Canadian Institute for Historical Microreproductions / Institut canadien de microreproductions historiques

1991

Technical and Bibliographic Notes / Notes techniques et bibliographiques

The Institute has attempted to obtain the best original copy available for filming. Features of this copy which may be bibliographically unique, which may alter any of the images in the reproduction, or which may significantly change the usual method of filming, are checked below.

L'Institut a microfilmé le meilleur exemplaire qu'il lui a été possible de se procurer. Les détails de cet exemplaire qui sont peut-être uniques du point de vue bibliographique, qui peuvent modifier une image reproduite, ou qui peuvent exiger une modification dans la méthode normale de filmage sont indiqués ci-dessous.

Coloured covers/
Couverture de couleur

Covers damaged/
Couverture endommagée

Covers restored and/or laminated/
Couverture restaurée et/ou pelliculée

Cover title missing/
Le titre de couverture manque

Coloured maps/
Cartes géographiques en couleur

Coloured ink (i.e. other than blue or black)/
Encre de couleur (i.e. autre que bleue ou noire)

Coloured plates and/or illustrations/
Planches et/ou illustrations en couleur

Bound with other material/
Relié avec d'autres documents

Tight binding may cause shadows or distortion
along interior margin/

La reliure serrée peut causer de l'ombre ou de la
distortion le long de la marge intérieure

Blank leaves added during restoration may appear
within the text. Whenever possible, these have
been omitted from filming/

Il se peut que certaines pages blanches ajoutées
lors d'une restauration apparaissent dans le texte,
mais, lorsque cela était possible, ces pages n'ont
pas été filmées.

The copy filmed here has been reproduced thanks
to the generosity of:

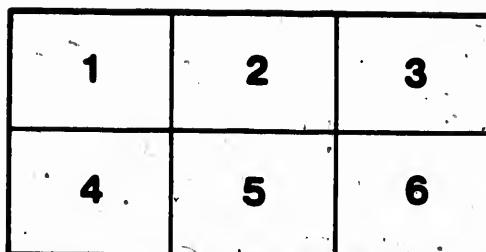

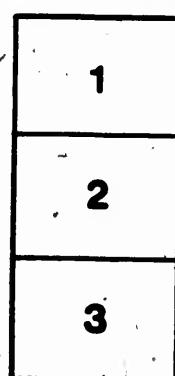

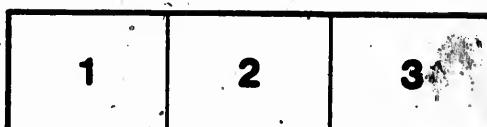

Library of the National
Archives of Canada

The images appearing here are the best quality
possible considering the condition and legibility
of the original copy and in keeping with the
filming contract specifications.

Original copies in printed paper covers are filmed
beginning with the front cover and ending on
the last page with a printed or illustrated impres-
sion, or the back cover when appropriate. All
other original copies are filmed beginning on the
first page with a printed or illustrated impres-
sion, and ending on the last page with a printed
or illustrated impression.

The last recorded frame on each microfiche
shall contain the symbol → (meaning "CON-
INUED"), or the symbol ▽ (meaning "END"),
whichever applies.

Maps, plates, charts, etc., may be filmed at
different reduction ratios. Those too large to be
entirely included in one exposure are filmed
beginning in the upper left hand corner, left to
right and top to bottom, as many frames as
required. The following diagrams illustrate the
method:

L'exemplaire filmé fut reproduit grâce à la
générosité de:

La bibliothèque des Archives
nationales du Canada

Les images suivantes ont été reproduites avec le
plus grand soin, compte tenu de la condition et
de la netteté de l'exemplaire filmé, et en
conformité avec les conditions du contrat de
filmage.

Les exemplaires originaux dont la couverture en
papier est imprimée sont filmés en commençant
par le premier plat et en terminant soit par la
dernière page qui comporte une empreinte
d'impression ou d'illustration, soit par le second
plat, selon le cas. Tous les autres exemplaires
originaux sont filmés en commençant par la
première page qui comporte une empreinte
d'impression ou d'illustration et en terminant par
la dernière page qui comporte une telle
empreinte.

Un des symboles suivants apparaîtra sur la
dernière image de chaque microfiche, selon le
cas: le symbole → signifie "A SUIVRE", le
symbole ▽ signifie "FIN".

Les cartes, planches, tableaux, etc., peuvent être
filmés à des taux de réduction différents.
Lorsque le document est trop grand pour être
reproduit en un seul cliché, il est filmé à partir
de l'angle supérieur gauche, de gauche à droite,
et de haut en bas, en prenant le nombre
d'images nécessaire. Les diagrammes suivants
illustrent la méthode.

Regarding Portable Gravity Concrete Mixers

The Mixers are shown in Catalogue and Pamphlets being fed by means of storage bins, tipping trys or measuring boxes, and also by men with shovels, as best suits the work in hand.

The Mixer being portable, enables it to be easily moved about, and, as it requires no other power but gravitation, there is no engine, boiler, or piping, to move along with it.

Its capacity is only dependent upon how much can be fed to the Mixer, and how much concrete can be removed from the delivery end of same per day.

If it is proposed to feed the Mixer by hand with shovels, the best method would be one which was used by a contractor in London, Eng., namely, support the Mixer on a long bar which is well greased, employ nine men, four men to measure a batch in the ordinary manner, Stone, Sand spread on top of the stone, and Cement on top of the sand. One man goes to the discharge end of the Mixer to operate the water and gate, the concrete being delivered direct into the wheelbarrow, wagon, or trench as required. As soon as the batch is ready, the four men shovel it into the Mixer and, while they are doing this, four other men should be measuring another batch close at hand. When batch No. 1 is finished, the Mixer is slid along the bar in front of batch No. 2; and while that is being shovelled into the Mixer, the four men who shovelled batch No. 1 are measuring another batch in the same place; so that on finishing batch No. 2, the Mixer can be slid back to its original position in front of them. By this method a continuous supply of concrete is maintained, it also gives each gang a turn at measuring and feeding. The output of these nine men was 100 cubic yards per day.

"How soon will a Mixer pay for itself?" This is answered by comparing the amount of concrete that nine men can produce mixing it by hands with shovels in a day of ten hours, as against the same gang with a Mixer producing 100 cubic yards in the same time.

Again, **when the nine men would have finished mixing the concrete by hand, it would have to be shovelled into barrows, or other conveyors, or into the trench.** The Gravity Mixer fills the conveyors, therefore the act of shovelling into the Gravity Mixer is equivalent to filling the conveyors with mixed concrete, so that in addition to producing more concrete per day, it must save the cost of labor for dry and wet mixing. In other words, the cost of mixing the concrete and filling the wagons or conveyors would be the wages of the nine men employed. On works where a tipping box can be used the cost of concreting is greatly reduced, and the methods of working fully explained in the pamphlets. For a very large dock, or reservoir, there is no device that can turn out concrete more accurately or cheaply than that shown on page 5 in 2nd set of Advance Sheets.

"Comparison with Steam Mixers." It should be kept in mind that the Steam Mixer has not yet been made that can turn out the quantity a Gravity Mixer can, the latter being a continuous Mixer and does not have to wait for the drum to be charged, nor does it use steam or hand power to revolve a drum. Moreover, the Mixer being easily moved about, does not require anything like the setting up a Steam Mixer does; furthermore, there is a vast difference in the cost.

On large jobs, feeding from Storage Bins, or using the **Accurate Measurer and Feeder**, 60 to 100 cubic yards per hour can be readily produced, PROVIDED the Storage Bins are kept full and the concrete removed as rapidly as it comes from the Mixer.

Some of our best customers are the ones that needed the inst persuation to purchase a Mixer in the first instance, as they thought the price rather high for such a simple device. Admitting that looking at the intrinsic value of the several parts of which the Mixer is composed the price appears high, yet the best proof of the Mixer's value as an investment is given by the following:

For some work at London, England, the Portable Gravity Concrete Mixer was used on one portion, while on another part of the work, concrete was being mixed in the usual manner by hand. At the end of two weeks when the contractor could figure up his costs intelligently, he immediately purchased another, the following being a copy of his letter:—

"15 Railway Approach, London Bridge, S.E., 9th August, 1901."

Dear Sir,

"Will you please send me as soon as possible another Portable Gravity Mixer for my work at the Central Electric Supply Co's. Building, Grove Road, Marylebone, the same as last, viz:— 8 feet without joint.

"Kindly let me know when you can deliver, I should like it at once."

The Mixer was submitted to a similar test at the New Entrance to the Docks at Swansea, England, since that date (between January and August, 1901) the contractor has purchased eight more mixers for his various contracts. It was also submitted to a similar test at the London and India Docks by another contractor, as shown in photograph, etc., on pages 10-12 of 2nd set of Advance Sheets, that contractor has since purchased six more for various contracts in England and foreign countries. In August 1901 a Mixer was sold to one of the largest Railway Contractors in England, for use on the Midland Railway, whom our London representative had been trying to persuade to buy for at least six months, and since that date there have been shipped him for various contracts, one on Oct. 18th, another Nov. 26th, and another Dec. 13th, 1901.

Remember, the quantity made depends altogether on how much can be fed to the mixer and what method best suits the work in hand.

E. F. DARTNELL, Sales Agent for Canada
