formed of the pulp enveloping the seeds of the *Bixa orellana*, and West Indies; but dye is made, at least to any extent, only in the first.

It is prepared by macerating the pods in boiling water, extracting the seeds, and leaving the pulp to subside; the fluid being subsequently drawn off, the residuum, with which oil is sometimes mixed up, is placed in shallow vessels and gradually dried in the shade. It is of two sorts, viz. *flag* or *cake*, and *roll annatto*. The first, which is by far the most important article in a commercial point of view, is furnished almost wholly by Cayenne. It is imported in square cakes, weighing 2 lbs. or 3 lbs. each, wrapped in banana leaves. When well made, it should be of a bright yellow colour, soft to the touch, and of a good consistence. It imparts a deep but not durable orange colour to silk and cotton, and is used for that purpose by the dyers. Roll annatto is principally brought from Brazil. The rolls are small, not exceeding 2 oz. or 3 oz. in weight; it is hard, dry, and compact, brownish on the outside, and of a beautiful red colour within. The latter is the best of all ingredients for the colouring of cheese and butter; and is now exclusively used for that purpose in all the British and in some of the continental dairies. In Gloucestershire it is the practice to allow 1 oz. of annatto reckoned sufficient for a cheese of 60 lbs. are genuine, it neither affects the taste nor the smell of cheese or butter. The Spanish Americans mix annatto with their chocolate, to which it gives a beautiful tint. (Gray's *Supplement to the Pharmacopoeias*; London's *Ency. of Agriculture*, and *Private Information*.)

Previously to 1832 the duty on flag annatto was 18s. 8d. a cwt., and on other sorts 5l. 12s. The duty was then reduced to 1s. a cwt. on the former

and to 4s. on the latter, and was finally repealed in 1815.

In 1865, 3,647 cwts. were imported chiefly in the form of flag annatto. Of this the greater part came from France. The average value of roll was 4*l.* 5*s.*, of flag 8*l.* 3*s.* per cwt.; 722 cwts. were exported.

**ANNUITIES.** [INTEREST AND ANNUITIES.]  
**ANTIGUA.** [COLONY TRADE; ST. JOHN'S; SUGAR.]

**ANTIMONY** (Ger. and Dutch spiegelglas; Fr. antimoine; Ital. antimonio; Russ. antimonia; Lat. antimonium). A metal which, when pure, is of a greyish white colour, and has a good deal of brilliancy, showing a radiated fracture when broken; it is converted by exposure to heat and air into a white oxide, which sublimes in vapours.

It is found in Saxony and the Hartz, also in Cornwall, Spain, France, Mexico, Siberia, the Eastern Islands, and Martaban in Pegu. We are at present wholly supplied with this metal from Singapore, which receives it from Borneo.

It is also said to exist in considerable quantities in the province of Victoria, and in Tulare county, California. It is found in large quantities in the territory of Sarawak in Borneo, from which about 6,500*l.* worth was exported in 1863.

It is imported in the shape of ore, and commonly as ballast. It is about as hard as gold; its specific gravity is about 6.7; it is easily reduced to a very fine powder; its tenacity is such that a rod of  $\frac{1}{16}$ th of an inch diameter is capable of supporting 10 lbs. weight. Antimony is used in medicine, and in the composition of metal types for printing. The ores of antimony are soft, and vary in colour from light lead to dark lead grey; their specific gravity varies from 4.4 to 6.8; they possess a metallic lustre, are brittle, and occur in the crystallised massive forms. (Thomson's *Chemistry*, and *Private Information*.)

The imports into the United Kingdom of antimony in 1863, were, ore of antimony 1,948 tons, crude 1,171 cwts. and regulus 295 cwts. The value of the whole was about 23,500*l.* Antimony is also found in Tuscany at Pereta in the Maremme and also at Castagneto Meccano in the Volterrano. The mines at Pereta yielded in 1845 according to Pilla 48½ tons. A small amount (about 800 quintals) is annually produced in Spain. The production of the French antimony mines amounted in 1858 to 6,729 quintals, the total value of which was 144,759 francs. The mines from which these supplies were principally drawn were those of Corsica (3,750 quintals) and the Department of Cantal (2,000 quintals).

**ANTOL.** A Hungarian wine-measure containing about 116 imp. gallons.

**ANTWERP.** The principal seaport of Belgium, lat. 51° 13' 16" N., long. 4° 24' 10" E. A large, well-built, and strongly fortified city, on the Scheldt. Pop. in 1861, 114,669.

Previously to its capture by the Spaniards, under Farnese, in 1585, Antwerp was one of the greatest commercial cities of Europe; but it suffered much by that event. In 1648, at the treaty of Westphalia, it was stipulated by Spain and Holland that the navigation of the Scheldt should be shut up; a stipulation which was observed till the occupation of Belgium by the French, when it was abolished. In 1803, Napoleon I., who intended to make Antwerp a great naval establishment, undertook the construction of docks on a grand scale, for the accommodation of ships of war; and of 10 years new and convenient docks and warehouses have been opened for the use of the steamers and other vessels connected with the trade of the port. Down to 1863 the port charges

of Antwerp were extremely high. This was in consequence of the Belgians having charged themselves with a payment to indemnify the Dutch for consenting to abolish the duties they had been in the habit of levying on the vessels and goods ascending the Scheldt. To reimburse themselves, the Belgians imposed heavy tonnage, pilotage, and other duties on vessels entering Antwerp (which has more than three-fourths of the entire shipping trade of the country), Ostend, and other ports, and these, of course, were much objected to by the foreigners on whom they fell. At length, after a great deal of negotiation, the precedent set in the case of the Sound Duties was followed; the different powers agreeing to pay the Belgian Government certain sums proportioned to the extent of their trade with this city, &c., stipulating per contra that the tonnage duty should be abolished, and the charges for pilotage reduced at from 25 to 30 per cent. (Treaty of July 16, 1863, Art. 3). And though the trade of Antwerp has more recently been accidentally depressed, there can be no doubt that this effectual reduction of the charges on vessels entering her port will powerfully contribute to its advancement. Our contribution to the purchase, which was much the largest, amounted to 8,782,320 fr. Ships of the largest burden come up to the town, and goods destined for the interior are forwarded with the greatest facility by means of canals and railways.

From the principal part of the commerce of Belgium carried on by sea centring in Antwerp, it has again become a place of much commercial importance. The great articles of export are corn, especially wheat; flax, butter, cattle, sheep, and pigs; cast and wrought iron; muskets, fowling-pieces, and small arms, vast quantities of which are produced at Liège; woollen fabrics; linen ditto; clover and other seeds; coal, spelter, books, &c.

The great articles of import are raw cotton, sugar, coffee, and other colonial products; indigo and all sorts of dyewoods; spices, wine, machinery, rice, ashes, fish, oils, &c.

Goods may be warehoused in Antwerp, *en entrepôt*, at the rates of charge specified in a fixed tariff.

In 1864 the values of the imports into Belgium amounted to 688,878,101 francs, and those of the exports to 596,892,863 francs. The trade with England is the most extensive carried on with Belgium by sea, and next to it that with the Baltic, the United States, France, Holland, &c. The trade of France with Belgium generally is, however, much greater than that of any other country. But it is principally carried on by land, across the frontier between the two countries. A considerable proportion of the imports into Antwerp not being intended for home consumption, but for transit to other countries, their amount is commonly a good deal better than that of the exports.

The value of our imports from Belgium amounted in 1866 to 7,906,867*l.*, and of the exports of British productions to 2,861,065*l.* In the same year we exported to Belgium 3,920,908*l.* value of foreign and colonial merchandise.

*Conditions under which Goods are sold.*—On goods generally 2 per cent. is allowed for payment in twenty days, and 1½ per cent. on credit of six weeks or two months. On cottons at twenty days' credit, 3 per cent. are allowed, and 1½ per cent. on a credit of two or three months. Of ashes, hides, and sugar, 3 per cent. for twenty days, and 1½ per cent. for three months' credit.

Navigation Belgium, reduced tariff the advantage conceded to Belgium of the same year the two countries in either of them before the (Belgium).] Money, W. a system of money been adopted were kept in the quintal former referred to, = 10 Commercial Bank founded in Antwerp of 1,000,000 fr. each business. Here insurance companies to Brussels, 284 successful, and both cities, but a Custom-house arriving at Antwerp must make, with writing of the goods specifying the parcels, &c., their price at the time the name of the ship the captain, and belongs, &c.

The following charges at Antwerp tons, under the new

To pilotage from sea to  
 To ditto from Flushing  
 To ditto from Antwerp  
 To ditto from Flushing  
 To the pilot for a night  
 Pilots for moving the vessel  
 Sea Protest and extending  
 Tribunal of Commerce for  
 Surveyor's fees upwards  
 Harbour dues on 200 tons  
 For manifest, provision list  
 After bailli's mustering  
 Brokerage on 200 tons at  
 Light dues at 18 fr. 100 c.  
 Custom-house clearance  
 Bill of Health and visa, ac  
 Consul's fees

Total  
 at florins, 159 per  
 at 25 francs per  
 at francs 5-20 per

In addition to the charges, by regulation using the basins, &c.:

Vessels below 100 (Belgian tons)	100
from 100 to 150	150
151 to 200	200
201 to 250	250
251 to 300	300
above 300	350

These dues are reduced making more than two

3rd voyage, reduction of 6th voyage, reduction of 6th and succeeding voyages

Steam-vessels lading or at the quays will pay voyages in one year 20 ten voyages 15 centime voyage 10 centimes.

Previously to the abolition the shipping charges were they are now.

E. W. W. W.

Navigation was concluded between France and Belgium, securing mutually to each country reduced tariff rates and other concessions. All the advantages thus obtained by France were conceded to Great Britain by our treaty with Belgium of July 23, 1863. On November 13 of the same year a convention was signed between the two countries giving to joint stock companies in either of the two countries the right of appearing before the tribunals of the other. [TREATIES (Belgium).]

**Money, Weights, and Measures.**—The French system of moneys, weights, and measures has been adopted in Belgium. Formerly accounts were kept in florins, worth 1s. 8 $\frac{1}{2}$ d. sterling. The quintal formerly in use, and still sometimes referred to, = 103 $\frac{1}{2}$  lbs. avoirdupois. In 1837, the Commercial Bank, a joint-stock association, was founded in Antwerp. It has a capital of 25,000,000 fr. (1,000,000 $\frac{1}{2}$  sterling), divided into 25,000 shares of 1,000 fr. each, and transacts all sorts of banking business. Here, also, are two considerable insurance companies. The railway from Antwerp to Brussels, 28 $\frac{1}{2}$  miles in length, has been signally successful, and has been of great advantage to both cities, but especially to Antwerp.

**Custom-house Regulations.**—Captains of ships arriving at Antwerp, or any of the Belgian ports, must make, within 24 hours, a declaration in writing of the goods of which their cargo consists, specifying the marks and numbers of the bales, parcels, &c., their value, according to the current price at the time when the declaration is made, the name of the ship or vessel, as well as that of the captain, and of the country to which she belongs, &c.

The following is a pro formâ account of port charges at Antwerp, for a vessel measuring 200 tons, under the new system:—

To pilotage from sea to Flushing on 38 palms	fr. etc.
To ditto from Flushing to Antwerp, 38 ditto	79 55
To ditto from Antwerp to Flushing, 28 ditto	82
To ditto from Flushing to sea, 28 ditto	54
To the pilot for night on board and gratuity	27 09
Fines for moving the vessel in and out the dock	- - - - - 4 2
Sea Protest and extending same at Tribunal of Commerce	25
Tribunal of Commerce for appointing surveyors inwards	15
Surveyor's fees inwards	20
Harbour dues on 200 tons at 80 centimes and 15 per cent.	110
For manifest, provision list, stamps, &c.	- - - - - 11 20
Water bailiff's mustering of the crew and certificates	150
Brokerage on 200 tons at 75 centimes per ton	37 40
Light dues at 18 to 100 centimes per ton	- - - - -
Custom-house clearance papers, cancelling bonds	- - - - -
Bill of Health and visa, according to circumstances	- - - - -
Consul's fees	- - - - -
<b>Total</b>	<b>690 91</b>
at florins, 189 per francs 400	Florins 292 45
at 25 francs per pound sterling	£ 21 16
at francs 5-20 per American dollar	Dollars 119 75

In addition to the above, the following dues are charged, by regulation of July 22, 1863, to vessels using the basins, &c.:—

tons	centimes
Vessels below 100 (Belgian measure)	40 per ton
from 100 to 150	45 "
151 to 200	50 "
201 to 250	55 "
251 to 300	65 "
above 300	70 "

These dues are reduced as follows on vessels making more than two voyages in the year—

3rd voyage, reduction of one-fourth
4th voyage, reduction of one-half
5th and succeeding voyages, reduction of three-quarters

Steam-vessels lading or discharging in harbour or at the quays will pay per ton, for the first ten voyages in one year 22 centimes, for the second ten voyages 15 centimes, and for each following voyage 10 centimes.

Previously to the abolition of the Scheldt duties, the shipping charges were more than double what they are now.

**Entry at Lillo.**—(Lillo, the first Belgian custom-house, opposite Doel.) Here the custom-house officers come on board, and the master has to hand them:—

1. A manifest of the cargo, with the exact number of boxes, bales, casks, cases, packages, &c., with the marks, number and contents as exact as possible.

2. A specification of the provisions, such as salt, beef, pork, bread, flour, groats, peas, fish, butter, wine, brandy, gin, beer, coals, firewood and planks for dunnage, pigs, cauvras, new ropes, iron-ballast, &c. &c., also the number of the crew.

The vessel then proceeds for Antwerp with or without a custom-house officer, as may be prescribed.

The custom-house laws being very severe, every master of a vessel is recommended to be most particular in making this entry; but should a mistake have taken place, or there be goods in dispute, he should inform his broker at Antwerp on his arrival, so as to be enabled immediately to take the needful steps to obtain a rectification.

**Draft of Water.**—On the arrival of a vessel before the town, the pilot-boat goes alongside, to ascertain the draft of water in palms or decimeters; it is therefore advisable for the master or the mate to be present at the hooking, to convince himself of the real draft of water, according to which the sea and river pilotage are settled.

**Vessels remaining in the River.**—These must ride with two anchors or have a pilot on board, which costs from 4 francs 24 cents. per every twenty-four hours.

**Docking the Vessel.**—Every vessel must have a Belgian pilot, to bring her into the dock, as well as going out. The harbour-master assigns to each vessel her place in the dock, and no hauling can be done without his permission.

**Fire and Light.**—Vessels lying in the docks are prohibited to have fire and light on board, except during the winter season, when permission is usually granted by the police.

**Water Bailiff.**—A list containing the names of the crew, passengers and their passports, is handed to him on arrival. Sailors are paid off and engaged before this officer, who also orders the arresting of sailors on written demand of the master.

**Flag.**—On Sundays and holidays it is customary to have the colours hoisted.

**Cleanliness.**—Lying alongside the quay, the crew must take care that the place before the vessel be swept every day, and the rubbish put up against the poles, it being forbidden to throw any rubbish into the docks.

**Ballast.**—Sand ballast is brought alongside in lighters, and costs 2 francs 25 cents. per last of about 2 tons in the dock and 2 francs 10 cents. in the river. The lighters are discharged by the ship's crew or by labourers paid by the master. A tarpaulin or sail must be put between the vessel and the lighter, to prevent the sand from falling into the dock. Discharging ballast into lighters, costs in the dock 1 franc 55 cents.—in the river 1 franc 40 cents. per last. Fifteen per cent. additional on all these rates.

**Brokerage.**—Fixed by law at 75 centimes per ton measurement, which include reporting and clearing at the custom-house.

**Survey inwards.**—For the whole time of discharging, a vessel under 100 tons, 12 francs. 100 to 200 tons, 20 francs. 201 to 300 tons, 30 francs. 301 to 400 tons, 45 francs. 401 to 800 tons, 55 francs. 800 to 1,200 tons, 82 francs 25 cents. above 1,200 tons, 110 francs.

**Mooring.**—Masters must be particular, in mooring

their vessels, to have the chains or hawsers well secured with chafing gear so as not to injure the quays.

**Cooking-house charges.**—For vessels of all nations under 35 tons 1 franc, 35 to 100 tons 2 francs, 101 to 200 tons 3 francs, 201 to 300 tons 4 francs, 301 or above 5 francs, all with 15 per cent. additional.

A part of a week is reckoned as a whole. Vessels laid up in the dock pay after the first 2 months only  $\frac{1}{3}$  of the tax until they fit out again.

**Carriage dues.**—Vessels of all nations under 100 tons . . . francs per day, 100 to 149 tons 11 cents, per ton a day, 150 to 199 tons 13 cents., 200 to 249 tons 12 cents., 250 to 299 tons 11 cents., 300 to 349 tons 10 cents., 350 to 399 tons 9 cents., 400 and above 8 cents, per ton a day.

**N.B.**—All vessels leaving Antwerp must be provided with a surveyor's certificate that they are sea-worthy. When in ballast, this certificate costs from 6 francs to 13 francs 50 cents.; when loaded, from 10 francs to 30 francs, according to the burden of the vessel, besides 11 francs 40 cents. for certificate of tribunal. The cooking-house duties depend on the size of the vessel, and must be paid whether the house be used or not.

About 85 ships of from 11,000 to 12,000 tons burden belong to Antwerp; and from 4,000 to 5,000 passengers arrive annually at the city by the steam-packets from England.

In 1863, 2,553 vessels of 608,553 tons arrived at Antwerp; of these, 917 vessels of 236,758 tons were British. The number of vessels which arrived at all the Belgian ports in the same year was 3,893, the tonnage of which amounted to 712,373; of these, 597 of 62,525 tons were Belgian; 1,581 of 281,510 tons British; and the remainder Swedish, French, Dutch, &c.

The total number of vessels entering from Belgium into ports of the United Kingdom in 1866 was 2,916, with a tonnage of 674,956.

The commerce of Belgium is almost exclusively confined to European countries; the trade with those countries being about 95 per cent. of the whole.

**Fisheries.**—In 1863 there were 275 smacks

measuring 9,579 tons engaged in the Belgian Fisheries.

**Value of Belgian Imports and Exports in 1863.**

	Imports.	Exports.
Home consumption . . . . .	616,390,000	653,709,000
From Great Britain . . . . .	1,000,000	107,500,000
Total . . . . .	1,168,000,000	991,700,000

The general condition of Belgium is singularly prosperous, and her public revenue is almost annually in excess of the expenditure. In addition to great and well-developed agricultural resources she possesses in her mineral and metallurgic industries a large source of wealth. Of these last we subjoin a table compiled by Mr. Barron, her Majesty's secretary of legation at Brussels, from an original source, and which exhibits their condition and progress during recent years.

**Table and Number of the Belgian Merchant Marine, 1837-63.**

Years	Number			Tonnage		
	Sailing Vessels	Steamers	Total	Sailing Vessels	Steamers	Total

## APPRAISER

are Hereford, Monmouth, Gloucester, Worcester, Somerset, and Devon. Mr. Marshall estimated the produce of the first four at 30,000 hogsheds a year, of which Worcester is supposed to supply 10,000; but it is now probably much greater. Half a hogshed of cider may be expected, in an ordinarily favourable season, from each tree in an orchard in full bearing. The number of trees on an acre varies from 10 to 40, so that the quantity of cider must vary in the same proportion, that is, from 5 to 20 hogsheds. The produce is, however, very fluctuating; and a good crop seldom occurs above once in three years. (*London's Encyc. of Agriculture, &c.*)

Besides the immense consumption of native apples, we import, for the table, large supplies of French and other foreign apples. In 1842, the French and other foreign apples, in an ad valorem duty, which had previously been an ad valorem one of 5 per cent., was fixed at 6d. per bushel on raw, and 2s. per bushel on dried apples; and in 1853 the duties were further reduced to 3d. per bushel on raw, and 1s. per bushel on dried apples. This duty is now repealed. During 1865, 732 entries for consumption amounted to 515,732 bushels. The apples produced in the vicinity of New York are universally admitted to be the finest of any; but unless selected and packed with care, they are very apt to spoil before reaching England. The exports of apples from the United States land, during the year ended June 30, 1864, amounted to 183,697 barrels, valued at 487,140 dollars. Of these, 59,606 barrels besides 3,164 bushels of dried fruit were shipped for the United Kingdom. (*Papers laid before Congress.*)

By the 13 & 14 Vict. c. 97, APPRAISER. By the 13 & 14 Vict. c. 97, every person except a licensed auctioneer, who for hire exercises the occupation of an appraiser to value property, repairs and labour, must take out an annual 40s. license, under a penalty of 50l. for non-compliance.

Appraisers omitting to write and set down in figures every valuation made by them, within 14 full amount on paper duly stamped, and within 14 days deliver the same to their employers, are subject to a penalty of 50l. No person may pay for or receive an appraisal unless the same be written on stamped paper under penalty of a fine of 20l. One stamp only is required for the whole appraisalment. The amount received in 1865-6 for appraisers' licenses granted in the United Kingdom was 7,502l.

APPRENTICE. A person of either sex, bound by indenture to serve some particular individuals, or company of individuals, for a specified time, in or of some art, science, or trade, is called an apprentice.

According to the common law of England, everyone has a right to employ himself at pleasure in every lawful trade. But this sound principle was almost entirely subverted by a statute, passed in the fifth year of the reign of Queen Elizabeth, commonly called the Statute of Apprenticeship. It enacted that no person should, for the future, exercise any trade, craft, or mystery, at that time exercised in England and Wales, unless he had previously served to it an apprenticeship of seven years at least; so that what had before been a bye-law of a few corporations, became the general and statute law of the kingdom. Luckily, however, the courts of law were always singularly disinclined to give effect to the provisions of this statute; and the rules which they established for its interpretation served materially to mitigate its injurious operation. But though its impolicy had been long apparent, it was continued till 1814, when it was repealed by the 54 Geo. III. c. 36. This Act did not interfere with any

## APPRENTICE

of the existing rights, privileges, or bye-laws of the different corporations; but wherever these do not interpose, the formation of apprenticeships, and their duration, are left to be adjusted by the parties themselves.

Merchant ships of 80 tons and upwards were formerly obliged to carry a certain number of apprentices in proportion to their tonnage (7 & 8 Vict. c. 112). But this obligation was suppressed in 1849, by the 12 & 13 Vict. c. 29. And as the obligation to have a certain proportion of the crew British subjects has also been put an end to (16 & 17 Vict. c. 131 s. 31), the manning of ships is now quite free.

The Merchant Shipping Act of 1854 regulates, by the following sections, apprenticeships to the Sea Service.

Apprenticeships to the Sea Service. Sec. 141.—All shipping masters appointed under this Act shall, if applied to for the purpose, give to any board of guardians, overseers, or other persons desirous of apprenticing boys to the sea service, and to masters and owners of ships requiring apprentices, such assistance as is in their power for facilitating the making of such apprenticeships, and may receive from persons availing themselves of such assistance such fees as may be determined in that behalf by the Board of Trade, with the concurrence, so far as relates to pauper apprentices in England, of the Poor Law Board in England, and so far as relates to pauper apprentices in Ireland, of the Poor Law Commissioners in Ireland.

Sec. 142. In the case of every boy bound apprentice to the sea service by any guardians or overseers of the poor, or other persons having the authority of guardians of the poor, the indentures shall be executed by the boy and the person to whom he is bound in the presence of and shall be attested by two justices of the peace, who shall ascertain that the boy has consented to be bound, and has attained the age of twelve years, and is of sufficient health and strength, and that the master to whom the boy is to be bound is a proper person for the purpose.

Sec. 144. Subject to the provisions hereinbefore contained, all apprenticeships to the sea service made by any guardians or overseers of the poor, or persons having the authority of guardians of the poor, shall, if made in Great Britain, be made in the same manner and be subject to the same laws and regulations as other apprenticeships made by the same persons, and if made in Ireland shall be subject to the following rules; (that is to say,)

1. In every union the guardians of the poor, or other persons duly appointed to carry into execution the Acts for the relief of the destitute poor, and having the authority of guardians of the poor, may put out and bind as an apprentice to the sea service any boy who or whose parent or parents is or are receiving relief in such union, and who has attained the age of twelve years, and is of sufficient health and strength, and who consents to be so bound;
2. If the cost of relieving any such boy is chargeable to an electoral division of a union, then (except in cases in which paid officers act in place of guardians) he shall not be bound as aforesaid unless the consent in writing of the guardians of such electoral division or of a majority of the guardians (if more than one) be first obtained, such consent to be, when possible, indorsed upon the indentures;
3. The expense incurred in the binding and outfit of any such apprentice shall be charged to the union or electoral division (as the case

may be) to which the boy or his parent or parents is or are chargeable at the time of his being apprenticed :

- All indentures made in any union may be sued upon by the guardians of the union or persons having the authority of guardians therein for the time being, by their name of office, and actions brought by them upon such indentures shall not abate by reason of death or change in the persons holding the office; but no such action shall be commenced without the consent of the Irish Poor Law Commissioners :
- The amount of the costs incurred in any such action, and not recovered from the defendant therein, may be charged upon the union or electoral division (as the case may be) to which the boy or his parent or parents was or were chargeable at the time of his being apprenticed :

AQUA FORTIS. [*Acidus (Nitric Acid).*]

AQUAMARINE. [*Uranium*]

AQUA VITÆ (Ger. aquavit; Fr. eau de vie; Ital. aqua vite; Span. agua de vida; Russ. wodka; Lat. aqua vite). A name familiarly applied to all native distilled spirits; equivalent to the eau de vie, or brandy, of the French, the whisky of the Scotch and Irish, the geneva of the Dutch, &c. In this way it is used in the excise laws relating to the distilleries.

ARANGOES. A species of beads made of rough coraline.

They are of various forms, as barrel, bell, round, &c., and all drilled. The barrel-shaped kind cut from the best stones, are from two to three inches long, and should be chosen as clear as possible, whether red or white, having a good polish and free from flaw. The bell-shaped are from one to two inches long, being in all respects inferior. Considerable quantities were formerly imported from Bombay, for re-exportation to Africa; but since the abolition of the slave trade, the imports and exports of arangoes are comparatively trifling. (Milburn's *Orient. Com.*)

ARCHANGEL. The principal commercial city of the north of Russia, in lat. 64° 32' 8" N., long. 40° 33' E., on the right bank of the Dwina, about 35 English miles above where it falls into the White Sea. The growth of the town is steady. The harbour is at the island of Sollenbole, about a mile from the town. The bar at the mouth of the Dwina has from 13 to 14 feet water; so that ships drawing more than this depth must be partially loaded outside the bar from lighters. The Dwina being a navigable river, traversing a great extent of country, and connected by canals with the Volga on the one hand, and the Neva on the other, Archangel is a considerable *entrepôt*. It was discovered in 1554, by the famous Richard Chancellor, the companion of Sir Hugh Willoughby in his voyage of discovery; and from that period down to the foundation of Petersburg, was the only port in the Russian empire accessible to foreigners. Though it has lost its ancient importance, it still enjoys a pretty extensive commerce. The principal articles of export are wheat and oats, rye and rye-flour, tallow, flax, hemp, timber, linseed, potash, mats, tar, &c. Deals from Archangel, and Omega in the vicinity of Archangel, are considered superior to those from the Baltic. Hemp not so good as at Riga, but proportionally cheaper. Tallow is also inferior. Iron, which is sometimes exported, same as at Petersburg, sometimes cheaper and sometimes dearer. The quality of the wheat exported from Archangel is about equal to that from Petersburg. The imports, which are not very extensive, con-

sist principally of sugar, coffee, spices, salt, woollens, hardware, &c.

The following Tables exhibit the principal features of the trade of Archangel. Its most important trade is, as will be seen, with this country.

Value of Exports from Archangel.

Year	Value (£)
1859	1,007,706
1860	554,708
1861	758,662
1862	767,809
1863	556,173

Whereof to Great Britain—

Year	Value (£)
1859	1,007,706
1860	554,708
1861	758,662
1862	767,809
1863	556,173

These amounts represent the official values (based on the market value) with the addition of shipping charges.

The quantities of the principal exports in each of some years, distinguishing the quantities shipped to Great Britain, in 1863, were as follow:—

Bank.—There is a branch of the Imperial Bank of Russia at Archangel. Exporters generally pay cash for produce. The money is generally obtained from the Archangel bank on bills drawn on St. Petersburg at 40 days' date. The discount charged on these bills is 1½ per cent. (equal F)

to 10½ per cent. per annum). Sums payable at inland places have to be sent by post insured for ½ per cent. Rates of Exchange, same as at St. Petersburg.

**Lighthouses.**—A lighthouse was erected in 1864 at Svriatoi Noss, lat. 68° 9' 50" N., long. 39° 47' 40" E. Fixed white light, visible 20 miles; the light is kept burning from August 1 to November 1. The lighthouse for the port of Archangel is at Moudinga, near the Berezov bar at the entrance of the principal channel of the Dwina on the W. coast of Moudinga Island, lat. 64° 55' 30" N., long. 40° 16' 0" E. Fixed white light. Archangel pilots are to be found here: they meet vessels 4 miles outside the shoals of the bar.

**Telegraphs.**—There is a telegraphic communication between Archangel and St. Petersburg and from thence to London. A message of 20 words, including address and signature, to London costs 6 roubles 83 copees, equal to about 11. sterling.

[Principally derived from Mr. Renny's excellent *Consular Reports.*]

The trade of Archangel is much influenced by the demand from the more southerly parts of Europe, and especially from England, for corn. When a brisk demand is anticipated, oats are brought in large quantities from the interior, sometimes even from a distance of 1,500 miles, in covered barks capable of holding several hundred quarters. But as there are few extensive mercantile establishments here, the supplies are scanty, except when a large demand is expected for some time previously to the season for bringing them down. (*Odley's European Commerce, and private information.*)

**Moneys, Weights, and Measures,** same as at PETERSBURG.

ARCHIL. [ORCHELLA.]

ARECA PALM [*Areca catechu*]. [BETEL LEAF; BETEL NUT.]

ARGOL, ARGAL, or TARTAR (Ger. weinstein; Dutch wynsteen; Fr. tartre; Ital. Span., and Port. tartaro; Russ. winni kamen; Lat. tartarus). A hard crust formed on the sides of the vessels in which wine has been kept; it is red or white according to the colour of the wine, and is otherwise impure. On being purified, it is termed *cream* or *crystals of tartar*. It consists principally of bitartrate of potash.

White argol is preferable to red, as containing less drossy or earthy matter. The marks of good argol of either kind are, its being thick, brittle, hard, brilliant, and little earthy. That brought from Bologna is reckoned the best, and fetches the highest price. Argol is of considerable use among dyers, as serving to dispose of the stuffs to take their colours the better. Pure argol, or cream of tartar, is extensively used in medicine. It has an acid and rather unpleasant taste. It is very brittle, and easily reduced to powder: specific gravity 1.95.

The duty on argol, of 6d. per cwt., was repealed in 1845.

The imports and exports of argol in 1866 amounted to 18,250 cwts., of the value of 57,967l. Argol is chiefly produced in France, from which country there were exported in 1863, 2,636,852 kilos, valued at 3,410,797 francs.

ARISTOLOCHIA (Fr. serpentaire; Ger. schlangenzwanzel; Ital. serpentaria; Lat. aristolochia serpentaria). The dried root of Virginia snake-root, or birthwort: it is small, light and bushy, consisting of a number of fibres matted together, sprung from one common head, of a brownish colour on the outside, and pale or yellow within. It has an aromatic smell something like that of valerian, but more agreeable; and a warm, bitterish,

pungent taste, very much resembling camphor.—(*Ency. Metrop.*)

ARMS. [FIRE-ARMS.]

ARRACK or RACK (Fr. arac; Ger. arrack, rack; Dutch arak, rak; Ital. araco; Span. arak; Port. araco; Russ. arak), a spirituous liquor manufactured at different places in the East.

Arrack is a term applied in most parts of India, and the Indian islands, to designate every sort of spirituous liquor; a circumstance which accounts for the discrepancy in the statements as to the materials used in making it, and the mode of its manufacture. The arrack of Goa and Batavia is in high estimation; that of Colombo or Ceylon has been said to be inferior to the former; but this is doubtful. Goa and Colombo arrack is invariably made from the vegetable juice *toddy*, which flows by incision from the cocoa-nut tree (*Cocos nucifera*). After the juice is fermented, it is distilled and rectified. It usually yields about an eighth part of pure spirit. Batavia or Java arrack is obtained by distillation from molasses and rice, with only a small admixture of toddy. When well prepared, arrack is clear and transparent; generally, however, it is slightly straw-coloured. Its flavour is peculiar; but it differs considerably, no doubt, in consequence of the various articles of which it is prepared, and the unequal care taken in its manufacture. In England, arrack is seldom used except to give flavour to punch; formerly the imports were quite inconsiderable; but they have recently been a good deal greater, though as they are mixed up in the official returns with rum from India, it is impossible to state their exact amount. In the East its consumption is immense. It is issued to the soldiers in India as part of the established rations; and it is supplied, instead of rum, to the seamen of the royal navy employed in the Indian seas. It is one of the principal products of Ceylon. It is sold in Ceylon by the legger of 150, and in Java by the legger of 160 gallons. The duty on arrack, &c. is 10s. 6d. per gallon.

Its average value in Ceylon varies from 12l. to 8l. per legger, but it fell to 6l. 10s. in 1862. The exports of arrack from Java were in 1859, 12,673 leggers, valued at about 49,000l.; the principal exports were to Holland; it is subject to an export duty of 6 per cent. unless exported in Dutch ships, when it is free.

*Pariah-arrack* is a phrase used to designate a spirit distilled in the peninsula of India, which is said to be often rendered unwholesome by an admixture of *ganga* (*Cannabis sativa*), and a species of *Datura*, in the view of increasing its intoxicating power. But it is not clear whether the term *pariah-arrack* be meant to imply that it is an inferior spirit, or an adulterated compound. This liquor is sometimes distilled from cocoa-nut toddy, and sometimes from a mixture of jaggery, water, and the barks of various trees. (Milburn's *Oriental Com.*; Mr. Marshall's valuable *Essay on the Cocoa-Nut Tree*, p. 18.)

ARROBA. A Spanish and Portuguese measure of weight and capacity. It is still in general use in Spain and Portugal and in the Central and South American Republics. The standard Spanish arroba for wine is 981 cubic inches or 3.54 gallons, and for oil 771 cubic inches or 2.78 gallons. The Spanish arroba of weight equals 25.36 lbs. avoird., and the Portuguese 32.38 lbs. The Central American and Hungary arroba equals 25.35 lbs. avoird.; that of Brazil 32.38 lbs. The weight arroba of Chili equals 25.36 lbs., and the liquid arroba 6.70 Imp. gallons.

antidote to the poisoned arrows of the Indians. The powder is prepared from roots of a year old. It is reckoned a very wholesome, nutritious food; it is often adulterated, when in the shops, with the starch or flour of potatoes. It is a native of South America; but has been long introduced into the West Indies, where it forms a pretty important article of cultivation. An excellent kind of arrow-root, if it may be so called, is now prepared in India from the root of the *Curcuma angustifolia*. The plant is abundant on the Malabar coast, where the powder is made in such quantities as to be a considerable object of trade. Some of it has been brought to England. The *Maranta arundinacea* has been carried from the West Indies to Ceylon, where it thrives extremely well, and where arrow-root of the finest quality has been manufactured from it. A very finely prepared meal of Indian corn is now largely used as a substitute for this ingredient. (Ainslie's *Mat. Indica*.)

Imports, &c., of arrow-root in 1864, were 15,440 cwt., of the value of 41,661*l*.

Large quantities of *Canna arrow-root (Canna edulis)* or 'tous les mois' are produced in Queensland and manufactured in the neighbourhood of Brisbane. Queensland also produces the true white arrow-root of a quality fully equal to the best kinds of Bermuda arrow-root. The *canna arrow-root* is of comparatively little value at present in the English market on account of the abundant supply. (*Jury Report, Exhibition 1862*.) The extensive consumption of the finely-prepared flours of maize, no doubt, tends considerably to check any great progress in the consumption of arrow-root.

**ARSENIC** (Ger. arsenik; Fr. arsenic; Ital. and Span. arsenico; Russ. mischjah; Lat. arsenicum). This metal has a bluish white colour not unlike that of steel, and a good deal of brilliancy. It has no sensible smell while cold, but when heated it emits a strong odour of garlic, which is very characteristic. It is the softest of all the metallic bodies, and so brittle that it may easily be reduced to a very fine powder by trituration in a mortar. Its specific gravity is 5.76. (Thomson's *Chemistry*.) Arsenic is chiefly obtained from Cornwall and South Wales.

Metallic arsenic is not used in the arts, and is not, therefore, extracted from the ore, except for the purposes of experiment or curiosity. The arsenic of commerce is the white oxide, or *arsenious acid* of chemists. It is a white, brittle, compact substance, of a glassy appearance; is inodorous; has an acrid taste, leaving on the tongue a sweetish impression; and is highly corrosive. In its metallic state arsenic exerts no action on the animal system; but when oxidised, it is a most virulent poison. The arsenic of the shops is sometimes adulterated with white sand, chalk, or gypsum; the fraud may be detected by heating a small portion of the suspected powder; when the arsenic is dissipated, leaving the impurities, if there be any, behind. Though the most violent of all the mineral poisons, the white oxide of arsenic, or the arsenic of the shops, is yet, when judiciously administered, of great efficacy. It is also used for various purposes in the arts. It is principally imported from Saxony and Bohemia.

White arsenic is extensively used in the preparation of various pigments, and also in the mineral gums used by paper-stainers and others. It is employed in the manufacture of glass and porcelain, a small portion making the glass transparent, a larger quantity opalescent. (Hunt's *Ure's Dictionary of Arts, &c.*)

**ARTIFICIAL FLOWERS** (Ger. künstliche blumen; Dutch, kunstbloemen; Swed. blommar

artificiella; Dan. kunst blomster; Fr. fleurs artificielles; Ital. fiori finti or contrafatti; Span. flores de mano; Chinese, chi-hwa). Artificial flowers are made from feathers, shells, papers, insects' wings, cambric, &c. Their manufacture forms an important branch of industry, particularly in France and the United Kingdom. This manufacture is of very ancient date. According to P'liny, they were used in Rome 350 years a.c., and they are said to have been known to the Chinese in the third century. In Spain and Italy they were made at a very early period from silk, cambric, and gauze, and are reported to have been introduced from the latter country into France towards the end of the 15th century, when the manufacture was carried on at Lyons, and subsequently at Paris. Such flowers however appear to have been used not for personal, but for church adornments. The real progress of the manufacture in France began in the last century. In 1738 Seguin de Mendes at Paris commenced the manufacture of artificial flowers of a natural character, and in 1770 a Swiss improved it. Since that period the trade has been constantly developed and is fast progressing. The value of the artificial flowers produced in Paris in 1847 was upwards of 11,000,000 francs, and in 1858 was estimated at 16,000,000 francs.

In the former period there were 622 manufacturers employing 6,153 hands, of whom the larger proportion were women, at an average rate of wages of 3 francs 77 cents. for the men and 1 franc 94 cents. for the women. In 1860 the number of manufacturers in Paris was altogether 1,317, and the value of their productions 28,082,013 francs. The number of hands employed was 7,831. Average rate of wages for men 3 francs 75 cents. for women 2 francs 50 cents. The annual production of artificial flowers in the French provinces is estimated at about 1,000,000 francs.

The following table exhibits the declared values of the exports of this article from France:—

	1817	1857
	fr.	
United States	433,000	1,795,000
Great Britain	336,500	1,186,000
Zollverein	115,000	286,000
Belgium	57,000	487,500
Italian States	30,000	86,500
Brazil	32,000	85,500
Other countries	237,000	619,500
Total	1,240,500	4,116,000

The manufacture of artificial flowers in Great Britain is carried on principally in the metropolises.

**ASAFETIDA** (Ger. tenfeldsdrach, stinkasant; Dutch, duiveldreck; Fr. assa-fetida; Sp. asa-fetida; Lat. asa-fetida; Arab. liltect; Pers. nngoozen). A gum resin, consisting of the inspissated juice of a large umbelliferous plant, the *Narthex asafetida*. It is produced in the southern provinces of Persia, and in the territory of Sindh, or country lying at the mouth of the Indus, flourishing abundantly in the mountainous provinces of Laar and Khorassan. It is exported from the Persian Gulf to Bombay and Calcutta, whence it is sent to Europe. It has a nauseous, somewhat bitter, biting taste, and an excessively strong, fetid, alliaceous smell: the never it is, it possesses its smell and other peculiar properties in the greater perfection. It is imported, packed in

irregular masses, in mats, cas's, and cases; the last being in general the best. It should be chosen clean, fresh, strong-scented, of a pale reddish colour, variegated with a number of fine, white tears; when broken, it should somewhat resemble marble in appearance; and, after being exposed to the air, should turn of a violet red colour. That which is soft, black, and foul, should be rejected. The packages should be carefully examined, and ought to be tight to prevent the smell from injuring any other article. The imports are at present so trivial, that they are not distinguished separately in the returns of imports and exports. Here, indeed, it is only used in the *Materia Medica*; but in France, it is used both in that way, and to some extent also as a condiment. It is worth in the London market from 12s. to 4l. per cwt.

In India the price of *asafoetida* is about 2s. per pound.

**ASH (COMMON).** The *Fraxinus excelsior* of botanists, a forest tree of which there are many varieties. It is abundant in England, and is of the greatest utility.

The ash is of very rapid growth; and, unlike most other trees, its value is rather increased than diminished by this circumstance. Like the chestnut, the wood of young trees is most esteemed. It grows on a great variety of soils, but is best where the growth has been most vigorous. It is

ferior to the oak in stiffness, and is more easily split; but in toughness and elasticity it is far superior to the oak, or to any other species of timber. Hence its universal employment in all those parts of machinery which have to sustain sudden shocks, such as the circumference, teeth, and spokes of wheels, ship-blocks, &c., and in the manufacture of agricultural implements; in the latter it is employed almost exclusively. So important indeed is the use of ash in these implements, and so large has been the development of this branch of manufacturing industry, that the price of ash timber has more than doubled during the last ten or fifteen years. The want of prolonged durability is its greatest defect; and it is too flexible to be employed in building. The wood of old trees is of a dark brown colour, sometimes beautifully figured; the wood of young trees is brownish white, with a shade of green. The texture is alternately compact and porous: where the growth has been vigorous, the compact part of the several layers bears a greater proportion to the sponge, and the timber is comparatively tough, elastic, and durable. It has neither taste nor smell, and when young, is difficult to work. (*Treatise on Principles of Carpentry*.)

**ASHES** (Ger. *vedasse*; Ger. *waidasche*; Dutch, *weedas*; Dan. *veedasse*; Ital. *feccia bruciata*; Span. *alumbre de lez*; Russ. *veidasch*; Lat. *cineres infectorii*). The residuum or earthy part of any substance after it has been burnt. In Commerce, the term is applied to the ashes of vegetable substances; from which are extracted the alkaline salts called **BARI LA**, **KELP**, **PEARL-ASH**, **POTASH**, &c.

**ASPHALTUM.** [BITUMEN.]

**ASSETS.** In Commerce, a term used to designate the stock in trade, and the entire property of all sorts, belonging to a merchant or to a trading association. It is also applied to goods or property placed, for the discharge of some particular trust or obligation, in the hands of executors, assignees, &c. [BANKRUPTCY.]

**ASSENTO.** A Spanish word signifying a contract. In commercial history, it means the contract or agreement by which the Spanish government ceded first to a company of French,

and afterwards (by the treaty of Utrecht) to a company of English merchants, the right to import, under certain conditions, a specified number of slaves into the Spanish colonies. (For full particulars with respect to this contract, see Mr. Bandinel's valuable work on the Slave Trade.)

**ASSIGNEE.** A person appointed by competent authority to do, act, or transact some business, or exercise some particular privilege or power, for or on account of some specified individual or individuals.

Assignees may be created by deed, or by law: by deed, where the lessee of a farm assigns the same to another; by law, where the law makes an assignee, without any appointment of the person entitled, as an executor is assignee in law to the testator, and administrator to an intestate. The term is most commonly applied to the official assignees appointed to manage bankrupt estates. [BANKRUPTCY.]

**ASSIZE.** [BREAD.]

**ASSURANCE.** [INSURANCE.]

**ATOCIA GRASS.** A name sometimes given to **ESPARTO FIBRE**.

**AUCKLAND.** The principal town and seat of government in the British colony of New Zealand. Population in 1861, 7,989.

The colony of New Zealand consists of three islands, called New Ulster, New Munster, and New Leinster. The islands lie between 34° and 48° S. latitude, and 166° and 179° E. longitude. They were discovered and partially explored by Tasman in 1642, and still more fully by Cook in 1777. The first settlement of New Zealand took place in 1814; the colony was constituted in 1839; and gifted with a separate constitution in 1840.

The chief exports of New Zealand are gold and gold dust, wool, and Kowrie gum. In the three years 1863-5, the value of gold and specie exported amounted to 2,529,479l., 2,081,347l., and 2,293,017l.; of wool to 830,295l., 1,070,397l., 1,141,761l. The total exports were 3,485,405l., 3,401,667l., 3,713,218l. The imports during the same years were 7,024,674l., 7,000,655l., 5,594,977l.; the chief articles being drapery, wines and spirits, and provisions. Of these quantities 2,197,473l., 2,071,229l., and 1,720,587l. represent British trade.

The tonnage of Auckland in 1865 was 13,094, the vessels registered in the port 300, and the imports and exports of the town were in the same year 1,842,416l., and 234,410l. The imports and exports of Otago, or Dunedin, are far larger; but this town is situated in the gold district.

**AUCTION.** A public sale of goods to the highest bidder. Auctions are generally notified by advertisement, and are held in some open place. The biddings may be made either by parties present, or by the auctioneer under authority given to him: the sale is usually terminated by the fall of a hammer.

The duties on property sold by auction were repealed in the year 1845.

The auction duties, which were first imposed in 1777, consisted of duties proportioned to its value, charged on certain descriptions of property when sold by auction. They amounted to 7d. per pound sterling on the value of estates, houses, annuities, shares in public companies, ships, funds, and some other articles; and to 1s. per pound on the value of household furniture, books, horses, carriages, and all other goods and chattels. The exemptions were, however, very numerous, comprising various descriptions of movable property, with all sorts of property sold by order of the court: of chancery and exchequer, or for behoof of creditors; or under distress for rent, &c.

AUCTIONEER. A person who conducts sales by auction. It is his duty to state the conditions of sale, to declare the respective biddings, and to terminate the sale by knocking down the thing sold to the highest bidder. An auctioneer is held to be lawfully authorised by the purchaser to sign a contract for him, whether it be for lands or goods. And his writing down the name of the highest bidder in his book is sufficient to bind any other person for whom the highest bidder purchased even though such person be present, provided he do not object before entry. The following provisions with respect to auctioneers are embodied in the 8 Viet. c. 15.

Every auctioneer must take out a license (renewable annually on July 5), for which he is to be charged 10*l.* The duty collected in the United Kingdom in 1865-6 amounted to 49,080*l.*

The statute then goes on to enact—

*Auction License not necessary in certain Cases.*—

It shall not be necessary for any person selling any goods or chattels by auction in any of the cases hereinafter mentioned to take out the license by this Act required, viz. any person selling any goods or chattels by auction under a distress for nonpayment of rent or tithes to less amount than 20*l.*; or under authority of the Act 6 Geo. IV. c. 48, 'For the Recovery of Small Debts in Scotland'; or under authority of the Act 6 & 7 Wm. IV. c. 75, intitled 'An Act to extend the Jurisdiction and regulate the Proceedings of the Civil Bill Courts in Ireland,' and the Act 7 Wm. IV. c. 1 Viet. c. 43, intitled 'An Act to amend the Laws for the Recovery of Small Debts by Civil Bill in Ireland'; or under authority of the Act 7 Wm. IV. & 1 Viet. c. 41, intitled 'An Act for the more effectual Recovery of Small Debts in the Sheriff Courts and for regulating the Establishment of Circuit Courts for the Trial of Small Debt Causes by the Sheriffs in Scotland,' or under authority of any other Act or Acts of parliament now in force in which the like exemption as by the Act specified is given to the proper officer of court executing the process of such court to sell the effects seized by him by auction, without asking out or having any license as an auctioneer, provided the sum for which such process is enforced is under 20*l.*—Sec. 5.

6 Geo. IV. c. 81 s. 8 repealed, and 1 Excise License to be sufficient.—So much of the Act 6 Geo. IV. c. 81 as enacts 'that every person exercising or carrying on the trade or business of an auctioneer or selling any goods or chattels, lands, tenements, or hereditaments by auction, shall, over and above any license to him or her granted as an auctioneer, take out such license as is required by law to deal in or retail, or to vend, trade in, or

sell, any goods or commodities, for the dealing in or retailing or vending, trading in or selling of which an excise license is specially required, before he or she shall be permitted or authorised to sell such goods or commodities by auction, and if any such person shall sell any such goods or commodities as aforesaid by auction without having taken out such license as aforesaid for that purpose, he or she shall be subject and liable to the penalty in that behalf imposed upon persons dealing in or retailing, vending, trading, or selling any such goods or commodities without license, notwithstanding any license to him or her before granted as aforesaid for the purpose of exercising or carrying on the trade or business of an auctioneer, or selling any goods or chattels, lands, tenements, or hereditaments by auction, anything herein contained to the contrary notwithstanding,' together with the proviso thereto attached, and so much of any other Act or Acts of parliament by which it is required that a separate and distinct license shall be taken out by any auctioneer selling by auction gold or silver plate or patent medicines, or any other articles, are hereby repealed; and any auctioneer having at the time in force a license on which the duty under the provisions of this Act has been paid may sell by auction any such property, goods, or commodities, without taking out any other license in such respect, any other Act or Acts to the contrary thereof notwithstanding.—Sec. 6.

Clause 7 orders that every auctioneer, before he shall commence any sale, shall suspend or affix a ticket or board containing his full Christian name and surname and place of residence in large letters to some conspicuous part of the room or place where the auction is held, under a penalty of 20*l.*

Clause 8 enacts that every person acting as auctioneer shall produce his license, or make a deposit of 10*l.* on pain of 1 month's imprisonment, on the demand at the time of any sale by auction of any officer of excise, customs, or stamps and taxes.

An auctioneer who declines to disclose the name of his principal at the time of sale makes himself responsible. But if he disclose the name of his principal, he ceases to be responsible, either for the soundness of or title to the thing sold, unless he have expressly warranted it on his own responsibility.

If an auctioneer pay over the produce of a sale to his employer, after receiving notice that the goods were not the property of such employer, the real owner of the goods may recover the amount from the auctioneer.

It has long been a common practice at certain

auctions (called for that reason *mock auctions*) to employ *puffers*, or mock bidders, to raise the value of the articles sold by their apparent competition, and many questions have grown out of it. It was long ago decided, that if the owner of an estate put up to sale by auction employ puffers to bid for him, it is a fraud on the real bidder, and the highest bidder cannot be compelled to complete his contract. (6 *T. Rep.* p. 642.) But it would seem as if the mere employment of puffers under any circumstances were now held to be illegal. "The inclination of the courts at the present time is, that a sale by auction should be conducted in the most open and public manner possible; that there should be no reserve on the part of the seller, and no collusion on the part of the buyers. Pulling is illegal, according to a late case, even though there be only one puffer; and it was then decided that the recognised practice at auctions, of employing such persons to bid upon the sale of horses, could not be sustained." (Woolrych *On Commercial Law*, p. 262.)

A party bidding at any auction may retract his offer at any time before the hammer is down. Another clearly established principle is, that verbal declarations by an auctioneer are not to be suffered to control the printed conditions of sale; and these, when pasted up under the box of the auctioneer, are held to be sufficiently notified to purchasers.

Auctioneers, like all other agents, should carefully observe their instructions. Should those who employ them sustain any damage through their carelessness or inattention, they will be responsible. They must also answer for the consequences, if they sell the property intrusted to their care for less than the price set upon it by the owners, or in a way contrary to order.

An auctioneer who has duly paid the license duty is not liable, in the city of London, to the penalties for acting as a *broker* without being admitted agreeably to the 6 Anne c. 16.

The establishment of mock auctions is a common practice among swindlers in London. Persons are frequently placed at the doors of such auctions, denominated *barbers*, to invite strangers to come in; and puffers are in wait to bid up the article much beyond its value. A stranger making an offer at such an auction is almost sure to have the article knocked down to him. Plated goods are often disposed of at these auctions; but it is almost needless to add, they are of very inferior quality. Attempts have sometimes been made to suppress mock auctions, but hitherto without much success.

AUSTRALIA. [ADELAIDE; BRISBANE; COLONIES AND COLONY TRADE; MELBOURNE; SYDNEY; &c.]

AVERAGE (Fr. *avarie*; Ital. *germinamento*). For an elaborate dissertation on the origin of this term, see Arnould's *Marine Insurance*, 3rd edit. with Mr. Maclellan's note, p. 738). A term used in Commerce and Navigation to signify a contribution made by the individuals, when they happen to be more than one, to whom a ship, or the goods on board it, belong, or by whom it or they are insured; in order that no particular individual or individuals amongst them, who may have been forced to make a sacrifice for the preservation of the ship or cargo, or both, should lose more than others. 'Thus,' says Mr. Serjeant Marshall, 'where the goods of a particular merchant are thrown overboard in a storm to save the ship from sinking; or where the masts, cables, anchors, or other furniture of the ship, are cut away or destroyed for the preservation of the whole; or money or goods are given as a composition to pirates to save the rest; or an expense is incurred in reclaiming the ship, or defending a

suit in a foreign court of admiralty, and obtaining her discharge from an unjust capture or detention; in these and the like cases, where any sacrifice is deliberately and voluntarily made, or any expense fairly and *bonâ fide* incurred, to prevent a total loss, such sacrifice or expense is the proper subject of a general contribution, and ought to be rateably borne by the owners of the ship, freight, and cargo, so that the loss may fall equally on all, according to the equitable maxim of the civil law—no one ought to be enriched by another's loss: "Nemo debet locupletari aliena jactura."

Upon this fair principle is founded the doctrine of average contributions; regulations with respect to which having been embodied in the Rhodian law, were thence adopted into the Roman law; and form a prominent part of all modern systems of maritime jurisprudence. The rule of the Rhodian law is, that 'if, for the sake of lightening a ship in danger at sea, goods be thrown overboard, the loss incurred for the sake of all, shall be made good by a general contribution.'—(*Dig. lib. xiv. tit. 2, s. 1*; Schomburg, *On the Maritime Laws of Rhodes*, p. 60.)

Formerly it was a common practice to ransom British ships when captured by an enemy, the ransom being made good by a general average. But this practice having been deemed disadvantageous, it was abolished by stat. 22 Geo. III. c. 25, which declares, 'That all contracts and agreements which shall be entered into, and all bills, notes, and other securities, which shall be given by any person or persons, for ransom of any ship or vessel, merchandise, or goods, captured by the subjects of any state at war with his Majesty, or by any person committing hostilities against his Majesty's subjects, shall be absolutely void in law, and of no effect whatever; and a penalty of 500*l.* is given to the informer, for every offence against this Act.

Average is either *general* or *particular*; that is, it either affects all who have any interest in the ship and cargo, or only some of them. The contributions levied in the cases mentioned above, come under the first class. But when losses occur from ordinary wear and tear, or from the perils naturally incident to a voyage, without being *voluntarily* encountered, such as the accidental springing of masts, the loss of anchors, &c., or when any peculiar sacrifice is made for the sake of the *ship only*, or of the *cargo only*, these losses, or this sacrifice, must be borne by the parties immediately interested, and are consequently deeded by a *particular* average.

There are also some small charges called *petty* or *accustomed* averages; it is usual to charge one third of them to the ship and two thirds to the cargo.

No general average ever takes place, except it can be shown that the danger was imminent, and that the sacrifice made was *indispensable*, or *supposed to be indispensable, by the captain and officers for the safety of the ship and cargo*. The captain, on coming on shore, should immediately make his protests; and he, with some of the crew, should make oath that the goods were thrown overboard, masts or anchors cut away, money paid, or other loss sustained, for the preservation of the ship and goods, and of the lives of those on board, and for no other purpose. The average, if not settled before, should then be adjusted, and it should be paid before the cargo is landed; for the owners of the ship have a *lien* on the goods on board, not only for the freight, but also to answer all averages and contributions that may be due. But though the captain should neglect his duty in this respect, the sufferer would not be without

a remedy, but might bring an action either against him or the owners.

The laws of different states, and the opinions of the ablest jurists, vary as to whether the loss incurred in defending a ship against an enemy or pirate, and in the treatment of the wounded officers and men, should be made good by general or particular average. The Ordinance of the Hanse Towns (art. 35), the Ordinance of 1681 (liv. iii. tit. 7, s. 6), and the *Code de Commerce* (art. 400, s. 6), explicitly declare that the charges on account of medicine and for attendance upon the officers and seamen wounded in defending the ship, shall be general average. A regulation of this sort seems to be founded on reason. But other codes are silent on the subject; and though the contrary opinion had been advanced by Mr. Serjeant Marshall, and by Mr. Justice Park in the earlier editions of his work, the Court of Common Pleas has unanimously decided that in England neither the damage done to a ship, nor the ammunition expended, nor the expense of healing sailors wounded in an action with an enemy or pirate is a subject of general average. (Abbott, *On the Law of Shipping*, pt. iii. ch. viii.)

The general safety of the whole adventure must also be a motive for the sacrifice, for if a captain of a ship, on the point of capture, threw overboard a quantity of dollars, not to save the ship and cargo, but merely to prevent the dollars from getting into the enemy's hand; this is not such a jettison as would entitle the owner of the dollars to a general average contribution. (Arnould, p. 773.)

Some goods are excepted, giving no claim to contribution, as those of which there is no bill of lading; those taken on board by the captain contrary to the charter-party; and especially those carried on deck, unless there is a usage and custom for such carriage. Thus timber cast overboard is held to be entitled to average, as were also some pigs carried between Waterford and London.

Much doubt has been entertained, whether expenses incurred by a ship in an intermediate port in which she has taken refuge, should be general average or fall only on the ship. But on principle at least, it is clear, that if the retreat of the ship to port be made in order to obviate the danger of foundering, or some other great and imminent calamity, the expenses incurred in entering it, and during the time she is forced by stress of weather, or adverse winds, to continue in it, ought to belong to general average. But if the retreat of the ship to port be made in order to repair an injury occasioned by the unskillfulness of the master, or in consequence of any defect in her outfit, such, for example, as deficiencies of water, provisions, sails, &c., with which she ought to have been sufficiently supplied before setting out, the expenses should fall wholly on the owners.

When a ship (supposed to be seaworthy) is forced to take refuge in an intermediate port, because of a loss occasioned by a peril of the sea, as the springing of a mast, &c., then, as the accident is not ascribable to any fault of the master or owners, and the retreat to port is indispensable for the safety of the ship and cargo, it would seem that any extraordinary expense incurred in entering it should be made good by general average.

Supposing, however, that it could be shown that the ship was not, at her outset, seaworthy, or in a condition to withstand the perils of the sea; that the mast, for example, which has sprung, had been previously damaged; or supposing that the mischief had been occasioned by the incapacity of the master; the whole blame would, in

such a case, be ascribable to the owners, who besides defraying every expense, should be liable in damages to the freighters for the delay that would necessarily take place in completing the voyage, and for whatever damage might be done to the cargo.

These, however, are merely the conclusions to which, as it appears to us, those must come who look only to principles. The law with respect to the points referred to differs in different countries, and has differed in this country at different periods. 'A doubt,' says Lord Tenterden, 'was formerly entertained as to the expenses of a ship in a port in which she had taken refuge, to repair the damage occasioned by a tempest; but this has been removed by late decisions. And it has been held, that the wages and provisions of the crew during such a period must fall upon the ship alone. But if a ship should necessarily go into an intermediate port for the purpose only of repairing such a damage as is in itself a proper object of general contribution, possibly the wages, &c. during the period of such detention, may also be held to be general average, on the ground that the necessary should follow the nature of its principal.' (*Law of Shipping*, pt. iii. ch. viii.)

Perhaps the reader who reflects on the vagueness of this passage will be disposed to concur with Lord Tenterden's remark in another part of the same chapter, 'That the determinations of the English courts of justice furnish less of authority on this subject (average) than on any other branch of maritime law.'

The question, whether the repairs which a ship undergoes that is forced to put into an intermediate port ought to be general or particular average, has created a great diversity of opinion; but the principles that ought to regulate our decision with respect to it seem pretty obvious. Injuries voluntarily done to the ship, as cutting away masts, yards, &c., to avert some impending danger, are universally admitted to be general average. It seems, however, hardly less clear, and is, indeed, expressly laid down by all the great authorities, that injuries done to the ship by the violence of the winds or the waves should be particular average, or should fall wholly on the owners. The ship, to use the admirable illustration of this principle given in the civil law, is like the tool or instrument of a workman in his trade. If in doing his work he break his hammer, his anvil, or any other instrument, he can claim no satisfaction for this from his employer. (*Dig. lib. xiv. tit. 2, s. 2.*) The owners are bound, both by the usual conditions in all charter-parties, and at common law, to carry the cargo to its destination; and they must consequently be bound, in the event of the ship sustaining any accidental or natural damage during the voyage, either to repair that damage at their own expense, or to provide another vessel to forward the goods. In point of fact, too, such subsidiary ships have often been provided; but it has never been pretended that their hire was a subject of general average, though it is plain it has quite as good a right to be so considered as the cost of repairing the damage done to the ship by a peril of the sea. Hence when a ship puts into an intermediate port for the common safety, the charges incurred in entering the port, and down to the earliest time that the wind and weather become favourable for leaving it, ought to be general average; but the repair of any damage she may have sustained by wear and tear or by the mere violence of the storm, or an accidental peril, and the wages of the crew, and other expenses incurred after the weather has moderated, should fall wholly on the owners.

A recent decision in the case of a British ship that had been obliged to put into port in consequence of an injury resulting from her accidentally coming into collision with another, affirmed that so much of the repair she then underwent as was *absolutely necessary to enable her to perform her voyage* should be general average. The Judges, however, spoke rather doubtfully on the subject; and it is exceedingly difficult to discover any good grounds for the judgment. (Plummer and another v. Wildman, 3 M. & S. 482.) It seems directly opposed to all principle, as well as to the authority of the laws of Rhodes (*Dig.* 14, tit. 2), of Oleron (art. 9), of Wisby (art. 12), and to the common law with respect to freight. Lord Tenterden has expressed himself as if he were hostile to the judgment. It is, indeed, at variance with all the doctrines he lays down; and the terms in which he alludes to it, 'yet in one case,' appear to hold it forth as an exception (which it certainly is) to the course of decisions on the subject.

This rule has been adopted in the United States, but in this country (Arnould, 792) the case must either be considered as overruled or at all events not to be an authority for the rule thus deduced from it. Indeed, Lord Ellenborough himself afterwards refers to it as decided on the ground that the repairs were rendered necessary by a sacrifice of part of the ship for the general safety, and held on the case then before him (Power v. Whitmore) that the expense of repairs can only be a subject of general contribution when rendered necessary by a general average loss. This is accordingly the received rule of law in this country upon the subject.

It is now usual in this country, when a vessel puts into port on account of a damage belonging to particular average, which requires to be repaired before she can safely proceed on her voyage, to allow in general average the expense of entering the port and unloading, to charge the owners of the goods or their underwriters with the warehouse rent and expenses attending the cargo, and to throw the expense of reloading and departure on the freight.

Considerable doubts have existed in regard to the policy of making the loss of goods stowed upon the deck and thrown overboard the subject of general average. The French Ordinance of 1681, proceeding on the assumption that deck stowage is in all cases improper, has expressly excluded goods so stowed from the benefit of such average (Liv. iii, tit. 8, s. 13.) This, however, is plainly a matter in regard to which no invariable rule can be safely laid down; for though, speaking generally, stowage on the deck be improper and dangerous in most distant voyages, it may not be so, at least in certain seasons of the year, and in certain descriptions of vessels, in the coasting or cross-channel trades, or in over-sea voyages to contiguous countries. And such being the case, the preferable plan would seem to be to leave cases of the jettison of the deck cargo to be decided according to the practice of the peculiar trade in which they may happen to take place. This, too, we infer, though the point has not been judicially determined, is, in fact, the law of England at this moment. *Prima facie*, deck goods are excluded from the benefit of general average; but if it can be shown that stowage on deck is the usage of the trade in which a jettison takes place, and the custom of the parties engaged in it, the general presumption against the practice would be defeated, and the goods would be admitted to the benefit of general average. (Shee's valuable edition of Lord Tenterden's work on the *Law of Shipping*, pp. 481—489.)

A late statute, the 5 Vict. 2 sess. c. 17, makes it illegal for ships laden with timber and clearing out from any port in British North America between November 1 and May 1 to have any portion of the cargo on deck. But, with this exception, the propriety of stowing goods on the deck must be determined by the opinions of those engaged in the particular trade in which it may have occurred.

According to the law of England, when a ship is injured by coming into collision with, or *running foul* of another, if the misfortune has been accidental, and no blame can be ascribed to either party, the owners of the damaged ship have to bear the loss. In cases where a collision has taken place through the fault of one party only, he, of course, is responsible for the consequences; but where both parties are to blame, without its being possible to discriminate the precise culpability of each, the loss or damage is to be defrayed equally by both parties. And this, also, is the rule laid down by the laws of Oleron and Wisby, and the famous French Ordinance of 1681, in reference to accidental collisions. The *Code de Commerce* (art. 407), however, throws the loss resulting from accidental collisions on the suffering party, harmonising in this respect with the law of England. [COLLISION.]

The ship and freight, and everything on board, even jewels, plate, and money, except wearing apparel, contribute to general average. But the wages of seamen do not contribute; because, had they been laid under this obligation, they might have been tempted to oppose a sacrifice necessary for the general safety.

Different states have adopted different modes of valuing the articles which are to contribute to an average. In this respect the law of England has varied considerably at different periods. At present, however, the ship is valued at the price she is worth on her arrival at the port of delivery. The value of the freight is held to be the clear sum which the ship has earned after seamen's wages, pilotage, and all such other charges as come under the name of petty averages, are deducted. It is now the settled practice to value the goods lost, as well as those saved, at the price they would have fetched in ready money, at the *port of delivery*, on the ship's arrival there, freight, duties, and other charges being deducted. Each person's share of the loss will bear the same proportion to the value of his property that the whole loss bears to the aggregate value of the ship, freight, and cargo. The necessity of taking the goods lost into this account is obvious; for otherwise their owner would be the only person who would not be a loser.

When the loss of masts, cables, and other furniture of the ship, is compensated by general average, it is usual, as the new articles will, in all ordinary cases, be of greater value than those that have been lost, to deduct *one-third* from the value of the former, leaving two-thirds only to be contributed.

But the mode of adjusting an average will be better understood by the following example, extracted from Chief Justice Tenterden's valuable work on the *Law of Shipping*, pt. iii. ch. viii. :—  
 'The reader will suppose that it became necessary, in the Downs, to cut the cable of a ship destined for Hull; that the ship afterwards struck upon the Goodwin, which compelled the master to cut away his mast, and cast overboard part of the cargo, in which operation another part was injured; and that the ship being cleared from the sands, was forced to take refuge in Ramsgate harbour, to avoid the further effects of the storm.

Amount of Losses		
Goods of A. cast overboard	£ 500	
Damage of the goods of B. by the jettison	500	
Freight of the goods cast overboard	100	
Price of a new cable, anchor, and mast	300. }	
Deduct one third	100. }	
Expense of bringing the ship off the sands	50	
Wharfage and port duties going into the harbour and out, and commission to the agent who made the disbursements	100	
Expenses there	25	
Adjusting this average	1	
Postage	1	
<b>Total of losses</b>	<b>1,180</b>	
Value of Articles to contribute.		
Goods of A. cast overboard	500	
Sound value of the goods of B., deducting freight and charges	1,900	
Goods of C.	500	
D.	2,000	
E.	5,000	
Value of the ship	2,000	
Clear freight, deducting wages, victuals, &c.	800	
<b>Total of contributory values</b>	<b>11,800</b>	

Then, 11,800L. : 1,180L. :: 100L. : 10L.

That is, each person will lose 10 per cent. upon the value of his interest in the cargo, ship, or freight. Therefore, A. loses 50L., B. 100L., C. 50L., D. 200L., E. 500L., the owners 200L. ; in all, 1,180L. Upon this calculation, the owners are to lose 200L. ; but they are to receive from the contribution 300L. to make good their disbursements, and 100L. more for the freight of the goods thrown overboard; or 400L., minus 200L.

They, therefore, are actually to receive	£ 200
A. is to contribute 50L., but has lost 500L. ; therefore	450
B. is to receive	100
C. is to contribute 100L., but has lost 200L. ; therefore	100
<b>Total to be actually received</b>	<b>700</b>
On the other hand, C., D., and E. have lost	£ 7,000
nothing, and are to pay as before ; viz. :	5,000
<b>Total to be actually paid</b>	<b>7,000</b>

which is exactly equal to the total to be actually received, and must be paid by and to each person in rateable proportion.

‘ In the above estimate of losses, I have included the freight of the goods thrown overboard, which appears to be proper, as the freight of the goods is to be paid, and their supposed value is taken clear of freight, as well as other charges. In this country, where the practice of insurance is very general, it is usual for the broker, who has procured the policy of insurance, to draw up an adjustment of the average, which is commonly paid in the first instance by the insurers without dispute. In case of dispute, the contribution may be recovered either by a suit in equity, or by an action at law, instituted by each individual entitled to receive, against each party that ought to pay, for the amount of his share. And in the case of a general ship, where there are many consignees, it is usual for the master, before he delivers the goods, to take a bond from the different merchants for payment of their portions of the average when the same shall be adjusted.’

The subject of average does not necessarily make a part of the law of insurance ; though as insurers, from the terms of most policies, are liable to indemnify the insured against those contributions which are properly denominated *general average*, its consideration very frequently occurs in questions as to partial losses. But in order to confine assurances to that which should be their only object, namely an indemnity against real and important losses arising from a peril of the sea, as well as to obviate disputes respecting losses arising from the perishable quality of the goods insured, and all trivial subjects of difference and litigation, it seems to be the general law of all

maritime states, and is expressly, indeed, provided by the famous Ordinance of 1681 (see liv. iii. tit. 6, s. 47, and the elaborate commentary of M. Valin), that the insurer shall not be liable to any demand on account of average, unless it exceed *one per cent.* An article (No. 408) to the same effect is inserted in the *Code de Commerce*; and by stipulation, this limitation is frequently extended in French policies to *three or four per cent.* A similar practice was adopted in this country in 1749. It is now constantly stipulated in all policies, that upon certain enumerated articles of a quality peculiarly perishable, the insurer shall not be liable for any partial loss whatever; that upon certain others liable to partial injuries, but less difficult to be preserved at sea, he shall only be liable for partial losses above *five per cent.*; and that as to all other goods, and also the ship and freight, he shall only be liable for partial losses above *three per cent.* This stipulation is made by a memorandum inserted at the bottom of all policies done at Lloyd’s, of the following tenor: ‘N.B. Corn; fish, salt, fruit, flour, and seeds are warranted free from average, unless general, or the ship be stranded; sugar, tobacco, hemp, flax, hides, and skins are warranted free from average under 5L. per cent.; and all other goods free from average under 3L. per cent., unless general, or the ship be stranded.’

The form of this memorandum was universally used, as well by the Royal Exchange and London Assurance Companies as by private underwriters, till 1754, when it was decided that a ship having run aground, was a stranded ship within the meaning of the memorandum; and that although she got off again, the underwriters were liable to the average or partial loss upon damaged corn. This decision induced the two companies to strike the words *or the ship be stranded* out of the memorandum; so that now they consider themselves liable to no losses which can happen to such commodities, except general averages and total losses. The old form is still retained by the private underwriters. [JETSAM; STRANDING.]

The reader is referred for the further discussion of this important subject, to the article *MARINE INSURANCE*; and to Mr. Stevens’s *Essay on Average*; Abbott *On the Law of Shipping*, pt. iii. ch. viii.; Marshall *On Insurance*, book i. ch. xii. s. 7; Park *On Insurance*, ch. vii.; and Mr. Benecke *On the Principles of Indemnity in Marine Insurance*; Arnould *On Marine Insurance*; Pritchard’s *Admiralty Digest*; Smith’s *Mercantile Law*.

*International General Average.*—It is clear that there is a tendency for the rules of commercial law, and especially that portion which deals with shipping and marine assurance, to become identical in all civilised communities. Hence all admiralty and naval courts take into account decisions which have been given in foreign tribunals, quote cases which have been adjudicated on, and treat commercial law with greater or less exactness as part of the law of nations.

The reader is referred especially to the *Report of the Social Science Association for 1864*, containing the resolutions arrived at by representatives from Belgium, France, Holland, the Hanse Towns, Russia, and the United States.

AVOIRDUPOIS. A weight used in determining the gravity of bulky commodities.

## B

**BABOOL BARK.** The bark of the *Acacia arabica* is almost exclusively used by the natives of India for tanning purposes, being the only bark which can be obtained throughout the Peninsula in large quantities, and cheap. The price varies from  $\frac{1}{2}$  to 2 rupees per maund, about 80 lbs. avoird.

**BACON AND HAMS.** The former is made from the sides and belly of the pig, and the latter from its hind legs. The process of curing may be effected indifferently by the employment of salt or sugar, or both; but the first is by far the most commonly used. After being impregnated with salt or sugar, and allowed to remain a certain time in the solution, the bacon and hams are taken out, dried and smoked. The counties of England most celebrated for bacon and hams, are York, Hants, Berks, and Wilts. Ireland produces great quantities of both; but they are coarse, not so well cured as the English, and much lower priced. Of the Scotch counties, Dumfriess, Wigton, and Kirkcubright are celebrated for the excellence of their bacon and hams, of which they export large quantities, principally to the Liverpool and London markets. [Pork.]

**BAGGAGE.** In Commercial Navigation, the wearing apparel and other articles destined for the sole use or accommodation of the crews and passengers of ships. The following are the principal custom-house regulations with respect to baggage: Baggage and apparel accompanied by the proprietor, worn and in use (not made up for the purpose of being introduced into this country), exempted from all duty on importation.

Baggage, containing no article liable to duty, and arriving by continental steam vessels, may be examined between Gravesend and London, provided the proprietor be present, and see the packages resealed and labelled by the officer. Such baggage is landed before any other, provided the label be not removed or torn. (*Customs Order*, Aug. 3, 1853.)

At the outports those passengers having but single packages landed, will have these first examined.

Articles in baggage (not merchandise) subject to duty, will be delivered to passengers, if the duties thereon, and a small fee for passing the entry, be deposited with the person authorised to receive the same.

If unaccompanied, and examined by sight entry, baggage may be delivered on a proper indorsement being made and certified by the examining officer.

If not cleared at the expiration of six months from the date of landing, it is liable to be sold for duty and charges, the residue (if any) to be paid to the right owner on proof being adduced to the satisfaction of the Board.

One rifle or fowling-piece, and one pair of pistols accompanying the party, for private use, free per *Customs Order*, Sept. 23, 1829. Now duty free.

Trifling articles of silk, and leather gloves in small quantities, found in passengers' baggage, landed from the continent, admitted for entry for private use on the usual declaration. (*Customs Order*, August 7, 1833.) Now duty free.

One pint of drinkable spirits of whatever strength, or half a pint of cordial or Cologne water, in baggage, for private use—free. (*Treasury Order*, October 25, 1820.)

Half a pound of cigars or manufactured tobacco in the baggage of passengers delivered duty free.

Passengers from short voyages may enter 3 lbs., and those from long voyages may enter 7 lbs., of cigars. (*Customs Order*, January 14, 1837.)

Books, plate, or other articles on which drawback might have been received, free, on declaration that no drawback has been received.

Drawings and sketches made for amusement, and not for sale, by the proprietor, and accompanied by him, duty free. (*Treasury Order*, August 5, 1817.)

Foreign newspapers unbound, duty free. (*Customs Order*, April 29, 1829.)

Passengers denying having Foreign Goods in their Possession.—The following clause in the Act 16 & 17 Vict. c. 107, has reference to this subject: 'If any passenger or other person, on board any ship or boat, or who may have landed from the same, shall, upon being questioned by any officer whether he has any foreign goods upon his person, or in his possession, deny the same, and any such goods shall, after such denial, be discovered to be, or to have been, upon his person, or in his possession, such goods shall be forfeited, and such person shall forfeit treble the value of such goods.' Sec. 229.

Any Licensed Agent overcharging parties for customs duties or other disbursement, will have his license withdrawn, and be prosecuted. (*Customs Order*, Dec. 24, 1847.)

A customs officer taking any fee, perquisite, or reward for anything done or omitted to be done by him in discharge of his duty, is to be dismissed.—(16 & 17 Vict. c. 107 s. 3.)

**BAHIA or SALVADOR.** A large city (formerly a capital) of Brazil, contiguous to Cape St. Antonio, which forms the right or eastern side of the entrance of the noble bay of Todos os Santos, or All-Saints.

The map conveys a clearer and better idea of this celebrated bay than could be acquired from any description.

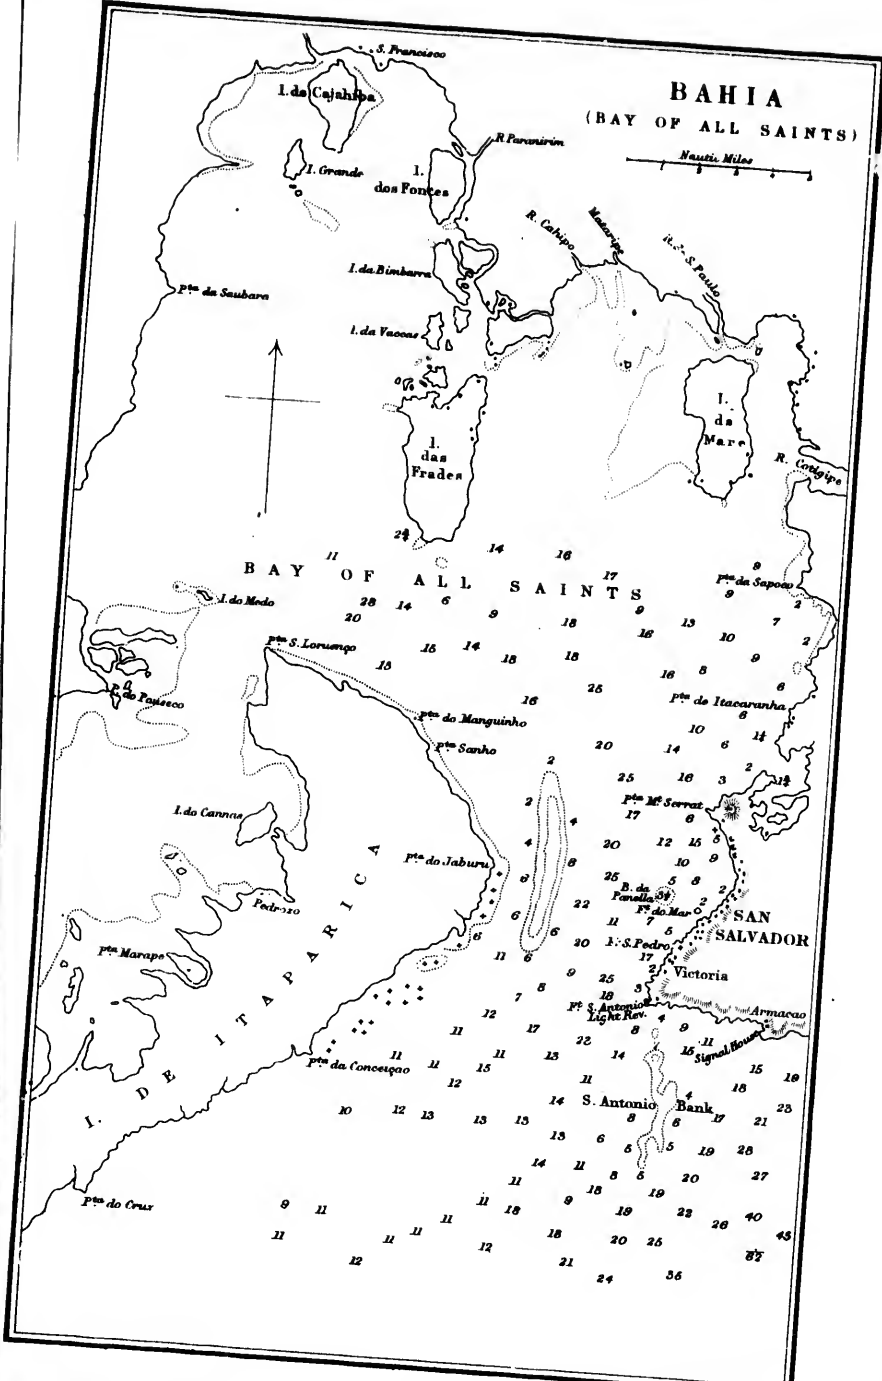

According to the observations of M. Roussin, the lighthouse on the Cape is in lat.  $13^{\circ} 0' 30''$  S., long.  $38^{\circ} 30'$  W. The opposite side of the entrance to the Bay is formed by the island of Taporica, distant from Cape St. Antonio about  $2\frac{1}{2}$  leagues. But a bank along the shore of the island narrows the passage for large ships to about two-thirds this distance. Another bank runs S.S.W. from Cape St. Antonio about  $\frac{1}{4}$  league. Within, the bay expands into a capacious basin, having several islands and harbours, the depth of water varying from 8 and 10 to 40 fathoms, affording ample accommodation and secure anchorage for the largest fleets.

There is another entrance to the bay, on the west side of the island of Taporica; but it is narrow, intricate, and at its mouth has not more than 6 feet water. Several rivers have their embouchure in the bay, which generally occasions a current to set

The diamonds exported were 4,672 oitavas, valued at 290,000*l.*, to which may be added more than double the quantity sent away clandestinely.  
 \* The Bahia bag of coffee contains only 4 arrobas, 128 lbs., instead (as at Rio Janeiro) of 5 arrobas.

*Weights and Measures.*

- 1 quintal=4 arrobas.
- 1 Canada=2 imperial gallons.
- 1 arroba=32 lbs.
- 1 alqueire=1/4 of a bushel.

[PERNAMBUCO.]

**BALACHONG.** An article consisting of pounded or bruised fish. It consists principally of scud and offensive to strangers. Though used as a condiment to rice, is largely consumed in all the countries to the east of Bengal, including the southern provinces of China, and the islands of the Eastern Archipelago. Its distribution gives rise to an extensive internal traffic.

**BALANCE.** In Accounts, the term used to express the difference between the debtor and creditor sides of an account.

**BALANCE.** In Commerce, the term commonly used to express the difference between the value of the exports from and imports into a country. The balance used to be said to be favourable when the value of the exports exceeded that of the imports, and unfavourable when the value of the imports exceeded that of the exports. And in this country this was long believed to be the case, and down to a late period we were annually congratulated by our finance ministers on the excess of the exports over the imports.

The attainment of a favourable balance was formerly regarded as an object of the greatest importance. The precious metals, in consequence of their being used as money, were long considered as the only real wealth that could be possessed either by individuals or nations. And as countries without mines could not obtain supplies of these metals except in exchange for exported products, it was concluded, that if the value of the commodities exported exceeded that of those imported, the balance would have to be paid by the importation of an equivalent amount of the precious metals; and conversely. A very large proportion of the restraints imposed on the freedom of commerce during the last three centuries grew out of this notion. The importance of having a favourable balance being universally admitted, every effort was made to attain it; and nothing seemed so effectual for this purpose as the devising of schemes to facilitate exportation, and to hinder the importation of almost all products, except gold and silver, that were not intended for future exportation. But the gradual though slow

The value of the above articles may be estimated at about 1,500,000*l.* Bahia has long been the principal mart for the sale of diamonds. And the late discovery of a new and highly productive diamond-field in the interior has led to a great increase in the exports of the gem, the value of which is believed to amount to from 450,000*l.* to 550,000*l.* [DIAMOND.] Tapioca and other articles are also exported. In 1866, 228 British vessels, of the burden of 192,991 tons, entered at and 207, of 125,402 tons, cleared out from Bahia. See, for some remarks on the trade with Brazil, the art. on RIO DE JANEIRO.

The imports consist principally of cottons and other manufactured goods, provisions, flour, salt, iron, hardware, coals, soap, wines, &c. The exports from Bahia have rather increased of late years, notwithstanding the greater obstructions thrown in the way of importing slaves, and the greater scarcity and high price of labour.

No articles are prohibited to be imported, nor are there any privileges in favour of ships belonging to any country. The coasting trade is exclusively carried on by Brazilian vessels.

There is no difference made in the duty on goods, whether imported in native or foreign vessels.

Vessels putting into Bahia in distress pay no tonnage dues. Those which discharge or take in cargo pay 30 reis per ton, per day, Brazilian measurement; but should a vessel remain in port more than 50 days, this payment ceases to be enforced.

*Port Dues on Vessels.*

Vessels of other nations pay lighthouse, &c.	10,240

Bahia has not been affected, according to Mr. Consul Morgan, by the total abolition of the slave traffic.

Bahia is the only port of this province where goods may be warehoused on importation, and afterwards exported. A duty is charged thereon at the rate of 4 per cent. on tariff valuation.

The duty of 15 per cent. formerly levied on chronometers and other nautical instruments in use on board vessels has been recently abolished.

Average Exchange, 30*l.* per 1000 reis.

growth of sounder opinions with respect to the nature and functions of money, showed the futility of a system of policy having such objects in view. It is now conceded on all hands that gold and silver are nothing but commodities; and that it is in no respect necessary to interfere either to encourage their importation or to prevent their exportation. In Great Britain they may be freely exported and imported, whether in the shape of coin or bullion. [Coin.]

The truth is, however, that the theory of the balance of trade was not erroneous merely from the false notions which its advocates entertained with respect to money, but proceeded on radically mistaken views as to the nature of commerce. The mode in which the balance was usually estimated was, indeed, completely fallacious. But had it been correctly ascertained, it would have been found, in opposition to the common opinion, that the imports into commercial countries must, speaking generally, exceed the exports; and that a balance, whether on the one side or the other, is but rarely cancelled by a bullion payment.

1. The proper business of the wholesale merchant consists in carrying the various products of the different countries of the world from the places where their value is least to those where it is greatest; or, which is the same thing, in distributing them according to the effective demand. It is clear, however, that there could be no motive to export any species of produce, unless that which it was intended to import in its stead were of greater value. When an English merchant commissions a quantity of Polish wheat, he calculates on its selling for so much more than its price in Poland, as will be sufficient to pay the expense of freight, insurance, &c., and to yield, besides, the common and ordinary rate of profit on the capital employed. If the wheat did not sell for this much, its importation would obviously be a loss to the importer. It is plain, then, that no merchant ever did or ever will export, but in the view of importing something more valuable in return. And so far from an excess of exports over imports being any criterion of an advantageous commerce, it is directly the reverse; and the truth is, notwithstanding all that has been said and written to the contrary, that unless the value of the imports exceeded that of the exports, foreign trade could not be carried on. Were this not the case—that is, were the value of the exports always greater than the value of the imports—merchants would lose on every transaction with foreigners, and the trade with them would be speedily abandoned.

In England, the rates at which all articles of export and import are officially valued were fixed so far back as 1696. But the very great alteration that has since taken place, not only in the value of money, but also in the cost of by far the greater number of the commodities of this and other countries, long ago rendered the official valuation of no use whatever, either as a means of learning the values or the quantities of the exports or imports. In so far, however, as respects the former, this defect was unintentionally remedied in 1798, when the 'convoy duty,' being an ad valorem tax laid on the exports, furnished the means of ascertaining their amount. And the importance of the information so obtained was such, that, whether articles of export have or have not been charged with duties, exporters have since been made to declare, in every case, the real value of the articles which they export.

It has been alleged, and apparently with some probability, that merchants have not infrequently been in the habit of exaggerating the value of

articles entitled to drawbacks on exportation. But the extension and improvement of the warehousing system, and the diminution of the number of drawbacks, have materially lessened whatever fraud or inaccuracy may have arisen from this source. So long, indeed, as the greater number of articles were charged with an ad valorem duty of 10s. per cent. on exportation, it may be presumed that their value was rather under than overrated. But since the repeal of that duty (5 & 6 Vict. c. 47, s. 40), their declared value is believed to come very near the truth; at least, sufficiently so for all practical purposes.

But until very recently no authentic information was obtained in regard to the value of the imports. In 1848, however, the Board of Customs having approved a plan suggested by Mr. Messenger, inspector-general of imports and exports, for ascertaining the value of the former, it was submitted by them to the Treasury. And its advantages having been fully appreciated by Mr. James Wilson, M.P., then secretary to their Lordships, it was carried into effect in 1854. It is needless to enter into any minute details with respect to the mode of computing the values of the imports. It is sufficient to state that it is effected by ascertaining the current prices of imported articles from price-currents, mercantile circulars, &c., and from these deducing the aggregate value of each. It would be idle to suppose that results derived from a process of this sort should be altogether exact; but the errors it involves are of no great moment, and for statistical purposes it may be reckoned quite correct, and most valuable.

In a former edition of this work, we ventured to say that, though we had no means of comparing the real values of the imports with those of the exports, we had no doubt that the former very considerably exceeded the latter. It could hardly, indeed, be otherwise. The value of an exported commodity is estimated at the moment of its being sent abroad, and before its cost is increased by the expense of transporting it to the place of its destination; whereas the value of the commodity imported in its stead is estimated after it has arrived at its destination, and, consequently, after its cost has been enhanced by the expense of freight, insurance, importers' profits, &c.

	1853	1854	1855	1856
Value of imports	£ 418,919,020	£ 271,594,172	£ 271,073,285	£ 295,201,553
Value of exports	£ 196,902,409	£ 212,619,614	£ 218,831,576	£ 238,803,900
Excess of imports	£ 222,016,611	£ 59,974,558	£ 52,241,709	£ 56,397,653

To measure, therefore, the advantage of commerce by the excess of the exports over the imports is a proceeding false alike in fact and principle. The value of the imports, in all but anomalous and extremely rare instances, invariably exceeds that of the exports. And it is plain that this excess, whatever it may be, forms the only fund whence the expenses and profits of the merchants can be derived. The larger, consequently, it becomes, the more will it be for their advantage.

In the United States, the value of the imports, as ascertained by the custom-house returns, has usually exceeded the value of the exports. And although our practical politicians were in the habit of considering the excess of the former as a certain proof of a disadvantageous commerce, 'it is nevertheless true,' says Mr. Pitkin, 'that the real gain of the United States has been nearly in proportion as their imports have exceeded their exports.' (*Commerce of the United States*, 2nd ed. p. 280.) The excess of American imports has in part been occasioned by the Americans generally

exporting their own surplus produce, and consequently, receiving from foreigners not only an equivalent for their exports, but also for the cost of conveying them to the foreign market. 'In 1811,' says the author just quoted 'four sold in America for nine dollars and a-half per barrel, and in Spain for fifteen dollars. The value of the cargo of a vessel carrying 5,000 barrels of flour would, therefore, be estimated at the period of its exportation at 47,500 dollars; but as this flour would sell, when carried to Spain, for 75,000 dollars, the American merchant would be entitled to draw on his agent in Spain for 27,500 dollars more than the flour cost in America; or than the sum for which he could have drawn, had the flour been exported in a vessel belonging to a Spanish merchant. But the transaction would not end here. The 75,000 dollars would be vested in some species of Spanish or other European goods fit for the American market; and the freight, insurance, &c., on account of the return cargo, would probably increase its value to 100,000 dollars; so that, in all, the American merchant might have imported goods worth 52,500 dollars more than the flour originally sent to Spain.' It is as impossible to deny that such a transaction as this is advantageous, as it is to deny that its advantage consists entirely in the excess of the value of the goods imported over the value of those exported. And it is equally clear that America might have had the real balance of payments in her favour, though such transactions as the above had been multiplied to any conceivable extent.

2. In the second place, when a balance is due by one country to another, it is but seldom that it is paid by remitting bullion from the debtor to the creditor country. If the sum due by the British merchants to those of Holland be greater than the sum due by the latter to them, the balance of payments will be against Britain; but this balance will not, and indeed cannot, be discharged by an exportation of bullion, unless bullion be, at the time, the cheapest exportable commodity; or, which is the same thing, unless it may be more advantageously exported than anything else. To illustrate this principle, let us suppose that the balance of debt, or the excess of the value of the bills drawn by the merchants of Amsterdam, on London over those drawn by the merchants of London on Amsterdam, amounts to 100,000*l.*: it is the business of the London merchants to find out the means and it is plain, that if they find that any less sum, as 96,000*l.*, 97,000*l.*, or 99,900*l.*, will purchase and send to Holland as much cloth, cotton, hardware, colonial produce, or any other commodity, as will sell in Amsterdam for 100,000*l.*, no gold or silver will be exported. The laws which regulate the trade in bullion are not in any degree different from those which regulate the trade in other commodities. It is exported only when its exportation is advantageous, or when it is more valuable abroad than at home. It would, in fact, be quite as reasonable to expect that water should flow from a low to a high level, as it is to expect that bullion should leave a country where its value is great, to go to, one where it is low! It is never sent abroad to destroy, but always to find its level. The balance of payments might be 10 or 100,000,000 against a particular country, without causing the exportation of a single ounce of bullion. Common sense tells us that no merchant will remit 100*l.* worth of bullion to discharge a debt in a foreign country, if it be possible to invest any smaller sum in any species of merchandise which would sell abroad for 100*l.* exclusive of expenses. The merchant

who deals in the precious metals is as much under the influence of *self-interest*, as he who deals in coffee or indigo; and what merchant would attempt to extinguish a debt, by exporting coffee which cost 100*l.*, if he could effect his object by sending abroad indigo which cost only 99*l.*?

The argument about the balance of payments is one of those that contradict and confute themselves. Had the apparent excess of exports over imports, as indicated by the British Custom-house books for the hundred years down to 1853, been always paid in bullion, as the supporters of the old theory contend is the case, there should at this moment be some 500,000,000 or 600,000,000 of bullion in the country, instead of 80,000,000 or 100,000,000, which it is supposed at most to amount to! Nor is this all. If the theory of the balance were good for anything—if it had not been a mere idle delusion—it follows, as every country in the world, with the single exception of the United States, has had its favourable balance, that they must have been paid by an annual importation of bullion from the mines corresponding to their aggregate amount. But it is certain that though it were increased in a fivefold proportion, it would be insufficient for this purpose! This reductio ad absurdum is decisive of the degree of credit that should be attached to conclusions respecting the flourishing state of the commerce of any country drawn from the excess of the exports over the imports!

Not only, therefore, is the theory with respect to the balance of trade erroneous, but the very reverse of that theory is true. In the *first* place the value of the commodities imported by every country which carries on an advantageous commerce (and no other will be prosecuted for any considerable period), invariably exceeds the value of those which she exports. Unless such were the case, there would plainly be no fund whence the merchants and others engaged in foreign trade could derive either a profit on their capital, or a return for their outlay and trouble; and in the *second* place, whether the balance of debt be for or against a country, that balance will neither be paid nor received in bullion, unless it be at the time the commodity by the exportation or importation of which the account may be most profitably settled. Whatever the partisans of the doctrine as to the balance may say about money being a preferable product, or *merchandise par excellence*, it is certain it will never appear in the list of exports and imports while there is anything else with which to carry on trade, or cancel debts, that will yield a larger profit, or occasion less expense to the debtors.

It is difficult to estimate the mischief which the absurd notions relative to the balance of trade have occasioned in almost every commercial country;—here they have been particularly injurious. It is principally to the prevalence of prejudices to which they have given rise, that the restrictions on the trade between this country and France are to be ascribed. The great or rather the only argument insisted upon by those who prevailed on the legislature, in the reign of William and Mary, to declare the trade with France a *nuisance*, was founded on the statement that the value of the imports from that kingdom considerably exceeded the value of the commodities we exported to it. The balance was regarded as a *tribute* paid by England to France, and it was sagaciously asked, what had we done, that we should be obliged to pay so much money to our natural enemy? It never occurred to those who so loudly abused the French trade, that no

merchant would import any commodity from France, unless it brought a higher price in this country than the commodity exported to pay it; and that the profit of the merchant, or the national gain, would be in exact proportion to this excess of price. The very reason assigned by these persons for prohibiting the trade affords the best attainable proof of its having been a lucrative one; nor can there be any doubt that an unrestricted freedom of intercourse between the two countries would be of the greatest service to both.

**BALE.** A pack, or certain quantity of goods or merchandise; as a *bale* of silk, cloth, &c.

*Bales* are always marked and numbered, that the merchants to whom they belong may know them, and the marks and numbers correspond to those in the bills of lading, &c. Selling under the *bale*, or under the *cords*, is a term used in France and other countries for selling goods wholesale, without sample or pattern, and unopened.

**BALKS.** Large pieces of timber.

**BALLAST** (Dutch, ballast; Fr. lest; Ger. ballast; Ital. savorra; Span. lastre; Swed. ballast). A quantity of iron, stones, sand, gravel, or any other heavy material laid in a ship's hold, in order to sink her deeper in the water, and to render her capable of carrying sail without being overset. All ships clearing outwards, having no goods on board other than the personal baggage of the passengers, are said to be in ballast.

The quantity of ballast required to fit ships of equal burden for a voyage, is often materially different; the proportion being always less or more, according to the sharpness or fitness of the ship's bottom, called, by seamen, the *floor*.

The proper ballasting of a ship deserves peculiar attention, for, although it be known that ships in general will not carry sufficient sail till they are laden so that the surface of the water nearly glances on the extreme breadth midships, more than this general knowledge is required. If the ship have a great weight of heavy ballast, as lead, iron, &c., in the bottom, the centre of gravity will be too low in the hold; this no doubt will enable her to carry a press of sail, but it will, at the same time, make her sail heavily, and roll so violently as to run the risk of being dismasted.

The object in ballasting a ship is, therefore, so to dispose of the ballast or cargo, that she may be duly poised, and maintain a proper equilibrium on the water, so as neither to be too *stiff*, nor too *crank*, qualities equally pernicious. If too stiff, she may carry much sail, but her velocity will not be proportionally increased; whilst her masts are endangered by sudden jerks and excessive labouring. If too crank, she will be unfit to carry sail without the risk of oversetting.

Stiffness in ballasting is occasioned by disposing a too great quantity of heavy ballast, as lead, iron, &c., in the bottom, which throws the centre of gravity very near the keel; and this being the centre about which the vibrations are made, the lower it is placed, the more violent is the rolling.

Crankness, on the other hand, is occasioned by having too little ballast, or by disposing the ship's lading so as to raise the centre of gravity too high: this also endangers the masts when it blows hard; for when the masts cease to be perpendicular, they strain on the shrouds in the nature of a lever, which increases as the sine of their obliquity: and it is superfluous to add, that a ship that loses her masts is in great danger of being lost.

Hence the art of ballasting consists in placing the centre of gravity to correspond with the trim and shape of the vessel, so as to be neither too high nor too low; neither too far forward nor too

far aft; and to lade the ship so deep, that the surface of the water may nearly rise to the extreme breadth midships: she will then carry a good quantity of sail, incline but little, and ply well to windward. (Falconer's *Marine Dict.*)

The mischievous consequences of not attending to the circumstances now mentioned are often experienced by ships loading barilla, brimstone, and such heavy articles on the coast of Sicily and Spain. The habit there is to cut large quantities of brushwood and faggots, and to spread them in the hold, to hinder the cargo from sinking the centre of gravity too low, and causing the ship to labour violently; but it very frequently happens that the pressure of the cargo on this sort of dunnage is so great as to squeeze it into a much smaller space than could at first have been supposed; so that ships after getting to sea are sometimes obliged to return to port to unload a part of their cargo, to prevent their foundering. In such cases firm dunnage, such as oak staves, should, if possible, be always employed. (Jackson's *Commerce of Mediterranean*, pp. 125-128.)

Ships that have cargoes of light goods on board require a quantity of ballast, increasing, of course, according to the greater lightness of the goods.

By the Thames Conservancy Act, 27 & 28 Vict. cap. 113, ss. 41-48, ballast in the Thames is vested in the Thames Commissioners, who are empowered to grant licenses to have ballast in the form and under the conditions annexed. The Act takes away all previous Acts, charters and grants, and thus causes the rights of the Trinity House to cease.

The charge made for ballast is 6d. the entire yard.

*Ballast License, eastward of London Bridge.*—We, the conservators of the river Thames, by virtue of the powers granted to us by the Act of Parliament entitled "The Thames Conservancy Act, 1864," do hereby grant our license to

of \_\_\_\_\_ to raise ballast, \_\_\_\_\_ of the burthen of \_\_\_\_\_ tons, from the bed of the river Thames, from the \_\_\_\_\_ to the \_\_\_\_\_ on payment of the sum of \_\_\_\_\_ and subject to the conditions hereafter specified.

'Given under our hand and seal this \_\_\_\_\_ (Signed) \_\_\_\_\_

'Secretary.

'41, Trinity Square, Tower Hill, E.C.'

*Conditions referred to in this License.*—That the space in the river within which dredging under this license will be allowed, extends from London Bridge to Yantlet Creek, except as hereinafter mentioned, viz. in that part of the said river situate and being between the marsh wall and low-water mark, in front of certain land or lands belonging to the War Department, on the north side of the said river, and nearly opposite the Royal Arsenal at Woolwich, and also save and except in that other part of the river situate and lying between Pageant's Wharf and Cuckold's Point thereon.

'No dredging with a bag and spoon will be allowed within 100 yards of any wharf or of the river bank, nor will any gravel, sand, or other material be allowed to be dug or procured from the foreshore within 100 feet of any wharf, or of the bank of the river.

'The dredging authorised by this license is to be carried on under the inspection of the harbour-master of the district, and the person to whom this license is granted, and the men employed by

him in the dredging, are to obey all orders given to him or them by the said harbour-master, with respect to the mooring or placing, or mode of working the barge or vessel having this license.

That the license be kept on board the vessel for which it is granted, and produced whenever required by the officers of the conservancy.

That the name of the vessel, and the name and address of the owner, be painted in white letters of at least 2½ inches in length, and of proportionate thickness (say ½-inch) on a black ground, and in such a position as to be fairly seen when the vessel is fully laden.

That all applications for licenses be made in writing, addressed to the secretary.

That this license be forfeited on the infraction or evasion of any of the above conditions.

**Rates.**—For every ton of ballast delivered in or unladen from the inward West India Dock, the further sum of 10*d.*; and for every ton of ballast delivered in or unladen from the outward West India Dock, the further sum of 4*d.*; and for every ton of ballast delivered in or unladen from the London Docks, the further sum of 4*d.*; and for every ton of ballast delivered in or unladen from the inward East India Dock, the further sum of 10*d.*; and for every ton of ballast delivered in or unladen from the outward East India Dock, the further sum of 4*d.*; and for every ton of ballast delivered in or unladen from the Commercial Dock, the further sum of 4*d.*; and for every ton of ballast delivered in or unladen from the East Country Dock, the further sum of 4*d.*; and for every ton of ballast delivered in or unladen from the City Canal the further sum of 4*d.*; and for every ton of ballast delivered in or unladen from the Surrey Canal, the further sum of 4*d.*; and for every ton of ballast delivered in or unladen from the Regent's Canal, the further sum of 4*d.*

Which further rates or prices shall be payable and paid over and above the respective rates first mentioned.

The ballast of all ships or vessels coming into the Thames is to be unladen into a lighter, at the charge of 3*d.* a ton. If any ballast be thrown or unladen from any ship or vessel into the Thames, the captain, master, &c., shall for every such offence forfeit 20*l.* No ballast is to be received on board otherwise than from a lighter. By the stat. 54 Geo. III. c. 149, it is enacted, that no person shall, under a penalty of 10*l.* over and above all expenses, discharge any ballast, rubbish, &c. in any of the ports, harbours, roadsteads, navigable rivers, &c. of the United Kingdom; nor take ballast from any place prohibited by the Lords of the Admiralty.

**Heaving of Ballast.**—The men employed in this laborious occupation have, for a lengthened period, been held in a sort of thralldom by what are called the 'Long shore publicans,' who have paid them according to a truck system of the very worst kind. To emancipate the labourers from this degrading subjection, and place them on a more independent footing, the Trinity House offers to heave ballast as follows, viz.:

Trinity House, London, November 11, 1853.

Her Majesty having, as provided by s. 14 of the Act 16 & 17 Vict. c. 131, been pleased by order in council, dated October 24, 1853, to approve a scale of rates, to be established and paid to this corporation by the owners or masters of, or agents for, any ships, who may be desirous that the Trinity House should undertake to place ballast on board, or unload it from, such ships, in addition to the rates already payable under the Act 6 & 7 Vict. c. 57, for placing the ballast

alongside the same. The said scale so approved is hereby made public for the information of all persons who may be desirous to avail themselves of this regulation, viz.:

“For vessels having ports, 4*d.* for every ton of ballast placed on board or unladen;

“For vessels not having ports, 6½*d.* for every ton of ballast placed on board or unladen.”

And notice is given, that on and after the 1st day of December, 1853, this corporation will cause ballast to be placed on board of, or unladen from, all ships or vessels, the owners, masters, or agents of which may be desirous that it shall be so placed or unladen, on payment of the rates above specified, at the time of making entry and payment for the quantity of ballast required to be put on board, or unladen, as the case may be.

By order, J. HERBERT,

Secretary.

The Act 16 & 17 Vict. c. 107 s. 145 enacts that before any ship shall depart in ballast from the United Kingdom for parts beyond seas, not having any goods on board, except stores from the warehouse borne upon the victualling bill of such ship, nor any goods reported inwards for exportation in such ship, the collector or comptroller shall clear such ship in ballast, by notifying such clearance and the date thereof of the victualling bill, and deliver the same to the master of such ship as the clearance thereof; and the master of such ship shall answer to the collector or comptroller such questions touching her departure and destination as shall be demanded of him; and ships having only passengers with their baggage on board, and ships laden only with chalk or slate, shall be deemed to be in ballast; and if any such ship, whether laden or in ballast, shall depart without being so cleared, if she have any such stores on board, the master shall forfeit and pay the sum of 100*l.*

Ballast is not part of a ship's furniture.

Ship owners are bound to ballast a ship properly, but they may put merchandise on board as ballast, if it occupy no more room than ballast would have.

No passenger ship shall be (18 & 19 Vict. c. 119 s. 19) allowed to clear out or proceed to sea with any horses, cattle, gunpowder, vitriol, lucifer-matches, guano, or green hides, or any other article on board whether as cargo or ballast, which may be deemed by the emigration officer at the point of clearance likely to endanger the health or lives of passengers.

**BALSAM** (Ger. halsam; Dutch, balsam; Fr. baume; Ital. and Span. balsamo; Lat. balsamum). Balsams are vegetable juices, either liquid, or which spontaneously become concrete, consisting of a substance of a resinous nature, combined with benzoic acid, or which are capable of affording benzoic acid by being heated alone, or with water. The liquid balsams are copaiva, opobalsam, balsam of Peru, storax, and Tolu; the concrete are benzoin, dragon's blood, and red or concrete storax. (Ure.)

1. *Copaiva* (Fr. baume de copahu; Ger. kopaiva balsam; Span. copayva).—This is obtained from the *Copaifera multijuga*, and other trees growing in South America and the West India Islands. The largest quantity is furnished by the province of Para in Brazil. It is imported in small casks, containing from 1 to 1½ ewt. Genuine good copaiva or copaiba balsam has a peculiar odour, and a bitterish, hot, nauseous taste. It is clear and transparent; its consistence is that of oil; but when exposed to the action of the air it becomes solid, dry, and brittle, like resin.

Copaiva is said to be frequently adulterated

with castor oil, and turpentine. No test other than the quantity of essential oil obtainable by distillation appears to be conclusive.

2. *Opobalsam* (Fr. balsamier de la Mecque; Ital. opobalsamo; Lat. balsamum verum album, a gypticum; Egypt. balssan).—The most precious of all the balsams, commonly called Balm of Gilead. It is the produce of a tree (*Angris Gileadensis*), indigenous to Arabia and Abyssinia, and transplanted at an early period to Judea. It is obtained by cutting the bark with an axe at the time that the juice is in the strongest circulation. The true balsam is of a pale yellowish colour, clear and transparent, about the consistence of Venice turpentine; of a strong, penetrating, agreeable, aromatic smell, and a slightly bitterish pungent taste. By age it becomes yellow, browner, and thicker; losing by degrees, like volatile oils, some of its finer and more subtle parts. It is rarely if ever brought genuine into this country; dried Canada balsam being generally substituted for it. It was in high repute among the ancients; but it is now principally used as a cosmetic by the Turkish ladies. (Drs. Ure and Thomson.)

The Canada balsam, now referred to, is merely *fine turpentine*. It is the produce of the *Pinus balsamea*, and is imported in casks, each containing about 1 cwt. It has a strong, but not a disagreeable odour, and a bitterish taste; it is transparent, whitish, and has the consistence of copaiva balsam. [TURPENTINE.]

'Safra and Beder are the only places in the Hedjaz where the balsam of Mecha, or balessan, can be procured in a pure state. The tree from which it is collected grows in the neighbouring mountains, but principally upon Djebel Sobh, and is called, by the Arabs, Be-chem. I was informed that it is from 10 to 15 feet high, with a smooth trunk, and thin bark. In the middle of summer small incisions are made in the bark; and the juice, which immediately issues, is taken off with the thumb-nail, and put into a vessel. The gum appears to be of two kinds, one of a white, and the other of a yellowish white colour; the first is the most esteemed. I saw here some of the latter sort in a small sheep-skin, which the Bedonius use in bringing it to market: it had a strong turpentine smell, and its taste was bitter. The people of Safra usually adulterate it with sesamum oil and tar. When they try its purity, they dip their finger into it and then set it on fire; if it burn without hurting or leaving a mark on the finger, they judge it to be of good quality; but if it burn the finger as soon as it is set on fire, they consider it to be adulterated. I remember to have read, in Bruce's *Travels*, an account of the mode of trying it, by letting a drop fall into a cup filled with water; the good balsam falling coagulated to the bottom, and the bad dissolving and swimming on the surface. I tried this experiment, which was unknown to the people here, and found the drop swim upon the water; I tried also their test by fire upon the finger of a Bedonin, who had to regret his temerity; I therefore regarded the balsam sold here as adulterated; it was of less density than honey. I wished to purchase some; but neither my own baggage nor any of the shops of Safra could furnish anything like a bottle to hold it; the whole skin was too dear. The Bedonius, who bring it here, usually demand 2 or 3 dollars per pound for it when quite pure; and the Safra Arabs resell it to the hadjeys of the great caravan at between 8 and 12 dollars per pound in an adulterated state. It is bought up principally by Persians.' (Burckhardt's *Travels in Arabia*, vol. ii. p. 123.)

3. *Balsam of Peru* (Fr. baume de Peru; Ger. Peruvianischer balsam; Span. balsamo de quinquina; Lat. balsamum peruvianum).—The produce of a tree (*Myrozyllon peruvianum*) growing in the warmest parts of South America.

The balsam of Peru was first mentioned by Monasdes, under the name of *balsamum*. From the tree which was named by Dr. Royle, *Myrosperrum Perceira*, two kinds of balsam are obtained, the black balsam (balsam of Peru of commerce), gained by incisions into the stem, and the white balsam (Sonsouate or San Salvador white balsam), obtained by pressure of the fruit after removal of the outer fibrous portions.

Both of these products are procured exclusively from the balsam coast of San Salvador, between the ports of Libertad and Acajutla. The principal market for its sale is Sonsouate. The native Indian population collect and bring it to Sonsouate for sale, in gourds. It is usually sold by the pound, and is paid for in silver pillar dollars. The average annual production of black balsam is about 25,000 lbs. According to M. Saravia, of Sonsouate, it is obtained by inserting rags in incisions in the tree. These rags, when well soaked, are boiled in water, and the balsam allowed to subside; the water is then poured off and the impure balsam packed in gourds; and M. Victor le Nonvel corroborates this account.

The tree is also an inhabitant of Peru, New Granada, Columbia, and Mexico. Black balsam of Peru is a transparent, deep reddish-brown or black liquid, about the consistence of treacle, and possesses an odour similar to that of vanilla or benzoin. It is soluble in alcohol.

There is another balsamic substance which bears the name of balsam of Peru; it is of a deep brown colour, and has an odour similar to that of Tolu; it is called by Professor Gurbourb *baume de Perou en cocon*, from being ordinarily collected in cocoon shells.

The white balsam of Peru is supposed to be the product of the oleoresinous matter contained in the pericarp and the fatty and other constituents of the seed. It is imported in globular earthen jars, containing about 20 lbs. each. It closely resembles Bordeaux turpentine, is semi-fluid and somewhat granular.

Balsamelo is another product of the same tree, procured by digesting the fruit in rum. (Pereira's *Materia Medica*, and *Private information*.)

Our imports of balsam of Peru amounted in 1863 to 25,508 lbs., four-fifths of which were imported from New Granada; but in 1866 the imports from the latter had fallen to 5,859 lbs. The total value of the imports was 6,699*l.* and the average value per lb. 5*s.* 3*d.*

4. *Storax* (Fr. storax; Ger. storaxbanm; Ital. storace; Span. azumar; Lat. styrax; Arab. asterak). The produce of a tree (*Liquidambar orientale*) growing in the south of Europe and the Levant.

The purest kind is storax in grains. Another kind is called *Styrax calamita*, so named from being brought in masses, wrapped up in the leaves of a kind of calamus. Both these kinds have the odour of vanilla, and are rarely found in the market. A third variety is light, pliable, and imported in brown or reddish-brown masses. A fourth is semi-fluid, the liquid storax of the shops. Storax is employed in medicine and perfumery, but it is very liable to adulteration. Its odour appears to be due to a volatile oil. (*United States Dispensatory*.)

5. *Tolu Balsam* of (Fr. baume de Tolu; Ger. Tolutanischer balsam; Span. balsamo de Tolu). The juice of the *Myrosperrum toluiferum*, a tree found

China.  
Benzo

in Carthage. The wood of this tree, according to Humboldt, is of a dark red colour, and of an agreeable odour, and is much used for building.

The balsam is obtained by making incisions in the trunk, and is brought from Carthage in calabashes, earthenware jars, and glass vessels. The test of its purity is its solution in sulphuric acid, from which no sulphurous acid gas should be disengaged in the process, and which should completely dissolve it. Balsam of Tolu contains cinnamic acid. Balsam of Tolu is not, as has been believed, a variety of balsam of Peru, but is the produce of a different tree and a different region. (*United States Dispensary*.)

6. *Benzoin* or *Benjamin* (Fr. benzoin; Ger. benzoe; Span. bengui; Ital. belzaino; Lat. benzoinum; Arab. liban; Hind. luban; Jav. menian; Malay. caminyau). This is an article of much greater commercial importance than any of those balsams previously mentioned. It is obtained from a tree (*Styrax benzoin*) cultivated in Sumatra and Borneo, but particularly the former. The plants produce in the seventh year. The balsam is obtained by making incisions in the bark, when it exudes, and is scraped off. During the first 3 years the balsam is of a clear white colour, after which it becomes brown. Having borne 10 or 12 years, the tree is cut down, a very inferior article being obtained by scraping the wood. The balsams procured in these different stages are distinguished in commerce, and differ widely in value. Benzoin has a very agreeable, fragrant odour, but hardly any taste. It is imported in large masses, packed in chests and casks. It should be chosen full of clear, light-coloured, and white spots, having the appearance of white marble when broken: it is rarely, however, to be met with in so pure a state, but the nearer the approach to it the better.

Subjoined is a table of the imports, &c. of benzoin in 1863:—

From	cwt.	Value	Average value
		£	per cwt.
From Holland	287	2,373	8 5 4
Siam	73	1,541	18 7 6
India, Singapore, and Ceylon	2,880	25,039	8 14 0
Other parts	102	812	8 2 1
Total	3,342	29,615	

About 480 cwts. of this amount were exported to France in 1863.

The exports of this article from Siam are not the produce of that country, according to Sir R. Schomburgk, who states that 'it is all brought from the Laos country.' The tree is destroyed to procure the gum, the bark is clipped all over, and after the gum has all exuded and hardened, it is found between the stem and bark, which is then stripped off. The tree is called Kanyan by the Siamese. The gum, which exudes naturally, has a much stronger perfume than that procured by cutting, but from dropping on the ground it is a good deal mixed with earth and other impurities; it is not white, but of a clear brownish colour. From the manner in which it is brought down the country, it is much destroyed, being broken into dust often from the rough usage which it receives before arriving at the navigable parts of the Meinan. The common way of bringing it to the river is in small baskets strapped in pairs across bullocks' backs. It sells at Bangkok for about 30 ticals per picul. Sir Robert Schomburgk subsequently discovered in his journey to Laos that the benzoin imported into Siam was brought not from Laos, but from the Western provinces of China.

Benzoic acid is prepared chiefly from the Su-

matra kind of benzoin, the average yield from good samples being about 10 or 12 per cent. A kind of benzoin, from Penang, having a smell like storax, does not contain benzoin, but chiefly cinnamic acid, which has no commercial value.

The benzoic acid prepared from gum benzoin has an agreeable odour of the benzoin, but an inferior kind is in the market prepared from the urine of the herbivora. It has a different smell, indicating its origin. Most of the benzoin imported into London and sold at the public sales is re-exported to Russia, Greece, and Roman Catholic countries.

The Siam benzoin fetches the highest price, but the 'tear' benjamin has almost disappeared from the market. The best Siam is now generally met with in small flat pieces.

*Dragon's Blood* (Fr. sang-dragon; Lat. sanguis draconis; Arab. damulakhwatu; Hind. heraduky; Ger. drachenblut; Dan. dragoblod; Span. and Port. sangue de drago; Ital. sangui di drago). The produce of a large species of rattan palm (*Palma juncus draco rumphius*; *Calamus draco*; *Willd.*), a native of the islands of the Indian Archipelago, but principally produced in Sumatra and Borneo.

The berry of the *Calamus draco*, which is round pointed and about the size of a cherry, yields a resinous substance, the dragon's blood of commerce.

Dr. Pereira describes the following kinds:—

1. Dragon's blood in the reed, dragon's blood in sticks, occurs in dark reddish-brown sticks, of from 12 to 18 in. long, and from ¼ in. to ½ in. in diameter, enveloped with the leaf of the Talipot palm and bound round with slender slips of cane. Supposed to be obtained from a species of *Calamus*, perhaps *C. draco*.

2. Dragon's blood in oval masses, in drops, occurs in reddish-brown lumps of the size and shape of an olive, enveloped with the leaf of the Talipot palm, which connects them together in a row, like beads of a necklace. This kind is rare in England.

3. Dragon's blood in powder is a reddish powder of very fine quality, imported from the East Indies. Is probably the dust of the fruit of the *C. draco*.

4. Dragon's blood in the tear occurs in irregular pieces, some as large as the fist.

5. Lump dragon's blood varies in quality from fine to ordinary, and occurs in pieces of all sizes and shapes.

6. Dragon's blood in cakes occurs in flat oblong pieces, half the size of a brick, and mostly fine in quality. (Pereira's *Materia Medica*; *Guillaumin's Diction. de Commerce*.)

The following were the imports in 1865:—Copaiba, 230,508 lbs.; Peru, 17,626 lbs.; others unenumerated, 46,000 lbs.

BALTIMORE. A large, opulent, and commercial city of the United States, in Maryland, on the north side of the Patapsco river, about 14 miles above its entrance into Chesapeake Bay, lat. 39° 17' N., long. 76° 36' W. Population in 1850, 169,054; in 1860, 212,418. It is now, 1867, estimated at 300,000. The harbour is spacious, convenient, and the water deep. The exports principally consist of wheat-flour and wheat, tobacco (of which it furnishes a larger supply than any other port in the Union, with, perhaps, the single exception of Richmond, in Virginia), Indian corn and meal; bacon, pork, rice, beef, lard, butter, cheese, and other articles of provision; with candles, soap, refined sugar, &c. The imports principally consist of cottons and woollens, sugar, coffee, tea, iron, wine, brandy, silk

goods, spices, rum, &c. The registered, enrolled, and licensed tonnage, belonging to Baltimore, June 30, 1866, amounted to 69,555 tons, of which a large portion was employed in the coasting trade. In 1857, 57 vessels of the burden of 12,410 tons were built at Baltimore, but this is above the average of late years. In 1865 only 2 were built. The total value of the articles imported into Baltimore in the year ending June 30, 1866, was 10,010,000 dollars; the total value of the exports during the same year being 11,091,693 ditto. (*Consular Reports, 1867.*) In Maryland the dollar is worth 78. 6d. currency, 11. sterling being=11. 13s. 4d. currency. For an account of the currency of the different states of the Union, with a table of the value of the dollar in each, see New York; and to it also the reader is referred for an account of the foreign trade of the United States. Weights and measures same as those of England.

The trade of Baltimore was severely crippled by the civil war, and is now adversely affected by the high tariffs and protective duties of the United States. This is especially the case with the trade between this port and the British West Indies, and with the export of tobacco. In 1866 it imported 180,870 bags of coffee, chiefly from Rio, while among its receipts were 33,680 bales of cotton; of which 7,499 bales were exported. The Maryland crop of wheat was small in 1866, but that of maize was the largest ever known, amounting to 4,479,033 bushels. The most important export, however, was petroleum, of which 1,982,368 gallons were sent to foreign countries in 1866. There are thirteen or fourteen refineries engaged in distilling this product. The price fluctuates enormously, varying from a dollar per gallon, at which it stood in July 1864, to 32 cents, its price in December 1866. Baltimore also exports large quantities of provisions—beef, pork, butter, lard, bacon. In 1866, 527,680 lbs. of bacon were exported. The stock of tobacco in 1866 was 73,308 hhds. The largest exports of Maryland tobacco were to Bremen, Rotterdam, and France. The imports of coal, once a large trade in this town, have been seriously checked by the enormous duties imposed on them. In some cases, as might be expected, these excessive imposts have been evaded by wholesale smuggling. (*Consular Reports, 1867.*)

There is a lighthouse on Lazaretto Point, on the N. side of Baltimore island, lat. 39° 15' 42" N., long. 76° 33' 59" W., and visible for 10 miles.

Oysters.—Baltimore is one of the principal places in the Union for the supply of oysters. In 1866 the entire produce of the fishery amounted to 7,000,000 bushels, valued at 5,300,000 dollars. The vessels engaged in this trade were no less than 1,100, some of 50 tons each, and nearly 600 other vessels were employed in bringing them to market. (*Consular Report, 1866.*)

**Commercial Regulations adopted by the Board of Trade, in June 1857: to obtain where no express agreement to the contrary exists.**

Commissions on General Business.		per cent.
On sales of foreign merchandise		5
On sales of domestic merchandise, not otherwise provided for		2½
On guarantee		2½
On selling flour and meal		12½
On selling grain received by vessels		1
On railroad or steamboat, exclusive of the expense of delivery		2
On purchase and shipment of merchandise, on costs and charges, with funds in hand		2½
On effecting marine insurance, 2½ per cent. on premium for domestic and 5 per cent. on foreign. No charge to be made for effecting insurance on property consigned or shipped.		
On collecting delayed and litigated accounts		5

	per cent.
On landing, re-shipping, or delivering goods from vessels in distress, on a value of invoice	2½
On procuring or obtaining money on Bottomry or Supplemental Bond on Vessels	2½
Landing and re-shipping on specie and bullion	1
Receiving and forwarding merchandise entered at Custom House, on invoice value 1 per cent., and on expenses incurred	2½

On consignments of merchandise withdrawn or re-shipped full commissions are to be charged, to the extent of advances or responsibilities incurred, and one-half commission on the residue of the value.

The risk of loss by robbery, fire (unless insurance be ordered), theft, popular tumult, and all other unavoidable occurrences is in all cases to be borne by the owners of the goods, provided due diligence has been exercised in the care of them.

Shipping.		per cent.
On purchase or sale of vessels		2½
On disbursements and outfit of vessels		2½
On procuring freight and passengers		2½
On collecting freight		2½
On collecting insurance losses of all kinds		2½
Charters of vessels on amount of freight, actual or estimated, to be considered as due when the charter parties are signed		2½
No charter to be considered binding till a memorandum or one of the copies of the charter has been signed.		
On giving bonds for vessels under attachment in litigated cases, on amount of liability		2½

The foregoing commissions are exclusive of auction duty, and commissions, brokerage, storage, and every other charge actually incurred.

**Freight and Freighting.**

If a vessel is freighted by the ton, and no special agreement is made respecting the proportions of which each article shall be computed, the following shall be the standard of computation, viz.:

2,210 lbs.	pig and bar iron, lead, copper, coal, logwood, fustic, and other heavy dry-woods	
2,000 "	Nicaragua and Braziletto wood	
2,210 "	nett sugar and rice in casks	
1,850 "	coffee in bags	
1,500 "	in casks	
1,500 "	cocoa in bags or bulk	
1,100 "	in casks	
1,110 "	pimento in bags	
952 "	in casks	
800 "	ship bread in bags	
700 "	in casks	
1,150 "	dried hides	
900 "	w. green teas and China raw silk	
1,120 "	Bohea and other black tea	
1,500 "	Virginia tobacco in hhds.	
1,500 "	Kentucky "	
1,000 "	Maryland "	
8 lbs.	flour of 136 nett	
6 "	beef, pork, and tallow	
7 "	navel stores and pickled fish	
200 gals.	wine measure—estimating the full contents of the cask of oil, wine, brandy, &c.	
22 bush.	grain, peas, beans, &c. in casks	
40 "	in bulk	
40 "	Liverpool blown salt in bulk	
34 "	ground	
51 "	St. Ubes, Cape de Verdes, &c. in bulk	
50 "	West India salt in bulk	
20 "	sea coal in bulk	
40 cubic feet	of plank, boards, timber, bale goods, packages and boxes	

In estimating the contents in cubic feet, of various packages and goods, the following shall be the standard:

A flour barrel	5
A tree of rice	11
A hhd. of flaxseed	12
Virginia tobacco	15
Kentucky, Georgia, and Carolina	10
Maryland and Ohio	55
5 bushels of grain in bulk	5

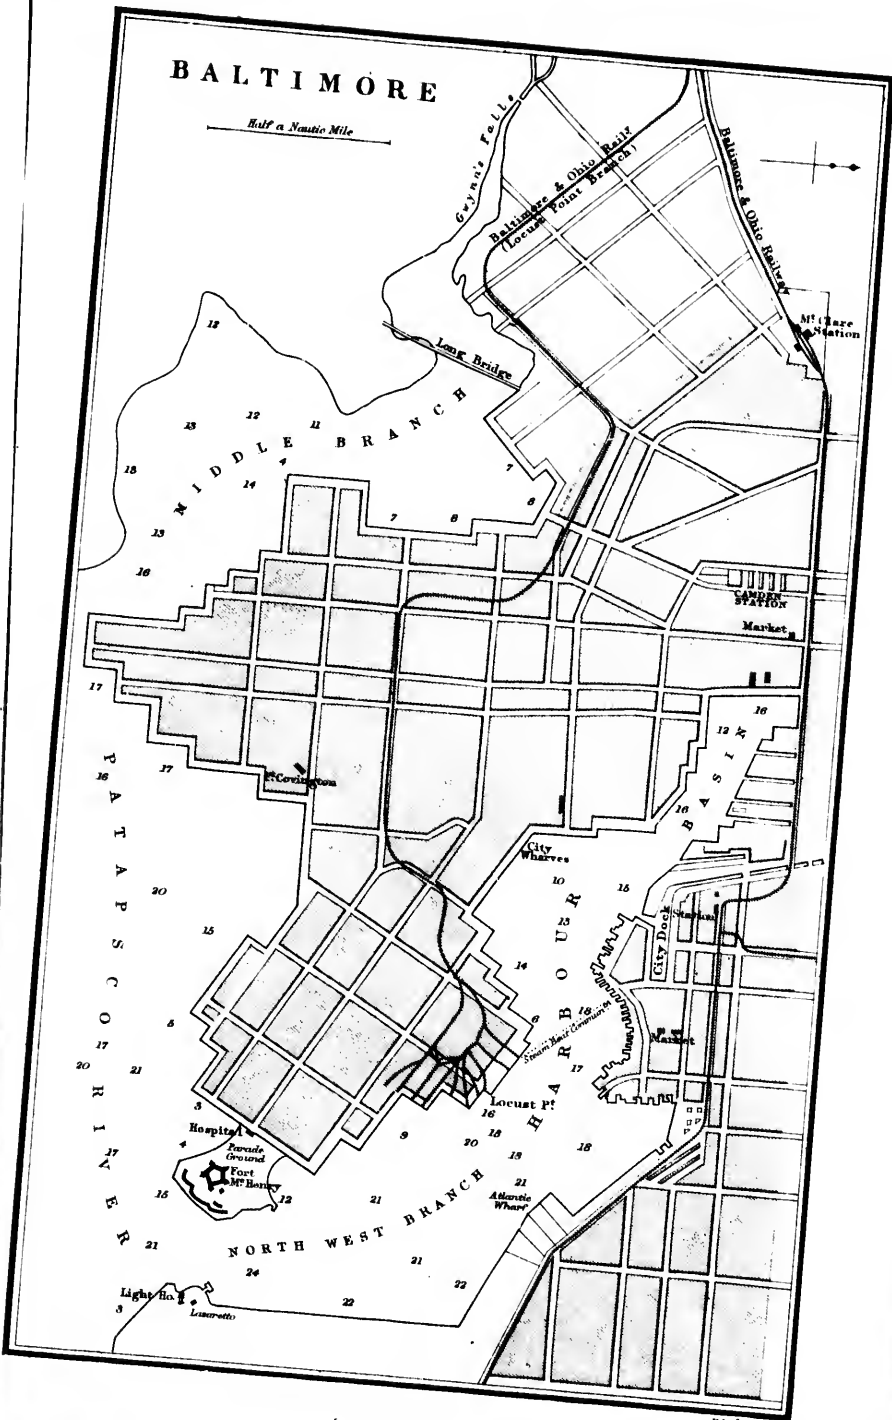

In computing boxes of candles and soap, kegs of butter and lard, hams and bacon, and generally all similar articles, 200 lbs. nett weight shall be considered equal to a barrel of 5 cubic feet.

All goods brought to this port on freight must be delivered on a wharf, at the expense of the vessel bringing the same; a delivery, after due notice, on any good wharf at Fell's Point during business hours, is a delivery in the city and port of Baltimore. Hides and articles prohibited to be landed in the city at certain periods, may be landed where the public authorities may direct.

BALTIMORE

In all cases when vessels are obliged (by the quarantine regulations or city authorities) to discharge their cargo in the stream, the expense of delivering the same east of Jones' Falls will be borne by the carrier only. But when requested by the consignee to be delivered west of Jones' Falls, then the expense shall be equally borne by the carrier and consignee (each one-half).

If a vessel is chartered for a voyage out and home, each shipper shall be entitled to his fair proportion of the whole homeward freight, pro rata, of the bulk or space occupied by each shipper on the outward voyage.

In all cases where a vessel is chartered or freighted for a voyage out and home, the freighter or charterer is bound to furnish sufficient cargo or ballast at the port of discharge of the outward cargo, to enable said vessel to return safely home, and the same from port to port, where the charter provides for more than one port; provided no agreement to the contrary is made by the parties.

Weights and Tares.

Sugar, coppers, alum, brimstone, shot, lead, iron, steel, hemp, dye-woods, and all other articles heretofore sold by the cwt. of 112 lbs. or ton of 2,240 lbs., shall in future be sold by the decimal hundred of 100 lbs., or ton of 2,000 lbs.

Tares shall be allowed as follows:—

Sugar, in hhd., or tcs., 12 per cent.; in brls. 10 per cent.; in boxes, 15 per cent.; do. in linen bags 3, and mats 5 per cent.; and in all other packages, the actual tare.

Coffee in hhd., or tcs., 12 per cent.; in brls. 2 per cent.; in flour brls., 20 lbs. each; in all other packages the actual tare.

Pepper in linen or single gunny bags, 3 per cent.; in other packages, the actual tare.

Pimento in linen or single gunny bags, 3 per cent.; in other packages, the actual tare.

Rice in tcs. and half tcs., 10 per cent.

Coppers in hhd., or brls., actual tare.

Teas, green, whole chests 20 lbs., and in all other packages, Canton tare.

Cassia in mats, 10 per cent.; boxes and other packages, the actual tare.

Indigo in ceroons, in single hides, 11 per cent.; in all other cases, the actual tare.

Ginger 2 per cent., and cloves 9 lbs. per bale.

Alum, brimstone, nutmegs, mace, almonds, figs, cheese, soap, candles, chocolate, currants, prunes, starch, and all other articles not before mentioned, the actual tare.

For a sack of ground alum salt, 216 lbs. gross shall be considered as fair average weight.

No charge shall be made for casks, barrels, boxes, or other packages whatever.

Drafts as follows: On all weights *even beam*—4 per cent. to be allowed for draft.

Pork or beef to be packed or repacked in accordance with existing city ordinances.

The tonnage dues are 30 cents a ton. Vessels to and from the British provinces pay this tax once a year. The harbour dues are 2 cents a

are no light-house dues. There are no public wharves. The pilots are organised, and chartered under a state law, but it is optional to use them or not. The rates are—vessels drawing 15 feet

dollars; from 12 to 15 feet, outward 4 dollars; less than 12 feet, inward 4 dollars, outward 250 dollars.

If the master does not take a pilot, he is required to take out a pilot license. This license, for which he pays 6 cents

per ton, permits him to pilot his own vessel, and holding such a license, to employ a pilot, a deduction of 20 per cent.

Vessels drawing 22 feet can enter the port and those drawing 18 feet can come up to the wharves.

(Private information.) For further particulars, see Edwards' *British Shipmasters' Guide*.

BAMBOO (Fr. bambou, bambouches; Ger. indianischer rohr; Ital. bambu; Hind. rans; Malay, bilah; Jav. Preng). A species of cane,

the *Bambos arundinacea* of botanists. It grows everywhere within the tropics, and is of the greatest utility; strictly speaking it is a gigantic

grass with a ligneous stem. It often rises to the height of 40 or 50 feet, and sometimes to the double those heights. Like most plants long and extensively cultivated, it diverges into many varieties.

Some of these are dwarfish, while others instead of being hollow canes, are solid. The bamboo is of rapid growth, and in four or five years is fit for many uses, but does not bear fruit

perishes. The grain makes tolerable bread. The young, but gigantic shoots, as they spring from the earth, make a tender and good esculent

vegetable. The mature bamboo is employed in an immense variety of ways, in the construction of houses, bridges, boats, agricultural implements,

&c. Some varieties grow to such a size as to be, in the largest part, nearly two feet in circumference, and single knees of these are used as pails or buckets. The Chinese fabricate their cheap and useful paper of macerated bamboo, and use it in the manufacture of ropes, which are of great strength and solidity, for the rigging of their junks. The canes used in Europe as walking sticks are not bamboos, but rattans—a totally distinct class of plants. Bamboos are never used for that purpose. (*Private information.*)

**BANCO.** A word borrowed from the Italian, and used in certain commercial towns to distinguish real or ideal bank values from currency values. It is a term rarely used except at Hamburg.

**BANDANAS.** Silk handkerchiefs, generally red spotted with white. They were formerly manufactured only in the East Indies; but they are now manufactured of the very best quality at Glasgow and other places.

**BANGKOK.** The capital of the kingdom of Siam, situated about 20 miles direct distance, but about 30 by water, from the sea on both sides the river: Meinam, but chiefly on its left or eastern bank, in lat. 13° 40' N., long. 101° 10' E. The Meinam opens in the centre nearly of the bottom of the Gulf of Siam. There is a bar at its mouth, consisting, for the most part, of an extensive mud flat. The outer edge of this flat, which is little more than 200 yards broad, is sandy and of harder materials than the inner part; which is so soft that when a ship grounds on it during the ebb, she often sinks 5 feet in the mud and clay, which supports her upright, so that she is but little inconvenienced. The highest water on the bar of the Meinam, from February to September, is about 13½ feet; and in the remaining 4 months, somewhat more than 14 feet—a difference probably produced by the accumulation of water at the head of the bay after the south-west monsoon and by the heavy floods of the rainy season. On account of the deficiency of water on the bar, vessels sent to Bangkok had better, perhaps, not exceed 200 or 250 tons burden. In all other respects, the river is extremely safe and commodious. Its mouth is no sooner approached, than it deepens gradually; and at Paknam, two miles up, there are 6 and 7 fathoms water. This depth increases as you ascend, and at Bangkok is not less than 9 fathoms. The only danger is, or rather was, a sandbank off Paknam, bare at low water; but a battery has been erected within the last few years, affording at all times a distinct beacon. The channel of the river is so equal, that a ship may range from one side to another, approaching the banks so closely that her yards may actually overhang them. The navigation is said to be equally safe all the way up to the old capital, Yuthia, 80 miles from the mouth of the river.

The city of Bangkok extends along the banks of the Meinam to the distance of about 2½ miles, but is of no great breadth, probably not exceeding 1½ mile. On the left bank there is a long street or row of floating houses: each house or shop, for they are in general both, consisting of a distinct vessel, which may be moored anywhere along the banks. Besides the principal river, which at the city is about a quarter of a mile broad, the country is intersected by a great number of tributary streams and canals, so that almost all intercourse at Bangkok is by water. The population has been variously computed at from 50,000 to 400,000; but, though probably in excess, the latter is no doubt the nearest to the mark. Half the population consists of Chinese settlers.

The common necessities of life at Bangkok are exceedingly cheap. A cwt. of rice may always be had for 2s. and very often for 1s. Other necessaries, such as salt, palm-sugar, spices, vegetables, fish, and even flesh, are proportionally cheap. The price of good pork, for example, is 2½d. per lb. A duck may be had for 7d. and a fowl for 3d. The neighbourhood of Bangkok is one of the most productive places in the world for fine fruits; here are assembled, and to be had in the greatest perfection and abundance, the orange and lichi of China, the mango of Hindostan, and the mangostein, durian, and shaddock of the Malay countries.

The area of the kingdom of Siam has been estimated at about 200,000 square miles, and its population at from nearly 3,000,000 to 6,000,000; both estimates being by the highest authorities, viz., Mr. Crawford, one of the most intelligent Englishmen that has ever visited the country, and the other by M. Pallexoix, bishop of Siam. Sir John Bowring reckons the population at between 4,000,000 and 5,000,000; but it is evident that no dependence can be safely placed on any of these estimates. From a quarter to a third part of the population are supposed to be Chinese. Sir John Bowring says: 'There is no class of settlers, who, under proper control, are so likely to be useful as the Chinese. That passion for acquiring wealth, which leads them to dare all danger and difficulty, is a most valuable recommendation. Their habits of subordination, their inbred respect for authority, their gregarious spirit, which drives them into associations of every sort, private and public, praiseworthy and pernicious, only require a thorough knowledge of their character to be turned to the best account.' (*The Kingdom and People of Siam*, i. 243.) The Chinese are, in truth, by far the best and most valuable part of the population.

**Trade.**—Being near the mouth of a great navigable river, which runs through the whole extent of the country, Bangkok is well situated for commerce, and formerly she possessed a considerable trade. This, however, gradually fell off, in consequence of the monopolies and other injudicious measures of the government. But latterly a more liberal spirit has prevailed; and since 1855, when the commercial treaty negotiated by Sir John Bowring (see *post*) came into operation, trade has been largely extended; and the capacities of the country are so very great that, were they at all developed, Bangkok could not fail to become one of the principal emporiums of the East.

The trade which is centred at Bangkok is principally carried on with China, Cochinchina, and the neighbouring countries, and with Singapore, Java, &c. But vessels direct from England and other European countries and the United States, occasionally arrive at the port. Pallexoix has given (tom. i. p. 327) a list of the articles, with their quantities and prices, that are usually shipped from Siam; but we prefer laying before the reader an account of the articles, &c., that were really imported into and exported from Bangkok in 1864-65.

A large part of the imports consist of English cotton stuffs and twist, copper, iron and nails, shipping stores, &c. The imports from China comprise coarse earthenware and porcelain, spelter, quicksilver, tea, lacksoy (vermicelli), dried fruits, raw silk, crapes, satins, and other silk fabrics, nankeens, shoes, fans, umbrellas, writing paper, sacrificial paper, incense rods, and many other minor articles. Not the least valuable part of the importations are immigrants.

Opium has become an extensive article of consumption. It was formerly prohibited; but, to use the words of Sir John Bowring, 'The influence of the Chinese, the wants of the treasury, the impotency of prohibitions and punishments to prevent its importation, have led to the legalisation of the drug, and the establishment of an opium farm, for which a large sum is annually paid by an opulent Chinese contractor.' (Bowring's Siam, i. 255.)

The tonnage engaged in the trade with China formerly consisted almost entirely of junks; but latterly these have been to a considerable extent superseded by the employment of square-rigged vessels built in Siam after European models.

The supplies of many of the above articles, especially of sugar, pepper, rice, &c., may be indefinitely increased. The principal sugar growing districts are situated in the immediate vicinity of the capital; and nothing is wanted but the application of skill and capital to the culture of the cane and the manufacture of the sugar to increase the produce of the latter to any amount. Pepper is mostly grown near, and is brought from Maritban, on the east side of the Gulf.

M. Pallegoix states that the main obstacles to the extension of trade at Bangkok consist: 1. In the difficulty of disposing of goods within a limited period; 2. In the dilatoriness with which they are paid for; and 3. In the delay which attends the getting on board of a return cargo: and to obviate these he suggests that foreigners trading with Siam should have agents and warehouses in

the country, to whom they might consign their goods, to be sold according to the demand, and who might purchase and accumulate, as occasion served, articles of export. Those who act thus, he says, generally succeed. (Pallegoix, i. 326.)

Port Dues and Duties.—Previously to 1855 British ships arriving at Bangkok were subject to certain port dues, but these were abolished by the treaty of that year. Duties on imports were at the same time fixed at 3 per cent. The duties on exports and trade regulations are specified in the tariffs, &c., annexed to the treaty. [TREATIES, COMMERCIAL.]

European pilots are always in attendance outside the bar. As soon as the river is entered, all difficulties cease. Vessels are obliged to anchor at Paknam, a town situated about 3 miles from the entrance on the eastern bank. They there land their guns and ammunition, and take on board a customs officer before proceeding to Bangkok.

Paklat Lang, on the west bank of the river, 5 miles above Paknam, is the entrance to a canal which saves a circuit of nearly 10 miles to boats proceeding to or from Bangkok. Ships must take the circuitous route by the river. The canal enters the river at the small village of Paklat Bon. On arrival at Bangkok, vessels can, in any state of the tide, either lie alongside the wharves of their consignees, or, if preferred, anchor in the main stream, where every facility for unloading exists in the abundance of cargo-boats always at

land at a reasonable charge. There are no port dues on European bottoms. On ships reporting at their respective consulates importers have to enter particulars of their merchandise at the Siamese custom-house, which thereon grants the customary order to the landing waiter in charge to permit the landing of the goods.

All merchandise (with the exception of specie) pays the uniform ad valorem duty of 3 per cent. Produce not directly taxed on its production or transit to Bangkok from the interior, pays various export duties.

**Monies, Weights, and Measures.**—Gold and copper are not used as money in Siam, and the currency consists only of cowrie shells and silver. The denominations are as follows:—200 bia or cowries make 1 p'hai-nung; 2 p'hai-nungs, 1 sing-p'hai; 2 sing-p'hai, 1 fuang; 2 fuangs, 1 salung; 4 salungs, 1 bat or tical; 80 ticals, 1 cattie; 100 catties, 1 picul.

The standard coin is the bat, which Europeans have called a *tical*; but there are also coins, though less frequently, of the lower denominations. These are of a rude and peculiar form. They are, in fact, nothing more than small bits of a silver bar bent, and the ends beaten together. They are impressed with two or three small stamps, not covering the whole surface of the coin. The cattie and picul are, of course, only used in speaking of large sums of money. Gold and silver are weighed by small weights, which have the same denominations as the coins. The p'hai-nung, the lowest of these, is in this case subdivided into 32 sungs, or red beans, the *Abrus precatorius* of botanists.

The bat, or tical, was assayed at the mint of Calcutta; it was found to weigh 236 grains; its standard, however, was uncertain, and the value of different specimens varied from 1 rupee 3 annas and 3 pice, to 1 rupee 3 annas and 7 pice. The value, therefore, in sterling money, is about 2s. 6d., and it is so considered.

The denominations of the smaller coins are as follows:—

2 Lots	= 1 At.	The one bat pewter coin, the latter about the size of a halfpenny, and replacing the 100 cowrie shells, which were until lately the only medium of exchange for values under the 'Fuang.'
2 At	= 1 Song P'hai.	A flat copper coin of the same size, but thicker than the above.
2 Song P'hai	= 1 Fuang.	Flat silver coins.
2 Fuangs	= 1 Salung.	
4 Salungs	= 1 Bat or Tical.	equal in weight to the Chinese.
80 Ticals	= 1 Chang or Cattie.	
20 Catties	{ = 1 Hap or Picul } { or 4000 Ticals }	

There is no gold money used in general, and the largest silver coin is the tical. The cattie and picul represent merely weights of silver, and are only used for the calculation of large sums as in India is used the term *lac*.

In respect to ordinary measures, the Siamese cattie is double the weight of the Chinese cattie, which, as is well known, is equal to 14 lb. avoirdupois. The picul, however, is of the same weight, consisting in the one case of 50 catties only, and in the other of 100. In weighing rice and salt, a large measure is used, consisting, in respect to the first of 22 piculs, and of the last of 25 piculs. Rice is also measured by the basket, of which 100 go to the large measure above mentioned.

The long measures are as follow:—12 finger breadths make 1 span; 2 spans, 1 cubit; 4 cubits, 1 fathom; 20 fathoms, 1 sen; and 100 sen, 1 yuta, or, as it is more commonly pronounced by the Siamese, yat. The fathom is the measure of most frequent use, and the Siamese have a pole of this length divided into its fractional parts,

This, as nearly as can be ascertained, is equal to about 6 feet 6 inches. The sen appears to be also used in the admeasurement of land, and to be the name of a square measure of 20 fathoms to the side.

For the treaty between Great Britain and Siam, see TREATIES, COMMERCIAL.

This article has been compiled from information procured on the spot, and communicated to us by our friend John Crawford, Esq.; from the *Description du Royaume Thai ou Siam*, 2 tomes, Paris, 1851, de M. Pallegoix; Sir John Bowring's *Account of the Kingdom and People of Siam*; information supplied by T. G. Knox, Esq., H.M. consul at Bangkok; *Consular Reports*; the *Gulf of Siam: Pilot*; and *Parliamentary Papers*.

**BANK--BANKING.** Banks are establishments intended to serve for the safe custody and issue of money; for facilitating its payment by one individual to another; and sometimes for the accommodation of the public with loans.

#### SEC. I. GENERAL PRINCIPLES IN REGARD TO PAPER MONEY AND BANKING.

**Substitution of Notes for Coins.**—Notwithstanding the precious metals are in many respects admirably fitted to serve as media of exchange, they have two very serious drawbacks, viz., their cost, and the difficulty and expense of carrying them from place to place. If no bank notes circulated in the United Kingdom, it might be fairly assumed that from 35,000,000 to 40,000,000 more sovereigns would be required for the public accommodation than at present, including in those now employed the reserves held by the bankers; and the expense of such a currency, taking it at 37,500,000*l.* and the rate of profit at 6 per cent., with an allowance of 1 per cent. for wear and tear and loss of coins, would be at least 2,625,000*l.* a-year. But the inconvenience attending the use of a currency consisting wholly of gold would be a much greater drawback on its employment than its cost. The weight of 1,000 sovereigns exceeds 21 lbs. troy; so that were there nothing but coins in circulation, the conveyance of large sums from place to place to discharge accounts would be a very laborious process, and even small sums could not be conveyed without considerable difficulty. Hence it is that most commercial and civilised nations have fabricated a portion of their money of less costly and heavy materials, and resorted to various devices for economising the use of coin. Of the substitutes for the latter hitherto suggested, paper is in all respects the most eligible. When governments are sufficiently powerful and intelligent to enforce the observance of contracts, individuals possessed of written promises from others that they will pay certain sums at specified periods

begin to assign them to those to whom they are indebted; and when those by whom such obligations are subscribed are persons of whose solvency no doubt can be entertained, they are readily accepted in payment of the debts due by one individual to another. But when the circulation of obligations or bills in this way has continued for a while, individuals begin to perceive that they may derive a profit by issuing them in such a form as to fit them for being readily used as a substitute for money in the ordinary transactions of life. Hence the origin of bank notes or paper money. An individual in whose wealth and discretion the public have confidence being applied to for a loan, say of 5,000*l.*, grants the applicant his bill or note payable on demand for that sum on his receiving adequate security for its repayment with interest. Now, as this note passes, in consequence of the confidence placed in the issuer, currently from hand to hand as cash, it is quite as useful to the borrower as if he had obtained an equivalent amount of gold; and supposing that the rate of interest is 4 per cent., it will yield, so long as it continues to circulate, a revenue of 200*l.* a year to the issuer. A sense of the advantages that might, in this way, be derived from the circulation of bills or notes led to the formation of banks for their regular issue. Those who issue such notes, coin as it were their credit. They derive the same revenue from the loan of their written promises to pay certain sums that they would derive from the loan of the sums themselves; and while they thus increase their own income, they at the same time contribute to increase the wealth of the society. Besides being incomparably cheaper, bank notes are also incomparably more commodious than a metallic currency. A bank note for 1,000*l.* or 100,000*l.* may be carried about with as much facility as a single sovereign. It is of importance, too, to observe, that its loss or destruction, whether by fire, shipwreck, or otherwise, would be of no greater importance, in a public point of view, than the loss or destruction of as much paper. No doubt it might be a serious calamity to the holder; but to whatever extent it injured him, it would proportionally benefit the issuer, whereas the loss of coin is an injury to the holder without being of service to anyone else; it is, in fact, so much abstracted from the wealth of the community.

*Regulations in regard to the Issue of Notes.*—To obviate the endless inconveniences that would arise from the circulation of coins of every weight and degree of purity, were there no restrictions on their issue, all governments have forbidden the circulation of coins not of a certain specified or standard weight and fineness. And the recurrence of similar inconveniences from the issue of notes for varying sums, and payable under varying conditions, has led, in most countries in which paper money is made use of, to the enacting of regulations forbidding the issue of notes below a certain amount, and laying down rules for their payment. In England at this moment no note payable to bearer on demand can be issued for less than 5*l.*, and they must all be paid the moment they are presented. In Scotland and Ireland the minimum value of bank notes is fixed at 1*l.*, the regulations as to payment being the same as in England. In order to preserve the monopoly of the London circulation to the Bank of England, no notes payable to bearer on demand are allowed to be issued by individuals or associations, other than the Bank of England, within 65 miles of St. Paul's. But beyond these limits they may be issued by certain banks, under the provisions of the Act 7 & 8 Vict. c. 32 &c.

*Distinction between Bills of Exchange and*

*Paper-Money.*—Under the phrase paper-money or paper-currency, we do not include bills of exchange, or bills issued by bankers, merchants, and others, and payable some time after date. Such bills perform, in some respects, the same functions as money; and have, in consequence, been frequently regarded in the same light as bank notes. But this is quite improper; for though there are many points in which a bill of exchange and a bank note closely resemble each other, there are others in which there is a distinct and material difference between them. A note bears to be payable on demand; it is not indorsed by a holder on his paying it away; the party receiving has no claim on the party from whom he received it, in the event of the failure of the issuers. Practically speaking, this is the fact; but a person paying away a bank note is liable to be called upon for repayment, should the bank fail before it was in the power of the party to whom it was paid, using ordinary diligence, to present it. The responsibility seldom exceeds a couple of hours, and can hardly in any case exceed a couple of days. In practice it is never adverted to; and everyone is thus encouraged, reckoning on the facility of passing it to another, to accept bank paper, 'even though he should doubt the ultimate solvency of the issuer.' (Thornton *On Paper Credit*, p. 172.) Bills, on the contrary, are almost all drawn payable at some distant period; and those into whose hands they come, if they be not in want of money, prefer retaining them in their possession, in order to get the interest that accrues upon them. But the principal distinction between notes and bills is, that every individual, in passing a bill to another, has to indorse it, and by doing so makes himself responsible for its payment. 'A bill circulates,' says Mr. Thornton, 'in consequence chiefly of the confidence placed by each receiver of it in the last indorser his own correspondent in trade; whereas the circulation of a bank note is owing rather to the circumstance of the name of the issuer being so well known as to give it an universal credit.' (*Ibid.* p. 40.) Nothing, then, can be more inaccurate than to represent bills and notes in the same point of view. If A pay to B 100*l.* in satisfaction of a debt, there is an end of the transaction; but if A pay to B a bill of exchange for 100*l.*, the transaction is not completed; and in the event of the bill not being paid by the person on whom it is drawn, B will have recourse upon A for its value. It is clear, therefore, that a great deal more consideration is always required, and may be fairly presumed to be given, before anyone accepts a bill of exchange in payment, than before he accepts a bank note. The note is payable on the instant, without deduction—the bill not until some future period; the note may be passed to another without incurring any risk or responsibility, whereas every fresh issuer of the bill makes himself responsible for its value. Notes form the currency of all classes, not only of those who are, but also of those who are not engaged in business, as women, children, labourers, &c., who in most instances are without the power to refuse them, and without the means of forming any correct conclusion as to the solvency of the issuers. Bills, on the other hand, pass only, with very few exceptions, among persons engaged in business, who are fully aware of the risk they run in taking them. There is plainly, therefore, a wide and obvious distinction between the two species of currency; and it cannot be fairly argued, that because Government interferes to regulate the issue of the one, it should also regulate the issue of the other. To

use the words of Lord Mansfield, 'Bank notes are not, like bills of exchange, mere securities or documents for debts, nor are so esteemed, but are treated as money in the ordinary course and transactions of business, by the general consent of mankind; and on payment of them, whenever a receipt is required, the receipts are always given as for money, not as for securities or notes.' (*Chitty On Bills*, 8th ed. p. 555.)

*Necessity of insuring the Conversion of Bank Notes into Coin.*—The taking of measures to insure the convertibility of bank notes into coin is a matter which cannot safely be left to the discretion or judgment of individuals, but which must be settled by Government. No bank notes should be permitted to circulate, about the equivalency of which to the coins they profess to represent there can be the smallest room for doubt. It is alleged, indeed, that in this, as in most other things, we may safely trust to the prudence and sagacity of those who deal with banks; and that, if left to themselves, the public will very rarely be deceived. But the widest experience shows that little, if any, dependence can be placed on this doctrine. The public is very apt to be misled, in the first instance, in giving confidence to or taking the paper of individuals or associations; and though that were not the case, the condition of an individual or company may change from bad or expensive management, improvident speculation, unavoidable losses, and fifty other things of which the public know nothing, or nothing certain. The fact that any particular banker who issues paper enjoys the public confidence, is, at best, a presumption merely, and no proof that he really deserves it. The public may believe him to be rich and discreet; but this is mere hypothesis; the circumstances which excite confidence at the outset, and which preserve it, are often very deceptive; and in the vast majority of instances the public has no certain knowledge, nor the means of obtaining any, as to the real state of the case. But it is unnecessary to argue this point speculatively. There have, unfortunately, been innumerable instances in which it has turned out that bankers who have long been in the highest credit, and whose notes had been unhesitatingly accepted by the public, have been found to be, on the occurrence of anything to excite suspicion, quite unable to meet their engagements.

The issue of notes is of all businesses that which seems to hold out the greatest prospect of success to the schemes of those who attempt to get rich by preying on the public. The cost of engraving and issuing is nothing compared with the sums for which they are issued; and provided they be got into anything like extensive circulation, they become at once considerably productive. They are not issued, except, as previously explained, on the deposit of bills or other securities, yielding a considerable rate of interest; so that if an individual, or set of individuals, with little or no capital, should contrive by fair appearances, promises, and similar devices, to insinuate himself or themselves into the public confidence, and succeed in getting 20,000*l.*, 50,000*l.*, or 100,000*l.* into circulation, he or they would secure a good income in the meantime; and on the bubble bursting, and the imposture being detected, they would be no worse off than when they set up their bank. On the contrary, the presumption is, that they would be a great deal better off; and that they would take care to provide, at the cost of the credulous and deceived public, a reserve stock for their future maintenance. Hence, seeing that the facilities for

committing fraud are so very great, the propriety or rather necessity of providing against them.

It is sometimes, no doubt, contended that the grand principle of the freedom of industry should be universally respected; that it can in no case be departed from with impunity; and that it is not only injurious, but unjust, to lay any restrictions upon the business of banking. But we are not to be led astray by a cuckoo-ery of this description. The business of banking—that is of keeping and dealing in money—is one thing, while the manufacture and issue of notes, intended to be substituted for and to serve as money, is another and a totally different thing. And though everybody may perhaps be allowed to undertake the former, it by no means follows that the same license is to be extended to those who make and issue notes. It is to be recollected that in matters of this sort, neither freedom nor restriction is, abstractly considered, just or unjust, good or bad, expedient or inexpedient. It is by their respective influence upon society that they are to be judged; and though a free and liberal course of policy be in general most for the public advantage, there are very many cases in which it is necessary to impose restrictions. It is admitted on all hands that governments are bound to suppress or regulate every business or pursuit which is likely otherwise to become publicly injurious. And does anyone doubt that the issue of notes payable on demand is in the foremost class of these businesses? The experience of all ages and nations is conclusive as to this point. It has been everywhere regulated, in the most democratical as well as in the most despotic states, in England and Russia, Holland and France, the United States and Austria. The reasonableness of the practice accords with its uniformity. *Le droit d'émettre des billets est très-avantageux; mais aussi il est si dangereux que l'Etat doit ou s'en réserver l'exercice, ou le régler de manière à en prévenir les abus.* (Report on the Extension of the Privilege of the Bank of France in 1840.)

It may perhaps be said that bank notes are essentially private paper; that the accepting of them in payment is optional; and that as they may be rejected by everyone who either suspects or dislikes them, there is no room or ground for interfering with their issue! But vague generalities of this sort are entitled to very little attention. Everybody knows that, whatever notes may be in law, they are, in most parts of the country, practically and in fact legal tender. The bulk of the people are without power to refuse them. The currency of many extensive districts consists in great part of country notes, and such small farmers or tradesmen as should decline taking them would be exposed to the greatest inconveniences. Everyone makes use of, or is a dealer in, money. It is not employed by men of business only, but by persons living on fixed incomes, women, labourers, minors, and in short by every class of individuals; very many of whom being necessarily, from their situation in life, quite unable to form any estimate of the solidity of the different banks whose paper may be in circulation, are uniformly severe sufferers by their failure. And as the notes which come into their hands make a part of the currency or money of the country, it is evidently quite as much the duty of Government, in the view of preventing these losses and the ruin they occasion, to take such steps as may be required to make bank notes truly and substantially what they profess to be, as that it should take measures to prevent

the issue of spurious coins, or the use of false or deficient weights and measures.

Banks afford great facilities to the public in the negotiation of bills of exchange, or in the making of payments at distant places. Many of the banking companies established in different districts have a direct intercourse with each other, and they have all correspondents in London. Hence an individual residing in any part of the country, who may wish to make a payment in any other part, however distant, may effect his object by applying to the bank nearest to him. Thus, suppose A of Penzance has a payment to make to B of Inverness: to transmit the money by letter would be hazardous; and if there were fractional parts of a pound in the sum, it would hardly be practicable: how then will A manage? He will pay the sum to a banker in Penzance, and his creditor in Inverness will receive it from a banker there. The transaction is extremely simple: the Penzance banker orders his correspondent in London to pay to the correspondent of the Inverness banker the sum in question on account of A, and the Inverness banker, being advised in course of post of what has been done, pays B. A small commission charged by the Penzance banker, and the postages, constitute the whole expense. There is no risk whatever, and the whole affair is transacted in the most commodious and cheapest manner.

Recently, however, the facilities given to the transmission of money by means of post-office orders have materially interfered with this branch of banking business, especially in the transmission of small sums, and are a great convenience to the public. [POST OFFICE.]

**Legal Description of Bank Notes.**—Bank notes are merely a species of promissory notes. They are subscribed either by the parties on whose account they are issued, or by some one in their employment, whose signature is binding upon them. A Bank of England note for 5*l.* is as follows:—

**Bank of England.**

*I promise to pay the Bearer on Demand*

*the Sum of Five Pounds.*

1858 Dec<sup>r</sup> 14 London 14 Dec<sup>r</sup> 1858.

*For the Gov<sup>t</sup> and Comps of the*

**£5*lib.***

**BANK OF ENGLAND.**

A. B.

No particular form of words is necessary in a bank note. The essential requisites are, that it should be for a definite sum (in England and Wales not less than 5*l.*, and in Scotland and Ireland not less than 1*l.*), that it should be payable to bearer on demand, and that it should be properly stamped. Promissory notes, though issued by bankers, if not payable to bearer on demand, do not come under the denomination of bank notes; they are not, like the latter, taken as cash in all ordinary transactions, nor are they, like them, assignable by mere delivery. By the provisions of 27 & 28 Vict. c. 78, the signature of bank notes may be impressed by machinery. The Act was passed in order to remove any doubt as to the validity of such notes, &c.

The circulation of notes for less than 5*l.* was restrained by law (stat. 15 Geo. III. c. 51) from 1766 to 1797. In 1808, it was enacted by stat. 48 Geo. III. c. 88, that all bank notes, promissory notes, or other negotiable instruments for less than 20*s.* should be absolutely void: a penalty of from 20*s.* to 5*l.*, at the discretion of the justices,

being imposed on their issuers. It was enacted by the 7 Geo. IV. c. 6, that the issue of all bank notes or promissory notes for less than 5*l.*, by the Bank of England, or by any licensed English bankers, and stamped February 5, 1826, or previously (after which period such notes were not stamped), should terminate on April 5, 1829.

The stamp duties on bank notes or promissory notes payable on demand are—

	£	s.	d.	and not exceeding	£	s.	d.	£	s.	d.
Not exceeding	1	0	0	2	0	0	0	0	0	0
Exceeding	1	0	0	2	0	0	0	0	0	0
"	2	0	0	5	0	0	0	0	1	3
"	5	0	0	10	0	0	0	0	1	9
"	10	0	0	20	0	0	0	0	2	0
"	20	0	0	50	0	0	0	0	3	0
"	50	0	0	100	0	0	0	0	5	0
"	50	0	0	100	0	0	0	0	8	6

Which notes may be reissued after payment, as often as shall be thought fit, provided they be issued by a banker or person who has taken out a license, renewable annually, and costing 30*l.*, to issue notes payable to bearer on demand. Any banker or other person issuing such reissuable notes, without being duly licensed, shall forfeit 100*l.* for every offence. (55 Geo. III. c. 184 s. 27.)

These conditions do not apply to the Bank of England. The stamp duties on the notes of that establishment were formerly compounded for at the rate of 3,500*l.* per million of those in circulation; but the Act 7 & 8 Vict. c. 32, has wholly exempted them from all charge on account of stamp duties.

Notes or bills not payable to bearer on demand are not reissuable, under a penalty of 50*l.* For the stamp duties affecting them, see EXCHANGE.

By the 9 Geo. IV. c. 23, English bankers not in the city of London, or within three miles thereof, are authorised to issue promissory notes, and to draw and issue bills of exchange, on unstamped paper, for any sum of 5*l.* or upwards, expressed to be payable to the bearer on demand, or to order at any period not exceeding 7 days after sight (*bills* may also be drawn at any period not exceeding 21 days after date), upon obtaining licenses, costing 30*l.*, to that effect; provided such bills of exchange be drawn upon bankers in London and Westminster, or Southwark; or provided such bills be drawn by any banker or bankers at the place where he or they shall be licensed to issue unstamped notes and bills, upon himself or themselves, or his or their copartner or copartners, payable at any other place where such banker or bankers shall be licensed to issue such notes and bills. Bankers having such licenses are to give security, by bond, that they will keep a true account of all promissory notes and bills so issued, and account for the duties on them at the rate of 3*s.* 6*d.* for every 100*l.*, and also for the fractional parts of 100*l.* of the average value of such notes and bills in circulation. Persons postulating unstamped notes or bills shall, for every such offence, forfeit 100*l.*

**Legal Effect of the Payment of Bank Notes.**—

Notes of the Bank of England were not, previously to the Act 3 & 4 Wm. IV. c. 98, like bills of exchange, mere securities or documents of debt, but were treated as money or cash in the ordinary course or transactions of business: the receipts given upon their payment being always given as for money. Now, however, they are legal tender, everywhere except at the Bank, for all sums above 5*l.* All notes payable to bearer are assignable by delivery. The holder of a bank note is *primâ facie* entitled to its prompt payment, and cannot be affected by the previous fraud of any former holder in obtaining it, unless evidence be given to show that he was privy to such fraud. Such privacy may, however, be inferred from the circumstances of the case. To use the words of Lord

Tenterden, 'If a person take a bill, note, or any other kind of security, under circumstances which ought to excite suspicion in the mind of any reasonable man acquainted with the ordinary affairs of life, and which ought to put him on his guard to make the necessary enquiries, and he do not, then he loses the right of maintaining possession of the instrument against the lawful owner.' (Guildhall, October 25, 1826.)

Country bank notes are usually received as cash. But though taken as such, if they be presented in due time and not paid, they do not amount to a payment, and the deliverer of the notes is still liable to the holder. It is not easy to determine what is a due or reasonable time, inasmuch as it must depend in a great measure on the circumstances of each particular case. On the whole, the safest rule seems to be to present all notes or drafts payable on demand, if received in the place where they are payable, on the day on which they are received, or as soon after as possible. When they have to be transmitted by post for payment, no unnecessary delay should be allowed to intervene. (Clitty's *Commercial Law*, vol. iii, p. 590.) [CHECK.]

Among the schemes devised to secure the convertibility of notes into coin, the following are, perhaps, the most prominent, viz.—

1. *Measures suggested to insure the conversion of Notes into Coin. Inadequacy of these Measures.*—To confine the issue of notes to joint-stock banks, or associations with large numbers of partners, each of which should be indefinitely liable for the debts of the association. At the time when this description of banks was established by the 7 Geo. IV. c. 46, it was supposed that they would prove to be of the greatest advantage, and afford that complete security to the holders of their notes, and those who entrusted them with money, that is so desirable. But everybody knows that these anticipations have been entirely disappointed, and that the history of the joint-stock banks founded under the above statute discloses some of the most flagrant instances to be met with of recklessness, imposture and fraud. And this, after all, is only what might have been expected. The shares in many joint-stock banks are small, few being above 100*l.*, the greater number not exceeding 50*l.*, whilst many are only 25*l.*, and some not more than 10*l.*, if so much. Generally, too, it is understood, or rather it is distinctly set forth in the conditions of partnership, that not more than ten, twenty, or fifty per cent. of these shares is to be called for; so that an individual with a few pounds to spare may become a shareholder in a bank. And owing to a practice or rather a flagrant abuse, introduced into the management of various banks, of making large advances or discounts on the credit of the stock held by shareholders, not a few individuals in doubtful or even desperate circumstances take shares in them, in the view of obtaining loans, and bolstering up their credit! The great danger arising from such banks is obvious, and when one of them stops payment, the claims on it, if ultimately made good, can be so only at the cost, and perhaps ruin, of such of its proprietors as have abstained from the abusive practices resorted to by others.

At the same time, however, it is quite plain that a joint-stock bank, provided it possess adequate capital, and is discreetly managed, may afford ample security to its shareholders and the public. And it is further plain, in the event of its shareholders being a numerous body, comprising, as is sometimes the case, hundreds of individuals, many of whom have large fortunes, that its creditors, though exposed to immediate

injury, may in the end have little or nothing to fear, even from gross mismanagement. But it is very difficult to discriminate between one variety of joint-stock banks and another. A bank may have a considerable body of proprietors; but, though the contrary opinion may prevail, few of them may be wealthy, and many mere men of straw, so that the security afforded by such a bank may be worth little or nothing. Neither is there any foundation for the notion, that because a bank has fifty or a hundred partners, it will be either richer or better managed than if it had only five or ten. In truth, the presumption seems to be quite the other way. The petty subscriptions of many may amount in the aggregate to a considerable sum, which, however, may be greatly inferior to the fortunes of a few wealthy individuals. And when the latter engage in banking, or any other sort of business, they must, if they would protect themselves from ruin, pay unremitting attention to their concerns, and act in a discreet and cautious manner. But the partners and managers of a great joint-stock company act under no such direct and pressing responsibility. 'I think,' said the highest authority on such subjects, 'that joint-stock banks are deficient in everything requisite for the conduct of banking business, except extended responsibility; the banking business requires peculiar persons attentive to all its details, constantly, daily, and hourly watchful of every transaction, much more than mercantile or trading businesses. It also requires immediate, prompt decisions upon circumstances when they arise—in many cases a decision that does not admit of delay for consultation; it also requires a discretion to be exercised with reference to the special circumstances of each case. Joint-stock banks, being, of course obliged to act through agents, and not by a principal, and therefore under the restraint of general rules, cannot be guided by so nice a reference to degrees of difference in the character or responsibility of parties; nor can they undertake to regulate the assistance to be granted to concerns under temporary embarrassment by so accurate a reference to the circumstances, favourable or unfavourable, of each case.' (*Evidence of Lord Overstone, before Committee on Bank Charter, in 1840.*)

In fact, more than nine-tenths of the partners in joint-stock banks are wholly ignorant of banking business, and have nothing better to trust to than the supposed honesty and intelligence of the directors; and, even if they were acquainted with the business, the result would be nearly the same, as it would not be possible for anyone, by a cursory inspection of the books of a bank (if such were permitted), to form an accurate estimate of its condition, or of the mode in which it transacted business. And hence the directors in these establishments are practically all but absolute. If they be carefully selected, and be worthy of the confidence placed in them, all goes on smoothly; and this also is the case when they are most unworthy, till they have involved the concern in inextricable difficulties! The history of the Norwich Bank, of the Northern and Central Bank, the Marylebone Bank, the Manchester Bank, the London and Eastern Bank, the Royal British Bank, the Borough Bank of Liverpool, the Western Bank of Glasgow, and a host of others, sufficiently attests the truth of what has now been stated. The responsibility of the directors to the shareholders has not been found, in any of these instances, to have been any check whatever over their frauds and improvidence. The whole paid-up capital of the Western Bank, amounting to 1,500,000*l.*, had been wasted in the most improvi-

But supposing tha

dent speculations and a vast debt incurred; while that of the Royal British Bank and of the London and Eastern Bank had been seized upon by the directors or their dependants, and additional debts contracted, before the great body of the shareholders had the least suspicion that the companies were otherwise than prosperous!

We may observe, by the way, that the mischief occasioned by an establishment of this sort, when perverted from its proper objects and mismanaged, is not to be estimated by the ruin it entails on its partners, and probably also on its customers. It becomes, in fact, a public nuisance, and entails privations on many who might be supposed to be beyond the sphere of its influence. Within the ten years ending with 1842 it was estimated that about 1,500,000*l.* of banking capital was wholly dissipated in Manchester and its immediate vicinity. And as nine-tenths of this enormous loss was occasioned by advances made to manufacturers who had little or no capital of their own, it is not easy to imagine what a violent stimulus it must have given to reckless speculation, and how very injurious it must have been to parties trading on their own capital.

It is clear, therefore, that the institution of joint-stock banks affords no security that their affairs will be properly administered, and their notes uniformly paid on their being presented.

2. To insure the convertibility of bank notes into coin, it has been proposed that they should not be issued except upon security being previously given for their payment. That, for example, an individual or company intending to issue 100,000*l.*, 200,000*l.*, or other sum of notes, should be obliged previously to deposit in the hands of a functionary appointed for the purpose, approved securities over lands, houses, stocks, or other available property for an equal amount. And it is plain that this would be in many respects an efficient measure. Under a system of this sort, adventurers without capital, and sharpers anxious to become indebted to the public, would find that the issue of notes was not a business by which they could expect to profit, and that it must be exclusively reserved for parties possessed of adequate capital.

But though a plan of this sort would effect to a considerable extent the objects in view, it has, notwithstanding, two cardinal defects, viz.—

In the first place, though it were fitted to secure the ultimate payment of notes, it would not secure their immediate payment, which is essential to their advantageous employment as money. The stoppage of a bank which had deposited securities would have to be officially ascertained before any steps could be taken for their sale; and after this had been done, some considerable time would have to elapse before they could be disposed of, and their produce made available for the liquidation of the notes. Most securities, too, are of fluctuating and uncertain value, and might not, even under the most favourable circumstances, realise the sum for which they were pledged. And in the event of the occurrence of a panic, or disturbed state of credit, it might be impossible immediately to convert the securities into cash, or possible only at a heavy loss. This plan is, therefore, very far from giving that effectual security for the convertibility of notes into coin, which, on the first view of the matter, it appears to afford. Latterly, it has been extensively acted upon in most parts of the United States; and there, when a bank stops payment, its notes are always sold at a discount, which, of course, varies according to the peculiar circumstances affecting each case. (See *post.*)

But supposing that this plan were effectual,

which it is not, to insure the immediate convertibility of notes into coin, it is defective from its not preventing their over-issue. A paper currency is not in a sound or wholesome state, unless

1. Each particular note or parcel of such currency be paid immediately on demand; and, and value exactly as a metallic currency would do were the paper currency withdrawn and coins substituted in its stead. The last condition is quite as indispensable to the existence of a well-established currency as the former; and it is one that cannot be realised otherwise than by confining the supply of paper to a single source.

The issues of paper money should always be determined by the exchange, or rather by the influx and efflux of bullion, increasing when the latter is flowing into a country, and decreasing when it is being exported. And when the issue of paper is in the hands of a single body, a regard to its interests will make it regulate its amount with reference to this principle. But when the power to issue notes is vested in different bodies, some of which may be little, if at all, affected by variations of the exchange, this is no longer the case. And instances have repeatedly occurred, as will afterwards be seen, of the country banks having increased their issues when the exchange was unfavourable and the currency redundant. Hence the plan of exacting securities is doubly defective, inasmuch as it neither insures the immediate conversion of notes into coin, nor prevents their over-issue.

3. The only other plan for insuring the conversion of notes into coin, or rather for keeping them on a level therewith, to which it is at present necessary to allude—consists in providing for the publicity of the affairs of the banks by which they are issued. The issues of banks, under this system, are usually made to bear some fixed proportion to their capital; the whole, or some considerable share, of which is to be paid up before the bank begins business; and monthly, quarterly, half-yearly, or annual returns are thereupon to be published, exhibiting the state of the bank, and enabling, as it is said, the public to judge whether it be safe to deal with it. But it is almost needless to say that such regulations are no protection against fraudulent dealings; and that, in reality, they are good for little, unless it be to deceive and mislead the public. It is impossible, if the managers of a bank or other association wish to make a deceptive or unintelligible return, to hinder them. And even when they wish to make a really accurate return, they must frequently make one that is false, from their inability to estimate their bonds, bills, and other assets at their just value. But it is useless to insist on what is so very obvious. The 'cooking of returns,' as it has been called, is an art that is well understood and extensively practised. Long after the capital of the British Bank had been wholly lost, and it had been precipitated into the abyss of bankruptcy, its directors did not hesitate to put forth statements, in which it was represented to be in a prosperous condition, and a division of profits recommended! And this, unhappily, is not a solitary instance. It is only one example, and that not the worst, of a very large class of cases. But such as it is, it is more than sufficient to show that it would be childish to place any confidence in the returns referred to.

*Act of 1857 against fraudulent Returns by Bankers.*—It may, however, be supposed that the late Act, the 20 & 21 Vict. c. 54 (1857), for the punishment of frauds committed by trustees,

bankers, and others, will put an end to the practices hitherto complained of. But though it were much to be wished that such should be the case, and though, no doubt, it will have considerable influence, it will not suffice to repress the evil. Besides making bankers and others who embezzle, appropriate, or make away with property entrusted to their care, guilty of a misdemeanour, the statute goes on to enact, 'That if any director, manager, or public officer of any body corporate, or public company, shall make, circulate, or publish, or concur in making, circulating, or publishing, any written statement or account which he shall know to be false in any material particular, with intent to deceive or defraud any member, shareholder, or creditor of such body corporate or public company, or with intent to induce any person to become a shareholder or partner therein, or to intrust or advance any money or property to such body corporate, or public company, or to enter into any security for the benefit thereof, he shall be guilty of a misdemeanour.' (Sec. 8.)

And it is further enacted, 'That every person found guilty of a misdemeanour under this Act shall be liable, at the discretion of the court, to be kept in penal servitude for the term of three years, or to suffer such other punishment, by imprisonment, for not more than two years, with or without hard labour, or by fine, as the court shall award.' (Sec. 10.)

It is difficult to see how, under a law of this sort, such flagrantly false statements as those put forth by the Royal British and other banks, after they were in a state of utter bankruptcy, should not subject their authors to the full penalties of the statute. But villany is fertile in resources; and no severity of punishment has ever been found to be effectual for the suppression of crime. Though it may be fairly presumed that the 'cooking of returns' will be less frequent, and less glaring, in time to come than formerly, it would be idle to expect that it should ever be wholly put down. And, as already seen, even when the directors of a bank are so disposed, it will frequently be out of their power to lay before the public a really true statement of their affairs. It is plain, then, that this so-called publicity affords nothing approaching to that undoubted and unquestionable guarantee which should be required from all parties and associations empowered to issue notes.

But the difficulties in the way of insuring the conversion of the latter into coins, though great, are not insuperable. A plan originally suggested by Lord Overstone, and adopted and carried into effect by Sir Robert Peel, has been found to be quite effectual to secure this grand object. And it has the additional and important recommendation, of having done this without subjecting the public to any sensible inconvenience.

But before entering into an exposition of the plan referred to, it will be necessary to premise some details with regard to the constitution and action of the existing banks.

## SEC. II. BANKS OF DEPOSIT AND BANKS OF ISSUE.

*Principles on which they are established.*—Banks are commonly divided into *banks of deposit* and *banks of issue*: i. e. banks that take care of other people's money, and banks that issue money of their own. But there are few banks of issue that are not at the same time banks of deposit; and the latter are further divisible into two great classes: viz. those who do and those who do not issue the money of their customers. The banking companies established

in this country belong to the first class; while the old Bank of Amsterdam did, and the existing Bank of Hamburg does, belong to the second class.

*Advantages of Bankers.*—Instead of keeping money in their own houses, where it would be exposed to various accidents, and to the attacks of thieves and robbers, most people wisely commit it to the care of a banker, and avail themselves of his services in receiving and making payments on their account. They send to their banker such sums of money as they may happen to receive, and all bills and drafts payable to them; and he becomes responsible for their amount, for the regular presentation of the bills for acceptance and payment, and for their proper noting, if not accepted or paid. It is also the practice for parties who have an account at a banker's to make all considerable payments by cheques payable by him. As the discharge of these functions involves considerable risk and expense, it is usual for bankers either to charge a percentage for their trouble, or to stipulate that the parties dealing with them shall keep an average balance of cash in their hands corresponding to the amount of business transacted in their behalf. In this way business is carried on with safety, ease, and despatch; and at much less expense than it would be if individuals kept their own money, and made their own payments.

Of the sums paid into banks, some are intended to meet the cheques and orders drawn against them in the ordinary course of business; while others are sent rather for safe custody, to be retained, till opportunities be found for their investment. The former are generally placed under what are called *drawing*, and the latter under *deposit* accounts; but there is no difference between the two, except that the sums in deposit accounts are usually permitted to lie for longer periods without being operated upon or called up. Such portions of the one or the other as the bankers do not retain in their coffers to meet the usual demands of their customers, they employ in the discount of bills, or in making advances of one sort or other, generally at short dates, to those who require them, and in whom they think they may confide.

This last is one of the most important functions performed by banks of deposit. They become, as it were, receptacles or reservoirs into which the surplus or unemployed capital of the surrounding districts is collected, and from which it is again distributed to those who want it. And it may be proper to observe, that the bankers do not always, nor perhaps even most commonly, confine their advances to those who can give security for their repayment. On the contrary, they are often more influenced in making loans by their knowledge of the conduct, the intelligence, and the pursuits of the parties, than by anything else. And it frequently happens that industrious, frugal, and enterprising young men, who have no guarantee to offer save their character, obtain advances that would be denied to wealthier, but otherwise less trustworthy parties.

On this, as on most other points, the late evidence of Lord Overstone is highly instructive.

Q. But, generally speaking, persons who have no capital, have very little opportunity of raising money, have they? *Ans.* That certainly is not so. The whole principle of banking is to afford capital—to transfer it from the inactive accumulator to the active and energetic person who wants the capital. The banker is the go-between, who receives deposits on the one side, and on the other applies those deposits, intrusting

them, in the form of capital, to the hands of active, energetic persons, who, he thinks, will make a good use of it.

*Q.* Who have no security to give? *Ans.* Who have in many instances no security to give, except their character, and skill, and talent, of which the banker forms his judgment.

*Q.* To persons of character who have no other security to give? *Ans.* To persons of character who, in some cases, have no security to give; but who, in all cases, have no security to give equal to the amount advanced to them, except that best form of security, their character, their energy, and their prudence. (*Minutes of Evidence*, p. 348.)

But without insisting on these considerations, which, however, are not a little important, it is manifest that those who have capital to lend, and those who wish to borrow, are equally indebted to the agency of the bankers, who, while they enable these great classes mutually to assist each other, contribute to increase the public wealth by facilitating the flow of capital into the most productive channels.

*Credit, Definition of.*—But, however great, this advantage is not to be exaggerated. Though banks afford valuable assistance in the collection and distribution of capital, it must not be supposed, as is often done, that they have any direct influence over its formation. That is the joint effect of industry and economy—the former in producing convenient and desirable articles, and the latter in saving and preserving them for future use. Credit is neither more nor less than the transfer of money or other valuable produce from one set of individuals called lenders, to another set called borrowers—a transfer which is greatly facilitated by the establishment of banks. And as there can be no reasonable doubt that those who borrow have, in the majority of instances, better means of employing capital with advantage than those by whom it is lent, its transference from the one to the other will, in so far as this presumption is realised, be publicly advantageous. But this is the entire extent of the beneficial influence of what is called credit; and when it happens, as is too often the case, to divert capital into the pockets of knaves and gamblers it is disadvantageous. No doubt we frequently hear of great undertakings being carried on by means of credit; but such statements are entirely false and misleading. They will, indeed, be uniformly found, when analysed, to mean only that the undertakings are carried on by means of borrowed capital. Credit is impotent to effect anything whatever. It is, in fact, a mere name for the trust reposed by a lender in a borrower. To call it capital is as much an abuse of language as it would be to call weight colour, or colour weight. It may transfer money or produce from A to B, or from C to D, but that is all that it either does or can do. When credit is said to be high, nothing is really meant save that those who have money or capital to lend have great confidence in the borrowers, and conversely when credit is said to be low.

*Banks sometimes encourage Gambling and Over-trading.*—Banks, when not conducted by men of probity, skill, and caution, are very apt to excite and inflame a spirit of speculation and gambling. They do this by furnishing speculators with loans and discounts, by means of which they are not enabled merely, but tempted, to engage in hazardous enterprises. And for a time, or while the process is going on, everything wears an air of prosperity; and those old-fashioned houses, as they are called, that carry on a legitimate business on capital of their own are frequently undersold

and driven from the market by the competition of adventurers trading on the funds of others, ready to encounter any risk, and living in the greatest splendour. But at length the thing is overdone, the bubble bursts, the worthless machinery of fictitious bills, rediscounts, and so forth, is exposed, and the tragi-comedy is wound up by the offer of a composition of some 1s. or 2s. per pound. Bankers and money dealers who employ the money entrusted to their care in so reckless a manner, are fitter for Newgate than for the situations they so unworthily fill. It would be a great stretch of charity to suppose that advances of the kind now alluded to can be wholly the result of imprudence. Bankers have peculiar means at their disposal by which to become acquainted with the character, position, and capabilities of those who apply to them for advances. And it is their duty to avail themselves of these means to distinguish between the careful and the improvident or reckless trader—between the man who may and the man who may not be trusted. It is difficult to believe, provided they make the necessary enquiries, that they should be often or greatly deceived in their judgment of individuals; and, provided they act with due caution, they will never so far commit themselves, even with the most respectable firms, as to endanger their own establishment in the event of the failure of the latter. Bankers may risk their private fortunes, if they have any, as they please, but they are not entitled to risk the money of their constituents by making advances to equivocal parties, and especially to those who are notoriously overtrading. It is impossible, perhaps, to bring an abuse of this sort within the meshes of the penal law, but it cannot be too strongly condemned in the opinion of the public. There is nothing about which people should be so cautious as the employment of bankers; and high character, experience, and reputation for prudent management, ought always to have the preference over fair promises and prospectuses, even when the latter are backed by offers of high interest.

*Interest on Deposits.*—The private bankers of London have not been, until recently, in the habit of allowing interest on deposits, though in special cases it was sometimes done. But in Scotland, and also in many parts of England, it has been long the practice to pay an interest on deposits of from one to two per cent. less than the market rate at the time. And the joint-stock banks set on foot in the metropolis since 1826, having introduced the practice of giving interest on deposits, provided a certain notice (generally from three to eight days) be given before they are withdrawn, very large sums have been deposited in these establishments. Most private banks have been compelled, in order to maintain their position, to adopt in a greater or less degree the same system. There can, indeed, be little doubt that it will, in no very lengthened period, become universal, and that the amount of deposits will be progressively and largely augmented.

By bringing, as it were, the advantages of savings' banks, without any of their limitations, within reach of all classes, of the middle and upper as well as of the lower, this system is, in many respects, highly advantageous. It may, indeed, be doubted whether any means could be devised more likely to generate and diffuse a spirit of economy. Unhappily, however, its advantages are alloyed by the formidable disadvantage of its involving a great amount of insecurity and hazard.

*Dangers incident to the Deposit System.*—Banks that give interest on deposits must employ

the balance at their disposal so as to realise that interest, plus a profit to themselves. Investment is not optional with them, it is indispensable; and they cannot, in seeking investments, look to security only. Profit must be in their estimation as great, or even a greater consideration. But profit and risk are inseparable, and are always directly proportioned to each other; and hence it is, that in periods of discredit, or when a revulsion occurs, suspicions may be expected to arise in regard to the solidity of deposit banks, especially of those that pay high rates of interest on the sums committed to their custody. These suspicions may frequently, no doubt, be very ill-founded; but, if they be entertained, the result will be nearly the same. This was exemplified by what took place in 1866, when these banks were seriously affected by the deposit system.

It is difficult to know how to ward off such contingencies; but it nevertheless seems to be indispensable that something should be done in that view, otherwise we may be said to be always exposed to the most tremendous risks. It may not be practicable to form an accurate estimate of the amount now held as deposits by bankers and money dealers in Great Britain only; but if we take the entire sum at about three hundred millions, we shall probably be within and not beyond the mark. And of this vast sum more than half is payable *at call*, and more than three-fourths within ten days. But everybody knows that such payments are practically impossible. And hence it is plain, that in the event, which may any day occur, of a bank with a large amount of deposits getting into difficulties, or of any circumstance occurring that should occasion a distrust of the system and a general panic, the whole fabric would fall to pieces, and we should have a universal smash.

This appears to be as unsatisfactory a state of things as can well be imagined. But *de republica nil desperandum*. Though formidable, the evil is not insuperable; and the dangers referred to are so great and imminent, that no time should be lost in adopting measures by which they may be either obviated or mitigated. Explosions of the credit system are, in the commercial and financial, what explosions of gunpowder are in the physical world. And it would seem to be quite as necessary to endeavour to lessen the frequency and violence of the former as of the latter. Hence we think it would be good policy to enact, that all sums *bearing interest*, in the hands of bankers, discount-brokers, and money-dealers generally, should not be legally demandable without a month or six weeks' notice. A regulation of this sort would not interfere with anything that is valuable in the existing system, while it would confer on it some portion of that solidity of which it is at present so miserably deficient. It would protect all classes against the effects of sudden and unreasonable fears and panics. It would give time to the borrowers to collect their resources; and to the depositors calmly to enquire into the character and situation of those to whom they had entrusted their money. This may not be enough; but some such measure as this appears to be indispensable for the security and protection of the public.

*Notes deposited in Banks not the Property of the Depositors.*—It has sometimes been contended that the notes and moneys deposited in banks by private parties continue to be their property, and are as really a portion of their money as the notes or sovereigns which they retain in their tills or their pockets. The place where it is kept is different; but, except in this respect, the money which they have lodged in and that which they

have out of banks, is said to be, to all intents and purposes, identical. But though specious, this statement is entirely fallacious. The money which depositors lodge in banks forms a part of the money of the country; but after its lodgment in them it ceases to belong to, or to make a part of, the property or money of the depositors. They have consigned it to banking establishments, and acquired credits in its stead; i.e. they have acquired the *right* to draw upon and receive equal sums of money from these establishments. But everybody knows that the right to a thing is not the thing itself, but something altogether different. A banker who owes a million or other sum to depositors might regard himself as being in a sufficiently secure state, if, according to circumstances, he had a third, a fourth, or a fifth part of that sum in notes and gold in his till to answer the demands of the depositors, while he employed the reserve in advances to others. Hence it is plain that bank credit and money have nothing in common. Those who confound things that are so very different can have no clear apprehension of either the one or the other.

It is on the distinction between money and deposits or credits, that the business of banking really depends. It is a business by which a small amount of money is made to supply a large amount of credit, the profits of the bankers arising from the use of the money so economised. The Bank of England, for example, often holds more than twenty millions of public and private deposits, while she is considered to be in a perfectly safe and sound position if she have in the till of her banking department five millions, or even less, in notes and coins.

It is hardly necessary, after these statements, to observe that the profit made by bankers in employing part of the money committed to their custody is extrinsic to, and independent of, any profits which they may realise on capital of their own. 'Such banks,' to use the words of Mr. Ricardo, 'would never be established if they obtained no other profits than those derived from the employment of their own capital. Their real advantage commences only when they begin to employ the capital of others.' (*Economical and Secure Currency*, p. 87.)

*Necessity of Capital to the Security of Banks.*—But we are not thence to conclude that it is indifferent whether such banks have or have not independent capitals of their own. That would be the greatest of errors. Unless it have a command of capital proportioned in some degree to the extent of its business, those who deposit their money in a bank have but slender security for its payment. For if bankers make improvident or injudicious advances, if the securities in their possession be discredited, or difficulties of any kind arise in the conduct of their business, those who have no capital, or but little of their own, may be obliged to stop payment, when more opulent firms may be but little affected by the like circumstances. Much, no doubt, must always depend on the character and knowledge of the parties; but no amount of skill or caution can ever fully compensate for the want of adequate capital. It is the sheet-anchor of security, the only real and substantial guarantee to which the ordinary creditors of a bank have to look. When such capital has been accumulated by the bank, it shows that its affairs have been well managed, and raises a strong presumption in its favour; and when it has devolved on the partners by inheritance, or been bequeathed to them in legacies, the fair inference would seem to be, that they will not (unless they be mere fools, unworthy of any kind of confidence)

rashly compromise its security by engaging in questionable proceedings.

*Limited Liability, Disadvantages of.*—By a late Act, the 20 & 21 Vict. c. 49, banks may be constituted with limited liability. But this is a vicious principle, lessening the natural responsibility under which every man ought to act, and tempting parties to engage in all manner of desperate adventures. In banking, such a principle must be especially mischievous; for it is a business that requires great caution and prudence—the very virtues with which the principle of limited liability is most at variance. It may, indeed, be said that the numerous instances of mismanagement and embezzlement that now prevail, show that even the principle of indefinite liability is not enough to make joint-stock banks be conducted prudently and honestly. But, however defective, still it is the only principle on which any stress can be safely laid, and the instances referred to, bear, after all, but a small proportion to those of an opposite description. The great majority of banks are discreetly and faithfully managed. And if knavery and folly be sometimes found to prevail where every partner is deeply interested in their prevention, and is liable to the last farthing he possesses for the consequences, the fair presumption is, that they would be much more prevalent were the parties liable only for the amount of their shares in the bank. To suppose the contrary would be a contradiction; it would be equivalent to supposing that a man is to be as much interested in the safety of 10l. or 100l., as of 1,000l. or 10,000l., or of his entire fortune, however great it may be.

Whatever else may be the effect of the late disclosures of mismanagement, fraud, and robbery, on the part of the directors and secretaries of joint-stock banks, it can hardly fail to make the partners in those associations more alive to the dangers of their situation, and to convince them, that if they would provide for their own safety, they must be more cautious than hitherto in regard to the persons they employ to fill these situations, and less disposed to take their statements for granted. Such, however, is the carelessness of most people, even in regard to those matters which most nearly concern them, that these anticipations, though reasonable, may not be fully realised. But, in the case of banks with limited liability, they must be sanguine indeed who look for any improvement. The partners in these associations have no sufficient interest in their prosperity to make them take any unusual trouble about the way in which they are conducted, and they neither fear ruin, nor even any considerable inconvenience, from their failure. The chances, consequently, are ten to one that their managers will be left without let or hindrance to pursue their own schemes; and, when such is the case, what but abuse can be expected to be the result?

But it is argued, whatever may be the influence of unlimited liability on the partners of the banks in which it is established, that the depositors in banks with limited liability will be on their guard, and will not trust them with their money, unless they were well assured of their solidity. But, in truth and reality, they never can have any assurance of the sort on which it would be safe to rely. A bank with limited liability might have, or pretend to have, a large capital. And supposing it really had such a capital in the current year, that may not be the case in the next, or in any subsequent year. And yet as the public can know nothing certain of the bank's losses, its credit may not be impaired, and deposits may be pressed upon it after it is really

insolvent. In such cases the public is helpless; and if the indefinite responsibility of the partner in banks be not enough to make them look to their proper management, it would be worse than idle to depend in any degree on the fears or interests of the depositors. This is not a matter about which there needs be any speculation. The experience of the United States is decisive of the question. In the Union, the banks are all, or nearly all, established under a system of limited liability, and, notwithstanding their insecurity, and their perpetually recurring insolvency, they always hold large sums in deposit. Promises, professions, the bait of high interest, and the confidence placed by everyone in his superior sagacity and good fortune, fill the coffers even of the establishments least worthy of credit. And such, no doubt, would be the case in England, were a like system established amongst us. But what, under such circumstances, would be the situation even of a well-managed bank, were any suspicions to be entertained of its credit? The rush would be tremendous; for everybody would reasonably conclude, that if he did not succeed by pressing forward with 'hot haste' in getting payment of his deposit, the chances were ten to one he would get little or nothing. He has no proprietary body to which to look for payment of his claims; and if the doors were once shut against him, he could hardly expect more than some miserable dividend at some distant term.

During the crisis of 1857, when the Western and City Bank of Glasgow stopped payment, there was comparatively little agitation, the holders of their notes and of deposit receipts being well assured that, whatever inconvenience they might be subjected to in the meantime, in the end they would be fully paid. But had the liability of the partners been limited, such would not have been the case, and the panic would have been so great that it is not believed that a single bank would have weathered the storm.

*Introduction of Banking into London.*—The business of banking was not introduced into London till the seventeenth century. It was at first conducted by the goldsmiths, who lent the money lodged in their hands for security to Government and individuals. In the course of time, the business came to be conducted by houses who confined themselves to it only, and nearly in the mode in which we now find it. From 1708, as already stated, down to 1826, with the exception of the Bank of England, no company with more than six partners could be established, either in London or anywhere else in England and Wales, for conducting banking business; and a very large portion of that business is still conducted in the metropolis by firms with a small number of partners, or by what are called *private banks*.

*Clearing House.*—By far the largest proportion of the bank bills in circulation in the country, and of the foreign bills drawn upon Great Britain, are made payable in London, the grand focus in which all the pecuniary transactions of the empire are ultimately adjusted. And in order to facilitate this adjustment, and to economise the use of money, the principal bankers of the metropolis established, in 1773, the *clearing house*. This is a house to which each banker who deals with it is in the habit of daily sending a clerk, who carries with him the various bills and cheques in the possession of his house that are drawn upon other bankers; the practice formerly being to exchange them for the bills and cheques in the possession of those others that were drawn upon his constituents, and to pay the balance on

the one side or the other in cash or Bank of England notes. By this means the bankers connected with the clearing house were enabled to settle transactions to the extent of several millions a day, by the employment of not more, at an average, than from 200,000, to 500,000, in cash or Bank of England notes.

Latterly, however, the arrangements connected with the clearing house have been so much simplified and improved, that neither notes nor coins are any longer required in settling the largest transactions. The clearing house itself, and the various banking firms connected with it, have accounts at the Bank of England; and the balances that were formerly settled by a money payment are at present settled by transfers from one account to another. The saving of money in the adjustment of large transactions occasioned by this and other contrivances, accounts for the fact that the proportion of notes of 20l. and upwards issued by the Bank has considerably declined of late years, while that of 5l. and 10l. notes, which are used in ordinary dealings, has been materially increased.

*Security afforded by Banks of Deposit.*—The security afforded by a bank of deposit is a matter as to which there must always be more or less of doubt. When, indeed, a banking company confines itself to its proper business, and does not embark in speculations of unusual hazard, or from which its funds cannot be easily withdrawn, it can seldom fail, except in periods of panic or general distrust, of being in a situation to meet its engagements; whilst the large private fortunes that frequently belong to the partners afford those who deal with it an additional guarantee. Much, however, depends on the character of the parties, on their living within or beyond their incomes, and on a variety of circumstances with respect to which the public can never be correctly informed; so that though there can be no doubt that the security afforded by many banks of deposit is of the most unexceptionable description, this may not be the case with others.

*Not necessary for the State to provide for the Security of Depositors.*—All joint-stock banks, or banks having more than six partners, whether for deposit and issue, or for deposit merely, are ordered, by the Act 3 & 4 Wm. IV. c. 83, to send quarterly returns of the number and names of their partners to the Stamp-office. But there was no good reason why similar returns should not, and several why they should, be required from all banks; and this having been done by the Act 7 & 8 Vict. c. 82, which also provides for their publication, little if any further interference would seem to be required with banks not issuing notes. There is in this respect a wide difference between them and banks of issue. It is the duty of Government to take care that the value of the currency shall be as invariable as possible; but it has never been pretended that it is any part of its duty to enquire into the security given by the borrowers to the lenders of money, any more than into the security given by the borrowers to the lenders of anything else. Government obliges a goldsmith to have his goods stamped, this being a security to the public that they shall not be imposed on in buying articles of the quality of which they are generally ignorant; but it does not require that the person to whom the goldsmith sells or lends his goods should give him a guarantee for their payment. This is a matter as to which individuals are fully competent to judge for themselves; and there is no good reason why a lender or depositor of bullion or notes should be more protected than a lender or depositor of

timber, coal, or sugar. Gold being the standard or measure of value, Government is bound to take effectual precautions that the currency shall truly correspond in the whole and in all its parts with that standard; that every pound note shall be worth a sovereign; and that the amount and value of the aggregate notes in circulation shall vary exactly as a gold currency would do were it substituted in their stead. But if A trust a sum of money in the hands of B, it is their affair, and concerns none else. Provided the money allott correspond with the standard, it is of no importance, in a public point of view, into whose hands it may come. The bankruptcy of a deposit bank, like that of a private gentleman who has borrowed largely, may be productive of much loss or inconvenience to its creditors. But if the paper in circulation be equivalent to gold, such bankruptcies cannot affect either the quantity or value of money, and are, therefore, directly injurious only to the parties concerned.

But though such be the direct effects of the bankruptcies of deposit banks, their indirect effect, by propagating panics and runs on other banks, may be most disastrous. And to prevent their mischievous influence in this respect, it would be good policy, as already seen, to require a month's or six weeks' notice to make deposits bearing interest legally demandable.

*Deposit Banks which do not employ the Money of the Depositors.*—The other description of banks of deposit, or those which do not employ the funds in their hands, or engage in any sort of business, are established without any view to profit, that they may secure the money, and facilitate the transactions of those who deal with them. The latter obtain *bank credits* or *bank money*, equivalent to the sums they deposit in the bank; and as the principal traders in towns where such a bank is established belong to it, each has a bank credit, and their payments are made without the intervention of money, by writing off so much from the credit or account of one to the credit or account of another. It is only in the event of a person having to pay money to a stranger that he has any motive to withdraw any portion of his deposit from the bank. An institution of this sort is, to those who deal with it, what the clearing house is to the London bankers. Its expenses are usually defrayed either by a small fee charged on every transfer of bank credit from one individual to another, or by a charge on the coin or bullion deposited, or both.

A bank of this sort can never, unless its agents act dishonestly, be involved in debt, or in any kind of difficulty. The constitution of the Bank of Amsterdam was in so far vicious that it was not managed by parties interested in its welfare; that is, by agents chosen by the depositors. On the contrary, it was managed in the most secret manner by those who happened to be magistrates of the city, whether they were or were not depositors. And they, in violation of their oaths, privately lent to others a large portion of the funds deposited in the bank. But a proceeding of this sort is hardly possible in the case of a properly constituted deposit bank, like that established in Hamburg. For in the latter the managers are appointed for short periods by the depositors, who of course endeavour to select the most trustworthy persons. And though it is necessary that the strictest secrecy should be kept in regard to the accounts of individuals in the bank, its affairs are otherwise transacted with sufficient publicity, while the deposits in its coffers may be withdrawn at any moment.

*Notice of Banking.*—The trade or business of a banker has probably existed in all civilised countries in all ages. The bankers of Greece (*ραναεστ-ται*) and Rome (*argentarii, mensarii, numularii*) exercised nearly the same functions as those of the present day, except that they do not appear to have issued notes. They received money on deposit, to be paid on demands made by cheques or orders, or at some stipulated period, sometimes paying interest for it, and sometimes not. Their profits arose from their lending the balance at their disposal at higher rates of interest than they allowed the depositors. They were also extensively employed in valuing and exchanging foreign moneys for those of Athens, Corinth, Rome, &c., and in negotiating bills of exchange. In general they were highly esteemed, and great confidence was placed in their integrity. The rate of interest charged by the bankers was sometimes very high, but that was not a consequence, as has been alleged, of their rapacity, but of the defective state of the law, which, as it gave every facility to debtors disposed to evade payment of their debts, obliged the bankers to guarantee themselves by charging a proportionally high rate of interest. (Boeckh's *Political Economy of Athens*, i. 168, &c.; *Voyage d'Anacharse*, ch. iv. *passim*; Smith's *Dictionary of Greek and Roman Antiquities*, s. v. 'Argentarii,' &c.) In modern times the business of banking and exchange was for a while almost entirely engrossed by the Jews and Lombards of Italy.

### SEC. III.—BANK OF ENGLAND, ACCOUNT OF.

*Establishment and History of the Bank of England.*—The Bank of England, which has long been the principal bank of deposit and circulation, in this country and in Europe, was founded in 1694. Its principal projector, Mr. William Paterson, an enterprising and intelligent Scotch gentleman, was afterwards engaged in the ill-fated colony at Darien. Government being at the time much distressed for want of money, partly from the defects and abuses in the system of taxation, and partly from the difficulty of borrowing, because of the supposed instability of the revolutionary establishment, the Bank grew out of a loan of 1,200,000*l.* for the public service. The subscribers advanced as interest, and 4,000*l.* a year as the expense of management, in all 100,000*l.* a year, were incorporated into a society denominated the Governor and Company of the Bank of England. The charter is dated July 27, 1694. It declares, amongst other things, that they shall be capable, in law, to purchase, enjoy, and retain to them and their successors, any moneys, lands, tenements, and possessions whatsoever; and to purchase and acquire all sorts of goods and chattels whatsoever, wherein they are not restrained by Act of Parliament; and also to redeem, and dispose of the same.

That the management and government of the corporation be committed to the governor and twenty-four directors, who shall be elected between March 25 and April 25 each year, from among the members of the company duly qualified.

That no dividend shall at any time be made by the said governor and company, save only out of the interest, profit, or produce arising by or out of the said capital stock or fund, or by such dealing as is allowed by Act of Parliament.

That they must be natural-born subjects of England, or naturalised subjects; they shall have in their own name, and for their own use, severally, viz. the governor at least 4,000*l.*, the deputy-governor

3,000*l.*, and each director 2,000*l.* of the capital stock of the said corporation.

That thirteen or more of the said governors and directors (of which the governor or deputy-governor must be always one) shall constitute a court of directors, for the management of the affairs of the company, and for the appointment of all agents and servants which may be necessary, paying them such salaries as they may consider reasonable.

Every elector must have in his own name and for his own use 500*l.* or more capital stock, and can only give one vote. He must, if required by any member present, take the oath of stock; or the declaration of stock, in case he be one of the people called Quakers.

Four general courts to be held in every year: in the months of September, December, April, and July. A general court may be summoned, at any time, upon the requisition of nine proprietors, duly qualified as electors.

The majority of electors in general courts have the power to make and constitute by-laws and ordinances for the government of the corporation, provided that such by-laws and ordinances be not repugnant to the laws of the kingdom, and be confirmed and approved, according to the statutes in such case made and provided.

The corporation is prohibited from engaging in any sort of commercial undertaking other than dealing in bills of exchange, and in gold and silver. It is authorised to advance money upon the security of goods or merchandise pledged to it; and to sell by public auction such goods as are not redeemed within a specified time.

It was also enacted in the same year in which the Bank was established, by statute 6 Wm. & Mary c. 20, that the Bank 'shall not deal in any goods, wares, or merchandise (except bullion), or purchase any lands or revenues belonging to the crown, or advance or lend to their Majesties, their heirs or successors, any sum or sums of money, by way of loan or anticipation, or any part or parts, branch or branches, fund or funds of the revenue, now granted or belonging, or hereafter to be granted to their Majesties, their heirs and successors, other than such fund or funds, part or parts, branch or branches of the said revenue only, on which a credit of loan is or shall be granted by Parliament.' And in 1697 it was enacted, that the common capital and principal stock, and also the real fund of the governor and company, or any profit or produce to be made thereof, or arising thereby, shall be exempted from any rates, taxes, assessments, or impositions whatsoever, during the continuance of the Bank; and that all the profit, benefit, and advantage, from time to time arising out of the management of the said corporation, shall be applied to the uses of all the members of the said corporation of the Governor and Company of the Bank of England, rateably and in proportion to each member's part, share, and interest in the common capital and principal stock of the said governor and company hereby established.

It was further enacted, in 1697, that the forgery of the company's seal, or of any sealed bill or bank note, should be felony without benefit of clergy, and that the making of any alteration or erasure in any bill or note should also be felony.

In 1696, during the great recoinage, the Bank was involved in considerable difficulties, and was even compelled to suspend payment of her notes, which were at a heavy discount. Owing, however, to the judicious conduct of the directors, and the assistance of Government, the Bank got over the crisis. But it was at the same time judged

expedient, in order to place her in a situation the better to withstand any adverse circumstances that might afterwards occur, to increase her capital from 1,200,000*l.* to 2,201,171*l.* In 1708 the directors undertook to pay off and cancel 1,500,000*l.* of Exchequer bills they had circulated two years before, at 4*½* per cent., with the interest on them, amounting in all to 1,775,028*l.*; which increased the permanent debt due by the public to the Bank, including 400,000*l.*, then advanced in consideration of the renewal of the charter, to 3,375,028*l.*, for which they were allowed 6 per cent. The Bank capital was then also doubled, or increased to 4,402,343*l.* But the year 1708 is chiefly memorable, in the history of the Bank, for the Act that was then passed, which declared, that during the continuance of the corporation of the Bank of England, "it should not be lawful for any body politic, erected or to be erected, other than the said Governor and Company of the Bank of England, or for any persons whatsoever, united or to be united in covenants or partnership, exceeding the number of six persons, in that part of Great Bri-

tain called England, to borrow, owe, or take up any sum or sums of money on their bills or notes payable on demand, or in any less time than six months from the borrowing thereof." This proviso, which has had so powerful an operation on banking in England, is said to have been elicited by the Mine-venture Company having commenced banking business, and begun to issue notes.

It has been pretty generally imagined, from the private banking companies in the metropolis not issuing notes, that they were legally incapacitated from doing so. But the clause in the Act of 1708, which has been the only restriction on the issue of notes, applied generally to all England, and had no peculiar reference to London. The fact that banks with 6 or fewer partners have not issued notes in the metropolis, as well as in the provinces, is, therefore, ascribable either to their being aware that their notes would obtain no considerable circulation concurrently with those of a great association like the Bank of England, or from their believing that their issue would not be profitable.

We subjoin—

*An Account of the successive Renewals of the Charter, of the Conditions under which these Renewals were made, and of the Variations in the Amount and Interest of the Permanent Debt due by Government to the Bank, exclusive of the Dead Weight.*

Date of Renewal	Conditions under which Renewals were made, and Permanent Debt contracted	Permanent Debt
		£ s. d.
1694.	Charter granted under the Act 5 & 6 Wm. III. c. 20, redeemable upon the expiration of 12 months' notice after August 1, 1705, upon payment by the public to the Bank of the demands therein specified. Under this Act the Bank advanced to the public 1,200,000 <i>l.</i> , in consideration of their receiving an annuity of 100,000 <i>l.</i> a year, viz. 3 per cent. interest, and 4,000 <i>l.</i> for management.	1,200,000 0 0
1697.	Charter continued by the 8 & 9 Wm. III. c. 20, till 12 months' notice after August 1, 1710, on payment, &c.	
1708.	Under this Act the Bank took up and added to their stock 1,601,171 <i>l.</i> Exchequer bills and tallies. Charter continued by 7 Anne, c. 7, till 12 months' notice after August 1, 1734, on payment, &c. Under this Act the Bank advanced 400,000 <i>l.</i> to Government, without interest; and delivered up to be cancelled 1,775,028 <i>l.</i> 17s. 10d. Exchequer bills, in consideration of their receiving an annuity of 100,000 <i>l.</i> 13s., being at the rate of 6 per cent.	2,175,027 17 10
1713.	Charter continued by 12 Anne, stat. 1, c. 11, till 12 months' notice after August 1, 1742, on payment, &c. In 1716, by the 5 Geo. I. c. 8, Bank advanced to Government, at 5 per cent. And by the same Act, the interest on the Exchequer bills cancelled in 1708 was reduced from 6 to 5 per cent. In 1721, by 8 Geo. I. c. 21, the South Sea Company were authorised to sell 200,000 <i>l.</i> Government annuities, and corporations purchasing the same at 36 years' purchase were authorised to add the amount to their capital stock. The Bank purchased the whole of these annuities at 29 years' purchase 5 per cent. interest was payable on this sum to Midsummer, 1727, and thereafter, 4 per cent. At different times between 1727 and 1738, both inclusive, the Bank received from the public, on account of permanent debt, 5,375,027 <i>l.</i> 17s. 10d., and advanced to it on account of ditto 5,000,000 <i>l.</i> ; difference	2,000,000 0 0
	Debt due by the public in 1738	9,100,000 0 0
1742.	Charter continued by 15 Geo. II. c. 13, till 12 months' notice after August 1, 1761, on payment, &c. Under this Act the Bank advanced 1,600,000 <i>l.</i> without interest, which being added to the original advance of 1,200,000 <i>l.</i> , and the 100,000 <i>l.</i> advanced in 1710, bearing interest at 6 per cent., reduced the interest on the whole to 5 per cent. In 1745, under authority of 19 Geo. II. c. 6, the Bank delivered up to be cancelled 986,000 <i>l.</i> of Exchequer bills, in consideration of an annuity of 35,172 <i>l.</i> , being at the rate of 3 per cent.	1,600,000 0 0
	In 1749, the 23 Geo. II. c. 6, reduced the interest on the 1 per cent. annuities held by the Bank to 3 <i>½</i> per cent. for 7 years from December 29, 1750, and thereafter to 3 per cent.	986,800 0 0
1761.	Charter continued by 6 Geo. III. c. 25, till 12 months' notice after August 1, 1786, on payment, &c. Under this Act the Bank paid into the Exchequer 110,000 <i>l.</i> free of all charge.	
1781.	Charter continued by 21 Geo. III. c. 60, till 12 months' notice after August 1, 1812, on payment, &c.	
1800.	Under this Act the Bank advanced 5,000,000 <i>l.</i> for the public service for 5 years at 5 per cent. Charter continued by 40 Geo. III. c. 28, till 12 months' notice after August 1, 1835, on payment, &c. Under this Act the Bank advanced to Government 3,000,000 <i>l.</i> for 6 years without interest; but in pursuance of the recommendation of the committee of 1807, the advance was continued without interest till 6 months after the signature of a definitive treaty of peace. In 1816, the Bank, under authority of the Act 56 Geo. III. c. 96, advanced at 3 per cent. to be repaid on or before August 1, 1825	3,000,000 0 0
1825.	Charter continued by 5 & 4 Wm. IV. c. 98, till 12 months' notice after August 1, 1855, with a proviso that it may be dissolved on 12 months' notice after August 1, 1815, on payment, &c. This Act directs that in future the Bank shall deduct 120,000 <i>l.</i> a year from their charge on account of the management of the public debt, and that a fourth part of the debt due by the public to the Bank, or 3,671,700 <i>l.</i> , be paid off. Permanent advance by the Bank to the public, bearing interest at 3 per cent., independent of the advances on account of dead weight, &c.	11,686,800 0 0
1811.	Charter continued by 7 & 8 Vict. c. 34, till 12 months after August 1, 1855, on payment, &c. This Act, an abstract of which is given in a subsequent part of this article, exempts the notes of the Bank from all charge on account of stamp duty, and directs that in future the Bank shall deduct 150,000 <i>l.</i> a year from the charge on account of the management of the public debt. It also separates the banking from the issuing department of the establishment, and enacts other important changes.	3,671,700 0 0
		11,015,100 0 0

The charter of the Bank of England, when first granted, was to continue for eleven years certain, or till a year's notice after August 1, 1705. The charter was further prolonged in 1697. In 1708, the Bank having advanced 400,000*l.* for the public service, without interest, the exclusive privileges of the corporation were prolonged till 1733. And in consequence of various arrangements made at different times, the exclusive privileges of the Bank have been continued by successive renewals, till a year's notice after August 1, 1855. (See table prefixed.)

(For further details as to this subject, see the Appendix No. 1 of the Report of 1832 on the Renewal of the Bank Charter, and the Acts of Parliament referred to in it; see also Postlethwait's *History of the Revenue*, pp. 301—310; and Fairman *On the Funds*, 7th ed. pp. 85—88, &c.)

The capital of the Bank on which dividends are paid has never exactly coincided with, though till of late it seldom differed very materially from, the permanent advance by the Bank to the public. We have already seen that it amounted, in 1708, to 4,402,343*l.* Between that year and 1727 it was

increased to near 9,000,000. In 1746 it amounted to 10,780,000. From this period it underwent no change till 1782, when it was increased 8 per cent., or to 11,642,400. It continued stationary at this sum down to 1816, when it was raised to 14,553,000, by an addition of 25 per cent. from the profits of the Bank, under the provisions of the Act 56 Geo. III. c. 96. The Act for the renewal of the charter, in 1833, 3 & 4 Wm. IV. c. 98, directed that the sum of 3,671,700*l.* of the debt due to the Bank should be repaid by the public, giving the directors power, if they thought fit, to deduct it from the Bank capital. But this was not done; the sum being reinvested in a Government annuity, terminable in 1860.

The Bank of England has been frequently affected by panics amongst the holders of its notes. In 1745 the alarm occasioned by the advance of the Highlanders under the Pretender as far as Derby led to a run upon the Bank; and in order to gain time to concert measures for averting the run, the directors adopted the device of paying in shillings and sixpences. But they derived a more effectual relief from the retreat of the Highlanders; and from a resolution agreed to at a meeting of the principal merchants and traders of the City, and very numerously signed, declaring the willingness of the subscribers to receive Bank notes in payment of any sum that might be due to them, and pledging themselves to use their utmost endeavours to make all their payments in the same medium.

During the tremendous riots in June, 1780, the Bank incurred considerable danger. Had the mob attacked the establishment at the commencement of the riots, the consequences might have proved fatal. Luckily, however, they delayed their attack till time had been afforded for providing a force sufficient to insure its safety. Since that period a considerable military force is nightly placed in the interior of the Bank, as a protection in any emergency that may occur.

In the latter part of 1792 and beginning of 1793 there was, in consequence of a previous over-issue on their part, a general run on most of the private banks; and about a *third part* of these establishments were forced to stop payments. This led to a considerable demand for coin from the Bank.

The year 1797 is, however, the most important epoch in the recent history of the Bank. Owing partly to events connected with the war in which we were then engaged; to loans to the Emperor of Germany; to bills drawn on the treasury at home by the British agents abroad; and partly, and chiefly, perhaps, to the advances most unwillingly made by the Bank to Government, which prevented the directors from having a sufficient control over their issues, the exchanges became unfavourable in 1795, and in that and the following year large sums in specie were drawn from the Bank. In the latter end of 1796 and beginning of 1797 considerable apprehensions were entertained of invasion, and rumours were propagated of descents having been actually made on the coast. In consequence of the fears that were thus excited, runs were made on the provincial banks in different parts of the country; and some of them having failed, the panic became general, and extended itself to London. Demands for cash poured in upon the Bank from all quarters; and on Saturday, Feb. 25, 1797, she had only 1,272,000*l.* of cash and bullion in her coffers, with every prospect of a violent run taking place on the following Monday. In this emergency an order in council was issued on Sunday the 26th, prohibiting the directors from paying their notes in cash until the sense of Parliament had been taken

on the subject. And after Parliament met, and the measure had been much discussed, it was agreed to continue the restriction till six months after the signature of a definitive treaty of peace.

As soon as the order in council prohibiting payments in cash appeared, a meeting of the principal bankers, merchants, traders, &c. of the metropolis was held at the Mansion House, when a resolution was agreed to and very numerously signed, pledging, as had been done in 1745, those present to accept, and to use every means in their power to cause Bank notes to be accepted as cash in all transactions. This resolution tended to allay the apprehensions that the restriction had excited.

Parliament being sitting at the time, a committee was immediately appointed to examine into the affairs of the Bank; and their report put to rest whatever doubts might have been entertained with respect to the solvency of the establishment, by showing that at the moment when the order in council appeared the Bank was possessed of property to the amount of 15,513,690*l.*, after all claims upon her had been deducted.

Much difference of opinion has existed with respect to the policy of the restriction in 1797; but, considering the peculiar circumstances under which it took place, its expediency seems abundantly obvious. The run did not originate in any over-issue of Bank paper, but grew entirely out of political causes. So long as the alarms of invasion continued, it was clear that no Bank paper immediately convertible into gold would remain in circulation. And as the Bank, though possessed of ample funds, was without the means of instantly retiring her notes, she might, but for the interference of Government, have been obliged to stop payment; an event which, had it occurred, must have produced consequences in the last degree fatal to the public interests.

It had been generally supposed, previously to the passing of the Restriction Act, that Bank notes would not circulate unless they were immediately convertible into cash; but the event showed conformably to principles that have since been fully explained, that this was not really the case. Though the notes of the Bank of England were not at the passing of the Restriction Act publicly declared to be legal tender, they were rendered so in practice, by being received as cash in all transactions on account of Government and of the vast majority of individuals. For the first three years of the restriction, their issues were so moderate that they not only kept on a par with gold, but actually bore a small premium. In the latter part of 1800, however, their quantity was so much increased that they fell to a discount of 8 per cent. as compared with gold, but they soon after rose nearly to par; and it was not until 1808 that the decline of their value excited any considerable attention. Early in 1810 they were at a discount of about 13½ per cent.; and this extraordinary fall having attracted the attention of the legislature, the House of Commons appointed a committee to enquire into the circumstances by which it had been occasioned. The committee examined several witnesses; and in their report, which was drawn up with considerable ability, they justly ascribed the fall to the over-issue of Bank paper, and recommended that the Bank should be obliged to resume cash payments within two years. This recommendation was not, however, acted upon; and the value of Bank paper continued to decline, as compared with gold, till 1814.

At the period when the restriction on cash payments took place in 1797, it is supposed that there

were about 280 country banks in existence; but so rapidly were these establishments multiplied, that they amounted to above 900 in 1813. The price of corn, influenced partly by the depreciation of the currency, and the facility with which discounts were obtained, but far more by deficient harvests, and the unprecedented difficulties which the war threw in the way of importation, had risen to an extraordinary height during the five years ending with 1813. But the harvest of that year being unusually productive, and the intercourse with the Continent being then also renewed, prices, influenced by both circumstances, sustained a very heavy fall in the latter part of 1813, and the beginning of 1814. And this fall having ruined a considerable number of farmers, and produced a general want of confidence, such a destruction of provincial paper took place as has rarely been paralleled. In 1814, 1815, and 1816, no fewer than 240 country banks stopped payment; and eighty-nine commissions of bankruptcy were issued against these establishments, being at the rate of one commission against every ten and a half of the total number of banks existing in 1813.

The great reduction that had been thus suddenly and violently brought about in the quantity of country bank paper, by extending the field for the circulation of Bank of England paper, raised its value in 1817 nearly to a par with gold. The return to cash payments being thus facilitated, it was fixed, in 1819, by the Act 59 Geo. III. c. 78, commonly called Sir Robert Peel's Act, that they should take place in 1823. But to prevent any future over-issue, and at the same time to render the measures as little burdensome as possible, it was enacted, in pursuance of a plan suggested by the late Mr. Ricardo, that the Bank should be obliged, during the interval from the passing of the Act till the return to specie payments, to pay her notes, if required, in bars of standard bullion of not less than sixty ounces weight. This plan was not, however, acted upon during the period allowed by law; for, a large amount of gold having been accumulated at the Bank, the directors preferred recommending specie payments on the 1st of May, 1821. (See Table I., p. 116, for an account of the price of bullion, the depreciation of paper, &c. from 1800 to 1821.)

A great diversity of opinion has been entertained with respect to the policy of the return to the old standard in 1819. By one party it has been represented as a wise and politic measure; they contend that Sir Robert Peel's Act not only put an end to those fluctuations in the value of money which had previously been productive of great mischief, and gave effect to the solemn engagements into which the public had entered with the national creditor, but that it did this without adding anything material to the national burdens. But another, and also a very numerous party, take a totally different view of this measure: they contend that the public was not really bound to return to cash payments at the old standard at the termination of the war; that the return has very greatly enhanced the value of the currency; and that this enhancement, by adding proportionally to the fixed burdens laid on the industrious classes, has been most injurious to their interests.

It will, however, be found in this, as in most cases of the sort, that the statements of both parties are exaggerated; and that if, on the one hand, the measure has not been so advantageous as its eulogists represent, neither, on the other, has it been nearly so injurious as its enemies would have us believe.

In discussing this question, it is material to observe that the value of paper, which had been

in 1815 and 1816 about 163 per cent. below that of gold, rose in 1817 and 1818, from the causes already mentioned, without any interference whatever on the part of Government, to within little more than 23 per cent. of the value of gold; and that in 1819 the depreciation only amounted to 43 per cent. (See Table I., p. 116.) It is, therefore, quite ludicrous to ascribe to the Act of 1819, as is often done, the whole rise that has taken place in the value of the currency since the peace, seeing that the currency had been for three years previously to its enactment from 123 to 143 per cent. above its value in 1815, and from 21 to 23 per cent. above its value in 1814. The main object which the promoters of the Act of 1819 had in view was to sustain the value of the currency at the point to which it had recovered itself without legislative interference. This, however, could not be done without recurring to specie payments; and the difference of 43 per cent. that obtained in 1819 between the value of gold and paper, was not deemed sufficiently considerable to warrant a departure from the old standard, and from the acts engaging to restore it.

But it is alleged that those who suppose that the Act of 1819 added only 43 per cent. to the value of the currency mistake altogether the effect of the measure. It is admitted, indeed, that paper was then only 43 per cent. less valuable than gold; but by reverting to specie payments, we made an unexpected purchase of thirty millions of gold; and it is affirmed that this novel and large demand, concurring simultaneously with the contraction of paper in several of the Continental states, and with a falling off in the supply of bullion from the mines, had the effect of adding very greatly to the value of gold itself, and consequently to that of the currency. It is very difficult, or rather, perhaps, impossible, to determine the precise degree of credit that should be attached to this statement; but while we incline to think that it is well founded to a certain extent, we see no grounds for believing that it is so to anything like the extent that has been stated. The gold imported into Great Britain, to enable the Bank to resume specie payments, was not taken from any particular country or district, but was drawn from the market of the world; and considering the vast extent of the supply whence it was derived, it is against all reason to suppose that its value could be materially influenced by our purchases. We doubt, too, whether the contraction of the paper currency of some of the Continental states, and the substitution of specie in its stead, was not more than balanced by the cessation of the demand for specie for the military chests of the different armies, by the stoppage of the practice of hoarding, and the greater security consequent on the return of peace. And with respect to the falling off in the supplies from the mines, it is not a circumstance, supposing it to have had a considerable influence, that Parliament could take into account. It could neither determine the extent to which bullion had been raised, nor at what point the rise would stop, nor how soon it might again begin to decline. The diminution in the supply of bullion had then continued for too short a period, and its influence on the value of gold was much too uncertain, to make it a ground for interfering in any degree with the standard. And notwithstanding the falling off in the productiveness of the American mines still continues, the diminution thence arising has been since more than compensated by the extraordinary increase that has taken place of late years in the produce of the Russian mines and washings.

The decline in the price of most articles that has taken place since the peace has been often referred to as a conclusive proof of the great enhancement in the value of bullion. But the inference is by no means so certain as has been represented. The prices of commodities are as much affected by changes in the cost of their production, as by changes in the quantity of money aloft. Now, there is not one of the great articles of commerce the cost of which has not been considerably reduced, or which has not been supplied from new and more productive sources, within the last few years. The growth of corn, for example, has been vastly extended in France, Prussia, and generally throughout the Continent, by the splitting of large estates, and the complete subversion of the feudal system; and the reduction of its price in this country has been wholly owing to the astonishing improvements made in agriculture, and to the increase of imports from Ireland. The fall in the price of wool is satisfactorily accounted for by the introduction and rapid multiplication of Merino sheep in Germany, where they seem to succeed even better than in Spain, and by the large and rapidly growing imports from Australia, where little more than 50 years ago there was not a single sheep! And a very large portion, if not the whole, of the fall in the price of colonial products, is admitted, on all hands, to be owing to the destruction of the monopoly system, and the vast extension of cultivation in Cuba, Brazil, Java, Louisiana, &c. Although, therefore, we do not deny that the falling off in the supply of bullion from the mines must, at first, have had some influence over prices, we hold it to be the greatest imaginable error to ascribe to it the entire fall that took place after the peace. Were its effect rated at from 5 to 10 per cent., we believe it would be very considerably overstated. [PRECIOUS METALS.]

On the whole, therefore, we are disposed to approve of the conduct of those who framed the Act of 1819. That it added somewhat to the burdens of the industrious classes, and has been in so far hostile to the public interests, it seems impossible to doubt; but it has not been so in anything like the degree which its enemies represent. The period, too, when it was passed is now so distant, that the existing engagements amongst individuals have almost all been formed with reference to the altered value of the currency; so that whatever injury it may have occasioned in the first instance must be nearly gone by. To modify or change the standard at this late period, would not be to repair injustice, but to commit it afresh. At the end of the war the circumstances were considerably different. The standard had been really abandoned for the previous 18 years; and perhaps we may now say, that it would have been better, all things considered, had the mint price of bullion been raised in 1815 to the market price. But having surmounted all the difficulties attendant upon the restoration of the old standard, and maintained it since 1821, it would be in the last degree impolitic to subject it to new alterations. Should the country become, at any future period, unable to make good its engagements, it will better consult its honour and its interest by fairly compounding with its creditors, than by endeavouring to slip from its engagements by resorting to the underhand and dishonest expedient of enfeebling the standard.

The price of corn, which had been very much depressed in 1821 and 1822, rallied in 1823; and this circumstance contributed, along with others peculiar to that period, to promote an extraordinary rage for speculation. The issues of the

country banks being in consequence far too much extended, the currency became redundant in the autumn of 1824; and the exchanges having been depressed, a drain for gold began to operate upon the Bank of England. But the directors of that Bank having entered, in the early part of that year, into an engagement with Government to pay off such holders of 4 per cent. stock as might dissent from its conversion into a 3½ per cent. stock, they were obliged to advance a considerable sum on this account after the depression of the exchange. This tended to counteract the effect of the drain on the Bank for gold; and, in consequence, the London currency was not very materially diminished till September, 1825. When, however, the continued demand of the public on the Bank for gold had rendered money scarce in the metropolis, the pressure speedily extended to the country. Such of the provincial banks—and they were a numerous class—as had been originally established without sufficient capital, or had conducted their business upon erroneous principles, began to give way the moment they experienced an increased difficulty of obtaining pecuniary accommodations in London. The alarm, once excited, soon became general; and confidence and credit were, for awhile, almost wholly suspended. In the short space of six weeks, above seventy banking establishments were destroyed, notwithstanding the very large advances made to them by the Bank of England; and the run upon the Bank for cash to supply the exigencies of the country banks was so heavy, that she was well nigh drained of all the coin in her coffers, and obliged to issue about a million of 1*l.* and 2*l.* notes.

To guard against a recurrence of the wide-spread mischief and ruin produced by this and the previous bankruptcies of the country banks, it was resolved, in 1826, with consent of the Bank of England, to make a change in the law of 1708, limiting the number of partners in banking establishments to six only. And it was accordingly enacted, that thenceforth any number of partners might form themselves into associations to carry on the business of banking, including the issue of notes, any where not within *sixty-five miles* of London. The directors of the Bank of England came, at the same time, to the resolution of establishing branches in some of the principal towns; and these have since been established in Gloucester, Manchester, Birmingham, Leeds, Liverpool, Bristol, Exeter, Newcastle-upon-Tyne, Hull, Norwich, &c.

The branch banks have been useful, but we have already seen that the benefits which it was supposed would result from the formation of joint-stock banks have been in great measure disappointed. At best, the formation of joint-stock banks was but a feeble palliative of inveterate disorders. It was quite illusory to expect to make any real improvement upon the system of country banking in England, by the mere introduction of a plan for *allowing* banking establishments with large capitals to be set on foot. There had always been, and were at the moment, a great number of such establishments in England. What we really wanted was the adoption of a system that should suppress all local issues, or exclude the possibility of notes being discredited, by making sure that notes when issued should be paid.

Besides attempting to lessen the frequency of bankruptcy among the country banks by repealing the law limiting the number of partners, it was further resolved, in 1826, to prohibit the issue of 1*l.* notes. The policy and effects of this measure

gave rise to much dispute. It seems clear that it went far to shut up one of the most convenient channels by which the inferior class of country bankers contrived to get their notes into circulation, and must in so far have done good. But there were many other channels still open to them; and to imagine that this measure was to place the provincial currency on that solid basis on which it should be placed was quite visionary. There were no notes under 5*l.* in circulation in 1792; and yet fully *one third* part of the country banks then in existence became bankrupt! No doubt can, however, be entertained, that the representations of the extreme injury occasioned by the withdrawal of 1*l.* notes were greatly exaggerated. At the same time it is obvious that the means of the bankers to make advances, as well as the profit derived from making them, must both have been diminished by the suppression of the small notes; and it would be foolish to deny that this circumstance must have occasioned some loss and inconvenience to individuals; though, as respects the public, the measure was highly advantageous.

The extraordinary extent to which the forgery of the 1*l.* notes of the Bank of England was carried affords of itself a sufficient vindication of the policy of their suppression. But the comparatively limited circulation of the country banks, and perhaps we may add the greater attention paid to the manner in which their notes were engraved, hindered their forgery from becoming injuriously prevalent.

The defects inherent in the old system were again fully developed in 1836 and 1837. It is needless now to enter upon any investigation of the circumstances which led to the overtrading of these years; but it was carried to a great extent both here and in the United States. In nothing, however, was this more strikingly evinced, than in the rapid increase of joint-stock banks; their number, which in 1834-35 had amounted in England and Wales to 55, having risen in 1835-36 to no fewer than 100! Many of these were banks of issue, and in consequence of the large additions that were thus suddenly made to the number of notes afloat, and still more to the number of bills, cheques, and other substitutes for money, the currency became redundant and the exchange depressed; and the deficient harvests of 1838 and 1839, conspiring with this redundancy, occasioned a further fall in the exchange, and a severe drain upon the Bank of England for gold. But while the latter was narrowing her issues by supplying the exporters of bullion with gold in exchange for notes, the country banks went on increasing their issues! What the former did by contracting on the one hand, the latter more than undid by letting out on the other. The vacuum created by the withdrawal of Bank of England paper was immediately filled up, and made to overflow, by the issue of a more than equal amount of provincial paper; so that had it not been for the rise in the rate of interest, and the other repressive measures adopted by the Bank, the probability is that she might have gone on paying away bullion for notes, till she was drained of her last sixpence; without in any degree affecting the exchange; and as it was, the bullion in her coffers in August 1839 was reduced to 2,120,000*l.*, so that we narrowly escaped a tremendous crisis.

#### SEC. IV.—PRINCIPLE AND OPERATION OF THE ACT OF 1844.

This perilous experience having again forcibly attracted the public attention to the state of the

banking system, Sir Robert Peel was induced to attempt its improvement. And the measures which he introduced and carried through Parliament in 1844 and 1845, for the improvement of our banking system, were so skilfully contrived as to provoke little opposition, at the same time that they effected most important and highly beneficial changes.

The measures in question consisted of the Act 7 & 8 Vict. c. 32, which refers to the Bank of England, and the English country banks; and the Act 8 & 9 Vict., of which c. 37, 38 refer to the banks of Ireland and Scotland respectively. These statutes were intended to obviate the chances of over-issue and of sudden fluctuations in the quantity and value of money, by limiting the power to issue notes payable on demand, and by making the amount of such notes in circulation vary with the amount of bullion in the possession of the issuers. In dealing with the Bank of England, Sir Robert Peel adopted the proposal previously made by Lord Overstone, for effecting a complete separation between the issuing and banking departments of that establishment, and giving the directors full liberty to manage the latter at discretion, while they should have no power whatever over the other.

*Principle on which Act of 1844 was founded.*—The notes of the Bank of England in circulation for some years previously to 1844 rarely amounted to 20,000,000*l.*, or sunk so low as 16,000,000*l.* And such being the case, Sir Robert Peel was justified in assuming that the circulation of the Bank could not, in any ordinary condition of society, or under any mere commercial vicissitudes, be reduced below 14,000,000*l.* And the Act of 1844 allows the Bank to issue this amount upon securities, of which the 11,015,100*l.* she has lent to the public is the most important item. Inasmuch, however, as the issues of the provincial banks were at the same time limited in their amount, and confined to certain existing banks, it was further provided, in the event of any of these banks ceasing to issue notes, that the Bank of England might be empowered, by order in council, to issue, upon securities, two-thirds, and no more, of the notes which such banks had been authorised to issue. Under this condition, the total secured issue of the Bank has (1858) been increased from 14,000,000*l.* to 14,475,000*l.* *But for every other note which the issue department may at any time issue over and above the maximum amount (14,475,000*l.*) issued on securities, an equal amount of coin or bullion must be paid into its coffers.* And hence, under this system, the notes of the Bank of England are rendered really and truly equivalent to gold, while their immediate conversion into that metal no longer depends, as it previously did, on the good faith, the skill, or the prudence of the directors. And these important results have been attained without imposing any burden of which anyone has any right to complain. Our currency rests on the fundamental principle, that all debts above forty shillings shall be paid in gold. But individuals and associations, including the banking or commercial department of the Bank, have the option, if they prefer it, to exchange gold for bank notes, and to make use of the latter in their dealings with the public. Hence, if A. or B. goes to the issuers of paper, and gets 100 or 500 notes from them in exchange for an equivalent amount of gold, it is his own convenience he has exclusively in view. He was at full liberty to use gold, but he preferred exchanging it for notes because he could employ the latter more advantageously. This is the way in which paper is issued under the Act of 1844; and such being the case it is

contradictory to say that it is productive either of hardship or inconvenience.

It has been alleged that this system is injurious by shackling the bank in the use of her credit. But it must be clear on the least reflection that it does nothing of the sort. It merely prevents her from issuing substitutes for money which do not represent money. It does not absorb or lock up a single sixpence worth of her capital; nor does it interfere in any manner of way with her employment either of it, or of her credit. The gold in the issue department of the Bank was not purchased by her, and does not belong to her. She is its keeper, but not its owner. It belongs to the public, or to the holders of bank notes, who deposited it in the Bank in exchange for notes, with and under the express stipulation, that on paying the latter into the Bank, they should receive back their gold. Any interference with these deposits would be an interference with property held in pledge for others; that is, it would be an act precisely of the same kind with that which deservedly subjected Strahan, Paul, and Co. to transportation for fourteen years. The authority of Mr. Sheffield Neave, formerly governor of the Bank, may be quoted in corroboration of this statement: 'The issue-department is out of our hands altogether. We are mere trustees under the Act of Parliament, to see that those securities are placed there and kept up to that amount; and in no case can any creditor of the Bank touch that which is reserved for a note-holder. We are in that respect merely ministrative; we are trustees to hold that amount in the issue-department, and our banking department has a totally separate function, which has no relation whatever to the issue-department.' (*Min. of Evidence*, 1857, p. 99.)

But though she may not lay violent hands on the property of the public, the Bank, it is obvious, has at this moment the same absolute command over her entire capital and credit, that she would have were the Act of 1844 non-existent. In her banking capacity she is free from all restraint, and is in precisely the same situation as other banking or mercantile establishments. She may lend or not lend as she pleases, and may lay down such conditions as she pleases in regard to the interest and the terms of her loans and discounts. In short, she may do whatever she likes with her own. But further she is not permitted to go. She may not substitute shadows for realities. She cannot, whether to assist others, or to relieve herself from embarrassment, issue a single note except upon a deposit of bullion. But this rule does not operate on herself only. It applies to all individuals and associations. And to relax it in any degree would be—disguise it as you will—to authorise an issue of fictitious or spurious paper, and consequently to vitiate the currency and to abuse credit in the way that is sure to be in the end the most disastrous.

It is further objected to the Act of 1844, that it 'limits the currency;' that it makes no provision for the increasing demands of the public; and confined us in 1858, when the exports would probably exceed 120,000,000*l.*, to the same amount of money as in 1844, when the exports did not exceed 58,500,000*l.* But though this statement has been made by parties who ought to have known better, the reader can hardly require to be told that it is completely destitute of foundation. The 14,000,000*l.* issued on securities, is the only thing that is limited in the Act; everything else varies with the varying condition and circumstances of the country, including the means by which the use of money may be economised. In the week ending

August 29, 1857, the issue department of the Bank had issued notes to the amount of 25,323,965*l.*, being no fewer than 11,323,965*l.* over and above the amount authorised to be issued on securities. And if the country had really required a larger supply of money, that is, if more coins, or paper equivalent to coins, could have been absorbed into the circulation without rendering the currency redundant, and depressing the exchange, the additional quantity would have been forthwith supplied. For under such circumstances, merchants, bankers, and money-dealers would have realised a certain and immediate profit by carrying bullion to the Mint or the Bank, that they might obtain coins, or notes, or both, with which to increase the currency. It is one of the chief merits of the Act of 1844, that, under its agency, the supply of money is not to any extent or in any degree regulated or influenced by the proceedings of the Bank or the Government. They have nothing to do in the matter, unless it be to coin the bullion which individuals or firms carry to the Mint for that purpose, and to exchange, when called upon, notes for coins, and coins for notes. The supply of money, like that of all non-monopolised articles, is wholly dependent upon, and is determined by, the free action of the public. It would, indeed, be quite as true to say, that the Act of 1844 limits the amount of corn, of cloth, or of iron produced in the country, as that it limits the amount of money. It maintains the value of the notes issued by the Bank on a level with the coins for which they are substitutes; but beyond that its effect is *nil*. It has nothing whatever to do with the greater or less amount of the currency. That depends entirely on the estimate formed by the public of its excess or deficiency, an estimate which, when wrong, is sure to be corrected by the exchange.

We may add, that no inference can ever be safely drawn from the number of notes or coins, or both, afloat in a country, as to whether its currency be, or be not, in excess. That is to be learned by the state of the exchange, or by the influx and eflux of bullion. If the imports of bullion exceed the exports, it shows that the currency is in some degree deficient, while if the exports exceed the imports, it shows that the currency is in excess, and that no additions can be made to it without further depressing the exchange and increasing the drain of bullion. When the imports and exports of bullion are about equal, then of course the currency is at about its proper level. These are the only criteria by which anything can ever be correctly inferred in regard to the deficiency or excess of currency. Its absolute amount affords hardly even a basis for conjecture. When there is little speculation or excitement, an issue of 25,000,000*l.* or 27,000,000*l.* bank-notes may be in excess! while, at another time, and with a different state of trade and speculation, an issue of 35,000,000*l.* or 37,000,000*l.* of notes may not be enough. Except in periods of internal commotion, or when we are disturbed by alarms of invasion, the state of the exchange is the only, as it is the infallible, test of the sufficiency and insufficiency of the currency.

We have seen that bills of exchange, about which so much is said, though they serve some of the purposes of money, are not money. But whether the amount of them in circulation be great or small, and whether they be drawn at long or short dates, though highly important in other respects, has no reference to, or bearing upon, this question. When from any cause, whether from an excess in the amount of bills or notes afloat, the currency becomes redundant, the exchange is depressed, and notes are sent to the issue depart-

ment of the Bank to be exchanged for gold, which is forthwith exported. And it is by the immediate action of the adverse exchange upon notes, and the consequent influence of the contraction of the latter upon bills, that the amount of the currency is lessened, its value raised, and the exchange brought to par. At such periods there is usually more or less of mercantile pressure, and a greater demand for discounts and pecuniary accommodation. This leads to a rise in the rate of interest; but no change in this rate has any influence over the currency, except in so far as its rise may diminish, and its fall may increase, the demands upon the Bank for loans. A system of this sort effectually prevents any great excess of bills from ever getting into the market; and thus checks, in limine, what would otherwise be the most copious source of wild speculation, overtrading, and bankruptcy.

It may be said, perhaps—for there is no end of apologies for whatever is vicious—that if the issue of notes were in the hands of Government, the entire profit accruing thereon would belong to the public. But supposing such to be the case, the difference between that profit, and that which is or may be realised under the present system, would either be nothing at all, or so inconsiderable as to be wholly unworthy of attention. It will be afterwards seen that at this moment the public receives by far the greater part of the profit made by the Bank on the fixed issue of 14,000,000*l.*, and if it be deemed expedient, that part may be still further increased, or turned into the lion's share. Assuming, therefore, for a moment, that the power to issue notes is vested in Government commissioners, it is not pretended that these notes are to be legal tender. Nothing so monstrous as that could be thought of, or at all events, durst be proposed. The notes issued by the commissioners, like those issued by the Bank, must be paid on demand. But to do this, a stock of bullion must be provided; and unless the plan now followed were adopted, and all issues above the amount of 14,000,000*l.*, or thereby, were made upon deposits of bullion, the public would not have that perfect security which is given them by the present system, and which is worth more than ten times all the profits arising out of the fixed issue. Even under the old system, or that which existed previously to 1844, the rule of the Bank was to keep a stock of bullion on hand equal to a third part of her issues. But this rule was not, and in truth could not be, acted upon. It is plain, however, had it been *bonâ fide* carried out, that the profits on the issue of notes would not have been materially, if at all, different from what they are at this moment. Nothing, therefore, can be more completely futile than the talk about the large profits that would accrue to the public by vesting the power to issue notes in commissioners appointed by Government. With the same security as at present for the conversion of the notes into coin, nothing would be gained by such appointment; and if, as would most likely be the case, it lessened the security referred to, and added to the chances of over-issue and mismanagement, the injury to the public hence resulting might be enormous. We therefore, are disposed to believe, that of the various proposals in regard to the currency, that which proposes to vest the issue of notes in the hands of Government commissioners is one of the most objectionable. The chances are ten to one that they would act as directed by the Government of the day; and this, at all events, would be popularly assumed to be the case. Supposing, however, that they did nothing of the sort, but were perfectly independent, still it is obvious that whatever they did more or less than

is done at present, would be mischievous. And such being the case, it is not easy to see what advantage would be gained by their appointment; while it would have the serious disadvantage of making Government directly responsible, in the public estimation, for whatever inconvenience might at any time be supposed to result from the limitation of the currency.

The objections to the Act of 1844 are so various and so opposite that they are not easily collected. Sometimes we are told that it is inconsistent with itself and incomplete, and that it deals stringently with the Bank of England, while it hardly interferes with the country banks. But this is an unfair representation. In dealing with the country banks the Act may not have gone quite so far as it was desirable it should have gone, or as Sir Robert Peel wished it to go; but it notwithstanding effected, even in that respect, a very great improvement, and really left but little to be wished for.

To prevent future over-issues of country paper it was enacted, that from and after the passing of the Act, no new bank for the issue of notes should be established in any part of the United Kingdom. And it was further enacted, that the *maximum* issue of notes by the existing country banks should, in future, be limited to the average amount which they had respectively in circulation during the twelve weeks preceeding the 27th April, 1844; and various penalties are imposed on those whose issues exceed that fixed amount. This condition applies only to banks in England and Wales. The issues of those in Scotland and Ireland are limited to the average amount of those in circulation during the twelve months ending the 1st of May, 1845. (See *post.*) It was then, also, ordered that the names of the partners, in joint-stock and other banks, should be periodically published.

These are most important regulations. No doubt it would have been better had provincial issues been entirely suppressed, and Bank of England notes made the only legal substitute for coins. But in matters of legislation what is practicable is of quite as much importance as what is absolutely just and proper. Sir Robert Peel knew what he could carry through Parliament. Had he attempted more, he would not only have failed of his object, but would, most likely, have endangered the success of the other and far more important portion of his measure which related to the Bank of England.

Under the operation of the Act of 1844 the extinction of the country issues is being gradually effected, partly by some of the issuing banks finding it to be for their advantage to use notes of the Bank of England instead of their own, and partly by the wind-up-of some concerns and the bankruptcy of others. But, owing to the limitation of the issues, comparatively little inconvenience has resulted to the public from the latter circumstance.

On the whole, therefore, there does not appear to be much ground on which to object to the existing arrangements in regard to the country banks. Though not theoretically perfect, their practical deficiencies are unimportant. To attempt to obviate them might imperil other and more important arrangements. And we incline to think that the notion that such would be the case has had not a little to do in making them be pressed on the attention of the public.

*Suspensions of 1847 and 1857.*—But it is said, 'that even the best system cannot always be carried to an extreme. The Act of 1844 has had to be suspended in 1847, and again in 1857; and

machinery for its relaxation in periods of difficulty should be introduced into it!

We beg, however, to express our dissent from this doctrine. It would be easy to show that the embarrassment of the banking department of the Bank in 1847 which led to the suspension of the Act, was mainly a consequence of the injudicious proceedings of the directors; and it is to be hoped that the experience they acquired on that occasion may not be forgotten. But in whatever way the crisis may have originated, there can be no question that the suspension of 1847 was a measure of doubtful policy. The exchanges had already become favourable, and it was the prevalent opinion in very well-informed quarters, that the panic which had begun to show itself would speedily have disappeared without the intervention of Government. It should never be forgotten that, apart from internal panics, the time when the Act is said to be working harshly and oppressively is the very time when it is most for the public advantage that it should be honestly carried out.

The revulsion in 1857 was occasioned by the stoppage of the American banks. The real value of the exports from this country to the United States amounted in 1856 to 21,476,000*l.*, of which a large portion was unpaid when the banks stopped payments; and a further and very large sum was due to us on account of dividends on state, railway and canal stocks, and so forth, held by parties in England. The sudden cessation of so large an amount of payments could not fail to occasion a good deal of distress among the merchants and others dealing with America. And it was among this class, or those intimately connected with it, that the greatest overtrading and abuse of credit had taken place. Some firms in Glasgow, which had been notoriously overtrading for a number of years, were the first to give way. And their failure being on a very large scale, the banks by which they had been principally supported became the objects of suspicion. And from suspicion to distrust there is but a step. Notwithstanding the numbers and wealth of the shareholders responsible for the banks in question, they were subjected to a run on the part of the inferior class of note-holders and depositors, and their resources being either anticipated or locked up, they were obliged to suspend payments. And had they only failed, none could have regretted the result. On the contrary, it would have been nothing more than they deserved, for they had for a lengthened period grossly abused the ample resources at their command, and resorted to the most questionable means to bolster up the speculators with whom they had become identified. But the mischief is, that the disastrous effects of such proceedings cannot be confined to the guilty parties. A fire originating in a pig-sty may destroy a palace. The suspension of the offending banks, by generating uneasy feelings and suspicions in the public mind, led to a run on some of the other banks. And to provide for their own safety these establishments immediately began to sell securities, and to adopt other means, by which to obtain supplies of gold. Large amounts of it were in consequence carried to Scotland. And, in addition to the demand for gold, that for discounts, notwithstanding the high rate of ten per cent. charged by the Bank, continued undiminished, so that the reserve in her possession was reduced on November 11 to 1,462,133*l.*; and it was the general belief, that this inadequate reserve would be forthwith either much reduced or wholly swallowed up. To avert the possibility of such an event occurring, the directors were

authorised, on November 12, to issue notes without being bound by the conditions of the Act of 1844.

This, though a brief, is, we believe, a sufficiently accurate account of the circumstances that led to the suspension of the Act in 1857. The weight to be attached to them will be differently estimated by different individuals. The suspension is believed by some to have been, at least, premature, and others think that probably it might have been avoided. It is alleged that the panic in Scotland had begun to subside previously to the measure being adopted; and it was all but certain that when it had subsided, a considerable portion of the gold that had been sent to Scotland would speedily find its way back to London, and some considerable risk and inconvenience should have been encountered rather than that measures should have been adopted, the effect of which will be to protect speculators and money dealers without capital, and wanting alike in character and conduct, from the consequences of their unjustifiable proceedings. But, at the same time, we admit that the immediate exposure and punishment of these parties, however desirable, was not to be purchased at the risk of a general revulsion. And as the information laid before ministers made them believe that such a calamity was imminent unless the statute of 1844 was suspended, they were bound to act upon that conviction, and to provide 'ne quid detrimenti respublica capiat.'

But whatever may be thought of these conclusions, it is at all events certain that the Act of 1844 had nothing whatever to do with the late revulsion. It did not occasion the American stoppage, and under its operation the foreign drain for gold had been entirely stopped; and though it could not prevent the abuses in banking, and the system of rediscounting and overtrading in which so many banks and firms have been engaged, it contributed in no ordinary degree, by preventing the issue of spurious paper, to confine them within comparatively narrow limits and to lessen the violence of the crisis.

The Act of 1844 is a rule to be enforced in all but extraordinary and unforeseen emergencies, the urgency of which cannot be appreciated beforehand, but must be determined at the moment. But when these occur, it may, like the Habeas Corpus Act, be properly suspended. It is mainly calculated to regulate our currency by the exchanges, or through our commercial intercourse with other countries; but it is not applicable, nor is any system of which the convertibility of paper into coin makes a part applicable, to a state of internal discredit or panic. Had it existed in 1797, it must have been suspended; and its suspensions in 1847 and 1857 are only to be justified by the state of our domestic affairs making an adherence to principle inexpedient and impracticable. But, whenever the circumstances referred to, that is, when the panic and distrust that occasioned the suspension of the Act subsided, it is clear it should be, and it has been, revived in its pristine vigour. The Habeas Corpus Act is not the less efficient at this moment that it has been repeatedly suspended in periods of danger and difficulty.

We subjoin a full

ABSTRACT OF THE ACT 7 & 8 VICT. C. 32, FOR REGULATING THE ISSUE OF BANK NOTES, AND FOR GIVING TO THE BANK OF ENGLAND CERTAIN PRIVILEGES FOR A LIMITED PERIOD, 19 JULY, 1844.

*Bank to establish a separate Department for the Issue of Notes.*—Whereas it is expedient to regulate the issue of bills or notes payable on demand:

and whereas the Act 3 & 4 Wm. IV. c. 98 gave to the corporation of the governor and company of the Bank of England certain privileges for a limited period, under certain conditions; and it is expedient that the privileges of exclusive banking therein mentioned should be continued to the said governor and company of the Bank of England, with such alterations as are herein contained, upon certain conditions: be it therefore enacted, that from and after the 31st day of August, 1844, the issue of promissory notes of the governor and company of the Bank of England, payable on demand, shall be separated and thenceforth kept wholly distinct from the general banking business of the said governor and company; and the business of and relating to such issue shall be thenceforth conducted and carried on by the said governor and company in a separate department, to be called 'The Issue Department of the Bank of England,' subject to the rules and regulations hereinafter contained; and it shall be lawful for the court of directors of the said governor and company, if they shall think fit, to appoint a committee or committees of directors for the conduct and management of such issue department of the Bank of England, and from time to time to remove the members, and define, alter, and regulate the constitution and powers of such committee, as they shall think fit, subject to any bye-laws, rules, or regulations which may be made for that purpose: provided nevertheless, that the said issue department shall always be kept separate and distinct from the banking department of the said governor and company. (Sec. 1.)

*Management of the Issue by Bank of England.*—Upon August 31, 1844, there shall be transferred, appropriated, and set apart by the said governor and company to the issue department of the Bank of England securities to the value of 11,000,000*l.*, whereof the debt due by the public to the said governor and company shall be and be deemed a part; and there shall also at the same time be transferred, appropriated, and set apart by the said governor and company to the said issue department so much of the gold coin and gold and silver bullion then held by the Bank of England as shall not be required by the banking department thereof; and thereupon there shall be delivered out of the said issue department into the said banking department of the Bank of England such an amount of Bank of England notes as, together with the Bank of England notes then in circulation, shall be equal to the aggregate amount of the securities, coin, and bullion so transferred to the said issue department of the Bank of England; and the whole amount of Bank of England notes then in circulation, including those delivered to the banking department of the Bank of England as aforesaid, shall be deemed to be issued on the credit of such securities, coin, and bullion so appropriated and set apart to the said issue department; and from thenceforth it shall not be lawful for the said governor and company to increase the amount of securities for the time being in the said issue department save as herein-after is mentioned; but it shall be lawful for the said governor and company to diminish the amount of such securities, and again to increase the same to any sum not exceeding in the whole the sum of 11,000,000*l.*, and so from time to time as they shall see occasion; and from and after such transfer and appropriation to the said issue department as aforesaid, it shall not be lawful for the said governor and company to issue Bank of England notes, either into the banking department of the Bank of England or to any persons or person whatsoever, save in exchange for other Bank of England notes, or for gold coin

or for gold or silver bullion received or purchased for the said issue department under the provisions of this Act, or in exchange for securities acquired and taken in the said issue department under the provisions herein contained: provided always, that it shall be lawful for the said governor and company in their banking department to issue all such Bank of England notes as they shall at any time receive from the said issue department or otherwise, in the same manner in all respects as such issue would be lawful to any other person or persons. (Sec. 2.)

*Proportion of Silver Bullion to be retained in the Issue Department.*—Whereas it is necessary to limit the amount of silver bullion on which it shall be lawful for the issue department of the Bank of England to issue Bank of England notes; be it therefore enacted, that it shall not be lawful for the Bank of England to retain in the issue department of the said Bank at any one time an amount of silver bullion exceeding one-fourth part of the gold coin and bullion at such time held by the Bank of England in the issue department. (Sec. 3.)

*All Persons may demand of the Issue Department Notes for Gold Bullion.*—From and after the 31st day of August, 1844, all persons shall be entitled to demand from the issue department, Bank of England notes in exchange for gold bullion, at the rate of 3*l.* 17*s.* 9*d.* per ounce of standard gold: provided always, that the said governor and company shall in all cases be entitled to require such gold bullion to be melted and assayed by persons approved of by the said governor and company at the expense of the parties tendering such gold bullion. (Sec. 4.)

*Power to increase Securities in the Issue Department, and issue additional Notes.*—If any banker who on the 6th day of May, 1844, was issuing his own bank notes shall cease to issue his own bank notes, it shall be lawful for H.M. in council at any time after the cessation of such issue, upon the application of the said governor and company, to authorise and empower the said governor and company to increase the amount of securities in the said issue department beyond the total sum or value of 11,000,000*l.*, and thereupon to issue additional Bank of England notes to an amount not exceeding such increased amount of securities specified in such order in council, and so from time to time: provided always, that such increased amount of securities specified in such order in council shall in no case exceed the proportion of two-thirds the amount of bank notes which the banker so ceasing to issue may have been authorised to issue under the provisions of this Act; and every such order in council shall be published in the next succeeding *London Gazette*. (Sec. 5.)

*Account to be rendered by the Bank of England.*—An account of the amount of Bank of England notes issued by the issue department of the Bank of England, and of gold coin and of gold and silver bullion respectively, and of securities in the said issue department, and also an account of the capital stock, and the deposits, and of the money and securities belonging to the said governor and company in the banking department of the Bank of England, on some day in every week to be fixed by the commissioners of stamps and taxes, shall be transmitted by the said governor and company weekly to the said commissioners in the form prescribed in the schedule hereto annexed marked (A), and shall be published by the said commissioners in the next succeeding *London Gazette* in which the same may be conveniently inserted. (Sec. 6.)

Bank upon the day of party of and dis duty, o upon or to bear theucefo exempt Bank'soe want after the ment or a made by the provis year of William I the charg deemed de said gover the privile exemption this Act, sh privileges a no longer, o the sums no and compan the public 180,000*l.*, any ment, or in a withstanding tion shall in rights of the m paid for the m rate and accor 48 Geo. *Bank of England exempted from Stamp Duty upon their Notes.*—From and after the said 31st day of August, 1844, the said governor and company of the Bank of England shall be released and discharged from the payment of any stamp duty, or composition in respect of stamp duty, upon or in respect of their promissory notes payable to bearer on demand; and all such notes shall thenceforth be and continue free and wholly exempt from all liability to any stamp duty whatsoever. (Sec. 7.)

*Bank to allow 180,000*l.* per Annum.*—From and after the said 31st day of August, 1844, the payment or deduction of the annual sum of 120,000*l.*, made by the said governor and company under the provisions of the said Act passed in the fourth year of the reign of his late Majesty King William IV., out of the sums payable to them for the charges of management of the public unredeemed debt, shall cease, and in lieu thereof the said governor and company, in consideration of the privileges of exclusive banking, and the exemption from stamp duties, given to them by this Act, shall, during the continuance of such privileges and such exemption respectively, but no longer, deduct and allow to the public, from the sums now payable by law to the said governor and company for the charges of management of the public unredeemed debt, the annual sum of 180,000*l.*, anything in any Act or Acts of Parliament, or in any agreement, to the contrary notwithstanding; provided always, that such deduction shall in no respect prejudice or affect the rights of the said governor and company to be paid for the management of the public debt at the rate and according to the terms provided in the Act 48 Geo. III. c. 4, intitled 'An Act to authorise the advancing for the Public Service, upon certain Conditions, a proportion of the Balance remaining in the Bank of England, for the payment of Unclaimed Dividends, Annuities, and Lottery Prizes, and for regulating the Allowances to be made for the Management of the National Debt.' (Sec. 8.)

*Bank to allow the Public the Profits of increased Circulation.*—In case, under the provisions hereinbefore contained, the securities held in the said issue department of the Bank of England shall at any time be increased beyond the total amount of 14,000,000*l.*, then and in each and every year in which the same shall happen, and so long as such increase shall continue, the said governor and company shall, in addition to the said annual sum of 180,000*l.*, make a further payment or allowance to the public, equal in amount to the net profit derived in the said issue department during the current year from such additional securities, after deducting the amount of the expenses occasioned by the additional issue during the same period, which expenses shall include the amount of any and every composition or payment to be made by the said governor and company to any banker in consideration of the discontinuance at any time hereafter of the issue of bank notes by such banker; and such further payment or allowance to the public by the said governor and company shall, in every year while the public shall be entitled to receive the same, be deducted from the amount by law payable to the said governor and company for the charges of management of the unredeemed public debt, in the same manner as the said annual sum of 180,000*l.* is hereby directed to be deducted therefrom. (Sec. 9.)

*No new Bank of Issue.*—From and after the passing of this Act no person other than a banker who on the 6th day of May, 1844, was lawfully issuing his own bank notes shall make

or issue bank notes in any part of the U. K. (Sec. 10.)

*Restriction against Issue of Bank Notes.*—From and after the passing of this Act it shall not be lawful for any banker to draw, accept, make, or issue, in England or Wales, any bill of exchange or promissory note or engagement for the payment of money payable to bearer on demand, or to borrow, owe, or take up, in England or Wales, any sums or sum of money on the bills or notes of such banker payable to bearer on demand, save and except that it shall be lawful for any banker who was on the 6th day of May, 1844, carrying on the business of a banker in England or Wales, and was then lawfully issuing, in England or Wales, his own bank notes, under the authority of a license to that effect, to continue to issue such notes to the extent and under the conditions herein-after mentioned, but not further or otherwise, and the right of any company or partnership to continue to issue such notes shall not be in any manner prejudiced or affected by any change which may hereafter take place in the personal composition of such company or partnership, either by the transfer of any shares or share therein, or by the admission of any new partner or member thereto, or by the retirement of any present partner or member therefrom; provided always, that it shall not be lawful for any company or partnership now consisting of only six or less than six persons to issue bank notes at any time after the number of partners therein shall exceed six in the whole. (Sec. 11.)

*Bankers ceasing to issue Notes may not resume.*—If any banker in any part of the U. K. who after the passing of this Act shall be entitled to issue bank notes shall become bankrupt, or shall cease to carry on the business of a banker, or shall discontinue the issue of bank notes, either by agreement with the governor and company of the Bank of England or otherwise, it shall not be lawful for such banker at any time thereafter to issue any such notes. (Sec. 12.)

*Existing Banks of Issue to continue under certain Limitations.*—Every banker claiming under this Act to continue to issue bank notes in England or Wales shall, within one month next after the passing of this Act, give notice in writing to the commissioners of stamps and taxes at their head office in London of such claim, and of the place and name and firm at and under which such banker has issued such notes during the twelve weeks next preceding the 27th day of April last; and the upon the said commissioners shall ascertain if such banker was, on the 6th day of May, 1844, carrying on the business of a banker, and lawfully issuing his own bank notes in England or Wales, and if it shall so appear, then the said commissioners shall proceed to ascertain the average amount of the bank notes of such banker which were in circulation during the said period of twelve weeks preceding the 27th day of April last, according to the returns made by such banker in pursuance of the Act 4 & 5 Viet. c. 50, intitled 'An Act to make further Provision relative to the Returns to be made by Banks of the Amount of their Notes in Circulation; and the said commissioners or any two of them shall certify under their hands to such banker the said average amount, when so ascertained as aforesaid; and it shall be lawful for every such banker to continue to issue his own bank notes after the passing of this Act; provided nevertheless, that such banker shall not at any time after the 10th day of October, 1844, have in circulation upon the average of a period of four weeks, to be ascertained as hereinafter mentioned, a greater

amount of notes than the amount so certified, (Sec. 13.)

*Provision for united Banks.*—If it shall be made to appear to the commissioners of stamps and taxes that any two or more banks have, by written contract or agreement (which contract or agreement shall be produced to the said commissioners), become united within the twelve weeks next preceding such 27th day of April as aforesaid, it shall be lawful for the said commissioners to ascertain the average amount of the notes of each such bank in the manner herein-before directed, and to certify the average amount of the notes of the two or more banks so united as the amount which the united bank shall thereafter be authorised to issue subject to the regulations of this Act. (Sec. 14.)

*Duplicate Certificate to be published in the Gazette.*—The commissioners of stamps and taxes shall, at the time of certifying to any banker such particulars as they are herein-before required to certify, also publish a duplicate of their certificate thereof in the next succeeding *London Gazette* in which the same may be conveniently inserted; and the *Gazette* in which such publication shall be made shall be conclusive evidence in all courts whatsoever of the amount of bank notes which the banker named in such certificate or duplicate is by law authorised to issue and to have in circulation as aforesaid. (Sec. 15.)

*If Banks become united, Commissioners to certify the Amount of Bank Notes which each Bank was authorised to issue.*—In case it shall be made to appear to the commissioners of stamps and taxes, at any time hereafter, that any two or more banks, each such bank consisting of not more than six persons, have, by written contract or agreement (which contract or agreement shall be produced to the said commissioners), become united subsequently to the passing of this Act, it shall be lawful to the said commissioners upon the application of such united bank, to certify, in manner herein-before mentioned, the aggregate of the amounts of bank notes which such separate banks were previously authorised to issue, and so from time to time; and every such certificate shall be published in manner herein-before directed; and from and after such publication the amount therein stated shall be and be deemed to be the limit of the amount of bank notes which such united bank may have in circulation: provided always, that it shall not be lawful for any such united bank to issue bank notes at any time after the number of partners therein shall exceed six in the whole. (Sec. 16.)

*Penalty on Banks issuing in excess.*—If the monthly average circulation of bank notes of any banker, taken in the manner herein-after directed, shall at any time exceed the amount which such banker is authorised to issue and to have in circulation: under the provisions of this Act, such banker shall in every such case forfeit a sum equal to the amount by which the average monthly circulation, taken as aforesaid, shall have exceeded the amount which such banker was authorised to issue, and to have in circulation as aforesaid. (Sec. 17.)

*Issuing Banks to render accounts.*—Every banker in England and Wales who, after the 10th day of October, 1844, shall issue bank notes, shall on some one day in every week after the 15th day of October, 1844 (such day to be fixed by the commissioners of stamps and taxes), transmit to the said commissioners an account of the amount of the bank notes of such banker in circulation on every day during the week ending on the next preceding Saturday, and also an account of the

average amount of the bank notes of such banker in circulation during the same week; and on completing the first period of four weeks, and so on, completing each successive period of four weeks, every such banker shall annex to such account the average amount of bank notes of such banker in circulation during the said four weeks, and also the amount of bank notes which such banker is authorised to issue under the provisions of this Act; and every such account shall be verified by the signature of such banker or his chief cashier, or, in the case of a company or partnership, by the signature of a managing director or partner or chief cashier of such company or partnership, and shall be made in the form to this Act annexed marked (B); and so much of the said return as states the weekly average amount of the notes of such bank shall be published by the said commissioners in the next succeeding *London Gazette* in which the same may be conveniently inserted; and if any such banker shall neglect or refuse to render any such account in the form and at the time required by this Act, or shall at any time render a false account, such banker shall forfeit the sum of 100*l.* for every such offence. (Sec. 18.)

*Mode of ascertaining the average Amount of Bank Notes of each Banker.*—For the purpose of ascertaining the monthly average amount of bank notes of each banker in circulation, the aggregate of the amount of bank notes of each such banker in circulation on every day of business during the first complete period of four weeks next after the 10th day of October, 1844, such period ending on a Saturday, shall be divided by the number of days of business in such four weeks, and the average so ascertained shall be deemed to be the average of bank notes of each such banker in circulation during such period of four weeks, and so in each successive period of four weeks, and such average is not to exceed the amount certified by the commissioners of stamps and taxes as aforesaid. (Sec. 19.)

*Commissioners empowered to cause the Books of Bankers to be inspected.*—Whereas, in order to insure the rendering of true and faithful accounts of the amount of bank notes in circulation, as directed by this Act, it is necessary that the commissioners of stamps and taxes should be empowered to cause the books of bankers issuing such notes to be inspected, as herein-after mentioned: be it therefore enacted, that all and every the book and books of any banker who shall issue bank notes under the provisions of this Act, in which shall be kept, contained, or entered any account, minute, or memorandum of or relating to the bank notes issued or to be issued by such banker, or of or relating to the amount of such notes in circulation from time to time, or any account, minute, or memorandum the sight or inspection whereof may tend to secure the rendering of true accounts of the average amount of such notes in circulation, as directed by this Act, or to test the truth of any such account, shall be open for the inspection and examination, at all reasonable times, of any officer of stamp duties authorised in that behalf by writing, signed by the commissioners of stamps and taxes or any two of them; and every such officer shall be at liberty to take copies of or extracts from any such book or account as aforesaid: and if any banker or other person keeping any such book, or having the custody or possession thereof, or power to produce the same, shall, upon demand made by any such officer, showing (if required) his authority in that behalf, refuse to produce any such book to such officer for his inspection and examination, or to permit him to

inspect and examine the same, or to take copies thereof or extracts therefrom, or of or from any such account, minute or memorandum as aforesaid, kept, contained, or entered therein, every such banker or other person so offending shall for every such offence forfeit the sum of 100*l.*: provided always, that the said commissioners shall not exercise the powers aforesaid without the consent of the Lords of the Treasury. (Sec. 20.)

*Stamp Office.*—Every banker in England and Wales who is now carrying on or shall hereafter carry on business as such, shall, on the 1st day of January in each year, or within 15 days thereafter, make a return to the commissioners of stamps and taxes at their head office in London of his name, residence, and occupation, or, in the case of a company or partnership, of the name, residence, and occupation of every person composing or being a member of such company or partnership, and also the name of the firm under which such banker, company, or partnership carry on the business of banking, and of every place where such business is carried on; and if any such banker, company, or partnership shall omit or refuse to make such return within 15 days after the said 1st day of January, or shall wilfully make other than a true return of the persons as herein required, every banker, company, or partnership so offending shall forfeit and pay the sum of 50*l.*; and the said commissioners of stamps and taxes shall, on or before the 1st day of March in every year, publish in some newspaper circulating within each town or county respectively, a copy of the return so made by every banker, company, or partnership carrying on the business of bankers within such town or county respectively, as the case may be. (Sec. 21.)

*Bankers to take out a separate License for every Place at which they issue Notes or Bills.*—Every banker who shall be liable by law to take out a license from the commissioners of stamps and taxes to authorise the issuing of notes or bills, shall take out a separate and distinct license for every town or place at which he shall, by himself or his agent, issue any notes or bills requiring such license to authorise the issuing thereof, anything in any former Act contained to the contrary thereof notwithstanding: provided always, that no banker who on or before the 6th day of May, 1844, had taken out four such licenses, which on the said last-mentioned day were respectively in force, for the issuing of any such notes or bills at more than four separate towns or places, shall at any time hereafter be required to take out or to have in force at one and the same time more than four such licenses to authorise the issuing of such notes or bills at all or any of the same towns or places specified in such licenses in force on the said 6th day of May, 1844, in which towns or places respectively, such bankers had, on or before the said last-mentioned day, issued such notes or bills in pursuance of such licenses or any of them respectively. (Sec. 22.)

*Compensation to certain Bankers named in the Schedule.*—Whereas the several bankers named in the schedule hereto annexed marked (C) have ceased to issue their own bank notes under certain agreements with the governor and company of the Bank of England; and it is expedient that such agreements should cease and determine on the 31st day of December next, and that such bankers should receive by way of compensation such composition as hereafter mentioned; and a list of such bankers, and a statement of the maximum sums in respect of which each such banker is to receive compensation, hath been delivered to the

commissioners of stamps and taxes, signed by the chief cashier of the Bank of England: be it therefore enacted, that the several agreements subsisting between the said governor and company and the several bankers mentioned in the schedule hereto relating to the issue of Bank of England notes shall cease and determine on the 31st day of December next; and from and after that day the said governor and company shall pay and allow to the several bankers named in the schedule hereto marked (C), so long as such banker shall be willing to receive the same, a composition at and after the rate of 1*l.* per cent. per annum on the average amount of the Bank of England notes issued by such bankers respectively and actually remaining in circulation, to be ascertained as follows: (that is to say) on some day in the month of April, 1845, to be determined by the said governor and company, an account shall be taken of the Bank of England notes delivered to such bankers respectively by the said governor and company within three months next preceding, and of such of the said Bank of England notes as shall have been returned to the Bank of England, and the balance shall be deemed to be the amount of the Bank of England notes issued by such bankers respectively and kept in circulation; and three calendar months; and the average of the balances ascertained on taking four such accounts of England notes issued by such bankers respectively and kept in circulation during the year 1845, and on which amount such bankers are respectively to receive the aforesaid composition of 1 per cent. for the year 1845; and similar accounts shall be taken in each succeeding year; but in each year such accounts shall be taken in different months from those in which the accounts of the last preceding year were taken, and on different days of the month, such months and days to be determined by the said governor and company; and the amount of the composition payable as aforesaid shall be paid by the said governor and company out of their own funds; and in case any difference shall arise between any of such bankers and the governor and company of the Bank of England in respect of the composition payable as aforesaid, the same shall be determined by the Chancellor of the Exchequer for the time being, or by some person to be named by him, and the decision of the Chancellor of the Exchequer, or his nominee, shall be final and conclusive: provided always, that it shall be lawful for any banker named in the schedule hereto of such composition as aforesaid, but no such banker shall by such discontinuance as aforesaid thereby acquire any right or title to issue bank notes. (Sec. 23.)

*Bank of England to be allowed to compound with Issuing Banks.*—It shall be lawful for the said governor and company to agree with every banker who under the provisions of this Act shall be entitled to issue bank notes, to allow to such banker a composition at the rate of 1 per cent. per annum on the amount of Bank of England notes which shall be issued and kept in circulation by such banker, as a consideration for his relinquishment of the privilege of issuing his own bank notes; and all the provisions herein contained for ascertaining and determining the amount of composition payable to the several bankers named in the schedule hereto marked (C) shall apply to all such other bankers with whom the said governor and company are hereby authorised to agree as aforesaid: provided that the amount of composi-

tion payable to such bankers as last aforesaid shall in every case in which an increase of securities in the issue department shall have been authorised by any order in council be deducted out of the amount payable by the said governor and company to the public under the provisions herein contained: provided always, that the total sum payable to any banker under the provisions herein contained by way of composition as aforesaid, in any one year, shall not exceed, in case of the bankers mentioned in the schedule hereto marked (C), 1 per cent, on the several sums set against the names of such bankers respectively in the list and statement delivered to the commissioners of stamps as aforesaid, and in the case of other bankers shall not exceed 1 per cent, on the amount of bank notes which such bankers respectively would otherwise be entitled to issue under the provisions herein contained, (Sec. 24.)

*Compositions to cease on 1st August, 1856.*—All the compositions payable to the several bankers mentioned in the schedule hereto marked (C), and such other bankers as shall agree with the said governor and company to discontinue the issue of their own bank notes as aforesaid, shall, if not previously determined by the act of such banker as herein-before provided, cease and determine on the 1st day of August, 1856, or on any earlier day on which Parliament may prohibit the issue of bank notes. (Sec. 25.)

*Banks within Sixty-five miles of London may accept, &c. Bills.*—From and after the passing of this Act it shall be lawful for any society or company or any persons in partnership, though exceeding six in number, carrying on the business of banking in London, or within 65 miles thereof, to draw, accept, or endorse bills of exchange, not being payable to bearer on demand, anything in the herein-before recited Act passed in the fourth year of the reign of his said Majesty King William IV., or in any other Act, to the contrary notwithstanding. (Sec. 26.)

*Bank to enjoy Privileges, subject to Redemption.*—The said governor and company of the Bank of England shall have and enjoy such exclusive privilege of banking as is given by this Act, upon such terms and conditions, and subject to the termination thereof at such time and in such manner as is by this Act provided and specified; and all and every the powers and authorities, franchises, privileges, and advantages given or recognised by the said recited Act, 3 & 4 Wm. IV. c. 98, as belonging to or enjoyed by the said governor and company of the Bank of England, or by any subsequent Act or Acts of Parliament, shall be and the same are hereby declared to be in full force, and continued by this Act, except so far as the same are altered by this Act; subject, nevertheless, to redemption upon the terms and conditions following: viz. at any time upon 12 months' notice to be given after the 1st day of August, 1855, and upon repayment by Parliament to the said governor and company or their successors of the sum of 11,015,100*l.*, being the debt now due from the public to the said governor and company, without any deduction, discount, or abatement whatsoever, and upon payment to the said governor and company and their successors of all arrears of the sum of 100,000*l.* per annum, in the last-mentioned Act mentioned, together with the interest or annuities payable upon the said debt or in respect thereof, and also upon repayment of all the principal and interest which shall be owing unto the said governor and company and their successors upon all such tallies, exchequer orders,

exchequer bills, or parliamentary funds which the said governor and company or their successors shall have remaining in their hands or be entitled to at the time of such notice to be given as last aforesaid, then and in such case, and not till then, the said exclusive privileges of banking granted by this Act shall cease and determine at the expiration of such notice of 12 months: and any vote or resolution of the House of Commons, signified under the hand of the Speaker of the said House in writing, and delivered at the public office of the said governor and company, shall be deemed and adjudged to be a sufficient notice. (Sec. 27.)

*Return of the Bank Notes issued from April 11, 1860, to February 7, 1866, on the first Wednesday of each month: distinguishing Notes held by the Public, and the Bank, and the Securities on which the Issue was paid.*

**SEC. V.—MANAGEMENT OF THE BANK OF ENGLAND.**

Since 1826 the Bank has established branches in some of the great commercial towns, the mode and terms of conducting business at which have been described as follows:—

The branch bank at Swansea (and the same is true of those established in other places) is to be a secure place of deposit for persons having occasion to make use of a bank for that purpose; such persons are said to have *drawing accounts*: to facilitate to the mercantile and trading classes the obtaining discounts of good and unexceptionable bills, founded upon real transactions, two approved names being required upon every bill or note discounted; these are called *discount accounts*. The applications of parties who desire to open discount accounts at the branch are forwarded to the parent establishment for approval, and an answer is generally received in about ten days. When approved, good bills may be discounted at the branch without reference to London. Bills payable at Swansea, London, or any other place where a branch is established, are discounted under this regulation. The dividends on any of the public funds, which are payable at the Bank of England, may be received at the branch by persons who have opened "drawing accounts," after signing powers of attorney for that purpose, which the branch will procure from London. No charge is made in this case, except the expense of the power of attorney and the postages incurred in transmitting

it. Purchases and sales of every description of Government securities are effected by the branch at a charge corresponding to that made by the local bankers where the branch is situated. A commission, including brokerage in London, and all expenses of postage, is charged on paying at the Bank of England bills accepted by persons having drawing accounts at Swansea, such bills to be advised by the branch; also for granting letters of credit on London, or on the other branches. The branch grants bills on London, payable at seven days' date, without acceptance, for sums of 10*l.* and upwards. Persons having drawing accounts at Swansea may order money to be paid at the bank in London to their credit at Swansea, and *vice versa*, at a charge of 6*d.* in lieu of postage. The branch may be called upon to change any notes issued and dated at Swansea; but they do not change the notes of the bank in London, nor receive them in payment, unless as a matter of courtesy where the parties are known. Bank post bills, which are accepted and due, are received at the branch from parties having drawing accounts, and taken to account without any charge for postage; but unaccepted bank post bills, which must be sent to London, are subject to the charge of postage, and taken to account when due. No interest is allowed on deposits. No advance is made by the branch upon any description of landed or other property, nor is any account allowed to be overdrawn. The notes are the same as those issued by the parent establishment, except being dated Swansea, and made payable there and in London. No note issued exceeds the sum of 500*l.*, and none are for a less amount than 5*l.*

But though it might have been advisable to establish offices in Manchester, Birmingham, and one or two more great towns, for the interchange of bank-notes and gold, we much doubt whether the establishment of the branch banks has been advantageous. Speaking generally, it may be laid down that local affairs are best conducted by local agencies; and this is believed to be especially the case in banking. It is a business which is most likely to flourish when those by whom banks are established in country districts belong to those districts, and are well acquainted with the character and pursuits of those with whom they deal.

**Bank of England in connection with Government.**—The Bank of England transacts the whole business of Government. "She acts not only," says Adam Smith, "as an ordinary bank, but as a great engine of state. She receives and pays the greater part of the annuities which are due to the creditors of the public; she circulates Exchequer bills; and she advances to the Government the annual amount of the land and malt taxes, which are frequently not paid till some years thereafter."

**Assistance rendered by Bank to the Mercantile Interest.**—The greater part of the paper of the Bank has generally been issued in the way of advances or loans to Government, upon security of certain branches of the revenue, and in the purchase of Exchequer bills and bullion; but her issue through the medium of discounts and advances to individuals has also been at all times considerable, while during war, and in periods of distress, it is occasionally very great. Generally, however, the directors do not appear to have thought it advisable to enter into any very keen competition with private bankers in the discounting of mercantile paper. And hence it is that the rate of interest charged by the Bank for loans being usually equal to, and sometimes rather above, the market rate, comparatively few

applications are made to her, in ordinary periods, for discounts. But, at the same time, every one who has any reasonable security to offer, knows where they may always be had; while the rate of interest charged by the Bank necessarily forms a *maximum* rate which no other establishment can exceed. When, however, any circumstances occur to occasion a pressure in the money market, or a difficulty of obtaining accommodation in the usual channels, the market rate of interest generally rises to the rate fixed by the Bank, how high soever that may be, and on such occasions the private bankers, and the public generally, resort to the Bank for aid. She then becomes, as it were, a *bank of support*; and has, as such, on various occasions, rendered good service to public credit, and to the commercial interests of the country.

But, at the same time, it must be admitted that the interference of the Bank in assisting the commercial interest is a matter that requires the greatest consideration, and that it can only be safely undertaken in rare instances and under very peculiar circumstances. We repeat again, that however a drain for gold may originate, the fact of its existence shows conclusively that gold is more valuable abroad than here, and consequently that the currency is redundant and ought to be diminished. Under such circumstances, it is the imperative duty of the directors, if they would prevent the total exhaustion of their banking reserve, not to fill up the vacuum caused by the exchange of notes for bullion, by the issue of fresh notes. It is at such periods, no doubt, that the applications for assistance are the most urgent; but it is impossible to yield to them, and at the same time to enforce that systematical and continuous reduction of the issues which is indispensable for the safety of the banking department of the Bank. She can no longer assist herself, as on former occasions, by making fresh issues of paper. And in truth that resource was of no real advantage to her, but the reverse. It tempted her to disregard those great principles and warnings which never can be neglected with impunity. The great commercial crises that took place in 1793, in 1815-16, in 1825, and in 1836-39, were all increased in violence and destructiveness by the Bank declining to narrow her issues immediately on the exchange becoming unfavourable, and deferring her repressive action till too late a period.

*Methods by which the Bank may reduce her Issues.*—When the Bank sets about reducing her issues, she may effect her object in various ways, viz., by rejecting a portion of the bills sent to her for discount, by raising the rate of interest at which she discounts or makes advances, by shortening the dates or *échéance* of the bills which she negotiates, and by selling bullion and securities. Of these means, some may be more or less expedient at one time, and some at another. On the whole, however, the first mode, or the rejection of bills, seems to be, in all respects, the most objectionable. The Bank will not, of course, discount any bill in regard to the payment of which there can be any reasonable doubt. And when the solidity of the bills offered for discount cannot be objected to, it becomes an invidious, if not an unjust proceeding, to discount some and reject others. Under such circumstances, the true plan is to raise the rate of interest, for while such rise operates equally and universally, it makes rich parties, or those who can avail themselves of other means of accommodation, withhold their demands, and thus effect its object in the fairest and easiest way, and without sacrificing individuals.

Inasmuch, however, as any sudden rise in the

rate of discount, especially if it be considerable, is always productive of more or less inconvenience to the mercantile world, it may be proper, when the exchange becomes unfavourable, to endeavour to restore it to par by shortening the dates of bills, and, if circumstances will permit, by selling bullion and securities. But, at all events, the redundancy of the currency must be got rid of, and the exchange redressed; and if the other means at the disposal of the Bank be inadequate to effect this object, a rise in the rate of interest should be at once resorted to, and carried to the necessary extent.

It may be observed, with respect to the sale of securities, that they may be wholly or partly paid by drafts against deposits held by the Bank. But, if so, it is clear that, at all events, her debts, or the obligation under which she lies to pay notes or gold to depositors when demanded, will be in so far reduced.

The fact that the applications for discount at the Bank are usually most numerous when the rate of discount is highest, has caused some doubts to be entertained in regard to the efficacy of a rise in that rate to raise the value of the currency, and restore an unfavourable exchange to par.

But the additional demand for discounts, on the occasions referred to, is most commonly a consequence of the increased difficulty of obtaining them in other quarters; and when the rate of discount becomes unusually high, apprehensions of a revulsion begin to be entertained, and bankers and others carry bills to the Bank, not that they may get gold to send abroad, but that they may provide for their own security, by getting a supply of notes or gold, or both, to keep in reserve. And it is further to be observed, that the rise in the rate of interest, whether it be, as it usually is, the result of capital becoming scarcer or more productive, or of a temporary increase in the demand for money, uniformly operates to hinder the exportation of the latter. That such is the case is evinced by what took place in 1825, and in 1836-37. And on a more recent occasion, notwithstanding the large sums lent by the Bank on bills and advances of one sort or other, the 10 per cent. rate of interest charged by her was sufficient to stop the efflux of bullion to the Continent and the United States; and, but for the abuse of credit by some private establishments, the restoration of the exchange to par would have been effected without any internal revulsion.

*Mischievous Effects of discounting Bills at long Dates.*—The Bank of England rarely discounts bills that have more than two, or at most three, months to run, and it were well were this rule generally observed by other establishments. The discounting of bills at long dates is a powerful stimulus to unsafe speculations. When individuals obtain loans which they are not to be called upon to pay for six, twelve, or, perhaps, eighteen months, they are tempted to adventure in speculations which are not expected to be wound up till some proportionally distant period; and as these not unfrequently fail, the consequence is that, when the bills become due, there is commonly little or no provision made for their payment. In such cases the discounters, to avert an imminent loss, sometimes consent to renew the bills. But, while a proceeding of this sort is rarely productive of ultimate advantage to either party, the fact of its having taken place makes other adventurers reckon that in the event of their speculations proving to be less successful than they anticipated, their bills will be treated in the same manner, and thus aggravates and extends the evil.

In other respects, too, the discount of bills at long dates, or their renewal, or the making of permanent loans, is altogether inconsistent with sound banking principles, for it prevents the bankers from having that command over their resources which is advantageous at all times, and indispensable in periods of difficulty or distress.

*Distinction between real and accommodation Bills.*—In the discounting of bills, a great deal of stress is usually laid, or pretended to be laid, on the distinction between those that arise out of real transactions and those that are fictitious, or that are intended for accommodation purposes. The former are said to be legitimate, while the latter are stigmatised as illegitimate. But Mr. Thornton (*On the Paper Credit of Great Britain*, ch. ii.) has shown that the difference between these two classes of bills is neither so well marked nor so wide as most persons suppose. A notion seems to be generally entertained that all real bills are drawn against produce of one sort or other, which, or its value, is supposed to form a fund for their payment. Such, however, is not always, nor even most commonly, the case. A, for example, sells to B certain produce, for which he draws a bill at sixty days' date. But prices are rising, trade is brisk, or a spirit of speculation is afloat, and in a week or two (sometimes much less) B sells the produce at an advance to C, who thereafter sells it to D, and so on. Hence it may, and in fact frequently does, happen, that bills amounting to four, five, or even ten times the value of a quantity of merchandise, have grown out of its successive sales, before the first bill of the series has become due. And not only this, but bills are themselves very frequently rediscounted; and in this case the credit of the last indorser is generally the only thing looked to; and there is not, perhaps, one case in ten in which any enquiries are made in regard to the origin and history of the bills, though they are often of the most questionable description.

On the whole, therefore, it would seem that the real or presumed solidity of the parties signing a bill, and responsible for its payment, is the only safe criterion by which to judge whether it should or should not be discounted. But the fact of a merchant or other trader offering accommodation bills for discount ought unquestionably to excite a suspicion that he is trading beyond his capital. Enquiries of the most searching description should forthwith be instituted; and unless satisfactory explanations are given, his paper should be rejected. On the same principle, the offering of bills for rediscount ought to awaken suspicions of the bankers and others who resort to so questionable a mode of carrying on business. But, except in so far as a feeling of distrust may be thus very properly excited, there does not appear to be anything in an accommodation bill *per se* to hinder it from coming within the pale of negotiability. It is a mode of obtaining a loan from a bank; and when the character of the bill is known to the banker, or is openly declared, it does not appear to be an objectionable mode.

Besides bills avowedly intended for accommodation purposes, another and a different variety of such bills is drawn by parties at a distance from each other, often men of straw, and made to appear as if they were bottomed on real transactions. And we are sorry to say, that bills of this sort are always current, and often to a large extent. Of course no person of respectability can be knowingly connected with such bills, which are almost always put in motion either to bolster

up some bankrupt concern, or to cheat and defraud the public. But despite the mischief of which they are productive, it appears to be pretty generally supposed that the currency of these bills is an evil which cannot be prevented. There can, however, be no real doubt that it may, at all events, be very greatly diminished; and this desirable result would be effected were it enacted that all bills should henceforth bear upon their face what they really are—that those that are intended for accommodation purposes shall have at their head the words *Accommodation Bill*; and that those only shall bear to be for 'value received' that have grown out of bona fide transfers of property. An enactment of this sort could not be felt as a grievance by any one unless he had a fraudulent purpose in view. And were the impressing of a false character on a bill made a criminal offence punishable by three years' imprisonment, or some such penalty, there is every probability that a formidable check would be given to the issue of spurious bills, and to the manifold abuses to which the practice gives rise.

Bill-discounters who have got fictitious paper on their hands, and attempt, as has been done, to get rid of it by concealing its character, or representing it in a favourable light, make themselves parties to the fraud. Such conduct is so very flagitious, that when it can be fairly brought home to the parties, it should subject them to the severest penalties.

*Rates of Discount charged by Bank.*—The rates of discount charged by the Bank fluctuate with the variations in the demand for money, and in the rate of interest. The rates of discount since 1856 have been as follow:—

Rates of Discount.

*Bank does not allow Interest on Deposits.*—The Bank of England does not allow, either at the head office in London or at her branches, any interest on deposits; and in doing so she acts wisely. Notwithstanding the non-payment of interest, she has often very large amounts of deposits on her hands, and were she to pay interest, the probability is that they would be very greatly increased, and might, in periods of difficulty, seriously compromise her safety. At present the Bank may either retain deposits or invest them in those securities from which they may be most easily withdrawn. But if she allowed interest, the case would be different, and she would be obliged to look quite as much or more to the profits to be made by investments as to the facility of repossessing herself of funds. We beg, in corroboration of what has now been stated, to draw the reader's attention to the following extract from the evidence of Mr. Weggleson, late Governor of the Bank, before the Committee of 1857:—

'We,' said he, 'at the Bank of England, have always considered that the proper functions of a banker were to keep the spare cash of his customer, such cash as his customer required for his daily expenditure, for the sudden demands of his business, and any accidental accumulation which might happen before the customer had occasion to invest it. That is contrasted with the system pursued by the joint-stock banks. The joint-stock bank invites a large deposit by offering a certain rate of interest for the deposit; in point of fact, the joint-stock bank becomes the investor of the money instead of the customer. The customer of a joint-stock bank does not himself invest his own money, but he employs the joint-stock bank to do it, taking the guarantee of the joint-stock bank, and taking, possibly, a lower rate of interest. Now that system, if applied to the Bank of England, would be, I think, very prejudicial to the public interests. It would, in the first place, force upon the Bank of England to invest its reserves much more closely than it does now. If it had to pay interest upon its deposits, it could only do so by investing them in some securities that would pay a higher rate of interest than that which it pays. Its deposits are also of that particular character which would render it still more inexpedient that they should be closely invested. They consist, in the first place, of Government deposits, which rise from a low rate at one period of a quarter up to 5,000,000*l.* or 6,000,000*l.* higher at another period of a quarter, and again collapse to a very low rate at another period. Again, the private deposits consist, to a certain extent, of the deposits of the bankers and the joint-stock banks of London. Those deposits are the amounts which those bankers require to work their own business. Consequently, they are not deposits which should be very closely invested by the Bank of England. In times when there is a great accumulation of deposits in the Bank of England, it is because the public are not able at those times to find investments to their mind to employ those deposits; and, consequently, it is not at all likely that the Bank of England, if that is the case with the public generally, will be able to find investments which the public themselves have not been able to do. All these reasons combined would lead me to think that to force a system upon the Bank of England by which it should be obliged to employ its deposits very closely—much more closely than it does at present—would be not only prejudicial and unsafe as regards the Bank of

England, but would be prejudicial to the public interest.' (Q. 159.)

The truth is, that the whole subject of deposits is beset with difficulties. The extent to which it has been already carried has deeply endangered the stability of the banking system, and we have seen that it is indispensable it should be subjected to regulation.

Previously to 1786 the Bank received an allowance for trouble in paying the dividends, superintending the transfer of the stock &c. of the national debt of 562*l.* 10*s.* a million on its amount. In 1786 this allowance was reduced to 450*l.* a million, the Bank being, at the same time, entitled to a considerable allowance for her trouble in receiving contributions on loans, lotteries &c. This, though long regarded as a very improvident arrangement on the part of the public, was acquiesced in till 1808, when the allowance on account of management was reduced to 340*l.* per million on 600,000,000*l.* of the public debt, and to 300*l.* per million on all that it exceeded that sum, exclusive of some separate allowances for annuities &c. The impression, however, was still entertained that the allowances for management should be further reduced, and this has been effected in the interim.

Exclusive of her functions as public banker, and manager of the public debt, the Bank of England is connected with Government through the circulation. We have seen that she is entitled to issue upwards of 14,000,000*l.* upon securities, that is, on the credit of the funds she has lent to Government. But for these she receives about 3 per cent. interest, and such being the case, the public is clearly entitled to a portion, if not to the whole amount, of the profits realised by the Bank on the issue of these 14,000,000*l.* It is difficult to say how much this may amount to. The issue department of the Bank seldom reissues notes, but for the most part destroys them as soon as they are returned to it. This practice is said to be necessary to enable the Bank to obviate fraud, by keeping a proper account of the numbers of the notes aloft. An opinion is, however, pretty generally entertained that this might be effected by a less expensive process than that which is now resorted to. And, certainly, it seems to be a very wasteful proceeding, that a quantity of newly manufactured notes issued by the Bank in the forenoon, and returned to her in the afternoon, should not be reissued, but consigned to the flames. The Scotch banks are justly censurable for keeping their notes too long aloft, but this is running with a vengeance into the opposite extreme.

But, as it is, the cost of maintaining an issue of 14,000,000*l.* is estimated by the Bank at about 113,000*l.* a year; and taking the gross profits of the issue at 3 per cent., or 420,000*l.*, the nett profits may be estimated at 307,000*l.* a year; and of this sum the Bank pays to Government 180,000*l.*, viz. 60,000*l.* in lieu of the old charge for stamp duty, abolished in 1814, and a further sum of 120,000*l.*, leaving the Bank 127,000*l.* for her share of the profits. And so long as the cost of the issues remains at about its present amount, we do not know that there is much to object to in this arrangement. Probably, however, were the allowance to Government further increased by some 50,000*l.* or 60,000*l.*, the Bank might find means, without injury to the public, of reissuing her notes, or of otherwise reducing the cost of their circulation. During the year ended March 31, 1856, the payments made to the Bank for managing the national debt and annuities amounted to 95,870*l.*

It should be observed that the responsibility and expense incurred by the Bank, in managing the public debt, are very great. The temptation to the commission of fraud, in transferring stock from one individual to another, and in the payment of the dividends, is well known; and notwithstanding the skillfully devised system of checks adopted by the Bank for its prevention, she has frequently sustained very great losses by forgery and otherwise. In 1803 the Bank lost, through a fraud committed by one of her principal cashiers, Mr. Aslett, no less than 310,000*l.*; and the forgeries of Fauntleroy, the banker, cost her a still larger sum! At an average of the ten years ending with 1831, the Bank lost, through forgeries on the public funds, 40,204*l.* a-year. (*Report on Bank Charter*, App. p. 165.)

Besides the transactions alluded to, the Bank entered, on March 20, 1823, into an engagement with Government with respect to the public pensions and annuities, or, as they have been more commonly termed, the *dead weight*. At the end of the war, the naval and military pensions, superannuated allowances &c. amounted to above 5,000,000*l.* a-year. They would, of course, have been gradually lessened, and ultimately extinguished, by the death of the parties. But it was resolved in 1822 to attempt to spread the burden equally over the whole period of *forty-five* years, during which it was calculated the annuities would continue to decrease. To effect this purpose, it was supposed that, upon Government offering to pay 2,800,000*l.* a-year for forty-five years, capitalists would be found who would undertake to pay the entire annuities, according to a graduated scale previously determined upon, making the first year a payment of 1,900,000*l.*, and gradually decreasing the payments until the forty-fifth and last year, when they were to amount to only 300,000*l.* This supposition was not, however, realised. No capitalists were found willing to enter into such distant engagements. But in 1823 the Bank agreed, on condition of receiving an annuity of 685,740*l.* for *forty-four* years, commencing on April 5, 1823, to pay, on account of the pensions &c. at different specified periods, between the years 1823 and 1828, both inclusive, the sum of 13,989,419*l.* (*A Geo. IV. c. 22.*)

Formerly the business transacted at the Bank was so much encumbered with forms and conditions, that the generality of merchants and ordinary people rarely thought of employing her to keep their money or make their payments. But in this respect an entire change has been effected. Cheques, the minimum amount of which was formerly 10*l.*, may now be drawn of any amount, great or small; and all sorts of banking business is conducted with facility and despatch, and, we may add, with perfect security.

The Bank opens banking accounts, or, as they are called, 'drawing accounts,' for the safe custody, and the receipt and payment of cash, not only with merchants and traders, but with all persons who choose to keep their money at a banker's and to draw cheques against it. The Bank also takes charge of their customers' bills of exchange, exchequer bills, and other securities, and does all that is needful either in the collection of bills of exchange, the exchange of exchequer bills, or the receipt of dividends, and so forth, free of any charge. Plate-chests, and deed and security boxes, may be deposited, free of expense, by customers, for safe custody. The Bank looks to the average balance of cash on each account to compensate for the trouble and expense of keeping it, and in this respect the requirements

of the Bank are certainly not greater than those of ordinary bankers. No particular sum is required to be lodged on opening an account; it is only necessary that the party should be known as respectable, and in a condition to require a banking account. A commission is now (1868) charged if the account be not considered remunerative. But the Bank receives and holds sums of money for safe custody for parties who have no current accounts.

The following are the regulations under which accounts are conducted:—1. All letters should be addressed to the chief cashier.

2. It is desirable that drafts should be drawn upon cheques furnished by the Bank.

3. Cheques upon City bankers, eastward of King Street, Cheapside,

paid in by 12 o'clock may be drawn for after 1.

Do, " 2 o'clock " " after 3.

4. Cheques paid in after 2, and before 3 o'clock, and cheques upon all other London bankers paid in before 12 o'clock, may be drawn for on the following morning.

5. Cheques paid in after 3 o'clock are sent out at 9 the following morning, and may be drawn for as soon as received.

6. Cheques on country bankers paid in before 11 o'clock (on Saturdays 10 o'clock) will be collected through the country clearing, and go to account 2 days after date of paying in.

7. Dividend warrants are received at the drawing office until 4 o'clock in the afternoon for all persons having accounts at the Bank.

8. It is requested that notice be given at the drawing office of bills accepted payable at the Bank, with the date of their maturity.

9. Persons keeping a drawing account with the Bank (although not having a discount account) may tender bills for discount through the drawing office. Application for discounts, or for advances on stock, &c., must be made before 2 o'clock.

10. Bills of exchange and notes not paid when due will be noted.

11. The Bank will make purchases or sales of British or foreign securities upon an order in writing addressed to the chief cashier; and dividends on stock may be received under powers of attorney granted to the cashiers of the Bank.

12. Exchequer bills, bonds, railway debentures &c. may be deposited, and the interest, when payable, will be received and placed to account.

13. Credits paid in to account are received without the Bank book, and are afterwards entered therein without the party claiming them.

14. Notes of country bankers, payable in London, are sent out the same day for payment if paid in before 3 o'clock.

15. The pass-books should be left at the drawing office, at least once a month, to be written up.

16. Where post-bills are required, or a payment is to be made to any office of the Bank by cheque on the Bank of England, the cheque must be presented to the office on which it is drawn, and exchanged for an order on the post-bill office, or on the office where the payment is to be made.

17. Cash-boxes taken in, contents unknown, for such parties as keep accounts at the Bank.

18. A person having a drawing account may have a discount account; but no person can have the latter without having also the former. When a discount account is opened, the signatures of the parties are entered in a book, and powers of attorney are granted empowering the persons named in them to act for their principals. Bills of exchange having more than 95 days to run are not eligible for discount.

N.B.—All changes in the residence of persons keeping cash at the Bank are requested to be made

known at the drawing office; and it is particularly requested not to offer any gratuities to the clerks of the banking offices, such gratuities being strictly forbidden.

There are no general holidays at the Bank except Christmas and Good Friday, though May 1 and November 1 are held as such in the transfer offices.

We subjoin an account of the days for transferring stock, and when the dividends are due at the Bank:—

Transfer Days.—The transfer days are now Tuesdays, Wednesdays, Thursdays, and Fridays. Dividends are due at the following dates after an interval of three days, or if a Sunday intervenes, of four days.

At the Bank.

Table listing Bank Stock, 5 per Cent. Cons., 5 per Cent. 1726, 5 per Cent. Reduce, New 5 per Cent. Annuit., New 4 per Cent. Annuit., East India Stock, East India Bond, 5 per Cent. 1751, New 4 1/2 per Cent. Cons.

Tickets for preparing transfer of stock must be given in at each office before one o'clock. Private transfers may be made at other times than as above, by paying 2s. 6d. extra for each transfer; but no transfer can be made after one o'clock on Saturdays.

Transfer at the Bank must be made by half-past two o'clock.

Expense of Transfer.

Bank Stock, not exceeding 25l. z. above that sum, 12s. India Stock, 1l. 10s. z. non-transfer days, 2s. 6d. extra. Transfers in Consols and other Government Stocks are exempt from duty.

Powers of attorney for the sale or transfer of stock to be left at the Bank &c. for examination one day before they can be acted upon; if for receiving dividends, they may be left at any time.

The expense of a power of attorney varies from 1s. to 1l. 10s. If wanted for the same day, half-past twelve o'clock is the latest time for receiving

orders. The boxes for receiving powers of attorney for sale close at two.

Probates of wills, letters of administration, and other proofs of decease, must be left at the Bank &c. for registration, from two to three clear days, exclusive of holidays.

Stock cannot be added to any account (whether single or joint) in which the decease of the individual, or one or more of a joint party, has taken place; and the decease to be proved as soon as practicable. Powers of attorney, in case of the death of the party or parties granting them, become void.

The unaltered possession of 500l. or upwards Bank stock, for six months clear, gives the proprietor a vote.

SEC. VI.—CIRCULATION OF THE BANK OF ENGLAND, AND OF THE ENGLISH PROVINCIAL BANKS.

SEC. VII.—BANKS (SCOTLAND).

The Act of 1763, preventing more than six individuals from entering into a partnership for carrying on the business of banking, did not extend to Scotland. In consequence of this exemption, several banking companies, with numerous bodies of partners, have existed for a lengthened period, in that part of the empire.

**Bank of Scotland.**—The Bank of Scotland was projected by Mr. John Holland, merchant, of London, and was established by Act of the Scotch Parliament (Wm. III. Parl. 1, s. 5) in 1695, by the name of the Governor and Company of the Bank of Scotland. Its original capital was 1,200,000*l.* Scotch, or 100,000*l.* sterling, distributed in shares of 1,000*l.* Scotch, or 80*l.* sterling, each. The Act exempted the capital of the bank from all public burdens, and gave it the exclusive privilege of banking in Scotland for 21 years. The objects for which the bank was instituted, and its mode of management, were intended to be, and have been, in most respects, similar to those of the Bank of England. The responsibility of the shareholders is limited to the amount of their shares.

The capital of the bank was increased to 200,000*l.* in 1744, and was enlarged by subsequent Acts of Parliament, the last of which (44 Geo. III. c. 23)

was passed in 1801, to 1,500,000*l.*, its present amount. Of this sum, 1,000,000*l.* has been paid up. The last mentioned Act directed that all sums relating to the affairs of the bank should henceforth be rated in sterling money; that the former mode of dividing bank stock by shares should be discontinued; and that, for the future, it should be transferable in sums or parcels of any amount. On the union of the two kingdoms in 1707, the Bank of Scotland undertook the re-coinage, and effected the exchange of the currency in Scotland. It was also the organ of Government in the issue of the new silver coinage in 1817.

The Bank of Scotland is the only Scotch bank constituted by Act of Parliament. It began to establish branches in 1696, and issued notes for one pound so early as 1701. The bank also began at a very early period to receive deposits on interest, and to grant credit on cash-accounts, a minute of the directors with respect to the mode of keeping the latter being dated so far back as 1729. It is, therefore, entitled to the credit of having introduced and set on foot the distinctive principles of the Scotch banking system, which, whatever may be its defects, is perhaps superior to most other systems hitherto established. Generally speaking, the Bank of Scotland has been cautiously and skillfully conducted; and there can be no doubt that it has been

productive, both directly and as an example to other banking establishments, of much public utility and advantage.

It may be worth mentioning, that the Act of Wm. III., establishing the Bank of Scotland, declared that all foreigners who became partners in the bank should, by doing so, become to all intents and purposes naturalised Scotchmen. After being for a long time forgotten, this clause was taken advantage of in 1818, when several aliens acquired property in the bank in order to secure the benefit of naturalisation. But, after being suspended, the privilege was finally cancelled in 1822.

We subjoin an official abstract of the constitution and objects of the Bank of Scotland, printed for the use of the proprietors. The terms and mode of transacting business are, of course, sometimes altered, according to circumstances.

I. The Bank of Scotland is a public national establishment, erected and regulated by the legislature alone; and expressly as a public bank in this kingdom; for the benefit of the nation, and for the advancement of agriculture, commerce, and manufactures; and for other objects of public policy. (Wm. III. Parl. 1, s. 5; 14 Geo. III. c. 32; 24 Geo. III. c. 8; 32 Geo. III. c. 25; 34 Geo. III. c. 19; 44 Geo. III. c. 23.)

II. The statutory capital is at present 1,500,000L sterling. It is raised by voluntary subscription; and has been subscribed for, 1,000,000L, has been called for, and paid in. (41 Geo. III. c. 23.)

III. Subscribers, not under obligations to the bank, may, at pleasure, transfer their right. If under obligation to the bank, the obligation must be previously liquidated; or the proceeds of the sale, at a price to the satisfaction of the directors, must be applied towards such liquidation. Transfers are made by a short assignment and acceptance thereof, both in a register appointed for that purpose. The expense, beside the Government stamp, is 11s. (Wm. III. Parl. 1, s. 5.)

IV. Bank of Scotland stock may be acquired, in any portions, by any person, community, or other lawful party whatsoever; without selection, exclusion, or limitation of numbers. (Wm. III. Parl. 1, s. 5; 44 Geo. III. c. 23.)

V. Bank of Scotland stock may be conveyed by will, and if specially mentioned, without expense of confirmation. It cannot be arrested; the holder's right may be adjudged. Dividends may be arrested. (Wm. III. Parl. 1, s. 5.)

VI. The Bank of Scotland is a public corporation by Act of Parliament. The bank's transactions are distinct from those of the stockholders; and theirs from those of the bank. (Wm. III. Parl. 1, s. 5.)

VII. The establishment is expressly debarred from any other business than that of banking. (Wm. III. Parl. 1, s. 5.)

VIII. The management is vested, by statute, in a governor, deputy governor, twelve ordinary, and twelve extraordinary, directors. They are chosen annually, on the last Tuesday of March, by the stockholders having 250L of stock or upwards. Those above 250L have a vote for every 250L to 5,000L, or 20 votes. No person can have more than 20 votes. The governor must hold, at least, 2,000L of stock; the deputy governor 1,500L; and each director 750L. They swear to be equal to all persons; and cannot hold any inferior office in the bank. (Wm. III. Parl. 1, s. 5; 14 Geo. III. c. 32; 44 Geo. III. c. 23.)

IX. The executive part is conducted by a treasurer, secretary and other public officers, all sworn. Those having the official charge of cash find due security. (Wm. III. Parl. 1, s. 5.)

X. The board of directors sits for the general administration of the bank, at the bank's public

head office in Edinburgh. The local business of that district is also conducted at that office. For the local business in the other parts of the kingdom, the bank has its regular public offices in the principal towns. At each of these offices there is the bank agent or cashier, who gives due security, and conducts the bank's business for that district in the manner after mentioned. (Wm. III. Parl. 1, s. 5.)

XI. The bank takes in money at all its public offices, on deposit receipts or on current deposit accounts. At the head-office drafts on the branches, and at the branches drafts on the other branches and on the head-office are granted. Both at the head-office and branches drafts are granted on the London, Dublin, and English and Irish provincial correspondents of the bank. All receipts and drafts are on the bank's engraved forms, and bear to be granted 'for the Bank of Scotland,' or 'for the Governor and Company of the Bank of Scotland.' At the head-office official documents are signed by the treasurer, and at the branches by the agents, and all are countersigned.

Remittances can be made to the principal colonial and continental towns; and bills, payable in the colonies and in foreign countries, can be negotiated through the bank. (*Resolution of Court, 1793, as since modified.*)

N.B.—The bank has always allowed interest on deposits, at a rate varying according to circumstances.

XII. Bills on London, Edinburgh, or any town in the United Kingdom, are discounted at all the bank's public offices. The bank's agents judge, in ordinary cases, of the bills presented; so that parties meet with no delay. The bank does not re-issue the bills which it has discounted. (*Resolution of Court, Feb. 23, 1789, and subsequent Modifications.*)

XIII. Government stock and other public funds may be purchased or sold, and dividends thereon may be received, through the bank.

XIV. The bank gives credit on cash accounts at any of its offices, on bond, with security. The security may be personal co-obligants, or such other security as may be specially agreed on. Applications for cash accounts are given in to the office where the cash account is wanted, and must specify the credit desired, and the security proposed; and the individual partners, where co-partneries are proposed. Cash accounts are granted by the directors only; and are not recalled unless by their special authority. It is understood that these credits are not used as dead loans, to produce interest only. In the fair course of business, the advantage of the bank is consulted by an active circulation of its notes, and by frequent repayments to it in a way least affecting that circulation. (*Resolution of Court, Nov. 6, 1729, and Feb. 23, 1789.*)

XV. The bank's dividend has been for some time 8 per cent. per annum on its paid-up capital of 1,000,000L sterling. The dividends are paid regularly twice a year, without expense. They may be drawn either at the bank's head-office, or at any of its other offices, as most agreeable to the stock-holder.

The above may suffice as a general outline of the mode in which the business of banking is conducted in Scotland.

The *Royal Bank of Scotland* was established in 1727. Its original capital of 151,000L has been increased to 2,000,000L.

The *British Linen Company* was incorporated in 1746, for the purpose, as its name implies, of undertaking the manufacture of linen. But the views in which it originated were speedily abandoned; and it became a banking company only. Its capital amounts to 1,000,000L.

Cash Account the Scotch ba counts, or upo commonly ter A cash-credi by a banking c

None of the other banking companies established in Scotland are chartered associations with limited responsibility, the parties being liable, to the whole extent of their fortunes, for the debts of the firms. Some of them, such as the Edinburgh and Glasgow Bank, the National Bank, the Commercial Bank &c. have very numerous bodies of partners. Their affairs are uniformly conducted by a board of directors, annually chosen by the shareholders.

The Bank of Scotland began, as already stated, to issue 1*l.* notes so early as 1701; and their issue has since been continued without interruption. In Scotland, to use the statement given in the Report of the Committee of the House of Commons of 1826, on the Promissory Notes of Scotland and Ireland, 'the issue of promissory notes payable to the bearer on demand, for a sum of not less than

20*s.*, has been at all times permitted by law; nor has any Act been passed limiting the period for which such issue shall continue legal in that country.'

**Deposits.**—All the Scotch banks receive deposits of so low a value as 10*l.*, and sometimes lower, and allow interest upon them.

The interest allowed by the banks upon deposits varies from time to time, according to the variations in the current rate of interest. And it has been estimated, by the best authorities, that the aggregate amount of the sums deposited with the Scotch Banks is little, if anything, under 50,000,000*l.*

We borrow from Oliver and Boyd's excellent Almanac for 1868 the following table, exhibiting the capital and other particulars of the Banks of Issue in Scotland, with the price of their shares, as publicly quoted in the third week of December 1867:

Instituted	Name	Partners	Shr.	Paid up capital	Dividend		Share paid	Price
					Rate	Payable

\* The capital of the banks marked with an asterisk is not in shares, but in stock transferable to any amount.  
 † Ex dividend.  
 ‡ Dividend and loans.

A witness, connected for many years with different banks in Scotland, being examined by the Commons' Committee of 1826, stated that more than half the deposits in the banks with which he had been connected were in sums from 10*l.* to 200*l.* Being asked what class of the community it is that makes the small deposits, he gave the following answer; from which it appears that the mode of conducting this branch of the banking business in Scotland has long given to that country most part of the benefits derivable from the establishment of savings banks.

**Q.** What class of the community is it that makes the smallest deposits?

**Ans.** They are generally the labouring classes in towns like Glasgow; in country places like Perth and Aberdeen, it is from servants and fishermen, and that class of the community who save small sums from their earnings, till they come to be a bank deposit. There is now a facility for their placing money in the Provident Banks, which receive money till the deposit amounts to 10*l.* When it comes to 10*l.* it is equal to the minimum of a bank deposit. The system of banking in Scotland is an extension of the Provident Bank system. Half-yearly or yearly these depositors come to the bank, and add the savings of their labour, with the interest that has accrued upon the deposits from the previous half-year or year, to the principal; and in this way it goes on, without being at all reduced, accumulating (at compound interest) till the depositor is able either to buy or build a house, when it comes to be 100*l.*, or 200*l.*, or 300*l.*, or till he is able to commence business as a master in the line in which he has hitherto been a servant. A great part of the depositors of the bank are of that description, and a great part of the most thriving of our farmers and manufacturers have arisen from such beginnings.

**Cash Accounts.**—The loans or advances made by the Scotch banks are either in the shape of discounts, or upon cash-credits, or, as they are more commonly termed, *cash accounts*.

A *cash-credit* is a credit given to an individual by a banking company for a limited sum, seldom

under 100*l.* or 200*l.*, upon his own security, and that of two or three individuals approved by the bank, who become sureties for its payment. The individual who has obtained such a credit is enabled to draw the whole sum, or any part of it, when he pleases, replacing it, or portions of it, according as he finds it convenient; interest being charged upon such a part only as he draws out. If a man borrows 5,000*l.* from a private hand, besides that it is not always to be found when required, he pays interest for it whether he be using it or not. His bank credit costs him nothing, except during the moment it is of service to him, and this circumstance is of equal advantage as if he had borrowed money at a much lower rate of interest. (Hume's *Essay on the Balance of Trade*.) This, then, is plainly one of the most commodious forms in which advances can be made.

Cash-credits are not, however, intended to be a *dead loan*, though they not unfrequently become such; a main object of the banks in granting them is to get their notes circulated, and they do not grant them except to persons in business, or to those who are frequently drawing out and paying in money.

The system of cash-credits has been very well described in the Report of the Lords' Committee of 1826 on Scotch and Irish Banking. 'There is also,' say their lordships, 'one part of their system which is stated by all the witnesses (and, in the opinion of the committee, very justly stated) to have had the best effects upon the people of Scotland, and particularly upon the middling and poorer classes of society, in producing and encouraging habits of frugality and industry. The practice referred to is that of cash-credits. Any person who applies to a bank for a cash-credit is called upon to produce two or more competent sureties, who are jointly bound; and, after a full enquiry into the character of the applicant, the nature of his business, and the sufficiency of his securities, he is allowed to open a credit, and to draw upon the bank, for the whole of its amount, or for such part as his daily transactions may require. To the credit of the account he pays in such sums as he may not have occasion to use,

and interest is charged or credited upon the daily balance, as the case may be. From the facility which these cash-credits give to all the small transactions of the country, and from the opportunities which they afford to persons who begin business with little or no capital but their character, to employ profitably the minutest products of their industry, it cannot be doubted that the most important advantages are derived to the whole community. The advantage to the banks who give these cash-credits arises from the call which they continually produce for the issue of their paper, and from the opportunity which they afford for the profitable employment of part of their deposits. The banks are indeed so sensible that, in order to make this part of the business advantageous and secure, it is necessary that their cash-credits should (as they express it) be frequently operated upon, that they refuse to continue them unless this implied condition be fulfilled. The total amount of the cash-credits is stated by one witness to be 5,000,000*l.*, of which the average amount advanced by the banks may be one-third.

The expense of a bond for a cash-credit of 500*l.* is 12*s.* 6*d.* stamp duty, and a charge of from 5*s.* to 10*s.* 6*d.* per cent. for preparing it.

*Stability of the Scotch Banks.*—There have been, until lately, comparatively few failures among the Scotch banks. In 1793 and 1825, when so many of the English banks were swept off, there was not a single establishment in Scotland that gave way. This superior solidity appears to have been owing to various causes, partly to the banks having, for the most part, large bodies of partners, who, being conjointly and individually bound for the debts of the companies to which they belong, go far to render their ultimate security all but unquestionable; and partly to the facility afforded by the law of Scotland, of attaching a debtor's property, whether it consist of land or moveables, and making it available for the payment of his debts.

But, on the whole, we are inclined to think that the long familiarity of the inhabitants with banks and paper money, and the less risk that has attended the business of banking in Scotland, have been the principal causes of the greater stability of the Scotch banks. Latterly, however, owing to the rapid growth of Glasgow, Dundee, and other commercial towns, the risk attending banking in Scotland has materially increased. And while hazard has been augmenting on the one hand, there appears, on the other, to have been a still more rapid decrease of that cautious policy that was supposed to be a characteristic of Scotch bankers. In the crisis of 1857 two of the principal Scotch banks, the head-quarters of which were in Glasgow, were compelled to stop payments. They had very large capitals, the Western Bank 1,500,000*l.*, and the City of Glasgow Bank 1,000,000*l.*, with a great many branches, large amounts of deposits, and very numerous and wealthy proprietary bodies. Had their management displayed anything like ordinary skill and prudence, they might have gone triumphantly through a far more serious trial. But the management of the Western Bank was characterised by the most marvellous folly and recklessness; that of the City of Glasgow Bank, though in many respects blameworthy, has been, as compared with that of the Western Bank, prudent and skilful. It has recommenced business; and it is to be hoped that its managers will profit by the lesson they have received. Having advanced immense sums to a few firms that never were entitled to any considerable credit, the Western Bank was so crippled that, for a lengthened period before its stoppage, the directors were

reduced to the miserable expedient of sending up the bills they had discounted in Glasgow to be re-discounted in London; and when this resource failed them, and the other banks declined to come forward to their assistance, they had nothing for it but to shut their doors. On the stoppage taking place the affairs of the bank were found to be in a much worse state than any one could have anticipated. The losses are estimated at above 3,000,000*l.*, so that, besides the sacrifice of their paid-up capital of 1,500,000*l.*, the shareholders have had to advance a further sum of more than that amount to meet the demands upon them. No such gigantic failure ever occurred in Scotland. The holders of notes and deposit-receipts will be paid in full. But of the 1,200 or 1,300 individuals who held shares in the bank, a large proportion have been nearly, and many entirely, ruined. It is difficult, indeed, to imagine the distress and misery of which this catastrophe has been productive.

The ruin in which the bank has been involved did not come suddenly upon it. On the contrary, it was accumulating for years. And yet the directors took no steps, or none that were efficient, to arrest the progress of the evil; nor did they apprise their confiding constituents of the perilous condition into which the bank had got. Concealment was practised to the very last moment, till the concern was irretrievably sunk in the abyss of bankruptcy. It is much to be wished that directors who have so acted were really responsible for their conduct. No charge of corruption is brought against them; but their inattention to, and neglect of, the important interests committed to their charge, has been wholly inexcusable. They were bound, on undertaking the office of directors, to bestow unremitting care and diligence upon the performance of the duties which it imposed on them. They might neglect their own business; but they could not, without a flagrant breach of trust, neglect the duties they had undertaken to discharge on account of others. This, however, is precisely what they have done. They appear to have selected the most reckless and incompetent managers, and then to have given them *carte blanche*. Whatever such conduct may be in law, it is morally and politically in the highest degree culpable. Hundreds have been sent to the antipodes and the treadmill for offences that were comparatively innocuous. No doubt, the grand source of mismanagement in banks and other associations is to be found in the apathy of the shareholders, in the blind and often undeserved confidence they place in those who are, no matter how, at the head of their concerns. If those who may be ruined by the proceedings of their own officers and servants will not look after them, it were idle to attempt to throw such a duty upon others.

In a public point of view, the stoppage of the Glasgow banks was productive of the very worst results. By creating a panic, and occasioning a heavy internal demand for gold, it may indeed be said to have been the main cause of the suspension of the Act of 1844.

#### SEC. VIII.—BANKING IN IRELAND.

*Banking in Ireland.*—‘In no country, perhaps,’ says Sir Henry Parnell, ‘has the issuing of paper-money been carried to such an injurious excess as in Ireland. A national bank was established in 1783, with similar privileges to those of the Bank of England, in respect to the restriction of more than six partners in a bank; and the injury that Ireland has sustained from the repeated failure of banks may be mainly attributed to this defective

The following  
enactments in co

regulation. Had the trade of banking been left as free in Ireland as in Scotland, the want of paper-money that would have arisen with the progress of trade would in all probability have been supplied by joint-stock companies, supported with large capitals, and governed by wise and effectual rules.

In 1797, when the Bank of England suspended its payments, the same privilege was extended to Ireland; and after this period the issues of the Bank of Ireland were rapidly increased. In 1797 the amount of the notes of the Bank of Ireland in circulation was 621,917*l.*; in 1801, 2,266,417*l.*; and in 1814, 2,986,999*l.*

These increased issues led to corresponding increased issues by the private banks, of which the number was fifty in 1804. The consequence of this increase of paper was its great depreciation; the price of bullion and guineas arose to 10 per cent. above the Mint price; and the exchange with London became as high as 18 per cent., the par being 8*l.* This unfavourable exchange was afterwards corrected, not by any reduction in the issues of the Bank of Ireland, but by the depreciation of the British currency in the year 1810, when the exchange between London and Dublin settled again at about par. [EXCHANGE.]

The loss that Ireland has sustained by the failure of banks may be described in a few words. It appears by the Report of the Committee on Irish Exchanges in 1804, that there were, at that time, in Ireland fifty registered banks. Since that year a great many more have been established, but the whole have failed, one after the other, involving the country from time to time in immense distress, with the following exceptions: First, a few that withdrew from business; secondly, four banks in Dublin; thirdly, three at Belfast; and, lastly, one at Mallow. These eight banks, with the new Provincial Bank and the Bank of Ireland, are the only banks now (1827) existing in Ireland.

In 1821, in consequence of eleven banks having failed nearly at the same time, in the preceding year, in the south of Ireland, Government succeeded in making an arrangement with the Bank of Ireland, by which joint-stock companies were allowed to be established at a distance of fifty miles (Irish) from Dublin, and the bank was permitted to increase its capital from 2,500,000*l.* to 3,000,000*l.* sterling. The Act 1 & 2 Geo. IV. c. 72 was founded on this agreement. But ministers having omitted to repeal in this Act various restrictions on the trade of banking that had been imposed by 33 Geo. II. c. 14, no new company was formed. In 1824 a party of merchants of Belfast, wishing to establish a joint-stock com-

pany, petitioned Parliament for the repeal of this Act of Geo. II.; and an Act was accordingly passed in that session, repealing some of its most objectionable restrictions. (5 Geo. IV. c. 73.)

In consequence of this Act, the Northern Bank of Belfast was converted into a joint-stock company, with a (nominal) capital of 500,000*l.*, and commenced business on the 1st of January, 1825. But the restrictions of 33 Geo. II., and certain provisions contained in the Acts 1 & 2 Geo. III. and 5 Geo. IV., obstructed its progress, and they found it necessary to apply to Government to remove them; and a bill was accordingly introduced, which would have repealed all the obnoxious clauses of the 33 Geo. II., had it not been so altered in the committee as to leave several of them in force. In 1825 the Provincial Bank of Ireland commenced business with a (nominal) capital of 2,000,000*l.*; and the Bank of Ireland has of late established branches in all the principal towns. (*Observations on Paper-Money &c.* by Sir Henry Parnell, p. 171.)

Since Sir Henry Parnell published the pamphlet from which we have taken the foregoing extract, several joint-stock banking companies have been founded in Ireland. The Provincial Bank, to which Sir Henry alludes, has a paid-up capital of 510,000*l.*, and has been well and profitably managed. But others have been less fortunate. The Agricultural and Commercial Bank of Ireland, established in 1834, with 2,170 partners, a paid-up capital of 352,790*l.*, and many branches, stopped payment during the pressure in November 1836, and by doing so involved many persons in great distress. It appears to have been extremely ill-managed. The auditors appointed to examine into its affairs reported that 'Its book-keeping has been found to be so faulty, that we are convinced no accurate balance-sheet could at any time have been constructed.' And they significantly added, 'the personal accounts at the head office require a diligent and searching revision.'

The Tipperary Joint-Stock Bank, which was established in 1839, and stopped payments in 1855, appears to have been little, if at all, better than a mere swindling engine. Luckily it did not issue notes; and the sphere of its operations was not very extensive. But, so far as its influence went, nothing could be worse, being ruinous alike to the majority of its partners and the public.

The existing Irish joint-stock banks, amounting to eight, have been all established between 1821 and 1864. We borrow principally from Thom's *Irish Almanac*, the most valuable publication of its class, the following details with respect to the Irish banks in 1867:—

\* These are not banks of issue.

The following are the latest parliamentary enactments in connection with Irish banking.

By 9 Geo. IV. c. 24 all public notaries practising in Ireland were constrained to keep open their

offices till nine p.m. By 27 & 28 Vict. c. 7 the notary is not constrained to keep his office open after six p.m., and every note or bill, payment of which is not presented upon this hour, is held to be dishonoured.

By 27 & 28 Vict. c. 20 so much of 8 & 9 Vict. c. 37 as prohibits the negotiation of bills of exchange and promissory notes below 5*l.* is repealed for the space of two years.

By c. 86 the Treasury may compound with bankers in Ireland for the stamp duty on bank post bills for a period of three years.

By 28 & 29 Vict. c. 16 the interest payable to the governor and company of the Bank of Ireland in respect of 2,630,769*l.* 4*s.* 8*d.*, due to them by the public, is fixed at 3 per cent. The payment in respect of the management of the public debt is 450*l.* per million, if the debt be under 30,000,000*l.*; 300*l.* per million, when between 30,000,000*l.* and 40,000,000*l.*; and if above 40,000,000*l.*, then 150*l.* per million for each additional million.

#### SEC. IX.—BANKS OF VENICE, AMSTERDAM &c.

It would far exceed our limits to enter into any detailed statements with respect to the banks and banking systems of foreign countries; we shall therefore confine ourselves to a brief notice of such banks as have been most celebrated, or are at present of the greatest importance.

*Bank of Venice.*—The Bank of Venice was the most ancient bank in Europe. Historians inform us that the republic being hard pressed for money, was obliged, upon three different occasions, in 1156, 1480, and 1510, to levy forced contributions upon the citizens, giving them in return perpetual annuities at certain rates per cent. The annuities on the forced loan of 1480 were to be suspended during periods of war. The annuities due under the forced loan of 1156 were, however, finally extinguished in the sixteenth century. And the offices for the payment of the annuities due under the other two loans having been consolidated, eventually became the Bank of Venice. (Cleirac, *Du Négoce, de la Banque &c.*—Bordeaux, 1656, pp. 112—117, a scarce and valuable volume.) This might be effected as follows: The interest on the loan to Government being paid punctually, every claim registered in the books of the office would be considered as a productive capital; and these claims, or the right of receiving the annuity accruing thereon, must soon have been transferred, by demise or cession, from one person to another. This practice would naturally suggest to holders of stock the simple and easy method of discharging their mutual debts by transfers on the office books, and as soon as they became sensible of the advantages to be derived from this method of accounting, bank-money was invented.

The Bank of Venice was essentially a deposit bank. Though established without a capital, its bills bore at all times an agio or premium above the current money of the republic. The invasion of the French, in 1797, occasioned the ruin of this establishment.

*Bank of Amsterdam.*—The Bank of Amsterdam was founded in 1609, on strictly commercial principles and views, and not to afford any assistance, or to commix with the finances of the state. Amsterdam was then the great entrepôt of the commerce of the world, and, of course, the coins of all Europe passed current in it. Many of them, however, were so worn and defaced as to reduce their general average value to about 9 per cent. less than their Mint value; and, in consequence, the new coins were immediately melted down and exported. The currency of the city was thus exposed

to great fluctuations; and it was chiefly to remedy this inconvenience, and to fix the value or par of the current money of the country, that the merchants of Amsterdam established a 'bank,' on the model of that of Venice. Its first capital was formed of Spanish ducats or ducatoons, a silver coin which Spain had struck in the war with Holland, and with which the tide of commerce had enriched the country it was formed to overthrow. The bank afterwards accepted the coins of all countries, worn or new, at their intrinsic value, and made its own bank-money payable in standard coin of the country, of full weight, deducting a 'brassage' for the expense of coinage, and giving a credit on its books, or 'bank-money,' for the deposits.

The Bank of Amsterdam professed not to lend out any part of the specie entrusted to its keeping, but to retain in its coffers all that was inscribed on its books. In 1672, when Louis XIV. penetrated to Utrecht, almost every one who had an account with the bank demanded his deposit, and these were paid off so readily that no suspicion could exist as to the fidelity of the administration. Many of the coins then brought forth bore marks of the conflagration which happened at the Hôtel de Ville, soon after the establishment of the bank. This good faith was maintained till about the middle of last century, when the managers secretly lent part of their bullion to the East India Company and Government. The usual 'oaths of office' were taken by the magistracy of a religious community that all was safe; and the good people of Holland believed, as an article of their creed, that every florin which circulated as bank-money had its metallic constituent in the treasury of the bank, sealed up and secured by oaths, honesty, and good policy. This blind confidence was dissipated in December 1790, by a declaration that the bank would retain 10 per cent. of all deposits, and would return none of a less amount than 2,500 florins.

Even this was submitted to and forgiven. But four years afterwards, on the invasion of the French, the bank was obliged to declare that it had advanced to the states of Holland and West Friesland, and the East India Company, more than 10,500,000 florins, which sum they were, of course, unable to make up to their depositors, to whom, however they assigned their claims on the states and the company. Bank-money, which previously bore an agio of 5 per cent., immediately fell to 16 per cent. below current money.

This epoch marked the fall of an institution which had long enjoyed an unlimited credit, and had rendered the greatest services. The amount of treasure in the vaults of the bank, in 1775, was estimated by Mr. Hoop at 33,000,000 florins. (Storch, *Cours d'Economie Politique*, tom. iv. p. 102.)

*Bank of Hamburg.*—The Bank of Hamburg was established in 1619, on the model of that of Amsterdam. It is purely a deposit bank for the transfer of sums from the account of one individual to that of another. It receives no deposits in coin, but only in bullion of a certain degree of fineness. Down to 1815 it charged itself with the bullion at the rate of 412 schillings the mark, and issued it at the rate of 414 schillings, being a charge of four-ninths, or nearly one-half per cent., for its retention; but since that date it receives and issues bullion at the same rate, charging one per mille for its expenses. It advances money on jewels to three-fourths of their value. The city is answerable for all pledges deposited with the bank; they may be sold by auction if they re-

#### SEC. X.—THE BANK OF FRANCE,

which is second only in magnitude and importance to the Bank of England, was originally founded in 1800, but was not placed on a solid and well-defined basis till 1806. Her capital, which was originally fixed at 45,000,000 fr., was raised in the last mentioned year to 90,000,000 fr., divided into 90,000 shares, or *actions*, of 1,000 fr. each. Of these shares, 67,900 have passed into the hands of the public; the remaining 22,100, having been purchased up by the bank out of her surplus profits, were subsequently cancelled. Hence her capital amounted, down to 1818, to 67,900,000 fr. (27,16,600*l.*), with a reserve fund, first of 10,000,000 fr., and more recently of 12,980,750 fr. Since 1806 the bank has enjoyed the privilege of being the only institution in Paris entitled to issue notes payable on demand; and, as will be afterwards seen, she is now the only authorised issuer of such paper in France. Her charter and exclusive privileges have been prolonged and varied by laws passed at different periods; according to existing arrangements they are not terminable till 1897.

The bank has established, at different periods between 1817 and 1856, offices or branches (*succursales*) in different parts of the country. They are managed nearly in the same way as the parent establishment; but their operations have been on a comparatively small scale. These are exclusive of the departmental banks, united, as will be immediately seen, to the bank in 1848.

Notwithstanding the skill and caution with which her affairs have generally been conducted, the Revolution of 1848 brought the bank into a situation of extreme danger. She had to make large advances to the provisional Government and the city of Paris. And these circumstances, combined with the distrust that was universally prevalent, occasioned so severe a drain upon her for gold, that, to prevent the total exhaustion of her coffers, she was authorised, by a decree of March 16, 1848, to suspend cash payments, her notes being at the same time made legal tender. But to prevent the abuse that might otherwise have taken place under the suspension, the maximum amount of her issues was fixed at 350 millions. She was then also authorised to reduce the value of her notes from 500 fr. to 200 and 100 fr.

Previously to 1848, joint-stock banks, on the model of that of Paris, and issuing notes, had been established in Lyons, Marseilles, Bordeaux, Rouen, and other large cities. And it was then determined that these banks should be incorporated with the Bank of France, and made branches of the latter. This was effected by decrees issued on April 27 and May 2, 1848, by which the shareholders of the banks referred to (nine in number) were allowed, for every 1,000 fr. nominal value of their shares, a share of 1,000 fr. nominal value of the stock of the Bank of France. And, in consequence of this measure, 23,351 new shares, representing a capital of 23,351,000 fr., were added to the stock of the Bank of France, making the latter consist of 91,250,000 fr., divided into 91,250 shares. In 1851 the bank resumed, and has since continued, specie payments.

The suppression of the local issues of the departmental banks was, no doubt, a judicious measure, and was indispensable, indeed, to secure the equal value of the paper circulation in dif-

ferent parts of the country. This, however, might have been effected by the mere stoppage of the issues of the departmental banks, without consolidating them with the Bank of France. The latter measure is one of which the policy is very questionable; and there are, as already seen, good grounds for thinking that the banking business of the departments would have been more likely to be well conducted by local associations than by branches of the Bank of France.

Owing to the peculiar circumstances of the last few years, occasioned partly by the war with Russia, but more by the rage for speculation and the drain for silver to the East, the Bank of France has been exposed to considerable difficulties. And in the view of strengthening her position, and also, it may be presumed, of providing a loan for Government, a law has been recently passed (June 9, 1857), by which the capital of the bank has been doubled. Previously to this law, her capital amounted, as already seen, to 91,250 shares of 1,000 fr. each; whereas it now consists of 182,500 shares of 1,000 fr. each. The new shares were assigned to the existing proprietors at the rate of 1,100 fr. per share, producing a sum total of 100,370,000 fr., of which 100,000,000 fr. have been lent to Government at 3 per cent. Hence the measure, though it has added to the credit and security of the bank, has not made any addition to the means directly at her disposal.

Down to the passing of this law, the bank could not raise the rate of interest on loans and discounts above 6 per cent. But this impolitic restriction is now removed, and the bank may charge any rate of interest which she reckons expedient, except upon advances to Government, the maximum interest on which is limited to 3 per cent. The bank has been farther authorised to issue notes of the value of 50 fr., to make advances on railway shares &c. and the charter has been extended to 1897.

The bank is obliged to open a *compte courant* for anyone who requires it, and performs services, for those who have such accounts, similar to those performed for their customers by the banks in London. She does not charge any commission on current accounts, so that her only remuneration arises from the use of the money placed in her hands by the individuals whose payments she makes. It is probable, therefore, as has been alleged, that this part of her business is but little profitable. The bank also discounts bills with three signatures, at variable dates, but not having more than three months or ninety days to run. In 1855 the aggregate amount of these discounts in Paris and the departments amounted to the very large sum of 3,262,000,000 fr., the interest being 5 per cent. till October 18, and afterwards 5 per cent. Besides discounting bills, the bank makes advances on stocks and pledges of various kinds, and undertakes the care of valuable articles, such as plate, jewels, title-deeds &c. at a charge of one-eighth per cent. on the value of the deposit, for every period of six months and under. Nothing can show more clearly the petty retail character of the trade of Paris, and generally of France, than the smallness of the value of the bills discounted by the bank. Thus of 963,000 bills discounted in 1847, the average amount was only 55*l.* 4*s.*, and of these no fewer than 126,000 were for less than 200 fr. (8*l.*), and 470,000 for less than 1,000 frs. (20*l.*), each. (Tooke and Newmarch *On Prices*, vi. 51.)

The administration of the bank is vested in a council of twenty-one members, viz. a governor and two sub-governors, nominated by the Emperor; and fifteen directors and three censors,

nominated by the shareholders. The bank has a large surplus capital or *rest*. In 1853 and 1856 she divided no less than 200 fr. and 272 fr. profits on each share; but these have much exceeded the dividends in any previous year. In 1818 the dividends only amounted to 75 fr. per share. In

July 1856 the 1,000 fr. share of bank-stock was worth 4,075 fr.; in July 1857 it had sunk to 2,880 fr. Her intimate connection with the Government is decidedly the most objectionable feature in the constitution of the Bank of France.

paid dividends 10 years 10 cent., 1 year in 1856.

Note Cir

The following is an Account of the Bank of France for the Five Years ending 1865, stated in English money at 25 francs = 1l.

SEC. XI.—BANKING IN GERMANY.

*Prussia.*—The Bank Royal of Prussia was founded at Berlin in 1765, upon the model of that of Hamburg. So it existed until 1846, when it was reorganised under a new charter, by which more extension was given to its operations. In accordance with this new constitution, the issue of notes has been carried to 15,000,000 thalers (the thaler equal to 2s. 10 $\frac{3}{4}$ d. sterling). In 1850 this issue was raised to 21,000,000 of thalers. The capital of the bank is always to be, in proportion with the notes in circulation, two-sixths in silver, three-sixths in bills discounted, and the rest in loans on securities. The bank notes are from twenty-five to fifty thalers each; but in 1856, an issue of notes of ten thalers was permitted to the extent of about 400,000, sterling. It pays from 2 to 3 per cent. on deposits. In 1856 the discounts amounted to 238,000,000 thalers. But there cannot be a doubt, although accurate information on foreign banking is not easily attainable, that the progress of commerce is rapidly augmenting their use. The share of the Government in the bank amounts, at most, to 500,000 thalers. The shareholders are entitled to an annual interest of 3 $\frac{1}{2}$  per cent. upon the capital, and, after a further deduction of 1 per cent. set apart for the reserve or rest, which is not to exceed 30 per cent. of the capital, one moiety of the surplus profits is apportioned to them in addition, and the other goes to the treasury. The bank has branches in a great number of cities, as Breslau, Königsberg, Danzig, Stettin, Magdeburg, Münster, Cologne, Memel, Posen, Stolpe, Elberfeld, Trèves, Aix-la-Chapelle, Düsseldorf, Coblenz, Minden, Erfurt, Frankfurt-on-the-Oder, Stralsund, Köslin, Liegnitz, and Oppeln, and thus forms a vast network of financial operations through all the kingdom.

The private bank of the noblesse of Pomerania was founded at Stettin, in 1824, by an association of noble proprietors, with a capital of 1,000,000 thalers. After the crisis of 1830 this capital was carried to 1,531,500 thalers. The operations of this bank embrace discount, loans upon lodgments of merchandise, loans upon public and private securities, current accounts, and deposits with interest. Its issue is limited to 1,000,000 thalers, on condition that it retains one third in specie. There is a circulation of about 90,000,000 of thalers of mortgage notes in Prussia (these are, in fact, for 105,000,000). They have been issued, at different periods, by associations of proprietary nobles of various parts of the kingdom, and carry interest at 3 $\frac{1}{2}$  per cent.

*Austria.*—The Bank of Vienna was founded in 1815, with the purpose of restoring the finances, and particularly for the conversion of the state paper money, the value of which was by this time all but nominal. At the end of 1864 the capital was 11,250,000 florins, the reserve 11,267,900

florins, the note circulation 375,828,020 florins, mortgages in circulation (Pfandbriefe in Umlauf) 41,553,370 florins. The specie held by the bank amounted to 117,363,718 florins. Its privileges are extended to December 31, 1876. The loan to the state in consideration of these privileges is 80,000,000 florins without security.

The Bank of Vienna is the sole state bank of Austria. Its functions are chiefly those of issuing paper, discounting commercial bills, and of developing certain kinds of public works. It has the sole right of issuing notes. It appears that the chief danger which the bank runs is that consequent upon advances to Government, which are made, as might be expected, profusely in times of pressure. These advances are accompanied with a largely increased issue of paper. The bank allows no interest on deposits. The rate of discount is never above 5 or below 4 per cent.

The bank had, in 1865, nineteen branches, the chief of these being the establishments at Prague, Pesth, and Brünn. The business, however, done at the branches is comparatively trivial.

*Bavaria.*—The Royal Bank of Nuremberg, which has branches at Anspach (at which place it was first founded), Bayreuth, Bamberg, Hof, Ludwigshafen, Batisbon and Wurtzburg, is an ancient establishment, the supervision of which is in the hands of finance ministers. The funds of the bank are derived from state grants, advances made by the officials of the bank reserve funds, and deposits from the law courts. The net profits are divided into two portions: of these one is divided between the state and the officials of the bank; the other moiety forms a reserve. It publishes no accounts. Its business is that of exchange, discount, loan and deposit: loans being granted on sufficient security, and deposits bearing interest of from 2 to 3 per cent.

The loan and exchange Bank of Bavaria, which was founded in Munich in 1831, and authorised by royal decree in 1835, began operations in 1835. Its charter is for 99 years from July 1, 1831. It had three branches in 1863. Its function is to lend on goods up to half their value; to discount bills of exchange of ninety days, and containing not less than three names, or Bavarian securities at six months' date; to lend on specie *à* *vo* to ninety percent.; to contract fire and life insurances. The issue is limited to 8,000,000 florins, 2,000,000 being based on specie. The annual dividend on the stock of the bank appears to be large.

*Leipsic.*—This bank was founded by royal decree in 1839, to endure for forty years, with a capital of 1,500,000 thalers, a sum which has been subsequently increased. It receives deposits without interest, discounts three months' bills with three names, and performs similar operations. Its issues of 20, 50, and 100 thalers must be supported by two-thirds their amount in specie or ingots. The profits are divided: 3 per cent. is first paid on the capital, and of the surplus 25 per cent. is added to the reserve, until it reaches 3,000,000 thalers, 5 for the management, 70 for the shareholders.

*Württemberg.*—There are four banks at Stuttgart, one belonging to the king. Another, possessing a capital of 9,000,000 florins, pays 5 per cent. and whatever surplus may exist, issues notes, two-thirds of which may be guaranteed on commercial bills, one-third in specie.

*Belgium.*—The National Bank of Belgium is modelled on that of the Bank of France. Its capital consists of 25,000 shares, each of 1,000 francs: it issues paper payable on sight and to bearer to the amount of 20, 50, 100, 500, and 1,000 francs; but without permission from Government cannot increase its issues beyond three times its

metallie reserve. This bank has paid large and increasing dividends to holders of its stock.

The Bank of Belgium has a capital of 30,000,000 francs in 1,000 franc shares. It was authorised by royal decree in 1835 for the period of forty years.

There are also banks at Ghent, Liège, Seraing, Tongres, Namur, Verviers, besides loan and discount establishments and institutions of *crédit foncier* and *mobilier*. One of the last kind has been in existence since 1822, was authorised by the king of Holland, was modified by the Belgian monarchy after the war of independence, and has been eminently successful. There are, in short, few European countries in which banking has been so fully developed as in Belgium.

**Denmark.**—There is a bank at Copenhagen (with branches at Flensburg and Rendsburg), which was created in 1818, with a capital of 13,461,600 rixdollars. The capital was provided by a special tax, the contributors to which, provided their quota was not short of 100 rixdollars (about 10*l.* 5*s.*), became *pro rata* shareholders. The bank issues notes, the amount of which in 1864 was 20,000,000 rixdollars.

**Greece.**—The National Bank of Greece, situate at Athens, with branches at Patras and Syra, has a capital of 5,000,000 drachmas, divided into 5,000 shares. It discounts bills at a maximum rate of 8 per cent., lends on deposit of gold or silver at a maximum of 10 per cent., and makes advances on accounts current and deposits. It issues notes of 25, 100, and 500 drachmas, of which one-third must be supported by specie, and bills of not less than 100, or more than 1,000, drachmas. After providing that 7 per cent. should be paid as interest on the shares, the surplus is divided as follows: four-twentieths to the reserve fund, until this fund amounts to one-fifth of the capital; one-twentieth to the directors and officials; fifteen twentieths to the proprietors of shares. The bank had, in 1863, 2,128,000 drachmas as a reserve, and had paid, from its commencement in 1812 to this date, a rate varying between 7½ and 12 per cent. on the capital.

**Italy.**—The National Bank of Italy has its chief office at Turin with branches at Florence, Naples, Milan, and Genoa. Its capital amounts to 100,000,000 francs in 100,000 shares on each of which 700 francs is paid. Its foundation took place in 1863, by the union of the National Bank of Turin with that of Tuscany. There are also a bank at Naples and at Rome, the former with a capital of 1,000,000 ducats, the latter of 2,000,000 Roman scudi. The issues of the Papal Bank are as low as a single scudo. Establishments of *crédit foncier* and *mobilier* have also been founded in Italy.

**Portugal.**—The National Bank of Portugal—chief office at Lisbon with branch at Oporto—has a capital of 8,000 contos of reis, divided into 80,000 shares. It was established by royal decree, by a fusion of the old Bank of Lisbon and the *Companhia Contianza Nacional*. It issues notes, the lowest at 1,200 reis, makes advances on bills and deposits of merchandise &c., on immovable property, and on accounts current. Bills having two names, and for ninety days, are discounted at 5 per cent. and loans are negotiated at the same rate on public and private securities.

**Spain.**—The Bank of Spain has its chief office at Madrid, with branches at Valencia and Alicante. The governor and deputy-governor are nominated by the state. Its capital is 120,000,000 reals vellen, in 60,000 shares. Interest fixed at 6 per cent. The bank was founded by the crown in 1819, in place of the Bank of S. Ferdinand, which had itself been incorporated with that of Isabella II. An earlier institution was the bank of S.

Conles, founded by a Frenchman, in 1782, one Cabanus.

The bank issues notes up to a moiety of its capital, under the guarantee of a third of the issue in specie, the lowest note being of 500 reals vellen. It discounts ninety days' bills with three signatures, and makes advances on deposits to four-fifths their value. The dividend on the shares has been as high as 26 per cent. There are other banks in Spain, besides institutions of credit.

**Sweden and Norway.**—The Bank of Sweden has its chief office at Stockholm, with branches at Gothenburg, Malmö and Wisby. Its capital is 13,000,000 bank thalers. It was founded in 1637. It issues notes. The Royal Loan Bank of Norway has a capital of 3,000,000 thalers specie. Its chief offices are at Drontheim, but it has several branches. It issues paper to double the amount of its reserve in bullion.

**Switzerland.**—There are numerous banks in this republic, each state in the confederation being possessed of a bank.

**Turkey.**—The transactions of this community are managed by the Imperial Ottoman Bank, which is empowered to issue notes. The capital of the bank is 67,000,000 francs.

**Wallachia and Moldavia.**—These principalities have a bank at Jassy, the capital of which is 10,000,000 thalers in 50,000 shares. It issues a paper currency, which must be supported by one-third its amount in specie.

**Bank of the Netherlands.**—The original capital was fixed at 5,000,000 florins, with a power of doubling this, if expedient; but two years elapsed before the whole was subscribed for. Of this capital the State held 1,000,000 florins.

In 1815 the capital was raised to 10,000,000 florins; and as the rest then amounted to 250,000 florins, in order to place the new shares on the same footing with the old, 1,050 florins were paid up on each share. The whole were immediately placed, as will be seen by the balance of March 31, 1820.

In 1838 the charter was renewed for another period of 25 years by royal decree, and the capital increased to 15,000,000 florins, the State receiving and exercising the right of holding 500,000 florins of the increase of capital. The sum to be paid up on each of the new shares was fixed at 115 florins, thus bringing the capital and rest up to 17,500,000 florins, at which figure it remained with trifling change up to the expiration of the renewed charter. It appears by the statement made by the Minister of Finance, in laying before the States-General a bill for the renewal of the charter of the Bank, that the last-named 500 shares belonging to the State were sold in 1840 at a premium of 163,809 florins 35 cents; and the original 1,000 shares likewise held by the State were realised in 1841, fetching the sum of 1,610,000 florins.

By the new charter of 1838, several restrictions existing under the former one were removed, while on the other hand the Bank lost some of its privileges.

Up to the year 1852 a strict injunction of secrecy was imposed and observed; in the last-mentioned year this injunction was removed, and the publication of some details of the operations of the Bank rendered imperative, and of others permissive. The same decree empowered it also to make loans on all foreign Government stocks without distinction.

Lastly the charter was again renewed by Act of the Legislature in 1863. The 1,000 shares reserved to the Government by the new charter were sold at the price of 1,940 florins per share.

It is alleged that the Bank of the Netherlands has a considerably greater supply of bullion in proportion to its circulation than any other bank.

#### SEC. XII.—BANKING IN THE UNITED STATES.

It has been the uniform practice of the different States of the Union to allow banks to be established for the issue of notes, payable in specie on demand. In cases where the liability of shareholders in banks was to be limited to the amount of their shares, they had, previously to 1838, to be established by Acts of the local legislatures. But, in general, these were easily obtained; and down to a comparatively late period, it may be said that banking was quite free; and that, practically, all individuals or associations might issue notes, provided they abided by the rules laid down for their guidance, and engaged to pay them when presented.

Under this system, the changes in the amount and value of the paper currency of the United States have been greater than in any other country; and it has produced an unprecedented amount of bankruptcy and ruin.

Between 1811 and 1820, about 195 banks, in different parts of the Union, became bankrupt; and it is said, in a report by the Secretary of the Treasury of the United States, dated May 12, 1820, that these failures, which mostly happened in 1814 and 1819, produced a state of distress so general and severe, that few examples of the like had then occurred.

But had as this instance was, it was nothing to that which took place subsequently to 1834. The accounts of the aggregate issues of the banks differ a little; but the following statement is believed to be very nearly accurate, viz. :—

Years	Notes
1830 - - - - -	66,638,980 dollars.
1831 - - - - -	91,839,570 "
1832 - - - - -	103,629,435 "
1836 - - - - -	110,310,633 "
1837 - - - - -	119,185,890 "

Now observe, that this sudden and enormous increase took place under the obligation, which we are told is quite enough to prevent all abuse, of paying notes on demand. The result was, what most men of sense must have anticipated, viz. that a revaluation took place, and that every bank within the Union, without, it is believed, a single exception, stopped payment in 1837.

In 1838 each of the banks as had been best managed, and had the largest capitals, resumed payment in specie. But in 1839 and 1840 a farther crash took place. And the bank-notes afloat, which, as has been seen, amounted to 149,185,830 dollars in 1837, sunk to 85,734,000 dollars in 1842, and to 58,563,000 dollars in 1843. It is supposed that in this latter crash nearly 180 banks, including the Bank of the United States, were totally destroyed. And the loss occasioned, by the depreciation which it caused in the value of stocks of all kinds, and of all sorts of property, was quite enormous. And yet, vast as that loss was, it was really trifling, as a writer in the *American Almanac* has stated, compared with the injury resulting to society from the upheaving it occasioned of the elements of social order, and the utter demoralisation of men by the irresistible temptation to speculation which it afforded, ending in swindling to retain ill-gotten riches.

The evils of the American system have been aggravated by the looseness of the notes which most banks have issued. This brings them into the hands of retail traders, labourers, and others in the humbler walks of life, who always suffer severely by the failure of a bank.

Since 1838 and 1842, various measures have

been taken in nearly all the States, but principally in New York, to restrain the free action of the banks, and to prevent a repetition of the calamities referred to.

In New York, for example, the banks have been divided into two great classes—the incorporated and the free banks. The former, which are incorporated by a State law, have to conform to certain regulations, and have to contribute a half per cent. annually upon their capital to a security fund, which is devoted to the payment of the notes of defaulting banks. But this is a most objectionable plan; for, in the first place, it does not prevent bankruptcies; and in the second place, it compels the well-managed banks to contribute to a fund which goes to pay the debts of those that are mismanaged. It has consequently declined in favour, and is now rarely acted upon.

In the other, or free banking system, all individuals or associations who choose to deposit securities (minimum amount 100,000 dollars) for their payment, are allowed to issue an equal amount of note. And this is certainly by far the more efficient as well as the most popular of the two plans. But it is objectionable, because, 1st. A longer or shorter, but always a considerable, period necessarily elapses after a bank stops before its notes can be retired; and, 2nd. Because the securities lodged for the notes are necessarily at all times of uncertain and fluctuating value; while, in periods of panic or general distrust, they become all but inconvertible. The Sub-secretary of the Treasury of the United States has animadverted as follows on this plan, in a letter dated Nov. 27, 1854:

“The policy of many of the State governments has of late years consisted in encouraging the issue of small notes, by sanctioning the establishment of what are popularly called “free banks,” with deposits of stocks and mortgages for the “ultimate” security of their issues. This “ultimate” security is, it may be admitted, better than no security at all. The mischief is, that it is least available when most wanted. The very causes which prevent the banks from redeeming their issues promptly, cause a fall in the value of the stocks and mortgages on “the ultimate security” of which their notes have been issued. The “ultimate security” may avail something to the broker who buys them at a discount, and can hold them for months or years; but the labouring man who has notes of these “State security banks” in his possession, finds, when they stop payment, that “the ultimate security” for their redemption does not prevent his losing twenty-five cents, fifty cents, or even seventy-five cents in the dollar.

“In a circulating medium we want something more than “ultimate security.” We want also “immediate” security; we want security that is good to-day, and will be good to-morrow, and the next day, and for ever thereafter. This security is found in gold and silver, and in these only.”

The above statements are taken from a paper read by Lord Overstone to the late Committee on Banks.

It appears from the Report of the Superintendent of Banking for the State of New York for 1856, that the securities he then held in trust amounted to 39,359,071 dols., which were almost wholly lodged by banking associations and individual bankers.

During the year the securities held in trust for the under-mentioned banks that had become insolvent in 1855 were disposed of. But the sums realised by their sale did not in any case suffice to pay the notes at par, while a period varying from two to four years would have to elapse before the affairs of the insolvent banks will be finally settled.

Names of Banks that Failed	Notes Redeemed	Rate of Redemption	Time for Redemption
Eight Avenue Bank	All	91 cents	May 21, 1861
Farmers' Bank, Onondaga	All	85 cents	Nov. 12, 1859
James' Bank	All	91 cents	June 17, 1858
MERCHANTS' and MECHANICS' BANKS, Onwego	All	77 cents	Sept. 28, 1860
N. W. Rochelle, Bank of	Stock Notes	Par	June 17, 1858
New Rochelle, Bank of	Stock and Estate Notes	81 cents	June 17, 1858

This statement sets the defective nature of the security system, as administered in New York, in the clearest point of view. It might, no doubt, be improved by increasing the proportion of securities to notes. But owing to the variety of securities that are taken (viz. all manner of bonds and mortgages, state, canal, and railway stocks &c. &c.), and the uncertainty of their value, a great deal of risk is always incurred in accepting them, and they can never form a proper foundation on which to issue notes.

But, however desirable, it would, we fear, be visionary to expect that local issues should be suppressed in America, or that her paper currency should be placed on a really sound foundation. But it may, nevertheless, be easily and greatly improved. And, perhaps, this would be best ef-

fectured by suppressing low notes, or those for less than twenty dollars, and increasing the proportion of securities to issues. The rules on which so much stress is laid, in most parts of America, for making the issues of banks depend on the magnitude of their capitals, or the amount of specie in their vaults, are really of no use whatever. They may be and have been eluded and defeated in a thousand ways, and serve only to make the public look for protection to what is altogether impotent and worthless for any good purpose.

The following table, from *Hunt's Commercial Magazine* for March 1857, gives an account of the number and condition of the banks of the United States, as officially reported, in certain years from 1834 to 1856.

Table of the Secretary of the Treasury, showing the Number of Banks and Branches, with their Capitals, Discounts, Specie, Circulation, and Deposits, in the Union, in the following Years, from 1834 to 1856. The last line gives the position of the Banks near January 1, 1856.

In 1857 another crash took place, and all the banks in the Union, from the Gulf of Mexico to the frontiers of Canada, again stopped payments.

This new crash affords, had that been necessary, a fresh and striking illustration of the truth of the principles we have endeavoured to establish in the course of this treatise; and it may be expected to awaken, if that be possible, the American people to a proper sense of the enormous abuses connected

with their banking system; and the necessity of placing it on an entirely new foundation.

The above account shows that there had been a rapid increase of discounts since 1851, and that increase was especially great in 1856, and went on augmenting down to August (1857). On the 8th of that month, the discounts and advances by the New York banks amounted to 122,077,252 dollars, the deposits in their possession being at the same time 94,436,417 dollars. This was the maximum of

But at the same

both. On August 24, the Ohio Life and Trust Company, which carried on an extensive banking business in New York, stopped payments; and by so doing gave a severe shock to credit and confidence, which the suspension of two or three more banks turned into a panic. Notes being in a certain degree secured, the run upon the banks was principally for deposits. And to meet it they so reduced their discounts and advances, that on October 17 they amounted to only 97,245,826 dollars. This sudden and violent contraction necessarily occasioned the suspension of many of those mercantile houses that had depended on the banks for discounts. And it did this without stopping the drain for deposits, which had sunk on October 17 to 52,891,623 dollars, being a decrease of 41,546,784 dollars, in about two months. The universal stoppage of the banks was a consequence of these proceedings.

There seems to be no doubt that improvident advances on the part of the banks, and overtrading, were the main causes of the crisis. And it is important to observe that it is stated in the *Banker's Magazine* for November 1857 (p. 430), and other works of authority published in New York, that the improvidence referred to was, in part at least, occasioned by the too high interest allowed at New York on deposits on current accounts, or at call. This made the opulent bankers and capitalists in the Western States keep large balances at New York; and it tempted, and in some degree obliged, the bankers and money-dealers in the latter to make advances on questionable security, for the sake of the high interest payable on them. A system of this sort may be truly said to force capital into the hands of the least deserving, and to be a prolific source of wild speculation and overtrading. And whenever any serious check is given in any quarter of the Union to the process of inflation, the consequences are sure to be in the last degree disastrous; for, the greater number of the banks being very ill supplied with specie, they can resist no serious demand upon them either for payment of notes or deposits; and when one or a few stop, a panic is generated, which involves even the best managed banks in the common ruin.

A tendency to panics is, in fact, one of the peculiarities of the American system. Owing to the liability of the partners in banks being limited, the depositors in them, and the holders of notes not issued upon securities, having nothing to trust to, make all imaginable haste, when their suspicions are awakened, to save themselves by withdrawing their deposits, and cashing their notes. And hence the rapidity with which panics spread throughout the Union; and, we may add, that the slowness with which they are disseminated in this country arises from the contrary circumstances, from the confidence placed by the public in the unlimited obligation of the partners to make good all demands.

In the city of New York, the action of the foreign exchanges compels the banks to have always on hand a very considerable amount of specie. But the reader will hardly believe with what a small stock of coin the banks in the country parts of that state, and generally throughout the Union, contrive to carry on their business. In illustration of this statement, we may mention, that in June 1857 the fifty-six banks in the city of New York are reported in the official returns to have had 8,000,000 dols. notes in circulation, with an aggregate amount of no less than 12,000,000 dols. specie in their coffers. But at the same time that the city banks were

in this situation the circulation of the 255 country banks then existing in the state is returned at 24,000,000 dols., and their specie at only 1,200,000 dols., being only one-twentieth part of their notes afloat. And as these returns give only average results, it follows that, while some of the banks would have more, others would have proportionally less specie than this medium rate.

A notion, indeed, would appear to be gaining ground among the banks, in some parts of the States, that when they have given security for their issues, they have done quite enough, and that they may dispense with the troublesome obligation to pay them on demand. It appears, for example, that in the moral and religious state of Massachusetts there were, on July 7, 1856, no fewer than 135 banks (excluding those in Boston), which had 6,601,130 dols. of deposits, and notes in circulation amounting to 13,106,068 dols., while their specie on hand amounted to only 1,092,463 dols., or about one-thirteenth part of the circulation. And in other parts of the Union the stock of bullion was still more scanty. Thus, in Illinois, on July 6, 1857, the State Bank, with notes afloat to the amount of 725,000 dols., had, to meet all demands, 61,000 dols. in specie in her coffers; while the Grayville Bank, with a circulation of 471,556 dols., was provided with a supply of 18,951 dols. in specie; and the Raleigh Bank, with a circulation amounting to 248,000 dols., had a specie fund of no less than 1,000 dols.! It may be supposed, perhaps, that this would be the minimum amount of specie, but no. For some banks (such as the Bank of the Commonwealth, with notes afloat to the extent of 84,915 dols.) were honest enough to admit that they had a considerable circulation without being encumbered with a single dollar!

It is evident that a banking system of this sort has no better foundation than a house of cards. It is sure to fall to pieces at the first touch. The grand object of by far the greater number of the bankers is to get their notes into circulation; and as these are often issued for very small sums, cost nothing, and at the same time yield some eight, ten, or twelve per cent., or more, of interest, we need not wonder at the eagerness with which they pursue this object, or at their success, or the abuses to which it leads. The discount of bills at distant dates, and their renewal, make part of the system.

The security system followed in New York, even were it generally adopted, affords no guarantee against these evils. Instead of preventing, it really tends to encourage, over-issue, and it is impotent to insure a proper supply of bullion. All that it contemplates is the ultimate payment of the notes; but it does not prevent the bankruptcy of those by whom they are issued, and we have seen that it does not accomplish even that ultimate payment which it has exclusively in view. The whole system is rotten to the core; and unhappily, too, is deeply injurious to all those with whom the Americans have any dealings, as well as to themselves.

We are glad to be able to corroborate our views of these matters by the high authority of a former President of the United States. Mr. Buchanan, in his Message to Congress, delivered on December 8, 1857, makes the following conclusive statement: 'The first duty which banks owe to the public is to keep in their vaults a sufficient amount of gold and silver to insure the convertibility of their notes into coin at all times and under all circumstances. No bank ought ever to be chartered without such restrictions

on its business as to secure this result. All other restrictions are comparatively vain. This is the only true touchstone—the only efficient regulator of a paper currency—the only one which can guard the public against over-issues and bank suspensions. As a collateral and eventual security it is doubtless wise, and in all cases ought to be required, that banks shall hold an amount of United States or state securities equal to their notes in circulation, and pledged for their redemption. This, however, furnishes no adequate security against over-issues. On the contrary, it may be perverted to inflate the currency; indeed, it is possible by this means to convert all the debts of the United States and state governments into bank notes, without reference to the specie required to redeem them. However valuable these securities may be in themselves, they cannot be converted into gold and silver at the moment of pressure, as our experience teaches, in sufficient time to prevent bank suspensions and the depreciation of bank-notes.

It is truly stated by Mr. Buchanan, in the Message now referred to, 'that it is easy to account for our financial history for the last forty years. It has been a history of extravagant expansions in the business of the country, followed by ruinous contractions. At successive intervals the best and most enterprising men have been tempted to their ruin by excessive bank loans of mere paper credit, exciting them to extravagant importations of foreign goods, wild speculations, and ruinous and demoralising stock gambling. When the crisis arrives, as arrive it must, the banks can extend no relief to the people. In a vain struggle to redeem their liabilities in specie, they are compelled to contract their loans and their issues; and at last, in the hour of distress, when their assistance is most needed, they and their debtors together sink into insolvency.'

We have already seen that the real value of our exports to the United States in 1856 amounted to 21,476,000. But we have been too much in the habit of estimating our commercial prosperity by the magnitude of the exports, which is a most fallacious criterion. We have heard it stated by well-informed parties, and we believe the statement to be true, that but for the extreme inflation of the banking and credit system of the United States, the imports from England in 1858 would not have exceeded 15,000,000, or 16,000,000; and that those from France and other countries would have been reduced in something like the same proportion. And, had such been the case, production here would not have been unnaturally stimulated, and a fair profit would have been obtained from our exports, whereas they will now entail a large and most serious loss.

Besides the bankruptcy and ruin that periodically arise from such a system, it is at all times productive of the greatest inconvenience and trouble. Where there are so many separate and independent banks (about 1,400), the sphere of the influence and circulation of each is necessarily circumscribed; and when notes get to any considerable distance from the place where they are issued, especially when they get into a different state, they circulate with difficulty, and generally at a discount. But this is not the only evil by which their circulation is attended. Banks are every now and then suspending payments, or getting into discredit. And lists are regularly published of such defaulting or suspected banks, and of the rates of discount at which their notes are current, without which no traveller can leave

his house, and no shopkeeper can venture to transact any business. It is truly astonishing, seeing the extreme inconvenience resulting from such a state of things, that it should be tolerated even for a week. If the general Government be not sufficiently strong to suppress local issues, and to substitute in their stead a national paper issued on deposits of bullion, the public may, if they choose, rid themselves of the evil by refusing to accept payment otherwise than in coin. The banking interest is, however, so very powerful, and embraces so great a number of individuals, that we doubt whether, even with the co-operation of the general Government, the time has yet arrived for anything effectual being done for the amendment of the system. But the longer it exists, the more intolerable will it become; and in the end, no doubt, it will be suppressed. It forms, at present, the most gigantic abuse by which an intelligent people ever permitted themselves to be disgraced and oppressed.

Congress passed an Act, dated February 25, 1863, by which the privilege possessed by the several states was virtually superseded. The title of this Act is, 'An Act to provide a National Currency, secured by a pledge of United States Stocks, and to provide for the Circulation and Redemption thereof.'

The Act provides a new officer, called the *comptroller of the currency*, who is nominated by the secretary of the treasury for 5 years, subject to the approval of the president and senate. This officer is bound to make an annual financial report. The immediate object of the department is the circulation and redemption of the legal tender greenbacks; the indirect effect is the extinction of the States banks, and the establishment in their stead of national banks. Banks known by the name of national banks may now be founded by not less than five persons, who are bound to lodge duly legalised certificates with the public officer, specifying the name of the company, its place of business, the amount of its capital, which must not be less than 50,000 dollars in towns under 10,000 inhabitants, and in towns above that number, than 100,000; the names and residences of the shareholders, with the number of shares subscribed for by each, 30 per cent. of which must at least be paid up; and lastly the date at which the operations of the bank are to commence.

The comptroller, when he is satisfied that these conditions have been fulfilled, gives the proper authority to the company, under which they commence their operations. The company is bound to forward a certain amount of United States bonds to the treasury, in exchange for which they receive 'currency circulating notes in blank' registered and countersigned to 90 per cent. of the bonds deposited. The aggregate amount of these notes shall not exceed 350,000,000 dollars, 150,000,000 of which are circulated by the bank, the rest by the secretary of the treasury. The notes are 5, 10, 20, 100, 500, and 1000 dollars. The banks, in lieu of taxes on their circulation, pay 1 per cent. on the notes issued to them at the returns of July 1 and Jan. 1, 2 per cent. being recoverable in default.

The notes are receivable at par for taxes, excise, land sales, and all public debts, except customs and dividends on United States stock. Banks which fail to meet their obligations after protest made by creditors before a notary, are suspended by the comptroller, and the guarantee bonds forfeited. These are sold by public auction at New York, after thirty days' notice, and the creditors reimbursed.

nine directors, all citizens of the United States, resident more than a year, and each possessed of 1 per cent. of the capital, or, in case it exceed 200,000 dollars, of 10 per cent. A bank must always possess to the amount of one-fourth of its circulation deposits in lawful money. The bank must not pledge its own stock in order to procure specie or notes.

Banks are required to make a detailed statement of their affairs at the beginning of each quarter, and a statement of their average circulation, deposits, lawful money, and balances available for the redemption of their circulating notes, at the beginning of each month. It is urged by the comptroller that this quarterly return is insufficient, and that it would be desirable that a full exhibit of the affairs of each bank should be required on the first Monday of each month. The first national bank was organised on June 20, 1863.

On Jan. 1, 1863, there were 507 Eastern banks, 491 in the Middle states, 147 in the South-east, 114 in the South-west, 207 in the North-western states—1,466. For nine years precedent and 1851, there were the following:—

Jan. 1.		Jan. 1.	
1851	- - 879	1858	- - 1,422
1854	- - 1,298	1859	- - 1,476
1855	- - 1,507	1860	- - 1,302
1856	- - 1,596	1861	- - 1,601
1857	- - 1,410	1862	- - 1,196

On Jan. 1, 1863, the capital was 405,000,000, the circulation 238,000,000, the deposits 598,000,000, the specie 101,000,000, of dollars.

In October, 1867, the number of national banks was 1,639, with a capital of 424,394,861 dols., having bonds on deposit, 340,675,000. The circulation of legal tender paper was 299,103,996.

Between June 20, 1863, and Oct. 1, 1867, only ten of these banks have failed, with liabilities to the public of 4,560,000 dols. The liquidation of these banks has led to the loss of only 1,000,000 dols. (Mr. Holland's *Report*, Dec. 1867.)

#### SEC. XIII.—BANKS FOR SAVINGS.

Banks established for the receipt of small sums deposited by the poorer class of persons, and for their accumulation at compound interest. They are managed by individuals who are supposed to derive no benefit from the deposits. All moneys paid into any savings bank established according to the provisions of the Acts 9 Geo. IV. c. 92, and 7 & 8 Vict. c. 83, are ordered to be paid into the Banks of England and Ireland, and vested in Bank annuities or Exchequer bills. The last-mentioned statute reduced the interest payable to the trustees of banks to 3l. 5s., and that payable to depositors to 3l. 0s. 10d. per cent. per annum; the difference of 4s. 2d. per cent. being intended to form a fund to defray the cost of management &c. No depositor can contribute more than 30l. exclusive of compound interest, to a savings bank in any one year; and the total deposits to be received from any individual are not to exceed 150l.; and whenever the deposits, and compound interest accruing upon them, standing in the name of any one individual, shall amount to 200l., no interest shall be payable upon such deposit so long as it shall amount to 200l. The commissioners for the reduction of the national debt have the disposal of the sums vested in the public funds on account of savings banks.

This system began in 1817; and on the 20th of November, 1857, there was due to depositors, including interest accruing on deposits, 35,255,722l. It farther appears that from the 6th of August, 1817, down to the 20th of November, 1857, the

public paid on account of interest and charges on the sums due to savings banks and friendly societies under the Act referred to, 28,852,013l. 8s. 5d., and that the dividends received during the same period on the stock and other public securities in which the commissioners for the reduction of the national debt invested the said sums, amounted to 26,077,961l. 19s. 2d., leaving a balance of 2,774,051l. 9s. 3d., which consequently may be said to be the sum which the system has cost the public. (*Parl. Paper*, No. 441, sess. 1858.) The reduction of the interest on deposits in 1844 from 2½d. to 2d. per diem contributed in some degree to diminish the loss to the public. But it is mainly owing to the circumstance that the contributions to savings banks, and consequently the investments on their account, are greatest when the country is prosperous and the funds high; and that the deposits are principally drawn out under the opposite circumstances, or when confidence is shaken and the funds are low. But, after all, the loss to the public is not very considerable; and it does not seem too great a price to pay for the maintenance of so advantageous a system.

That this is a true statement may be easily shown. In the metropolis, and many other parts of England, public banks do not receive small deposits, and until recently they did not pay any interest on them. And even in Scotland, where the public banks allow interest upon deposits, they do not generally receive less than 5l. or 10l. But few poor persons are able to save even this much, except by a lengthened course of economy. The truth, therefore, is, that until savings banks were established, the poorer classes were everywhere without the means of securely and profitably investing these small sums they are not unfrequently in a condition to save, and were consequently led, from the difficulty of disposing of them, to neglect opportunities for making savings, or, if they did make them, were tempted, by the offer of high interest, to lend them to persons of doubtful characters and desperate fortunes, by whom they were for the most part squandered. Under such circumstances, it is plain that nothing could be more important, in the view of diffusing habits of forethought and economy amongst the labouring classes, than the establishment of savings banks, where the smallest sums are accumulated at compound interest, and are paid, with their accumulations, the moment they are demanded by the depositors. The system has not yet received its full development. The want of perfect security operates as a serious drawback to its extension; but the magnitude of the deposits already received sets its powerful and salutary operation in a very striking point of view.

Savings banks are now regulated by the Act of 1863, 23 & 24 Vict. c. 87, and the various sections of the previous Acts which that statute left un repealed. These are 3 & 4 Wm. IV. c. 14 ss. 21, 22, 25, 28, 29, 30, 31, 32, 33, 34 & 35, and 17 & 18 Vict. c. 20, sec. 2 only of which is repealed.

*Purchase of Government Annuities by Depositors in Savings Banks.*—The Act 2 & 3 Wm. IV. c. 14, under the provisions of which depositors in savings banks were allowed to purchase Government annuities, was subsequently amended by the 7 & 8 Vict. c. 83, which Acts were afterwards consolidated and amended by the 16 & 17 Vict. c. 45; and the facilities for the purchase of such annuities were extended by the 27 & 28 Vict. c. 43. That these measures were benevolently intended, and that they may be productive of advantage to many individuals, cannot be doubted;

but we look upon all attempts, and particularly those made by Government, to get individuals to exchange capital for annuities, as radically objectionable, and as being subversive of principles which ought to be strengthened rather than weakened. [FUNDS; INTEREST AND ANNUITIES.]

Sec. 6 of the 27 & 28 Vict. c. 43 requires the construction of fresh tables of the annuities and insurances contemplated by the Act; and s. 14 empowers the Postmaster-General to authorise his officers to receive the moneys payable under the Act and under the 16 & 17 Vict. c. 45.

Persons desiring to purchase annuities or to effect insurances should apply for a proposal form at one of the post offices opened for the purpose. Instructions as to the mode of filling up the form are printed on it.

This serious defect and the constant defalcation of the trustees of savings banks led to the introduction into Parliament of a measure to remedy the evil by the establishment of Government savings banks, pledging the security of the state to depositors, and the Act of 1861, 24 Vict. c. 14, known as the Post Office Savings Bank Act, was passed with this object.

GENERAL POST OFFICE SAVINGS BANK.

The 24 & 25 Vict. c. 14 extends the facilities for the deposit of small savings, by making the General Post Office available for the purpose, and affording the direct security of the state to every

BANKRUPT AND BANKRUPTCY

depositor for the repayment of all money deposited, together with the interest due thereon.

Before the post office savings banks were established, 638 savings banks (in which number penny banks are, of course, not included) were open in the United Kingdom for the receipt of small savings. Of these, 355 were open but once in each week, 54 were open but once in each fortnight, several were open but once a month, and only 20 were open daily. Since the establishment of the 3,064 post office banks, all of which are open daily, the duration and the frequency of the term for business have been increased at many of the old savings banks. On the other hand, the trustees of many of the old savings banks have either closed or signified their intention to close the institutions under their control, in the belief that the post office banks afford the public a sufficient amount of accommodation.

The following statement gives the proportion of savings bank depositors to the whole population of the kingdom at each of four decennial periods, and shows that the rate of increase in the number of such depositors has, throughout the last 30 years, been greater than the rate of increase of population:—

On Nov. 29	1852, there were for	About
	every 100 persons	1½ savings bank depositors.
"	1812	" " 3½ " "
"	1852	" " 4½ " "
"	1862	" " 5½ " "

The following Table is appended in Illustration of the Condition of the Post Office Savings Banks on March 31, 1864.

Countries	Number of Depositors' Accounts to March 31 1864			Deposits		Withdrawals		Amount of Balances remaining at Credit of Depositors' Accounts
	Opened	Closed	Remaining Open	Number	Amount	Number	Amount	
England - - -	405,560	76,914	327,516	1,556,202	5,339,250	315,595	1,652,071	3,700,176
Wales - - -	11,713	3,162	11,551	65,420	174,323	8,961	55,295	121,028
England and Wales -	418,273	79,376	338,867	1,621,622	5,513,573	324,556	1,707,366	3,821,205
Islands - - -	923	193	736	3,797	10,829	3	3,290	7,598
Scotland - - -	23,588	4,705	18,883	91,846	468,173	16,126	60,312	107,861
Ireland - - -	18,015	4,276	13,739	78,569	249,946	1	89,109	160,756
Total - - -	461,505	88,550	372,955	1,795,171	5,955,714	357,176	1,856,282	4,097,432

Out of the 7,000,000L paid into the post office savings banks since their establishment in 1861, only 1,100,000L has been transferred from the older savings banks; thus it is obvious that the post office banks have created an almost entirely new business.

SEAMEN'S SAVINGS BANK.

With a view of inducing provident habits in the seamen and their families, and of providing for the safe custody and increase of their savings, the legislature has passed an Act empowering the Board of Trade to establish savings banks at suitable places within the United Kingdom for the benefit of seamen belonging to the mercantile marine, as well as their wives and families, the management and control of these banks being vested in the Board of Trade. Under the provisions of the Merchant Shipping and Seamen's Savings Bank Acts a department has been established in London at the Board of Trade as the Central Savings Bank, where all accounts of the depositors are kept. The shipping masters at the several ports are to act as its agents to receive and to pay deposits.

The Regimental Savings Banks are conducted under the War-Office, and those for the seamen of the Royal Navy under the Admiralty.

**BANKRUPT AND BANKRUPTCY.** In the general sense of the term, bankrupt is equivalent to insolvent, and is applied to designate any individual unable to pay his debts. Formerly in the law of England bankrupts formed that particular class of insolvents who were engaged in trade, or who 'sought their living by buying and selling,' and who were declared, upon the oath of one or more of their creditors, to have committed what the law had defined to be an act of bankruptcy. But the distinction between traders and non-traders was in most respects abolished by the Act of 1861, the 24 & 25 Vict. c. 134. At present, however, we shall merely lay before the reader a few observations with respect to the principles and leading provisions embraced in the law as to bankruptcy and insolvency; referring to the article **INSOLVENCY AND BANKRUPTCY** for some further observations on the subject.

All classes of individuals, even those who have least to do with industrious undertakings, are exposed to vicissitudes and misfortunes, the occurrence of which may render them incapable of making good the engagements into which they have entered, and render them bankrupt or insolvent. But though bankruptcy be most frequently, perhaps, produced by uncontrolled

causes, it is living by extravagance, the state of some frequent faith. But the individual as a very in enterprises, which being able to the money him, or the hands in an expenditure incoherent system of expect to rupty. on a system tracing that, in they had in payment of duty when they are able speculate bankrupted way invol should be as the circ are often a difficult to any genera hence it is rupty have countries a not, perhaps against which be made.

The excess with respect according to the Twelve civilised (insolvent def formalities, taking a share debt; and this horrible sell him, his fathers the merits on the ferocious and Romans.

There is historians of debtor ever this barbarous republic is some of which that were given to ere, subjecting the law, however of Rome 427 the Twelve then enacted cease to be that the lat seize upon t auction in s subsequent s

causes, it is frequently also produced by persons living beyond their means, and by their repugnance to make those retracements which the state of their affairs imperatively demands; and sometimes and, we regret to have to add, not unfrequently, bankruptcy originates in fraud or bad faith. But, however it may be occasioned, whether by the misfortunes, the folly, or the fraud of the individual, it ought, *primâ facie*, to be viewed as a very grave moral offence. No man is justified in entering into engagements, or making promises, which he has not a reasonable prospect of being able to fulfil; nor is he justified in applying the money or loans that may have been made to him, or the property that may have come into his hands in the course of his business, to maintain an expenditure that decidedly exceeds his ordinary income or profits. Those who persevere in a system of this sort cannot, if they think at all, expect to arrive at any goal other than bankruptcy. They must know that they are carrying on a system of deception; that they are contracting debts which they can never pay; and that, in truth, they are as really swindlers as if they had offered fictitious bills or dock-warrants in payment of their bonds. And hence the difficulty of dealing with this subject. Misfortunes, when they really occur, or the failure of reasonable speculations, are easily dealt with; but all bankruptcies not at once accounted for in that way involve serious grounds of suspicion, and should be thoroughly sifted. Inasmuch, however, as the circumstances which end in bankruptcy are often of a very complicated character, and difficult to disentangle, it is not easy to lay down any general rules for dealing with them. And hence it is that the laws with respect to bankruptcy have differed very widely in different countries and periods of society, and that it is not, perhaps, possible to suggest any system against which pretty plausible objections may not be made.

The execrable atrocity of the early Roman laws with respect to bankruptcy is well known. According to the usual interpretation of the law of the Twelve Tables, which Cicero has so much eulogised (*De Orat.* lib. i.), the creditors of an insolvent debtor might, after some preliminary formalities, cut his body to pieces, each of them taking a share proportioned to the amount of his debt; and those who did not choose to resort to this horrible extremity were authorised to subject the debtor to chains, stripes, and hard labour; or to sell him, his wife, and children, to perpetual slavery *trans Tiberim!* This law, and the law giving fathers the power of inflicting capital punishments on their children, strikingly illustrate the ferocious and sanguinary character of the early Romans.

There is reason to think, from the silence of historians on the subject, that no unfortunate debtor ever actually felt the utmost severity of this barbarous regulation; but the history of the republic is full of accounts of popular commotions, some of which led to very important changes, that were occasioned by the exercise of the power given to creditors of enslaving their debtors, and subjecting them to corporal punishments. The law, however, continued in this state till the year of Rome 427, 120 years after the promulgation of the Twelve Tables, when it was repealed. It was then enacted that the persons of debtors should cease to be at the disposal of their creditors, and that the latter should merely be authorised to seize upon the debtor's goods, and sell them by auction in satisfaction of their claims. In the subsequent stages of Roman jurisprudence farther

changes were made, which seem generally to have leaned to the side of the debtor; and it was ultimately ruled that an individual who had become insolvent without having committed any fraud should, upon making a *cessio bonorum*, or a surrender of his entire property to his creditors, be entitled to an exemption from all personal penalties. (Terasson, *Histoire de la Jurisprudence Romaine*, p. 117.)

The law of England distinguished, down to a late period (1861), between the insolvency of persons engaged in trade and that of others, the former being treated with comparative indulgence. But despite the elaborate reasonings of Blackstone in its favour (*Comment.* book ii. ch. xxxi.), there were no really good grounds for this preference. Vast numbers of traders found their way into the Gazette without being the victims either of accidental losses or unavoidable contingencies. All that was most revolting in the worst cases of insolvency was equalled or surpassed by many of the cases in bankruptcy. Recklessness, improvidence, and the obtaining of loans or advances under false pretences, are as common in one class of society as another; and though this were not the case, the classes excluded from the benefit of the Bankruptcy Acts had to encounter as many risks as the others. There are few trades so hazardous as that of a farmer, and yet if he became insolvent he was not entitled to the same privileges he would have enjoyed had he been the keeper of an inn, or a commission agent! The injustice of this distinction is obvious; but, without dwelling upon it, it is clear that discharges, which were not given to insolvents, should be granted indiscriminately to all honest debtors. Being relieved from all concern as to his previous incumbrances, an insolvent who has obtained a discharge is prompted to exert himself vigorously in future, at the same time that his friends are not deterred from coming forward to his assistance. But no one, however favourably disposed, could venture to aid an insolvent who continued liable to his previous debts with a loan; and he was discouraged, even if he had means, from attempting to earn anything more than a bare livelihood; so that, while creditors did not, in one case out of a hundred, gain the smallest sum by this constant liability of the insolvent, his energies and usefulness were forever paralysed. We, therefore, are glad that the distinction between bankruptcy and insolvency has been practically abolished. Every case of a failure to meet one's engagements should be tried on its own merits. Improvidence, extravagance, and bad faith are equally objectionable in the case of traders and non-traders, and should be dealt with in precisely the same way.

The law of Bankruptcy is administered by a Court which sits in London, and by district courts in Manchester, Birmingham, and other large towns. The County Court Judges have also the powers of Commissioners of Bankruptcy, and may act as such.

The Acts which constitute what are called a bankruptcy are specified in clauses 70-85 of the Act 25 & 26 Vict. c. 134. They all involve either an inability or a disinclination to pay one's just debts. They consist principally of allowing oneself to be imprisoned for a debt, a trader for fourteen days, and a non-trader for two months; going or escaping abroad with intent to defraud creditors; filing a declaration of inability to meet one's engagements; suffering execution to be levied by seizure and sale of goods; traders executing a conveyance of their property to trustees for the benefit of the creditors &c.

An adjudication of bankruptcy takes place upon

the debtor or a creditor to the extent of 50l. presenting a petition to the court, which, on proof of the statement, adjudges the debtor a bankrupt. An official assignee is then appointed by the court to ascertain and take care of the debtor's property. The creditors also appoint an assignee, and the proceedings then take place which are specified in the Act, clauses 86-225, for realising and rateably dividing the property of the bankrupt among the creditors, or for otherwise winding up and terminating the bankruptcy.

Upon the bankrupt passing his last examination under the statute, the court appoints a meeting for considering whether a discharge should be granted to him, and the conditions under which it should be granted. Formerly discharges or certificates were of three kinds, but these distinctions are now abolished. The court is authorised, according to the estimate which it forms of the conduct of the bankrupt, to suspend his discharge, with or without protection from arrest, for such term as they may think fit, stating in the discharge the reasons for such suspension, and whether he has been imprisoned under the provisions of the Act. It is left to the creditors to determine whether any, and if any, what allowance shall be made to a bankrupt out of his estate.

And it is further enacted, that any bankrupt who has carried on trade by means of fictitious capital, or who could not have had, at the time when any of his debts were contracted, any reasonable or probable ground of expectation of being able to pay the same, or that, if a trader, he has, with intent to conceal the true state of his affairs, wilfully omitted to keep proper books of account, or, whether trader or not, that his insolvency is attributable to rash and hazardous speculation, or unjustifiable extravagance in living, or that he has put any of his creditors to unnecessary expense by frivolous or vexatious defence to any action or suit to recover any debt or money due from him, the court may either refuse an order of discharge, or may suspend the same from taking effect for such time as the court may think fit, or may grant an order of discharge subject to any condition or conditions touching any salary, pay, emoluments, profits, wages, earnings, or income, which may afterwards become due to the bankrupt, and touching after-acquired property of the bankrupt, or may sentence the bankrupt to be imprisoned for any period of time not exceeding one year from the date of such sentence.

But, despite these and other penalties embodied in the Act, we are strongly impressed with a conviction that bankruptcy is treated in this country with too much indulgence. The offences specified in the Act are mostly of a very grave character, and some of them deserve to be very severely treated. But it so happens that it is often very difficult to establish by the evidence of witnesses some of the least justifiable and most common causes of bankruptcy, such as extravagant living, which is its great source, improvident speculation, and so forth. And we doubt whether any such evidence should be required. Bankruptcy, or the failure of individuals to fulfil their engagements, is, and should be considered a very serious offence. But, like other offences, it is of various degrees of magnitude, and may arise from very different causes. There is a wide difference between bankrupts who pay their creditors 10s., 15s., or 18s. per pound, and those who pay them only 1s. or 2s. per ditto, and it is not reasonable that they should be treated in the same way. Innumerable accidents and disappointments may occur to hinder a man from meeting his engagements; but if he have lived within his income and properly proportioned

his speculations to the extent of his capital, it is difficult to see how he should be unable to pay a dividend of less than 10s. or 12s. per pound on his debts. And supposing this to be a correct view, it might be safely enacted that all bankruptcies in which the estates realised less than 10s. per pound of dividend should *ipso facto* be held to be fraudulent, or caused by improper proceedings on the part of the bankrupts; and that they should be dealt with accordingly, unless they succeeded in satisfactorily establishing the propriety of their conduct. In cases where the dividend exceeded 10s., it might, as at present, be left to the creditors to arraign the proceedings of the bankrupts in opposing their discharge.

We do not well see how a system of this sort could be justly objected to. Those who make improvident speculations, or who pursue a line of conduct which involves them deeper and deeper in debt and difficulties, cannot fail to know that they must necessarily become bankrupts; and, if they only injured themselves, few would regret the hardships which they might suffer. But they are sure to injure others—the savings on which the industrious and frugal had to depend being often squandered by the most unworthy parties, and on the most unworthy objects. Bankruptcy, when not occasioned by uncontrollable or unlooked-for causes, is, in truth, a great crime. Individuals who systematically contract debts which they have no reasonable prospect of being able to pay—who, to obtain loans, misrepresent the true state of their affairs, and pervert them, when obtained, to spendthrift or dishonest purposes—are one of the worst varieties of swindlers. And the vast extent to which bankruptcy is carried, the extravagance and bad faith of many bankrupts, and the frequent non-existence and inconsiderable amount of the dividends, show the extent and malignancy of the disease, and the propriety of taking measures for its abatement.

The policy of imprisoning for debt, when nothing unfair or improper is involved in its contraction, is not a little questionable. Notwithstanding the deference due to the authorities who have vindicated this practice, we confess we are unable to discover anything very cogent in the reasonings advanced in its favour. Provided a person in insolvent circumstances intimate his situation to his creditors, and offer to make a voluntary surrender of his property to them, he has, supposing he has acted honestly, done all that should be required of him, and ought not to undergo any imprisonment. If, indeed, he have deceived his creditors by false representations, or have grossly misconducted himself, or have endeavoured to convey away any part of his property, then, undoubtedly, he should be subjected to the pains and penalties attached to swindling; but when such practices are not alleged, or cannot be proved, sound policy, we apprehend, would dictate that creditors should have no power over the persons of their debtors, and that they should be entitled only to their effects. The maxim *carcer non solvit* is not more trite than true. It is said that the fear of imprisonment operates as a check to prevent persons from getting into debt, and so no doubt it does. But then it must, on the other hand, be borne in mind, that the power to imprison tempts individuals to trust to its influence to enforce payment of their claims, and makes them less cautious in their enquiries as to the condition and circumstances of those to whom they give credit. The carelessness of tradesmen, and their extreme earnestness to obtain custom, are, more than anything else, the great causes of insolvency,

and the power and encourage an individual which he is speculation. done so, be all. If he wished should not ha with him only tions are, on voluntary; an a debtor who l representations only to blame. It is pretty a prisonment in

and the power of imprisoning merely tends to foster and encourage these habits. If a tradesman trust an individual with a loan of money or goods, which he is unable to pay, he has made a bad speculation. But why should he, because he has done so, be allowed to arrest the debtor's person? If he wished to have perfect security, he either should not have dealt with him at all, or dealt with him only for ready money. Such transactions are, on the part of tradesmen, perfectly voluntary; and if they place undue confidence in a debtor who has not misled them by erroneous representations of his affairs, they have themselves only to blame.

It is pretty evident, too, that the efficiency of imprisonment in deterring individuals from running

into debt has been greatly overrated. Insolvents who are honest must have suffered from misfortune or been disappointed in the hopes they entertained of being able, in one way or other, to discharge their debts. The fear of imprisonment did not greatly influence such persons; for when they contracted debts, they had no doubt of their ability to pay them. And though the imprisonment of bonâ fide insolvents be abolished, it could give no encouragement to the practices of those who endeavour to raise money by false representations; for these are to be regarded as swindlers, and ought as such to be subjected to adequate punishment. [CONTINUED.]

The following return sets these statements in the clearest point of view:—

Return for the Year ending October 11, 1865, of Judicial and Financial Matters transacted under (Parl. Paper, No. 31, Sess. 1864) the Bankruptcy Act of 1861.

The Acts of Parliament under which bankruptcy is administered in Scotland are 19 & 20 Vict. c. 29, explained by 20 & 21 Vict. c. 19, and amended by 23 & 24 Vict. c. 19. (Mr. Murdoch's Law of Bankruptcy and Insolvency.)

**Bankruptcy in Ireland.**—The Irish law of Bankruptcy is generally identical with that of England before the Act of 1861. The distinction between traders and non-traders is still retained, though the same judges adjudicate in cases of bankruptcy and insolvency.

The following tables, extracted from official returns, give the number of deeds registered between April 11, 1865, and April 11, 1866, with the rates of composition paid:—

Bankruptcy is considered in France as simple and fraudulent, bankruptcy being distinguished from insolvency.

The French law of bankruptcy in its characteristic particulars has been admitted into many European countries, and appears to make progress. That of the United States agrees generally with the English law of 1849, which, as we have seen, is stricter than the present law of England.

**BARCALAO or BACALAO.** The Spanish name for cad.

**BARCELONA.** The capital of Catalonia, and the principal town of Spain, on the Mediterranean, lat. 41° 22' 58" N., long. 2° 8' 11" E. It is a strongly-fortified, well-built city. The population, which has rapidly increased, amounted, in 1857, to 242,015. Barcelona is eminently distinguished in the history of the middle ages for the zeal, skill, and success with which her citizens prosecuted commercial adventures at a very early period. She would seem also to be entitled to the honour of having compiled and promulgated the

famous code of maritime law known by the name of the *Consolato del Mare*; and the earliest authentic notices of the practice of marine insurance and of the negotiation of bills of exchange are to be found in her annals. For proofs of this, see ISSUJANSEF, MARITIME LAW, &c. The *Memorias Historicas sobre la Marina, Comercio &c. de Barcelona*, by Capmany, in 4 vols. 4to. is one of the most valuable and authentic works on the commerce, arts, and commercial and maritime legislation of the middle ages. The first volume is the most interesting, at least to the general reader; the others consisting principally of extracts from the archives of the city. There is a brief but pretty good account of the early trade of Barcelona, drawn principally from Capmany, in the work of Depping, *Histoire du Commerce entre le Levant et l'Europe depuis les Croisades &c.* tom. i. ch. v. Catalonia has continued, amidst all the vicissitudes it has undergone, to be the most industrious of the Spanish provinces. Many very extensive manufactures, especially of silk and cotton, have been established in Barcelona, and within the last 10 or 12 years an extraordinary degree of enterprise has been infused into all classes of the population. In 1865 the town had no fewer than 7 banking companies, 10 maritime insurance companies, 5 railway companies, 4 steam navigation companies, 3 canal companies, 3 gas companies &c. The Bank of Barcelona, which was founded in 1844, has a capital of 80 millions of reals, of which 20 millions have been paid up. It has been well managed; and its success has led to the formation of other banking and discount companies. Another company recently formed deserves special mention, being for the establishment of an electric telegraph to connect Barcelona with France and Europe generally on the one side, and with Madrid through Tarragona on the other. It is true that some of the many companies formed of late years have been wound up; but others continue in a flourishing state. The railways which centre in the city, and are being extended into the interior, will be of infinite advantage to its industry and trade.

The Harbour, which is naturally bad, is formed by a mole or jetty, which has recently been a good deal enlarged, running out to a considerable distance in a southerly direction, and having a lighthouse and some batteries near its extremity. The depth of water within the mole is from 18 to 20 feet; but there is a bar between the mole and Monjouch, which has frequently not more than 10 feet water; and which would, it is believed, entirely shut up the harbour, were it not occasionally lowered by means of dredging machines. Vessels in the harbour moor at a short distance from the mole: where, though exposed to the southerly gales, they are so well protected that no accident of any consequence has taken place since the dreadful storm of 1821. Large ships must anchor outside the mole, and in winter are much incommoded by winds. Vessels entering the harbour are under no obligation to take a pilot on board; but they are always in attendance, and it is generally deemed safest to have their assistance in passing the bar.

The port of Barcelona is being considerably increased by the carrying out of a sea-wall from the shore under Fort Monjouch and by another prolonging the old extremity of the mole so as to approach at some distance, leaving a good entry. Much of this work has been effected already, and which will enable vessels to ride safely within the port, but the works are far from terminated; when concluded, the port will be capacious and safe, though as for its depth much dredging will be re-

quired to keep it clean and useful. The depth of water is not above 20 feet.

The principal articles of import are raw cotton; sugar, coffee, cocoa, and other colonial products, principally from Cuba and Porto Rico; salted fish, hides, and horns; iron and hardware; machinery, coal &c. have lately been imported in large quantities, principally from England. Most species of manufactured goods are prohibited; but it is needless to add that they are notwithstanding largely introduced into this as into most other parts of Spain. The trade with the colonies, France, and the coasting trade is active and increasing. Catalonia being the grand seat of the Spanish cotton trade, the imports of raw cotton are very considerable. In proof of this, it may suffice to mention that in the year ending June 30, 1858, no fewer than 80,043 bales (36,805,962 lbs.), worth 4,516,244 dolrs., were shipped from the United States for Spain on the Mediterranean, that is, for Barcelona; at the same time that additional supplies were obtained from Brazil and other parts. 50,000 to 100,000 persons, mostly in Catalonia, are said to be dependent on the manufacture. The raw cotton is principally imported in Spanish ships. The direct imports from England, ex. coal, are not very considerable, and the exports to her still less.

The chief exports are wrought silks, cotton stuffs, soap, fire-arms, paper, hats, laces, ribands, steel &c. The principal articles of native produce that Catalonia has to export are most conveniently shipped at Villanova, Tarragona, and Salon. They consist of wine, brandy, nuts, almonds, cork bark, wool, fruits &c. A good deal of brandy is sent to Cadiz and Cette: most part of the former finds its way into the wine vaults of Xeres; and the latter, being conveyed by the Canal of Languedoc to the Garonne, is used in the preparation of the wines of Bordeaux. From 25,000 to 30,000 bags of nuts are annually sent from Tarragona to England. Tarragona also exports about 12,000 bags of almonds.

In the years 1861-2-3, the tonnage which cleared from Barcelona was 195,607 with cargoes; 74,393 in ballast; 177,712 with cargoes; 63,716 in ballast; 307,905 with cargoes; 71,813 in ballast; while that which entered was 240,923 with cargoes; 5,666 in ballast; 237,615 with cargoes; 5,795 in ballast; 344,555 with cargoes; 4,793 in ballast respectively. The imports and exports and merchandise cleared coastwise were in value as follow:—

	1861	1862	1863
Imports - - -	reales 265,309,789	reales 342,969,187	reales 405,872,631
Exports - - -	146,065,104	149,111,380	132,015,918
Coasting trade, entered	435,295,012	367,961,968	334,799,000
cleared - - -	471,931,761	369,612,814	359,286,153
Total - - -	1,141,701,206	1,339,758,239	1,432,969,223
	214,111,012	215,597,582	214,528,692

The trade of Barcelona is by far the largest of any Spanish port, and a spur has been given to it by the opening of the railway which now connects it with Madrid, and the most important towns of Spain, and with the rest of Europe.

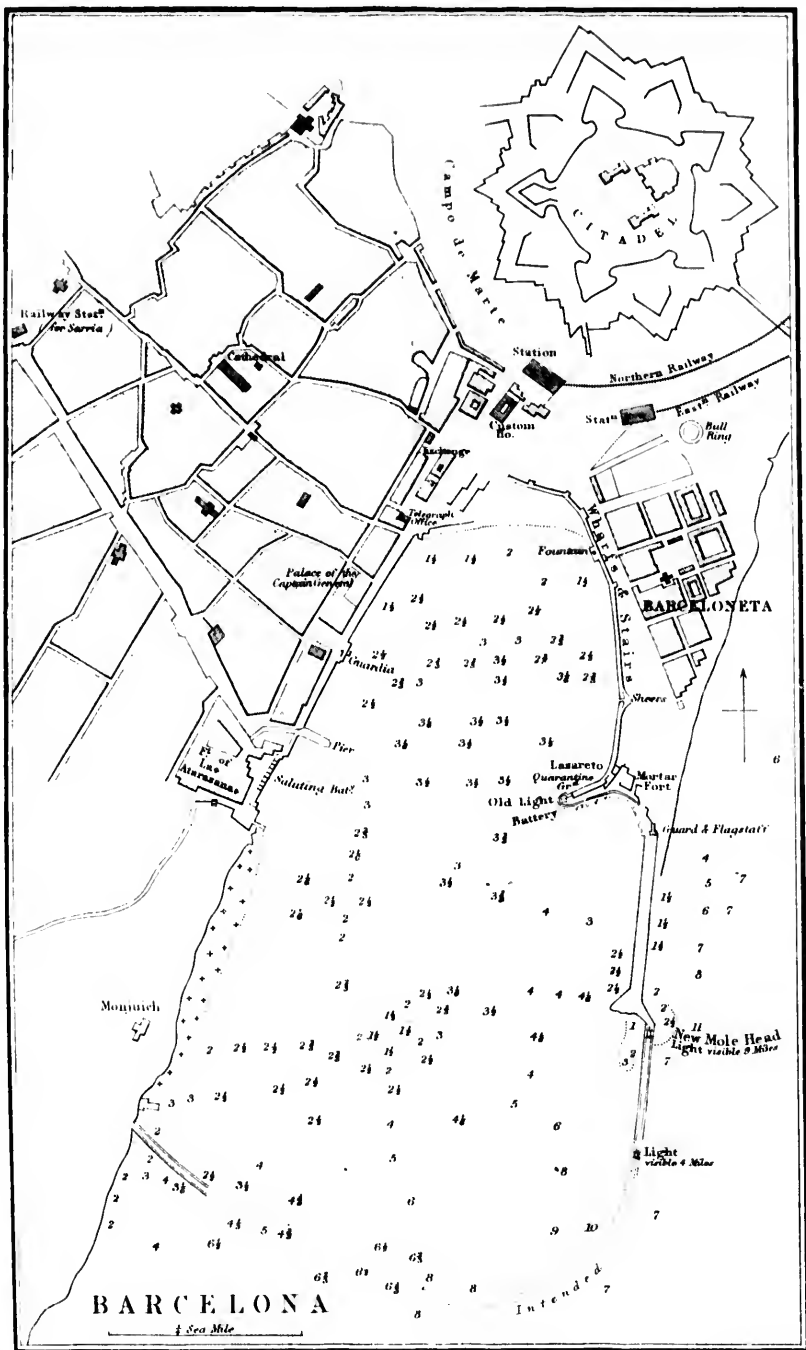

*Custom-house and Warehousing Regulations* same as at ALICANT.

Port charges have been reduced, and are now nearly identical for Spanish, British vessels, and most of the Foreign, being uniformly exacted on Tonnage.

*Port dues now paid by British vessels.*—Anchorage at 1 real (2½d.) per ton, Spanish measure; lighthouses, 1 real per ton; navigation dues, one-eighth of a real per Spanish hundredweight; of cargo taken in or discharged.

marine and other  
The best, or *Alican*  
*Salsola soda*, whic  
for this purpose in  
places on the easter

*Extra dues paid for support of works carried out to improve the port.*—Anchorage,  $\frac{1}{2}$  real per ton; lighthouses,  $\frac{1}{2}$  real per ton; navigation,  $\frac{1}{2}$  real per Spanish cwt.; and health dues,  $\frac{1}{2}$  real per ton on arrivals from European ports, and 1 real on those from America.

*Commission* is at the rate of 2 $\frac{1}{2}$  per cent. on goods shipped, and 2 per cent. on those received on consignment. Goods are sometimes sold for ready money, and sometimes on credit for 3 or 4 months.

*Taxes.*—At the Custom-house, real taxes only are allowed; and the net weights must be rigorously manifested. A surplus of 3 per cent. is, however, allowed to cover any inexactness in the net portion between foreign and Spanish weights; but if the weight of any parcel should turn out to be 3 per cent. greater than is marked in the manifest, the surplus is seized, at the same time that the importer loses the benefit of the 3 per cent. allowed by law, and becomes liable to the penalties of smuggling. The taxes usually allowed by merchants are, on Havannah sugar 13 per cent.; on coffee 2 per cent., exclusive of the barrel, bag &c. in which it is contained; on cocoa and pepper 2 per cent.; Pernambuco cotton 4 lbs. per bale; other cotton 1 lb. per cwt.

*Money.*—Accounts are kept in *libras* of 20 *suelos*, 240 *dineros*, or 480 *mallas*. The *libra* is likewise divided into *reales de plata Catalan*, of 3 *suelos* each; and into *reales arditos* of 2 *suelos* each. Hence, 67 of the former, or 10 of the latter, = 1 *libra Catalan*.

The *libra Catalan* is = 2s. 4d. sterling nearly.

The *peso duro*, or hard dollar, is valued at 37 $\frac{1}{2}$  *suelos Catalan*, eight such dollars making 15 *libras*.

*Weights and Measures.*—There are endless discrepancies amongst the weights and measures in the different Spanish provinces, and there is a very great discrepancy in the accounts of the authors who have written upon them. The following statements are taken from Nelkenbröcher:—

The quintal is divided into 4 *arrobas*, or 104 lbs. of 12 oz. to the pound. The pound = 6,174 English grains = 4 kilog. = 8325 $\frac{1}{6}$  av. of Holland. 100 lbs. of Barcelona = 88·215 lbs. avoirdupois.

The yard, named *cana*, is divided into 8 *palmos*, of 4 *quartos*, and is = 21 inches very nearly. Hence, 100 *canas* = 53·499 metres = 77·5 yards of Amsterdam = 58·514 English yards.

The *quartera*, or measure for grain, is divided into 12 *cortanes* and 48 *picolins*. 100 *quarteras* = 23·536, or 23 $\frac{1}{2}$  Winchester quarters.

The *carga*, or measure for liquids, is divided into 12 *cortanes* or *arrobas*, 24 *cortanins*, and 72 *mitadellas*. It is = 32·7 English wine gallons. 4 *cargas* = 1 *pipe*. The pipe of Majorca oil contains 107 *cortanes*.

(We have derived these details from various sources; but principally from a report obligingly given us for this work by Mr. Baker, and from Inglis's *Spain* in 1830, vol. ii. pp. 381-387, 362.)

**BARILLA** (Dutch, *soda*; Fr. *soude*, *barille*; Ger. *soda*, *barilla*; Ital. *barriglia*; Port. *solda*, *barrilha*; Russ. *socianka*; Span. *barilla*; Arab. *kali*). Carbonate of soda [ALKALIES] is found native in Hungary, Egypt, and many other countries. It is largely used by bleachers, manufacturers of hard soaps, glass-makers &c. The barilla of commerce consists of the ashes of several marine and other plants growing on the sea-shore. The best, or Alicant barilla, is prepared from the *Salsola soda*, which is very extensively cultivated for this purpose in the *huerta* of Murcia, and other places on the eastern shores of Spain. (Townsend's

*Travels in Spain*, vol. iii. p. 195.) The plants are gathered in September, dried and burned in furnaces heated so as to bring the ashes into a state of imperfect fusion, when they concrete into hard, dry, cellular masses of a greyish blue colour. Sicily and Teneriffe produce good barilla, but inferior to that of Alicant and Carthagena. Kelp, which is a less pure alkali, is formed by the incineration of the common sea-weed. [KELP.]

The Saracens established in Spain seem to have been the first who introduced the manufacture of barilla into Europe. They called the plants employed in its preparation *kali*; and this, with the Arabic article *al* prefixed, has given rise to the modern chemical term alkali. Prime quality in barilla is to be distinguished by its strong smell when wetted, and by its whitish colour. Particular attention should be paid to have as little small or dust as possible.

The manufacture of artificial *soda* (*soude*; *factive*), now very extensively carried on, occasioned an extraordinary decline in the imports of barilla, the quantity entered for home consumption in 1831, amounting to 237,712 cwt., having been reduced in 1841 to 47,380 cwt. Considerable quantities are imported from Teneriffe, Alicant in Spain, Sicily, the United States, and Russia. Thus, of 1449 tons imported in 1857, 819 came from the Canary Islands, 158 from Italy (Sicily), 122 from the United States, and 103 from Russia. The duty on barilla, after being reduced in 1842 from 40s. 10s. a ton, was wholly repealed in 1845. But this judicious measure has not had so much influence over the consumption of the article as was expected.

**BARK.** The outer rind of trees. There is an immense variety of barks known in commerce as cinnamon, Peruvian bark, oak bark, quercitron &c. The term *bark* is, however, generally employed to express either Peruvian bark, or oak bark and quercitron, and it is these only we here notice.

Peruvian bark (Fr. *quinquina*; Ger. *kronchina*; Dutch, *china-bast*; Span. *quina*, *quenquina*; Lat. *quenquina*, *Cortex Peruvianus*). There are several sorts of this bark known in commerce. The first sort is the *pale bark* of the shops. It is the original *cinchona* of Peru, and is the produce of different varieties of the *Chinchona officinalis* of Linnæus. The sorts called *Condaminca*, *Bonplandiana* and *Crispa* or *Crespilla* are now naturalised in India and flourishing on the higher ranges of the Neilgherries, and the *C. Succirubra* and *C. Calisaya*; and are also largely propagated in the Government plantations, with every prospect of successful results in India, Ceylon, and the West Indies. This sort is usually imported in chests covered with skins, each containing about 200 lbs. well packed, but generally mixed with a quantity of dust and other heterogeneous matter. It consists of pieces 8 or 10 inches long, some of them being scarcely one-tenth of an inch thick, singly and doubly quilled or rolled inwards, the quills generally being in size from a swan's quill to an inch and a half. It is internally of a pallid fawn or cinnamon hue, but approximates, on being moistened, to the colour of a pale orange. When in substance it has scarcely any odour, but during the decoction the odour is sensible and agreeably aromatic. The taste is bitter, but not unpleasant, acidulous and austere.

The second sort, or *red bark*, is obtained from the *C. Succirubra* growing on the Andes, chiefly in Ecuador in the forests of Chimborazo, where the true *red bark* is known as the '*Cascarilla roja*,' and its production appears at present to be confined to the district lying between 1° and 2°

S. lat. and 30' and 40' W. long. of Guilo. It is, however, supposed to have within a recent period existed in all the valleys of the Andes which debouch in the Guyanulian plain, but in most of these districts it has been completely exhausted. The red bark is imported in chests containing from 100 to 150 lbs. each. It consists of various sized pieces, most of them flat, but some partially quilled or rolled. The internal part is woody, and of a rust red colour; it has a weak peculiar odour, and its taste is much less bitter, but more austere and nauseous than that of the other barks.

We would refer for a description of the mode of collecting the bark to a report by Mr. Spruce to the Under-Secretary of State for India (*Parl. Papers, Return E. India Cinchona Plant*, 1863, No. 118, p. 65 et seq.) with reference to his expedition to the red bark tree districts, Limon, the situation to which Mr. Spruce's observations refer, is at the junction of a stream of that name with the river Chasuan.

The entire quantity of the red bark collected in 1859 did not reach 50 quintals, and it was sold for 43 dols. the quintal. In 1860 no red bark at all was got out, so that the trade in it is well nigh extinct.

The third sort of yellow bark of the shops is obtained from the *Cinchona Calisaya*, growing in Bolivia and the Peruvian province of S. Carabaya. It is imported in *serons*, containing 6 *arrobas* of about 150 lbs. each, and consists of pieces 8 or 10 inches long, some quilled but greater part flat. The interior is of a yellow colour passing to orange. It has nearly the same odour in decoction as the pale; the taste is more bitter and less austere, and it excites no astringent feeling when chewed. The *C. Calisaya* is used in the manufacture of sulphate of quinine and is consequently of great commercial value. The forests of New Granada yield several sorts of bark used in quinine manufactures. The most valuable of these are the *C. pitaya* and the *C. lancifolia*, which have recently been imported into Europe in great quantities. According to Dr. Macpherson's account of the medico-botanical history of cinchona, it was first introduced into Europe in 1540, and it is stated that the value of Peruvian bark as a medicine was first made known in connection with the cure of the Countess of Chinchon, whence the name Cinchona or more properly Chinccona.

The quantity exported from Payta (the port of Loxa) in 1860 was 1,400 quintals of pale bark at 30 dols. the quintal. The quantity exported from Arica in 1859 was 1,926 quintals, valued at 17,341, and from January to November 1860 it was 3,888 quintals valued at 35,000. From Islay in 1863 the quantity exported was 3,615 quintals, valued at 100 dols. per quintal, or 361,500 dols. The bark from Islay is yellow bark.

The exhaustion of the Bolivian bark tree forests led the Government of Bolivia to establish in 1859 a 'bank of bark'; but as this institution was granted a monopoly of the export of bark, the result was, as stated by Dr. Forbes Royle, rather to enhance the price than to continue the preservation of the supply.

The increasing cost of the article and the danger arising from the reckless system of destruction of the bark-trees pursued by the owners of the Bolivian forests, added to the great cost of the supply of the article for the British service in India (stated by Mr. Markham to have been 53,000*l.* in the years 1857-8), induced the British Government to endeavour to introduce the cultivation of the Cinchona in the hill districts of British India. Dr. Forbes Royle had recommended its introduction in 1835,

in his work on Himalayan Botany, suggesting that it might be cultivated on the slopes of the Neilgherries, and he again recommended that endeavours should be made with the same object in 1847, and his recommendations were strongly supported by Dr. Falconer, superintendent of the Hon. East India Company's Botanic Gardens in 1852. At length, in 1859, Mr. Clements Markham was instructed by Lord Stanley, then Secretary of State for India, to proceed to Peru with a view to procure seeds and plants of the Cinchona and to convey them to India, to which country, in conjunction with Mr. Spruce, a botanist, and Mr. Cross, a practical gardener, he succeeded, after innumerable difficulties owing principally to the jealousy of the Peruvian Government, in conveying upwards of 400 plants of the *C. Calisaya*, where they were planted at the nursery at Ootacamund. These plants were, however, reported as all dead at the end of 1860, but Mr. Cross succeeded in arriving in April 1861, with 463 plants of the *C. succirubra* and six plants, brought from England, of the *C. Calisaya*, *C. canicifolia*, and *C. Paludiana*. From this stock the present Cinchona plantations in India have been established with results so successful, that the number of plants growing on the Neilgherries in February 1863 was as follows:—

Number and Distribution of Cinchona Plants on the Neilgherries, on February 23, 1863.

Botanical Names	Commercial Names	No. of Plants	Value per Pound of Dry bark in the London Market
1. <i>C. succirubra</i>	Red bark	48,989	6 to 8 3/4
2. <i>C. Calisaya</i>	Yellow bark	1,180	10 1/2 to 7 0
3. <i>C. Urtucifolia</i>	Original Loxa bark	927	10 1/2 to 7 0
4. <i>C. Condaminea</i>	Select crown bark	51,012	10 1/2 to 7 0
5. <i>C. Cereifolia</i>	Fine crown bark	825	10 1/2 to 6 0
6. <i>C. lancifolia</i>	Pitaya bark	11	8 1/2 to 10
7. <i>C. nitida</i>	Genuine grey bark	8,514	8 1/2 to 9
8. <i>C. species without name</i>	Fine grey bark	2,595	8 1/2 to 10
9. <i>C. micrantha</i>	Grey bark	8,346	8 1/2 to 9

11. <i>C. Paludiana</i>	Unknown	425	Wordless
Total number of plants		155,739	

The Dutch Government attempted to introduce the Cinchona into their East Indian possessions in 1852, and Mr. Hasskarl succeeded in 1854 in introducing it into Java, where the plants are now thriving. The principal plantations are situated on the Kending and Malabar range of mountains in the southern portion of the island.

The quantity of Peruvian bark imported into Great Britain in 1866 was 13,797 cwt., valued at 109,477*l.*

The above has been compiled chiefly from information furnished by J. E. Howard, Esq., the author of the *Nueva Quinologia de Paron*, and from *Parl. Paper* 118, 1863, East India Cinchona. See also Dr. Weddell's *Quinologia*.

The encarrilleros or peelers usually destroy the tree by stripping off its bark as it stands; whereas were they to cut it close to the ground, young shoots would spring up, which would in their turn become fit for peeling in from six to twenty years. This reckless destruction, coupled with the enormous demand for quinine in Europe, has occasioned so great a scarcity, that the authorities in Upper Peru contemplate placing an interdiction on the exportation of bark for a series of years. It is asserted that 800 to 900 trees are cut down in order to furnish 11,000 pounds of bark, and that 25 to 50 ounces, 1/2 to 3 per cent., are

the two extremes of quinine from 100 pounds. The sum expended by the Indian Government in the purchase of this valuable medicine is stated to exceed five lacs of rupees annually. Madras consumes, on an average, 2,090 lbs. of bark and 451 of quinine. Great Britain imports annually about 400,000 lbs. of bark, and retains towards 120,000 lbs. for home consumption.

The following represents the imports &c. of Peruvian bark in the year 1863:—

The re-exports of bark from Great Britain to foreign countries in 1865 amounted to 14,975 cwt., of which 5,517 cwt. went to Holland and 3,307 cwt. to France. Sulphate of quinine is manufactured in great quantities at Stuttgart in Württemberg, and in France, from which sources the continent of Europe is largely supplied.

The superior cheapness of the German and French quinine is probably in some degree owing to the lower cost of the alcohol used in its production.

**Quercitron Bark.**—We are indebted for the discovery and application of the useful properties of quercitron to Dr. Bancroft, who obtained a patent for his invention in 1775; but the American war breaking out soon after, deprived him of its advantages. In consideration of this circumstance, Parliament passed, in 1785, an Act (25 Geo. III. c. 38) securing to him the privileges conveyed by his patent for fourteen years. At the expiration of the latter period the House of Commons agreed to extend his privilege for an additional seven years, but the House of Lords rejected the bill. Like too many discoverers, Dr. Bancroft profited but little by his invention, though it has been of great use to the arts and manufactures of the country. (Bancroft *On Permanent Colours*, vol. ii. p. 112; *Report of the Committee of the House of Commons on Patents*, Appendix, page 175.)

**BARLEY** (Fr. orge; Ger. gerstengraupen; Dutch, ryg; Ital. orzo; Span. cebada; Russ. fatchmea; Lat. hordeum; Arab. dhourra; Hind. jaw). A species of bread-corn (*Hordeum*, Linn.), of which there are several varieties. It is extensively cultivated in most European countries, and in most of the temperate districts of Asia and Africa. It may also be raised between the tropics; but not at a lower elevation than from 3,000 to 4,000 feet, and then it is not worth cultivating. Large quantities of barley have been, for a lengthened period, raised in Great Britain. Recently, however, its cultivation has been supposed, though probably on no good grounds, to be declining. In 1765 Mr. Charles Smith estimated the number of barley consumers in England and Wales at 739,000; and as a large proportion of the population of Wales, Westmoreland, and Cumberland continue to subsist chiefly on barley bread, we are inclined to think that this estimate may not, at present, be very wide of the mark. But the principal demand for barley in Great Britain is for conversion into malt, to be used in the manufacture of ale, porter, and British spirits; and though its consumption in this way has not certainly increased proportionally to the increase of wealth and population, still there does not seem

to be any ground for supposing that it has diminished. Barley is also extensively used in fattening black cattle, hogs, and poultry. It now generally follows turnips, and is a very important crop in the rotation best adapted to light soils. The principal barley countries of England are Norfolk, Suffolk, Cambridge, Bedford, Herts, Leicester, Nottingham, the upper parts of Hereford, Warwick, and Salop. The produce varies, according to soil, preparation, season &c. from about 20 to 60 or 70 bushels an acre. The most usual crop is from 28 to 36 or 38 bushels. The Winchester bushel of good English barley generally weighs about 50 lbs., but the best Norfolk barley sometimes weighs 53 or 54 lbs. Its produce in flour is about 12 lbs. to 14 lbs. grain. Barley is a tender plant, and easily hurt in any stage of its growth. It is more hazardous than wheat, and is, generally speaking, raised at a greater expense, so that its cultivation should not be attempted except when the soil and climate are favourable for its growth.

The question whether malted or unmalted barley is the fittest food for cattle, has in this country practical interest. For purposes of revenue, a considerable duty is levied on malt. It is asserted that this duty checks the cultivation of barley on light soils, and that even when barley is grown, its most useful purpose, that of stimulating the flow of milk in cows, and of promoting the rapid growth of fat stock, is prohibited by the operation of an excise duty. The Act 27 & 28 Vict. c. 9 has indeed so far relaxed the excise system as to permit, under proper regulations and supervision, the malting of barley for the use of stock, the chief precaution taken in order to prevent the abuse of the privilege being the admixture of a certain amount of linseed meal with the malt. This, it appears, renders the malt permanently unfit for the manufacture of beer or spirit.

In the 11th Inland Revenue Report (1867), p. xxiii., it is stated 'The farmers, however, appear to be finding out by experience what science long ago indicated as the truth—that malt contains no feeding properties not possessed by barley, and that the cost of malting is worse than thrown away, because the barley during the process loses a portion of its nutritious constituents, its value as an article of food being proportionately diminished.' Number of samples examined for cattle-feeding purposes in 1866-7, only 95 as against 462 in the preceding year. The customs' duty on foreign barley, pearled, is 4*d.* per cwt.

(For details as to the prices of barley, the quantities imported and exported &c. see **CORN LAWS AND CORN TRADE**; and for further details as to its consumption and culture, see Smith's *Tracts on the Corn Trade*, 2nd edition, p. 182; Brown *On Rural Affairs*, vol. ii. p. 42; Loudon's *Encyclopedia of Agriculture*; and *Report of the Relative Values of Malted or Unmalted Barley as Food for Stock*, presented to Parliament in 1866.)

**BARRATRY.** In Navigation, barratry is, in its most extensive sense, any fraudulent or unlawful act committed by the master or mariners of a ship, contrary to their duty to their owners, and to the prejudice of the latter. It appears to be derived from the Italian word *barratrare*, to cheat. It may be committed by running away with a ship, wilfully carrying her out of the course prescribed by the owners, delaying or deserting the voyage, deserting convoy without leave, sinking or deserting the ship, embezzling the cargo, smuggling, or any other offence whereby the ship or cargo may be subjected to arrest, detention, loss, or forfeiture.

It is the practice in most countries to insure against barratry. Most foreign jurists hold that it comprehends every fault which the master and crew can commit, whether it arise from fraud, negligence, unskillfulness, or mere imprudence. But in this country it is ruled that no act of the master or crew shall be deemed barratry unless it proceed from a *criminal or fraudulent* motive.

Barratry can only be committed by the master and mariners by some act contrary to their duty in the relation in which they stand to the owners of the ship. It is, therefore, an offence against them, and consequently an owner himself cannot commit barratry. He may, by his fraudulent conduct, make himself liable to the owner of the goods on board, but not for barratry. Neither can barratry be committed against the owner *with his consent*: for though he may be liable for any loss or damage occasioned by the misconduct of the master to which he consents, yet this is not barratry. Nothing is more clear than that a man can never set up as a crime an act done by his own direction or consent. (Marshall *On Insurance*, book i. ch. xii. s. 6.)

When, therefore, the owner of a ship is also the master, no act of barratry can be committed; for no man can commit a fraud against himself.

It is a maxim in law, that fraud shall not be presumed, but must be clearly proved; and it is a rule in questions of insurance, that he who charges barratry must substantiate it by conclusive evidence.

It is not necessary, to render an act barratrous, that it should be committed with a criminal intent as respects the owners, in order to injure them, or to benefit the captain or crew. It may even be committed with a view to promote the owner's interests; for an *illegal act* done without the authority or privity of the owners, and which proves detrimental to them, is barratry, whatever be the motives in which it originated. Lord Ellenborough, in an able judgment, has laid it down as clear law, 'that a breach of duty by the master in respect of his owners, with a fraudulent or criminal intent, or *ex maleficio*, is barratry; that it makes no difference whether this act of the master be induced by motives of advantage to himself, malice to the owner, or a *disregard of those laws which it was his duty to obey*; and that it is not for him to judge or suppose, in cases not intrusted to his discretion, that he is not breaking the trust reposed in him, when he endeavours to advance the interests of his owners by means which the law forbids, and which his owners also must be taken to have forbidden.'

The circumstance of the owners of ships being permitted to insure against the barratry of the master and mariners can hardly fail, it may be not uncharitably presumed, of rendering them less scrupulous in their enquiries with respect to their character than they would otherwise be. Perhaps, therefore, it might be expedient to prohibit such insurances, or to lay some restrictions upon them. They were, indeed, expressly forbidden by the Ordinance of Rotterdam; and Lord Mansfield, whose authority on all points connected with the law of insurance is so deservedly high, seems to have thought that it would be well to exclude barratry entirely from policies, and to cease 'making the underwriter become the insurer of the conduct of the captain whom he does not appoint, and cannot dismiss, to the owners who can do either.' But though it were expedient to prevent the owners from making an insurance of this sort, nothing can be more reasonable than that third parties, who freight a ship, or put goods on board, should be

allowed to insure against such a copious source of loss. In the maritime policies effected in France, the barratry of the master of the ship will, under certain circumstances, vitiate the claim to compensation, especially when the captain has been appointed by the claimant. (For a further discussion of this subject, see *MARINE INSURANCE*; and Marshall *On Insurance*, book i. ch. xii. s. 6, and Park *On Insurance*, ch. v.)

By 24 & 25 Vict. c. 100 s. 13 it is enacted that if any person set fire to any ship or part thereof, or any goods or chattels therein, or shall cast away any ship with intent to commit murder, he shall be guilty of felony, and liable, at the discretion of the court, to be kept to penal servitude for life, or for any term not less than three years, or to be imprisoned for any term not exceeding two years, with or without hard labour, and with or without solitary confinement.

**BARREL.** A cask or vessel for holding liquids, particularly ale and beer. Formerly the barrel of beer in London contained only 32 ale gallons = 32 imperial gallons; but it was enacted by 43 Geo. III. c. 69 that 36 gallons of beer should be taken to be a barrel; and by the 6 Geo. IV. c. 58 it is enacted that whenever any gallon measure is mentioned in any excise law, it shall always be deemed and taken to be a standard imperial gallon. At present, therefore, the barrel contains 36 imperial gallons. It may be worth while observing that the barrel or cask is an exclusive product of European ingenuity; and that no such article is known to any nation of Asia, Africa, or America, who have not derived it from Europeans.

**BARWOOD.** A red dye-wood brought from Africa, particularly from Angola, and the river Gaboon. The dark red which is commonly seen upon British Bandana handkerchiefs is for the most part produced by the colouring matter of barwood, saddened by sulphate of iron. (Bancroft *On Colours*.) The imports of barwood, in 1865, amounted to 2,347 tons. It is estimated, in the official accounts, as being worth about 3*l.* per ton.

**BARYTA, SULPHATE OF.** This substance is found native in many parts of the United Kingdom, and is known under the name of *heavy spar*.

Considerable importance attaches to this substance from the use which has latterly been made of it in the arts, as a body for paint. The native sulphate being crystallised, and therefore more or less translucent, is not available for this purpose, and when mixed with white lead, as is frequently done, must be looked on as an adulteration. That, however, which is prepared by artificial means is more opaque, though still far inferior in body and solidity to white lead. It has certain advantages, however. It is not affected as lead is by the vapour of sulphuretted hydrogen, and therefore does not blacken on exposure to the air, and its use is unattended with those deleterious effects which ensue from the constant manipulation of lead salts. Sulphate of baryta is used as a water-colour by artists, under the name of *permanent white* or *blank fix*. It is also said to be largely used in the manufacture of paper-hangings.

A very great impetus has been given to the use of barytes by the paper collar trade. When the collars were covered with white lead there was reason to fear that health might be endangered by the pores absorbing this deleterious substance. A durable enamel prepared from barytes has consequently been substituted, and with so much success, that upwards of twenty tons are daily

used in the city alone. (J. 1866.)

**BASKETS** panier; Spanish; Basket principally of osier, birch & splinters of wood of other articles of dry goods, and of quality and produced at and imported undevously to 185 year the duty peaked. Very baskets are imported.

**BAST.** MAT [HATS; MAT BATAVIA.

used in the collar manufactories of New York city alone. (*Journal of the Society of Arts*, Oct. 26, 1866.)

BASKETS (Fr. corbeilles; Ger. körbe; Ital. panier; Span. canastas, canastos; Russ. korshint). Baskets are made, as everyone knows, principally of the interwoven twigs of willows, osier, birch &c. but frequently also of rushes, splinters of wood, straw, and an immense number of other articles. They are used to hold all sorts of dry goods, and are constructed of every variety of quality and shape. Besides the vast quantities produced at home, some of the finer kinds were imported under an ad valorem duty, which, previously to 1854, was 10 per cent. In the above year the duty was reduced to 4d. It is now repealed. Very large quantities of rods for making baskets are imported.

BAST. Material for straw hats or bonnets. [HATS; MATTING.]

BATAVIA. A city of the Island of Java, the capital of the Dutch possessions in the East Indies, and the principal trading port of the Oriental Islands; lat. of lighthouse on the west pier, visible 13 miles off in clear weather, 6° 5' 4" S., long. 106° 47' 40" E., on the north-west coast of the island, on an extensive bay. The harbour, or rather road, lies between the main land and several small uninhabited islands, which, during the hoisterous or north-western monsoon, afford sufficient shelter, and good anchorage. Ships of from 300 to 500 tons anchor at about 1½ mile from shore. A small river runs through the town, which is navigable for vessels of from 20 to 40 tons, a couple of miles inland; a number of canals branch off from it into different parts of the town, affording great conveniences for trade. Batavia was formerly so very insalubrious, that General Daendels was anxious to transfer the seat of government to Sourabaya; but being thwarted in this, he set about building a new town, a little farther inland, on the heights of Weltevreden, whither the Government offices were immediately removed. Most part of the principal merchants now live in the new town, repairing to the old city, only when business requires it, during a portion of the day. In consequence, the old town is at present principally occupied by Chinese, and the descendants of the ancient colonists, several of its streets having been deserted and demolished. More recently, however, the Baron Capellen, whose enlightened administration will long be gratefully remembered in Java, sensible of the superior advantages of the old town as a place of trade, exerted himself to prevent its further decay, by removing the causes of its unhealthiness; to accomplish which, he widened several of the streets, filled up some of the canals, and cleaned others, demolished useless fortifications &c.: and the effect of these judicious measures has been, that Batavia is now as healthy as any other town of the island. The population, according to an accurate census taken in 1832, consisted of 2,800 Europeans, 80,000 natives, 25,000 Chinese, 1,000 Arabs, and 9,500 slaves; in all 118,300 persons, exclusive of the garrison. As the population has increased since, it may at present be estimated at from 140,000 to 150,000, independently of the military, of which there are always a considerable number. Among the principal merchants are Dutch, English, Americans, French, and Germans. The island of Java forms the most important portion of the Dutch possessions in the East, and is, in fact, one of the finest colonies in the world. It contains, inc. Madura, an area of 52,000 square miles, with a population on Dec. 31, 1862, of 13,380,770.

Foreign ships are admitted to the ports of Batavia, Samarang, and Sourabaya, on a principle of reciprocity. They are, however, prohibited from engaging in the coasting trade, which is reserved exclusively for Dutch and colonial ships. A large portion of the import and export trade of Java, especially the latter, has been engrossed by the Netherlands Commercial Company, established in 1819. But of late years the private traders have been gaining on the Company; and were it not for the patronage that has been injudiciously accorded to the latter by Government, its agents would most probably be driven from the field.

Tariff in force from January 1, 1866, to January 1, 1872.

Art. 1.—On all articles imported for consumption into Java and Madura, the west coast of Sumatra, Benkoelen, the Lampong districts, Palembang, Banca, Billiton, and West, South, and East sections of Borneo, a duty shall be paid as specified in the following tariff, save on articles positively exempted.

Art. 2.—Besides the goods exempt from import-duty, the following also may be imported free.

1. All goods for the use or on account of the Government.

2. a. All produce of the Netherlands East Indies where customs-duties are levied, as cotton goods, tobacco and cigars, must be followed by a certificate of export. b. All the produce of other Netherlands East India possessions and of the Inland friendly States of the Eastern Archipelago;—gambier excepted only on Java and Madura, besides woven cotton goods, tobacco and cigars.

The prohibitory stipulations relating to the import of some articles have nevertheless effect on these goods.

3. All goods on which duty is paid at one of the Netherlands India custom-boards.

When a higher duty must be paid at the second

place of import, the goods cannot enter before the difference is paid.

4. Clothes, linen, used furniture, and luggage of passengers (*regalen*), imported by them.

Art. 3.—An *Export* duty shall be paid on the articles, as specified in the following list, when they are exported from the countries named in Art. 1.

Articles	Rate	Duties when exported to	
		The Netherlands	Elsewhere
Bird's nests	value	6 per ct.	5 per ct.
Coffee	-	6 per ct.	9 per ct.
Hides	-	2 per ct.	2 per ct.
Indigo, not prepared for the inland market	n. pd.	10 cents.	15 cents.
Sugar	value	free	3 per ct.
Tin	100 n. pd.	3-50 fl.	5 fl.
Tobacco not prepared for the inland market	100 n. pd.	1 fl.	1 fl.

Art. 4.—When goods subject to a differential customs-duty are exported to the Netherlands, then the payment of the higher duties shall be warranted, according to the stipulations of the governor-general.

The lowest duty shall be levied only when it shall be proved that the goods are landed in their entirety within the term fixed by the governor-general in a Dutch harbour, out of the same ship in which they had been laden.

The governor-general may exempt from the higher duty when convinced that goods have been totally or partly lost at sea, or necessarily laden in another ship.

The governor-general may also exempt from the higher duty part of a cargo landed in one of the Dutch harbours, when it has been necessary, in consequence of a disaster on sea, to sell the rest of the goods in a foreign harbour.

Art. 5.—No export duty is to be paid on—

- The goods exported for the use or account of the Government;
- The goods on which the duty is paid at one of the Netherlands Indies custom-boards.

When a higher duty is due at the second place of export, then the goods cannot be cleared before the difference is paid.

Art. 6.—The rules about the import and export duties, and the particular stipulations for *Moera-Kompeh*, in Djambi, fixed by resolution of the governor-general of April 2, 1847, shall continue to have effect.

The governor-general may levy custom duties in those parts of the Dutch Indies not indicated in Art. 10 where as yet no duties were levied; provided that this shall take place after a non-differential tariff.

Art. 7.—On the import and export duties no additional cents are to be paid.

Art. 8.—The dock-duties (*entrepôt-gelden*), those for loading from one ship into another, and those for weighing (*waaggeld*), are abolished.

The governor-general fixes the tariffs of payment for warehousing and watching goods, and other services rendered.

Art. 9.—No duties on the transit will be levied.

Art. 10.—No import or export duties will be levied in the residency *Riouw*, its subjections on the east coast of Sumatra, not including the government of Celebes and subjections, the government of the *Maluccas*, and the residencies *Menado* and *Timor*. The application of this stipulation in the western, southern, and eastern sections of Borneo is reserved.

Art. 11.—Necessary measures will be taken to maintain the execution of this law, and to prevent the duties being evaded.

Bank of Batavia and other banks in Batavia in 1863. The structure of the Bank of Batavia, which had 2,000,000 florins subscribed was favourable and successful of the year, had the bank begun to enjoy rapid increase. Java led to a demand to pay on loans; and consisted of banks the profits being that they amount to the price of the 500 then also 1,550 as brief as it was bitant interest to the bank to make

*Bank of Batavia.*—A bank, for the issue of notes and other banking business, was established at Batavia in 1827, with branches at Samarang and Sourabaya; the history of which is not uninteresting. The capital of the bank, consisting of 2,000,000 florins, divided into 4,000 shares, was subscribed with difficulty; and the most unfavourable anticipations were entertained of the success of the establishment. No sooner, however, had the bank been set on foot, than she began to enjoy a large share of prosperity. The rapid increase of cultivation and commerce in Java led to a corresponding demand for capital, and to the payment of a very high rate of interest on loans; and as the loans made by the bank consisted of bank notes, which cost next to nothing, the profits became quite enormous; so much so that they amounted in 1837 to 33 per cent., the price of the 500 florin share of bank stock being then also 1,550 florins. But this prosperity was as brief as it was signal.—The offer of an exorbitant interest had tempted, in not a few cases, the bank to make advances on doubtful security;

and in Java, as elsewhere, issues of paper payable on demand necessarily stop the moment the circulation has been fully saturated with notes; and this result having been attained in 1838, and the notes issued by the bank being henceforth returned on her for payment, she speedily became involved in the greatest difficulties; many of those who depended on her advances for support were no longer able to meet their engagements; and the whole island was subjected to a severe pecuniary and commercial crisis: in fact, but for the intervention of the Government, in 1840, when bank notes were made *legal tender* for a limited period, she must have stopped payments! This intervention gave her time to recover from the difficulties into which she had been precipitated; and after sustaining a very heavy loss, she resumed specie payments. At present the maximum amount of notes which the bank may issue is fixed from time to time by the governor-general. In 1846 she was prohibited from making any dividends till the losses her capital had sustained during the crisis were made good.

 § Paper excepted.

**General Remarks on Java.**—The previous statements show that the produce and trade of Java have increased during the last 30 years with a rapidity unknown in any other colony, Cuba, perhaps, excepted. And if the resources and capabilities of this noble island be fully developed, it is quite impossible to say how much farther her trade may be extended. It would far exceed our limits, and, even were this not the case, it would involve us in discussions nowise suitable for this work, were we to enter into any detailed examination of the means by which the extension of culture in Java has been brought about. We may, however, shortly mention that the produce for exportation is principally raised on account of Government, partly by contributions in kind from the cultivators, these being, in fact, the rent of the land which the latter occupy, Government being here, as in Hindostan, the only, or, at all events, the paramount proprietor; and partly by a system of *corvée* or compulsory labour established on one-fifth part of the lands applicable to the culture of rice, of which Government has resumed the possession. And, provided these contributions and *corvées* be not carried to excess, we incline to think that they are at once the least onerous mode in which the natives can be made to pay their taxes, and the most profitable for the Government. It is, we apprehend, idle to suppose that industry, if left to itself, will ever become flourishing in a country like Java, where the wants of the inhabitants are so few and so easily satisfied, and where the climate indisposes to exertion. No doubt the system of compulsory labour may be easily abused and converted into

an instrument of the most grinding oppression; but so long as it is managed with discretion and good sense, we are disposed to believe, from all we can learn, that it is preferable to every other system hitherto devised for developing the resources of tropical countries. (Temminck, *Possessions Néerlandaises dans l'Inde Archipelagique*, i. 237 &c.)

Very great public improvements have also been already effected, and are still in progress, in the island. Among others, an excellent high road has been constructed through its whole length, from Bantam on its W. to Sourabaya on its E. coast, whence cross roads lead to all the principal stations. A number of forts have also been constructed in commanding situations in the interior, the principal of which at Surackarta, near the centre of the island, is a regular and strong citadel. It is said to be intended to transfer the seat of government thither from Batavia. These forts have been erected principally to keep the natives in check, and to prevent those outbreaks that have done so much to retard the prosperity of the island. Several important establishments have also been recently founded along the S. coast, which had previously been all but neglected. (Argout *Sur Java, Singapore* &c.)

Rice used to be the staple product of Java; but it is now far surpassed by coffee and sugar, the culture of both of which has been astonishingly increased. In proof of this we may mention that the exports of coffee, which in 1860 amounted to 268,740 piculs, had increased in 1864 to 1,017,596 do. or to 60,571 tons; while the exports of sugar,

which in 1864 increased in tons. More than in Batavia. The other products of Banca, tobacco. The importation of iron, with iron, has the Levant, and of other articles. Particular notice of the commandment not to land passengers to a boat from the landing, is first and afterwards office.—3. which in 1830 amounted to 108,640 piculs, had increased in 1854 to 1,793,510 piculs or 106,756 tons. More than half the trade of the island centres in Batavia.

Indigo has also become an important product. The other principal articles of export are tin from Banca, tobacco, tea, and birds' nests.

The imports comprise cottons, woollens, and other manufactured goods; wines and spirits, with iron, hardware, and machinery; opium from the Levant and from Bengal; and a great variety of other articles.

**Port Regulations.**—The following is the substance of the port regulations of Batavia: 1. The commander of a ship arriving in the roads is not to land himself, or permit any of his crew or passengers to land, until his vessel be visited by a boat from the guard ship.—2. The master, on landing, is first to wait on the master attendant, and afterwards report himself at the police office.—3. A manifest of the whole cargo must be delivered at the Custom-house within 24 hours of the ship's arriving in the roads.—4. The master of a vessel must lodge the ship's papers with the master attendant when he first lands, which are duly delivered up to him when he receives his port clearance from the same authority.—5. No goods can be shipped or landed after sunset, under a penalty of 500 florins.—6. No goods can be shipped on Sunday without a

special permission from the water fiscal, which, however, is never refused on application.—7. No muskets or ammunition can be imported; but the prohibition does not extend to bowling pieces exceeding 100 florins value.

**Money.**—Accounts are kept, at Batavia, in the florin or guilder, divided into centimes, or 100 parts, represented by a copper coinage or doits. The florin is a new coin made expressly for India, but of the same value as the florin current in the Netherlands. It is usually estimated at the rate of 12 to the pound sterling, but the correct par is 11 florins 58 cent. per pound. Doubloons, and the coins of continental India, are receivable at the Custom-house at a fixed tariff; the Spanish dollar, for example, at the rate of 100 for 260 florins.

**Weights.**—The Chinese weights are invariably used in commercial transactions at Batavia, and throughout Java and the other Dutch possessions in India. These are the picul and the cattie, which is its hundredth part. The picul is commonly estimated at 125 Dutch, or 133½ lbs. avoirdupois, but at Batavia it has been long ascertained and considered to be equal to 136 lbs. avoirdupois. (Hogendorp, *Coup d'Œil sur l'île de Java*, c. viii. &c.) By far the best work on Java, and generally on the Dutch possessions in the East, is that of Temminck, referred to above, in 3 tomes, Leide, 1846-49.

**BATTEN.** A name in common use for a scantling of wood 2½ inches thick and 7 wide. If above 7 inches wide, it is called *deal*.

**BAZAAR.** A term used in the East to designate a market, or building in which various articles of merchandise are exposed for sale. Bazaars are now met with in most large cities of Europe. There are several in London, of which the one in Soho Square is the most considerable. The largest of Eastern bazaars is said to be that of Tauris in Armenia, which is reputed to contain 15,000 shops, in which every kind of merchandise is exposed for sale. The bazaar of Ispahan encloses a square, which would, it is said, hold an army of near 40,000 men. That of Constantinople was built by Mahomet II. Sometimes these bazaars are devoted to the sale of special commodities, as drugs; and generally, when they are large, particular streets and districts are occupied by traders of one kind only.

**BDELLIUM.** This gum resin is of two kinds, known as Indian and African, the former produced by a tree found in India and Madagascar, and called *Amirys camphora*. The latter is said to be the produce of *Hendelotia africana*, a native of Senegal. It is found either in small and somewhat globular pieces, of a reddish colour, semitransparent and brittle, with a wax-like fracture; or in large irregular lumps of a dark brownish-red colour, less transparent, somewhat tenacious, and adhering to the teeth when chewed. Its medical properties are somewhat analogous to those of myrrh, but it is seldom used in modern pharmacy. (Wood and Bache, *United States Dispensatory*.)

**BEACONS.** In Commerce and Navigation, public marks or signals to give warning of rocks, shoals &c. No man is entitled to erect a light-house, beacon &c. without being empowered by law. The Trinity House corporation are authorised to set up beacons in whatever places they

shall think fit; and any person who shall wilfully remove or run down any buoy, beacon &c. belonging to the Trinity House, or to any other corporation, individual or individuals, having authority to establish it, shall, besides being liable to the expense of replacing the same, forfeit a sum of not less than 10l. nor more than 50l. for every such offence. (6 Geo. IV. c. 125 s. 91.) [BUOYS.]

**BEADS** (Fr. *rosaires*; Ger. *rosenkränze*; Dutch, *paternosters*; Ital. *corone*; Span. *coronas*). Small globules or balls used as necklaces, and made of different materials; as pearl, steel, amber, garnet, coral, diamonds &c. But those of crystal or glass, generally called *bugles*, are by far the most extensively produced, and form, indeed, how inconsiderable soever they may appear, an important commercial article. Roman Catholics use them in rehearsing their *Paternosters* and *Ave Marias*; and besides their consumption for these and other purposes in Europe, they are largely exported to Africa, the West Indies, India &c. They are produced to a greater or less extent in most parts of the Continent, but principally in Venice, which is, and has long been, the grand seat of their manufacture. In 1865 we imported the enormous quantity of 3,365,221 lbs. beads, of which no fewer than 3,054,763 lbs. were brought from Venice; the residue mostly came to us from Bohemia, through the Hanse Towns. In 1866 we imported 3,438,587 lbs. We re-export them in very large quantities to the places referred to above. Beads are, also, made in China, and sent to India and elsewhere.

The non-manufacture of beads in this country used to be ascribed to the influence of the glass duties; but the repeal of the latter has had little or no effect on their production. The truth is, that the colours of the Venetian beads, and their finish, are decidedly superior to those of the beads produced here and in most other places. Beads have fallen greatly in price of late years.

Those made fanciful sortions are ex BEANS Russ. *boobin* known vegetable both is of much in as it has got loams and cl lowish bean, Shangtung, Manchuria, Ningpo, and employed in for cooking at the same or Dolichos soja China, Chinese Bean of S. In 1866 beef amounted to visions.] BEER. [ALE. BEET. Certain the sea, and whi

Those made in France are mostly of the finer and fanciful sorts, on which gilding and other decorations are expended. (*Private information.*)

**BEANS** (Fr. fèves; Ger. bohnen; Ital. fave; Russ. boubii; Span. nabu; Lat. fabae). A well-known vegetable of the pulse species, largely cultivated both in gardens and fields. Its cultivation is of much importance in rural economy, inasmuch as it has gone far to supersede fallows on strong loams and clays. There is a round white or yellowish bean, grown principally in the north at Shangtung and Chih-le, and in the south of Manchuria, and largely exported to Shanghai, Ningpo, and other Chinese ports. They are chiefly employed in the manufacture of oil, used both for cooking and lighting. Soy is prepared from the same or a closely allied kind of bean, the *Dolichos soja*. (Lockhart, *Medical Missionary in China, Chinese Repository*, &c.)

**Bean of S. Ignatius.**—The fruit of the *Strychnos Ignatia*, a native of the Philippine Islands, is of the size and shape of a pear, and encloses about twenty seeds. These seeds contain a notable quantity of two alkaloids, strychnia and brucia, and possess the poisonous properties of these substances. They are not used in British pharmacy, but are found in the *United States Dispensary*.

**Bean, Tonka.**—The seed of the *Dipterix odorata*, or *Commersonia odorata*, a tree growing in Guiana. An oblong pod contains a single seed, of an agreeable, aromatic odour, chiefly used to flavour snuff, but it is also employed in perfumery.

**BEAVER.** [SKINS.]

**BEECH** (*Fagus sylvatica*). A forest-tree to be met with everywhere in England. There is only one species, the difference in the wood proceeding from the difference of soil and situation. A considerable quantity of beech is grown in the southern parts of Bucks. It is not much used in building, as it soon rots in damp places; but it is used as piles in places where it is constantly wet. It is manufactured into a great variety of tools, for which its great hardness and uniform texture render it superior to all other sorts of wood; it is also extensively used in making furniture.

**BEEF.** The flesh of kine. It is used either fresh or salted. Formerly it was usual for most families, at least in the country, to provide a stock of salt beef in October or November, which served for their consumption until the ensuing summer; but in consequence of the universal establishment of markets where fresh beef may be at all times obtained, the practice is now nearly relinquished, and the quantity of salted beef made use of as compared with fresh beef is quite inconsiderable. Large supplies of salted beef are, however, prepared at Cork, and other places, for exportation to the East and West Indies. During the war large supplies were also required for victualling the navy. The vessels engaged in the coasting trade, and in short voyages, use only fresh provisions.

The English have at all times been great consumers of beef; and at this moment more beef is used in London, as compared with the population, than anywhere else. Previously to 1842 the importation of fresh beef was prohibited; and salt beef from a foreign country was at the same time charged with a duty of 12s. per cwt. But in that year the duties on both sorts were reduced to 8s. 4½d. per cwt., and in 1846 they were wholly repealed. In 1866 the imports of salted and fresh beef amounted to 232,948 cwt. [CATTLE; PROVISIONS.]

**BEER.** [ALE AND BEER.]

**BEET.** Certain plants, originally grown near the sea, and which belong to the natural order

*Chenopodiaceae*, have long ago been employed for domestic and agricultural purposes, under the names of beet and mangold. They are characterised by containing a large quantity of sugar, and the cultivation of the beet and the extraction of this sugar form an important and increasing industry in central Europe.

This cultivation was the consequence of the exclusion of colonial produce from France during the continental war, and notwithstanding the great increase in the growth of cane sugar, that of the beet has grown and is growing rapidly. The French agriculturists reckon five varieties of beet, *grosse rouge*, *petite rouge*, *jaune*, *blanche*, and *veinée de rouge*. The richest in sugar are the yellow and red, but the percentage varies with the soil and the season. A beet crop is an excellent rotation to grain.

As the beet root sugar is chemically identical with that from the cane, it can be fermented and become a wash for spirits. The distillation of spirit from beet was hardly known in France before 1810, when it is said that only 30 hectolitres were manufactured. After the oidium attacked the grape, the produce of beet-root distillation increased enormously, and it has probably by this time reached 400,000 hectolitres (8,800,000 gallons).

For the statistics &c. of the beet root sugar produce of France &c. see SUGAR.

**BELL-METAL** (Fr. métal de fonte ou de cloches; Ger. glockengut; Dutch, klokspys; Span. campanil; Russ. koloklnaja mjed). A composition of tin and copper, usually consisting of 3 parts of copper and 1 of tin. Its colour is greyish-white; it is very hard, sonorous, and elastic. Less tin is used for church bells than for clock bells; and in very small bells a little zinc is added to the alloy. (Thomson's *Chemistry*.)

**BEN** (Fr. ben; Ger. salbuisse; Dutch, bebennoten; Swed. bennotter; Span. anis unguentarias; Ital. noce di been, ghiande unguentaria). The nut of a kind of tree known to botanists as *Gulandina bonduc*, originally brought from tropical Asia, but now cultivated successfully in central Europe. The seed is a cone, containing a number of triangular seeds, about the size of a hazel nut, these seeds holding a white and sweet kernel, which gives on expression a large quantity of oil. This oil is particularly free from mucilaginous admixture, and therefore does not solidify. Hence it is exceedingly useful for watchmakers, and other mechanics who need a lubricating oil which does not readily congeal. It is also free from any disposition to grow rancid, and it thus forms a convenient vehicle for perfumes. Ben oil is now a rare article of commerce, and is sometimes confounded with oil of sesame.

**BENZOLIN.** [BALSAM.]

**BERGEN.** The first commercial city of Norway, situated at the bottom of a deep bay, in lat. 60° 24' N., long. 5° 20' E. Pop. in 1860, 26,540. It has a light on Nordnaes Point, visible 4 miles off in clear weather. The bay is enclosed on all sides by rugged rocks and islands; the water is deep; but, owing to the number and intricacy of the passages, the access to the town is attended at all times with a good deal of difficulty, and should never be attempted without a pilot. Cod-fish, salted or dried, is the principal article of export: when dried, it is called stock-fish, and goes chiefly to Italy and Holland. The fishery is the principal employment; and considerable quantities of fish and other products are also brought hither for exportation from the more northerly parts of the kingdom. At an average, from 25,000,000 to 30,000,000 lbs. salted and dried fish are annually

exported. Herrings, whale oil, skins, bones, tar, lobsters &c. are also largely exported. Consul-General Crowe, in his Report of Feb. 1848, states that fishing for sharks along the western coast of Norway has become profitable. The exports of timber from Bergen are inconsiderable, and none has lately gone to England. Norway timber is not so large as that brought from Prussian ports, nor so free from knots; but, being of slower growth, it is more compact and less liable to rot. The planks are either red or white fir or pine; the red wood is produced from the Scotch fir; the white wood, which is inferior in price and estimation, is the produce of the spruce fir: each tree yields three pieces of timber of 11 or 12 feet in length; and is 70 or 80 years of age before it arrives at perfection. The planks or deals of Bergen are, however, a good deal inferior to those of Christiania. The imports into Bergen principally consist of grain from the Baltic; and salt, hardware, coffee, sugar &c. from England.

For *Money, Weights, and Measures*, see CHRISTIANIA; where there are further details as to the trade and navigation of Norway.

**BERRIES** (*Bacca*). The fruits or seeds of many different species of plants. The berries quoted in London Price Currents are bay, juniper, Turkey, and Persian.

1. *Bay Berries* (Fr. baies de laurier; Ger. Lorbeer; Ital. bacchi di lauro; Span. bayas). The fruit of the *Laurus nobilis*. This tree is a native of the south of Europe, but is cultivated in this country, and is not uncommon in our gardens. The berry is of an oval shape, fleshy, and of a dark purple colour, almost black; it has a sweet fragrant odour, and an aromatic astringent taste. Bay berries, and the oil obtained by boiling them in water, are imported from Italy and Spain.

2. *Juniper Berries* (Fr. genévrier; Dutch, sevenboom; Ital. ginpro; Span. cnebro). The fruit of the common juniper (*Juniperus communis*). They are round, of a black purple colour, and require two years to ripen. They have a moderately strong, not disagreeable, but peculiar smell, and a warm, pungent, sweetish taste, which, if they be long chewed, or previously well bruised, is followed by a considerable bitterness. They are found in this country; but most of those made use of here are imported from Holland, Germany, and Italy. They should be chosen fresh, not much shrivelled, and free from mouldiness, which they are apt to contract in keeping. On distillation with water, they yield a volatile essential oil, very subtle and pungent, and in smell greatly resembling the berries. The peculiar flavour and diuretic qualities of Geneva depend principally on the presence of this oil. Much English gin is said to be flavoured with oil of turpentine. (Lewis's *Mat. Med.*; Thomson's *Dispensatory*.)

The duty on juniper berries, previously to 1832, was 11s. 1d. per cwt., being more than 100 per cent. on the price in bond. The oppressiveness of this duty seems to have been the principal reason why turpentine, which in point of flavour and all other respects is so inferior, was largely used in preference to juniper berries in the preparation of gin. This oppressive duty was reduced, in 1832, to 2s., again, in 1842, to 1s. 6d., and was finally repealed in 1845. This wise and liberal measure has materially improved the beverage of a large proportion of the people. In 1865, 2,842 cwt. of juniper berries were retained for consumption.

3. *Turkey Yellow Berries*. The unripe fruit of the *Rhamnus infectiorius* of Linnæus. They are used as a dye drug, in preparing a lively but very fugitive yellow, for topical application in calico-printing. Considerable quantities of them are

exported from Salonica, to which they are brought from Thessaly and Albania. An inferior sort is produced in France. (Bancroft *On Colours*.) The duty on Turkey berries was abolished in 1845. The imports in 1865 amounted to 5,184 cwt., and the exports to 1,116 do. Price in the London market, September 1865, *5l. 7s. 6d. to 5l. 14s. 2d.* per cwt.

4. *Persian Yellow Berries* are said by the merchants to be of the same species as the Turkey yellow berries. The colours which they yield are more lively and lasting. They are high priced, fetching from 80s. to 110s. per cwt.

**BERYL** (called by the jewellers *Aquamarine*). This stone was suspected by Pliny to be a variety of the emerald; a conjecture which modern mineralogists have completely confirmed. The term *emerald* is applied to that particular variety which presents its own peculiar colour, or *emerald green*; while that of beryl is given indiscriminately to all the other varieties; as the sea green, pale blue, golden yellow, and colourless. The beryl is found in very many parts of the world—in the United Kingdom, France, Bavaria, Siberia, Sweden, Saxony, Elba, Brazil, Massachusetts, Hindostan.

The commercial value of the beryl or aquamarine is trifling; it is used principally in Birmingham, for imitation jewellery, and as ornaments for metal work. (Emanuel *On Diamonds*.)

**BETEL-LEAF** (Hind. pan; Malay, sireh; Javanese, suro). The leaf alluded to in art. **BETEL-NUT**. It is the produce of a species of pepper vine (*Piper Betle*), and somewhat resembles the ivy-leaf. In their fresh state, betel leaves form an important article of Eastern traffic, being every where used in the preparation of betel. The *Piper Betle* is a scandent plant, and poles are placed in the ground, round which it twines itself. In consequence of the great consumption of its leaves, it is extensively cultivated throughout tropical Asia. It grows in the greatest perfection in rich soils close to the Equator; and is raised with more difficulty the farther we recede from it. (*Ency. Britannica*, new ed., art. 'Betel'; Crawford's *Indian Archipelago*, vol. 1. p. 408.)

**BETEL-NUT** or **ARECA** (Sansc. and Hind. supri; Malay, pinang; Javanese, jambi). The fruit of the *Areca catechu*, a slender and graceful palm, rising to the height of about 30 or 40 feet; it produces fruit at the age of five or six years, and continues bearing till its twenty-fifth or thirtieth year. The fruit, which is the only part of the palm that is made use of, is eaten both in its unripe and in its mature state. When ripe, it is of the size of a small egg, and of an orange colour; the exterior part consists of a soft, spongy, fibrous matter, enclosing a nucleus resembling a nutmeg in shape, internal structure, and colour, but usually larger, and always harder. A single tree produces, according to its situation, age, culture &c., from 200 to 800 nuts. They are objects of great importance in the East, forming the principal ingredient of a compound in universal use as a masticatory in all central and tropical Asia. The whole ingredients are the leaf of the **BETEL-PEPPER**, in which the areca nut is wrapped; a little **CHUNAM**; and generally, but not always, a little *catechu* or *terra japonica* [**CATECHU**]. The whole compound is called *betel*, and is used to an extent of which it is difficult for a European to form a just idea. All individuals, without exception of age or sex, begin at an early period to accustom themselves to betel. They are unceasingly masticating it, and derive a gratification from its use that strangers can neither understand nor explain. It reddens the saliva, gives a bright hue to the lips, and, in course of time, renders

the teeth quite black. It is said to dispel nausea, excite appetite, and strengthen the stomach. Besides being used as an article of luxury, it is a kind of ceremonial which regulates the intercourse of the more polished classes of the East. When any person of consideration visits another, after the first salutations, betel is presented: to omit it on the one part would be considered neglect, and its rejection would be judged an affront on the other. No one of inferior rank addresses a dignified individual without the previous precaution of chewing betel; two persons seldom meet without exchanging it; and it is always offered on the ceremonious interviews of public missionaries. The areca nut is, in consequence, an article of very extensive trade. The countries which yield it most largely for exportation are Malabar, Ceylon, and Sumatra. Of the extent of this trade some notion may be formed from the fact that the imports of areca into Calcutta in 1841-42 amounted to 53,633 Ind. maunds, or 1,966 tons, and those into Canton, in 1837, by British ships only, amounted to 25,978 piculs, or 1,502 tons, notwithstanding Bengal and Southern China are countries in which areca is largely produced. (Art. 'Betel,' *Encyc. Brit.* new ed.; Bell's *Review of the External Commerce of Bengal*; Crawford's *Indian Archipelago*, vol. i. p. 102, vol. iii. p. 414; *Chinese Calendar and Register*.)

BEZOAR (Arab. faduj; Hind. zeher-morah; Pers. padzehr kanié). A concretion found in the stomach of an animal of the goat kind: it has a smooth, glossy surface, and is of a dark green or olive colour. The word *bezor*, however, has lately been extended to all the concretions found in animals; such as the *hog bezor*, found in the stomach of the wild boar in India; the *bovine bezor*, found in the gull-bladder of the ox, common in Nepal; and the *camel bezor*, found in the gull-bladder of the camel: this last is much prized as a yellow paint by the Hindoos. The finest bezor is brought to India from Borneo and the sea-ports of the Persian Gulf; the Persian article is particularly sought after, and is said to be procured from animals of the goat kind, *Capra Gazella*. Many extraordinary virtues were formerly ascribed to this substance, but without any sufficient reason. (Ainslie's *Materia Indica*.)

BHANG or CHURRUS (the latter name used in tracts north of the Punjab to denote a resinous exudation derived from the hemp, *Cannabis sativa*). The dried hemp plant which has flowered and from which the resin has not been removed is called Gunjah, and is used for smoking. It has also valuable medicinal properties as an antispasmodic and anodyne. The larger leaves and capsules are called bháng, Tubjee, and Siddha.

The resin called Churrus is worth about 8s. 4d. per lb.; a still finer kind, collected by hand in Nepal, and called moncea, is worth from 10s. to 12s. per lb. The ordinary churrus is collected by a singular process. Men clad in leathern dresses run through the hemp fields, brushing through the plants with all possible violence; the soft resin adheres to the leather, and is subsequently scraped off and kneaded into balls. Sometimes the leathern attire is dispensed with, and the resin is collected on the skin of naked coolies. (*Exhibition Catalogue for India*, pp. 42, 81.)

BIAZ. A cotton material resembling linen, manufactured in Central Asia to a considerable extent, both for native use and for exportation to Russia. There are three sorts: the best, or Bokharian; the medium, or Khivan; and an inferior variety manufactured in Tashkend. The Bokharian biaz is brought to the bazaars and purchased by dealers for export to Russia. It is sold

in pieces from 12½ to 16½ yards in length and 10½ inches in breadth. The best description sells at about 1s. 6d. and the lowest at 10¾d. per piece. A camel's load consists of 400 pieces, each piece weighing about 1½ lb. The Tashkend biaz, although inferior in quality and measure to that of Bokhara, is of but very little less value, the price of a piece of 14 yards being at Tashkend 10¾d. to 1s. 3d. The price of the Khivan biaz is from 16s. 3d. to 17s. 1½d. per 10 pieces. The quantity imported into Russia between 1840 and 1850 was, according to Mr. Lumley, about 1,600,000 pieces, valued at 114,150l. A blue biaz, *tentel* or *boyak*, dyed with indigo, is also exported from Bokhara, Khiva, and Tashkend to Russia. For further information on this subject see Mr. Lumley's valuable Report on Central Asia, with Reports of Secretaries of Legation presented to Parliament in 1862.

BILBAO. The capital of Biscay, one of the three Basque Provinces, a seaport town of Spain, on the river Nervion, about 8½ English miles from Portugalete. Population in 1864, 25,000.

Port.—The Bay of Bilbao lies between Panto Galea on its east, and Panto Lazurero on its western side, distant apart about 3 miles. It stretches S.E. to within ¾ mile of Portugalete, a small town at the mouth of the Nervion, lat. 43° 15' 47" N., long. 2° 45' W.

The water in the bay varies from 5 to 10 and 14 fathoms. There is a bar at the mouth of the river. High water at full and change at 3 1/2 p.m. The depth of water at high tide on the bar may be said to have a maximum of 16 to a minimum of 12 feet. Instances, however, are frequent of 18 and 19 feet: about 15 feet at high water may generally be depended on.

The channel is constantly changing, and heavy seas on the bar are of continual occurrence. The head pilot is in attendance, weather permitting, taking soundings, and directing incoming or outgoing vessels; but when he is unable to go out, signals are made by red flags at Portugalete and Santurce, either to direct the passage of the ships or to forbid their attempting to cross the bar. Vessels never, except in the finest weather, or to avoid running on an impracticable bar and lee shore, anchor in the bay. Pilots go off from Portugalete and Santurce on the west, and Algorta on the east side of the bay, and sometimes board from Santañia. The lighthouse is at Panto Galen. (For bearings, see SAILING DIRECTIONS.) Vessels proceed to Olaveaga, 2 miles below the town of Bilbao, to discharge, to which point ships of any draught that can cross the bar can safely proceed and discharge afloat. Only steamers of light draught, and ships drawing not more than 9 feet, can get up to Bilbao, and even then they lie aground at low water. Vessels also discharge coal cargoes and load iron ore at San Nicolas, about 2 miles above Portugalete. Goods are conveyed in lighters from Olaveaga to Bilbao; but the railway will be continued to Olaveaga, and probably to Portugalete, and thus put an end to the heavy expense and inconvenience of the present system of discharging and loading. A proposed port outside the bar, stretching from Santurce to Algorta, would obviate that formidable obstacle.

The following are the port dues and expenses:—

Inwards.		Rs. v. ct.
Advice to head pilot of draught of water	- - - -	23 0
Head pilot	- - - -	56 75
Pilotage, per Spanish foot	- - - -	10 0
Boat from sea to Olaveaga (every vessel above 50 tons is bound to take a boat)	- - - -	150 0
Detection at Quarantine, to pilot	- - - -	12 50
Extra boats, to tow in or out each	- - - -	30 0
Pair of bullocks to tow up the river, per kilometre	- - - -	2 16

Coasting pilot (if any) west coast, per league	15	0
east coast	20	0
Measuring vessel for payment of duties, per Spanish ton	0	50
Anchorage duty, per Spanish ton	1	0
Light dues	0	75
Quarantine dues, per Spanish ton	0	125
Navigation duty on cargo, per quintal	2	0
Brokerage, per Spanish ton	2	0

**Outwards, with cargo.**

Register at Customs	10	0
Pilotage, loads, head pilot, and oars, the same as inwards.		
Navigation duty, the same, but if cargo is iron ore, per quintal	0	61
Brokerage, per Spanish ton	1	0
" if chartered in port, 2 per cent.		

**Outwards in ballast.**

The same, excepting that the navigation duty is not charged.		
Ballast, per ton	5	0

Telegraphic communication has long been established. The rate of exchange, taking an average for the last five years, may be calculated at 97 1/2, Von, to the £ sterling.

The Bilbao and Tudela Railway, commenced in 1858 and completed in 1863, is one of the most remarkable works in Spain. In a distance of about 22 English miles in a direct line it accomplishes an ascent of 2,000 feet, and reaches the level of the plateau of the interior. At Miranda this railway intersects the North of Spain line, and places Bilbao in direct communication with France, Barcelona, Madrid &c.

The Bank of Bilbao, established in 1857, is the only bank of issue and discount. There are also two associations for general financial purposes, but having no power of issue.

**Trade and Commerce.**—The articles of import are British and French manufactures of every description, coal-fish, timber, and colonial produce. The exports are grain and flour, iron, zinc and lead ore, wine, madder, preserved food, liquorice, lamb and goat skins, chestnuts &c. The wool trade has ceased for many years. An idea of the rapid advance in the commercial importance of Bilbao during the last few years may be formed from the following:—

Exports.		Imports.	
1859	£ 45,214	1859	£ 755,657
1861	291,262	1861	2,769,955

**Moneys.**—The same as throughout Spain.

**Weights and Measures.**—The metrical system is now the legal one, and will no doubt in a few years be universally adopted. The ancient weights and measures of Biscay are the quintal of 108 lbs., the arroba of 25 lbs., the cantara of about 4 gallons, and the azumbre of half a gallon; but these are liable to considerable variations according to the different articles concerned.

**Privileges.**—The Basque Provinces still retain their principal ancient privileges, known as the *Fueros*, but great efforts are being made to deprive them of these advantages. The most important are, the free importation of tobacco and salt, freedom from Government taxation, stamps, and the conscription.

[We are indebted for this article on Bilbao to Horace Young, Esq.]

**BILL OF EXCHANGE. [EXCHANGE.]**

**BILL OF HEALTH.** A certificate or instrument signed by consuls or other proper authorities, delivered to the masters of ships at the time of their clearing out from all ports or places suspected of being particularly subject to infectious disorders, certifying the state of health at the time that such ship sailed. A *clean* bill imports that at the time the ship sailed no infectious disorder was known to exist. A *suspected* bill, commonly called a *touché* patent or bill, imports that there were rumours of an infectious disorder,

but that it had not actually appeared. A *fout* bill, or the absence of clean bills, imports that the place was infected when the vessel sailed. [QUARANTINE.]

**BILL OF LADING.** A *formal receipt* subscribed by the master of a ship in his capacity of carrier, acknowledging that he has received the goods specified in it on board his ship, and binding himself (under certain exceptions) to deliver them, in the like good order as received, at the place and to the individual named in the bill, or his assigns, on his or their paying him the stipulated freight &c. When goods are sent by a ship hired by a charterparty, the bills of lading are delivered by the master to the merchant by whom the ship is chartered; but when they are sent by a *general ship*—i.e. by a ship not hired by charterparty, but employed as a general carrier—each individual who sends goods on board receives a bill of lading for the same. In all cases, therefore, the bill of lading is the evidence of and title to the goods shipped.

The liability of a carrier, at common law, is to deliver the goods entrusted to his care, cancelled only by 'the act of God and the queen's enemies,' but to limit this responsibility, the following exception is now, invariably almost, introduced into the clause in bills of lading, binding the master to the delivery of the goods: '*The act of God, the queen's enemies, fire, and all and every other dangers and accidents of the seas, rivers, and navigation, of whatever nature and kind soever, excepted.*'

Bills of lading are not, in general, immediately given by the master on receiving the goods. The usual practice is for the master or his deputy to give a common receipt for the goods, which is delivered up on receiving the bill of lading. The latter should always be required within 24 hours after the goods are received on board.

Three sets of all bills of lading are made out on stamped paper: one of these should be remitted by the first post to the person to whom the goods are consigned, a second being sent to him by the ship; the third is retained by the shipper of the goods. The master ought always to retain copies of the bills of lading for his government. A stamp duty of 6d. is charged on each bill of lading, whether for goods exported or carried coastwise.

The usual form of a bill of lading is as follows:—

W. B. } N. B.—SHIPPED, in good order  
No. 1, a 10. } and well conditioned, by A. B. merchant, in and upon the good ship called \_\_\_\_\_ whereof C. D. is master, now in the river Thames and bound for \_\_\_\_\_ the goods following, viz. [here describe the goods] marked and numbered as per margin, to be delivered in the like good order and condition, at aforesaid (the act of God, the queen's enemies, fire, and all and every other dangers and accidents of the seas, rivers, and navigation, of whatever nature and kind soever, excepted), unto the said A. B. or his assigns, he or they paying for the said goods at the rate of \_\_\_\_\_ per piece freight, with primage and average accustomed. In witness whereof, I, the said master of the said ship, have affirmed to three bills of lading, of this tenour and date; any one of which bills being accomplished, the other two are to be void.

London, this \_\_\_\_\_ day of \_\_\_\_\_ 1868. C. D., Master.

But in the case of the West India the cargo from the bill of lading is used as evidence of God, the act of God, the queen's enemies, fire, and all and every other dangers and accidents of the seas, rivers, and navigation, of whatever nature and kind soever, excepted, and the bill of lading is the evidence of and title to the goods shipped.

*Transfer of B.* transferable either like bills of exchange, or by the character of the consigned, whether factor, agent, or bill holder of a consignee is entitled to them from the person who purchased the bill, unless he can show that the goods, (Holt, L.)

Formerly, a factor did not pledge the goods, but the hardship and inconvenience were such, that Geo. IV. c. 94, declares that any bill of lading shall be deemed to be a bill of lading, if it is specified in it, so as to entitle the holder of such goods to sue the person to whom the bill is consigned, if he has notice that the bill is a bill of lading and bona fide.

**Delivery under** to sign and deliver possible that there upon the captain by however, is, in such that he act with good judgment; and that to the person who the presentment of the circumstances be not his having unfairly act differently, he peculiarities of the his negligence; the instructions of the carrier or servant, to deliver according to the bill of lading.

Where several bills of lading have been sent, the time when they are to be delivered; but the person to whom they are sent, or one of them from the person to whom they are sent, is entitled to the bill of lading, though difficult to constructively the bill of lading, a delivery of the bill of lading will discharge him.

By 23 Vict. c. 2, becomes the entry of the bill of lading, the charge by 26 Vict. c. 22: s. 1, the same subject.

Great inconvenience and difficulty occur in a bill of lading, especially in several countries, and several of the same countries, are exceedingly strict in their requirements, a mistake in any one of these countries, a mistake frequently to the injury of the party.

**BILL OF SALE.** which an individual interest he has in it

But in the case of ships homeward bound from the West Indies, which send their boats to fetch the cargo from the shore, the exception in the bill of lading is usually expressed as follows: 'The act of God, the queen's enemies, fire, and all and every other dangers and accidents of the seas, rivers, and navigation, of whatever nature and kind soever, *sæc risk of boats, so far as ships are liable thereto*, excepted.' Other exceptions may be and are sometimes introduced; but the above is the general form.

**Transfer of Bills of Lading.**—Bills of lading are transferable either by blank or special indorsement, like bills of exchange. And whatever may be the character of the person to whom the goods are consigned, whether he be a buyer, or merely the factor, agent, or broker of the consignee, the bona fide holder of a bill of lading indorsed by the consignee is entitled to the goods, and may claim them from the master, if he can prove that he has purchased the bill for a *good consideration*: but unless he can do this, he is not entitled to the goods. (Holt, *Law of Shipping*, 2nd ed. p. 363.)

Formerly, a factor, though he might sell, could not *pledge* the goods of his principal. But the hardship and inconvenience arising from this rule were such, that it was set aside by the Act 6 Geo. IV. c. 94. The second section of this Act declares that any person in possession of a bill of lading shall be deemed the true owner of the goods specified in it, so as to make a sale or pledge by him of such goods or bill of lading valid, unless the person to whom the goods are sold or pledged has notice that the seller or pledger is not the actual and bona fide owner of the goods. [FACTOR.]

**Delivery under Bill of Lading.**—It being usual to sign and deliver three bills of lading, it is possible that there may be conflicting demands upon the captain by the different holders. Nothing, however, is, in such a case, required of him, except that he act with good faith, and to the best of his judgment; and that he make delivery of the goods to the person who first demands them of him, upon presentment of the bill of lading, *provided the circumstances be not such as to justify a suspicion of his having unfairly got possession of it*. If he act differently, he is answerable, according to the peculiarities of the case, to the person injured by his negligence; the bill of lading being not only the instructions of the merchant to him, as his carrier or servant, but his own especial agreement to deliver according to its conditions.

Where several bills of lading of a different import have been signed, no regard is to be paid to the time when they were first signed by the master; but the person who first gets legal possession of one of them from the owner or shipper has a right to the consignment; and where such bills of lading, though different upon the face of them, are constructively the same, and the master has acted bona fide, a delivery according to such legal title will discharge him from all. (Holt, pp. 375, 377.)

By 23 Vict. c. 22 s. 21 &c. a bill of lading becomes the entry or shipping bill of goods exported. The charges under this Act are repealed by 26 Vict. c. 22; see also 18 & 19 Vict. c. 111 on the same subject.

Great inconveniences arise, should any irregularity occur in a bill of lading; for the regulations of several countries, as in particular Spain, Portugal, and several of the South American governments, are exceedingly strict. In the ports of these countries, a mistake in these documents leads frequently to the infliction of severe penalties.

**BILL OF SALE.** A formal instrument by which an individual conveys away the right and interest he has in the goods or chattels named

therein. The property of ships is transferred by bill of sale, of which there are two descriptions, viz. (1) the *grand* bill of sale, which conveys the property of the ship from the builder to the owner or first purchaser; and (2) the *ordinary* bill of sale, by which any subsequent transfer is made. No stamp duty is payable on these documents, nor is it necessary that they should be under seal. (Maule and Pollock *On the Law of Shipping*, p. 43.) [REGISTRY.]

**BILL OF SIGHT.** When a merchant is ignorant of the real quantities or qualities of any goods consigned to him, so that he is unable to make a perfect entry thereof, he or his agent must subscribe a declaration to that effect before the collector or comptroller, who is authorised, on receiving such declaration, to allow the importer to enter the goods by **BILL OF SIGHT**. (See the form, **IMPORTATION AND EXPORTATION**.) They may then be provisionally landed; and perfect entry of the same must be made within 3 days, by indorsing on the bill of sight such particulars as are required in making perfect entry of goods, whether for payment of duty, warehousing, or delivery free of duty. (16 & 17 Vict. c. 107 ss. 61, 62.)

Goods entered by bill of sight for delivery on payment of duty are not to be delivered till perfect entry thereof has been made, and the duty paid, unless the importer deposit a sum of money sufficient to cover the duty payable thereon. (Sec. 63.)

In default of perfect entry within 3 days, goods entered by bill of sight are to be taken to the Queen's warehouse; and if the importer do not, within 1 month, make perfect entry, and pay the duties thereon, or on such parts as can be entered for home use, together with charges of moving and warehouse rent, such goods shall be sold for payment of the duties. (Sec. 64.) [IMPORTATION AND EXPORTATION.]

**BILL OF STORE.** A license granted by the Custom-house to re-import British goods into the United Kingdom.

The Act 16 & 17 Vict. c. 107 has the following clause in regard to the entry of goods by bill of store:—

All British goods re-imported into the United Kingdom shall be entered as foreign, and shall be liable to the same duties, rules, regulations, and restrictions as such goods, if foreign, would be liable to on the first importation thereof, unless the same shall be re-imported within 10 years after the exportation thereof, and it shall be proved to the satisfaction of the Commissioners of Customs that the property in such goods has continued and still remains in the person by whom or on whose account the same have been exported, in which case the same may be entered as British goods, by bill of store, containing such particulars and in such form and manner as the said Commissioners may direct: Provided always, that the following goods shall, on re-importation, be deemed and taken to be foreign goods, viz. corn, grain, meal, flour, and hops, and also all goods for which any drawback of excise shall have been received on exportation, unless by special permission of the Commissioners of Customs, and on re-payment of such drawback, and also all goods for which a bill of store cannot be issued in manner directed by the said Commissioners, except remnants of British goods, with permission of the Commissioners of Customs. (Sec. 65.)

The following is a regulation of the Board of Customs, dated November 9, 1861, by which the importation of returned British goods is greatly facilitated:—

That the limit of time within which goods may be returned and admitted as British be

abolished in all cases except where a Bill of Store is required, and that the declaration of continued proprietorship be in all cases dispensed with.

That returned British goods of the same description as foreign goods on which duty is chargeable upon importation, or which were entitled to drawback on exportation, be deemed to be foreign unless a Bill of Store be obtained in accordance with the other provisions of the above section, corn, grain, meal, flour, and hops being in all cases deemed to be foreign.

That returned British goods bearing marks or brands of British manufacturers be deemed to be foreign goods with British marks or brands, and as such liable to forfeiture, unless declaration be made by the persons whose marks or brands they bear, that the goods are of British manufacture, or unless a Bill of Store be obtained.

That returned British goods not bearing marks or brands, not entitled to drawback on exportation, and not of a description which, if foreign, would be chargeable with duty, be admitted upon their being entered as British goods with the usual declaration to the truth of the particulars contained in the entry, as required on all import entries.

**BILL (VICTUALLING).** Formerly a victualling bill was a list of all stores for shipment, but now it shows only stores shipped from the bonded warehouse or for drawback on board vessels proceeding on over-sea voyages. This document serves also as a certificate of clearance when there is nothing but stores on board the ship (16 & 17 Vict. c. 107 s. 145), and this law also enacts that if after clearing outwards a vessel be found to possess any such stores which are not endorsed on the victualling bill, such stores shall be forfeited. (See 146.)

**BILLINGSGATE.** A market for fish, contiguous to the Custom-house in London. It is held every lawful day, and was established in 1609 by stat. 10 & 11 Wm. III. c. 24. Every person buying fish in Billingsgate market may sell the same in any other market-place or places within the city of London or elsewhere, by retail, with this condition, that none but fishmongers be permitted to sell in fixed shops or houses. No person or persons shall purchase at Billingsgate any quantity of fish, to be divided by lots or in shares amongst any fishmongers or other persons, in order to be afterwards put to sale by retail or otherwise; nor shall any fishmonger engross, or buy in the said market, any quantity of fish, but what shall be for his own sale or use, under the penalty of 20*l*. No person is to have in his possession, or expose to sale, any spawn of fish, or fish unsizeable, or out of season. (36 Geo. III. c. 118.) The minimum size of the lobsters to be sold at Billingsgate is fixed by statute. [LOBSTER.]

Previously to 1812 no fish of foreign taking or curing, or in foreign vessels, could be imported into the United Kingdom, except turbot and lobsters, stock-fish, live eels, anchovies, sturgeon, botargo, and caviare. But the importation of all sorts of fish was then permitted on payment of duties, which were finally repealed in 1853. At present, therefore, the trade in fish is quite free.

For some further remarks with respect to this subject, see *FISH*.

**BIRCH** (Fr. boulean; Dutch, berke; Ger. birke; Ital. betulla; Lat. betula; Pol. brzoza; Russ. bereza; Span. abedul, betulla). A forest-tree met with everywhere in the north of Europe. It is applied to various purposes. In Lapland, Norway, and Sweden, the long twigs of the birch are woven into mats and twisted into ropes; the outer bark forms an almost incorruptible covering for houses;

and the inner bark is used, in periods of scarcity, as a substitute for bread. Russia leather is prepared by means of the empyreumatic oil of the birch. It is an excellent wood for the turner, being light, compact, and easily worked. Its durability is not very great. It is sometimes used in the manufacture of herring barrels.

**BIRDLIME** (Ger. vogelheim; Fr. glu; Ital. pania; Span. liga; Russ. pitschei klei). It is found in the inner bark of certain plants, as the mistletoe (*Viscum album*) and the holly (*Ilex aquifolium*). It is prepared by boiling the bark several hours in water, separating it from the liquid, in which it is insoluble, and setting it aside till it becomes viscous. Birdlime is greenish, tenacious, glutinous, of a bitter taste, and a smell similar to linseed oil. If exposed to the air in thin layers, it becomes dry brown, and may be powdered, but regains its viscididity when treated with water. A substance similar to birdlime, and called specially *glu* by French chemists, exudes spontaneously from the bark of certain plants. When this substance is purified, it is without odour or taste, is very adhesive, is fusible by heat and inflammable, is quite insoluble in water, and nearly so in alcohol, but is freely dissolved by ether and turpentine oils. It has been called *viscin*. The use of birdlime is familiar, but it has little commercial importance.

**BIRDS' NESTS** (Ger. Indianische vogelnester; Dutch, Indiaansche vogelnestjes; Fr. nids de Tunkiu; Ital. nidi di Tunchino; Span. nidos de la China; Javanese, susu; Malay, sarungburung; Chinese, yiu-wo). The nests of a species of small swallow peculiar to the Indian islands (*Hirundo esculenta*), very much esteemed in China. In shape these nests resemble those of other swallows. They are formed of a viscid substance; and in external appearance, as well as consistence, are not unlike fibrous, ill-coagulated isinglass. Esculent nests are principally found in Java, in caverns that are most frequently, though not always, situated on the sea-coast. Many conflicting statements have been made as to the substance of nests; some contending that they are formed of sea-foum or other marine products, and others that they are elaborated from the food of the bird &c. But these are points as to which nothing satisfactory is known.

It is asserted that at the time of pairing the swallow secretes a glutinous substance from its bill, and that this mucus flowing from the bill in filaments forms the material of the nest. This substance, for which the name *cablose* has been suggested, is hardly soluble in cold, and slowly in boiling water, but readily in alkaline solutions, whether cold or hot. Iodine tinges it an orange yellow.

Singapore is the chief mart for birds' nests, to which they are brought from Borneo, Java, Rio Minto, Sumbawa, Sumatra, and Celebes. The price of the same quality varies enormously; at Manilla a picul (133 lbs.) will fetch 2,000 piastres, while in Canton the same quantity may be worth nearly 4,000 piastres.

Birds' nests are served at the close of great entertainments, in the proportion of a nest and a half to each guest.

We borrow from Mr. Crawford's valuable work on the *Eastern Archipelago* (vol. iii. pp. 432—437) the following authentic and curious details as to the traffic in this singular production: 'The best nests are those obtained in deep damp caves, and such as are taken before the birds have laid their eggs. The coarsest are those obtained after the young are fledged. The finest nests are the whitest, that is, those taken before the nest has

been rendered young birds, if regularly offered to the quantity by the caves a year or two difficult of access by the office. The caves in Java of the collection Karang-bolan south coast only to be applied of many hundred rattan, over rocks. When the perilous of be performed recesses of the be instantly nothing below its way into the

'The only undergo is that exposure to the in small boxes, assorted for the according to the first or best, second that are regular parts, 533 parts of the third.

'The common are, for the first dollars the picul second, 2,800 Sp the third, 1,600 prices it is sufficient are no more than They are consumed the best part is the then, under the fully stimulating their most valuable perfectly harmless, much resemble habits, have no the latter acquire in it. Among the parallel to it, unstimulation in which luxury, remarkable for any qualities.

Mr. Crawford birds' nests export 212,400 lbs., which observes, 'of this try which produces wants of a single exclusive property forms a valuable revenue of the course not equal, and the circumstances in which the nest is obtained, and the mode and sequester lawless, a proper subject to the perjury and it not unfrequently is the privilege of one person in such situations,

been rendered impure by the food and *faces* of the young birds. They are taken twice a-year, and if regularly collected, and no unusual injury be offered to the caverns, will produce very equally, the quantity being very little, if at all improved by the caves being left altogether unmolested for a year or two. Some of the caverns are extremely difficult of access, and the nests can only be collected by persons accustomed from their youth to the office. The most remarkable and productive caves in Java, of which I superintended a moiety of the collection for several years, are those of *Karany-bolang*, in the province of *Baglen*, on the south coast of the island. Here the caves are only to be approached by a perpendicular descent of many hundred feet, by ladders of bamboo and rattan, over a sea rolling violently against the rocks. When the mouth of the cavern is attained, the perilous office of taking the nests must often be performed by torch-light, by penetrating into recesses of the rock where the slightest trip would be instantly fatal to the adventurers, who see nothing below them but the turbulent surf making its way into the chasms of the rock.

The only preparation which the birds' nests undergo is that of simple drying, without direct exposure to the sun, after which they are packed in small boxes, usually of half a picul. They are assorted for the Chinese market into three kinds, according to their qualities, distinguished into *first or best, second, and third* qualities. Caverns that are regularly managed will afford, in 100 parts, 53·3 parts of those of the first quality, 35 parts of those of the second, 11·7 parts of those of the third.

The common prices for birds' nests at Canton are, for the first sort, no less than 3,500 Spanish dollars the picul, or 5*l.* 18*s.* 1½*d.* per lb.; for the second, 2,800 Spanish dollars per picul; and for the third, 1,600 Spanish dollars. From these prices it is sufficiently evident that the birds' nests are no more than an article of expensive luxury. They are consumed only by the great; and indeed the best part is sent to the capital for the consumption of the court. The sensual Chinese use them, under the imagination that they are powerfully stimulating and tonic; but it is probable that their most valuable quality is their being perfectly harmless. The people of Japan, who so much resemble the Chinese in many of their habits, have no taste for the edible nests; and how the latter acquired a taste for this foreign commodity is no less singular than their persevering in it. Among the Western nations there is nothing parallel to it, unless we except the whimsical estimation in which the Romans held some articles of luxury, remarkable for their scarcity rather than for any qualities ascribed to them.

Mr. Crawford estimates the whole quantity of birds' nests exported from the Archipelago at 212,400 lbs., worth 281,290*l.* The value, he observes, of this immense property to the country which produces it, rests upon the capricious wants of a single people. It is claimed as the exclusive property of the sovereign, and everywhere forms a valuable branch of his income, or of the revenue of the state. This value, however, is of course not equal, and depends upon the situation and the circumstances connected with the caverns in which the nests are found. Being often in remote and sequestered situations, in a country so lawless, a property so valuable and exposed is subject to the perpetual depredation of freebooters, and it not infrequently happens that an attack upon it is the principal object of the warfare committed by one petty state against another. In such situations, the expense of affording them

protection is so heavy, that they are necessarily of little value. In situations where the caverns are difficult of access to strangers, and where there reigns enough of order and tranquillity to secure them from internal depredation, and to admit of the nests being obtained without other expense than the simple labour of collecting them, the value of the property is very great. The caverns of *Karany-bolang*, in Java, are of this description. These annually afford 6,810 lbs. of nests, which are worth, at the Batavia prices of 3,000, 2,500, and 1,200 Spanish dollars the picul, for the respective kinds, nearly 139,000 Spanish dollars; and the whole expense of collecting, curing, and packing, amounts to no more than 11 per cent. on this amount. The price of birds' nests is of course a monopoly price, the quantity produced being by nature limited, and incapable of augmentation. The value of the labour expended in bringing birds' nests to market is but a trifling portion of their price, which consists of the highest sum that the luxurious Chinese will afford to pay for them, and which is a tax paid by that nation to the inhabitants of the Indian islands. There is, perhaps, no production upon which human industry is exerted, of which the cost of production bears so small a proportion to the market price. (See also the valuable work of Count Hogenorp, *Coup d'Œil sur l'Île de Java*, p. 291.)

The present importation of all kinds can only be guessed at: 500 piculs were entered at Shanghai and Canton in 1860, but the entire import can hardly be less than 700 or 800 piculs annually. (Williams' *Chinese Commercial Guide*, 6th ed.)

**BISMUTH** (Ger. wismuth; Dutch, bismuth, bergsteen, blinkendin; Fr. bismuth; Ital. bismutte; Span. bismuto, piedra inga; Russ. wismut; Lat. bismuthum). A metal of a reddish white colour, and almost destitute of taste and smell. It is softer than copper; its specific gravity is 9·822. When hammered cautiously, its density is considerably increased; it breaks, however, when struck smartly by a hammer, and, consequently, is not malleable, neither can it be drawn out into wire; it melts at the temperature of 476°. The chief source of bismuth is Saxony, but it is found in Swabia, the Pyrenees, Sweden, and Cornwall. (Thomson's *Chemistry*.)

Bismuth is used in the composition of pewter, in the fabrication of printers' types, and in various other metallic mixtures. With an equal weight of lead, it forms a brilliant white alloy, much harder than lead, and more malleable than bismuth, though not ductile; and if the proportion of lead be increased, it is rendered still more malleable. Eight parts of bismuth, 5 of lead, and 3 of tin, constitute the fusible metal, sometimes called Newton's, from its discoverer, which melts at the heat of boiling water, and may be fused over a candle in a piece of stiff paper without burning the paper. It has been suggested that this alloy of bismuth might be used advantageously in order to prevent steam explosions. Pewterers' solder is formed of 1 part of bismuth, with 5 of lead, and 3 of tin. It forms the basis of a sympathetic ink. (Ure.)

**BITUMEN** (Ger. jadenpech; Fr. bitume; Dutch, jodenlym; Ital. asfalto; Span. asfalto; Port. asphalto; Russ. asfalt; Lat. asphaltum bitumen judaicum). This term includes a considerable range of inflammable mineral substances, burning with the flame in the open air. They differ in consistency, from a thin fluid to a solid; but the solids are for the most part liquefiable at a moderate heat. They are—1. *Naphtha*; a fine, white, thin, fragrant, colourless oil, which issues out of white, yellow, or black clays in Persia and Media. This

is highly inflammable. Near the village of Amiano, in the state of Parma, there exists a spring which yields this substance in a sufficient quantity to illuminate the city of Genoa, for which purpose it is employed. With certain vegetable oils, naphtha is said to form a good varnish.—2. *Petroleum* is much thicker than naphtha, resembling in consistence common tar. It has a strong disagreeable odour, and a blackish or reddish brown colour. During combustion it emits a thick black smoke, and leaves a little residue in the form of black coal. It is more abundant than the first-mentioned variety, from which it does not seem to differ, except in being more inspissated. It is found in various countries, and is especially abundant in the Birman empire, where it is met with above Prome, within about 2 miles of the Irrawadi. The gross annual produce of the wells in this place has been estimated at about 80,000,000 lbs., worth on the spot about 1s. 8d. per cwt.; and the supply might, if a market could be found, be indefinitely increased. It is used as a lamp oil, and, when mingled with earth or ashes, as fuel and in the lining of boats. (*Geographical Dictionary*, i. 453.) In the United States it is found abundantly in Kentucky, Ohio, and New York, where it is known by the name of *Seneca* or *Genesee* oil. It is also obtained from wells in the island of Zante. Herodotus tells us that he had seen these wells (lib. iv. c. 195); and the description he has given of them, and of the mode of obtaining the petroleum, corresponds, in all respects, with the accounts of the best modern travellers. The average annual produce of the Zante springs is about 100 barrels. (Chandler's *Travels in Greece*, 4to. ed. p. 301; Holland's *Travels in Greece*, 4to. ed. p. 18.) Petroleum is particularly abundant in Persia. 'When taken from the pit, it is a thick liquid resembling pitch. The bottoms of most vessels which navigate the Euphrates and Tigris are covered with it, and it is also used in lamps, instead of oil, by the natives. The most productive fountains are those of Kerkook, Mendali, and Badku. The wells in the neighbourhood of the latter seem to be quite inexhaustible, being no sooner emptied than they again begin to fill. Some of them have been found to yield from 1,000 to 1,500 lbs. a day!' (Kinnier's *Persian Empire*, pp. 39, 359.)—3. *Maltha*, or *Sea-wax*, is a solid whitish substance, not unlike tallow. It melts when heated, and in cooling assumes the consistence of white cerate. This is, most probably, the *bitumen candidum* of Pliny (*Hist. Nat.* lib. xxxv. c. 15). It is not used as pitch; but it affords a better light than petroleum, and emits a less disagreeable smell. It is found on the surface of the Baikal Lake in Siberia, at the foot of the mountains of Bucktiari in Persia, and in some other places.—4. *Elastic Bitumen* yields easily to pressure; it is flexible and elastic. It emits a strong bituminous odour, and is about the weight of water. On exposure to the air it hardens, and loses its elasticity. It takes up the traces of crayons in the same manner as caoutchouc, or India-rubber, whence it has obtained the name of *mineral caoutchouc*. It has hitherto been found only in the lead mines of Derbyshire.—5. *Compact Bitumen*, or *Asphaltum*, is of a shining black colour, solid, and brittle, with a conchoidal fracture. Its specific gravity varies from 1 to 1.6. Like the former varieties, it burns freely, and leaves but little residuum. It is found in India, on the shores of the Dead Sea, in France, in Switzerland, and in large deposits in sandstone in Albania; but nowhere so largely as in the island of Trinidad, where it forms a lake 3 miles in circumference, and of a thickness unknown. A

gentle heat renders it ductile, and, when mixed with grease or common pitch, it is used for paying the bottoms of ships, and is said to protect them from the teredo of the West Indian seas. The ancients employed bitumen in the construction of their buildings. The bricks of which the walls of Babylon were built were, it is said (Herodotus, lib. i. s. 179), cemented with hot bitumen, which gave them unusual solidity. [PETROLEUM.]

**BLACKING** (Ger. schuhschwärze, wiesch; Fr. noir (de cordonnier), cirage; Ital. nero da ugnere le scarpe; Span. negro de zapatos). A factitious article, prepared in various ways, used in the blacking of boots and shoes. The principal ingredients in its manufacture are oil, vinegar, bone-earth, molasses, and sulphuric acid. It is in very extensive demand. Some of the establishments for its manufacture, especially those in the metropolis, are on a very large scale; and it is in such only that it can be cheaply and advantageously produced. One of the principal, or rather we may say the principal outlay in establishing a blacking business, consists in advertising. Indeed, any individual or set of individuals, provided they supply a reasonably good article, may by continuous advertising and puffing attain to the highest eminence in the 'blacking line.' Exclusive of that used at home, blacking is a considerable article of export.

**BLACK-LEAD, PLUMBAGO, GRAPHITE,** or **WAD** (Dutch, potlood; Fr. noir; Ger. plomb noir, plomb de mine, potlot; Ger. potthlo, reissbley; Ital. miniera di piombo, piombaggine, corezolo; Lat. plumbago; Span. piedra mineral de piombo). A mineral of a dark steel grey colour, and a metallic lustre; it is soft, has a greasy feel, and leaves a dark-coloured line when drawn along paper.

This mineral is found only in a state of purity in Borrodale in Cumberland, the mines in which have been wrought since the days of Elizabeth. The lead is not found in veins, but in detached pieces, or in what are called *sops* or *bellies*, so that the supply is very irregular, the miners being frequently employed for a lengthened period in seeking at random for the lead. Its quality also differs very widely. The best is that which is lightest, and the trace of which on paper is easily and completely removed by the application of India-rubber. The mine is only opened at intervals, and is at present (1868) closed. The supply has been extremely scanty, and mostly also very inferior. When the mine is open, the trade is supplied at sales held on the first Monday of each month, in *Essex Street, Strand*, London.

At a sale of black-lead held at *Essex Street, Strand* (according to a writer in the *Builder*, Sept. 1, 1866), picked plumbago brought 20s. the lb., the article having been picked through at former sales. After this, there was a considerable stock sold at much lower prices, more like 20l. the ton than anything else, while the pure Borrodale lead would now fetch 30s. the lb., or more than 3,000l. the ton.

The mine ceased to be worked three or four years ago. The company who took it passed through the Bankruptcy Court. The Keswick makers not unfrequently purchase pure lead found in the locality which has been washed down from the mountains into the rivers and low lands, so that pure Borrodale lead pencils may still be purchased at Keswick, but comparatively few people go to the price, viz. 6s. the dozen.

In one year (1803) the produce of the Borrodale mine was 500 casks, each of 1½ cwt., the produce being worth 30s. the lb. So valuable was the product, every cart-load being worth from 3,000l.

to 4,000l., that the produce was sent under military escort to Kendal. In order to prevent deceptions on the mine, an Act, 25 Geo. II. c. 10, made robbery from a black-lead mine felony.

The sources of black-lead are numerous. It is found in Ceylon, and according to Sir E. Tennent 2,000 tons are annually exported from the southern part of the island. It is also procured from Siberia, Austria, Prussia, in North America near Lake Superior, in Scotland, and from Schwarzenbach in Bohemia, whence about 70,000 lbs. per annum are obtained. It has also been discovered in beds of great thickness on the banks of the Yenisei about 300 English miles east of the town of Toorookhansk, and again in South Siberia near the Chinese frontier. The chief sources, however, of commercial graphite are Passau, in Bavaria; India, both in the Himalayas and Ceylon; and Spain. It is also a product of some iron works. In 1865, 4,836 tons were imported, chiefly from Ceylon.

**BLACK-LEAD PENCILS** (Dutch, potlootpenen; Fr. crayons noirs; Ger. bleystifte; Ital. lapis nero; Port. lapis negro; Russ. karanaschit; Span. lapiz negro). Pencils formed of black lead, encircled with cedar.

There is hardly, perhaps, anything in which the temptation to substitute a spurious for a genuine article is greater, or in which, consequently, the purchaser is more liable to be deceived, than black-lead pencils. This is occasioned by the vast difference between the cost of genuine Cumberland lead, and of the other articles that are or may be substituted for it. Pencils are usually described as follows:—

First quality, or drawing pencils.

Second ditto, or prepared pencils.

Third ditto, or composition pencils.

1. Pencils of the first quality are, when genuine, made of pure Cumberland lead, which costs at present (1868) 30s. per lb. or 168l. per cwt. From 18 to 20 dozen such pencils are produced from a pound of this lead.

These pencils are usually made by sawing the lead into the pieces inserted in the cedar. Sometimes, however, the lead is in parts gritty and defective, so that a pencil of this kind may, in fact, be very inferior. To obviate this defect, some makers prepare the lead, to free it from the grit or earthy particles; and, provided no antimony or other alloy be mixed up with the prepared lead, the pencils produced from it are most to be depended on.

2. Pencils of the second quality are manufactured out of the sawings or dust of pure lead, with the dust of the small pieces picked up by poor people from the rubbish thrown out of the mine, mixed or alloyed with a greater or less quantity of antimony. The goodness of this pencil depends, of course, on the proportion in which the pure lead exceeds the antimony. But as the cost of the former may be taken at 100l. per cwt. and that of the latter at only 26s., there is an all but irresistible temptation to increase the proportion of the latter beyond the bounds. This sort of composition produces about 15 or 16 dozen pencils to the lb.; their price varying according to the purity of the lead.

3. The third quality of pencil is made by using Mexican or Spanish lead dust, costing 45s. or 50s. per cwt., with antimony costing about 26s. per cwt. It produces about 14 or 15 dozen pencils to the lb., which may be sold at from 2s. 6d. to 12s. per gross, according to the cost of the articles employed and the care taken in mixing them. This sort of pencil may take a firm point, and make a fine stroke, but its trace will not obliterate on

being rubbed with India-rubber. The easy and complete obliteration of the strokes is, in fact, the best and perhaps only test of a pencil being of pure Cumberland lead. (*Private information.*)

**BLEACHING POWDERS.** These are the chlorides of the alkalies and alkaline earths. The cheapest and most generally used is the chloride of lime.

This product is manufactured in various parts of the country. The *Industrial Resources of the Tyne, Wear, and Tees* estimates the amount produced in that region at 11,280 tons per annum. The use of the powder is not confined to the bleaching of manufactured goods, for, according to the work referred to, the demand has greatly increased in consequence of the extensive use of the Spanish esparto grass in the manufacture of paper. The use of the chlorides, especially that of lime, as a disinfectant is well known.

The price of chloride of lime, which amounted to about 28l. a ton before chemical discovery had cheapened the process, has now been reduced to a third of that amount.

**BLOCKADE.** [*CONTRABAND; NEUTRALITY.*]

**BLUBBER** (Ger. thran, fischtran; Dutch, thraan; Ital. olio di pesce; Span. grassa, aceite de pescalo; Russ. salo worwannoe, worwan; Lat. oleum piscinum). The fat of whales and other large sea-animals, of which train oil is made. The blubber is the *adeps* of the animal: it lies under the skin, and over the muscular flesh: it is about 6 inches in thickness, but about the under lip it is 2 or 3 feet thick. The whole quantity yielded by one of these animals ordinarily amounts to 40 or 50, but sometimes to 80 or more cwt. Formerly train oil was manufactured from the blubber in the seas round Spitzbergen, and other places where whales were caught; but the practice is now to bring the blubber home in casks, and to prepare the oil afterwards.

It is enacted by the 6 Geo. IV. c. 107 s. 44 that before any blubber, train oil, spermaceti oil, head matter, or whale fins, shall be entered as being entirely the produce of sea animals caught by the crews of ships fitted out in the United Kingdom, or the islands of Jersey, Guernsey, Sark, and Man, the master of the ship importing such goods shall make oath, and the importer also shall make oath to the best of his knowledge and belief, that the same are the produce of fish or creatures living in the sea, taken and caught wholly by the crew of such ship, or by the crew of some other ship (naming it) fitted out in the United Kingdom, or in one of the islands of Guernsey, Jersey, Alderney, Sark, or Man (naming which).

Before blubber, train oil &c. can be entered as from a British possession, a certificate must be obtained from the custom-house officer at such British possession, or in default of such officer being there, from two principal inhabitants, notifying that oath had been made before him or them that such blubber &c. was the produce of fish or creatures living in the sea, and had been taken by British subjects usually residing in some part of his Majesty's dominions; and the importer is to make oath, to the best of his knowledge and belief, to the same effect.

The gauging of casks of oil and blubber is dispensed with since 1825. They are to be passed at the rate of 126 gallons the pipe, and 63 gallons the hogshend.

**BOART.** A technical term, used by diamond merchants to designate granular or imperfectly crystallised diamonds. This substance is either crushed into powder or used for engraving on hard stones. Boart is worth from 22s. to 30s. per carat. (*Emanuel On Diamonds &c.*)

**BOATS.** Open vessels, commonly wrought by oars, and of an endless variety of shapes, according to the purposes to which they are to be applied.

*Boats of Vessels to bear Name of Vessel, Port, and Master.*—The owner of every ship belonging wholly or in part to any of her Majesty's subjects shall paint or cause to be painted upon the outside of the stern of every boat belonging to such ship the name of such ship and the port or place to which she belongs, and the master's name within-side the transom, in white or yellow Roman letters, not less than 2 inches in length, on a black ground, on pain of the forfeiture of every such boat not so marked, wherever the same shall be found. (16 & 17 Vict. c. 107 s. 203.)

*Boat not belonging to Ships to have Name of Owner and Port thereon.*—The owner of every boat not belonging to any ship shall paint or cause to be painted upon the stern of such boat, in white or yellow Roman letters, of 2 inches in length, on a black ground, the name of the owner of the boat and the port or place to which she belongs, on pain of the forfeiture of such boat not so marked, wherever the same shall be found. (Sec. 204.)

**BOHEA.** A species of tea. [TEA.]

**BOLE.** A friable earthy substance, a species of the soapstone family. Specific gravity 1.4 to 2. It is found in the island of Lemnos, whence it is sometimes called Lemnian earth; and in Armenia, Italy, France, Silesia, various parts of South America &c. Armenian and French holes were at one time not uncommon in this country, being used in the materia medica; but they are now entirely or almost entirely discarded. In India, however, Armenian bole still continues to be in extensive demand. It is brought to Bombay from the Persian Gulf. It is soft, feels greasy to the touch, adheres strongly to the tongue, and is very friable: it is generally of a yellowish brown colour; though sometimes it is seen of a fine flesh red, which is the variety held in the highest estimation. Armenian bole consists chiefly of alumina and silica, coloured by oxide of iron. The chief use of Armenian bole is that of the manufacture of tooth powder. Some savage nations, such as the Ottomques, described by M. Humboldt, are in the habit of allaying the pains of hunger by eating boles, which however are occasionally nutritious, because masses of infusoria fossilised, but still containing animal matter, are found in the substance. The Javanese, when they wish to become thin, eat cakes, called *tanaampo*, made of bole. (Lewis, *Mat. Medica*; Thomson's *Chemistry*; Ainslie's *Mat. Indica*.)

**BOMBAY.** A seaport on the western coast of British India, one of the greatest emporiums in the East; lat. 18° 56' N., long. 72° 57' E. It stands on the south-eastern extremity of a small island of the same name, separated from the main land by an arm of the sea, forming with the contiguous islands of Colaba, Salsette, Butcher's Island, and Caranjah, one of the best harbours in India. Bombay Island was ceded by the Portuguese to the English in 1661. In 1668 it was transferred by the Crown to the East India Company, by letters patent, in free and common soceage, on payment of an annual rent of 10*l.*, and in 1859 it was placed with the rest of India under the direct government of the Crown. The fort stands on the south-east extremity of the island, on a narrow neck of land, immediately over the harbour. The fortifications are extensive, and on the sea side very strong.

The population of Bombay Island, on its cession in 1661, did not exceed 15,000. In 1864 it amounted, including all its suburbs, to 816,562 inhabitants,

of whom 530,450 were males and 286,112 females, being in the ratio of 185.4 males to 100 females. The following table shows the casto or race. (*Bombay Almanac* 1865.)

Boothils or Jain	-	8,021	Parsees	-	49,901
Brahmin	-	30,601	Jews	-	3,872
Linget	-	1,398	Native Christians	-	19,903

Mussulmen	-	145,880	Chinese	-	358
Negro African	-	2,074	Total	-	816,562

The total area of the Bombay Presidency under the administration of British rule, excluding native States, amounts to 142,043 square miles, with a total population of 13,039,106, of which the European portion, according to a census taken in 1861, was 27,317. The gross revenues of the Presidency show a progressive increase.

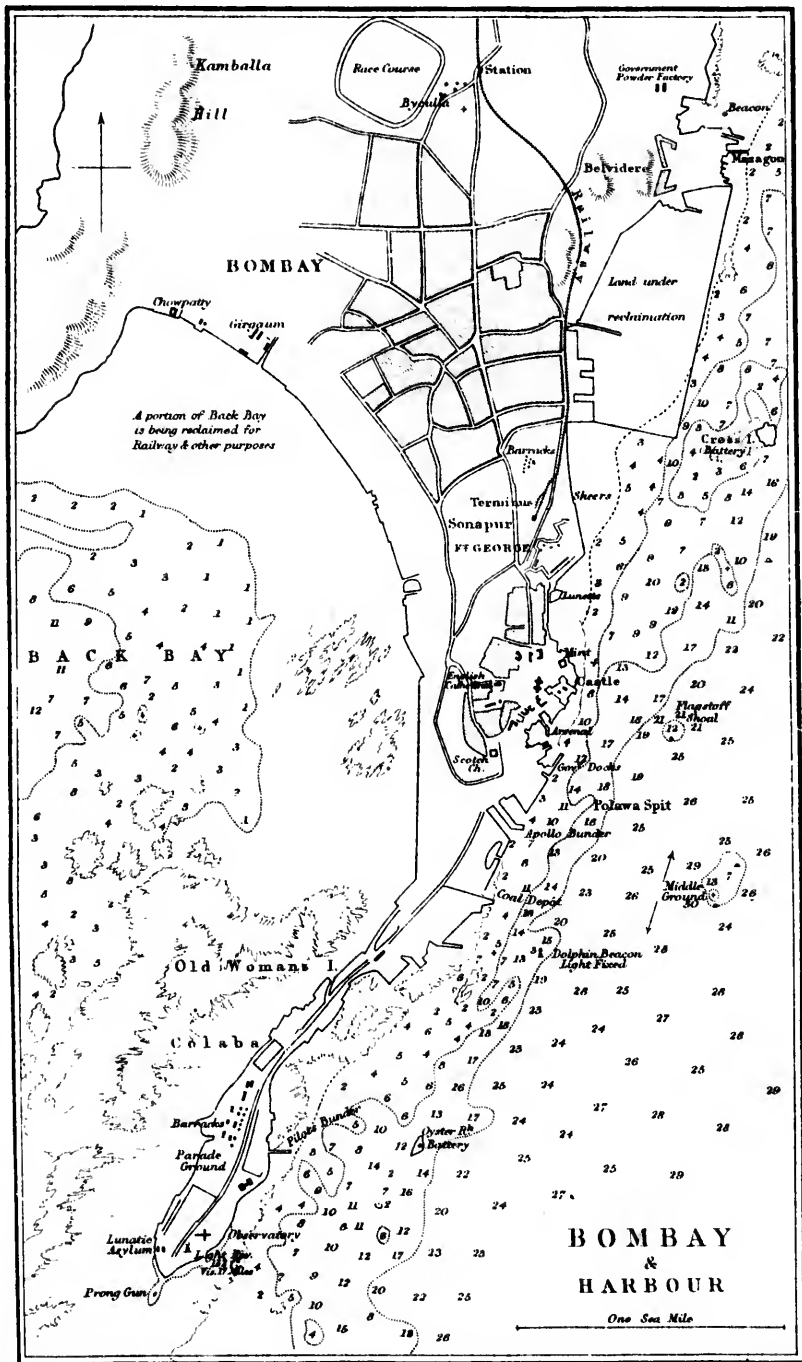

In 1845-44	-	-	-	-	£3,807,564
1853-51	-	-	-	-	4,000,807
1863-61	-	-	-	-	5,215,717

**Bombay Harbour** is one of the safest and most commodious in India. It is bounded on the west and north by the island of Colaba or Old Woman's Island, Bombay Island, and the island of Salsette. The first two are separated only by a narrow creek fordable at low water, and Bombay Island was joined to Salsette by a causeway constructed in 1805. On the east side of the harbour, between it and the main land, is Butcher's Island, distant about 4 miles from Bombay; and immediately behind Butcher's Island is the famous island of Elephanta. About 3 miles south from Butcher's Island is the island of Caranjah, on the western side of which, next the harbour, is an extensive shoal. S.W. from Caranjah, distant about 5 miles, is Tull Point; between which and Colaba, or Old Woman's Island, is the entrance to the harbour. A lighthouse was erected in 1844 on the southern extremity of Colaba Island, elevated about 120 feet above high-water, which in clear weather may be seen at the distance of 17 or 18 miles. The point on which the lighthouse stands is surrounded on all sides by an extensive reef of rocks divided into prongs; of these, the most dangerous is the prong stretching S.W. about 3 miles from the lighthouse, and forming the northern boundary of the entrance into the harbour. It is proposed to erect a new lighthouse a mile and a half farther out on the reef. The reef stretching W.N.W. from Tull Point about 3½ miles forms the southern boundary of the entrance; the breadth of the channel between them being about 3 miles, with a depth of from 7 to 8 fathoms. A new light was erected in 1867 on Kennary Island, 161 feet above the level of the sea. These lighthouses will contribute much to the safety of the navigation into and out of the harbour of Bombay. In going into the harbour, it is necessary to clear a sunken rock, lying almost due east from the lighthouse, at about 1½ mile distant; and also a bank, called the Middle Ground, lying nearly opposite to and about 1½ mile from the southern extremity of the town. (Nicholson and Watson's *Plan of Bombay Harbour*.)

**Docks.**—Bombay is the only port of consequence in British India in which the rise and fall of the tide are so considerable as to admit of the formation of extensive wet docks. At ordinary spring tides the rise is about 14 feet, but occasionally as high as 17. The capacious docks constructed by the East India Company are their property, and are for the most part under the direction of Parsees, who, excepting the Chinese, are the most industrious and intelligent people of the East. Merchant vessels of the largest class, or from 1,300 to 1,400 tons burden, for the cotton trade to China, have been built in these docks. Frigates

and line-of-battle ships have also been occasionally constructed in them, sometimes under the exclusive direction of Parsee artificers. The timber having to be brought from a great distance, ships built at Bombay are very costly; but being, contrary to the practice in other parts of India, entirely constructed of teak, they are the most durable vessels in the world, requiring little repair, and often running 50 or 60 years. Being for the most part built by natives, without any very strict application of the rules of art, they are commonly, though not always, heavy sailers.

The Bombay port establishment, under Act I. of 1859, consists of the shipping master, a deputy, an accountant, a master attendant and conservator of the port, with 2 assistants, and 17 pilots.

*Rates of Dock Charges for Repairs to Ships and Steam Vessels.*

	Large Dock Rs.	Small Dock Rs.
Opening the gates - - -	400	300
Daily dock hire - - -	40	25
Superintendance - - -	10 per diem	-
11re of shores - - -	20 per spring	15 per spring
11re of gangway ladder - - -	2	2
Boring holes in copper sheets - - -	3 per 100	3 per 100

Any artificers or foremen employed from the dockyard to be charged at dockyard rates.

Pilotage and labour—hauling in and out—will be charged extra.

Commission on work, and materials used in ship-building or repairing, and on machinery, brazier's or plumber's work, and on all contractor's bills and on all ship's supplies brought into the dockyard 10 per cent.

All stores brought into the dockyard for the repairs of vessels must be weighed or measured, and the full value declared to the dockyard clerk; and a copy of the contract for repairs must be furnished to him before the vessel leaves the dock.

Timber cut for shores, and dock blocks cut, will be charged for extra.

**PORT RULES, DUES, AND PILOTAGE FEES.**

*Port Rules.*—Clause 1.—1. No vessel, if above 200 tons, entering Bombay harbour, shall run up amongst the shipping until she shall have received permission from the master attendant or other duly authorized person, but must anchor within and to the eastward of the inner floating light; and no such vessel anchored within the limits of the port of Bombay shall move from one place to another within the port, between sunset and sunrise, without the special permission of the master attendant.

2. A vessel working out of harbour, if not clear of it at sunset, must anchor. In the S. W. Monsoon both anchors and cables are to be kept clear should they be required, and the sheet cable to be bent to the anchor.

3. All vessels above 200 tons, entering or leaving the harbour whilst a pilot may be on board, are to fly their national flag from the time of his boarding to the time of leaving, from the time of sunrise to sunset, or before and after, as long as the flags may be visible; and also every ship will show his number on entering the port.

Clause 2.—All vessels above 200 tons, within the port of Bombay, shall be bound to take up such berth as may be appointed for them by the master attendant, the harbour master, or their assistants, and shall change their berths or remove when required by such authority.

The berths of coasting craft and small vessels to be determined under the provisions of section 59 of Act I. of 1852, by the customs authorities with the consent and approval of the master attendant.

Clause 3.—All vessels in the port of Bombay shall have their tlying jib-booms rigged on, and shall when ordered by the master attendant rig in their jib and driver booms, and strike their masts or yards; and any signals made from the dockyard sheer flagstaff directing the striking of masts or yards, or the rigging in of booms, shall be considered to be orders, and obeyed as such.

Clause 4.—Cargo boats, full or empty, shall not be allowed to swing astern of any vessel without permission, nor shall anchors be coek-billed, or spare spars allowed to hang alongside or astern of any vessel.

Clause 5.—Vessels taking in or discharging ballast or any particular kind of cargo, within the port of Bombay, shall be bound to take up such berth as the master attendant or the harbour master may direct.

Clause 6.—Free passages to be kept to all piers, jetties, landing-places, wharves, docks, and moorings; and all boats and vessels shall be bound to move when required to clear such passages.

Clause 7.—All vessels within the port of Bombay will moor and unmoor according to the orders of the master attendant or the harbour master, and shall keep a clear hawse.

Clause 8.—1. On making a written application to the master attendant, a vessel may be moved from any mooring or anchorage within the harbour to any other mooring or anchorage approved by the master attendant, on paying the rates specified in Act XXXI. of 1857.

2. Transporting vessels below the Middle Ground, 20 rupees for vessels not exceeding 300 tons, and for all ships above that tonnage 30 rupees.

All vessels within the port of Bombay shall be moored or warped from place to place as required by the master attendant or harbour master; and no vessel shall cast off a warp that has been made fast to her to assist a vessel mooring, without being required so to do by the pilot or officer in charge of the vessel mooring.

Clause 9.—No vessel shall use any of the Government chain moorings, whether fixed or swinging, without permission of the master attendant or the harbour master.

Clause 10.—All vessels occupying Government moorings, fixed or swinging, shall be liable to pay for the same according to the following scale, but no more:—

*For Fixed Moorings.*

	From Nov. 1 to May 30.	From June 1 to Oct. 31.
	Rs.	Rs.
Vessels up to 199 tons - - -	1 per diem.	3 per diem.
From 200 to 399 " - - -	2 " "	4 " "
300 - 399 " - - -	3 " "	5 " "
399 - 499 " - - -	4 " "	6 " "
499 - 599 " - - -	5 " "	7 " "
599 - 699 " - - -	6 " "	8 " "
699 - 999 " - - -	8 " "	10 " "
1,000 and upwards - - -	8 " "	10 " "
Swinging Moorings - - -	3 " "	4 " "

Clause 11.—No boats to ply as cargo boats except under license, as provided for by section 86 of Act I. of 1852.

Clause 12.—1. No boats lying within 50 yards of the dockyard stairs or wharves, or within 50 yards of the wharf in the basin formed within the breakwater in the vicinity of the custom house bunder, or Government docks, will be allowed to have fire on board.

2. No vessel shall boil pitch on board, but must do so in a boat alongside or astern.

3. All vessels taking in cotton are not on any account to have any lights in the hold or orlop whilst the hatches are opened, and during the stowage of the cotton; the fires are to be put out,

and all spirits, oil, paints, and spirits of turpentine are to be stowed in a place of security.

4. All vessels that may require to be steamed must be moved below the Middle Ground, clear of the shipping.

Clause 13.—No private vessels are to hoist signal lights at nights or to fire any great guns, or muskets, at the hour of sunrise or sunset, or at any other time, without permission excepting in cases when assistance is needed.

The provisions of sections 12, 28, 37, and 40 of the said Act, No. XXII. of 1855, are hereby specially extended to the port of Bombay.

**Port Dues.**—Port dues are levied under the provisions of Acts XXII. of 1855 and XXXI. of 1857, at the rate of 2 annas for every ton of burden, and ships entering the port with ballast 1 anna per ton.

Fees are levied at the rates below indicated for the following services :

Transporting.		
	Fair season	Monsoon
Vessels not exceeding 500 tons	40 rupees	65 rupees

And 10 rupees additional for every additional 100 tons. This only applies to vessels transporting from their moorings to Government docks and vice versa, or to Mazagon and back to harbour.

**Transporting to the Middle Ground.**

Tons	Rs.
Vessels not exceeding 500	60
Between 500 and 1,000	80
1,000 and 1,500	100
1,500 and 2,000	120

Vessels proceeding to sea, and anchoring by desire at the Middle Ground for less than twenty-four hours, half the above rate.

Hooking - - - 16 rupees | Measuring - - - 50 rupees

**Pilotage in and out of Bombay Harbour.**—For vessels from 100 tons to 2,000 tons during fair season and S.W. monsoon. The S.W. monsoon commences from June 1 and ends September 30.—

If a pilot proceeds on board a ship (when requested) to take her to sea, and his services are for that day dispensed with by reason of the ship not being ready—a fee of rs. 20 is charged by the master attendant for the attendance of the pilot.

**Pilotage in and out of the Port of Kurrachee.**—From and after the last day of January 1865, pilot fees for pilot services as shown in the following scale will be charged on all sailing vessels over 100 tons burden that may enter or leave the port of Kurrachee. The monsoon season comprises the months of June, July, and August.

Ships from	Tons	Fair season		Monsoon

1,900 - 2,000	-	135	160	135	160

Inward pilotage only will be charged on Steamers.

On all sea-going vessels of 100 tons and upwards, the same being necessitated to receive a pilot on board when moving within port limits, 2 annas for each ton of burden.

Coasting craft and vessels under 100 tons burden, which vessels are not required to take a pilot when moving within port limits, 4 annas for each ton of burden. (Extract *Bombay Almanac*, 1865.)

**Money.**—Accounts are kept in rupees; each rupee being divided into 4 quarters, and each quarter into 100 reas. The rupee is also divided into 16 annas, or 50 pice. An urdee is 2 reas; a doreea, 6 reas; a doognee, or single pice, 4 reas; a fudlea, or double pice, 8 reas; a panchlea is 5 rupees; and a gold mohur, 15 rupees. Of these, the annas and reas only are imaginary moneys. The coins of Bombay are the mohur, or gold rupee, the silver or Government rupee, and their divisions; also the double and single pice, the urdee, and doreea, which are copper coins with a mixture of tin or lead. The following is the assay and sterling value of the present gold and silver coinage of Bombay:—

	Gross wt.	Pure metal.	Sterling value
Gold mohur	180	145	23s 2d
Government rupee (silver)	180	165	1-11

if silver be taken at 5s. 2d. per oz., and 2s. 0½d. if silver be taken at 5s. 6d. per oz.

The Government rupee has been coined only since November 1, 1862; but it is almost identical in respect of value with the rupees previously in circulation. [CALCUTTA.]

The charge of coinage in the Bombay Mint is 2½ per cent. for gold, and 3 per cent. for silver, including the charges for refining. The machinery for this mint was sent out from England a few years ago, and is complete, but very costly.

**Weights and Measures.**—The unit of weight in Bombay, as in other parts of India, is, by the law of 1833, the tola of 180 grains Troy, the other weights being derived from it as follows:—

8 rattrees	=	1 masha	=	15	trov grains
12 mashes	=	1 tola	=	180	trov grains
80 tolas (or sicca weight)	=	1 seer	=	2½ lb. Troy	
40 seer = 1 man (or bazaar maund)	=	100 lb. Troy			

The following table shows the commercial weights of the several Presidencies of India, Travancore, China, and England, compared with the new Indian maund introduced into Bengal in 1833, and adopted in the tariff valuation under the Bombay Presidency since 1840.

	lbs.	ozs.	grs.	maunds.

**WEIGHTS AND MEASURES.**

**Bazaar weight.**—In Bombay the following are the local weights in use:—

4 dhan or yav	= 1 rakhta	= 2-1267	gr. tr.	= 0-1182	tol.
8 rakhta	= 1 masha	= 4-8069	" "	= 0-9152	" "
4 masha	= 1 tank	= 4-4889	dr. av.	= 0-7809	" "
72 tank, or	= 1 ser	= 11-1-5	av.	= 27-2-9	" "
30 pala	= 1 man	= 28	lb.	= 10-8-3	" "
40 sera	= 1 khandi	= 609	lb.	= 6-8056	lm. m.

The khandi for cotton is 28 máns or 784 lbs. avoird. or 7 cwt.

The 'pakka ser' is 1½ lbs. avoird. or 72-59 tolas.

At Panvel the ser weighs 72-83 tolas.

The British Indian or imperial ser and man are 2-9387755 Bombay sera and máns respectively; and the Bombay man is 0-3402778 imp. máns.

The Bombay ser weighs 317-51485 grammes, and the man 12-700594 kilogrammes.

At Poona the ser is 80 ankushi rupees or 76-66 standard tolas, or 1-9714 lbs. avoird. or 2-33664 lbs. troy = 9588 B. I. sera.

44 tanks	= 1 chhatank	= 1-9714 oz. av.	= 0-958 lm. ch.
4 chhatanks	= 1 pan-ser	= 7-8856	" "
4 pava	= 1 ser	= 1-9714 lb.	= 0-9584 ser.
5 sera	= 1 passer	= 9-8-57	" "
8 passer	= 1 man	= 78-8-36	" "
3 man or 120 sera	= 1 pala	= 23-6-57	" "
63 pala (20 máns)	= 1 khandi	= 1577-12	" "

Kacheha máns of 12½ and 14 sera are also used in the district.

In the Khed, Poorundhur, and Bhimathadi talukas, the ser weighs 76 tolas; in Shiwner and Indapur, 76½; in Pabal 77; and in Mawal 75 tolas.

At Ahmednuggur and Sholapore the British Indian or imperial weights are in use.

At Ahmednuggur the Pala is 21 máns.  
,, Nihapore, 1 Manki = 1 Dharas = 12 sera.

In Satara the ser varies in different localities from 92-75 tolas at Koley to 115 tolas at Mamdapur; in Satara city it is 93-25 tolas.

In Sindh the British Indian weights were declared by proclamation August 1, 1853, to be the only legal standard.

8 máns = 1 khandi = 638 2/7 lbs. av. = 25-510204 Bombay máns.

At Surat the Surat ser of 35 Surat tolas is variously stated from 36-4583 to 37 tolas, and the man from 37½ to 38 lbs. avoirdupois, the former being probably the more accurate determination, from which—

1 Surat ser.	= 155729	Brit. Ind. sera.
1 "	= 1339286	Bomb. sera.
1 Brit. Ind. ser.	= 2-1942857	Surat sera.
1 Bomb. ser.	= 2-746967	" "

The Khandi for cotton is 21 máns, or 7 cwt. 34 lbs.

In Khandeish &c. the British Indian system is authorised.

At Baroach &c.

At Baroach the ser is	40 tolas.
At Ahmed "	38-5 "
At Ambusar and Ankiesar	38 "
At Wagra	37½ "
At Hansot	38-8125 "

**Native Jewellers' Weight.**

1 dhan	= 15-32 gr. troy.
4 dhan = 1 rati	= 17-8 "
8 rati = 1 masha	= 15 "
12 masha = 1 tola	= 1-90 "

A dhan is 0-46875 gr. troy or 0-0303745 French grammes.

**Goldsmiths' Weight.**

2 gunj = 1 wal	= 5-8288 gr. troy.
4 wal = 1 masha	= 15-3129 "
12 masha = 1 tola	= 1-83-7536 "

Mashas, rati, dhans are employed in the native evaluation of assay of the precious metals: thus

'10 mashas fine' signifies 10-12ths pure, or the same as '10 oz. touch.'

**Measures of Length.**—The gaz or unit of lineal measure not only differs in different provinces of India, but also, like the ser, in the same province for different purposes. The English yard, however, is rapidly becoming the only standard unit, especially where English education has obtained a firm footing.

3 jau	= 1 angul	= 3	ln. or 19-05 mm.
4 angul	= 1 muthi	= 3	" 7-2 "
12 angul	= 1 big' hath or bilaut	= 9	" 28-6 "
2 big' hath or 24 angr.	= 1 hath or culit	= 18	" 457-19 "
2 hath	= 1 gaz or yard	= 3	R. 91-38 "
4 hath	= 1 danda or ham	= 4	yd. 1-8287 met.
8000 danda	= 1 kos or kros	= 10-0	sta. 3657-5 "
4 kros	= 1 yojan	= 9 1-11	m. 11650 "

In Bombay the half hath is called Vént; and the measuring rod or kathfi for land, according to Jervis, is 9-3644 feet. In Gujarat 5 hath make 1 Vasó or Kathfi. In Western India almost every village has its own Kathfi.

The Kos of the Ayin-akbari was about 2-58 miles, or 4,540 yards, or 4,150 mètres.

The Bengal Kos contains only 1,000 danda or dhanu. In surveying, 80 hath = 1 Rassi.

In the N.W.P.—Delhi, Lúdhianah, Ferozepore, and part of Berar: 33 inches = 1 Iláhi gaz, 3 li. gaz = 1 bans or gantéh, and 20 bans = 1 Jarib. In Benares and Ghazeeepore the gaz used by Mr. Duncan in the settlement of 1795 was 33-6 inches. The true Iláhi gaz probably measured 32-6 to 32-8 inches; in Bareilly, Bulanshahr, Agra &c. it is reckoned at 32-5 inches.

In Orissa the padika or rod is 10-4355 feet; in Tirhút the lagi is 9½ feet; and in Jynteah the clastidari hath is 18-87 inches, and 16 háths make 1 null.

In Bombay, for cloth—

2 angul = 1 tasd	= 1 1/8 inch.
24 tasu	= 1 gaz = 27 "

In Púna the gaz is 34½ inches, but English cloth is sold by the yard.

In Bengal—

3 angul or argil = 1 gith	= 2½ inch.
8 gith	= 1 hath = 18 "
3 hath	= 1 gaz = 36 "

**Measures of Surface.**—In Bengal the following are used:—

2 square háths = 1 gandeh	= 2½ sq. ft.
20 gandeh = 1 chhatank	= 5 sq. yds.
16 chhatank = 1 katha	= 80 "
20 katha	= 1 bighá = 1600 "

The Bengal bighá is <sup>40</sup>/<sub>271</sub> or 0-3305785 of an acre.

The Benares and Ghazeeepore bighá contains 3,600 square Benares gaz, or 3,136 sq. yards, or 647934 acre.

In Bombay, Poona &c.—

31 1-36 square háths = 1 kathfi.	
20 kathiyu	= 1 pand, or vasd.
20 pand	= 1 bighá.
6 bighá	= 1 ruksh.
120 bighá	= 1 chahúr.

If the Bombay kathfi of 5 <sup>40</sup>/<sub>271</sub> háths be exactly 9-3644 feet as stated by Jervis, this bigh will contain 8897-422 sq. yards = 0-805253 acre; but in other places it varies with the kathfi, which is the only real measure ever used in the central and southern parts of the Bombay Presidency. In some places the survey chain of 33 feet has taken its place, and—

16 ans or links = 1 gunta or chah.	
40 guntas	= 1 acre.

In Gujarat—

30 khunt = 1 padat.  
 30 padat = 1 padat.  
 30 padat = 1 vishwahi.  
 30 vishwahi = 1 vado.  
 30 vado = 1 vingho, bighá or dári.

In the North-West provinces,—Delhi, Patna, Shahabad, Sarun, Bhagalpore, and Monghyr, the bighá of 3,600 square Ikhi gáz = 3,025 sq. yards or 0.625 acre prevails, and is divided as follows:—

30 sawani or nanwabi = 1 sawani = 24,5025 sq. in.  
 30 sawani or nanwabi = 1 kachwanai = 5,40312 sq. ft.  
 30 kachwanai = 1 biswanai = 7,36125 sq. yds.  
 30 biswanai = 1 bhava = 1512 " "  
 30 bhava = 1 bighá = 39125 " "

1 acre = 1.6 Delhi bighá. The Orissa bighá is 1 acre or 4810 sq. yds. The Tibhut bighá is 400 sq. ligá = 1245 sq. yds. = 372934 acre.

In Madras—

21 grounds = 1 máni or ground = 2400 sq. ft.  
 1 káni = 1 acre = 6400 sq. yd.  
 1 acre = 0.75625 káni.

**Liquid and Dry Measures.**—India, properly speaking, does not possess dry or liquid measures. Where these are employed they represent the ser or the máni weight. The value of any vessel of capacity rests solely on the weight contained in it. In South and West India an equal mixture of the principal grains is taken, and a vessel formed to hold a given weight of it.

In Bengal the following are used for grain;—the conversion into English measure being derived from the capacity of a vessel holding a máni of water or 1  $\frac{1}{35}$  bushel:—

6 chhatánka = 1 kánki = 11.107 c. in. = 0.5143 pts.  
 15 chhatánka = 1 ser = 57.037 " = 1.6337 " "  
 4 kánki = 1 rok = 71.3 " = 2.0571 " "  
 4 rok or 5 ser = 1 pýsali, or drón = 285.186 c. in. = 8.2286 gal.  
 8 máni = 1 máni = 2281.49 " = 6.2286 gal.  
 20 pýsali = 1 máni = 5703.72 " = 16.0714 " "

It may be remarked that the máni of 8  $\frac{1}{2}$  gallons very nearly would form a very convenient dry measure; it would be a little larger than the English bushel, and ought to be a cylinder 8 inches deep and 19.055 inches diameter, or 8  $\frac{1}{2}$  inches deep and 18.487 inches diameter.

At Bombay—

56 tanks = 1 tpari = 9.706 c. in. = 5.3-5 oz. av.  
 2 tpari = 1 ser = 19.402 " = 11 " "  
 4 sera = 1 pýsali or ad = 77.637 " = 2.4-5 lbs.  
 16 pýsali = 1 ball = 124.43 " = 44-4-5 " "  
 8 pharas or 1 khandi = 993.7 " = 358-2-5 " "  
 25 fara = 1 runda = 17.9715 c. ft. = 14 gals.  
 17  $\frac{1}{2}$  pýsali = 1 fara of rice = 1339.23 c. in. = 6.01 gal.  
 17  $\frac{1}{2}$  pýsali = 1 fara of other = 1358.66 " = 6.01 " "  
 84 pýsali = 1 fara of lime or chunam = 659.91 " = 2.98 " "

These faras are not regulated on any authoritative basis.

	Arrivals				Departures			
	1855-54		1853-54		1853-54		1855-54

Total	-	-	6,717	498,848	-	-	4,851	295,244
Grand total	-	-	5,880	400,987	7,339	789,136	4,931	357,297
	-	-					5,486	736,538

In 1843 there belonged to Bombay, and mostly to native merchants, 58 ships of the aggregate burden of 31,378 tons, of which 6 only were under 200 tons. They were for the most part navigated by natives or lascars, the master and superior officers only, and that not always, being English-

For salt in Bombay—

1 adhvall = 4.11745 pint.  
 103 adhvall = 1 pharo or faroo = 5.7979 gall.  
 100 phara = 1 ana = 7.2474 bush.  
 16 ana = 1 ras = 141.918 grs.

The faro for salt contains 1607.61 cubic inches; and there is a ser for liquids of 60 tolas, or about 42.78 cubic inches, that is, 1.2343 pint. At Poona and Ilawell Taluka—

8 chýstin = 1 ser = 38.52 stand. tolas.  
 2 sera = 1 adholi = 1.916 " sera.  
 4 sera = 1 pýsali = 3.832 " "  
 12 pýsali or 48 sera = 1 runda = 15.983 " "  
 24 máni, or 120 sera = 1 palla = 5.4487 " máni.  
 3 palla = 1 khandi = 27.59 " "

According to Sykes, a ser in the Deccan contains 2.44934 lbs. avoird. of Jerwall rice, or 1.0417 quart. The Adholi is the largest measure in common use.

The measures are all heaped; and equal quantities of five sorts of grain give the equivalent weight in tolas.

In Ilawell Taluka (the adholi = 212 tolas.  
 Khed, Mawal, and Indapore " = 218 " "  
 Poorandhur " = 222 " "  
 Ilhmathadi " = 224 " "  
 Shivaner " = 233 " "  
 Pabal " = 239 " "

At Hyderabad, &c. (Sindh)—

4 chaotia = 1 psol = 1.743 imp. sera.  
 4 patole (37.5-77 tolas) 1 toya = 18.7881 " "  
 4 toyas = 1 kasa = 18.9216 " "  
 5 kassas = 1 mundi = 53.912 " "  
 12 mundias, 60 kassas 1 shirwar = 1127.304 " "

The values of these measures vary at different places; the Toya at Nuggur is 528 tolas, at Mitthi 518, and at Islamkot 464, on the frontier about 344, and at Shikarpore 295 tolas weight of water.

In Kurrachee everything is sold by weight.

At Madras—

8 alacka = 1 palli 93.75 c. in. = 5.0308 in.  
 8 palli = 1 markat = 7.50 " = 10.9616 " "  
 5 markats = 1 parash = 37.50 " = 17.2050 " "

The Garisha or Garco for grain is 12  $\frac{1}{2}$  máni or 320 lbs. avoird. = 3  $\frac{3}{8}$  British India máni.

**Shipping.**—Vessels of various nationalities trade in and out of the port of Bombay, but the far greater portion are under British colours, showing an average of upwards of 800 tons. The native craft is larger than in any other part of India, trading generally from port to port, and even as far as the Arabian and Persian Gulfs. The following table shows the arrivals and departures at the port of Bombay to and from all foreign places:—

*Commerce &c.*—Bombay is much less favourably situated in respect to natural internal communications than Calcutta and Madras, inasmuch as the rivers with one or two exceptions do not afford the same facilities for navigation on the Western as on the Eastern coast of India; all the inland trade has hitherto been carried on along the roads, which are available only for pack-bullocks and camels. The abolition of transit duties and the introduction of railways communicating with the principal markets in the interior have, however, considerably tended to increase the trade of the port of Bombay and otherwise improved the Presidency generally.

The external trade of Bombay is principally carried on with Great Britain, France, ports in Arabian and Persian Gulfs, China, and Mauritius, in British and other European vessels, as well as a very large coasting trade in native vessels from minor ports in the Presidency to the port of Bombay for the purpose of exporting produce to other parts of the universe. The coasting trade is chiefly carried on between Calcutta, the Malabar and Canara coast, Cutch and Kattywar.

The principal articles of import from the United Kingdom consist of coal, cotton goods, metals (raw), chiefly copper and iron, machinery, malt liquor, manufactured metals, woollen stuffs, apparel, books and stationery, wines and spirits &c. From France, wines and spirits, furniture, books, jewellery, musical instruments, clocks &c. From China, raw silk and silk goods, sugar and sugar-candy, tea, glassware, tobacco &c. From the Arabian and Persian Gulfs, horses, cotton-wool, gums, fruits, grain, precious stones, wool &c., and from Mauritius sugar.

The export trade to the United Kingdom chiefly consists of raw cotton, cashmere shawls, seeds, spices from Africa, silk and silk goods, hides and skins, opium, coffee, grain, ivory, gums. To France, coffee, seeds, and shawls. To China, cotton goods and opium. To Mauritius grain, and to the Arabian and Persian Gulfs cotton goods, sugar and sugar-candy, tobacco, tea, grain &c.

*Value of Principal Articles Imported into the Presidency of Bombay from all parts out of India.*

The discrepancy between the imports and exports is to be accounted for by the vast exportations of cotton from Bombay. These exportations were in response to the void created by the sudden cessation of the supplies of American cotton. For some time the trade of Bombay was ex-

cessively active, speculation was rife, fortunes were rapidly accumulated. Land in the neighbourhood of the port rose to a fabulous price. As might be expected, the reopening of the Southern ports of the American Union reversed some of these circumstances, and the necessary consequences of over speculation ensued, but Bombay has been permanently benefited by the extraordinary commercial activity of the years 1862-5.

*Value of Principal Articles Exported (including Imports re-exported) from the Presidency of Bombay to all parts out of India.*

1866-7	22,230,504	19,570,047	4,940,181	46,740,731

*Banks.*—These consist of the Chartered Mercantile Bank of India, and the Chartered Bank of India, and branches of the Oriental Bank of London, the Agra Bank &c. Including agencies of English houses, there are about 13 in all, the capital amounting in the aggregate to about 16,000,000. But it would appear from the *Bombay Calendar and Directory* for 1868, that there were, besides these, 56 Banking and Financial Associations connected with Bombay then in course of liquidation.

*Insurance.*—Companies for the insurance of lives, shipping, and against fire, have been established in Bombay; and several of the London and Calcutta Insurance Companies have agents here.

*Marine Insurance Companies.*—There are 39 marine insurance offices, chiefly agencies, at Bombay. The fire and life insurance business is conducted almost exclusively by agents for companies in England, there being only one life company, namely, the Bombay Ladbale, having a quin-

quennial existence, as the first appears to have been established in 1829 and terminated December 31, 1833; and the seventh Laudable Society terminated on December 31, 1863.

**Customs Duties: Import and Export.**—By the Indian Customs Duties Act of March 1867, one uniform tariff for imports and exports was fixed for all ports in British India. [CALCUTTA.]

\* \* \* The standard ton at Bombay for measurement of goods shall be taken at 50 cubic feet.

The freight on oil is paid on the full gauge of the cask, ascertained at the port of discharge.

When freight is payable on weight, the same is to be on the net weight delivered.

**Rules and regulations for the measurement by callipers upon shipments to Great Britain of cotton, wool, hemp, and other screwed and pressed bales, at the port of Bombay.**—1. That callipers shall from time to time be submitted to the Secretary of the Chamber of Commerce, and if found correct, shall be branded with a stamp bearing the name of the chamber, to indicate the same.

2. That if, from use or otherwise, any callipers should get out of order and be objected to, the party objecting shall send the callipers to the chamber for examination; and should the objection

be valid, the chamber's stamp shall be defaced by the secretary; if, however, the objection is found to be groundless, the secretary shall give a note to that effect, and the party objecting shall be bound by his decision.

3. That any callipers found incorrect, and on which the stamp has been defaced, may be re-stamped after adjustment.

4. That no measurements shall be held good except such as are taken by callipers bearing the chamber's stamp.

5. That cotton, hemp, wool, and other screwed bales shall be measured as follows, namely—the greatest length to be first ascertained, and then the bale to be set on either end, as the shipmaster may wish, and cross measurements to be taken at top over the lashings, excepting the knots, and as near the centre of the bale as possible. That an average of 100 bales be struck by ascertaining the actual measurement of any 10 bales, and proportionately, the shipper selecting and measuring one half, and the shipmaster the other half; should, however, any dispute or difficulty arise in the selection of bales, either party to have the option of measuring the whole quantity.

6. That all produce subject to measurement be measured within the day on which it has been ordered to be screwed, provided the order has been given by the shipmaster or agents of the vessel; and that from June 1 to October 15 the same be measured at the Screws; during the remainder of the year, if required, on the Bunds, weather permitting. No cotton, wool, or other goods to be measured until a Custom-house pass has been obtained for the same.

7. That in the event of the shipmaster not attending to measure at each hour as may have been appointed by his agent or agents of the ship do empower a person attending on his behalf, whose sanction to a measurement shall be binding upon the shipmaster.

**Money.**—Silver is the legally constituted medium of exchange in all money transactions throughout the British-Indian possessions. Gold coin was intended to be a legal tender, at a fixed value of 16 rupees for the gold mohur of Calcutta, and 15 rupees for the gold rupee of Madras and Bombay; but it is not demandable in payment, and is left to find its current value in the market.

The value of a rupee is generally assumed as equal to 2s. sterling. At the Calcutta mint price of silver it is worth 2s. 0/035d.; at the commercial price of exchange 1s. 11/5d.; and at the London mint price of silver it is worth 1s. 11/0d.

The rupee weighs 180 grains troy, or 1 tola, and consists of 11 parts of silver and 1 of alloy. The gold rupee is of the same weight and standard. The copper coins are the half anna, weighing 200 grains; the quarter anna or paisa, 100 grains; the half paisa, 50 grains; and the pie, 33 1/3 grains.

In Bombay, accounts are still often kept in rupees, quarters, and rases, 2 1/2 rases making one anna.

	Value Sterling.

greatly out of fashion, being superseded by alpaca fabrics, but it is said that there is a considerable export trade in the fabric to South America.

**BONES.** In the Arts, the bones of cattle and other animals are extensively used in forming handles for knives, and various other purposes; but of late years they have been of most importance in agriculture. When employed in the latter they are, in most instances, ground or reduced to powder, and are commonly used as manure for turnips, being in general drilled in with the seed, though sometimes also they are sown broadcast and with other crops. The quantity used varies from about 25 bushels of dust to about 40 bushels large an acre. Their effect is said to be considerably increased when they have undergone the process of fermentation. They were first used, in this country on a large scale, as a manure in Lincolnshire; and there can be no doubt that their extensive employment in that county has been one of the chief causes of its rapid improvement, and of the high state of cultivation to which it has attained. Bone-dust is now, however, very largely used, not only in Lincolnshire, York, and the adjacent counties, but in most other parts of England, and almost everywhere in Scotland; and its influence in increasing the crops of corn and turnips, and consequently also the supplies of butcher's meat and farm manure, has been quite extraordinary. In fact, it is to the employment of this manure and guano, combined with the extension of furrow drainage and the introduction of steam navigation, that the wonderful improvements that have been made in agriculture since 1820, and the vast increase of agricultural produce, are principally to be ascribed.

In 1827 Mr. Huskisson estimated the real value of the bones annually imported for manure at about 100,000*l.*; but at present (1868) it probably amounts to more than quadruple that sum. The ad valorem duty of 1 per cent. on bones produced, in 1841, 2,933*l.* 5*s.* 3*d.* nett, showing that the value of the imports must then have exceeded 293,000*l.*, of which it is abundantly certain that but a comparatively small portion was employed otherwise than in agriculture. They are principally brought from the Netherlands, Germany, and South America. It is a curious fact, that while the duty on bones imported into Scotland in 1841 amounted

to 749*l.* 4*s.* 4*d.*, the duty on those imported into Ireland amounted to only 2*l.* 10*s.* 1*d.* After being reduced in 1842 to 6*d.* a ton, the duty on bones was finally repealed in 1845. In 1866 the imports of bones (exclusive of whale fins) into the United Kingdom amounted to 80,306 tons, valued at 409,590*l.*

Burnt bones or animal charcoal possess remarkable powers of absorbing noxious gases, and of bleaching water which is stained by organic matter. Hence they are used largely as the material for filters, and in particular for refining sugar. The same substance is employed to form the cupel of the gold and silver refiner, the scoria of the alloy sinking into the substance of the cupel, and the button of pure metal remaining on the surface of the crucible.

The most powerful kinds of animal charcoal are obtained from the ignition of substances possessing a large amount of animal matter, as dried blood, hair &c. Thus, white bone black has a power in decolorising syrup and indigo which may be represented by 1, a charcoal formed from blood ignited with carbonate of potassa has the powers of 20 and 50 on these substances respectively.

**BOOK-KEEPING.** The art of keeping the accounts and books of a merchant. Book-keeping by double entry means that mode or system in which every entry is double, that is, has both a debtor and a creditor. It is also called the Italian method, because it was first practised in Venice, Genoa, and other towns in Italy, where trade was conducted on an extensive scale at a much earlier date than in England, France, or other parts of Europe. This method, however familiar to merchants and book-keepers, seems intricate to almost all who have not practised it; nor is the dryness and difficulty of the task much lessened by the printed works on the subject, which, having been compiled more by teachers than by practical merchants, contain a number of obsolete rules and unnecessary details. The most effectual mode of giving clearness and interest to our remarks will be, first, to state a few mercantile transactions, and then to explain the nature of the accounts and entries which result from them.

The Journal of a mercantile house ought to open, at the beginning of each year, with an enumeration of their assets and debts, as follows:—

Folio of Ledger		SUNDRIES De. to STOCK.		For the following, being the assets of the house.		
1	Cash amount at the banker's this day (Jan. 1)	-	-	2,350	0	0

				£32,391	17	10

Let the transaction to be first explained be an order for goods from a correspondent abroad. A house in Jamaica sends instructions to the house at home to buy and ship a quantity of manufactured articles, suited to the Jamaica market, as follows:—

Order from James Allan & Co. of Kingston, Jamaica, to Henry Barclay & Co. of London.

J. A. & Co. **Linen:** Lint Strelitz Onaburgs, 14 bales, 6d. per yard.  
 Best tow Strelitz do., 9 bales, 4d. or 4½d.  
 Best white Platillas, 1 case.  
 Linen tick assorted, 3-4ths width, Or, 1s., 1s. 3d., 10 pieces each, cut up in 22-yard lengths.  
**Woolens:** 5 bales Fenistones, 3-4ths wide, best indigo blue, 1s. a yard.  
**Cottons:** 50 pieces stout calico, 2½ yards each, 3-4ths wide, 4d. a yard.  
 50 do. do. do. 7-8ths, superior, 5d. a yard.  
 100 do. stout calico shirting, 7-8ths wide, superior, 6d. a yard.  
**Hats:** 4 dozen gentlemen's superfine black, 20s. each.  
 2 do. do. do. drab, 20s. each.  
 1 do. youths' do. black, 15s. each.  
 20 do. felt hats, for negroes, 2s. per dozen.  
**Shoes:** 10 dozen prime calf-skin shoes, full size, 65s. per dozen.  
 10 do. youths' do. 55s. per dozen.  
 5 do. gentlemen's dress do. 72s. per dozen.

This order the London merchant divides among six, seven, or more wholesale dealers, according to their respective lines of business. Each dealer, or tradesman, as he is commonly called, provides his portion of the order in the course of the fortnight,

three weeks, or month, allowed him by the merchant; and when the goods are packed and ready to ship, he sends in his account, or bill of parcels thus:—

London, 20th February, 1843.

Messrs. HENRY BARCLAY & Co.

Bought of SIMON FRAZER.

	£	s.	d.
10 pieces best tow Strelitz Onaburgs, 146 yards each, at 4d. per yard	24	6	8

					£1,415	10	0

At 6 months' credit; due September 6. London, March 6, 1843. Errors excepted. HENRY BARCLAY & Co.

This invoice, being sent out by the vessel to Messrs. Allan & Co., conveys to them a number of particulars in a short space; viz. the mark, the numbers, the value, and the contents of each package. In former times it was the practice to make an invoice very long, inserting in it a literal copy of each bill of parcels, but it has now become usual to make each tradesman deliver a duplicate of his account, to be sent abroad with the goods; in which case the invoice may be, like the above, little more than a summary of the bills of parcels. This method has two advantages: it saves time

at the counting-house of the exporter, and it affords to his correspondent an assurance that no more is charged to him than has been actually paid for the articles.

An invoice ought to be made out with the utmost care, for it is a document of great importance in several respects: first, between the exporting merchant and his correspondent abroad; and next, when in the hands of the latter, it may and generally does form a voucher for calculating the import duty, as well as for the sales effected to retailers or other dealers.

The sur generally 2 per cent insurers in It is thus r

London, April 2, 18

The sum insured by the exporting merchant generally exceeds the amount of the invoice by 2 per cent., because the recovery of a loss from insurers involves a charge of fully that amount. It is thus necessary to cover not only the price of the goods, and the charges of shipping, insurance, and freight, but such further sum as may enable the shipper, in case of loss, to carry to the credit of his correspondent the amount of the invoice, clear of any deduction.

Journal Entries resulting from the foregoing Invoice.

London, October 2, 1842.		HENRY BARCLAY & Co.	

The following is an invoice of 60 barrels of herrings, shipped by Henry Barclay & Co. of London, in the *Barclay*, James Ferrier, bound to Barbadoes, by order and for account and risk of John Henderson, Esq., planter, and consigned to him at Bridgetown, Barbadoes.

London, Feb. 18, 1843.

J.H.		£ s. d.	
60 barrels prime white herrings, deliverable at Bridgetown, Barbadoes, free of charge, at 2½s. per barrel - - - - -	£63	0	0

This invoice is very short, the agreement having been that the herrings should be delivered at a fixed price, all charges included.

Account of Sales.—We come now to a trans-

action of a different kind; to the sale of goods imported from abroad. A merchant in England receives from a correspondent, whether in India, the West Indies, or North America, notice of a shipment of sugar, coffee, rice, or other produce, about to be made to England, with instructions to effect insurance on the computed value. This is the first step in the transaction; on the arrival of the vessel the goods are entered, landed, and warehoused; and a broker is instructed to report on the state and prospects of the market. On a sale taking place, an account is made out and forwarded to the correspondent abroad, as follows:—

ACCOUNT SALES of 7 hhds. Sugar, by the <i>Ceres</i> , from Trinidad, for Account of MORRIS FITTMAN, Esq. of Trinidad.				£ s. d.

London, April 2, 1843.								

We have here, on one side of the account, the quantity and value of the goods sold; on the other, the various charges attending the bringing home, the warehousing, and the sale of the articles.

The quantity of goods accounted for in an account sale must be the same as in the invoice; if it be less, whether through damage at sea, through waste, or any other cause, the extent of the deficiency should be explicitly stated. By the over-taker in the following sale is meant the additional

barrel or package required for the coffee taken out of such of the tierces as have been opened on account of breakage or other damage.

*Allowances of Weight*.—The tare is the weight of the cask, and differs, of course, in almost every package: but trett (see the following sale) is a fixed allowance of 5 lbs. per tierce in the case of coffee, intended, like draft in the case of sugar, to insure good weight to the buyer, and to enable him to do the same to those who purchase again from him.

ACCOUNT SALE OF 20 Tierces Coffee, per Vittoria, from Demerara, for Account of James Forbes, Esq. Demerara.			
<b>CHARGES.</b>

			Henry Barclay & Co.

London, April 5, 1843.

Errors excepted.

Freight is charged on the weight of the produce only; not of the produce and packages together. This allowance is of old standing,

and is to be traced less to the reason of the case than to the competition prevailing among shipmasters.

*Journal Entries resulting from the preceding Accounts of Sale.*

We have thus given an example of the transactions which form a great part of the business of our merchants; the export of manufactured goods, and the import and sale of

produce received in return. Our next illustration shall be of a merchant's cash book. The following is an example of the entries for a month:—

3	Charges.		
	31st. Paid postage, and petty disbursements this month - - - - -	15 2 6	
		£2,170 7 2	

The above shows, that for all sums received, the account of cash is made debtor, and the parties paying the same are made creditors; while for all sums paid, the cash is credited, and the parties receiving them are made debtors.

We are next to state the mode of entering bill transactions.

*Bills receivable.*—We have seen by the Balance sheet that several correspondents are

indebted to the house. The debts of correspondents abroad may be reduced by remitting either bills, specie, or merchandise for sale; from correspondents in England, bills are almost the only mode of remitting. When bills come to hand, the rule is to enter each in the bill book, with a minute statement of the date, term, sum, and other particulars thus:—

No.	Received	From whom	Drawn by	Date	Term	Drawn on	To order of	Due	Sum	How disp. of
630	8 March	Bailey & Co.	W. Adams	11th inst, 1 March	2 months	T. Jones, Dublin	A. Williams	1-4 May	350	Rainier & Co.
631	10 March	Watson & Co.	J. Jacobs	3 March	1 month	J. Adams, London	G. Wilson	3-6 April	185	Smith & Co.
632	12 March	Spence & Co.	T. Johnson	Falmouth, 3 March	2 months	T. Allan, Liverpool	D. Jones	5-8 May	1260	Creswell & Co.

The Journal Entries for these bills are as follow :—

Folio of Ledger	BILLS RECEIVABLE Dr. to SUNDRIES.		£ s. d.
	For the following remitted this month.		
7	To James Hailey & Co. No. 630, on T. Jones, Dublin, due 4th of May	- - - - -	350 0 0
7	To T. Watson & Co. No. 631, on J. Adams, London, due 6th of April	- - - - -	135 0 0
7	To William Spence & Co. No. 632, on T. Allan, Liverpool, due 8th of May	- - - - -	260 0 0
			£745 0 0

*Bills Payable.*—The entries under this head are, of course, wholly different from the preceding, account of sums owing by it to correspondents. Each acceptance is entered in the book of bills being for acceptances of the house given on

No.	Drawn by	Place and Date	To order of	On account of	Term	When accep.	Due.	Sum
151	J. Allan & Co.	Jamaica, 15 January	J. Jones	J. Allan & Co.	90 days' aight	12 March	10—13 June	175 10 0
152	G. & W. Fox	Falmouth, 7 March	J. Thomson	G. & W. Fox	15 days' date	14 March	22—25 March	75 15 0
153	J. Clark	Hull, 5 March	G. Harclay	J. Smith & Sons	1 month's date	16 March	5—8 March	132 10 0

The Journal entries for these bills are as follows :—

Folio of Ledger	SUNDRIES DRA. to BILLS PAYABLE.		£ s. d.
	For the following bills accepted.

	Less brokerage	- - - - -	6 16 7
			669 8 11
			£901 2 2

The preceding entries, few as they are compared to the monthly transactions of a house of business, are sufficient to show the nature of a Journal as well as of the subsidiary books (for cash, bills, invoices, and account sales) from which it is composed. The Journal, being a complete record of the business of the house, is very varied and comprehensive in its nature, and may be termed an index to every book of consequence in the counting-house. But while in the cash book every payment or receipt is entered on the day it takes place, and in the bill books every bill is registered on the day it comes to hand, or is accepted, the Journal entries, being completed only at the end of the month, admit of being combined to a considerable extent, so as to exhibit a number of transactions in collective sums. Thus

all the acceptances of the house paid in the course of the month appear in the Journal entry of Bills Payable Dr. to Cash: they are arranged in this entry as they fall due, after which the whole are added into one sum, which sum alone needs be carried to the Ledger. In like manner, all bills receivable, whether discounted, or kept by the house till they fall due, are collected under the head of Bills Receivable Dr. to Cash, summed up together, and carried to the Ledger in one line; a point of great importance, as we shall see presently, in facilitating the balance of the Ledger.

We proceed to give a specimen of the Ledger: the whole of the Journal entries in the preceding pages, when posted into the Ledger, will stand thus :—

commonly over a number of folio pages. It is advisable, therefore, to divide each page into portions of ten lines each, adding such portions separately. This lessens the risk of error, as it is evidently easier to add five or six such portions in succession, than to do at once a whole folio containing fifty or sixty sums.

Another important point towards agreeing a balance, is to limit carefully the number of Ledger entries; in other words, to comprise as much as possible in those aggregate sums in the Journal which are posted in the Ledger. Thus, in the case of the monthly entries for bills, whether receivable or payable, while the inner column of the Journal contains the amount of each specific bill, the final column—that which is carried to the Ledger—should, and generally does, comprise a number of bills in one sum. Entries in the cash book, which generally form so large a proportion of the transactions of the month, are carried by some book-keepers directly from the cash book into the Ledger, without an intermediate arrangement in the Journal form. In some lines of business this plan may answer; but as a general rule it is better to take the trouble of journalising the cash, thereby comprising in 30 or 40 Ledger entries the transactions of the month, which, when posted separately, would exceed 100. The time required for re-writing or rather re-casting them will, in most cases, be amply made good by exhibiting the cash in a proper form, and by facilitating the balance of the Ledger at the close of the year.

We have said the close of the year, because, in nine mercantile houses out of ten, that is the

period for striking a balance. In some branches of trade, however, the case is otherwise. Thus, among West India merchants, April 30 is the time of balancing, because at that season the sales of the preceding crop are, in general, completed, and those of the current year not yet begun.

Arrears in book-keeping ought to be most carefully avoided—calculated as they are to engender mistakes, and to produce loss from delay in adjusting accounts. The practice of balancing the ledger every 6 months, and of transmitting as often accounts current to the correspondents and connections of merchants, will, it is to be hoped, become general. It is, however, hardly practicable in cases where, as too often happens in the lesser mercantile establishments, the book-keeper is charged with a share of the active management. Exemption from interruption, and removal from the bustle of current business, are main requisites to accuracy and despatch in accounts. In examining, or, as it is called, collating the books, the book-keeper requires not only a retired apartment, but the assistance of a clerk for the purpose of calling them over. A similar arrangement for another purpose—we mean for composing the Journal, the book-keeper dictating from the subsidiary books to a clerk whose writing forms the draught or rough copy of the Journal—has as yet been seldom adopted; although, when properly applied, it is highly conducive both to accuracy and expedition.

A Ledger must, of course, have an index; but it is very brief, containing merely the titles of the accounts and a reference to the page, as follows:—

Allen & Co., James	:	:	:	:	Folio
Amelia, ship	:	:	:	:	6

Bailey & Co., James	:	:	:	:	Folio
Bills payable	:	:	:	:	7

*The Subsidiary Books.*—In former times, when business in this country was conducted by most persons on a very limited scale, the accounts of a number of merchants, or rather of those dealers whom we should now think it a compliment to call merchants, were often kept on a plan somewhat like that at present followed by our shop-keepers. The merchant or his chief clerk kept a daily record of transactions, whether sales, purchases, receipts, or payments, in a diary, which was called a Waste-book, from the rude manner in which the entries or rather notices in it were written, being inserted, one by one, soon after the transactions in question took place. From this diary the Journal and Ledger were posted; and book-keeping by double entry being in those days understood by few, one person frequently kept the books of several merchants, passing one or two days in the week at the house of each, and reducing these rough materials into the form of regular entries. In process of time, as transactions multiplied and mercantile business took a wider range, separate books were more generally required for particular departments, such as a bill book for all bills of exchange, and a cash book for all ready money transactions. This had long been the case in the large mercantile towns of Italy and Holland; and above a century ago it became a general practice in London and Bristol, which were then the only places of extensive business in England. But in English, as in foreign counting-houses, the bill book and even the cash book were long considered as little more than memoranda of details; not as books of authority, or as fit documents for Journal entries; for that purpose the diary only was used. In time, however, the mode of keeping these subsidiary books improved, and merchants became aware that, when cash or bill

transactions were properly entered in them, the Journal might be posted from them as well as from the diary.

Similar observations are applicable to the other subsidiary books, viz. an invoice book for goods shipped, and an account of sales book for goods received and sold. When from the gradual improvement in the management of counting-houses these books were kept in a manner to supply all that was wanted for Journal entries, the use of the diary was dispensed with for such entries also. And at last it was found, that in all well-regulated counting-houses the books kept for separate departments of the business were sufficient for the composition of the Journal, with the exception of a few transactions out of the regular course, which might be easily noticed in a supplementary book called a Petty Journal, or a book for occasional entries. The consequence was, that the diary or waste book, formerly the groundwork of the Journal and Ledger, became excluded from every well-regulated counting-house. This has long been the case, and the name of waste book would have been forgotten, were it not found in the printed treatises on book-keeping which have appeared from time to time, and have been generally composed by teachers in schools or academies, who, unacquainted with the actual practice of merchants, were content to copy and reprint what they found laid down in old systems of book-keeping.

- The subsidiary books required in a counting-house are, the Cash book;
- Book of Acceptances of the house, or Bills Payable;
- Book of Bills receivable, or bills on other merchants which are or have been in possession of the house;

Bought book, or book for bills of parcels;  
Invoice book, or register of goods sold or exported;

Account of Sales book;  
Insurance Policy book; containing copies of all policies of insurance;

Petty Journal, or book for such occasional entries as do not belong to any of the preceding.

Such are the authorities from which it is now customary, in every well-regulated house, to compose the Journal. Their number indicates a repartition or subdivision, to a considerable extent, of counting-house work, and nowhere is such repartition productive of greater advantage. How much better is it to enter all bills receivable in one book, all bills payable in another, and all cash transactions in a third, than in any way to blend these very distinct entries! The effect of this subdivision is to simplify the Journal entries in a manner highly conducive to accuracy and despatch; and to present such means of checking or examining them, that many transactions may be stated, and an account extended over a number of folios, without a single error.

The use of most of the subsidiary books is sufficiently pointed out by their names; but it may be well to add a few remarks on the *Bought Book*, or receptacle for the accounts of goods purchased. A bill of parcels is the name given to the account of goods supplied by a manufacturer, tradesman, or dealer, to a merchant. Such accounts soon become numerous, and it is evidently of consequence to adopt the best method of keeping them. In former times it was the practice to fold them up in a uniform size, and after writing on the back the names of the respective furnishers, to put them away in bundles. But wherever the purchases of a merchant are extensive, and the bills of parcels numerous, the better mode, after arranging them alphabetically, is to paste them in a large book, generally a folio, made of blue or sugar-loaf paper: this book to have its pages numbered, and to have an alphabetical index. Any single bill of parcels may thus be referred to with the same ease as we turn to an account in a ledger; and one of these folios may be made to hold a very great quantity of bills of parcels; as many as would form a number of large bundles when tied up on the plan of former times.

*Book of Bills Payable.*—The notice, or, as it is termed, advice of bills payable after sight, generally comes to hand before the bills themselves. As the time of the arrival of the latter is uncertain, the better plan is not to enter them from the advice among the other bills payable, but to appropriate a space of 10 or 12 pages at the beginning or end of the book of bills payable, and to insert there the substance of the advice received.

There are a few books in every counting-house which do not form part of the vouchers or materials for the Journal; viz. the Account Current book, containing duplicates of the accounts furnished by the house to their different correspondents and connections;

The Letter book, containing copies of all letters written to the correspondents or connections of the house;

The Petty Cash book, or account of petty disbursements, the sum of which is entered once a month in the cash book;

The Order book, containing copies of all orders received;

The Debenture book, or register of drawbacks payable by the Custom-house.

It was formerly a practice in some houses for the book-keeper to go over the letter book at the end of each month, that he might take note of

any entries not supplied by the subsidiary books. This, however, is now unnecessary; these books, when carefully kept, containing, in one shape or other, every transaction of the house.

*The Principle of Double Entry.*—From these explanations of the practice of book-keeping, we must call the attention of our readers to a topic of more intricacy—the origin of the present system, and the manner in which it was adopted. To record the transactions of a merchant in a Journal or day book was an obvious arrangement, and to keep a Ledger or systematic register of the contents of the Journal was a natural result of his business, particularly when conducted on credit. Such, in a rude form, are the books of our shopkeepers, who enter their sales and purchases in a day book, and in their Ledger carry the former to the Dr. of their customers, the latter to the Cr. of the wholesale dealers who supply them with goods. By making at the end of the year a list of the sums due to him by his customers, and of those due by him to wholesale dealers, a shopkeeper may, after adding to the former the value of his stock on hand, make out an approximate statement of his debts and assets. Now, that which in this manner is done indirectly and imperfectly, it is the object of double entry to do with method and certainty. The shopkeeper makes out a list of debtors on one side and of creditors on the other, but he cannot make them balance, because his entries have been single; that is, they have had no counterpart. On making a purchase of cottons from Messrs. McConnell of Manchester, or of woollens from Messrs. Gott of Leeds, he merely enters the amount to their credit, but he makes no one Dr. to them, because the goods are not sold; and to introduce an imaginary account would be too great a refinement for a plain practical man. But a person accustomed to double entry would, without any effort of thought, make 'Printed Calicoes' Dr. to Messrs. McConnell, and 'Kerseymeres' Dr. to Messrs. Gott, for the respective amounts; after which, as the sales proceeded, he would make the buyers Drs. to these accounts for the amount of their purchases.

We thus perceive that the intricacy in the application of double entry was not with the personal so much as with the nominal accounts. Let us refer to the country where book-keeping was first studied, and take as an example the case of Doria, a merchant in Genoa, shipping, in a former age, silk, of the value of 200*l.*, bought from Flori, in Piedmont, to Henderson and Co., silk manufacturers, in England, on the terms of charging, not an additional price, but a commission of 5 per cent. with interest until reimbursed his advance. In entering the transaction, Doria's book-keeper would, as a matter of course, make Hendersons debtors to Flori 200*l.* for the cost of the silk; but he might not so readily find a creditor for the 10*l.* commission, or the 7*l.* interest eventually due on the advance. The custom in this primitive era of book-keeping probably was, to introduce the firm of the house into their books, making Hendersons debtors to Doria for the 10*l.* and 7*l.*; but as the practice of book-keeping improved, it was found preferable to avoid inserting, on any occasion, the firm of the house, and to substitute nominal accounts, such as, commission, interest, bills payable, bills receivable. These, attention and practice rendered in time familiar to the book-keeper, who learned to open his Journal at the beginning of a year by making the parties who owed balances to the house debtors, not to the firm by name, but to Stock; and those to whom the house was indebted, creditors by Stock. As the transactions

of the year money was the house, account bill payable; so assumed its imperceptible. What appeared to the test of accuracy debtor side of the creditor as a matter through this length, may be a general account, the account may the account i references to wise be req dealer could he took stock Ledger balan taking, howe servants, beco of calculation, in trade, whe facturer, doub of his accounts enquiry as to th acquisition of hi ca This advanta without any gro the books of de nine parts in a single entry; fo double entry in end of the mon to exhibit the m actions, *Nominal Acco us to notice onl chandise. London, December 31

We have here o made or responsib iles in question, c

of the year proceeded, he made those to whom money was paid debtors, not to the firm of the house, but to Cash; and those for whose account bills were accepted debtors to Bills payable; so that book-keeping by double entry assumed its present form gradually and almost imperceptibly.

What are the advantages of this method compared to that of single entry? First, it supplies a test of accuracy, inasmuch as, the entries on the debtor side of the Ledger being equal to those on the creditor side, their respective totals ought, as a matter of course, to balance. After going through this proof, personal accounts, of whatever length, may be settled with confidence; while in a general account, such as mercantile or printed calicoes, the value sold and the value remaining on hand may be ascertained by merely balancing the account in the Ledger, without the repeated references to the sales book that would otherwise be required. Without double entry, a dealer could hardly estimate his property unless he took stock; but with it an extraction of the Ledger balances fulfills that object, and stock-taking, however proper as a test of the honesty of servants, becomes quite unnecessary as a means of calculation. In short, in regard to any person in trade, whether merchant, dealer, or manufacturer, double entry forms the connecting link of his accounts, and affords a ready solution of any enquiry as to the appropriation, increase, or diminution of his capital.

This advantage may fortunately be obtained without any great sacrifice of time or labour. Of the books of dealers, manufacturers, and retailers, nine parts in ten may continue to be kept by single entry; for the addition of a few pages of double entry in the form of a summary, at the end of the month or quarter, will be sufficient to exhibit the result of a great extent of transactions.

**Nominal Accounts.**—Of these our limits permit us to notice only two; Profit and Loss, and Merchandise. The former contains on the creditor side all the entries of commissions earned, and gains obtained on particular adventures; while the debtor side exhibits the losses incurred, whether by bad debts or by unsuccessful purchases.

Every house keeping regular books must have a profit and loss account, but a merchandise account is altogether optional. Those who have such a head in their Ledger are accustomed to make it Dr. to the dealers or furnishers from whom they make purchases, and to credit it in return by the correspondents or connections to whom they make sales. In many houses, however, there is no such intermediate account; the parties to whom the goods are sent being made Drs. at once to the furnishers of the goods, as in the case of the shipment to Jamaica stated in our preceding pages.

A merchant, before estimating his profits, ought to charge interest on each head of investment. His clear profit cannot be ascertained without it; and the practice of charging it is a lesson to him to hold no property that does not afford, at least, interest on his advances.

Mercantile books and accounts must be kept in the money of the country in which the partners reside. A house in Rotterdam composed of English partners necessarily keep their accounts in Dutch money, although their transactions may be chiefly with England. Further, books, it is obvious, can be kept in only one kind of money; and when a merchant in England receives from a distant country accounts which cannot at the time be entered in sterling for want of a fixed exchange, these accounts should be noted in a separate book, until the exchange being ascertained, they can be entered in the Journal in sterling.

A book-keeper will do well to avoid all such puzzling distinctions as 'J. Johnson, my account with him;' and 'J. Johnson, his account proper;' on the plain ground that every account in the Ledger ought to be the general account of the person whose name it bears.

**Errors excepted.**—This expression is merely a proviso, that if any mistakes be discovered in the account in question, they shall be open to correction.

**Accounts Current.**—An account current generally contains all the transactions of the house with one of its correspondents during a given time, generally 6 or 12 months. The following is an example:—

London, December 31, 1812.

Errors excepted.

HENRY BARCLAY & Co.

We have here on the Dr. side all the payments made or responsibilities incurred for the correspondents in question, and on the Cr. side the different receipts on their account. The interest for the half year, the commission on receipts and payments, the postage and petty charges, being then

added, the account may be closed and the balance carried to next year. Copies of accounts current ought to be sent off as soon as possible after the day to which they are brought down; and with that view they ought to be written out from the Ledger before the close of the year or half year, particularly as the entries for interest and commission can be made only after they are written out. The whole ought then to be copied into the account current book.

But in some counting-houses the account current book, instead of being copied from the Ledger and Journal, is posted, like the latter, from the bill book, the cash book, the invoice book, and the account of sales book. It is then considered a check on the Journal and Ledger; and from the comparative ease with which it is posted, may be completed and made use of before the latter are fully brought up. This is certainly an advantage in houses where, from pressure on the book-keeper, the Journal and Ledger are in arrear, but such ought never to be the case for any length of time; while as to the former point—that of forming a check on the Journal and Ledger—the fact is, that these books, from the mode in which they are kept, are much more likely to be correct than the account current book.

*Printed Works on Book-keeping.*—To the publications of old date by teachers have succeeded, in the present age, several treatises on book-keeping by accountants. Some of these are of very limited use, being directed more to recommend a favourite practice of the author in some particular branch of book-keeping than to convey a comprehensive view of the system. The only works on the subject entitled to that character are two; one, *A Complete System of Book-keeping*, London 1799, by the late Benjamin Booth; the other, *The Science of Book-keeping exemplified*, by Mr. Jones, an accountant in London, printed in 1831. Booth was a man of ability, who had experience both as a merchant and a book-keeper, having passed one part of his life in London, the other in New York. The reader of his work finds a great deal of information in short compass, without being perplexed either by superfluous detail or by fanciful theory. The form of Mr. Booth's Journal and Ledger is similar to what we have given in the preceding pages, and to the practice of our merchants for more than a century; it was by much the best work on book-keeping, until Mr. Jones devised several improvements calculated to lessen the risk of error in both Journal and Ledger. One of these improvements is the use of two columns for figures in each page of the Journal, one for the Drs., the other for the Crs.; by inserting each sum twice, the book-keeper obtains the means of proving the Journal additions page by page. The posting from the Journal to the Ledger is also simplified and rendered less subject to error by the use of these columns. In regard to the great task of balancing the Ledger, Mr. Jones's plan is to do it quarter by quarter, making use of a separate book, called a balance book, in which are inserted the totals on each side of the Ledger accounts at the end of 3 months. By these means the agreement of the general balance is made a matter of certainty after completing the additions. Other parts of Mr. Jones's book, viz. his *formulae* for books on the single entry plan, and for the accounts of bankers, contain suggestions of evident utility. His volume consists of two parts: the printed part (120 pp.) containing the treatise, with directions; and the lithographed part (140 pp.) giving copious examples in two sets of books, one kept by single, the other by

double entry. If, on a reimpression, the author were to divide the work, and to sell the single entry part separately from the double entry, the price of each might be moderate, and a great service would be rendered to the mercantile public.

**BOOKS** (Ger. *bücher*; Dutel. *boeken*; Dan. *bøger*; Swed. *böcker*; Fr. *livres*; Ital. *libri*; Span. *libros*; Port. *livros*; Russ. *knigi*; Pol. *ksiąski*, *księgi*; Lat. *libri*). Written or printed treatises on any branch of science, art, or literature, composed with the view of instructing, amusing, or persuading the reader.

*Copyright* is the right which the authors of books or treatises claim to the exclusive privilege of printing, publishing, and selling them.

Books are sometimes blank, as account books; but these enjoy no peculiar privileges, and do not come within the scope of our enquiries.

Books are divided into *classes*, according to the mode in which the sheets of the paper on which they are printed or written are folded: viz. *folio*, when the sheet is folded into two leaves; *quarto*, when folded into four; *octavo*, when folded into eight; *duodecimo*, when the sheet is folded into twelve, &c. In making these classifications, no attention is paid to the size of the sheet.

1. *Progress and present State of the Law as to the Copyright of Books.*—It has been doubted whether, in antiquity, an author had any exclusive right to a work, or whether, having once published it, he could restrain others from copying it, and selling copies. We incline to think that he could. The public sale of copies of works is often referred to in the classics; and in such a way as warrants the inference that they were productive to the author, which could not have been the case had every one been permitted to copy them at pleasure. Terence, in one of his plays (*Præ. in Eunuch.* l. 20), says, 'Fabulam, quam nunc acturi sumus, postquam ædiles emerunt;' but why should the magistrates have bought it, had it been free to every one to copy it? Martial, in one of his epigrams, says—

Sunt quidam, qui me dicunt non esse poetam:  
Sed qui me vendit, bibliopola, puat.

Lib. xiv. Ep. 191.

This evidently conveys the idea that he had assigned the right to sell his book to a single person who profited by it. Passages to the same effect may be found in Horace (*De Arte Poetica*, line 345), Juvenal (*Sat.* 7, line 83) &c.

It would have been singular, indeed, had it been otherwise. Of all the species of property a man can possess, the fruits of his mental labours seem to be most peculiarly his own. And though it may, we think, be shown that many serious inconveniences would result from giving the same absolute and interminable property over ideas that is given over material objects, these inconveniences could hardly have been perceived in antiquity.

It will also be observed, that in antiquity a copyright was of much less value than in modern times. Books could then only be multiplied by copying them with the pen; and if any one chose privately to copy a work, or to buy it of another, it must have been very difficult to hinder him: but when printing had been introduced, the greater cheapness of books not only extended the demand for them in far greater proportion, and consequently rendered copyrights more valuable, but it also afforded the means of preventing their piracy. Printing is not a device by which a few copies of a book can be obtained at a cheap rate. It is productive of cheapness only when it is employed upon a large scale, or when a considerable impression is to be thrown off. And hence, after its

invention, printed books were sold at a high price; and the market; the price of each might be moderate, and a great service would be rendered to the mercantile public.

decided, upon an a

invention, piracy could hardly be committed in secret: the pirated book had to be brought to market; the fraud was thus sure to be detected, and the offending party might be prosecuted and punished.

For a considerable time after the invention of printing, no questions seem to have occurred with respect to copyrights. This was occasioned by the early adoption of the licensing system. Governments soon perceived the vast importance of the powerful engine that had been brought into the field; and they endeavoured to avail themselves of its energies by interdicting the publication of all works not previously licensed by authority. During the continuation of this system, piracy was effectually prevented. The Licensing Act (13 & 14 Ch. II, c. 2) and the previous Acts and proclamations to the same effect, prohibited the printing of any book without consent of the owner, as well as without a license. In 1694 the Licensing Act finally expired, and the press then became really free. Instead, however, of the summary methods for obtaining redress for any invasion of their property enjoyed by them under the Licensing Acts, authors were now left to defend their rights at *common law*; and as no author or bookseller could procure any redress for a piracy at common law, except in so far as he could *prove damage*, property in books was virtually annihilated; it being in most cases impossible to prove the sale of one printed copy out of a hundred. Under these circumstances, applications were made to Parliament for an Act to protect literary property, by granting some speedy and effectual method of preventing the sale of spurious copies. In consequence, the statute 8 Anne c. 19 was passed, securing to authors and their assignees the exclusive right of printing their books for 14 years certain, from the day of publication, with a contingent 14 years, provided the author were alive at the expiration of the first term. Persons printing books protected by this Act, without the consent of the authors or their assignees, were to forfeit the pirated copies, and *1d.* for every sheet of the same. Such books as were not entered at Stationers' Hall were excluded from the benefit of this Act.

It had been customary, for some time previous to this period, for the libraries of the Universities of Oxford and Cambridge, &c. to get a copy of most books entered at Stationers' Hall; and the Act of Anne made it imperative that single copies of all works entitled to its protection should be delivered to the following libraries: viz. the Royal Library, now transferred to the British Museum; the Libraries of Oxford and Cambridge; the Libraries of the four Scotch Universities; the Library of Stion College, London, and that of the Faculty of Advocates in Edinburgh; in all, *nine* copies.

The Act of Anne did not put to rest the questions as to copyright. The authors contended that it did not affect their natural ownership; and that they or their assigns were entitled to proceed at *common law* against those who pirated their works after the period mentioned in the statute had expired. The publishers of spurious editions resisted these pretensions, and contended that there was either no right of property at common law in the productions of the mind; or that, supposing such right to have existed, it was superseded by the statute of Anne. There was some difference of opinion in the courts as to these points; but Lord Mansfield, Mr. Justice Blackstone, and the most eminent Judges, were favourable to the claims of the authors. However, it was finally decided, upon an appeal to the House of Lords in

1774, that an action could not be maintained for pirating a copyright after the term specified in the statute. (Goldson *On the Law of Patents and Copyrights*, p. 205.)

The Act of Queen Anne referred only to Great Britain; but in 1801 its provisions were extended to Ireland; the penalty, exclusive of forfeiture, on printing or importing books without consent of the proprietor, was also increased from *1d.* to *3d.* a sheet. In return for this concession, two additional copies of all works entered at Stationers' Hall were to be delivered; one to Trinity College, Dublin, and one to the King's Inns, Dublin.

Everyone must be satisfied that 14 years' exclusive possession is far too short a period to indemnify the author of a work, the composition of which has required any considerable amount of labour and research; though 28 years is perhaps, all things considered, not a very improper period. But the grand defect of the statute of Anne consisted in its making the right to the exclusive possession for 28 years contingent on the fact of a person having lived a day more or less than 14 years after the publication of his work. This was making the enjoyment of an important right dependent on a mere accidental circumstance over which man has no control. Could anything be more oppressive and unjust than to hinder an author from bequeathing that property to his widow and children, that would have belonged to himself had he been alive? Nothing, indeed, as it appears to us, can be more obvious than the justice of extending all copyrights to the same period, whether the authors be dead or not.

But though the extreme hardship, not to say injustice, of the Act of Queen Anne had been repeatedly pointed out, its provisions were continued down to 1814, when the Copyright Act, 54 Geo. III. c. 156, was passed. This Act extended the duration of all copyrights, whether the authors were dead or alive, to 28 years certain; with the further provision, that if the author should be alive at the end of that period, he should enjoy the copyright during the residue of his life.

But though the Act of 1814 conferred a most important advantage on authors and publishers, it did not satisfy their pretensions, and repeated attempts were subsequently made to have copyrights declared perpetual, or, at all events, to have their term considerably extended. In consequence, after a great deal of discussion, the existing Copyright Act, 5 & 6 Vict. c. 45, was passed in 1842. This statute extends the duration of all copyrights, whether the authors be dead or alive, to *forty-two* years certain: providing, further, that if the author be alive at the expiration of this period of 42 years from the publication of his work, he shall enjoy the copyright to his death, and that his heirs or assigns shall enjoy it for 7 years after that event. We subjoin an abstract of this statute.

Clause 1 repeals former Acts, viz. 8 Anne c. 19, 41 Geo. III. c. 107, and 54 Geo. III. c. 156.

Clause 2 refers to the interpretation of this Act.

*Enturance of Term of Copyright in any Book hereafter to be published.*—The copyright in every book which shall hereafter be published in the lifetime of its author shall endure for the natural life of such author, and for the further term of 7 years from the time of his death, and shall be the property of such author and his assigns: provided always, that if the said term of 7 years shall expire before the end of 42 years from the first publication of such book, the copyright shall in that case endure for such period of 42 years; and that the copyright in every book which shall be published after the death of its author shall endure

for the term of 42 years from the first publication thereof, and shall be the property of the proprietor of the author's manuscript from which such book shall be first published, and his assignees. (Sec. 3.)

*In Cases of subsisting Copyright the Term to be extended.*—The copyright which at the time of passing this Act shall subsist in any published book (except as hereinafter mentioned) shall be extended and endure for the full term provided by this Act in cases of books thereafter published, and shall be the property of the person who at the time of passing this Act shall be the proprietor of such copyright: provided, that in all cases in which such copyright shall belong in whole or in part to a publisher or other person who shall have acquired it for other consideration than that of natural love and affection, such copyright shall not be extended by this Act, but shall endure for the term which shall subsist therein at the time of passing this Act, and no longer, unless the author of such book, if he be living, or the personal representative of such author, if he be dead, and the proprietor of such copyright shall, before the expiration of such term, consent and agree to accept the benefits of this Act in respect of such book, in the form given in the schedule annexed to the Act to be entered in the book of registry hereinafter directed to be kept, in which case such copyright shall endure for the full term of the books to be published after the passing of this Act, and shall be the property of such person or persons as in such minute shall be expressed. (Sec. 4.)

Clause 5 gives the Judicial Committee of the Privy Council power to license the republication of such books as the proprietor refuses to republish after death of the author.

Clauses 6 and 7 specify the terms within which copies of books published after the passing of this Act, and of subsequent editions, shall be delivered at the British Museum.

Clause 8 directs that (besides the copy for the British Museum) a copy of every book be delivered within a month after demand to the office of the Stationers' Company for the following libraries: viz. the Bodleian at Oxford, the Public Library at Cambridge, the Faculty of Advocates at Edinburgh, and that of Trinity College, Dublin.

Clauses 9 and 10 authorise publishers to deliver copies to the libraries, instead of at the Stationers' Company, and impose penalties for default in delivering copies for the use of the said libraries.

*Book of Registry to be kept at Stationers' Hall.*—A book of registry, wherein may be registered the proprietorship in the copyright of books, and assignments thereof, and in dramatic and musical pieces, whether in manuscript or otherwise, and licenses affecting such copyright shall be kept at the hall of the Stationers' Company, and shall be open to the inspection of any person, on payment of one shilling for every entry searched for or inspected in the said book; and the officer in charge of such book shall, whenever required, give a copy of such entry in such book, certified under his hand, and impressed with the stamp provided by said company for that purpose, to any person requiring the same, on payment of the sum of five shillings; and such copies so certified and impressed shall be received in evidence in all courts and in all summary proceedings, and shall be *prima facie* proof of the proprietorship or assignment of copyright or license as therein expressed, and in the case of dramatic or musical pieces shall be *prima facie* proof of the right of representation or performance. (Sec. 11.)

Clause 12 enacts that making a false entry in the book of registry shall be a misdemeanour.

Clause 13 enacts that entries of copyright may be made in the book of registry.

Clause 14 enacts that persons aggrieved by any entry in the book of registry may apply to a court of law in term, or judge in vacation, who may order such entry to be varied or expunged.

*Remedy for the Piracy of Books by Action on the Case.*—If any person shall, in any part of the British dominions, after the passing of this Act, print or cause to be printed, for sale or exportation, any book in which there shall be a subsisting copyright, without the consent in writing of the proprietor, or shall import for sale or hire any such book unlawfully printed from parts beyond the sea, or, knowing such book to have been so unlawfully printed or imported, shall sell, publish, or expose to sale or hire, or shall have in his possession, for sale or hire, any such book without consent as aforesaid, such offender shall be liable to a special action on the case at the suit of the proprietor of such copyright, to be brought in any court of record in that part of the British dominions in which the offence shall be committed: provided always, that in Scotland such offender shall be liable to an action in the Court of Session in Scotland, to be brought and prosecuted in the same manner as any other action of damages to the like amount may be brought and prosecuted there. (Sec. 15.)

Clause 16 enacts that in actions for piracy the defendant shall give notice of the objections to the plaintiff's title on which he means to rely.

Clause 17 enacts that no person, except the proprietor &c., shall import into the British dominions, for sale or hire, any book first composed &c. within the United Kingdom, wherein there shall be copyright, and reprinted elsewhere, under penalty of forfeiture thereof, and also of 10*l.* and double the value. Books may be seized by officers of customs or excise.

Clause 18 relates to and defines the copyright in encyclopaedias, periodicals, and works published in a series, reviews, or magazines.

Clause 19 enacts that proprietors of encyclopaedias, periodicals, and works published in series, may enter at once at Stationers' Hall, and thereon have the benefit of the registration of the whole.

Clause 20 enacts that the provisions of 3 & 4 Wm. IV. c. 15 shall be extended to musical compositions, and the term of copyright, as provided by this Act, applied to the liberty of representing dramatic pieces and musical compositions.

Clause 23 enacts that pirated books shall become the property of the proprietor of the copyright, and may be recovered by action.

Clause 25 makes copyright personal property.

It was further enacted by the statute 5 & 6 Vict. c. 47 that the importation of all books, of which there is an existing copyright, into the United Kingdom, should be absolutely prohibited from April 1, 1843.

The great practical difficulty in interpreting the Copyright Acts is in distinguishing between an original work and a copy made, *animo furandi*, from one already in existence. The following is a summary of Mr. Godson's remarks on this subject:—

'The identity of a literary work consists entirely in the *sentiments* and *language*. The same conceptions, clothed in the same words, must necessarily be the same composition; and whatever method is taken of exhibiting that composition to the ear or the eye, by *recital*, or by *writing*, or by *printing*, in any number of copies, or at any period of time, the property of another person has been violated; for the new book is still the identical work of the real author.

'Thus, sentiments and language are the essence of a literary work. A few pages may not be new, or although different, it is still the same work.'

'Although that a variation in substance which is a piracy; yet an author after an abridgment are servilely imitated.'

'But if the circumstances are such that the author is found sufficient to adopt part of the work, and make use of it for the purposes of science, or having done so, the matter so taken without what is called a piracy, and such a case, if it has been swayed by the law, and the course must be taken, and the work must be copied, then it is a piracy; for the book having been taken, and piracy has undeniably been committed.'

'But if only a part of the work is taken, and the author is found sufficient to adopt part of the work, and make use of it for the purposes of science, or having done so, the matter so taken without what is called a piracy, and such a case, if it has been swayed by the law, and the course must be taken, and the work must be copied, then it is a piracy; for the book having been taken, and piracy has undeniably been committed.'

'But if only a part of the work is taken, and the author is found sufficient to adopt part of the work, and make use of it for the purposes of science, or having done so, the matter so taken without what is called a piracy, and such a case, if it has been swayed by the law, and the course must be taken, and the work must be copied, then it is a piracy; for the book having been taken, and piracy has undeniably been committed.'

'If a work be taken, and the author is found sufficient to adopt part of the work, and make use of it for the purposes of science, or having done so, the matter so taken without what is called a piracy, and such a case, if it has been swayed by the law, and the course must be taken, and the work must be copied, then it is a piracy; for the book having been taken, and piracy has undeniably been committed.'

*11. Expeditious Term.*—Copyrights should be given for a term not exceeding 14 years, and should be renewable for another term of 14 years, if the author be living at the expiration of the first term. This is the provision for a term of 14 years, and should be renewable for another term of 14 years, if the author be living at the expiration of the first term.

Most books or manuscripts are sold to booksellers, or printed, and then the demand for them is great. The copyright is a property, and the author is entitled to a share of the profit. The copyright is a property, and the author is entitled to a share of the profit. The copyright is a property, and the author is entitled to a share of the profit.

'Thus, therefore, a transcript of nearly all the sentiments and language of a book is a glaring piracy. To copy part of a book, either by taking a few pages *verbatim*, when the sentiments are not new, or by imitation of the principal ideas, although the treatises in other respects are different, is also considered to be illegal.

'Although it was held by Ellenborough C.J. that a variance in *form* and *manner* is a variance in *substance*, and that any material alteration which is a *melioration* cannot be considered as a piracy; yet a piracy is committed, whether the author attempt an original work, or call his book an abridgment, if the principal parts of a book are servilely copied or unfairly varied.

'But if the main design be not copied, the circumstance that part of the composition of one author is found in another is not of itself piracy sufficient to support an action. A man may fairly adopt part of the work of another; he may so make use of another's labours for the promotion of science, and the benefit of the public: but having done so, the question will be, Was the matter so taken used fairly with that view, and without what may be termed the *animus furandi*?

'In judging of a quotation, whether it is fair and candid, or whether the person who quotes has been swayed by the *animus furandi*, the quantity taken, and the *manner* in which it is adopted, of course must be considered.

'If the work complained of be in *substance* a copy, then it is not necessary to show the intention to pirate; for the greater part of the matter of the book having been purloined, the intention is apparent, and other proof is superfluous. A piracy has undoubtedly been committed.

'But if only a *small portion* of the work is quoted, then it becomes necessary to show that it was done *animus furandi*, with the intention of depriving the author of his just reward, by giving his work to the public in a cheaper form. And then the *mode* of doing it becomes a subject of enquiry; for it is not sufficient to constitute a piracy, that part of one author's book is found in that of another, unless it be nearly the whole, or so much as will show (being a question of fact for the jury) that it was done with a bad intent, and that the matter which accompanies it has been *colourably* introduced.' (1*p.* 215—217.)

'If a work be of such a libellous or mischievous nature as to affect the *public morals*, and that the author cannot maintain an action at law upon it, a court of equity will not interpose with an injunction to protect that which cannot be called property. Even if there be a doubt as to its evil tendency, the Lord Chancellor will not interfere.' (Godson, p. 212.)

11. *Expediency of limiting Copyrights to a reasonable Term.*—It is argued by many that copyrights should be made perpetual; that, were this done, men of talent and learning would devote themselves much more readily than at present to the composition of works requiring great labour; inasmuch as the copyright of such works, were it perpetual, would be an adequate provision for a family. But we doubt much whether these anticipations would be realised. Most books or manuscripts are purchased by the booksellers, or published upon the presumption that there will immediately be a considerable demand for them; and we apprehend that when copyrights are secured for 42 years certain, very little more would be given for them were they made perpetual. When an annuity, or the rent or profit arising out of any fixed and tangible property, with respect to which there can be no risk, is sold, if the number of years for which it is

to continue be considerable, the price which it is worth, and which it fetches, does not differ materially from what it would bring were it perpetual. But the copyright of an unpublished work is, of all descriptions of property in which to speculate, the most hazardous, and the chances of reaping contingent advantages from it, at the distance of 42 years, would be worth very little indeed.

Those who write books, and those who publish them, calculate on their obtaining a ready and extensive sale, and on their being indemnified in a few years. Very few authors, and still fewer booksellers, are disposed to look forward to so distant a period even as 28 years for remuneration. They are, with very few exceptions, sanguine enough to suppose that a much shorter term will enable them to reap a full harvest of fame and profit from the publication; and we doubt much whether there be one case in a hundred in which an author would obtain a larger sum for a perpetual copyright than for one that is to continue for the period stipulated in the late Act.

But while the making of copyrights perpetual would not, as it appears to us, be of any material advantage to the authors, there are good grounds for thinking that it would be disadvantageous to the public. Suppose an individual computes a table of logarithms to five or seven places; if his computations be correct, no improvement can be made upon them to the extent at least to which they go. But is he or his assigns to be entitled, in all time to come, to prevent other individuals from publishing similar tables, on the ground of an invasion of private property? Such a preclusion could not be admitted without leading to the most mischievous consequences; and yet there is no real ground (though the courts have attempted to make one) on which the claim in question and others of the same description could be resisted, were copyrights made perpetual, and placed in all respects on the same footing as other property. We, therefore, are clearly of opinion that good policy suggests the limitation of the exclusive right of printing and publishing literary works to some such reasonable period as may secure to authors the greater part of the profit to be derived from their works; and that this period being expired, they should become public property.

Perhaps the period of 28 years has been advantageously extended to 42; but we are satisfied that more injury than benefit would result to literature by extending it beyond this term. In France, copyrights continue for 20 years after the death of the author. In most of the German states they are perpetual; this, however, until very recently, hardly indemnified the authors for the ease with which spurious copies might be obtained from other states. But by a resolution of the late German Diet, a copyright secured in one state is good in all.

III. *International Copyrights.*—The establishment of an international copyright system, that should enable the authors of one country to secure the copyright of their works in other countries, has, of late, excited a good deal of attention. We doubt, however, whether the advantages that would result from such a system, were it established, would be so great as many seem to suppose. No doubt it would be advantageous for the authors of popular works in Great Britain and the United States, for example, to be able to secure a copyright in both countries; but the real question is, would the interests of literature and of the public be promoted by such arrangement? Now we incline to think that this question must be answered in

the negative. The single market of either Great Britain or the United States is quite large enough to secure a sale for really good works sufficient to afford ample encouragement to their authors; and such being the case, it is difficult to see on what ground the republication at a cheap rate in the one country of books originally published in the other should be prevented. Indeed, such prevention would appear, by obstructing the circulation of knowledge and of amusement, to be injurious to both. It has, it is true, been alleged, that if we had a copyright system in common with America, English and American books might be published at a less price, inasmuch as the extension of the market would secure them a larger sale. But though this result *might*, we doubt much whether it really *would*, happen. We apprehend that then, as now, authors and publishers would impose such prices on their works as they supposed would realise the largest amount of profit, and that if they thought a high price more likely to do this than a low one, it would be preferred. The extensive reprinting of cheap editions of French works that has for a lengthened period been carried on at Brussels has certainly been disadvantageous to the literati of France. Still, however, the market of that kingdom seems to be sufficiently extensive to insure the unlimited production of works displaying the greatest talent, research, and industry; and it is plain that if the production of valuable works be not checked in France by their being reprinted abroad, the injury done to French men of letters redounds to the advantage of every foreigner who has occasion to look into or consult their works. Every effort should be made to prevent copyrights being invaded by pirates at home, and by the clandestine importation of books printed abroad; but farther than this we should not go. We are well convinced that it is for the advantage of the public and of literature that nations should have full liberty to republish each other's works in such forms and at such times and prices as they may think fit.

The real evil with which our literature has to contend originates in the barefaced piracy carried on at home, and not in the proceedings of foreigners. The latter may, perhaps, interfere a little with the sale of native works, by supplying the public with foreign instead of home editions; but the proceedings of the indigenous pirates are ten times more mischievous. They consist for the most part of knaves and drudges, without talent or learning of any sort, save only that of transmuting and adulterating the labours of others, and disguising their own rascality. Such persons fasten like leeches on any new work of talent, research, and industry; they forthwith announce some system, compilation, or abridgment of the same sort, every idea and statement in which is stolen; and then publish their spurious rubbish at a low price, advertise it as being decidedly the best work on the subject, and find numbers of newspaper writers ready to puff off and eulogise their disinterested and meritorious labours! It is difficult, we admit, to deal with such a nuisance, and it cannot, perhaps, be abated by legislation. But while we regret the fact, there cannot, we believe, be a question that courts and juries have for a lengthened period inclined too much to a lenient interpretation of the law as to piracy; and that literary plunderers, whose robberies are but little disguised, too often escape with impunity.

IV. *Taxes on Literature.*—These taxes, if carried beyond their proper limits, become impolitic, oppressive, and unjust; impolitic, because they tend to obstruct the growth and diffusion of

knowledge; oppressive, because they sometimes swallow up the entire reward of the labours of the most deserving persons; and unjust, because they are not proportioned to the value of the article on which they are laid, and have not infrequently to be paid out of capital.

Formerly 11 copies of all new works had to be given to different public libraries. Happily, however, this tax, which not infrequently prevented the publication of expensive works that had only a limited demand, has been reduced to 5 copies. We incline to think that it is expedient, to secure the preservation of books and to facilitate their consultation, that copies of all works should be deposited in the British Museum, and in libraries in Edinburgh and Dublin. Perhaps it would be right that the public, for whose advantage they are preserved, should pay for such copies; we should not, however, object to the authors doing this, but they should not be required to do more. To call upon them to provide copies for the libraries of rich foundations, like the Universities of Oxford and Cambridge, is a proceeding at variance with every fair principle.

The law of other countries is in this respect preferable to ours. In America, Prussia, Saxony, and Bavaria, only one copy of any work is required from the author; in France and Austria, two copies are required; and in the Netherlands, three.

V. *Book Trade of Great Britain.*—London is the great centre of the British book trade; the number of new publications that issue from its presses being far greater than all that appear in the rest of the empire. Within the course of the last 60 years, however, many very important works have been published in Edinburgh; but the latter, as well as those that appear in Oxford, Cambridge, Glasgow &c., are principally disposed of by the London trade. The booksellers of Edinburgh, and all the provincial towns, have agents in London, to whom they consign a certain number of copies of every work they publish; and to whom, also, they address their orders for copies of such new or old works as they have occasion for. The London booksellers, who act as agents for those in the country, are in the habit of regularly despatching parcels to their correspondents on the last day of each month, with the magazines and other monthly publications; but if any new work of interest appears in the interim, or orders be received from the country that cannot be conveniently deferred to the end of the month, a parcel is immediately forwarded by rail. The booksellers of Edinburgh and Dublin act as agents for those of London, and supply the Scotch and Irish country trade with the metropolitan publications.

The publishers sell the books which they publish to the retailers at certain prices. But, instead of allowing the latter to dispose of these books at prices varying according to the conditions and circumstances under which they might be sold, they endeavoured to compel them to be sold at or near uniform prices fixed by themselves. Thus, if the publishers sold a book to the trade at 9s., they fixed the price at which the latter should sell it to the public at 12s., or thereby; and they proclaimed that if any retail dealer sold it for less than 10 per cent. under this price, the publishers, who had combined for the purpose, would not supply him with another book! But we are glad to have to state that this audacious attempt to keep up the prices of books at an artificial elevation has completely broken down; and retail dealers who purchase books from publishers may now sell them at any price they please, without

any risk of having their supplies cut off. The credit given by the publishers to the retailers varies from seven to twelve months; a discount being allowed for prompt payment at the rate of 5 per cent. per annum.

From enquiries we have had made with much care and labour, founded on *Low's British Catalogue*, we find that at an average of the 4 years ending with 1852, 3,279 volumes of new works, and 1,101 volumes of new editions and reprints (exclusive of pamphlets and periodical publications), were annually published in Great Britain; and we have farther ascertained that the publication price of the former was 7s. 7d., and of the latter 6s. 3d. a volume. Hence, if we suppose the average impression of each work to have been 750 copies, it will be seen that the total value of the new works annually produced, if they were sold at their publication price, would be 932,465*l.* 12s. 6*d.*, and that of the new editions and reprints 278,960*l.* 12s. 6*d.*, making together 1,211,156*l.* 6s. We believe, however, that if we estimate the price at which the entire impressions of both descriptions of works actually sell at 3s. 6*d.* a volume, we shall not be far from the mark; and if so, the real value of the books annually produced will be 574,875*l.* a year. Since this date the production of books in Great Britain has been rapidly increasing, and the amount annually published cannot be less than a third more than the quantity of 1852.

It would be, in many points of view, desirable, were the librarians of the British Museum directed to keep and annually publish an account, classified according to the subject and the size of the works, of all the new British books, pamphlets, and periodical publications that come into their hands, specifying the average publication price of each class. Such a return might be made up with the greatest facility, and would afford authentic information not otherwise attainable.

The old book trade carried on in Great Britain is very extensive, and employs many dealers. The price of old books depends very much on their condition; but, independent<sup>y</sup> of this circumstance, it is very fluctuating and capricious, equally good copies of the same works being frequently to be had in some shops for the half of what they can be bought for in others.

**VI. Regulations as to Importation of Foreign Works.**—To prevent foreign books and maps, the property of individuals, from being charged with duty more than once, the proprietor shall, on each importation subsequent to the original one, declare that the duties were paid when they were first imported, or that he purchased them in this country in a fair way of trade; that they are the identical books or maps he exported from this kingdom, and that they are new brought back for his private use, and not for sale. (*Treasury Order*, October 3, and *Customs Order*, October 8, 1818.)

Individuals coming from foreign parts might, down to April 1, 1843, import as baggage single copies of English works of which the copyright had not expired; but, in consequence of the facilities for smuggling that grew out of this indulgence, it has been withdrawn, and the importation of all English works printed in foreign countries, of which there is an existing copyright, is absolutely prohibited. (5 & 6 Vict. c. 47 s. 21.)

The duty on foreign works produced, in 1852, 7*l.* 11*sh.* 19s. 3*d.* The duty was, however, reduced in 1853, and has since been abolished. [TAUFR.]

**VII. Book Trade of France.**—The activity of the French press has been very greatly increased since the commencement of the present century.

Count Daru, in his *Notions Statistiques sur la Librairie*, published in 1827, estimated the number of printed sheets, exclusive of newspapers, produced by the French press in 1816, at 66,852,883; and it appears (*art. 'Librairie, Dict. du Commerce*) that in 1836 the number of printed sheets (ex. newspapers) had increased to 118,857,000. Between the years 1812 and 1859 inclusive, the number of works published in France, exclusive of engravings, musical compositions, and newspapers, amounted to 321,950. The quality of many of the works that have recently issued from the French press is also very superior; and it may be doubted whether such works as the *Biographie Universelle*, the new and enlarged edition of the *Art de vérifier les Dates*, in 42 vols. octavo, and the 2 octavo editions of Bayle's *Dictionary*, could have been published in any other country. The greater number of new French works of merit, or which it is supposed will command a considerable sale, are immediately reprinted in the Netherlands or Switzerland, but principally in the former. To such an extent is this practice carried, that a single bookseller in Brussels has reprinted as many as 150,000 volumes of new French works in the course of a single year!

All the French booksellers are *brevetés*, that is, licensed, and sworn to abide by certain prescribed rules. This regulation is complained of by the publishers, as tending to lessen the number of retail booksellers in the country, and to prevent that competition which is so advantageous.

The discount allowed by the French publishers to the retail dealers is not regulated, as in England, by the size of the volumes, but by the subjects. The discount on the sale of books of history, criticism, and general literature, is usually about 25 per cent.; in the case of mathematical and strictly scientific works, it is seldom more than 10 or 15 per cent.; while upon romances, tales, &c. it is often as high as 30 or 60 per cent.

**VIII. German Book Trade.**—This trade is very much facilitated by the book fairs at Leipzig; the Easter fair being frequented by all the booksellers of Germany, and by those of some of the neighbouring countries, as of France, Switzerland, Denmark, Livonia &c., in order to settle their mutual accounts, and to form new connections. The German publisher sends his publications to the keeper of assortments *à condition*, that is, on commission, for a certain time, after which the latter pays for what have been sold, and may return the remainder. This is not so favourable for the publisher as the custom in the French and English book trades, where the keepers of assortments take the quantity they want at a fixed rate. In the German book trade it is the custom for almost every house, either in the country or abroad, which publishes or sells German books, to have its agent at Leipzig, who receives and distributes its publications. A, of Riga, who publishes a book calculated for the German trade, has his agent B in Leipzig, to whom he sends, free of expense, a number of copies of his publication, that he may distribute the new work to all the booksellers with whom he is connected, from Vienna to Hamburg, and from Strasburg to Königsberg, each of whom has his agent in Leipzig. Instructions are also given as to the number of copies to be sent to each. B delivers those copies in Leipzig to the agents, who send them every week, or more or less frequently, by the post or by carriers, at the expense of the receiver. C, of Strasburg, who finds that he has not received copies enough, writes for an additional number of copies to his agent D of Leipzig: D gives this order to B, who delivers

the number wanted to D to be transmitted to C. This arrangement is advantageous to the German book trade as well as to Leipzig. The dealer receives everything from Leipzig; and as a great number of packets, with books from all parts of Germany, arrive there for him every week, he can have them packed together and sent at once. The carriage is thus much less than if the packets were sent to him separately from the different places, and the whole business is simplified. The booksellers are also enabled to agree with ease on a certain discount per cent. No such intimate connection of the booksellers has yet been formed in any other country. The German booksellers rarely unite, as is the practice in England, in undertaking the publication of extensive works. (*German Conversations-Lexicon*, American edition.)

The literary deluge which commenced in Germany in 1814 still continues to increase. For the 2,000 works which were then about the annual complement, we have now perhaps 10 times as many. Magazines and Encyclopedias have increased in the same proportion, and the public has shown as great a desire to read as the learned have to write. Private libraries are diminishing, while the public ones are daily increasing.

**BOOTS AND SHOES.** The external covering for the legs and feet, too well known to require any description. (For an account of the value of the boots and shoes annually produced in Great Britain, see **LEATHER**.)

**BORAX** or **TINCAL** (Arab. burak; Pers. tunkar). A compound of soda and boracic acid. It exists native, and is also prepared artificially. It is found in Europe, in Peru, and in the republic of Ecuador, in a mineral which is called tinkalzite, and which appears to be a mixed borate of soda and lime. But the principal source of native borax is the lakes of Thibet and Persia, from which it is obtained by spontaneous evaporation. The impure borax called tincal crystallises on the borders of the lakes. It is always covered with an earthy coating, greasy to the touch. This appearance is derived from a fatty matter. There is also a tincal exported from China, and it is reported that borax is found in vast quantities in California.

The purification of borax was originally a secret possessed by the Dutch and Venetians only, but is now, owing to the development of chemical science, practised in most manufacturing countries. The chief peculiarity in the refining of borax consists in separating the fatty matter by means of lime, which forms an insoluble soap, and by getting rid of saline impurities by careful crystallisation.

**Artificial Borax.**—Large quantities of borax are now manufactured by direct combination of boracic acid and soda. This acid is produced in large quantities in certain parts of the Italian volcanic field, and especially in a region in Tuscany. The soil in this district is cleft by numerous fissures, which form a vent for hot vapours, called solfioni. The process is to build a basin of masonry round several of these fissures, so as to form a lagoon; water being introduced from a neighbouring stream. The water, owing to the heat of the emitted vapour, gradually boils, and becomes impregnated with boracic acid. It is then drawn off and evaporated in leaden pans, the heat being supplied as before by the steam issuing from the earth. The produce of these works is annually increasing. In 1815 it was nearly 1,000 tons, in 1855 it was over 1,800. The boracic acid is then saturated with carbonate of soda. It may be added that the origin of this acid is exceedingly obscure. It is not found in the extruded gases, nor in the soil; but as boracic acid is volatilised

by the aid of steam, it seems that it is carried mechanically to the lagoon.

Borax has an alkaline reaction. Its chief uses are as a flux for metals; as a material to facilitate the soldering of metallic surfaces, which it seems to effect by preventing oxidation; as an ingredient in glass and porcelain; and as a medicine.

The duties on borax were repealed in 1845.

**BORDEAUX.** A large and opulent city of France, on the Garonne, about 75 miles from its mouth. Latitude 40° 50' 26" North; Longitude 0° 34' West. Population in 1865, 173,300. The commerce of Bordeaux is very extensive, but the most important article is that of wine. The Garonne, which at its confluence with the river Dordogne about 18 miles below Bordeaux changes its name and becomes the *Gironde* thence to the sea, is a noble river, with depth of water sufficient to enable large ships to come up to the city, laying open, in conjunction with the Dordogne and their tributary streams, a large extent of country. The commerce of Bordeaux has been considerably extended since the introduction of railroads. Formerly the *Grand Canal du Langueilac*, extending from Toulouse to Cette on the Mediterranean, was the principal channel for the transport of goods between Bordeaux and the south of France. But since the establishment of the 'Compagnie des Chemins de Fer du Midi,' which now farms this canal, and whose interest it is to divert from it its usual traffic in order to favour their own line, it has lost much of its importance. Wine, brandy, fruit, grain and seeds, resin, turpentine, pine timber for railroad purposes and pit-props, are the staple articles of export; but the generality of merchants confine themselves more especially to the wine trade. Most part of their other business is confined to dealing on commission, but this they conduct almost invariably on their own account. The reason they assign for this is, that the difficulties attending the purchase and subsequent care of wines so as to render them fit for exportation are so very great as to make it almost impossible to conduct the business on anything like ordinary terms, so as to satisfy their employers. Colonial produce, cotton, dye stuffs, hides, tobaccos, rice, coffee, sugar, cocoa, pepper, form the principal articles of import.

**Money.**—Money is the same in Bordeaux as in other parts of France. All accounts are kept in francs, the par of exchange being 25 francs the pound sterling.

**Weights and Measures.**—The decimal system has entirely superseded the old system.

The old measure of the *vette* has long since been abolished. Wine is sold by the tun of 4 hogsheads of 225 litres each, equal to 50 gallons; brandy and spirits by the hectolitre; oil by 100 kilogrammes.

**Entrance to the River.**—Since the last publication of this Dictionary great improvements have been effected. The entrance as well as the whole course of the river up to Bordeaux have been thoroughly buoyed, and many additional lights and beacons have been added. The passes have been greatly improved by the works effected under the directions of the Government engineers; and though the navigation for vessels of high tonnage is still intricate, it has been rendered much more safe than it was formerly. (*Consular Report to the Admiralty*, August 11, 1860.)

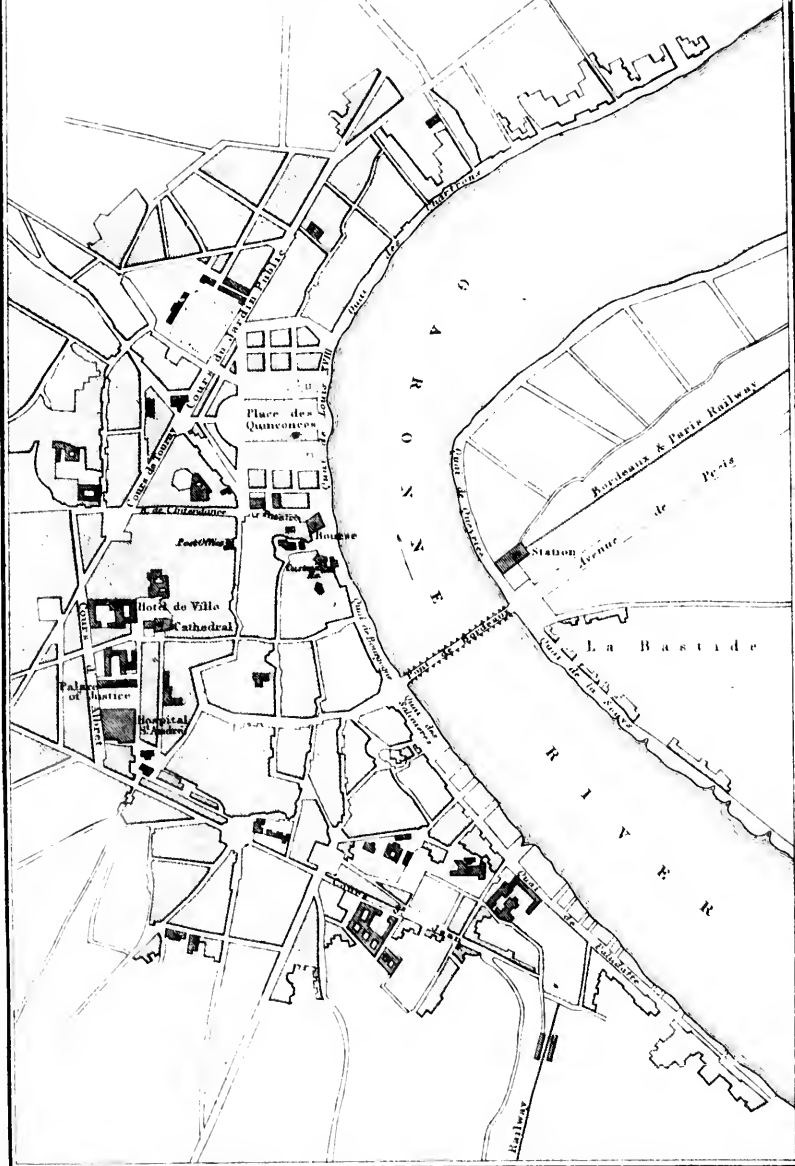

**Port Charges.**—The following is an account of charges and harbour dues levied at Bordeaux on British shipping trading between British possessions in Europe and this port.

	fr.	cts.
To report and pilotage from sea to Bordeaux (draught of water 17 feet)	-	275 25
Luzaretto dues, 10 cents. per register ton	-	0 0
Moving vessel up and mooring her	-	10 0
Entering the vessel at Custom House and other offices, and brokerage inwards, at 50 cents. per ton (whether laden or in ballast)	150	0
Declaration and protest at the Custom House (if any), including stamps and registering and declaration at the Tribunal of Commerce (when required)	58	55
Advertisements in the papers against treating the crew, and for freight and passengers (optional)	27	0
Tonnage money and navigation dues, as per receipts, on French measurement, about 310 tons, at 1 fr. per ton.	387	0
Double decline thereon, clearance and stamps	-	10 0
Clearance at sundry offices	-	12 0
Manifest and freight list (if any)	-	125 20
Ballast taken on, from 1 fr. 10 cents. to 1 fr. 25 cents. per ton	-	150 0
Pilotage from Bordeaux to sea, in ballast (draught of water 10 feet)	-	30 0
Carriage, attendance, and brokerage, outwards, 50 cents. per ton (in ballast)	-	30 0
Mooring dues, 10 cents. per ton and per month	-	1 fr. 50 cts.
N. H. Brokerage outward, when laden and chartered lump sum 1 fr. per ton measurement; when laden otherwise, 1 fr. 50 cts. per ton of goods taken in.	-	-

Quayage and use of cranes to deliver or take in goods, 1 fr. per ton, paid by the shippers.

Use of cranes to take goods out of the hold on deck, 60 cents. per ton, paid by the ship.

To moor and unmoor ship to and from the quay a drayman is employed, and is paid 15 frs. for each operation. If the ship can spare no hands to assist in mooring, labourers are employed at the rate of 5 frs. each.

British ships coming from or going elsewhere than British possessions in Europe pay foreign navigation dues, that is 3 fr. 75 c. instead of 1 fr. per ton, and the pilotage is one half more than in the former case, and the clearance at the customs is 36 fr. instead of 15 (for vessels of 300 tons).

Bordeaux is a favourable place for repairing and careening ships, and for obtaining supplies of all sorts of stores.

The following is a statement of the number and tonnage of vessels entered and cleared at the port of Bordeaux in the year 1864:—

	vessels	tons
Entered	1,468	256,565
Cleared	1,455	279,291

The relative proportions of British and French vessels were:—

	vessels entered	tons entered	vessels cleared	tons cleared
British	507	121,626	391	119,838
French	961	134,939	1,064	159,453

(See also Detailed Report showing the Regulations &c. respecting Shipping, transmitted to the Board of Trade, Nov. 1855.)

**Coasting Trade.**—1,644 French vessels of 129,762 tons entered, and 1,745 vessels of the same nation of 116,714 tons cleared, during the year 1864.

**Banking Establishment.**—There is only one bank in Bordeaux, which formerly was in the hands of a local company, but was incorporated in 1848 in the 'Banque de France.' It is now called 'succursale de la Banque de France,' and all its operations are conducted according to the statutes and regulations of that establishment.

**Brokers.**—No one is allowed to act as a mercantile broker in France who has not attained the age of twenty-five years, and who, being a French subject or being naturalised, has not served four years in a mercantile house or with a broker.

They are nominated by the Emperor after their qualifications have been ascertained by the Chamber of Commerce.

All foreigners are obliged to employ ship brokers to transact their business at the custom-house; and although masters and owners of French vessels might sometimes dispense with their services, they never do so, finding it to be,

in all cases, most advantageous to use their intervention. All duties outward on vessels and cargoes are paid by the ship brokers, who invariably clear out all vessels, French as well as foreign.

All goods brokers must deposit in the treasury, as a guarantee, the sum of 8,000 francs if of the first category, or 4,000 francs if of the second.

The first category comprises the brokers exercising their functions in the city of Bordeaux; the second, those similarly employed in the various arrondissements.

The insurance, ship, and money and exchange brokers are subjected to the same rules and regulations as the goods brokers, but the deposit of the money brokers is 30,000 francs instead of 8,000.

At the present moment there are 28 goods brokers; 22 ship brokers; 20 money and exchange brokers; 15 wine and spirit brokers; 7 insurance brokers.

**RATES OF COMMISSION.**

*Shipbrokers.*

	per ton.	fr. cent.
On foreign going vessels:	-	-
Arriving laden or in ballast	-	0 50
Departing in ballast	-	1 00
Laden per charter-party, or on owner's account	1	00
Laden on freight (not chartered)	1	50
On coasters:	-	-
No regular, but very moderate charges.	-	-
On goods shipped:	-	-
In foreign-going ships	-	2 00
In coasters trading to and from all French ports, except those on the Mediterranean	-	1 50
In coasters trading only to ports between Bordeaux and Nantes inclusively	-	1 00

*Goods Brokers.*

On most goods, principally colonial, with the exception of cotton, sugar, and indiarubber,  $\frac{1}{2}$  per cent. paid by the purchaser.  
On mid-wool,  $\frac{1}{2}$  per cent. paid by the purchaser.  
On cotton and sugar,  $\frac{1}{4}$  per cent., that is  $\frac{1}{2}$  per cent. paid by the seller and  $\frac{1}{4}$  by the purchaser.

	per ton.	fr. cent.
On prunes, paid by the purchaser	-	0 40
per 4 cases, 1st quality	-	1 00
per 50 kilos, 2nd quality	-	0 60
per cask of 200 kilos, common	-	0 40
100 "	-	0 30
60 "	-	0 20
On walnuts, per bag	-	6 25

The following goods pay a commission of  $\frac{1}{2}$  per cent.; that is,  $\frac{1}{4}$  by the seller and  $\frac{1}{4}$  by the buyer.

Oils.	Seeds:	Rape.	Verdigris.
Wheat.	Linseed.	Juniper berries.	Argol.
Mizard.	Sesamum.	Horse green.	Next foot oil.
Barley.	Flax.	Guinea cloth.	Cotton.
Rye.	Clover.	Hops.	Raw sugar.
Flour.	Poppy.	Haisins.	-

**Brandy and Spirits Brokers.**

Alcohol, per pipe 1 fr. 50 by seller and 1 fr. 50 by buyer.	per cent.	per cent.
Brandy per cask of 4 hectolitres, 1 00 by seller 1 00 by buyer.	-	-
Cognac " " 5 " 2 00 " 2 00 "	-	-
" " " 3 " 1 50 " 1 50 "	-	-
" " " 2 " 1 00 " 1 00 "	-	-
" per case of 12 bottles 12 $\frac{1}{2}$ " 12 $\frac{1}{2}$ "	-	-
Rum, $\frac{1}{2}$ per cent. the seller, and $\frac{1}{2}$ per cent. the buyer.	-	-

**Wine Brokers.**—2 per cent. paid by the seller per tun of 4 hogsheads. When wine is sold under 150 francs the tun, the broker's commission, paid by the seller, is 3 francs per tun.

**Insurance Brokers.**— $\frac{1}{2}$  per cent. on the capital insured.

**Money and Exchange Brokers.**— $\frac{1}{2}$  per cent.

The exchange or money brokers of Bordeaux follow a kind of business pretty similar to the London private bankers. They receive, negotiate, and pay bills and orders of such houses as have accounts open with them, charging and allowing an interest on balances, which varies from  $3\frac{1}{2}$  to  $4\frac{1}{2}$  per cent., according to circumstances. They charge  $\frac{1}{2}$  per cent. for negotiating bills, and  $\frac{1}{4}$  per cent. on all the payments they make.

There are, besides, numerous capitalists who employ their spare funds in discounting bills. They prefer bills at long dates, and take from 3 to

6 per cent. discount, according to the confidence they have in the paper presented.

There are not wanting individuals who guarantee, with their names, every sort of paper presented, taking from 5 to 60 per cent. for the risk.

Merchants' Commissions.—2 per cent. on current affairs, 5 per cent. on litigious affairs, variable on goods in transitu, 1 per cent. on insurances.

For a considerable portion of the above valuable information on the trade of Bordeaux we are indebted to Mr. Scott, her Majesty's consul at Bordeaux.

Quarantine.—Quarantine can be performed in the river Gironde, in the neighbourhood of Paulliac, a small port about 30 miles below Bordeaux. The old Lazaretto has been pulled down as being uselessly large, and a smaller and more appropriate establishment is erecting.

Colonial produce, spices, dye-stuffs, and metals are usually sold for cash, with 3 per cent. discount. Corn, flour, brandy, and several other articles, are sold for nett cash, without discount.

The usage is generally established in Bordeaux to consider all paper having less than 30 days to run as cash; and with such all payments are made, where there is not an express stipulation to be paid in coin.

Tares.—The tares allowed at Bordeaux are the following:—

Tares allowed by the Custom House,

Anchorvies. In small kegs of 5 kilos, 1-6th of their weight.	per cent.
Cocoa: in cases or casks	12
in bales or bags	5
Coffee: in casks	12
in bales or bags	5
in the husk	40
in pulville	10
Cotton, Turkish: in small bales of coarse bullrush mats, or coarse goat hair	40
of other countries: in small bales, less than 50 kilos	8
in bales above 50 kilos	6
Indigo in cases or casks enclosing a leather bag	21
a canvas bag	11

Wool	5 per cent.
Wool (dyeing)	tret 1 per cent.
Woad	nett

Bordeaux possesses some iron founderies, cotton factories, sugar refineries, glass works &c.; but labour and living are too high to admit of its becoming a considerable manufacturing city.

Insurance of ships, houses, and lives is effected at Bordeaux. The first is carried on partly by individuals, and partly by companies; the last two by companies only. The partners in these associations are generally liable only to the amount of the shares they respectively hold.

For statements as to the Warehousing System, Smuggling, &c. the reader is referred to the article HAVRE.

Bordeaux Wine Trade.—The cultivation of the vine has greatly increased since 1834, except in a portion of the white wine district; though for many years, owing to the vine disease, the quantity of wine produced fell short of what it ought to have been. The disease has, however, gradually diminished, and had almost entirely disappeared in 1864, which year may be considered to have produced a low average quantity.

The average production of the vines in the Department of the Gironde, for the five years ending with 1864, amounted to 231,404,400 litres (257,116 tuns), equal to 50,908,968 gallons.

The red wines of the Gironde may be divided into three categories, the first of which is divided into several classes.

The first category includes the five classes of

the superior of Médoc. The second Graves, St. Côtes, and The third deux Mers (Bas Médoc). The first according to the crisis bou the Haut Mé The first of the Château first three are Médoc, N.V. trict called the highest excel and in favour fr. per tun, when they la the price is a bottle of the 6 or 7 fr. The cate, and is cha palate and its of the nature of the Latour has a considerable ar Lafite. The C is lighter, and of the Lafite, e a flavour. Pr frances per tun. The other distr varying in price f tun. The white win duced in the d Prignac, and Bar classes, besides t quantity of the tw of the third about rity of the two fir high prices have sale. The quantity p

the superior *crûs* (growths) and the *crûs bourgeois* of Médoc.

The second category includes the Vins de Graves, St. Emilion, Blaye and Bourg, Vins de Côtes, and Vins de Paysans du Médoc.

The third category, Vins de Palus and Entre deux Mers (district lying between the two rivers), Bas Médoc, and Cargo wines.

The first category is divided into five sub-classes, according to the excellence of the wines, besides the *crûs bourgeois*, all of which are the produce of the Haut Médoc.

The first class comprises the Lafite, the Latour, the Château Margaux, and the Hautbrion. The first three are the produce of the district of Haut Médoc, N.W. of Bordeaux, and the last of the district called des Graves. These wines are all of the highest excellence; their produce is very limited, and in favourable years sells at from 3,000 to 4,000 fr. per tun, which contains 210 imp. gallons, but when they have been kept in the cellar for 6 years, the price is doubled, so that even in Bordeaux a bottle of the best wine cannot be had for less than 6 or 7 fr. The Lafite is the most choice and delicate, and is characterised by its silky softness on the palate and its charming perfume, which partakes of the nature of the violet and raspberry. The Latour has a fuller body, and at the same time a considerable aroma, but wants the softness of the Lafite. The Château Margaux on the other hand is lighter, and possesses all the delicate qualities of the Lafite, except that it has not quite so high a flavour. The Hautbrion again has more spirit and body than any of the preceding, but is rough when new, and requires to be kept 6 or 7 years in wood; while the others become fit for bottling in much less time. (Henderson *On Wines*, p. 184.)

The second class comprises the growths of Mouton, Léoville, Larose, Pichon &c.

The third class comprises the growths of Langoa, La Grange, Giscours, Palmer, Kirwan &c.

The fourth class comprises the growths of St. Pierre, Château Beycheval, Duluc, Carnel &c.

The fifth class comprises the growths Canet, Blatille, Grand Puy, Lynch, D'Armailhac, Cantemerle &c.

The *crûs bourgeois*, inferior to the last named, but superior to the Vins de paysans, all of which are likewise the produce of Haut Médoc. The principal parishes in which all these wines are produced are Macan, Labarde, Cantenac, Margaux, St. Julien, Pauillac, and St. Estéphe.

The production of the five categories of *crûs classés* was estimated, in 1864, at about 5,000 tuns, the prices ranging between 5,000 francs for the first growths to 1,200 francs for the fifth growths. The *crûs bourgeois* produced 7,500 tuns, and prices varied from 700 to 1,200 francs.

The district of Blaye and Bourg produced about 30,000 tuns. Prices varied from 200 francs to 450 francs per tun.

The district of Libourne produced about 50,000 tuns, varying in price from 300 francs to 1,000 francs per tun.

The other districts produced about 157,000 tuns, varying in price from 120 francs to 400 francs per tun.

The white wines of the first quality are produced in the districts of Sauterne, Bommes, Preigne, and Barsac. They are divided into three classes, besides the common kinds; the average quantity of the two first classes is about 950 tuns, of the third about 700 tuns. In 1864 the quantity of the two first classes was 635 tuns, but their high prices have hitherto interfered with their sale.

The quantity produced of other classes, includ-

ing the *Vins de Graves*, amounted to about 2,200 tuns, and their prices ranged from 240 francs to 500 francs per tun, with the exception of the higher kinds of *Graves*.

The production of the classed white wines has remained stationary, but that of the unclassified wines has decreased to the extent of two thirds, owing to the invasion of the oidium, which, since 1852, has forced many proprietors to pull up the greatest part of their vines.

The unclassified wines of Médoc were estimated at about 40,000 tuns, varying in price from 250 francs to 600 francs per tun.

The expenses attending the cultivation of the vine, including the vintage, in the district of Médoc, where, owing to the superior value of the wine, no expense is spared in producing the greatest quantity and the best quality, are estimated at about 300 francs per *journal*, equal to  $\frac{1}{3}$  hectare, or 3 rods, 6 poles English measure, besides the interest on the capital, to which must be added, in years when the wine is not immediately disposed of, the expense of keeping and loss in ullage.

The produce of a *journal* is estimated as follows:—

On the light sandy soils, 1 to 2 hogsheds; on the good average soil of Médoc, 2 to 3 hogsheds; on the strong alluvial soils, where the wines are of the commonest kinds, up to as much as 6 tuns.

The merchants generally purchase the finest *crûs* as soon as they can judge their character. The system of farming certain of them for a number of years is almost entirely exploded, as experience has shown that such an operation is a very losing concern. The wines are transported to the private establishments of the purchasers in Bordeaux, so situated as to insure an equable temperature throughout the year; and in these they ripen and undergo all the different processes of fining, racking, mixing &c. considered necessary to bring them to the requisite condition for sale.

The old custom of adapting Bordeaux wines to the taste of the English market has entirely ceased here for many years past. The taste for pure wines having generally superseded that for the heavily loaded wines of the former generation, the wine merchants of Bordeaux have ceased the operation of blending their wines with the strong, full-bodied, and high-flavoured wines of the Rhone, such as Hermitage, Côte rotie, eroze &c., and the still more heavy wines of Catalonia. In former days, the greatest portion of the wines of the Rhone were imported into Bordeaux for the above specified purpose; but at the present time, and for several years past, the purchase of them has entirely ceased, and they take another direction, that of Burgundy, or direct to England, where the operation formerly practised in Bordeaux is said still to prevail.

The wines shipped under the titles of Lafite, Latour, and Château Margaux are also freely mixed with the wines of the surrounding vineyards, which, from the nature of the soil, proximity, and mode of cultivation, cannot differ materially.

Other good wines are also said to enter largely into the composition of these celebrated crûs. Some houses pretend to keep their wines pure, but the practice of mixing is at any rate very general.

The purchase of the wines, whether from the grower or the merchant, is effected through brokers. There are a few of them who have the reputation of accuracy in dissecting the different flavours, and in tracing the results of the wine by certain measures of training and treatment.

England consumes the greatest portion of the high-classed wines, besides a large share of the lower kinds, especially since the Treaty of Commerce with France. A certain quantity is taken by the Russians and citizens of the United States; the remainder is consumed in Bordeaux or in Paris, where, owing to increase of wealth, high-priced wines are now in demand.

The wines of inferior quality and value are exported to various parts of the Continent of Europe, and wherever a demand may exist. The wines known as *Cargo Wine* are the least valuable. They are chiefly from the district of 'Entre deux Mers,' but for several years past, and more particularly since the diminution in the production of wine, many of these wines are so manufactured that it is hardly possible to know of what they are composed. The best, however, are a mixture of the common white wines, the coarse dark-coloured wines of the south, such as Narbonne, Roussillon &c., and a certain quantity of distilled water. They can be put on board at 2*l*. per hogshead and upwards, and at 5*s*. per case of 12 bottles. These kinds of wine, when properly prepared, will last sound two or three years, whether in wood or in bottle, and bear the sea-carryage well; a vast quantity being exported to North and South America, the colonies, the south coast of Africa, and India.

The practice formerly pursued by the Dutch, as described in the first edition of this Dictionary, of sending ships with supercargoes to purchase the wines, has been modified—the purchases for that country being now in some cases conducted by the purchasers personally under the guidance of a merchant of Bordeaux, to whom is intrusted the shipment of their purchases. In others, the Bordeaux merchants are employed to purchase, ship &c., without the presence of the Dutch purchaser—a commission being allowed on all these operations. Many Bordeaux merchants connected with Holland speculate on their own account, sending samples of their purchases to their customers. They seldom purchase old wines, or those of

full body, as the prevalent taste in Holland is for new and light wines.

**Brandies and Spirits of Wine.**—The quantity distilled in the Department of the Gironde has been very insignificant for several years past. Notwithstanding the increase of the cultivation of the vine, the oidium or vine disease reduced the quantity so greatly below the average as to increase the price even of the lowest qualities, from which brandy is made, to such an extent that far greater profits were derived from the sale of the wines than from the distilling of them into spirits. The manufacture of brandy may therefore be said to have been confined exclusively to the neighbouring countries of Armagnac and Marmande.

The district of Armagnac produces yearly on an average about 40,000 to 50,000 pieces, of 4 hectolitres each, and the present price is 72 francs per hectolitre.

The district of Marmande produces from 10,000 to 15,000 pieces, valued at 58 francs per hectolitre. Languedoc produces annually about 40,000 pieces, of 80 veltes each, the greater part of which comes to Bordeaux to be forwarded to the different parts of the north of France, or to foreign countries. France consumes about two-thirds of the above quantity; the remaining one-third goes to the north of Europe. The prices of brandy are from 130 fr. to 150 fr. per 50 veltes, ordinary proof; spirits of wine, from 4 fr. to 5 fr. per velte.

The greatest shipments of brandy take place to England from the port of Tonnay-Charente, on the Charente. Cognac, from which the brandy takes its name, and where there are large distilleries, is a few leagues up the river. The quantity exported is far greater than what is made at Cognac; the two leading distillers there (Martell and Hennessy) buying great quantities from the small cultivators. The greater part of the wines made about Angoulême, and thence down toward the sea, are of inferior quality, and it only for making brandy; and so little do the prices vary, that the proprietors look upon it nearly in the same light as gold. When they augment their capital by savings or profits, it is employed in keeping a larger stock of brandy, which has the further advantage of paying the interest of their capital by its improved value from age. England is said to receive upwards of 6,000 pieces annually from Charente.

A very large proportion of these brandies is sent to Bordeaux, where they are converted into common or cargo Cognac, and sent off as such to various parts of the world. The remainder finds its way pure to various parts of France, or is employed here for brandied fruits, liqueurs, and cordials.

At Bordeaux, as at Paris and Marseilles, there is a constant gambling unbusiness in the sale of spirits of wine. It is in the form of spirits of wine that nearly all the brandy consumed in France is expedited, as in this form there is a great saving in carriage. (For an official account of the exports of wine and brandy from France, see *WINE*.)

**Export of Fruits.**—The fruit exported consists of prunes, almonds, walnuts, apples &c.

The influx of the South American Spaniards, which was noted thirty years ago, has long since ceased. Many of those who at that time had settled in Bordeaux have either died or left it altogether, and their capital has gone with them. At the present time there are few existing, and the trade with the South American continent has again fallen into the hands of the French merchants. Many of these capitalists embarked in speculations

*Operation of the French Commercial System on the Trade of Bordeaux &c.*—The trade of this great city has suffered severely from the short-sighted, anti-social policy of the French Government. This policy was first broadly laid down, and systematically acted upon, by Napoleon I.; and we believe it would not be difficult to show that the privations it entailed on the people of the Continent powerfully contributed to accelerate his downfall. But those by whom he has been succeeded have not hitherto seen the expediency of returning to a sounder system; on the contrary, they have carried, in some respects at least, the 'continental system' to an extent not contemplated by Napoleon. Notwithstanding the vast importance to a country like France of supplies of iron and hardware at a cheap rate, that which is produced by foreigners is excluded, though it might be obtained for a third part of the price of that which is manufactured at home. A similar line of policy has been followed as to cotton yarn, earthenware &c. And in order to force the manufacture of sugar from the beet-root, oppressive duties have been laid, not only on foreign sugar, but even on that imported from the French colonies. The operation of this system on the commerce and industry of the country has been most mischievous. By forcing France to raise, at home, articles for the production of which she has no natural or acquired capabilities, the exportation, and consequently the growth, of those articles in the production of which she is superior to every other country has been very greatly narrowed. All commerce being bottomed on a fair principle of reciprocity, a country that refuses to import must cease to export. By excluding foreign produce—by refusing to admit the sugar of Brazil, the cottons and hardware of England, the iron of Sweden, the linens of Germany, and the cattle of Switzerland and Württemberg—France has done all that was in her power to drive the merchants

of those countries from her markets. They are not less anxious than formerly to obtain her wines, brandies, and silks; inasmuch, however, as commerce is merely an exchange of products, and as France will accept very few products belonging to others, they cannot, how anxious soever, maintain that extensive and mutually beneficial intercourse with her they would otherwise carry on; they sell little to her, and their purchases are, of course, proportionally diminished.

This, indeed, is in all cases the necessary and inevitable effect of the prohibitive system. It never fails to lessen exportation to the same extent that it lessens importation; so that, when least injurious, it merely substitutes one sort of industry for another—the production of the article that had been obtained from the foreigner, for the production of that which had been sent to him as an equivalent. [Commerce.]

France is not only extremely well situated for carrying on an extensive intercourse with foreign countries, but she is largely supplied with several productions, which, were she to adopt a liberal commercial system, would meet with a ready and advantageous sale abroad, and enable her to furnish equivalents for the largest amount of imports. The superiority enjoyed by Amboyna in the production of cloves is not more decided than that enjoyed by France in the production of wine. Her claret, burgundy, champagne, and brandy are unrivalled; and furnish, of themselves, the materials of a vast commerce. Indeed, the production of wine is, next to the ordinary business of agriculture, by far the most extensive and valuable branch of industry in France. It is stated by the landholders and merchants of the department of the Gironde, in the admirable *Pétition et Mémoire à l'Appui*, presented by them to the Chamber of Deputies in 1828, that the quantity of wine annually produced in France amounts, at an average, to about 40,000,000 hectolitres, or 1,060,000,000 gallons; that its value is not less than from 800,000,000 to 1,000,000,000 francs, or from 32,000,000*l.* to 40,000,000*l.* sterling; and that upwards of *three millions* of individuals are employed in its production. In some of the southern departments it is of paramount importance. The population of the Gironde, exclusive of Bordeaux, amounts to about 450,000 individuals, of whom no fewer than 230,000 are supposed to be directly engaged in the cultivation of the vine.

Here, then, is a branch of industry in which France has no competitor, which even now affords employment for about a tenth part of her population, and which is susceptible of indefinite extension. She has, in this single article, the means of carrying on the most extensive and lucrative commerce. 'Le gouvernement français,' says M. Chaptal, in his work *Sur l'Industrie Française*, 'doit les plus grands encouragements à la culture des vignes, soit qu'il considère ses produits relativement à la consommation intérieure, soit qu'il les envisage sous le rapport de notre commerce avec l'étranger, dont il est en effet la base essentielle.'

But instead of labouring to extend this great branch of industry, Government has consented to sacrifice it to the interests of the iron-founders, the cotton and linen manufacturers, and the planters of Martinique and Guadalupe! We do not, indeed, imagine that they were at all aware that such would be the effect of their policy. Theirs is only one instance, among myriads that may be specified, to prove that ignorance in a ministry is quite as pernicious as bad intentions. The consideration, apparently not a very recalcitrant one, that, notwithstanding the bounty of nature, wine was not gratuitously produced in France, and

could not, therefore, be exported except for an equivalent, would seem never to have occurred to the ministers of Louis XVIII. and Charles X. But those whose interests were at stake did not fail to apprise them of the hollowness of their system of policy. In 1822, when the project for raising the duties on sugar, iron, linens &c. was under discussion, the merchants of Bordeaux, Nantes, Marseilles, and other great commercial cities, the silk manufacturers of Lyons, and the wine-growers of the Gironde, and some other departments, presented petitions to the Chambers, in which they truly stated that it was a contradiction and an absurdity to attempt selling to the foreigner without, at the same time, buying from him; and expressed their conviction that the imposition of the proposed duties would be fatal to the commerce of France, and would consequently inflict a very serious injury on the wine-growers and silk manufacturers. These representations did not, however, meet with a very courteous reception. They were stigmatised as the work of ignorant and interested persons. The Chambers approved the policy of ministers; and in their ardour to extend and perfect it, did not hesitate deeply to injure branches of industry on which several millions of persons are dependent, in order that a few businesses, nowise suited to France, and the support of which costs her several millions a year, might be bolstered up and protected!

It is plain, had there not been some powerful countervailing cause in operation, that the exports of wine from France would have been very greatly augmented since the peace of 1815. The United States, Russia, England, Prussia, and all those countries that have at all times been the great importers of French wines, have made prodigious advances in wealth and population since 1789; and, had the commerce with them not been subjected to injurious restrictions, there is every reason to think that their imports of French wine would have been much greater now than at any former period. So far, however, from this being the case, they have declined in a most extraordinary degree. This is proved beyond all question by the following extract from a report made to the Council General of the Gironde in 1841, and published by its orders and with its sanction:—

Previously to 1790 the wine trade at Bordeaux had an immense development. The books of our most ancient houses, transmitted down religiously from father to son, and the registries of our lands, prove that in the years preceding 1787 our exports had reached more than 100,000 tuns of wine, 10,000 casks of brandy, and 5,000 of vinegar. They also show that from 1,200 to 1,400 vessels from the North took large quantities of wine, in return for their national produce, which they easily disposed of amongst us. It was a most lucrative commerce, for we then sent 15,000 tuns to Prussia, 18,000 to England and Ireland, 6,000 to Dantzic, 40,000 to Hamburg, Lubeck, and Bremen, 15,000 to Holland, 7,000 to Sweden, 5,000 to Denmark and Norway, and 12,000 to Russia. But at that period we had not closed our frontiers to the produce of all these nations—we received at moderate duties their woollens, linens, hemp, iron, wood, cattle, and other articles, the consumption of which was less expensive, and the quality better, than similar articles made at home, and forced on us by customs duties. At present, notwithstanding the rapid increase of commercial affairs—notwithstanding the new nations of America, the advantages of a more expeditious, certain, and economical navigation, the demands of nations increased in number and industry, and consequently more disposed to pur-

chase for consumption, our commerce is declining in a most alarming manner. Authentic documents prove that, in 1839, our exports only reached 1,339 tuns to England, 2,499 to Russia, 147 to Sweden, 342 to Norway, 2,964 to Prussia, 612 to Denmark, 8,188 to the Hanse Towns, and 7,621 to the Netherlands. Since then our exports have not increased; so that instead of 100,000 tuns at least taken by the north of Europe from the department of the Gironde previously to 1790, not more than 25,000 tuns are taken at present. Yet the taste for wine and the necessity to use it have not been weakened amongst the various nations; but the exaggerated duties with which its introduction has been loaded only allow it to be consumed by the wealthy classes, who are everywhere the least numerous. These duties are established in retaliation of those which France lays on foreign productions. If the exportation of wine has diminished in so great a proportion, the cause must be sought in the protective system. When the variations in the exports of wine are attentively examined, and their decrease looked to since 1822, when this system attained its height, to 1810, it is impossible not to be struck with the fact that these variations are intimately connected with the system itself. The decrease in the exports of wine has followed the increased development of the protective system, and, therefore, we are forced to draw this conclusion, that it is *this system which destroys our export trade*. Yet foreign consumption is the most certain and most profitable for Bordeaux wines, and it is particularly in the markets of the north of Europe and of England that the wines of the finest quality which our department produces find purchasers. Let us, then, insist on the necessity of re-opening these markets, which have been closed by the enormous amount of duties imposed by foreigners in reprisal of those laid by us on their products.

Besides the injury inflicted on the wine trade by the prohibitive system of commercial policy adopted in France, and the retaliatory measures provoked in other countries, it suffered severely from the octrois and other duties on internal consumption. But the depression, though felt everywhere, was greatest in the Gironde, which was especially dependent on its export trade. This was strikingly evinced by the large stocks of wine remaining in the hands of the growers and merchants, and by the fall in its price. This, of course, reacted on the vineyards, many of which became all but unsaleable; and in 1843 the committee of wine growers applied to Government for a loan of 2,000,000 francs to be applied to the payment of taxes due by the wine growers.

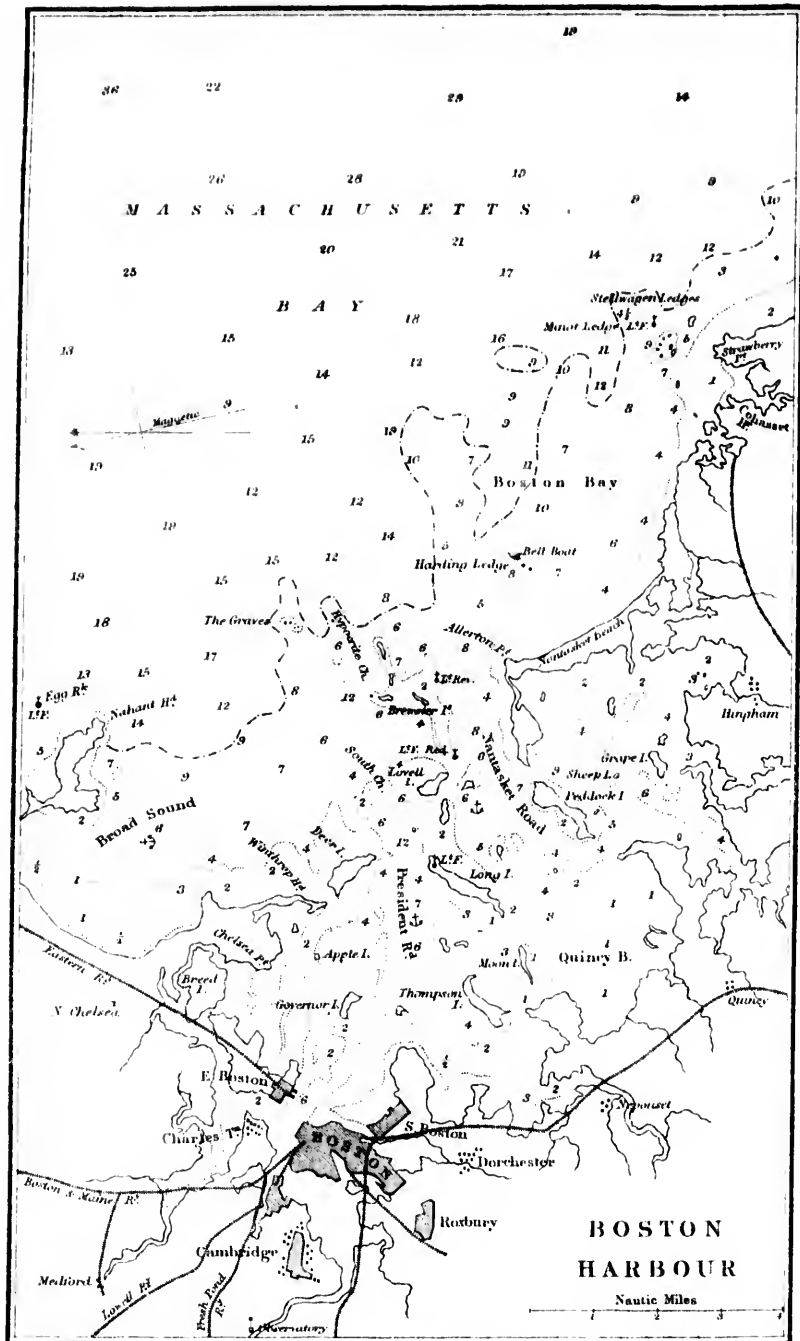

Such were the effects of the restrictive system of policy on the wine trade of France—on a branch of industry which employed *three millions* of people.

A wiser policy has, however, prevailed in France since the negotiation of the French commercial treaty and the partial development of the principles of free trade in that country.

BOSTON. A commercial city of the United States, the capital of Massachusetts, and the largest town of New England, lat. 42° 23' N., long. 71° 4' W. Population in 1860, 177,812. The city is situated on a peninsula near the bottom of a large and deep bay, being surrounded on all sides by water, except on the south, where it is joined to the mainland by the narrow isthmus called Boston Neck. But it communicates, by means of extensive wooden bridges, with Charlestown on the north side of the bay, and with Dorchester on the south. Boston Bay is of great extent, and is studded with many islands.

**Lighthouses, Boston Bay.**—There are 4 lights; one on the Minot Ledge, the second on the north entrance of the harbour on Lighthouse Island, the third on the west end of the Spit abreast the Narrows, and the fourth on the north-east end of Long Island. The second light is revolving, the third is red.

**Shipping.**—With the exception of New York, Boston has a larger mercantile marine than any other port in the United States. According to the accounts laid before Congress January 1, 1858, the registered, enrolled, and licensed tonnage belonging to Boston on June 30, 1857, amounted to 447,996 tons, of which 42,179 tons were employed in the coasting trade. In 1856, 48 ships, of the burden of 50,394 tons, were launched in Boston and her immediate vicinity. Since the war, however, the shipping of Boston has been materially diminished.

**Shipping Charges.**—For an account of these, see New Yous.

**How to enter the Port.**—In coming from the Atlantic, a ship should bring the lighthouse to bear W. by N. to W.N.W. and run direct for it. The largest ships may pass it at within less than a cable's length. If there be no pilot on board, or the master be unacquainted with the harbour, or the wind be north-westerly, which is the most unfavourable for entering, she had better steer W. by S. for Nantucket roads, where she may anchor and get a pilot.

**Mooring &c.**—Generally speaking, there is sufficient depth of water to enable the largest ships to come up to the town at all times of the tide. They usually moor alongside quays or wharfs, where they lie in perfect safety. But Mr. Consul Lonsada, in his Report of Jan. 24, 1867, says that the roadstead is fast filling up, and unless energetic measures are taken, it will be merely a question of time when large vessels will be unable to enter. There are in all about 60 wharfs; which, for the most part, are built on piles, with a superstructure of stone and earth. The two principal are 'Long Wharf,' 550 yards in length; and 'Central Wharf,' 413 yards long by 50 in breadth, having a range of lofty brick stores and warehouses along its whole length.

**Pilotage.**—No particular place is specified at which vessels must heave to for a pilot. But all vessels, with the exception of coasters under 200 tons, and American vessels laden with plaster of Paris from British America, if hailed by a pilot within about 1½ mile of the outer light, must take him on board, under a penalty of 50 dollars. If they have got within this distance before being hailed, the obligation to take a pilot on board ceases. This regulation has obviously been dictated by a wish to have the pilots constantly on the alert; it being supposed that masters not well acquainted with the bay will heave to to take one on board, though they have got within the free limits.

**Careening, Stores, &c.**—Boston is a very favourable place for careening and repairing ships. All kinds of supplies may be had of the best quality and at moderate prices.

**Immigration.**—The number of immigrants arriving at Boston is not great, seldom exceeding 1,600 or 1,800 in a year. A city ordinance directs that the masters of vessels bringing immigrants shall enter into a bond with sureties, to the amount of 200 dollars for each immigrant, that he shall not become a charge upon the state for 3 years, or pay a commutation of 5 dollars on account of each individual. But this regulation does not apply to immigrants having a reasonable amount of property. the declaration of

the foreign consuls as to this point is commonly acted upon.

**Trade of Boston &c.**—Boston has a very extensive trade with the Southern States and with foreign countries, and is also one of the principal seats of the American fisheries. She is largely indebted to her southern neighbours, and principally to New York, Maryland, and Pennsylvania, for supplies of flour and wheat, and for great quantities of barley, maize, oatmeal, oats &c. as well as for cotton, tobacco &c. Of these, the imports of flour amount, at an average, to about 1,400,000 barrels a-year; all sorts of grain to about 3,500,000 bushels; cotton 220,000 bales; sugar 80,000,000 lbs.; coffee 50,000 bags &c. Her returns are made, partly in native raw produce, as beef, pork, lard &c.; partly and principally in the produce of her manufacturing industry, in which Massachusetts is decidedly superior to every other state in the Union; and partly in the produce of her fisheries and foreign trade. At an average, Boston annually sends to the southern parts of the Union about 70,000 barrels of beef and pork; 200,000 barrels mackerel, herrings, alewives &c.; large quantities of dried and smoked fish; 5,000,000 pairs of boots and shoes; besides a very large amount of cotton and woollen manufactured goods, paper, nails, iron, furniture, cordage &c.; so as to leave a large balance in her favour. Her exports of native produce to foreign countries consist principally of the same articles she sends to the southern States; but she also exports a large amount of the foreign produce she had previously imported. The imports from abroad consist principally of cotton and woollen goods; linens and canvas; hardware, silks, sugar, tea, coffee, wines and brandy, spices, hides, indigo, dyewoods &c. The total imports from foreign countries into the state of Massachusetts in the year ending June 30, 1864, amounted to 31,365,627 dols.; while the exports of native produce, during the same year, amounted to only 15,664,033 dols., and of native and foreign produce together to 17,057,092 dols.; the balance against Massachusetts being paid off by bills upon the southern States, to which she exports much more than she imports from them. New York alone is, in fact, supposed to be at all times indebted to Boston about 5,000,000 dols. We subjoin some statements illustrative of the trade of Boston.

**Value of the Domestic Produce of Massachusetts, 1865, 1866.**

	1866 Dollars	1865 Dollars
Cotton	32,000,000	40,000,000
Flour	21,000,000	15,000,000

Wine	94,814	85,769
Wool	31,218	21,001

**Ice.**—Boston was the original and still continues to be the principal seat of the American ice trade. This novel branch of industry began here in 1806, and has since vastly increased. For a while the exportation was confined to the southern ports of

the Union, the Havannah, and other ports of the West Indies; but now it extends to all parts of South America, to India and China, and to many parts of Europe. At present (1867) the exports amount to about 160,000 tons, whereof about 22,000 are sent to the East Indies. The cost of the ice free on board exceeds 300,000 dollars a-year, and it affords a profitable article of freight to a vast amount of shipping. It was formerly sold in New Orleans and the Havannah at 6 cents per lb., but it is now sold for 1 cent per ditto, and a similar reduction has taken place in its price in other emporiums. The ice is principally brought by railway from Fresh Pond, Wenham, and other lakes, about 18 miles from Boston. It is sawn into square blocks, not less than 12 inches thick, and is remarkably pure and solid.

*Insurance Companies.*—Insurance, both fire and marine, is carried on to a great extent by joint-stock companies, and to some extent also by individuals. There is a great deal of risk in the business, which is more, indeed, like a lottery than a regular trade; and the dividends, consequently, vary from next to nothing to 10, and sometimes even to 20 per cent. or upwards.

*Credit.*—Foreign goods are frequently sold for ready money, but more usually at a credit of from 3 to 12 months: average length of credit, 6 months; but on iron and some other articles 12 months' credit is given. Discount for ready money at the rate of 6 per cent. per annum.

*Commission.*—The rates of commission are arbitrary, varying from 2 to 5, and sometimes (*del credere* included) to 7½ per cent. On small accounts, and West India goods, 5 per cent. is usually charged. The ordinary rate may be taken at 2½ per cent.; but competition is so great that commission merchants may be found who will transact business on almost any terms. Sometimes whole cargoes are sold by brokers on an agreement to receive a specific sum in lieu of commission and brokerage.

*Money.*—In Massachusetts, and throughout New England, the dollar passes at 6s.; so that the pound sterling = 11, 6s. 8d. Boston currency. (For further particulars as to *Money, Weights, Measures* &c. see *New York*.)

We have derived these details partly from official, partly from private information, and partly from tables and statements in Hunt's valuable *Commercial Magazine*. See, for detailed information as to the shipping rates and charges at the port of Boston, Edwards's *British Shipmaster's Guide* (Longmans & Co.).

**BOTARGO** (called in Provence *Bouargues*). A sausage made on the shores of the Mediterranean, and the Black Sea, of the roe of the mullet. The best come from Tunis and Alexandria.

**BOTTLES** (Fr. *bouteilles*; Ger. *bouteillen*; Ital. *bottiglie*, *fiacchi*; Russ. *buliliki*; Span. *botellas*). Glass vessels for holding liquids, too well known to require any description. They are exported in considerable quantities. The duty of 2s. a cwt. on bottle glass, like the duties on other descriptions of glass, was both oppressive in amount, and was imposed and collected in the most vexatious manner. Happily, however, it was repealed in 1845. Since the repeal the produce of common glass bottles has increased four fold.

During the year 1862 there were forty-seven bottle houses in operation on the banks of the Tyne, and the Wear, and their produce was about 4,230,000 dozens. (*Industrial Resources of the Tyne, Wear, and Tees*, 1864). [GLASS.]

**BOTTOMRY AND RESPONDENTIA.** Bottomry, in Commercial Navigation, is a mortgage of

the ship. The owner or captain of a ship is, under certain circumstances, authorised to borrow money, either to fit her out so as to enable her to proceed on her voyage, or to purchase a cargo for the voyage, pledging the keel, or bottom of the ship (a part for the whole), in security for payment. In bottomry contracts it is stipulated, that if the ship be lost in the course of the voyage, the lender shall lose his whole money; but if the ship arrive in safety at her destination, the lender is then entitled to get back his principal, and the interest agreed upon, however much that interest may exceed the legal rate. (Black. *Com.* book ii. c. xxx.) The extraordinary hazard run by the lenders of money on bottomry, who, in fact, become adventurers in the voyage, has been held, in all countries, as justifying them in stipulating for the highest rate of interest.

When the loan is not on the ship, but on the goods laden on board, which, from their nature, must be sold or exchanged in the course of the voyage, the borrower's personal responsibility is then the principal security for the performance of the contract, which is therefore called *respondentia*. In this consists the principal difference between bottomry and respondentia. The one is a loan upon the ship, the other upon the goods. The money is to be repaid to the lender, with the *marine interest*, upon the safe arrival of the ship, in the one case, and of the goods in the other. In all other respects these contracts are nearly the same, and are governed by the same principles. In the former, the ship and tackle, being hypothecated, are liable, as well as the person of the borrower; in the latter, the lender has, in general, only the personal security of the borrower.

This contract, which *must always be in writing*, is sometimes made in the form of a deed poll, called a bill of bottomry, executed by the borrower; sometimes in the form of a bond or obligation, with a penalty. But whatever may be its form, it must contain the names of the lender and the borrower, those of the ship and the master; the sum lent, with the stipulated *marine interest*; the voyage proposed, with the commencement and duration of the risk which the lender is to run. It must show whether the money is lent upon the ship, or upon goods on board, or on both; and every other stipulation and agreement which the parties may think proper to introduce into the contract. (See the *Forms* at the end of this art.)

The loan in bottomry is on risk during the voyage. Hence no one can be entitled to it who does not take on himself the perils of the voyage. Thus the words in a bond stipulating payment of the sum borrowed 'in eight days after my arrival at the port of London' were understood to mean my arrival with the ship, or the ship's arrival. (Smith's *Mercantile Law*, book iii. c. vii.)

'It is obvious,' says Lord Tenterden, 'that a loan of money upon bottomry, while it relieves the owner from many of the perils of a maritime adventure, deprives him also of a great part of the profits of a successful voyage; and, therefore, in the place of the owners' residence, where they may exercise their own judgment upon the propriety of borrowing money in this manner, the master of the ship is, by the maritime law of all states, precluded from doing it, so as to bind the interest of his owners, without their consent. With regard to a foreign country, the rule appears to be, that if the master of a vessel has occasion for money to repair or victual his ship, or for any other purpose necessary to enable him to complete the enterprise in which she is engaged; whether the occasion arises from an extraordinary peril or misfortune, or from the ordinary course of the adventure; he may,

if he cannot obtain a loan in any other manner, borrow money, and the interest thereon, is to be paid out of the freight, if the ship is lost, and the master is responsible. (Black. *Com.* book ii. c. iii.)

The authority of the law, in relation to the ship and freight, is not clear, but the practice of the foreign ports, and the usage of the freight, is in favour of the lender; but the law is not clear, whether the lender is to be paid of the owner at the residence probably Ireland.

It has been held, that a bond in bottomry is void, if the lender is not bound by it.

The rule is, that the lender is not bound against the owner, unless the owner seems, on the face of the contract, to be bound by it.

It is now a question, whether these laws, which relate to the lender on a ship, can be recovered, when the ship is lost, or when the lender is not bound by it, in point of contract, on the part of the master was correct.

In bottomry, the lender receives the whole of the money, and is not bound by it.

nothing; he is not bound by it, unless he is bound by it, in the particular average.

this; but it was held in *Joyce v. Geo. III.* [Northampton, 1769.]

if he cannot otherwise obtain it, borrow money on bottomry at marine interest, and pledge the ship, and the freight to be earned in the voyage, for repayment at the termination of the voyage. When this is done, the owners are never personally responsible. The remedy of the lender is against the master of the ship." (*Law of Shipping*, part ii. c. iii.)

The authority of the master to hypothecate the ship and freight in case of necessity, and in furtherance of the voyage in which he is engaged, at a foreign port, is indisputable, and his hypothecation of the freight or cargo is also justifiable, if necessary; but he must not do so when he can obtain money on better terms, e.g. on the personal credit of the owner, or when he can communicate with the owner at his residence. All England would be the residence of the owner, and, since the Union, probably Ireland. (Smith, *ibid.*)

It has been held that if this communication could have been made by telegraph, the bottomry bond is void. (Maule and Pollock.)

The rule that the remedy of the lender is against the owner of the ship, was contingent, it seems, on the laws regulating the rate of interest. It is now a question, however, since the repeal of these laws, whether the owner's personal credit may not be pledged. For the process by which the lender on a ship hypothecated in a foreign country can recover, see *Smith*. If a number of loans are effected, it is the rule, if the ship be sold, that the *last* in point of date is entitled to priority of payment, on the presumption (to be proved) that the master was compelled to contract the obligation by absolute necessity.

In bottomry and respondentia bonds, the lender receives the whole of his principal and interest or nothing; he is not answerable for general or particular average. [Mr. Serjeant Marshall doubts this; but it was so decided by the Court of King's Bench in *Joyce v. Williamson*, B. R. Mich. 21 Geo. III.] Nor will any loss by capture, if subsequently recaptured, affect his claim. In this respect our law differs from that of France (*Code de Commerce*, art. 330) and most other countries; the lenders on bottomry bonds being there subject to average, as our underwriters upon policies of insurance. No loss can void a bottomry contract, unless a total loss, proceeding from a peril of the sea, during the voyage, and within the time specified by the contract. If the loss happen through any default or act of the owners or master, to which the lender was not privy, he may still recover.

There is no restriction by the law of England as to the persons to whom money may be lent on bottomry or at respondentia, except in the single case of loans on the ships of foreigners trading to the East Indies, which are forbidden by the 7 Geo. I. stat. 1 c. 21 s. 2.

It does not, however, appear to be necessary, in order to enable the master of a ship in a foreign port to obtain money for her repair, outfit &c., that the contract pledging the vessel in security of the debt should be in the nature of a bottomry bond. Provided the person who advances the money do not choose to take upon himself the risk of the ship's return, and do not stipulate for maritime interest, there seems, says Lord Tenterden, "to be no reason why the master should not pledge both the ship and the personal credit of the owner." And in the case of money advanced in this way to refit a ship in distress at Jamaica, which was captured on the voyage home, the lender recovered. (*Law of Shipping*, part ii. c. iii.)

Bottomry contracts were well known to the ancients. At Athens the rate of interest was not

fixed by law; but the customary rate seems to have been about 12 per cent. But when money was lent for a voyage, upon the security of the ship and cargo, the interest, on account of the superior risk encountered by the lender, was in most cases much higher. By the Rhodian law, the exaction of such high interest as is usual in bottomry was declared to be illegal, unless the principal was really exposed to the dangers of the sea. (Boeckh's *Public Economy of Athens*, vol. i. p. 177, Eng. trans.) This principle was adopted by the Romans, who gave to bottomry interest the name of *nauticum fenus*; and has been transferred from the Roman law into all modern codes.

'Formerly,' says Mr. Serjeant Marshall, 'the practice of borrowing money on bottomry and respondentia was more general in this country than it is at present. The immense capitals now engaged in every branch of commerce render such loans unnecessary; and money is now seldom borrowed in this manner but by the masters of foreign ships who put into our ports in need of pecuniary assistance to refit, to pay their men, to purchase provisions &c. Sometimes officers and others belonging to ships engaged in long voyages, who have the liberty of trading to a certain extent, with the prospect of great profit, but without capitals of their own to employ in such trade, take up money on respondentia to make their investments; but even this, as I am informed, is now not very frequently done in this country.'

The term *bottomry* has sometimes been incorrectly applied to designate a contract by the terms of which the ship is not pledged as a security, but the repayment of money, with a high premium for the risk, is made to depend upon the success of the voyage. This, however, is plainly a loan upon a particular adventure, to be made by a particular ship, and not a loan upon the ship, and, of course, the lender has only the personal security of the borrower for the due performance of the contract. And it seems that loans have sometimes been made in this manner, and probably also with a pledge of the ship itself, to an amount exceeding the value of the borrower's interest in the ship; and such a contract is still legal in this country in all cases, except the case of ships belonging to British subjects bound to or from the East Indies; as to which it is enacted (19 Geo. II. c. 37 s. 5), 'That all sums of money lent on bottomry or at respondentia upon any ship or ships belonging to his Majesty's subjects, bound to or from the East Indies, shall be lent only on the ship, or on the merchandise or effects laden, or to be laden, on board of such ship, and shall be so expressed in the condition of the bond, and the benefit of salvage shall be allowed to the lender, his agents or assigns, who alone shall have a right to make assurance on the money so lent; and no borrower of money on bottomry or at respondentia as aforesaid shall recover more on any assurance than the value of his interest on the ship, or in the merchandises and effects laden on board of such ship, exclusive of the money so borrowed; and in case it shall appear that the value of his share in the ship, or in the merchandises and effects laden on board, doth not amount to the full sum or sums he hath borrowed as aforesaid, such borrower shall be responsible to the lender for so much of the money borrowed as he hath not laid out on the ship, or merchandises laden thereon, in the proportion the money not laid out shall bear to the whole money lent, notwithstanding the ship and merchandises be totally lost.'

Lord Tenterden says that this statute was introduced for the protection of the trade of the East India Company; and its rules must be

complied with in the case of bottomry by the masters of ships trading to the East Indies.

For a further discussion of this subject, see Abbott *On the Law of Shipping*, part ii. ch. iii.; Marshall *On Insurance*, book ii.; and Park *On Insurance*, ch. xxi.

### I. Form of a Bottomry Bond.

Know all men by these presents, That I, A. B., commander and two-thirds owner of the ship *Exeter*, for myself and C. D., remaining third-owner of the said ship, am held and firmly bound unto E. F. in the penal sum of two thousand pounds sterling, for the payment of which well and truly to be made unto the said E. F., his heirs, executors, administrators, or assigns, I hereby bind myself, my heirs, executors, and administrators, firmly by these presents. *In witness* whereof I have hereunto set my hand and seal, this 14th day of December, in the year of our Lord 1796.

Whereas the above bound A. B. hath taken up and received of the said E. F. the full and just sum of one thousand pounds sterling, which sum is to run at respondentia on the block and freight of the ship *Exeter*, whereof the said A. B. is now master, from the port or road of Bombay on a voyage to the port of London, having permission to touch, stay at, and proceed to all ports and places within the limits of the voyage, at the rate of premium of twenty-five per cent. (25 per cent.) for the voyage. In consideration whereof usual risks of the seas, rivers, enemies, fires, pirates &c. are to be on account of the said E. F. And for the further security of the said E. F. the said A. B. doth by these presents mortgage and assign over to the said E. F., his heirs, executors, administrators, and assigns, the said ship *Exeter*, and her freight, together with all her tackle, apparel &c. And is hereby declared, that the said ship *Exeter* and her freight is thus assigned over for the security of the respondentia taken up by the said A. B., and shall be delivered to no other use or purpose whatever until payment of this bond is first made, with the premium that may become due thereon.

Now the condition of this obligation is such, that if the above bound A. B., his heirs, executors, or administrators, shall not do well and truly pay, or cause to be paid, unto the said E. F. or his attorneys in London legally authorised to receive the same, their executors, administrators, or assigns, the full and just sum of 1,000*l.* sterling, being the principal of this bond, together with the premium which shall become due thereon, at or before the expiration of ninety days after the safe arrival of the said ship *Exeter* at her moorings in the river Thames, or in case of the loss of the said ship *Exeter*, such an average as by custom shall have become due on the salvage, then this obligation to be void and of no effect, otherwise to remain in full force and virtue. Having signed to three bonds of the same tenor and date, the one of which being accomplished, the other two to be void and of no effect.

A. B. for self } (L. S.)  
and C. D.)

Signed, sealed, and delivered, where } G. H.  
no stamped paper is to be had, in } I. K.  
the presence of

In this bond the occasion of borrowing the money is not expressed, but the money was in reality borrowed to reit the ship, which, being on a voyage from Bengal to London, was obliged to put back to Bombay to repair. (*The Exeter, Whitford*, 1 Rob. A. R. 176.) The occasion therefore of borrowing the money gave the lender the security of the entire interest of the ship. But this bond,

although expressed to be executed by the master for himself and the other part-owner, would not bind the other part-owner personally, unless he had by a previous deed authorised the master to execute such a bond for him. (*Abbott On the Law of Shipping*, part iii. ch. i. s. 2.)

### II. Form of a Bottomry Bill.

To all men to whom these presents shall come, I, A. B. of Bengal, mariner, part-owner and master of the ship called the *Exeter*, of the burden of five hundred tons and upwards, now riding at anchor in Table Bay, at the Cape of Good Hope, send greeting:

Whereas I, the said A. B., part-owner and master of the aforesaid ship, called the *Exeter*, now in prosecution of a voyage from Bengal to the port of London, having put into Table Bay for the purpose of procuring provisions and other supplies necessary for the continuation and performance of the voyage aforesaid, and at this time necessitated to take up upon the adventure of the said ship called the *Exeter* the sum of one thousand pounds sterling moneys of Great Britain, for setting the said ship to sea, and furnishing her with provisions and necessaries for the said voyage, which sum C. D. of the Cape of Good Hope, master or attendant, hath at my request lent unto me, and supplied me with, at the rate of twelve hundred and twenty pounds sterling for the said one thousand pounds, being at the rate of one hundred and twenty-two pounds for every hundred pounds advanced as aforesaid, during the voyage of the said ship from Table Bay to London. Now know ye, that I, the said A. B., by these presents, do, for me, my executors and administrators, covenant and grant to and with the said C. D. that the said ship shall, with the first convoy which shall offer for England after the date of these presents, sail and depart for the port of London, there to finish the voyage aforesaid. And I, the said A. B., in consideration of the sum of one thousand pounds sterling to me in hand paid by the said C. D. at and before the sealing and delivery of these presents, do hereby bind myself, my heirs, executors, and administrators, my goods and chattels, and particularly the said ship, the tackle and apparel of the same, and also the freight of the said ship, which is or shall become due for the aforesaid voyage from Bengal to the port of London, to pay unto the said C. D., his executors, administrators, or assigns, the sum of twelve hundred and twenty pounds of lawful British money, within thirty days next after the safe arrival of the said ship at the port of London from the same intended voyage.

And I, the said A. B., do, for me, my executors and administrators, covenant and grant to and with the said C. D., his executors and administrators, by these presents, that I, the said A. B., at the time of sealing and delivering of these presents, am a true and lawful part-owner and master of the said ship, and have power and authority to charge and engage the said ship with her freight as aforesaid, and that the said ship, with her freight, shall, at all times after the said voyage, be liable and chargeable for the payment of the said twelve hundred and twenty pounds, according to the true intent and meaning of these presents.

And lastly, it is hereby declared and agreed by and between the said parties to these presents, that in case the said ship shall be lost, miscarry, or be cast away before her arrival at the said port of London from the said intended voyage, that then the payment of the said twelve hundred and twenty pounds shall not be demanded, or be recoverable

by the said  
or assigns,

**BOUNTY.** A term used in Commerce and the Arts, to signify a premium paid by Government to the producers, exporters, or importers of certain articles, or to those who employ ships in certain trades.

1. *Bounties on Production* are most commonly given in the view of encouraging the establishment of some new branch of industry; or they are intended to foster and extend a branch that is believed to be of paramount importance. In neither case, however, is their utility very obvious. In all old settled and wealthy countries, numbers of individuals are always ready to embark in every new undertaking, if it promise to be really advantageous, without any stimulus from Government; and if a branch of industry, already established, be really important and suitable for the country, it will assuredly be prosecuted to the necessary extent, without any encouragement other than the natural demand for its produce.

2. *Bounties on Exportation and Importation.*—It is enacted by the 3 & 4 Wm. IV. c. 52 that a merchant or exporter claiming a bounty or drawback on goods exported must make oath that they have been actually exported, and have not been re-landed, and are not intended to be re-landed, in any part of the United Kingdom, or in the Isle of Man (unless entered for the Isle of Man), or in the islands of Faro or Ferro; and it is further enacted, that if any goods cleared to be exported for a bounty or drawback shall not be duly exported to parts beyond the seas, or shall be re-landed in any part of the United Kingdom, or in the islands of Faro or Ferro, or shall be carried to the islands of Guernsey, Jersey, Alderney, Sark, or Man (not having been duly entered, cleared, and shipped for exportation to such islands), such goods shall be forfeited, together with the ship or ships employed in re-landing or carrying them; and any person by whom or by whose orders or means such goods shall have been cleared, re-landed, or carried, shall forfeit a sum equal to treble the value of such goods. (Secs. 87-95.)

3. *Policy of Bounties.*—It was formerly customary to grant bounties on the exportation of various articles; but the impolicy of such practice is now very generally admitted. It is universally allowed that bounties, if they be given at all, should be given only to the exporters of such commodities as could not be exported without them. But it is plain that, by granting a bounty in such cases, we really tax the public, in order to supply the foreigner with commodities at less than they cost. A. has a parcel of goods which he cannot dispose of abroad for less than 110*l.*; but they will fetch only 100*l.* in the foreign

market; and he claims and gets a bounty of 10*l.* to enable him to export them. Such is the mode in which bounties on exportation uniformly operate; and to suppose that they can be a means of enriching the public, is equivalent to supposing that a shopkeeper may be enriched by selling his goods for less than they cost!

But however injurious to the state, it has been pretty generally supposed that bounties on exportation are advantageous to those who produce and export the articles on which they are paid. But the fact is not so. A trade that cannot be carried on without the aid of a bounty must be a naturally disadvantageous one. Hence, by granting it, individuals are tempted to engage or continue in businesses which are necessarily very insecure, and are rarely capable of being rendered lucrative; at the same time that they are prevented, by trusting to the bounty, from making those exertions they naturally would have made, had they been obliged to depend entirely on superior skill and industry for the sale of their produce. The history of all businesses carried on in this country by the aid of bounties proves that they are hardly less disadvantageous to those engaged in them than to the public.

The truth of these remarks has been acknowledged by Government. The bounty on the exportation of corn was repealed in 1815; and the bounties on the exportation of linen and several other articles ceased in 1830.

4. *Bounties on Shipping* have principally been paid to the owners of vessels engaged in the fishery, and their influence will be treated of under *FISHERY* and *WHALE FISHERY*. [DRAWBACK; TARIFF.]

**BOX-WOOD** (Ger. buchsbaumholz; Dutch, palmhout; Fr. buis; Ital. busso, bosso, bossolo). The wood of the box-tree (*Buxus sempervirens*), growing wild in several places in Great Britain. This tree was greatly admired by the ancient Romans, and has been much cultivated in modern times, on account of the facility with which it is fashioned into different forms. Box is a very valuable wood. It is of a yellowish colour, close-grained, very hard, and heavy; it cuts better than any other wood, is susceptible of a very fine polish, and is very durable. In consequence, it is much used by turners, and mathematical and musical instrument makers. It is too heavy for furniture. It is the only wood used by the engravers of wood-cuts for books; and provided due care be exercised, the number of impressions that may be taken from a box-wood cut is very great. In France, box-wood is extensively used for combs, knife-handles, and button-moulds; and sometimes, it has been used, as a substitute for hops in the manufacture of beer. The value of the box-wood sent from Spain to Paris is reported to amount to about 10,000 fr. a year. In 1815 the box-trees cut down on Box-hill, near Dorking in Surrey, produced upwards of 10,000*l.* They are now, however, become very scarce in England. Previously to 1837 the duty on box-wood was quite oppressive, being 5*l.* a ton if brought from a foreign country, and 1*l.* a ton if from a British possession; but it was then reduced to 10*s.* a ton without reference to origin. In 1841 this duty produced 554*l.*, showing that 1,108 tons had been entered for consumption. In 1842 the duty on box-wood from a British possession was reduced to 2*s.* 6*d.* a ton, and in 1845 it was repealed. Turkey box-wood sells in the London market for from 4*l.* 10*s.* to 8*l.* 15*s.* a ton.

The export of box-wood from Constantinople in 1864 amounted to about 7,000 tons, 3,000 of which were of large sizes: about 6,000 tons were sent to England, the remainder to France. In 1866 we

imported 4,166 tons, of which 4,055 were from Turkey. Considerable quantities of Circassian box-wood are shipped to Great Britain through Constantinople. The average value of Turkish box-wood was, in 1866, 6*l.* 17*s.* 3*d.* per ton, other box-wood 7*l.* The Customs duty, which produced 301*l.* in 1861, was abolished in 1866. It is subject in Turkey to an export duty of 1 per cent.

BRAN (Fr. son; Ger. kleie). The thin skins or husks of corn, particularly wheat, ground, and separated from the corn by a sieve or boulder. Bran contains a large amount of nitrogenous matter, and flour loses its nutritive power by the separation of bran. Bran is also used in dyeing.

BRANDY (Ger. brandwein; Dutch, brandewijn; Fr. eau de vie, brandevin; Ital. aquazente; Span. aguardiente; Port. aguardente; Russ. wino; Lat. vinum adustum). A spirituous and inflammable liquor, obtained by distillation from wine and the husks of grapes. It is prepared in most of the wine countries of Europe; but the superiority of French brandy is universally admitted. The latter is principally distilled at Bordeaux, Rochelle, Cognac, the Isle de Rhé, Orleans, Nantes, and in Poitou, Touraine, and Anjou. That of Cognac is in the highest estimation.

Wines of all descriptions, but chiefly those that are strong and harsh (*poissés*), are used in the manufacture of brandy. The superior vintages, and those that have most flavour, are said to make the worst brandy. It is naturally clear and colourless. The different shades of colour which it has in commerce arise partly from the casks in which it is kept, but chiefly from the burnt sugar, saunders wood, and other colouring matter intentionally added to it by the dealers. It is said that the burnt sugar gives mellowness to the flavour of the liquor, and renders it more palatable.

The art of distillation is believed to have been first discovered by the Arabians. From a passage in the *Testamentum Novissimum* of the famous Raymond Lully, who flourished in the thirteenth century, it would appear that the production of brandy and alcohol from wine was familiar to his contemporaries. (1. 2, edit. *Argent*, 1571.) But the practice does not appear to have been introduced into France till 1313. (Le Grand d'Aussi, *Vie privée de François*, t. iii. p. 64.) When first introduced, brandy or burnt wine (*vinum adustum*) appears to have been used principally as an anti-septic and restorative medicine; and the most extravagant panegyrics were bestowed on its virtues. It was described as a sovereign remedy in almost all the disorders of the human frame; it was commended for its efficacy in comforting the memory, and strengthening the reasoning powers; it was extolled, in short, as the elixir of life, and an infallible preservative of youth and beauty! (Henderson's *History of Wine*, p. 24.) Dr. Henderson says that the experience of later times has shown how little this eulogy was merited; but in this he is contradicted by Lurke, who maintains, with equal eloquence and ingenuity, that 'the *alembic* has been a vast benefit and blessing.' (*Thoughts and Details on Secrecy*, p. 41.)

*Duties on Brandy.*—In a former edition of this work we remarked on this subject as follows, viz.: 'In nothing, perhaps, has the injurious operation of oppressive duties been so strikingly exemplified as in the case of brandy. At the latter end of the 17th century, when the duty on brandy did not exceed 9*l.* a tun, the imports into England amounted to about 6,000 tuns, or 1,512,000 gallons. (*Historical and Political Remarks on the Tariff of the late Treaty*, 1786, p. 113); whereas at present, notwithstanding our vast increase in

wealth and population since the period referred to, we do not import so much brandy as we did then. Nor is this extraordinary circumstance to be ascribed to any preference on the part of the public to other beverages, but is wholly owing to the exorbitant duties with which brandy is loaded. The price of brandy in bond varies, at this moment, according to quality, from 4*s.* to 6*s.* a gallon (imperial measure), while the duty is no less than 22*s.* 10*d.* Had the imposition of such a duty taken away the taste for brandy, it would have been comparatively innocuous. But it has done no such thing. Its only effect has been to convert a trade, that might otherwise have been productive of the most advantageous results, into a most prolific source of crime and demoralisation. The temptation to smuggle, occasioned by the exorbitancy of the duty, is too overpowering to be counteracted by the utmost penalties of the law. All along the coasts of Kent and Sussex, and the districts most favourably situated for *running spirits*, almost the whole of the labouring population are every now and then withdrawn from their ordinary employments to engage in smuggling adventures. The efforts of the revenue officers to seize foreign brandy and geneva have in innumerable instances been repelled by force. Bloody and desperate contests have in consequence taken place. Many individuals who, but for this fiscal scourge, would have been industrious and virtuous, have become idle, predatory, and ferocious; they have learned to despise the law, to execute summary vengeance on its officers; and are influenced by a spirit that has been, and may be, turned to the most dangerous purposes.

Neither can it be truly said that this miserable system is upheld for the sake of revenue. On the contrary, it is easy to show that, besides the other mischievous effects it entails on the public, it occasions the loss of at least 1,000,000*l.* a-year. In 1786, Mr. Pitt, by a wise and politic measure, took 50 per cent. from the duty on brandy and geneva (the duty on the latter has been for a lengthened period the same as that on brandy); and instead of being diminished, the revenue was increased. In 1790, when the duty on brandy and geneva was 5*s.* the wine gallon, the quantity retained for home consumption was 2,225,590 gallons. During the 3 years ending with 1803, when the duty was 9*s.* 2*d.*, the quantities of brandy and geneva retained for home consumption amounted, at an average, to about 2,700,000 gallons; but during the 3 years ending with 1818, when the duty had been increased to 18*s.* 10*d.* the wine gallon, the quantities retained did not exceed 850,000 gallons, while the quantities actually entered for home consumption were much less! The consumption increased considerably between 1818 and 1822; but since the latter epoch it has remained nearly stationary; and, notwithstanding, the great increase of wealth and population in the interval, is not nearly so great now (1843) as it was half a century ago! Nothing, therefore, can be more palpably erroneous than to contend that the revenue is improved by the present system. Have we not seen the revenue derived from coffee trebled by reducing the duty from 1*s.* 7*d.* to 6*d.*? Have we not seen the revenue derived from British spirits greatly increased by reducing the duty from 5*s.* 6*d.* to 5*s.* the wine gallon? And where is the ground for supposing that the result would be different were the duties on brandy equally reduced? But the experience afforded by Mr. Pitt's measure is decisive as to this point. He quadrupled the consumption, and increased the revenue by taking a half from the duty when it was a good deal less oppressive than now? Were

BRANDY

a similar reduction made at present, does any one doubt that a similar result would follow? Smuggling and adulteration would immediately cease; our trade with France would be very greatly extended; and the revenue would gain not merely by a direct increase of duty, but indirectly by a very great diminution of the expense of collection.

But the effect of the increase of the duties on brandy in Ireland has been still more extraordinary. At an average of the 3 years ending with 1802, when the duty was 7s. 3 $\frac{1}{2}$ d. the wine gallon, the average annual consumption of brandy in Ireland amounted to 208,064 gallons, producing a nett revenue of 77,714*l*. Now, mark the consequence of *trebling* the duties. The consumption during the 3 years ending with 1842, notwithstanding the population is more than doubled, only amounted, at an average, to 15,399 gallons, producing about 17,560*l*. a-year revenue! Dr. Swift has shrewdly remarked, that in the arithmetic of the customs two and two do not always make four, but sometimes only one. But here we have threefold duties, with less than  $\frac{1}{3}$  of the revenue, and less than  $\frac{1}{15}$  of the consumption.

It is surely impossible that a system like this, evincing in every part a degree of ignorant rapacity, to be paralleled only by that of the savages who to get at the fruit cut down the tree, should be permitted for a much longer period to disgrace our fiscal code. Those only who are anxious for the continuance of smuggling, with all its consequent crime and misery, can be hostile to a reduction of the duty on brandy. By fixing it at 10*s*. a gallon, neither the consumption of British spirits nor that of rum would be sensibly affected. The middle classes would, however, be able to use brandy on occasions when, perhaps, at present, they use nothing; its clandestine importation would be prevented; those engaged in smuggling would be obliged to have recourse to industrious pursuits; and the manufacture of the abominable compounds, that are now so frequently substituted in its stead, would be put an end to.

At length, in 1816, the duties on brandy were reduced by Sir Robert Peel from 22*s*. 10*d*. to 15*s*. a gallon. But though considerable, this was not equal to some of the reductions effected by the same great minister in cases in which, perhaps, they were less necessary. It was, nevertheless, of much importance; and the subjoined account shows that the increased consumption which it occasioned has prevented any diminution of revenue; for the falling off in the consumption and duties in 1857 and 1858 was wholly a consequence of the scarcity and high price of brandy, occasioned by the vine disease. In 1860 the duty on brandy was fixed at 10*s*. 5*d*. per gallon. This change equalised the duty on foreign and British spirits.

Notwithstanding the improvement in the vintage since 1858, the price of brandy is still (1868) very high. And hence the substitution of British brandy, and of other more objectionable compounds, for the genuine article.

*Regulations as to Importation &c.*—Brandy, geneva, and other foreign spirits must be imported, if in casks, in casks containing not less than 20 gallons, under penalty of forfeiture. They must be imported in ships of 50 tons burden or upwards, and are not to be exported from a bonded warehouse except in a vessel of like tonnage under pain of forfeiture.

In Parl. Paper No. 400, Sept. 1864, it is stated that in 1862 847,935 gallons of British brandy were permitted from the rectifiers' stocks, and 706,356 gallons in 1863; 61,258 being permitted in the latter year for exportation.

BRASS (Ger. messing; Dutch, messing, missing, geelkoper; Fr. cuivre jaune, laiton; Ital. ottone; Span. laton, azofar; Russ. selonoi mjed; Lat. orichalcum, aurichalcum). A fictitious metal, made of copper and zinc in certain proportions. It is of a beautiful yellow colour, more fusible than copper, and not so apt to tarnish. It is malleable, so ductile that it may be drawn out into wire, and is much tougher than copper. Its density is greater than the mean density of the two metals. By calculation it ought to be 7.63 nearly, whereas it is actually 8.39; so that its density is increased by about one tenth. The ancients do not seem to have known accurately the difference between copper, brass, and bronze. They considered brass as only a more valuable kind of copper, and therefore used the word *as* to denote either. They called copper *as cyprium*, afterwards *cyprum*; and this in process of time was converted into *cuprum*. Dr. Watson has proved that it was to brass they gave the name of *orichalcum*. Brass is malleable when cold, unless the proportion of zinc be excessive; but when heated it becomes brittle. It

may be readily turned upon the lathe; and, indeed, works more kindly than any other metal.

There is a vast variety in the proportions of the different species of brass used in commerce; nor is it easy to determine whether the perfection of this alloy depends on any certain proportions of the two metals. In general, the extremes of the highest and lowest proportions of zinc are from 12 to 25 parts in the 100. In some of the British manufactories, the brass made contains one third its weight of zinc. In Germany and Sweden the proportion of zinc varies from one fifth to one fourth of the copper. The ductility of brass is not injured when the proportion of zinc is highest. This metal is much used in the escapement wheels and other nicer parts of watch-making; and bars of brass, very carefully made, fetch for this purpose a high price.

The use of brass is of very considerable antiquity. Most of the ancient genuine relics are composed of various mixtures of brass with tin and other metals, and are rather to be denominated bronzes. The best proportion for brass guns is said to be 1,000 lbs. of copper, 990 lbs. of tin, and 600 lbs. of brass, in 11 or 12 cwt. of metal. The best brass guns are made of malleable metal, not of pure copper and zinc alone; but worse metals are used to make it run closer and sounder, as lead and pot-metal. (Thomson's *Chemistry*; *Encyc. Britannica*; &c.)

The economical use of brass is largely increasing. It is employed for a great variety of mechanical purposes, and in the fine arts, no metal having been found so available for these uses. It would be impossible in the compass of this article to refer to all the ends which this important metal fulfils. But the reader may be referred to the exhaustive and valuable account of the brass manufacture in Birmingham, written by Mr. Aitken, and contained in the volume entitled *The Resources, Products, and Industrial History of Birmingham and the Midland Hardware District*.

The amount of the metals used in the Birmingham brass manufactories during the year 1865 is reckoned by this writer at upwards of 38,000 tons, the value being 2,371,658*l*.

There are various kinds of brass, known as pinebeck, prince's metal, bath metal, red brass, Dutch gold, Muntz's yellow metal, and malleable brass; the difference depending on the various proportions of copper and zinc. An alloy of brass with phosphorus is said to have valuable properties.

**BRAZIL NUTS** (Ger. *pechurinnüsse*; Dutch, *brazilie* or *soelic nooten*; Swed. *macis bönor*, *picorin bönor*; Dan. *pechurim noder*, *macis bönner*; Fr. *noix pécharins*; Ital. *fava bucarini*, *noei gemelle*; Span. *becuiba*; Port. *pucharins*) or *Chestnuts of Brazil*. The fruit of the *Juvia* (*Bertholletia excelsa*), a majestic tree growing to the height of 100 or 120 feet, abounding on the banks of the Orinoco, and in the northern parts of Brazil. The nuts are triangular, having a cuneiform appearance, with sutures at each of the angles; the shell is rough and hard, and of a brownish ash colour. The kernel resembles that of an almond, but is larger, and tastes more like a common hazel nut; it contains a great deal of oil that may be obtained by expression or otherwise. These nuts do not grow separately, or in clusters, but are contained, to the number of from 15 to 50 or more, in great ligneous pericarps or outer shells, generally of the size of a child's head. Humboldt says he had most frequently found from 15 to 22 nuts in each pericarp; but De Laet, who gave the first and most accurate description of this fruit, says that the pericarp is divided into

six compartments, each of which encloses from 8 to 12 nuts. The outer shell is very hard and strong, so that it is rather difficult to get at the nuts, which are closely packed in cells inside. The natives are particularly fond of this fruit, and celebrate the harvest of the *juvia* with rejoicings; it is also very much esteemed in Europe. The nuts brought to this country and the Continent are chiefly exported from Pará, and form an article of considerable commercial importance. (Humboldt's *Pers. Nar.* vol. v. p. 538, English translation.)

The fluctuations in the export from Pará of Brazil nuts are very considerable: between 1851 and 1856 the maximum and minimum amounts were 92,000 and 19,000 *aliquies*. An *aliquie* of Brazil nuts varies in weight from 60 to 80 lbs. avoird., according to the season and goodness of the nuts. They are principally exported to the United States and to Great Britain, the larger portion to the former country. The price varies considerably, being occasionally as low as 1,740 m. reis and as high as 5,400 m. reis per *aliquie*. The imports into the United Kingdom are not specified in the returns of trade. Price in London market, October 26, 1865 and 1866, 3*l*. to 35*s*. and 42*s*. to 45*s*. per barrel.

**BRAZIL-WOOD** (Fr. *bois de Brésil*; Ger. *Brasilienholz*; Dutch, *Brasilienhout*; Ital. *Legno del Brasile*; Span. *madera del Bresil*; Port. *pao Brasil*). It has been commonly supposed that this wood derived its name from the country in which it is principally produced. But Dr. Bancroft has conclusively shown that woods yielding a red dye were called Brazil-woods long previously to the discovery of America; and that the early voyagers gave the name of Brazil to that part of that continent to which it is still applied, from their having ascertained that it abounded in such woods. (*Philosophy of Colours*, vol. ii, pp. 316—321.)

It is found in the greatest abundance, and is of the best quality, in the province of Pernambuco, where it is called *Pao da rainha*, or Queen's wood; but it is also found in many other parts of the Western hemisphere. The tree is large, crooked, and knotty; the leaves are of a beautiful red, and exhale an agreeable odour. Its botanical name is *Cesalpinia brasiletto*, but it is called by the natives *ibiritanga*. Notwithstanding its apparent bulk, the bark is so thick that a tree as large as a man's body with the bark will not be so thick as the leg when peeled. When cut into chips, it loses the pale colour it before had, and becomes red, and when chewed has a sweet taste. It is used for various purposes by cabinet-makers, and admits of a beautiful varnish, but its principal use is in dyeing red; and though the colour is liable to decay, yet, by mixing with it alum and tartar, it is easily made permanent. There is also made of it, by means of acids, a sort of liquid lake or carmine for painting in miniature.

Brazil-wood has been for many years past a royal monopoly; its exportation, except on account of Government, being prohibited under the severest penalties. Owing to the improvident manner in which it has been cut down by the Government agents, it is now rarely found within several leagues of the coast. Indeed, we are assured that many of the planters have privately cut down the trees on their estates, and used the timber as fire-wood, that they might not expose themselves to annoyance from the arbitrary and vexatious proceedings of these functionaries. The quantity of Brazil wood imported into this country is inconsiderable. Its price in the London market is about 30*l*. per ton. In 1866, 1,201 tons were imported, chiefly from Venezuela and Mexico. **BRAZILETTO.** An inferior species of Brazil wood brought from Jamaica. It is one of the cheapest and least esteemed of the red dyewoods.

**BREAD** (Fr. pain; Ger. brot), the principal article in the food of most civilised nations, consists of a paste or dough formed of the flour or meal of different sorts of grain mixed with water and baked. When stale dough or yeast is added to the fresh dough, to make it swell, it is said to be *leavened*; when nothing of this sort is added, it is said to be *unleavened*.

For the process of bread-making, we refer the reader to Ure's *Dictionary of Manufactures*.

1. *Historical Sketch of Bread.*—The President de Goguet has endeavoured, with his usual sagacity and learning, to trace the successive steps by which it is probable men were led to discover the art of making bread (*Origin of Laws &c.* vol. i. pp. 95–105, Eng. trans.); but nothing positive is known on the subject. The method of grinding corn by hand-mills was practised in Egypt and Greece from a very remote epoch; but for a lengthened period the Romans had no other method of making flour than by beating roasted corn in mortars. The Macedonian war helped to make the Romans acquainted with the arts and refinements of Greece; and Pliny mentions that public bakers were then, for the first time, established in Rome. (*Hist. Nat. lib. xviii. c. 11.*) The conquests of the Romans diffused, amongst many other useful discoveries, a knowledge of the art of preparing bread, as practised in Rome, through the whole south of Europe.

The use of yeast in the raising of bread seems, however, from a passage of Pliny (*lib. xviii. c. 7.*), to have been practised by the Germans and Gauls before it was practised by the Romans; the latter, like the Greeks, having leavened their bread by intermixing the fresh dough with that which had become stale. The Roman practice seems to have superseded that which was previously in use in France and Spain; for the art of raising bread by an admixture of yeast was not practised in France in modern times till towards the end of the seventeenth century. It deserves to be mentioned, that though the bread made in this way was decidedly superior to that previously in use, it was declared, by the faculty of medicine in Paris, to be prejudicial to health; and the use of yeast was prohibited under the severest penalties! Luckily, however, the taste of the public concurring with the interest of the bakers, proved too powerful for these absurd regulations, which fell gradually into disuse; and yeast has long been, almost every where, used in preference to any thing else in the manufacture of bread, to the wholesomeness and excellence of which it has not a little contributed.

The species of bread in common use in a country depends partly on the taste of the inhabitants, but more on the sort of grain suitable for its soil. But the superiority of wheat to all other farinaceous plants in the manufacture of bread is so very great, that wherever it is easily and successfully cultivated, wheaten bread is used to the nearly total exclusion of most others. Where, however, the soil or climate is less favourable to its growth, rye, oats &c. are used in its stead. A very great change for the better has, in this respect, taken place in Great Britain within the last century. It is mentioned by Harrison, in his description of England (p. 168), that in the reign of Henry VIII. the gentry had wheat sufficient for their own tables, but that their household and poor neighbours were usually obliged to content themselves with rye, barley, and oats. It appears from

the household book of Sir Edward Coke, that in 1596, rye bread and oatmeal formed a considerable part of the diet of servants, even in great families, in the southern counties. Barley bread is stated, in the grant of a monopoly by Charles I. in 1626, to be the usual food of the ordinary sort of people. (Sir F. M. Eden *On the Poor*, vol. i. p. 561.) At the Revolution, the wheat produced in England and Wales was estimated by Mr. King and Dr. Davenant to amount to 1,750,000 quarters. (Davenant's *Works*, vol. ii. p. 217.) Mr. Charles Smith, the very well informed author of the *Tracts on the Corn Trade*, originally published in 1758, states that in his time wheat had become much more generally the food of the common people than it had been in 1689; but he adds (2nd ed. p. 182, London, 1766) that notwithstanding this increase, some very intelligent enquirers were of opinion that even then not more than half the people of England fed on wheat. Mr. Smith's own estimate, which is very carefully drawn up, is a little higher; for, taking the population of England and Wales, in 1760, at 6,000,000, he supposed that 3,750,000 were consumers of wheat; 739,000 of barley; 888,000 of rye; and 623,000 of oats. Mr. Smith further supposed that they individually consumed, the first class, 1 quarter of wheat; the second, 1 quarter and 3 bushels of barley; the third, 1 quarter and 1 bushel of rye; and the fourth, 2 quarters and 7 bushels of oats.

About the middle of last century hardly any wheat was used in the northern counties of England. In Cumberland, the principal families used only a small quantity about Christmas. The crust of the goose pie, with which almost every table in the county is then supplied, was, at the period referred to, almost uniformly made of barley meal. (Eden *On the Poor*, vol. i. p. 564.)

Everyone knows how inapplicable these statements are to the condition of the people of England at the present time. Wheaten bread is now universally made use of in towns and villages, and almost every where in the country. Barley is no longer used, except in the distilleries, and in brewing; oats are employed only in the feeding of horses; and the consumption of rye bread is comparatively inconsiderable. The produce of the wheat crops has been, at the very least, quadrupled since 1760. And if to this immense increase in the supply of wheat we add the still more extraordinary increase in the supply of butcher's meat [CATTLE], the fact of a very signal improvement having taken place in the condition of the population, in respect of food, will be obvious.

But great as has been the improvement in the condition of the people of England since 1760, it is but trifling compared to the improvement that has taken place, since the same period, in the condition of the people of Scotland. At the middle of last century Scotch agriculture was in the most depressed state; the tenants were destitute alike of capital and skill; green crops were almost wholly unknown; and the quantity of wheat raised was quite inconsiderable. A field of 8 acres sown with this grain, in the vicinity of Edinburgh, in 1727, was reckoned so great a curiosity that it excited the attention of the whole neighbourhood! (Robertson's *Rural Recollections*, p. 267.) But even so late as the American war, the wheat raised in the Lothians and Berwickshire did not exceed a third part of what is now grown in them; and taking the whole country at an average, it will be a moderate estimate to say that the cultivation of wheat has increased in a tenfold proportion since 1780. At

that period no wheaten bread was to be met with in the country places and villages of Scotland; *out cakes and barley bannoeks* being universally made use of. But at present the case is widely different. The upper and also the middle and lower classes in towns and villages use only wheaten bread, and even in farmhouses it is very extensively consumed. There is, at this moment, hardly a village to be met with, however limited its extent, that has not a public baker.

In many parts of England it is yet the custom for private families to bake their own bread. This is particularly the case in Kent, and in some parts of Lancashire. In 1804 there was not a single public baker in Manchester, and their number is still small.

2. *Regulations as to the Manufacture of Bread.*—Owing to the vast importance of bread, its manufacture has been subjected in most countries to various regulations, some of which have had a beneficial and others an injurious operation.

a. *Assize of Bread.*—From the year 1266, in the reign of Henry III., down to our own days, it has been customary to regulate the price at which bread should be sold according to the price of wheat or flour at the time. An interference of this sort was supposed to be necessary to prevent that monopoly on the part of the bakers which it was feared might otherwise take place. But it is needless, perhaps, to say that this apprehension was of the most futile description. The trade of a baker is one that may be easily learned, and it requires no considerable capital to carry it on; so that were those engaged in the business in any particular town to attempt to force up prices to an artificial elevation, the combination would be immediately defeated by the competition of others; and even though this were not the case, the facility with which bread may be baked at home would of itself serve to nullify the efforts of any combination. But the assize regulations were not merely useless; they were in many respects exceedingly injurious: they rendered the price of flour a matter of comparative indifference to the baker; and they obliged the baker who used the finest flour, and made the best bread, to sell at the same rate as those who used inferior flour, and whose bread was decidedly of a worse quality. But these considerations, how obvious soever they may now appear, were for a long time entirely overlooked. According, however, as the use of wheaten bread was extended, it was found to be impracticable to set assizes in small towns and villages; and, although the fewness of the bakers in such places gave them greater facilities for combining together, the price of bread was almost uniformly lower in them than in places where assizes were set. In consequence, partly of this circumstance, but still more of the increase of intelligence as to such matters, the practice of setting an assize was gradually relinquished in most places; and in 1815 it was expressly abolished, by an Act of the Legislature (55 Geo. III. c. 99), in London and its environs. In other places, though the power to set an assize still subsists, it is seldom acted upon, and has fallen into comparative disuse.

b. *Regulations as to the Weight, and Ingredients to be used in making Bread.*—According to the assize Acts, a sack of flour weighing 280 lbs. is supposed capable of being baked into 80 quarter loaves; one-fifth of the loaf being supposed to consist of water and salt, and four-fifths of flour. But the number of loaves that may be made from a sack of flour depends entirely on its goodness. Good flour requires more water than bad flour, and old flour than new flour. Sometimes 82, 80,

and even 86 loaves have been made from a sack of flour, and sometimes hardly 80.

Under the assize Acts, bakers were restricted to bake only three kinds of bread, viz. wheaten, standard wheaten, and household; the first being made of the finest flour, the second of the whole flour mixed, and the third of the coarser flour. The loaves were divided into peck, half-peck, and quarter loaves; the legal weight of each, when baked, being, the peck loaf 17 lbs. 6 oz., the half-peck 8 lbs. 11 oz., and the quarter 4 lbs. 5½ oz. avoirdupois.

Now, however, it is enacted, that, within the city of London, and in those places in the country where an assize is not set, it shall be lawful for the bakers to make and sell bread made of wheat, barley, rye, oats, buckwheat, Indian corn, peas, beans, rice, or potatoes, or any of them, along with common salt, pure water, eggs, milk, barn, leaven, potato, or other yeast, and mixed in such proportions as they shall think fit. (3 Geo. IV. c. 106 s. 2, and 1 & 2 Geo. IV. c. 50 s. 2.)

It is also enacted by the same statutes that bakers in London, and in the country, i.e. in all places 10 miles from the Royal Exchange where an assize is not set, may make and sell bread of such weight and size as they think fit, any law or assize to the contrary notwithstanding. But it is at the same time enacted that such bread shall always be sold by avoirdupois weight of 16 ounces to the pound, and in no other manner, under a penalty for every offence of not more than 40s., except, however, French or fancy bread, or roll, which may be sold without previously weighing the same.

Bakers or sellers of bread are bound to have fixed, in some conspicuous part of their shop, a beam and scales, with proper weights for weighing bread; and a person purchasing bread may require it to be weighed in his presence. Bakers, and others sending out bread in carts, are to supply them with beams, scales &c., and to weigh the bread if required, under a penalty of not more than 5*l.* (3 Geo. IV. c. 106 s. 8.)

Bakers, either journeymen or masters, using alum or any other unwholesome ingredient, and convicted on their own confession, or on the oath of one or more witnesses, to forfeit not exceeding 20*l.* and not less than 5*l.* if beyond the environs of London, and not exceeding 10*l.* nor less than 5*l.* if within London or its environs. Justices are allowed to publish the names of offenders. The adulteration of meal or flour is punishable by a like penalty. Loaves made of any other grain than wheat without the City and its liberties, or beyond 10 miles of the Royal Exchange, to be marked with a large Roman M.; and every person exposing such loaves without such mark shall forfeit not more than 40s. nor less than 10s. for every loaf so exposed. (1 & 2 Geo. IV. c. 50 s. 6.)

Any ingredient or mixture found within the house, mill, stall, shop &c. of any miller, mealman, or baker, which, after due examination, shall be adjudged to have been placed there for the purpose of adulteration, shall be forfeited, and the person within whose premises it is found punished, if within the city of London and its environs, by a penalty not exceeding 10*l.* nor less than 40s. for the first offence, 5*l.* for the second offence, and 10*l.* for every subsequent offence. (3 Geo. IV. c. 106 s. 14.) And if without London and its environs, the party in whose house or premises ingredients for adulteration shall be found shall forfeit for every such offence not less than 5*l.* and not more than 20*l.* (1 & 2 Geo. IV. c. 5 s. 8.)

Bakers in London and its environs are not to sell, or expose to sale, any bread, rolls, or cakes,

nor bake or sell any bread, rolls, or cakes, or victuals of any kind, during the hours of the afternoon, under 20s. for the second offence. Bakers in any town or village, or any part of the country, who sell any bread, rolls, or cakes, after 1 o'clock, and before 6 o'clock, shall be liable to a fine of 5*s.* for the first offence, and 20*s.* for the second. (59 Geo. IV. c. 1.)

There are several regulations with respect to the assize of bread. The assize is nearly everywhere in force, and is nearly everywhere in force to recapitulate the assize of bread has already been mentioned. Notwithstanding the assize of alum, it is in force in London, and in the metropolis, &c. The assize of bread is estimated to be an inferior quality, and is not so much valued as the quantity of salt and deficiency supplied. This improves the much whiter and

The census returns number of bakers in London, and in the metropolis, &c. The trade which is limited, and it is a curious line of business.

*Bread-making in France.* The Government in Paris has a privilege of the management, the law of July 1793, the variety of regulations, number was limited only 1,601, and the population in good health, it is said that they were compelled to sell bread, their loss being reimbursed by the communal revenue.

Table showing the average price of the Assize of Paris for Bread at various Years.

Years	Prices	Years
1801	32 5/11	1816
1802	40 5/8	1817
1805	24 5/8	1818
1804	23 9/16	1819
1805	29 2/25	1820
1805	29 1/2	1821
1807	30 2/25	1822
1808	26 1/19	1823
1809	22 7/25	1824

1812	30 7/7	1827
1813	39 1/3	1828
1814	28 2/1	1829
1815	28 5/8	1830

The regulations all taken away by a decree says nothing was conferred on the Minister of Agriculture, ho

nor bake or deliver any meat, pudding, ple, tart, or victuals of any sort, on Sundays, except between the hours of nine in the morning and one in the afternoon, under penalty of 10s. for the first offence, 20s. for the second offence, and 40s. for every subsequent offence. (3 Geo. IV. c. 106 s. 16.)

Bakers in the country are prohibited from selling &c. any bread &c. or baking or delivering any meat &c. on Sundays any time after half past 1 o'clock of the afternoon of that day, or during the time of Divine service, under penalty of 5s. for the first offence, 10s. for the second, and 20s. for the third and every subsequent offence. (59 Geo. IV. c. 36 s. 12.)

There are several regulations in the Acts now in force with respect to the sale &c. of bread where an assize is set; but as the practice of setting an assize is nearly relinquished, it seems unnecessary to recapitulate them. The weight of the assize bread has already been mentioned, and the principle on which its price is fixed.

Notwithstanding the prohibition against the use of alum, it is believed to be very generally employed, particularly by the bakers of London. 'In the metropolis,' says Dr. Thomson (*Suppl. to Encyc. Brit. art. 'Baking'*), 'where the goodness of bread is estimated entirely by its whiteness, it is usual with those bakers who employ flour of an inferior quality to add as much alum as common salt to the dough; or, in other words, the quantity of salt added is diminished a half, and the deficiency supplied by an equal weight of alum. This improves the look of the bread, rendering it much whiter and firmer.'

The census returns of 1860 give 12,308 as the number of 'bakers' in the metropolitan district. The trade which they carry on is in general but limited, and it is not reckoned a very advantageous line of business.

*Bread-making in France.*—The old assize of bread was, and theoretically is still, in force in France. The Government did not, however, fix the price, but this was left to the mayor of the commune, in Paris to the préfet of the city. This privilege of the mayor was conferred on him by a law of July 1791. In pursuance of these arrangements, the bakers were made liable to a variety of regulations. In most communes their number was limited. In Paris, in 1860, they were only 1,601, and their shops were liable to inspection. It is said that, in order to keep the Parisian populace in good humour, the bakers were compelled to sell bread in scarce times at low prices, their loss being reimbursed to them from the public or communal revenue.

Table showing the Mean Annual Prices per Kilogramme in Centimes and Fractions of Wheatens Bread at Paris from the year 1801 to 1858.

1815	28.5	1830	39.52				

The regulations affecting the baker's trade were taken away by a decree of June 22, 1863. But the decree says nothing of the assize, for this right was conferred on the mayor by law. The Minister of Agriculture, however, issued a circular, dated

August 22, 1863, suggesting to the mayor to suspend, provisionally, his privilege. If, it is said, experience is favourable to this suggestion, the law will be altered by the Legislature. [The information on this head has been supplied by M. Maurice Block.]

**BREMEN.** One of the Hansentia cities, on the Weser, about 50 miles from its mouth, lat. 53° 43' N., long. 8° 48' 3" E. The city and suburbs contain an area of 73½ square miles (British). The revenue for the three years 1862-4 was 279,404L, 241,627L, 261,910L; the expenditure 353,106L, 367,866L, 295,536L. Population in 1864, 104,091; that of Bremen town being 70,692; of Vegesack town 3,981; Bremer Haven 7,435; of the rural districts 21,983.

Its situation renders Bremen the principal emporium of Hanover, Brunswick, Hesse, and other countries traversed by the Weser.

*Entrance to Bremen.*—The entrance to the Weser lies between the Mellum and other sands on the south-western, and the Teglers Plat &c. on the north-eastern side. Its course from Bremerlehe to its mouth is nearly S.E. and N.W. It is buoyed throughout; the buoys on the right or starboard side when entering being black and marked with letters, while those on the left or larboard are white and numbered. The first or outer black buoy has a gilt key upon it, and is, therefore, called the *schlüssel* or key buoy; it lies in 10½ fathoms, bearing N.E. 5 miles from Wrangeroog light. This is an intermitting light, having replaced in 1850 the old coal-fire beacon on the island of Wrangeroog, opposite to the northern extremity of East Friesland. It is, according to the most authentic statements, in lat. 53° 47½' N., long. 7° 51' 55" E., and is elevated 63½ feet above high-water mark, being alternately visible and invisible for the space of a minute.

In place of the wooden *Bremen Beacon*, situated in 53° 42' 51" North lat. and 8° 14' 52" East long. from Greenwich, a lighthouse was erected in the Weser on the Hlobe Weg in 1856. It is of brick, and surrounded with sloping masonry of stone at the base. It is octagonal.

The light is catadioptric, according to Fresnel's system of the second order; it is 107 feet above high-water at ordinary tides, and is a fixed white light. In clear weather it is visible at the distance of 15 or 16 nautical miles, within all the points of the compass from S. round E. to N. W. by W., and may therefore be seen from the Key buoy.

From the outer light-vessel the lighthouse bears S. by E. ½ E., and from the lighthouse the church of Langwarden bears S.

For the convenience of mariners entering the Weser, but by no means to induce them to neglect the use of the lead, a small white light will be shown from the lighthouse at an elevation of 38 feet above common high-water mark, which in clear weather will be visible at the distance of 7 nautical miles. This light will disappear to those who are nearing too much the black buoy (or starboard) side, near buoys H. and J. To those entering the *Deussgat* it will assume a reddish colour in a line with the red buoy, and will disappear when they reach the line of the black W. A. buoy. This smaller light will be visible between the bearings of N. by W. ½ W. round northward to E. by S.

By a law of February 12, 1866, regulations have been laid down for discharging freights in the ports of the Weser. The time allowed for discharging vessels up to 75 lasts is eight days between March 1 and October 31, twelve days between Nov. 1 and Feb. 28. For every additional

30 lasts one day more is allowed. Sundays and holidays are not reckoned.

The number of Bremen vessels on January 1, 1867, amounted to 293, of the burden of 112,497 lasts, each last of 4,000 lbs., 2,032 lbs. being equal to one English ton. The number of vessels which arrived at Bremen in 1866 was 2,870, of 373,785 lasts burden. The following are the principal institutions in Bremen:—

The *Chamber of Commerce or Board of Trade* at Bremen was substituted in 1849 for the ancient court of Aldermen called Collegium Seniorum. The members of the chamber are elected by and from merchants. It consists of 24 members and two syndics. It possesses certain legislative and executive functions.

The *Bank* has a capital of 4,000,000 Bremen thalers and a note circulation of about 2,006,000 Bremen thalers.

A *Discount and Deposit Bank* has been established with a capital of 20 millions thalers (100,000L). It is empowered to issue notes of the value of 5 thalers and upwards, payable on demand,

to the amount of one-third of the bullion in its coffers; and is said to have been of considerable use, by its judicious conduct, during the crisis of 1857. It has since been authorised to add 2½ million thalers to its capital.

The gold thaler equals 3s. 4d. sterling.

The public debt of Bremen is about 12,000,000 thalers, chiefly contracted for railways, docks &c.

The *Norddeutsche Lloyd*.—This company owns 27 steamers and a number of iron lighters. Among the steamers are 4 large Transatlantic steam-ships, which maintain a regular communication once a fortnight with the United States, and 6 steamers which run between Bremen, London, and Hull.

The *Emigration Office*, where emigrants may obtain, gratuitously, all reliable information and advice. The number of emigrants embarking at Bremen during the period from 1851 to 1862 amounts to 455,782, averaging 38,000 a-year. The largest number, viz. 76,875, passed through in 1854. In 1866 the emigrants were 62,254, nearly all of whom went to the United States. (See below.)

*Vegesack*, situated on the Weser, is remarkable for ship-building. Its harbour is of no importance, and only fitted for smaller vessels. There is a Railway hence to Bremen; and *Bremer Haven*, the harbour of Bremen, has also been connected with the city by railroad (since 1862). The harbour works are very extensive, and are being enlarged year by year to meet the requirements of the extending trade. In addition to the adjacent Geestemünde, there are three large docks of such depth that vessels drawing 23 to 24 feet can enter with facility. The harbour dues are very moderate, and not higher than those of Geestemünde.

Besides her communications by water, Bremen

is now, also, connected by railways with Hanover, Leipzig, and the whole of western and central Germany; and hence the rapidly increasing magnitude of her commerce, which has more than doubled within the last 8 or 10 years. Though inferior as a navigable river to the Elbe, the Weser has the important advantage on its side of being free from those tolls and burdens which obstruct the navigation of the former. The toll at Elsfleth, below Bremen, was suspended or abolished early in this century; and the tolls on the Upper Weser have been abolished since 1815. And we may add that the advantages which have resulted from the free navigation of the Weser have powerfully contributed to awaken attention

to the mischief and elsewhere.

The charges of goods at principal German ports, grain, oak bark, seed, beef and mutton, oil, and cloths, oil, shipped here are useful commodities. The imports of quantities are colonial products, wines, raw cotton, wool, coal, hemp &c.

The overseas States is imported a great variety of back large quantities, and other American goods. The United States accounts published value of the exports of the year ended thalers, and that from Bremen in thalers.

Total Value of Port of Bremen Year 1864.

\* Exclusive of the trade with Bremen in the year 1864.

to the mischievous influence of the tolls at Stade and elsewhere on the Elbe.

The charges on the buying, selling, and shipping of goods at Bremen are very moderate. The principal German exports are woollen goods, linens, grain, oak bark, glass, smalts, hams, hides, rapeseed, beef and pork, rags, wool, wine, wooden toys and cloaks, oil-cake &c. The wheat and barley shipped here are mostly inferior; but the oats are useful common feed; beans are good. The linens are much the same as those from Hamburg. The imports consist of tobacco (of which large quantities are re-exported), coffee, sugar, and other colonial products; whale oil, iron, rice, hides, wines, raw cotton, cotton stuffs and yarn, earthenware, coal, brandy, tar, tea, dyewoods, timber, hemp &c.

The oversea trade of Bremen with the United States is important. She also sends thither a great variety of German products, and brings back large quantities of cotton, tobacco, rice, and other American produce. The annexed account shows the magnitude of her trade with the United States in 1864. From the official accounts published by order of Congress, the value of the exports of the domestic produce of the Union to Bremen was estimated for the year ended June 30, 1858, at 8,617,457 thalers, and that of the imports into the Union from Bremen in the same year at 10,452,106 thalers.

The value of the imports of British goods in 1865 was 1,143,201, and in 1866 1,438,325. The value of the exports to England in 1865 was 1,107,491, and in 1866 was 1,154,014.

**Duties.**—An export duty of  $\frac{1}{2}$  per cent., ad valorem, is charged on all merchandise shipped from Bremen; and an import duty of  $\frac{1}{2}$  per cent., ad valorem, on all foreign articles entered for sale.

Goods passing through Bremen in transitu are divided into four classes; those subjected to the highest duty paying about  $\frac{1}{4}$  per cwt. gross, while those subjected to the lowest duty pay only about  $\frac{1}{4}$  per ditto. As this duty can yield but a mere trifle, it should be repealed.

The value of the imports is calculated according to the invoice price, adding thereto the freight and the rate of insurance current in Bremen; the value of the exports is estimated from the invoice price only. Should there be no invoice of imports, it is the duty of the importer to make a correct estimate of the value upon oath.

**Emigration.**—Bremen has become the most considerable port on the Continent for the shipment of emigrants. In proof of this we subjoin an

*Account of the Numbers of the Emigrants sailed from Bremen during each of the 35 Years ending with 1866.*

Years	Emigrants	Years	Emigrants
1832	10,341	1850	25,778

1848	29,917	1866	62,254
1849	28,629		

Nine-tenths and more of the emigrants are destined for the United States, and are justly regarded as among the best of the recruits sent to them from Europe. It will be seen, however, that the number, which was diminished during the American war, has again largely increased.

**Ship-brokers** are licensed officers, and give security to the amount of 2,000 rix-dollars for the faithful discharge of their duties. These are to engage freights, to sell vessels by auction, to enter vessels, and collect freights. They are not permitted to have partners, to transact any commercial business on their own account, to accept commissions or consignments, to sell or purchase bills of exchange, or to engage in any mercantile concerns.

None but appointed brokers of this class can undertake any of the duties assigned to them.

Any person employing a non-appointed broker is deprived of legal redress against the unauthorised agent by whose conduct he may sustain injury.

Ship-brokers are obliged to keep a register of all vessels coming in or going out, of the names of the captains who employed them, to procure manifests of cargoes, and to attend to the payment of duties and other dues chargeable on vessel or cargo.

The fees allowed to them are, for chartering a vessel in bulk, 18 grotes per grain last; of this the owner pays 12 and the freighter 6 grotes.

For outward-bound vessels, taking merchandise as it may be offered, 2 per cent. on the freight.

For entering a vessel from sea measuring 50 lasts, 5 six-dollars; measuring 100 ditto, 7½ six-dollars; and if she measure above 100 lasts, 10 six-dollars.

Entry dues are to be paid by the consignees of foreign vessels out of the commission they may charge.

For the collection of freight money, the broker is entitled to receive 1 per cent., but the consignee of a foreign vessel is to pay this sum.

**Regulations of the Harbour of Bremer Haven.**—All vessels entering the harbour are subject to the superintendence of the harbour-masters, whose directions are to be obeyed.

No ballast or rubbish is to be thrown overboard under a heavy penalty.

It is not permitted to keep gunpowder on board longer than 2 hours after the vessel has reached her berth under a heavy penalty; nor is it permitted to discharge any fire-arms in port.

The use of all fire on board, from sunset to sunrise, is prohibited; the captain, however, may have a light, in a closed lantern, in his cabin.

The crews are not allowed to carry on shore any fire-arms, dirks, or other weapons.

**Harbour Dues at Bremen.**

**(Regulations of Nov. 17, 1863.)**

The following are the rates of pilotage for the pilot-company of Bremer Haven:—

I. Vessels coming from sea, of whatever construction, pay in gold or Bremen money for each foot Bremen measure which the vessel draws:

A. During the summer months, from April 16 to September 15, inclusive:—

**Bremer Haven.**

1. From sea to Bremer Haven	-	-	-	thal. gr.
2. the first to the fourth buoy	-	-	-	1 57
3. fourth to the seventh buoy	-	-	-	1 39
4. seventh buoy to the Bremen beacon	-	-	-	1 47
5. Bremen beacon to the red buoy	-	-	-	0 19
6. red buoy to Wremen	-	-	-	0 69
7. Wremen to Bremer Haven	-	-	-	1 61
8. Bremer Haven to Grossensiel	-	-	-	0 33

**Zweyburg.**

1. From sea to Zweyburg	-	-	-	thal. gr.
2. the first to the fourth buoy	-	-	-	2 18
3. fourth to the seventh buoy	-	-	-	1 64
4. seventh buoy to the Bremen beacon	-	-	-	1 46
5. Bremen beacon to the red buoy	-	-	-	1 54
6. red buoy to Wremen	-	-	-	1 16
7. Wremen to Bremer Haven	-	-	-	1 4
8. Bremer Haven to Zweyburg	-	-	-	0 68

**Brake.**

1. From sea to Brake	-	-	-	thal. gr.
2. the first to the fourth or Crossbuoy	-	-	-	2 0
3. fourth to the seventh buoy or Mellum	-	-	-	1 54
4. seventh buoy to the Bremen beacon	-	-	-	1 59
5. Bremen beacon to the red buoy	-	-	-	1 24
6. red buoy to Wremen	-	-	-	1 12
7. Wremen to Bremer Haven	-	-	-	0 66
8. Bremer Haven to Brake	-	-	-	0 48

B. In spring and autumn, from February 16 to April 15, and from September 16 to November 15, both inclusive:—

**Bremer Haven.**

1. From sea to Bremer Haven	-	-	-	thal. gr.
2. the first to the fourth buoy	-	-	-	2 15
3. fourth to the seventh buoy	-	-	-	1 59
4. seventh buoy to the Bremen beacon	-	-	-	1 51
5. Bremen beacon to the red buoy	-	-	-	1 39
6. red buoy to Wremen	-	-	-	1 9
7. Wremen to Bremer Haven	-	-	-	0 65
8. Bremer Haven to Grossensiel	-	-	-	0 45

**Zweyburg.**

1. From sea to Zweyburg	-	-	-	thal. gr.
2. the first to the fourth buoy	-	-	-	2 24
3. fourth to the seventh buoy	-	-	-	1 60
4. seventh buoy to the Bremen beacon	-	-	-	1 48
5. Bremen beacon to the red buoy	-	-	-	1 38
6. red buoy to Wremen	-	-	-	1 18
7. Wremen to Bremer Haven	-	-	-	1 0
8. Bremer Haven to Zweyburg	-	-	-	0 54

**Brake.**

1. From sea to Brake	-	-	-	thal. gr.
2. the first to the fourth buoy	-	-	-	2 35
3. fourth to the seventh buoy	-	-	-	2 15
4. seventh buoy to the Bremen beacon	-	-	-	1 69
5. Bremen beacon to the red buoy	-	-	-	1 57
6. red buoy to Wremen	-	-	-	1 47
7. Wremen to Bremer Haven	-	-	-	1 9
8. Bremer Haven to Brake	-	-	-	0 65

C. During the winter months, from November 16 to February 15, inclusive:—

**Bremer Haven.**

1. From sea to Bremer Haven	-	-	-	thal. gr.
2. the first to the fourth buoy	-	-	-	2 28
3. fourth to the seventh buoy	-	-	-	2 4
4. seventh buoy to the Bremen beacon	-	-	-	1 60
5. Bremen beacon to the red buoy	-	-	-	1 36
6. red buoy to Wremen	-	-	-	1 20
7. Wremen to Bremer Haven	-	-	-	0 69
8. Bremer Haven to Grossensiel	-	-	-	0 41

**Zweyburg.**

1. From sea to Zweyburg	-	-	-	thal. gr.
2. the first to the fourth buoy	-	-	-	2 61
3. fourth to the seventh buoy	-	-	-	2 37
4. seventh buoy to the Bremen beacon	-	-	-	2 13
5. Bremen beacon to the red buoy	-	-	-	2 69
6. red buoy to Wremen	-	-	-	1 45
7. Wremen to Bremer Haven	-	-	-	1 29
8. Bremer Haven to Zweyburg	-	-	-	1 54

**Brake.**

1. From sea to Brake	-	-	-	thal. gr.
2. the first to the fourth buoy	-	-	-	3 0
3. fourth to the seventh buoy	-	-	-	2 48
4. seventh buoy to the Bremen beacon	-	-	-	2 24
5. Bremen beacon to the red buoy	-	-	-	2 8
6. red buoy to Wremen	-	-	-	1 56
7. Wremen to Bremer Haven	-	-	-	1 40
8. Bremer Haven to Brake	-	-	-	1 16

The places named from Nov. 1 to 8 p.m. out of the commencement and the end of the divisions or stations, for which, the adjoining river is to be paid, whether the vessel went on board at the commencement or at the end of the space so designated.

**Tares.**—The usual tares are, on sugar in casks and Brazil chests, 17 per cent.; on Havannah boxes, 70 lbs.; Maryland tobacco, 90 lbs. per hog-head; ditto Virginia and Kentucky, 110 lbs. per hog-head; cotton, round bales, 4 per cent.; square ditto, 6 per cent.; tea (green), 20 lbs. per quarter chest, equal to the modern English chest; ditto (black), 22 lbs. per quarter chest. Most other articles, such as East India indigo, rice, coffee, spices &c. real tare. (Drawn up from the communications of Bremen merchants and Consular Reports.)

**BRIBE.** Any person giving or offering a bribe, recompense, or reward, to any officer of the customs, to induce him to neglect his duty, to forfeit 200*l.* (3 & 4 Wm. IV. c. 53 s. 38).

**BRICKS AND TILES.** Well-known articles used in the building and covering of houses. They are made of baked clay and sand.

Until 1833 an excise duty was charged both on bricks and tiles (the latter being then exempted

from the duty), so that their manufacture was placed under surveillance. It was ordered by 17 Geo. III. c. 42 that bricks made for sale should be 8½ inches long, 2½ inches thick, and 4 wide; on pain of forfeiting, for bricks of less dimensions when burnt, 20*s.* for every 1,000, and proportionally for a greater or less number. It was also provided that the size of the sieves or screens for sifting or screening sea-coal ashes to be mixed with brick earth in making bricks should not exceed ¼ inch between the meshes.

Bricks being the principal material used in London and in most parts of England in the building of houses, immense quantities are annually produced in that part of the United Kingdom. And notwithstanding the influence of the duty, their consumption in England nearly doubled during the 20 years ending with 1840; the number that paid duty in 1821 having been 899,178,510, whereas in 1840 it amounted to 1,677,811,134, and in 1847 to 2,193,829,491; but they subsequently fell off, the quantity brought to the charge in 1849, the last year of the duty, being only 1,462,767,154. In Scotland, where stone is mostly employed in building, their manufacture is comparatively unimportant. The duty, which produced, in 1849, a nett revenue (inc. Scotland) of 456,452*l.*, had long been felt to be extremely partial, seriously affecting some parts of the country, while it did not touch others. Its defects were set in a still more striking light by the rapidly extending use of tiles, after they had been relieved from the duty in drainage and otherwise. Influenced by these and other considerations, Government proposed and carried the repeal of the duty on bricks in 1850. Perhaps, however, the better plan would have been to have commuted it for an equivalent house-tax. **BRIMSTONE.** [SULPHUR.]

**BRISBANE.** The metropolis of the colony of Queensland. It is situated about 12 miles up the river Brisbane, and being accessible to steamers and coasters is a city of considerable commercial importance. Pop. (1861) 4,225; of the colony, 34,885. The imports from Queensland have risen from 155,673*l.* in 1862 to 341,362*l.* in 1866. The principal, nearly the sole, article is sheep and lamb's wool, of which 3,354,020 lbs. were imported thence into the United Kingdom in 1866; this material being of very good quality. A small amount of cotton, for the production of which the colony is well suited, is also exported. The exports from the United Kingdom to Queensland are cotton, linen and woollen fabrics, iron, hardware, and machinery. They have risen from 210,757*l.* in value (1862) to 561,693*l.* (1866). [COLONIES AND COLONY TRADE.]

**BRISTLES** (Fr. soies; Ger. borsten; Dutch, borstels; Ital. setole; Span. cerdas, setas; Pol. szezeciny; Russ. schtschetina; Lat. sete). The strong glossy hairs growing on the back of the hog and the wild boar.

These are very extensively used by brushmakers, shoemakers, saddlers &c. and form a considerable article of import.

British bristles are not to be had, the old breeds of the pig having died out, and the improved breeds being almost without hair.

Our supplies of bristles are chiefly obtained from Russia, European and Asiatic. The following is a list of the annual exports from St. Petersburg (the chief port of shipment) during the eleven years ending with 1865:—

	Poods		Poods		
1855	-	67,536	1861	-	57,635
1856	-	67,569	1862	-	64,373
1857	-	69,891	1863	-	75,065
1858	-	75,065	1864	-	71,951
1859	-	77,353	1865	-	74,995
1860	-	71,956			

100 poods = 32 cwt. Ogr. 16 lb. English.

The total quantity of bristles imported into the United Kingdom in 1866 was 2,678,565 lbs., valued at 352,223l.

There are various substances used as substitutes for bristles. Amongst these may be mentioned the *agava*, or fibre of the *Agave americana*, stated by the jury of the London Exhibition of 1862 to possess qualities which in some respects render it equal if not superior to hog's bristles. The fibre of the broom corn (*Sorghum vulgare*) is also used, as also that of the Piassava or Bass, which grows in the Brazilian forests on the *Attalea funifera*.

The duty, which varied from 2s. 6d. on rough to 3s. per cwt. on sorted bristles, was repealed in 1845.

**BROKERS.** Persons employed as middlemen to transact business or negotiate bargains between different merchants or individuals. They are sometimes licensed by public authority, and sometimes not.

Brokers are divided into different classes; as bill or exchange brokers, stockbrokers, ship and insurance brokers, pawnbrokers, and brokers simply so called, or those who sell or appraise household furniture distrained for rent. Exclusive, too, of the classes now mentioned, the brokers who negotiate sales of produce between different merchants usually confine themselves to some one department or line of business; and by attending to it exclusively, they acquire a more intimate knowledge of its various details, and of the credit of those engaged in it, than could be looked for on the part of a general merchant; and are consequently able, for the most part, to buy on cheaper and to sell on dearer terms than those less familiar with the business. It is to these circumstances—to a sense of the advantages to be derived from using their intervention in the transaction of business—that the extensive employment of brokers in London and all other large commercial cities is wholly to be ascribed.

The number of brokers in London is unlimited; but by the stat. 8 & 9 Wm. III. c. 20 they are to be licensed by the lord mayor and aldermen, under such restrictions and limitations as they may think fit to enact. By the 57 Geo. III. c. 60 brokers acting without being duly admitted are made liable in a penalty of 100l. The fee on admission is fixed by the same Act at 5l.; and there is besides an annual payment of 5l.

The following are some of the regulations established by the mayor and aldermen pursuant to the Act of Wm. III.: That every person shall, upon his admission, take an oath duly and faithfully to execute and perform the office of broker between party and party, in all things pertaining to the duty of the said office, without fraud or collusion, to the best and utmost of his skill and knowledge; that he shall in all cases reveal the name of his principal; and neither deal in goods on his own account, nor barter and sell again, nor make any gain in goods beyond the usual brokerage; and that he shall regularly register all the contracts &c. into which he enters.

Brokers grant a bond under a penalty of 500l. for the faithful performance of the duties sworn to in the oath of admission.

A medal is delivered to the broker, with his name engraved thereon, which he may produce, if required, as evidence of his qualification.

Twelve persons professing the Jewish religion are permitted to act as brokers within the City under the same regulations, and receive the silver medal accordingly. This medal is transferable, and is sold generally at from 800l. to 1,500l. exclusive of the expense of transfer, which is uncertain. Upon the decease of any of the holders

of the medal without its having been transferred, the appointment falls to the lord mayor for the time being; and for it the sum of 1,500l. has not unfrequently been given. (*Montefiore's Com. Dict. art. 'Brokers.'*)

If goods in the city of London be sold by a broker, to be paid for by a bill of exchange, the vendor has a right, *within a reasonable time*, if he be not satisfied with the sufficiency of the purchaser, to annul the contract, provided he intimate his dissent as soon as he has an opportunity of enquiring into the solvency of the purchaser. In a case of this sort (*Hougon v. Davies*, 2 Camp. N. P. C. 536), Lord Ellenborough was, at first, rather inclined to think that the contract concluded by a broker must be absolute, unless his authority were limited by writing, of which the purchaser had notice. But the special jury said, that 'unless the name of the purchaser has been previously communicated to the seller, if the payment is to be by bill, the seller is always understood to reserve to himself the power of disapproving of the sufficiency of the purchaser, and annulling the contract.' Lord Ellenborough allowed that this usage was reasonable and valid; but he clearly thought that the rejection must be intimated as soon as the seller has had time to enquire into the solvency of the purchaser. The jury found in the case in question, that five days was not too long a period for making the necessary enquiries.

**Brokers, Bill.**—propose and conclude bargains between merchants and others in matters of bills and exchange. They make it their business to know the state of the exchange, and the circumstances likely to elevate or depress it. They sell bills for those *drawing* on foreign countries, and buy bills for those *remitting* to them; and from their knowledge of the mutual wants of the one class as compared with those of the other, a few of the principal brokers are able to fix the rate of exchange at a fair average, which it would not be possible to do if the merchants directly transacted with each other. Their charge, as brokerage, is 2s. per cent.

'Those,' says Mr. Windham Beawes, 'who exercise the function of bill brokers, ought to be men of honour and capable of their business; and the more so, as both the credit and fortune of those who employ them may, in some measure, be said to be in their hands; and, therefore, they should avoid babbling, and be prudent in their office, which consists in one sole point, that is, *to hear all and say nothing*; so that they ought never to speak of the negotiations transacted by means of their intervention, or relate any ill report which they may have heard against a drawer, nor offer his bills to those who have spread it.'

**Brokers, Stock.**—are employed to buy and sell stock in the public funds or in the funds of joint stock companies. Their business is regulated by certain Acts of Parliament, by which, among other things, it is enacted, that contracts in the nature of wagers, or contracts apparently framed for the sale or purchase of stock, but really intended only to enable the parties to speculate on contingent fluctuations of the market, without any stock being actually sold, shall be void, and those engaging in them subjected to a penalty of 500l. (7 Geo. II. c. 8, made perpetual by 10 Geo. II. c. 8.) And by the same Act, anyone contracting to sell stock of which he is not actually possessed, or to which he is not entitled, forfeits 500l. Brokers not keeping a book in which all contracts are regularly inserted, are liable in a penalty of 50l. for each omission; half to the King and half to those who sue for it. The charge for brokerage on all public funds, except Exchequer

bills and India bonds it is 1s. per cent. the purchase and sale can be concluded licensed broker, in

**Brokers, Ship.**—employment of this class and selling of ships and adjusting the terms with the master for &c. Their charge is 1 per cent. on the gross insurance brokers, a premium, exclusive on settling with the broker looks to the broker tract and a proper him also the under candid disclosure affecting the risk, premiums. From the ment, ship and insurance indeed generally are honour, in whom full a ship broker is not the regulation and tions n. Rule, C. P. J.

**Brokers, Custom-h.**—Customs Consolidation that no person shall agent for transacting house in the port of trace or clearance authorised by license Customs, who are to for 1,000l. for the fait and his clerks. This r apply to the clerk of persons transacting bu on his or their account.

**Brokers, Pawn.** [P] **Brokers,** simply so c appraisers and sellers a are regulated by 57 G that no such person m where the sum due do more than the followin

**BROKERAGE.** The  
age, paid to brokers on  
bills, funds, goods &c. [P]  
**BRONZE** (Ger. stück,  
stückgoed; Ital. bronzo;

bills and India bonds, is 2s. 6d. per cent.; on these it is 1s. per cent. No transaction with respect to the purchase and sale of stock in the public funds can be concluded except by the intervention of a licensed broker, unless by the parties themselves.

**Brokers, Ship and Insurance.**—The chief employment of this class of brokers is in the buying and selling of ships, in procuring cargoes on freight and adjusting the terms of charter-parties, settling with the master for his salary and disbursements &c. Their charge as ship brokers is about 2 per cent. on the gross receipts. When they act as insurance brokers, they charge 5 per cent. on the premium, exclusive of a discount allowed them on settling with the underwriter. The merchant looks to the broker for the regularity of the contract and a proper selection of underwriters. To him also the underwriters look for a fair and candid disclosure of all material circumstances affecting the risk, and for payment of their premiums. From the importance of their employment, ship and insurance brokers ought to be, and indeed generally are, persons of respectability and honour, in whom full confidence may be reposed. A ship broker is not within the various Acts for the regulation and admission of brokers. (Gibbons v. Rule, C.P. June 27, 1827.)

**Brokers, Custom-house.**—It is enacted by the Customs Consolidation Act of 1853, ss. 15-17, that no person shall be authorised to act as an agent for transacting business at the Custom-house in the port of London, relative to the entrance or clearance of any ship &c. unless authorised by license of the Commissioners of Customs, who are to require bond with one surety for 1,000l. for the faithful conduct of such person and his clerks. This regulation does not, however, apply to the clerk or servant of any person or persons transacting business at the Custom-house on his or their account.

**Brokers, Pawn.** [PAWNBROKERS.]

**Brokers,** simply so called, in their character of appraisers and sellers of goods distrained for rent, are regulated by 57 Geo. III. c. 93, which enacts that no such person making any distress for rent where the sum due does not exceed 20l. shall take more than the following sums: viz.

For levying	4	d.
For men keeping possession, per day	3	0
Advertisements, if any	2	0
Catalogues, sales, commission &c. in the pound on the nett produce	10	0
Stamp duty, lawful amount.	1	0

Appraisements, whether by one broker or more, 6d. per pound on the value of the goods, under a penalty of treble the amount of the money unlawfully taken, with costs, to be recovered summarily before a justice of the peace.

In France the brokers who deal in money, exchange, merchandise, insurance, and stock, are called *agents de change*, and their number at Paris is limited to sixty. The company of *agents de change* is directed by a chamber of syndics (*chambre syndicale*) chosen annually by the company. They are severally obliged to give bonds to the amount of 125,000 fr. for the prevention of abuses. They are also obliged to keep books; are restricted to a charge of from  $\frac{1}{4}$  to  $\frac{1}{2}$  per cent.; and are interdicted from carrying on, or having any interest in, any commercial or banking operations. (*Code de Commerce*, s. 74 &c.) [BORDEAUX.]

In the United States, brokers are not licensed, nor do they give bonds.

**BROKERAGE.** The commission, or percentage, paid to brokers on the sale or purchase of bills, funds, goods &c. [FACTORAGE.]

**BRONZE** (Ger. *stuekgut*, *stuekmetail*; Dutch, *stuekgood*; Ital. *bronz*; Span. *metal de canones*;

Lat. *metallum tormentorum*). 'A mixed metal, consisting chiefly of copper, with a small proportion of tin, and sometimes other metals. It is used for casting statues, cannon, bells, and other articles, in all of which the proportions of the ingredients vary.' (Hunt's *Ure*.)

**BROOMS** (Ger. *besen*; Fr. *balais*; Ital. *scope*, *granate*; Span. *escobas*; Russ. *metli*). They are principally made of birch or heath. Vast quantities are manufactured in Southwark, for the supply of the London market.

**BRUSHES** (Ger. *bürsten*; Fr. *brosses*; Ital. *setole*, *spazzole*; Span. *brozas*, *cepillos*, *escobillas*; Russ. *schtschetki*). Well-known implements, made of bristles, and manufactured of various forms. Our exports of brooms and brushes in 1866 were valued at 49,201l. [BRISTLES.]

**BUBBLES.** A familiar name applied generally to fraudulent or unsubstantial commercial projects which hold out hopes of rapid gain, for the purpose of enriching the projectors at the expense of sanguine and ignorant adventurers; and particularly used to designate those projects the funds for which are raised by the sale of shares or subscription to a transferable stock.

In consequence of the mischief produced by the gambling in transferable shares of hubble companies at the time of the South Sea project, 1719 and 1720, the stat. 6 Geo. I. c. 18, reciting that several undertakings or projects had been contrived and practised which 'manifestly tended to the common grievance, prejudice, and inconvenience of great numbers of his Majesty's subjects in their trade and commerce,' and describing, among other practices of the time, the ordinary mode of raising money by shares and subscriptions to a pretended transferable stock, enacted that the undertakings and attempts so described, and public subscriptions, assignments, and transfers for furthering them, and particularly the raising or pretending to raise transferable stocks without authority of charter or Act of Parliament, should be deemed illegal and void, and prohibited them under severe penalties. Some decisions limited the operation of, and finally the stat. 6 Geo. IV. c. 91 altogether repealed, these enactments and prohibitions. The projectors of bubbles, therefore, are now punishable only when they can be deemed guilty of frauds or conspiracies at common law; and there is no other check on the adventurers than the loss and troublesome liabilities, under the law of partnership, in which participation in these projects often involves them.

**BUCHU LEAVES.** The leaves of the *Barosma ercna* and of other species of *Barosma*, small shrubs growing at the Cape of Good Hope. They have long been used by the Hottentots for a variety of diseases, and have been made known in Europe through the English and Dutch physicians resident at the Cape. They are employed in Europe principally in diseases of the urinary organs. Prices in London market October 1866,  $3\frac{1}{2}$ l. to 6d. per lb. for broad leaves, long narrow do. 9d. to 1s. per lb.

**BUCKWHEAT** (Fr. *blé sarrasin*, *blé noir*; Ger. *buchweizen*, *heidekorn*; Ital. *grano saraceno*, *faggina*, *frina*; Span. *trigo saraceno*, *trigo negro*; Pol. *tatarca*, *gryka*, *polanica*; Russ. *gretschn*; Lat. *fagopyrum*). It is principally cultivated in order that it may be cut when young and green, and employed as fodder for cattle; when allowed to ripen, the grain is usually employed to feed pigeons and poultry.

When ripe it is of a deep yellow colour, the seeds bearing a great resemblance to beech-mast. It will grow on the poorest soils. Buckwheat has been cultivated in this country from the latter part of the sixteenth century. Its native country

is unknown, but supposed to be Asia. Beckmann has a very learned dissertation on its introduction and early culture in Europe. (*History of Inventions*, vol. i. art. 'Buckwheat.') The imports of buckwheat are comparatively inconsiderable. The duty on it and on buckwheat meal is the same as on other sorts of corn or meal. [CORN LAWS.]

Buckwheat is largely produced in the United States. In 1840 the production was 7,291,743 bushels, in 1850 8,956,912 bushels, and in 1860 17,571,818 bushels, showing a larger increase than any other grain crop. The states in which the largest quantity is grown are New York, Pennsylvania, and Ohio.

BUENOS AYRES. This city, the capital of the province of the same name, was founded in 1535, and stands on the right bank at the head of the estuary of the Rio de la Plata, on a vast plain which is here about 35 or 40 feet above the sea, and which extends westward to the Andes. The level uniformity of its outline is only broken by the spires of various churches. The streets are regular and straight, intersecting each other at distances of about 150 yards, forming squares like a chessboard. The houses have never more than two storeys, and commonly only one. The Argentine Confederation contains the tract of South America comprised within the 22nd and 42nd degrees of latitude, and the 59th and 72nd of longitude, the area being 75,000 square leagues, or 675,000 geographical miles; the regions being that which lies within the great rivers Parana and Uruguay, the Pampas, and the mountainous districts of the Southern Andes. The political divisions of the Argentine Confederation comprise fourteen provinces—those of Buenos Ayres, Santa Fé, Entre Rios, and Corrientes on the coast; those of San Luis, Mendoza, and San Juan on the west, and at the base of the Chilean Andes; those of Cordova, Rioja, and Santiago del Estero in the centre; and Tucuman, Catamarca, Salta, and Jujuy in the north.

The rivers Parana and Uruguay join to form the Plata, and drain an area of 170,000 square leagues. The Plata is 8 leagues broad at the junction of the streams Parana and Uruguay, and after a course of 35 leagues the river is emptied into the ocean between the capes of St. Maria and St. Antonio, where its breadth is 70 leagues—the widest embouchure in the world. (Martin de Moussy, *Confédération Argentine*, 1860.) But the course of the river is encumbered with sandbanks, which shift from time to time and cause great difficulties to navigation. Hence it becomes necessary to employ pilots to Buenos Ayres and Montevideo, the capital of the Uruguayan Republic. Considerable danger arises also from the prevalence of gusty winds called *pamperos*, which are said to occasionally cause a rise in the water to the extent of a fathom.

The total population of the Argentine Confederation was estimated by De Moussy at 1,210,000. Of these, 83,250 were inhabitants of Buenos Ayres, 11,905 of Rosario, the two ports of the Confederation. One-third of the inhabitants of Buenos Ayres were Europeans, chiefly English and French. Mr. Clare Ford, secretary of the British Legation, states the population of the Republic in 1866 to be 1,465,000. At present (1868), judging from its past growth, it may amount to about 1,500,000.

From San Miguel tower, 68 feet high, a little westward of the cathedral, the true bearing of the north Cerro de San Juan on the Banda Oriental coast is N. 39° 41' 34" E. There are two wharves or piers, from 220 to 330 feet in length—the first near the church of La Merced, for passengers;

the second in front of the custom-house, for merchandise—but they are not long enough, and inconvenient when the river is low from N.W. winds.

*Trade of Buenos Ayres.*—Buenos Ayres has a considerable trade. Its imports are manufactured goods, cottons, earthenware, gunpowder, hardwares and cutlery, iron, leather, linens, oil, linseed, woollens &c.; and the exports are, wool, bones, copper unwrought, grease, horsehair, hides, horns, skins of various kinds, salt meat, tallow, tobacco &c. All kinds of supplies, including coal, but excepting meat, are at a very high price. Corn, which for a considerable period was not produced in sufficient quantity for home consumption, has latterly become an occasional article of export. Most part of the jerked beef, and numbers of mules, are exported to the Havannah and Brazil, and a growing quantity of River Plate beef to Europe. Hides, tallow, and wool, especially the first, are leading articles of export. Sir W. Parish estimated the total amount of the imports into the La Plata at about 2,110,000*l.*, of which about half might be for Buenos Ayres; but the trade is now much greater. Mr. Ford, in his excellent Report to the Foreign Office of Oct. 30, 1866, gives the following Tables:—

*Comparative Statement of Goods imported into Buenos Ayres during the Years 1864–65.*

	1864		1865	
	£	d.	£	d.
1. Different tissues; principally woollen and calicoes	1,002,915	4 0	1,412,739	12 0
2. Estates; principally sugar, yerba maté, and rice	1,074,885	8 0	937,776	8 0
3. Divers fabricated articles; principally haberdashery, perfumery, and ready-made clothes	656,641	16 0	873,895	8 0
4. Drinkables; principally red wines and gin	628,236	16 0	813,172	4 0
5. Materials for industrial purposes; principally coal, iron, and wood	485,191	4 0	649,897	12 0
6. Groceries; principally tobacco, packing paper, and kerosene	275,947	0 0	345,969	12 0
7. Articles used for shipping; ironmongery and paint	217,846	12 0	315,417	4 0
8. Writing materials, paper &c.	28,467	8 0	52,235	8 0
Total	4,370,134	8 0	5,420,603	8 0

\* \* \* Increase of 24 per cent. in 1865 over 1864.

*Statement of the Quantities and Values of each of the main Articles of Argentine Native Produce exported from Buenos Ayres in 1865.*

Articles	Quantities	Values
		£
Wool	115,842,430 lbs.	2,374,251
Hides, ox and cow	1,690,763 lbs.	934,266
Grease and tallow	28,822,799 lbs.	305,152
Sheep skins	17,265,333 lbs.	214,868
Salt meat	45,699,800 lbs.	138,792
Horsehair	3,296,127 lbs.	85,799
Horse hides	151,588 lbs.	43,337
Ostrich feathers	135,730 lbs.	38,498
Bone ash	6,989 tons	13,761
Hide cuttings	1,678,300 lbs.	5,933
Bones	9,217 tons	6,215
Shin and shank bones	4,808,400 lbs.	4,875
Giter skins	52,037 lbs.	3,884
Tips of horns	1,210,000 lbs.	3,230
Deer skins	91,058 lbs.	2,187
Shunk skins (unborn animals)	109,579 lbs.	1,599
Breeding rams	4,756	1,255
Hoofts, salted tongues, animal oil, titer and other skins, tags, and soap	—	20,122
Miscellaneous	—	88,793
Total	—	4,439,355

The value of our exports to the Argentine Confederation in 1866 was 2,880,787*l.*, cottons being by much the most important article, and next to it woollens, iron &c. France supplies silks, wines (of which the imports have largely increased), jewellery, perfumery &c. The imports from the United States consist chiefly of unbleached cloths, spirits, soap, sperm candles,

dried and sund deals. Goods, brandy, cigars, crockery, corlidge, canvas, trade is produce, partic oil, maccaroni, goods are in handkerchiefs, are imported, ed in 1865 was yerba maté, or article of some superseded, ever chiefly obtained Chili and Peru well supplied with vegetables, the butter used these details fit Woodbine Paris 349–369; the Re chargé d'affaires, Plate, by Wittrich

dried and salted provisions, tobacco, furniture, and deals. Germany sends woollen and cotton goods, brandy and gin; Holland, sugar, gin, brandy, cigars, cheese &c.; Belgium, ironmongery, crockery &c. The Baltic furnishes iron, cordage, canvas, pitch, deals &c. The Mediterranean trade is principally in Spanish and Italian produce, particularly cheap wines, brandies, olive oil, macaroni, dried fruits, and pepper. Spanish goods are in little demand, though some serges, handkerchiefs, and ribands, sewing silk, and salt, are imported. The value of Spanish wines imported in 1865 was alone upwards of 180,000. The *yerba maté*, or Paraguay tea, formerly an import article of some consequence, has been nearly superseded, even in Buenos Ayres, by genuine tea, chiefly obtained from India. The trade with Chili and Peru is insignificant. The markets are well supplied with butcher's meat and fish. Poultry, vegetables, and fruit are generally dear. All the butter used is imported. (We have derived these details from the excellent work of Sir Woodbine Parish *On Buenos Ayres*, 2nd ed. pp. 349-369; the *Report of Mr. Francis Clare Ford*, late chargé d'affaires, 1866; and *The States of the River Plate*, by Wilfrid Latham, 2nd ed. 1868.)

*Light*.—At  $4\frac{1}{2}$  miles N.E. by E.  $\frac{1}{2}$  E. from the custom-house at Buenos Ayres is a bulk or stationary guard-ship, painted black, with three masts, which shows a *fixed red light*, visible 6 miles.

*Outer Road*.—There are two anchorages in front of Buenos Ayres, formed by the city bank and that of the Camaron, an extension or tongue of the great Palmas flat. Both are anchorages exposed to the winds from S.E. to E.N.E., which often bring in a heavy ground swell; vessels frequently drag, foul each other, and sometimes go on shore. It is necessary to have good ground tacking, to be cautious not to ground on the anchors, and to give a berth to the buoys of vessels in the road to prevent grazing on their anchors. The bottom is a fine dark sand; within the 12 feet line of soundings it is generally hard, and to 15 feet hard and soft; beyond 15 it is mostly soft muddy sand. There are always a large number of vessels lying here.

There are several dangerous sunken vessels in the roads; two nearly close together, showing at low water, lie in the outer road in line with the Catalina channel, and one farther in, and are marked by beacons. The great or outer road northward of the city bank, at about  $3\frac{1}{2}$  miles from the shore, is from 3 to 4 miles in length in a north-west and south-east direction, and from  $\frac{1}{2}$  to  $\frac{3}{4}$  mile in breadth, with depths of 18 to 21 feet over soft mud. At the entrance to this anchorage there is a bar or flat with only 15 feet water on it at the mean level of the river, and at times not more than 12 feet, which obliges vessels of moderate draught to anchor at 6 or 7 miles from the town in 17 feet water, with the Residencia in the southern part of the city bearing S.W. by W.

The domes of the churches and the vessels at anchor in the outer road are seen at a distance of 10 or 11 miles. The bottom on the city bank or that southward of the outer road being hard, it is necessary to keep a little to the northward. Having passed the bar, the soundings slowly increase, and the bottom becomes softer; when in 17 feet water, soft mud, steer to the westward, and anchor in about 20 feet, with the guard-ship bearing S.E. by E.  $\frac{1}{2}$  E., distant  $2\frac{1}{2}$  miles; La Residencia S. by W.  $\frac{1}{2}$  W.; the Custom-house S.S.W.  $\frac{1}{2}$  W.; and the church of La Recoleta, north-west of the town, S.W.  $\frac{1}{2}$  W. A good

berth will also be found near the sunken vessels, where the water is deepest and the position convenient for boats. It is not usual to moor in the outer roads, but to veer a long scope of cable, and be ready to drop a second anchor with south-easterly winds.

*Inner Road*.—The inner or little road off the north-east angle of the city is a space of about  $1\frac{1}{2}$  mile in length, in a N.N.W. and S.S.E. direction, and about 3 cables in breadth, having 12 and 13 feet water. It is formed between the city bank and the coast: the latter is bordered with a bank of rotten stone. To the northward of the inner road is the anchorage El Pozo, having about a foot more water. Vessels in the Pozo and inner road always moor N.E. and S.W., and great attention should be given to prevent grounding on the anchors, for frequently there are only 8 or 10 feet water, and vessels are often aground and unable to go to sea for 15 or 20 days. A large number of vessels are always here. But as the banks are constantly shifting, it is necessary when going into the inner road to employ a pilot, and particularly for the purpose of choosing a clear berth, and avoiding the many lost anchors in the roads.

*Winds*.—During summer, between August and March, the winds are from the eastward. In April, May, June, and July, the weather is variable. The barometer always rises with a S.E. wind, which brings clear dry weather; falls for a pampero or S.W. wind, but falls lowest with the wind from N. to W., which brings cloudy, rainy weather. It may be fine weather at sunset, and 2 hours after blowing a gale, but the barometer is sure to indicate it.

*Tides*.—It is high-water at Buenos Ayres, full and change, at about 12 h.; and the rise may be from 3 to 5 feet. The flood runs 5 hours, and the ebb 7 hours, at from 1 to 2 miles an hour. The winds from the S.E. cause the water to rise, and those from the N.W. depress it, and in some places cause a difference of 12 feet. A case has occurred when the wind from the N.W. has so depressed the water, that a person was able to walk dry to the vessels anchored in the inner road.

*Rio Riachuel*.—At about a mile southward of the town is the little river Riachuel, with 13 to 16 feet at low tides, over soft mud, which serves as a port of commerce to Buenos Ayres. This river being the deepest on the south coast, was the cause of the town being placed on the neighbouring plain. Its mouth is obstructed by banks, so that vessels drawing less than 10 feet alone can enter when the water is high from the S.E. winds, 3 feet only being on the bar at low tides. Large numbers of coasters load and unload here.

At high tides vessels of less than 8 feet draught can navigate to the Conchas, where there is an excellent port. In strong winds from the S.E. many vessels leave the roads of Buenos Ayres to seek shelter there, but it is necessary to have a good pilot, as all this western part of the La Plata is obstructed by the great flat and bank of Las Palmas, on which near the coast the depths are irregular, the channel winding, and subject to frequent changes. There are in places 13 or 14 feet water, but the deepest is in front of the shore forming Olivos Point, where there are from 12 to 17 feet.

Above Las Conchas the shore is broken by a great number of little rivers, outlets from the Parana. At 25 miles N.N.E. of Las Conchas is the mouth of the Great Parana. The latter is the only one vessels of any size can enter.

Next in importance to Buenos Ayres come the Argentine ports of Rosario, Corrientes, Uruguay, San Nicolas, and Gualaguaychú. In 1866 there were 326 miles of Argentine Railways open to traffic.

**Money.**—The currency of Buenos Ayres was formerly an irredeemable paper money, issued by a bank, under authority of special laws passed from time to time, and was by law legal tender. This paper money, having no specie basis, was afflicted in value, as compared with gold, by over issues and by politics, and has fluctuated 50 per cent. in one day; but by a new Currency Law, January 4, 1867, the Provincial Bank of the State of Buenos Ayres is authorised to pay 25 paper dols. for every patacon, and also to give 1 patacon for every 25 dols. (paper). If paper money should exceed 25 per patacon, and the bank has paid away the specie received in exchange for the amount of the present emission, the bank shall still continue to give gold at 25 p. d. per patacon as long as sufficient coin exists. Parties indebted to the bank or state may pay in gold or paper money at the rate of 25 dols. per patacon. In 1865 the revenue of the Argentine Republic amounted to 1,659,014L, and the expenditure to 1,375,233L. Official financial accounts are made up in hard dollars, one of these being about equal to 4s.

The following are the statistics of the shipping and trade of Buenos Ayres:—

**Number and Tonnage of Sailing Vessels Entered and Cleared at the Port of Buenos Ayres in each of the Years 1861-65.**

Years	With Cargoes			
	Entered		Cleared out	
	Ships	Tons	Ships	Tons

which, in virtue of existing treaties, are assimilated to national vessels.

3. Foreign vessels pay, for visit of health officer, 25 dols. and the same amount for bill of health.

4. Foreign vessels belonging to nations having no consul, 40 dols. for do.

5. The duties to be paid one half on entrance and the other on departure.

6. National and foreign vessels, which do not leave nor receive cargoes, pay one-half of these duties.

**Customs Duties: Imports by Water.**—1. Gold and silver, coined or in bullion, books, printing-paper, plants of all kinds, fresh fruits, ice, fire-wood, charcoal, and cattle for breeding are free of duty, as also maize (Indian corn) and flour of maize imported by land.

2. The Executive Power may admit free, seeds destined for agriculture, articles exclusively de-

tinued to religion, instruments or utensils for scientific purposes, machines for the amalgamation of metals, and the formation of new fabrics or industries, the furniture and tools of immigrants, and things exclusively destined to their establishment.

3. Unset precious stones, gold and silver worked, or manufactured with or without precious stones, every instrument or utensil with handle or ornament of the same metals, when these shall augment their value one-third, to pay 8 per cent. of their value.

4. All articles not excepted in the previous, 15 per cent.

5. The impost of wharfage for articles of direct despatch to be 5 cents for every 8 arrobas of weight, or its equivalent in bulk.

6. The leakage granted to wines, spirits, liqueurs, beer in casks, and vinegar, to be calculated thus:—at 10 per cent. for the ports situated the other side of the Line, at 6 per cent. for the ports on this side, and 3 per cent. for ports within the Capes. Loss granted to wines, spirits, liqueurs, beer, vinegar, and oil, in bottles, 5 per cent. for breakage.

*Exports by Land and Water.*—7. The following to pay 5 per cent. of their value on exportation:—Horse and cow hides of all kinds, those of mules and sheep, skins in general, jerked and salted beef, hide-cuttings, salt tongues, ostrich feathers, bones, bone-ash, horns, horn-clippings, horsehair, washed and dirty wool, animal oil, tallow, and fluid and solid grease; cattle, horses, and sheep.

8. Every other production or manufacture not expressed in the preceding Article, such as gold and silver, coined or in bullion, is free of all export duty.

*Of Deposit and Transit.*—9. The Custom-houses duly authorised shall admit to deposit every article which is introduced liable to import duty.

10. The deposit to be made at the discretion of the Government, either in Government or private stores, the fiscal not being responsible for losses or damages of merchandise in private deposits; and further, if convenient to the Government, it can oblige the removal of the goods from the private stores to those of the State.

11. In all cases the Executive regulates the deposits in private stores.

12. Merchandise may be in deposit for two years from the entry of the vessel: this time elapsed, their despatch, for consumption or transit, is obligatory, though the deposit may be renewed, after examination of the goods and paying of the warehousing and wharfage.

13. The impost of warehousing and wharfage to be paid on goods in deposit, according to a tariff to be revised yearly.

14. The impost for a month to be paid for goods in deposit for a portion of a month.

15. The fiscal is responsible for the effects deposited in his own warehouses, saving accident beyond control, or injury arising from the inherent nature of the goods or their coverings.

16. The Custom-house to allow the free transit of merchandise in deposit from one port to another.

17. The Custom-house will likewise permit, free of duty, the transshipment of all goods within forty days from the day of entry of the vessel bringing the same, or presenting a copy of the manifest, excepting those for which the copy of the manifest is not necessary, or those which the parties declare, on the entry of the vessel, have only arrived in transit for foreign ports.

*Of the manner of calculating the Duties.*—18. The duties to be arranged by overseers, accompanied by valuers, and to be calculated on imports by their value in deposit, and on exports at their market value at the time of shipment, except

those previously classified and valued, which duties shall be calculated by a tariff of valuation formed upon the same basis of prices.

19. Every six months a valuation to be made of the merchandise and produce to be included in the tariff spoken of in the preceding Article.

20. The merchandise which appears damaged at the time of despatching it shall be valued by the price it obtains in public auction, with the deduction of the corresponding duty, the account of which must be rendered within thirty days from the day of despatch.

21. In case of a difference arising between the overseer, valuator, and the interested party, respecting the valuation of any merchandise or product of the country not included in the tariff of valuation, its despatch shall be put off until the difficulty is overcome; and this not being accomplished within eight days, the Custom-house shall have the right, and may likewise be obliged, to hold the article at the valuation it may see fit to put upon it, paying for it in Treasury bills.

22. From the merchants shall be accepted bills payable at three and six months, when the amount of duty passes 50 dols.; under this sum it shall be paid in ready cash.

23. The duties of exportation shall be paid in ready cash, and at the port of loading, the goods being despatched directly for a foreign port; neither can they be embarked in transit from one point to another of the Republic without their having been despatched by paying the duties, or a security given in the form to be determined by the Executive Power.

*Additional Duties.*—24. All goods and merchandise subject to import duty to pay a duty of 2½ per cent.

25. The produce of the country subject to export duty shall pay an additional duty of 5 per cent.

26. These additional to be collected separately from the ordinary duties.

*Additional Import Duties commencing January 1, 1867.*—Additional impost of 5 per cent. on all imports, excepting such articles as are comprised in Art. 3 of the present Custom-house Law, and 2 per cent. on all exports, payable cash down; to count from 30 days after the promulgation of this law.

**BUFF** (Ger. büffel, büffelhäute; Fr. buffle, peau de buffles, et peaux passées en buffles; Ital. bufalo, cuojo di bufalo). A sort of leather prepared from the skin of the buffalo, dressed with oil, after the manner of chamois. The skin of elks, oxen, and other like animals, when prepared after the same manner as that of the buffalo, is likewise called *buff*. It is used in making sword-belts and other articles where great thickness and firmness are required.

**BUGLES.** Small glass beads of different colours. They are in considerable demand in Africa, to which they are mostly exported.

**BULLION.** Uncoined gold and silver in the mass. [GOLD; PRECIOUS METALS; SILVER.]

**BUOYS.** Pieces of wood, cork, or hollow metallic substance, moored and floating on the water. Those of wood are sometimes solid, and sometimes hollow, like a cask, and strongly hooped; they are made of various shapes and sizes; and are either private or public.

*Private Buoys* are so called from their belonging to private individuals. They are principally employed to mark the place of the ship's anchor, being fastened to it by a rope or chain, so that the men who go in the boat to weigh it may readily find out where it is.

By 1 & 2 Geo. IV. c. 75 s. 11 it is enacted that if any person or persons shall wilfully cut

away, cast adrift, remove, alter, deface, sink, or destroy, or in any way injure or conceal, any buoy, buoy-rope, or mark, belonging to any ship or vessel, or which may be attached to any anchor or cable belonging to any ship or vessel, whether in distress or otherwise, such person or persons so offending shall upon conviction be adjudged guilty of felony, and shall be liable to be transported for any term not exceeding 7 years, or to be imprisoned for any number of years, at the discretion of the court.

**Public Buoys**, being intended for the public service, cannot be placed, altered, or removed, except by competent authority. They are generally of a pretty large size, and are firmly moored by chains or cables to rocks, large stones, anchors &c. By floating on the surface of the water they serve at once to mark the channels through which it is safe to steer, and to point out dangers to be avoided, such as sunken rocks, shoals, wrecks of vessels &c. The places in, and the purposes for which, buoys are exhibited, are always specified in good charts; and as the leading buoys are generally of a pecu-

liar figure or colour, which is also indicated in the chart, the navigator, as soon as he recognises them, shapes his course accordingly. Hence the great importance of having buoys properly placed, and of their being carefully marked in charts.

The 6 Geo. IV. c. 125 s. 91 enacts that every person who shall ride by, make fast to, remove, or wilfully run down or run foul of any vessel placed to exhibit lights, or any buoy or beacon belonging to the corporation of the Trinity House of Deptford Strond, or to any other corporation having authority to place such vessel, buoy, or beacon, shall, besides making good all damage occasioned thereby, forfeit for every such offence any sum not exceeding 50*l*. nor less than 10*l*.

Subjoined is an account specifying the buoys and beacons under the control of the Trinity House, Deptford Strond, with the rates of charges on account of the same on British and foreign ships and the produce of the rates, in each of the under-mentioned years. (Corrected to 1868.)

It would appear, from the Report of the Com-

Coasters	Rates of Charges		Amount collected			Estimate for 1858
	British and Foreign Vessels Overseen, per Ton	1 penny	1850	1851	1852	
For the buoys and beacons in the channels leading to the river Thames and port of London, including loadmanage and pilotage, also including the dues formerly returned under the head of Trinity House duties from stranger's ships.	In the port of London the following rates are payable for the inward passage only: viz.— The rates vary from ½ penny to 1 farthing per ton, according to the description of the vessel's cargo, and the places whence they arrive. Sheerness ½d. per ton The London rates of duty are also received at Gravesend, Rochester, Faversham, Leigh, Maidon, Colchester, Ipswich, Woodbridge, Harwich, and Aithorough, at which they are payable for the inward passage only. Buoys off Yarmouth ½ farthing per ton Buoys and beacons in the river Test ½d. per vessel under 40 tons. Coasters, British and foreign ½d. " on all others. Easter buoys:— Coasters (not stone boats) ½d. per ton per voyage. Stone boats 5s. per vessel per annum. British and foreign ½d. per ton per voyage. Conway buoys 3 farthings per ton, each and every time of passing. Carmarthen buoys 3 farthings per ton, each time of passing. Aberdovey buoys 1 halfpenny per ton. Woodbridge beacon &c. &c.— On all vessels entering the port of Woodbridge:— Under 50 tons 1s. per vessel. 50 and under 100 tons 2s. " " 100 tons and upwards 3s. " "	1 penny	£ s. d.	£ s. d.	£ s. d.	£ s. d.
			15,382 15 11½	14,421 10 0½	14,412 10 1½	15,342 16 0
			3,226 13 1	3,164 9 3½	3,333 6 1½	2,572 2 8
			998 4 0	959 19 8	1,009 4 6	799 10 8
			118 18 11	144 6 9	143 8 6	106 19 0
			22 9 7½	21 2 9½	28 16 7½	25 10 4
			17 16 4½	152 11 6	138 10 7	69 19 0
			30 15 9	26 4 0	26 19 2	23 13 0
			59 12 0	31 19 0	30 16 0	21 13 4
			17,997 6 8	16,918 12 7	19,153 12 5½	14,962 4 0

These rates are subject at this time (1868) to a discount or abatement of 50 per cent., so that practically they are just one-half. The inspection of lights, buoys, and beacons is, by the Merchant Shipping Amendment Act, vested in the General Lighthouse Authorities. [Лодочники.]

missioners on Lights, Buoys, and Beacons, laid before Parliament in 1861, that there were belonging to the United Kingdom 1,109 buoys in position, while of beacons of some magnitude there were 261 in position.

#### BURDEN OF A SHIP. [TONNAGE.]

##### BURGUNDY. [WINE.]

**BURGUNDY PITCH** (Fr. *poix de Bourgogne*, *poix jaune*, *poix blanche*). A resin, the produce of the *Pinus Abies*, or spruce fir. It is obtained by making incisions in the bark down to the wood, whence it flows thickly and languidly, immediately concreting into flakes that adhere firmly to the tree. These being taken off are melted in boiling water, and strained through coarse cloths. It is of a close consistence, rather soft, has a reddish brown colour, and a not unpleasant smell; it is very adhesive. The true Burgundy pitch comes chiefly from the department of the Vosges, and certain hilly regions in the centre and south-east of France. It is asserted that the best is derived from the *Abies picea*, or silver-fir tree. A fictitious

sort is made in England, and found in the shops under the title of *common Burgundy pitch*: it may be distinguished by its friability, want of viscosity and of the odour which characterises the genuine sort. Burgundy pitch is used chiefly in medicine. In 1866, 69,685 cwt. of pitch were imported, valued at 31,900*l*.

A species of Burgundy pitch exudes spontaneously from the Norway spruce fir. This, which undergoes no preparation, is the *resin* or *thus* of the old London Pharmacopoeias. It is imported in the form of tears or small masses packed in casks, each containing from 1 to 2 cwt. It fetches about half the price of that which is strained. (Gray's *Supplement to the Pharmacopoeias*; Thomson's *Dispensatory*.)

**BUSHIEL**. A measure of capacity for dry goods, as grain, fruit, dry pulse &c. containing 4 pecks, or 8 gallons, or ½ quarter.

The Winchester bushel contains 2150·12 cubic inches, while the Imperial bushel contains 2218·192. Hence, to convert Winchester bushels

into Imperial, multiply by 1·030706, or 969·447, or approximately 1000, and if great accuracy be required, multiply by 1·030706, or 969·447.

By 5 Geo. IV. the standard measure of time, fish, potatoes, and things shall be the bushel, and distilled water, and even bottom, side to outside, which the bushel is [WEIGHTS AND MEASURES.]

The standard measure as well for liquids as for heaped measure is 10 lbs. avoirdupois weighed in air at Fahrenheit's thermometer 30 inches; and such standard gallon contains all measures similar, or certain parts of a standard gallon; as, for example, the pint is ½ standard gallon; a peck, and 8 such gallons, such bushels a quantity not measured by heaped measure.

**BUSHIRE** or **ASHIRE** of Persia, in the present coast of the Persian Gulf 50° E. Population by Major Wilson at Ashire is situated at a sandy peninsula on the bay. There is large ships due west distant, in from 25 to 300 tons burden or there to the north, about 6 miles is pretty good westerly gales they their cables, and been about 15 leagues W. immediately to the passage to it is cannot be passed by or 9 feet water, except is a rise of from 8 to 1811 was 40° 43' W. by Captain Ritchie; all the other parts are tremely hot, partial.

The unhealthy season is the *Trade* &c.—Bushire particularly with Calcutta its merchants supply commodities, as also brought from Europe, indigo, sugar, sugar, important; the steel to every other, and is tin is brought from Bushire supplied by Mocha or Gulf. English cotton is the admitted inferior in great esteem in Persia to supersede those from Hindostan; and rapidly extending, an indefinite increase.

Bushire, a good ma-

into Imperial, multiply by the fraction  $\frac{2150 \cdot 42}{2218 \cdot 102}$  or  $\cdot 969447$ , or approximately deduct  $\frac{1}{30}$  and  $\frac{1}{200}$ ; and if great accuracy be required,  $\frac{1}{27000}$  and  $\frac{1}{200000}$  more. To convert prices per Winchester bushel into prices per Imperial bushel, multiply by the fraction  $\frac{218 \cdot 192}{2156 \cdot 42}$ , or  $\cdot 10315157$ .

By 5 Geo. IV. c. 74 s. 7 the bushel shall be the standard measure of capacity for coals, culm, lime, fish, potatoes, or fruit, and all other goods and things commonly sold by heaped measure. The bushel shall contain 80 lbs. avoirdupois of distilled water, being made round, with a plain and even bottom, and being 19 $\frac{1}{2}$  inches from outside to outside. Secs. 7 and 8 direct the mode in which the bushel shall be used for heaped measure. [WEIGHTS AND MEASURES.]

The standard measure of capacity, by this Act, as well for liquids as for dry goods not measured by heaped measure, shall be the gallon, containing 10 lbs. avoirdupois weight of distilled water weighed in air at the temperature of 62° of Fahrenheit's thermometer, the barometer being at 30 inches; and such measure shall be the Imperial standard gallon (containing 277·274 cubic inches), and all measures shall be taken in parts or multiples, or certain proportions, of the said Imperial standard gallon; and the quart shall be the fourth part, and the pint shall be an eighth, of such standard gallon; and 2 such gallons shall be a peck, and 8 such gallons shall be a bushel, and 8 such bushels a quarter of corn or other dry goods not measured by heaped measure.

**BUSHIRE or ABUSHIRE.** A seaport town of Persia, in the province of Fars, on the north-east coast of the Persian Gulf, lat. 29° N., long. 50° 50' E. Population uncertain, but estimated by Major Wilson at from 15,000 to 20,000. Bushire is situated at the northern extremity of a sandy peninsula, to the north and east of which is the bay. There is a convenient anchorage for large ships due west from the town, 3 or 4 miles distant, in from 25 to 28 feet water; but ships of 300 tons burden or thereby lie in the inner roads, to the north, about 6 miles from shore; the anchorage is pretty good; but during violent north-westerly gales they are sometimes obliged to cut their cables, and bear up for Karak, a small island about 15 leagues W.N.W. of Bushire. The water immediately to the east of the town is deep, but the passage to it is obstructed by a bar, which cannot be passed by vessels drawing more than 8 or 9 feet water, except at spring tides, when there is a rise of from 8 to 10 feet. The variation in 1811 was 49 43' W. (*Chart of the Persian Gulf*, by Captain Ritchie, &c.) The climate here, as in all the other parts of the Persian Gulf, is extremely hot, particularly June, July, and August. The unhealthy season is in the fall of the year.

*Trade &c.*—Bushire has a good deal of trade, particularly with Calcutta, Bombay, and Madras. Its merchants supply almost all Persia with Indian commodities, as also with a good many of those brought from Europe. Of the imports from India, indigo, sugar, sugar candy, and spices are the most important; the steel of India is preferred in Persia to every other, and is made into excellent sabres; tin is brought from Banca; and coffee is principally supplied by Mocha and other ports on the Arabian Gulf. English cotton goods, notwithstanding the admitted inferiority of our red dyes—a colour in great esteem in Persia—have already gone far to supersede those that were formerly brought from Hindostan; and the demand for them is rapidly extending, and is susceptible of an almost indefinite increase. Besides those imported at Bushire, a good many are introduced through

Bussorah, and some through Turkey and Russia; the latter by way of the Black Sea, the former of Smyrna and Constantinople. Hitherto, indeed, a considerable part of the cottons imported through the last-mentioned channels have been supplied by Switzerland and Germany—their fabrics having been, in some respects, better fitted than ours for the Turkish and Persian markets; but they seem to have lost this advantage, as our exports of cottons to Turkey are now rapidly increasing. Woollen goods, cutlery, watches &c. sent to India from England are thence exported to Bushire. Imitation shawls, of the proper size and pattern, are said to meet with a fair sale. The exports principally consist of raw silk, Kerman wool, Kerman and Cashmere shawls, carpets, horses, silk goods, dried fruits, wine, grain, copper, turquoises, asafetida, gill-nuts, pearls, and other articles of minor importance. Turkey annually supplies Persia with a very considerable amount of bullion, most part of which is sent to India.

Of the Persian exports, raw silk is the most important. It is produced to some extent in every province; but Gheelan and Mazunderan are those which are most celebrated for its growth. In the former, about 900,000 lbs. are annually raised. Russia is a large consumer of this article. Dried fruits and dates are sent in considerable quantities to India. Horses are largely exported to India both by sea and land; they serve for mounting our Indian cavalry, and for supplying the large private demand that always obtains in Hindostan for this noble animal. Though neither so swift nor so beautiful as those of Arabia, the Persian horses are large, more powerful, and, all things considered, better for cavalry. They are capable of supporting an extraordinary amount of fatigue. Wine of Shiraz enjoys a degree of celebrity to which, judging from the few samples we have seen, it seems but ill entitled. Mr. Fraser says that it is made in so careless a manner, that, in choosing it, not more than 1 bottle in 4 or 5 can be made use of. Persian tobacco and yellow dye berries are highly esteemed; the former enters to a considerable extent into the trade to Turkey as well as to India; the berries bring a very high price in our markets, but the imports hitherto have been inconsiderable. Turquoises, asafetida, and various sorts of drugs, rose water, with other minor articles, form part of the exports. Sheep's and goats' wool is also exported. The best is that of Kerman. The down furnished by the goats of this province is almost as fine as that of the Thibet or shawl goats. Cotton is extensively produced in Persia; the Russians carry away some, but the greater part is used in the country. Grain is sent to Muscat, but not in large quantities. The pearl trade is now principally centred at Muscat. The copper exported from Bushire is principally the produce of the Persian mines, mixed, however, with some Russian copper from Georgia. Of manufactured articles, the principal are carpets of the most beautiful fabric; shawls, partly native and partly brought from Cashmere; velvets, silk goods, gold and silver brocades, and a few other articles. The trade between Persia and Russia by the Caspian Sea is not very considerable. Most part of the paper used in the former is supplied by the latter. The furs of Russia find a ready market in Persia. The Russian provinces on the Caspian derive their supplies of indigo from Persia by way of Bushire.

The entire trade between British India and the Persian Gulf amounts to about 1,500,000 l. a-year. This, however, includes the trade to Muscat and Bussorah as well as to Bushire, and we have no means of discriminating the separate amount of each. Water at Bushire is excessively bad and dear;

but excellent water, and in great abundance, may be had at Karak. The anchorage at this island is safe at all times, and ships may lie close to the beach. Sir John Malcolm suggested that the permanent possession of Karak would be an object of considerable importance; and we are rather inclined to agree with him. It is of no value to the Persians, and there seems little doubt that they would be glad to cede it for a trifling consideration. Its possession would not only enable us to command the navigation of the Persian Gulf, but it would form a depot where goods destined for Bushire, Bussorah &c. might be kept in perfect safety, and in a situation the most convenient, being readily accessible to all sorts of Arabian vessels. A taste for British cottons and woollens is now forming in all the vast countries watered by the Euphrates and the Tigris, or which derive their supplies from the emporia erected on their banks; and it is of the greatest consequence that nothing be omitted that may serve to facilitate the diffusion of this taste, and the means of gratifying it.

**Money.**—Accounts are kept in toman of 50 abasses, or 100 mamoodis. The toman is a Persian gold coin, containing, according to the report of the Bombay mint, from 71.5 to 67 gr. pure metal, being consequently equal to from 12s. 7½d. to 11s. 11d. sterling. The toman of Bussorah is worth about 36s., and that of Gombroon about 24s. These, with Persian and foreign silver coins of all denominations, are found at Bushire; but the rates of the foreign coins are perpetually varying, and the weight of the native coins is also subject to frequent changes.

**Weights and Measures.**—Gold and silver are weighed by the miscal of 2 dwt. 23 7-12 gr. or 3 dwt. very nearly.

The commercial weights vary according to the commodities sold, and the places where they are used. The maund tabree weighs 63 lbs. avoirdupois at the Custom-house, but only 6½ lbs. at the bazaar. This weight is used by dealers in sugar, coffee, copper, and all sorts of drugs. The maund copra is 7½ lbs. at the Custom-house, and from 7½ to 7½ lbs. at the bazaar. Dealers in rice and other articles of provision use this weight. The maund shaw is double the maund tabree, or 13½ lbs. Pearls are weighed by the abbas = 2.25 gr. Troy.

There are various sorts of guz's or cubits. One called the royal guz = 37½ Eng. inches; the common guz is two thirds of the former, or 25 inches.

The Persian league or parasang is  $\frac{1}{20}$  of a degree of the equator, and should, therefore, be equal to 3 miles 3 furlongs and 25 poles English.

The artaba, or principal corn measure, is equivalent to about 2 Winchester quarters.

For further particulars, see Niebuhr, *Voyage en Arabie*, tome ii. p. 75; Kiuneir's *Memoir of the Persian Empire*, p. 70; Fraser's *Travels on the Shores of the Caspian*, Appen. pp. 352-384; *Parl. Paper* No. 735, 2nd Sess. 1832, pp. 632-638; Kelly's *Oriental Metrology*; Thornton's *E. Indian Calculator*; &c.

**BUSS.** A small sen-vessel, used by us and the Dutch in the herring fishery, commonly from 50 to 60 tons burden, and sometimes more. A buss has two small sheds or cabins; one at the prow, and the other at the stern: that at the prow serves for a kitchen. [FISHERY.]

**BUSSORAH or BASRAH.** A city of Arabia, on the western bank of the Shat-el-Arab (the name given to the river formed by the junction of the Tigris and the Euphrates), above 70 miles from its mouth, lat. 30° 30' N., long. 47° 32' E. Population about 60,000, consisting of Arabs, Turks, Persians, Armenians, Jews &c. The houses and streets are mean and filthy. There is a vast area

within the walls, occupied principally by gardens and plantations of date trees, and intersected by canals, on which are numerous small craft.

The bar at the mouth of the Shat-el-Arab has only about 12 feet water, but the channel within is deep, so that ships of 500 tons burden, provided they cross the bar at the springs, may without difficulty ascend the river as far as the city; and both its grand branches may be navigated to a great distance by smaller vessels. Bussorah is the principal inlet on the east, through which Indian and other Eastern products find their way into the Turkish Empire. Its commerce is, therefore, even at present, pretty considerable; and were the rich and extensive countries traversed by the Tigris and the Euphrates occupied by a civilised and industrious people, it would be very great. Its imports from India and Europe are similar to those at BAHREIN; from Persia it imports shaws, pearls from Bahrein &c. and coffee from Mocha. Mr. Vice-Consul Johnston reports that of British and British Indian coasters the unusual number of 27 steamers and 25 sailing vessels of 29,960 total tonnage entered and cleared this port in the year ended March 12, 1867; but the 27 steamers brought only 743 tons of cargo to, and took 369 from Bussorah—1,366 other vessels of 104,814 tons in all, chiefly Turkish and Persian, visited the port. Its exports are principally bullion, pearls, dates, grain, wool, horses, gull nuts, and drugs. In 1866-67 the value of the exports paying customs' duties in Bussorah, and exclusive of those on which duties were levied in the interior, was 81,762L, of which dates formed  $\frac{2}{3}$ . The value of the imports from British India and the United Kingdom was 269,613L, and of those from Persia and the Persian Gulf ports 55,822L. The commerce with the interior is conducted by means of caravans to Aleppo and Bagdad; but it might be carried on to much more advantage by means of steam-boats. It was at one time proposed to forward mails from India by steam by the Shat-el-Arab and the Euphrates to Bir, thence by land to Scanderoon, and again by steam to Gibraltar and England; but this project was very wisely given up in favour of the route by the Red Sea.

**Money.**—Though the Persian keran is now almost the only coin in circulation, purchases and sales continue to be effected exclusively in shamis, the keran and other coins being accepted at the rate of the day when payments fall due. Notwithstanding this, the demand for shamis does not appear to lessen.

Coins	1866-67
Shamis per 100 German Crowns	216
Shamis per 100 Persian Kerans	41
Shamis per 100 Rupees	102
Grand Signor Piastres per Shami	10½
Grand Signor Piastres per £ sterling	110

**Weights and Measures.**—Gold and silver are weighed by the *cheki* of 100 miscals, or 7,200 Eng. grains.

The commercial weights are the *maund atteree*, the *maund sofy* or *sesse*, and the *she* of Bagdad. 1 *yakia* = 19 oz. avoirdupois; 2½ *yakias* = 1 oke of Bagdad = 4½ oz. avoirdupois; 1 *maund atteree* = 28 lbs. 8 oz. avoirdupois; 1 *maund sofy* = 90 lbs. 4 oz. avoirdupois; 1 *utra* of indigo = 138 lbs. 15 oz. avoirdupois.

These are the weights used by the Europeans settled at Bussorah; those used by the Arabians differ a little from the above, and frequently also among themselves—a circumstance to which the merchant must pay particular attention.

The long measures are the Aleppo yard for silks and woollens = 2 feet 2¼ inches; the Hadded do. for cottons and linens = 2 feet 10½ inches; the Bagdad do. for all purposes = 2 feet 7½ inches.

For further details as to the commerce of Bussorah,

see the *memoir on the Oriental Metrology*, p. 424.

BUTTE. A vessel or measure for wine, containing 2 hogsheds, or 126 wls. gallons.

BUTTER (Dan. smør; Dutch, boter; Fr. beurre; Ger. butter; Ital. burro, butiro; Lat. butyrum; Pol. maslo; Port. manteiga; Russ. maslo korowe; Span. manteca; Swed. smör). A fat, unctuous, and, in temperate climates, a pretty firm substance, obtained from milk, or rather from cream, by the process of churning.

The various circumstances attending the introduction and use of butter in antiquity have been investigated by Beckmann with great learning and industry. The conclusion at which he arrives is, that butter was not used either by the Greeks or Romans in cooking or the preparation of food, nor was it brought upon their tables by way of dessert, as is everywhere customary at present. We never find it mentioned by Galen and others as a food, though they have spoken of it as applicable to other purposes. No notice is taken of it by Apicius; nor is there any thing said of it in that respect by the authors who treat of agriculture, though they have given us very particular information with respect to milk, cheese, and oil. This, as has been remarked by others, may be easily accounted for, by the ancients having accustomed themselves to the use of good oil; and in the like manner butter is very little employed at present in Italy, Spain, Portugal, and the southern parts of France. (*History of Inventions*, vol. ii. p. 413. Eng. ed.)

Beckmann has further shown that the little butter that was used by the ancients was in an oily or liquid state; and such is its usual state in all hot countries. It is rather singular that he does not allude to the consumption of butter by the Arabs, by whom it has been very extensively used from a remote period.

Arab cookery is extremely *friant*, more so than even the Italian; but no oil is used for culinary purposes, except in frying fish. Butter is their universal sauce, and of it the consumption is immense; their vegetable dishes float in butter; with it they work their *adjoue* (paste made of dates) into a proper consistency; dried corn, or bread crumbs, boiled in butter, is a common breakfast with all classes; and in the desert, the *hemmayes* are prepared for use in the same manner. Arab butter is made from the milk of sheep and goats, that of camels not being used for that purpose. The home supply is not nearly sufficient for the consumption, and butter consequently forms an important article of importation. (*Geographical Dictionary*, ed. 1811, art. 'Arabia.')

Butter is very extensively used in this and most other northern countries; that of England and Holland is reckoned the best. In London, the butters of Epping, Cambridge, and Yorkshire, once so famous, are all but entirely superseded, Aylesbury, Dorset, and Devonshire being now in the highest repute. The Aylesbury butter, which brings the highest price in the London market, comprises the best produce of the dairies of Buckinghamshire and Oxfordshire. It is generally packed in 'flats,' each containing from 18 to 30 lumps of 2 lbs. a piece, while the Dorset butter is packed in tubs.

The butter of Somersetshire and Gloucestershire is very good; it is made up in 1 lb. prints, packed in square baskets, and sent to the London market by railway. The butter of the mountains of Wales and Scotland, and the moors, commons, and heaths of England, is of excellent quality when it is pro-

perly managed; and though not equal in quantity, it often is confessedly superior to that produced by the richest meadows. Much butter, but of second and third rate qualities, is now imported from Jersey chiefly in tubs resembling wash tubs.

Considerable quantities of butter are made in Ireland, and it forms a prominent article in the exports of that country; generally, it is very inferior to that of Britain; but this is a consequence rather of the want of attention than of any inferiority in the milk. It is not much used in London. However, some of the best Irish butter brought to London, after being washed and re-packed, is sold as Dorsetshire butter.

The salt butter of Holland, when unadulterated, is superior to that of every other country; and large quantities of it are annually exported. It forms about one-third of all the foreign butter we import, the rest being brought from France, Germany, Belgium &c. Latterly the supplies of Ostend butter have materially increased, the qualities ranging from the very best, which is occasionally sold for Aylesbury, to the very worst description, or imitation butter. It is generally imported in long boxes, containing about 1 cwt. each.

The production and consumption of butter in Great Britain are very great. The consumption in the metropolis may, it is believed, be averaged at about 8 lbs. a year for each individual; and supposing this estimate to be nearly accurate, and the population to amount to 3,200,000, the total annual consumption would, on this hypothesis, be 25,600,000 lbs., or 11,428 tons; but to this may be added 3,000 tons for the butter required for the victualling of ships and other purposes; making the total consumption, in round numbers, 14,428 tons, or 32,320,000 lbs., which at 1s. per lb. would be worth 1,616,000l.

The average yield of milk by a cow in England is stated by Mr. Horsfall (*Jour. Roy. Agric. Soc.* vol. xvii. p. 267, quoted from Muspratt's *Chemistry*) to be from 160 to 180 lbs. daily, and the average yield of butter 8 or 9 oz. or 1 oz. per quart, equal to about 1 lb. for every 16 quarts.

The average produce per cow of the butter dairies is estimated by Mr. Marshall at 168 lbs. a year; but owing to the improvements that have been made in the interval, the yield per cow may now be safely estimated at 180 lbs.; so that, supposing we are nearly right in the above estimates, about 180,000 cows will be required to produce an adequate supply of butter for the London market.

In 1852 the entries of butter for consumption amounted to 287,266 cwt., producing a net revenue of 143,341l. The duty of 10s. a cwt. on butter from a foreign country was reduced in 1853 to 5s. a cwt.; that on butter from a British possession was continued at 2s. 6d. per cwt. The duty was repealed in 1859.

Account of the Quantity and Value of Butter imported into the United Kingdom in 1866 from each of the undermentioned Countries.

	cwt.	£
Denmark	67,505	319,598
Hanse Towns	113,531	621,687
Holland	383,227	1,975,010
Belgium	76,667	496,712
France	432,196	2,274,493
Canada	35,442	163,385
Other parts	53,912	173,600
Total	1,165,081	5,992,455

Imports of butter have increased enormously since the abolition of the duty, as will be seen from the subjoined table:—

Year	cwt.	Year	cwt.
1855	447,266	1861	992,772
1856	513,592	1862	1,037,371
1857	441,606	1863	986,709
1858	387,568	1864	1,094,617
1859	421,663	1865	1,083,717
1860	840,112	1866	1,165,081

The principal sources of foreign supply have been the Hanse Towns, Holland and Belgium, France, and Denmark. The price, which in 1854 was about 4*l.* 5*s.* the cwt., has since risen steadily, and is now about 5*l.* 2*s.* for the same quantity.

The average contract prices of the butter furnished to Greenwich Hospital from 1730 to 1868 have been as follow:—

Year	Prices per lb.	Year	Prices per lb.	Year	Prices per lb.
1750	s. d.	1790	s. d.	1830	s. d.
1740	0 5	1800	0 6	1835	0 7
1750	0 5	1810	0 7	1840	0 10
1760	0 5	1815	1 2	1849	0 10
1770	0 6	1820	0 9	1858	0 11
1780	0 6	1825	0 10	1868	0 9

In order to obviate the practice of fraud in the weighing and packing of butter, different statutes have been passed, particularly the 36 Geo. III. c. 86 and 58 Geo. III. c. 73, the principal regulations of which are subjoined. It is very doubtful, however, whether they have been productive of any good effect. It might be proper, perhaps, to order the weight of the butter, exclusive of the vessel, and the dairyman's or seller's name, to be branded on the inside and outside of each vessel; but most of the other regulations, especially those as to the thickness of the staves, and the weight of the vessels, seem to be at once vexatious and useless.

Every cooper or other person who shall make any vessel for the packing of butter shall make the same of good, well-seasoned timber, tight and not leaky, and shall groove in the heads and bottoms thereof; and every vessel made for the packing of butter shall be a tub, firkin, or half-firkin, and no other.

Every tub shall weigh of itself, including the top and bottom, not less than 11 lbs. nor more than 15 lbs. avoirdupois; and neither the top nor the bottom of any such tub shall exceed in any part five eighths of an inch in thickness.

Every firkin shall weigh at least 7 lbs. including the top and the bottom, which shall not exceed four eighths of an inch thick in any part.

Half-firkins to weigh not less than 4 lbs. nor more than 6 lbs. including the top and the bottom, which shall not exceed the thickness of three eighths of an inch in any part; upon pain that the cooper or every other person making any such vessel, in any respect contrary to the preceding directions, shall forfeit every such vessel and 10*s.*

Every cooper &c. shall brand every cask or vessel before going out of his possession, on the outside, with his name, in legible and permanent letters, under penalty of 10*s.*, together with the exact weight or tare thereof.

Every dairyman, farmer, or seller of butter, or other person packing the same for sale, shall pack it in vessels made and marked as aforesaid, and in no other, and shall properly soak and season every such vessel; and on the inside, and on the top on the outside, shall brand his name at length, in permanent and legible letters; and shall also, with an iron, brand on the top on the outside, and on the bunge or body of every such cask, the true weight or tare of every such vessel, when it shall have been soaked and seasoned; and also shall brand his name at length, on the bunge or body of every such vessel, across two different staves at least, and shall distinctly, and at length, imprint his Christian and surname upon the top of the butter in such vessel when filled, on pain of forfeiting 5*l.* for every default thereof.

Every tub of butter shall contain, exclusive of the tare of good and merchantable butter, 84 lbs.;

every firkin 56 lbs.; every half-firkin 28 lbs.; and no old or corrupt butter shall be mixed, or packed in any vessel whatever, with any butter that is new and sound; nor shall any butter made of whey be packed or mixed with butter made of cream, but the respective sorts shall be packed separately, and the whole vessel shall, throughout, be of one sort and goodness; and no butter shall be salted with any great salt, but all butter shall be salted with small salt; nor shall more salt be intermixed with the butter than is needful for its preservation, under penalty of 5*l.* for offending against any of these regulations.

No change, alteration, fraud, or deceit shall be practised by any dealers or packers of butter, either with respect to the vessel or the butter so packed, whether in respect to quantity or otherwise, under a penalty of 30*l.* to be imposed on every person engaged in the offence.

Every cheesemonger, dealer in butter, or other person, who shall sell any tubs, firkins, or half-firkins of butter, shall deliver, in every such cask or vessel respectively, the full quantity appointed by this Act, or, in default thereof, shall be liable to make satisfaction to the person who shall buy the same for what shall be wanting, according to the price for which it was sold, and shall be liable to an action for recovery of the same, with full costs of suit.

No cheesemonger, dealer in butter &c. shall repack for sale any butter, under penalty of 5*l.* for every tub, firkin, or half-firkin so repacked.

Nothing in this Act shall extend to make any cheesemonger, dealer in butter, or other person, liable to any penalties for using any of the tubs, firkins, or half-firkins, after the British butter used in such vessels shall have been taken thereout, for the repacking for sale of any foreign butter, who shall, before he so repack such foreign butter, entirely cut or efface the several names of the original dairyman, farmer, or seller of butter from every such vessel, leaving the name and tare of the cooper, and the tare of the original dairyman, farmer, or seller thereon; and, after the names are so effaced, shall, with an iron, brand his Christian and surname, and the words *foreign butter*, upon the bunge of every such vessel, across two staves at least, to denote that such butter is foreign butter.

Persons counterfeiting or forging any such names or marks shall for every such offence forfeit 40*l.*

Penalties not exceeding 5*l.* to be determined by one justice, upon the evidence of one witness, and the whole shall go to the informer.

Penalties above 5*l.* to be recovered by action of debt, or information, in the courts at Westminster, and the whole to the informer.

Nothing to extend to the packing of butter in any pot or vessel which shall not be capable of containing more than 14 lbs.

Previously to 1826 no butter could be sold in any public market in Ireland, or exported from it, without being previously examined and branded by a public inspector; but compliance with this regulation is no longer compulsory, but is left to the discretion of the parties.

It is enacted by statute 4 Wm. III. c. 7 that every warehouse-keeper, weigher, searcher, or shipper of butter and cheese, shall receive all butter and cheese that shall be brought to him for the London cheesemongers, and ship the same without undue preference; and shall have for his pains 2*s.* 6*d.* for every load; and if he shall make default, he shall, on conviction before one justice, on oath of one witness, or confession, forfeit for every firkin of butter 10*s.*, and for every weigh of

cheese 5*s.*; half to the informer.

And every searcher or informer who shall receive any pair of 2*s.* 6*d.* for any cheese.

The master of any vessel or of any cheese before the cheesemonger's or dealer's shall forfeit for every cask or for every vessel.

This Act does not extend to

Cheshire or Lancashire.

The total produce of the States in 1850 was 459,681,372 lbs.

The master of a ship refusing to take in butter or cheese before he is full laden (except it be a cheesemonger's own ship sent for his own goods) shall forfeit for every firkin of butter refused 5s., and for every weight of cheese 2s. 6d.

This Act does not extend to any warehouse in Cheshire or Lancashire.

The total product of butter in the United States in 1850 was 313,345,306 lbs., and in 1860 459,681,372 lbs. The States in which the largest amounts are produced are New York, Pennsylvania, Ohio, Illinois, Indiana, Michigan, Missouri, Iowa, Maine, Kentucky. Each of these States produced in 1860 over 10,000 lbs.

Butter made in hot countries is generally liquid. In India it is called *ghee*, and is mostly prepared from the milk of buffaloes; it is usually conveyed in dippers, or bottles made of hide, each of which contains from 10 to 40 gallons. Ghee is an article of considerable commercial importance in many parts of India.

**BUTTONS** (Dutch, *knoopen*; Fr. *bouton*; Ger. *knöpfe*; Ital. *bottoni*; Russ. *pogowizá*; Span. *botones*). Well-known articles, serving to fasten clothes &c. They are manufactured of an endless variety of materials and forms.

The chief seat of the button manufacture in England is Birmingham, which fifty years ago not only enjoyed the supposed advantages of a rigorous protective system, but exported largely to the Continent and the United States. At first it seems buttons were made with the needle, and various Acts of Parliament were passed in favour of the persons engaged in this industry. The gilt button trade commenced about 100 years ago. Covered buttons made by machinery were introduced at the beginning of the present century, and the flexible shank button was patented in 1825. Linen buttons for underclothing were first manufactured in 1841.

Since this time various materials have been

employed. The use of hoofs for the manufacture of 'horn buttons' commenced in France. These were followed by the vegetable ivory button, a material of which we are informed fifteen to sixteen tons a-week are consumed in Birmingham. In 1860 Mr. Manton patented a mineral button, the use of which is rapidly increasing. Metal buttons have still maintained their ground, being needed for military and other uniforms, though they are not manufactured in equal quantities to those of twenty-five years ago. Mr. Wright, of Birmingham, computes the consumption of metal in such buttons at from nine to twelve tons a-week.

Pearl buttons are manufactured from shells. The finest of these are called Macassar, and the shells are worth from 140*l.* to 160*l.* the ton. The Manilla shells are worth from 100*l.* to 120*l.*, those of Bombay and Alexandria from 70*l.* to 80*l.*, of good quality, the poorest being those from Panama, and worth from about 20*l.* to 30*l.* The manufacture of pearl buttons is declining. Glass buttons are also made.

The number of persons engaged in the Birmingham button trade is calculated by Mr. Turner at about 6,000.

The chief seats of foreign manufacture are the Rhenish provinces, Bohemia, Vienna, and Paris. The production is so considerable in the United States as to have met the enormous demand during the late war without any foreign importation. (*The Industries of Birmingham &c.*)

It might have been supposed that the manufacture of such an article as this would have been left to be carried on according to the views and interests of those concerned, individuals being allowed to select any sort of button they pleased. Such, however, has not been the case; and various statutes have been passed, pointing out the kind of buttons to be worn, and the way in which they are to be made! Most of these regulations have luckily fallen into disuse, but they still occupy a place in the statute-book, and might, we presume, be enforced.

In 1866, metal buttons to the value of 27,298*l.*, and other kinds to the value of 97,689*l.*, were imported into the United Kingdom, principally from Holland, Hamburg, and France.

C

**CABLES.** Strong ropes or chains, principally used in the anchoring or mooring of ships.

1. *Rope Cables* are, in Europe, principally manufactured of hemp; but in the East they are very frequently made of *coir*, or the fibrous part of the cocoa-nut, and in some places, particularly on the Red Sea, of the coating of the branches of the date-tree. Hemp cables are for the most part formed of three principal strands, every strand of three ropes, and every rope of three twists; the latter having more or fewer threads according to the greater or less thickness of the cable. But very large cables, or those used by the largest ships, are usually formed by a combination of smaller ropes twisted round their common axis. Cables of this sort are stronger than the others, harder, and more compact, so that they are frequently constructed in this way even when their thickness is not very great. The reduction of length by twisting may be taken at about  $\frac{1}{4}$  the length of the yarn. Large vessels have ready for service three cables, which are usually designated the *sheet* cable, the *best bower* cable, and the *small*

*bower* cable; but besides these, most ships have some spare cables. The ordinary length of a cable is from 100 to 120 fathoms.

2. *Wire Ropes* were first employed in the silver-mines of the Hartz mountains, having proved more economical than flat hempen ropes.

The use of wire ropes for mining commenced in this country about 1840. Now, however, the use of this material is gradually being adopted in shipping. In the case of steamers and iron ships wire rigging is almost invariably used, and even in wooden ships, though there has been a prejudice against its employment, it is rapidly coming into favour, and the export of it to the shipping and ship-building ports abroad is increasing. It is calculated that the produce of wire ropes in the Tyne, Wear, and Tees district was 4,500 tons in 1864, and was of the value of 170,000*l.* Wire ropes, weight for weight, are less costly than hempen fabrics. (*Industrial Resources of the Tyne, Wear, and Tees.*)

3. *Iron Cables.*—The application of strong iron chains or cables to the purposes of navigation is a

late and important discovery, for which we are indebted to Captain Samuel Brown, R.N. In 1812 the Admiralty adopted chain cables in the navy. It is singular, indeed, that this application should not have been made at a much earlier period. On rocky bottoms, or where coral is abundant, a hempen cable speedily chafes, and is often quite destroyed in a few months, or perhaps days. A striking instance of this occurred in the voyage of discovery under the orders of M. Bougainville, who lost *six* anchors in the space of nine days, and narrowly escaped shipwreck; a result, says that able seaman, which would not have happened 'si nous eussions été munis des quelques chaînes de fer. C'est une précaution que ne doivent jamais oublier tous les navigateurs destinés à de périlleux voyages.' (*Voyage autour du Monde*, p. 207, 4to ed.) The work from which this extract is taken was published in 1771; and yet it was not till nearly forty years after that any attempt was made practically to profit by so judicious a suggestion. The difficulties in the way of importing hemp from 1808 to 1814, and its consequent high price, gave the first great stimulus to the manufacture of iron cables.

Iron cables are constructed in different ways. (*Encyc. Metrop.*) Their great weight contributes to their strength, inasmuch as the impulse of the ship is checked before the cable is brought nearly to a straight line, or that the strain approaches to a maximum. Bolts and shackles are provided at every fathom or two fathoms, by striking out which the ship may, if necessary, be detached from her anchors with less difficulty than a hempen cable can be cut.

If properly made, iron cables are a great deal stronger than those of hemp; and as to durability no sort of comparison can be made. No wonder, therefore, that they should be rapidly superseding the latter, which are now almost wholly laid aside in the navy, and, to a great extent, also in the merchant service.

*Testing of Iron Cables.*—In addition to iron cables, iron chains are now frequently used in the rigging of ships; and there can be no doubt that both the one and the other are great improvements, provided they are properly made, and of the proper degree of strength. The latter, however, is a sine qua non, without which ships, their cargoes and crews, are exposed to the greatest danger. And hence we are clearly of opinion that all chain cables, chain ropes, and anchors should not be left to be tested by the maker, but that before being offered for sale they should be carefully tested in public proof-houses. We regret to have to state that there can be no possible doubt that cables, anchors, and iron chains of a very worthless description were till lately sent in large quantities into the market, and that a great deal of property and many valuable lives were consequently lost. A shameless abuse of this sort ought to be put down at all hazards: it is injurious alike to the public and the honest manufacturer, and is a disgrace to the Government by whom it is tolerated. And do what we will, it cannot be suppressed except by prohibiting the sale of all cables, chains, and anchors not subjected to a public test, and marked as approved by the examiners. We might refer, were it necessary, in proof of the statements now made, to a paper put forth by the operative chain-makers. The abuses which it discloses are of the most discreditable character, and call imperatively for redress. [ANCHORS.]

We subjoin an abstract of the Act 27 & 28 Vict. c. 27, passed to remedy the evils complained of:—

1. Any corporation, public body, or company

may erect and maintain proving establishments, apparatus, and machinery suitable for the testing of chain cables or anchors, and may raise money for that purpose.

2. The Board of Trade may grant to any corporation, public body, or company, person or persons erecting any suitable proving establishment, apparatus, and machinery, license to test chain cables and anchors under this Act, and the board may suspend or revoke any such license so granted; and the expression 'tester' in this Act applies to every corporation, public body, or company, person, or persons to whom such license shall be granted, such license not to be granted until the proving establishment, apparatus, and machinery erected have been inspected and certified as efficient by an inspector appointed under this Act.

3. The Board of Trade to appoint a fit person to act as inspector of such proving establishments, apparatus, and machinery, and may at pleasure remove such inspector from his office, who must conform to any regulations made by the Board.

4. Any license granted to be renewable annually, but not until the proving establishment, apparatus, and machinery, in respect whereof such license was granted, have been inspected and certified by the inspector within that year.

5. On the original grant, and on every annual renewal of such license, a fee not exceeding fifty pounds to be paid to the Board of Trade, and to be by them paid into the Exchequer.

6. The inspector to receive such salary and allowances as may be directed by the Board of Trade and Treasury, out of money to be provided by Parliament for the purpose.

7. Every tester shall, with all reasonable despatch, subject every chain cable or anchor that shall be brought to his proving establishment to the same tensile strain as that to which chain cables and anchors respectively of similar size, weight, or description are subjected before being used in her Majesty's naval service, and shall stamp every five fathoms in length of every such chain cable, and also every such anchor, with a stamp or die to be provided for that purpose by the tester, and approved by the Board of Trade, denoting that such chain cable or anchor has been 'proved,' and which shall bear the mark of the tester.

8. Every tester may make such charges as he thinks fit for the testing and stamping with proof mark any chain cable or anchor not exceeding the scale authorised by the Board of Trade; and such tester shall affix upon some conspicuous part of the proving establishment a table of the charges so authorised, and such table shall distinctly be painted on a board or boards, or printed in legible characters on paper affixed to such board or boards; and it shall not be lawful for such tester to make any alteration in such table or charges until such alteration be approved by the Board, and the tester shall have caused written or printed notice of the intended alteration to be affixed to such table for not less than three months.

9. Any tester may detain any chain cable or anchor so tested until such charge shall be paid; and if not paid within three months after the testing he may sell the cable or anchor by auction, and out of the purchase money deduct the expenses of sale, and all other expenses incurred by such with respect to the cable or anchor, and shall pay the surplus (if any), on demand, to the owner or to the captain or master of the vessel, or other person on whose application the cable or anchor had been tested.

10. When any tester shall have tested and

stamped any chain cable or anchor, the same was tested, testing, delivered, certificate of such

11. After first and sixty-five it or dealer in contract to sell cable whatever one hundred and chain cable or one tested and duly acts in contravention for every such violation for the sale or in Scotland by a magistrate, be liable pounds.

12. If any person ing any chain cable any tester, or with be the stamp of or of the tester whoso or counterfeited, or for the purpose or such chain cable or ing in the same be anchor duly tested of this Act, or if chain cable or anchor marked or stamped, or shall delivered be taken or used as vessel, or if any person to any person any ing to be a certificate chain cable or anchor under the provisions chain cable or anchor or document had in every person so offending a misdemeanor, or in every such misdemeanor in the discretion of any term not exceeding hard labour, and confinement.

13. No maker of, anchors, ship-owner, son of this Act, or of relieved from any res chain cable or anchor to which, but for the subject.

14. Nothing in the tracts made by the any chain cables or anchors dockyards or for the ships.

15. This Act shall one thousand eight hundred and eighty CADIZ. A large of Spain, on its south and elevated extremity or tongue of land, projecting N.W. about 4½ nautical miles on all sides, except the land, by the sea, and 1860, 71,521. It is in stance, a very striking lighthouse of St. Sebastian of the city, being 36° 31' 36" N., long. 6° conspicuous object to the Atlantic. The light is of great brilliancy

stamped any chain cable or anchor, he shall, if requested by the person on whose application the same was tested, within one month after such testing, deliver, free of charge, to such person a certificate of such testing.

11. After first July one thousand eight hundred and sixty-five it shall not be lawful for any maker of or dealer in chain cables or anchors to sell or contract to sell for the use of any vessel any chain cable whatever or any anchor exceeding in weight one hundred and sixty-eight pounds, unless such chain cable or anchor shall have been previously tested and duly stamped; and if any person acts in contravention of this provision, he shall for every such offence, upon a summary conviction for the same before a justice of the peace, or in Scotland before any sheriff, justice, or magistrate, be liable to a penalty not exceeding fifty pounds.

12. If any person shall stamp or assist in stamping any chain cable or anchor with the stamp of any tester, or with a stamp or mark purporting to be the stamp of any tester, without the authority of the tester whose stamp shall have been so used or counterfeited, or with any other stamp or mark, for the purpose or with the intention of passing such chain cable or anchor, or of allowing or assisting in the same being passed as a chain cable or anchor duly tested and stamped under the powers of this Act, or if any person, knowing any such chain cable or anchor to have been so wrongfully marked or stamped as aforesaid, shall sell the same, or shall deliver the same to any person to be taken or used as part of the equipment of any vessel, or if any person shall write out and deliver to any person any certificate or document purporting to be a certificate under this Act, that any chain cable or anchor has been tested and stamped under the provisions of this Act, knowing that the chain cable or anchor referred to in such certificate or document had not been so tested or stamped, every person so offending shall be guilty of a misdemeanor, or in Scotland of an offence, and for every such misdemeanor or offence shall be liable, in the discretion of the court, to be imprisoned for any term not exceeding two years, with or without hard labour, and with or without solitary confinement.

13. No maker of, or dealer in, chain cables or anchors, ship-owner, or other person, shall by reason of this Act, or of anything done thereunder, be relieved from any responsibility in respect of any chain cable or anchor made, sold, or used by him to which, but for this Act, he would have been subject.

14. Nothing in this Act shall affect any contracts made by the Admiralty for the supply of any chain cables or anchors to any of her Majesty's dockyards or for the use of any of her Majesty's ships.

15. This Act shall continue in force to first July one thousand eight hundred and seventy-two.

**CADIZ.** A large commercial city and seaport of Spain, on its south-western coast, on the rocky and elevated extremity of a narrow, low peninsula, or tongue of land, projecting from the Isla de Leon, N.N.W. about  $\frac{1}{4}$  nautical miles. It is surrounded on all sides, except the south, where it joins the land, by the sea, and is fortified. Population, in 1860, 71,521. It is well built, and has, at a distance, a very striking appearance. The tower or lighthouse of St. Sebastian stands on the western side of the city, being, according to Tofiño, in lat.  $36^{\circ} 31' 36''$  N., long.  $6^{\circ} 18' 30''$  W. It is a most conspicuous object to vessels approaching from the Atlantic. The light, which is 160 feet high, is of great brilliancy, red and white, revolves

twice a minute, and in fair weather may be seen 24 miles off.

**Bay of Cadiz.**—The entrance to this noble basin lies between the city and the town and promontory of Rota, bearing N.W. by N., distant about  $\frac{1}{4}$  league. The bay is of very great extent, affording, in most places, good anchorage. The port is on the eastern side of the city, where a mole of considerable dimensions has been constructed; but the water is not sufficiently deep to allow large vessels to approach nearer than within about  $\frac{3}{4}$  mile, where they anchor in from 5 to 7 fathoms. The rocks called the Cochinos, the Puercas, and the Diamante, lie to the north of the city in the entrance to the bay; the first two at about  $\frac{3}{4}$  mile distant, and the Diamante at rather more than  $\frac{1}{2}$  mile from the city. Vessels may enter between the Puercas and the Diamante; but none, except those not drawing more than 15 feet water, and well acquainted with the channel, ought to attempt entering between the Cochinos and Puercas and the city. The town of St. Mary's, on the opposite side of the bay, is famous for being the depôt of the wines of Xeres. The outer bay, or that of Cadiz properly so called, is separated from the inner bay by the promontory having at its extremity the castle of Matagorda, which approaches within about  $\frac{3}{4}$  mile of the Puntales castle on the Isla de Leon. Within the inner bay is the famous arsenal of the Caraccas, the town of San Carlos, the canal of Trocadero &c. At spring tides the water in the bay rises 10 or 11 feet, but at neaps the rise does not exceed 6 feet. (For further particulars, see the excellent *Chart of the Bay of Cadiz*, by Tofiño; Malham's *Naval Gazetteer*; and Purly's *Sailing Directions for the Bay of Biscay*, &c.)

**History, Trade &c.**—Cadiz is a very ancient city, having been founded by the Phœnicians about 1,200 years before the Christian era. The temple which they erected in it in honour of Hercules was one of the most celebrated in antiquity. (Sainte Croix, *des Anciennes Colonies*, p. 14; Pomp. Mela, lib. iii. c. vi.) Its excellent port, and its situation, favourable alike for commerce and security, have made it, whether possessed by Carthaginians, Romans, Moors, or Christians, and under every vicissitude, a place of considerable commercial and political importance. It has long been the principal station of the Spanish naval force. In 1720 the commerce with Spanish America, which had previously been exclusively carried on from Seville, was transferred to Cadiz. It enjoyed this valuable monopoly till 1765, when it was partially relaxed by the trade to Cuba, St. Domingo, Porto Rico, and the other islands, being opened to all the greater ports of Spain. The benefits resulting from this relaxation were so very great, that in 1778 the trade to all parts of America was opened to ships from every considerable Spanish port, except those of Biscay, which, not being subject to the general laws of the kingdom, were not allowed to participate in this privilege. In consequence, however, of her situation, the great capital of her merchants, and their established connections, Cadiz continued, notwithstanding the abolition of the monopoly, to preserve by far the largest share of the American trade. But since the colonies achieved their independence, her commerce has been contracted within comparatively narrow limits; and though considerably increased of late years, it will not attain to anything like the extent to which it might arrive without a total change of policy on the part of the Spanish Government. Barcelona is at present the principal seat of Spanish commerce, (Robertson's *America*, b. viii. passim; Townsend's

ports 850,000. More than  $\frac{2}{3}$  of the whole comes to England. The other articles of export are quicksilver, brandy, oranges and other fruits, oil, provisions, flour, salt, wool &c. The imports consist principally of sugar and coffee from the Havannah and Porto Rico, cocoa, hemp, flax, linens, dried fish, hides, cotton wool and cotton manufactures, coal and iron, rice, spices, indigo, staves and timber &c.

The white wines of Xeres in its vicinity form by far the principal article of export from Cadiz. The quantity exported may amount to about 35,000 pipes a-year. The prices vary from 12l. to 65l. per pipe; but, as the lower qualities predominate, the price may be taken, at a medium, at about 25l., making the total value of the ex-

ports 850,000. More than  $\frac{2}{3}$  of the whole comes to England. The other articles of export are quicksilver, brandy, oranges and other fruits, oil, provisions, flour, salt, wool &c. In the years 1861-3 the shipping of Cadiz was as follows:—

	1861	1862	1863
Entered and cleared with cargoes -	2,281	2,155	2,378
Tonnage of ditto -	500,646	511,507	539,114
Tonnage of coasting trade, entered -	180,905	218,524	224,505
Ditto cleared -	135,096	16,722	159,208

In 1865, 409,497 tons of coal and coke were imported into various Spanish ports.

The wine exports of Cadiz for 1866 (taking Xeres and Port St. Mary together) are estimated by Mr. Consul Dunlop at 60,000 butts. See also Mr. Savile Lumley's note of May 4, 1867, on the Wine Trade of Spain, published among the Reports of Secretaries of Embassy and Legation.

Pilots (ordinary) if to Pto. Cádiz

For every change Besides this, from every pilot for the

Puntiles Port dues (e Captain of port, 4 real Lighthouse Anchorage

If quaranted a v ton, daily.

The total amount of salt exported from Spain in the year 1863 was 2,327,844 hectolitres, chiefly to Brazil, Prussia, Russia, Sweden, and Uruguay.

Mr. Consul Graham Dunlop gives the following table in his Report of May, 1867, showing the number and nationality of vessels which entered Cadiz in 1866:—

	Number
English	412
French	153
Swedish and Norwegian	56
Italian	51
Dutch	47
Russian	42
Portuguese	20
American	18
Prussian	8
Austrian	1

**Bank of Cadiz.**—This joint-stock bank was established with special privileges, and was permitted to issue notes. In 1864 the notes fell to a discount, but are still in circulation. The bank is therefore in discredit.

**Banks.**—Some other smaller banks exist in Cadiz, joint-stock and private; but most of the legitimate discounting is accomplished by the more respectable of the merchants of the place, who advance on wine, and do other ordinary banking business.

**Money.**

old Isabella of 100 reals or 5 dols.	Silver ½ dollar of 10 reals
piece of 80 " 4 " "	peseta of 5 " "
40 " 2 " "	" 4 " "
20 " 1 " "	½ peseta of 2 " "
Silver dollar of 20 " "	coin of 1 " "

Accounts are kept in reals and cents. There are sometimes also doubloons and half-doubloons in circulation, and French five-franc pieces of silver which pass currently for 19 reals, called always in Cadiz 'Napoleons.' English gold and silver are rarely seen, and do not pass current.

**Weights and Measures.**—The ordinary quintal is divided into 4 *arrobas*, or 100 lbs. of 2 marcs each: 100 lbs. Castile=101½ lbs. avoirdupois. The common Spanish pound of weight is about 2 lbs. English. The yard, or *vara*=.927 English yard, or 100 varas=92½ English yards. The *cahiz*, or measure for corn, is divided into 12 *fanegas*, or 144 *celeminas*, or 576 *quartillas*; 100 *cahiz*=19.7 Winchester quarters, and 5 fanegas=1 quarter. The *cantaro*, or *arroba*, the measure for liquids, is divided into 8 *azumbres*, and 32 *quartillos*. There are two sorts of *arrobas*, the greater and the lesser; they are to each other as 32 to 25; the former being equal to 4½ English wine gallons, the latter to 3½ do. A *moyo* of wine=16 *arrobas*. The *botta*=30 *arrobas* of wine, or 88½ of oil. A *pipe*=27 *arrobas* of wine, or 34½ of oil. Hence the *botta*=127½ English wine gallons, and the *pipe* 114¾ do.

**Port and other Charges at Cadiz, fixed January 3, 1852.**—The ships of all the nations which concede an equal benefit in their respective territories to the vessels of the Spanish marine to be put on an equality in the Peninsula and adjacent islands with Spanish vessels for the exaction of navigation and port dues, i. e. of lighthouses, anchorage, and loading and unloading, established in the law of April 11, 1849, and in the royal decree of December 16, 1851.

Shipping charges &c. at Cadiz are heavy.  
 Pilotage (ordinary for every vessel) 9 dollars 50 cents.  
 if to Trocadero about 41. 50. sterling  
 Caracas about 41. sterling

For every change of anchorage 3 dols. 25 cents. Besides this, from 1 to 5 dols. are allowed to every pilot for the hire of his boat.

Puntales Fort dues (every vessel passing) 75 reals  
 Captain of port, 4 reals to 8, according to tonnage and rig  
 Lighthouse dues 1 real per Spanish ton  
 Anchorage dues 1 " " "

If quarantined a vessel pays 25 reals per Spanish ton, daily.

N. B. All vessels arriving with a bill of health not countersigned by a Spanish consul or authority are quarantined, generally for 3 or 4 days.

There is also a small tax on vessels leaving, called 'consumos-dues,' which is levied according to crew and passengers. A most important branch of the import trade of Spain is the smuggling, which is now managed in the Custom-houses as well as by the contrabandistas. This is said to be an understood matter, and in the South of Spain, where free-trade doctrines are more prevalent than in Catalonia, it would be impossible to prevent smuggling, except by free-trade.

**Customs Regulations.**—Art. 1. Shippers of merchandise in foreign countries shall present to the Spanish consul a statement in duplicate, and without corrections or erasures, of the goods they embark, expressing the name and nature of the vessel, and of the master, port of destination, description of the bales, boxes, packages &c. &c. to be shipped, their marks and numbers, class, quality, and quantity of the merchandise contained in each, in Spanish weight or measure, the consignees thereof, of what nation the produce and manufacture; if of the country whence shipped; and if not, of what other nation or fabric may be their origin, concluding the statement or note with a declaration that it details the true contents of the packages, and that they contain nothing else. There must be separate notes from each shipper and for each consignee.

Art. 3. From all these notes the consul is to form a general summary, with a copy of which, and one of each of the notes of the shippers, he is to form a true register of the cargo, to be delivered to the master in a sealed despatch (with wax and wafer), addressed to the administrator of the custom-house at the port of destination. No merchandise can go on board after delivery of the register to the master without subjecting all to seizure on arrival in Spain.

Art. 8. The master who, in the act of receiving pratique, shall not deliver to the administrator the sealed despatch or register handed to him by the Spanish consul shall pay a fine of 400 dols., the cargo discharged and stored until the consul shall remit a certified copy of the original notes presented by the shippers, and for which the administrator shall apply.

Art. 10. On examination by the administrator, in presence of the master, of these sealed despatches or register, if they manifest marks or evidences of having been previously opened, the master shall be fined 100 dols. for this alone, and—

Art. 11. In case amendments and alterations are observed in the notes, the master shall answer before the tribunal of finance for the crime of forgery, which he may be guilty of.

Art. 12. Where no consul resides, shippers must send their notes to the one nearest resident, and the master shall receive from him these registers, with the understanding that merchandise from a foreign country shall not be admitted to entry which shall not come with the requisites detailed.

Art. 14. The exceptions to the above are cargoes of lumber, staves, codfish, hides, coals, which it shall be evident come to the order of the master in search of a market; but in such cases a document of origin must be presented from the place of loading, specifying the quantity aboard of the vessel.

Art. 23. Within twenty-four hours after anchoring (being visited), the master shall present to the administrator of the custom-house a manifest of the cargo &c.

Art. 27. Fine of 100 dols. if the manifest be not presented within twenty-four hours.

Art. 38. Fine of 100 dols. for every package in excess, and 50 dols. for every one manifested less than what is expressed in the register made up by the Spanish consul.

Art. 39. If the manifest does not specify minutely the contents of the packages of prohibited merchandise manifested in the transitu, they shall be landed and examined.

Art. 42. All goods must be manifested to specified consignees, in no case to 'order.' The general term *merchandise* is not recognised nor admitted, in which case the goods shall be landed and examined in the presence of the master or his agent, and if they shall be found to be illicit goods, they shall be forfeited, and the master fined 25 per cent. if they be worth more than 2,000 dols., and if less 500 dols. If the goods be of licit traffic, half the sums.

Art. 181. Transhipments prohibited.

Art. 182. Merchandise cannot be manifested in transitu for the port from which the vessel originally sailed, nor those touched at in the voyage.

#### TREASURY DEPARTMENT—ORDER IN COUNCIL.

'Your Excellency will please to notify to H.M. consuls abroad that under no pretence they give course to the declarations or notes of shippers unless exactly in conformity with the customs regulations, nor despatch registers including articles of prohibited traffic, under the understanding that for the confiscations and fines which shall be imposed for defects in consular documentation the consuls themselves shall be responsible, notifying them also that all the documents which they give course to must, without exception, be made in the Spanish language.

'Madrid, September 26, 1850.

In the *Gaceta* of Madrid of April 2, 1865, occurs an official notice with a royal decree, showing the exact state of the present Spanish Navigation laws, viz.—

'It is decreed that *flour* imported into the islands of Cuba and Puerto Rico shall pay duty (from July 1, 1865) on each barrel of 92 kilograms=200 lbs. of Spain, as follows:—

	dols.
1. Flour, the produce of Spain, coming from Spanish ports under Spanish flag	2
2. Comies from Spanish ports under a foreign flag	4
3. Foreign flour under Spanish flag	7
4. Foreign flour under foreign flag	10

The railway from Cadiz to Madrid has been completed. This will open a large inland trade advantageous for Cadiz. The railway to Malaga has also been finished, and that to Granada and some interior towns will soon be opened. The journey from Cadiz to the capital per rail is now (1868) performed in about 25 hours.

Cadiz is the port of the whole district, including Port St. Maria, Port Real, San Fernando, Puntales, Rota, Jerez, Seville, San Lucar, Conlova.

Although there is a good deal of fruit &c. shipped in small steamers at Seville, and taken abroad, the long river navigation is against Seville.

*Spanish Commercial Policy.*—It is the peculiar misfortune of Spain that every part of her political system has been alike vicious and objectionable. Had her commercial policy been liberal, it would, in some degree, have compensated for the defects in the distribution of property and political power, and would, no doubt, have given a powerful stimulus to industry. But, unluckily, it has been in perfect harmony with her other institutions, and was, in all respects, worthy of the favourite seat and stronghold of the Inquisition. From the reign of Ferdinand and Isabella down almost to yesterday, the grand object of the Spanish Government, next

to the extirpation of heresy, has been to exclude foreign manufactures from the Peninsula, and to preserve a monopoly of its markets, as well as of those of the colonies, to the home manufacturers. It is, however, almost needless to say that their efforts to bring about this result have been signally unsuccessful. Oppressive taxes, with the multiplication of fasts and holidays, the Government monopolies, and the badness of the roads and other means of communication, made it impossible for the Spanish manufacturers, even if they had evinced greater enterprise and industry than they have done, to produce manufactured articles as cheap as the English, French, and others less unfavourably situated; and such being the case, it is plain that the prohibition of certain descriptions of commodities, and the oppressive duties laid on others, could have no effect except to suppress the legitimate commerce of the country, and to throw it wholly, or almost wholly, into the hands of smugglers. Any one who takes up a map of Spain must be satisfied at a glance that it would be impossible for an army of customs officers to prevent her being deluged with smuggled produce, provided they were materially cheaper than her native products; for, besides her extensive sea frontier, they may be introduced by way of France and Portugal, and also through the Basque Provinces, which have distinct laws, and enjoy an exemption from the commercial code inflicted on the rest of the kingdom. We need not, therefore, be surprised that every effort to prevent the clandestine introduction of foreign products completely failed. The severities occasionally inflicted on the smugglers, instead of abating, seem really to have increased, the evil. The contraband trade has long been a favourite occupation, and has been eagerly followed by the adventurous, and the necessitous, and the desperate. It is believed that for nearly three centuries from 100,000 to 150,000 individuals have been pretty constantly engaged in this occupation; that is, they have been engaged in trampling on the laws, obstructing their officers, and committing acts of violence and blood. A few years ago about 3,000 actions were annually instituted against *contrabandistas* and others engaged in illicit trade, which terminated in the ruin of a vast number of families; at the same time that the courts of law were filled with perjury, and the country with bloody conflicts; and yet these atrocities secured no one object Government had in view.

Notwithstanding their being absolutely prohibited, English and French cotton goods might, in 1848, be bought in every shop in Madrid, and generally throughout Spain; the former at from 20 to 30 per cent. above their price in Gibraltar, where they are about as cheap as in Manchester; and the latter at from 20 to 30 per cent. above their price in Bayonne, which is nearly identical with their price in Rouen! While Cadiz was a free port, about 6,000 persons are said to have been employed in it twisting cigars, which, as soon as finished, were forthwith smuggled into the interior. Three-fourths, in fact, of the foreign trade of Spain were then in the hands of the *contrabandistas*, who carried it on in defiance of the law; and when such was the case, need we wonder at the low state of industry, or at the prevalence of those predatory and ferocious habits that uniformly mark the character of the smuggler?

And, strange to say, notwithstanding the ruinous influence of this wretched system was long since exposed by Ulloa, Campomanes, and other distinguished Spaniards, and by Mr. Townsend and other foreigners who had visited the country, and notwithstanding all the vicissitudes Spain has

undergone during the previous half century, it continued to maintain its ascendancy down to 1819. But the leading Spanish statesmen having been, at length, satisfied of the disastrous influence of the old system, a vigorous effort was made, in the year now mentioned, to introduce a more rational tariff; and notwithstanding the selfish and shortsighted opposition of the Catalans and others, the new tariff was happily passed into a law. It is true that it leaves much to be desired; but it is, at the same time, a vast improvement on the system by which it was preceded; and it is especially valuable as being the first step in the introduction of a new and more liberal and rational policy. In a few cases the duties on importation were increased, but in the great majority of instances they were reduced, and the greater number of the articles that were formerly prohibited are now admitted on payment of duties. The following are the bases of the new tariff, viz.—

‘Machines and instruments necessary for agricultural, manufacturing, and mining operations, to pay a duty of from 1 to 14 per cent, ad valorem.’

‘Raw material not abundantly produced by Spain, and used in the operations of the national industry, whatever be the form or the increase of value that it may acquire, to pay from 1 to 14 per cent.’

‘Raw material similar to that abundantly produced by Spain, productive agents in the same case, such as coal and coke, and articles of merchandise of foreign manufacture which may compete with those of the same kind and quality manufactured in Spain, to pay from 25 to 50 per cent.’

N.B.—Cottons and silks come under this class. The duties on the former are generally about 35 per cent, ad valorem.

‘Foreign produce and manufacture required for consumption, and not supplied by the national industry, to pay a maximum of 15 per cent., and at the utmost 20 per cent, in every exceptional case.’

‘The duties hitherto levied on the colonial produce of foreign countries to be suitably increased.’

‘A discriminating duty of 20 per cent, to be charged on articles imported in foreign bottoms; and on those articles which contribute most to the support of the national navigation the discriminating duty may be raised to 50 per cent.’

The prohibited imports are arms, projectiles, and munitions of war, including all kinds of gunpowder; quicksilver; charts, published by the Admiralty, and reprinted abroad; maps and plans by Spaniards, during copyright; cinnabar; vessels constructed of wood of less burden than 300 tons, of 20 quintals each; grain, flour, biscuit, bread, and macaroni &c. for soup, not admitted by the corn laws; books and prints in Spanish, by Spanish authors, if not imported by those individuals during copyright; missals, breviaries, and other books of liturgy (dictionaries, vocabularies, insignias, devices, and military ornaments are not included in this prohibition); pictures &c. offensive to morality, or ridiculing the Catholic religion; common salt, tobacco, shoes, and ready-made clothing, except for the private use of travellers; chemical preparations forbidden by the sanitary laws.

Moderate export duties to be levied on antimony or galena, not argentiferous; black copper, roughly melted; litharge containing less than an ounce of silver per quintal; pig lead, raw silk.

*Prohibited Exports.*—Cork in the bark of the province of Gerona; litharge containing an ounce and upwards of silver per quintal; argentiferous galena; lead containing 24 drachms and upwards

of silver per quintal; cotton, hempen, and woollen rags, and worn-out articles of those materials.

The high discriminating duty on goods imported on foreign bottoms is the most objectionable feature in the Spanish tariff; though we can hardly be surprised at the Spaniards continuing to act on a principle that was acted upon down to a very recent period by the English and the Americans. We believe, however, that it will be far more injurious to themselves than to any one else; and that its effect will be to lessen and embarrass their trade without really providing employment for Spanish merchantmen.

To the other facilities for smuggling in Spain must be added the venality and corruption of the customs officers. Notwithstanding his *españolism*, Mr. Ford bears testimony to its universality. He says, ‘Every lock in Spain is to be picked with a silver key, and every difficulty smoothed by a properly administered bribe. The customs *empleados* have been defined to be gentlemen, who, under the pretence of searching portmanteaus, take money on the highway without incurring the disgrace of begging or the danger of robbing; and practically they worry honest travellers who won’t pay them, as much as they facilitate those who will.’ But, in truth, this venality is not confined to the revenue officers, but pervades and debases all classes, from the highest to the lowest.

The following information has been supplied to the editor by an eminent Spanish merchant:—

‘To pass through the custom-house requires a regular education on the part of the merchant. The amount of duty to be paid depends more on mutual understanding than on law. Such laws as are supposed to be in force are imperfectly worded as well as badly administered, and references to the Board of Customs at Madrid are incessant and vexatious. There is little or no official honesty; there is a price for everything, business being vastly expedited by presents. This general corruption of Government officials is almost necessitated by the low rate at which they are paid. Of course uncertainty is fatal to successful trade.’

The writer illustrates the utter want of system in Spanish finance by referring to the fact that during the late dearth of cotton the exporters of Spanish goods to Cuba wished the Government to allow the importation of Spanish goods into that colony duty free, so as to expedite the export of Cuban cotton. The Government assented, but in practice neutralised the boon by annexing a condition that the duty should be paid in Cuba, but repaid to the exporter in Spain. This neither met the difficulty nor checked smuggling: at last the Government saw and acknowledged its error; but the opportunity had passed away.

We incline to think that, allowing for smuggling, the import and export trade of Spain might each be estimated, previously to the late change in the tariff, at about 4,000,000*l.* sterling, or perhaps a little more; and the good effects of that change are already obvious, both importation and exportation having greatly increased, and a corresponding stimulus having been given to industry. This has been further increased by the opening of railways, the formation of companies for steam-navigation, banking &c. In 1856 the duties on imports and exports amounted to 352,936,000 reals. The trade of Spain by sea during that year employed in the out and home voyages 9,660 Spanish vessels of the aggregate burden of 500,870 tons, and 9,357 foreign ships of the aggregate burden of 1,217,488 tons, showing that the foreign vessels employed were more than double the size of the Spanish.

The great articles of export from Spain consist (exclusive of silk manufactures) of raw products. Of these, wine, olive oil, wool, fruits of various kinds, lead, quicksilver, brandy, cork-wood, salt, raw silk, wheat &c. are the most important, and are almost all susceptible of an indefinite increase.

The great articles of import are colonial products, obtained principally from Cuba, Porto Rico &c.; cottons and cotton wool; linens, linen yarn, woollens, with, of late years, large quantities of iron and machinery, coal &c. from England; salted fish, hardware, glass, and earthenware; timber, rice, hides, butter and cheese &c. Subjoined is

The importance of the trade that Spain formerly carried on with her vast possessions in the New World was, at all times, much exaggerated; and she, in truth, was little better than an agent in the business, the greater part of the goods sent on Spanish bottoms to the colonies being, in reality, the property of foreign merchants. Spain, notwithstanding the emancipation of Mexico and South America, has still some very valuable colonies; and, if nothing else can, the astonishing progress made by Cuba and Porto Rico since the abolition of the prohibitive system should satisfy her of his ruinous tendency.

Wool used to be a leading article of import into this country from Spain; but now, though our imports of wool have vastly increased, they are principally supplied by our possessions in Australia, Africa, India &c. The quantities brought from Spain have, indeed, become quite

inconsiderable; so much so, that while in 1866 she supplied us with only 123,058 lbs., our total imports amounted to the immense quantity of 239,358,689 lbs.! Wine, raisins, olive oil, nuts, lead, copper ore, cattle, and quicksilver are at present the principal articles imported into the United Kingdom from Spain in ordinary years. Sometimes, however, she supplies us with large quantities of wheat and flour. And the completion of the railway from Santander to Leon and Estremadura, two of the finest wheat-growing provinces of Europe, will make the Peninsula one of the principal sources whence we may at all times draw large supplies of these indispensable articles. Previously to the alteration of the tariff in 1819 the declared value of the direct exports from the United Kingdom to Spain varied from 500,000l. to 800,000l. a-year; whereas they amounted, at an average of 1865 and 1866, to 3,079,257l. a-year, while our imports thence in 1867 are valued at 6,088,389l. This is a great increase; still it may be safely affirmed that our trade with Spain does not yet amount to  $\frac{1}{4}$  of what it would be were she to adopt a really free commercial system.

Some portion, though far less now than formerly, of the exports to Portugal, Gibraltar, and Malta find their way, by the intervention of the smuggler, into Spain.

Owing to the badness of the roads, and their unfitness for carriages, the principal carriers of merchandise are the *arrieros*, or muleteers, who traverse the country in all directions along beaten tracks, many of which are accessible only to them. They form a large portion of the provincial population, and, on the whole, have a good character for honesty to their employers, though they are nearly all, more or less, engaged in smuggling transactions. The extent of this traffic may be estimated from the fact that about three-fourths of the entire inland traffic in corn is carried on by their means. Waggon's have, however, been introduced on all the practicable roads; and should the latter be improved, the business of the *arrieros* will proportionally fall off.

There can be no reasonable doubt that, but for the system of misrule to which Spain has been subjected, her commerce would have been very extensive. Her natural advantages, superior to most, and not inferior to those enjoyed by any other kingdom; her wines, brandies, fruits &c.; her wheat, of which she might produce the largest supplies; her wool; her iron, which is of the best quality; her lead and quicksilver mines, respectively the most productive in the world; the number and excellence of her harbours; the enterprising and adventurous character of her inhabitants, and her favourable situation, would, were she permitted to avail herself of them, raise her to a very high rank among commercial nations. Let the Government follow up what it has so well begun, by ceasing to counteract the intentions of nature; let moderate duties take the place of prohibitions, and freedom of regulation, and all sorts of industrious pursuits will revive from the deadly lethargy in which they have been so long sunk.

[We are indebted to Mr. Graham Dunlop, her Majesty's consul at Cadiz, for corrections in this article, as well as to his Report of May 20, 1867, for further information.]

splendid; but the streets are, for the most part, narrow, steep, and filthy.

The Gulf of Cagliari extends from Pula on the west to Cape Carbonara on the east, a distance of about 24 miles across, and about 12 in depth, with good anchorage everywhere after getting into soundings. A mole projects from the Praticue office, and ships usually lie about 1 mile S.W. by S. from it, in 6 or 8 fathoms water, on an excellent bottom of mud. There is a very convenient pier harbour at the south angle of the tower wall, capable of containing 14 or 16 vessels of a tolerable size, besides small craft. Altogether, Cagliari is one of the best and safest ports in the Mediterranean.

There are two lighthouses, one on Fanale Point, the other at the entrance of the harbour. The former gives a red flash every two minutes. The harbour lights are also red.

**Imports and Exports.**—Almost all the trade of Sardinia is carried on by strangers; and even the fish on its coast and in its harbours is caught by Sicilians, Neapolitans, Tuscans, and Genoese. Corn is the principal article of export. In good years the exports from the whole island may amount to 400,000 starelli, or about 500,000 bushels, of wheat, 200,000 starelli of barley, 6,000 ditto of maize, 100,000 ditto of beans, 200,000 ditto of peas, 1,000 ditto of lentils. Were the projected railways made, no doubt these exports would increase. The culture of vines is gradually becoming of more importance; and about 3,500 Catalan pipes are exported, principally from Alghero and Ogliastra. Cheese is an important object in the rural economy of Sardinia, and considerable quantities are exported. Salt is a royal monopoly, and affords a considerable revenue. Flax, linseed, hides, oil, saffron, rags, alquifoux &c. are among the articles of export. The tunny and coral fisheries employ a good many hands; but, as already observed, they are almost wholly managed by foreigners.

Almost every article of dress, whether for the gentry or the peasantry, is imported. Soap, stationery, glass, earthenware, and furniture, as well as sugar, coffee, drugs, spices &c. are also supplied by foreigners; and, notwithstanding the Sards possess many rich mines, several of which were successfully worked in antiquity, and are once more becoming productive, they import all their iron and steel. The only manufactures carried on in the island are those of gunpowder, salt, tobacco, and woollen caps.

By far the largest portion of the exports from the island is forwarded to the continental states of the kingdom. The quantity of these exports is said to have amounted, at an average of the 3 years ending with 1863, to—

Almonds	lbs. 967,083	Corkwood	cwis. 21,330
Beacon and salt meat	lbs. 315,399	Fish salt	lbs. 1,038,885
Beania	cwis. 5,880	Lead ore	cwis. 280,875
Beans, barley, pulse	qrs. 15,071	Olive oil	lbs. 1,377,632
Cattle	no. 22,914	Salt	tnns. 81,229
Cheese	cwis. 49,284	Skins	lbs. 1,250,600
Coral	lbs. 70,192	Wheat	qrs. 25,553
		Wine	gals. 722,926
		Wool	lbs. 355,065

But the returns for 1864 and 1865 show a striking falling off in each item of export except lead ore.

The following was the tonnage of Cagliari in 1864 and 1866:—

	1861		1866		
	vessels	tons	vessels	tons	
Entered	Foreign	372	90,100	310	185,668
	Coasting	843	82,692	106	20,791
Cleared	Foreign	375	90,299	696	157,011
	Coasting	846	79,612	77	25,763

The following represents the amount of British trade with the island of Sardinia for the years 1861-5:—

	1861	1862	1863	1864	1865
	£	£	£	£	£
Imports	45,977	46,532	9,385	29,518	49,501
Exports	5,322	37,232	7,974	67,112	57,035
Ditto Colonial and foreign	2,972	8	211	1,679	331
Total	51,481	63,775	17,699	98,455	106,865

**Money, Weights, and Measures.**—Accounts are kept in lire, reali, and soldi. 5 soldi = 1 reale = 1/4d.; 4 reali = 1 lira = 1s. 6d.; 10 reali = 1 scudo = 3s. 9d. The paper money consists of notes for 5, 10, and 20 scudi.

Farm produce and the coarser metals are weighed by the *pesi di ferro*: 12 Sard. oz. = 1 lb. = 14 oz. 5 dr. avoirdupois; 26 lbs. = 1 rubbo; 4 rubbi = 1 cantaro = 93 lbs. 0 oz. 8 dr. avoirdupois.

The starello, or corn measure, is equivalent to 1 bush, 1 1/4 peck Eng. The palm = 10 1/2 Eng. inches.

**Causes of the depressed State of Sardinia.**—The above statements sufficiently show that the commerce of Sardinia is very far from being what might naturally be expected from her extent, fertility, admirable situation, and the excellence of her many harbours. She contains an area of about 9,500 square miles, being, in point of size, but little inferior to Sicily; and in antiquity was reckoned, along with the latter, a principal granary of Rome. 'Siciliam et Sardiniam benignissimas urbis nostræ nutrices.' (Val. Max. lib. vi. c. 6.)

Utraque frugiferis est in aula nihil arvis:  
Nec plus Hesperiam longinqua mensibus ulle,  
Nec Romam magis complerant horrea terræ.

Lucan, lib. lin. 65.

But the establishment of the feudal system in its worst form, and the unfavourable political and municipal regulations under which the island has latterly been placed, have gone far to neutralise the advantages it owes to nature. The agriculturists of Sardinia principally consist of two great classes—those who cultivate small farms on the *métayer* principle, and those who work on the estates of others, getting, in most instances, a patch of land for their support, and cultivating it at such times as they are not employed on the lord's lands. Both classes are excessively poor. The agreements under which the former class hold are seldom for more than a year; the landlord furnishing the seed as well as the land, and receiving half the produce. Those who occupy land for which they are obliged to pay a rent in corvées, or other feudal services, are, if possible, still worse off; having usually to borrow the seed either from the landlord or from the *Manti Frumentarii* established for that purpose, and having also to defray the title and a host of other burdens. Another disadvantage under which all classes labour is the want of houses on their farms; the peasants live together in villages, and have frequently to perform a journey of several miles in going to and coming from their farms.

Lands belonging to a canton or commune are frequently cultivated on a kind of partnership system, being divided into three portions: one of these, called *vidazzone*, comprises all the lands that are in cultivation, and which are distributed by lot among certain individuals, while the other two portions are occupied in common as pasture. But, as a new distribution takes place every year, it is plain that no individual can take any interest in the improvement of the soil; and this sort of tenure becomes, in fact, the most effectual that can be devised for the extinction of industry. Latterly, however, the Government has been making efforts to promote the formation of inclosures and the division of the lands, which, though opposed by the prejudices of the people, have made some progress. (Marmora, *Voyage en Sardaigne*, lib. v. ch. i.)

Even these are not, perhaps, the greatest disengagements to agriculture. As if to annihilate the possibility of the peasantry emerging from their depressed condition, and to oblige them to continue their industry to the supply of their indispensable wants, it has been enacted that no corn shall be exported if its price exceed 30 real the *starello*; and a heavy duty is laid on all that is exported, as a substitute for a general land-tax. Most other articles of export have been loaded with similar duties; and it would really seem that every device that ignorance and short-sighted rapacity could suggest had been practised to reduce this 'benignant nurse' of imperial Rome to a state of poverty and destitution.

Happily, as already seen, the bounty of nature has proved an overmatch for the perverse ingenuity of man; and such is the fertility of this fine island, that, notwithstanding the influence of the duty now referred to, and the wretched system of agriculture, it exports in good years considerable quantities of corn. The culture of the vine is gradually increasing in importance, and about 3,500 Catalan pipes are exported, chiefly from Alghero and Ogliastro. Olive oil, owing to the little care taken in its preparation, and its consequent bad quality, has hitherto been but little exported; it is susceptible, however, of an indefinite increase, and might be made an important article. Tobacco is a royal monopoly, and brings about 7,000,000 livres a-year into the public treasury. Flax, linseed, saffron, hemp, and barilla are grown to some extent; silk is produced only in limited quantities, but its produce might, no doubt, be vastly increased; some cotton is produced, and also small quantities of madder, which last grows wild in the island. The mountains are clothed with forests of oak, beech, chestnut, and other timber; but, from the want of roads, these are nearly useless. The agricultural implements and processes are excessively rude. The Sardinian plough, the counterpart of that described by Virgil, does little more than scratch the ground. It is without a coulter, and is very frequently wholly constructed of wood. Oxen only are used in ploughing and other field labour. The corn is left in the fields till it be thrashed, an operation effected by the primitive practice of treading with horses and oxen.

During the present century, however, some very important changes for the better have been introduced into the island, and some of the worst of the abuses previously noticed have been obviated. In 1836, in pursuance of enquiries previously commenced, feudal jurisdictions were completely abolished; and since then the feudal system has been wholly subverted. According to a law passed in 1839, all lands were declared to be the property of individuals, communes, or the crown; the latter becoming the possessor of all waste lands, or those to which neither private parties nor communes could show any title. Lands which have been cultivated or applied to use, whether enclosed or not, were assigned in perpetuity to the occupiers, undisturbed possession being held to confer a sufficient right to the property in the absence of any other title: those whose interests were at all affected by the new changes received compensation in money or lands, or by an assignment of public funded property. The king substituted himself in the place of the barons; he took all the feudal rents into his own hands; and their value being estimated at 20 years' purchase, public securities to the amount, bearing 5 per cent. interest, were made over to the nobles in exchange for the privileges of which they had been deprived. All kinds of vassalage were, at the

same time, made redeemable; and courts of law placed under the direct control of the state were substituted in the place of the feudal jurisdictions where the barons were at once suitors and judges. It is impossible to overrate the importance of these changes; and there cannot be a doubt that they will have the greatest and most beneficial influence. (Von Raumer, *Italy* &c. i. 295-301.) We may also mention, in proof of the improvement of the island, that the population, which in 1816 amounted to only 352,000, had increased in 1838 to 524,633, and in 1862 to 573,115. A good road has been constructed, uniting Cagliari and Sassari, and cross roads have been carried from it to some of the more considerable places in the island. A railway commenced in 1861, to join Cagliari, Oristano, and Sassari, is expected to be finished in 1869, and will no doubt give an impetus to trade and commerce. Stringent measures have recently, also, been adopted for the suppression of the banditti, with which the island has long been infested. And should these measures of improvement be properly carried out, the administration of justice simplified and freed from the abuses and venality by which it has long been disgraced, and all restraints on exportation abolished, it may be confidently predicted that Sardinia will gradually become more and more prosperous; that the revenues of the crown will be increased in a ten-fold proportion; and that the population will cease to be conspicuous only for ferocity, idleness, and contempt of innovation. (See *Geographical Dictionary*, art. 'Sardinia,' and the authorities therein referred to; Mr. Consul Craig's *Report of June, 1867*; &c.)

**CAJEPUT OIL.** The volatile oil obtained from the leaves of the cajeput tree (*Melaleuca cajuputi*, Linn.). The name is a corruption of the Malay words *cayu-pati*, that is, white-wood oil; because the bark of the tree which yields it has a whitish appearance, like our birch. This tree is common in Amboyna and other Eastern islands. The oil is obtained by distillation from the dried leaves of the smaller of two varieties. It is prepared in great quantities in Banda, and sent to Holland in copper flasks. 'It is very mobile, transparent, of a fine pale bluish-green colour. It has a strong, agreeable odour, and a warm, aromatic taste.' (*British Pharmacopœia*, 1867.) It burns entirely away without leaving any residuum. It is often adulterated with other essential oils, coloured with resin of milfoil.

The colour of cajeput oil is not, as has been frequently said, derived from the presence of copper. It has been found that when the oil is distilled, at first a light colourless oil comes over, and then a green and denser oil.

Cajeput oil not being used except in the *materia medica*, only small quantities are imported. In July 1831 it sold in bond at about 7d. per oz.; but an idea having then got abroad that it was one of the most efficient remedies in cases of cholera, its price rose in November 1831 to no less than 11s. per oz.! But it soon after fell into discredit with the faculty, and additional supplies having been obtained from Holland, its price declined almost as fast as it had risen. It is not now worth more than from 4d. to 9d. per oz.

**CALABAR SKIN** (Fr. petit-gris; Ger. grauwerk; Ital. vaor, vajo; Russ. bjelka; Span. gris perqueno). The Siberian squirrel skin, of various colours, used in making muffs, tippets, and trimmings for cloths.

**CALABASHES.** Gourds, the skins or rinds of which, after the pulp has been extracted, are used by the native Indians of America as cups, bottles &c. Many kinds of resins and other drugs are run into gourds, as convenient vessels for carriage.

**CALAMANDEI** of timber brought that common edge-must be rasped and it is singularly rich admixture of colour fine chocolate, now lute black, now fawn and cream colour the rich beauty of from any undue show polish, and is wholly into tables. governor of Ceylon, room of his seat in Mander. It is scarcely regularly imported; has been imported by the colony, far the most beautiful. The nearer it is taken finer it is. (Milburn's *Vegetative Knowledge*, Vol. I.)

**CALCUTTA.** The deney of Bengal, the dominions in India, 49° N., long. 88° 27' 16" from the sea, being situated of the western branch of the Hooghly River, which is navigable to a large ships. At high tide the town is about a mile from the sea, the ebb the side opposite the long range of dry earth, the length and intricacy of sea, it is generally under water. In 1717 Calcutta was the population of the town amounted to 4, it was 413,182, of which was only 8,892. But 180,000 persons who reside in the neighbouring villages early in the morning to the town. The small number in Calcutta (where, however, numerous than in any well excite surprise. The prohibition of European occupation an influx of British but this anticipation scarcely a single English capital sufficient to cultivate himself has established himself in the cultivation of indigo and no immigration of artisans only what might have been being too fully occupied, too heavy, and the wages admit of anything like immigration. The Eurasian factors and native mother clerks in the Government establishments, and various and useful class. (Vol. i. part iii. p. 10 &c.) The suburbs, extends about 2 of the river, with an average about 1½ mile. Fort William is on the same side of the river. It is a strong regular force that it would require for its effectual defence great natural advantages and all sorts of foreign produce

**CALAMANDER WOOD.** A beautiful species of timber brought from Ceylon. It is so hard that common edge-tools cannot work it, so that it must be rasped and almost ground into shape. It is singularly remarkable for the variety and admixture of colours. The most prevailing is a fine chocolate, now deepening almost into absolute black, now fading into a medium between fawn and cream colours. It arrests the eye from the rich beauty of the intermingled tints, not from any undue showiness. It takes a very high polish, and is wrought into chairs, and particularly into tables. Sir Robert Brownrigg, late governor of Ceylon, had the doors of the dining-room of his seat in Monmouthshire made of calamander. It is scarce in Ceylon, and is not regularly imported; all that is in Great Britain has been imported by private gentlemen, returning from the colony, for their own use. It is by far the most beautiful of all the fancy woods. The nearer it is taken from the root of the tree, the finer it is. (Millburn's *Orient Com.; Lib. of Entertaining Knowledge, 'Vegetable Substances,'* p. 179.)

**CALCUTTA.** The principal city of the Presidency of Bengal, the capital of the British dominions in India. Its citadel is in lat. 22° 34' 49" N., long. 88° 27' 16" E. It is about 100 miles from the sea, being situated on the eastern bank of the western branch of the Ganges, denominated the Hooghly River, which is the only arm of the Ganges navigable to any considerable distance by large ships. At high water the river opposite to the town is about a mile in breadth; but during the ebb the side opposite to Calcutta exposes a long range of dry sand-banks. Owing to the length and intricacy of the navigation from the sea, it is generally undertaken with a pilot.

In 1717 Calcutta was but a small village. In 1837 the population of what is properly called the town amounted to only 229,700, and in 1861 it was 413,182, of which the European portion was only 8,892. But this is exclusive of about 180,000 persons who reside at night in the suburbs, or neighbouring villages, coming into Calcutta early in the morning to their respective employments. The small number of English resident in Calcutta (where, however, they are far more numerous than in any other part of India) may well excite surprise. It was supposed that the cessation of the Company's monopoly, and of the prohibition of European resort to India, would occasion an influx of British settlers and capital; but this anticipation has not been realised. Scarcely a single English agriculturist, with capital sufficient to cultivate 100 acres of land, has established himself in India, except for the cultivation of indigo and tea, and there has been no immigration of artisans. And this, after all, is only what might have been expected; the country being too fully occupied, the burden on the lands too heavy, and the wages of labour far too low, to admit of anything like an extensive European immigration. The Eurasians, the progeny of white fathers and native mothers, are mostly employed as clerks in the Government offices and mercantile establishments, and are said to be an industrious and useful class. (*Bengal & Agra Gazetteer*, vol. i. part iii. p. 10 &c.) The town, excluding suburbs, extends about 4½ miles along the bank of the river, with an average breadth inland of about 1½ mile. Fort William, the citadel, lies on the same side of the river, a little lower down. It is a strong regular fortification, but so extensive that it would require a garrison of 10,000 men for its effectual defence. Calcutta possesses great natural advantages for inland navigation; all sorts of foreign produce being transported with

great facility on the Ganges and its subsidiary streams to the north-western quarters of Hindostan, over a distance of at least 1,000 miles, while the productions of the interior are received by the same easy channels.

The principal merchants and traders consist of British and other Europeans, Portuguese born in India, Armenians, Jews, Persians from the coast of the Persian Gulf (commonly called Parsees), Moguls, Mohammedans of Hindostan, and Hindoos; the latter usually either of the Brahminical or mercantile castes, and natives of Bengal.

The principal foreign business is conducted by English merchants; but other parties also, either in partnership with the English or on their own account, speculate largely to Europe, America, and especially to China. The brokers known under the name of Sircars and Baboos are all Hindoos. The general rates of agency commission are as follow:—

*Schedule of Commission Charges revised and adopted by a Special General Meeting of the Bengal Chamber of Commerce, held on June 18, 1861, with effect from January 1, 1862.*

	per cent.
1. On the sale, purchase, or shipment of bullion, gold dust, or coin	1
2. On the purchase (when in funds) or sale of indigo, raw silk, silk piece goods, opium, pearls, precious stones, or jewellery	2½
3. On purchasing ditto, when funds are provided by the agent	5
4. On the sale or purchase of all other goods—the commission in all cases to be charged upon the gross amount of sales, and in regard to purchases upon both cost and charges	5
5. On returns for consignments, if made in produce	2½
6. On returns of consignment, if in billie bullion, or treasure	1
7. On accepting bills against consignments	1
8. On the sale or purchase of ships, factories, houses, lands, and all property of a like description	2½
9. On goods and treasure consigned, and all other property of any description referred to agency for sale, whether advanced upon or otherwise, which shall afterwards be withdrawn; and on goods consigned for conditional delivery to others and so delivered (on invoice amount at 2s. per rupee)	½
10. On making advances or procuring loans of money for commercial purposes, when the aggregate commission does not exceed 5 per cent.	2½
11. On ordering or receiving and delivering goods, or superintending the fulfilment of contracts, or on the shipment of goods, where no other commission is derived	2½
12. On guaranteeing bills, bonds, or other engagements, and on becoming security for administration of estates or to Government for the disbursement of public money	2½
13. On <i>de-créder</i> , or guaranteeing the due realisation of sales	2½
14. On the management of estates for executors or administrators	2½
15. On chartering ships or engaging tonnage for constituents for vessels to proceed to out-ports for loading	2½
16. On advertising as the agents for owners or commanders of ships for cabin passengers on the amount of passage money, whether the same shall pass through the agent's hands or not	2½
17. On procuring freight for a ship by shipping order or charter, or on procuring employment for a ship on monthly hire, or acting as agents for owners, captain, or charterers of a vessel, upon the gross amount of freight, brokerage inclusive	5
18. On engaging Asiatic emigrants for a ship to the Mauritius, the West Indies, or elsewhere, upon the gross amount of earnings	5
19. On engaging troops for a ship to Great Britain or elsewhere, on the gross amount of passage money for rank and file	2½
20. On realising inward freight, inward troop, emigrant, or cabin passage money	2½
21. On landing and re-shipping goods from any vessel in distress, or on landing and selling by auction damaged goods from any such vessel, and acting as agent for the master on behalf of all concerned—on the declared value of all such goods as may be re-shipped, and on the net proceeds of all such goods as may be publicly sold	5
If opium, indigo, raw silk, or silk piece goods	2½
If treasure, precious stones, or jewellery	5
22. On effecting insurances, whether on lives or property	2½
23. On settling insurance claims, losses, and averages of all classes, and on procuring returns of premium	2½
24. On drawing, purchasing, selling, or negotiating bills of exchange	1
25. On bills of other claims when a process at law or arbitration is incurred in claiming them	2½
If recovered by such means	5
26. On bills of exchange returned dishonoured	1
27. On collecting house rent	2½
28. On ships' disbursements	2½
29. On realising bottomry bonds, or negotiating any loan on <i>respondentia</i>	2½
30. On granting letters of credit	1
31. On sale or purchase of Government securities and bank or other joint stock shares, and on every exchange or transfer not by purchase from one class to another	3
32. On delivering up Government securities and bank or other joint stock shares, on the market value	4
33. On all amounts debited and credited within the year (less the balance brought forward) upon which no commission is owing to 5 per cent. has been charged	4

Brokerage when paid is to be separately charged.

**Customs Tariff**—By Act No. XVII., called 'The Indian Customs Duties Act. 1867,' passed by the Governor-General of India on March 6, 1867, the following import and export tariffs are approved as applicable to every port in the territories of British India:—

**Import Tariff.**

No.	Description of Article	Value on which duty is assessed	Rate of duty
1	Apparel, including haberdashery, milliners &c.	rs. an.	7½ per cent.
2	Arms, ammunition, and military stores:	ad valorem	
	Gunpowder, common	0 5 per lb.	7½ per cent.
	Fire-arms, and parts of	except as regards military and other regulations uniform forms and accoutrements when imported for private use by persons in the public service, which are free.	
	All other sorts, including military accoutrements, uniforms &c.	ad valorem	7½ per cent.
3	Blacking: quarts - small - in tins -	5 0 per doz. 2 8 " 0 3 "	7½ per cent.
4	Cabinet ware -	ad valorem	7½ per cent.
5	Candles: wax, composition, and other kinds - paraffine - spermaceti - composition, and other sorts -	1 0 per lb. 0 8 " 0 8 " 0 6 "	7½ per cent.
6	Carpets and carpeting: single carpets - carpeting in rolls -	ad valorem ad valorem	5 per cent.
7	Carriages -	ad valorem	7½ per cent.
8	Chemicals -	ad valorem	7½ per cent.
9	China and Japan ware, other than lacquered ware, which is free -	ad valorem	7½ per cent.
10	Clocks, watches, and other timekeepers -	ad valorem	7½ per cent.
11	Coinc-bullion's materials -	ad valorem	7½ per cent.
12	Coffees: Persian Gulf and Red Sea - Other places -	50 0 per cwt. 20 0 "	7½ per cent.
13	Corks -	1 8 per gross	7½ per cent.
14	Thread, sewing thread, white and coloured, sewing thread, in reels, or on cards not exceeding one hundred yards* -	0 12 per lb. 2 3 per gross reel	7½ per cent.
	Coa and comity -	50 0 per cwt.	
	Twist, mule, under No. 15 Noa. 16 to 21 - 22 - 32 - 33 - 42 - 43 - 52 - 53 - 60 - 70 - 80 - 90 - 100 - 110 to 150 - 160 - 200 -	0 7 per lb. 0 11 " 0 12 " 0 13 " 0 14 " 1 1 " 1 2 " 1 3 " 1 4 " 1 5 " 1 6 " 1 7 " 1 8 " 1 9 " 1 10 " 1 11 " 1 12 "	3½ per cent.
	Water - Above 50 -	0 13 " 1 4 "	
	Turkey red twist, all kinds -	1 6 per lb.	
	Twist, orange, red, and other colours † -	1 2 "	3½ per cent.
	Piece goods: Grey-shirtings, madapolans and printers - Long cloths, jeans, domestic sheetings, drills, and T. cloth - Other sorts -	0 15 " ad valorem	5 per cent.
	Cotton rope -	25 0 per cwt.	7½ per cent.
	Cotton goods, other kinds -	ad valorem	
15	Drugs and medicines: Acid, sulphuric - Alkali, country (Sajee Khar) - Aloes, black - Alum - Arsenic - China, Muscel - Asafetida (Hing) - Cassia, coarse (Hingra) - Brimstone, flour -	0 3 per lb. 2 0 per cwt. 10 0 " 25 0 " 3 8 " 8 0 " 55 0 " 10 0 " 7 0 " 6 0 " 4 8 "	7½ per cent.
	Camphar, Bhimsing (Barran) - refined cake - crude in powder -	50 0 per lb. 65 0 per cwt. 50 0 "	

\* Exceeding this length to be charged in proportion.  
† Duty to be charged on the grey weight of the coloured yarn; when not ascertainable, the actual wharf weight or invoice weight to be taken.

No.	Description of Article	Value on which duty is assessed	Rate of duty
16	Cassia lignea - (Costs, red) - Copra, green - Copra, white - Sal ammoniac - Salep - Senna leaves - All other sorts -	rs. an. 50 0 per cwt. ad valorem 2 8 per cwt. 12 0 per lb. 60 0 " 6 0 " ad valorem	7½ per cent.
17	Dyeing and colouring materials: Cochineal - Gallinule - Country, myrobalan - Persian - Gamboge wood - Masile or munjele - Orchilla weed - Saffron, Europe - Saffron, Moorland - Persian - in cakes or lumps - Sapan wood and root - All other sorts -	1 12 per lb. 3 0 per cwt. 55 0 " 20 0 " 10 0 " 8 0 " 16 0 per lb. 10 0 per cwt. 18 0 per lb. 5 0 " 3 8 per cwt. ad valorem	7½ per cent.
18	Felt: Sheathing 140 x 52 inches - In rolls or in lengths - All other sorts -	0 4 per piece ad valorem	7½ per cent.
19	Fireworks: China - Other sorts -	50 0 per box of 13½ lbs. ad valorem	7½ per cent.
20	Flax, manufactures of: Piece goods - Other sorts -	ad valorem ad valorem	5 per cent.
21	Fruits and vegetables: Almonds, without shell - with shell - Cacao kernels - Coconuts - Currants, Europe - Persian - Dates, dry, in bags - wet, in bags - in pots - Figs, Europe - Persian, dried - Garlic - Pistachio nuts - Prunes, Muscorah - Raisins, Black, Persian (Half, Red Sea, and Khuni) - Monaka, Persian (Half, and Red Sea) - Other sorts -	25 0 per cwt. 10 0 " 10 0 " 30 0 per 1000 9 0 per cwt. 12 0 " 4 0 " 3 0 " 12 0 " 6 0 " 4 0 " 12 0 " 7 0 " ad valorem	7½ per cent.

Remarks on the above Duties.—The policy of charging duties on exported articles seems very questionable. The great difficulty under which India labours, in a commercial point of view, consists principally in her inability to furnish equivalents for foreign imported goods, and to make the necessary payments abroad; and, when such is the case, it is certainly not a little contradictory to lay duties on exports. The most obvious considerations of expediency and common sense would suggest that they should be allowed to be exported duty free. There can be no doubt that the stimulus this would give to their production would, by increasing the public wealth, infinitely more than compensate the Government for the loss of the inconsiderable sum produced by the duties with which they are charged.

\*All goods not enumerated or comprehended in the above list will be charged for per agreement.

Cargoes of vessels put back from sea will be received into the warehouse—salt-petre and damaged goods excepted; and it will be optional with the Association to apply the above rates, or charge rent according to the space occupied.

Where parties desire to engage accommodation by the month or for a longer period, the Association lets space by measurement: for instance, a range 100 feet long by 20 feet wide on the upper storeys would rent for 150 Rs. a month. Ditto on the ground floor for 200 Rs. per month.

Rent commences from the moment goods are brought within the premises of the warehouse; and if goods are left in the compound of the warehouse, they will remain there at the risk and expense of depositors.

Rent will not be charged for a shorter period than half a month; and thereafter the shortest broken period for which it will be charged is a quarter of a month.

The Association does not undertake to store goods, or to supply labour for that purpose, and is not responsible for any loss or damage that may arise in their receipt or delivery.

**COINS, WEIGHTS, MEASURES, EXCHANGES, &c.**

**Calcutta in Bengal. Coins.**—Accounts are kept here in rupees, with their sub-divisions annas and pie: 12 pie make 1 anna; 16 annas, 1 rupee.

The standard of the Bengal money has ever been silver. Gold is occasionally coined, but the great bulk of the currency is silver.

A lakh of rupees is 100,000; and a crore, 100 lakhs or 1,00,00,000 rupees; and in accounts sums are distinguished into crores, lakhs, and single rupees, by marks or divisions, as in the foregoing examples.

Cowries, small, white, glossy shells, are made use of for small payments in the bazaar, and are generally thus reckoned:—

4 cowries } equal to { 1 gunda.  
20 gundas } equal to { 1 panna.  
4 panna } equal to { 1 anna.  
4 annas } equal to { 1 kabani, which is about 1/4 of a rupee.

But they rise and fall according to the demand there is for them, and the quantity in the market.

**Coinage.**—The Act No. XIII. of 1862 provides for a new silver and a new copper coinage, thus:—

That from November 1, 1862, no silver or copper coins, except those mentioned below, shall be coined at the Mints in British India:—

**Silver Coin.**

- A rupee to be called the Government rupee.
- A half rupee.
- A quarter rupee or four anna piece.
- An eighth of a rupee or two anna piece.

**Copper Coin.**

- A double pie or half anna.
- A pie or quarter anna.
- A half pie or one-eighth of an anna.
- A pie, being one-third of a pie, or one-twelfth of an anna.

That the rupee so coined shall be 180 grains troy, and the standard as follows:— $\frac{11}{12}$  or 165 grains of pure silver;  $\frac{1}{12}$  or 15 grains of alloy. The other silver coins shall be of proportionate weight and of the same standard.

The copper coins, viz.:

The double pie shall weigh 800 grains troy.
The pie " " " 100 " "
The half pie " " " 50 " "
The pie " " " 33 1/3 " "

Until the Governor-General in Council shall otherwise order, the silver and copper coins so coined shall bear on the obverse the likeness and the name of her Majesty Queen Victoria, and the inscription *Victoria Queen*, and on the reverse the designation of the coins in English filled by the word *India*, with such date and embellishments on each coin as the Governor-General in Council shall from time to time direct.

**British-Indian Weights and Measures.**—The *tola* is the unit of the British-Indian ponderary system. Its advantages are—1. That the maund, formed from the modified weight, would be precisely equal to 100 English troy pounds; and, 2. That 35 seers would also be precisely equal to 72 pounds avoirdupois: thus establishing a simple connexion, void of fractions, between the two English metrical scales and that of India. The *tola* weighs 180 grains English troy weight. From it upwards are derived the heavy weights, viz. *Chittack*, *Seer*, and *Mau* (or Maund); and by its sub-division the small or jeweller's weights, called *Mashas*, *Ruttees*, and *Dhans*.

The following scheme comprehends both of these in one series:

Mau	Pusserree	Seer	Chittack	Tola	Masha	Ruttee	Dhan
1	8	40	610	3200	38100	307200	1288800
	1	5	80	400	4800	38100	153500
		1	16	80	960	7680	30720
			1	5	60	480	1920
				1	12	96	384
					1	8	32
						1	4

The *Mau* (or that weight to which it closely accords in value, and to which it is legally equivalent in the new scale) has been hitherto better known among Europeans by the name of *Bazaar Maund*, but upon its general adoption, under Regulation VII. of 1853, for all transactions of the British Government, it should be denominated the *BRITISH MAUND* (in Hindee *Ungreeze Mau*), to distinguish it at once from all other weights in use throughout the country. In the same way the Madras, Bombay, and Furruckabad ropce (when the Sicea rupee is abolished, and an English device adopted) may be called the *British rupee*, and in the native language *Ungreeze ruqya*.

The *Pusserree* is, as its name denotes, a five seer weight, and therefore should not form an integral point of the scale, but as its use is very general, it has been introduced for convenience of reference.

The *Seer* being in the retail business being liable, according to hitherto prevalent article sold as well as rarily referred to in cantile dealings, as sicea, buurrees, taking *seer* being always 8

The *Chittack* is the gross weights, and halves and quarters thus marking the which are otherwise the *seer* &c. to the

The *Tola* is chiefly precious metals and is received in this de bullion produce are also usual at the mint of the *tola* into annas of *mashas* and *ruttees*

		1

The *Seer* being the commonest weight in use in the retail business of the bazaars in India, and being liable, according to the pernicious system hitherto prevalent, to vary in weight for every article sold as well as for every market, is generally referred to the common unit in native mercantile dealings, as 'the seer of so many *tolas*' (or *sicen*, *blurrees*, *taknis* &c.); the standard or *bazaar seer* being always 80 *tolas*.

The *Chittuck* is the lowest denomination of the gross weights, and is commonly divided into halves and quarters (called in Bengalee *kacha*); thus marking the line between the two series, which are otherwise connected by the relation of the seer &c. to the *tola*.

The *Tola* is chiefly used in the weighing of the precious metals and coin; all bullion at the mints is received in this denomination, and the tables of bullion produce are calculated per 100 *tolas*. It is also usual at the mints to make the sub-divisions of the *tola* into *annas* (sixteenths) and *pie*, in lieu of *masias* and *ruttees*.

**Comparison of the Tola and Maud with the Gold and Silver or Troy Weights of other Countries.**

*Masias*, *Ruttees*, and *Dhans* are used chiefly by native goldsmiths and jewellers. They are also employed in the native valuation; by assay of the precious metals: thus 10 *masias* fine signifies 10.12ths pure, and corresponds to '10-oz. touch' of the English assay report of silver. There is a closer accordance with the English gold assay scale, inasmuch as the 96 *ruttees* in a *tola* exactly represent the 96 carat grains in the gold assay pound, and the *ghan* the quarter grain.

British-Indian weights	English troy weights				French weights
	lbs.	oz.	dwt.	grs.	grammes

**Comparison with Troy Weights.**—For the conversion of English troy weights into those of India, the following scale will suffice, since the simplicity of their relation renders a more detailed table unnecessary.

Lb. Tr.	Oz.	Dwt.	Grs.	Tols and Dec.
1	12	240	5760	3.9000
	1	20	480	2.6666 &c.
		1	24	0.1333 &c.
			1	0.0055 &c.

The accordance of the *mun* weight with the 100 lbs. troy of England affords a ready means of ascertaining its relative value in the standards of other countries employed in weighing the precious metals, since tables of the latter are generally expressed in lbs. troy. The following are a few of those valuations or the principal weights of Europe &c. extracted from Kelly's *Cambist*, page 222. The weights in troy grains have been converted into *tolas* by dividing them by 180.

*Required the equivalent of 57,353 muns 35 seers and 6 chittucks in avoirdupois pounds.*

Taking the numbers opposite to 57, 35, and 30 respectively, and removing the decimal point—in the first, three places to the right hand; in the second, one place to the right; and in the third, one place to the left, we have

$$\begin{array}{r} 57,000 \text{ mounds} = 16302856 \\ 350 \qquad \qquad \qquad 28000 \\ \hline 3 \qquad \qquad \qquad 216:857 \\ 37 \text{ seers} \qquad \qquad 70:114 \\ 6 \text{ chit.} \qquad \qquad \qquad 771 \\ \hline \text{lbs. 4794:9:712} \quad 17 \text{ oz. nearly.} \end{array}$$

Since 35 seers are exactly equal to 72 lbs. avoirdupois, the following simple and accurate rules for their mutual conversions will be found equally convenient with the table:

**Rule I.—To convert Indian Weight into Avoirdupois Weight.**

1. Multiply the weight in *seers* by 72 and divide by 35: the result will be the weight in lbs. avoirdupois; or
  2. Multiply the weight in *maunds* by 36 and divide by 49: the result will be the weight in cwt. avoirdupois,
- One ton = 27.222 *maunds*, or 27½ *maunds* nearly.

**Rule II.—To convert Avoirdupois weight into Indian weight.**

1. Multiply the weight in lbs. av. by 35, and divide by 72: the result will be the weight in *seers*; or
  2. Multiply the weight in cwt. by 49, and divide by 36: the result will be the weight in *maunds*.
- One *maund* = 82½ lbs. avoirdupois exactly.

**For converting Avoirdupois Weights into British-Indian Weights.**

Tons	Muns or Bazaar Maunds	Cwt.	Muns or Bazaar Maunds	lbs.	Muns or Bazaar Maunds						
100	2722	10	10	19	25	34	74	100	1	8	93
90	2459	9	9	18	24	20	0	90	1	5	124

4	108	5	10	4	5	17	12	4	0	1	153
3	81	26	11	3	4	5	6	3	0	1	74
2	54	17	12	2	2	29	12	2	0	0	153
1	27	8	11	1	1	14	7	1	0	0	74

The salt maund is 2½ per cent. heavier than the bazaar maund, having 82 *tolas* to the seer.

**Coins.**

$$\left. \begin{array}{l} 2 \text{ double} \\ 12 \text{ pie, small} \\ 16 \text{ annas} \\ 16 \text{ rupees} \end{array} \right\} \text{make} \left\{ \begin{array}{l} 4 \text{ single pysa} \\ 1 \text{ anna} \\ 1 \text{ rupee} \\ 1 \text{ gold mabar} \end{array} \right.$$

When accounts are kept in rupees, they use the imaginary pic of 12 to an anna. A small copper coin of the value of a pic has recently been put in circulation.

Small shells, called cowries, are also made use of for paying coolies &c. which are reckoned as follows:—

4 cowries } 1 gundah  
20 gundahs } make 1 pun  
8 puns } 1 anna

But these rates vary from time to time. The anna a few years ago was valued at 5 puns.

1	0-082	0-073	1	0-008	1	0-008

The word *mun*, of Arabic or Hebrew origin, is used throughout Persia and Northern India; but, as might be expected, it represents very different values in different places: thus the *mun* of Tabriz is only 6 1/2 lbs. avoird., while that of Paldoda, in Ahmednuggur, is 163 1/2 lbs.

It is probable that the seer or *ser*, a Hindoo weight (*setak*), was more uniform than the maund, since it was sub-divided upon the tola (*tolaha*), which, with its sub-division, the *massa*, must, in very ancient times, have been extensively known throughout commercial Asia: there can be little doubt that the *tale* and *mace* of the Chinese are identical in origin.

It may be generally assumed that the maund system follows the common scale, viz. —

16 chittacks = 1 seer  
40 seers = 1 maund  
20 maunds = 1 candy or maunce

The use of a five-seer weight also universally prevails under the name of *pusseree*, *dhurce*, or *ris*. The *dhurce*, from its name, however, seems to be properly a measure; and accordingly while in Malwa it is equal to 5 seers, in other places it is found of 4, 4 1/2, 5 1/2, 10, 11, and 12 seers. The terms *adhola*, *adhelee* (half), *pao*, *powah* (quarter), *cdhpao* (half-quarter), frequently occur: they explain themselves.

**Weight.**—The sub-divisions of the ponderary systems, throughout the whole of British India, generally agree in name, though they differ in value. Thus in every case

(variable) dhan = 1 ruttee  
8 ruttees = 1 massa  
12 massas = 1 tola  
(variable) tola = 1 chittack  
16 chittacks = 1 seer  
40 seers = 1 maund

The number of dhans in a ruttee, and the number of tolas in a chittack, are arbitrary. The annexed tables show all the varieties that have been brought to notice. To save needless repetition, we shall refer to them as may be necessary, and give in detail only the peculiar systems of each district.

**Table I.**

4 or 8 dhana = 1 ruttee  
8 ruttees = 1 massa  
12 massas = 1 tola

**Table II.**

**Measure.**—The linear measures of India generally are based on the following system:—

5 ungootees or fingers' breadth = 1 mooshtika or palm  
6 mooshtikas = 1 busta, or haath, or cubit

Also—

11 jussos or lengths of the thumb  
20 jussos  
21 jussos  
42 ungootees

From the very c. Jorvis, as given in logy, it appears that

1 cubit or haath of 14 guz  
1 guz of 10 jussos

Also—

11 Jussos or lengths of the first joint	} = 1 hauth or cubit
of the thumb	
20 Jussos	= 1 guz or clothier's yard
24 Jussos	= 1 guz or artificer's yard
42 Ungoolies	= 1 Mahomedan guz or yard

From the very careful investigations of Major Jervis, as given in his works on Indian Meteorology, it appears that

1 cubit or hauth of 14 Jussos or 24 ungooolies	= 19.5189 inches
1 guz of 20 Jussos	= 27.0271 "
1 guz of 24 Jussos	= 33.0325 "
1 guz of 14 ungooolies	= 31.2106 "

The standard of Ilahee guz used in the land settlement of the North-Western provinces has been fixed at 33 inches, whence

33 inches	= 1 Ilahee guz
3 guz	= 1 hauth or measuring rod
20 x 20 = 400 sq. fathoms	= 1 beegah = 3025 sq. yards

In Bengal the hauth or cubit has been assumed to be 18 inches in length, and thus generally—

4 square hauths	= 1 square cowrie or kurra
4 " " " "	= 1 " " " " " " " "
20 " " " "	= 1 " " " " " " " "
20 " " " "	= 1 beegah = 1,600 sq. yards

These are the beegals most in use, and are the only values referable to fixed standards. The hauth may be said to vary between 15 and 30 inches, and the beegah between 1,500 and 3,000 square yards. The data at present before us are not sufficiently precise, and we have consequently not affected an accuracy which in truth we could not attain.

**Banks.**—The Bank of Bengal was established in 1809. Its authorised capital, according to Thacker's *Bengal Directory* for 1868, is 3,00,00,000 rupees, which, at 2s. the rupee, gives 3,000,000*l.*, of which 2,200,000*l.* has been paid up. The shares are now selling at a high premium. The management is conducted by nine directors—three appointed by Government, and six elected by proprietors: time of service for the latter three years. This bank possesses peculiar advantages, and consequently its circulation extends over a very large area, its notes being received at all public offices, in payment of revenue, by the collectors of the various districts. Besides this (exclusive of savings' banks) there are 18 other banks, or branches of banks, of which 13 are 'limited.' The nominal capital of these amounts in the aggregate to about 14,000,000*l.*, the paid up capital, however, falling much short of this amount.

**Insurances.**—The fire, life, and marine insurance business is conducted by 62 establishments and agencies, 8 of which are local, the nominal capital amounting in aggregate to over 30,000,000*l.* The larger proportion appear to conduct marine insurance exclusively.

**Pilotage, Port Charges &c.**—The Marine Board at Calcutta have issued the following regulations as to pilotage, port charges &c. :—

1. Commanders are requested, prior to quitting their vessels, on arrival off Calcutta, to fill up and certify, or cause to be filled up and certified, a form of certificate showing the actual registered tonnage, the draught of water, and whether the vessel has or has not been tugged by a steamer any part of the way, or has not had the use of a row-boat. This form will be furnished to the pilot, in order to the bills of the vessel being correctly made out.

2. Commanders are further requested, as early after their arrival as possible, to notify in writing to the master attendant the name and residence of the reference for the payment of their vessels' bills.

3. On the receipt by the master attendant of the above certificate and written reference for payment, a single bill will be prepared, including

inward pilotage, port dues, and row-boat hire (if any), which, together with the certificate, will be forwarded to the collector of customs for collection within fifteen days of the arrival of the vessel, and having on it the name and residence of the party referred to for payment, which commanders are requested to furnish to the master attendant in writing, as early after their arrival as practicable; that officer will more readily be enabled to present it. By this arrangement all the charges connected with the vessel up to her arrival off Calcutta will be embodied in one bill, instead of, as hitherto, being made in separate bills.

4. In the event of the vessel's docking, or being transported at the desire of the commander, it is requested that a certificate may be given by the commanding officer of the operation having been performed, in order to its accompanying the bill when presented for payment to the referee.

5. The charges for hauling to the chain moorings, for their monthly hire, and for hauling from the moorings, will be in separate bills, including the charge for hauling to the moorings, that for occupying them, and that for hauling from them; and commanders are requested to give, or cause their commanding officers to give, to the master attendant or the harbour-master certificate of the date of hauling to and from the moorings, which certificate, as before, will accompany the bill when presented for payment. The hire of the moorings will be charged for the day on which the vessel is hauled thereto, without reference to the period of the day; and in like manner no charge will be made for the day on which she hauls from her moorings, however late in the day she may quit them.

6. The system of charging outward pilotage on an estimated draught of water, with an addition of 10 per cent., subject to adjustment after the vessel has sailed, and of charging a certain number of days for a row-boat, subject to a like adjustment, is abolished; and in future the outward pilotage and charge for row-boat hire on outward-bound vessels will be made as follows:—

When the vessel is finally laden, the commander is to give notice thereof to the master attendant, when the draught of water is to be ascertained and certified by the commander or commanding officer on the part of the vessel, and by the pilot on the part of Government, subject, in case of dispute, to the decision of the master attendant. On receipt of the certificate, the master attendant will cause a bill to be made out for the regular amount of pilotage, and for the row-boat hire. The bill and certificate will be presented in due course for payment.

7. As, however, it frequently happens that vessels are taking in cargo or filling their water up to the last day of their departure, or that from other causes the bills for the chain moorings and outward pilotage cannot be made out till the eve of departure, owners, agents, and commanders are, in such cases, particularly requested, with a view to despatch, to cause an individual to attend at the Banksball and expedite the transmission of the bill and certificate to the collector of customs for collection.

8. In the event of a vessel being tugged any part of the way down by steam, or not having the use of a row-boat, commanders are to obtain from the pilot at Kodgeroo a certificate to that effect, which they should forward by dak to their agents. On receipt thereof, agents are requested to make out a bill against her Majesty's Government for the  $\frac{1}{2}$  deduction from the pilotage allowed if tugged by steam, or for the row-boat hire paid, as the case may be, and to forward it, together

with the certificate, to the civil paymaster for audit and payment.

9. In cases where a vessel leaves Calcutta, avowedly intending to fill up cargo at some place below, the pilotage will be charged at the draught at which she leaves Calcutta in like manner, though at the reduced amount, as if she had proceeded to sea; and with respect to the subsequent pilotage charge from the place at which the vessel takes in the additional cargo to sea, owners or agents of vessels will be required to furnish a special guarantee to pay the amount chargeable according to a certificate of the draught of water to be signed by the commander or commanding officer and pilot.

10. Two sets of moorings at Diamond Harbour having been fitted specially to enable vessels

arriving in distress from loss of anchors and cables to be readily moored, the charge will be Co.'s Ra. 10 for mooring and unmooring, and the daily hire the same as for the moorings at Calcutta. The moorings will of course be available to vessels not in distress from loss of anchors and cables, but the harbour-master will be instructed at all times to keep two sets vacant during the SW. monsoon to meet casualties.

11. Annexed is a statement of the several port and pilotage charges; and the master attendant trusts that, with these and the certificates of the commanders or commanding officers before them, owners and agents of vessels will at all times be enabled readily to ascertain the correctness of the bills, and to discharge them on presentation.

Pilotage Chargeable on Vessels: Intermediate or Broken Pilotage.

Table with columns for Draught of Water, Full Pilotage, and five intermediate pilotage rates (1-5) for Co.'s Ra. and Inward/Outward directions.

PILOTAGE CHARGES.

Customs Wharfage Rules and Scale of Charges.—The following new Wharfage Rules and Scale of Charges have been in operation from January 1, 1860:—

I. Goods lying on the Wharf or in the Custom House Compound, and not under cover, to be allowed to remain four days without incurring any charge for rent, after that period single rent (at the rates enumerated in the annexed Table) to be charged for four days, and double rent for any further number of days.

II. Goods lying under cover within the Custom House to be allowed two days rent-free, two days single rent, and for any number of days in excess of that period double rent.

III. Goods landed at the Custom House and Goods remaining in the shade on the Ghaut beyond twenty-four hours shall be charged Double Wharfage, and if remaining beyond eight days Treble Wharfage.

IV. The day of landing and that of removal to be reckoned as one day; Sundays and holidays are not reckoned in the rent-free terms. When delay is caused by the inability of the Custom House Officers to examine and pass the goods after application in due course for that purpose, the days of such delay are not to reckon in any term.

Metals, per br. md.	0 0 6

New Wharfage Rules.—Importers and others landing goods at the Custom House are to appoint watchmen to take care of them: such watchmen are to have in their possession the badge or written authority of the persons appointing them, and which is to be produced when required by an officer of Customs.

Wharf Assistants are strictly cautioned from receiving packages containing matches, acids, crackers, gunpowder, gun-caps, saltpetre, or other inflammable articles within their sheds, and to bring to the notice of the Controller as soon as they find from their boat notes or information otherwise received that such articles are about to be landed. Any person bringing such goods into the Sheds and Godowns of the Custom House will be liable to a fine of 500 Rupees, and to make good all damages arising therefrom.

No packages are allowed to be opened on the Wharf without the Collector's orders, or if for appraisement, under direction of one of the Appraisers.

No full casks or cases of wine, beer, or any other liquor are to be passed out until the empty ones covered by the same Perwannah are removed first. This rule is applicable in cases where parties are allowed to fill up beer, spirits, tar &c., on the wharf before passing.

As the Out-Sheds are only intended for the accommodation of goods landed before the opening and after the closing of the gates, unless under special permission of the Collector, and with certain exceptions, no goods are allowed to be placed therein between the hours of 10 A. M. and 5 P. M.

The following goods only are allowed to be landed outside at all hours:—Timbers and planks of all descriptions, heavy anchors and chains, tar, rosin, pitch, and all heavy packages which require the use of the crane.

All expenses incurred for advertising and removing packages are to be paid by the owners or consignees thereof at the time of passing.

An extra Officer and a Peon to be appointed to all private bond Godowns at the expense of the bonders. The former to receive and the latter to accompany the goods passing into private bond. An officer is also appointed, at the expense of the bonders, to pass out goods from private bond on which duty has been paid.

A Peon (if one be available) will be appointed

by the Officer at the Bonded Warehouse to accompany goods into public bond, otherwise a fee of 4 annas must be paid for an extra Peon.

The rate to be charged by the extra Officer has been fixed from 10 A.M. to 1 P.M. at 1 rupee and 8 annas; and any further time beyond the above up to 5 P.M., 3 rupees. From 5 to 6 P.M. an extra charge of 12 annas will be made, and 1 rupee from 3 to 6-30 P.M. after which time Officers are not expected to work. Fee for Peons, 4 annas each per day.

A conveyance fee of 1 rupee to be paid to the extra Officer when required to attend at a Godown the distance of which from the Custom House exceeds  $\frac{1}{2}$  a mile.

Instances having occurred in which goods could not be received and duly secured in the Bonded Warehouse on account of passing out late from the Wharf, Assistants will not allow any goods intended for private bond to be carted after 4 P.M., and for public bond after 4-30 P.M.

No work will be allowed on Sundays and Christian holidays.

Work before and after hours, and on general holidays, will be allowed only on payment of fees, and under sanction of the Collector.

The rate for working on those holidays, and before and after hours, i.e., from 7 to 10 A.M. and from 5 P.M. to sunset, is fixed at 5 rupees for each requisition for the Assistants, and 8 annas to the Peons; if after sunset, extra fees of 5 rupees and 8 annas, respectively, will be charged.

All applications for working on holidays should be sent in to the Collector the day previous, and in time to allow the necessary arrangements to be made.

Goods lying under cover within the Custom House to be allowed four days rent-free, two days single rent, and for any number of days in excess of that period, double rent up to fourteen days (exclusive of the rent-free and single rent terms), after that to treble rent for ten days more, and quadruple rent for any period in excess of that term. These rates to be calculated by the single rates fixed in Government Order No. 2796, dated November 15, 1859, published in the *Calcutta Gazette* on January 4, 1860.

All empty Cargo Boats lying for more than twenty-four hours on the River bank within the limits of the Custom House, i.e., from Colliah Ghant to Clive-street Ghant, will be charged a rent of 5 rupees per day.

Country timber landed within the above limits will be charged, from the date of landing, a rent of 1 rupee per log per day.

N.B.—A second charge of half the above rates will be made on all packages not carried when lifted from the boat.

*Trade of Calcutta.*—During the present century the trade of Calcutta has experienced some very striking vicissitudes. Previously to the opening

of the trade in 1814-15 cotton piece goods formed the principal article of export from India; the value of those exported from Calcutta, at an average of the five years from 1814-15 to 1818-19, being (at 2s. per sicca rupee) 1,260,736l. a-year. The extreme cheapness of labour in India, and the excellence to which the natives had long attained in several departments of the manufacture, would, it might have been supposed, have sufficed to place this important department beyond the reach of foreign competition. But the wonderful genius of our mechanics, the admirable skill of our workmen, and our immense capital, have far more than counterbalanced the apparently insuperable drawback of high wages, and the expense of bringing the raw material of the manufacture from America, and even India itself; and have enabled our manufacturers to bear down all opposition, and to triumph over the cheaper labour, contiguous material, and traditional art of the Hindoos. The imports of British cottons and twist into India have increased since 1814-15 with a rapidity unexampled in the annals of commerce; and the native manufacture has sustained a shock from which it is not very likely it will ever recover. The influence of these circumstances on the trade in piece goods has been very striking. During the year 1857-58 the value of those exported from Bengal was no more than 73,231l., being only about  $\frac{1}{10}$  of what it amounted to 36 or 37 years previously! In 1862-3 it fell, including twist and yarn, to 23,878l., but rose to 119,576l. in 1863-4, and was 78,357l. in 1864-5.

The importation of bullion into Calcutta has fluctuated in an extreme degree since the opening of the trade in 1814. Bullion had from the earliest period been one of the most advantageous articles of export to the East, and it continued to be largely imported into Calcutta down to 1827-28. But from that period the imports declined, and were comparatively inconsiderable down to 1837-38; indeed, in 1831-32, and 1832-33, the exports of bullion exceeded the imports; but since 1837-38 its importation has again become greater than ever. [EAST INDIES; PRECIOUS METALS.]

It does not, however, appear to be very difficult to account for these variations. Formerly the export of bullion to India, though influenced by other causes, was mainly occasioned by the difficulty under which we were then placed of providing articles of merchandise suitable for the Indian markets sufficient to balance our imports. The astonishing increase of our exports of cotton goods and yarn to India has, however, gone far to obviate this difficulty: in truth, the fair presumption seems to be, that in future the circumstances of the case will be reversed, and that the difficulty of procuring return cargoes of produce suitable for our markets will, in ordinary years, be found to be the principal obstacle to the extension of our trade with Hindostan as well as with China. There seems to be no limit other than the necessity of furnishing equivalents in their stead, to the indefinite sale of our products in the East; and in so far, at least, as India is concerned, the facilities for furnishing such equivalents will, most likely, be gradually increased. The soil and climate of Bengal seem to be peculiarly well suited to the production of grain, sugar, indigo, opium, silk, cotton, saltpetre, jute, tea, spices, and a host of other articles; and as the inhabitants are not deficient in industry, nor in the desire to improve their condition, it would seem that there wants only a reduction of the land-tax, which is so heavy as to paralyse all their energies, to enable them to increase their articles of export to an indefinite extent, and to

render their country prosperous.

Calcutta is the chief trade of Bengal; the Chittagong, Cuttack figures and statement mainly the external deney. Of the prin this part of India, o cotton to the United (in this article there h increased export aris in America); indigo t ricia, France, and Gerri dom, Europe, and Am dom, France, Mauri Persian Gulfs; grain Mauritius; raw silk France; saltpetre to U China, and France; s America, Mauritius, an to United Kinglom ar chiefly to the United former New South Wa

*Imports.*—The princi Calcutta consist of ce piece goods, chiefly Bri apparel of all kinds, bo nery, malt liquors, metal iron, tin, spelter, mar and military stores, rail wines, salt, woollen goo

render their country comparatively flourishing and prosperous.

Calcutta is the chief port for carrying on the trade of Bengal; the minor ports being Balasore, Chittagong, Cuttack, and Pooree. The subjoined figures and statements, therefore, will represent mainly the external trade of the Bengal Presidency. Of the principal articles exported from this part of India, opium goes to China chiefly; cotton to the United Kingdom, France, and China (in this article there has been of late years a largely increased export arising from the late disturbances in America); indigo to the United Kingdom, America, France, and Germany; jute to United Kingdom, Europe, and America; rice to United Kingdom, France, Mauritius, America, Arabian and Persian Gulfs; grain of other kinds principally to Mauritius; raw silk to United Kingdom and France; saltpetre to United Kingdom and America, China, and France; spices to United Kingdom, America, Mauritius, and Straits Settlements; seeds to United Kingdom and America; sugar and tea chiefly to the United Kingdom, though of the former New South Wales receives largely.

**Imports.**—The principal articles of import into Calcutta consist of cotton twist and yarn, and piece goods, chiefly British manufacture; wearing apparel of all kinds, books and stationery; machinery, malt liquors, metals (raw) consisting of copper, iron, tin, spelter, manufactured metals, naval and military stores, railway materials, spirits and wines, salt, woollen goods, also bullion, or treasure.

The following tables will show the state of the trade of Bengal at different periods:—

In 1865-66, 1,089 vessels of 801,170 tons entered the port, and 1,120 of 854,440 tons cleared out.

**Remarks on Exports.**—The reader will elsewhere find [CANTON; OPIUM] pretty ample information in relation to the trade in opium. It is sufficient here to state that it has rapidly grown in magnitude and importance. At an average of the years 1830-31 and 1831-32 the exports from Calcutta were 7,273 chests, worth 1,121,560*l.*; whereas during the year 1865-58 the exports had increased to 38,874 chests, worth 746,083*l.* In 1863-4 the value of the exports from Bengal was 5,207,236*l.*, and in 1864-5 4,724,300*l.* China is not the principal merely, but almost the only market for opium, so that the trade between Calcutta and her is now second only to that between Calcutta and England. It is true that large quantities of opium are shipped for Singapore and other intermediate ports, but China is its ultimate destination.

Towards the close of last century the exports of indigo from Calcutta were comparatively trifling; but about that period Europeans began to engage in the business; and the culture of the plant was, in consequence, so much extended, and the preparation of the drug so much improved, that it has been for a lengthened period an article of primary commercial importance. Of late years, however, the growth of indigo appears to have increased but slowly; the shipments in 1830-31 and 1831-32 being 2,856 tons, and those in 1857-58 only 3,071 tons. The value of the exports from Bengal in 1864-5 (1,426,888*l.*) is, however, higher than that of 1863-4. The stationary state of the trade has been ascribed partly to the influence of importations from Java, where indigo is now very extensively raised, and partly to the alleged decrease in the use of blue cloth. France is, next to England, the great market for indigo.

We had occasion to remark, in a former edition

of this work, that of the various articles brought from India, sugar seemed to be the one in which an increase of importation would most likely take place. In 1835 the duty on East India sugar, previously comparatively high, was reduced to the amount of that on West India sugar; and that circumstance, and the continued high price of sugar in this country, gave a powerful stimulus to its culture in and exportation from India. But the great increase in the exports of sugar from 1830 down to 1840 has not been continued; and now that the sugar trade is placed on a proper footing by the abolition of the discriminating duties on foreign sugars, the importations from India will, perhaps, be but slowly increased.

In consequence of the American civil war the exports of cotton from Bengal increased enormously, the value having risen from 76,536*l.* in 1860-61 to 3,074,403*l.* in 1863-4; but it fell to 2,452,759*l.* in 1864-5, and the average export for subsequent years will probably be much less.

The exports of saltpetre from India have not, as many anticipated, been affected by the competition of nitrate of soda from South America. In 1830-31 the exports from Calcutta were 424,729 *fat.* maunds; whereas, in 1856-57, they amounted to 946,801 *Ind.* maunds. The value of the exports from Bengal, however, fell from 813,101*l.* in 1862-3 to 529,010*l.* in 1864-5.

The exports of rice from Bengal fluctuate very greatly. This is not caused so much by variations in the crops of the country as by variations in those of other countries; for, when a scarcity occurs in almost any parts of continental Asia or in any of its islands, recourse is most frequently had to Bengal to supply the deficiency, and the demands thence arising have been sometimes enormous. In 1831-32, for example, the exports of rice from Calcutta to the coast of Coromandel amounted to only 16,545 maunds, whereas in 1833-34 they amounted to 1,252,056 maunds. (Bell's *Comparative View of 1832-33 and 1833-34*, p. 41.) The value of the exports of rice from Bengal in 1864-5 was 2,611,759*l.* It is worthy of remark, that while Bengal is shipping immense supplies of rice and other grain to distant parts, a large part of her own population is frequently in a state of great want and suffering. Ireland is not, therefore, the only country in which the most abject poverty and wretchedness on the part of the inhabitants are found combined with great fertility of soil and a large exportation of food.

Besides the articles of native Indian produce exported from Calcutta, she re-exports pretty considerable quantities of various articles brought from other parts. The value of the British cotton goods re-exported amounts to about 200,000*l.* a-year.

They are principally for silver. The cotton the Burmese dominions in Burma, as in England, genuineness of the smuggled calicoes from the Government without much difficulty. CALICO (Ger. kaftun); Swed. kattun; Ital. tela bambagina; Portug. algodim; Pol. baweluka; Chi. cotton; so called from coast, whence it was all white or unprinted; nominated calicoes; this term is applied printed.

*Historical Notice of* This art, though ancient, has been practised in the East on the shores of the Calicut, the figures of which with a colour formed by iron and alum, and used in the East, as the clothes themselves, and the colours of which had not those used with the use of mordant passage in Pliny (*Hist. Nat.*), which, though in some instances, the ancient Egyptians with the principle of calico, says he, 'the clothes, and drugs (sorbentibus medicamentis) were used in a vat full of boiling dye, a little; when they were painted of various colours, seeing that there is one (unus in cortina color) should be produced by the Pliny further states that hevesive they could not be clothes were the stronger process is known to India from the earliest mechanical inventions of the cause of vast improvement and beautiful art; but shows distinctly that we have only perfecting a practice in the remotest Calico Printing in Calicoes.—In Great Britain has formed, for a considerable and valuable trade, truly said to have grown of repeated efforts for its use of calicoes from mand for linen and was passed in 1721, imposing weaver, and of 20*l.* upon calico! Fifteen years' statute was so far modified in 1753, when it was factored in Great Britain 'provided the warp the yarn.' This was the law till after the invention of introduced a new era in ton manufacture, which obvious to everyone, passed, allowing printed cotton, to be used, after yard (raised to 3*l.* in 18

They are principally bartered with the Burmese for silver. The conveyance of the latter out of the Burmese dominions is strictly prohibited; but in Burma, as in England and elsewhere, the liguency of the smuggler is too much for the vigilance of the Government, and the trade is carried on without much difficulty. [EAST INDIES.]

CALICO (Ger. kattun; Dutch, katoen; Dan. tøn; Sweil. eattun; Fr. coton, toile de coton; Ital. tela bambagina, tela dipinta; Span. tela de algodón; Port. pano de algodão; Russ. wũboika; Pol. bawelnika; Chinese, pi). Cloth made of cotton; so called from Calicut, on the Malabar coast, whence it was first imported. In England, all white or unprinted cotton cloths are denominated calicoes; but in the United States this term is applied to those only that are printed.

*Historical Notice of the Art of Calico Printing.*—This art, though apparently one of the most difficult, has been practised from a very remote era. Herodotus mentions (lib. i. s. 202) that a nation on the shores of the Caspian were in the habit of painting the figures of animals on their clothes, with a colour formed from the leaves of trees bruised and soaked in water; and he adds that this colour was not effaceable, and was as durable as the clothes themselves. It is difficult to imagine that the colours could have been so permanent, had not those using them been acquainted with the use of mordants. There is, however, a passage in Pliny (*Hist. Nat.* lib. xxxv. sec. 11), which, though in some respects obscure, shows that the ancient Egyptians were fully acquainted with the principle of calico printing. 'They paint,' says he, 'the clothes, not with colours, but with drugs (sorbentibus medicamentis) that have no colour. This being done, they immerse them in a vat full of boiling dye, and leave them there for a little: when they take them out, they are painted of various colours. It is extraordinary; seeing that there is only one colour in the vat (unus in cortina color), that a variety of colours should be produced by the operation of the drugs.' Pliny further states that the colours were so adhesive they could not be washed out; and that clothes were the stronger for being dyed. A similar process is known to have been followed in India from the earliest times. The chemical and mechanical inventions of modern ages have been the cause of vast improvements in this ingenious and beautiful art; but the passage now quoted shows distinctly that we have, in this instance, been only perfecting and improving processes practised in the remotest antiquity.

*Calico Printing in this Country. Duties on Calicoes.*—In Great Britain the printing of cottons has formed, for a considerable period, a very important and valuable business, which may be truly said to have grown up amongst us in despite of repeated efforts for its suppression. To prevent the use of calicoes from interfering with the demand for linen and woollen stuffs, a statute was passed in 1721, imposing a penalty of 5*l.* upon the weaver, and of 20*l.* upon the seller, of a piece of calico! Fifteen years later this extraordinary statute was so far modified, that calicoes manufactured in Great Britain were allowed to be worn, 'provided the warp thereof was entirely of linen yarn.' This was the law with respect to calicoes till after the invention of Sir Richard Arkwright introduced a new era into the history of the cotton manufacture, when its impolicy became obvious to everyone. In 1774 a statute was passed, allowing printed goods, wholly made of cotton, to be used, after paying a duty of 3*d.* per yard (raised to 3½*d.* in 1806); and enacting some

regulations as to the marks to be affixed to the ends of the pieces, the stripes &c.

This Act continued in force down to 1831; but, though an improvement upon the old law, it was much, and justly, complained of. Its injustice and injurious operation were very forcibly pointed out by Mr. Poulett Thomson (afterwards Lord Sydenham), in his excellent speech on taxation, on March 26, 1830. 'It is a matter of surprise to me,' said the right hon. gent., 'that this most impolitic impost should have been allowed to continue, especially when it was declared by the committee of 1818 to be "partial and oppressive, and that its repeal was most desirable;" who, indeed, can examine it and not feel the truth of this observation? Is it credible, that, in order to raise a nett revenue of 599,669*l.*, a gross tax should be imposed of 2,019,737*l.*? and yet this was the return, according to the paper on your table, for 1828. And these figures are still far from showing the real cost of the collection of this tax;—that must be taken upon the gross produce: and supposing the rate of the collection for the excise to be 5 per cent., which is less than it really is, you have a cost of 20 per cent. on the nett produce of this tax, for charges. In addition to this, from all the enquiry I have been able to make, the increased cost to the manufacturer is fully 5 per cent. upon the whole quantity made; so that you have thus two sums, each of 100,000*l.*, levied on the public, for the sake of exacting a duty of 600,000*l.* But the revenue is again, in this case, far from being the measure of the injury you inflict. The inequality of the tax constitutes its chief objection. The duty is levied upon the square yard, at 3½*d.* per yard. Thus, the piece of calico which sells for 6*d.*, duty paid, contributes equally with that which is worth 5*s.* a yard. You levy an onerous and oppressive tax of 100 or 150 per cent. upon the poor, who are the purchasers of inferior cottons; whilst the rich, who buy only the finest kinds, pay but 10 or 15 per cent.'

It is due to Mr. Thomson to state that, besides giving this forcible exposition of the inequality and injurious operation of the duty on printed goods, one of his first measures, on coming into office, was to propose its repeal.

In consequence, partly of the abolition of the tax, but principally, no doubt, of the extraordinary increase of the cotton manufacture, the business of calico printing has increased prodigiously since 1830. In proof of this we may mention that in 1829, about twelve months previously to the abolition of the duty, 89,862,433 yards of all descriptions of printed goods were exported to foreign parts; whereas, in 1841, there were exported, of printed cottons only, the enormous quantity of 329,210,892 yards, of the declared value of 7,772,737*l.* Our exports of printed cottons in 1866 amounted to 897,825,517 yards, valued at 22,095,216*l.*, and in 1867 to 880,619,835 yards, valued at 19,405,384*l.* [COTTON.]

CAMBRIC or CAMBRICK (Ger. kammetuch; Dutch, kameryksdoek; Fr. cambray batiste; Ital. cambraja; Span. cambray; Port. cambray; Russ. kamertug). A species of very fine white linen, first made at Cambray, in French Flanders, whence it derives its appellation. It is now produced, of an equally good quality, in Great Britain.

CAMEL (Fr. chameau; Ital. and Span. camelo; Ger. kameel; Arab. djemel; Lat. camelus; Gr. κάμηλος). This animal is indigenous to Arabia, and we only mention it in this place on account of its extreme importance in the commerce of the East.

The camel is one of the most useful of the animals over which the inhabitants of Asia and Africa have acquired dominion. These continents

are intersected by vast tracts of burning sand, the seats of desolation and drought, so as apparently to exclude the possibility of any intercourse taking place between the countries that they separate. But as the ocean, which appears at first view to be placed as an insuperable barrier between different regions of the earth, has been rendered, by navigation, subservient to their mutual intercourse; so by means of the camel, which the Arabians emphatically call *the shir of the desert*, the most dreary wastes are traversed and the nations which they disjoin are enabled to trade with one another. By the wise economy of Providence, the camel seems formed on purpose to be the beast of burden in those regions where he is placed, and where his service is most wanted. In all the districts of Asia and Africa, where deserts are most frequent and extensive, the camel abounds. This is his proper station, and beyond this the sphere of his activity does not extend far. He dreads alike the excesses of heat and cold, and does not agree even with the mild climate of our temperate zone.' (Robertson's *Disquisition on Ancient India*, Note 53.)

The first trade in Indian commodities of which we have any account (Genesis xxxvii. 25) was carried on by camels; and they still continue to be the instruments employed in the conveyance of merchants and merchandise throughout Turkey, Persia, Arabia, Egypt, Barbary, and many contiguous countries. The merchants assemble in considerable numbers, forming themselves into an association or CARAVAN, for their mutual protection against the attacks of robbers, and the dangers incident to a journey through such rude and inhospitable countries. These caravans are often very large, and usually consist of more camels than men. The capacity of the camel to endure fatigue, and the small supply of provisions that he requires, are almost incredible. 'His ordinary burden,' says Volney, 'is 750 lbs.; his food, whatever is given him—straw, thistles, the stones of dates, beans, barley &c. With a pound of food a-day, and as much water, he will travel for weeks. In the journey from Cairo to Suez, which is 40 or 46 hours, they neither eat nor drink; but these long fasts, if often repeated, wear them out. Their usual rate of travelling is very slow, hardly above 2 miles an hour: it is in vain to push them; they will not quicken their pace; but, if allowed some short rest, they will travel 15 or 18 hours a-day.' (*Voyage en Syrie*, tom. ii. p. 383.)

The Arabians regard the camel as a sacred animal, the gift of Heaven, without whose aid they could neither subsist, nor trade, nor travel. His milk is their ordinary food; they also eat his flesh, especially that of the young camel, which they reckon excellent; its hair, which is renewed every year, is partly manufactured into stuffs for their clothes and furniture, and partly sent abroad as a valuable article of merchandise; and even its faeces serve them for fuel. (See the admirable description of the camel in Buffon.)

But, however useful to the inhabitants of parched, sandy deserts, it may be worth while, perhaps, to remark that the camel is of very little service elsewhere. He cannot walk 100 yards on wet or slippery ground without stumbling. He is totally unknown in all hilly or woody countries; and, with few exceptions, may be said to be as great a stranger in the Eastern Islands, Japan, the southern parts of China, and all the southern parts of the latter, including Bengal, as he is in Europe. In all those vast countries the ox is the most useful of the lower animals. It is used for draught (for which the camel is totally

unfit), in the cart and plough, in the carrying of burdens, in treading corn, in the oil-press &c., and finally as food.

**CAMEL'S HAIR** (Ger. *kamelhaar*; Fr. *poil de chameau*, *laine de chevron*; Ital. *pelo di camello*; Span. *pelo ó lana de camello*). The hair of the camel imported into this country is principally used in the manufacture of the pencils for drawing and painting. In the East, however, it is an important article of commerce, and is extensively used in the arts. It serves for the fabrication of the tents and carpets of the Arabs, and for their wearing apparel. Cloth is also manufactured of it in Persia and other places. The most esteemed hair comes from Persia. It is divided into three qualities—black, red, and grey. The black is the dearest, and the grey is only worth half the red. Considerable quantities of camel's hair are exported from Smyrna, Constantinople, and Alexandria. It is used in the manufacture of hats, particularly by the French. (Roese's *Cyclopaedia*, art. 'Camelus.')

In 1866 there were imported into the United Kingdom 336,392 lbs. of camel's hair, valued at 10,500l.

**CAMELET or CAMBLET** (Ger. and Dutch, *kamelot*; Fr. *camelot*; Ital. *ciambellotto*; Span. *camelote*; Russ. *kamolot*). A plain stuff, manufactured on a loom, with 2 treadles, as linens are. There are camellets of various colours and sorts; some wholly of goats' hair; others, in which the warp is of hair, and the woof half hair and half silk; and others, again, in which both the warp and the woof are of wool; and, lastly, some, of which the warp is of wool and the woof of thread: some are striped, some watered, and some figured.

**CAMOMILE or CHAMOMILE** (Fr. *camomille*; Ital. *camomilla*; Span. *manzanilla*; Lat. *chamomilla*). A well-known plant (the *Anthemis nobilis* of Linnaeus) whose flowers are used for medicinal purposes. Both varieties, single and double, but especially the former, are bitter and very aromatic. (*British Pharmacopoeia* of the Medical Council.) Most of what is brought to the London market is grown about Mitcham, in Surrey. The imports, however, are not inconsiderable, having amounted in 1852 to 82,262 lbs.; the exports, during the same year, were only 1,000 lbs. A duty of 1d. per lb. formerly laid on this article was repealed in 1845.

**CAMPHOR or CAMPHIRE** (Ger. *kampher*; Dutch, *kamfer*; Fr. *camphre*; Ital. *canfora*; Span. *alcanfor*; Russ. *kamfora*; Lat. *camphora*; Arab. and Pers. *kâfour*; Malty, *katur*). There are two descriptions of this valuable article, which must not be confounded.

1. *Camphor of Commerce*, or that met with in Europe, is obtained by boiling the timber of a species of laurel (*Laurus Camphora*), a tree found in the forests of Fokien, in China, near the city of Chinchew, very commonly in Formosa, and in certain localities in Japan. Most of the camphor imported into Europe comes from China; but a small quantity, considered of superior quality, comes from Japan by way of Batavia. The exports from Canton may be estimated at about 3,000 piculs, or 400,000 lbs.; and if to this we add the exports from Batavia of Japan camphor, amounting to about 500 piculs, the total annual exports will be about 466,000 lbs. It is brought to this country in chests, drums, and casks; and is in small, granular, friable masses, of a dirty white or greyish colour, very much resembling half-refined sugar. When pure, the camphor of commerce has a strong, peculiar, fragrant, penetrating odour, and a bitter, pungent, aromatic taste. It is in reality a concrete essential oil. Camphor, when refined, is in thin hollow cakes of a beautiful virgin white-

ness, and, if exposed to great heat, it is sublimed. Great care is therefore taken to prevent its being mixed with the exports of camphor, which are 7,466 cwt. and 9,355 lbs.

2. *Camphor of Malacca* (the *Camphora* of the port of Sumatra) is a product of the forest tree, confined to the Malay peninsula. It is in the fissures of the tree, but very few trees afford it, only in small quantities.

The younger trees are cut down, and only a few of the best are left after diligent search, examined before use. Should any be found, they are cut into logs, and the camphor is separated. The wood of the tree is therefore less liable to be much esteemed for camphor.

This species of camphor is more esteemed than that which yields a bad reputation among the Chinese, and is wholly consumed. The price of the finest Chinese camphor is 30 dollars per picul, while that of the latter 100 times former!

The virtues of this kind are overestimated. Specimens of it are indeed the quality of an inferior degree, and are used in *pien, lung-nau, and po-medicine*, employing the fire-works.

Camphor is exceedingly useful if stowed with them.

Malay camphor is without an article of trade.

**CAMPHOR OIL** (Obtained from the essential oil, obtained by heating the wood of the tree. It is nearly as cheap as camphor, but not held in any esteem here, perhaps, be profitably imported as a substitute for spirits of turpentine, and for medicinal purposes. The timber of the *Dryobalanops* is inferior to any produced in the East, and is used for the purposes of the *Private information*; at *chipalago*, vol. i. p. 516.)

**CAMWOOD**. A red wood, imported from Europe from Africa by the Portuguese, principally obtained from Leone, where it is called *cam* or *kam wood* has the colouring matter very little from that of ordinary wood, and is of a quality or quantity; with similar mordants, as in *Dampier*, vol. ii. part ii. this valuable article amounts to 100 tons, while the exports are 100 tons. The use of the article is in the *CANAL*, *CANALS*, a channel, filled with water by means of locks or sluices, and is used in the navigation between two or more rivers.

1. *Historical Sketch of the comparative value of the goods may be con-*

ness, and, if exposed to the air, totally evaporates. Great care is therefore requisite in packing camphor, to prevent serious loss. The imports and exports of camphor, in 1866, were respectively 7,466 cwt. and 9,356 do.

2. *Camphor Malay*, commonly called, to distinguish it from the last, camphor of Harau, from the port of Sumatra, where it is mostly shipped. It is a product of the *Dryobalanops Camphora*, a forest tree, confined to Sumatra, Borneo, and the Malay peninsula. It is found in concrete masses in the fissures of the wood; there are, however, but very few trees that afford it; and those that do, only in small quantities.

The younger trees seldom possess this concretion, and only a few of the old ones. It is found only after diligent search, for hundreds of trees may be examined before any camphor is discovered. Should any be found, the tree is cut down, sawn into logs, and the substance extracted by instruments. The wood of the tree is fragrant, and being therefore less liable to the attacks of insects is much esteemed for carpentry.

This species of camphor is less biting and pungent than that yielded by the laurel, and is in high repute among the Chinese, by whom it is almost wholly consumed. There is an immense disparity in the prices of the two species in China; the finest Chinese camphor being sometimes quoted at 30 dollars per picul, while the Malay camphor is quoted at 30 dollars per catty, making the price of the latter 100 times greater than that of the former!

The virtues of this kind of camphor have been over-estimated. Specimens brought to Europe possess indeed the qualities of ordinary camphor, but in an inferior degree. The Chinese call it *ping pien, lang-nau*, and *po-lo-hiang*. They use it in medicine, employing the common camphor for fire-works.

Camphor is exceedingly apt to taint other goods, if stowed with them.

Malay camphor is wholly unknown in Europe as an article of trade.

**CAMPBOR OIL** (Malay, *Minyak*). A fragrant essential oil, obtained in large quantities by heating the wood of the *Dryobalanops Camphora*. It is nearly as cheap as spirits of turpentine, but is not held in any esteem by the Chinese. It might, perhaps, be profitably imported into England as a substitute for spirits of turpentine in the arts, and for medicinal purposes. We may add that the timber of the *Dryobalanops Camphora* is not inferior to any produced in the countries where it grows, for the purposes of house and ship building. (*Private information*; and Crawford's *Indian Archipelago*, vol. i. p. 516.)

**CAMWOOD.** A red dyewood, first brought to Europe from Africa by the Portuguese. It is principally obtained from the vicinity of Sierra Leone, where it is called *kambi*; whence its name of cam or kam wood has obviously been derived. The colouring matter which it affords differs but little from that of ordinary Nicaragua wood, either in quality or quantity; and it may be employed with similar mordants. (Bancroft *On Colours*; Dampier, vol. ii. part ii. p. 58.) The imports of this valuable article amounted, in 1866, to 397 tons, while the exports amounted to only 33 tons. The use of the article is declining.

**CANAL, CANALS.** A canal is an artificial channel, filled with water kept at the desired level by means of locks or sluices, forming a communication between two or more places.

1. *Historical Sketch of Canals. Ancient Canals.*—The comparative cheapness and facility with which goods may be conveyed by sea or by means

of navigable rivers seem to have suggested, at a very early period, the formation of canals. The best authenticated accounts of ancient Egypt represent that country as intersected by canals conveying the waters of the Nile to the more distant parts of the country, partly for the purpose of irrigation and partly for that of internal navigation. The efforts made by the old Egyptian monarchs, and by the Ptolemies, to construct a canal between the Red Sea and the Nile, are well known, and evince the high sense which they entertained of the importance of this species of communication. (Ameillon, *Commerce des Egyptiens*, p. 76.)

Greece was too small a territory, too much intersected by arms of the sea, and subdivided into too many independent states, to afford much scope for inland navigation. Attempts were, however, made to cut a canal across the Isthmus of Corinth; but they did not succeed.

The Romans did not distinguish themselves in canal navigation. Their aqueducts, the stupendous ruins of which attest the wealth and power of their founders, were intended to furnish supplies of water to some adjoining city, and not for the conveyance of vessels or produce.

2. *Chinese Canals.*—In China, canals, partly for irrigation and partly for navigation, have existed from a very early period. The most celebrated amongst them is the Imperial or Grand Canal, commencing at Hang-tehou, near the mouth of the Tching-tang-chiang river, in about lat. 30° 22' N., long. 119° 45' E.; it then stretches north, and crossing the great rivers Yang-tse-Kiang and Hoang-ho, terminates at Lin-ting, on the Eu-ho river, in about lat. 37° N., long. 116° E. The direct distance between the extreme limits of the canal is about 512 miles, but, including its bends, it is above 650 miles in length; and as the Eu-ho, which is a navigable river, unites with the Pei-ho, also navigable, an internal water-communication is thus established between Hang-tehou and Peking across 10° of lat. But apart from its magnitude and utility, the Grand Canal does not rank high as a work of art. A vast amount of labour has, however, been expended upon it; for though it mostly passes through a flat country, and winds about to preserve its level, its bed is in parts cut down to a great depth, while in other parts it is carried over extensive hollows, and even lakes and morasses, on vast mounds of earth and stone. The sluices, which preserve its waters at the necessary level, are all of very simple construction, being merely intended to elevate or depress the height of the water by a few inches; as, excepting these, there is not a single lock or interruption to the navigation throughout the whole length of the canal. It is seldom more than 5 or 6 feet in depth, and in dry seasons is sometimes considerably less. The vessels by which it is navigated are sometimes rowed, and sometimes dragged by men, so that the navigation is for the most part slow. The canal is frequently faced with stone. The construction of this great work is usually ascribed to the Tartars, but the Chinese allege that it was merely repaired and renovated by the latter, and that it had been completed in the remotest period of their history. (Barrow's *China*, p. 335 &c.; La Lande, *Canaux de Navigation*, p. 529 &c.)

3. *Italian Canals.*—The Italians were the first people in modern Europe that attempted to plan and execute canals. They were principally, however, undertaken for the purpose of irrigation; and the works of this sort executed in the Milanese and other parts of Lombardy, in the eleventh, twelfth, and thirteenth centuries, are still regarded as models, and excite the warm admiration of

every one capable of appreciating them. In 1271 the Navilio Grande, or canal leading from Milan to Abbiate Grasso and the Tesino, was rendered navigable. (Young's *Travels in France* &c. vol. ii. p. 170.)

**A. Dutch Canals.**—No country in Europe contains, in proportion to its size, so many navigable canals as the kingdom of the Netherlands, and particularly the province of Holland. The construction of these canals commenced as early as the twelfth century, when, owing to its central and convenient situation, Flanders began to be the entrepôt of the commerce between the north and south of Europe. Their number has since been astonishingly increased. 'Holland,' says Mr. Phillips, in his *History of Inland Navigation*, 'is intersected with innumerable canals. They may be compared in number and size to our public roads and highways; and as the latter with us are continually full of coaches, chaises, waggons, carts, and horsemen going from and to the different cities, towns, and villages; so, on the former, the Hollanders in their boats and pleasure barges, their treckschuyts, and vessels of burden, are continually journeying and conveying commodities for consumption or exportation from the interior of the country to the great cities and rivers. An inhabitant of Rotterdam may, by means of these canals, breakfast at Delft or the Hague, dine at Leyden, and sup at Amsterdam, or return home again before night. By them, also, a most prodigious inland trade is carried on between Holland and every part of France, Flanders, and Germany. When the canals are frozen over, they travel on them with skates, and perform long journeys in a very short time; while heavy burdens are conveyed in carts and sledges, which are then as much used on the canals as on our streets.'

'The yearly profits produced by these canals are almost beyond belief; but it is certain, and has been proved, that they amount to more than 250,000*l.* for about 400 miles of inland navigation, which is 625*l.* per mile, the square surface of which mile does not exceed two acres of ground; a profit so amazing, that it is no wonder other nations should imitate what has been found so advantageous.

'The canals of Holland are generally 60 feet wide and 6 deep, and are carefully kept clean; the mud, as manure, is very profitable. The canals are generally levels; of course, locks are not wanted. From Rotterdam to Delft, the Hague, and Leyden, the canal is quite level, but is sometimes affected by strong winds. For the most part the canals are elevated above the fields or the country, to enable them to carry off the water which in winter inundates the land. To drain the water from Delfland, a province not more than 60 miles long, they employ 200 windmills in spring-time to raise it into the canals. All the canals of Holland are bordered with dams or banks of immense thickness, and on these depends the security of the country from inundation; of course it is of great moment to keep them in the best repair; to effect which there is a kind of militia, and every village has a magazine of proper stores and men, whose business it is to convey stones and rubbish in carts to any damaged place. When a certain bell rings, or the waters are at a fixed height, every man repairs to his post. To every house or family there is assigned a certain part of the bank, in the repair of which they are to assist. When a breach is apprehended, they cover the banks all over with cloth and stones.

**B. Canal from Amsterdam to Nieuwediep, near the Helder.**—The object of this canal, which is the greatest work of its kind in Holland, and probably

in the world, is to afford a safe and easy passage for large vessels from Amsterdam to the German Ocean. This city has 40 feet of water in the road in front of its port, but the pampus or bar at the junction of the Y with the Zuyder Zee, 7 miles below, has only a depth of 10 feet; and hence all ships of any considerable burden entering or leaving the port must unload and load part of their cargoes without the bar. As the Zuyder Zee is everywhere full of shallows, all ordinary means of improving the access to Amsterdam were necessarily ineffectual; and the resolution was, therefore, at length adopted, of cutting a canal from the city to the Helder, the most northern point of the province of Holland. The distance between these extreme points is 41 English miles, but the length of the canal is about 50*½*. The breadth at the surface of the water is 124½ English feet (120 Rhinland feet); the breadth at bottom 36; the depth 20 feet 9 inches. Like the Dutch canals generally, its level is that of the highest tides, and it receives its supply of water from the sea. The only locks it requires are, of course, two tide-locks at the extremities; but there are, besides, two sluices, with floodgates in the intermediate space. It is crossed by about 18 drawbridges. The locks and sluices are double, i.e. there are two in the breadth of the canal; and their construction and workmanship are said to be excellent. They are built of brick, for economy; but bands of limestone are interposed at intervals, and these project about an inch beyond the brick, to protect it from abrasion by the sides of vessels. There is a broad towing-path on each side, and the canal is wide enough to admit of two frigates passing. (For the expense of towing, see AMSTERDAM.)

The line which the canal follows may be easily traced on a map of Holland. From the Y at Amsterdam it proceeds north to Furmerend; thence west to Alkmaar Lake; again north by Alkmaar to a point within 2 miles of the coast, near Petten; whence it runs nearly parallel to the coast till it joins the sea a little to the east of the Helder, at the fine harbour of Nieuwediep, formed within the last 50 years. At the latter place there is a powerful steam-engine for supplying the canal with water during neap-tides, and other purposes. The time spent in towing vessels from Nieuwediep to Amsterdam is 18 hours. The Helder is the only spot on the shores of Holland that has deep water; and it owes this advantage to its being opposite to the Texel, which, by contracting the communication between the German Ocean and the Zuyder Zee to a breadth of about a mile, produces a current which scours and deepens the channel. Immediately opposite the Helder there are 100 feet water at high tides, and at the shallowest part of the bar to the westward there are 27 feet. In the same way, the artificial mound which runs into the Y opposite Amsterdam, by contracting the water-way to about 1,000 feet, keeps a depth of 40 feet in the port (at high water), while above and below there is only 10 or 12.

The canal was begun in 1819, and finished in 1825. The cost was estimated at 10,000,000 or 12,000,000 florins, or about 1,000,000*l.* sterling. If we compute the magnitude of this canal by the cubic contents of its bed, it is the greatest, we believe, in the world, unless some of the Chinese canals be exceptions. The volume of water which it contains, or the *prisme de remplissage*, is twice as great as that of the New York Canal, or the Canal of Languedoc, and two and a half times as great as that of the artificial part of the Caledonian Canal. In consequence, however, of the facility with which the Dutch canal was dug, and of the evenness of the ground through which it passes,

the difficulties contend in making those which had the canals now what returns this is not, at least in able concern. The lowness of in the amount of 40 expenses; and should think, be tolls laid on the SPREEDAM.] This sideration to be at of a work of this s the trade of Amst may far more than evident, too, that would have effect tag; that is, they object for which th have derived these article in the *Scot information*.)

the difficulties with which the engineer had to contend in making it were trifling compared to those which had to be overcome in constructing the canals now mentioned. We have not learned what returns this canal yields; most probably it is not, at least in a direct point of view, a profitable concern. Even in Holland, notwithstanding the lowness of interest, it would require tolls to the amount of 40,000*l.* a-year to cover interest and expenses; and so large a sum can hardly, we should think, be raised by the very moderate tolls laid on the ships passing through it. [AMSTERDAM.] This, however, is not the only consideration to be attended to in estimating the value of a work of this sort. Its influence in promoting the trade of Amsterdam, and, indeed, of Holland, may far more than compensate for its cost. It is evident, too, that the imposition of oppressive tolls would have effectually counteracted this advantage; that is, they would have defeated the very object for which the canal was constructed. (We have derived these details, partly from an able article in the *Scotsman*, and partly from *private information*.)

At the present time (1867) a new canal is in course of formation in Holland from the Zuyder Zee at Vuurtooren to Amsterdam, through the Het-ij, Wij-Ker-meer to the North Sea near Breesaap. The estimated cost of the work is 18,000,000 florins, and it is computed that it will be completed by 1870. The entrance into the North Sea will be by two jetties, that on the north 2,000 metres in length, that on the south 1,500. The canal is designed to drain 6,000 hectares (15,000 acres) of land, and will shorten the journey from Amsterdam to the sea by 56 kilometres.

It is almost unnecessary to say that railways have superseded the use of canals for passenger traffic, and that the service of the latter is confined almost entirely to the carriage of goods.

6. *Danish Canals.*—The Holstein Canal, formerly belonging to Denmark, is of very considerable importance. It joins the river Eyder with Kiel Bay on the north-east coast of Holstein, forming a navigable communication between the North Sea, a little to the north of Heligoland, and the Baltic; enabling vessels to pass from the one to the other by a short cut of about 100 miles, instead of the lengthened and difficult voyage round Jutland, and through the Cattagat and the Sound. The Eyder is navigable for vessels not drawing more than 9 feet water from Tonningen, near its mouth, to Rendsburg, where it is joined by the canal, which communicates with the Baltic at Holtenau, about 3 miles north of Kiel. The canal is about 26 English miles in length, including about 6 miles of what is principally river navigation. The excavated portion is 95 feet wide at top, 51 feet 6 inches at bottom, and 9 feet 6 inches deep (Eng. measure). Its highest elevation above the level of the sea is 24 feet 4 inches; to which height vessels are raised and let down by 6 locks or sluices. It is navigable by vessels of 120 tons burden, or more, provided they are constructed in that view. The total cost of the canal was about 500,000*l.* It was opened in 1785, and has so far realised the views of its projectors as to enable coasting vessels from the Danish islands in the Baltic and the east coast of Holstein, Jutland &c. to proceed to Hamburg, Holland, England &c. in less time, and with much less risk, than, in the ordinary course of navigation, they could have cleared the point of the Skaw; and conversely with ships from the west. The smaller class of foreign vessels, particularly those under the Dutch and Hansatic flags, navigating the Baltic and North Seas, have largely availed themselves of the facilities afforded by

this canal. About 3,000 vessels pass annually through the canal. This is a sufficient evidence of its utility. It would, however, be much more frequented, were it not for the difficult navigation of the Eyder from the sea to Rendsburg. The dues are moderate. (Coxe's *Travels in the North of Europe*, 5th ed. vol. v. p. 239, where there is a plan of the canal; Catteau, *Tableau des Etats Danois*, tom. ii. pp. 300—304; and *private information*.)

7. *Swedish Canals.*—The formation of an internal navigation connecting the Cattagat and the Baltic has long engaged the attention, and occupied the efforts, of the people and Government of Sweden. Various motives conspired to make them embark in this arduous undertaking. The Sound and other channels to the Baltic were commanded by the Danes, who were able, when at war with the Swedes, greatly to annoy the latter by cutting off all communication by sea between the eastern and western provinces of the kingdom. Hence, in the view, partly of obviating this annoyance and partly of facilitating the conveyance of iron, timber, and other bulky products from the interior to the coast, it was determined to attempt forming an internal navigation, by means of the river Gotha, and the lakes Wener, Wetter &c., from Gottenburg to Soderköping on the Baltic. The first and most difficult part of this enterprise was the perfecting of the communication from Gottenburg to the lake Wener. The Gotha, which flows from the latter to the former, is navigable, through by far the greater part of its course, for vessels of considerable burden; but, besides others less difficult to overcome, the navigation at the point called Tröllhætta is interrupted by a series of cataracts about 112 feet in height. Owing to the rapidity of the river, and the stubborn red granite rocks over which it flows, and by perpendicular banks of which it is bounded, the attempt to cut a lateral canal, and still more to render it directly navigable, presented the most formidable obstacles. But, undismayed by these impediments, on which it is, indeed, most probable he had not sufficiently reflected, Polhem, a native engineer, undertook, about the middle of last century, the Herculean task of constructing locks in the channel of the river, and rendering it navigable! Whether, however, it were owing to the all but insuperable obstacles opposed to such a plan, to the defective execution, or deficient strength of the works, they were wholly swept away, after being considerably advanced, and after vast sums had been expended upon them. From this period down to 1793 the undertaking was abandoned; but in that year the plan was proposed, which should have been adopted at first, of cutting a lateral canal through the solid rock, about 1½ mile from the river. This new enterprise was begun under the auspices of a company incorporated for the purpose in 1794, and was successfully completed in 1800. The canal is about 3 miles in length, and has about 6½ feet water. This is the statement of Catteau, *Tableau de la Mer Baltique*, tome ii. p. 77; Oddy, in his *European Commerce*, p. 306, and Palbi, *Abrégé de la Géographie*, p. 385, say that the depth of water is 10 feet. It has 8 sluices, and admits vessels of above 100 tons. In one part it is cut through the solid rock to the depth of 72 feet. The expense was a good deal less than might have been expected, being only about 80,000*l.* The Lake Wener, the navigation of which was thus opened with Gottenburg, is very large, deep, and encircled by some of the richest of the Swedish provinces, which now possess the inestimable advantage of a convenient and ready outlet for their products.

As soon as the Trüllhetta canal had been completed, there could be no room for doubt as to the practicability of extending the navigation to Soderköping. In furtherance of this object, the lake Wener was joined to the lake Wetter by the Gotha canal, which admits vessels of the same size as that of Trüllhetta; and the prolongation of the navigation to the Baltic from the Wetter, partly by two canals of equal magnitude with the above, and partly by lakes, has since been completed. The entire undertaking is called the Gotha Navigation, and deservedly ranks among the very first of the kind in Europe.

Besides the above, the canal of Arboga unites the lake Hielmar to the lake Maclar; and since 1819 a canal has been constructed from the latter to the Baltic at Söclertelje. The canal of Strömsholm, so called from its passing near the castle of that name, has effected a navigable communication between the province of Dalecarlia and the lake Maclar &c. The total revenue of the 6 Swedish canals in 1864 was 36,436*l*. (*Report of Mr. Hamilton, Secretary of Legation, of February 9, 1867; Cox's Travels in the North of Europe, 5th ed. vol. iv. pp. 253-266, and vol. v. pp. 58-66; Thomson's Travels in Sweden, p. 35; &c.*)

8. *French Canals.*—The first canal executed in France was that of Briare, 34½ English miles in length, intended to form a communication between the Seine and Loire. It was commenced in 1605, in the reign of Henry IV., and was completed in 1642, under his successor, Louis XIII. The canal of Orleans, which joins the above, was commenced in 1675. But the most stupendous undertaking of this sort that has been executed in France, or indeed on the Continent, is the canal of Languedoc. It was projected under Francis I., but was begun and completed in the reign of Louis XIV. It reaches from Narbonne to Toulouse, and was intended to form a safe and speedy means of communication between the Atlantic Ocean and the Mediterranean. It is 64 French leagues in length, and 6 feet deep; and has, in all, 114 locks and sluices. In its highest part it is 600 feet above the level of the sea. In some places it is conveyed, by bridges of great length and strength, over large rivers. It cost upwards of 1,300,000*l*., and reflects infinite credit on the engineer, Riquet, by whom it was planned and executed.

Besides this great work, France possesses several magnificent canals, such as that of The Centre, connecting the Loire with the Saône; of St. Quentin, joining the Scheldt and the Somme; of Besançon, joining the Saône, and consequently the Rhone, to the Rhine; of Burgundy, joining the Rhone to the Seine &c. Some of these are of very considerable magnitude. The canal of the Centre is about 72 English miles in length. It was completed in 1791, at an expense of about 11,000,000 francs. Its summit level is about 240 feet above the level of the Loire at Digoin; the breadth at the water's edge is about 48 feet, and at bottom 30 feet; depth of water 5½ feet; number of locks 81. The canal of St. Quentin, 28 English miles in length, was completed in 1810. The canal joining the Rhone to the Rhine is the most extensive of any. It stretches from the Saône, a little above St. Jean de Lesne, by Dol, Besançon, and Mulhouse, to Strasburg, where it joins the Rhine—a distance of about 200 English miles. From Dol to Vogeaucourt, near Montbeliard, the canal is principally excavated in the bed of the Doubs. It is not quite finished. The canal of Burgundy will, when completed, be about 242 kilom. or 150 English miles in length; but at present it is only navigable to the distance of about 95 kilom. In addition to these, a great many other canals have been

finished, while several are in progress, and others projected. There is an excellent account of the French canals in the *Histoire de la Navigation Intérieure de la France*, by M. Dutens, in 2 vols. 4to., and to it we beg to refer the reader for further details. He will find at the end of the second volume a very beautiful map of the rivers and canals of France.

The railroads now constructed in France have, however, checked the progress of canals. [*BONDEAUX.*] We may observe, too, that the state of the law in France is very unfavourable to the undertaking and success of all great public works; and we are inclined to attribute the comparative fewness of canals in France, and the recent period at which most of them have been constructed, to its influence. In that country, canals, docks, and such like works, are mostly carried on at the expense and for behoof of Government, under the control of its agents. No scope has been given to the enterprise of individuals or associations. Before either a road or a canal can be constructed, plans and estimates must be made out and laid before the Minister of the Interior, by whom they are referred to the prefect of the department, and then to the *Bureau des Ponts et des Chaussées*; and supposing the project to be approved by these, and the other functionaries consulted with respect to it, the work must after all be carried on under the superintendance of some public officer. In consequence of this preposterous system, very few works of this description have been undertaken as private speculations; and while not a few of these begun by Government remain unfinished and comparatively useless, those that are completed have, as was to be expected, rarely proved profitable. There are some good remarks on this subject in the useful work of M. Dupin on the *Forces Commerciales* of Great Britain.

9. *Prussian Canals.*—The Prussian states are traversed by the great navigable rivers the Elbe, the Oder, and the Vistula; the first having its embouchure in the North Sea, and the others in the Baltic. The formation of an internal navigation to join these great water-ways excited the attention of Government at a distant period; and this object has been successfully accomplished partly by the aid of the secondary rivers falling into the above, and partly by canals. In 1662 the canal of Muhlrose was undertaken, uniting the Oder and the Spree; the latter being a navigable river falling into the Havel, also a navigable river joining the Elbe near Havelburg. But the navigation from the Oder to the Elbe by this channel was difficult and liable to frequent interruption; and to obviate these defects, Frederick the Great constructed, towards the middle of last century, the Fimow canal, stretching from the Oder at Oderburg to the Havel near Liebenwalde; the communication is thence continued by the latter and a chain of lakes to Plauen, from which point a canal has been opened joining the Elbe near Magdeburg.

The Elbe being in this way connected with the Oder by a comparatively easy navigation, the latter has been united to the Vistula, partly by the river Netze, and partly by a canal joining that river to the Brahe, which falls into the Vistula near Bromberg. A vast inland navigation has thus been completed, barks passing freely through the whole extent of country from Hamburg to Dantzic; affording the means of shipping the products of the interior, and of importing those of foreign countries, either by the North Sea or the Baltic, as may be found most advantageous. 10. *Russian Canals.*—The inland navigation of Russia is of vast extent, and very considerable importance. The reader will find some details with respect to it under the art. *PETRUSSBURG.*

11. *Bavarian Canals.*—A grand canal which was for a lengthened period in progress in Bavaria was completed in 1846, and promises to become of great public utility. It extends from Dietfurth on the Altmühl, a navigable affluent of the Danube, to Bamberg on the Mayn, a distance of 23½ German, or about 112 English miles. It is on a large scale, and has cost above 1,000,000*l.* This magnificent undertaking, which carries an inland navigation through the centre of Europe, and realises the project of Charlemagne for uniting the Black Sea with the German Ocean, is conducted by a joint-stock company, with the assistance of the Bavarian Government. But the navigation of the Mayn and the Danube must be considerably improved before this grand channel of communication can acquire all the importance which, most probably, it is destined to obtain.

12. *Austrian Canals.*—The Austrian empire is traversed in its whole extent by the Danube; but the advantages that might result to the foreign trade of the empire from so great a command of river navigation have been materially abridged by the jealousy of the Turks, who command the embouchure of the river, and by the difficulties in some places incident to its navigation. Two pretty extensive canals have been constructed in Hungary. That called the Béga Canal is 73 English miles in length: it stretches from Fasset through the Banat by Temeswar to Beckserek, whence vessels pass by the Béga into the Theiss a little above its junction with the Danube. The other Hungarian canal is called after the Emperor Francis. It stretches from the Danube by Zambor to the Theiss, which it joins near Foldvar, being 62 English miles in length; its elevation where highest does not exceed 27 feet. Besides the above, the canal of Vienna establishes a communication between that city and Neustadt. It is said to be the intention to continue this canal to Trieste; but however desirable, we doubt much whether this be practicable. A railroad has been made from Munchausen on the Danube to Budweis on the Moldau, a navigable river that falls into the Elbe, which promises to be a highly useful communication. (*Bright's Travels in Hungary*, p. 246; Balbi, *Abrégé de la Géographie*, p. 216.)

13. *Spanish Canals.*—Nowhere are canals more necessary, both for the purposes of navigation and irrigation, than in Spain; but the nature of the soil, and the poverty and ignorance of the Government as well as of the people, oppose formidable obstacles to their construction. During the reign of Charles II. a company of Dutch contractors offered to render the Mançanares navigable from Madrid to where it falls into the Tagus, and the latter from that point to Lisbon, provided they were allowed to levy a duty for a certain number of years on the goods conveyed by this channel. The Council of Castile took this proposal into their serious consideration, and after maturely weighing it pronounced the singular decision—'That if it had pleased God that these two rivers should have been navigable, He would not have wanted human assistance to have made them such; but that, as He has not done it, it is plain He did not think it proper that it should be done. To attempt it, therefore, would be to violate the decrees of His providence, and to mend the imperfections which He designedly left in His works!' (*Clarke's Letters on the Spanish Nation*, p. 281.) But such undertakings

are no longer looked upon as sinful; and many have been projected since the accession of the Bourbon dynasty, though few have been perfected. The canal of the Ebro, begun under the Emperor Charles V., is the most important of the Spanish canals; but it is only partially completed, and during dry seasons it suffers from want of water. It runs parallel to the right bank of the Ebro, from Tudela in Navarre to below Saragossa; the intention being to carry it to Sastago, where it is to unite with the Ebro. The canal of Castile is intended to lay open the country between the Douro and Reynosa, and to facilitate the conveyance of grain from the interior to Santander and Bilbao. It passes by Valladolid, Palencia, and Aguilar del Campos; a small part has been executed, and is now in operation. A company has also undertaken, what the Dutch contractors formerly offered—to render the Tagus navigable from Aranjuez to Lisbon; the free navigation of the river having been stipulated at the Congress of Vienna. A project for deepening the Guadalquivir, and some others, are also on foot. (*Geographical Dictionary*, ii. 710.) It would appear from Mr. Sackville West's Report to the Foreign Office, of January 1, 1867, that on December 31, 1865, the total amount of canal shares and subventions was 211,040,251 reals vellon, or 2,110,402*l.*, and that the sum estimated as necessary for their completion was 1,816,190 reals vellon, or 118,561*l.* (*Reports of Secretaries of Legation*, No. 5 of 1867.)

14. *British Canals.*—Owing partly to the late rise of extensive manufactures and commerce in Great Britain, but more, perhaps, to the insular situation of the country, no part of which is very distant from the sea or from a navigable river, no attempt was made, in England, to construct canals till a comparatively recent period. The efforts of those who first began to improve the means of internal navigation were limited to attempts to deepen the beds of rivers, and to render them better fitted for the conveyance of vessels. So early as 1635, Mr. Sandys, of Flatbury, Worcestershire, formed a project for rendering the Avon navigable from the Severn, near Tewkesbury, through the counties of Warwick, Worcester, and Gloucester, 'that the towns and country might be better supplied with wood, iron, pit-coal, and other commodities.' This scheme was approved by the principal nobility and landowners in the adjoining counties; but the civil war having broken out soon after, the project was abandoned, and does not seem to have been revived. After the Restoration and during the earlier part of last century various Acts were at different times obtained for cheapening and improving river navigation. For the most part, however, these attempts were not very successful. The current of the rivers gradually changed the form of their channels; the dykes and other artificial constructions were apt to be destroyed by inundations; alluvial sand-banks were formed below the weirs; in summer the channels were frequently too dry to admit of being navigated, while at other periods the current was so strong as to render it quite impossible to ascend the river, which at all times, indeed, was a laborious and expensive undertaking. These difficulties in the way of river navigation seem to have suggested the expediency of abandoning the channels of most rivers, and of digging parallel to them artificial channels, in which the water might be kept at the proper level by means of locks. The Act passed by the Legislature in 1755 for improving the navigation of Sankey Brook on the Mersey gave rise to a lateral canal of this description, about 11½ miles in length,

which deserves to be mentioned as the earliest effort of the sort in England.

But before this canal had been completed, the celebrated Duke of Bridgewater, and his equally celebrated engineer, the self-instructed James Brindley, had conceived a plan of inland navigation independent altogether of natural channels, and intended to afford the greatest facilities to commerce, by carrying canals across rivers and through mountains, wherever it was practicable to construct them.

The Duke was proprietor of a large estate at Worsley, 7 miles from Manchester, in which were some very rich coal-mines, which had hitherto been in great measure useless, owing to the cost of carrying coal to market. Being desirous of turning his mines to some account, it occurred to him that his purpose would be best accomplished by cutting a canal from Worsley to Manchester. Mr. Brindley, having been consulted, declared that the scheme was practicable; and an Act having been obtained, the work was immediately commenced. 'The principle,' says Mr. Phillips, 'laid down at the commencement of this business reflects as much honour on the noble undertaker as it does upon his engineer. It was resolved that the canal should be perfect in its kind; and that, in order to preserve the level of the water, it should be free from the usual obstruction of locks. But in accomplishing this end many difficulties were deemed insurmountable. It was necessary that the canal should be carried over rivers, and many large and deep valleys, where it was evident that such stupendous mounds of earth must be raised as would scarcely, it was thought by numbers, be completed by the labour of ages; and, above all, it was not known from what source so large a supply of water could be drawn, even on this improved plan, as would supply the navigation. But Mr. Brindley, with a strength of mind peculiar to himself, and being possessed of the confidence of his great patron, contrived such admirable machines, and took such methods to facilitate the progress of the work, that the world soon began to wonder how it could be thought so difficult.

When the canal was completed as far as Barton, where the Irwell is navigable for large vessels, Mr. Brindley proposed to carry it over that river by an aqueduct 39 feet above the surface of the water in the river. This, however, being considered as a wild and extravagant project, he desired, in order to justify his conduct towards his noble employer, that the opinion of another engineer might be taken, believing that he could easily convince an intelligent person of the practicability of the design. A gentleman of eminence was accordingly called, who, being conducted to the place where it was intended that the aqueduct should be made, ridiculed the attempt; and, when the height and dimensions were communicated to him, he exclaimed, "I have often heard of castles in the air, but never was shown before where any of them were to be erected." This unfavourable verdict did not deter the Duke from following the opinion of his own engineer. The aqueduct was immediately begun; and it was carried on with such rapidity and success as astonished those who, but a little before, thought it impossible.

Before the canal from Worsley to Manchester had been completed, it occurred to the Duke and his engineer that it might be practicable to extend it by a branch, which, running through Chester parallel to the river Mersey, should at length terminate in that river below the limits of its artificial navigation, and thus afford a new, safer, and cheaper means of communication between Man-

chester and its vicinity and Liverpool. The execution of this plan was authorised by an Act passed in 1761. This canal, which is above 29 miles in length, was finished in about 5 years. It was constructed in the best manner, and has proved equally advantageous to its noble proprietor and the public.

'When the Duke of Bridgewater,' says Dr. Aikin, 'undertook this great design, the price of carriage on the river navigation was 12s. the ton from Manchester to Liverpool, while that of land carriage was 40s. the ton. The Duke's charge on his canal was limited by statute to 6s.; and together with this vast superiority in cheapness, it had all the speed and regularity of land carriage. The articles conveyed by it were, likewise, much more numerous than those by the river navigation; besides manufactured goods and their raw materials, coals from the Duke's own pits were deposited in yards at various parts of the canal, for the supply of Cheshire; lime, manure, and building materials were carried from place to place; and the markets of Manchester obtained a supply of provisions from districts too remote for the ordinary land conveyances. A branch of useful and profitable carriage, hitherto scarcely known in England, was also undertaken, which was that of passengers. Boats, on the model of the Dutch treckschuyts, but more agreeable and capacious, were set up, which, at very reasonable rates and with great convenience, carried numbers of persons daily to and from Manchester along the line of the canal.' (Aikin's *Description of the Country round Manchester*, p. 116.)

The success attending the Duke of Bridgewater's canals stimulated public-spirited individuals in other districts to undertake similar works. Mr. Brindley had early formed the magnificent scheme of joining the great ports of London, Liverpool, Bristol, and Hull by a system of internal navigation; and though he died in 1772, at the early age of 56, he had the satisfaction to see his grand project in a fair way of being realised. The Trent and Mersey, or as it has been more commonly termed, the Grand Trunk Canal, 96 miles in length, was begun in 1766 and completed in 1777. It stretches from near Runcorn on the Mersey, where it communicates with the Duke of Bridgewater's Canal, to Newcastle-under-Line; thence southwards to near Titchfield; and then north-westerly, till it joins the Trent at Wilden Ferry, at the north-western extremity of Leicestershire. A water communication between Hull and Liverpool was thus completed; and by means of the Staffordshire and Worcestershire Canal, which joins the Grand Trunk near Haywood in the former, and the Severn near Stourport in the latter, the same means of communication was extended to Bristol. During the time that the Grand Trunk Canal was being made, a canal was undertaken from Liverpool to Leeds, 120 miles in length; another from Birmingham to the Staffordshire and Worcestershire Canal, joining it near Wolverhampton; and one from Birmingham to Fazley and thence to Coventry. By canals subsequently undertaken, a communication was formed between the Grand Trunk Canal and Oxford, and consequently with London, completing Brindley's magnificent scheme. In 1792 the Grand Junction Canal was begun, which runs in a pretty straight line from Brentford, on the Thames, a little above the metropolis, to Braunston, in Northamptonshire, where it unites with the Oxford and other central canals. It is about 90 miles in length. There is also a direct water communication, by means of the river Lea navigation, the Cambridge Junction Canal &c. between London and the Wash. In addition to

these, an immense number of them of great length have been constructed in so that a command obtained, unparallelled with the exception

In Scotland, the canal and Clyde was begun in 1777, and was one of the American wars of 1790. Its total length cuts to Glasgow and 100 miles. Where high level of the sea. It of the English canal surface is 56, and at allly it was about 8 banks have been of water is now about 39 locks. In complete difficulties had to be ever, were all successful unprofitable for a w past yielded a better Swift boats on the described were established (Cleland's *Statistics of*

The Union Canal near Falkirk, in Edinburgh, being 31½ miles wide at the top, 20 at the bottom, was completed in 1822. It is an extremely ill-advised canal that its proprietors have the Edinburgh and Glasgow who employ it in their other heavy goods.

A canal intended to connect Glasgow, Paisley, and Edinburgh, commenced in 1807; but the connecting Glasgow with Edinburgh has hitherto been about 12 miles long broad at top, 18 at bottom here that the experiment on quick travelling by canal have demonstrated that it is not a properly constructed canal for passengers and goods, along or 10 miles an hour, with (See post.)

The Crinan Canal across the mountains of Scotland, admitting vessels of 100 tons, is 12 miles in length, and 12 feet deep.

The Caledonian Canal, which stretches N.W. and N.E. from Inverness to Glasgow, is chiefly formed by Loch Lochy. The total length, including the lakes, is 60½ miles, of which only about 23 miles are above the level of the sea. It is mostly constructed upon a level intended to be 20 feet deep and 122 at top; the locks are 40 feet deep and 49 broad; and had it not been as was originally intended for merchant ships of 1,000 tons, it would have passed through it. It was executed entirely at the expense of the Government, from the designs and plans of Thomas Telford, and amounted, exclusive of interest, to £1,347,780. It was opened in May, 1853, to L. 347,780. It is, however, to have been projected, and has been

these, an immense number of other canals, some of them of great magnitude and importance, have been constructed in different parts of the country; so that a command of internal navigation has been obtained, unparalleled in any European country, with the exception of Holland.

In Scotland, the great canal to join the Forth and Clyde was begun in 1768, but it was suspended in 1777, and was not resumed till after the close of the American war. It was finally completed in 1790. Its total length, including the collateral cuts to Glasgow and the Monkland Canal, is 38½ miles. Where highest it is 150 feet above the level of the sea. It is on a larger scale than any of the English canals. Its maximum width at the surface is 56, and at the bottom 27 feet. Originally it was about 8 feet 6 inches deep; but its banks have been raised, so that the depth of water is now about 10 feet. It has, in all, 39 locks. In completing this canal many serious difficulties had to be encountered. These, however, were all successfully overcome; and though unprofitable for a while, it has for many years past yielded a better return to its proprietors. Swift boats on the plan of those subsequently described were established on this canal in 1832. (Cleland's *Statistics of Glasgow*, p. 170 &c.)

The Union Canal joins the Forth and Clyde Canal near Falkirk, and stretches thence to Edinburgh, being 31½ miles in length. It is 40 feet wide at the top, 20 at bottom, and 5 deep. It was completed in 1822. But it appears to have been an extremely ill-advised undertaking; so much so that its proprietors have sold it at a heavy loss to the Edinburgh and Glasgow Railway Company, who employ it in the conveyance of coal and other heavy goods.

A canal intended to form a communication between Glasgow, Paisley, and Ardrossan was commenced in 1807; but only that portion connecting Glasgow with Paisley and the village of Johnstone has hitherto been finished. This part is about 12 miles long; the canal being 30 feet broad at top, 18 at bottom, and 4½ deep. It was here that the experiments were originally made on quick travelling by canals, which are said to have demonstrated that it was practicable to impel a properly constructed boat, carrying passengers and goods, along a canal at the rate of 9 or 10 miles an hour, without injury to the banks! (See post.)

The Crinan Canal across the peninsula of Kinross, admitting vessels of 160 tons burden, is 9 miles in length, and 12 feet in depth.

The Caledonian Canal is the greatest undertaking of the sort attempted in the empire. It stretches S.W. and N.E. across the island from a point near Inverness to another near Fort William. It is chiefly formed by Loch Ness, Loch Oich, and Loch Lochy. The total length of the canal, including the lakes, is 60½ miles; but the excavated part is only about 23 miles. At the summit it is 96½ feet above the level of the Western Ocean. It is mostly constructed upon a very gradual scale, being intended to be 20 feet deep, 50 feet wide at bottom, and 122 at top; the locks are 20 feet deep, 172 long, and 49 broad; and had it been wholly executed as was originally intended, frigates of 32 guns and merchant ships of 1,000 tons burden might have passed through it. It was opened in 1822, being executed entirely at the expense of Government, from the designs and under the superintendance of Thomas Telford, Esq. The entire cost amounted, exclusive of interest, on the 1st of May, 1853, to 1,347,780*l.* It would appear, however, to have been projected without due consideration, and has been a most unprofitable

speculation. The revenue of the canal amounted in 1852-53 to only 5,889*l.*, whereas the expenditure during the same year, exc. any allowance for wear and tear, and inc. only 900*l.* for repairs, amounted to 7,429*l.*! But this is not all. Owing to a wish to lessen the expense and to hasten the opening of the canal, parts of it were not excavated to their proper depth, while others were executed in a hurried and insufficient manner. Hence the canal does not really admit vessels of above 250 or 300 tons burden, and previously to steam tugs being provided on the lakes, they were frequently delayed in making their passage across for a lengthened period. During 1837 and 1838 the works sustained considerable damage; and the reader needs not be surprised to hear that it was gravely debated whether it would not be better entirely to break up and abandon the canal!

There was naturally, however, an extreme disinclination to destroy a work which, how inexpedient soever originally, has been executed at an enormous expense; and various schemes have been suggested for relieving the public from the expense of keeping it up without involving its destruction. Among others it has been proposed to assign it to a joint-stock company, on their agreeing to complete the works and keep them in repair: and an Act authorising such transfer was passed in 1840. But hitherto it has not been found possible to dispose of the canal in this way, and Parliament has since voted large sums for the partial repair of the works, which, though a good deal improved, will every now and then require fresh outlays.

Some other canals have been projected and completed in different parts of Scotland. Of these the Monkland Canal, for the supply of Glasgow with coal, has been the most successful.

15. *Irish Canals.*—Various canals have been undertaken in Ireland, of which the Grand Canal and the Royal Canal are the principal. The Grand Canal was begun in 1765, by a body of subscribers; but they could not have completed the work without very large advances from Government. The canal commences at Dublin, and stretches in a westerly direction, inclining a little to the south, to the Shannon, with which it unites near Banagher, a distance of 85 statute miles, and thence on the west side of the river to Ballinasloe, 14 miles. But exclusive of the main trunk, there is a branch to Athy, where it joins the Barrow, a distance of about 27 miles; and there are branches to Portarlington, Mount Mellick, and some other places. The total length of the canal, with its various branches, is about 164 Eng. miles. Its summit elevation is 200 feet above the level of the sea at Dublin. It is 40 feet wide at the surface, from 24 to 20 feet at bottom, has 6 feet water, and cost, in all, above 2,000,000*l.*

Two capital errors seem to have been committed in the formation of this canal—it was framed on too large a scale, and was carried too far north. Had it been 4 or 4½ instead of 6 feet deep, its utility would have been but little impaired, while its expense would have been very materially diminished. But the great error was in its direction. Instead of joining the Shannon about 15 miles above Lough Derg, it should have joined it below Limerick. By this means barges and other vessels passing from Dublin to Limerick, and conversely, would have avoided the difficult and dangerous navigation of the Upper Shannon; and the canal would have passed through a comparatively fertile country; and it would not have been necessary to carry it across the bog of Allen, in which, says Mr. Wakefield, 'the company have buried more money than would have cut a spacious

canal from Dublin to Limerick.' (*Account of Ireland*, vol. i. p. 612.)

The Royal Canal was undertaken in 1789. It stretches westward from Dublin to the Shannon, which it joins near Tormanbury. Its entire length is about 92 miles, exclusive of a branch of 5 miles from Kilashee to Longford: its highest elevation is 322 feet above the level of the sea. At bottom it is 24 feet wide, having 6 feet depth of water. It had cost, exclusive of interest on stock, loans &c. advanced by Government, in February 1823, 1,421,951*l*.

This canal seems to have been planned in the most injudicious manner. It has the same defect as the Grand Canal, of being extravagantly large; and throughout its whole course it is nearly parallel to, and not very distant from, the latter. There are consequently two immense canals where there ought, perhaps, to be none. At all events, it is abundantly certain that one canal of comparatively moderate dimensions would have been quite enough for all the business of the district, even if it were much greater than it is at this moment, or than it is ever likely to become.

It appears from *Thom's Almanac* for 1868, that in 1866 the gross revenue of the Royal Canal was 10,504*l*., while the net revenue of the Grand Canal for the first half of 1866 was 7,535*l*.; and deducting from these sums the expense attending the working of the canals, and allowing for their ordinary wear and tear, it is extremely doubtful whether these great public works, which have cost between 5,000,000*l*. and 6,000,000*l*., produce a sixpence of clear revenue.

Besides the above, there are some other canals, as well as various river excavations, in Ireland, the chief of which is the Ulster, 48 miles long; but hardly one of them yields a reasonable return for the capital expended upon it. They have almost all been liberally assisted by grants of public money; and their history, and that of the two great canals now adverted to, strikingly corroborates the caustic remark of Arthur Young, that 'a history of public works in Ireland would be a history of jobs.' (*Tour in Ireland*, part ii. p. 60, 4to. ed.) Those who wish to make themselves fully acquainted with the history and state of the canals of Ireland may consult the Report by Messrs. Henry Mullins and M'Mahon, in the Appendix to the Report of the Select Committee of 1830 on the State of Ireland, and the valuable Report on Railways.

16. *American Canals*.—The United States are pre-eminently distinguished by the spirit with which they have undertaken, and the perseverance they have displayed in executing, the most magnificent plans for improving and extending internal navigation. Besides many others of great, though inferior, magnitude, a canal has been formed connecting the Hudson with Lake Erie. This immense work is 363 miles in length, the rise and fall along the entire line being 692 feet. It was originally 40 feet wide at the surface, 28 feet at bottom, and 4 feet deep. But these dimensions being found, from the rapidly increasing traffic and importance of the canal, to be far too limited, an Act was passed in 1835, providing for its enlargement. Under this Act the canal has been increased, so as to be 70 feet wide on the surface, 42 feet at the bottom, and 7 feet in depth, the locks being of corresponding dimensions. The original cost of the canal was 9,027,456 *dol*.; and the cost of the enlargement has been about 25,000,000 *dol*., or nearly three times its first cost. The Erie Canal is the property of the state of New York, and is one of the greatest and most important works of its kind in the world.

Notwithstanding the contracted scale on which it was originally constructed, it has completely verified the predictions of its projector, De Witt Clinton, having been at once extremely profitable as a mercantile speculation, and of singular advantage in a public point of view to the State of New York and the Union generally.

The *Chesapeake and Ohio Canal* would, had it been completed, have been a great and useful work. It begins at the tide water of the Potomac River above Georgetown in the district of Columbia, and is intended to terminate at Pittsburg, in Pennsylvania, a distance of 341½ miles. Its dimensions are nearly identical with those of the new Erie Canal; its breadth at the surface being from 60 to 80 feet, ditto at bottom 50 feet, with a depth of water varying from 6 to 7 feet. Several tunnels occur in the line which crosses the Alleghany ridge. The cost of this work was estimated at 22,275,000 *dol*., which were to be subscribed partly by individuals, and partly by the United States and the States of Maryland and Pennsylvania. Owing, however, to the inability, or rather disinclination, of the two last-mentioned states to make good their engagements, the works on the canal have been suspended, after about 10 millions of dollars have been expended upon them. But the probability is that they will be resumed and completed at some future period; their completion being the only means by which the capital already expended upon them can be made to yield any thing.

A great many other canals have been completed and are in progress in different parts of the Union. Of the former, the Ohio Canal, uniting the Ohio with Lake Erie, is by far the most important, and is, if at all, only less advantageous than the Erie Canal. Cleveland, where the canal unites with Lake Erie, has become one of the greatest emporiums on the Lakes.

17. *Canadian Canals*.—The British Government has expended a very large sum upon the Rideau River and Canal, stretching from Kingston, on Lake Ontario, to Bytown, on the Ottawa, or Grand River, an affluent of the St. Lawrence. But this work was undertaken as much in the view of improving the military defences of Canada as of protecting its commerce, though in the latter respect it has been of considerable utility. The British Government has also constructed the Welland Canal, uniting Lakes Erie and Ontario, the navigation between which by the river is interrupted by the Falls of Niagara. This canal has become a well-frequented commercial channel, and is every day rising in importance.

18. *Utility of Canals*.—The utility of canals, when judiciously contrived, and opening an easy communication between places capable of maintaining an extensive intercourse with each other, has never been better set forth than in a work published in 1765, entitled 'A View of the Advantages of Inland Navigation,' &c. But the following extract from Macpherson's *Annals of Commerce* (anno 1760) contains a brief, and at the same time eloquent, summary of the principal advantages resulting from their construction:—"They give fresh life to established manufactures, and they encourage the establishment of new ones by the ease of transporting the materials of manufacture and provisions; and thence we see new villages start up upon the borders of canals in places formerly condemned to sterility and solitude. They invigorate, and in many places create, internal trade, which, for its extent and value, is an object of still more importance than foreign commerce, and is exempted from the many hardships and dangers of a maritime life and changes of climate. And

they greatly promote the quantity which they, or the navigation, with, terminate, produce from, and chandise into, which are thus pl maritime parts; parts become coast of shipping. The equalised through of Providence are the monopolist is iniquity and opprovisions are tran tance. The adva provides a great p the whole of the s on manufactures a great. Manure, m articles, which co expense of cartage duce, can be carri canals; whereby p ren lands are brog emolument of the general advantage mented supply of t rials of manufactu which to a manufa actually concerned duly appreciating minerals in general, of great bulk in pro had hitherto lain u reason of the expen sibility, of carriage, dered a fund of wea which this gives b in turn, it is maintaine

19. *Increased Speed*.—Great as have been the advantages from the formation of canals, it has been to a considerable extent the formation of RAILWAYS that canals will always be of less importance of coal and other commodities, and even passengers with a rapidity that supposed impossible. In the case of the Paisley and Glasgow Canal, which was opened on the Paisley and Glasgow Canal, in June 1840, in the following statement, it is necessary to call the attention of the reader to the fact that Mr. Thomas Graham's Report on the Letter to Canal Provisions. The experiments of the canal in Scotland, Paisley Canal, with the town of Paisley, a distance of 12 miles, every previous theory of attaining great velocity, and without danger or damage to the vessels, is in moving vessels at

'The ordinary speed of the canal, in the first years, been from nine to ten miles per day, at this rapidity, although there are still some boats which are five feet six inches broad, and narrowness of the canal, they carry easily from 100 to 110 passengers. The

they greatly promote foreign trade, and consequently enrich the merchants of the ports where they, or the navigable rivers they are connected with, terminate, by facilitating the exportation of produce from, and the introduction of foreign merchandise into, the interior parts of the country, which are thus placed nearly on a level with the maritime parts; or, in other words, the interior parts become coasts, and enjoy the accommodations of shipping. The price of provisions is nearly equalised through the whole country; the blessings of Providence are more uniformly distributed; and the monopolist is disappointed in his schemes of iniquity and oppression by the ease wherewith provisions are transported from a considerable distance. The advantages to agriculture, which provides a great part of the materials, and almost the whole of the subsistence, required in carrying on manufactures and commerce, are pre-eminently great. Manure, marl, lime, and all other bulky articles, which could not possibly bear the great expense of cartage, and also corn and other produce, can be carried at a very light expense on canals; whereby poor lands are enriched, and barren lands are brought into cultivation, to the great emolument of the farmer and landholder, and the general advantage of the community, in an augmented supply of the necessaries of life and materials of manufactures; coals (the importance of which to a manufacturing country few people not actually concerned in manufactures are capable of duly appreciating), stone, lime, iron ore, and minerals in general, as well as many other articles of great bulk in proportion to their value, which had hitherto lain useless to their proprietors by reason of the expense, and, in many cases, impossibility, of carriage, are called into life, and rendered a fund of wealth, by the vicinity of a canal; which thus gives birth to a trade, whereby, in return, it is maintained.

**19. Increased Speed of Travelling by Canals.**—Great as have been the advantages derived from the formation of canals, their progress has been to a considerable degree checked by the formation of RAILROADS. We believe, however, that canals will always be preferred for the conveyance of coal and other bulky and heavy products; and even passengers could be conveyed along them with a rapidity that would previously have been supposed impossible. This new system was introduced on the Paisley and Glasgow Canal, by Mr. Houston, in June 1831. The results are described in the following statements, to which it is unnecessary to call the reader's attention:—

Mr. Thomas Graham, civil engineer, in his *Letter to Canal Proprietors and Traders*, says, 'The experiments of great velocity have been tried and proved on the narrowest, shallowest, and most curved canal in Scotland, viz. the Ardrossan or Paisley Canal, connecting the city of Glasgow with the town of Paisley and village of Johnstone—a distance of 12 miles.' The result has disproved every previous theory as to difficulty and expense of attaining great velocity on canals, and as to the danger or damage to their banks by great velocity in moving vessels along them.

'The ordinary speed for the conveyance of passengers on the Ardrossan Canal has, for nearly 2 years, been from nine to ten miles an hour; and, although there are fourteen journeys along the canal per day, at this rapid speed, its banks have sustained no injury. The boats are 70 feet in length, about 5 feet 6 inches broad, and, but for the extreme narrowness of the canal, might be made broader. They carry easily from 70 to 80 passengers; and, when required, can and have carried upwards of 110 passengers. The entire cost of a boat and fit-

tings up is about 125*l*. The hulls are formed of light iron plates and ribs, and the covering is of wood and light oiled cloth. They are more airy, light, and comfortable than any coach. They permit the passengers to move about from the outer to the inner cabin, and the fares per mile are one penny in the first, and three farthings in the second cabin. The passengers are all carried under cover; having the privilege also of an uncovered space. These boats are drawn by 2 horses (the prices of which may be from 50*l*. to 60*l*. per pair), in stages of 4 miles in length, which is done in from 22 to 25 minutes, including stoppages to let out and take in passengers, each set of horses doing 3 or 4 stages alternately each day. In fact, the boats are drawn through this narrow and shallow canal at a velocity which many celebrated engineers had demonstrated, and which the public believed, to be impossible.

'The entire amount of the whole expenses of attendants and horses, and of running one of these boats 4 trips of 12 miles each (the length of the canal) or 48 miles daily, including interest on the capital, and 20 per cent. laid aside annually for replacement of the boats, or loss on the capital therein vested, and a considerable sum laid aside for accidents and replacement of the horses, is 700*l*. some odd shillings; or, taking the number of working days to be 312 annually, something under 2*l*. 2*s*. 4*d*. per day, or about 1*l*. *d*. per mile. The actual cost of carrying from 80 to 100 persons a distance of 30 miles (the length of the Liverpool Railway), at a velocity of nearly 10 miles an hour, on the Paisley Canal, one of the most curved, narrow, and shallow in Britain, is therefore just 1*l*. 7*s*. 6*d*. sterling. Such are the facts, and, incredible as they may appear, they are facts which no one who enquires can possibly doubt.'

Boats on this principle were for a time established on a great many British canals, and on the Grand and Royal Canals in Ireland.

**20. Profits of Canals.**—It is a well-known fact, that canals, at an average, and allowing for the length of time that must elapse from the first outlay of capital before they yield any return, are not very productive. When, indeed, they connect places that have an extensive intercourse, and when no very extraordinary difficulties have to be surmounted in their construction, they most commonly yield very large profits; but, generally speaking, this does not appear to be the case; and, on the whole, they seem to have been more beneficial to the public than to their projectors.

It is customary to insert clauses in the Acts authorising canals to be cut, limiting the charge which the proprietors shall be entitled to impose upon the goods conveyed by them. But we think that the dividend ought also to be limited; and that it should be stipulated that whatever a moderate toll yielded over and above defraying this dividend, and providing for the repair of the canal, should be accumulated as a fund in order to buy up the stock of the canal, so that the toll may ultimately be reduced to such a sum as may suffice merely to meet the necessary repairs. We are not aware that any good objection could be made to a plan of this sort; and had it been adopted in this country, there are several instances in which it would have been very advantageous for the public. When the canal of Languedoc was completed, the most likely method, it was found, of keeping it in constant repair was to make a present of the tolls to Riquet the engineer. 'These tolls constitute,' says Dr. Smith, 'a very large estate to the different branches of the family of that gentleman, who have, therefore, a great interest to keep the work in constant repair. But

had these tolls been put under the management of commissioners, who had no such interest, they might, perhaps, have been dissipated in ornamental and unnecessary expenses, while the most essential parts of the work were allowed to go to ruin. Dr. Smith ought, however, to have mentioned that Riquet advanced a fourth part of the entire sum laid out upon the canal (Dutens, *Navigations Intérieure de la France*, tom. i. p. 119 &c.); and that officers were appointed by the Crown to see that the tolls were not rendered oppressive, and the canal kept in good order. At the Revolution most part of the property of the canal was confiscated; but at the restoration of the Bourbons in 1814 such parts of the confiscated property as had

not been sold were restored to the successors of M. Riquet, who have at this moment the principal management of the canal.

CANARY SEED. [SEED.]

CANDLE (Ger. *Lichter*; kerzen; Dutch, *kaarzen*; Fr. *candelle*; Ital. *candelle*; Span. and Port. *velas*; Russ. *svjetschi*; Lat. *candela*). A taper of tallow, wax, or spermaceti, the wick of which is commonly of several threads of cotton spun and twisted together.

Dr. Ure gives the following table, as containing the result of certain experiments he had made in order to determine the relative intensity of the light, and the duration of different sorts of tallow candles:—

Number in a Pound	Duration of a Candle	Weight in Grains	Consumption per Hour, in Grains	Proportion of Light	Economy of Light	Candles equal one Argand
16 mould	5h. 9m.	682	152	121	69	5.7
10 dipped	1 56	672	150	13	65	5.25
8 mould	7 23	856	132	103	59	6.6
6 "	7 23	1,160	163	114	66	5.0
4 "	9 56	1,784	186	201	80	3.9
Argand oil flame	—	—	512	69.4	100	—

'A Scotch matchkin,' says Dr. Ure, 'or  $\frac{1}{4}$  of a gallon of good seal oil, weighs 6,010 gr., or 13 $\frac{1}{10}$  oz. avoirdupois, and lasts in a bright Argand lamp 11 hours 44 minutes. The weight of oil it consumes per hour is equal to 4 times the weight of tallow in candles 8 to the pound, and  $\frac{3}{4}$  times the weight of tallow in candles 6 to the pound. But its light being equal to that of 5 of the latter candles, it appears from the above table that 2 lbs. weight of oil, value 9d. in an Argand, are equivalent in

illuminating power to 3 lbs. of tallow candles, which cost about 2s. The larger the flame in the above candles, the greater the economy of light.'

See, for ample information on the kinds and manufacture of candles, Hunt's *Ure's Dictionary*.

Until 1831, when it was repealed, candles were, for a lengthened period, subject to an excise duty; and their consumption was, in consequence, pretty exactly ascertained.

Year	Tallow	Rate of Duty per lb.	Wax	Rate of Duty per lb.	Spermaceti	Rate of Duty per lb.	Nett Revenue
	lbs.	d.	lbs.	d.	lbs.	d.	£ s. d.

In 1866 our export of British stearine candles amounted to 6,145,136 lbs. valued at 222,467*l.*; and in 1867 to 4,831,427 lbs. valued at 182,792*l.*; and of foreign candles, in 1866, 4,446,624 lbs. valued at 136,145*l.* More than half of these exports was consigned to Australia, and nearly the whole of the remainder to other British colonies.

CANDLE, SALE OR AUCTION BY INCH OF, is where bystanders are allowed to bid for merchandise while a small piece of candle is burning, and the commodity is adjudged to the last bidder whenever the candle is burnt out.

CANELLA ALBA (Fr. *canelle blanche*; Ger. *weisser Zimmt*; Ital. *canella bianca*; Span. *canella blanca*; Lat. *canella alba*). The inner bark of the *Canella alba*, a tree growing in the West Indies. It is brought to this country packed in casks and cases, in long pieces, some rolled in quills and others flat; the quilled sort is considerably thicker than cinnamon, and the flat nearly  $\frac{3}{4}$  inch in thickness. The quilled pieces are yellow on both sides; the flat pieces are yellow on the outside and pale brown within. They have an aromatic, clove-like odour, and an acrid, peppery taste. The virtues of canella reside in a volatile oil which may be extracted by distillation. (*British Pharmacopœia*.)

CANES. [BAMBOO; RATTANS.]

CANNA STARCH. A kind of starch, known by the French under the name of *tous les mois*, is found in commerce. It is uncertain from which

species of *Canna* (Nat. Order *Marantaceæ*) it is derived, but it is known that 3 tubers of the *Canna Achiras* are used as food in Peru and Chile, and that similar economical uses belong to the tubers of the *Canna edulis* of the West Indies, in which islands it is regularly cultivated. *Canna* starch is said to be superior to even the best arrow-root. The granules are whiter than those of ordinary fecula, are said to be larger, and to present a different appearance under the microscope.

CANNON, CANNONS (Dutch, *kanonen*; Fr. *canons*; Ger. *kanonen*; Ital. *canonni*; Pol. *dziła*; Port. *canhoes*; Russ. *puschki*; Span. *canones*; Swed. *kanon*). A kind of long hollow engines for throwing iron, lead, or stone balls by the force of gunpowder. They are commonly made of iron, but frequently also of a mixture of copper, tin, and brass. They are either cast hollow, or solid and then bored; those made in the latter way being very superior. Brass cannons, or cannons made of mixed metal, are said not to be so well calculated for hard service, or quick and continued firing, as those made of iron. The proportions of the ingredients used in making the former do not differ materially in different countries, though they rarely coincide. To 240 lbs. of metal fit for casting, we commonly put 68 lbs. of copper, 52 lbs. of brass, and 12 lbs. of tin. To 4,200 lbs. of metal fit for casting, the Germans put 3,687 $\frac{3}{4}$  lbs. of copper, 204 $\frac{1}{4}$  lbs. of brass, and 307 $\frac{3}{4}$  lbs. of tin. Others,

again, use 100 lbs. and 9 lbs. of tin; a 10 lbs. of brass, and

It seems to be the first made use of by Antonio de Cupman, who rendered some sort of artillery was used so early as 1312. (Quærens, *Q.*) Cannons were certainly used in 1347 at the siege of Calicut, at Chioggia in 1366, at Genoa in 1379 and 1380, and at them at the sieges of Constantinople in 1453. When first introduced, most part very heavy balls of an enormous size, owing to their frequent bursting, were used. There is a valuable article on the history of cannons in the *Encyclopædia*, which was published before the present work. In 1866 we exported iron and mortars of Britain at 97,394*l.* (Brande's *Science*, s. v. 'Guns; Cannon.')  
CANTHARIDES or blister-plasters, *mouches d'Espagne*; Ital. *cantharide*; hispanisk *muchi*; Silesiac *coleopteris* insects possess peculiar properties, and owe their name to the *Cantharis vesicatoria*, which is called *cautharidin* by chemists, and reside in certain parts of the body.

The *Cantharis vesicatoria* is a greater part of that found in the country from eight to ten lines in breadth. It is of a bright green colour. When alive, they are found in the white poplar, ash, &c. They are abundant in the Southern France, and also in the mountains of Spain, where they are usually collected in May, when they are torpid. They are protected by masks, and when they are shaken the trees, the linen cloths spread under them are plunged into diluted vinegar, and the insects are packed in casks, carefully stoppered, and kept in a cool atmosphere. The best cantharides are those from the southern provinces of Russia, of a purplish or rosy colour, rather than those from the countries. In 1866 we exported cantharides, valued at 2,400*l.*

Spanish flies are exposed to lose their powers. They are used in medicine. Powdered flies with euphorbium.

The *Cantharis vittata*, a species of *Mela* possess several kinds of *Mela* possess as large or larger quills. The physicians of the 17th century were of the opinion that several indigenous medicinal properties were possessed by the *British Pharmacopœia*; V. *States Dispensatory*.)

CANTON. Once the capital of China, it is the capital of the provinces of China Proper, N. Long, 113° 14' 30" E., 23° 14' 30" N. The Chi-Kiang river, the great interior stream of China, reaches the sea. C.

again, use 100 lbs. of copper, 6 lbs. of brass, and 9 lbs. of tin; and others, 100 lbs. of copper, 10 lbs. of brass, and 15 lbs. of tin.

It seems to be the general opinion that cannon were first made use of in 1336 or 1338; but Don Antonio de Capmany has produced some statements which render it almost certain that some sort of artillery was used by the Moors in Spain so early as 1312. (*Questiones Criticas*, p. 181 &c.) Cannons were certainly used by the English in 1347 at the siege of Calais, and by the Venetians at Chioggia in 1366, and in their wars with the Genoese in 1379 and 1380. The Turks employed them at the sieges of Constantinople, in 1394 and 1453. When first introduced, they were for the most part very heavy and unwieldy, and threw balls of an enormous size: they were, however, owing to their frequently bursting, about as dangerous to those using them as to their opponents. There is a valuable article on the construction and history of cannons in Rees's *Cyclopaedia*; but it was published before the appearance of Capmany's work. In 1866 we exported 17,166 cwt. of cannon and mortars of British manufacture, valued at 97,394*l.* (Brande and Cox, *Dictionary of Science*, s. v. 'Guns,' 'Rifled Cannons.')

**CANTHARIDES** or **SPANISH FLY** (Fr. *cantharides*; mouches d'Espagne; Ger. *spanische fliegen*; Ital. *cantarelle*; Lat. *cantharis*; Russ. *lischpanski muchi*; Span. *cantaridas*). Many coleopterous insects possess peculiar medicinal properties, and owe them to a peculiar principle called *cantharidin* by chemists, and which is said to reside in certain parts only of the insect's body.

The *Cantharis vesicatoria*, which supplies the greater part of that found in commerce, is an insect from eight to ten lines in length, by two or three in breadth. It is of a bright and shining metallic green colour. When alive, this animal has a fetid odour. They are found feeding on the leaves of the white poplar, ash, privet, elder, and lilac. They are abundant in Hungary, Spain, Italy, and Southern France, and also in Western Asia. They are usually collected in May and June, at sunrise, when they are torpid. Persons having their faces protected by masks, and their hands by gloves, beat or shake the trees, and catch the insects in linen cloths spread underneath. They are then plunged into diluted vinegar, or exposed to the vapour of vinegar, and subsequently dried and packed in casks, carefully protected from the atmosphere. The best cantharides come from the southern provinces of Russia, and are of a more coppery colour than those of the Mediterranean countries. In 1866 we imported 21,361 lbs. of cantharides, valued at 2,465*l.*

Spanish flies are exposed to damp, they putrefy, and lose their powers. They are also attacked by mites. Powdered flies are occasionally mixed with euphorbium.

The *Cantharis vittata*, *Mylabris cichorii*, and several kinds of *Mela* possess the active principle in as large or larger quantity than the common fly. The physicians of the United States have discovered that several indigenous insects possess the same medical properties with the Spanish fly. (*British Pharmacopoeia*; Wood and Bache's *United States Dispensatory*.)

**CANTON.** Once the chief commercial mart of China, is the capital of Kwang-tung, one of the 23 provinces of China Proper, in 1 at. 23° 7' 10" S., Long, 113° 14' 30" E., on a broad and navigable tidal stream, the Chu-Kiang, or Pearl River, forming one of the channels by which the united waters of two great interior streams, the North and West Rivers, reach the sea. Canton is situated in the

most southerly of the provinces on the sea-board of China. This province is traversed from west to east, from north to south, and from east to west, by three magnificent streams, of which the two latter are navigable by heavily-laden boats for distances of from 200 to 300 miles, whilst the former is derived from the remotest interior, being accessible for fully 700 miles along its own channel, and navigable also by large steamers for nearly 300 miles from the sea. The North and West Rivers join about 30 miles to the westward and northward of Canton, whence, in a noble channel of more than a mile broad, known as the Lower West River, or the Broadway, they pursue a direct southerly course to the sea. A portion of the united West and North Rivers is, however, diverted at the junction through a narrow channel in an easterly direction, and, after passing the important trading and manufacturing town of Fat-shun (Fu-shan), expands at Canton into the broad tidal river, branching into two channels (eventually subdivided into an intricate network around numberless flat, alluvial islands), which has the name of Chu-Kiang. 12 miles farther down the river is the safe and commodious anchorage of Whampoa, and 10 miles lower the East River joins, discharging itself by several mouths channelled through an alluvial plain. The bold shore a few miles lower down, and some rocky islets, compress the stream into a considerably narrower channel, called by the Chinese Hu Mun, or Tiger's Mouth, and by the Portuguese Boca Tigris, and hence 'The Bogue.' This was a fortified position from a very early period; but after having been thrice taken and dismantled at different times within the last thirty years by British squadrons, the once famous batteries of the Bogue are now (1868) only masses of battered masonry. On leaving the Bogue the river expands to a breadth of several miles, joining by numerous tortuous channels the waters of the Lower West River, until it is finally lost in the sea about 80 miles from Canton. The breadth of the estuary is fully 70 geographical miles. At the extreme eastern limit lies the island forming the British colony of Hong Kong, 40 miles to the westward of which, and close to the Broadway Channel, is the Portuguese settlement of Macao.

The facilities offered to commerce by so extensive a river-system and its accessibility from the sea made Canton at a very early date the principal seaport of the empire. This distinction it retained despite the drawback it suffers by its distance from the rich producing districts of Central China. The Northern harbours having silted up as early as the fifteenth and sixteenth centuries, the export and import trade centred at Canton, and as early as the eighth century trade with the ports of the Red Sea and the Indian Ocean was carried on here by Arabian vessels. Of European nations, the Portuguese were the first to reach China. In 1517 Fernao Peres de Andrade visited Canton, and Spanish, Dutch, and English adventurers soon followed. In 1637 the first British vessels reached this port after an encounter with the Bogue forts. Subsequently the prospect of a lucrative trade in silks, drugs, and tea led the East India Company to strive persistently to establish themselves here independently of the Portuguese, who again sought, at their settlement of Macao, to monopolize all communication with China. By the end of the reign of Charles II. the Company had planted several agencies at different ports along the coast, and about 1685 its factory was established at Canton. The first duty upon tea imported into England (5*s.* per lb.) was imposed about 1689. For exactly a century and a half, down to 1834, the trade between the United Kingdom and China

was monopolised by the East India Company; but in that year this monopoly was happily abolished, and the trade with China thrown open to all classes under the conditions specified in the Act 3 & 4 Wm. IV. c. 93.

The only real difficulty in trading with China originated in the despotism, pride, and jealousy of the Government, and in the general corruption of its officers. The former affected to treat all foreigners with contempt, and exposed them to frequent insult; while the latter endeavoured to multiply and enforce vexatious regulations and demands, that they might profit by the donations given for their evasion. We submitted, with exemplary forbearance, for a lengthened period, to every petty indignity the Chinese Government chose to inflict; but the proceedings connected with the seizure and destruction, in 1839, of the opium belonging to British subjects—[*Opium*]—led to hostilities between this country and China; and these, as every one knows, have been productive of events which must powerfully influence the future intercourse of Englishmen, and of foreigners generally, with the Chinese.

Our military and naval operations resulted in the signature of a treaty at Nanking, on August 29, 1842, by which four additional ports (Shanghai, Ningpo, Fu-chow, and Amoy) were thrown open to foreign trade, the rights of residence in and access to all these cities as well as the surrounding country were conceded, a fixed tariff was proclaimed, the Cohong or Chinese mercantile monopoly abolished at Canton, and the Island of Hong Kong ceded to the British.

From this period our commercial relations with China vastly increased, but the preeminence of Canton gradually declined. Several years elapsed, indeed, before the new ports drew to themselves any considerable share of trade.

Tea has always been by far the principal article of import from China; and it is mainly owing to the diffusion of the taste for it, and its consumption by all ranks and orders of the people, that the trade with China has attained its present importance; and, as already seen, we believe we must look principally to the increased consumption of tea that will, no doubt, follow the effectual reduction that has been made in the exorbitant duties with which it was formerly loaded, for the future increase of the trade. The other articles of import are raw silk and silk manufactures, cassia lignea, and a few more; but they are of very inferior value and importance as compared with tea.

The great articles of export from this country to China consist of cotton stuffs and yarn, woollen goods, linen &c., earthenware, iron, and steel &c. Bullion used to be largely exported to China, but for some years past that has not been the case. [*PRECIOUS METALS.*]

Previously to the abolition of the monopoly, in 1834, the real value of the merchandise annually exported from the United Kingdom to China did not exceed 600,000*l.*, whereas it had increased in 1836 to 1,326,388*l.* The interruption of the regular trade by the disturbances and hostilities that afterwards ensued prevents any conclusions in regard to its real amount being deduced from the returns for 1839, 1840, and 1841.

*War of 1856.*—The Treaty of 1842 did not prove to be so lasting as many supposed it would be. It was, in truth, in many respects vague and indefinite, and disputes, of one sort and another, could hardly fail to arise out of its provisions. But that which led to, or was a pretext for, the war of 1856 was about as worthless as could well be imagined. On the 8th of October of that year a species of vessel called a *lorcha*, registered at

Hong Kong, and said (though that has been stoutly denied) to have had the British flag flying, was boarded near Canton by a party of Chinese, who seized a portion of her crew (natives) and hauled down the alleged British flag. The consul and the governor of Hong Kong took, or pretended to take, fire at this real or imaginary insult to the majesty of the British nation; and the Chinese governor having refused to humour their prejudices by making an apology, they proceeded forthwith to bombard Canton, and to destroy the war junks in the river. When the intelligence of these violent proceedings arrived in England, they gave rise to much diversity of opinion. They were disapproved of by the House of Commons; but on its being dissolved, and an appeal made to the country, the bellicose propensities of the latter were fully developed, and a House was returned pledged to inflict signal vengeance on the Chinese for their insult to our flag and dignity! An expedition was in consequence fitted out to accomplish this and other objects. Happily it was accompanied by an able diplomatist, the Earl of Elgin, who was authorised to negotiate a treaty with the Chinese. It would be useless, and it would also be foreign to the object of this work, to enter into any details in regard to the proceedings of Lord Elgin's expedition. It is enough to say that they were completely successful; and a portion of the English forces, accompanied by a small French squadron, having proceeded up the Peiho to Tien-tsin, within 80 miles of Peking, a treaty of peace was agreed to on June 26, 1858, between the British (by whom it was in fact dictated) and Imperial commissioners; and similar treaties were subsequently agreed to with the plenipotentiaries of France, Russia, and the United States.

The allied occupation of Canton was prolonged through the attempt of the Chinese Government in 1859 to resist the advance of the British and French Ministers towards Peking, and the ratification of the treaties concluded by Lord Elgin and Baron Gros in the previous year. This resistance led to the successful campaign of 1860, which brought the British army under Sir Hope Grant to the gates of Peking. Hero the treaty of 1858 was fully ratified, and an additional convention wrung from the Chinese commissioners.

The following is a synopsis of the treaty of Tien-tsin:—

*Summary of the Treaty between her Majesty and the Emperor of China, signed at Tien-tsin, June 26, 1858.*

Art. 1. Confirms the treaty of Nankin of 1842, and abrogates the supplementary treaty and general regulations of trade.

2. Provides for the appointment of ambassadors, ministers, or other diplomatic agents on the part of either country at the courts of Peking and St. James's.

3. Contains provisions for the permanent establishment of a British minister, his family and suite at Peking, and the forms to be observed in his communications with the Imperial Government.

4. Makes arrangements for the travelling and the transmission of the correspondence of the minister and the employment by him of special couriers.

5. The Emperor of China consents to nominate one of the secretaries of state, or some high officer, to transact business with the British minister either personally or in writing, on a footing of perfect equality.

6. The same privileges are to be granted to the Chinese minister in London.

7. Consuls may be appointed in China, and may

reside in any of the open ports, and in any rank and position as the authorities are determined.

8. The Christian religion, and the rights of the Christians, and the rights of the professors protected.

9. British subjects to have full and free access into all parts of the interior of the empire, their consuls, countersignatures, and regulations are to be determined. The provisions to be applied to ships' crews, and to those of whom regulations are to be given to Nankin, or other ports.

10. British merchant ships to be allowed to trade up the great river, and in the present disturbed state of the valley no port is to be closed, with the exception of Chin Kiang, until a year from the signature of the treaty, after which peace is restored, British ships to be allowed to trade at such ports, as may be determined, exceeding three in number, after consulting with the local authorities, the details of which shall determine.

11. In addition to the ports of Canton, Shanghai, Ningpo, Tientsin, Swatow, and Kowloon, other ports may be opened, and the trade to be carried on at such ports, as may be determined.

12. British subjects are to have full and free access to all parts of the interior of the empire.

13. No restrictions to be placed on the trade of British subjects in any lawful capacity.

14. The hire of boats for passengers to be settled by mutual agreement, and the number of passengers to be limited, and no monopoly of the trade to be granted, the regulations to be determined by law.

15. All questions in regard to the jurisdiction between British and Chinese subjects to be determined by law.

16. Chinese subjects guilty of crimes towards British subjects to be punished by the Chinese authorities; British subjects guilty of crimes towards British subjects to be punished by the Chinese authorities; British subjects guilty of crimes in China to be tried according to the laws of Great Britain.

17. Determines the mode of settling the master of complaints on the part of Chinese subjects.

18. Provides for the protection of the property of British subjects in the interior of the empire.

19. If any British merchant ship is plundered by robbers, the authorities are to be notified, and to capture and punish the robbers, and to return the stolen property.

20. Wrecked or stranded property to be secured under stress of weather, and security in any Chinese port to be furnished by the local authorities, with the means of conveyance to the nearest consular station.

21. Chinese criminals, or those who are on board of British ships, or on board of Chinese ships, to be punished in the same manner as if they were British subjects, the same also if taking refuge in the vessels of British subjects.

reside in any of the open ports, and their official rank and position as regards the Chinese local authorities are determined.

8. The Christian religion, as professed by Protestants or Roman Catholics, to be tolerated, and its professors protected.

9. British subjects to travel for pleasure or trade into all parts of the interior, with passports from their consuls, countersigned by the local authorities. The regulations as regards these passports are determined. The provisions of the article not to be applied to ships' crews, for the due restraint of whom regulations are to be drawn up by the consul and the local authorities. No pass to be given to Nankin, or cities in the hands of the rebels.

10. British merchant ships are to be allowed to trade up the great river (Yang-tze), but in the present disturbed state of the upper and lower valley no port is to be opened for trade with the exception of Chin Kiang, which is to be opened in a year from the signature of the treaty. When peace is restored, British vessels are to be admitted to trade at such ports, as far as Hankow, not exceeding three in number, as the British minister, after consulting with the Chinese secretary of state, shall determine.

11. In addition to the present ports, New Chwang, Tang Chow, Tai Wan (Formosa), Chow Chow (Swatow), and Kiung-Chow (Hainan) are to be opened, and the right of residence and holding landed property is conceded.

12. British subjects are to make agreements for landed property at the rates prevailing among the people.

13. No restrictions to be placed on the employment by British subjects of Chinese subjects in any lawful capacity.

14. The hire of boats for transport of goods or passengers to be settled between the parties themselves without the interference of the Chinese Government. The number of the boats not to be limited, and no monopoly allowed. If any smuggling takes place, the offender to be punished according to law.

15. All questions in regard to rights of property of a person between British subjects to be subject to the jurisdiction of the British authorities.

16. Chinese subjects guilty of any criminal act towards British subjects to be arrested and punished by the Chinese authorities according to the law of China; British subjects committing any crime in China to be tried and punished by the consul or other public functionary according to the laws of Great Britain.

17. Determines the mode of procedure in the matter of complaints on the side either of British or Chinese subjects.

18. Provides for the protection of the persons and property of British subjects.

19. If any British merchant vessel in Chinese waters is plundered by robbers or pirates, the Chinese authorities are to use every endeavour to capture and punish the offenders, and to recover the stolen property.

20. Wrecked or stranded vessels, or vessels under stress of weather, are to be afforded relief and security in any Chinese port; and the crews are to be furnished by the Chinese, if necessary, with the means of conveyance to the nearest consular station.

21. Chinese criminals taking refuge in Hong Kong, or on board of British ships, shall, upon the requisition of the Chinese authorities, be given up; the same also if taking refuge in the houses or on board the vessels of British subjects at the open ports.

22. The Chinese authorities to do their utmost to arrest Chinese subjects failing to discharge their debts to British subjects or fraudulently absconding, and to enforce recovery of the debts. The British authorities to do likewise as regards British subjects indebted to Chinese.

23. Debts incurred by Chinese at Hong Kong must be recovered in the courts of justice on the spot. If the debtor should abscond, and should possess real or personal property in the Chinese territory, the Chinese authorities, in concert with the British consul, are to see justice done between the parties.

24. British subjects shall pay on all merchandise imported or exported the duties prescribed by the tariff, but in no case shall they pay other or higher duties than the subjects of other foreign nations pay.

25. Import duties to be considered payable on the landing of the goods, and duties of export on the shipment of the same.

26. The tariff fixed by Article 10 of the treaty of Nankin to be revised by a commission of British and Chinese officers to meet at Shanghai, so that the revised tariff may come into operation immediately after the ratification of the treaty.

27. Either contracting party may demand a further revision of the tariff and of the commercial articles of the treaty at the end of ten years; but six months' notice must be given, or the tariff is to remain in force for ten years more, and so at the end of each successive ten years.

28. It is agreed that within four months of the signature of the treaty, the Chinese collector of duties at ports already opened and hereafter to be opened to British trade shall be obliged, on application of the consul, to declare the amount of duties leviable on produce between the place of production and the port of shipment, and upon imports between the consular port in question and the inland markets named by the consul; and a notification thereof shall be published in English and Chinese. British subjects may, however, clear their goods of all transit duties by payment of a single charge; the amount of the charge to be calculated as near as possible at the rate of 2½ per cent. ad valorem duty, and it is to be fixed for each article at the conference to be held at Shanghai.

The payment of transit dues by commutation is in no way to affect the tariff duties on imports or exports, which will continue to be levied separately and in full.

29. Regulates the amount of tonnage dues. British merchant vessels of more than 150 tons burden to pay at the rate of 4 mace per ton; if of 150 tons and under, at the rate of 1 mace per ton.

Vessels engaged in the coasting trade, or clearing for Hong Kong from any of the open ports, shall be entitled to a special certificate exempting them from all further payment of tonnage dues in any open port of China for a period of 4 months from the date of port clearance.

30. The master of any British merchant vessel may within 48 hours after his arrival, but not later, depart without breaking bulk; in which case he will not be subject to pay tonnage dues. No other fees or charges upon entry or departure shall be levied.

31. No tonnage dues to be paid on passenger boats, or boats conveying baggage, letters, articles of provision, or other articles not subject to duty. All cargo boats, however, conveying merchandise subject to duty, shall pay tonnage dues once in 6 months, at the rate of 4 mace per register ton.

32. The consuls and superintendents of customs

to consult together respecting the erection of buoys and light ships, as occasion may demand.

33. Duties to be paid to the authorised Chinese bankers, either in sycee or in foreign money, according to the assay made at Canton, July 13, 1843.

34. Sets of standard weights and measures to be delivered by the superintendent of customs to the consul at each port, to secure uniformity.

35. British merchant vessels to be at liberty to engage pilots to take them into any of the open ports, and to convey them out, after they have discharged all legal dues and duties.

36. The superintendent of customs shall depute one or more customs officers to guard a British merchant ship on arriving off one of the open ports. They shall stay either in a boat of their own or on board ship; their food and expenses shall be supplied from the custom house, and they shall be entitled to no fees from the master or consignee.

37. Ships' papers, bills of lading &c., to be lodged in the hands of the consul twenty-four hours after arrival, and full particulars of the vessel to be reported to the superintendent of customs within a further period of twenty-four hours; omission to comply with this rule within forty-eight hours punishable by a fine of 50 taels for each day's delay. The total amount of penalty not to exceed 200 taels. The master responsible for the correctness of the manifest: a false manifest subjects the master to a fine of 500 taels, but he will be allowed to correct any mistake within twenty-four hours without incurring the penalty.

38. If the master shall begin to discharge any goods without the permit from the superintendent of customs, he shall be fined 500 taels, and the goods discharged shall be confiscated wholly.

39. British merchants must apply to the superintendent of customs for a special permit to land or ship cargo. Cargo landed or shipped without such permit will be liable to confiscation.

40. No transshipment from one vessel to another can be made without special permission, under pain of confiscation of the goods transhipped.

41. The superintendent of customs shall give a port clearance when all dues and duties have been paid, and the consul shall then return the ship's papers.

42. If the British merchant cannot agree with the Chinese officer in fixing a value on goods subject to an ad valorem duty, each party shall call in two or three merchants, and the highest price at which any of the merchants would purchase them shall be assumed to be the value of the goods.

43. Provides that duties shall be charged upon the nett weight of each article, making a deduction for the tare weight of congee &c., and regulates the manner in which the tare on any article, such as tea, shall be fixed. The British merchant may appeal to his consul within twenty-four hours.

44. Upon all damaged goods a fair reduction of duty shall be allowed, proportionate to their deterioration. If any disputes arise, they shall be settled in the manner pointed out in the clause of this treaty having reference to articles which pay duty ad valorem.

45. British merchants who have imported merchandise into an open port and paid duty may re-import their goods under certain regulations without payment of any additional duty.

British merchants desiring to re-export duty-paid imports to a foreign country to be entitled, under similar regulations, to a drawback certificate, which is to be a valid tender in payment of customs duties.

Foreign grain brought into a Chinese port in a British ship, if no part has been landed, may be re-exported without hindrance.

46. The Chinese authorities at the ports to adopt the means they may judge most proper to prevent the revenue suffering from fraud or smuggling.

47. British merchant-vessels not to resort to other than the ports declared open; not unlawfully to enter ports, or to carry on clandestine trade along the coasts. Vessels violating this provision to be, with their cargoes, subject to confiscation by the Chinese Government.

48. If a British merchant vessel be concerned in smuggling, the goods to be subject to confiscation by the Chinese authorities, and the ship may be prohibited from trading further, and sent away as soon as her accounts shall have been adjusted.

49. All penalties or confiscations under the treaty to belong and be appropriated to the public service of the Chinese Government.

50. All official communications addressed by British diplomatic or consular agents to the Chinese authorities are henceforth to be written in English. For the present they will be accompanied by a Chinese version; but it is understood that in case of there being any difference of meaning between the English and Chinese text, the English Government will hold the sense expressed in the English text to be the correct sense. This provision is to apply to the present treaty, the Chinese text of which has been carefully corrected by the English original.

51. The character '1' (barbarian) not to be applied to the British Government or to British subjects in any Chinese official document issued by the Chinese authorities.

52. British ships of war or no hostile purpose, or being engaged in the pursuit of pirates, to be at liberty to visit all the Chinese ports, and to receive every facility for procuring necessaries, or, if required, for making repairs. The commanders of such ships to hold intercourse with the Chinese authorities on terms of equality and courtesy.

53. The contracting parties agree to concert measures for the suppression of piracy.

54. Confirms all advantages secured to the British Government by previous treaties, and stipulates that the British Government shall participate in any advantages which may be granted by the Emperor of China to any other nation.

55. The conditions affecting indemnity for expenses incurred, and loss sustained, in the matter of the Canton question, to be included in a separate article, which shall be in every respect of equal validity with the other articles of the treaty.

56. Ratifications to be exchanged within a year after the day of signature.

Separate article provides that a sum of 2,000,000 taels, on account of the losses sustained by British subjects through the misconduct of the Chinese authorities at Canton, and a further sum of 2,000,000 taels on account of the expenses of the war, shall be paid to the British representative in China by the authorities of the Kwang Tung province.

The arrangements for effecting these payments to be determined by the British representative in concert with the Chinese authorities at Kwang Tung.

The British forces are not to be withdrawn from Canton until the above amounts are discharged in full.

We also annex an abstract of the trade regulations annexed to the treaty.

Rule 1. *Unenumerated Goods.*—Articles not enumerated in the list of exports, but enumerated

In the list of imports, amount of duty on ports; and, similar the list of imports exports, when limited duty set against them.

Articles not enumerated in the list of duty-free goods, to be subject to a duty of 5 per cent value.

Rule 2. *Duty free goods.*—Lion, foreign coins, preserved meats, confectionery, fireworks, perfume, ware, perfumery, foreign wood, candles (foreign), wine, bottles, ships' stores, personal baggage, drugging, glass and crystal ware.

The above pay no duty if transported into the port of destination, except personal baggage and foreign coins, payable at the rate of 2½ per cent ad valorem.

A freight or port duty (personal baggage and foreign coins excepted) shall be liable to tonnage-duty.

Rule 3. *Contraband.*—Gunpowder, shot, crum, muskets, pistols, and other arms, and accoutrements of war; and other articles prohibited by the Treaty.

Rule 4. *Weights and Measures.*—The weight of the hundred catties is held to be equal to three hundred and thirty-three and a half English pounds, and the length of the foot to be equal to thirteen English inches.

One Chinese chih is held to be equal to one-tenth of an English inch, and three inches to equal one Chinese chih.

Rule 5. *Regarding Contraband.*—The prohibitions in opium, cash, grain, sulphur, and saltpetre, and other articles, shall be subject to the following conditions:

1. Opium will henceforth be prohibited from import duty at the port. It will be subject to duty on Chinese only, and only foreign trader will not be subject to the provisions of Article 5, by which British ships, by which British ships, proceed into the interior will not extend to it.

2. *Copper Cash.*—The prohibitions of the same treaty, by which British ships, regulated; the transit of the Chinese Government as the Chinese Government revisions of the Treaty, to be applied to opium.

3. *Copper Cash.*—The prohibitions of the same treaty, by which British ships, regulated; the transit of the Chinese Government as the Chinese Government revisions of the Treaty, to be applied to opium.

In the list of imports, when exported will pay the amount of duty set against them in the list of imports; and, similarly, articles not enumerated in the list of imports, but enumerated in the list of exports, when imported will pay the amount of duty set against them in the list of exports.

Articles not enumerated in the list, nor in either list of duty-free goods, will pay an ad valorem duty of 5 per cent. calculated on their market value.

**Rule 2. Duty-free wools.**—Gold and silver bullion, foreign coins, flour, Indian meal, sago, biscuit, preserved meats and vegetables, cheese, butter, confectionery, foreign clothing, jewellery, plated ware, perfumery, soap of all kinds, charcoal, firewood, candles (foreign), tobacco (foreign), cigars (foreign), wine, beer, spirits, household stores, ships' stores, personal baggage, stationery, carpeting, drugging, cutlery, foreign medicines, and glass and crystal ware.

The above pay no import or export duty, but, if transported into the interior, will, with the exception of personal baggage, gold and silver bullion, and foreign coins, pay a transit duty at the rate of 2½ per cent. ad valorem.

A freight or part freight of duty-free commodities (personal baggage, gold and silver bullion, and foreign coins excepted) will render the vessel carrying them, though no other cargo be on board, liable to tonnage-dues.

**Rule 3. Contraband goods.**—Import and export trade is alike prohibited in the following articles: Gunpowder, shot, cannon, fowling-pieces, rifles, muskets, pistols, and all other munitions and implements of war; and salt.

**Rule 4. Weights and Measures.**—In the calculations of the Tariff, the weight of a picul of one hundred catties is held to be equal to one hundred and thirty-three and one-third pounds avoirdupois; and the length of a chang of ten Chinese feet to be equal to one hundred and forty-one English inches.

One Chinese chih is held to equal fourteen and one-tenth inches English; and four yards English less three inches to equal one chang.

**Rule 5. Regarding certain Commodities heretofore Contraband.**—The restrictions affecting trade in opium, cash, grain, pulse, sulphur, brimstone, saltpetre, and spelter are relaxed, under the following conditions:

1. Opium will henceforth pay thirty taels per picul import duty. The importer will sell it only at the port. It will be carried into the interior by Chinese only, and only as Chinese property; the foreign trader will not be allowed to accompany it. The provisions of Article 9 of the Treaty of Tientsin, by which British subjects are authorised to proceed into the interior with passports to trade, will not extend to it, nor will those of Article 28 of the same treaty, by which the transit-dues are regulated; the transit-dues on it will be arranged as the Chinese Government see fit; nor, in future revisions of the Tariff, is the same rule of revision to be applied to opium as to other goods.

2. **Copper Cash.**—The export of cash to any foreign port is prohibited; but it shall be lawful for British subjects to ship it at one of the open ports of China to another, on compliance with the following Regulation:—The shipper shall give notice of the amount of cash he desires to ship, and the port of its destination, and shall bind himself, either by a bond with two sufficient sureties, or by depositing such other security as may be deemed by the Customs satisfactory, to return, within six months from the date of clearance, to the collector at the port of shipment, the certificate issued by him, with an acknowledgment thereon of the re-

ceipt of the cash at the port of destination, by the collector at that port, who shall thereto affix his seal; or, failing the production of the certificate, to forfeit a sum equal in value to the cash shipped. Cash will pay no duty inwards or outwards; but a freight or part freight of cash, though no other cargo be on board, will render the vessel carrying it liable to pay tonnage-dues.

3. The export of rice and all other grain whatsoever, native or foreign, no matter where grown or whence imported, to any foreign port, is prohibited; but these commodities may be carried by British merchants from one of the open ports of China to another, under the same conditions in respect of security as cash, on payment at the port of shipment of the duty specified in the Tariff.

No import duty will be leviable on rice or grain; but a freight, or part freight of rice or grain, though no other cargo be on board, will render the vessel importing it liable to tonnage-dues.

4. **Pulse.**—The export of pulse and bean-cake from Tang-chau and New-chwang under the British flag is prohibited. From any other of the open ports they may be shipped, on payment of the tariff duty, either to other ports of China or to foreign countries. The restriction as to the ports of Tang-chau and New-chwang was abolished in January 1862.

5. Saltpetre, sulphur, brimstone, and spelter, being munitions of war, shall not be imported by British subjects, save at the requisition of the Chinese Government, or for sale to Chinese duly authorised to purchase them. No permit to land them will be issued until the Customs have proof that the necessary authority has been given to the purchaser. It shall not be lawful for British subjects to carry these commodities up the Yang-tszekiang, or into any port other than those open to the seaboard, nor to accompany them into the interior on behalf of Chinese. They must be sold at the ports only, and, except at the ports, they will be regarded as Chinese property.

Infractions of the conditions, as above set forth, under which trade in opium, cash, grain, pulse, saltpetre, brimstone, sulphur, and spelter may be henceforward carried on, will be punishable by confiscation of all the goods concerned.

**Rule 6. Liability of Vessels entering Port.**—To prevent misunderstanding, it is agreed that the term of twenty-four hours, within which British vessels must be reported to the Consul under Article 37 of the Treaty of Tien-tsin, shall be understood to commence from the time a British vessel comes within the limits of the port; as, also, the term of forty-eight hours allowed her by Article 30 of the same Treaty to remain in port without payment of tonnage-dues.

The limits of the ports shall be defined by the Customs, with all consideration for the convenience of trade, compatible with due protection of the revenue; also the limits of the anchorages within which lading and discharging are permitted by the Customs; and the same shall be notified to the Consuls for public information.

**Rule 7. Transit Dues.**—It is agreed that Article 28 of the Treaty of Tien-tsin shall be interpreted to declare the amounts of transit dues legally leviable upon merchandise imported or exported by British subjects, to be one half of the tariff duties, except in the case of the duty-free goods liable to a transit duty of 2½ per cent. ad valorem, as provided in Article 2 of these rules. Merchandise shall be cleared of its transit dues under the following conditions:—

In the case of Imports.—Notice being given at the port of entry, from which the imports are to be forwarded inland, of the nature and quantity

of the goods; the ship from which they have been landed; and the place inland to which they are bound, with all other necessary particulars, the Collector of Customs will, on due inspection made, and on receipt of the transit duty due, issue a transit-duty certificate. This must be produced at every barrier station, and visé. No further duty will be leviable upon imports so certificated, no matter how distant the place of their destination.

In the case of Exports.—Produce purchased by a British subject in the interior will be inspected, and taken account of, at the first barrier it passes on its way to the port of shipment. A memorandum, showing the amount of the produce and the port at which it is to be shipped, will be deposited there by the person in charge of the produce; he will then receive a certificate, which must be exhibited and visé at every barrier, on his way to the port of shipment. On the arrival of the produce at the barrier nearest the port, notice must be given to the Customs at the port, and the transit dues due thereon being paid, it will be passed. On exportation the produce will pay the tariff duty.

Any attempt to pass goods inwards or outwards otherwise than in compliance with the rule here laid down will render them liable to confiscation.

Unauthorised sale, in transitu, of goods that have been entered as above for a port, will render them liable to confiscation. Any attempt to pass goods in excess of the quantity specified in the certificate will render all the goods of the same denomination named in the certificate liable to confiscation. Permission to export produce which cannot be proved to have paid its transit dues will be refused by the Customs until the transit dues shall have been paid. The above being the arrangement agreed to regarding the transit dues, which will thus be levied once and for all, the notification required under Article 28 of the Treaty of Tientsin, for the information of British and Chinese subjects, is hereby dispensed with.

*Rule 8. Foreign Trade under Passport.*—It is agreed that Article 9 of the Treaty of Tien-tsin shall not be interpreted as authorising British subjects to enter the capital city of Peking for purposes of trade.

*Rule 9. Abolition of the Melting Fee.*—It is agreed that the percentage of one tael two mace, hitherto charged in excess of duty payments, to defray the expenses of melting by the Chinese Government, shall be no longer levied on British subjects.

*Rule 10. Collection of Duties under one System at all Ports.*—It being, by Treaty, at the option of the Chinese Government to adopt what means appear to it best suited to protect its revenue, accruing on British trade, it is agreed that one uniform system shall be enforced at every port.

The high officer appointed by the Chinese Government to superintend foreign trade will, accordingly, from time to time, either himself visit, or will send a deputy to visit, the different ports. The said high officer will be at liberty, of his own choice, and independently of the suggestion or nomination of any British authority, to select any British subject he may see fit to aid him in the administration of the Customs revenue; in the prevention of smuggling; in the definition of port boundaries; or in discharging the duties of harbour-master; also in the distribution of lights, buoys, beacons, and the like, the maintenance of which shall be provided for out of the tonnage-dues.

The Chinese Government will adopt what measures it shall find requisite to prevent smuggling

upon the Yang-tze-kiang when that river shall be opened to trade.

The following is a synopsis of the Supplementary Convention of Peking, signed October 24, 1860:—

Art. I. Expresses the regret of the Emperor of China for the breach of friendly relations in 1859.

Art. II. Establishes the right of residence at Peking on the part of the British Ambassador.

Art. III. Provides for the payment of a war-indemnity of six millions of taels (2,000,000L) in addition to two million taels previously demanded as indemnity for the losses of British merchants at Canton.

Art. IV. Opens the Port of Tien-tsin to trade.

Art. V. Authorises the emigration to foreign countries of Chinese with their families.

Art. VI. Cedes to the Queen of Great Britain and Ireland a tract of land known as Kow-loon, on the mainland opposite Hong Kong.

Art. VII. Provides for the immediate operation of the Treaty of 1858.

Art. VIII. Provides for the publication throughout the Empire of the treaty and convention.

Art. IX. Contains agreements with respect to the evacuation of the sundry places of which possession had been taken.

High expectations were now entertained, and with reason, of a vastly extended commerce with China, and large European settlements sprang up at the ports newly thrown open. The diffusion of trade over so wide an area could not, however, but be prejudicial to the prosperity of Canton, already seriously undermined by the hostilities of 1856-1858. The teas and other exports which were formerly brought by a land journey of 600 miles from the producing districts of Hu-peh across the mountains, and down the North River to the Canton market, were now purchased at Hankow, in the centre of the producing districts, and despatched by steamers navigating the Yang-tze to Shanghai, whence they were shipped to England direct. Imports in like manner were introduced at half a dozen eligible points to the markets of the interior.

Hong Kong, too, in 1854 suddenly rose in importance, owing to the prevalence of the rebellion around Canton, which caused many of the native traders to seek security in Hong Kong either as residents or by transporting merchandise thence in steamers to Canton. Two years later the entire foreign community was removed from Canton, owing to the pending hostilities, and a large accession to the importance of Hong Kong as a settlement was the natural consequence. The proximity of our colony to the seat of trade gave encouragement to merchants to maintain their depôts and residences in the island, inducing the Chinese dealers to visit them there for the purchase of imports. For the introduction of these into the interior, exceptional facilities were afforded by the numerous branches of the Canton river, through which merchandise, and especially opium, can be clandestinely conveyed, and the payment of customs duties at Canton avoided. Under these circumstances Hong Kong grew rapidly, at the expense of Canton; and when tranquillity was restored, it became apparent, after a year or two, that the great mercantile houses no longer make the latter place their head quarters. The number of foreign residents has dwindled year by year in proportion to the growth of Hong Kong, whilst the introduction of powerful river steamers built in the United States, and making the voyage between Canton and Hong Kong daily in less than six hours, has rendered it still more easy for the Chinese dealers to visit the colony and supply their wants from the importers there in the cheapest and most

expeditious method in the principal from Canton, and assistants employed silk; but a large trade has passed agents, whilst it very rapidly to or through the agencies, thus portance of the once drew to the of the entire out of intercommuni the extended use the vast influx of world, are rapidly to a level with native as well as uniform distribution, entailed the evils unsettled markets, of periodical failures. Perhaps at no time the trade of China by a few wealthy Chinese native agents, markets of Europe, as in Australia and Singapore. This diversion of trade must be steadily borne upon the diminished and of exports and farther on. This diminishes the actual fall so much as the trans business done to China annually published later, respecting which is accessible. At the time is not the case, as the outward commerce in trade within the cognate establishments; but at Canton with Hong Kong much merchandise is being regularly between imports or exports by purely native tariff, and the foreign Inspectorate returns of trade are derided. The administration of China demands a brief on imports and exports, transit of merchandise, one of the recognised sources and have usually been in court favourites, farming lucrative conditions. The paid annually by the State at Canton was fixed at (267,000L) per annum were usually above 1,000,000L pursued at this and other constant bargaining between the merchant, and a corruption was usually a This demoralising system who proved, naturally, was equally injurious to and to the higher class of Shanghai by rebels in 1850. The Chinese Collectorate

expeditious manner. In consequence of this revolution in the method of conducting trade, many of the principal firms have withdrawn altogether from Canton, whilst others are still represented by assistants employed for the purchase of tea and silk; but a large and increasing proportion of the trade has passed into the hands of commission agents, whilst the Chinese themselves are learning very rapidly to do business on their own account, or through the medium of the foreign commission agencies, thus progressively curtailing the importance of those few celebrated houses which once drew to themselves all but a fractional part of the entire outward and inward trade. Rapidity of intercommunication, the employment of steam, the extended use of the English language, and the vast influx of competitors from all parts of the world, are rapidly reducing the power of capital to a level with that of energy and enterprise, native as well as foreign; but with the more uniform distribution of the advantages of trade are entailed the evils of commercial insecurity and unsettled markets, with the attendant calamities of periodical failure and panics.

Perhaps at no distant time, instead of having the trade of China to a great extent engrossed by a few wealthy British houses, we may have Chinese native agencies in the various commercial marts of Europe, as we already see them flourishing in Australia and California, in Java and Singapore.

This diversion of trade from Europeans to Chinese must be steadily borne in mind in any reflections upon the diminished returns of customs revenue and of exports and imports which will be shown farther on. This diminution does not really represent the actual falling off in the amount of trade so much as the transfer of a large portion of the business done to Chinese hands. The statistics annually published have no reference to the latter, respecting which little or no information is accessible. At the other open ports, indeed, this is not the case, as the necessity of carrying on all outward commerce in foreign bottoms brings the trade within the cognisance of the Customs establishments; but at Canton the river communication with Hong Kong is so easy and safe, that much merchandise is carried by native junks plying regularly between the two places, and the imports or exports by which pay duty under a purely native tariff, apart from the jurisdiction of the foreign Inspectorate of Customs whence the returns of trade are derived.

The administration of the Maritime Customs of China demands a brief explanation here. Duties on imports and exports, as well as on the internal transit of merchandise, have been for 1,500 years one of the recognised sources of revenue in China, and have usually been made productive of profit to court favourites, farming the income under highly lucrative conditions. The revenue required to be paid annually by the Superintendent of Customs at Canton was fixed in 1800 at 800,000 taels (267,000*l.*) per annum, but the actual receipts were usually above 1,000,000 taels. The system pursued at this and other ports was one of constant bargaining between the Custom-house and the merchant, and a well-understood system of corruption was usually at work. A nominal tariff existed, but was seldom the rule for levying duty. This demoralising system was profitable to many, who proved, naturally, its warm supporters, but was equally injurious to the Chinese Government and to the higher class of merchants.

An accidental circumstance (the capture of Shanghai by rebels in 1853) led to the placing of the Chinese Collectorate of Customs at that port

in the hands of a commission of three Europeans, appointed by the Consuls of Great Britain, France, and the United States. The honesty and regularity with which business was transacted under them commended the services of foreigners to the notice of the Chinese authorities, by whom the system was continued, with the tacit consent of the Cabinet of Peking, even after the expulsion of the rebels.

A few years later, a clause of the Treaty of Tien-tsin placed the employment of foreigners in the Customs department on a recognised footing. The system was soon extended to all the open ports, with beneficial results. At Canton (as elsewhere) a European Commissioner is stationed, with a staff of clerks, tide-waiters &c., by whom the entire working of the tariff is conducted, with the exception of money payments. These remain entirely in the hands of the Chinese. The papers of all vessels entering port are deposited with the Consul of the nation to which they belong, and report is then made to the Custom-house, which completes the *entry* of the vessel. The master or consignee obtains from the Custom-house his permit to load or discharge cargo, and, on payment into the Chinese Customs' Bank of all duties and tonnage-dues, a clearance (called the Grand Chop) is issued under the seal of the Chinese Superintendent of Customs, on production of which at his Consulate the master receives back his papers and can proceed to sea.

The following statement shows the state of the commerce at Canton down to 1865:—

Year	Value of Imports	Value of Exports	Total Value in Mexican dollars
	dollars	dollars	
1860	18,400,000	16,200,000	34,600,000
1861	12,900,000	15,900,000	28,700,000
1862	10,500,000	17,700,000	28,200,000
1863	9,500,000	16,000,000	25,500,000
1864	8,100,000	13,600,000	21,700,000
1865	7,900,000	17,500,000	21,400,000

The duties have fallen off proportionately: the total collection for—

1860	amounted to	1,496,000	taels
1861	"	1,230,000	"
1862	"	1,089,000	"
1863	"	950,000	"
1864	"	737,000	"

It is thus shown that the value of the foreign trade of Canton for 1864 was about  $\frac{1}{3}$  what it was in 1860, and the amount of duties received is less than  $\frac{1}{2}$  of what it was 5 years previously. On the other hand while in 1842 the exports from the United Kingdom to China amounted to 969,311*l.*, in 1843 they were 1,456,180*l.*, and in 1845 they rose to the then unprecedented amount of 2,394,827*l.* But though they declined in 1848 to 1,445,950*l.*, they have since progressively risen till, in 1866, they amounted to, exclusive of Hong Kong and Macao, 5,008,474*l.*, and inclusive of these two ports 7,677,633*l.* Great as this amount may seem, most probably it would, at no distant period, be very much increased but for the difficulty the Chinese experience in making returns; a difficulty which will, however, be now very materially diminished.

Although Canton is situated nearly in the same parallel of latitude as Calcutta, there is a considerable difference in their temperature; the former being much cooler, and requiring fires during the winter months. The streets are very narrow, paved with little round stones, and flagged close to the sides of the houses. The front of every house is a shop, and these of particular streets are laid out for the supply of strangers. China-street is appropriated to Europeans; and here the productions of almost every part of the globe are to be found. One of the shopkeepers is always to be found sitting on the counter, writing with a

camel's-hair brush, or calculating with his swan-pan, on which instrument a Chinese will perform operations in numbers with as much celerity as the most expert European arithmetician.

The Chinese, considered as traders, are eminently active, persevering, and intelligent. They are, in fact, a highly commercial people; and the notion that was once very generally entertained, of their being peculiarly characterised by a contempt of commerce and of strangers, is as utterly unfounded as any notion can possibly be. Business is transacted at Canton with great despatch; and nowhere in the world may cargoes be sold and bought, loaded and unloaded, with more business-like speed and activity.

Provisions and refreshments of all sorts are abundant in Canton, and, in general, of an excellent quality; nor is the price exorbitant. Every description of them, dead and alive, is sold by weight. It is a curious fact that the Chinese make no use of milk, either in its liquid state or in the shape of curds, butter, or cheese. Among the delicacies of a Chinese market are to be seen horse-flesh, dogs, cats, hawks, and owls. The country is well supplied with fish from the numerous canals and rivers by which it is intersected.

The British settlement at Canton is designated the Shamen Site, and is an artificial island constructed in 1860-1 at an expense of 325,000 dollars, of which one-fifth was defrayed by the French Government, to whom a proportionate allotment of the area was made.

Steamers of heavy burden can ascend the river to an anchorage immediately facing the Shamen Site; and although the limits of the port of Canton are officially held not to extend above the anchorage of Whampoa, the advantage to trade which is entailed by the loading and discharging of steamers at Canton is so great that a tacit permission is given to the practice. Several large steamers trade regularly between Canton, Shanghai, and Tien-tsin, carrying almost exclusively native merchandise, such as drugs, dried fruits, iron and brass ware, paper (of which large quantities are manufactured near Canton from the macerated hull of the bamboo) &c. The great variety of these miscellaneous articles of commerce can best be estimated by a review of the Custom-house returns, in which they are included in virtue of their shipment in British bottoms. It is rarely, however, that foreign traders are concerned in these shipments. The great staples of tea and silk, opium and cotton goods, may still be said to occupy almost exclusively the attention of foreign merchants. Continental (chiefly German) houses do, indeed, import some quantities of petty European manufactures, among which watches and fire-arms take the lead; but the importance of this trade is not great. Among the articles of the second class to be enumerated are matting and fire-crackers (largely shipped to the United States) and drugs. Guano of late years been introduced, and has found a ready sale. The price obtained has been on an average about 300 dollars per picul (133½ lbs.).

A very considerable trade in Indian cotton, imported from Bombay by Parsee and Koja traders, for the most part is carried on in ordinary years; but the flow of cotton eastwards was interrupted during 1862-1864, when this article of merchandise was for the first time exported from China (principally from Shanghai) to meet the English demand consequent upon the war in the United States. Indian cotton is considered by the Chinese inferior to their own staple, but its cheapness causes it to be extensively employed. Rice is

another article very largely imported, as the production in China has never kept pace with the demand. The carrying trade in rice forms one of the principal sources of employment for sailing vessels during the winter months, when tea and other freights are slack. It is brought from Siam, Burmah, Manila, and Saigon, and is usually transhipped at Hong Kong on board native junks.

As regards the manner of purchase and sale, it must be borne in mind that imports are seldom brought to Canton by the European merchants, who, as has already been said, prefer attracting the Chinese buyers to Hong Kong. Propositions to establish bonded warehouses at Canton have hitherto been negatived by the Chinese Government, and have also been unfavourably viewed by the residents of Hong Kong. Exports, however, must be purchased on the spot from the Chinese brokers. To buyer and seller alike the brokers are as essential in China as in other countries, and by their intervention trade is carried on at Canton with great facility. Tea is brought from the interior by companies of traders, who purchase and prepare it for the market in the producing districts. The owners of a lot or *chop* of tea (usually 500 to 600 chests) place their merchandise in the hands of a broker, who obtains for them from the native banks an advance of some 75 per cent. of its value, and circulates among the foreign merchants samples or 'musters' of its quality. When a purchase is decided upon, the *chop* is examined by the tea inspector of the firm, but seldom more than one per cent. of the chests is opened. If, as is usually the case, the tea in bulk is approved of as 'equal to muster,' it is immediately prepared for shipment, a guarantee or *security chop* being usually given by the broker, who thus becomes responsible for its good quality throughout until its arrival in England and examination by sworn brokers. Silk is similarly examined and guaranteed.
