The copy filmed here has been reproduced thanks to the generosity of:

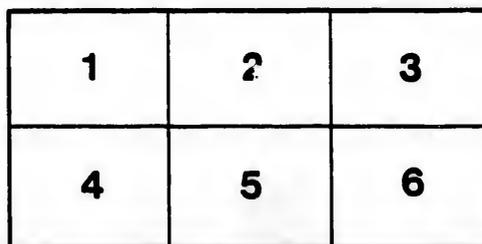

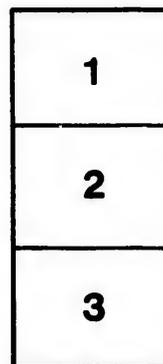

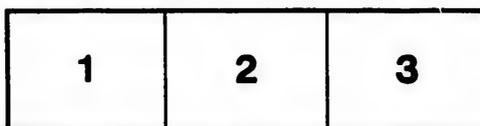

Seminary of Quebec  
Library

The images appearing here are the best quality possible considering the condition and legibility of the original copy and in keeping with the filming contract specifications.

Original copies in printed paper covers are filmed beginning with the front cover and ending on the last page with a printed or illustrated impression, or the back cover when appropriate. All other original copies are filmed beginning on the first page with a printed or illustrated impression, and ending on the last page with a printed or illustrated impression.

The last recorded frame on each microfiche shall contain the symbol  $\rightarrow$  (meaning "CONTINUED"), or the symbol  $\nabla$  (meaning "END"), whichever applies.

Maps, plates, charts, etc., may be filmed at different reduction ratios. Those too large to be entirely included in one exposure are filmed beginning in the upper left hand corner, left to right and top to bottom, as many frames as required. The following diagrams illustrate the method:

L'exemplaire filmé fut reproduit grâce à la générosité de:

Séminaire de Québec  
Bibliothèque

Les images suivantes ont été reproduites avec le plus grand soin, compte tenu de la condition et de la netteté de l'exemplaire filmé, et en conformité avec les conditions du contrat de filmage.

Les exemplaires originaux dont la couverture en papier est imprimée sont filmés en commençant par le premier plat et en terminant soit par la dernière page qui comporte une empreinte d'impression ou d'illustration, soit par le second plat, selon le cas. Tous les autres exemplaires originaux sont filmés en commençant par la première page qui comporte une empreinte d'impression ou d'illustration et en terminant par la dernière page qui comporte une telle empreinte.

Un des symboles suivants apparaîtra sur la dernière image de chaque microfiche, selon le cas: le symbole  $\rightarrow$  signifie "A SUIVRE", le symbole  $\nabla$  signifie "FIN".

Les cartes, planches, tableaux, etc., peuvent être filmés à des taux de réduction différents. Lorsque le document est trop grand pour être reproduit en un seul cliché, il est filmé à partir de l'angle supérieur gauche, de gauche à droite, et de haut en bas, en prenant le nombre d'images nécessaire. Les diagrammes suivants illustrent la méthode.

A NEW  
**GEOGRAPHICAL, HISTORICAL, AND COMMERCIAL**  
**GRAMMAR;**  
 AND  
**PRESENT STATE**  
 OF THE SEVERAL  
**KINGDOMS OF THE WORLD.**

CONTAINING

- I. The Figures, Motions, and Distances of the Planets, according to the Newtonian System, and the latest Observations.
- II. A general View of the Earth, considered as a Planet; with several useful Geographical Demarcations and Problems.
- III. The grand Divisions of the Globe into Land and Water, Continents and Islands.
- IV. The Situation and Extent of Empires, Kingdoms, States, Provinces, and Colonies.
- V. Their Climate, Air, Soil, Vegetable Productions, Metals, Minerals, Natural Curiosities, Seas, Rivers, Bays, Capes, Promontories, and Lakes.
- VI. The Birds and Beasts peculiar to each Country.
- VII. Observations on the Changes that have been any-where observed upon the Face of Nature, since the most early Periods of History.
- VIII. The History and Origin of Nations, their Forms of Government, Religion, Laws, Revenues, Taxes, Naval and Military Strength, Orders of Knighthood, &c.
- IX. The Genius, Manners, Customs, and Habits of the People.
- X. Their Language, Learning, Arts, Sciences, Manufactures, and Commerce.
- XI. The chief Cities, Structures, Ruins, and artificial Curiosities.
- XII. The Longitude, Latitude, Bearings, and Distances of principal Places from London.

TO WHICH ARE ADDED,

- I. A GEOGRAPHICAL INDEX, with the Names of Places alphabetically arranged.
- II. A TABLE of the COINS of all Nations, and their Value in ENGLISH MONEY.
- III. A CHRONOLOGICAL TABLE of remarkable Events, from the Creation to the present Time.

By WILLIAM GUTHRIE, Esq.

THE ASTRONOMICAL PART BY JAMES FERGUSON, F.R.S.

The distinguished approbation which the public have shown to this work, as is evident from the many editions through which it has passed, from the rapidity of the sale of very large impressions, and from the increasing demand which continues to be made for it, amply, it may be presumed, a proof sufficiently manifest of its utility and excellence.

It may, however, be reasonably expected that, at the appearance of this new edition, some account should be given of the improvements which have been made, and of the addition of new matter; which will be found to such an

extent, as to be celebrated as the present for Geographical Enquiries, and for the spirit of adventure which has expanded the most distant countries, it is highly probable that a work of this kind should afford a collection of new information which is most useful and interesting, and amply exhibits every thing valuable to be found in the latest voyages and travels. Of these, since the last improved edition of this

Geography in 1792, a number have been published which have been better with the most correct and authentic accounts of the distant Kingdoms upon the Continent of Europe. In our description of the extent of the Kingdoms, and the number of the and of the Kingdoms, and many other things have been added, as well many important corrections and additions, as in the last edition our account of the Kingdom of China was considerably enlarged and improved, from Mr. George Johnston's authentic Ac-

## ADVERTISEMENT.

---

THE distinguished approbation which the public have shown to this work, as is evident from the many editions through which it has passed, from the rapidity of the sale of very large impressions, and from the increasing demand which continues to be made for it, affords, it may be presumed, a proof sufficiently satisfactory of its utility and excellence.

It may, however, be reasonably expected that, at the appearance of this new edition, some account should be given of the improvements which have been made, and of the accession of new matter, which will be found to enrich it.

In an age so celebrated as the present for Geographical science, and for that spirit of adventure which has explored the most distant countries, it is highly proper that a work of this kind should afford a selection of that information which is most useful and interesting, and faithfully exhibit every thing valuable to be found in the latest voyages and travels. Of these, since the last improved edition of this Grammar, in 1798, a number have been published, which have been perused with the most careful attention, and which have furnished many important particulars to the accounts of the different kingdoms upon the continent of *Europe*. In our descriptions of the extensive regions of *Asia*, the embassies to Tibet and Ava, of captain Turner and major Symes, have furnished us with many important corrections and additions; as in the last edition our account of the empire of China was considerably enlarged and improved, from sir George Staunton's authentic Ac-

count of the Voyage and Embassy of Lord Macartney.—Of *Africa*, little is yet known; though great exertions have lately been made to add to our knowledge of that continent. The Travels of Mr. Park, who appears to have penetrated farther into the interior parts of that vast country than perhaps any other European, and the geographical illustrations of his journey by that judicious geographer major Rennell, as also the Travels of Mr. Browne in Egypt and Dar-Fur, have enabled us to make important additions to our account of that quarter of the globe.—The Geography of *America* owes much to the labours of Mr. Morse, a gentleman of that country, who visited in person the several states in the Union, and maintained an extensive correspondence with men of science. From this authentic source a particular account is now given of each state singly, with its divisions into districts, counties, towns, &c. besides a variety of other particulars; and the new states of Vermont, Kentucky, and Tennessee, are inserted in their proper order, according to their respective situations. The voyages of the unfortunate French navigator, M. de la Pérouse, and captain Vancouver, have afforded us much useful information; the latter, especially, has enabled us to correct the misrepresentations of some former voyagers, with respect to pretended discoveries on the north-west coast of America, which had never before been so accurately explored. In fine, no publications on the subject of geography, and the present state of the different countries of the world, have been published since the last edition which have not been carefully consulted.

As this work is historical as well as geographical, the perpetual changes of states and human affairs, especially those produced by the late revolutions which have convulsed Europe, have rendered some consider-

## ADVERTISEMENT.

able additions and alterations necessary in the historical part. Such have been made in this edition; and the history of each country is brought down to the present time; that of Great Britain is considerably enlarged; and the stupendous exertions and rapid conquests of the French republic have been faithfully detailed; while the calamitous events, which, in that distracted country, have been the consequence of contending factions and an unsettled government, have been pourtrayed in their true colours, and such as cannot fail to excite every honest Briton to cherish and defend the excellent and well-poised constitution of his own happy island; a constitution formed and improved by the accumulated wisdom of ages.

To make room for these additions, and such insertions as were absolutely necessary to render the work more perfect, some parts, which appeared too diffuse, have been abridged; and others, less important, have been omitted. Yet so numerous have the additions been, as to enlarge this edition much beyond the last. Though the two last improved editions exceeded in bulk very considerably the preceding ones, this will be found to exceed the last (in 1798) by more than thirty pages, and nearly one hundred of new information;—a proof that great pains have been employed to give the work a just and continued claim to general notice and approbation.

August, 1800.

As this work is historical as well as geographical, the perpetual changes of states and human affairs, especially those produced by the late revolutions which have occurred in Europe, have rendered some consider-

## PREFACE.

---

TO a man sincerely interested in the weifare of fociety and of his own country, it must be particularly agreeable to reflect on the rapid progress and general diffusion of learning and civility which, within the present age, have taken place in Great Britain. Whatever may be the case in some other kingdoms of Europe, we, in this island, may boast of our superiority to those illiberal prejudices which not only cramp the genius but sour the temper of man, and disturb all agreeable intercourse of fociety. Among us, learning is no longer confined within the schools of the philosophers, or the courts of the great; but, like all the greatest advantages which heaven has bestowed on mankind, it is become as universal as it is useful.

This general diffusion of knowledge is one effect of that happy constitution of government which, towards the close of the last century, was confirmed to us, and which constitutes the peculiar glory of this nation. In other countries, the great body of the people possess little wealth, have little power, and consequently meet with little respect; in Great Britain the people are opulent, have great influence, and claim, of course, a proper share of attention. To their improvement, therefore, men of letters have lately directed their studies; as the great body of the people, no less than the dignified, the learned, or the wealthy few, have an acknowledged title to be amused and instructed. Books have been divested of the terms of the schools, reduced from that size which suited only the purses of the rich and the avocations of the studious, and are adapted to persons of more ordinary fortunes, whose attachment to other pursuits admitted of little leisure for those of knowledge. It is to books of this kind, more than to the works of our Bacons, our Lockes, and our Newtons, that the generality of our countrymen owe that superior improvement which distinguishes them from the lower ranks of men in all other countries. To promote and

advance in its improvement is the principal design of our present undertaking. No subject appears more interesting than that we have chosen, and none seems capable of being handled in a manner that may render it more generally useful.

The knowledge of the world, and of its inhabitants, though not the sublimest pursuit of mankind, it must be allowed is that which most nearly interests them, and to which their abilities are best adapted. And books of Geography, which describe the situation, extent, soil, and productions of kingdoms; the genius, manners, religion, government, commerce, sciences, and arts, of all the inhabitants upon earth; promise the best assistance for attaining this knowledge.

The compendium of Geography we now offer to the Public differs in many particulars from other books on that subject. Besides exhibiting an easy, distinct, and systematic account of the theory and practice of what may be called Natural Geography, the Author has attempted to render the following performance an instructive, though compendious, detail of the general history of the world. The character of nations depends on a combination of a great many circumstances, which reciprocally affect each other. There is a nearer connection between the learning, the commerce, the government, &c. of a state, than most people seem to apprehend. In a work of this kind, which pretends to include moral, or political, as well as natural Geography, no one of these objects should pass unnoticed. The omission of any one of them would, in reality, deprive us of a branch of knowledge, not only interesting in itself, but which is absolutely necessary for enabling us to form an adequate and comprehensive notion of the subject in general. We have thought it necessary, therefore, to add a new article to this work, which comprehends the history and present state of learning in the several countries we describe, with the characters of such persons as have been most eminent in the various departments of letters and philosophy. This subject will, on a little reflection, appear altogether requisite, when we consider the powerful influence of learning upon the manners, government, and general character of nations. These objects, indeed, till of late, seldom found a place in geographical perfor-

mances; and, even where they have been introduced, are by no means handled in an entertaining or instructive manner. Neither is this to be altogether imputed to the fault of geographical writers. The greater part of travellers, acting solely under the influence of avarice, the passion which first induced them to quit their native land, were at little pains, and were indeed ill qualified, to collect such materials as are proper for gratifying our curiosity, with regard to these particulars. The geographer, then, who could only employ the materials put into his hands, was not enabled to give us any important information upon such subjects. In the course of the present century, however, men have begun to travel from different motives. A thirst for knowledge, as well as for gold, has led many into distant lands. These they have explored with a philosophic attention; and, by laying open the internal springs of action, by which the inhabitants of different regions are actuated, exhibit to us a natural and striking picture of human manners, under the various stages of barbarity and refinement. Without manifest impropriety, we could not but avail ourselves of their labours, by means of which we have been enabled to give a more copious and more perfect detail of what is called Political Geography, than has hitherto appeared.

In considering the present state of nations, few circumstances are of more importance than their mutual intercourse. This is chiefly brought about by commerce, the prime mover in the œconomy of modern states, and of which, therefore, we have never lost sight in the present undertaking.

We are sensible that a reader could not examine the present state of nations with much entertainment or instruction, unless he was also made acquainted with their situation during the preceding ages, and of the various revolutions and events, by the operation of which they have assumed their present form and appearance. This constitutes the historical part of our work; a department which we have endeavoured to execute in a manner entirely new. Instead of fatiguing the reader with a dry detail of newspaper occurrences, no way connected with one another, or with the general plan of the whole, we have mentioned only such facts as are interesting, either in themselves, or from their relation to objects of import-

## PREFACE.

Instead of a meagre index of incoherent incidents, we have drawn up a regular and connected epitome of the history of each country;—such an epitome as may be read with equal pleasure and advantage, and which may be considered as a proper introduction to more copious accounts.

Having, through the whole of the work, mentioned the ancient names of countries, and, in treating of their particular history, sometimes carried our researches beyond the limits of modern times, we have thought it necessary, for the satisfaction of such readers as are unacquainted with classical learning, to begin our historical Introduction with the remote ages of antiquity. By inserting an account of the ancient world in a book of geography, we afford an opportunity to the reader of comparing together, not only the manners, government, and arts of different nations, as they now appear, but as they subsisted in ancient ages; which exhibiting a general map, as it were, of the history of mankind, renders our work more complete than any geographical treatise extant.

In the execution of our design, we have all along endeavoured to observe order and perspicuity. Elegance we have sacrificed to brevity; happy to catch the leading features which distinguish the characters of nations, and by a few strokes to hit off, though not completely to finish.

What has enabled us to comprise so many subjects within the narrow bounds of this work, is the omission of many immaterial circumstances, which are recorded in other performances of the same kind, and of all those fabulous accounts or descriptions which, to the disgrace of the human understanding, swell the works of geographers; though the falsity of them, both from their own nature, and the concurring testimony of the most enlightened and best-informed travellers and historians, has been long since detected.

As to particular parts of the work, we have been more or less diffuse, according to their importance to us as men and as subjects of Great Britain. Our own country, in both respects, deserved the greatest share of our attention. Great Britain, though she cannot boast of a more luxuriant soil or happier climate than many other countries, has advantages of another and superior kind, which make her the delight, the envy, and the mistress of the world:

these are, the equity of her laws, the freedom of her political constitution, and the moderation of her religious system. With regard to the British empire, we have therefore been singularly copious.

Next to Great Britain, we have been most particular upon the other states of Europe; and always in proportion as they present us with the largest field for useful reflection. By comparing together our accounts of the European nations, the important system of practical knowledge is inculcated, and a thousand arguments will appear in favour of a mild religion, a free government, and an extended, unrestrained commerce.

Europe having occupied so large a part of our volume, Asia next claims our attention; which, however, though in some respects the most famous quarter of the world, offers, when compared to Europe, extremely little for our entertainment or instruction. In Asia, a strong attachment to ancient customs, and the weight of tyrannical power, bear down the active genius of man, and prevent that variety in manners and character which distinguishes the European nations.

In Africa, the human mind seems degraded below its natural state. To dwell long upon the manners of this country, a country so immersed in rudeness and barbarity, besides that it could afford little instruction, would be disgusting to every lover of mankind. Add to this, that the inhabitants of Africa, deprived of all arts and sciences, without which the human mind remains torpid and inactive, discover no great variety in manners or character. A gloomy sameness almost every-where prevails; and the trifling distinctions which are discovered among them seem rather to arise from an excess of brutality on the one hand, than from any perceptible approaches towards refinement on the other. But though these quarters of the globe are treated less extensively than Europe, there is no district of them, however barren or savage, entirely omitted.

America, whether considered as an immense continent, uninhabited by an endless variety of different people, or as a country intimately connected with Europe by the ties of commerce and government, deserves very particular attention. The bold discovery and barbarous conquest of this New World; and the manners and prejudices of the original inhabitants, are objects which, together with the

description of the country, deservedly occupy no small share of this performance.

In treating of such a variety of subjects, some less obvious particulars, no doubt, must escape our notice. But if our general plan be good, and the outlines and chief figures sketched with truth and judgment, the candour of the learned, we hope, will excuse imperfections which are unavoidable in a work of this extensive kind.

We cannot, without exceeding the bounds of a Preface, insist upon the other parts of our plan. The Maps, which are executed with care, by the best-informed artists in these kingdoms, will, we hope, afford satisfaction. The science of natural geography, for want of proper encouragement from those who are alone capable of giving it, still remains in a very imperfect state; and the exact divisions and extent of countries, for want of geometrical surveys, are far from being well ascertained. This consideration has induced us to adopt the most unexceptionable of Templeman's Tables, which, if they give not the exactest account, afford at least a general idea of this subject; which is all indeed we can attain, until the geographical science arrives at greater perfection.

# INTRODUCTION.

## PART I.

### OF ASTRONOMICAL GEOGRAPHY.

#### SECT. I.

#### OF THE PLANETS, THE COMETS, THE FIXED STARS, AND THE DIFFERENT SYSTEMS OF THE UNIVERSE.

THE science of GEOGRAPHY cannot be completely understood without considering the earth as a planet, or as a body moving round another at a considerable distance from it. It will therefore be necessary to begin this work with a summary view of the science of ASTRONOMY, and a brief account of the planets and other heavenly bodies. Of these, the most conspicuous is that glorious luminary, the sun, the fountain of light and heat to the several planets which move round it, and which, together with it, compose what astronomers have called the Solar System. The way or path in which the planets move round the sun, is called their Orbit; and it is now fully proved by astronomers, that there are seven planets which move round the sun, each in its own orbit. The names of these, according to their nearness to the centre or middle point of the sun, are Mercury, Venus, the Earth, Mars, Jupiter, Saturn, and the Georgium Sidus. The two first, because they move within the orbit of the earth (being nearer the sun), are called *inferior* planets, or, perhaps more properly, *interior* or *inner* planets; the four last, moving without the orbit of the earth, are called *superior*, or, perhaps more properly, *exterior* or *outer* planets. If we can form an idea of the manner in which any one of these planets, suppose our earth, moves round the sun, we can easily conceive the manner in which all the rest perform a similar revolution. We shall only, therefore, particularly consider the motion of the earth, or planet on which we live, leaving that of the others to be collected from a table, which we shall give, with such explanations as may render it intelligible to the meanest capacity.

The earth was long considered as one extensive plane, of no remarkable thickness; and the regions below it were supposed to be the habitations of spirits. The heavens, in which the sun, moon, and stars, ap-

peared to move daily from east to west, were conceived to be at no great distance from it, and to be only designed for its use or ornament. Several reasons, however, occurred, which rendered this opinion improbable; it is needless to mention them, because we have now a sufficient proof of the figure of the earth, from the voyages of many navigators, who have actually sailed round it; as for instance, that of Magellan's ship, which was the first that circumnavigated the globe, sailing west from a port in Europe in 1519, and returning to the same, after a voyage of 1124 days, without altering its direction, except to the north or south, as compelled by the winds, or intervening land.

The spherical figure of the earth being fully proved, the hypothesis of its motion was evidently rendered much more probable. For while it was considered as a plane, mankind had an obscure notion of its being supported, like a scaffolding, on pillars, though they could not tell what supported these. But the figure of a globe is much better adapted to motion; and a very strong, and, in reality, unanswerable argument for this motion was derived from considering, that, if the earth did not move round the sun, not only the sun, but all the stars and planets, must move round the earth. Now, as astronomers, by reckonings founded on the surest observations, have been able to ascertain pretty nearly the distances of the heavenly bodies from the earth and from each other, in the same manner as every person acquainted with the first elements of mathematics can measure the height of a steeple, or any object placed on it,—it appeared, that, if we conceived the heavenly bodies to move round the earth, we must suppose them endowed with a motion or velocity so immense as to exceed all conception: whereas all the appearances in nature may be as well explained by imagining the earth to move round the sun in the space of a year, and to turn on its own axis once in 24 hours.

To form a conception of these two motions of the earth, we may imagine a ball moving on a billiard-table or bowling-green: the ball proceeds forwards upon the green or table, not by sliding along like a plane upon wood, or a slate upon ice, but by turning round its own axis, which is an imaginary line drawn through the centre or middle of the ball, and ending on its surface in two points called its poles. We must, however, remember that these two motions in the earth are perfectly distinct, and not imagine that the number of revolutions caused by the rotatory motion is in proportion to the space passed through by the progressive, as is the case with the ball on the table or the bowling-green. The earth, therefore, in the space of 24 hours, moves from west to east, while the inhabitants on the surface of it, like men on the deck of a ship, who are insensible of their own motion, and think that the banks move from them in a contrary direction, will conceive that the sun and stars move from east to west in the same time of 24 hours in which they, along with the earth, move from west to east. This daily or diurnal motion of the earth being once clearly conceived, will enable us easily to form a notion of its annual or yearly motion round the sun. For as that luminary seems to have a diurnal motion round our earth, which is really occasioned by the daily motion of the earth round its own axis, so, in the course of a year, he seems to have an annual motion in the heavens, and to rise and set in different points of them, which is really occasioned by the annual motion of the earth in its orbit or path round the sun, which it completes in the space of a year. Now, as to the first of these motions we owe the difference of day and night, so to the second we are indebted for the difference in the length of the days and nights, and in the seasons of the year.

THE PLANETS.] It will easily be conceived that what has been said with regard to the motion of the earth, is equally applicable to all the other planets. Of these, beside the seven already mentioned, which move round the sun, there are fourteen others which move round four of these, in the same manner as they do round the sun; and of these our earth has one, called the moon; Jupiter has four; Saturn has seven (two\* of these having been lately discovered by Dr. Herschel); and the Georgium Sidus two, as that excellent astronomer has shown. These are called moons, from their resemblance to our moon; and sometimes *secondary* planets, because they seem to be attendants of the Earth, Jupiter, Saturn, and the Georgium Sidus, about which they move, and which are called *primary*.

It will be necessary for the understanding of the following table, to explain what is meant by the *inclination of the axes* of the planets to their orbits, and the *mean distances* of the planets. We have already said that the annual motion of the earth occasioned the diversity of seasons. But this would not happen, were the axis of the earth exactly parallel to or in a line with the axis of its orbit: because then the same parts of the earth would be turned towards the sun in every diurnal revolution; which would deprive mankind of the grateful vicissitudes of the seasons, arising from the difference in length of the days and nights. This, therefore, is not the case: — the axis of the earth is inclined to the plane of the earth's orbit, which we may conceive by supposing a spindle put through a ball, with one end of it touching the ground; if we move the ball directly forwards, while one end of the spindle continues to touch the ground, and the other points towards some quarter of the heavens, we may form an idea of the inclination of the earth's axis to its orbit, from the inclination of the spindle to the ground. The same observation applies to some of the other planets, as may be seen from the table.

In order to understand what is meant by the mean distances of the planets from the sun, we must observe that the orbit, or path which a planet describes, were it to be marked out, would not be quite round or circular, but in the shape of a figure called an *ellipsis*, which, though resembling a circle, is longer than broad. Hence the same planet is not always at the same distance from the sun; and the mean distance of it is that which is exactly betwixt its greatest and least distance. Here follows the table:

\* See the 80th vol. of the Philosophical Transactions.

## INTRODUCTION.

**A TABLE OF THE DIAMETERS, PERIODS, &c. OF THE SEVERAL PLANETS IN THE SOLAR SYSTEM.**

Names of the planets.	Diameters in English Miles.	Mean distances from the sun, as determined from observations of the transit of Venus, in 1761.	Annual period round the sun.	Diurnal rotation on its axis.	Hourly motion in its orbit.	Hourly motion of its equator.	Inclination of axis to orbit.

The Georgian planet (or Georgium Sidus) was discovered by Dr. Herschel with his telescope of great size and power, forty feet in length, and four and a half in diameter, in the year 1781. For this discovery he obtained from the Royal Society the honorary recompense of Sir Godfrey Copley's medal. Though it was not till then known as a planet, yet there are many reasons to suppose it had been seen before, but had been considered as a fixed star. But, from the steadiness of its light, from its diameter being increased by high magnifying powers, and from the change he had observed in its situation, Dr. Herschel first concluded that it was a comet; but in a little time, he, with others, determined that it was a planet, from its vicinity to the ecliptic, the direction of its motion being stationary in the time, and in such circumstances, as correspond with similar appearances in other planets.—When the moon is absent, it may be seen by the naked eye; and the discovery of two satellites attending it seems to confer upon it a dignity, and to raise it into a more conspicuous situation among the great bodies of our solar system. As the distances of the planets, when marked in miles, are a burden to the memory, astronomers often express their mean distances in a shorter way, by supposing the distance from the earth to the sun to be divided into ten parts. Mercury may then be estimated at four of such parts from the sun, Venus at seven, the Earth at ten, Mars at fifteen, Jupiter at fifty-two, Saturn at ninety-five, and the Georgium Sidus at one hundred and ninety.

COMETS.] The reader having obtained an idea of the planets from the table, and the previous observations necessary for understanding it, must next turn his attention to the comets, which, as they revolve round our sun, are a part of the solar system. These, descending from the far distant parts of the system with great rapidity, surprise us with their singular appearance of a train or tail, which accompanies them; become visible to us in the lower parts of their orbits, and, after a short stay, go off again to vast distances, and disappear. Though some of the ancients had more just notions of them, yet the opinion having prevailed, that they were only meteors generated in the air, like to those we see in it

every night, and in a few moments vanishing, no care was taken to observe or record their phenomena accurately, till of late. Hence this part of astronomy is very imperfect. The general doctrine is that they are solid compact bodies, like other planets, and regulated by the same laws of gravity, so as to describe equal areas in proportional times by radii drawn to the common centre. They move about the sun in very eccentric ellipses, and are of much greater density than the earth; for some of them are heated in every period to such a degree as would vitrify or dissipate any substance known to us. Sir Isaac Newton computed the heat of the comet that appeared in the year 1680, when nearest the sun, to be 2000 times hotter than red-hot iron, and that, being thus heated, it must retain its heat till it comes round again, although its period should be more than 20,000 years; and it is computed to be only 575. The number of comets is very much greater than that of the planets which move in the vicinity of the sun. From the reports of historians, as well as from the observations of late years, it has been ascertained that more than 450 have been seen previous to the year 1771; and when the attention of astronomers was called to this object by the expectation of the return of the comet of 1759, no fewer than seven were observed in the course of seven years. From this circumstance, and the probability that all the comets recorded in ancient authors were of considerable apparent magnitude, while the smaller were overlooked, it is reasonable to conclude that the number of comets considerably exceeds any estimation that might be made from the observations we now possess. But the number of those, whose orbits are settled with sufficient accuracy to ascertain their identity when they may appear again, is no more than 59, reckoning as late as the year 1771. The orbits of most of these are inclined to the plane of the ecliptic in large angles, and the greater number of them approached nearer to the sun than to the earth. Their motions in the heavens are not all in the order of the signs, or direct, like those of the planets; but the number whose motion is retrograde, is nearly equal to that of those whose motion is direct. All which have been observed, however, have moved through the ethereal regions and the orbits of the planets, without suffering the least sensible resistance in their motions; which sufficiently proves that the planets do not move in solid orbs. Of all the comets, the periods of three only are known with any degree of certainty, being found to return at intervals of 75, 129, and 575 years; and of these, that which appeared in 1680 is the most remarkable. This comet, at its greatest distance, is about 11 thousand 200 millions of miles from the sun, while its least distance from the centre of the sun is about 490 thousand miles; being less than one third part of the sun's semidiameter from his surface. In that part of its orbit which is nearest the sun, it flies with the amazing velocity of 880,000 miles in an hour; and the sun, as seen from it, appears 100 degrees in breadth, consequently 40,000 times as large as he appears to us. The astonishing distance that this comet runs out into empty space naturally suggests to our imagination the vast distance between our sun and the nearest of the fixed stars, of whose attractions all the comets must keep clear, to return periodically and go round the sun. Dr. Halley, to whom every part of astronomy, but this in a particular manner, is highly indebted, has joined his labours to those of sir Isaac Newton on this subject. Our earth was out of the way, when this comet last passed near her orbit: but it requires a more perfect knowledge of the motion of the comet, to be able to judge if it will always pass by us

with so little effect; for it may be here observed that the comet, in one part of its orbit, approaches very near to the orbit of our earth; so that, in some revolutions, it may approach near enough to have very considerable, if not fatal, effects upon it. See Newton, Halley, Gregory, Keil, Maclaurin, Derham, Ferguson, and Whiston.

THE FIXED STARS.] Having thus briefly surveyed the solar system, which, though great in itself, is small in comparison with the immensity of the universe, we next proceed to the contemplation of those other vast bodies, called the *fixed stars*, which, being of infinite use in the practice of geography, claim a particular notice in this work. These fixed stars are distinguished by the naked eye from the planets, by being less bright and luminous, and by continually exhibiting that appearance which we call the twinkling of the stars. This arises from their being so extremely small, that the interposition of the least body, of which there are many constantly floating in the air, deprives us of the sight of them; when the interposed body changes its place, we again see the star; and this succession being perpetual, occasions the twinkling. But a more remarkable property of the fixed stars, and that from which they have obtained their name, is their never changing their situation, with regard to each other; as the planets, from what we have already said, must evidently be always changing theirs. The stars which are nearest to us seem largest, and are therefore called stars of the first magnitude. Those of the second magnitude appear less, being at a greater distance; and so proceeding on to the sixth magnitude, which includes all the fixed stars that are visible without a telescope. As to their number, though, in a clear winter's night without moonshine, they seem to be innumerable (which is owing to their strong sparkling, and our looking at them in a confused manner), yet when the whole firmament is divided, as it has been by the ancients, into signs and constellations, the number that can at any time be seen with the naked eye, is not above a thousand. Since the invention of telescopes, indeed, the number of the fixed stars has been justly considered as immense; because the greater perfection we arrive at in our glasses, the more stars always appear to us. Mr. Flamsteed, late royal astronomer at Greenwich, has given us a catalogue of about 3000 stars. These are called telescopic stars, from their being invisible without the assistance of the telescope. Dr. Herschel, to whose ingenuity and assiduity the astronomical world is so much indebted, has evinced what great discoveries may be made by improvements in the instruments of observation. In speaking here of his discoveries, I shall use the words of M. de la Lande: "In passing rapidly over the heavens with his new telescope, the universe increased under his eye; 44,000 stars, seen in the space of a few degrees, seemed to indicate that there were seventy-five millions in the heavens." But what are all these, when compared to those that fill the whole expanse, the boundless fields of æther? Indeed the immensity of the universe must contain such numbers as would exceed the utmost stretch of the human imagination; for who can say how far the universe extends, or point out those limits where the Creator "stayed his rapid wheels," or where he "fixed the golden compasses?"

The immense distance of the fixed stars from our earth, and from each other, is, of all considerations, the most proper for raising our ideas of the works of God. For, notwithstanding the great extent of the earth's orbit or path (which is at least 196 millions of miles in diameter) round the sun, the distance of a fixed star is not sensibly affected by it; so that the star does not appear to be any nearer to us when the earth is in that part

of its orbit nearest the star, than it seemed to be when the earth was at the most distant part of its orbit, or 100 millions of miles farther removed from the same star. The star nearest us, and consequently the largest in appearance, is the dog-star, or Sirius. Modern discoveries make it probable that each of those fixed stars is a sun, having planets and comets revolving round it, as our sun has the earth and other planets revolving round him. Now the dog-star appears 27,000 times less than the sun: and, as the distance of the stars must be greater in proportion as they seem less, mathematicians have computed the distance of Sirius from us to be two billions and two hundred thousand millions of miles. A ray of light, therefore, though its motion is so quick as to be commonly thought instantaneous, takes up more time in travelling from the stars to us than we do in making a West-India voyage. A sound, which, next to light, is considered as the quickest body we are acquainted with, would not arrive to us from thence in 50,000 years. And a cannon ball, flying at the rate of 480 miles an hour, would not reach us in 700,000 years.

The stars, being at such immense distances from the sun, cannot possibly receive from him so strong a light as they seem to have, nor any brightness sufficient to make them visible to us. For the sun's rays must be so scattered and dissipated before they reach such remote objects, that they can never be transmitted back to our eyes, so as to render those objects visible by reflection. The stars, therefore, shine with their own native and unborrowed lustre, as the sun does; and since each particular star, as well as the sun, is confined to a particular portion of space, it is evident that the stars are of the same nature with the sun.

It is far from probable that the Almighty, who always acts with infinite wisdom, and does nothing in vain, should create so many glorious suns, fit for so many important purposes, and place them at such distances from each other, without proper objects near enough to be benefited by their influences. Whoever imagines that they were created only to give a faint glimmering light to the inhabitants of this globe, must have a very superficial knowledge of astronomy\*, and a mean opinion of the divine wisdom; since, by an infinitely less exertion of creating power, the Deity could have given our earth much more light by one single additional moon.

Instead then of one sun and one world only, in the universe, as the unskilful in astronomy imagine, that science discovers to us such an inconceivable number of suns, systems, and worlds, dispersed through boundless space, that if our sun, with all the planets, moons, and comets belonging to it, were annihilated, they would be no more missed by an eye that could take in the whole creation, than a grain of sand from the sea-shore; the space they possess being comparatively so small, that it would scarcely be a sensible blank in the universe, although the Georgium Sidus, the outermost of our planets, revolves about the sun in an orbit of 10,830 millions of miles in circumference, and some of our comets make excursions upwards of ten thousand millions of miles beyond the orbit of the Georgium Sidus; and yet, at that amazing distance, they are incomparably nearer to the sun than to any of the stars, as is evident from their keeping clear of the attracting power of all the stars, and returning periodically by virtue of the sun's attraction.

\* Especially since there are many stars which are not visible without the assistance of a good telescope; and, therefore, instead of giving light to this world, can only be seen by a few astronomers.

## INTRODUCTION.

From what we know of our own system, it may be reasonably concluded that all the rest are with equal wisdom contrived, situated, and provided with accommodations for rational inhabitants. For although there is an almost infinite variety in the parts of the creation which we have opportunities of examining, yet there is a general analogy running through and connecting all the parts into one scheme, one design, one whole.

Since the fixed stars are prodigious spheres of fire, like our sun, and at inconceivable distances from each other as well as from us, it is reasonable to conclude they are made for the same purposes that the sun is, — each to bestow light, heat, and vegetation, on a certain number of inhabited planets, retained by gravitation within the sphere of its activity.

What a sublime idea does this suggest to the human imagination, limited as are its powers, of the works of the Creator! Thousands and thousands of suns, multiplied without end, and ranged all around us, at immense distances from each other, attended by ten thousand times ten thousand worlds, all in rapid motion, yet calm, regular, and harmonious, invariably keeping the paths prescribed them: and these worlds peopled with myriads of intelligent beings, formed for endless progression in perfection and felicity!

If so much power, wisdom, goodness, and magnificence, is displayed in the material creation, which is the least considerable part of the universe, how great, how wise, how good must HE be, who made and governs the whole!

**THE CONSTELLATIONS.]** The *first people* who gave much attention to the fixed stars, were the *shepherds* in the beautiful plains of Egypt and Babylon; who, partly for amusement, and partly with a view to direct them in travelling during the night, observed the situation of these celestial bodies. Endowed with a lively fancy, they divided the stars into different assemblages or constellations, each of which they supposed to represent the image of some animal, or other terrestrial object. The peasants in our own country do the same, for they distinguish that great northern constellation, which astronomers call *Ursa Major*, by the name of the *Plough*, the figure of which it certainly may represent, with a very little aid from the fancy. The constellations in general have preserved the names which were given them by the ancients: by whom they were reckoned 21 *northern* and 12 *southern*; but the moderns have increased the number of the northern to 36, and that of the southern to 32. Besides these, there are the 12 *signs* or constellations in the *Zodiac*, as it is called from the Greek word *ζωον*, an animal, because each of these 12 is supposed to represent some animal. This is a great circle which divides the heavens into two equal parts, of which we shall speak hereafter. In the mean time we shall conclude this section with an account of the rise and progress of astronomy, and the revolutions which have taken place in that science.

**DIFFERENT SYSTEMS OF THE UNIVERSE.]** Mankind must have made a very considerable improvement in observing the motions of the heavenly bodies, before they could so far disengage themselves from the prejudices of sense and popular opinion, as to believe that the earth upon which we live was not fixed and immovable. We find, accordingly, that *Thales*, the *Milesian*, who, about 580 years before *Christ*, first taught astronomy in *Europe*, had made a sufficient progress in this science to calculate eclipses, or interpositions of the moon between the earth and the sun, or of the earth between the sun and the moon (the nature of which may be easily understood from what we have already observed). *Pythagoras*, a native

of Samos, flourished about 50 years after Thales, and was, no doubt, equally well acquainted with the motion of the heavenly bodies. He conceived an idea, which there is no reason to believe had ever been thought of before, namely, that the earth itself was in motion, and that the sun was at rest. He found that it was impossible, in any other way, to explain consistently the heavenly motions. His system, however, was so extremely opposite to all the prejudices of sense and opinion, that it never made great progress, nor was ever widely diffused in the ancient world. The philosophers of antiquity, despairing of being able to overcome ignorance by reason, endeavoured to adapt the one to the other, and in some measure to reconcile them. Ptolemy, an Egyptian philosopher, who flourished 138 years before Christ, supposed, with the vulgar, that the earth was fixed immoveably in the centre of the universe, and that the seven planets, considering the moon as one of the primaries, were placed near to it. Above them he placed the firmament of fixed stars, then the crystalline orbs, then the primum mobile, and, last of all, the *cælum empyreum*, or heaven of heavens. All these vast orbs he imagined to move round the earth once in 24 hours, and, besides that, in certain stated and periodical times. To account for these motions, he was obliged to conceive a number of circles, called eccentrics and epicycles, crossing and interfering with each other. This system was universally maintained by the peripatetic philosophers, who were the most considerable sect in Europe, from the time of Ptolemy to the revival of learning in the sixteenth century.

At length, Copernicus, a native of Poland, a bold and original genius, adopted the Pythagorean or true system of the universe, and published it to the world in the year 1530. This doctrine had remained so long in obscurity, that the restorer of it was considered as the inventor; and the system obtained the name of the Copernican philosophy, though only revived by that great man.

Europe, however, was still immersed in ignorance; and the general ideas of the world were not able to keep pace with those of a refined philosophy. Copernicus therefore had few abettors, but many opponents. Tycho Brahe, in particular, a noble Dane, sensible of the defects of the Ptolemaic system, but unwilling to acknowledge the motion of the earth, endeavoured, about the year 1586, to establish a new system of his own, which was still more perplexed and embarrassed than that of Ptolemy. It allows a monthly motion to the moon round the earth, as the centre of its orbit; and makes the sun to be the centre of the orbits of Mercury, Venus, Mars, Jupiter, and Saturn. The sun, however, with all the planets, is supposed to be whirled round the earth in a year, and even once in the twenty-four hours. This system, notwithstanding its absurdity, met with many advocates. Longomontanus, and others, so far refined upon it, as to admit the diurnal motion of the earth, though they insisted that it had no annual motion.

About this time, after a darkness of many successive ages, the first dawn of learning and taste began to appear in Europe. Learned men in different countries began to cultivate astronomy. Galileo, a Florentine, about the year 1610, introduced the use of telescopes, which furnished new arguments in support of the motion of the earth, and confirmed the old ones. The fury and bigotry of the clergy, indeed, had almost stifled the science in its infancy; and Galileo was obliged to renounce the Copernican system, as a damnable heresy. The happy reformation in religion, however, placed a great part of Europe beyond

the reach of the papal thunder. It taught mankind that the Scriptures were not given for explaining systems of natural philosophy, but for a much nobler purpose,—to render us just, virtuous, and humane; that, instead of opposing the word of God, which, in speaking of natural things, suits itself to the prejudices of weak mortals, we employed our faculties in a manner highly agreeable to our maker, in tracing the nature of his works, which, the more they are considered, afford us the greater reason to admire his glorious attributes of power, wisdom, and goodness. From this time, therefore, noble discoveries were made in all the branches of astronomy. Not only the motions of the heavenly bodies were clearly explained, but the general law of nature, according to which they moved, was discovered and illustrated by the immortal Newton. This law is called *Gravity* or *Attraction*, and is the same by which any body falls to the ground, when disengaged from what supported it. It has been demonstrated, that this same law, which keeps the sea in its channel, and the various bodies which cover the surface of this earth from flying off into the air, operates throughout the universe, retains the planets in their orbits, and preserves the whole fabric of nature from confusion and disorder.

## SECT. II.

### OF THE SPHERE.

HAVING, in the foregoing section, treated of the UNIVERSE in general, in which the earth has been considered as a planet, we now proceed to the doctrine of the SPHERE, which ought always to precede that of the globe or earth, as we shall see in the next section. In treating this subject we shall consider the earth as at rest, and the heavenly bodies as performing their revolutions around it. This method cannot lead the reader into any mistake, since we have previously explained the true system of the universe, from which it appears, that it is the *real* motion of the earth which occasions the *apparent* motion of the heavenly bodies. It is besides attended with this advantage, that it perfectly agrees with the information of our senses. The imagination therefore is not put on the stretch; the idea is easy and familiar; and, in delivering the elements of science, this object cannot be too much attended to.

N. B. In order more clearly to comprehend what follows, the reader may occasionally turn his eye to the figure of the artificial sphere on the opposite page.

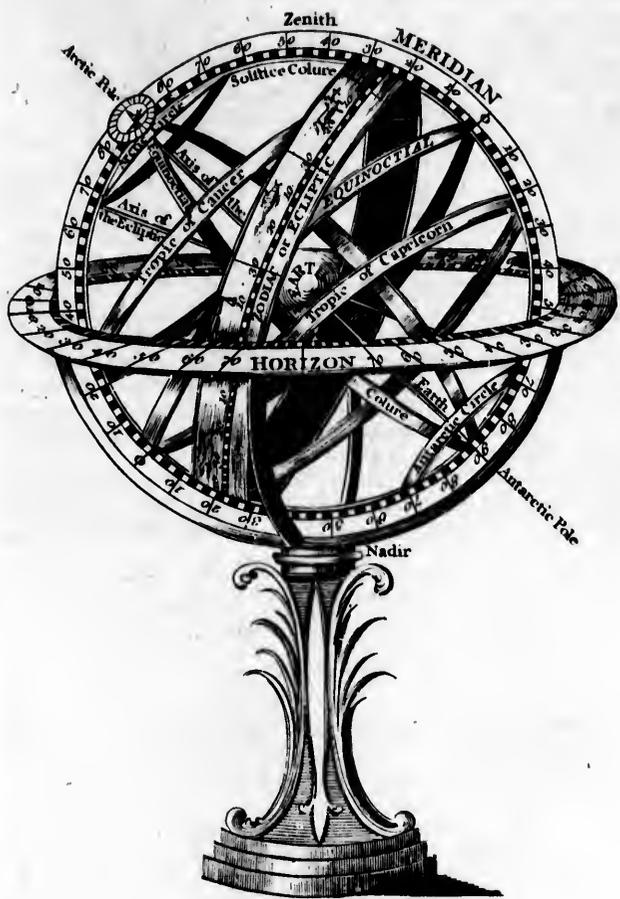

The ancients observed, that all the stars turned (in appearance) round the earth, from east to west, in twenty-four hours; that the circles which they described in those revolutions, were parallel to each other, but not of the same magnitude; those passing over the middle of the earth being the largest, while the rest diminished in proportion to their distance from it. They also observed, that there were two points in the heavens which always preserved the same situation. These points they termed celestial poles, because the heavens seemed to turn round them. In order to imitate these motions, they invented what is called the *Artificial Sphere*, through the centre of which they drew a wire or iron rod, called an *Axis*, whose extremities were fixed to the immovable points called *Poles*. They farther observed, that, on the 20th of March and

23d of September, the circle described by the sun was at an equal distance from both of the poles. This circle, therefore, must divide the earth into two equal parts, and on this account was called the *Equator* or *Equaller*. It was also called the *Equinoctial Line*, because the sun, when moving in it, makes the days and nights of equal length all over the world. Having also observed, that, from the 21st of June to the 22d of December, the sun advanced every day towards a certain point, and, having arrived there, returned towards that from which he had set out, from the 22d of December to the 21st of June — they fixed *these points*, which they called *Solstices*, because the direct motion of the sun was stopped at them; and represented the bounds of the sun's motion by two circles, which they named *Tropics*, because the sun no sooner arrived there than he turned back. Astronomers, observing the motion of the sun, found its quantity, at a mean rate, to be nearly a degree (or the 360th part) of a great circle in the heavens, every twenty-four hours. This great circle is called the *Ecliptic*, and it passes through certain constellations, distinguished by the names of animals, in a *zone* called the *Zodiac*. It touches the tropic of Cancer on one side, and that of Capricorn on the other, and cuts the equator obliquely, at an angle of twenty-three degrees twenty-nine minutes, the sun's greatest declination. To express this motion, they supposed two points in the heavens, equally distant from and parallel to this circle, which they called the *Poles* of the zodiac, which, turning with the heavens, by means of their axis, describe the *two polar circles*. In the artificial sphere, the equinoctial, the two tropics, and two polar circles, are cut at right angles by two other circles called *Cohures*, which serve to mark the points of the solstices, equinoxes, and poles of the zodiac. The ancients also observed that when the sun was in any point of his course, all the people inhabiting directly north and south, as far as the poles, have noon at the same time. This gave occasion to imagine a circle passing through the poles of the world, which they called a *Meridian*, and which is immoveable in the artificial sphere, as well as the *horizon*, which is another circle representing the bounds betwixt the two hemispheres, or half spheres, viz. that which is above, and that which is below it.

### SECT. III.

#### OF THE GLOBE.

BY the GLOBE is meant the representation of the different places and countries on the face of the earth, upon an artificial globe or ball. Geographers have represented the situation of one place upon this earth with regard to another, or with regard to the earth in general, by transferring the circles of the sphere to the artificial globe; and this is the only method they could employ. This will be abundantly obvious from an example. After that circle in the heavens, which is called the equator, was known to astronomers, there was nothing more easy than to transfer it to the earth, by which the situation of places was determined, according as they lay on one side of the equator or the other. The same may be observed of the other circles of the sphere above mentioned. The reader having obtained an idea of the principle upon which the doctrine of the globe is founded, may proceed to consider the doctrine

itself, or, in other words, the description of our earth, as represented by the *artificial globe*.

**FIGURE OF THE EARTH.]** Though, in speaking of the earth with the other planets, it was sufficient to consider it as a spherical or globular body,—yet it has been discovered that this is not its true figure, and that the earth, though nearly a sphere or ball, is not perfectly so. This occasioned great disputes between the philosophers of the last age, among whom sir Isaac Newton and Cassini, a French astronomer, were the heads of two different parties. Sir Isaac demonstrated, from mathematical principles, that the earth was an *oblate spheroid*, or that it was flattened at the poles, and juttied out towards the equator, so that a line, drawn through the centre of the earth, and passing through the poles, which is called a diameter, would not be so long as a line drawn through the same centre and passing through the east and west points. The French philosopher asserted precisely the reverse; that is, that its diameter was lengthened towards the poles. In order to decide this question, the king of France, in 1736, sent out some able mathematicians towards the north pole, and likewise others towards the equator, in order to measure a degree, or the three hundred and sixtieth part of a great circle, in those different parts; and from their report, the opinion of sir Isaac Newton was confirmed beyond dispute. Since that time, therefore, the earth has always been considered as more flat towards the poles than towards the equator. The reason of this figure may be easily understood, if the reader fully comprehends what we formerly observed, with regard to the earth's motion. For if we fix a ball of soft clay on a spindle, and whirl it round, we shall find that it will jut out or project towards the middle, and flatten towards the poles. This is exactly the case with respect to our earth; only that its axis, represented by the spindle, is imaginary. But though the earth be not properly spherical, the difference from that figure is so small, that it may be represented by a globe, without any sensible error.

**CIRCUMFERENCE AND DIAMETER OF THE EARTH.]** In the general table which we have exhibited, page 4, the diameter of the globe is given according to the best observations; so that its circumference is 25,038 English miles. This circumference is conceived, for the convenience of measuring, to be divided into three hundred and sixty parts or degrees, each degree containing sixty geographical miles, or sixty-nine English miles and a half. These degrees are in the same manner conceived to be divided each into sixty minutes.

**AXIS AND POLES OF THE EARTH.]** The axis of the earth is that imaginary line passing through its centre, on which it is supposed to turn round once in twenty-four hours. The extreme points of this line are called the Poles of the earth; one in the north and the other in the south, which are exactly under the two points of the heavens called the North and South Poles. The knowledge of these poles is of great use to the geographer in determining the distance and situation of places; for the poles mark, as it were, the ends of the earth, which is divided in the middle by the equator: so that the nearer one approaches to the poles, the farther he removes from the equator; and, in removing from the poles, he approaches the equator.

**CIRCLES OF THE GLOBE.]** These are commonly divided into the *greater* and *lesser*. A great circle is that whose plane passes through the centre of the earth, and divides it into two equal parts or hemispheres. A lesser circle is that which, being parallel to a greater, cannot pass

through the centre of the earth, nor divide it into two equal parts. The greater circles are *six* in number, the lesser only *four*.

**EQUATOR.]** The first *great circle* is the *Equator*, or *Equinoctial*; and by navigators called the *Line*. The poles of this circle are the same with those of the world. It passes through the east and west points of the world, and, as has been already mentioned, divides it into the northern and southern hemispheres. It is divided into three hundred and sixty degrees, the use of which will soon appear.

**HORIZON.]** This *great circle* is represented by a broad circular piece of wood encompassing the globe, and dividing it into the upper and lower hemispheres. Geographers very properly distinguish the horizon into the *sensible* and *rational*. The first is that which bounds the utmost prospect of our sight, when we view the heavens around us, *apparently* touching the earth or sea.

This circle determines the rising or setting of the sun and stars, in any particular place; for when they begin to appear above the eastern edge, we say they rise; and when they go beneath the western, we say they are set. It appears that each place has its own *sensible* horizon. The other horizon, called the *rational*, encompasses the globe exactly in the middle. Its poles (that is, two points in its axis, each ninety degrees distant from its plane, as those of all circles are) are called the *Zenith* and *Nadir*,—the former exactly above our heads, and the latter directly under our feet. The broad wooden circle which represents it on the globe, has several circles drawn upon it: of these the innermost is that exhibiting the number of degrees of the twelve signs of the zodiac (of which hereafter), viz. thirty to each sign. Next to this, you have the names of these signs, together with the days of the month according to the old style, and then according to the new style. Besides these, there is a circle representing the thirty-two rhumbs, or points of the mariner's compass. The use of all these will be explained hereafter.

**MERIDIAN.]** This *circle* is represented by the *brass ring* on which the globe hangs and turns. It is divided into three hundred and sixty degrees, and cuts the equator at right angles; so that, counting from the equator each way to the poles of the world, it contains four times ninety degrees, and divides the earth into the eastern and western hemispheres. This circle is called the *meridian*, because, when the sun comes to the south part of it, it is then *meridies* or mid-day, and then the sun has its greatest altitude for that day, which is therefore called its meridian altitude. Now, as the sun is never in its meridian altitude at two places east or west of one another at the same time, each of these places must have its own meridian. There are commonly marked on the globe twenty-four meridians, one through every fifteen degrees of the equator.

**ZODIAC.]** The *zodiac* is a *broad circle*, which cuts the equator obliquely; in which the twelve signs above mentioned are represented. In the middle of this circle is supposed another called the *Ecliptic*, from which the sun never deviates in his annual course, and in which he advances thirty degrees every month. The twelve signs are,

1. Aries	♈	. . .	March	7. Libra	♎	. . .	September
2. Taurus	♉	. . .	April	8. Scorpio	♏	. . .	October
3. Gemini	♊	. . .	May	9. Sagittarius	♐	. . .	November
4. Cancer	♋	. . .	June	10. Capricorn	♑	. . .	December
5. Leo	♌	. . .	July	11. Aquarius	♒	. . .	January
6. Virgo	♍	. . .	August	12. Pisces	♓	. . .	February

**COLURES.]** If we imagine *two great circles* passing both through the poles of the world, and one of them through the equinoctial points Aries and Libra, and the other through the solstitial points Cancer and Capricorn, these are called the Colures,—the one the Equinoctial, the other the Solstitial Colure.—These are *all the great circles*.

**TROPICS.]** If we suppose two circles drawn parallel to the equinoctial, at twenty-three degrees thirty minutes distance from it, measured on the brazen meridian, the one towards the north, the other towards the south, these are called Tropics, from the Greek word *τροπή*, a turning, because the sun appears, when in them, to turn backwards from his former course. The one is called the Tropic of Cancer, the other of Capricorn, because they pass through the first points of these signs.

**POLAR CIRCLES.]** If two other circles are supposed to be drawn at the like distance of twenty-three degrees thirty minutes, reckoned on the meridian from the polar points, these are called the Polar Circles. The northern is called the *Arctic*, because the north pole is near the constellation of the Bear, in Greek *αρκτος*; the southern, the *Antarctic*, because opposite to the former. And these are the *four lesser circles*. Besides these ten circles now described, which are always drawn on the globe, there are several others which are only supposed to be drawn on it. These will be explained as they become necessary, lest the reader should be disgusted with too many definitions at the same time, without seeing the purpose for which they serve. The principal design of all these circles being to exhibit the respective situation of places on the earth, we shall proceed to consider more particularly how that is effected by them. It was found easier to distinguish places by the quarters of the earth in which they lay, than by their distance from any one point. Thus, after it was discovered that the equator divided the earth into two parts, called the Northern and Southern hemispheres, it was easy to see that all places on the globe might be distinguished, according as they lay on the north or south side of the equator.

**ZONES.]** After the four lesser circles we have mentioned came to be known, it was found that the earth, by means of them, might be divided into five portions, and consequently that the places on its surface might be distinguished according as they lay in one or other of these portions, which are called *Zones*, from the Greek word *ζώνη*, which signifies a girdle; being broad spaces, like swathes, girding the earth about.

The *torrid zone* is that portion of the earth between the tropics, and called by the ancients *torrid*, because they conceived, that, being continually exposed to the perpendicular or direct rays of the sun, it was rendered uninhabitable, and contained nothing but parched and sandy deserts. This notion, however, has long since been refuted. It is found that the long nights, great dews, regular rains and breezes, which prevail almost throughout the torrid zone, render the earth not only habitable, but so fruitful, that in many places they have two harvests in a year; all sorts of spices and drugs are almost solely produced there; and it furnishes the most perfect metals, precious stones, and pearls. In short, the countries of Africa, Asia, and America, which lie under this zone, are in all respects the most fertile and luxuriant upon earth.

The two *temperate zones* are comprised between the tropics and polar circles. They are called temperate, because, meeting the rays of the sun obliquely, they enjoy a moderate degree of heat.

The two *frigid zones* lie between the polar circles and the poles, or rather are included within the polar circles. They are called the frigid or frozen, because most part of the year it is extremely cold there, and

every thing is frozen so long as the sun is under the horizon, or but a little above it. However, these zones are not quite uninhabitable, though much less fit for living in than the torrid.

None of all these zones are thoroughly discovered by the Europeans. Our knowledge of the southern temperate zone is very imperfect; we know little of the northern frigid zone; and still less of the southern frigid zone. The northern temperate and torrid zones are those we are best acquainted with.

CLIMATES.] But the division of the earth into hemispheres and zones, though it may be of advantage in letting us know in what quarter of the earth any place lies, is not sufficiently minute for giving us a notion of the distances between one place and another. This however is still more necessary, because it is of more importance to mankind to know the situations of places with regard to each other, than with regard to the earth itself. The first step taken for determining the relative situation of places was to divide the earth into what are called *Climates*. It was observed, that the day was always twelve hours long at the equator, and that the longest day increased in proportion as we advanced north or south on either side of it. The ancients therefore determined how far any place was north or south of the equator, or what is called the *Latitude* of the place, from the greatest length of the day in that place. They conceived a number of circles parallel to the equator, which bounded the length of the day at different distances from the equator; and as they called the spaces contained between these circles *Climates*, because they declined from the equator towards the pole, so the circles themselves may be called *Climatical Parallels*. This, therefore, was a new division of the earth, more minute than that of zones, and still continues in use; though, as we shall show, the design which first introduced it may be better answered in another way. There are thirty climates between the equator and either pole. In the first twenty-four, the days increase by half hours; but in the remaining six, between the polar circle and the pole, the days increase by months. The nature and reason of this the reader will more fully understand, when he becomes acquainted with the use of the globe: in the mean time, we shall insert a table, which will serve to show in what climate any country lies, supposing the length of the day, and the distance of the place from the equator, to be known.

Cl.	Lat. D. M.	Breadth. D. M.	Lo. Da. H. M.	Names of Countries and remarkable Places, situated in every Climate North of the Equator.
1	8 25	8 25	12 30	I. Within the first Climate lie the Gold and Silver Coasts in Africa; Malacca in the East-Indies; Cayenne and Surinam in Terra Firma, South America.
2	16 25	8 0	13 0	II. Here lie Abyssinia in Africa; Siam, Madras, and Pondicherry in the East-Indies; Straits of Darien, between N. and S. America; Tobago, the Granades, St. Vincent and Barbadoes, in the West-Indies.
3	23 50	7 25	13 30	III. Contains Mecca in Arabia; Bombay, part of Bengal, in the East-Indies; Canton in China; Mexico, Bay of Campeachy, in North America; Jamaica, Hispaniola, St. Christopher's, Antigua, Martinico, and Guadaloupe, in the West-Indies.
4	30 20	6 50	14 0	IV. Egypt, and the Canary Islands, in Africa; Delhi, capital of the Mogul Empire, in Asia; Gulf of Mexico and East Florida, in North America; the Havanna, in the West-Indies.
5	36 28	6 8	14 30	V. Gibraltar in Spain; part of the Mediterranean sea; the Barbary coast, in Africa; Jerusalem; Ispahan, capital of Persia; Nankin in China; California, New Mexico, West Florida, Georgia, and the Carolinas, in North America.
6	41 22	4 54	15 0	VI. Lisbon, in Portugal; Madrid, in Spain; Minorea, Sardinia, and part of Greece, in the Mediterranean; Asia Minor; part of the Caspian Sea; Samarcand, in Great Tartary; Peking, in China; Corea, and Japan; Williamsburgh, in Virginia; Maryland, and Philadelphia, in North America.
7	45 29	4 7	15 30	VII. Northern provinces of Spain; southern ditto of France; Turin, Genoa, and Rome, in Italy; Constantinople, and the Black Sea, in Turkey; the Caspian Sea, and part of Tartary; New York, Boston, in New England, North America.
8	49 1	3 32	16 0	VIII. Paris; Vienna, capital of Germany; Nova Scotia, Newfoundland, and Canada, in North America.
9	52 0	2 59	16 30	IX. London, Flanders, Prague, Dresden; Cracow, in Poland; southern provinces of Russia; part of Tartary; north part of Newfoundland.
10	54 27	2 27	17 0	X. Dublin, York, Holland, Hanover, and Tartary; Wariaw, in Poland; Labrador, and New South Wales, in North America.
11	56 37	2 10	17 30	XI. Edinburgh, Copenhagen; Moscow, capital of Russia.
12	58 29	1 52	18	XII. South part of Sweden; Toboiki, cap. of Siberia.
13	59 58	1 29	18 50	XIII. Orkney Isles; Stockholm, capital of Sweden.
14	61 18	1 20	19	XIV. Bergen, in Norway; Peterburgh, in Russia.

30	90 0		6 Months.	XXX. Unknown.

**LATITUDE.]** The distance of places from the equator, or what is called the *Latitude*, is easily measured on the globe, by means of the meridian above described. For we have only to bring the place, whose latitude we would know, to the meridian, where the degree of latitude is marked, and it will be exactly over the place. As latitude is reckoned from the equator towards the poles, it is either northern or southern; and the nearer the poles, the greater the latitude. No place can have more than ninety degrees of latitude, because the poles, where the reckoning of the latitude terminates, are at that distance from the equator.

**PARALLELS OF LATITUDE.]** Through every degree of latitude, or, more properly, through every particular place on the earth, geographers suppose a circle to be drawn, which they call a parallel of latitude. The intersection of this circle with the meridian of any place shows the true situation of that place.

**LONGITUDE.]** The *Longitude* of a place is its situation with regard to the first meridian, and consequently reckoned towards the east or west: in reckoning the longitude, there is no particular spot from which we ought to set out preferably to another; but, for the advantage of a general rule, the meridian of Ferro, the most westerly of the Canary islands, was formerly considered as the first meridian in most of the globes and maps, and the longitude of places was reckoned to be so many degrees east or west of the meridian of Ferro. The modern globes fix the first meridian, from which the degrees of longitude are reckoned, in the capital city of the different countries where they are made, viz. the English globes date the first meridian from London or Greenwich, the French globes from Paris, &c. The degrees of longitude are marked on the equator. No place can have more than 180 degrees of longitude, because the circumference of the globe being 360 degrees, no place can be remote from another above half that distance; but many foreign geographers improperly reckon the longitude quite round the globe. The degrees of longitude are not equal, like those of latitude, but diminish in proportion as the meridians incline, or their distance contracts in approaching the pole. Hence, in sixty degrees of latitude, a degree of longitude is but half the quantity of a degree on the equator, and so of the rest. The number of miles contained in a degree of longitude in each parallel of latitude, are set down in the table in the following page.

**LONGITUDE AND LATITUDE FOUND.]** To find the longitude and latitude of any place, therefore, we need only bring that place to the brazen meridian, and we shall find the degree of longitude marked on the equator, and the degree of latitude on the meridian. So that to find the distance between two places in the same latitude, we have only to subtract the greater longitude from the less, and the difference, reduced to miles, according to the table given below, will be the distance sought. If the places have the same longitude, the difference of latitude turned into miles at the rate of 60 geographic or 69½ English statute miles, to a degree, will give the distance.

**DISTANCE OF PLACES MEASURED.]** The distance of places which lie in an oblique direction, i. e. neither directly south, north, east, nor west, from one another, may be measured by extending the compasses from the one to the other, and then applying them to the equator. For instance, extend the compasses from Guinea in Africa, to Brazil in America, and then apply them to the equator, and you will find the distance to be twenty-five degrees, which, at sixty miles to a degree, makes the distance 1500 miles.

**QUADRANT OF ALTITUDE.]** In order to supply the place of the compasses in this operation, there is commonly a pliant narrow plate of brass screwed on the brazen meridian, which contains ninety degrees, or one quarter of the circumference of the globe, by means of which the distances and bearings of places are measured without the trouble of first extending the compasses between them, and then applying the same to the equator. This plate is called the Quadrant of Altitude.

**Hour CIRCLE.]** This is a small brass circle fixed on the brazen meridian, divided into twenty-four hours, and having an index moveable round the axis of the globe.

## A TABLE,

PROBLEMS PERFORMED BY THE GLOBE.

PROBLEM 1. *The Diameter of an artificial Globe being given, to find its Surface in Square, and its Solidity in cubic Measure.*

MULTIPLY the diameter by the circumference, which is a great circle dividing the globe into two equal parts, and the product will give the first: then multiply the said product by one sixth of the diameter, and the product of that will give the second. After the same manner we may find the surface and solidity of the natural globe, as also of the whole body of the atmosphere surrounding the same, provided it be always and every where of the same height; for, having found the perpendicular height of the atmosphere by the common experiment of the ascent of mercury at the foot and top of a mountain, double the said height, and add the same to the diameter of the earth; then multiply the whole, as a new diameter, by its proper circumference, which again multiply by one sixth of that diameter, and from the product subtract the solidity of the earth, it will leave that of the atmosphere.

PROB. 2. *To rectify the Globe.*

The globe being set upon a true plane, raise the pole according to the given latitude; then fix the quadrant of altitude in the zenith; and if there be any mariner's compass upon the pedestal, let the globe be so situated, that the brazen meridian may stand due south and north, according to the two extremities of the needle, allowing for its variation.

PROB. 3. *To find the Longitude and Latitude of any Place.*

For this, see page 17.

PROB. 4. *The Longitude and Latitude of any Place being given, to find that Place on the Globe.*

Bring the degree of longitude to the brazen meridian; reckon upon the same meridian the degree of latitude, whether south or north, and make a mark where the reckoning ends; the point exactly under the mark is the place desired.

PROB. 5. *The Latitude of any Place being given, to find all those Places that have the same Latitude.*

The globe being rectified (a) according to the latitude (a) of the given place, and that place being brought to the brazen meridian, make a mark exactly above the same, and turning the globe round, all those places passing under the said mark have the same latitude with the given place.

PROB. 6. *To find the Sun's Place in the Ecliptic at any Time.*

The month and day being given, look for the same upon the wooden horizon; and over-against the day you will find the sign and degree in which the Sun is at that time; which sign and degree being noted in the ecliptic, the same is the Sun's place, or nearly, at the time desired.

PROB. 7. *The Month and Day being given, as also the particular Time of that Day, to find those Places of the Globe to which the Sun is in the Meridian at that Time.*

The pole being elevated according to the latitude of the place where you are, bring the said place to the brazen meridian, and setting the

index of the horary circle at the hour of the day, in the given place, or where you are, turn the globe till the index points at the upper figure of XII. which done, fix the globe in that situation, and observe what places are exactly under the upper hemisphere of the brazen meridian; for those are the places desired.

**PROB. 8.** *To know the Length of the Day and Night in any Place of the Earth at any Time.*

Elevate the pole (a) according to the latitude of the given place; find the sun's place in the ecliptic (b) at that time; which being brought to the east side of the horizon, set the index of the horary circle at noon, or the upper figure XII. and turning the globe about till the aforesaid place of the ecliptic touch the western side of the horizon, look upon the horary circle; and where the index points, reckon the number of hours to the upper figure of XII. for that is the length of the day; the complement of which to 24 hours is the length of the night.

**PROB. 9.** *To know by the Globe, what o'Clock it is in any Part of the World at any Time, provided you know the Hour of the Day where you are at the same Time.*

Bring the place in which you are to the brazen meridian, the pole being raised (a) according to its latitude, and set the index of the horary circle to the hour of the day at that time. Then bring the desired place to the brazen meridian, and the index will point out the hour at that place.

**PROB. 10.** *A Place being given in the Torrid Zone, to find the two Days of the Year in which the Sun shall be vertical to the same.*

Bring the given place to the brazen meridian, and mark what degree of latitude is exactly above it. Move the globe round, and observe the two points of the ecliptic that pass through the said degree of latitude. Search upon the wooden horizon (or by proper tables of the sun's annual motion) on what days he passes through the aforesaid points of the ecliptic; for those are the days required, in which the sun is vertical to the given place.

**PROB. 11.** *The Month and the Day being given, to find by the Globe those Places of the Northern Frigid Zone, where the Sun begins then to shine constantly without setting; as also those Places of the Southern Frigid Zone, where he then begins to be totally absent.*

The day given (which must always be one of those either between the vernal equinox and the summer solstice, or between the autumnal equinox and the winter solstice), find (d) the sun's place in the ecliptic, and marking the same, bring it to the brazen meridian, and reckon the like number of degrees from the north pole towards the equator, as there is between the equator and the sun's place in the ecliptic, making a mark where the reckoning ends. This done, turn the globe round, and all the places passing under the said mark are those in which the sun begins to shine constantly without setting, upon the given day. For solution of the latter part of the problem, set off the same distance from the south pole upon the brazen meridian towards the equator, as was formerly set off from the north; then marking as before, and turning the globe round, all places passing under the mark are those where the sun begins his total disappearance from the given day.

**PROB. 12.** *A Place being given in either of the Frigid Zones, to find by the Globe what number of Days the Sun constantly shines upon the said Place, and what Days he is absent, as also the first and last Day of his Appearance.*

Bring the given place to the brazen meridian, and observing its latitude (*a*), elevate the globe accordingly; count the same (*a*) number of degrees upon the meridian from each side of the equator as the place is distant from the pole; and making marks where the reckonings end, turn the globe, and carefully observe what two degrees of the ecliptic pass exactly under the two points marked on the meridian; first for the northern arch of the circle, namely, that comprehended between the two degrees marked, which being reduced to time, will give the number of days that the sun constantly shines above the horizon of the given place: and the opposite arch of the said circle will in like manner give the number of days in which he is totally absent, and also will point out which days those are. And in the interval he daily will rise and set.

**PROB. 13.** *The Month and Day being given, to find those Places on the Globe, to which the Sun, when in the Meridian, shall be vertical on that Day.*

The sun's place in the ecliptic being found (*b*), bring the same to the brazen meridian, on which make a small mark exactly above the sun's place. Which done, turn the globe; and those places which have the sun vertical in the meridian, will successively pass under the said mark.

**PROB. 14.** *The Month and Day being given, to find upon what Point of the Compass the Sun then rises and sets in any Place.*

Elevate the pole according to the latitude of the desired place, and, finding the sun's place in the ecliptic at the given time, bring the same to the eastern side of the horizon, and it will show the point of the compass upon which he then rises. By turning the globe about till his place coincides with the western side of the horizon, you may also see upon that circle the exact point of his setting.

**PROB. 15.** *To know by the Globe the Length of the longest and shortest Days and Nights in any Part of the World.*

Elevate the pole according to the latitude of the given place, and bring the first degree of Cancer, if in the northern, or Capricorn, if in the southern hemisphere, to the east side of the horizon; and setting the index of the horary circle at noon, turn the globe about till the sign of Cancer touches the western side of the horizon, and then observe upon the horary circle the number of hours between the index and the upper figure of XII. reckoning them according to the motion of the index; for that is the length of the longest day, the complement of which to 24 hours is the extent of the shortest night. As for the shortest day and longest night, they are only the reverse of the former.

**PROB. 16.** *The Hour of the Day being given in any Place to find those Places of the Earth where it is either Noon or Midnight, or any other particular Hour, at the same Time.*

Bring the given place to the brazen meridian, and set the index of the horary circle at the hour of the day in that place. Then turn about the globe till the index points at the upper figure of XII. and observe what

places are exactly under the upper semicircle of the brazen meridian ; for in them it is mid-day at the time given. Which done, turn the globe about till the index points at the lower figure of XII. and whatever places are then in the lower semicircle of the meridian, in them it is midnight at the given time. After the same manner we may find those places that have any other particular hour at the time given, by moving the globe till the index points at the hour desired, and observing the places that are then under the brazen meridian.

**PROB. 17.** *The Day and Hour being given, to find by the Globe that particular Place of the Earth to which the Sun is vertical at that Time.*

The sun's place in the ecliptic (*a*) being found, and (*a*) **PROB. 6.** brought to the brazen meridian, make a mark above the (*b*) **PROB. 16.** same; then (*b*) find those places of the earth in whose meridian the sun is at that instant, and bring them to the brazen meridian; which done, observe that part of the earth which falls exactly under the aforefaid mark in the brazen meridian; for that is the particular place to which the sun is vertical at that time.

**PROB. 18.** *The Day and Hour at any Place being given, to find all those Places where the Sun is then rising, or setting, or in the Meridian; consequently all those Places which are enlightened at that Time, and those which have twilight, or dark night.*

This problem cannot be solved by any globe fitted up in the common way, with the hour-circle fixed upon the brazen meridian, unless the sun be on or near either of the tropics of the given day. But by a globe fitted up with the hour-circle on its surface below the meridian, it may be solved for any day in the year, according to the following method.

Having found the place to which the sun is vertical at the given hour, if the place be in the northern hemisphere, elevate the north pole as many degrees above the horizon, as are equal to the latitude of that place: if the place be in the southern hemisphere, elevate the south pole accordingly; and bring the said place to the brazen meridian. Then, all those places which are in the western semicircle of the horizon have the sun rising to them at that time, and those in the eastern semicircle have it setting; to those under the upper semicircle of the brazen meridian, it is noon; and to those under the lower semicircle, it is midnight. All those places which are above the horizon, are enlightened by the sun, and have the sun just as many degrees above them as they themselves are above the horizon; and this height may be known, by fixing the quadrant of altitude on the brazen meridian over the place to which the sun is vertical; and then laying it over any other place, observing what number of degrees on the quadrant are intercepted between the said place and the horizon. In all those places that are 18 degrees below the western semicircle of the horizon, the morning twilight is just beginning; in all those places that are 18 degrees below the semicircle of the horizon, the evening twilight is ending; and all those places that are lower than 18 degrees, have dark night.

If any place be brought to the upper semicircle of the brazen meridian, and the hour index be set to the upper XII. or noon, and then the globe be turned round eastward on its axis, — when the place comes to the western semicircle of the horizon, the index will show the time of sun-rising at that place; and when the same place comes to the eastern se-

semicircle of the horizon, the index will show the time of the sun's setting.

To those places which do not go under the horizon, the sun sets not on that day: and to those which do not come above it, the sun does not rise.

**PROB. 19.** *The Month and Day being given, with the Place of the Moon in the Zodiac, and her true Latitude, to find the exact Hour when she will rise and set, together with her southing, or coming to the Meridian of the Place.*

The moon's place in the zodiac may be found readily enough at any time by an ordinary almanack; and her latitude, which is her distance from the ecliptic, by applying the semicircle of position to her place in the zodiac. For the solution of the problem, elevate the pole (a) according to the latitude of the given place; and the sun's place in the ecliptic at the time being (b) found, and marked, as also the moon's place at the same time, (b) **PROB. 6.** bring the sun's place to the brazen meridian, and set the index of the horary circle at noon; then turn the globe till the moon's place successively meet with the eastern and western side of the horizon, as also the brazen meridian; and the index will point at those various times the particular hours of her rising, setting, and southing.

**PROB. 20.** *Two Places being given on the Globe, to find the true Distance between them.*

Lay the graduated edge of the quadrant of altitude over both the places; and the number of degrees intercepted between them will be their true distance from each other, reckoning every degree to be 69½ English miles.

**PROB. 21.** *A Place being given on the Globe, and its true Distance from a second Place, to find what other Places of the Earth are at the same Distance from the given Place.*

Bring the given place to the brazen meridian, and elevate the pole according to the latitude of the said place; then fix the quadrant of altitude in the zenith, and reckon upon that quadrant the given distance between the first and second place, provided the same be under 90 degrees; otherwise you must use the semicircle of position, and making a mark where the reckoning ends, and moving the said quadrant or semicircle quite round upon the surface of the globe, all places passing under that mark are those desired.

## GEOGRAPHICAL OBSERVATIONS.

1. The latitude of any place is equal to the elevation of the pole above the horizon of that place, and the elevation of the equator is equal to the complement of the latitude, that is, to what the latitude wants of 90 degrees.

2. Those places which lie on the equator have no latitude, it being there that the latitude begins; and those places which lie on the first meridian have no longitude, it being there that the longitude begins. Consequently, that particular place of the earth where the first meridian intersects the equator, has neither longitude nor latitude.

3. All places of the earth equally enjoy the benefit of the sun, in respect of time, and are equally deprived of it.

4. All places upon the equator have their days and nights equally long, that is, 12 hours each at all times of the year. For although the sun declines alternately, from the equator, towards the north and towards the south, yet, as the horizon of the equator, cuts all the parallels of latitude and declination in halves, the sun must always continue above the horizon for one half a diurnal revolution about the earth, and for the other half below it.

5. In all places of the earth between the equator and poles, the days and nights are equally long, viz. 12 hours each, when the sun is in the equinoctial: for, in all the elevations of the pole, short of 90 degrees (which is the greatest), one half of the equator or equinoctial will be above the horizon, and the other half below it.

6. The days and nights are never of an equal length at any place between the equator and polar circles, but when the sun enters the signs  $\gamma$  Aries and  $\text{♎}$  Libra. For in every other part of the ecliptic, the circle of the sun's daily motion is divided into two unequal parts by the horizon.

7. The nearer any place is to the equator, the less is the difference between the length of the days and nights in that place; and the more remote, the contrary; — the circles which the sun describes in the heavens every 24 hours, being cut more nearly equal in the former case, and more unequal in the latter.

8. In all places lying upon any given parallel of latitude, however long or short the day and night be at any one of those places at any time of the year, it is then of the same length at all the rest; for in turning the globe round its axis (when rectified according to the sun's declination), all those places will keep equally long above and below the horizon.

9. The sun is vertical twice a year to every place between the tropics; to those under the tropics, once a year, but never any where else. For there can be no place between the tropics, but that there will be two points in the ecliptic, whose declination from the equator is equal to the latitude of that place; and there is but one point of the ecliptic, which has a declination equal to the latitude of places on the tropic which that point of the ecliptic touches; and as the sun never goes without the tropics, he can never be vertical to any place that lies without them.

10. In all places lying exactly under the polar circles, the sun, when he is in the nearer tropic, continues 24 hours above the horizon without setting; because no part of that tropic is below their horizon. And when the sun is in the farther tropic, he is for the same length of time without rising; because no part of that tropic is above their horizon. But at all other times of the year, he rises and sets there, as in other places; because all the circles that can be drawn parallel to the equator, between the tropics, are more or less cut by the horizon, as they are farther from, or nearer to, that tropic which is all above the horizon; and when the sun is not in either of the tropics, his diurnal course must be in one or other of those circles.

11. To all places in the northern hemisphere, from the equator to the polar circle, the longest day and shortest night is when the sun is in the northern tropic; and the shortest day and longest night is when the sun is in the southern tropic; because no circle of the sun's daily motion is so much above the horizon, and so little below it, as the northern tropic; and none so little above it, and so much below it, as the southern. In the southern hemisphere, the contrary takes place.

12. In all places between the polar circles and poles, the sun appears for some number of days (or rather diurnal revolutions) without setting, and at the opposite time of the year, without rising; because some part of the ecliptic never sets in the former case, and as much of the opposite part never rises in the latter. And the nearer unto, or the more remote from the pole these places are, the longer or shorter is the sun's continuing presence or absence.

13. If a ship sets out from any port, and sails round the earth eastward to the same port again; let her perform her voyage in what time she will, the people in that ship, in reckoning their time, will gain one complete day at their return, or count one day more than those who reside at the same port; because, by going contrary to the sun's diurnal motion, and being forwarder every evening than they were in the morning, their horizon will get so much the sooner above the setting sun, than if they had kept for a whole day at any particular place. And thus, by cutting off from the length of every day a part proportionable to their own motion, they will gain a complete day at their return, without gaining one moment of absolute time. If they sail westward, they will reckon one day less than the people do who reside at the same port; because, by gradually following the apparent diurnal motion of the sun, they will keep him each particular day so much longer above the horizon, as answers to that day's course; and thereby cut off a whole day in reckoning, at their return, without losing one moment of absolute time.

Hence, if two ships should set out at the same time from any port, and sail round the globe, one eastward and the other westward, so as to meet at the same port on any day whatever, they will differ two days in reckoning their time, at their return. If they sail twice round the earth, they will differ four days; if thrice, then six, &c.

#### OF THE NATURAL DIVISIONS OF THE EARTH.

THE constituent parts of the Earth are two, the *land* and *water*. The parts of the land are continents, islands, peninsulas, isthmuses, promontories, capes, coasts, mountains, &c. This land is divided into two great continents (besides the islands), viz. the *eastern* and *western* continent. The eastern is subdivided into three parts, viz. Europe, on the north-west; Asia, on the north-east; and Africa (which is joined to Asia by the isthmus of Suez, 60 miles over), on the south. The western continent consists of North and South America, joined by the isthmus of Darien, nearly 70 miles broad.

A *continent* is a large portion of land, containing several countries or kingdoms, without any entire separation of its parts by water, as Europe. An *island* is a smaller part of land, quite surrounded by water, as Great Britain. A *peninsula* is a tract of land, every where surrounded by water, except at one narrow neck, by which it joins the neighbouring continent; as the Morea in Greece; and that neck of land which so joins it, is called an *isthmus*; as the isthmus of Suez, which joins Africa to Asia, and the isthmus of Darien, which joins North and South America. A *promontory* is a hill, or point of land, stretching itself into the sea, the end of which is called a *cape*; as the Cape of Good Hope. A *coast* or *shore* is that part of a country which borders on the sea side. Mountains, valleys, woods, deserts, plains, &c. need no description. The most remarkable are taken notice of, and described, in the body of this work.

The parts of the water are oceans, seas, lakes, straits, gulfs, bays, or creeks, rivers, &c. The waters are divided into three extensive oceans (besides lesser seas, which are only branches of these), viz. the *Atlantic*, the *Pacific*, and the *Indian Ocean*. The Atlantic, or Western Ocean, divides the eastern and western continents, and is 3000 miles wide. The Pacific divides America from Asia, and is 10,000 miles over. The Indian Ocean lies between the East Indies and Africa, being 3000 miles wide.

The *ocean* is a vast collection of water, without any entire separation of its parts by land; as the Atlantic Ocean. A *sea* is a smaller collection of water, which communicates with the ocean, confined by the land; as the Mediterranean and the Red Sea. A *lake* is a large collection of water, entirely surrounded by land; as the lake of Geneva, and the lakes in Canada. A *strait* is a narrow part of the sea, confined or lying between two shores, and opening a passage out of one sea into another: as the strait of Gibraltar, or that of Magellan. This is sometimes called a *sound*; as the strait into the Baltic. A *gulf* is a part of the sea running up into the land, and surrounded by it, except at the passage whereby it communicates with the sea or ocean. If a gulf be very large, it is called an inland sea; as the Mediterranean; if it do not go far into the land, it is called a *bay*, as the Bay of Biscay; if it be very small, a *creek*, *haven*, *station*, or *road* for ships, as Milford Haven. Rivers, canals, brooks, &c. need no description; for these lesser divisions of water, like those of land, are to be met with in most countries, and every one has a clear idea of what is meant by them. But in order to strengthen the remembrance of the great parts of the land and water we have described, it may be proper to observe that there is a strong analogy or resemblance between them. The description of a continent resembles that of an ocean; an island encompassed with water resembles a lake encompassed with land. A peninsula of land is like a gulf or inland sea. A promontory or cape of land is like a bay or creek of the sea; and an isthmus, when by two lands are joined, resembles a strait, which unites one sea to another.

To this description of the divisions of the earth, we shall subjoin a table, exhibiting the superficial contents of the whole globe in square miles, sixty to a degree, and also of the seas and unknown parts, the habitable earth, the four quarters or continents; likewise of the great empires and principal islands, placed as they are subordinate to each other in magnitude.

**WINDS AND TIDES.]** We cannot finiſh the doctrine of the earth, without conſidering the winds and tides, from which the changes that happen on its ſurface principally ariſe.

**WINDS.]** The earth on which we live is every where ſurrounded by a fine inviſible fluid, which extends to ſeveral miles above its ſurface, and is called *Air*. It is found by experiments, that a ſmall quantity of air is capable of being expanded, ſo as to fill a very large ſpace, or to be compressed into a much ſmaller compats than it occupied before. The general cauſe of the expansion of the air is heat; the general cauſe of its compression is cold. Hence if any part of the air or atmopſhere receive a greater degree of cold or heat than it had before, its parts will be put in motion, and expanded or compressed. But when air is put in motion we call it *wind* in general, and a breeze, gale, or ſtorm, according to the quickneſs or velocity of that motion. Winds, therefore, which are con-

monly considered as things extremely variable and uncertain, depend on a general cause, and act with more or less uniformity in proportion as the action of this cause is more or less constant. It is found by observations made at sea, that, from thirty degrees north latitude, to thirty degrees south, there is a constant east wind throughout the year, blowing on the Atlantic and Pacific oceans, and called the *Trade Wind*. This is occasioned by the action of the sun, which, in moving from east to west, heats and consequently expands the air immediately under him; by which means a stream or tide of air always accompanies him in his course, and occasions a perpetual east wind within these limits. This general cause however is modified by a number of particulars, the explication of which would be too tedious and complicated for our present plan, which is to mention facts rather than theories.

The winds called the *Tropical Winds*, which blow from some particular point of the compass without much variation, are of three kinds; 1. The *General Trade Winds*, which extend to nearly thirty degrees of latitude on each side of the equator in the Atlantic, Ethiopic, and Pacific seas. 2. The *Monsoons*, or shifting trade winds, which blow six months in one direction, and the other six months in the opposite. These are mostly in the Indian or Eastern Ocean, and do not extend above two hundred leagues from the land. Their change is at the vernal and autumnal equinoxes, and is accompanied with terrible storms of thunder, lightning, and rain. 3. The *Sea and Land Breezes*, which are another kind of periodical winds, that blow from the land from midnight to mid-day, and from the sea from about noon till midnight; these, however, do not extend above two or three leagues from shore. Near the coast of Guinea in Africa, the wind blows nearly always from the west, south-west, or south. On the coast of Peru in South America, the wind blows constantly from the south-west. Beyond the latitude of thirty north and south, the winds, as we daily perceive in Great Britain, are more variable, though they blow oftener from the west than any other point. Between the fourth and tenth degrees of north latitude, and between the longitude of Cape Verd and that of the easternmost of the Cape Verd islands, there is a tract of sea condemned to perpetual calms, attended with terrible thunder and lightning, and such rains, that this sea has acquired the name of *the Rains*.

It may be also useful to students in navigation and geography to observe farther, that the course or latitude our ships generally keep in their passage from England to America, and the West Indies, is,

To Boston in New England, and Halifax in Nova Scotia, from 42 to 43 degrees.

To New York by the Azores or Western Islands, 39 degrees.

To Carolina and Virginia by Madeira, which is called the upper course, 32 degrees; but the usual course, to take advantage of the trade-winds, is from 16 to 23 degrees; and in this course they frequently touch at Antigua: it is this course our West India ships sail in.

The Spanish galleons and the flota from Spain keep from 15 to 18 degrees; and in their return to Spain, about 37 degrees.

*TIDES.*) By the *tides* is meant that regular motion of the sea, according to which it ebbs and flows twice in twenty-four hours. The doctrine of the tides remained in obscurity, till the immortal sir Isaac Newton explained it by his great principle of gravity or attraction. For, having demonstrated that there is a principle in all bodies within the solar system, by which they mutually draw or attract one another in proportion to their distance, it follows, that those parts of the sea which are im-

mediately below the moon, must be drawn towards it; and consequently, wherever the moon is nearly vertical, the sea will be raised, which occasions the flowing of the tide there. A similar reason occasions the flowing of the tide likewise in those places where the moon is in the nadir, and which must be diametrically opposite to the former: for in the hemisphere farthest from the moon, the parts in the nadir being less attracted by her than the other parts which are nearer to her, gravitate less towards the earth's centre, and consequently must be higher than the rest. Those parts of the earth, on the contrary, where the moon appears on the horizon, or ninety degrees distant from the zenith and nadir, will have low water; for as the waters in the zenith and nadir rise at the same time, the waters in their neighbourhood will press towards those places to maintain the equilibrium; to supply the places of these, others will move the same way, and so on to the places ninety degrees distant from the zenith and nadir, where the water will be lowest. By combining this doctrine with the diurnal motion of the earth, above explained, we shall be sensible of the reason why the tides ebb and flow twice in a lunar day, or about twenty-four hours fifty minutes.

The tides are higher than ordinary, twice every month, that is about the times of new and full moon, and are called *Spring Tides*: for at these times the actions of both the sun and moon are united, and draw in the same straight line; and consequently the sea must be more elevated. At the conjunction, or when the sun and moon are on the same side of the earth, they both conspire to raise the waters in the zenith, and consequently in the nadir; and at the opposition, or when the earth is between the sun and moon, while one occasions high water in the zenith and nadir, the other does the same. The tides are less than ordinary twice every month, about the first and last quarters of the moon, and are called *Neap Tides*: for in those quarters, the sun raises the waters where the moon depresses them, and depresses where the moon raises them; so that the tides are only occasioned by the difference by which the action of the moon, which is nearest us, prevails over that of the sun. These things would happen uniformly, were the whole surface of the earth covered with water; but since there are a multitude of islands and continents which interrupt the natural course of the water, a variety of appearances are to be met with in different places, which cannot be explained without considering the situation of the shores, straits, and other objects that have a share in producing them.

**CURRENTS.]** There are frequently streams or currents in the ocean, which set ships a great way beyond their intended course. There is a current between Florida and the Bahama Islands, which always runs from south to north. A current runs constantly from the Atlantic, through the straits of Gibraltar, into the Mediterranean. A current sets out of the Baltic sea, through the sound or strait between Sweden and Denmark, into the British channel, so that there are no tides in the Baltic. About small islands and head-lands in the middle of the ocean, the tides rise very little; but in some bays, and about the mouths of rivers, they rise from 12 to 50 feet.

**MAPS.]** A map is the representation of the earth, or a part of it, on a plane surface. Maps differ from the globe in the same manner as a picture does from a statue. The globe truly represents the earth; whereas a map, being a plane surface, cannot represent a spherical body. But though the earth can never be exhibited exactly by one map, yet by means of several, each containing about ten or twenty degrees of latitude,

the representation will not fall very much short of the globe for exactness; because such maps might be joined together so as to form a convex surface, nearly as spherical as the globe itself.

**CARDINAL POINTS.]** The north is considered as the upper part of the map; the south is at the bottom, opposite to the north; the east is on the right hand, the face being turned to the north; and the west on the left hand opposite to the east. From the top to the bottom are drawn meridians, or *lines of longitude*; and from side to side, *parallels of latitude*. The outermost of the meridians and parallels are marked with degrees of latitude and longitude, by means of which, and the scale of miles commonly placed in the corner of the map, the situation, distance, &c. of places, may be found, as on the artificial globe. Thus, to find the distance of two places, suppose London and Paris, by the map, we have only to measure the space between them with the compasses, or a bit of thread, and to apply this distance to the scale of miles, which shows that London is 210 miles distant from Paris. If the places lie directly north or south, east or west, from each other, we have only to observe the degrees on the meridians and parallels; and by turning these into miles, we obtain the distance without measuring. Rivers are described in maps by black lines, and are wider towards the mouth than towards the head or spring. Mountains are sketched on maps as on a picture. Forests and woods are represented by a kind of shrub; bogs and morasses, by shades; sands and shallows are described by small dots; and roads usually by double lines. Near harbours, the depth of the water is expressed by figures representing fathoms.

**LENGTH OF MILES IN DIFFERENT COUNTRIES.]** There is scarcely a greater variety in any thing than in this sort of measure: not only those of separate countries differ, as the French from the English, but those of the same country vary in the different provinces, from each other, and from the standard. Thus the common English mile differs from the statute mile: and the French have three sorts of leagues. We shall here give the miles of several countries, compared with the English, by Dr. Halley.

The English statute mile consists of 5280 feet, 1760 yards, or 8 furlongs:

The Russian vorst is little more than  $\frac{1}{2}$  of a mile English.

The Turkish, Italian, and old Roman lesser mile, is nearly one English:

The Arabian, ancient and modern, is about  $1\frac{1}{2}$  English.

The Scotch and Irish mile is about  $1\frac{1}{2}$  English.

The Indian is almost 3 English.

The Dutch, Spanish, and Polish, is about  $3\frac{1}{2}$  English.

The German is more than 4 English.

The Swedish, Danish, and Hungarian, is from 5 to 6 English.

The French common league is near 3 English; and

The English marine league is 3 English miles.

## PART II.

### OF THE ORIGIN OF NATIONS, LAWS, GOVERNMENT, AND COMMERCE.

**HAVING**, in the following work, mentioned the ancient names of countries, and even sometimes, in speaking of those countries, carried our researches beyond modern times, — it was thought necessary, in

order to prepare the reader for entering upon the particular history of each country we describe, to present him with a general view of the history of mankind, from the first ages of the world to the reformation in religion during the 16th century. By a history of the world, we do not mean a mere list of dates (which, when taken by itself, is a thing extremely insignificant), but an account of the most interesting and important events which have happened among mankind; with the causes that have produced, and the effects which have followed from them. This we judge to be a matter of high importance in itself, and indispensably requisite to the understanding of the present state of commerce, government, arts, and manners, in any particular country: it may be called commercial and political geography, and, undoubtedly, constitutes the most useful branch of that science.

The great event of the creation of the world, before which there was neither matter nor form of any thing, is placed, according to the best chronologers, in the year before Christ 4004; and in the 710th year of what is called the Julian period, which has been adopted by some chronologers and historians, but is of little real service. The sacred records have fully determined the question, that the world was not eternal, and also ascertained the time of its creation with great precision\*.

It appears in general, from the first chapters in Genesis, that the world, before the flood, was extremely populous; that mankind had made considerable improvement in the arts, and were become extremely vicious, both in their sentiments and manners. Their wickedness gave occasion to a memorable catastrophe, by which the whole human race, except Noah and his family, were swept from the face of the earth. The deluge took place in the 1656th year of the world, and produced a very considerable change in the soil and atmosphere of this globe, rendering them less friendly to the frame and texture of the human body. Hence the abridgement of the life of man, and that formidable train of diseases which has ever since made such havock in the world. A curious part of history follows that of the deluge, — the repeopling of the world, and the rising of a new generation from the ruins of the former. The memory of the three sons of Noah, the first founders of nations, was long preserved among their several descendants. Japhet continued famous among the western nations, under the celebrated name of Iapetus; the Hebrews paid an equal veneration to Shem, who was the founder of their race; and, among the Egyptians, Ham was long revered as a divinity, under the name of Jupiter Hammon. It appears that hunting was the principal occupation some centuries after the deluge. The world teemed with wild beasts; and the great heroism of those times consisted in destroying them. Hence Nimrod obtained immortal renown, and, by the admiration which his courage and dexterity universally excited, was enabled to acquire an authority over his fellow-creatures, and to found at Babylon the first monarchy whose origin is particularly mentioned in history. Not long after, the foundation of Nineveh was laid by Assur; in Egypt the four governments of Thebes, Theri, Memphis, and Tanis, began to assume some appearance of form and regularity. That these events should have happened so soon after the deluge, whatever surpris-

\* The Samaritan copy of the Pentateuch, or five books of Moses, makes the antediluvian period only 1307 years, 349 short of the Hebrew Bible computation; and the Septuagint copy stretches it to 2262 years, which is 606 years exceeding it; but the Hebrew chronology is generally acknowledged to be of superior authority.

It may have occasioned to the learned some centuries ago, need not in the smallest degree excite the wonder of the present age. We have seen, from many instances, the powerful effects of the principles of population, and how speedily mankind increase, when the generative faculty lies under no restraint. The kingdoms of Mexico and Peru were incomparably more extensive than those of Babylon, Nineveh, and Egypt, during that early age; and yet these kingdoms are not supposed to have existed four centuries before the discovery of America by Columbus. As mankind continued to multiply on the earth, and to separate from B. C. each other, the tradition concerning the true God was obliterated or obscured. This occasioned the calling of Abraham to be the father of a chosen people. From this period the history of ancient nations begins to dawn; and we learn several particulars of importance.

Mankind had not long been united into societies before they began to oppress and destroy each other. Chedorlaomer, king of the Elamites, or Persians, was already become a robber and a conqueror. His force, however, could not have been very great, since, in one of his expeditions, Abraham, assisted only by his household, set upon him in his retreat, and, after a fierce engagement, recovered all the spoil that had been taken. Abraham was soon after obliged by a famine to leave Canaan, the country where God had commanded him to settle, and to go into Egypt. This journey gives occasion to mention some particulars respecting the Egyptians, which evidently discover the characteristics of an improved and powerful nation. The court of the Egyptian monarch is described in the most brilliant colours. He was surrounded by a crowd of courtiers, solely occupied in gratifying his passions. The particular governments into which that country was divided, were now united under one powerful prince; and Ham, who led the colony into Egypt, became the founder of a mighty empire. We are not, however, to imagine, that all the laws which took place in Egypt, and which have been so justly admired for their wisdom, were the work of that early age. Diodorus Siculus, a Greek writer, mentions many successive princes, who laboured for their establishment and perfection. But in the time of Jacob, two centuries after, the first principles of civil order and regular government seem to have been tolerably understood among the Egyptians. The country was divided into several districts or separate departments; councils composed of experienced and select persons, were established for the management of public affairs; granaries for preserving corn were erected; and, in fine, the Egyptians in that age enjoyed a commerce far from inconsiderable. These facts, though of an ancient date, deserve our particular attention. It is from the Egyptians that many of the arts, both of elegance and utility, have been handed down in an uninterrupted chain to the modern nations of Europe. The Egyptians communicated their arts to the Greeks; the Greeks taught the Romans many improvements both in the arts of peace and war; and to the Romans, the present inhabitants of Europe are indebted for their civilisation and refinement. The kingdoms of Babylon and Nineveh remained separate for several centuries: but we scarcely know even the names of the kings who governed them, except that of Nimus, the successor of Asur, who, fired with the spirit of conquest, extended the

bounds of his kingdom, added Babylon to his dominions, and laid the foundation of that monarchy, which, raised to its meridian splendor by his enterprising successor Semiramis, and distinguished by the name of the Assyrian empire, ruled Asia for many ages.

Javan, son of Japhet, and grand-son of Noah, was the stock from whom all the people known by the name of Greeks are descended. Javan established himself in the islands on the western coast of Asia Minor, from whence it was impossible that some wanderers should not pass over into Europe. The kingdom of Sicyon, near Corinth, founded by the Pelagi, is generally supposed to have commenced in the year before Christ 2090. To these first inhabitants succeeded a colony from Egypt, who, about 2000 years before the Christian era, penetrated into Greece, and, under the name of Titans, endeavoured to establish monarchy in that country, and to introduce into it the laws and civil polity of the Egyptians. But the empire of the Titans was soon dissolved; and the Greeks, who seem to have been at this time as rude and barbarous as any people in the world, again fell back into their lawless and savage manner of life. Several colonies, however, soon after passed over from Asia into Greece, and, by remaining in that country, produced a more considerable alteration in the manners of its inhabitants. The most ancient of these were the colonies of Inachus and Ogyges; of whom the former settled in Argos, and the latter in Attica. We know very little of Ogyges or his successors. Those of Inachus endeavoured to unite the dispersed and wandering Greeks; and their endeavours for this purpose were not altogether unsuccessful.

But the history of the Israelites is the only one with which we are much acquainted during those ages. The train of curious events which occasioned the settling of Jacob and his family in that part of Egypt of which Tanis was the capital, are universally known. That patriarch died, according to the Septuagint version of the Bible, 1794 years before Christ, but, according to the Hebrew chronology, only 1689 years, and in the year of the world 2315. This is a remarkable era with respect to the nations of heathen antiquity, and concludes that period of time which the Greeks considered as altogether unknown, and which they have greatly disfigured by their fabulous narrations. Let us regard this period then in another point of view, and consider what we can learn from the sacred writings, with respect to the arts, manners, and laws of ancient nations.

It is a common error among writers on this subject, to consider all the nations of antiquity as being then alike in these respects. They find some nations extremely rude and barbarous, and hence they conclude that all were in the same situation. They discover others acquainted with many arts, and hence they infer the wisdom of the first ages. There appears, however, to have been as much difference between the inhabitants of the ancient world, with regard to arts and refinement, as between the civilised kingdoms of modern Europe, and the Indians of America, or the negroes on the coast of Africa. Noah was undoubtedly acquainted with all the science and arts of the antediluvian world; these he would communicate to his children, and they again would hand them down to their posterity. Those nations, therefore, who settled nearest the original seat of mankind, and who had the best opportunities to avail themselves of the knowledge which their great ancestor was possessed of, early formed themselves into regular societies, and made considerable improvements in the arts which are most subservient to human life. Agriculture appears to have been known in the first ages of

the world. Noah cultivated the vine: in the time of Jacob, the fig-tree and the almond were well known in the land of Canaan; and the instruments of husbandry, long before the discovery of them in Greece, are often mentioned in the sacred writings. It is scarcely to be supposed that the ancient cities, both in Asia and Egypt, (whose foundation, as we have already mentioned, ascends to the remotest antiquity) could have been built, unless the culture of the ground had been practised at that time. Nations who live by hunting or pasturage only, lead a wandering life, and seldom fix their residence in cities. Commerce naturally follows agriculture: and though we cannot trace the steps by which it was introduced among the ancient nations, we may, from detached passages in sacred writ, ascertain the progress which had been made in it during the patriarchal times. We know from the history of civil society, that the commercial intercourse between men must be pretty considerable, before the metals come to be considered as the medium of trade; and yet this was the case even in the days of Abraham. It appears, however, from the relations which establish this fact, that the use of money had not been of ancient date; it had no mark to ascertain its weight or fineness; and in a contract for a burying-place, in exchange for which Abraham gave silver, the metal was weighed in the presence of all the people. As commerce improved, and bargains of this sort became more common, this practice was laid aside, and the quantity of silver was ascertained by a particular mark, which saved the trouble of weighing it. But this does not appear to have taken place till the time of Jacob, the second from Abraham. The *reflab*, of which we read in his time, was a piece of money, stamped with the figure of a lamb, and of a precise and stated value. It appears from the history of Joseph, that the commerce between different nations was by this time regularly carried on. The Ishmaelites and Midianites, who bought him of his brethren, were travelling merchants, resembling the modern caravans, who carried spices, perfumes, and other rich commodities, from their own country into Egypt. The same observation may be made from the book of Job, who, according to the best writers, was a native of Arabia Felix, and also a contemporary with Jacob. He speaks of the roads of Tema and Saba, i. e. of the caravans which set out from those cities of Arabia. If we reflect that the commodities of that country were rather the luxuries than the necessaries of life, we shall have reason to conclude that the countries into which they were sent for sale, and particularly Egypt, were considerably improved in arts and refinement.

In speaking of commerce, we ought carefully to distinguish between the species of it which is carried on by land, or inland commerce, and that which is carried on by sea; which last kind of traffic is both later in its origin, and slower in its progress. Had the descendants of Noah been left to their own ingenuity, and received no tincture of the antediluvian knowledge from their wise ancestors, it is improbable that they should have ventured on navigating the open seas so soon as we find they did. That branch of his posterity who settled on the coasts of Palestine, were the first people of the world among whom navigation was made subservient to commerce: they were distinguished by a word which in the Hebrew tongue signifies *merchants*, and are the same nation afterwards known to the Greeks by the name of Phœnicians. Inhabiting a barren and ungrateful soil, they applied themselves to better their situation by cultivating the arts. Commerce was their principal pursuit: and with all the writers of pagan antiquity they pass for the inventors of whatever tended to its improvement. At the time of Abraham they were re-

garded as a powerful nation; their maritime commerce is mentioned by Jacob in his last words to his children; and, according to Herodotus, the Phœnicians had by this time navigated the coasts of Greece, and carried off the daughter of Inachus.

The arts of agriculture, commerce, and navigation, suppose the knowledge of several others: astronomy, for instance, or a knowledge of the situation and revolutions of the heavenly bodies, is necessary both to agriculture and navigation; that of working metals, to commerce; and so of other arts. In fact, we find, that before the death of Jacob several nations were so well acquainted with the revolutions of the moon, as to measure by them the duration of their year. It had been a universal custom among all the nations of antiquity, as well as the Jews, to divide time into portions of a week, or seven days: this undoubtedly arose from the tradition with regard to the origin of the world. It was natural for those nations who led a pastoral life, or who lived under a serene sky, to observe that the various appearances of the moon were completed nearly in four weeks; hence the division of a month. Those people, again, who lived by agriculture, and were become acquainted with the division of the month, would naturally remark that twelve of these brought back the same temperature of the air, or the same seasons; hence the origin of what is called the *lunar year*, which has every where taken place in the infancy of science. This, together with the observation of the fixed stars, which, as we learn from the book of Job, must have been very ancient, naturally prepared the way for the discovery of the *solar year*, which at that time would be thought an immense improvement in astronomy. But, with regard to those branches of knowledge which we have mentioned, it is to be remembered that they were peculiar to the Egyptians, and a few nations of Asia. Europe offers a gloomy spectacle during this period. Who could believe that the Greeks, who in later ages became the patterns of politeness and of every elegant art, were descended from a savage race of men, traversing the woods and wilds, inhabiting the rocks and caverns, a wretched prey to wild animals, and sometimes to each other? This, however, is no more than what was to be expected. Those descendants of Noah, who had removed to a great distance from the plains of Shinar, lost all connection with the civilised part of mankind. Their posterity became still more ignorant; and the human mind was at length sunk into an abyss of misery and wretchedness.

We might naturally expect, that, from the death of Jacob, and as we advance forward in time, the history of the great empires of Egypt and Assyria would emerge from their obscurity. This, however, is far from being the case; we only get a glimpse of them, and they disappear entirely for many ages. After the reign of Ninias, who succeeded Semiramis and Ninus in the Assyrian throne, we find an astonishing blank in the history of that empire, for no less than eight hundred years. The silence of ancient history on this subject is commonly attributed to the softness and effeminacy of the successors of Ninus, whose lives afforded no events worthy of narration. Wars and commotions are the great themes of the historian, while the gentle and happy reigns of wise princes pass unobserved and unrecorded. Sesostris, a prince of wonderful abilities, is supposed to have mounted the throne of Egypt after Amenophis, who was swallowed up in the Red Sea about the year before Christ 1492. By his assiduity and attention, the civil and military establishments of the Egyptians received very considerable improvements. Egypt, in the time of Sesostris and his immediate successors, was, in all probability, the most

powerful kingdom upon earth, and, according to the best calculation, is supposed to have contained twenty-seven millions of inhabitants. But ancient history often excites, without gratifying, our curiosity; for, from the reign of Sesostris to that of Bocchoris, in the year before Christ 1781, we have little knowledge of even the names of the intermediate princes. If we judge, however, from collateral circumstances, the country must still have continued in a very flourishing condition: for Egypt continued to pour forth her colonies into distant nations. Athens, that seat of learning and politeness, that school for all who aspired to wisdom, owed its foundation to Cecrops, who landed in Greece with an Egyptian colony, and endeavoured to civilise the rough manners of the original inhabitants. From the institutions which Cecrops established among the Athenians, it is easy to infer in what a condition they must have lived before his arrival. The laws of marriage, which few nations are so barbarous as to be altogether unacquainted with, were not known in Greece. Mankind, like the beasts of the field, were propagated by accidental connections, and with little knowledge of those to whom they owed their generation. Cranaüs, who succeeded Cecrops in the kingdom of Attica, pursued the same beneficial plan, and endeavoured, by wise institutions, to bridle the keen passions of a rude people.

Whilst these princes used their endeavours, for civilising this corner of Greece, the other kingdoms, into which this country, by the natural boundaries of rocks, mountains, and rivers, was divided, and which had been already peopled by colonies from Egypt and the East, began to assume some appearance of form and regularity. This engaged Amphictyon, one of those uncommon geniuses who appear in the world for the benefit of the age in which they live, and the admiration of posterity, to endeavour to unite in one confederacy the several independent kingdoms of Greece, and thereby deliver them from those intestine divisions which must render them a prey to one another, or to the first enemy who might think proper to invade them. This plan he communicated to the kings or leaders of the different territories, and by his eloquence and address engaged twelve cities to unite together for their common preservation. Two deputies from each of those cities assembled twice a year at Thermopylæ, and formed what, after the name of its founder, was called the Amphictyonic Council. In this assembly, whatever related to the general interest of the confederacy, was discussed and finally determined. Amphictyon likewise, sensible that those political connections are the most lasting which are strengthened by religion, committed to the Amphictyons the care of the temple at Delphi, and of the riches which, from the dedications of those who consulted the oracle, had been amassed in it. This assembly, constituted on such solid foundations, was the great spring of action in Greece, while that country preserved its independence; and, by the union which it inspired among the Greeks, enabled them to defend their liberties against all the force of the Persian empire. Considering the circumstances of the age in which it was instituted, the Amphictyonic council is, perhaps, the most remarkable political establishment which ever took place among mankind.

In the year before Christ 1322, the Isthmian games were instituted at Corinth; and in 1303 the famous Olympic games by Pelops; which games, together with the Pythian and Nemean, have been rendered immortal by the genius of Pindar.

The Greek states, formerly unconnected with each other except by mutual inroads and hostilities, soon began to act with concert, and to undertake distant expeditions for the general interest of the confederacy.

The first of these was the famous expedition of the Argonauts, in which all Greece appears to have taken part.

The object of the Argonauts was to open the commerce of the Euxine sea, and to establish colonies in the adjacent country of Colchis. The ship Argo, which was the admiral of the fleet, is the only one particularly named; though we learn from Homer and other ancient writers, that several vessels were employed in that expedition. The fleet was, from the ignorance of those who conducted it, long tossed about on different coasts. The rocks at some distance from the mouth of the Euxine sea occasioned great difficulty to the Argonauts: they sent forward a light vessel, which passed through, but returned with the loss of her rudder. This is expressed, in the fabulous language of antiquity, by their sending out a bird, which returned with the loss of its tail, and may give us an idea of the allegorical obscurity in which the other events of that expedition are involved. The fleet, however, at length arrived at Aea, the capital of Colchis, after performing a voyage, which, considering the mean condition of the naval art during that age, was not less important than the circumnavigation of the earth by our modern discoverers.

From this expedition to that against Troy, which was undertaken to recover the fair Helena, a queen of Sparta, who had been carried off by Paris, son of the Trojan king, the Greeks must have made a wonderful progress in arts, in power, and opulence: no less than twelve hundred vessels were employed in this voyage, each of which, at a medium, contained upwards of a hundred men. These vessels, however, were but half-decked; and it does not appear that iron entered at all into their construction. If we add to these circumstances, that the Greeks had not the use of the saw, an instrument so necessary to the carpenter, a modern must form but a mean notion of the strength or elegance of this fleet.

Having thus considered the state of Greece as a whole, let us examine the circumstances of the particular countries into which it was divided. This is of great importance to our present undertaking, because it is in this country only that we can trace the origin and progress of government, arts, and manners, which compose so great a part of our present work. There appears originally to have been a remarkable resemblance, as to their political situation, between the different kingdoms of Greece. They were governed each by a king, or rather by a chieftain, who was their leader in time of war, their judge in time of peace, and who presided in the administration of their religious ceremonies. This prince, however, was far from being absolute. In each society there were a number of other leaders, whose influence over their particular clans or tribes was not less considerable than that of the king over his immediate followers. These captains were often at war with each other, and sometimes with their sovereign; and each particular state was in miniature, what the whole country had been before the time of Amphictyon. They required the hand of another delicate painter to blend the opposite colours, and to enable them to produce one powerful effect. The history of Athens affords us an example of the manner in which these states, which, for want of union, were weak and insignificant, became, by being cemented together, important and powerful. Theseus, king of Attica, about the year B. C. 1234, had, by his exploits, acquired great reputation for valour and ability. He saw the inconveniencies to which his country, from being divided into twelve districts, was exposed; and he conceived, that, by means of the influence which his personal character, united to the royal authority with which he was invested, had universally procured him, he might be able to remove them.

For this purpose he endeavoured to maintain and even to increase his popularity among the peasants and artisans; he detached, as much as possible, the different tribes from the leaders who commanded them; he abolished the courts which had been established in different parts of Attica, and appointed one council-hall common to all the Athenians. Theseus, however, did not trust solely to the force of political regulations. He called to his aid all the power of religious prejudices. By establishing common rites of religion to be performed in Athens, and by inviting thither strangers from all quarters by the prospect of protection and privileges, he raised that city from an inconsiderable village to a powerful metropolis. The splendour of Athens and of Theseus now totally eclipsed that of the other villages and their particular leaders. All the power of the state was united in one city, and under one sovereign. The petty chieftains, who had formerly occasioned so much confusion, being now divested of all influence and consideration, became humble and submissive; and Attica remained under the peaceable government of a monarch.

This is a rude sketch of the origin of the first monarchy of which we have a distinct account, and may, without much variation, be applied to the other states of Greece. This country, however, was not destined to continue long under the government of kings. A new influence arose, which in a short time proved too powerful both for the king and the nobles. Theseus had divided the Athenians into three distinct classes, —the nobles, the artisans, and the husbandmen. In order to abridge the exorbitant power of the nobles, he had bestowed many privileges on the two other ranks of citizens. This plan of politics was followed by his successors; and the lower ranks of the Athenians, partly from the countenance of their sovereign, and partly from the progress of arts and manufactures which gave them an opportunity of acquiring property, became considerable and independent. These circumstances were attended with a remarkable effect. Upon the death of Codrus, a prince of great merit, in the year before Christ 1070, the Athenians, become weary of the regal authority, under pretence of finding no one worthy of filling the throne of that monarch, who had devoted himself to death for the safety of his people, abolished the regal power, and proclaimed that none but Jupiter should be king of Athens. This revolution in favour of liberty was so much the more remarkable, as it happened about the same time that the Jews became unwilling to remain under the government of the true God, and desired a mortal sovereign, that they might be like other nations.

The government of Thebes, another of the Grecian states, much about the same time, assumed the republican form. Near a century before the Trojan war, Cadmus, with a colony from Phœnicia, had founded this city, which from that time had been governed by kings. But the last sovereign being overcome in single combat by a neighbouring prince, the Thebans abolished the regal power. Till the days however of Pelopidas and Epaminondas (a period of seven hundred years), the Thebans performed nothing worthy of the republican spirit. Other cities of Greece, after the example of Thebes and Athens, erected themselves into republics. But the revolutions of Athens and Sparta, two rival states, which, by means of the superiority they acquired, gave the tone to the manners, genius, and politics of the Greeks, deserve our particular attention. We have seen a tender shoot of liberty spring up in the city of Athens, upon the decease of Codrus; 1070. its last sovereign. This shoot gradually improved into a vigorous

plant. The Athenians, by abolishing the name of king, did not entirely subvert the regal authority: they established a perpetual magistrate, who, under the name of Archon, was invested with almost the same powers which their kings had enjoyed. The Athenians in time became sensible that the archontic office was too lively an image of royalty for a free state. After it had continued, therefore, three hundred and thirty-one years in the family of Codrus, they endeavoured to lessen its dignity, not by abridging its power, but by shortening its duration. The first period assigned for the continuance of the archonship in the same person was three years. But the desire of the Athenians for a more perfect system of freedom than had hitherto been established, increased in proportion to the liberty they enjoyed. They again demanded a reduction of the power of their archons; and it was at length determined that nine annual magistrates should be appointed under this title. These magistrates were not only chosen by the people, but accountable to them for their conduct at the expiration of their office. These alterations were too violent not to be attended with some dangerous consequences. The Athenians, intoxicated with their freedom, broke out into the most unruly licentiousness. No written laws had been as yet enacted in Athens; and it was hardly possible that the ancient customs of the realm, which were naturally supposed to be in part abolished by the successive changes in the government, should sufficiently restrain the tumultuous spirits of the Athenians in the first flutter of their independence. The wiser part of the state, therefore, who began to prefer any system of government to their present anarchy and confusion, were induced to cast their eyes on Draco, a man of an austere but virtuous disposition, as the fittest person for composing a system of law to bridle the furious and unruly multitude. Draco undertook the office about the year 628, but executed it with so much rigour, that, in the words of an ancient historian, "His laws were written with blood, and not with ink." Death was the indiscriminate punishment of every offence; and the code of Draco proved to be a remedy worse than the disease. Affairs again fell into confusion, which continued till those laws were reformed in the time of Solon, about the year before Christ 594. The wisdom, virtue, and amiable manners of Solon recommended him to the most important of all offices, the giving laws to a free people. This employment was assigned him by the unanimous voice of his country; but he long deliberated whether he should undertake it. At length, however, motives of public utility overcame all considerations of private ease, safety, and reputation, and determined him to enter on an ocean pregnant with a thousand dangers. The first step of his legislation was to abolish all the laws of Draco, excepting those relative to murder. The punishment of this crime could not be too great; but to consider other offences as equally criminal, was confounding all notions of right and wrong, and rendering the law ineffectual by means of its severity. Solon next proceeded to new-model the political law: his establishments on this head remained among the Athenians, while they preserved their liberties. He seems to have set out with this principle, that a perfect republic, in which each citizen should have an equal political importance, was a system of government, beautiful indeed in theory, but not reducible to practice. He divided the citizens therefore into four classes, according to the wealth which they possessed; and the poorest class he rendered altogether incapable of any public office. They had a voice, however, in the general council of the nation, in

which all matters of principal concern were determined in the last resort. But lest this assembly, which was composed of all the citizens, should, in the words of Plutarch, like a ship with too many sails, be exposed to the gusts of folly, tumult, and disorder, be provided for its safety by the two anchors of the Senate and Areopagus. The first of these courts consisted of four hundred persons, a hundred from each tribe of the Athenians, who prepared all important bills that came before the assembly of the people; the second, though but a court of justice, gained a prodigious ascendancy in the republic, by the wisdom and gravity of its members, who were not chosen but after the strictest scrutiny and the most serious deliberation.

Such was the system of government established by Solon, which, the nearer we examine it, will the more excite our admiration. Upon the same plan most of the other ancient republics were established. To insist on all of them, therefore, would neither be entertaining nor instructive. But the government of Sparta, or Lacedæmon, had something in it so peculiar, that the great outlines of it at least ought not to be here omitted. The country of which Sparta afterwards became the capital, was, like the other states of Greece, originally divided into several petty principalities, of which each was under the jurisdiction of its own immediate chieftain. Lelex is said to have been the first king, about the year before B. C. Christ 1516. At length, the two brothers, Eurysthene and Procles, obtaining possession of this country, became conjunct in the 1102. royalty; and, what is extremely singular, their posterity, in a direct line, continued to rule conjunctly for nine hundred years, ending with Cleomenes, anno 220 before the Christian æra. The Spartan B. C. government, however, did not take that singular form which 884. renders it so remarkable, until the time of Lycurgus, the celebrated legislator. The plan of policy devised by Lycurgus agreed with that already described, in comprehending a senate and assembly of the people, and, in general, all those establishments which are deemed most requisite for the security of political independence. It differed from that of Athens, and indeed from all other governments, in having two kings, whose office was hereditary, though their power was sufficiently circumscribed by proper checks and restraints. But the great characteristic of the Spartan constitution arose from this, that, in all laws, Lycurgus had at least as much respect to war as to political liberty. With this view, all sorts of luxury, all arts of elegance or entertainment, every thing, in fine, which had the smallest tendency to soften the minds of the Spartans, was absolutely proscribed. They were forbidden the use of money; they lived at public tables on the coarsest fare; the younger were taught to pay the utmost reverence to the more advanced in years; and all ranks capable of bearing arms were daily accustomed to the most painful exercises. To the Spartans alone war was a relaxation rather than a hardship; and they behaved in it with a spirit, of which scarcely any but a Spartan could even form a conception.

In order to see the effect of these principles, and to connect under one point of view the history of the different quarters of the globe, we must now cast our eyes on Asia, and observe the events which happened in those great empires of which we have so long lost sight. We have B. C. already mentioned in what obscurity the history of Egypt is 781. involved, until the reign of Bocchoris. From this period to the dissolution of their government by Cambyses of Persia, in the year before Christ 524, the Egyptians are more celebrated for the wisdom of

their laws and political institutions, than for the power of their arms. Several of these seem to have been dictated by the true spirit of civil wisdom, and were admirably calculated for preserving order and good government in an extensive kingdom. The great empire of Assyria likewise, which had so long disappeared, becomes again an object of attention, and affords the first instance we meet with in history, of a kingdom which fell asunder by its own weight, and the effeminate weakness of its sovereigns. Sardanapalus, the last emperor of Assyria, neglecting the administration of affairs, and shutting himself up in his palace with his women and eunuchs, fell into contempt with his subjects. The governors of his provinces, to whom, like a weak and indolent prince, he had entirely committed the command of his armies, did not fail to seize this opportunity of raising their own fortune on the ruins of their master's power. Arbaces, governor of Media, and Belshis, governor of Babylon, conspired against their sovereign, and having set fire to his capital (in which Sardanapalus perished, before Christ 820), divided between them his extensive dominions. These two kingdoms, sometimes united under one prince, and sometimes governed each by a particular sovereign, maintained the chief sway in Asia for many years. Phul revived the kingdom of Assyria, anno, before Christ, 777: and Shalmaneser, one of his successors, put an end to the kingdom of Israel, and carried the ten tribes captive into Assyria and Media, before Christ 721. Nebuchadnezzar, king of Babylon, also, in the year before Christ 587, overturned the kingdom of Judah, which had continued in the family of David from the year 1055, and mastered all the countries round him. But in the year 538, Cyrus the Great took Babylon, and reduced this quarter of the world under the Persian yoke. B. C. The manners of this people, brave, hardy, and independent, as well as the government of Cyrus in all its various departments, are elegantly described by Xenophon, a Grecian philosopher and historian. It is not necessary, however, that we should enter into the same detail upon this subject, as with regard to the affairs of the Greeks. We have, in modern times, sufficient examples of monarchical governments: but how few are our republics! The era of Cyrus is in one respect extremely remarkable, besides that in it the Jews were delivered from their captivity, because with it the history of the great nations of antiquity, which has hitherto engaged our attention, may be said to terminate. Let us consider then the genius of the Assyrians, Babylonians, and Egyptians, in arts and sciences,—and, if possible, discover what progress they had made in those acquirements which are most subservient to the interests of society.

The taste for the great and magnificent seems to have been the prevailing character of those nations; and they principally displayed it in their works of architecture. There are no vestiges, however, now remaining, which confirm the testimony of ancient writers with regard to the great works that adorned Babylon and Nineveh: neither is it clearly determined in what year they were begun or finished. There are three pyramids, stupendous fabrics, still remaining in Egypt, at some leagues distance from Cairo, and about nine miles from the Nile, which are supposed to have been the burying-places of the ancient Egyptian kings. The largest is five hundred feet in height, and each side of the base six hundred and ninety-three feet in length. The apex is thirteen feet square. The second covers as much ground as the first, but is forty feet lower. It was a superstition among the Egyptians, derived from the earliest times, that even after death the soul continued in the body as long as it remained uncorrupted. Hence proceeded the custom of embalming,

or of throwing into the dead body such substances as experience had discovered to be the greatest preservatives against putrefaction. The pyramids were erected with the same view. In them the bodies of the Egyptian kings, it has been supposed, were deposited. From what we read of the walls of Babylon, the temple of Belus, and other works of the East, and from what travellers have recorded of the pyramids, it appears that they were really superb and magnificent structures, but totally void of elegance. The orders of architecture were not yet known, nor even the construction of vaults. The arts in which those nations, next to architecture, principally excelled, were sculpture and embroidery. As to the sciences, they had all along continued to bestow their principal attention on astronomy. It does not appear, however, that they had made great progress in explaining the causes of the phenomena of the universe, or indeed in any species of rational and sound philosophy. To demonstrate this to an intelligent reader, it is sufficient to observe, that, according to the testimony of sacred and profane writers, the absurd reveries of magic and astrology, which always decrease in proportion to the advancement of true science, were in high esteem among them during the latest period of their government. The countries which they occupied were extremely fruitful, and without much labour afforded all the necessaries, and even luxuries, of life. They had long inhabited great cities. These circumstances had tainted their manners with effeminacy and corruption, and rendered them an easy prey to the Persians, a nation just emerging from barbarism, and, of consequence, brave and warlike. Such revolutions were easily effected in the infancy of the military art, when strength and courage alone gave advantage to one nation over another,—when, properly speaking, there were no fortified places, which in modern times have been discovered to be so useful in stopping the progress of a victorious enemy,—and when the event of a battle commonly decided the fate of an empire. But we must now turn our attention to other objects.

The history of Persia, after the reign of Cyrus, who died in the year before Christ 529, offers little, considered in itself, that merits our regard; but, when combined with that of Greece, it becomes particularly interesting. The monarchs who succeeded Cyrus gave an opportunity to the Greeks to exercise those virtues which the freedom of their government had created and confirmed. Sparta remained under the influence of Lycurgus's institutions: Athens had just recovered from the tyranny of the Pisistratideæ, a family who had trampled on the laws of Solon, and B. C. usurped the supreme power. Such was their situation, when the  
504. lust of universal empire, which seldom fails to torment the breast of tyrants, led Darius (at the instigation of Hippias, who had been expelled from Athens, and on account of the Athenians' burning the city of Sardis) to send forth his numerous armies against Greece. But the Persians were no longer those invincible soldiers who, under Cyrus, had conquered Asia. Their minds were enervated by luxury and servitude. Athens, on the contrary, teemed with great men, animated  
B. C. by the late recovery of their freedom. Miltiades, in the plains of  
490. Marathon, with ten thousand Athenians, overcame the Persian army of a hundred thousand foot and ten thousand cavalry. His countrymen Themistocles and Aristides, the first celebrated for his abilities, the second for his virtue, gained the next honours to the general. It does not fall within our plan to mention the events of this war, which, as the noblest monuments of the triumph of virtue over force, of courage over numbers, of liberty over servitude, deserve to be read at length in ancient writers.

Xerxes, the son of Darius, came in person into Greece, with an immense army, which, according to Herodotus, amounted to two millions B. C. and one hundred thousand men. This account has been justly 480. considered, by some ingenious modern writers, as incredible. The truth cannot now be ascertained; but that the army of Xerxes was extremely numerous, is the more probable, from the great extent of his empire, and from the absurd practice of the Eastern nations, of encumbering their camp with a superfluous multitude. Whatever the numbers of his army were, he was every-where defeated, by sea and land, and escaped to Asia in a fishing-boat. Such was the spirit of the Greeks, and so well did they know, that, "wanting virtue, life is pain and woe; that wanting liberty, even virtue mourns, and looks around for happiness in vain." But though the Persian war concluded gloriously for the Greeks, it is, in a great measure, to this war that the subsequent misfortunes of that nation are to be attributed. It was not the battles in which they suffered the loss of so many brave men, but those in which they acquired the spoils of Persia,—it was not their enduring so many hardships in the course of the war, but their connections with the Persians after the conclusion of it,—which subverted the Grecian establishments, and ruined the most virtuous confederacy that ever existed upon earth. The Greeks became haughty after their victories. Delivered from the common enemy, they began to quarrel with one another; and their quarrels were fomented by Persian gold, of which they had acquired enough to make them desirous of more. Hence proceeded the famous Peloponnesian war, in B. C. which the Athenians and Lacedæmonians acted as principals, and 431. drew after them the other states of Greece. They continued to weaken themselves by these intestine divisions, till Philip, king of Macedon (a country till this time little known, but which, by the active and crafty genius of that prince, became important and powerful), rendered himself the absolute master of Greece, by the battle of Chæronea. B. C. But this conquest is one of the first we meet with in history, 338. which did not depend on the event of a battle. Philip had laid his scheme so deeply, and by bribery, promises, and intrigues, gained over such a number of considerable persons in the several states of Greece to his interest, that another day would have put in his possession what Chæronea had denied him. The Greeks had lost that virtue which was the basis of their confederacy. Their popular governments served only to give a sanction to their licentiousness and corruption. The principal orators in most of their states were bribed in the service of Philip; and all the eloquence of a Demosthenes, assisted by truth and virtue, was unequal to the mean but more seductive arts of his opponents, who, by flattering the people, used the surest method of gaining their affections.

Philip had proposed to extend the boundaries of his empire beyond the narrow limits of Greece. But he did not long survive the battle of Chæronea. Upon his decease, his son Alexander was chosen general against the Persians, by all the Grecian states, except the Athenians and Thebans. These made a feeble effort for expiring liberty; but they were obliged to yield to superior force. Secure on the side of Greece, B. C. Alexander set out on his Persian expedition, at the head of thirty 334. thousand foot, and five thousand horse. The success of this army in conquering the whole force of Darius in three pitched battles, in over-running and subduing, not only the countries then known to the Greeks, but many parts of India, whose very names had never before

reached an European ear, has been described by many authors, both ancient and modern, and constitutes a singular part of the history of the world. Soon after this rapid career of victory and success, B. C. 323. Alexander died at Babylon. His captains, after sacrificing all his family to their ambition, divided among them his dominions. This gives rise to a number of æras and events too complicated for our present purpose, and even too uninteresting. After considering therefore, the state of arts and sciences in Greece, we shall pass over to the Roman affairs, where the historical deduction is more simple, and also more important.

The bare names of illustrious men who flourished in Greece from the time of Cyrus to that of Alexander, would fill a large volume. During this period, all the arts were carried to the highest perfection; and the improvements we have hitherto mentioned, were but the dawning of that glorious day. Though the eastern nations had raised magnificent and stupendous structures, the Greeks were the first people in the world, who, in their works of architecture, added beauty to magnificence, and elegance to grandeur. The temples of Jupiter Olympius and of the Ephesian Diana were the first monuments of good taste. They were erected by the Grecian colonies who settled in Asia Minor before the reign of Cyrus. Phidias, the Athenian, who died in the year B. C. 432, is the first sculptor whose works have been immortal. Zeuxis, Parrhasius, and Timanthes, during the same age, first discovered the power of the pencil, and all the magic of painting. Composition, in all its various branches, reached a degree of perfection in the Greek language, of which a modern reader can hardly form an idea. After Hesiod and Homer, who flourished 1000 years before the Christian æra, the tragic poets, Æschylus, Sophocles, and Euripides, were the first considerable improvers of poetry. Herodotus gave simplicity and elegance to profane writing. Socrates gave it cadence and harmony; but it was left to Thucydides and Demosthenes to discover the full force of the Greek tongue. It was not, however, in the finer arts alone that the Greeks excelled. Every species of philosophy was cultivated among them with the utmost success. Not to mention the divine Socrates, the virtues of whose life, and the excellence of whose philosophy, justly entitled him to a very high degree of veneration,—his three disciples, Plato, Aristotle, and Xenophon, may, for strength of reasoning, justness of sentiment, and propriety of expression, be considered as the equals of the best writers of any age or country. Experience, indeed, in a long course of years, has taught us many secrets in nature, with which those philosophers were unacquainted, and which no strength of genius could divine. But whatever some vain empirics in learning may pretend, the most learned and ingenious men, both in France and England, have acknowledged the superiority of the Greek philosophers, and have reckoned themselves happy in catching their turn of thinking and manner of expression. The Greeks were not less distinguished for their active than for their speculative talents. It would be endless to recount the names of their famous statesmen and warriors; and it is impossible to mention a few without doing injustice to a greater number. War was first reduced into a science by the Greeks. Their soldiers fought from an affection to their country and an ardour for glory; and not from a dread of their superiors. We have seen the effects of this military virtue in their wars against the Persians; the cause of it was the wise laws which Amphictyon, Solon, and Lycurgus, had established in Greece. But we must now leave this nation, whose history, both civil and philosophical, is as important as their territory was inconsiderable,

and turn our attention to the Roman affairs, which are still more interesting, both on their own account, and from the relation in which they stand to those of modern Europe.

The character of Romulus, the founder of the Roman state, when we view him as the leader of a few lawless and wandering banditti, is an object of extreme insignificance. But when we consider him as the founder of an empire as extensive as the world, and whose progress and decline have occasioned the two greatest revolutions that ever happened in Europe, we cannot but be interested in his conduct. His disposition was extremely martial; and the political state of Italy, divided into a number of small but independent districts, afforded a noble field for the display of military talents. Romulus was continually embroiled with one or other of his neighbours; and war was the only employment, by which he and his companions expected not only to aggrandise themselves, but even to subsist. In the conduct of his wars with the neighbouring people, we may observe an adherence to the same maxims by which the Romans afterwards became masters of the world. Instead of destroying the nations he had subjected, he united them to the Roman state; whereby Rome acquired a new accession of strength from every war she undertook, and became powerful and populous from that very circumstance which ruins and depopulates other kingdoms. If the enemies with whom he contended had, by means of the art or arms they employed, any considerable advantage, Romulus immediately adopted that practice or the use of that weapon, and improved the military system of the Romans by the united experience of all their enemies. Of both these maxims we have an example in the war with the Sabines. Romulus, having conquered that nation, not only united them to the Romans, but, finding their buckler preferable to the Roman, instantly threw aside the latter, and made use of the Sabine buckler in fighting against other states. Romulus, though principally attached to war, did not altogether neglect the civil polity of his infant kingdom. He instituted what was called the Senate, a court originally composed of a hundred persons distinguished for their wisdom and experience. He enacted laws for the administration of justice, and for bridling the fierce and unruly passions of his followers; and, after a long reign spent in promoting the civil and military interests of his country, was, according to the most probable conjecture, privately assassinated by some of the members of that senate which he himself had instituted.

The successors of Romulus were all very extraordinary personages. Numa, who came next after him, established the religious ceremonies of the Romans, and inspired them with that veneration for an oath, which was ever after the soul of their military discipline. Tullus Hostilius, Ancus Martius, Tarquinius Priscus, and Servius Tullius, laboured, each during his reign, for the greatness of Rome. But Tarquinius Superbus, the seventh and last king, having obtained the crown by the execrable murder of his father-in-law Servius, continued to support it by the most cruel and infamous tyranny. This, together with the insolence of his son Sextus Tarquinius, who, by dishonouring Lucretia, a Roman lady, affronted the whole nation, occasioned the expulsion of the Tarquin family, and with it the dissolution of the regal government. As the Romans, however, were continually engaged in war, they found it necessary to have some officer invested with supreme authority, who might conduct them to the field, and regulate their military enterprises. In the room of the kings, therefore, they appointed two annual magistrates, called consuls, who, without creating

the same jealousy, succeeded to all the powers of their former sovereignties. This revolution was very favourable to the Roman power and grandeur. The consuls, who enjoyed but a temporary power, were desirous of signalising their reign by some great action: each vied with those who had gone before him, and the Romans were daily led out against some new enemy. When we add to this, that the people, naturally warlike, were inspired to deeds of valour by every consideration which could excite them,—that the citizens of Rome were all soldiers, and fought for their lands, their children, and their liberties,—we shall not be surpris'd that they should, in the course of some centuries, extend their power over all Italy.

The Romans, now secure at home, and finding no enemy to contend with in Italy, turned their eyes abroad, and met with a powerful rival in the Carthaginians. This state had been founded or enlarged on the coast of the Mediterranean in Africa, some time before Rome, by a colony of Phœnicians, anno B. C. 869; and, according to the practice of their mother-country, they had cultivated commerce and naval greatness.

Carthage, in this design, had proved wonderfully successful. She now commanded both sides of the Mediterranean. Besides that of Africa, which she almost entirely possessed, she had extended herself on the Spanish side through the Straits. Thus mistress of the sea and of commerce, she had seized on the islands of Corsica and Sardinia. Sicily had difficulty to defend itself; and the Romans were too nearly threatened, not to take up arms. Hence a succession of hostilities between these rival states, known in history by the name of Punic wars, in which the Carthaginians, with all their wealth and power, were an unequal match for the Romans. Carthage was a powerful republic when Rome was an inconsiderable state; but she was now become corrupt and effeminate, while Rome was in the vigour of her political constitution. Carthage employed mercenaries to carry on her wars; Rome, as we have already mentioned, was composed of soldiers. The first war with Carthage lasted twenty-three years, and taught the Romans the art of fighting on the sea, with which they had hitherto been unacquainted.

B. C. 264. A Carthaginian vessel was wrecked on their coast; they used it for a model; in three months fitted out a fleet; and the consul Duilius, who fought their first naval battle, was victorious. The behaviour of Regulus, the Roman general, may give us an idea of the spirit which then animated this people. Being taken prisoner in Africa, he was sent back on his parole to negotiate a change of prisoners. He maintained in the senate the propriety of that law which cut off from those who suffered themselves to be taken, all hopes of being saved; and returned to certain death.

Neither was Carthage, though corrupted, deficient in great men. Of all the enemies the Romans ever had to contend with, Hannibal, the Carthaginian, was the most inflexible and dangerous. His father, Hamilcar, had imbibed an extreme hatred against the Romans; and having settled the intestine troubles of his country, he took an early opportunity to inspire his son, though but nine years old, with his own sentiments. For this purpose he ordered a solemn sacrifice to be offered to Jupiter; and, leading his son to the altar, asked him whether he was willing to attend him in his expedition against the Romans. The courageous boy not only consented to go, but conjured his father, by the gods present, to furnish him to victory, and teach him the art of conquering. "That I will joyfully do," replied Hamilcar, "and with all the care of a father who loves

"you, if you will swear upon the altar to be an eternal enemy to the Romans." Hannibal readily complied; and the solemnity of the ceremony, and the sacredness of the oath, made such an impression on his mind, as nothing afterwards could ever efface. Being appointed general at twenty-five years of age, he crosses the Ebro, the Pyrenees, and the Alps, and unexpectedly rushes down upon Italy. The loss of four battles threatens the fall of Rome. Sicily sides with the conqueror. Hieronymus, king of Syracuse, declares against the Romans, and almost all Italy abandons them. In this extremity, Rome owed its prefer-

vation to three great men. Fabius Maximus, despising popular clamour and the military ardour of his countrymen, declines coming to an engagement. The strength of Rome has time to recover. Marcellus raises the siege of Nola, takes Syracuse, and revives the drooping spirits of his troops. The Romans admired the character of these great men, but saw something more divine in the young Scipio. The success of this young hero confirmed the popular opinion, that he was of divine extraction, and held converse with the gods. At the age of four and twenty, he flies into Spain, where both his father and uncle had lost their lives, attacks New Carthage, and carries it at the first assault. Upon his arrival in Africa, kings submit to him, Carthage trembles in her turn, and sees her armies defeated. Hannibal, sixteen years victorious, is in vain called home to defend his country. Carthage is rendered tributary, gives hostages, and engages never to enter on a war, but with the consent of the Roman people.

After the conquest of Carthage, Rome had inconsiderable wars, but great victories; before, its wars were great, and its victories inconsiderable. At this time the world was divided, as it were, into two parts; in the one fought the Romans and Carthaginians; the other was agitated by those quarrels which had lasted since the death of Alexander the Great; and of which the scene of action was Greece, Egypt, and the East. The states of Greece had once more disengaged themselves from a foreign yoke. They were divided into three confederacies, the Ætoli-ans, Achæans, and Bœotians; each of these was an association of free cities, which had assemblies and magistrates in common. The Ætoli-ans were the most considerable of them all. The kings of Macedon maintained that superiority which, in ancient times when the balance of power was little attended to, a great prince naturally possessed over his less powerful neighbours. Philip, the monarch who then reigned in Macedon, had rendered himself odious to the Greeks, by some unpopular and tyrannical measures; the Ætoli-ans were most irritated; and, hearing the fame of the Roman arms, called them into Greece, and overcame Philip by their assistance. The victory, however, chiefly redounded to the advantage of the Romans. The Macedonian garrisons were obliged to evacuate Greece; the cities were all declared free; but Philip became a tributary to the Romans, and the states of Greece became their dependents. The Ætoli-ans, discovering their first error, endeavoured to remedy it by another still more dangerous to themselves, and more advantageous to the Romans. As they had called the Romans into Greece to defend them against king Philip, they now called in Antiochus, king of Syria, to defend them against the Romans. The famous Hannibal too had recourse to the same prince, who was at this time the most powerful monarch in the East, and the successor to the dominions of Alexander in Asia. But Antiochus did not follow his advice so much as that of the Ætoli-ans; for, instead of renewing the war in Italy, where Hannibal, from experience, judged the Romans to be most vulnerable,

he landed in Greece with a small body of troops, and, being overcome without difficulty, fled over into Asia. In this war the Romans made use of Philip for conquering Antiochus, as they had before done of the

B. C. Ætoliens for conquering Philip. They now pursued Antiochus, the last object of their resentment, into Asia, and, having  
193. vanquished him by sea and land, compelled him to submit to a disgraceful treaty.

In these conquests the Romans still allowed the ancient inhabitants to possess their territory; they did not even change the form of government; the conquered nations became the allies of the Roman people; which denomination however under a specious name, concealed a condition very servile, and insomuch that they should submit to whatever was required of them. When we reflect on those easy conquests, we have reason to be astonished at the resistance which the Romans met with from Mithridates, king of Pontus, for the space of twenty-six years. But this monarch had great resources. His kingdom, bordering on the inaccessible mountains of Caucasus, abounded in a race of men whose minds were not enervated by pleasure, and whose bodies were firm and vigorous; and he gave the Romans more trouble than even Hannibal.

The different states of Greece and Asia, who now began to feel the weight of their yoke, but had not the spirit to shake it off, were transported at finding a prince who dared to show himself an enemy to the Romans, and cheerfully submitted to his protection. Mithridates, however, was at last compelled to yield to the superior fortune of the Romans. Vanquished successively by Sylla and Lucullus, he was at length subdued by Pompey, and stripped of his dominions and his life, in the year before Christ 63. In Africa, the Roman arms met with equal success. Marius,

B. C. in conquering Jugurtha, made all secure in that quarter. Even  
105. the barbarous nations beyond the Alps began to feel the weight of the Roman arms. Gallia Narbonensis had been reduced into a province. The Cimbri, Teutones, and the other northern nations of Europe, broke into this part of the empire. The same Marius, whose

B. C. name was so terrible in Africa, then made the north of Europe  
102. to tremble. The barbarians retired to their wilds and deserts, less formidable than the Roman legions. But while Rome conquered the world, there subsisted an incessant war within her walls. This war had continued from the first period of the government. Rome, after the expulsion of her kings, enjoyed but a partial liberty. The descendants of the senators, who were distinguished by the name of Patricians, were invested with so many odious privileges, that the people felt their dependence, and became determined to shake it off. A thousand disputes on the subject arose betwixt them and the patricians, which always terminated in favour of liberty.

These disputes, while the Romans preserved their virtue, were not attended with any sanguinary consequences. The patricians, who loved their country, cheerfully parted with some of their privileges to satisfy the people; and the people, on the other hand, though they obtained laws by which they might be admitted to enjoy the first offices of the state, and though they had the power of nomination, always named patricians. But when the Romans, by the conquest of foreign nations, became acquainted with all their luxuries and refinements,—when they became tainted with the effeminacy and corruption of the eastern courts, and sported with every thing just and honourable in order to obtain them,—the state, torn by the factions between its members, and without virtue on either side to keep it together, became a prey to its own children.

Hence the bloody seditions of the Gracchi, which paved the way for an inextinguishable hatred between the nobles and commons, and made it easy for any turbulent demagogue to put them in action against each other. The love of their country was now no more than a specious name: the better sort were too wealthy and effeminate to submit to the rigours of military discipline; and the soldiers, composed of the dregs of the republic, were no longer citizens. They had little respect for any but their commander; under his banner they fought, and conquered, and plundered; and for him they were ready to die. He might command them to embroil their hands in the blood of their country. They, who knew no country but the camp, and no authority but that of their general, were ever ready to obey him. The multiplicity of the Roman conquests, however, which required their keeping on foot several armies at the same time, retarded the subversion of the republic. These armies were to many checks upon each other. Had it not been for the soldiers of Sylla, Rome would have surrendered its liberty to the army of Marius.

Julius Cæsar at length appears. By subduing the Gauls, he gained his country the most useful conquest it ever made. Pompey, his only rival, is overcome in the plains of Pharsalia. Cæsar is victorious almost at the same time all over the world; in Egypt, in Asia, in Mauritania, in Spain, in Gaul, and in Britain: conqueror on all sides, he is acknowledged master at Rome, and in the whole empire. Brutus and Cassius attempt to give Rome her liberty by stabbing him in the senate-house. But though they thereby deliver the Romans from the tyranny of Julius, the republic does not obtain its freedom. It falls under the dominion of Mark Antony; young Cæsar Octavianus, nephew to Julius Cæsar, wrests it from him by the sea-fight at Actium; and there is no Brutus or Cassius to put an end to his life. Those friends of liberty had killed themselves in despair; and Octavius, under the name of Augustus, and title of emperor, remains the undisturbed master of the empire. During these civil commotions, the Romans still preserved the glory of their arms amongst distant nations; and while it was unknown who should be master of Rome, the Romans were, without dispute, the masters of the world. Their military discipline and valour abolished all the remains of the Carthaginian, the Persian, the Greek, the Assyrian, and Macedonian glory; they were now only a name. No sooner, therefore, was Octavius established on the throne, than ambassadors from all quarters of the known world crowd to make their submissions. Æthiopia sues for peace; the Parthians, who had been a most formidable enemy, court his friendship; India seeks his alliance; Pannonia acknowledges him; Germany dreads him; and the Weser receives his laws. Victorious by sea and land, he shuts the temple of Janus. The whole earth lives in peace under his power; and Jesus Christ comes into the world four years before the common æra.

Having thus traced the progress of the Roman government while it remained a republic, our plan obliges us to say a few words with regard to the arts, sciences, and manners of that people. During the first ages of the republic, the Romans lived in a total neglect, or rather contempt, of all the elegant improvements of life. War, politics, and agriculture, were the only arts they studied, because they were the only arts they esteemed. But upon the downfall of Carthage, the Romans, having no enemy to dread from abroad, began to taste the sweets of security, and to cultivate the arts. Their progress, however, was not gradual, as in the other countries we have described. The conquest of Greece at once

put them in possession of every thing most rare, curious, or elegant. Asia, which was the next victim, offered all its stores; and the Romans, from the most simple people, speedily became acquainted with the arts, the luxuries, and refinements of the whole earth. Eloquence they had always cultivated as the high road to eminence and preferment. The orations of Cicero are inferior only to those of Demosthenes. In poetry, Virgil yields only to Homer, whose verse, like the prose of Demosthenes, may be considered as inimitable. Horace, however, in his Satires and Epistles, had no model among the Greeks, and stands to this day unrivalled in that species of writing. In history, the Romans can boast of Livy, who possesses all the natural ease of Herodotus, and is more descriptive, more eloquent, and sentimental. Tacitus, indeed, did not flourish in the Augustan age; but his works do himself the greatest honour, while they disgrace his country and human nature, whose corruption and vices he paints in the most striking colours. In philosophy, if we except the works of Cicero, and the system of the Greek philosopher Epicurus, described in the nervous poetry of Lucretius, the Romans, during the time of the republic, made not the least attempt. In tragedy they never produced any thing excellent; and Terence, though remarkable for purity of style, wants that *vis comica*, or lively vein of humour, that distinguishes the writings of the comic poets of Greece, and those of our immortal Shakespeare.

We now return to our history, and are arrived at an æra which presents us with a set of monsters, under the name of emperors, whose acts, a few excepted, disgrace human nature. They did not, indeed, abolish the forms of the Roman republic, though they extinguished its liberties; and while they were practising the most unwarrantable cruelties upon their subjects, they themselves were the slaves of their soldiers. They made the world tremble, while they in their turn trembled at the army. Rome, from the time of Augustus, became the most despotic empire that ever subsisted in Europe; and the court of its emperors exhibited the most odious scenes of that caprice, cruelty, and corruption, which universally prevail under a despotic government. When it is said that the Roman republic conquered the world, it is only meant of the civilised part of it, chiefly Greece, Carthage, and Asia. A more difficult task still remained for the emperors, to subdue the barbarous nations of Europe — the Germans, the Gauls, the Britons, and even the remote people of Scotland; for though these countries had been discovered, they were not effectually subdued by the Roman generals. These nations, though rude and ignorant, were brave and independent. It was rather from the superiority of their discipline, than of their courage, that the Romans gained any advantage over them. The Roman wars with the Germans are described by Tacitus; and from his accounts, though a Roman, it is easy to discover with what bravery they fought, and with what reluctance they submitted to a foreign yoke. From the obstinate resistance of the Germans, we may judge of the difficulties the Romans met with in subduing the other nations of Europe. The contests were bloody; the countries of Europe were successively laid waste; numbers of the inhabitants perished in the field, many were carried into slavery, and but a feeble remnant submitted to the Roman power. This situation of affairs was extremely unfavourable to the happiness of mankind. The barbarous nations, indeed, from their intercourse with the Romans, acquired some taste for the arts, sciences, language, and manners of their new masters. These, however, were but

miserable consolations for the loss of liberty, for being deprived of the use of arms, for being overawed by mercenary soldiers, kept in pay to restrain them, and for being delivered over to rapacious governors, who plundered them without mercy.

The Roman empire, now stretched out to such an extent, had lost its spring and force. It contained within itself the seeds of dissolution; and the violent irruptions of the Goths, Vandals, Huns, and other barbarians, hastened its destruction. These fierce tribes, who came to take vengeance on the empire, either inhabited the various parts of Germany which had never been subdued by the Romans, or were scattered over the vast countries of the north of Europe, and the north-west of Asia, which are now inhabited by the Danes, the Swedes, the Poles, the subjects of the Russian empire, and the Tartars. They were drawn from their native country by that restlessness which actuates the minds of barbarians, and makes them rove from home in quest of plunder or new settlements. The first invaders met with a powerful resistance from the superior discipline of the Roman legions; but this, instead of daunting men of a strong and impetuous temper, only roused them to vengeance. They returned to their companions, acquainted them with the unknown conveniences and luxuries that abounded in countries better cultivated, or blessed with a milder climate, than their own; they acquainted them with the battles they had fought, or the friends they had lost; and warmed them with resentment against their opponents. Great bodies of armed men (says an elegant historian, in describing this scene of desolation), with their wives and children, and slaves, and flocks, issued forth, like regular colonies, in quest of new settlements. New adventurers followed them. The lands which they deserted were occupied by more remote tribes of barbarians. These in their turn pushed forward into more fertile countries; and, like a torrent continually increasing, rolled on, and swept every thing before them. Wherever the barbarians marched, their route was marked with blood. They ravaged or destroyed all around them. They made no distinction between what was sacred and what was profane. They respected no age, or sex, or rank. If a man was called to fix upon the period in the history of the world, during which the condition of the human race was the most calamitous and afflicted, he would, without hesitation, name that which elapsed from the death of Theodosius the Great, A. D. 395, to the establishment of the Lombards in Italy, A. D. 571. The contemporary authors, who beheld that scene of desolation, labour and are at a loss for expressions to describe the horrors of it. *The scourge of God, the destroyer of nations*, are the dreadful epithets by which they distinguish the most noted of the barbarous leaders.

Constantine, who was emperor at the beginning of the fourth century, and who had embraced Christianity, transferred the seat of empire from Rome to Constantinople. The western and eastern A. D. provinces were in consequence separated from each other, and 328. governed by different sovereigns. The withdrawing the Roman legions from the Rhine and the Danube to the east, threw down the western barriers of the empire, and laid it open to the invaders.

Rome (now known by the name of the *Western Empire*, in contradistinction to Constantinople, which, from its situation, was called the *Eastern Empire*;) weakened by this division, became a prey to the barbarous tribes. Its ancient glory, vainly deemed immortal, was effaced; and Odoacer, a barbarian chieftain, was seated on the A. D. throne of the Cæsars. These irruptions into the empire were 476.

gradual and successive. The immense fabric of the Roman empire was the work of many ages; and several centuries were employed in demolishing it. The ancient military discipline of the Romans was so efficacious, that the remains of it, which descended to their successors, must have rendered them superior to their enemies, had it not been for the vices of their emperors, and the universal corruption of manners among the people. Satiated with the luxuries of the known world, the emperors were at a loss to find new provocatives. The most distant regions were explored, the ingenuity of mankind was exercised, and the tribute of provinces expended upon one favourite dish. The tyranny and the universal deprivation of manners that prevailed under the emperors, or, as they are called, Cæsars, could only be equalled by the barbarity of those nations of which the empire at length became the prey.

Towards the close of the sixth century, the Saxons, a German nation, were masters of the southern and more fertile provinces of Britain; the Franks, another tribe of Germans, of Gaul; the Goths, of Spain; the Goths and Lombards, of Italy and the adjacent provinces. Scarcely any vestige of the Roman policy, jurisprudence, arts, or literature, remained. New forms of government, new laws, new manners, new dresses, new languages, and new names of men and countries, were every where introduced.

From this period, till the 15th century, Europe exhibited a picture of most melancholy Gothic barbarity. Literature, science, taste, were words scarcely in use during these ages. Persons of the highest rank, and in the most eminent stations, could not read or write. Many of the clergy did not understand the Breviary, which they were obliged daily to recite; some of them could scarcely read it. The human mind, neglected, uncultivated, and depressed, sunk into the most profound ignorance. The superior genius of Charlemagne, who, in the beginning of the ninth century, governed France and Germany, with part of Italy,—and Alfred the Great in England, during the latter part of the same century,—endeavoured to dispel this darkness, and give their subjects a short glimpse of light. But the ignorance of the age was too powerful for their efforts and institutions. The darkness returned, and even increased; so that a still greater degree of ignorance and barbarism prevailed throughout Europe.

A new division of property gradually introduced a new species of government, formerly unknown; which singular institution is now distinguished by the name of the *Feudal System*. The king or general, who led the barbarians to conquest, parcelled out the lands of the vanquished among his chief officers, binding those on whom they were bestowed to follow his standard with a number of men, and to bear arms in his defence. The chief officers imitated the example of the sovereign, and, in distributing portions of their lands among their dependents, annexed the same condition to the grant; a system admirably calculated for defence against a foreign enemy, but which degenerated into a system of oppression.

The usurpation of the nobles became unbounded and intolerable. They reduced the great body of the people into a state of actual servitude, and deprived them of the natural and most unalienable rights of humanity. They were slaves fixed to the soil which they cultivated, and together with it were transferred from one proprietor to another, by sale or by conveyance. Every offended baron or chieftain buckled on his armour, and sought redress at the head of his vassals. His adversaries

met him in like hostile array. The kindred and dependents of the aggressor, as well as of the defender, were involved in the quarrel. They had not even the liberty of remaining neuter\*.

The monarchs of Europe perceived the encroachments of their nobles with impatience. In order to create some power that might counterbalance those potent vassals, who, while they enslaved the people, controlled or gave laws to the crown, a plan was adopted of conferring new privileges on towns. These privileges abolished all marks of servitude; and the inhabitants of towns were formed into corporations, or bodies politic, to be governed by a council and magistrates of their own nomination.

The acquisition of liberty soon produced a happy change in the condition of mankind. A spirit of industry revived; commerce became an object of attention, and began to flourish.

Various causes contributed to revive this spirit of commerce, and to renew the intercourse between different nations. Constantinople, the capital of the Eastern or Greek empire, had escaped the ravages of the Goths and Vandals, who overthrew that of the West. In this city some remains of literature and science were preserved: this, too, for many ages, was the great emporium of trade; and the crusades, which were begun by the Christian powers of Europe with a view to drive the Saracens from Jerusalem, having opened a communication between Europe and the East, Constantinople was the general place of rendezvous for the Christian armies, in their way to Palestine, or on their return from thence. Though the object of these expeditions was conquest and not commerce, and though the issue of them proved unfortunate, their commercial effects were both beneficial and permanent.

Soon after the close of the holy war, the mariner's compass was invented, which facilitated the communication between remote nations. The Italian states, particularly those of Venice and Genoa, began to establish a regular commerce with the East and the ports of Egypt, and drew from thence all the rich productions of India. These commodities they disposed of to great advantage among the other nations of Europe, who began to acquire some taste of elegance, unknown to their predecessors, or despised by them. During the 12th and 13th centuries the commerce of Europe was almost entirely in the hands of the Italians, more commonly known in those ages by the name of Lombards. Companies or societies of Lombard merchants settled in every different kingdom; they became the carriers, the manufacturers, and the bankers of Europe. One of these companies settled in London; and thence the name of Lombard street was derived.

While the Italians in the south of Europe cultivated trade with such industry and success, the commercial spirit awakened in the north towards the middle of the 13th century. As the Danes, Swedes, and other nations around the Baltic, were at that time extremely barbarous, and infested that sea with their piracies, the cities of Lubeck and Hamburg, soon after they had begun to open some trade with the Italians, entered into a league of mutual defence. They derived such advantages from this union, that other towns acceded to their confederacy; and, in a short time, eighty of the most considerable cities, scattered

\* This Gothic system still prevails in Poland: a remnant of it continued in the Highlands of Scotland to late as the year 1748. And even in England, a country renowned for civil and religious liberty, some relics of these Gothic institutions are perceivable at this day.

through those large countries of Germany and Flanders which stretch from the bottom of the Baltic to Cologne on the Rhine, joined in an alliance, called the *Hanseatic League*, which became so formidable, that its friendship was courted and its enmity dreaded by the greatest monarchs. The members of this powerful association formed the first systematic plan of commerce known in the middle ages, and conducted it by common laws enacted in their general assemblies. They supplied the rest of Europe with naval stores, and pitched on different towns, the most eminent of which was Bruges in Flanders, where they established staples, in which their commerce was regularly carried on. Thither the Lombards brought the productions of India, together with the manufactures of Italy, and exchanged them for the more bulky but not less useful commodities of the North.

As Bruges became the centre of communication between the Lombards and Hanseatic merchants, the Flenings traded with both in that city to such extent as well as advantage, as diffused among them a general habit of industry, which long rendered Flanders and the adjacent provinces the most opulent, the most populous, and best cultivated countries in Europe.

Struck with the flourishing state of these provinces, of which he discovered the true cause, Edward III. of England endeavoured to excite a spirit of industry among his own subjects, who, blind to the advantages of their situation, and ignorant of the source from which opulence was destined to flow into their country, totally neglected commerce, and did not even attempt those manufactures, the materials of which they furnished to foreigners. By alluring Flemish artificers to settle in his dominions, as well as by many wise laws for the encouragement and regulation of trade, he gave a beginning to the woollen manufacture of England, and first turned the active and enterprising genius of his people towards those arts which have raised the English to the first rank among commercial nations.

The Christian princes, alarmed at the progress of their inveterate enemies the Turks, endeavoured to gain the friendship and assistance of the khans of Tartary. The Christian embassies were managed chiefly by monks, an active and enterprising set of men, who, impelled by zeal, and undaunted by difficulties and danger, penetrated to the remote courts of those infidels. The English philosopher, Roger Bacon, was so industrious as to collect from their relations and traditions many particulars of the Tartars, which are to be found in Purchas's *Pilgrim*, and other books of travels. The first regular traveller of the monkish kind, who committed his discoveries to writing, was John du Plant Carpin, who, with some of his brethren, about the year 1246, carried a letter from pope Innocent to the great khan of Tartary, in favour of the Christian subjects in that prince's extensive dominions. Soon after this, a spirit of travelling into Tartary and India became general: and it would be no difficult matter to prove that many Europeans, about the end of the fourteenth century, served in the armies of Tamerlane, one of the greatest princes of Tartary, whose conquests reached to the remotest corners of India; and that they introduced into Europe the use of gunpowder and artillery; the discovery made by a German chemist being only partial and accidental.

After the death of Tamerlane, who, jealous of the rising power of the Turk, had checked their progress, the Christian adventurers, upon their return, magnifying the vast riches of the East Indies, inspired their countrymen with a spirit of adventure and discovery, and were the first who suggested the practicability of a passage thither by sea. The Portuguese had been always famous for their ap-

plication to maritime affairs; and to their discovery of the Cape of Good Hope, Great Britain is at this day indebted for her Indian commerce.

The first adventurers contented themselves with short voyages, creeping along the coast of Africa, discovering cape after cape; but by making a gradual progress southward, they, in the year 1497, at length discovered and doubled the extreme cape of that continent, which opened a passage by sea to the eastern ocean, and all those countries known by the names of India, China, and Japan.

While the Portuguese were intent upon a passage to India by the east, Columbus, a native of Genoa, conceived a project of sailing thither by the west. His proposal being condemned by his countrymen as chimerical and absurd, he laid his scheme successively before the courts of France, England, and Portugal, where he had no better success. Such repeated disappointments would have broken the spirit of any man but Columbus. The expedition required expense, and he had nothing to defray it. Spain was now his only resource; and there, after eight years' attendance, he at length succeeded, through the interest of queen Isabella. This princess was prevailed upon to patronise him by the representation of Juan Perez, guardian of the monastery of Rabida. He was a man of considerable learning, and of some credit with queen Isabella; and being warmly attached to Columbus, from his personal acquaintance with him, and knowledge of his merit, he had entered into an accurate examination of that great man's project, in conjunction with a physician settled in his neighbourhood, who was eminent for his skill in mathematical knowledge. This investigation completely satisfied them of the solidity of the principles on which Columbus founded his opinion, and of the probability of success in executing the plan which he proposed. Perez, therefore, so strongly recommended it to queen Isabella, that she warmly entered into the scheme, and even generously offered, to the honour of her sex, to pledge her own jewels, in order to raise as much money as might be required in making preparations for the voyage. But Santangel, another friend and patron of Columbus, immediately engaged to advance the sum that was requisite, that the queen might not be reduced to the necessity of having recourse to that expedient.

Columbus now set sail, anno 1492, with a fleet of three ships, upon one of the most adventurous attempts ever undertaken by man, and in the fate of which the inhabitants of two worlds were interested. In this voyage he had a thousand difficulties to contend with; and his sailors, who were often discontented, at length began to insist upon his return, threatening, in case of refusal, to throw him overboard; but the firmness of the commander, and the discovery of land after a passage of 33 days, put an end to the commotion: From the appearance of the natives he found to his surprise that this could not be the Indies he was in quest of, and that he had accidentally discovered a new world,—of which the reader will find a more circumstantial account in that part of the following work which treats of America.

Europe now began to emerge out of that darkness in which she had been sunk since the subversion of the Roman empire. These discoveries, from which such wealth was destined to flow to the commercial nations of Europe, were accompanied and succeeded by others of A. D. unspeakable benefit to mankind. The invention of printing, the 1440. revival of religion, arts, and sciences, and, lastly, the happy reformation in religion, all distinguish the 15th and 16th centuries as the first æra of modern history. It was in these ages that the powers of Eu-

rope were formed into one great political system, in which each took a station, wherein it has since remained, with less variation than could have been expected after the shocks occasioned by so many internal revolutions, and so many foreign wars, of which we shall give some account in the history of each particular state, in the following work. The great events which happened then have not hitherto exhausted their force. The political principles and maxims then established still continue to operate; and the ideas concerning the balance of power, then introduced or rendered general, still influence, in some degree, the councils of European nations.

Of all the kingdoms of Europe, Great Britain has for a long time enjoyed the greatest degree of prosperity and glory. She ought, therefore, to be the more attentive to preserve so brilliant a pre-eminence. A great empire cannot be continued in a happy situation, but by wisdom and moderation. Without entering into the labyrinth of political disputes, it will be acknowledged that the unhappy contest of Great Britain with the American colonies, and especially the unsuccessful war against the new republic of France, have plunged her into difficulties; her national debt has been profusely augmented; and her taxes enormously increased.

---

## PART III.

### OF THE ORIGIN AND PROGRESS OF RELIGION.

**D**EITY is an awful object, and has ever roused the attention of mankind; but they, being incapable of elevating their ideas to all the sublimity of his perfections, have too often brought down his perfections to the level of their own ideas. This is more particularly true with regard to those nations whose religion had no other foundation but the natural feelings, and more often the irregular passions of the human heart, and who had received no light from heaven respecting this important object. In deducing the history of religion, therefore, we must make the same distinction which we have hitherto observed in tracing the progress of arts, sciences, and civilisation among mankind. We must separate what is human from what is divine.—what had its origin from particular revelations, from what is the effect of general laws, and of the unassisted operations of the human mind.

Agreeably to this distinction, we find, that, in the first ages of the world, the religion of the eastern nations was pure and luminous. It arose from a divine source, and was not then disfigured by human fancies or caprice. In time, however, these began to have their influence; the ray of tradition was obscured: and among those tribes which separated at the greatest distance, and in the smallest numbers, from the more improved societies of men, it was altogether obliterated.

In this situation a particular people were selected by God himself to be the depositories of his law and worship; but the rest of mankind were left to form hypotheses upon these subjects, which were more or less

perfect, according to an infinity of circumstances which cannot properly be reduced under any general heads.

The most common religion of antiquity—that which prevailed the longest, and extended the widest—was POLYTHEISM, or the doctrine of a plurality of gods. The rage of system, the ambition of reducing all the phenomena of the moral world to a few general principles, has occasioned many imperfect accounts, both of the origin and nature of this species of worship. For, without entering into a minute detail, is impossible to give an adequate idea of the subject: and what is said upon it in general must always be liable to many exceptions.

One thing, however, may be observed, that the polytheism of the ancients seems neither to have been the fruit of philosophical speculations, nor of disfigured traditions concerning the nature of the Divinity. It seems to have arisen during the rudest ages of society, while the rational powers were feeble, and while mankind were under the tyranny of imagination and passion. It was built, therefore, solely upon sentiment. As each tribe of men had their heroes, so likewise they had their gods. Those heroes who led them forth to combat, who presided in their councils, whose image was engraven on their fancy, whose exploits were imprinted on their memory, even after death enjoyed an existence in the imagination of their followers. The force of blood, of friendship, of affection, among rude nations, is what we cannot easily conceive: but the power of imagination over the senses is what all men have in some degree experienced. Combine these two causes, and it will not appear strange that the image of departed heroes should have been seen by their companions animating the battle, taking vengeance on their enemies, and performing, in a word, the same functions which they performed when alive. An appearance so unnatural would not excite terror among men unacquainted with evil spirits, and who had not learned to fear any thing but their enemies. On the contrary, it confirmed their courage, flattered their vanity; and the testimony of those who had seen it, supported by the extreme credulity and romantic cast of those who had not, gained an universal assent among all the members of their society. A small degree of reflection, however, would be sufficient to convince them, that, as their own heroes existed after death, the same might also be the case with those of their enemies. Two orders of gods, therefore, would be established;—the propitious and the hostile; the gods who were to be loved, and those who were to be feared. But time, which wears off the impressions of tradition, and the frequent invasions by which the nations of antiquity were ravaged, desolated, or transplanted, made them lose the names and confound the characters of those two orders of divinities, and form various systems of religion, which, though warped by a thousand particular circumstances, gave no small indications of their first texture and original materials. For, in general, the gods of the ancients gave abundant proof of human infirmity. They were subject to all the passions of men; they partook even of their partial affections; and, in many instances, discovered their preference of one race or nation to all others. They did not eat and drink the same substances with men; but they lived on nectar and ambrosia: they had a particular pleasure in smelling the steam of the sacrifices; and they made love with an ardour unknown in northern climates. The rites by which they were worshipped naturally resulted from their character. The most enlightened among the Greeks entertained nearly the same notions of gods and religion as those that are to be met with in

the poems of Hesiod and Homer; and Anaxagoras, who flourished before Christ 430 years, was the first, even in Greece, that publicly announced the existence of one Creator and Governor of the universe.

It must be observed, however, that the religion of the ancients was not much connected either with their private behaviour or with their political arrangements. If we except a few fanatical societies, whose principles do not fall within our plan, the greater part of mankind were extremely tolerant in their principles. They had their own gods, who watched over them; their neighbours, they imagined, also had theirs: and there was room enough in the universe for both to live together in good fellowship, without interfering or jostling with each other.

The introduction of Christianity, by inculcating the unity of God, by announcing the purity of his character, and by explaining the service he requires of men, produced a total alteration in the religious sentiments and belief of the civilised part of mankind, among whom it rapidly made its way by the sublimity of its doctrine and precepts. It required not the aid of human power; it sustained itself by the truth and wisdom by which it was characterised: but in time it became corrupted by the introduction of worldly maxims, of maxims very inconsistent with the precepts of its divine author, and by the ambition of the clergy.

The management of whatever related to the church being naturally conferred on those who had established it, first occasioned the elevation and then the domination of the clergy; and the exorbitant claims of the bishop of Rome over all the members of the Christian world. It is impossible to describe, within our narrow limits, all the concomitant causes, some of which were extremely delicate, by which this species of universal monarchy was established. The bishops of Rome, by being removed from the control of the Roman emperors, then residing in Constantinople; by borrowing, with little variation, the religious ceremonies and rites established among the heathen world, and otherwise working on the credulous minds of the barbarians, by whom that empire began to be diminished; and, by availing themselves of every circumstance which fortune threw in their way, slowly erected the fabric of their antichristian power, at first an object of veneration, and afterwards of terror, to all temporal princes. The causes of its happy dissolution are more palpable, and operated with greater activity. The most efficacious were the invention of printing, the rapid improvement of arts, government, and commerce, which, after many ages of barbarity, made their way into Europe. The scandalous lives of those who called themselves the "*ministers of Jesus Christ*," their ignorance and tyranny, the desire natural to sovereigns of delivering themselves from a foreign yoke, the opportunity of applying to national objects the immense wealth which had been diverted to the service of the church in every kingdom of Europe, conspired with the ardour of the first reformers, and hastened the progress of the reformation. The unreasonableness of the claims of the church of Rome was demonstrated; many of her doctrines were proved to be equally unscriptural and irrational; and some of her absurd mummeries and superstitions were exposed both by argument and ridicule. The services of the reformers in this respect give them a just claim to our veneration; but, involved as they had themselves been in the darkness of superstition, it was not to be expected that they should be able wholly to free themselves from errors; they still retained an attachment to some absurd doctrines, and preserved too much of the intolerant spirit of the church from which they had separated themselves. With all their defects, they are entitled

to our admiration and esteem; and the reformation, begun by Luther in Germany, in the year 1517; and which took place in England, A. D. 1534; was an event highly favourable to the civil as well as to the religious rights of mankind.

We shall now proceed to the main part of our work, beginning with EUROPE.

## EUROPE.

EUROPE, though the least extensive quarter of the globe (containing, according to Zimmermann\*, 2,627,574 square miles, whereas the habitable parts of the world, in the other quarters, are estimated at 36,000,000 square miles,) is, in many respects, that which most deserves our attention. Here the human mind has made the greatest progress towards improvement; and here the arts, whether of utility or ornament, the sciences both military and civil, have been carried to the greatest perfection. If we except the earliest ages of the world, it is in Europe that we find the greatest variety of character, government, and manners; and from its history we derive the greatest number of facts and memorials, either for our entertainment or instruction.

Geography discovers to us two circumstances with regard to Europe, which perhaps have had a considerable tendency in giving it the superiority over the rest of the world; first, the happy temperature of its climate, no part of it lying within the torrid zone; and secondly, the great variety of its surface. The effect of a moderate climate, both on plants and animals, is well known from experience. The immense number of mountains, rivers, seas, &c. which divide the different countries of Europe from each other, is likewise extremely commodious for its inhabitants. These natural boundaries check the progress of conquest or despotism, which has always been so rapid in the extensive plains of Africa and the East: the seas and rivers facilitate the intercourse and commerce between different nations; and even the barren rocks and mountains are more favourable for exciting human industry and invention, than the natural unsolicited luxuriancy of more fertile soils. There is no part of Europe so diversified in its surface, so interrupted by natural boundaries or divisions, as Greece; and we have seen that it was there the human mind began, to know and to avail itself of its strength; and that many of the arts, subservient to utility or pleasure, were invented, or at least greatly improved. What Greece therefore is with regard to Europe, Europe itself is with regard to the rest of the globe. The analogy may even be carried farther; and it is well deserving our attention. As ancient Greece (for we do not speak of Greece as it is at present, under the despotic government of the Turks) was distinguished, above all the rest of Europe, for the equity of its laws, and the freedom of its political constitutions,—so has Europe in general been remarkable for smaller deviations, at least from the laws of nature and equality, than have been admitted in the other quarters of the world. Though most of the European governments are monarchical, we may discover, on due examination, that there are a thousand little springs, which check the force and soften the rigour of monarchy. In propor-

\* See Zimmermann's Political Survey of Europe, p. 5.

tion to the number and force of these checks, the monarchies of Europe, such as Russia, France, Spain, and Denmark, differ from one another. Besides *monarchies*, in which one man bears the chief sway, there are in Europe *aristocracies* or governments of the nobles, and *democracies* or governments of the people. Venice is an example of the former; Holland, Switzerland, and some states of Italy, afford examples of the latter. There are likewise mixed governments, which cannot be assigned to any one class. Great Britain, which partakes of all the three, is the most singular instance of this kind we are acquainted with. The other mixed governments of Europe are composed only of two of the simple forms, such as Poland, and several states of Italy; all which shall be explained at length in their proper places.

The Christian religion is established throughout every part of Europe, except Turkey; but from the various capacities of the human mind, and the different lights in which speculative opinions are apt to appear, when viewed by persons of different educations and passions, that religion is divided into a number of different sects, but which may be comprehended under three general denominations; 1st, The Greek church; 2d, Popery; and, 3d, Protestantism; which last is again divided into Lutheranism and Calvinism, so called from Luther and Calvin, the distinguished reformers of the sixteenth century.

The languages of Europe are derived from the six following: the Greek, Latin, Teutonic or old German, the Celtic, Slavonic, and Gothic.

#### GRAND DIVISIONS OF EUROPE.

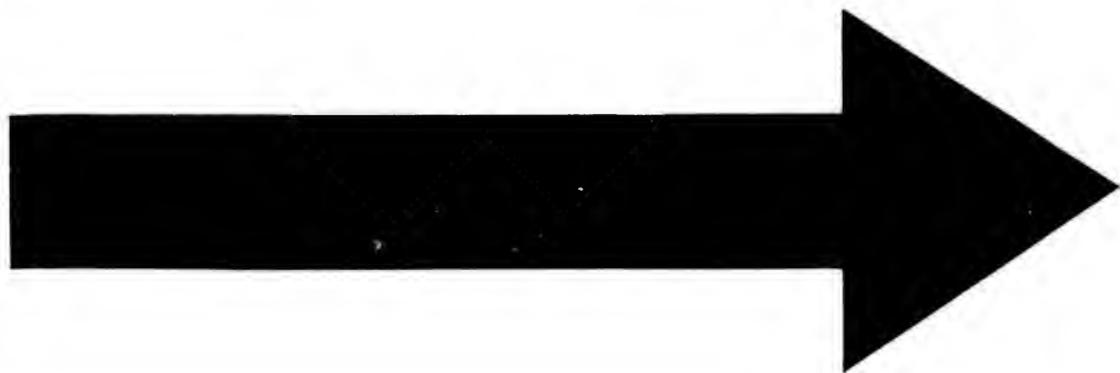

**T**HIS grand division of the earth is situated between the 10th degree west, and the 65th degree east longitude from London, and between the 36th and 72d degree of north latitude. It is bounded on the north by the Frozen Ocean; on the east, by Asia; on the south, by the Mediterranean sea, which divides it from Africa; and on the west, by the Atlantic Ocean, which separates it from America; being 3000 miles long, from Cape St. Vincent in the west, to the mouth of the river Oby in the north-east; and 2500 broad from north to south, from the North Cape in Norway, to Cape Caglia, or Matapan, in the Morea, the most southern promontory in Europe. It contains the following kingdoms and states:

	Kingdoms.
British Empire.	England ..
	Scotland ..
	Ireland ..
	Norway ..
	Denmark ..
	Sweden ..
	Russia ..
	Poland ..

Adriatic, or Gulph of Venice	Lusena, Cbrlu, Cephalonia, Zante, Leucadia . . . . .		Venice.
	Candia, Rhodes, Negropont, Lemnos, Tenedos, Seyros, Mitylene, Scio, Samos, Patmos, Paros, Cefigo, Santorin, &c. being part of ancient and modern Greece . . . . .		Turkey.

\* Minorca was taken from Spain by General Stanhope, 1708, and confirmed to Great Britain by the treaty of Utrecht, 1713, but was besieged and taken by the Spaniards February 15, 1782, and confirmed to them by the definitive treaty of peace, signed at Paris, September 3, 1763. It has since been again taken by the English, November 15, 1798.

DENMARK.

I shall, according to my plan, begin this account of his Danish majesty's dominions with the most northerly situations, and divide them into four parts: 1st, East and West Greenland; Iceland, and the islands in the Atlantic Ocean; 2d, Norway; 3d, Denmark Proper; and, 4th, his German territories.—The dimensions of these countries may be seen in the following table.

-- DENMARK.		Square Miles.	Length.	Breadth.	Chief Cities.
Denmark Proper	North Jutland . . . . .	9,600	150	98	Wyburgh.
	South Jutland, or Slefwick . . . . .	2,115	70	63	Slefwick.

The reader may perceive, that in the preceding table no calculation is made of the dimensions of East and West Greenland; because, in fact, they are not yet known, or known very imperfectly: we shall proceed to give the latest accounts of them, and from the best authorities that have come to our hands.

### EAST AND WEST GREENLAND, ICELAND, AND THE ISLANDS IN THE ATLANTIC OCEAN.

#### EAST GREENLAND;

THE most northerly part of his Danish majesty's dominions, or, as others call it, New Greenland, and the country of Spitzbergen, lies between 11 and 25 deg. E. long. and 76 and 80 deg. N. lat. according to captain Phipps's observations in his voyage, 1773. Though it is now claimed by Denmark, it certainly was discovered by sir Hugh Willoughby in 1553; and is supposed to be a continuation of Old Greenland. It obtained the name of Spitzbergen (or craggy mountains) from the height and ruggedness of its rocks. Few animals or vegetables are to be found here, and the fish and fowl are said to forsake the coast in winter. The Russians of Archangel have, within the last thirty years, formed settlements for hunting in several places of the island of Spitzbergen. The Aurora Borealis, or northern lights, reflected from the snow, enable them to pursue the chase during the long winter's night that reigns in these gloomy regions; and they take a great number of sea-lions, which serve them for food. There is a whale fishery, chiefly prosecuted by the Dutch and British vessels, on its coasts. It likewise contains two harbours; one called South Haven, and the other Maurice Bay. The inland parts are uninhabited.

#### WEST GREENLAND

LIES between the meridian of London, and 53 deg. W. long. and between 60 and 76 deg. N. lat.

INHABITANTS.] By the latest accounts from the missionaries employed for the conversion of the Greenlanders, their whole number does not amount to above 957 constant inhabitants. Mr. Crantz, however, thinks the roving southlanders of Greenland may amount to about 7000. There is a great resemblance, in aspect, manners, and dress, between those people and the Esquimaux Americans, from whom they naturally differ but little, even after all the endeavours of the Danish and German missionaries to convert and civilise them. They are low of stature, few exceeding five feet in height, and the generality are not so tall. The hair of their heads is long, straight, and of a black colour: but they have seldom any beards, because it is their constant practice to root them out. They have high breasts and broad shoulders, especially the women, who are obliged to carry great burdens from their younger years. They are very light and nimble of foot, and can also use their hands with much skill and dexterity. They are not very lively in their tempers; but they are good-humoured, friendly, and unconcerned about futurity. Their most agreeable food is the flesh of rein-deer; but that is now scarce among them; and their best provisions are fish, seals, and sea-fowl. Their drink is clear water, which stands in the house in a large copper vessel, or in a wooden tub, which is very neatly made by them, ornamented with fish-bones and rings, and provided with a pewter ladle or dipping dish. The

men make their hunting and fishing implements, and prepare the wood-work of their boats; and the women cover them with skins. The men hunt and fish: but when they have towed their booty to land, they trouble themselves no farther about it; nay, it would be accounted beneath their dignity even to draw out the fish upon the shore. The women are the butchers and cooks, and also the curriers to dress the pelts, and make cloaths, shoes, and boots, out of them; so that they are likewise both shoemakers and taylors. The women also build and repair the houses and tents, so far as relates to the masonry, the men doing only the carpenters' work. They live in huts during the winter, which is incredibly severe; but Mr. Crantz, who has given us the latest and best accounts of this country, says, that in the longest summer days it is so hot, from the long continuance of the sun's rays, that the inhabitants are obliged to throw off their summer garments. They have no trade, though they have a most improvable fishery upon their coasts; but they employ all the year either in fishing or hunting; in which they are very dexterous, particularly in catching and killing seals.

**CURIOSITIES.]** The taking of whales in the seas of Greenland, among the fields of ice that have been increasing for ages, is perhaps one of the boldest enterprises of man. These fields or pieces of ice are frequently more than a mile in length, and upwards of 100 feet in thickness; and when they are put in motion by a storm, nothing can be more terrible; the Dutch had 13 ships crushed to pieces by them in one season.

There are several kinds of whales in Greenland; some white, and others black. The black sort, the grand bay whale, is in most esteem, on account of his bulk, and the great quantity of fat or blubber he affords, which turns to oil. His tongue is about 18 feet long, inclosed in long pieces of what we call whalebone, which are covered with a kind of hair like horse-hair; and on each side of his tongue are 250 pieces of this whalebone. The bones of his body are as hard as an ox's bones, and of no use. There are no teeth in his mouth; and he is usually between 60 and 80 feet long; very thick about the head; but grows less from thence to the tail.

When the seamen see a whale-spout, the word is immediately given, *a fall! a fall!* when every one hastens from the ship to his boat; six or eight men being appointed to a boat, and four or five boats usually belong to one ship.

When they come near the whale, the harpooner strikes him with his harpoon (a barbed dart), and the monster, finding himself wounded, dives swiftly down into the deep, and would carry the boat along with him if they did not give him line fast enough. To prevent the wood of the boat taking fire by the violent rubbing of the rope on the side of it, one wets it constantly with a mop. After the whale has run some hundred fathoms deep, he is forced to come up for air, when he makes such a terrible noise with his spouting, that some have compared it to the firing of cannon. As soon as he appears on the surface of the water, some of the harpooners fix another harpoon in him, whereupon he plunges again into the deep; and when he comes up a second time, they pierce him with spears in the vital parts, till he spouts out streams of blood instead of water, beating the waves with his tail and fins till the sea is all in a foam, the boats continuing to follow him some leagues, till he has lost his strength: and when he is dying he turns himself upon his back, and is drawn on shore, or to the ship, if they be at a distance from the land. There they cut him in pieces, and, by boiling the blubber, extract the oil, if they have conveniences on shore; otherwise they barrel up the

pieces, and bring them home: the smell of these ships is almost insufferable. Every fish is computed to yield between 60 and 100 barrels of oil, of the value of 3l. or 4l. a barrel. Though the Danes claim the country of East and West Greenland, where these whales are taken, the Dutch have in a manner monopolised this fishery. Of late the English have also been very successful in it.

## ICELAND.

THIS island, which receives its name from the great masses of ice that are seen near it, lies between 63 and 67 deg. N. lat. and between 11 and 27 deg. W. long. It extends four hundred miles in length, and a hundred and sixty in breadth, containing about 46,000 square miles. In April, 1783, the inhabitants of Iceland observed something rising and flaming in the sea, to the south of Grinbourg, at eight miles distance from the rocks des Oiseaux, which afterwards was found to be a new island. The dimensions and situation of this island are not well ascertained; but according to some late information it was still increasing, and great quantities of fire issued from two of its eminences.

POPULATION, INHABITANTS, MANNERS, AND CUSTOMS.] It appears that a Norwegian colony, among which there were many Swedes, settled in Iceland in the ninth century. They found there inhabitants who were Christians, and whom they called *Papas*. It is said that the Norwegians also found among them Irish books, bells, and crosses: and it is conjectured that the people who were there when the Norwegians arrived in the island, originally came from England and Ireland. The inhabitants long retained their freedom; but they were at last obliged to submit to the kings of Norway, and afterward became subject, together with Norway, to the kings of Denmark. They were at first governed by an admiral, who was sent there every year to make the necessary regulations; but that mode has now been changed for many years, and a governor appointed, who is styled *Stjofamtman*, and who constantly resides in the country.

The number of inhabitants in Iceland is computed at about 60,000, which is by no means adequate to the extent of the country. It has been much more populous in former times; but great numbers have been destroyed by contagious diseases. The plague carried off many thousands from 1402 to 1404. Many parts of Iceland have also been depopulated by famine; for though the Icelanders cannot in general be said to be in want of necessary food, yet the country has several times been visited by great famines. These have been chiefly occasioned by the Greenland floating ice, which, when it comes in great quantities, prevents the grass from growing, and puts an entire stop to their fishing. The small-pox has likewise been very fatal here; for in the years 1707 and 1708 that disease destroyed 16,000 persons.

The Icelanders in general are middle-sized, and well made, though not very strong. They are an honest, well-intentioned people, moderately industrious, and are very faithful and obliging. Theft is seldom heard of among them. They are much inclined to hospitality, and exercise it as far as their poverty will permit. Their chief employment is attending to fishing and the care of their cattle. On the coasts the men employ their time in fishing both winter and summer; and the women prepare the fish, and sew and spin. The men also prepare leather, work at several mechanic trades, and some few work in gold and silver. They likewise

manufacture a coarse kind of cloth, which they call Wadmál. They have an uncommonly strong attachment to their native country, and think themselves no where else so happy. An Icelander, therefore, seldom settles in Copenhagen, though the most advantageous conditions should be offered him. Their dispositions are serious, and they are much inclined to religion. They never pass a river, or any other dangerous place, without previously taking off their hats, and imploring the divine protection; and they are always thankful for their preservation when they have passed the danger. When they meet together, their chief pastime consists in reading their history. The master of the house begins, and the rest continue in their turns when he is tired. They are famous for playing at chess; and one of their pastimes consists in reciting verses. Sometimes a man and woman take one another by the hand, and by turns sing stanzas, which are a kind of dialogue, and in which the company occasionally join in chorus. The dress of the Icelanders is not elegant or ornamental, but is neat, cleanly, and suited to the climate. On their fingers the women wear several gold, silver, or brass rings. The poorer women dress in the coarse cloth called Wadmál, and always wear black; those who are in better circumstances wear broad-cloth, with silver ornaments, gilt. The houses of the Icelanders are generally bad: in some places they are built of drift wood, and in others they are raised of lava, with moss stuffed between the lava. Their roofs are covered with sods laid over rafters, or sometimes over ribs of whales, which are both more durable and less expensive than wood. They have not even a chimney in their kitchens, but only lay their fuel on the hearth, between three stones, and the smoke issues from a square hole in the roof. Their food principally consists of dried fish, sour butter, which they consider as a great dainty, milk mixed with water and whey, and a little meat. Bread is so scarce among them, that there is hardly any peasant who eats it above three or four months in the year.

**RELIGION.]** The only religion tolerated in Iceland is the Lutheran. The churches in the east, south, and west quarters of the island, are under the jurisdiction of the bishop of Skalholt (the capital of the island), and those of the north quarter are subject to the bishop of Hoolum. The island is divided into 189 parishes, of which 127 belong to the see of Skalholt, and 62 to that of Hoolum. All the ministers are natives of Iceland, and receive a yearly salary of four or five hundred rix-dollars from the king, exclusive of what they have from their congregations.

**LANGUAGE.]** The language in Iceland is the same as that formerly spoken in Sweden, Denmark, and Norway, and has been preserved so pure, that any Icelander understands their most ancient traditional histories.

**LEARNING AND LEARNED MEN.]** It is said that poetry formerly flourished very much in Iceland; and we are informed that Egil Skallagrímson, Kormack Ormundson, Glum Geirson, and Thorliel Jarlaa, were celebrated as great poets. But the art of writing was not much in use till after the year 1000; though the Runic characters were known in that country before that period, and most probably brought thither from Norway. After the reception of the Christian religion, the Latin characters were immediately adopted, as the Runic alphabet, which only consists of sixteen letters, was found insufficient. The first Icelandic bishop, Isleif, founded a school at Skalholt; and soon after four other schools were founded, in which the youth were instructed in the Latin tongue, divinity, and some parts of theoretic philosophy. From the introduction of the Christian religion here till the year 1264, when Iceland became subject to

Among tion than abounds.

Norway, it was one of the few countries in Europe, and the only one in the North, wherein the sciences were cultivated and held in esteem.

But this period of time seems to have produced more learned men in Iceland than any other period since. It appears from their ancient chronicles, that they had considerable knowledge in morality, philosophy, natural history, and astronomy. Most of their works were written in the 11th, 12th, 13th, and 14th centuries; and some of them have been printed. Mr. Banks, now sir Joseph Banks, presented one hundred and sixty-two Icelandic manuscripts to the British Museum. That gentleman visited Iceland in 1772, accompanied by Dr. Solander, Dr. Van Troil, and Dr. Lind. Dr. Van Troil, who published an account of their voyage, observes, that he found more knowledge among the lower class in Iceland than is to be met with in most other places; that many of them could repeat the works of some of their poets by heart; and that a peasant was seldom to be found, who, besides being well instructed in the principles of religion, was not also acquainted with the history of his own country; which proceeds from the frequent reading of their traditional histories, that being one of their principal amusements.

John Arefon, bishop of Hoolum, employed John Matthieson, a native of Sweden, in establishing a printing press in Iceland about the year 1530; and the first book printed by him there was the *Breviarium Nidarosense*. He also printed an ecclesiastical manual, Luther's catechism, and other books of that kind. The Icelandic code of laws appeared in 1578, and the Icelandic bible in 1584. A new privileged printing-office has lately been established at Hrappsey in this island, at which several valuable books have been printed.

**MOUNTAINS, VOLCANOES, AND NATURAL CURIOSITIES.]** Though this island is situated so far to the north, earthquakes and volcanoes are more known than in many countries in much warmer climates. The former have several times laid the country almost desolate, particularly in the years 1734, 1752, and 1755, when fiery eruptions broke out of the earth and produced very fatal effects. Many of the snowy mountains have also gradually become volcanoes. Of these burning mountains, Heckla is most known to foreigners. This mountain is situated in the southern part of the island, about four miles from the sea-coast, and is divided into three points at the top, the highest of which is that in the middle, which is computed to be above 5000 feet higher than the sea. This mountain has frequently sent forth flames, and a torrent of burning matter. Its eruptions were particularly dreadful in 1693, when they occasioned terrible devastations, the ashes being thrown all round the island to the distance of 180 English miles. An eruption of Mount Heckla happened in 1766. It began on the 5th of April, and continued to the 7th of September following. Flames proceeded from the mountain in December 1771, and 1772; but no streams of lava.

But the greatest of the eruptions of Iceland, and, in fact, the most tremendous of any recorded in history, was that in 1783, which, we are assured, on the authority of Mr. Pennant, extended ninety-four miles in length, and fifty in breadth, dried up twelve rivers, and overwhelmed not only all the villages it found in its way, but likewise many hills. The perpendicular height of the sides of this current was from eighty to a hundred feet, so that the entire surface of the country was in a state of fluidity, and formed a lake of fire, resembling a mass of melted metal.

Among the curiosities of Iceland, none are more worthy of attention than the hot spouting water-springs, with which this island abounds. The hot springs of Aix-la-chapelle, Carlsbad, Bath, and

Switzerland, and several others found in Italy, are considered as very remarkable; but, excepting in the last-mentioned country, the water nowhere becomes so hot as to boil; nor is it any where known to be thrown so high as the hot spouting water-springs in Iceland. All those water-works that have been contrived with so much art, and at so enormous an expense, cannot by any means be compared with these. The water-works at St. Cloud, which are thought the greatest among all the French water-works, cast up a thin column eighty feet in the air; while some springs in Iceland spout columns of water, of several feet in thickness, to the height, as many affirm, of several hundred feet. These springs are of an unequal degree of heat. From some, the water flows gently as from other springs, and it is then called a bath: from others, boiling water spouts with great noise, and it is then called a kettle. Though the degree of heat is unequal, yet Dr. Van Troil says that he does not remember ever to have observed it under 188 of Fahrenheit's thermometer. At Geyser, Rosynum, and Laugarvatn, he found it at 212 (the boiling heat); and in the last place, in the ground, at a little hot current of water, 213 degrees. It is very common for some of the spouting-springs to cease, and others to rise up in their stead. Frequent earthquakes, and subterranean noises, heard at the time, cause great terror to the people who live in the neighbourhood. In several of these hot springs, the inhabitants who live near them boil their victuals, only by hanging a pot, into which the flesh is put in cold water, in the water of the spring. They also bathe in the rivulets that run from them, which, by degrees, become lukewarm, or are cooled by their being mixed with rivulets of cold water. The cows that drink of these springs are said to yield an extraordinary quantity of milk; and they are likewise esteemed very wholesome when drank by the human species.

The largest of all the spouting-springs in Iceland is called Geyser. It is about two days' journey from Heckla, and not far from Skalholt. In approaching towards it, a loud roaring noise is heard, like the rushing of a torrent, precipitating itself from stupendous rocks. The water here spouts several times a-day, but always by starts, and after certain intervals. Some travellers have affirmed that it spouts to the height of sixty fathoms. The water is thrown up much higher at some times than at others; when Dr. Van Troil was there, the utmost height to which it mounted was computed to be 92 feet.

Basaltine pillars are likewise very common in Iceland, which are supposed to have been produced by subterraneous fires. The lower sort of people imagine these pillars to have been piled upon one another by giants, who made use of supernatural force to effect it. They have generally from three to seven sides, and are from four to seven feet in thickness, and from twelve to sixteen yards in length, without any horizontal divisions. In some places they are only seen here and there among the lava in the mountains: but, in some other places, they extend two or three miles in length without interruption.

There are immense masses of ice, by which, every year, great damage is done to this country, and which affect the climate of it; they arrive commonly with a N. W. or N. N. W. wind from Greenland. The field ice is of two or three fathoms thickness, is separated by the winds, and less dreaded than the rock or mountain ice, which is often seen fifty and more feet above water, and is at least nine times the same depth below water. These prodigious masses of ice are frequently left in shoal water, fixed, as it were, to the ground, and in that state remain many months, nay, it is said, even years, undissolved, chilling all the ambient part of the atmosphere for many miles round. masses of ice are floating together, the wood that is often drifted along between them is so much chafed, and pressed with such violence together, that it takes fire; which circumstance has occasioned fabulous accounts of the ice being in flames. The ice caused so violent a cold in 1753, and 1754, that many horses and sheep were killed by it; and, through want of food, horses were observed to feed upon dead cattle, and the sheep to eat of each other's wool. A number of bears arrive yearly with the ice, which commit great ravages, particularly among the sheep. The Icelanders attempt to destroy these intruders as soon as they get sight of them: and sometimes they assemble together, and drive them back to the ice, with which they often float off again. For want of fire-arms, they are obliged to make use of spears on these occasions. The government encourages the natives to destroy these animals, by paying a premium of ten dollars for every bear that is killed. Their skins are also purchased for the king, and are not allowed to be sold to any other person.

It is extraordinary that trees do not thrive in Iceland; nay, there are very few to be found on the whole island, though there are certain proofs that wood formerly grew there in great abundance. Nor can corn be cultivated here to any advantage; though cabbages, parsnips, turnips, and peas, may be met with in five or six gardens, which are said to be all that are in the whole island.

[TRADE.] The commerce of this island is monopolised by a Danish company. The soil upon the sea-coast is tolerably good for pasture; and though there is not any considerable town in the whole island, the Icelanders have several frequented ports. Their exports consist of dried fish, salted mutton and lamb, beef, butter, tallow, train-oil, coarse woolen cloths, stockings, gloves, raw wool, sheep-skins, lamb-skins, fox-skins of various colours, eider-down, and feathers. Their imports consist of timber, fishing-lines and hooks, tobacco, bread, horse-shoes, brandy, wine, salt, linen, and a little silk, exclusive of some necessaries and superfluities for the more wealthy.

[STRENGTH AND REVENUE.] As Iceland affords no incitement for avarice or ambition, the inhabitants depend entirely upon his Danish majesty's protection; and the revenue he draws from the country amounts to about 30,000 crowns a year.

#### THE FARO OR FERRO ISLANDS,

SO called from their lying in a cluster, and the inhabitants ferrying from one island to another. They are about 24 in number, and lie between 61 and 63 deg. N. lat. and 6 and 7 deg. W. long. from London. The space of this cluster extends about 60 miles in length and 40 in breadth, 300 miles to the westward of Norway; having Shetland and the Orkneys on the south-east, and Greenland and Iceland upon the north and north-west. The trade and income of the inhabitants, who may be about 4000 or 5000, add little or nothing to the revenues of Denmark.

#### NORWAY.

Containing 168,400 square miles, with less than 4 inhabitants to each.

NAME, BOUNDARIES, } THE natural signification of Norway is,  
AND EXTENT. } the *Northern-way*. It is bounded on the south by the entrance into the Baltic, called the Scaggerac, or Categac; on the west and north by the Northern Ocean; and on the east is divided from Sweden by a long ridge of mountains, called at different parts by different names; as Fillefield, Dofrefield, Runfield, and Dourfield.

The reader may consult the table of dimensions in Denmark for its extent, which is not, however, well ascertained.

**CLIMATE.]** The climate of Norway varies according to its latitude, and its position toward the sea. At Bergen the winter is moderate, and the sea is practicable. The eastern parts of Norway are commonly covered with snow; and the cold generally sets in about the middle of October, and continues, with intense severity, to the middle of April; the waters being all that time frozen to a considerable thickness. In 1719, 7000 Swedes, who were on their march to attack Drontheim, perished in the snow, on the mountain which separates Sweden from Norway; and their bodies were found in different postures. But even frost and snow have their conveniences, as they facilitate the conveyance of goods by land. As to the more northern parts of this country, called Finmark, the cold is so intense, that they are but little known. At Bergen the longest day consists of about 19 hours, and the shortest of about five. In summer, the inhabitants can read and write at midnight by the light of the sky; and in the most northerly parts, about midsummer, the sun is continually in view. In those parts, however, in the middle of winter, there is only a faint glimmering of light at noon for about an hour and a half, owing to the reflection of the sun's rays on the mountains. Nature, notwithstanding, has been so kind to the Norwegians, that, in the midst of their darkness, the sky is so serene, and the moon and the aurora borealis so bright, that they carry on their fishery, and work at their several trades in the open air.

The air is so pure in some of the inland parts, that it has been said the inhabitants live so long as to be tired of life, and cause themselves to be transported to a less salubrious air. Sudden thaws, and snow-falls, have, however, sometimes dreadful effects, and destroy whole villages.

**MOUNTAINS.]** Norway is reckoned one of the most mountainous countries in the world; for it contains a chain of unequal mountains, running from south to north; to pass one of which, called the Ardanger, a man must travel about seventy English miles; and to pass others, upwards of fifty. Dofrefield is supposed to be the highest mountain, perhaps, in Europe. The rivers and cataracts which intersect those dreadful precipices, and that are passable only by slight tottering wooden bridges, render travelling in this country very terrible and dangerous; though the government is at the expense of providing, at different stages, houses accommodated with fire, light, and kitchen furniture. Detached from this vast chain, other immense mountains present themselves all over Norway; some of them with reservoirs of water on the top, and the whole forming a most surprising landscape. The activity of the natives in recovering their sheep and goats, when penned up, through a false step, in one of those rocks, is wonderful. The owner directs himself to be lowered down from the top of the mountain, sitting on a cross stick, tied to the end of a long rope; and when he arrives at the place where the creature stands, he fastens it to the same cord, and it is drawn up with himself. The caverns that are to be met with in those mountains are more wonderful than those, perhaps, in any other part of the world, though less liable to observation. One of them, called Dolsteen, was in 1750 visited by two clergymen, who reported, that they proceeded in it till they heard the sea dashing over their heads; that the passage was as wide and as high as an ordinary church, the sides perpendicular, and the roof vaulted; that they descended a flight of natural stairs; but when they arrived at another, they durst not venture to proceed, but returned; and that they consumed two candles going and returning.

**FORESTS.]** The chief wealth of Norway lies in its forests, which furnish foreigners with masts, beams, planks, and boards, and serve beside

for all domestic uses, particularly the construction of houses, bridges, ships, and for charcoal to the founderies. The timber growing here are fir, and pine, elm, ash, yew, benreed (a very curious wood), birch, beech, oak, eel, or alder, juniper, the aspen-tree, the comel or sloe-tree, hazel, elder, and even ebony (under the mountains of Kolen), lime or lindentree, and willows. The furs which Norway receives for timber are very considerable; but the industry of the inhabitants is greatly assisted by the course of their rivers, and the situation of their lakes, which afford them not only the conveniency of floating down their timber, but that of erecting saw-mills, for dividing their large beams into planks and deals. A tenth of all fawed timber belongs to his Danish majesty, and forms no inconsiderable part of his revenue.

**STONES, METALS, AND MINERALS.]** Norway contains quarries of excellent marble, as well as many other kinds of stones; and the magnet is found in the iron mines. The amianthus, or asbestos, of an incombustible nature, the thin fibres of which may be woven into cloth, and cleaned by burning, is likewise found here; as are crystals, granites, amethysts, agate, thunder-stones, and eagle-stones. Gold found in Norway has been coined into ducats. His Danish majesty is now working, to great advantage, a silver mine at Koningsburgh; other silver mines have been found in different parts of the country; and one of the many silver masses that have been discovered, weighing 560 pounds, is to be seen at the Royal Museum at Copenhagen. Lead, copper, and iron mines, are common in this country: one of the copper mines at Roraas is thought to be the richest in Europe. Norway likewise produces quicksilver, sulphur, salt, and coal mines, vitriol, alum, and various kinds of loam; the different manufactures of which bring in a large revenue to the crown.

**RIVERS AND LAKES.]** The rivers and fresh water lakes in this country are well stocked with fish, and navigable for ships of considerable burden. The most extraordinary circumstance attending the lakes is, that some of them contain floating islands, formed by the cohesion of roots of trees and shrubs; and, though torn from the main land, bear herbage and trees. In the year 1702, the noble family seat of Borge, near Fredericstادت, suddenly sunk, with all its towers and battlements, into an abyss a hundred fathoms in depth; and its scite was instantly filled with water, which formed a lake 300 ells in length, and about half as broad. This melancholy accident, by which 14 people and 200 head of cattle perished, was occasioned by the foundation being undermined by the waters of a river.

**UNCOMMON ANIMALS, } All the animals that are natives of Den-**  
**FOWLS, AND FISHES. } mark are to be found in Norway, with an**  
 addition of many more. The wild beasts peculiar to Norway are the elk, the rein-deer, the hare, the rabbit, the bear, the wolf, the lynx, the fox, the glutton, the leming, the ermine, the marten, and the beaver. The elk is a tall ash-coloured animal, its shape partaking at once of the horse and the stag; it is harmless, and in the winter social; and the flesh of it tastes like venison. The rein-deer is a species of stag; but we shall have occasion to mention it more particularly hereafter. The hares are small, and are said to live upon mice in the winter time, and to change their colour from brown to white. The Norwegian bears are strong and sagacious: they are remarkable for not hurting children; but their other qualities are common with the rest of their species in northern countries; nor can we much credit the very extraordinary specimens of their sagacity, recorded by the natives: they are hunted by little dogs;

and some prefer bear hams to those of Westphalia. The Norwegian wolves, though fierce, are shy even of a cow or goat, unless impelled by hunger: the natives are dexterous, in digging traps for them, in which they are taken or killed. The lynx, by some called the goupes, is smaller than a wolf, but as dangerous; they are of the cat kind, and have claws like tigers; they dig under ground, and often undermine sheep-folds, where they make dreadful havoc. The skin of the lynx is beautiful and valuable, as is that of the black fox. White and red foxes are likewise found in Norway, and partake of the nature of that wily animal in other countries; they have a particular way of drawing crabs ashore, by dipping their tails in the water, which the crab lays hold of.

The glutton, otherwise called the eryl, or vielfras, resembles a turn-spit dog, with a long body, thick legs, sharp claws and teeth; his fur, which is variegated, is so valuable, that he is shot with blunt arrows, to preserve the skin unhurt: he is so bold and ravenous, that it is said he will devour a carcase larger than himself, and unburdens his stomach by squeezing himself between two close-standing trees; and that, when taken, he has been even known to eat stone and mortar. The ermine is a little creature; remarkable for its shyness and cleanliness; and its fur forms a principal part even of royal magnificence. There is little difference between the marten and a large brown forest cat, only its head and snout are sharper; it is very fierce, and its bite dangerous. We shall have occasion to mention the beaver in treating of North America.

No country produces a greater variety of birds than Norway. The elks build upon rocks; their numbers often darken the air, and the noise of their wings resembles a storm; their size is that of a large duck; they are an aquatic fowl, and their flesh is much esteemed. No fewer than 30 different kinds of thrushes are found in Norway; with various kinds of pigeons, and several sorts of beautiful wild ducks. The Norwegian cock-of-the-wood is of a black or dark grey colour; his eye resembles that of a pheasant; and he is said to be the largest of all eatable birds. Norway produces two kind of eagles, the land and the sea; the former is so strong, that he has been known to carry off a child of two years old. The sea or fish-eagle is larger than the other; he subsists on aquatic food, and sometimes darts on large fishes with such force, that, being unable to free his talons from their bodies, he is dragged into the water and drowned.

Nature seems to have adapted these aerial inhabitants for the coast of Norway; and industry has produced a species of mankind peculiarly fitted for rendering them serviceable to the human race. These are the birdmen, or climbers, who are amazingly dexterous in mounting the steepest rocks, and bring away the birds and their eggs: the latter are nutritive food, and are parboiled in vinegar; the flesh is sometimes eaten by the peasants, who generally relish it; while the feathers and down form a profitable commodity. Even the dogs of the farmers, in the northern districts, are trained up to be assistants to these birdmen in taking their prey.

The Scandinavian lakes and seas are astonishingly fruitful in most kinds of fish that are found on the sea-coasts of Europe. Stock-fish innumerable are dried upon the rocks without salting. The liac-moren is a species of shark, ten fathoms in length, and its liver yields three casks of train oil. The tuella stynder is an excessively large turbot, which has been known to cover a man who has fallen overboard, to keep him from rising. The season for herring-fishing is announced to the fishermen by the spouting of water from the whales while following the herring shoals. Of the whale seven species have been remarked: the

large whale resembles a cod; has small eyes, a dark marbled skin, and white belly; they spout on the water, which they take in by inspiration, through two holes or openings in the head. They copulate like land animals, standing upright in the sea. A young whale, when first produced, is about nine or ten feet long; and the female sometimes brings forth two at a birth. The whale devours such an incredible number of small fish, that his belly is often ready to burst; in which case he makes a most tremendous noise, from pain. The smaller fish have their revenge; some of them fasten on his back, and incessantly beat him; others, with sharp horns, or rather bones, on their beak, swim under his belly, and sometimes rip it up; some are provided with long sharp teeth, and tear his flesh. Even the aquatic birds of prey declare war against him when he comes near the surface of the water; and he has been known to be so tortured, that he has beat himself to death on the rocks. The coast of Norway may be said to be the native country of herrings. Innumerable shoals come from under the ice near the north pole, and, about the latitude of Iceland, divide themselves into three bodies. One of these supplies the western isles and coasts of Scotland; another directs its course round the eastern part of Great Britain, down the Channel, and the third enters the Baltic through the Sound. They form great part of the food of the common people; and the cod, ling, kabeliau, and torck fishes follow them, to feed upon their spawn, and are taken in prodigious numbers, in 50 or 60 fathoms water: these, especially their roes, and the oil extracted from their livers, are exported and sold to great advantage; and above 150,000 people are maintained by the herring and other fishing on the coast of Norway. The sea-devil is about six feet in length, and is so called from its monstrous appearance and voracity. The sea-scorpion is likewise of a hideous form, its head being larger than its whole body, which is about four feet in length; and its bite is said to be poisonous.

The fabulous sea-monsters of antiquity are all equalled if not exceeded by the wonderful animals, which, according to some modern accounts, inhabit the Norwegian seas. Among these, the sea-snake, or serpent of the ocean, is one of the most remarkable, and perhaps the best attested. In 1756, one of them, it is said, was shot by a master of a ship; its head resembled that of a horse; the mouth was large and black, as were the eyes; a white mane hung from its neck; it floated on the surface of the water, and held its head at least two feet out of the sea. Between the head and neck were seven or eight folds, which were very thick; and the length of this snake was more than a hundred yards, some say, fathoms. They are said to have a remarkable aversion to the smell of castor; for which reason, ship, boat, and bark masters provide themselves with quantities of that drug, to prevent being overtaken; the serpent's olfactory nerves being remarkably exquisite. The particulars related of this animal, however incredible, have been attested upon oath. Egede (a very reputable author) says, that on the 6th day of July, 1734, a large and frightful sea-monster raised itself so high out of the water, that its head reached above the main-top-mast of the ship; that it had a long sharp snout, broad paws, and spouted water like a whale; and that the body seemed to be covered with scales; the skin was uneven and wrinkled, and the lower part was formed like a snake. The body of this monster is said to be as thick as a hoghead; his skin variegated like a tortoise-shell; and his excrement, which floats on the surface of the water, to be corrosive, and blister the hands of the seamen if they handle it.

The existence of the kraken, or korken, is likewise strongly asserted

it is said to be a mile and a half in circumference; and that when part of it appears above the water, it resembles a number of small islands and sand-banks, on which fishes sport, and sea-weeds grow; upon his farther emerging, a number of pellucid antennæ, each about the height, form, and size of a moderate mast, appear; by the action and re-action of which he gathers his food, consisting of small fishes. When he sinks, which he does gradually, a dangerous swell of the sea succeeds, and a kind of whirlpool is naturally formed in the water. In 1680, we are told, a young kraken perished among the rocks and cliffs of the parish of Alstahong; and his death was attended with such a stench, that the channel where he died was impassable.

The mer-men and mer-women are likewise said to have their residence in the Norwegian seas; but it is not easy to give credit to all that is related concerning them by the natives. The mer-man is about eight spans long, and is described as bearing nearly the same resemblance as an ape does to the human species. It has a high forehead, little eyes, a flat nose, and large mouth, without chin or ears; its arms are short, but without joints or elbows, and they terminate in members resembling a human hand, but of the paw kind, and the fingers connected by a membrane. The parts of generation indicate their sexes; though their under parts, which remain in the water, terminate like those of fishes. The females have breasts, at which they suckle their young ones.

**CURIOSITIES.]** Those of Norway are only natural. On the coast, latitude 67, is that dreadful vortex or whirlpool, called by navigators the Navel of the Sea, and by some *Malestrom*, or *Moskoestrom*. The island *Moskoe*, from whence this stream derives its name, lies between the mountain *Hesleggen* in *Lofoden*, and the island *Ver*, which are about one league distant; and between the island and coast on each side, the stream makes its way. Between *Moskoe* and *Lofoden* it is near 400 fathoms deep; but between *Moskoe* and *Ver*, it is so shallow as not to afford passage for a small ship. When it is flood, the stream runs up the country between *Lofoden* and *Moskoe* with a boisterous rapidity; and at ebb, returns to the sea with a violence and noise unequalled by the loudest cataracts. It is heard at the distance of many leagues, and forms a vortex or whirlpool of great depth or extent, so violent, that if a ship comes near it, it is immediately drawn irresistibly into the whirl, and there disappears, being absorbed and carried down to the bottom in a moment, where it is dashed to pieces against the rocks; and just at the turn of ebb and flood, when the water becomes still for about a quarter of an hour, it rises again in scattered fragments, scarcely to be known for the parts of a ship. When it is agitated by a storm, it has reached vessels at the distance of more than a Norway mile, where the crews have thought themselves in perfect security. Perhaps it is hardly in the power of fancy to conceive a situation of more horror than that of being thus driven forward by the sudden violence of an impetuous torrent to the vortex of the whirlpool, of which the noise and turbulence, still increasing as it is approached, are an earnest of quick and inevitable destruction; while the wretched victims, in an agony of despair and terror, cry out for that help which they know to be impossible, and see before them the dreadful abyss into which they are to be plunged, and dashed among the rocks at the bottom.

Even animals, which have come too near the vortex, have expressed the utmost terror when they found the stream irresistible. Whales are frequently carried away; and the moment they feel the force of the water, they struggle against it with all their might, howling and bellow-

ing in a frightful manner. The like happens frequently to bears, who attempt to swim to the island to prey upon the sheep.

It was the opinion of Kircher, that the Malestrom is a sea vortex, which attracts the flood under the shore of Norway, and discharges it again in the Gulf of Bothnia; but this opinion is now known to be erroneous, by the return of the shattered fragments of whatever happens to be sucked down by it. The large stems of firs and pines rise again so shivered and splintered that the pieces look as if covered with bristles. The whole phenomena are the effects of the violence of the daily ebb and flow, occasioned by the contraction of the stream in its course between the rocks.

PEOPLE, LANGUAGE, RELIGION, } The Norwegians are a people  
AND CUSTOMS OF NORWAY. } of an intermediate character between the simplicity of the Greenlanders and Icelanders, and the more polished manners of the Danes. Their religion is Lutheran; and they have bishops, as those of Denmark, without temporal jurisdiction. Their viceroys, like his master, is absolute: but the farmers and common people in Norway are much less oppressed than those in Denmark.

The Norwegians in general are strong, robust, and brave; but quick in resenting real or supposed injuries. The women are handsome and courteous; and the Norwegian modes of living greatly resemble those of the Saxon ancestors of the present English. Every inhabitant is an artisan, and supplies his family in all its necessaries with his own manufactures; so that in Norway there are few who are by profession haters, shoe-makers, tailors, tanners, weavers, carpenters, smiths, or joiners. The lowest Norwegian peasant is an artist and a gentleman, and even a poet. They often mix with oat-meal the bark of the fir, made into a kind of flour; and they are reduced to very extraordinary shifts for supplying the place of bread or farinaceous food. The middling Norwegians lead that kind of life which we may say is furnished with plenty; but they are neither fond of luxury, nor do they dread penury; and this middle state prolongs their lives surprisngly. Though their dress is in many respects accommodated to their climate, yet, by custom, instead of guarding against the inclemency of the weather, they out-brave it; for they expose themselves to cold, without any covering upon their breasts or necks. A Norwegian of a hundred years of age is not accounted past his labour; and, in 1733, four couples were married, and danced before his Danish majesty at Fredericshall, whose ages, when joined, exceeded 800 years.

The funeral ceremonies of the Norwegians contain vestiges of their former paganism: they play on the violin at the head of the coffin, and while the corpse is carried to the church, which is often done in a boat. In some places the mourners ask the dead person, why he died? whether his wife and neighbours were kind to him? and other such questions; frequently kneeling down and asking forgiveness, if ever they had offended him.

COMMERCE.] We have little to add to this head, different from what will be observed in our account of Denmark. The duties on their exports, most of which have been already recounted, amount to about 100,000 rix-dollars a year.

STRENGTH AND REVENUE.] By the best calculations, Norway can furnish out 14,000 excellent seamen, and above 30,000 brave soldiers, for the service of their king. The royal annual revenue from Norway amounts to near 200,000*l.*; and, till his present majesty's accession, the army, instead of being expensive, added considerably to his income, by the subsidies it drew from foreign princes,

**HISTORY.]** We must refer to Denmark likewise for this head. The ancient Norwegians certainly were a very brave and powerful people, and the hardiest seamen in the world. If we may believe their histories, they were no strangers to America long before it was discovered by Columbus. Many customs of their ancestors are yet discernible in Ireland and the north of Scotland, where they made frequent descents, and some settlements, which are generally confounded with those of the Danes. From their being the most turbulent, they are become now the most loyal subjects in Europe: their former character is no doubt to be ascribed to the barbarity and tyranny of their kings, when a separate people. Since the union of Calmar, which united Norway to Denmark, their history, as well as interests, are the same with those of Denmark.

Containing 15,744 square miles, with 139 inhabitants to each.	

**BOUNDARIES AND DIVISIONS.]** IT is divided on the north from Norway by the Scaggerac Sea, and from Sweden on the east by the Sound; it is bounded on the south by Germany and the Baltic; and the German Sea divides it from Great Britain on the west.

Denmark Proper is divided into two parts; the peninsula of Jutland, anciently called *Cheersonesus Cimbrica*, and the islands at the entrance of the Baltic mentioned in the table. It is remarkable, that, though all these together constitute the kingdom of Denmark, yet not any one of them is separately called by that name. Copenhagen, the metropolis, is in the island of Zealand.

**ATR, CLIMATE, SOIL, STATE OF AGRICULTURE, &c.]** One of the largest and most fertile of all the provinces of this kingdom is Jutland, which produces abundance of all sorts of grain and pasturage, and is a kind of magazine for Norway on all occasions. A great number of small cattle are bred in this province, and afterwards transported into Holstein, to be fed for the use of Hamburg, Lubeck, and Amsterdam. Jutland is every where interspersed with hills, and on the east side has fine woods of oak, fir, beech, birch, and other trees; but the west side being less woody; the inhabitants are obliged to use turf and heath for fuel. Zealand is for the most part a sandy soil, but rather fertile in grain and pasturage, and agreeably variegated with woods and lakes of water. The climate is more temperate here, on account of the vapours from the surrounding sea, than it is in many more southerly parts of Europe. Spring and autumn are seasons scarcely known in Denmark, on account of the sudden transitions from cold to heat, and from heat to cold, which distinguish the climate of this kingdom. In all the northern provinces of Denmark, the winters are very severe, so that the inha-

\* See Mallet's Denmark, p. 1, to 13, vol. v.

† Meaning where longest and broadest,—a method which the author has every where observed; and it seems to be the practice of other writers on the subject. Great allowances must therefore be made in most countries, as the readers will perceive by looking on the maps. Jutland, for instance, is 114 miles where broadest, though in sundry other parts it is not 30.

bitants often pass arms of the sea in sledges upon the ice; and during the winter all the harbours are frozen up.

The greatest part of the lands in Denmark and Holstein are fiefs; and the ancient nobility, by grants which they extorted at different times from the crown, gained such power over the farmers, and those who resided upon their estates, that at length they reduced them to a state of extreme slavery, so that they were bought and sold with their lands, and were esteemed the property of their lords. Many of the noble landholders of Sleswick and Holstein have the power of life and death. The situation of the farmers has, indeed, been made somewhat more agreeable by some modern edicts; but they are still, if such an expression may be allowed, chained to their farms, and are disposed of at the will of their lords. When a farmer in Denmark or Holstein happens to be an industrious man, and is situated upon a poor farm, which by great diligence he has laboured to cultivate advantageously, as soon as he has performed the toilsome task, and expects to reap the profits of what he has sown, his landlord, under pretence of taking it into his own hands, removes him from that farm to another of his poor farms, and expects that he should perform the same laborious task there, without any other emolument than what he may think proper to give him. This has been so long the practice in this country, that it necessarily throws the greatest damp upon the efforts of industry, and prevents those improvements in agriculture which would otherwise be introduced: the consequence of which is, that nine parts in ten of the inhabitants are in a state of great poverty. But if the farmers had a security for their property, the lands of Denmark might have been cultivated to much greater advantage than they are at present, and a much greater number of people supported by the produce of agriculture.

ANIMALS.] Denmark produces an excellent breed of horses, both for the saddle and carriage; about 5000 are sold annually out of the country, and of the horned cattle, 30,000. Besides numbers of black cattle, they have sheep, hogs, and game; and the sea coasts are generally well supplied with fish.

POPULATION, MANNERS, AND CUSTOMS.] By an actual enumeration made, in 1759, of his Danish majesty's subjects in his dominions of Denmark, Norway, Holstein, the islands in the Baltic, and the counties of Oldenburgh and Delmenhorst in Westphalia, they were said to amount to 2,444,000 souls, exclusive of the Icelanders and Greenlanders. The most accurate account of the population is that made under the direction of the famous Struensee; by which,

Sum total 2,017,027

Several of the smaller islands included in the district of Fionia, which may contain a few thousands, are omitted in this computation.

However disproportioned this number may seem to the extent of his Danish majesty's dominions, yet, every thing considered, it is far greater than could have been expected from the uncultivated state of his possessions. But the trade of Denmark has been so shackled by the corruption and arbitrary proceedings of its ministers, and the merchants are so terrified by the despotism of the government, that this kingdom, which

might be rendered rich and flourishing, is at present one of the most indigent and distressed states in Europe; and these circumstances prevent Denmark from being so populous as it otherwise would be, were the administration of government more mild and equitable, and proper encouragement given to foreigners, and to those who engage in agricultural and other arts.

The ancient inhabitants of Denmark possessed a degree of courage which approached even to ferocity; but, by a continual series of tyranny and oppression, their national character is much changed, and from a brave, enterprising, and warlike people, they are become indolent, timid, and dull of apprehension. They value themselves extremely upon those titles and privileges which they derive from the crown, and are exceedingly fond of pomp and show. They endeavour to imitate the French in their manners, dress, and even in their gallantry; though they are naturally the very contrast of that nation. The Danes, like other northern nations, are given to intemperance in drinking, and convivial entertainments; but their nobility, who begin now to visit the other courts of Europe, are refining from their provincial habits and vices.

**RELIGION.]** The religion of Denmark is Lutheran; and the kingdom is divided into six dioceses: one in Zealand, one in Funen, and four in Jutland; besides four in Norway, and two in Iceland. These dioceses are governed by bishops, whose duty it is to superintend the other clergy; nor have they any other mark of pre-eminence than a distinction in their ecclesiastical dress; for they have neither cathedrals nor ecclesiastical courts, nor the smallest concern with civil affairs: their morals, however, are so good, that they are revered by the people. They are paid by the state, the church lands having been appropriated to the government at the reformation.

**LANGUAGE AND LEARNING.]** The language of Denmark is a dialect of the Teutonic; but High Dutch and French are spoken at court; and the nobility have lately made great advances in the English, which is now publicly taught at Copenhagen as a necessary part of education. A company of English comedians occasionally visit that capital, where they find tolerable encouragement.

The university of Copenhagen has funds for the gratuitous support of 328 students: these funds are said to amount to 300,000 rix-dollars. But the Danes in general have made no great figure in literature; though astronomy and medicine are highly indebted to their Tycho Brahe, Borrichius, and the Bartholines: and the Round Tower and Christian's Haven display the mechanical genius of a Longomontanus. They begin now, however, to make some promising attempts in history, poetry, and the drama. But it appears, that, in general, literature receives very little countenance or encouragement in Denmark; which may be considered as the principal cause of its being so little cultivated by the Danes.

**CITIES AND CHIEF BUILDINGS.]** Copenhagen, which is situated on the fine island of Zealand, was originally a settlement of sailors, and first founded by some wandering fishermen in the twelfth century, but is now the metropolis, and makes a magnificent appearance at a distance. It is very strong, and defended by four royal castles or forts. It contains ten parish churches, besides nine others belonging to the Calvinists and other persuasions, and some hospitals. Copenhagen is adorned by some public and private palaces, as they are called. Its streets are 186 in number: and its inhabitants amount to 100,000. The houses in the principal streets are built of brick, and those in the lanes chiefly of timber. Its

iversity has been already mentioned. But the chief glory of Copenhagen is its harbour, formed by a large canal flowing through the city, which admits only one ship to enter at a time, but is capable of containing 500. Several of the streets have canals, and quays for ships to lie close to the houses; and its naval arsenal is said to exceed that of Venice. The road for shipping begins about two miles from the town, and is defended by 90 pieces of cannon, as well as the difficulty of the navigation. Yet, notwithstanding all these advantages, there is little appearance of industry or trade in this city; and Copenhagen, though one of the finest ports in the world, cannot boast of its commerce. The public places are filled with officers either in the land or sea service; and the number of forces kept up is much too large for this little kingdom. The police of Copenhagen is extremely regular, and people may walk through the whole city at midnight with great safety. Indeed, it is usually almost as quiet here at eleven o'clock at night as in a country village.

The royal palace of Christiansburg, one of the most commodious and most sumptuously furnished in Europe, was built in the reign of Christian VI. and is said to have cost, in building only, considerably above a million sterling; but this palace was reduced to a heap of ashes by a dreadful fire, which happened on the 26th of February 1794. The royal library, which stood detached from the principal pile, and contained between two and three hundred thousand volumes, was, however, fortunately preserved. The finest palace belonging to his Danish majesty lies about twenty English miles from Copenhagen, and is called Fredericksburgh. It is a very large building, moated round with a triple ditch, and calculated, like most of the ancient residences of princes, for defence against an enemy. It was built by Christian IV. and, according to the architecture of the times, partakes of the Greek and Gothic styles. In the front of the grand quadrangle appear Tuscan and Doric pillars; and on the summit of the building are spires and turrets. Some of the rooms are very splendid, though furnished in the antique taste. The knights' hall is of great length. The tapestry represents the wars of Denmark, and the ceiling is a most minute and laboured performance in sculpture. The chimney-piece was once entirely covered with plates of silver, richly ornamented; but the Swedes, who have often landed here, and even besieged the capital, tore them all away, and rifled the palace, notwithstanding its triple moat and formidable appearance. About two miles from Elfsineur is another small royal palace, flat roofed, with twelve windows in front, said to be built on the place formerly occupied by the palace of Hamlet's father. In an adjoining garden is shown the very spot where, according to tradition, that prince was poisoned.

Jagersburg is a park which contains a royal country seat, called the Hermitage, remarkable for the disposition of its apartments and the quaintness of its furniture, particularly a machine which conveys the dishes to and from the king's table in the second story. The chief ecclesiastical building in Denmark is the cathedral of Roschild, where the kings and queens of Denmark were formerly buried, and their monuments still remain. Joining to this cathedral, by a covered passage, is a royal palace, built in 1733.

Elfsineur is well built, contains 5000 inhabitants, and, with respect to commerce, is only exceeded by Copenhagen. It is strongly fortified on the land side, and towards the sea is defended by a strong fort, con-

taining several batteries of long cannon. Here all vessels pay a toll, and, in passing, lower their top-sails.

**COMMERCE.]** Denmark is extremely well situated for commerce; her harbours are well calculated for the reception of ships of all burdens, and her mariners are very expert in the navigation of the different parts of the ocean. The dominions of his Danish majesty also supply a great variety of timber and other materials for ship-building; and some of his provinces afford many natural productions for exportation. Among these, beside fir and other timber, are black cattle, horses, butter, stock-fish, tallow, hides, train-oil, tar, pitch, and iron, which being the natural product of the Danish dominions, are consequently ranked under the head of exports. To these we may add furs; but the exportation of oats is forbidden. The imports are, salt, wine, brandy, and silk, from France, Portugal, and Italy. Of late the Danes have had great intercourse with England, and from thence they import broad-cloths, clocks, cabinet, lock-work, and all other manufactures carried on in the great trading towns of England; but nothing shows the commercial spirit of the Danes in a more favourable light than their establishments in the East and West Indies.

In 1612, Christian IV. of Denmark established an East India company at Copenhagen: and soon after four ships sailed from thence to the East Indies. The hint of this trade was given to his Danish majesty by James I. of England, who married a princess of Denmark; and, in 1617, they built and fortified a castle and town at Tranquebar, on the coast of Coromandel. The security which many of the Indians found under the cannon of this fort invited numbers of them to settle here; so that the Danish East India company were soon rich enough to pay their king a yearly tribute of 10,000 rix-dollars. The company, however, willing to become rich all of a sudden, in 1620 endeavoured to possess themselves of the spice trade at Ceylon, but were defeated by the Portuguese. The truth is, they soon embroiled themselves with the native Indians on all hands: and had it not been for the generous assistance given them by Mr. Pitt, an English East India governor, the settlement at Tranquebar must have been taken by the Rajah of Tanjore. Upon the close of the wars in Europe, after the death of Charles XII. of Sweden, the Danish East India company found themselves so much in debt, that they published proposals for a new subscription for enlarging their ancient capital stock, and for fitting out ships to Tranquebar, Bengal, and China. Two years after, his Danish majesty granted a new charter to his East India company, with vast privileges; and for some time its commerce was carried on with great vigour. The Danes likewise possess the islands of St. Thomas and St. Croix, and the small island of St. John, in the West Indies, which are free ports, and notorious for smuggling; also the fort of Christianburg on the coast of Guinea. They also carry on a considerable commerce with the Mediterranean.

**CURIOSITIES, NATURAL AND ARTIFICIAL.]** Denmark Proper affords fewer of these than the other parts of his Danish majesty's dominions, if we except the contents of the Royal Museum at Copenhagen, which consists of a numerous collection of both. It contains several good paintings, and a fine collection of coins, particularly those of the consuls in the time of the Roman republic, and of the emperors after the seat of empire was divided into the East and West. Besides artificial skeletons, ivory carvings, models, clock-work, and a beautiful cabinet

of ivory and ebony, made by a Danish artist who was blind, here are to be seen two famous antique drinking vessels; the one of gold, the other of silver, and both of the form of a hunting horn; that of gold seems to be of pagan manufacture; and from the raised hieroglyphical figures on its outside, it probably was made use of in religious ceremonies; it is about two feet nine inches long, weighs 102 ounces, contains two English pints and a half, and was found in the diocese of Ripen, in the year 1639. The other, of silver, weighs about four pounds, and is termed *Cornu Oldenburgicum*; they say it was presented to Otho I. duke of Oldenburg, by a ghost. Some, however, are of opinion that this vessel was made by order of Christian I. king of Denmark, the first of the Oldenburg race, who reigned in 1448. Several vessels of different metals, and the same form, have been found in the north of England, and are probably of Danish original. This museum is likewise furnished with a prodigious number of astronomical, optical, and mathematical instruments, some Indian curiosities, and a set of medals, ancient and modern. Many curious astronomical instruments are likewise placed in the round tower at Copenhagen, which is so contrived that a coach may drive to its top. The village of Anglen, lying between Flensburg and Sleswick, is also esteemed a curiosity, as giving its name to the Angles, or Anglo-Saxon inhabitants of Great-Britain, the ancestors of the greater part of the modern English.

Perhaps, however, the greatest rarities in his Danish majesty's dominions are those ancient inscriptions upon rocks, that are mentioned by antiquaries and historians, and are generally thought to exhibit the old and original manner of writing, before the use of paper of any kind, or waxen tablets, were known. These characters are Runic, and so imperfectly understood by the learned themselves, that their meaning is very uncertain; but they are imagined to be historical. Stephanus, in his notes upon Saxo Grammaticus, has given specimens of several of these inscriptions.

CIVIL CONSTITUTION, GOVERNMENT, AND LAWS. } The ancient constitution of Denmark was originally much the same with that of other Gothic governments. The king came to the throne by election; and, in conjunction with the senate, where he presided, was invested with the executive power. He likewise commanded the army, and decided finally all the disputes which arose between his subjects. The legislative power, together with the right of election of the king, was vested in the states, who were composed, first, of the order of nobility, and secondly, of that of the citizens and farmers. After the Christian religion had gained ground in the North, the clergy were also admitted, not only to be an order of the states, but to have seats likewise in the senate. These orders had their respective rights and privileges, and were independent of each other. The crown had also its prerogatives, and a certain fixed revenue arising out of lands which were appropriated to its support. This constitution had many evident advantages: but, unfortunately, the balance of this government was never properly adjusted; so that the nobles very soon assumed a dictatorial power, and greatly oppressed the people, as the national assemblies were not regularly held to redress their grievances; and when the Roman-catholic clergy came to have a share in the civil government, they far surpassed the nobility in pride and ambition. The representatives of the people had neither power, credit, nor talents, to counteract the efforts of the other two orders, who forced the crown to give up its prerogatives, and to oppress and tyrannise over the people. Christian the Second, by endeavour-

ing in an imprudent manner to stem the torrent of their oppression, lost his crown and his liberty; but Christian the Third, by uniting himself with the nobles and the senate, destroyed the power of the clergy, though the oppression of the common people by the nobility still remained. At length, in the reign of Frederic the Third, the people, instead of exerting themselves to remedy the defects of the constitution, and to maintain their common liberties, were so infuriated as to make the king despotic, in hopes to render themselves less subject to the tyranny of the nobility. A series of unsuccessful wars had brought the nation in general into so wretched a condition, that the public had not money for paying off the army. The dispute came to a short question, which was, that the nobles should submit to taxes, from which they pleaded an exemption. The inferior people upon this threw their eyes towards the king, for relief and protection from the oppressions of the intermediate order of nobility; and in this they were encouraged by the clergy. In a meeting of the states, it was proposed that the nobles should bear their share in the common burdens. Upon this, Otto Craeg reminded the people that the commons were no more than *slaves* to the lords.

This was the watch-word which had been concerted between the leaders of the commons, the clergy, and even the court itself. Naufon, the speaker of the commons, exclaimed at the term *slavery*; the assembly broke up in a ferment; and the commons, with the clergy, withdrew to a house of their own, where they resolved to make the king a solemn tender of their liberties and services, and formally to establish in his family the hereditary succession to their crown. This resolution was executed the next day. The bishop of Copenhagen officiated as speaker for the clergy and commons. The king accepted of their tender, promising them relief and protection. The gates of Copenhagen were shut; and the nobility, thus surpris'd, were compelled reluctantly to submit.

On the 10th of January, 1661, the three orders of nobility, clergy, and people, signed each a separate act, by which they consented that the crown should be hereditary in the royal family, as well in the female as in the male line, and invested the king with absolute power, giving him the right to regulate the succession, and the regency, in case of a minority. This renunciation of their right, subscribed by the first nobility, is still preserved as a precious relic among the archives of the royal family.

After this extraordinary revolution in the government, the king of Denmark divested the nobility of many of the privileges which they had before enjoyed; but he took no method to relieve those poor people who had been the instruments of investing him with the sovereign power, but left them in the same state of slavery in which they were before, and in which they have remained to the present age. The king united in his person all the rights of sovereign power; but as he could not exercise all by himself, he was obliged to intrust some part of the executive power to his subjects. The supreme court of judicature for the kingdoms of Denmark and Norway is holden in the royal palace of Copenhagen, of which the king is the nominal president. What they call the German provinces have likewise their supreme tribunal; which, for the duchy of Holstein, is holden at Gluckstadt; and for the duchy of Sleswick, in the town of that name.

In affairs of importance, the king for the most part decides in his council, the members of which are named and displaced at his will. In this council, the laws are proposed, discussed, and receive the sanction of the royal authority, and all great changes or establishments are proposed,

and approved he grants protection, or

and approved or rejected by the king. Here likewise, or in the cabinet, he grants privileges, and decides upon the explication of laws, their extension, or restriction, and upon all the most important affairs of state.

In this kingdom, as in many others, the king is supposed to be present to administer justice in his supreme court; and, therefore, the kings of Denmark not only preside nominally in the sovereign court of justice, but they have a throne erected in it, towards which the lawyers always address their discourses in pleading, as do the judges in delivering their opinion. Every year the king is present at the opening of this court, and often gives the judges such instructions as he thinks proper. The decision of these judges is final in all civil actions; but no criminal sentence of a capital nature can be carried into execution till it is signed by the king.

There are many excellent regulations for the administration of justice in Denmark; but, notwithstanding this, it is so far from being distributed in an equal and impartial manner, that a poor man can scarcely ever have justice in this country against one of the nobility, or against one who is favoured by the court. If the laws are so clearly in favour of the former, that the judges are ashamed to decide against them, the latter, through the favour of the minister, obtains an order from the king to stop all the law proceedings, or a dispensation from observing particular laws; and there the matter ends. The code of laws at present established in Denmark was published by Christian V. founded upon the code of Valdemar, and all the other codes which have since been published, and is nearly the same with that published in Norway. These laws are very just and clear; and, if they were impartially carried into execution, would be productive of many beneficial consequences to the people. But as the king can alter and dispense with the laws as he pleases, and support his ministers and favourites in any acts of violence and injustice, the people of Denmark are subject to great tyranny and oppression, and have abundant reason to regret the tameness and servility with which their liberties were, in 1600, surrendered into the hands of their monarchs.

From that period, the peasants, till 1787, had been in a situation little better than the brute creation; they scarcely could be said to possess any loco-motive power, since they had no liberty to leave one estate, and to settle on another, without purchasing permission from their masters; and if they chanced to move without that permission, they were claimed as strayed cattle. Such was the state of those wretched beings, who, at best, only might be said to vegetate. These chains of feudal slavery were then broken, through the interest of his royal highness, the prince and heir apparent to the crown; and the prisoners, for such they certainly might be called, were declared free. Notwithstanding the remonstrances, which were made against this by the landed gentry, were very numerous, yet, after a minute examination of the whole, an edict was issued which restores the peasants to their long-lost liberty. A number of grievances, under which the peasantry laboured, were likewise abolished at the same time.

**PUNISHMENTS.]** The common methods of execution in Denmark are beheading and hanging: in some cases, as an aggravation of the punishment, the hand is chopped off before the other part of the sentence is executed. For the most atrocious crimes, such as the murder of a father or mother, husband or wife, and robbery upon the highway, the malefactor is broken upon the wheel. But capital punishments are not common in Denmark; and the other principal modes of punish-

## DENMARK.

ment are branding in the face, whipping, condemnation to the rask-house, to houses of correction, and to public labour and imprisonment; all which are varied in duration and rigour, according to the nature of the crime.

POLITICAL AND NATURAL }  
HISTORY OF DENMARK. }  
After the accession of his present majesty, his court seemed for some time to have altered its maxims. His father, it is true, observed a most respectable neutrality during the late war, but never could get rid of French influence, notwithstanding his connexions with Great-Britain. The subsidies he received maintained his army: but his family disputes with Russia concerning Holstein, and the ascendancy with the French had obtained over the Swedes (not to mention many other matters), did not suffer him to act that decisive part in the affairs of Europe, to which he was invited by his situation, especially about the time when the treaty of Closter-Seven was concluded. His present Danish majesty's plan seemed, soon after his accession, to be that of forming his dominions into a state of independency, by availing himself of their natural advantages. But sundry events which have since happened, and the general feebleness of his administration, have prevented any farther expectations being formed, that the real welfare of Denmark will be promoted, at least in any great degree, during the present reign.

With regard to the external interests of Denmark, they are certainly best secured by cultivating a friendship with the maritime powers. The exports of Denmark enabled her to carry on a very profitable trade with France, Spain, and the Mediterranean; and she has been particularly courted by the Mahometan states, on account of her naval stores.

The present imperial family of Russia has many claims upon Denmark, on account of Holstein; but there is at present small appearance of her being engaged in a war on that account. Were the Swedes to regain their military character, and to be commanded by so enterprising a prince as Charles XII. they probably would endeavour to repossess themselves, by arms, of the fine provinces torn from them by Denmark. But the greatest danger that can arise to Denmark from a foreign power is when the Baltic sea (as has happened more than once) is so frozen over as to bear not only men but heavy artillery; in which case the Swedes have been known to march over great armies, and to threaten the conquest of the kingdom.

REVENUES.] His Danish majesty's revenues have three sources: the impositions he lays upon his own subjects; the duties paid by foreigners; and his own demesne lands, including confiscations. Wine, salt, tobacco, and provisions of all kinds, are taxed. Marriages, paper, corporations, land, houses, and poll-money, also raise a considerable sum. The expenses of fortifications are borne by the people: and when the king's daughter is married, they pay about 100,000 rix-dollars towards her portion. The internal taxes of Denmark are very uncertain, because they may be abated or raised at the king's will. Customs and tolls, upon exports and imports, are more certain. The tolls paid by strangers arise chiefly from foreign ships that pass through the Sound into the Baltic, through the narrow strait of half a mile between Schonen and the island of Zealand. These tolls are in proportion to the size of the ship, and value of the cargo exhibited in the bills of lading. This tax, which forms a capital part of his Danish majesty's revenue, has more than once thrown the northern parts of Europe into a flame. It was often disputed by the English and Dutch, being nothing more originally than a voluntary contribution of the merchants towards the expenses of the light-houses on the coast; and the Swedes, who command

the opposite side of the pass, for some time refused to pay it; but in the treaty of 1720, between Sweden and Denmark, under the guarantee of his Britannic majesty George I. the Swedes agreed to pay the same rates as are paid by the subjects of Great-Britain and the Netherlands. The first treaty relative to it was by the emperor Charles V. on behalf of his subjects in the Low Countries. The toll is paid at Elfsneur, a town situated on the Sound, at the entrance of the Baltic Sea, and about 18 miles distant from Copenhagen. The whole revenue of Denmark, including what is received at Elfsneur, amounts at present to above 5,000,000 of rix-dollars, or 1,002,000*l.* sterling yearly.

The following is a list of the king's revenues, exclusive of his private estates:

	Rix-dollars at 4s. each.
Tribute of hard corn, or land-tax	1,000,000
Small taxes, including poll-tax, pound rents, excise, marriages, &c.	950,000
Custom-house duties	154,000
Duties of the Sound	200,000
Duties of Jutland, from salt-pits	27,000
Tithes and poll-tax of Norway	770,000
Tolls of Bergen, Drontheim, Christianfand, and Christiana	160,000
Other tolls	552,000
Revenue from mines	300,000
Revenue from Sleswick, Holstein, Oldenburg, and Delmenhorst	690,000
Taxes on acorns and mast from beech	20,000
Tolls on the Wefer	7,500
Post-office	70,000
Farms of Iceland and Ferro	35,000
Farms of Bornholm	14,800
Oyster Fishery	22,000
Stamp-paper	40,000
<b>Sum total,</b>	<b>5,012,300</b>

In English money, £. 1,002,460

By a list of the revenue taken in 1730, it then only amounted to English money £. 454,700.

ARMY AND NAVY.] The three last kings of Denmark, notwithstanding the degeneracy of the people in martial affairs, were very respectable princes, by the number and discipline of their troops, which they kept up with a vast care. The present military force of Denmark consists of 70,000 men, cavalry and infantry, the greatest part of which is a militia who receive no pay, but are registered on the army-list, and every Sunday exercised. The regular troops are about 20,000, and mostly foreigners, or officered by foreigners; for Frederic III. was too refined a politician to trust his security in the hands of those he had tricked out of their liberty. Though this army is extremely burdensome to the nation, yet it costs little to the crown; great part of the infantry lie in Norway, where they live upon the boors at free quarter; and in Denmark the peasantry are obliged to maintain the cavalry in victuals and lodging, and even to furnish them with money. The present fleet of Denmark is composed of 30 ships of the line, and 18 frigates;

but many of the ships being old, and wanting great repairs, it is supposed they cannot fit out more than 25 ships on the greatest emergency. This fleet is generally stationed at Copenhagen, where are the dock-yards, store-houses, and all the materials necessary for the use of the marine. They have 26,000 registered seamen, who cannot quit the kingdom without leave, nor serve on board a merchantman without permission from the admiralty; 4000 of these are kept in constant pay, and employed in the dock-yards; their pay, however, scarcely amounts to nine shillings per month; but they have a sort of uniform, with some provisions and lodging allowed for themselves and families.

ORDERS OF KNIGHTHOOD IN DENMARK.] There are two; that of the *Elephant*, and that of *Daneburg*. The former was instituted by Christian I. in the year 1478, and is deemed the most honourable; its badge is an elephant surmounted with a castle, set in diamonds, and suspended to a sky-blue watered ribboud, worn, like the *George* in England, over the right shoulder; the number of its members, besides the sovereign, are thirty, and the knights of it are addressed by the title of Excellence. The badges of the *Daneburg* order, which is said to have been instituted in the year 1219, and, after being long obsolete, revived in 1671 by Christian V. consist of a white ribboud with red edges, worn scarf wise over the right shoulder; from which depends a small cross of diamonds, and an embroidered star on the breast of the coat, surrounded with the motto, *Pietate et Justitia*. The badge is a cross pattée, enamelled white, on the centre the letter C and S crowned with a regal crown, and this motto, *Restitutor*. The number of knights is not limited; and they are very numerous.

HISTORY.] We owe the chief history of Denmark to a very extraordinary phenomenon; the revival of the purity of the Latin language in Scandinavia, in the person of Saxo Grammaticus, at a time (the 12th century) when it was lost in all other parts of the European continent. Saxo, like the other historians of his age, had adopted, and at the same time ennobled by his style, the most ridiculous absurdities of remote antiquity. We can however collect enough from him to conclude that the ancient Danes, like the Gauls, the Scots, the Irish, and other northern nations, had their bards, who recounted the military achievements of their heroes; and that their first histories were written in verse. There can be no doubt that the Scandinavians or Cimbri, and the Teutones (the inhabitants of Denmark, Norway, and Sweden), were Scythians by their original; but how far the tracts of land, called either Scythia\* or Gaul, formerly reached, is uncertain.

Even the name of the first Christian Danish king is uncertain; and those of the people of these countries are to be blended together, that it is impossible for the reader to conceive a precise idea of the old Scandinavian history. This undoubtedly was owing to the remains of their Scythian customs, particularly that of removing from one country to another; and of several nations or sects joining together in expeditions by sea or land, and the adventurers being denominated after their chief leaders. Thus the terms Danes, Saxons, Jutes or Gotlis, Germans, and

\* By Scythia may be understood all those northern countries of Europe and Asia (now inhabited by the Danes, Norwegians, Swedes, Russians, and Tartars; see the Introduction), whose inhabitants overturned and peopled the Roman empire, and continued, to live as the 13th century, to issue forth in large hordes, and naval expeditions, ravaging the more southern and fertile kingdoms of Europe. Hence, by sir William Temple and other historians, they are termed the *Northern Hive*, the *Mother of Nations*, the *Storehouse of Europe*.

Normans, were promiscuously used long after the time of Charlemagne. Even the short revival of literature under that prince throws very little light upon the Danish history. All we know is, that the inhabitants of Scandinavia, in their maritime expeditions, went generally under the name of Saxons with foreigners; that they were bold adventurers, rude, fierce, and martial; that, so far back as the year of Christ 500, they insulted all the sea-coasts of Europe; that they settled in Ireland, where they built stone houses; and that they became masters of England, and some part of Scotland; both which kingdoms still retain proofs of their barbarity. When we read the history of Denmark and that of England, under the Danish princes who reigned over both countries, we meet with but a faint resemblance of events; but the Danes, as conquerors, always give themselves the superiority over the English.

In the eleventh century, under Canute the Great, Denmark may be said to have been in its zenith of glory, as far as extent of dominion can give sanction to the expression. Few very interesting events in Denmark preceded the year 1387, when Margaret mounted the throne; and, partly by her address, and partly by hereditary right, formed the union of Calmar, anno 1397, by which she was acknowledged sovereign of Sweden, Denmark, and Norway. She held her dignity with such firmness and courage, that she was justly styled the Semiramis of the North. Her successors being destitute of her great qualifications, the union of Calmar, by which the three kingdoms were in future to be under one sovereign, lost its effect; but Norway still continued annexed to Denmark. In the year 1448, the crown of Denmark fell to Christian, count of Oldenburg, from whom the present royal family of Denmark is descended.

In 1513, Christian II. one of the greatest tyrants that modern times have produced, mounted the throne of Denmark; and having married the sister of the emperor Charles V. gave a full loose to his innate cruelty. Being driven out of Sweden for the bloody massacres he committed there, the Danes rebelled against him likewise; and he fled, with his wife and children, into the Netherlands. Frederic, duke of Holstein, was unanimously called to the throne, on the deposition of his cruel nephew. He embraced the opinions of Luther; and about the year 1536, the protestant religion was established in Denmark by that wise and politic prince, Christian III.

Christian IV. of Denmark, in 1629, was chosen for the head of the protestant league formed against the house of Austria; but, though brave in his own person, he was in danger of losing his dominions; when he was succeeded in that command by Gustavus Adolphus king of Sweden. The Dutch having obliged Christian, who died in 1648, to lower the duties of the Sound, his son Frederic III. consented to accept of an annuity of 150,000 forins for the whole. The Dutch, after this, persuaded him to declare war against Charles Gustavus, king of Sweden; which had almost cost him his crown in 1657. Charles formed the fortress of Fredericstadt; and in the succeeding winter marched his army over the ice to the island of Funen, where he surprised the Danish troops, took Odeusee and Nyburg, and marched over the Great Belt to besiege Copenhagen itself. Cromwell, who then governed England under the title of Protector, interposed; and Frederic defended his capital with great magnanimity till the peace of Roschild, by which Frederic ceded the provinces of Halland, Bleking, and Schonen; the island of Bornholm, and Bahus and Drontheim in Norway, to the Swedes. Frederic sought to elude these severe terms: but Charles took Cronenburg, and once more besieged Copenhagen by sea and land,

The steady intrepid conduct of Frederic under these misfortunes endeared him to his subjects; and the citizens of Copenhagen made an admirable defence till a Dutch fleet arrived in the Baltic, and beat the Swedish fleet. The fortune of war was now entirely changed in favour of Frederic, who showed on every occasion great abilities, both civil and military; and, having forced Charles to raise the siege of Copenhagen, might have carried the war into Sweden, had not the English fleet under Montague appeared in the Baltic. This enabled Charles to besiege Copenhagen a third time; but France and England offering their mediation, a peace was concluded in that capital, by which the island of Bornholm was restored to the Danes; but the island of Rugen, Bleking, Halland, and Schonen, remained with the Swedes.

Though this peace did not restore to Denmark all she had lost, yet the magnanimous behaviour of Frederic under the most imminent dangers, and his attention to the safety of his subjects, even preferably to his own, greatly endeared him in their eyes; and he at length became absolute, in the manner already related. Frederic was succeeded, in 1670, by his son Christian V. who obliged the duke of Holstein Gottorp to renounce all the advantages he had gained by the treaty of Roschild. He then recovered a number of places in Schonen: but his army was defeated in the bloody battle of Lundin, by Charles XI. of Sweden. This defeat did not put an end to the war, which Christian obstinately continued; till he was defeated entirely at the battle of Landskron: and having almost exhausted his dominions in military operations, and being in a manner abandoned by all his allies, he was forced to sign a treaty, on the terms prescribed by France, in 1679. Christian afterwards became the ally and subsidiary of Lewis XIV. who was then threatening Europe with chains, and, after a vast variety of treating and fighting with the Holsteiners, Hamburgers, and other northern powers, died in 1690. He was succeeded by Frederic IV. who, like his predecessors, maintained his pretensions upon Holstein, and probably must have become master of that duchy, had not the English and Dutch fleets raised the siege of Tonningen, while the young king of Sweden, Charles XII. who was then no more than sixteen years of age, landed within eight miles of Copenhagen, to assist his brother-in-law the duke of Holstein. Charles probably would have made himself master of Copenhagen, had not his Danish majesty agreed to the peace of Travendahl, which was entirely in the duke's favour. By another treaty concluded with the States General, Charles obliged himself to furnish a body of troops, who were to be paid by the confederates, and afterwards took a very active part against the French in the wars of Queen Anne.

Notwithstanding this peace, Frederic was perpetually engaged in wars with the Swedes; and while Charles XII. was an exile at Bender, he made a descent upon Swedish Pomerania, and another, in the year 1712, upon Bremen, and took the city of Stade. His troops, however, were totally defeated by the Swedes at Gadesbueh, and his favourite city of Altena was laid in ashes. Frederic revenged himself by seizing great part of Ducal Holstein, and forcing the Swedish general, count Steinbock, to surrender himself prisoner, with all his troops. In the year 1716, the successes of Frederic were so great, by taking Tonningen and Stralsund, by driving the Swedes out of Norway, and reducing Wisnar in Pomerania, that his allies began to suspect he was aiming at the sovereignty of all Scandinavia. Upon the return of Charles of Sweden from his exile, he renewed the war against Denmark with the most implacable violence; but, on the death of that prince, who was

killed at the siege of Fredericshall, Frederic durst not refuse the offer of his Britannic majesty's mediation between him and the crown of Sweden: in consequence of which, a peace was concluded at Stockholm, which left him in possession of the duchy of Sleswick. Frederic died in the year 1730, after having, two years before, seen his capital reduced to ashes by an accidental fire. His son and successor, Christian Frederic, or Christian VI. made the best use of his power, and the advantages with which he mounted the throne, by cultivating peace with all his neighbours, and promoting the happiness of his subjects, whom he eased of many oppressive taxes.

In 1734, after guarantying the Pragmatic Sanction \*, Christian sent 6000 men to the assistance of the emperor, during the dispute of the succession to the crown of Poland. Though he was pacific, yet he was jealous of his rights, especially over Hamburg. He obliged the Hamburgers to call in the mediation of Prussia, to abolish their bank, to admit the coin of Denmark as current, and to pay him a million of silver marks. In 1739, he had a dispute with his Britannic majesty about the little lordship of Steinhorst, which had been mortgaged to the latter by a duke of Holstein-Lawenburg, and which Christian said belonged to him. Some blood was spilt during the contest, in which Christian, it is thought, never was in earnest. It brought on, however, a treaty, in which he availed himself of his Britannic majesty's predilection for his German dominions; for the latter agreed to pay Christian a subsidy of 70,000*l.* sterling a year, on condition of keeping in readiness 7000 troops for the protection of Hanover. This was a gainful bargain for Denmark. Two years after, he seized some Dutch ships, for trading without his leave to Iceland; but the difference was made up by the mediation of Sweden. Christian had so great a party in that kingdom, that it was generally thought he would revive the union of Calmar, by procuring his son to be declared successor to the crown of Sweden. Some steps for that purpose were certainly taken; but whatever Christian's views might have been, the design was frustrated by the jealousy of other powers, who could not bear the thoughts of seeing all Scandinavia subject to one family. Christian died in 1746, with the character of being the father of his people.

His son and successor, Frederic V. had, in 1743, married the princess Louisa, daughter to his Britannic majesty George II. He improved upon his father's plan for the happiness of his people, and took no concern, except that of a mediator, in the German war. It was by his intervention that the treaty of Closter-Seven was concluded between his royal highness the late duke of Cumberland and the French general Richelieu. Upon the death of his first queen, who was mother to his present Danish majesty, he married a daughter of the duke of Brunswic-Wolfenbottle; and died in 1766.

His son, Christian VII. was born the 29th of January, 1749; and married his present Britannic majesty's youngest sister, the princess Carolina-Matilda. This alliance, though it wore at first a very promising appearance, had a very unfortunate termination. This is partly attributed to the intrigues of the queen-dowager, mother-in-law to the present king, who has a son named Frederic, and whom she is represented as desirous of raising to the throne. When the princess Carolina-Ma-

\* An agreement by which the princes of Europe engaged to support the house of Austria in favour of the queen of Hungary, daughter of the emperor Charles VI. who had no male issue.

Matilda came to Copenhagen, she received her with all the appearance of friendship and affection, acquainting her with all the king's faults, and at the same time telling her that she would take every opportunity, as a mother, to assist her in reclaiming him. By this conduct she became the depository of all the young queen's secrets, whilst at the same time it is said she placed people about the king, to keep him constantly engaged in all kinds of riot and debauchery, to which she knew he was naturally too much inclined; and at length it was so ordered, that a mistress was thrown in the king's way, whom he was persuaded to keep in his palace. When the king was upon his travels, the queen-dowager used frequently to visit the young queen Matilda, and, under the mask of friendship and affection, told her often of the debaucheries and excesses which the king had fallen into in Holland, England, and France, and often persuaded her not to live with him. But as soon as the king returned, the queen reproaching him with his conduct, though in a gentle manner, his mother-in-law immediately endeavoured to persuade the king to give no ear to her counsels, as it was presumption in a queen of Denmark to direct the king. Queen Matilda now began to discover the designs of the queen-dowager, and afterwards lived upon very good terms with the king, who for a time was much reclaimed. The young queen also now assumed to herself the part which the queen-dowager had been complimented with in the management of public affairs. This irritated the old queen; and her thoughts were now entirely occupied with schemes of revenge, which she at length found means to gratify in a very ample manner. About the end of the year 1770, it was observed that Brandt and Struensee were particularly regarded by the king; the former as a favourite, and the latter as a minister; and that they paid great court to queen Matilda, and were supported by her. This opened a new scene of intrigue at Copenhagen; all the discarded placemen paid their court to the queen-dowager, and she became the head and patroness of the party. Old count Molke, an artful displaced statesman, and others who were well versed in intrigues of this nature, perceiving that they had inexperienced young persons to contend with, who, though they might mean well, had not sufficient knowledge and capacity to conduct the public affairs, very soon predicted their ruin. Struensee and Brandt wanted to make a reform in the administration of public affairs at once, which should have been the work of time; and thereby made a great number of enemies, among those whose interest it was that things should continue upon the former footing. After this, queen Matilda was delivered of a daughter; but as soon as the queen-dowager saw her, she immediately turned back, and, with a malicious smile, declared that the child had all the features of Struensee: on which her friends published it among the people, that the queen must have had an intrigue with Struensee; which was corroborated by the queen's often speaking with this minister in public. A great variety of evil reports were now propagated against the reigning queen; and another report was also industriously spread, that the governing party had formed a design to supersede the king, as being incapable of governing; that the queen was to be declared regent during the minority of her son; and that Struensee was to be her prime-minister. Whatever Struensee did to reform the abuses of the late ministry was represented to the people as so many attacks upon, and attempts to destroy, the government of the kingdom. By such means the people began to be greatly incensed against this minister; and as he also attempted to make a reform in the military, he gave great offence to the troops, at the head of which were some of the crea-

tures of the queen-dowager, who took every opportunity to make their inferior officers believe that it was the design of Struensee to change the whole system of government. It must be admitted that this minister seems in many respects to have acted very imprudently, and to have been too much under the guidance of his passions; his principles also appear to have been of the libertine kind.

Many councils were held between the queen-dowager and her friends, upon the measures proper to be taken for effectuating their designs: and it was at length resolved to surprise the king in the middle of the night, and force him immediately to sign an order, which was to be prepared in readiness, for committing the persons before mentioned to separate prisons, to accuse them of high treason in general, and in particular of a design to poison or dethrone the king; and if that could not be properly supported, by torture or otherwise, to procure witnesses to confirm the report of a criminal commerce between the queen and Struensee. This was an undertaking of so hazardous a nature, that the wary count Molke, and most of the queen dowager's friends, who had any thing to lose, drew back, endeavouring to animate others, but excusing themselves from taking any open and active part in this affair. However, the queen-dowager at last procured a sufficient number of active instruments for the execution of her designs. On the 16th of January, 1772, a masked ball was given at the court of Denmark. The king had danced at this ball, and afterwards played at quadrille with general Gähler, his lady, and counsellor Struensee, brother to the count. The queen, after dancing as usual one country-dance with the king, gave her hand to count Struensee during the remainder of the evening. She retired about two in the morning, and was followed by him and count Brandt. About four the same morning, prince Frederic, who had also been at the ball, went with the queen-dowager to the king's bed-chamber, accompanied by general Eichstedt, and count Rantzau. They ordered his majesty's valet de-chambre to awake him, and, in the midst of the surprise and alarm that this unexpected intrusion excited, informed him that queen Matilda and the two Struensees were at that instant busy in drawing up an act of renunciation of the crown, which they would immediately after compel him to sign; and that the only means he could use to prevent so imminent a danger was to sign those orders, without loss of time, which they had brought with them, for arresting the queen and her accomplices. It is said that the king was not easily prevailed upon to sign these orders; but at length complied, though with reluctance and hesitation. Count Rantzau, and three officers, were dispatched at that untimely hour to the queen's apartments, and immediately arrested her. She was put into one of the king's coaches, in which she was conveyed to the castle of Cronenburg, together with the infant princess, attended by lady Moftyn, and escorted by a party of dragoons. In the mean time, Struensee and Brandt were also seized in their beds, and imprisoned in the citadel. Struensee's brother, some of his adherents, and most of the members of the late administration, were seized the same night, to the number of about eighteen, and thrown into confinement. The government after this seemed to be entirely lodged in the hands of the queen-dowager and her son, supported and assisted by those who had the principal share in the revolution; while the king appeared to be little more a pageant, whose person and name it was necessary occasionally to make use of. All the officers concerned in the revolution were immediately promoted, and an almost total change took place in all the departments of administration. A new council was appointed, in which

prince Frederic presided, and a commission of eight members, to examine the papers of the prisoners, and to commence a process against them. The son of queen Matilda, the prince royal, who was entered into the fifth year of his age, was put under the care of a lady of quality, who was appointed governess, under the superintendency of the queen-dowager. Struensee and Brandt were put in irons, and very rigorously treated in prison: they both underwent long and frequent examinations, and at length received sentence of death. They were beheaded on the 28th of April, having their right hands previously cut off: but many of their friends and adherents were afterwards set at liberty. Struensee at first absolutely denied having any criminal intercourse with the queen: but this he afterwards confessed: and though he is said by some to have been induced to do this only by the fear of torture, the proofs of his guilt in this respect were esteemed notorious, and his confessions full and explicit. In May, his Britannic majesty sent a small squadron of ships to convey that princess to Germany, and appointed the city of Zell, in his electoral dominions, for the place of her future residence. She died there of a malignant fever, on the 10th of May, 1775, aged 23 years and 10 months.

In 1780, his Danish majesty acceded to the armed neutrality proposed by the empress of Russia. He appears at present to have such a debility of understanding as to disqualify him for the proper management of public affairs. On the 16th of April, 1784, another court revolution took place. The queen-dowager's friends were removed, a new council formed under the auspices of the prince-royal, some of the former old members restored to the cabinet, and no regard is to be paid for the future to any instrument, unless signed by the king, and countersigned by the prince-royal.

The conduct of this prince is stamped with that consistency of behaviour which enables him to pursue, with unremitting zeal, the prudent and benevolent measures which he has planned for the benefit of his grateful country. The restoration of the peasantry to their long-lost liberty, and the abolition of many grievances under which they laboured, have already been mentioned. To these may be added the exertions he makes for the general diffusion of knowledge; the patronage he affords to societies of learning, arts, and science; the excellent measures he has adopted for the suppression of beggars, with whom the country was overrun, and the encouragement of industry, by the most extensive inquiries into the state of the poor throughout the kingdom; the wise regulations he has introduced into the corn trade, equally beneficial to the landed interest and to the poor; and the judicious laws, which under his influence have been made to encourage foreigners to settle in Iceland. The princess of Hesse-Cassel, his consort, is said to possess the most amiable dispositions and goodness of heart.

Count Schimmelmann, minister of state, finances, and commerce, has the merit of accomplishing the abolition of the slave-trade among the subjects of Denmark. His plan was approved by the king on the 22d of February, 1792, and is to be gradual; and in 1803 all trade in negroes is to cease on the part of Danish subjects. The disinterestedness of this minister, who possesses large estates in the Danish West-India islands, recommends his exertions to greater praise. The above ordinance does not seem to have caused any discontent in Denmark among the West-India merchants, and it is not thought it will cause any in the islands.

A scheme for defraying the national debt has been suggested and followed. One million has already been discharged.

Denmark, to its honour, formally refused to join in the alliance of potentates against France.

Christian VII. reigning king of Denmark and Norway, LL. D. and F. R. S. was born in 1749; in 1766 he was married to the princess Carolina-Matilda of England; and has issue.—1. Frederic, prince-royal of Denmark, born January 28, 1768, and married in 1790, to the princess Mary-Anne-Frederica, of Hesse.—2. Louisa-Augusta, princess-royal, born July 7, 1771, and married May 27, 1786, to Frederic, prince of Sleswick-Holstein, by whom she has issue:

Brothers and sisters to the king:—1. Sophia Magdalene, born July 3, 1746; married to the late king of Sweden, Gustavus III.—2. Wilhelmina, born July 10, 1747; married Sept. 1, 1764, William, the present prince of Hesse-Cassel.—3. Louisa, born Jan. 30, 1750; married Aug. 30, 1766, Charles, brother to the prince of Hesse-Cassel.—4. Frederic, born Oct. 28, 1753.

#### HIS DANISH MAJESTY'S GERMAN DOMINIONS.

**HOLSTEIN**, a duchy of Lower Saxony, about 100 miles long and 50 broad, and a fruitful country, was formerly divided between the empress of Russia (termed Ducal Holstein), the king of Denmark, and the imperial cities of Hamburg and Lubec; but on the 16th of November, 1773, Ducal Holstein, with all the rights, prerogatives, and territorial sovereignty, was formally transferred to the king of Denmark, by virtue of a treaty between both courts. The duke of Holstein-Gottorp is joint sovereign of great part of it, with the Danish monarch. Kiel is the capital of Ducal Holstein, and is well built, has a harbour, and neat public edifices. The capital of Danish Holstein is Gluckstadt, a well-built town and fortress, but in a marshy situation, on the right of the Elbe, and has some foreign commerce.

Altena, a large, populous, and handsome town, of great traffic, is commodiously situated on the Elbe, in the neighbourhood of Hamburg. It was built in that situation, that it might share in the commerce of the former. Being declared a free port, and the staple of the Danish East-India company, the merchants also enjoying liberty of conscience, great numbers flocked to Altena from all parts of the North, and even from Hamburg itself.

The famous city of Hamburg is situated on the verge of that part of Holstein called Stormar; but is an imperial, free, and Hanseatic city. It has the sovereignty of a small district round it, of about ten miles circuit: it is one of the most flourishing commercial towns in Europe: and though the kings of Denmark still lay claim to certain privileges within its walls, it may be considered as a well-regulated commonwealth. The number of its inhabitants is said to amount to 180,000; and it contains a variety of noble edifices, both public and private. It has two spacious harbours, formed by the river Elbe, which runs through the town; and 84 bridges are thrown over its canals. Hamburg has the good fortune of having been peculiarly favoured in its commerce by Great Britain, with which it carries on a considerable trade which has been very greatly increased in consequence of the war with France and Holland. The Hamburgers maintain twelve companies of foot, and one troop of dragoons, besides an artillery company.

Lubec, an imperial city, with a good harbour, once the capital of the

Hanse towns, and still a rich and populous place, is also fit this duchy. It is governed by its own magistrates. It has 20 parish-churches, & besides a large cathedral. Lutheranism is the established religion of the whole duchy.

In *Wesermark*, the king of Denmark has the counties of Oldenburg and Delmenhorst, containing about two thousand square miles; they lie on the south side of the Weser; their capitals have the same name; the first has the remains of a fortification, and the last is an open place. Oldenburg gave a title to the first royal ancestor of his present Danish majesty. The country abounds with marshes and heaths; its horses are the best in Germany.

## LAPLAND.

THE northern situation of Lapland, and the division of its property, require that it should be treated of under a distinct head, and in the same method observed with respect to other countries.

**SITUATION, EXTENT, DIVISION, AND NAME.** } The whole country of Lapland extends, so far as it is known from the North Cape in  $74^{\circ} 30'$  N. lat. to the White Sea, under the arctic circle. Part of Lapland belongs to the Danes, and is included in the government of Wardhus; part to the Swedes, which is by far the most valuable; and some parts in the east to the Russians. The dimensions of each of these parts are by no means accurately ascertained. An estimate of that belonging to the Swedes may be seen in the table of dimensions given in the account of Sweden; but other accounts say that it is about 100 German miles in length, and 90 in breadth: it comprehends all the country from the Baltic to the mountains that separate Norway from Sweden. The Russian part lies towards the east, between the lake Enarak and the White Sea. Those parts, notwithstanding the rudeness of the country, are divided into smaller districts, generally taking their names from rivers: but, unless in the Swedish part, which is subject to a prefect, the Laplanders can be said to be under no regular government. Swedish Lapland, therefore, is the object chiefly considered by authors in describing this country. It has been generally thought that the Laplanders are the descendants of Finlanders driven out of their own country, and that they take their name from *Lappes*, which signifies exiles. The reader, from what has been said in the Introduction, may easily conceive, that in Lapland, for some months in the summer, the sun never sets; and during winter it never rises; but the inhabitants are so well assisted by the twilight and the aurora-borealis, that they never discontinue their work through darkness.

**CLIMATE.** } In winter it is no unusual thing for their lips to be frozen to the cup in attempting to drink; and, in some thermometers, spirits of wine are congealed into ice: the limbs of the inhabitants very often mortify with cold: drifts of snow threaten to bury the traveller, and cover the ground four or five feet deep. A thaw sometimes takes place; and then the frost that succeeds presents the Laplander with a smooth level of ice, over which he travels with a rein-deer in a sledge with inconceivable swiftness. The heats of summer are excessive for a short time; and the cataracts which dash from the mountains often present to the eye the most picturesque appearances.

**MOUNTAINS, RIVERS, LAKES, AND FORESTS.** } Lapland is a vast mass of mountains, irregularly crowded together;

they are, which cover the delightful terrestrial borders in nature, for the noisome u flat count of the inland

they are, however, in some interstices, separated by rivers and lakes, which contain an incredible number of islands, some of which form delightful habitations, and are believed by the natives to have been the terrestrial paradise: even roses and other flowers grow wild on their borders in the summer; though this is but a short gleam of temperature, for the climate in general is excessively severe. Dusky forests, and noisome unhealthy morasses, and barren plains, cover great part of the flat country, so that nothing can be more uncomfortable than the state of the inhabitants.

[METALS AND MINERALS.] Silver and gold mines, as well as those of iron, copper, and lead, have been discovered and worked in Lapland to great advantage; beautiful crystals are found here, as are some strychnites and topazes; also various sorts of mineral stones, surprisingly polished by the hand of nature; valuable pearls have likewise been sometimes found in the rivers, but never in the seas.

QUADRUPEDS, BIRDS, FISHES, } We must refer to our accounts  
AND INSECTS. } of Denmark and Norway for great part of this article, as the animals are common to all the three countries. The *sibelin*, a creature resembling the marten, is a native of Lapland; and its skin, whether black or white, is highly esteemed. The Lapland hares grow white in the winter; and the country produces a large black cat, which attends the natives in hunting. By far the most remarkable, however, of the Lapland animals, is the *rein-deer*, which nature seems to have provided to recompense the Laplanders for the privation of the other comforts of life. This animal, the most useful perhaps of any in the creation, resembles the stag, only it somewhat droops the head, and the horns project forward. All who have described this animal have taken notice of the crackling noise that they make when they move their legs, which is attributed to their separating and afterwards bringing together the divisions of the hoof. The under part is entirely covered with hair, in the same manner that the claw of the *Ptarmigan* is with feathery bristles, which is almost the only bird that can endure the rigour of the climate. The hoof however is not only thus protected; the same necessity which obliges the Laplanders to use snow shoes makes the extraordinary width of the rein-deer's hoof to be equally convenient in passing over snow, as it prevents their sinking too deep, which they continually would, did the weight of their body rest only on a small point. This quadruped hath therefore an instinct to use a hoof of such a form in a still more advantageous manner, by separating it when the foot is to touch the ground so as to cover a larger surface of snow. The instant however the leg of the animal is raised, the hoof is immediately contracted, and the collision of the parts occasions the snapping noise. Probably the crackling which they perpetually make may serve to keep them together when the weather is remarkably dark. In summer, the rein-deer provide themselves with leaves and grass, and in the winter they live upon moss; which they have a wonderful sagacity at finding, and, when found, scrape away the snow that covers it with their feet. The scantiness of their fare is inconceivable, as is the length of the journeys which they can perform without any other support. They fix the rein-deer to a kind of sledge, shaped like a small boat, in which the traveller, well secured from cold, is laced down; with the reins, which are fastened to the horns of the animal, in one hand, and a kind of bludgeon in the other, to keep the carriage clear of ice and snow. The deer, whose harnessing is very simple, sets out, and continues the journey with prodigious speed; and is so safe and tractable, that the driver

is at little or no trouble in directing him. At night they look out for their own provender; and their milk often helps to support their master. Their instinct in choosing their road, and directing their course, can only be accounted for by their being well acquainted with the country during the summer months, when they live in the woods. Their flesh is a well-tasted food, whether fresh or dried; their skin forms excellent cloathing both for the bed and the body; their milk and cheese are nutritive and pleasant; and their intestines and tendons supply their masters with thread and cordage. When they run about wild in the fields, they may be shot at as other game. But it is said, that if one is killed in a flock, the survivors will gore and trample him to pieces; therefore single stragglers are generally chosen. With all their excellent qualities, however, the rein-deer have their inconveniences.

It is difficult in summer to keep them from straggling; they are sometimes buried in the snow; and they frequently grow retive, to the great danger of the driver and his carriage. Their surprising speed (for they are said to run at the rate of 200 miles a day) seems to be owing to their impatience to get rid of their incumbrance. None but a Laplander could bear the uneasy posture in which he is placed, when he is confined in one of these carriages or pulkhas; or would believe, that, by whispering the rein-deer in the ear, they know the place of their destination.

PEOPLE, CUSTOMS, AND MANNERS.] The language of the Laplanders is of Finnish origin, and comprehends so many dialects, that it is, with difficulty they understand each other. They have neither writing nor letters among them, but a number of hieroglyphics, which they make use of in their Roumes, a sort of sticks that they call Pistave, and which serve them for an almanack. These hieroglyphics are also the marks they use instead of signatures, even in matters of law. Missionaries from the Christianised parts of Scandinavia introduced among them the Christian religion; but they cannot be said even yet to be Christians, though they have among them some religious seminaries, instituted by the king of Denmark. Upon the whole, the majority of the Laplanders practise as gross superstitions and idolatries as are to be found among the most uninstructed pagans; and so absurd, that they scarcely deserve to be mentioned, were it not that the number and oddities of their superstitions have induced the northern traders to believe that they are skilful in magic and divination. For this purpose their magicians make use of what they call a drum, made of the hollowed trunk of a fir, pine, or birch tree, one end of which is covered with a skin; on this they draw, with a kind of red colour, the figures of their own gods, as well as of Jesus Christ, the apostles, the sun, moon, stars, birds, and rivers; on these they place one or two brass rings, which, when the drum is beaten with a little hammer, dance over the figures; and, according to their progress, the forcerer prognosticates. These frantic operations are generally performed for gain; and the northern ship-masters are such dupes to the arts of these impostors, that they often buy from them a magic cord, which contains a number of knots, by opening of which, according to the magician's directions, they are told they may obtain what wind they want. This is also a very common traffic on the banks of the Red Sea, and is managed with great address on the part of the forcerer, who keeps up the price of his knotted talisman. The Laplanders still retain the worship of several of the Teutonic gods, and have among them many remains of the Druidical

institutions. They believe the transmigration of the soul, and have festivals set apart for the worship of certain genii, called Jeahles, who they think inhabit the air and have great power over human actions; but being without form or substance, they assign to them neither images nor statues.

Agriculture is not much attended to among the Laplanders. They are chiefly divided into Lapland fishers, and Lapland mountaineers. The former always make their habitations on the brink or in the neighbourhood of some lake, from which they draw their subsistence. The others seek their support upon the mountains and their environs, possessing herds of rein-deer more or less numerous, which they use according to the season, but go generally on foot. They are excellent and very industrious herdsmen, and are rich in comparison of the Lapland fishers. Some of them possess six hundred or a thousand rein-deer, and have often money and plate besides. They mark every rein-deer on the ears, and divide them into classes; so that they instantly perceive whether any one has strayed, though they cannot count to so great a number as that to which their stock often amounts. Those who possess but a small stock give to every individual a proper name. The Lapland fishers, who are also called Laplanders of the Woods, because in summer they dwell upon the borders of the lakes, and in winter in the forests, live by fishing and hunting, and choose their situation by its convenience for either. The greatest part of them, however, have some rein-deer. They are active and expert in the chase: and the introduction of fire-arms among them has almost entirely abolished the use of the bow and arrow. Besides looking after the rein-deer, the fishery, and the chase, the men employ themselves in the construction of their canoes, which are small, light, and compact. They also make sledges, to which they give the form of a canoe, harness for the rein-deer, cups, bowls, and various other utensils, which are sometimes neatly carved, and sometimes ornamented with bones, brass, or horn. The employment of the women consists in making nets for the fishery, in drying fish and meat, in milking the rein-deer, in making cheese, and tanning hides; but it is understood to be the business of the men to look after the kitchen, in which it is said the women never interfere.

The Laplanders live in huts in the form of tents. A hut is from about twenty-five to thirty feet in diameter, and not much above six in height. They cover them, according to the season and the means of the possessor, some with briars, bark of birch or of linden,—others with turf, coarse cloth, or felt, or the old skins of rein-deer. The door is of felt, made like two curtains which open asunder. A little place surrounded with stones is made in the middle of the hut for the fire, over which a chain is suspended to hang the kettle upon. They are scarcely able to stand upright in their huts, but constantly sit upon their heels round the fire. At night they lie down quite naked; and, to separate the apartments, place upright sticks at small distances. They cover themselves with their clothes, or lie upon them. In winter they put their naked feet into a fur bag. Their household furniture consists of iron or copper kettles, wooden cups, bowls, spoons, and sometimes tin or even silver basons; to which may be added the implements of fishing and hunting. That they may not be obliged to carry such a number of things with them in their excursions, they build in the forests, at certain distances, little huts, made like pigeon-houses, and placed upon the trunk of a tree, cut off at the height of about six feet from the root. In these elevated huts they keep their goods and provi-

sions; and though they are never shut, yet they are never plundered. The rein-deer supply the Laplanders with the greatest part of their provisions: the chase and the fishery supply the rest. Their principal dishes are the flesh of the rein-deer, and puddings which they make of their blood, by putting it, either alone or mixed with wild berries, into the stomach of the animal from whence it was taken, in which they cook it for food. But the flesh of the bear is considered by them as their most delicate meat. They eat every kind of fish, even the sea-dog; as well as all kinds of wild animals, not excepting birds of prey and carnivorous animals. Their winter provisions consist chiefly of flesh and fish dried in the open air, both of which they eat raw, without any sort of dressing. Their common drink is water, sometimes mixed with milk; they make also broths and fish-soups. Brandy is very scarce with them, but they are extremely fond of it. Whenever they are inclined to eat, the head of the family spreads a carpet on the ground; and the men and women squat round this mat, which is covered with dishes. Every Laplander always carries about him a knife, a spoon, and a little cup for drinking. Each has his portion separately given him, that no person may be injured; for they are great eaters. Before and after the meal they make a short prayer; and as soon as they have done eating, each gives the other his hand.

In their dress, the Laplanders use no kind of linen. The men wear close breeches, reaching down to their shoes, which are made of untanned skin, pointed and turned up before; and in winter they put a little hay in them. Their doublet is made to fit their shape, and open at the breast. Over this they wear a close coat with narrow sleeves, the skirts of which reach down to the knees, and which is fastened round them by a leathern girdle, ornamented with plates of tin or brass. To this girdle they tie their knives, their instruments for making fire, their pipes, and the rest of their smoaking-apparatus. Their clothes are made of fur, of leather, or of cloth; the close coat of cloth or leather, always bordered with fur, or bindings of cloth of different colours. Their caps are edged with fur, pointed at top, and the four seams adorned with lists of a different colour from that of the cap. The women wear breeches, shoes, doublets, and close coats, in the same manner as the men: but their girdle, at which they carry likewise the implements for smoaking tobacco, is commonly embroidered with brass wire. Their close coat has a collar, which comes up somewhat higher than that of the men. Besides these, they wear handkerchiefs, and little aprons, made of painted cloth, rings on their fingers, and ear-rings, to which they sometimes hang chains of silver, which pass two or three times round the neck. They are often dressed in caps folded after the manner of turbans. They wear also caps fitted to the shape of the head: and as they are much addicted to finery, they are all ornamented with the embroidery of brass wire, or at least with lists of different colours.

Lapland is but poorly peopled, owing to the general barrenness of its soil. The whole number of its inhabitants may amount to about 60,000. Both men and women are in general considerably shorter than more southern Europeans. Maupertuis measured a woman who was suckling her child, whose height did not exceed four feet two inches and about a half; they make however a much more agreeable appearance than the men, who are often ill-shaped and ugly, and their heads too large for their bodies. Their women are complaisant, chaste, often well made, and extremely nervous; which is also observable among the men, although more rarely. It frequently happens that a Lapland woman will faint away,

or even fall unexpected in its own things imaginable blows with themselves, are

or even fall into a fit of frenzy, on a spark of fire flying towards her, an unexpected noise, or the sudden sight of an unexpected object, though in its own nature not in the least alarming; in short, at the most trifling things imaginable. During these paroxysms of terror, they deal about blows with the first thing that presents itself; and, on coming to themselves, are utterly ignorant of all that has passed.

When a Laplander intends to marry, he, or his friends, court the father of the fair one with brandy; and when, with some difficulty, he gains admittance to his fair one, he offers her a beaver's tongue, or some other eatable, which she rejects before company, but accepts in private. Cohabitation often precedes marriage; but every admittance to the fair one is purchased from the father, by her lover, with a bottle of brandy; and this prolongs the courtship sometimes for three years. The priest of the parish at last celebrates the nuptials; but the bridegroom is obliged to serve his father-in-law for four years after. He then carries his wife and her fortune home.

COMMERCE.] Little can be said of the commerce of the Laplanders. Their exports consist of fish, rein-deer, furs, baskets, and toys; with some dried pikes, and cheeses made of rein-deer milk. They receive for their six-dollars, woollen cloths, linen, copper, tin, flour, oil, hides, needles, knives, spirituous liquors, tobacco, and other necessaries. Their mines are generally worked by foreigners, and produce no inconsiderable profit. The Laplanders travel in a kind of caravan, with their families, to the Finland and Norway fairs. The reader may make some estimate of the medium of commerce among them, when he is told, that fifty squirrel skins, or one fox skin, and a pair of Lapland shoes, produce one six-dollar; but no computation can be made of the public revenue, the greatest part of which is allotted for the maintenance of the clergy. With regard to the security of their property, few disputes happen; and their judges have no military to enforce their decrees, the people having a remarkable aversion to war; and never being, so far as we know, employed in any army.

Of Sweden Proper, the following are the subdivisions:

Uplandia,	Helsingia,
Sudermania,	Dalecarlia,
Westmania,	Medelpedia,
Nericia,	Angermania,
Geftricia,	Jemptia.

Of Gothland, the following are the subdivisions:

East Gothland,	Dalia,
West Gothland,	Schonen,
Smaland,	Bleking,
Wermeland,	Holland.

Of Swedish Lapland, the following are the subdivisions:

Thorne Lapmark,	Pithia Lapmark,
Kimi Lapmark	Uma Lapmark.
Lula Lapmark,	

The principal places in West Bothnia are Umea, Pitea, and Tornea.

Of Finland, the following are the subdivisions:

East Bothnia,	Nyland,
Cajania,	Travastia,
Savoloxia,	Finland Proper.

The Swedish isles are, Gothland, Oeland, Aland, and Rugen.

The face of Sweden is nearly similar to those of its neighbouring countries; only it has the advantage of navigable rivers.

CLIMATE AND SEASONS, SOIL, } In Sweden, summer bursts sudden-

more speedy than in southern climates; for the sun is here so hot as  
sometimes to set forests on fire. Stoves and warm furs mitigate the cold  
of winter, which is so intense, that the noses and extremities of the in-  
habitants are sometimes mortified; and in such cases, the best remedy  
that has been discovered, is rubbing the affected part with snow. The  
Swedes, since the days of Charles XII. have been at incredible pains to  
correct the native barrenness of their country, by erecting colleges of  
agriculture, and in some places with great success. The soil is much

the same with that of Denmark, and some parts of Norway, generally very bad, but in some vallies surprisngly fertile. The Swedes, till of late years, had not industry sufficient to remedy the one, nor improve the other. The peasants now follow the agriculture of France and England; and some late accounts say that they raise almost as much grain as maintains the natives. Gothland produces wheat, rye, barley, oats, peas, and beans; and in case of deficiency, the people are supplied from Livonia and the Baltic provinces. In summer the fields are verdant and covered with flowers, and produce strawberries, raspberries, currants, and other small fruits. The common people know, as yet, little of the cultivation of apples, peaches, nectarines, pine-apples, and the like high-flavoured fruits; but melons are brought to great perfection in dry seasons.

**MINERALS AND METALS.]** Sweden produces crystals, amethysts, topazes, porphyry, lapis-lazuli, agate, cornelian, marble, and other fossils. The chief wealth of Sweden, however, arises from her mines of silver, copper, lead, and iron. The last-mentioned metal employs no fewer than 450 forges, hammering-mills, and smelting-houses. A kind of a gold mine has likewise been discovered in Sweden, but so inconsiderable, that, from the year 1741 to 1747, it produced only 2,389 gold ducats, each valued at 9s. 4d. sterling. The first gallery of one silver-mine is 100 fathoms below the surface of the earth; the roof is supported by prodigious oaken beams; and from thence the miners descend about 40 fathoms to the lowest vein. This mine is said to produce 20,000 crowns a year. The product of the copper-mines is uncertain; but the whole is loaded with vast taxes and reductions to the government, which has no other resources for the exigencies of the state. These subterraneous mansions are astonishingly spacious, and at the same time commodious for their inhabitants, so that they seem to form a hidden world. The water-falls in Sweden afford excellent conveniency for turning mills for forges; and for some years the exports of Sweden for iron brought in 300,000 l. sterling. It is supposed that they constituted two-thirds of the national revenue. It must, however, be observed, that the exactions of the Swedish government, the importation of American bar-iron into Europe, and some other causes, have greatly diminished this manufacture.

**ANTIQUITIES AND CURIOSITIES, }** A few leagues from Gotten-  
**NATURAL AND ARTIFICIAL. }** burg there is a hideous precipice, down which a dreadful cataract of water rushes with such impetuosity from the height, into so deep a bed of water, that large masts, and other bodies of timber, precipitated down it, disappear for near an hour before they are recovered: the bottom of this bed has never been found, though sounded by lines of several hundred fathoms. A remarkable slimy lake, which sings things put into it, has been found in the southern parts of Gothland: and several parts of Sweden contain a stone, which being of a yellow colour, intermixed with several streaks of white, as if composed of gold and silver, affords sulphur, vitriol, alum, and minium. In the university of Upsal is preserved the famous *Codex Argenteus*, a manuscript, with silver letters, of a Gothic translation of the Gospels, by Ulphilas, a bishop of the Goths in Mœsia, who lived about 1300 years ago. It is very ancient and very imperfect, but equally curious and valuable, because it contains all that remains of the ancient Gothic language, the venerable parent of the Runic, the old Teutonic, and the Anglo-Saxon; and, consequently, of the modern English, German, Danish, Swedish, and Icelandic languages.

**SEAS.]** Their seas are the Baltic, and the gulfs of Bothnia and Fin-

land, which are arms of the Baltic; and on the west of Sweden are the Categate sea, and the Sound, a strait about four miles over, which divides Sweden from Denmark.

These seas have no tides, and are frozen up usually four months in the year; nor are they so salt as the ocean; never mixing with it, because a current sets always out of the Baltic sea into the ocean.

[QUADRUPEDS, BIRDS, AND FISHES.] These differ little from those already described in Norway and Denmark. The Swedish horses are more serviceable in war than the German. The Swedish hawks, when carried to France, have been known to revisit their native country, as appears from one that was killed in Finland, with an inscription on a small gold plate, signifying that he belonged to the French king. The fishes found in the rivers and lakes of Sweden are the same with those in other northern countries, and taken in such quantities, that several sorts of them, pikes in particular, are salted and pickled for exportation. The train-oil of the seals taken in the gulf of Finland is a considerable article of exportation.

[INHABITANTS, MANNERS, AND CUSTOMS.] The character of the Swedes has differed greatly in different ages; nor is it very uniform. At present their peasants seem to be a heavy plodding race of men, strong and hardy, but without any other ambition than that of subsisting themselves and their families as well as they can: the mercantile classes are much of the same cast; but great application and perseverance is discovered among them all. It seems difficult, however, to conceive that the modern Swedes are descendants of those, who, under Gustavus Adolphus and Charles XII. carried terror in their names through distant countries, and shook the foundations of the greatest empires. The intrigues of their senators drew them to take part in the war, called the seven-years' war, against Prussia; yet their behaviour was spiritless, and their courage contemptible. The principal nobility and gentry of Sweden are naturally brave, polite, and hospitable; they have high and warm notions of honour, and are jealous of their national interests. The dress, exercises, and diversions of the common people, are almost the same with those of Denmark: the better sort are infatuated with French modes and fashions. The women go to the plough, thresh out the corn, row upon the water, serve the bricklayers, carry burdens, and do all the common drudgeries in husbandry.

[RELIGION.] Christianity was introduced here in the 9th century. Their religion is Lutheran, which was propagated amongst them by Gustavus Vasa, about the year 1523. The Swedes are surprisingly uniform and unremitting in religious matters; and had such an aversion to popery, that castration was the fate of every Roman-catholic priest discovered in their country. The archbishop of Upsal has a revenue of about 400*l.* a year, and has under him 13 suffragans, besides superintendents, with moderate stipends. No clergyman has the least direction in the affairs of state; but their morals and the sanctity of their lives endear them so much to the people, that the government would repent making them its enemies. Their churches are neat, and often ornamented. A body of ecclesiastical laws and canons direct their religious economy. A conversion to popery, or a long continuance under excommunication, which cannot pass without the king's permission, is punished by imprisonment and exile.

[LANGUAGE, LEARNING, AND LEARNED MEN.] The Swedish language is a dialect of the Teutonic, and resembles that of Denmark. The Swedish nobility and gentry are, in general, more conversant in polite

literature than those of many other more flourishing states. They have of late exhibited some noble specimens of their munificence for the improvement of literature; witness their sending, at the expence of private persons, that excellent and candid natural philosopher Hasselquist into the eastern countries for discoveries, where he died. This noble spirit is eminently encouraged by the royal family; and her Swedish majesty purchased, at no inconsiderable expence for that country, all Hasselquist's collection of curiosities. That able civilian, statesman, and historian, Puffendorff, was a native of Sweden; and so was the late celebrated Linnæus, who contributed so eminently to the improvement of several branches of natural knowledge, particularly botany. The passion of the famous queen Christina for literature is well known; and she may be accounted a genius in many branches of science. Even in the midst of the late distractions of Sweden, the fine arts, particularly drawing, sculpture, and architecture, were encouraged and protected. Agricultural learning, both in theory and practice, is now carried to a considerable height in that kingdom; and the character given by some writers, that the Swedes are a dull heavy people, fitted only for bodily labour, is in a great measure owing to their having no opportunity of exerting their talents.

**UNIVERSITIES.**] The principal is that of Upsal, instituted near 400 years ago, and patronised by successive monarchs, particularly by the great Gustavus Adolphus, and his daughter queen Christina. There are near 1500 students in this university; but for the most part they are extremely indigent, and lodge, five or six together, in very poor hovels. The professors in different branches of literature are about twenty-two; of whom the principal are those of divinity, eloquence, botany, anatomy, chemistry, natural philosophy, astronomy, and agriculture. Their salaries are from 70*l.* to 100*l.* per annum. This university, justly called, by Stillingfleet, "that great and hitherto unrivalled school of natural history," is certainly the first seminary of the North for academical education, and has produced, from the time of its institution, persons eminent in every branch of science. The learned publications which have lately been given to the world by its members, sufficiently prove the flourishing state of literature in these parts; and the theses, composed by the students on their admission to their degrees, would form a very interesting collection. Many of these tracts, upon various subjects of polite literature, antiquities, languages, &c. evince the erudition and taste of the respective authors. Among the works of this sort, which have widely diffused the fame of this learned society throughout Europe, are the *Amenitates Academicæ*, or a Collection of Theses upon Natural History, held under the celebrated Linnæus, and chiefly selected by that master.

There is another university at Abo in Finland, but not so well endowed, nor so flourishing; and there was a third at Lunden, in Schonen, which is now fallen into decay. Every diocese is provided with a free-school, in which boys are qualified for the university\*.

**MANUFACTURES; TRADE, COMMERCE, AND CHIEF TOWNS.** } The Swedish commonalty subsist by agriculture, mining, grazing, hunting, and fishing. Their materials for traffic are the bulky and useful commodities of masts, beams, deal-boards, and other sorts of timber for shipping; tar, pitch, bark of trees, pot-ash, wooden utensils

\* An academy of arts and sciences was some years since established at Stockholm and is now in a flourishing condition. They have published several volumes of memoirs, which have been well received by the public.

hides, flax, hemp, peltry, furs, copper, lead, iron, cordage, and fish. Even the manufacturing of iron was introduced into Sweden so late as the 16th century; for till that time they sold their own crude ore to the Hanse towns, and bought it back again manufactured into utensils. About the middle of the 17th century, by the assistance of the Dutch and Flemings, they set up some manufactories of glass, starch, tin, woollens, silk, soap, leather-dressing, and saw-mills. Bookselling was at that time a trade unknown in Sweden. They have since had sugar-baking, tobacco-plantations, and manufactures of sail-cloth, cotton, fustian, and other stuffs; of linen, alum, and brimstone; paper-mills, and gun-powder-mills. Vast quantities of copper, brass, steel, and iron, are now wrought in Sweden. They have also founderies for cannon, forges for fire-arms and anchors; armouries, wire and slating mills; mills also for fulling, and for boring and stamping; and of late they have built many ships for sale.

Certain towns in Sweden, 24 in number, are called staple-towns, where the merchants are allowed to import and export commodities in their own ships. Those towns which have no foreign commerce, though lying near the sea, are called land-towns. A third kind are termed mine-towns, as belonging to the mine-districts. The Swedes, about the year 1752, had greatly increased their exports, and diminished their imports, most part of which arrive, or are sent off, in Swedish ships; the Swedes having now a kind of navigation act, like that of the English. These promising appearances were, however, frustrated by the improper management and jealousies of the Swedish government.

Stockholm is a staple-town, and the capital of the kingdom: it stands about 760 miles North-east of London, upon seven small rocky islands, besides two peninsulas, and is built upon piles. It strongly impresses a stranger with its singular and romantic scenery. A variety of contrasted and enchanting views are formed by numberless rocks of granite, rising boldly from the surface of the water, partly bare and craggy, partly dotted with houses, or feathered with wood. The harbour, which is spacious and convenient, though difficult of access, is an inlet of the Baltic: the water is clear as crystal, and of such depth that ships of the largest burden can approach the quay, which is of considerable breadth, and lined with spacious buildings and warehouses. At the extremity of the harbour several streets rise one above another, in the form of an amphitheatre; and the palace, a magnificent building, crowns the summit. Towards the sea, about two or three miles from the town, the harbour is contracted into a narrow strait, and, winding among high rocks, disappears from the sight; the prospect is terminated by distant hills, overspread with forest. It is far beyond the power of words, or of the pencil, to delineate these singular views. The central island, from which the city derives its name, and the Rittterholm, are the handsomest parts of the town.

Excepting in the suburbs, where the houses are of wood, painted red, the generality of the buildings are of stone, or brick succeeded white. The royal palace, which stands in the centre of Stockholm, and upon the highest spot of ground, was begun by Charles XI. It is a large quadrangular stone edifice, and the style of architecture is both elegant and magnificent\*.

The number of housekeepers who pay taxes are 60,000. This city is furnished with all the exterior marks of magnificence, and erections for manufactures and commerce that are common to other great European

[GOVERNMENT.] The government of Sweden has undergone many changes. The Swedes, like the Danes, were originally free, and during the course of many centuries the crown was elective; but after various revolutions, Charles XII. who was killed in 1718, became despotic. He was succeeded by his sister Ulrica, who consented to the abolition of despotism, and restored the states to their former liberties; and they, in return, associated her husband, the landgrave of Hesse-Cassel, with her in the government. A new model of the constitution was then drawn up, by which the royal power was brought, perhaps, too low; for the king of Sweden could scarcely be called by that name, being limited in every exercise of government, and even in the education of his own children. The diet of the states appointed the great officers of the kingdom; and all the employments of any value, ecclesiastical, civil, or military, were conferred by the king; only with the approbation of the senate. The estates were formed of deputies from the four orders; nobility, clergy, burghers, and peasants. The representatives of the nobility, which included the gentry, amounted to above 1000, those of the clergy to 200, the burghers to about 150, and the peasants to 250. Each order sat in its own house, and had its own speaker; and each chose a secret committee for the dispatch of business. The states were to be convoked once in three years, in the month of January; and their collective body had greater power than the parliament of Great Britain, because the king's prerogative was more bounded.

When the states were not sitting, the affairs of the public were managed by the king and the senate; which were no other than a committee of the states, but chosen in a particular manner. The nobility, or upper-house, appointed 24 deputies, the clergy 12, and the burghers 12; these chose three persons, who were to be presented to the king, that he might nominate one out of the three for each vacancy. The peasants had no vote in electing a senator. Almost all the executive power was lodged in the senate, which consisted of 14 members, besides the chief governors of the provinces, the president of the chancery, and the grand-marshal. Those senators, during the recess of the states, formed the king's privy-council; but he had no more than a casting vote in their deliberations. Appeals lay to them from different courts of judicature; but each senator was accountable to the states for his conduct in the senate. Thus, upon the whole, the government of Sweden might be called republican; for the king's power was not so great as that of a stadtholder. The senate had even a power of imposing upon the king a sub-committee of their number, who were to attend upon his person, and to be a check upon all his proceedings, down to the very management of his family. It would be endless to recount the numerous subordinate courts, boards, commissions, and tribunals, which the jealousy of the Swedes had introduced into the civil, military, commercial, and other departments. Their officers and ministers, under the notion of making them checks upon one another, were multiplied to an inconvenient degree; and the operations of government were greatly retarded, if not rendered ineffectual, by the tedious forms through which they must pass.

But in August, 1772, the whole system of the Swedish government was totally changed by the late king, in the most unexpected manner. The circumstances which attended this extraordinary revolution will be found in our history of Sweden. By that event the Swedes, instead of

having the particular defects of their constitution rectified, found their king invested with a degree of authority little inferior to that of the most despotic princes of Europe. By the new form of government, the king may assemble and separate the states whenever he pleases: he has the sole disposal of the army, the navy, the finances, and all employments civil and military; and though he cannot openly claim a power of imposing taxes on all occasions, yet such as already subsist are to be perpetual; and, in case of invasion or pressing necessity, he may impose some taxes till the states can be assembled; but of this necessity he is to be the judge, and the meeting of the states depends wholly upon his will and pleasure; and when they are assembled, they are to deliberate upon nothing but what the king thinks proper to lay before them. It is easy to perceive, that a government thus constituted can be little removed from one of the most despotic kind. Yet, in order to amuse the nation with some slight appearances of a legal and limited government in the new system, which consists of fifty-seven articles, a senate is appointed, consisting of seventeen members, comprehending the great officers of the crown and the governor of Pomerania; and they are required to give their advice in all the affairs of the state, whenever the king shall demand it. In that case, if the questions agitated are of great importance, and the advice of the senators should be contrary to the opinion of the king, and they unanimous therein, the king, it is said, shall follow their advice. But this, it may be observed, is a circumstance that can hardly ever happen, that all the members of a senate, consisting chiefly of officers of the crown, should give their opinions against the king; and in every other case the king is to hear their opinions, and then to act as he thinks proper. There are some other apparent restraints of the royal power in the new system of government; but they are in reality very inconsiderable. It is said, indeed, that the king cannot establish any new law, nor abolish any old one, without the knowledge and consent of the states: but the king of Sweden, according to the present constitution, is invested with so much authority, power, and influence, that it is hardly to be expected that any person will venture to make an opposition to whatever he shall propose.

**PUNISHMENTS.]** The common methods of execution in Sweden are beheading and hanging: for murder, the hand of the criminal is first chopped off, and he is then beheaded and quartered; women, after beheading, instead of being quartered, are burned. No capital punishment is inflicted without the sentence being confirmed by the king. Every prisoner is at liberty to petition the king, within a month after the trial. The petition either complains of unjust condemnation, and in such a case demands a revival of the sentence; or else prays for pardon, or a mitigation of punishment. Malefactors are never put to death, except for very atrocious crimes; such as murder, house-breaking, robbery upon the highway, or repeated thefts. Other crimes, many of which in some countries are considered as capital, are chiefly punished by whipping, condemnation to live upon bread and water, imprisonment and hard labour, either for life or for a stated time, according to the nature of the crime. Criminals were tortured to extort confession, till the reign of the late king; but in 1773, his Swedish majesty abolished this cruel and absurd practice.

**POLITICAL INTERESTS OF SWEDEN.]** In the reign of Gustavus Vasa, a treaty of alliance first took place between Sweden and France; and afterwards Sweden also entered into a subsidiary treaty with France, in the reign of Gustavus Adolphus. In consequence of these treaties, France

by degrees acquired an ascendancy in Sweden, which was very pernicious to the interests of that kingdom. This crown has generally received a subsidy from France for above 100 years past, and has suffered greatly by it. During the reigns of Charles the XIth and Charles the XIIth, Sweden was sacrificed to the interest of France; and during the war with the king of Prussia, usually called the seven-years' war, for the sake of a small subsidy from France, the crown of Sweden was forced to contract a debt of 3,500,000*l*. which has since been considerably augmented; so that this debt now amounts to near five millions. Some of their ablest statesmen have perceived the mischievous tendency of their connexion with France, and have endeavoured to put an end to it; but the influence of the French court in Sweden, in consequence of their subsidies and intrigues, has occasioned considerable factions in that kingdom. In 1738, a most powerful party appeared in the diet, in favour of French measures. The persons who composed it went under the denomination of the *Hats*. The object set out to the nation was the recovery of some of the dominions yielded to Russia; and consequently the system they were to proceed upon was to break with that power, and connect themselves with France. The party directly opposed to them was headed by count Horn, and those who had contributed to establish the new form of government, which was settled after the death of Charles XII. Their object was peace, and the promotion of the domestic welfare of the nation. The system, therefore, which they adopted, was to maintain a close correspondence with Russia, and to avoid all farther connexion with France. These were styled the *Caps*. There was besides a third party, called the *Hunting-Caps*, composed of persons who were as yet undetermined to which of the other two they would join themselves. These parties long continued; but the French party generally prevailed, greatly to the detriment of the real interests of the kingdom. Some efforts were employed by the English court to lessen or destroy the French influence in Sweden, and for some time they were successful; but the Hat party again acquired the ascendancy. These parties, however, are now abolished, in consequence of the late king of Sweden having made such a total change in the constitution of the government.

REVENUE AND COIN.] The revenue of Sweden, by the unfortunate wars of Charles XII. and with the Russians since, has been greatly reduced. Livonia, Bremen, Verden, and other places disunited from that kingdom, contain about 78,000 square miles. Her gold and silver specie, in the late reign, arose chiefly from the king's German dominions. Formerly, the crown lands, poll-money, tithes, mines, and other articles, are said to have produced one million sterling. The payments that are made in copper, which is here the chief medium of commerce, are extremely inconvenient; some of those pieces being as large as tiles; and a cart or wheelbarrow is often required to carry home a moderate sum. The Swedes, however, have gold ducats, and eight-mark pieces of silver, valued each at 5*s*. 2*d*.; but these are very scarce, and the inhabitants of Sweden have now very little specie in circulation: large pieces of copper stamped, and small bank notes, being almost their only circulating money.

STRENGTH AND FORCES.] No country in the world has produced greater heroes, or braver troops, than the Swedes: and yet they cannot be said to maintain a standing army, as their forces principally consist of a regulated militia. The cavalry is clothed, armed, and maintained, by a rate raised upon the nobility and gentry, according to their estates; and

and the infantry by the peasants. Each province is obliged to find its proportion of soldiers, according to the number of farms it contains; every farm of 60 or 70 l. per annum is charged with a foot soldier, furnishing him with diet, lodging, and ordinary clothes, and about 20s. a year in money; or else a little wooden house is built him by the farmer, who allows him hay and pasturage for a cow, and ploughs and sows land enough to supply him with bread. When embodied, they are subject to military law, but otherwise to the civil law of the country. It may therefore literally be said that every Swedish soldier has a property in the country he defends. In 1791 the standing regiments amounted to 13,600 infantry and 1,000 cavalry; and the national troops to 22,500 infantry, 7,000 cavalry, and 3,500 dragoons\*. Sweden formerly could have fitted out 40 ships of the line; but of late years their ships, together with their docks, have been suffered greatly to decay.

**ROYAL STYLE.]** The King's style is, King of the Goths and Vandals, great prince of Finland, duke of Schonen, Pomerania, &c.

**ORDERS OF KNIGHTHOOD.]** These are the order of the North or Polar Star, consisting of twenty-four members; the order of *Vasa*; and the order of the *Sword*; the last created in 1772.

**HISTORY OF SWEDEN.]** The Goths, the ancient inhabitants of this country, joined by the Normans, Danes, Saxons, Vandals, &c. have had the reputation of subduing the Roman empire, and all the southern nations of Europe. The introduction of Christianity by Ansgarius, bishop of Bremen, in 829, seems to present the first certain period of the Swedish history.

The history of this kingdom, and indeed of all the northern nations, even during the first ages of Christianity, is confused and uninteresting, and often doubtful; but sufficiently replete with murders, massacres, and ravages. That of Sweden is void of consistency till about the middle of the fourteenth century, when it assumes a more regular appearance. At this time, however, the government of the Swedes was far from being clearly ascertained or uniformly administered. The crown was elective; though in this election the rights of blood were not altogether disregarded. The great lords possessed the most considerable part of the wealth of the kingdom, which consisted chiefly in land; commerce being unknown or neglected, and even agriculture itself in a very rude and imperfect state. The clergy, particularly those of a dignified rank, from the great respect paid to their character among the inhabitants of the North, had acquired an immense influence in all public affairs, and obtained possession of what lands had been left unoccupied by the nobility. These two ranks of men, enjoying all the property of the state, formed a council, called the Senate, which deliberated on all public affairs. This system of government was extremely unfavourable to the national prosperity. The Swedes perished in the dissensions between their prelates and lay-barons, or between those and their sovereign; they were drained of the little riches they possessed, to support the indolent pomp of a few magnificent bishops; and, what was still more fatal, the unlucky situation of their internal affairs exposed them to the inroads and oppression of a foreign enemy. These were the Danes, who, by their neighbourhood and power, were always able to avail themselves of the dissensions of Sweden, and to subject under a foreign yoke a country weakened and exhausted by its domestic broils. In this deplorable situation Sweden remained for more than two centuries; sometimes under a

nominal subjection to its own princes, sometimes united to the kingdom of Denmark, and in either case equally oppressed and insulted.

Magnus Ladislaus, crowned in 1276, seems to have been the first king of Sweden who pursued a regular system to increase his authority; and to succeed in this, he made the augmentation of the revenues of the crown his principal object. He was one of the ablest princes who ever sat on the Swedish throne: by his art and address he prevailed upon the convention of estates to make very extraordinary grants to him for the support of his royal dignity. The augmentation of the revenues of the crown was naturally followed by a proportionable increase of the regal power: and whilst, by the steady and vigorous exertion of this power, Magnus humbled the haughty spirit of the nobles, and created in the rest of the nation a respect for the royal dignity, with which they appear before to have been but little acquainted, he, at the same time, by employing his authority in many respects for the public good, reconciled his subjects to acts of power, which in former monarchs they would have opposed with the utmost violence. The successors of Magnus did not maintain their authority with equal ability; and several commotions and revolutions followed, which threw the nation into great confusion.

In the year 1387, Margaret, daughter of Valdemar king of Denmark, and widow of Huguin, king of Norway, reigned in both these kingdoms. That princess, to the ordinary ambition of her sex, added a penetration and enlargement of mind, which rendered her capable of conducting the greatest and most complicated designs. She has been called the Semiramis of the North, because, like Semiramis, she found means to reduce by arms, or by intrigue, an immense extent of territory; and became queen of Denmark, Norway, and Sweden, being elected to the throne of the latter in 1364. She projected the union of Calmar, so famous in the North; by which these kingdoms were for the future to remain under one sovereign, elected by each kingdom in its turn, and who should divide his residence between them all. Several revolutions ensued after the death of Margaret; and at length Christian II. the last king of Denmark who, by virtue of the treaty of Calmar, was also king of Sweden, engaged in a scheme to render himself entirely absolute. The barbarous policy by which he attempted to effect this design proved the destruction of himself, and afforded an opportunity for changing the face of affairs in Sweden. In order to establish his authority in that kingdom, he laid a plot for massacring the principal nobility. This horrid design was actually carried into execution, Nov. 8, 1520. Of all those who could oppose the despotic purposes of Christian, no one remained in Sweden but Gustavus Vasa, a young prince descended from the ancient kings of that country, and who had already signalised his arms against the king of Denmark. An immense price was set upon his head. The Danish soldiers were sent in pursuit of him; but by his dexterity and address he eluded all their attempts, and escaped under the disguise of a peasant to the mountains of Dalecarlia. After undergoing innumerable dangers and fatigues, and working in the brass-mines to prevent being discovered, he was betrayed by those in whom he reposed his confidence; but at length surmounting a thousand obstacles, engaged the savage but warlike inhabitants of Dalecarlia to undertake his cause, to oppose and to conquer his tyrannical oppressor. Sweden by his means again acquired independence. The ancient nobility were mostly destroyed. Gustavus was at the head of a victorious army, who admired his valour, and were attached to his person. He was created therefore first administrator, and afterwards king of Sweden, by universal consent,

and with the shouts of the whole nation. His circumstances were much more favourable than those of any former prince who had possessed this dignity. The massacre of the nobles had freed him from those proud and haughty enemies, who had so long been the bane of all regular government in Sweden. The clergy, indeed, were no less powerful than dangerous; but the opinions of Luther, which began at this time to prevail in the North, and the credit which they had acquired among the Swedes, gave him an opportunity of changing the religious system of that country; and the exercise of the Roman-catholic religion was prohibited in the year 1544, under the severest penalties, which have never yet been relaxed. Instead of a Gothic aristocracy, the most turbulent of all governments, and, when empoisoned by religious tyranny, of all governments the most wretched, Sweden, in this manner, became a regular monarchy. Some favourable effects of this change were soon visible: arts and manufactures were established and improved; navigation and commerce began to flourish; letters and civil improvements were introduced; and a kingdom, known only by name to the rest of Europe, began to be formidable by its arms, and to have a certain weight in all public treaties and deliberations.

Gustavus died in 1559, while his eldest son Eric was preparing to embark for England to marry queen Elizabeth.

Under Eric, who succeeded his father Gustavus Vasa, the titles of count and baron were introduced into Sweden, and made hereditary. Eric's miserable and causeless jealousy of his brothers forced them to take up arms; and the senate siding with them, he was deposed in 1560. His brother John succeeded him, and entered into a ruinous war with Russia. John attempted, by the advice of his queen, to re-establish the catholic religion in Sweden; but, though he made strong efforts for that purpose, and even reconciled himself to the pope, he was opposed by his brother Charles, and the scheme proved ineffectual. His son Sigismund was chosen king of Poland in 1587; upon which he endeavoured again to restore the Roman-catholic religion in his dominions; but he died in 1592.

Charles, brother to John, was chosen administrator of Sweden; and being a strenuous protestant, his nephew Sigismund endeavoured to drive him from the administratorship, but without effect; till at last he and his family were excluded from the succession to the crown, which was conferred upon Charles in 1599. The reign of Charles, through the practices of Sigismund, who was a powerful prince, and at the head of a great party both in Sweden and Russia, was turbulent; which gave the Danes encouragement to invade Sweden. Their conduct was checked by the great Gustavus Adolphus, heir apparent to the crown of Sweden, though then a minor. Upon the death of his father, which happened in 1611, he was declared of age by the states, though then only in his eighteenth year. Gustavus, soon after his accession, found himself, through the power and intrigues of the Poles, Russians, and Danes, engaged in a war with all his neighbours, under infinite disadvantages, all which he surmounted. He had nearly rendered himself sovereign of Russia. In 1617, he made a peace under the mediation of James I. of England, by which he recovered Livonia, and four towns in the prefecture of Novogorod, with which he likewise received a sum of money.

The ideas of Gustavus began now to extend. He had seen a vast deal of military service, and he was assisted by the counsels of La Gardie, one of the best generals and wisest statesmen of his age. His troops

had become princes of enterprising mind, who in which he only by the racter, that deracy for r a continued ing Riga, a victorious; Germans of Austrian ge Franconia. Austrian ge against Gust gaining a v period to th

station; and continued to marry, the r duke of Deu

Charles h John Casim ance, which upon the ice of a fever in years of age guardians to Swedes gave All differenc Holland; an the affairs o

had become the best disciplined and most warlike in Europe. The princes of the house of Austria were, it is certain, early jealous of his enterprising spirit, and supported his ancient implacable enemy Sigismund, whom he defeated. In 1627, he formed the siege of Dantzick, in which he was unsuccessful; but the attempt, which was defeated only by the sudden rise of the Vittula, added so much to his military character, that the protestant princes placed him at the head of the confederacy for reducing the house of Austria. His life, from that time, was a continued chain of the most rapid and wonderful successes. After taking Riga, and over-running Livonia, he entered Poland, where he was victorious; and from thence, in 1630, he landed in Pomerania, drove the Gerinans out of Mecklenburg, defeated the famous count Tilly, the Austrian general, who was till then thought invincible, and over-ran Franconia. Upon the defeat and death of Tilly, Wallenstein, another Austrian general, of equal reputation, was appointed to the command against Gustavus, who was killed upon the plain of Lutzen in 1632, after gaining a victory, which, had he survived, would probably have put a period to the Austrian greatness.

The amazing abilities of Gustavus Adolphus, both in the cabinet and the field, never appeared so fully as after his death. He left behind him a set of generals trained by himself, who maintained the glory of the Swedish army with most astonishing valour and success. The names of duke Bernard, Bannier, Torstenson, Wrangel, and others, and their prodigious actions in war, will long live in the annals of Europe. It is uncertain what course Gustavus would have pursued, had his life been prolonged, and his successes continued; but there is the strongest reason to believe, that he had in view somewhat more than the relief of the protestants, and the restoration of the Palatine family. His chancellor Oxenstiern was as consummate a politician as he was a warrior; and during the minority of his daughter Christina, he managed the affairs of Sweden with such success, that she in a manner dictated the peace of Westphalia, 1648, which gave a new system to the affairs of Europe.

Christina was but six years of age when her father was killed. She received a noble education; but her fine genius took an uncommon and indeed romantic turn. She invited to her court Descartes, Salmasius, and other learned men, to whom she was not, however, extremely liberal. She expressed a value for Grotius; and she was an excellent judge of the polite arts, but illiberal and indelicate in the choice of her private favourites. She at the same time discharged all the duties of her high station; and though her generals were basely betrayed by France, she continued to support the honour of her crown. Being resolved not to marry, she resigned her crown to her cousin Charles Gustavus, son to the duke of Deux-Ponts, in 1654.

Charles had great success against the Poles: he drove their king, John Casimir, into Silesia; and received from them an oath of allegiance, which, with their usual inconstancy, they broke. His progress upon the ice against Denmark has been already mentioned; and he died of a fever in 1660. His son and successor, Charles XI. was not five years of age at his father's death; and this rendered it necessary for his guardians to conclude a peace with their neighbours, by which the Swedes gave up the island of Bornholm, and Drontheim in Norway. All differences were accommodated at the same time with Russia and Holland; and Sweden continued to make a very respectable figure in the affairs of Europe. When Charles came to be of age, he received a

subsidy from the French king, Lewis XIV.; but perceiving the liberties of Europe to be in danger from that monarch's ambition, he entered into the alliance with England and Holland. He afterwards joined with France against the house of Austria; but being defeated in Germany at Esem Bellin, a powerful confederacy was formed against him. The elector of Brandenburg made himself master of Swedish Pomerania; the bishop of Munster over-ran Bremen and Verden, and the Danes took Wismar, and several places in Schonen. They were afterwards beaten; and Charles, by the treaty of St. Germain, which followed that of Nimeguen in 1678, recovered all he had lost, except some places in Germany. He then married Ulrica-Leonora, the king of Denmark's sister; but made a base use of the tranquillity he had regained, by employing his army to enslave his people. The states lost all their power; and Sweden was now reduced to the condition of Denmark. He ordered the brave Patkul, who was at the head of the Livonian deputies, to lose his head and his right hand, for the boldness of his remonstrance in favour of his countrymen; but he saved himself by flight; and Charles became so powerful, that the conferences for a general peace at Ryfsvick, 1697, were opened under his mediation.

Charles XI. died in 1697, and was succeeded by his minor son, the famous Charles XII. The history of no prince is better known than that of this hero. His father's will had fixed the age of his majority to eighteen; but it was set aside for an earlier date by the management of count Piper, who became in consequence his first minister. Soon after his accession, the kings of Denmark and Poland, and the czar of Muscovy, formed a powerful confederacy against him, encouraged by the mean opinion they had of his youth and abilities. He entered into a war with them all; and besieging Copenhagen, dictated the peace of Travendahl to his Danish majesty, by which the duke of Holstein was re-established in his dominions. The czar Peter was at that time ravaging Ingria, at the head of 80,000 men, and had besieged Narva. The army of Charles did not exceed 20,000 men; but such was his impatience, that he advanced at the head of 8000, entirely routed the main body of the Russians, and raised the siege. Such were his successes, and so numerous his prisoners, that the Russians attributed his actions to necromancy. Charles from thence marched into Saxony, where his warlike achievements equalled if they did not excel those of Gustavus Adolphus. He dethroned Augustus king of Poland; but stained all his laurels by putting the brave count Patkul to a death equally cruel and ignominious. He raised Stanislaus to the crown of Poland in 1703; and his name carried with it such terror, that he was courted by all the powers of Europe, and among others by the duke of Marlborough in the name of queen Anne, amidst the full career of her successes against France. His stubbornness and implacable disposition, however, were such, that he cannot be considered in a better light than that of an illustrious madman; for he lost, in the battle of Pultowa, 1709, which he fought in his march to dethrone the czar, more than all he had gained by his victories. His brave army was ruined, and he was forced to take refuge among the Turks at Bender. His actions there, in attempting to defend himself with 300 Swedes against 30,000 Turks, prove him to have been worse than frantic. The Turks found it, however, convenient for their affairs to set him at liberty. But his misfortunes did not cure his military madness; and after his return to his dominions, he prosecuted his revenge against Denmark, till he was killed by a cannon shot, as it is generally said, at the siege of Fredericks-

hall, in November more than was not in that a piff which put is said to b And it app had lost th riches; an and pernici to his coun

Gustavus claimed king he had an ir tion. He v wrote in the that he desi

hall, in Norway, belonging to the Danes, in 1718, when he was no more than thirty-six years of age. It has been supposed that Charles was not in reality killed by a shot from the walls of Fredericshall, but that a pistol, from one of those about him, gave the decisive blow which put an end to the life of this celebrated monarch. This opinion is said to be very prevalent among the best informed persons in Sweden. And it appears that the Swedes were tired of a prince under whom they had lost their richest provinces, their bravest troops, and their national riches; and who yet, untamed by adversity, pursued an unsuccessful and pernicious war, nor would ever have consented to restore tranquillity to his country.

Charles XII. was succeeded by his sister, the princess Ulrica Eleonora, wife to the hereditary prince of Hesse. We have seen in what manner the Swedes recovered their liberties; and given some account of the capitulation signed by the queen and her husband. Their first care was to make peace with Great-Britain, which the late king intended to have invaded. The Swedes then, to prevent farther losses by the progress of the Russian, the Danish, the Saxon, and other arms, made many and great sacrifices to obtain peace from those powers. The French, however, about the year 1738, formed that dangerous party in the kingdom under the name of the *Hats*, which has already been mentioned, and which not only broke the internal quiet of the kingdom, but led it into a ruinous war with Russia. Their Swedish majesties having no children, it was necessary to settle the succession; especially as the duke of Holstein was descended from the queen's eldest sister, and was at the same time the presumptive heir to the empire of Russia. Four competitors appeared; the duke of Holstein Gottorp, prince Frederic of Hesse-Cassel, nephew to the king, the prince of Denmark, and the duke of Deux-Ponts. The duke of Holstein would have carried the election, had he not embraced the Greek religion, that he might mount the throne of Russia. The czarina interposed, and offered to restore all the conquests she had made from Sweden, excepting a small district in Finland, if the Swedes would receive the duke of Holstein's uncle, the bishop of Lubeck, as their hereditary prince and successor to their crown. This was agreed to; and a peace was concluded at Abo, under the mediation of his Britannic majesty. This peace was so firmly adhered to by the czarina, that his Danish majesty thought proper to drop all his resentment, and forget the indignity done to his son. The successor of this prince, Adolphus Frederic, married the princess Ulrica, sister to the king of Prussia, and entered into the possession of his new dignity in 1751. He was a prince of a mild and gentle temper, but much harassed by the contending Swedish factions, and found his situation extremely troublesome, in consequence of the restraints and opposition which he met with from the senate. He passed the greatest part of his reign very disagreeably, and was at length, through the intrigues of the queen, brought over to the French party. He died in February 1771, and was succeeded by his son, Gustavus the Third, the late king, who possessed abilities greatly superior to those of his father.

Gustavus was about five and twenty years of age when he was proclaimed king of Sweden: his understanding had been much cultivated; he had an insinuating address, and a graceful and commanding elocution. He was at Paris at the time of his father's death, whence he wrote in the most gracious terms to the senate, repeatedly assuring them that he designed to govern according to the laws. In consequence of

the death of his predecessor, an extraordinary diet was called to regulate the affairs of the government, and to settle the form of the coronation-oath. Some time after his arrival in Sweden, on the 28th of March, 1772, his majesty solemnly signed and swore to observe twenty-four articles relative to his future administration of government. This was termed a capitulation; and among the articles were the following: "The king promises before God to support the government of the kingdom, as now established; to maintain the rights and liberties of the states, the liberty and security of all his subjects, and to reign with gentleness and equity according to the laws of the kingdom, the form of the regency as it was established in the year 1720, and conformable to the present act of capitulation. In consequence of the declaration of the states, the king will regard any person who shall openly or clandestinely endeavour to introduce absolute sovereignty, as an enemy to the kingdom, and as a traitor to his country, since every person must take an oath to this purpose before he can receive possession of any employment. With regard to the affairs of the cabinet and the senate, the king promises to follow the regulations of the year 1720 upon that head, according to which they are to be directed always by a majority of votes, and he engages never to act without, and much less against, their advice. To the end that the council of state may be so much the more convinced of the inviolable designs of his majesty, and of his sincere love for the good of his people, he declares them to be entirely disengaged from their oath of fidelity, in case that he wilfully acts contrary to his coronation-oath, and to this capitulation. And lastly, the king threatens any person with his highest displeasure who shall be so inconsiderate as to propose to him a greater degree of power and splendor than is marked out in this act of capitulation, as his majesty desires only to secure the affections of his faithful subjects, and to be their powerful defender against any attempts which may be made upon their lawful liberties."

But scarcely had the king taken these solemn oaths to rule according to the then established form of government, and accepted the crown upon these conditions, before he formed a plan to govern as he thought proper; regarding these oaths only as matters of ceremony. He made use of every art, the most profound dissimulation, and the utmost dexterity and address, in order to render this hazardous enterprise successful. On his first arrival at Stockholm, he adopted every method which could increase his popularity. Three times a week he regularly gave audience to all who presented themselves. Neither rank, fortune, nor interest, were necessary to obtain access to him; it was sufficient to have been injured, and to have a legal cause of complaint to lay before him. He listened to the meanest of his subjects with affability, and entered into the minutest details that concerned them: he informed himself of their private affairs, and seemed to interest himself in their happiness. This conduct caused him to be considered as truly the father of his people, and the Swedes began to idolise him. In the mean time there happened some contentions between the different orders of the Swedish states; and no methods were left untried to foment these jealousies. emissaries were likewise planted in every part of the kingdom, for the purpose of sowing discontent among the inhabitants, of rendering them disaffected to the established government, and of exciting them to an insurrection. At length, when the king found his scheme ripe for execution, having taken the proper measures for bring-

ing a considerable, on the 19th of March, the institution of government of all the military bayonets of the senate were that no new transaction in the city, cannon-lace, the bridges, the avenues, the streets, were lighted; all without a passport, senators were many others who of Sweden were employed in various oaths of fidelity militia. Oath, to whom that his only in by suppressing government, revised laws of Sweden said he, "as power, or wh greatest glory. Heralds then w claim an affirmation contained himself, he sho try.

ing a considerable number of the officers and soldiers\* into his interest, on the 19th of August 1772 he totally overturned the Swedish constitution of government. In less than an hour he made himself master of all the military force of Stockholm. He planted grenadiers, with their bayonets fixed, at the door of the council-chamber in which the senate were assembled, and made all the members of it prisoners. And that no news might be carried to any other part of Sweden of the transaction in which the king was engaged, till the scheme was completed, cannon were drawn from the arsenal, and planted at the palace, the bridges, and other parts of the town, and particularly at all the avenues leading to it. Soldiers stood over these with matches ready lighted; all communication with the country was cut off, no one without a passport from the king being allowed to leave the city. The senators were then confined in separate apartments of the palace; and many others who were supposed to be zealously attached to the liberties of Sweden were put under arrest. The remainder of the day the king employed in visiting different quarters of the town, in order to receive oaths of fidelity to him from the magistrates, the colleges, and city militia. Oaths were also tendered the next day to the public in general, to whom he addressed a speech, which he concluded by declaring that his only intention was to restore tranquillity to his native country, by suppressing licentiousness, overturning the aristocratic form of government, reviving the old Swedish liberty, and restoring the ancient laws of Sweden, such as they were before 1680. "I renounce now," said he, "as I have already done, all idea of the abhorred absolute power, or what is called *sovereignty*, esteeming it now, as before, my greatest glory to be the first citizen among a truly free people." Heralds then went through the different quarters of the town to proclaim an assembly of the states for the following day. This proclamation contained a threat, that if any member of the diet should absent himself, he should be considered and treated as a traitor to his country.

On the morning of the 21st of August, a large detachment of guards was ordered to take possession of the square where the house of nobles stands. The palace was invested on all sides with troops, and cannon were planted in the court facing the hall where the states were to be assembled. These were not only charged, but soldiers stood over them with matches ready lighted in their hands. The several orders of the states were here compelled to assemble by the king's command; and these military preparations were made in order to assist their deliberations. The king being seated on his throne, surrounded by his guards, and a numerous band of officers, after having addressed a speech to the states, ordered a secretary to read a new form of government, which he offered to the states for their acceptance. As they were surrounded by an armed force, they thought proper to comply with what was required of them. The marshal of the diet, and the speakers of the other orders, signed the form of government; and the states took the oath to the king, which he dictated to them himself. This extraordinary transaction was

\* The fidelity which was manifested by a private soldier, on this occasion, deserves to be recorded. The night preceding the revolution, the king, being desirous of visiting the arsenal, went thither, and ordered the sentinel to admit him. The latter refused. "Do you know whom you are speaking to?" said the king. "Yes," replied the soldier; "but I likewise know my duty."—*Vide* a very judicious and well-written account of this extraordinary revolution in Sweden, published by Charles Francis Sheridan, esq. who was secretary to the British envoy in Sweden at the time of the revolution.

concluded in a manner equally extraordinary. The king drew a book of psalms from his pocket, and, taking off his crown, began to sing *Te Deum*, in which he was joined by the assembly. He afterwards gave them to understand, that he intended in six years' time again to convene an assembly of the states. Thus was this great revolution completed without any bloodshed, in which the Swedes surrendered that constitution which their forefathers had bequeathed to them after the death of Charles the Twelfth, as a bulwark against any despotic attempts of their future monarchs.

The exorbitant power which Gustavus the Third had thus assumed, he exercised with some degree of moderation; and at an assembly of the states in 1786, after many points were referred to them by the king, and debated with great freedom, he dismissed them with condensation and gentleness, at the same time remitting a tenth part of the subsidy which they had granted him.

On the 12th of July, 1788, hostilities commenced on the frontiers of Finland, between a body of Russian light troops, and a detachment of the Swedes posted on the bridge of Pomahund. After various engagements both by land and sea, in which Gustavus displayed the greatest abilities, an agreement for establishing an everlasting peace, and fixing the frontiers of Russia as they were before the war broke out, was signed at Werela, on the river Kymene, between the plenipotentiaries of the empress of Russia and the king of Sweden.

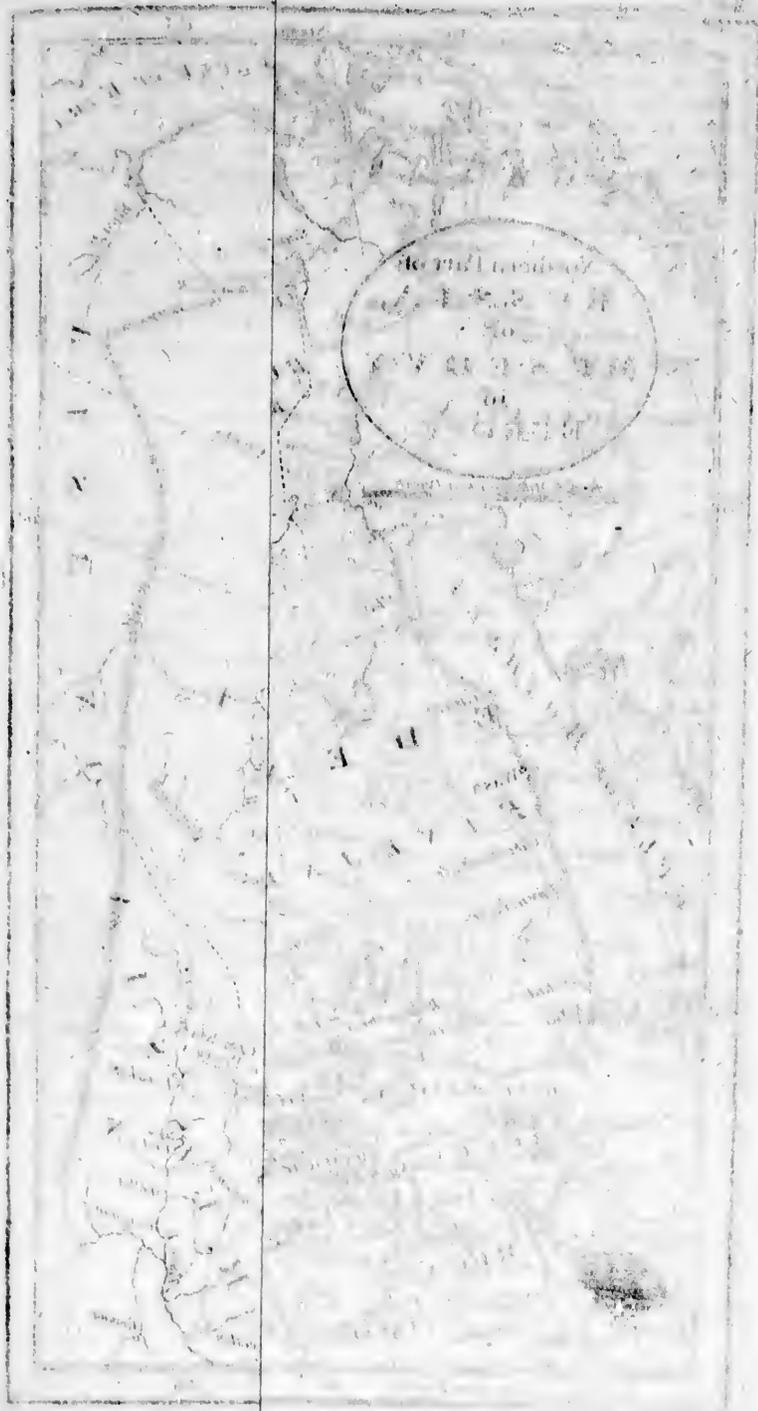

A diet summoned by the king to meet at Gesslé, a solitary place on the Bothnic Gulf, near seventy miles from Stockholm, excited much attention. Some imagined that the diet might assert the national freedom against a despotic monarch; but Gustavus had guarded against any such design, by his choice of the spot, and surrounding it with his mercenary troops. He found some difficulty in gaining his only intention, that of raising money, and was obliged to be satisfied with a part of his demand.

The diet being dissolved, the king returned to Stockholm, where, at a masquerade in the opera-house, on the night of the 16th of March, 1792, he was shot with a pistol by an assassin, named Ankerstroem, in consequence of a conspiracy among some of the discontented nobles; and having survived in great pain till the 29th of that month, he expired, in the forty-fifth year of his reign.

The reflection of dying ingloriously by the hand of a vile assassin is said to have embittered the last moments of the king's life much more than even the agonising pain of his wounds. He showed the same noble and brave spirit on his death-bed as he had done before his enemies during his life-time. He retained all his mental faculties to the last, which enabled him so well to arrange the future government of his country.

The wounds at first indicated the most promising appearance of recovery, and the slugs were all extracted: but some rusty pieces of iron had penetrated so far into the body as to render any surgical operation immediate death. The presence of mind shown by Gustavus during his illness was very great. While he waited for the arrival of his surgeons in an apartment adjoining to the saloon of the opera-house, several of the foreign ministers presented themselves, to whom he said, "I have given orders, gentlemen, that the gates of the city shall be shut. You will therefore not take it ill, if you should be unable to send couriers to your courts until after three days. Your advices will then be more certain, since it will be probably known whether I can survive or not." His conversation then related to the effects which the acci-

dent might produce in Europe; and the love of fame, which was always his predominant passion, was perceptible in his remarks.

Finding that he was not likely to survive, he settled all his affairs with the greatest composure imaginable. He sent for his son the prince-royal, and addressed a speech to him on the nature of good government, in a manner so truly affecting, that all who were present shed tears. At eight o'clock, on the morning of his death, he received the sacrament. The queen had taken leave of him the evening before; and at half past ten he died in great agonies.

The prince-royal, being fourteen years of age, was immediately proclaimed king, by the name of Gustavus Adolphus; and the duke of Södermania, his uncle, and brother to the late king, in compliance with his majesty's will, was declared sole regent, and guardian of the young sovereign, till he should attain his majority, which was fixed at the age of eighteen. We have only to add, that the prudence and conciliatory measures of the regent have established the tranquillity of this kingdom beyond expectation.

Gustavus Adolphus IV. the present king of Sweden, was born Nov. 1, 1778; and succeeded his father Gustavus III. March 29, 1792.

Gustavus III. the late king, was born Jan. 24, 1746; married Oct. 17, 1766, to the princess-royal of Denmark, by whom he had issue Gustavus Adolphus, the present king.

Brothers and sisters to the late king:

1. Charles, duke of Södermania, born Oct. 7, 1748.
2. Frederic Adolphus, duke of West-Gothland, born July 18, 1750.
3. Sophia Albertina, abbess of Quedlingburg, born in Oct. 1753.

## MUSCOVY, OR THE RUSSIAN EMPIRE IN EUROPE AND ASIA.

### SITUATION AND EXTENT OF THE RUSSIAN EMPIRE IN EUROPE.

Miles.		Degrees.	
Length	1500	between	25 and 65 East longitude.
Breadth	1100		47 and 72 North latitude.
Russia in Europe contains 1,194,976 square miles, with 17 inhabitants to each.			

DIVISIONS AND NAMES. } ACCORDING to the most authentic accounts of this mighty empire, it consists of forty-two provinces, or governments; besides part of Carelia, Esthonia, Ingria, Livonia, and part of Finland, which were conquered from Sweden; the Crimea, or Crim Tartary, anciently the Taurica Chersonesus, a peninsula in the Euxine Sea, subject to the Turks formerly, but added in the year 1783 to the Russian empire, with the isle of Taman, and part of Cuban\*; also the duchy of Courland, and a great part of Lithuania in Poland, together with another large portion of the latter country, united to the Russian empire, in consequence of a second

\* The Russians are supposed to have gained above a million of subjects by this cession.

partition of Poland in the year 1793; consisting of all that tract of land, with its inhabitants, which is contained within a line beginning at the village of Druy, on the left bank of the river Dwina, and thence extending to Neroch and Dabrova, passing Kunish, near the frontier of Galicia, proceeding thence to the river Dniester, and lastly running along that river till it enters the old border of Russia and Poland at Jegertic.

The following table will give some idea of the Russian empire properly so called, or Russia in Europe, with its acquisitions from Sweden in the present century; and also of the Russian empire in its most extensive sense; for we must also include all the acquisitions in Tartary, now known by the name of Siberia; the whole comprehending the northern parts of Europe and Asia, stretching from the Baltic and Sweden on the West, to Kamtschatka and the Eastern Ocean; and on the north, from the Frozen Ocean to the forty-seventh degree of latitude, where it is bounded by Poland, Little Tartary, Turkey, Georgia, the Euxine and Caspian Seas, Great Tartary, Chinese Tartary, and other unknown regions in Asia.

The country now comprised under the name of Russia, or the Russias, is of an extent nearly equal to all the rest of Europe, and greater than the Roman empire in the zenith of its power, or the empire of Darius subdued by Alexander, or both put together, as may be seen by turning to the table, page 27.

Russia takes its name from the Russi, or Borussi, a Slavonic tribe. The word Muscovy is derived from the river Mosca, on which the ancient capital Moscow stands. The country, according to its situation and climate, is divided into the northern, middle, and southern regions; which are again divided into governments, named after those towns in which courts of judicature are established. The northern division contains the governments of St. Petersburg, Archangel, Olonetz, Vybourg, Revel, Riga, Pscov, Tver, Novgorod, Vologda, Yaroslavi, Kostroma, Viatka, Perme, Tobolsk. The middle division contains the governments of Moscow, or Moscovy, generally called Mosqua by the Russians, Smolensk, Polotsk, Mooghilev, Tchernigow, Novgorod, and Sieverskoy, Kharkov, Kursk, Orel, Kalouz, Toola, Riazane, Vladimer, Nezney-Novgorod, Kazane, Sibirsk, Penza, Tambov, Voronez, Saralov, Oufa, Kolkvaue, Irkoutik. The southern division contains the governments of Kiev, Ecatherinoffav, Caucasus, the province of Taurida, and the habitations of the Don Kozacks\*.

CLIMATE, SOIL, PRODUCTIONS, VEGETABLES, MINES, AND MINERALS. } In the southern parts of Russia, or Muscovy, the longest day does not exceed fifteen hours and a half; whereas, in the most northern, the sun is seen in summer two months above the horizon. Hence there is in Muscovy a vast diversity both of soil and climate.

The severity of the climate, in Russia properly so called, is very great. Dr. John Glen King, who resided eleven years in Russia, observes, that the cold in St. Petersburg, by Fahrenheit's scale, is, during the months of December, January, and February, usually from 8 to 15 or 20 degrees below 0; that is, from 40 to 52 degrees below the freezing-point; though commonly, in the course of the winter, it is for a week or ten days some degrees lower. The same writer remarks, that it is very difficult for an inhabitant of our temperate climate to have any idea of a cold so great. It is such, that, when a person walks out in that severe weather, the cold makes the eyes water, and that water freezing, hangs in little icicles on the eye-lashes. As the common peasants usually wear their beards, you may see them hanging at the chin like a solid lump of ice. The beard is therefore found very useful in protecting the glands of the throat: and the soldiers, who do not wear their beards, are obliged to tie a handkerchief under the chin to supply their place. All the parts of the face, which are exposed, are very liable to be frozen: though it has often been observed, that the person himself does not know when the freezing begins, but is commonly told of it first by those who meet him, and who call out to him to rub his face with snow, the usual method to thaw it. It is also remarked, that the part which has once been frozen is ever after most liable to be frozen again. In some very severe winters, sparrows, though a hardy species of birds, have been seen quite numbed by the intense cold, and unable to fly: and drivers, when sitting on their loaded carriages, have sometimes been found frozen to death in that posture. When the thermometer has stood at 25 degrees below 0, boiling water thrown up into the air by an engine, so as to spread, has fallen down perfectly dry, formed into ice. A pint bottle of common water was found by Dr. King frozen into a solid piece of ice in an hour and a quarter. A bottle of strong

\* In this table, which is copied from the authentic work of captain Plefchief, the spelling of the Russian names is adapted to the English pronunciation, by his accurate translator Mr. Smirnov, chaplain to the Russian legation at the court of Great Britain.

ale has also been frozen in an hour and a half; but in this substance there was about a tea cup full in the middle unfrozen, which was as strong and inflammable as brandy and spirits of wine. But, notwithstanding the severity of the cold in Russia, the inhabitants have such various means and provisions to guard against it, that they suffer much less from it than might be expected. The houses of persons in tolerable circumstances are so well protected, both without doors and within, that they are seldom heard to complain of cold. The method of warming the houses in Russia is by an oven constructed with several flues; and the country abounds with wood, which is the common fuel. These ovens consume a much smaller quantity of wood than might be imagined; and yet they serve at the same time for the ordinary people to dress their food. They put a very moderate faggot into them, and suffer it to burn only till the thickest black smoke is evaporated; they then shut down the chimney to retain all the rest of the heat in the chamber; by this method the chamber keeps its heat twenty-four hours, and is commonly so warm that they sit with very little covering, especially children, who are usually in their shirts. The windows in the huts of the poor are very small, that as little cold may be admitted as possible: in the houses of persons of condition, the windows are caulked up against winter, and commonly have double glass-frames. In short, they can regulate the warmth in their apartments by a thermometer with great exactness, opening or shutting the flues to increase or diminish the heat. When the Russians go out, they are clothed so warmly, that they almost bid defiance to frost and snow; and it is observable that the wind is seldom violent in the winter; but when there is much wind, the cold is exceedingly piercing.

One advantage which the Russians derive from the severity of their climate, is the preserving of provisions by the frost. Good housewives, as soon as the frost sets in for the winter, about the end of October, kill their poultry, and keep them in tubs packed up with a layer of snow between them, and then take them out for use as occasion requires: by which means they save the nourishment of the animal for several months. Veal frozen at Archangel, and brought to Petersburg, is esteemed the finest they have; nor can it be distinguished from what is fresh killed, being equally juicy. The markets in Petersburg are by this means supplied in winter with all manner of provisions, at a cheaper rate than would otherwise be possible; and it is not a little curious to see the vast stacks of whole hogs, sheep, fish, and other animals, which are piled up in the markets for sale. The method of thawing frozen provisions in Russia is by immersing them in cold water; for when the operation of thawing them is effected by heat, it seems to occasion a violent fermentation, and almost a sudden putrefaction; but when produced by cold water, the ice seems to be attracted out of the body, and forms a transparent incrustation round it. If a cabbage, which is thoroughly frozen, be thawed by cold water, it is as fresh as if just gathered out of the garden; but if it be thawed by fire or hot water, it becomes so rancid and strong that it cannot be eaten.

The quickness of vegetation in Russia is pretty much the same as has been described in Scandinavia, or Sweden and Denmark. The snow is the natural manure of Russia, where grain grows in plenty, near Poland, and in the warmer provinces. The bulk of the people, however, are miserably fed; the soil produces a vast number of mushrooms for their subsistence; and in some places, besides oaks and firs, Russia yields rhubarb, flax, hemp, pasture for cattle, wax, honey, rice, and

melons. The

melons. The boors are particularly careful in the cultivation of honey, which yields them plenty of methoglin, their ordinary drink; they likewise extract a spirit from rye, which they prefer to brandy.

That a great part of Russia was populous in former days, is not to be disputed; though it is equally certain that the inhabitants, till lately, were but little acquainted with agriculture, and supplied the place of bread, as the inhabitants of Scandinavia do now, with a kind of saw-dust and a preparation of fish-bones. Peter the Great, and his successors down to the present time, have been at incredible pains to introduce agriculture into their dominions; and though the soil is not every where proper for corn, yet its vast fertility in some provinces bids fair to make grain as common in Russia as it is in the southern countries of Europe. The easy communication by means of rivers, which the inland parts of that empire have with each other, serves to supply one province with those products of the earth in which another may be deficient. As to mines and minerals, they are as plentiful in Russia as in Scandinavia; and the people are daily improving in working them. Mountains of rich iron ore are found in some places, most of which produce the load-stone, and yield from 50 to 70 per cent. Rich silver and copper mines are found on the confines of Siberia.

MOUNTAINS, RIVERS, FORESTS, } Russia is in general a flat level  
AND FACE OF THE COUNTRY. } country, except towards the north,  
where lie the Zimnopoias mountains, thought to be the famous Montes Riphæi of the ancients, now called the Girdle of the Earth. On the western side of the Dnieper comes in part of the Carpathian mountains; and between the Black Sea and the Caspian, Mount Caucasus borders a range of vast plains extending on the sea of Oral. And here it may be observed, that, from Petersburg to Pekin, we shall hardly meet with a mountain on the road through Independent Tartary; and from Petersburg to the north part of France, by the road of Dantzic, Hamburg, and Amsterdam, we scarcely can perceive the smallest hill.

The most considerable rivers are the Wolga, or Volga, running east and south, which, after traversing the greatest part of Muscovy, and winding a course of 3000 English miles, discharges itself into the Caspian Sea. It is reckoned one of the most fertile rivers of Europe; producing many kinds of fish, and fertilising all the lands on each side with various trees, fruits, and vegetables; and it is remarkable, that in all this long course there is not a single cataract to interrupt the navigation; but the nearer it approaches to its mouth, the number of its isles increases, and it divides itself into a greater number of arms than any known river in the world: all these arms divide themselves into others still less, which join and meet again; so that the Wolga discharges itself into the Caspian Sea by more than 70 mouths. By means of this noble river, the city of Moscow preserves a communication, not only with all the southern parts of Russia, but even with Persia, Georgia, Tartary, and other countries bordering on the Caspian Sea. The Don, or Tanais, divides the most eastern part of Russia from Asia, and, in its course towards the east, approaches so near the Wolga, that the czar Peter I. had undertaken to form a communication between them by means of a canal: this grand project, however, was defeated by the irruption of the Tartars. This river, exclusive of its turnings and windings, discharges itself into the Palus Mæotis, or sea of Asoph, about four hundred miles from its rise. The Borysthenes, or Dnieper, which is likewise one of the largest rivers in Europe, runs through Lithuania, the country of the Zaporog Cossacs, and that of

the Nagaisch Tartars, and falls into the Euxine or Black Sea, at Kinburn, near Oczakow : it has thirteen cataracts within a small distance. To these may be added the two Dwinas, one of which empties itself at Riga into the Baltic; the other has its source near Ustiaga, and, dividing itself into two branches near Archangel, there falls into the White Sea.

Forests abound in this extensive country; and the northern and north-eastern provinces are in a manner desert; nor can the few inhabitants they contain be called Christians rather than Pagans.

QUADRUPEDS, BIRDS, FISHES, } These do not differ greatly from  
AND INSECTS. } those described in the Scandinavian

provinces, to which we must refer the reader. The lynx, famous for its piercing eye, is a native of this empire; it makes prey of every creature it can master; and is said to be produced chiefly in the fir-tree forests. Hyænas, bears, wolves, foxes, and other creatures already described, afford their furs for clothing the inhabitants; but the furs of the black foxes and ermine are more valuable in Russia than elsewhere. The dromedary and camel were formerly almost the only beasts of burden known in many parts of Russia. The czar Peter encouraged a breed of large horses for war and carriages; but those employed in the ordinary purposes of life are but small; as are their cows and sheep.

We know of few or no birds in Russia that have not been already described. The same may be said of fishes, except that the Russians are better provided than their neighbours with sturgeon, cod, salmon, and beluga; the latter resembles a sturgeon, and is often called the large sturgeon; it is from twelve to fifteen feet in length, and weighs from 9 to 16 and 18 hundred weight; its flesh is white and delicious. Of the roe of the sturgeon and the beluga the Russians make the famous caviare, so much esteemed for its richness and flavour, that it is often sent in presents to crowned heads. In cutting up the belugas, they often find what is called the beluga-stone, which is concealed in that mass of glandular flesh which covers the posterior parts of the dorsal spine, supplying the place of a kidney in fish. The instant it is taken from the fish it is soft and moist, but quickly hardens in the air. Its size is that of a hen's egg; in shape it is sometimes oval, and sometimes flattened, and commonly sells for a ruble. This stone is supposed by professor Pallas to belong to the genitals of the fish: it holds a considerable rank, though with little merit, among the domestic remedies of the Russians, who scrape it, and, mixed with water, give it in difficult labours, in the diseases of children, and other disorders.

POPULATION, MANNERS, AND CUSTOMS.] The new register in 1764 contains 8,500,000 subject to the poll-tax; and a late ingenious writer, resident sometime in Russia, gives the following estimate:

Lower class of people paying capitation-tax,	18,000,000
Conquered provinces,	1,200,000
Noble families,	60,000
Clergy,	100,000
Military,	300,000
Civil,	30,000
Ukraine, Siberia, Cossacs, &c.	350,000

20,100,000

To these must now be added near a million more, by the acquisitions of the Crimea, and a part of Cuban Tartary; and at least 1,500,000 in the provinces dismembered from Poland.

As his imperial majesty of all the Russias possesses many of the countries whence the prodigious swarms of barbarians who overthrew the Roman empire issued, there is the strongest reason to believe that his dominions must have been better peopled formerly than they are at present; twenty-four millions are but a thin population for the immense tract of country he possesses. Perhaps the introduction of the small-pox and the venereal disease may have assisted in the depopulation: it is probable also, that the prodigious quantity of strong and spirituous liquors, consumed by the inhabitants of the North, is unfriendly to generation.

The Russians, properly so called, are in general a personable people, hardy, vigorous, and patient of labour, especially in the field, to an incredible degree. Their complexions differ little from those of the English or Scots; but the women think that an addition of red heightens their beauty. Their eye-sight seems to be defective, occasioned, probably, by the snow, which for a long time of the year is continually present to their eyes. Their officers and soldiers always possessed a large share of passive valour; but in the late war with the king of Prussia they proved as active as any troops in Europe; and in the late war with the Turks greatly distinguished themselves. They are implicitly submissive to discipline, let it be ever so severe; endure extreme hardships with great patience: and can content themselves with very hard fare.

Before the days of Peter the Great, the Russians were in general barbarous, ignorant, mean, and much addicted to drunkenness. No less than 4000 brandy-shops have been reckoned in Moscow. Not only the common people, but many of the boyars, or nobles, lived in a continual state of idleness and intoxication; and the most complete objects of misery and barbarity appeared in the streets, while the court of Moscow was the most splendid of any upon the globe. The czar and the grandes dressed after the most superb Asiatic manner; and their magnificence was astonishing. The earl of Carlisle, in the account of his embassy, says, that he could see nothing but gold and precious stones in the robes of the czar and his courtiers. The manufactures, however, of those and all other luxuries were carried on by Italians, Germans, and other foreigners. Peter saw the bulk of his subjects, at his accession to the throne, little better than beasts of burden, destined to support the pomp of the court. He forced his great men to lay aside their long robes, and dress in the European manner; and even obliged the laity to cut off their beards. The Russians, before this time, had scarcely a ship upon their coasts. They had no convenience for travelling, no pavements in their streets, no places of public diversion; and they entertained a sovereign contempt for all improvements of the mind. At present a French or English gentleman may make a shift to live as comfortably and sociably in Russia as in most other parts of Europe. Their polite assemblies, since the accession of the late empress, have been put under proper regulations; and few of the ancient usages remain. It is, however, to be observed, that, notwithstanding the severities of Peter and the prudence of succeeding governments, drunkenness still continues among all ranks: nor are even priests or ladies ashamed of it on holidays.

The Russians were formerly noted for so strong an attachment to their native soil, that they seldom visited foreign countries. This, however, was only the consequence of their pride and ignorance; for Russian nobility, besides those who are in a public character, are now found at

every court in Europe. Her late imperial majesty interested herself in the education of young men of quality, in the knowledge of the world, and foreign services, particularly that of the British fleet.

It is said that the Russian ladies were formerly as submissive to their husbands in their families as the latter are to their superiors in the field; and that they thought themselves ill treated if they were not often reminded of their duty by the discipline of a whip, manufactured by themselves, which they presented to their husbands on the day of their marriage. Their nuptial ceremonies are peculiar to themselves; and formerly consisted of some very whimsical rites, many of which are now disused. When the parents have agreed upon a match, though the parties perhaps have never seen each other, the bride is critically examined by a certain number of females, who are to correct, if possible, any defect they find in her person. On her wedding-day she is crowned with a garland of wormwood; and after the priest has tied the nuptial knot, his clerk or sexton throws a handful of hops upon her head, wishing that she may prove as fruitful as that plant. She is then led home, with abundance of coarse and indeed indecent ceremonies, which are now wearing off even amongst the lower ranks; and the barbarous treatment of wives by their husbands, which extended even to scourging or broiling them to death, is either guarded against by the laws of the country, or by particular stipulations in the marriage-contract.

[FUNERALS.] The Russians entertain many fantastic notions with regard to the state of departed souls. After the dead body is dressed, a priest is hired to pray for the soul, to purify the corpse with incense, and to sprinkle it with holy water while it remains above ground, which, among the better sort, it generally does for eight or ten days. When the body is carried to the grave, which is done with many gesticulations of sorrow, the priest produces a ticket, signed by their bishop and another clergyman, as the deceased's passport to heaven. This is put into the coffin, between the fingers of the corpse; after which the company return to the deceased's house, where they drown their sorrow in intoxication, which lasts, among the better sort, with a few intervals, forty days. During that time a priest every day recites prayers over the grave of the deceased; for though the Russians do not believe in purgatory, yet they imagine that their departed friend may be assisted by prayer in his long journey to the place of his destination after this life.

[PUNISHMENTS.] The Russians are remarkable for the severity and variety of their punishments, which are both inflicted and endured with a wonderful insensibility. Peter the Great used to suspend the robbers upon the Wolga, and other parts of his dominions, by iron hooks fixed to their ribs, on gibbets, where they writhed themselves to death, hundreds, nay thousands, at a time. The single and double knot have been inflicted upon ladies as well as men of quality. Both of them are excruciating; but in the double knot the hands are bound behind the prisoner's back, and the cord being fixed to a pulley, lifts him from the ground, with the dislocation of both his shoulders; and then his back is in a manner scarified by the executioner with a hard thong cut from a wild ass's skin. This punishment has been so often fatal, that a surgeon generally attends the patient to pronounce the moment it should cease. It is not always the number of the strokes, but the method of applying them, which occasions the death of a criminal; for the executioner can kill him in three or four strokes, by striking him upon the ribs; though persons are sometimes recovered, in a few weeks, who have received three hundred strokes moderately inflicted. and cutting out of the tongue are likewise practised in Russia; and even the empress Elizabeth, though she prohibited capital punishments, was forced to give way to the supposed necessity of those tortures.

According to the strict letter of the law, there are no capital punishments in Russia, except in the case of high treason: but there is much less humanity in this than has been supposed. For there are many felons who expire under the knout; and others die of fatigue in their journeys to Siberia, and from the hardships they suffer in the mines; so that there is reason to believe that no fewer criminals suffer death in Russia than in those countries where capital punishments are authorised by the laws.

Felons, after receiving the knout, and having their cheeks and forehead marked, are sometimes sentenced for life to the public works at Cronstadt, Vishnei-Volotchok, and other places: but the common practice is to send them into Siberia, where they are condemned for life to the mines at Nerzhink. There are, upon an average, from 1600 to 2000 convicts at these mines. The greatest part are confined in barracks, excepting those who are married: the latter being permitted to build huts near the mines, for themselves and families. The prohibition of the torture does honour to the late empress Catharine II.

TRAVELLING.] Among the many conveniencies introduced of late into Russia, that of travelling is extremely remarkable, and the expense very trifling. Like their Scandinavian neighbours, the Russians travel in sledges made of the bark of the linden tree, lined with thick felt, drawn by rein-deer, when the snow is frozen hard enough to bear them. In the internal parts of Russia, horses draw their sledges; and the sledge-way, towards February, becomes so well beaten, that they erect a kind of a coach upon the sledges, in which they may lie at full-length, and so travel night and day, wrapt up in good furs. In this manner they often perform a journey of about 400 miles, such as that between Petersburg and Moscow, in three days and nights. Her late imperial majesty, in her journeys, was drawn in a house which contained a bed, a table, chairs, and other conveniencies, for four people, by 24 post-horses; and the house itself was fixed on a sledge.

DIFFERENT NATIONS } As the present subjects of the Russian em-  
SUBJECT TO RUSSIA. } pire, in its most extensive sense, are the de-  
scendants of many different people, and inhabit prodigious tracts of  
country, so we find among them a vast variety of character and man-  
ners: and the great reformation introduced of late years, as well as the  
discoveries made, render former accounts to be but little depended  
upon. Many of the Tartars, who inhabit large portions of the Russian  
dominions, now live in fixed houses and villages, cultivate the land,  
and pay tribute like other subjects. Till lately they were not admitted  
into the Russian armies; but now they make excellent soldiers. Other  
Russian Tartars retain their old wandering lives. Both sides of the  
Volga are inhabited by Tschermises and Morduars, a peaceable, in-  
dustrious people. The Baskirs are likewise fixed inhabitants of the  
tract that reaches from Kasan to the frontiers of Siberia; and have cer-  
tain privileges, of which they are tenacious. The wandering Kalmucs  
occupy the rest of the tract to Astracan, and the frontiers of the Usbeks;  
and, in consideration of certain presents they receive from the sove-  
reigns of Russia, they serve in their armies without pay, but are apt to  
plunder equally friends and foes.

The *Cossacs*, who lately made a figure in the military history of Europe,

were originally Polish peasants, and served in the Ukraine, as a militia against the Tartars. Being oppressed by their unfeeling lords, a part of them moved to the uncultivated banks of the Don or Tanaïs, and there established a colony. They were soon after joined, in 1637, by two other detachments of their countrymen; and they reduced Asoph, which they were obliged to abandon to the Turks, after laying it in ashes. They next put themselves under the protection of the Russians, built Circaska, on an island in the Don; and their possessions, which consisted of thirty-nine towns on both sides that river, reached from Ribna to Asoph. They cultivated the country, but were so wedded to their original customs, that they were little better than nominal subjects to the czars, till the time of Peter the Great. They professed the Greek religion; their inclinations were warlike, and they occasionally served against the Tartars and Turks on the Palus Mæotis.

The character of the Tartars of Kasan may serve for that of all the Mahometan Tartars in their neighbourhood. Very few of them are tall; but they are generally straight and well made, have small faces, with fresh complexions, and a sprightly and agreeable air. They are haughty and jealous of their honour, but of very moderate capacity. They are sober and frugal, dexterous at mechanical trades, and fond of neatness. The Tartarian women are of a wholesome complexion rather than handsome, and of a good constitution: from their earliest infancy they are accustomed to labour, retirement, modesty, and submission. The Tartars of Kasan take great care of the education of their children. They habituate their youth to labour, to sobriety, and to a strict observance of the manners of their ancestors. They are taught to read and write, and are instructed in the Arabic tongue, and the principles of their religion. Even the smallest village has its chapel, school, priest, and school-master; though some of these priests and schoolmasters are not much skilled in the Arabic language. The best Tartarian academies in the Russian empire are those of Kasan, Tobolsk, and Astracan, which are under the direction of the gagouns, or high-priests. It is not uncommon to find small collections of historical anecdotes in manuscript, in the huts of the boors: and their merchants, besides what those little libraries contain, are pretty extensively acquainted with the history of their own people, and that of the circumjacent states, with the antiquities of each. Such as choose to make a progress in theology, enter themselves into the schools of Bougharia, which are more complete than the others.

The Tartar citizens of Kasan, Orenberg, and other governments, carry on commerce, exercise several trades, and have some manufactories. Their manner of dealing is chiefly by way of barter; coin is very rarely seen among them, and bills of exchange never. They are not in general very enterprising; but as they extend their connexions by partners and clerks, many of them carry on a great deal of business, which their parsimonious way of life renders very lucrative. At Kasan they make a trade of preparing what is called in England Morocco-leather. The villages of these people comprehend from ten to one hundred farms. Most of them also contain tanners, shoe-makers, tailors, dyers, smiths, and carpenters.

The habitations and manner of living of the Tartar citizens and villagers of Astracan are perfectly similar with those of the Tartars of Kasan. In the city of Astracan they have a large magazine for goods, built of bricks, and several shops upon arches. They carry on an important commerce with the Armenians, Persians, Indians, Bougharians: and

their manufactories in a very thriving manner.

The Finns are Laplanders, but towns and villages progress in the use of the Christian religion, exercise most of their industry in agriculture, and eat five meals a-day. They have a considerable degree of civility, and are under the crown.

The *Potiaks*, who live near Viatka, in the government of the Russians, but great numbers of these believe themselves to be of the Finns.

The *Ostiaks*, who are several numerous nations, which they were governed by their chiefs, are still dependent on the crown, and their rents are still repaid in kind, or in rent stocks or tributes, and some of their ancient customs still pre-tend the practice of polygamy, with the use of the bow and arrow, as far as ten, but not more.

The *Vogouls* are a people with a scanty hair, and a scanty beard, which they discard, and use fire-arms, the bows, and traps, snares, and nets.

The *Tschouwas* are under the government of the Russians, and live in towns, but their habitations are for the purpose of screw-barrel marriage ceremonies, to pull off her husband's hair, and washes the husband himself; and

The *Kirguis* are a people which characterise by a fierce look, and a natural sense, and a voluptuous manner, and their deserts in the mountains, and they employ their principles in a very elegant manner. They are great warriors, and their women, and children, in little horns fastened to the neck, perfectly in the same manner, only by the number.

their manufactories of Morocco-leather, cotton, camelots, and silks, are in a very thriving state.

The *Finnns* are of Asiatic origin, and have a close resemblance to the Laplanders, but are more civilised, and better informed. They live in towns and villages, have schools and academies, and have made some progress in the arts and sciences. They profess the Lutheran faith, and use the Christian æra in their chronology. They carry on commerce, and exercise most of the common trades. The boors are chiefly employed in agriculture, hunting, and fishing. They are great eaters, making five meals a-day, and are immoderately fond of brandy. They enjoy a considerable degree of freedom, as the Russian government has continued to them the enjoyment of the privileges which they formerly had under the crown of Sweden.

The *Votiaks*, who are a Finnish race, chiefly inhabit the province of Viatka, in the government of Kasan. Some of the *Votiaks* are Christians, but great part of them are heathens and idolaters: though even these believe the doctrine of a future state of rewards and punishments.

The *Osiaks*, who are likewise a Finnish race, are one of the most numerous nations of Siberia. Before they were in subjection to Russia, they were governed by princes of their own nation, and their descendants are still reputed noble. These people divide themselves into different stocks or tribes: they choose their chiefs from among the progeny of their ancient rulers. These maintain peace and good order, and superintend the payment of the taxes. They are entirely unacquainted with the use of letters, and are extremely ignorant; they can reckon as far as ten, but no farther, as is the case of other Finnish nations.

The *Vogouls* are rather below the middle stature, have generally black hair, and a scanty beard. Their principal occupation is the chase, in which they discover much eagerness and address; using indiscriminately fire-arms, the bow, and the spear. They are also skilful in contriving traps, snares, and gins, and all the lures of game.

The *Tschouwasches* dwell along the two sides of the Wolga, in the governments of Vischnoi-Novgorod, Kasan, and Orenberg. They never live in towns, but assemble in small villages, and choose the forests for their habitations. They are very fond of hunting, and procure for that purpose screw-barrel muskets, which they prefer to the bow. One of their marriage ceremonies is, that on the wedding night the bride is obliged to pull off her husband's boots. A late writer says, "Among the *Tschouwasches* the husband is master of the house; he orders every thing himself; and it is the duty of the wife to obey without reply."

The *Kirguisians* have a frank and prepossessing air, similar to that which characterises the Tartars of Kasan. They have a sharp but not a fierce look, and smaller eyes than those Tartars. They have good natural sense, and are affable, and high-spirited, but fond of their ease, and voluptuous. They dwell always in portable huts, wandering about their deserts in search of pasturage for their flocks and herds, which constitutes their principal occupation. The decoration of their horses employs them almost as much as that of their persons; they having generally elegant saddles, handsome housings, and ornamented bridles. They are great eaters, and they also smoke tobacco to excess. Men, women, and children, all smoke, and take snuff: they keep the latter in little horns fastened to their girdles. The great and wealthy live perfectly in the same manner as the rest of the people, and are distinguished only by the numerous train that accompanies them in their *cavalcades*,

and the quantity of huts which surround their quarters, inhabited by their wives, children, and slaves.

The *Tungusians* form one of the most numerous nations of Siberia. They are of a middle stature, well made, and of a good mien. Their sight and hearing are of a degree of acuteness and delicacy that is almost incredible; but their organs of smelling and feeling are considerably more blunt than ours. They are acquainted with almost every tree and stone within the circuit of their usual perambulation; and they can even describe a course of some hundred miles by the configurations of the trees and stones they meet with, and can enable others to take the same route by such descriptions. They also discover the tracks of the game by the compression of the grass or moss. They learn foreign languages with ease, are alert on horseback, good hunters, and dexterous at the bow.

The *Kalmucs* are a courageous tribe, and numerous; for the most part raw-boned and stout. Their visage is so flat, that the skull of a Kalmuc may be easily known from others. They have thick lips, a small nose, and a short chin, the complexion a reddish and yellowish brown. Their cloathing is oriental, and their heads are exactly Chinese. Some of their women wear a large golden ring in their nostrils. Their principal food is animals, tame and wild, and even their chiefs will feed upon cattle that have died of distemper or age, and though the flesh be putrid; so that in every horde the flesh-market has the appearance of a lay-stall of carrion; they eat likewise the roots and plants of their deserts. They are great eaters, but can endure want for a long time without complaint. Both sexes smoke continually: during the summer they remain in the northern, and in the winter in the southern deserts. They sleep upon felt or carpeting, and cover themselves with the same.

The *Kamtschadales* have a lively imagination, a strong memory, and a great genius for imitation. Their chief employments are hunting and fishing. The chase furnishes them with fables, foxes, and other game. They are very expert at fishing, and are well acquainted with the proper seasons for it. They eat and drink great quantities; but as what they eat is always cold, their teeth are very fine. Dogs are their only domestic animals, and they put a high value upon them. Some of them travel in small carriages drawn by dogs; and a complete Kamtschadalian equipage, dogs, harness, and all, costs in that country near twenty rubles, or 4l. 10s. The Kamtschadales believed the immortality of the soul, before they were prevailed upon to embrace the christian religion. They are superstitious to extravagance, and extremely singular and capricious in the different enjoyments of life, particularly their convivial entertainments.

The manners of the *Siberians* were formerly so barbarous, that Peter the Great thought he could not inflict a greater punishment upon his capital enemies, the Swedes, than by banishing them to Siberia. The effect was, that the Swedish officers and soldiers introduced European usages and manufactures into the country, and thereby acquired a comfortable living. In this forlorn region, so long unknown to Europe, some new mines have lately been discovered, which, upon their first opening, have yielded 45,000 pounds of fine silver, said to have been obtained with little difficulty or expense. But Kamtschatka is now considered as the most horrid place of exile in the vast empire of Russia; and here some of the greatest criminals are sent.

RELIGION.] The established religion of Russia is that of the Greek church, the tenets of which are by far too numerous and complicated to

be discussed here. It has been so long a doctrine that the Son, but from the thought they disseminate superstitious customs, whom they confer honours, so that the which is extremely peculiar notions of bishops; but not profound knowledge of his character and the great objects and preserved the bishops. Their influence, upon the establishing this possession of all that impolitic a greatly contributed to the incredible number been found prudent, however, come a monk till fifty; and even the

LEARNING AND but an inconsiderable encouragement academies and that they are not inhibited by their received all over mathematics, an bishop of Turin and the marshal laws, are elegant made in that eminent men of literature and science that the

be discussed here; but the great article of faith by which that church has been so long separated from the Latin or Catholic church, is the doctrine that the Holy Spirit does not proceed from the Father and the Son, but from the Father only. They deny the pope's supremacy; and though they disclaim image-worship, they retain many idolatrous and superstitious customs. Their churches are full of pictures of saints, whom they consider as mediators. They observe a number of fasts and lent, so that they live half the year very abstemiously: an institution which is extremely convenient for the soil and climate. They have many peculiar notions with regard to the sacraments. They oblige their bishops; but not their priests, to celibacy. Peter the Great showed his profound knowledge in government in nothing more than in the reformation of his church. He broke the dangerous powers of the patriarch and the great clergy. He declared himself the head of the church, and preserved the subordinations of metropolitans, archbishops, and bishops. Their priests have no fixed income, but depend, for subsistence, upon the benevolence of their flocks and hearers. Peter, after establishing this great political reformation, left his clergy in full possession of all their idle ceremonies; nor did he cut off their beards: that impolitic attempt was reserved for the emperor Peter III. and greatly contributed to his fatal catastrophe. Before his time, an incredible number of both sexes were shut up in convents: nor has it been found prudent entirely to abolish those societies. The abuses of them, however, are in a great measure removed; for no male can become a monk till he is turned of thirty; and no female a nun till she is fifty; and even then not without permission of their superiors.

The conquered provinces, as already observed, retain the exercise of their own religion; but such is the extent of the Russian empire, that many of its subjects are Mahometans, and more of them no better than Pagans, in Siberia and the uncultivated countries. Many ill-judged attempts have been made to convert them by force, which have only tended to confirm them in their infidelity. On the banks of the river Sarpa, is a flourishing colony of Moravian brethren, to which the founders have given the name of Sarepta; the beginning of the settlement was in 1705, with distinguished privileges from the imperial court.

[LANGUAGE.] The common language of Russia is a mixture of the Polish and Slavonian; their priests, however, and the most learned clergy, make use of what is called modern Greek: and they who are acquainted with the ancient language in its purity, may easily acquire the knowledge of it in its corrupted state. The Russians have thirty-six letters, the forms of which have a strong resemblance to the old Greek alphabet.

[LEARNING AND LEARNED MEN.] The Russians have hitherto made but an inconsiderable figure in the republic of letters: but the great encouragement lately given by their sovereigns, in the institution of academies and other literary boards, has produced sufficient proofs that they are no way deficient in intellectual abilities. The papers exhibited by them at their academical meetings have been favourably received all over Europe; especially those that relate to astronomy, the mathematics, and natural philosophy. The speeches pronounced by the bishop of Turer, the metropolitan of Novgorod, the vice-chancellor, and the marshal, at the opening of the commission for a new code of laws, are elegant and classical: and the progress which learning has made in that empire since the beginning of this century, with the specimens of literature published both at Petersburg and Moscow, is an evidence that the Russians are not unqualified to shine in the arts and sci-

ences. The efforts to civilise them did not begin with Peter the Great, but were much older. A small glimmering, like the first day-break, was seen under czar Iwan, in the middle of the 16th century. This became more conspicuous under Alexius Michaelowitz; but under Peter it burst forth with the splendor of a rising sun, and has continued ever since to ascend towards its meridian.

UNIVERSITIES.] Three colleges were founded by Peter the Great at Moscow; one for classical learning and philosophy, the second for mathematics, and the third for navigation and astronomy. To these he added a dispensary, which is a magnificent building, and under the care of some able German chemists and apothecaries, who furnish medicines not only to the army but all over the empire. And within these few years, Mr. de Shorealow, high-chamberlain to the empress Elizabeth, daughter to Peter the Great, has founded an university in this city. The late empress Catharine II. also founded an university at Petersburg, and invited some of the most learned foreigners in every faculty, who are provided with good salaries; and also a military academy, where the young nobility and officers' sons are taught the art of war. It ought also to be mentioned, to the honour of the same royal benefactress, that she founded a number of schools for the education of the lower classes of her subjects, throughout the best-inhabited parts of the empire.

CITIES, TOWNS, PALACES. } Peterburg naturally takes the lead in  
AND OTHER BUILDINGS. } this division. It lies at the junction of the Neva with the lake Ladoga already mentioned, in latitude 60; but the reader may have a better idea of its situation by being informed that it stands on both sides the river Neva, between that lake and the bottom of the Finland gulf. In the year 1703, this city consisted of a few small fishing huts, on a spot so waterish and swampy, that the ground was formed into nine islands, by which its principal quarters are still divided. Without entering into too minute a description of this wonderful city, it is sufficient to say that it extends about six miles every way, and contains every structure for magnificence, the improvement of the arts, revenue, navigation, war, commerce, and the like, that is to be found in the most celebrated cities in Europe. But there is a convent which deserves particular notice, in which 440 young ladies are educated; 200 of them of superior rank, and the others daughters of citizens and tradesmen, who, after a certain time allotted to their education, quit the convent with improvements suitable to their conditions of life; and those of the lower class are presented with a sum of money, as a dowry if they marry, or to secure to themselves a proper livelihood. Near to this convent is a foundling-hospital, assitant to that noble one established at Moscow, and where the mother may come to be delivered privately; after which she leaves the child to the state, as a parent more capable of promoting its welfare.

As Peterburg is the emporium of Russia, the number of foreign ships trading to it in the summer-time is surprising. In winter 3000 one-horse sledges are employed for passengers in the streets. It is supposed that there are 150,000 inhabitants in this city; and it is ornamented with thirty-five great churches; for in it almost every sect of the Christian religion is tolerated. It also contains five palaces, some of which are superb, particularly that which is called the New Summer-Palace, near the Triumphal Port, which is an elegant piece of architecture. This magnificent city is defended on the side next the sea by the fortress of Cronstadt, which, considering the difficulty and danger of navigating a large naval force through the gulf of Finland, is suffi-

cient to guard it on that side from the attempts of any enemy. Peterburg is the capital of the province of Ingria, one of Peter the Great's conquests from the Swedes. In the neighbourhood of this city are numerous country-houses and gardens.

The city of Moscow was formerly the glory of this great empire, and it still continues considerable enough to figure among the capitals of Europe. It stands, as has been already mentioned, on the river *Sitza* which it takes its name, in lat. 55-45, and about 1414 miles north-east of London. Though its streets are not regular, it presents a very picturesque appearance; for it contains such a number of gardens, groves, lawns, and streams, that it seems rather to be a cultivated country, than a city. The ancient magnificence of this city would be incredible, were it not attested by the most unquestionable authors: but we are to make great allowances for the uncultivated state of the adjacent provinces, which might have made it appear with a greater lustre in a traveller's eyes. Neither Voltaire nor Busching gives us any satisfactory account of this capital; and little credit is to be given to the authors who divide it into regular quarters, each quarter inhabited by a different order or profession. Busching speaks of it as the largest city in Europe: but that can be only meant as to the ground it stands on, computed to be sixteen miles in circumference. It is generally admitted, that Moscow contains 1600 churches and convents, and forty-three palaces or squares. The merchants' exchange, according to Busching, contains about 6000 fine shops, which display a vast parade of commerce, especially to and from China. No city exhibits a greater contrast than Moscow, of magnificence and meanness in building. The houses of the inhabitants in general are miserable timber booths; but their palaces, churches, convents, and other public edifices, are spacious and lofty. The Kremlin, or grand imperial palace, is mentioned as one of the most superb structures in the world: it stands in the interior circle of the city, and contains the old imperial palace, pleasure-house, and stables, a victualling-house, the palace which formerly belonged to the patriarch, nine cathedrals, five convents, four parish-churches, the arsenal, with the public colleges, and other offices. All the churches in the Kremlin have beautiful spires, most of them gilt or covered with silver; the architecture is in the Gothic taste; but the insides of the churches are richly ornamented; and the pictures of the saints are decorated with gold, silver, and precious stones. The cathedral has nine towers, covered with copper, double-gilt, and contains a silver branch with forty-eight lights, said to weigh 2800 pounds. A volume would scarcely suffice to recount the other particulars of the magnificence of this city. Its sumptuous monuments of the great-dukes and czars, the magazine, the patriarchal palace, the exchequer, and chancery, are noble structures. They have a barbarous anecdote, that the czar John Basilides ordered the architect of the church of Jerusalem to be deprived of his eye-sight, that he might never contrive its equal. The jewels and ornaments of an image of the Virgin Mary, in the Kremlin church, and its other furniture, can be only equalled by what was seen at the famous Holy House of Loreto in Italy. M. Voltaire says, that Peter, who was attentive to every thing, did not neglect Moscow at the time he was building Peterburg; for he caused it to be paved, adorned it with noble edifices, and enriched it with manufactures. The foundling-hospital at Moscow is an excellent institution, and appears to be, under very judicious regulations. It was founded by the late empress, and is supported by voluntary contributions, legacies, and

other charitable endowments. It is an immense pile of building, of a quadrangular shape, and contains 3000 foundlings: when completed, it is intended to contain 8000. They are taken great care of; and at the age of fourteen have the liberty of choosing any trade; for which purpose there are different species of manufactures established in the hospital. When they have gone through a certain apprenticeship, or have arrived at the age of twenty, they are allowed the liberty of setting up for themselves; a sum of money is bestowed upon each foundling for that purpose, and they are permitted to carry on trade in any part of the Russian empire. This is a very considerable privilege in Russia, where the peasants are slaves, and cannot leave their villages without the permission of their masters.

Nothing can be said with certainty as to the population of Moscow. When lord Carlisle was the English ambassador there, in the reign of Charles II. this city was twelve miles in compass, and the number of houses was computed at 40,000. When Voltaire wrote, Moscow was twenty miles in circumference, and its inhabitants amounted to 500,000. Mr. Coxe confirms the account of the circumference of this city, but thinks the estimate of its population much exaggerated: according to an account which was given to him by an English gentleman, which he received from a lieutenant of the police, and which he says may be relied on, Moscow contains within the ramparts 250,000 souls, and in the adjacent villages 50,000. Two French travellers, who were there in 1792, say, its population consists of from 300,000 to 328,000 souls, in summer; but in winter is increased to nearly 400,000. *Voyage de Deux Français.*

[CURIOSITIES.] This article affords no great entertainment, as Russia has but lately been admitted into the rank of civilised nations. She can, however, produce many stupendous monuments of the public spirit of her sovereigns; particularly her canals made by Peter the Great, for the benefit of commerce. Siberia is full of old sepulchres of an unknown nation, whose instruments and arms were all made of copper. In the cabinet of natural history at Petersburg, is a rhinoceros, dug up on the banks of the river Valui, with his skin, and the hair upon it, perfect. The Russians are extremely fond of the ringing of bells, which are always to be heard tinkling in every quarter. The great bell of Moscow weighs, according to Mr. Coxe, "432,000 pounds, and exceeds in bigness every bell in the known world. Its size is so enormous," says that writer, "that I could scarcely have given credit to the account of its magnitude, if I had not examined it myself, and ascertained its dimensions with great exactness. Its height is nineteen feet, its circumference at the bottom twenty-one yards eleven inches, its greatest thickness twenty-three inches." It was cast in the reign of the empress Anne: but the beam on which it hung, being burnt, it fell, and a large piece is broken out of it; so that it lately lay in a manner useless. Mr. Bruce in his Memoirs mentions a bell at Moscow, founded in the czar Boris's time, nineteen feet high, twenty-three in diameter, and two in thickness, and weighing 336,000 pounds. The building of Petersburg, and raising it on a sudden from a few fishing huts to be a populous and rich city, is perhaps an enterprise hardly to be paralleled in antiquity. The same may be said of the fortress of Cronstadt, in the neighbourhood of Petersburg, which is almost impregnable. This fortress and city employed for some years 300,000 men in laying its foundation, and driving piles night and day; a work which no monarch in Europe (Peter excepted) could have executed. The whole plan, with a very little

 about 2,400,000*l*. and her imports do not exceed 1,600,000*l*.; so that  
 the balance of trade is yearly 800,000*l*. sterling in her favour\*.

The productions and exports of Russia, in general, are many, and very valuable; viz. furs and peltry of various kinds, red leather, linen and thread, iron, copper, sail-cloth, hemp and flax, pitch and tar, wax, honey, tallow, singians, linseed-oil, pot-ash, soap, feathers, train-oil, hog's bristles, musk, rhubarb, and other drugs, timber, and also raw silk from China and Persia.

Her foreign commerce is much increased since her conquests from Sweden, especially of Livonia and Ingria, and since the establishing of the new emporium of Petersburg, whereby her naval intercourse with Europe is made much more short and easy. The Ukraine may be called the granary of the empire: the best corn, hemp, flax, honey, and wax, come from this fertile province, and 10,000 head of horned cattle are annually sent from its pastures into Silesia and Saxony.

Russia carries on a commerce over land, by caravans, to China, chiefly in furs: and they bring back from thence tea, silk, cotton, gold, &c. To Bochary, near the river Oxus in Tartary, Russia sends her own merchandize, in return for Indian silks, curled lamb-skins, and ready money; and also to the annual fair at Samarcand: she likewise trades to Persia by Astracan, across the Caspian sea, for raw and wrought silk. The late empress, in 1784, issued an edict, permitting all foreigners to carry on a free trade by sea and land with the several countries bordering on the Euxine, which have been lately annexed to the empire. The same privileges, religious and civil, are allowed to them in the ports of Cherson, Sebastopolis, and Theodosia (formerly Caffa) in the province of Taurica, as in Petersburg.

Before the time of Peter the Great, Archangel, which lies upon the White Sea, was the only port of naval communication which Russia had with the rest of Europe; but it was subject to a long and tempestuous voyage. They have now thirteen ports, Archangel, Petersburg, Riga, Revel, Perneau, Narva, Wibourg, Frederichsham, Astracan, and Kola, and the three opened in their new conquests. This town is about three English miles in length, and one in breadth, built all of wood, excepting the exchange, which is of stone. Notwithstanding the decrease of the trade of Archangel since the building of Petersburg, it still exports a considerable quantity of merchandize. Their masts and timber for the dock-yards come chiefly from the forests of Casan, that border on the province of Astracan.

The army is generally calculated to amount to from 400 to 450,000 men: according to Busching, it amounted, in 1772, to above 600,000; and, according to an estimate taken in 1784, it then amounted to 368,901†.

\* Coxe's Travels, vol. ii. p. 247.

† The French travellers before quoted remark on this head: "If we rely on the gazetter, we shall estimate the forces of the Russian empire at more than 500,000 men; and be led into no small error. The armies of that power have never exceeded 150,000 men in both cavalry and infantry. This is the greatest effort the empire can make. The irregular troops and regiments in garrison are not included in this estimate."

The Russian navy in the harbours of Cronstadt, Revel, and Archangel, in the year 1792, consisted of 50 ships of the line, of which 8 were of 110 guns, and the rest of 74 and 66; 27 frigates of 28, 32, and 38 guns; 50 galleys, 300 gun-boats, 16 fire-ships, and other smaller vessels; besides a fleet in the Black Sea, consisting of 17 ships of the line, and a still greater number of frigates, corvettes, &c. Twenty thousand sailors are kept in constant pay and service, either on board the ships or in the dock-yards. The harbour at Cronstadt, seven leagues from Petersburg, is defended on one side by a fort of four battions, and on the other by a battery of 100 pieces of cannon. The canal and large basin will contain near 600 sail of ships.

GOVERNMENT, LAWS, AND } The sovereign of the Russian empire  
DISTINCTION OF RANK. } is absolute and despotic in the fullest extent of those terms, and master of the lives and properties of all his subjects, who, though they are of the first nobility, or have been highly instrumental in promoting the welfare of the state, may notwithstanding, for the most trifling offence, or even for no offence at all, be seized upon and sent to Siberia, or made to drudge for life upon the public works, and have all their goods confiscated, whenever the sovereign or his ministers shall think proper. Persons of any rank may be banished into Siberia, for the slightest political intrigue; and their possessions being confiscated, a whole family may at once be ruined by the insinuations of an artful courtier. The secret court of chancery, which was a tribunal composed of a few ministers chosen by the sovereign, had the lives and fortunes of all families at their mercy. But this court was suppressed by Peter III.

The system of civil laws at present established in Russia is very imperfect, and in many instances barbarous and unjust; being an assemblage of laws and regulations drawn from most of the states of Europe, ill digested, and in many respects not at all adapted to the genius of the Russian nation. But the late empress made some attempts to reform the laws, and put them upon a better footing. The courts of justice were in general very corrupt, and those by whom it was administered extremely ignorant; but the judicious regulations of Catharine II. fixed a certain salary to the office of judge, which before depended on the contributions of the unhappy clients; and thus the poor were without hope or remedy.

The distinctions of rank form a considerable part of the Russian constitution. The late empress took the title of Autocratix, which implies that they owed their dignity to no earthly power. Their ancient nobility were divided into kuzes, or knazes, boyars, and vaivods. The kuzes were sovereigns upon their own estates, till these were reduced by the czar: but they still retain the name. The boyars were nobility under the kuzes; and the vaivods were governors of provinces. Those titles, however, so often revived the ideas of their ancient power, that the late empress introduced among their subjects the titles of counts and princes, and the other distinctions of nobility that are common to the rest of Europe.

REVENUE AND EXPENSES.] Nothing certain can be said concerning the revenues of this mighty empire; but they are, undoubtedly, at present, far superior to what they were in former times, even under Peter the Great. The vast exertions for promoting industry, made by his successors, especially her late imperial majesty, must have greatly added to their income, which, many years ago, was little less than

ORDERS.]  
in 1698, to a

30,000,000 of rubles, or nearly six millions sterling annually; thus computed:

	Rubles.
Capitation tax . . . . .	8,500,000
Other taxes and duties . . . . .	7,000,000
The crown-lands, with other do- mains taken from the clergy } . . . . .	6,000,000
Produce of the mines . . . . .	1,000,000
Monopoly of distilled liquors . . . . .	4,000,000
Monopoly of salt . . . . .	1,800,000
	28,800,000

According to Mr. Plefcheef's computation, published in English by the reverend Mr. Smirnov, the revenues of Russia exceed 40,000,000 of rubles; and the expenses, even in time of war, are said not to amount to 30,000,000. The two French travellers, who were in Russia in 1792, estimate the whole revenue of the empire to have been little less than 60,000,000 of rubles, or nearly 12,000,000l. sterling.

When this sum is considered relatively, that is, according to the high value of money in that empire, compared to its low value in Great Britain, it will be found a very considerable revenue. That it is so, appears from the vast armies maintained and paid by the two late empresses, in Germany, Poland, and elsewhere, when no part of the money returned to Russia; nor do we find that they received any considerable subsidy from the houses of Bourbon and Austria, who, indeed, were in no condition to grant them any. In 1733, reckoning the tribute paid by the Tartars, with all taxes and duties in money, the sum total is said to have amounted only to thirteen millions of rubles (each ruble amounting to 4s. 6d. sterling). This income was at that time sufficient to maintain 339,500 men, employed in the land and sea service. The other expenses, beside the payment of the army and navy of the late empresses, the number and discipline of which were at least equal to those of her greatest predecessors, were very considerable. Her court was elegant and magnificent; her guards and attendants splendid; and the encouragement she gave to learning, the improvement of the arts, and useful discoveries, cost her vast sums, exclusive of her ordinary expenses of state.

Some of the Russian revenues arise from monopolies, which are often necessary in the infancy of commerce. The most hazardous enterprise undertaken by Peter the Great was his imitating the conduct of Henry VIII. of England, in seizing the revenues of the church. He found, perhaps, that policy and necessity required that the greatest part of them should be restored, which was accordingly done; his great aim being to deprive the patriarch of his excessive power. The clergy are taxed in Russia; but the pecuniary revenues of the crown arise from taxes upon estates, bagnios, bees, mills, fisheries, and other particulars.

The Russian armies are raised with little or no expense, and, while in their own country, subsist chiefly on provisions furnished them by the country people according to their internal valuation. The pay of a soldier scarcely amounts to thirty shillings yearly; in garrison he receives only five rubles yearly. The pay of a sailor and a gunner is a ruble a month, and they are found with provisions when on shore.

ORDERS.] The order of St. *Andrew* was instituted by Peter the Great, in 1698, to animate his nobles and officers in his wars against the Turks.

He chose St. Andrew for his patron, because by tradition he was the founder of Christianity in the country. The knights are persons of the first rank in the empire. The order of St. *Alexander Nevski* was also instituted by Peter the Great, and confirmed by the empress Catharine I. in the year 1725. The order of St. *Catharine* was instituted by Peter the Great, in honour of his empress, for her assistance on the banks of the Pruth. The order of St. *George*, instituted by the late empress Catharine II. in favour of the military officers in her service. The order of St. *Wolodimir* was instituted October 3d, 1782, by the late empress, in favour of those who serve in a civil capacity. The order of St. *Anne* of Holstein, in memory of Anne, daughter of Peter the Great, was introduced into Russia by Peter III.

**HISTORY.]** It is evident, both from ancient history and modern discoveries, that some of the most neglected parts of the Russian empire at present were formerly rich and populous. The reader who casts his eyes on the general map of Europe and Asia, may see the advantages of their situation, and their communication by rivers with the Black Sea, and the richest provinces in the Roman and Greek empires. In later times, the Asiatic part of Russia bordered on Saer and in Tartary, once the capital, under Jenghis Khan and Tamerlane, of a far more rich and powerful empire than any mentioned in history; and nothing is more certain than that the conquest of Russia was among the last attempts made by the former of those princes. The chronicles of this empire reach no higher than the ninth century: but they have a tradition, that Kiovia and Novgorod were founded by Kii in the year 430. This Kii is by some considered as an ancient prince, while others mention him as a simple boatman, who used to transport goods and passengers across the Neiper. For a long time the chief or ruler had the title of grand duke of Kiow. We cannot, with the smallest degree of probability, carry our conjectures, with regard to the history of Russia, higher than the introduction of Christianity, which happened about the tenth century, when the prince of this country, called Olba, is said to have been baptized at Constantinople, and refused the hand of the Greek emperor, John Zimisces, in marriage. This accounts for the Russians adopting the Greek religion, and part of the alphabet. Photius, the famous Greek patriarch, sent priests to baptise the Russians, who were for some time subject to the see of Constantinople; but the Greek patriarch afterwards resigned all their authority over the Russian church; and its bishops erected themselves into patriarchs; who were in a manner independent of the civil power. It is certain, that, till the year 1450, the princes of Russia were but very little considered, being chiefly subjected by the Tartars. About this time John or Iwan-Basilides conquered the Tartars, and, among others, the duke of Great Novgorod, from whom he is said to have taken 300 cart-loads of gold and silver. His prosperous reign of forty years gave a new aspect to Russia.

His grandson, the famous John Basilowitz II. having cleared his country of the intruding Tartars, subdued the kingdoms of Kafan and Aitracan Tartary, in Asia, and annexed them to the Russian dominions. By his cruelty, however, he obliged the inhabitants of some of his finest provinces, particularly Livonia and Esthonia, to throw themselves under the protection of the Poles and Swedes. Before the time of this John II. the sovereign of Russia took the title of *Welike Knez*, "great prince," great lord, or great chief; which the Christian nations at-

erwards rendered by that of great-duke. The title of Tzar, or, as we call it, Czar (a word which signifies emperor, and is probably derived from the Roman *Cæsar*), was added to that of the Russian sovereigns. Upon the death of John Basilowitz, the Russian succession was filled by a set of weak, cruel princes; and their territories were torn in pieces by civil wars. In 1597, Boris Gedonow assassinated Demetri, or Demetrius, the lawful heir, and usurped the throne. A young monk took the name of Demetrius, pretending to be that prince who had escaped from his murderers: and with the assistance of the Poles, and a considerable party (which every tyrant has against him), he drove out the usurper and seized the crown himself. The imposture was discovered as soon as he came to the sovereignty, because the people were not pleased with him; and he was murdered. Three other false Demetrius's started up, one after another.

These impostures prove the despicable state of ignorance in which the Russians were immersed. The country became by turns a prey to the Poles and the Swedes, but was at length delivered by the good sense of the boyars, impelled by their despair so late as the year 1613. The independence of Russia was then on the point of being extinguished. Uladislavus, son of Sigismund II. of Poland, had been declared czar; but the tyranny of the Poles was such, that it produced a general rebellion of the Russians, who drove the Poles out of Moscow, where they had for some time defended themselves with unexampled courage. Philaretus, archbishop of Rostow, whose wife was descended from the ancient sovereigns of Russia, had been sent ambassador to Poland by Demetrius, one of the Russian tyrants, and there was detained prisoner, under pretence that his countrymen had rebelled against Uladislavus. The boyars met in a body; and such was their veneration for Philaretus, and his wife, whom the tyrant had shut up in a nunnery, that they elected their son Michael Fædorowitz, of the house of Romanoff; a youth of 15 years of age, to be their sovereign. The father being exchanged for some Polish prisoners, returned to Russia; and being created patriarch by his son, reigned in the young man's right with great prudence and success. He defeated the attempts of the Poles to replace Uladislavus upon the throne, and likewise the claim of a brother of Gustavus Adolphus. The claims of the Swedes and Poles upon Russia occasioned a war between those two people, which gave Michael a kind of breathing-time; and he made use of it for the benefit of his subjects. He reigned thirty-three years; and by his wisdom, and the mildness of his character, restored ease and tranquillity to his subjects. It here may be proper to mention the mode of the czar's nuptials, which could not be introduced into the miscellaneous customs of the nation. His czarist majesty's intention to marry being known, the most celebrated beauties of his dominions were sent for to court, and there entertained. They were visited by the czar, and the most magnificent nuptial preparations were made, before the happy lady was declared by sending her magnificent jewels and a wedding-robe. The rest of the candidates were then dismissed to their several homes, with suitable presents. The name of the lady's father who pleased Michael was Strefchen; and he was ploughing his own farm, when it was announced to him that he was father-in-law to the czar.

Alexius succeeded his father Michael, and was married in the same manner. He appears to have been a prince of great genius. He recovered Smolentko, Kiow, and the Ukraine, but was unfortunate in

his wars with the Swedes. When the grand-signor, Mahomet IV. haughtily demanded some possessions from him in the Ukraine, his answer was, "that he scorned to submit to a Mahometan dog, and that "his scymitar was as good as the grand-signor's sabre." He promoted agriculture; introduced into his empire arts and sciences, of which he was himself a lover; published a code of laws, some of which are still used in the administration of justice; and greatly improved his army by establishing discipline. This he effected chiefly by the help of strangers, most of whom were Scotch. He subdued a chief of the Don Cossacs, named Stenko Rasin, who endeavoured to make himself king of Astracan; and the rebel, with 12,000 of his adherents, were hanged on the high roads. He introduced linen and silk manufactures into his dominions; and, instead of putting to death or enslaving his Lithuanian, Polish, and Tartar prisoners, he sent them to people the banks of the Wolga and the Kama. Theodore succeeded his father Alexius in 1667. He reigned seven years; and having on his death-bed called his boyars around him, in the presence of his brother and sister, Iwan and Sophia, and of Peter, who was afterwards so celebrated, and who was his half-brother, he said to them, "Hear my last sentiments; they are dictated by my love for the state, and by my affection for my people. The bodily infirmities of Iwan necessarily must affect his mental faculties; he is incapable of ruling an empire like that of Russia; he cannot take it amiss if I recommend to you to set him aside, and let your approbation fall on Peter, who, to a robust constitution, joins great strength of mind, and marks of a superior understanding." But this wise destination extremely offended the princess Sophia, who was a woman of great ambition, and who, after the death of Theodore, found means to excite a horrible sedition among the Strelitzes, who then formed the standing army of Russia. Their excesses surpassed all description; but Sophia, by her management, replaced her brother Iwan in his birth-right, and exercised the government herself with the greatest severity and inhumanity; for all the Russian grandees who were related to Peter, or whom she supposed to favour him, were put to cruel deaths. The instances given of her barbarous administration are shocking to humanity. At length, in 1682, the two princes, Iwan and Peter, were declared joint sovereigns, and their sister, their associate co-regent. Her administration was bloody and tumultuous; nor durst she venture to check the fury of the Strelitzes, and other insurgents. Finding this debility in her own person, she intended to have married prince Basil Galitzin, who is said to have been a man of sense and spirit, and some learning. Being placed at the head of the army by Sophia, he marched into Crim Tartary; but Peter now was about 17 years of age, and asserted his right to the throne. Sophia and Iwan were then at Moscow; and upon Peter's publishing aloud that a conspiracy had been formed by his sister to murder him, he was joined by the Strelitzes, who defeated or destroyed Sophia's party, and forced herself to retire to a monastery. Galitzin's life was spared; but his great estate was confiscated, and the following curious sentence was pronounced as his punishment: "Thou art commanded by the most clement czar to repair to Karga, a town under the pole, and there to continue the remainder of thy days. His majesty, out of his extreme goodness, allows thee three pence per day for thy subsistence." This left Peter with no other competitor, in the year 1689, than the mild and easy Iwan; and upon his death, which happened

in 1696, Peter reigned for security, by the execution of Peter, though he was the jealousy of his Dutch; with the first early introduced into navigation, which was encouraged by Gordon, a Scotchman, whom he introduced a view of employing Peter, after this, the hands of Gordon, and his adventures numerous, and to common ship-carpenter self in ship-building, pline introduced, duced or crushed of Asia; and at ments, the whole every rank and station which he received only to enlarge his rendered him at rage; and the hand, both before redounds greatly merit; and he who had been his habitation, he plans and to at to her own country who served as a val triumphs, v towa in 1709, reign. Peter the Great entitled the Czar, as his first person and great death. Underdetermine on that the young of the sentence soon his sentence were the following tary law, c against the

in 1696, Peter reigned alone, and cruelly provided for his own future security, by the execution of above 3000 Strelitzes.

Peter, though he had been but very indifferently educated through the jealousy of his sister, associated himself with the Germans and Dutch; with the former for the sake of their manufactures, which he early introduced into his dominions; and with the latter for their skill in navigation, which he practised himself. His inclination for the arts was encouraged by his favourite Le Fort, a Piedmontese; and general Gordon, a Scotchman, disciplined the czar's own regiment, consisting of 5000 foreigners; while Le Fort raised a regiment of 12,000, among whom he introduced the French and German exercises of arms, with a view of employing them in curbing the insolence of the Strelitzes. Peter, after this, began his travels; leaving his military affairs in the hands of Gordon. He set out as an attendant upon his own ambassadors; and his adventures in Holland and England, and other courts, are too numerous, and too well known, to be inserted here. By working as a common ship-carpenter at Deptford and Saardam, he completed himself in ship-building and navigation; and through the excellent discipline introduced among his troops by the foreigners, he not only overawed or crushed all civil insurrections, but all his enemies on this side of Asia; and at last he even exterminated, excepting two feeble regiments, the whole body of the Strelitzes. He rose gradually through every rank and service both by sea and land; and the many defeats which he received, especially that from Charles XII. at Narva, seemed only to enlarge his ambition, and extend his ideas. The battles he lost rendered him at length a conqueror, by adding experience to his courage; and the generous friendship he showed to Augustus king of Poland, both before and after he was dethroned by the king of Sweden, redounds greatly to his honour. He had no regard for rank distinct from merit; and he at last married Catharine, a young Lithuanian woman, who had been betrothed to a Swedish soldier; because, after a long cohabitation, he found her possessed of a soul formed to execute his plans and to assist his councils. Catharine was so much a stranger to her own country, that her husband afterwards discovered her brother, who served as a common soldier in his armies. But military and naval triumphs, which succeeded one another after the battle of Pultowa in 1709, with Charles XII. were not the chief glory of Peter's reign. He applied himself with equal assiduity to the cultivation of commerce, arts, and sciences; and, upon the whole, he made such acquisitions of dominion, even in Europe itself, that he may be said at the time of his death, which happened in 1725, to have been the most powerful prince of his age, but more feared than beloved by his subjects.

Peter the Great was unfortunate in his eldest son, who in Russia is entitled the Czarowitz, and who, marrying without his consent, entered, as his father alleged, into some dangerous practices against his person and government; for which he was tried and condemned to death. Under a sovereign so despotic as Peter was, it is difficult to determine on the justice of the charge. It was undoubtedly his will that the young prince should be found guilty; and the very reading of the sentence appears to have been fatal to him. It is said, that, as soon as sentence of death was pronounced upon the prince, in which were the following words, "The divine, ecclesiastical, civil and military law, condemns to death, without mercy, all those whose attempts against their father and their sovereign are manifest," he fell into the

most violent convulsions, from which it was with great difficulty that he regained a little interval of sense, during which he desired his father would come to see him; when he asked his pardon, and soon after died. According to other accounts, he was secretly executed in prison, and marshal Weyde was the person who beheaded him. After this event, in 1724, Peter ordered his wife Catharine to be crowned, with the same magnificent ceremonies as if she had been a Greek empress, and to be recognised as his successor; which she accordingly was, and mounted the Russian throne upon the decease of her husband. She died, after a glorious reign, in 1727, and was succeeded by Peter II. a minor, son to the czarowitz. Many domestic revolutions happened in Russia during the short reign of this prince; but none were more remarkable than the disgrace and exile of prince Menzikoff, the favourite general in the two late reigns, and esteemed the richest subject in Europe. Peter II. died of the small pox, in 1730.

Notwithstanding the despotism of Peter and his wife, the Russian senate and nobility, upon the death of Peter II. ventured to set aside the order of succession which they had established. The male issue of Peter was now extinguished; and the duke of Holstein, son to the eldest daughter, was, by the destination of the late empress, entitled to the crown; but the Russians, for political reasons, filled their throne with Anne, duchess of Courland, second daughter to Iwan, Peter's eldest brother, though her eldest sister, the duchess of Mecklenburg, was alive. Her reign was extremely prosperous; and though she accepted the throne under limitations that some thought derogatory to her dignity, yet she broke them all, asserted the prerogative of her ancestors, and punished the aspiring Dologorucki family, who had imposed upon her limitations, with a view, as it is said, that they themselves might govern. She raised her favourite, Biron, to the duchy of Courland; and was obliged to give way to many severe executions on his account. Upon her death in 1740, John, the son of her niece the princess of Mecklenburg, by Anthony Ulric of Brunswick-Wolfenbuttle, was, by her will, entitled to the succession; but being no more than two years old, Biron was appointed to be administrator of the empire during his nonage. This destination was disagreeable to the princess of Mecklenburg and her husband, and unpopular among the Russians. Count Munich was employed by the princess of Mecklenburg to arrest Biron, who was tried, and condemned to die, but was sent into exile to Siberia.

The administration of the princess Anne of Mecklenburg and her husband was, on many accounts, but particularly that of her German connexions, disagreeable, not only to the Russians, but to other powers of Europe: and notwithstanding a prosperous war they carried on with the Swedes, the princess Elizabeth, daughter, by Catharine, to Peter the Great, formed such a party, that in one night's time she was declared and proclaimed empress of the Russias; and the princess of Mecklenburg, her husband, and son, were made prisoners.

Elizabeth's reign may be said to have been more glorious than that of any of her predecessors, her father excepted. She abolished capital punishments, and introduced into all civil and military proceedings a moderation, till her time unknown in Russia: but at the same time she punished counts Munich and Osterman, who had the chief management of affairs during the late administration, with exile. She made peace with Sweden, and settled, as we have already seen, the succession to that crown, as well as to her own dominions, upon the most equita-

ble foundation. He restored the natural ing the duke of Holstein, her heir. She soon after her accession he renounced the edly was his right, cels of Anhalt-Zerb a son, who is the pr

ble foundation. Having gloriously finished a war with Sweden, she restored the natural order of succession in her own family, by declaring the duke of Holstein-Gottorp, who was descended from her eldest sister, her heir. She gave him the title of grand-duke of Russia; and, soon after her accession to the throne, called him to her court, where he renounced the succession of the crown of Sweden, which undoubtedly was his right, embraced the Greek religion, and married a princess of Anhalt-Zerbst, the late empress Catharine II. by whom he had a son, who is the present emperor of Russia.

Few princes have had a more uninterrupted career of glory than Elizabeth. She was completely victorious over the Swedes. Her alliance was courted by Great Britain, at the expense of a large subsidy; but many political, and some private reasons, it is said, determined her to take part with the house of Austria against the king of Prussia in 1756. Her arms alone gave a turn to the fortune of the war, which was in disfavour of Prussia, notwithstanding that monarch's amazing abilities both in the field and cabinet. Her success was such as portended the entire destruction of the Prussian power, which was, perhaps, saved only by her critical death, on January 5, 1762.

Elizabeth was succeeded by Peter III. grand-duke of Russia, and duke of Holstein, a prince whose conduct has been variously represented. He mounted the throne possessed of an enthusiastic admiration of his Prussian majesty's virtues; to whom he gave peace, and whose principles and practices he seems to have adopted as the rule of his future reign. He might have surmounted the effects even of those peculiarities, unpopular as they then were in Russia; but it is said that he aimed at reformation in his dominions, which even Peter the Great durst not attempt; and that he even ventured to cut off the beards of his clergy. It is also alleged that he had formed a resolution to destroy both the empress and her son, though they had been declared heirs to the imperial throne by the same authority which had placed the crown upon his head: even the advocates of Peter the Third acknowledge that he had resolved to shut up his wife and son in a convent, to place his mistress upon the throne, and to change the order of succession. The execution of his designs was, however, prevented by an almost general conspiracy formed against him, in which the empress took a very active part, and this unfortunate prince scarcely knew an interval between the loss of his crown and his life, of which he was deprived, while under an ignominious confinement, in July 1762. His wife, the late Catharine II. was proclaimed empress.

The death of prince Iwan, son to the princess of Mecklenburg, was an act of state policy perfectly according with the means by which Catharine ascended the throne. This young prince, as soon as he came into the world, was designed, though illegally, to wear the imperial crown of Russia, after the death of his great aunt, the empress Anna Iwannowna; but, on the advancement of the empress Elizabeth, he was condemned to lead an obscure life in the castle of Schlusselfburg, under a strong guard, who had particular orders, that, if any person or any armed force was employed in attempting to deliver him, they should kill him immediately. He lived quietly in his prison, when the empress Catharine II. mounted the throne; and as the revolution which deposed her husband Peter III. had occasioned a strong ferment in the minds of the people, Catharine was apprehensive that some attempts might be made in favour of Iwan; she therefore doubled the guards of this unhappy prince, and particularly entrusted him to the

care of two officers who were devoted to her interest. However, a lieutenant of infantry, who was born in the Ukraine, undertook, or at least pretended so, to deliver Iwan by force of arms, from the fortress of Schlüsselburg; and under this pretence the prince was put to death, after an imprisonment of 23 years. The lieutenant who attempted to deliver him was arrested, and afterwards beheaded: but, notwithstanding this, it has been represented that he was a mere tool of the court, though he suffered for executing the instructions he received.

While this event excited the attention of the Russian nation, the flames of civil war broke out with great violence in Poland; which was generally the case when the throne was vacant. And as the internal tranquillity of Poland was a capital object with Russia, the empress Catharine sent a body of troops into that country; and by her influence count Poniatowski was raised to the throne. She also interposed, in order to secure the rights which the treaty of Oliva had given to the Greek and protestant subjects of Poland. But the unbrage which her imperial majesty's armies gave to the Roman-catholic Poles, by their residence in Poland, increased the rage of civil war in that country, and produced confederacies against all that had been done during the late election; which rendered Poland a scene of blood and confusion. The conduct of Russia with regard to Poland gave so much offence to the Ottoman court, that the grand-signor sent Obreskoff, the Russian minister, to the prison of the Seven Towers, declared war against Russia, and marched a very numerous army to the confines of Russia and Poland. Hostilities soon commenced between these rival and mighty empires. In the months of February and March, 1760, Cim Gueray, khan of the Tartars, at the head of a great body of Tartars, supported by 10,000 Spahis, having forced the Russian lines of communication, penetrated into the province of New Servia, where he committed great ravages, burning many towns and villages, and carrying off some thousand families captive. In April following, the grand vizir, at the head of a great army, began his march from Constantinople, and proceeded towards the Danube. In the mean time, prince Galitzin, who commanded the Russian army on the banks of the Neister, thought this a proper time to attempt something decisive, before the arrival of the great Turkish force in that quarter. Having accordingly crossed the Neister with his whole army, he advanced to Choczim, where he encamped in sight of a body of 30,000 Turks, commanded by Caraman Pacha, and intrenched under the cannon of the town. The prince, having made the necessary dispositions, attacked the Turks in their intrenchments early in the morning of the 30th of April, and, notwithstanding an obstinate defence, and a dreadful fire from the fortress, at length beat them out of their trenches. The Turks endeavoured to cover their retreat, by detaching a large body of cavalry to attack the right wing of the Russian army; but they met with such a warm reception from the artillery, that they soon retired in great disorder. General Stoffeln and prince Dolgoricki were then ordered to pursue the fugitives, at the head of eight battalions; which they did so effectually, that they followed them into the suburbs of Choczim, and their pursuit was at length only stopped by the palisades of the fortress.

On the 13th of July, a very obstinate battle was fought between a considerable Turkish army, and the Russians under prince Galitzin, in the neighbourhood of Choczim, in which the Turks were defeated. The Russians immediately invested Choczim; but the garrison, being numerous, made frequent sallies, and received great reinforcements from the

grand vizir's camp on the Danube. Several were obliged to retreat from the siege of Choczim, above 20,000 men.

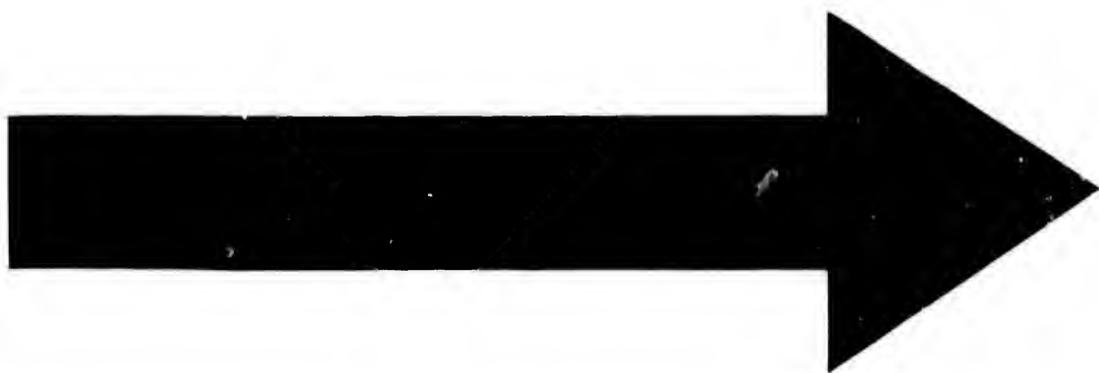

In the management of prudence, the designs of the pursued. But the caution gave occasion to clamours, and the he at length became more courage than

grand vizir's camp, who was now considerably advanced on this side of the Danube. Several actions ensued; and prince Galitzin was at length obliged to retreat, and repass the Neister. It was computed that the siege of Choczin, and the actions consequent to it, cost the Russians above 20,000 men.

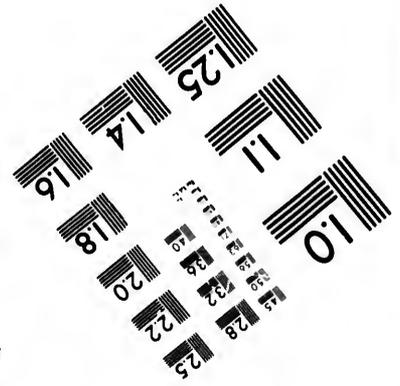

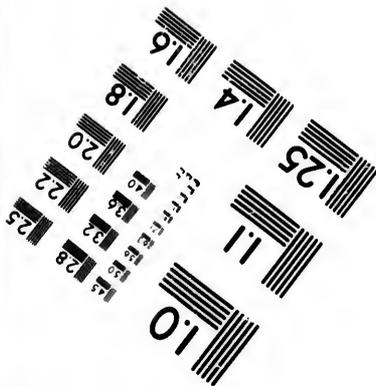

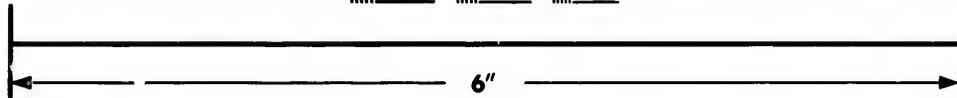

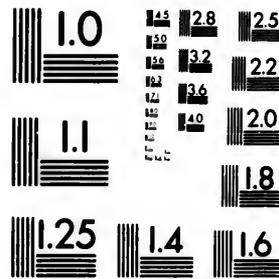

In the management of this war, the grand vizir had acted with a degree of prudence, which, it has been thought, would have proved fatal to the designs of the Russians, if the same conduct had been afterwards pursued. But the army of the vizir was extremely licentious, and his caution gave offence to the Janizaries; so that, in consequence of their clamours, and the weakness of the councils that prevailed in the seraglio, he at length became a sacrifice, and Moldovani Ali Pacha, a man of more courage than conduct, was appointed his successor.

During these transactions, general Romanzow committed great devastations upon the Turks on the borders of Bender and Oczakow, where he plundered and burnt several towns and villages, defeated a Turkish detachment, and carried off a great booty of cattle. The Tartars also committed great ravages in Poland, where they almost totally destroyed the palatinate of Bracklaw, besides doing much mischief in other places. In the beginning of September, the Russian army was again posted on the banks of the Neister, and effectually defended the passage of that river against the Turks, whose whole army, under the command of the new vizir, was arrived on the opposite shore. Having laid three bridges over the Neister, the Turkish army began to pass the river in the face of the enemy. Prince Galitzin having perceived this motion early in the morning of the 9th of September, immediately attacked those troops that had crossed the river in the night, who consequently could neither choose their ground, nor have time to extend or form themselves properly where they were. Notwithstanding these extreme disadvantages, the engagement was very severe, and continued from seven in the morning till noon. The Turks fought with great obstinacy, but were at length totally defeated, and obliged to repass the river with great loss, and in the utmost confusion. It was computed, that about 60,000 Turks crossed the river before and during the time of the engagement. Prince Galitzin charged at the head of five columns of infantry, with fixed bayonets, and destroyed the flower of the Turkish cavalry. It is said that the loss of the Turks in this battle amounted to 7000 men killed upon the spot, besides wounded and prisoners, and a great number who were drowned. Though the ill conduct of the vizir had greatly contributed to this misfortune, yet this did not prevent him from engaging in another operation of the same nature. He now laid but one bridge over the river, which he had the precaution to cover with large batteries of cannon, and prepared to pass the whole army over. According, on the 17th of September, eight thousand Janizaries and four thousand regular cavalry, the flower of the whole Ottoman army, passed over with a large train of artillery, and the rest of the army were in motion to follow, when a sudden and extraordinary swell of the waters of the Neister carried away and totally destroyed the bridge. The Russians lost no time in making use of this great and unexpected advantage. A most desperate engagement ensued, in which the slaughter of the Turks was prodigious. Not only the field of battle, but the river over which some few hundreds of Turks made their escape by swimming, was for several miles covered with dead bodies. The Russians took 64 pieces of cannon, and above 150 colours and horse-tails. The Turks immediately broke up their camp, and

abandoned the strong fortrefs of Choczim, with all its stores and numerous artillery, and retired tumultuously towards the Danube. They were much exasperated at the ill conduct of their commander the vizir; and it was computed that the Turks lost 26,000 of the best and bravest of their troops, within little more than a fortnight; and 49,000 more abandoned the army, and totally deserted, in the tumultuous retreat to the Danube. Prince Galitsin placed a garrison of four regiments in the fortrefs of Choczim, and soon after resigned the command of the army to general count Romanzow, and returned to Petersburg, covered with laurels.

The Russians continued to carry on the war with success; they overran the great province of Moldavia, and general Elmdt took possession of the capital, Jassy, without opposition. As the Greek natives of this province had always secretly favoured the Russians, they now took this opportunity of their success and the absence of the Turks to declare themselves openly. The Greek inhabitants of Moldavia, and afterwards those of Wallachia, acknowledged the empress of Russia their sovereign, and took oaths of fidelity to her. On the 18th of July, 1770, general Romanzow defeated a Turkish army near the river Larga: the Turks are said to have amounted to 80,000 men, and were commanded by the khan of the Crimea. But on the second of August, the same Russian general obtained a still greater victory over another army of the Turks, commanded by a new grand vizir. This army was very numerous, but was totally defeated. It is said that above 7000 Turks were killed in the field of battle, and that the roads to the Danube were covered with dead bodies: a vast quantity of ammunition, 143 pieces of brass cannon, and some thousand carriages loaded with provisions, fell into the hands of the Russians.

But it was not only by land that the Russians carried on the war successfully against the Turks. The empress sent a considerable fleet of men of war, Russian built, into the Mediterranean, to act against the Turks on that side; and, by means of this fleet, under count Orlop, the Russians spread ruin and desolation through the open islands of the Archipelago, and the neighbouring defenceless coasts of Greece and Asia, the particulars of which will appear in the history of Turkey.

The war between the Russians and the Turks still continued to be carried on by land as well as by sea, to the advantage of the former; but at length peace was concluded, on the 21st of July, 1774, highly honourable and beneficial to the Russians, by which they obtained the liberty of a free navigation over the Black Sea, and a free trade with all the ports of the Ottoman empire.

Before the conclusion of the war with the Turks, a rebellion broke out in Russia, which gave much alarm to the court of Petersburg. A Cossack, whose name was Pugatcheff, assumed the name and character of the late unfortunate emperor, Peter the Third. He appeared in the kingdom of Kafan, and pretended that he made his escape, through an extraordinary interposition of Providence, from the murderers who were employed to assassinate him; and that the report of his death was only a fiction invented by the court. There is said to have been a striking resemblance in his person to that of the late emperor; which induced him to engage in this enterprize. As he possessed abilities and address, his followers soon became very numerous; and he at length found himself so powerful, his followers being armed and provided with artillery, that he stood several engagements with able Russian generals, at the head of large bodies of troops, and committed great

ravages in the country. But being at last totally defeated, and taken prisoner, he was brought to Moscow in an iron cage, and there beheaded, on the 21st of January, 1775.

The peace of 1774 was then indispensably necessary to the immediate preservation of the Turkish empire; but within so small a space of time as five years a new war was just upon the point of breaking out between the two empires, and was only prevented by a new treaty of pacification, which took place on the 21st of March, 1779. But the great source of discord was still left open. The pretended independency of the Crimea afforded such an opening to Russia into the very heart of the Turkish empire, and such opportunities of interference, that it was scarcely possible that any lasting tranquillity could subsist between the two empires. A claim, made and insisted on by Russia, of establishing consuls in the three provinces of Moldavia, Wallachia, and Bessarabia, was exceedingly grievous to the Porte. After long disputes, the Turkish ministers, more from a sense of the disability of the state for war, than from pacific dispositions, found it necessary, towards the close of the year 1781, to give up the point in debate with respect to the consuls. This concession, however mortifying, produced but a short-lived effect. New troubles were continually breaking forth. The emperor of Germany having avowed his determination of supporting all the claims of Russia as well as his own, all the parties prepared, with the utmost vigour, for the most determined hostility. The year 1783 accordingly exhibited the most formidable apparatus of war on the northern and eastern borders of Europe. However, in the midst of all these appearances of war, negotiations for a peace continued to be carried on at Constantinople; which peace was at last signed, January 9th, 1784.

By this treaty Russia retains the full sovereignty of her new acquisitions, viz. the Crimea, the Isle of Taman, and part of Cuban.—As the recovery and restoration of every thing Greek is the predominant passion of the court of Petersburg, so the Crimea and its dependencies are in future to be known by the name of Taurica; particular places are likewise restored to their ancient appellations; and the celebrated port and city of Cassa has now resumed its long-forgotten name of Theodosia. Since this accession of dominion, new towns, with Greek or Russian names, are rising fast in the deserts, and are peopled mostly by colonies of Greeks and Armenians.

The year 1787 opened with the extraordinary spectacle of the journey of the empress of Russia to Cherson, where it seems to have been her original intention to have been crowned with all possible magnificence, and under the splendid titles of empress of the East, liberator of Greece, and reviver of the series of Roman emperors, who formerly swayed the sceptre over that division of the globe. But this coronation, for reasons we are unable to assign, was laid aside. The splendor of the route of the czarina surpasses whatever the imagination would spontaneously suggest. She was escorted by an army. Pioneers preceded her march, whose business it was to render the road as even and pleasant as it could possibly be made. At the end of each day's journey she found a temporary palace erected for her reception, together with all the accommodations and luxuries that Petersburg could have afforded. In the list of her followers were the ambassadors of London, Versailles, and Vienna; and her own ambassador, as well as the envoy of the emperor to the court of Constantinople, were appointed to meet her at Cher-

son. The king of Poland met her in her journey; and the emperor, not satisfied with swelling her triumph at Cherson, appeared in that capital eight days before her, and proceeded to a considerable distance up the Dnieper, to intercept her progress. Her route was through Kiow, where she remained three months, and was received under triumphal arches; and upon her arrival at Cherson, having thought proper to extend the walls of the city, she inscribed over one of the gates, "Through this gate lies the road to Byzantium." The czarina returned to Petersburg by the way of Moscow.

Scarcely had the empress returned to her capital, before she was followed by the Turkish declaration of hostilities. The emperor of Germany joined her in declaring war against the Porte, which, instead of being disheartened at the formidableness of this confederacy, applied itself with redoubled ardour to prepare for resistance. The operations of the Russian forces were directed against Choczim and Oczakow. In the former of these undertakings, they acted rather as auxiliaries to the emperor's general, the prince of Saxe Cobourg, who, from the last day of June to the 29th of September, 1788, continued a very powerful attack on this city, when it surrendered to the arms of the imperial forces. Oczakow, after an obstinate contest, in which the Russians at length became exposed to all the rigours of a winter campaign, was taken by storm on the 17th of December following.

It was during the progress of these hostilities with the Porte, that Russia found herself suddenly involved in a new and unexpected war. As a nation, Sweden had the greatest causes of resentment against Russia for past injury and loss, at the same time that she had every thing to dread from her present overgrown power and boundless ambition, which was as little qualified in the wanton display, as it was ungoverned in the actual exertion. Russia has constantly found means to maintain a strong and numerous party in Sweden. All these causes operating together, induced Gustavus the Third to meditate a project of hostilities against Russia, which commenced in Finland, a few days after the king's arrival in that province. But the principal action of the campaign was the naval battle off Hoogland, in the Gulf of Finland. The engagement, which lasted five hours, was fought with considerable skill and obstinacy on both sides. The forces were nearly equal. The Russian fleet, commanded by admiral Oreig, consisted of seventeen ships of the line; and the Swedish, under the command of the duke of Sudermania, the king's brother, consisted of fifteen of an inferior weight of metal, but reinforced by five frigates, one of forty-four, and the rest of forty guns each, which occasionally ranged themselves in order of battle. The Russians possessed, upon the whole, a superiority of 294 pieces of cannon, while that in the weight of metal was perhaps of greater moment. The victory, as is usually the case in actions not apparently and absolutely decisive, was claimed by both sides. But it seems, upon the whole, that the Swedes, in the brightest period of their glory, had never displayed greater gallantry by sea or land than they did upon this occasion. Their princely commander merited a very considerable share of the glory of this engagement. At last, after many other engagements attended with various success, on the 14th of August 1790, a convention for a peace was signed between the courts of Russia and Sweden, and ratified in six days after.

At the close of the year 1790, the empress had the satisfaction to see her conquests no longer bounded by the course of the Danube. The capture of Ismail was the last important action. Eight different times

were the Muscovites repulsed with the slaughter of many of their bravest soldiers. At the ninth, general Suvarrow put himself at their head, and snatching a standard out of an officer's hand, ran directly towards the town, passed the trenches, and climbing up the wall, planted it himself upon the ramparts. "There," cried he, "my fellow soldiers behold there your standard in the power of the enemy, unless you will preserve it; but I know you are brave, and will not suffer it to remain in their hands." This speech had the desired effect. It was taken by storm on the 22d of December, 1790; and it is said that the siege and capture did not cost the Russians less than 10,000 men. The most shocking part of the transaction is, that the garrison (whose bravery merited, and would have received from a generous foe, the highest honours) were massacred in cold blood by the merciless Russians, to the amount of upwards of 30,000 men, by their own account; and the place was given up to the unrestrained fury of the brutal soldiery. The most horrid outrages were perpetrated on the defenceless inhabitants; and the conduct of the conquerors was more like that of a horde of cannibals than of a civilised people; and too strongly evinces, that, whatever steps may have been taken by the late or other sovereigns of this empire to produce a forced civilisation, both the monarchs and the people of Russia are still barbarians.

England and Prussia, after a long and expensive armed negotiation, at length assented to the demand of the empress, which was strengthened by the interference of Spain and Denmark, that Oczakow, and the territory between the rivers Bog and Niester, shall in full sovereignty belong to Russia; that the river Niester shall for the future determine the frontiers of Russia and the Porte; that the two powers may erect on the shores of that river what fortresses they think proper; and Russia engages to grant a free navigation on the river Niester. This was concluded on the 11th of August, 1791. Thus has the Porte entered into a war, for the purpose of regaining the Crimea, and after reducing the Ottoman empire to extreme weakness, and internal symptoms of ruin, irretrievable by a government in a regular progress of deterioration, lost an important territory, and left the existence of the empire at the mercy of another Russian war. By some advantages offered to Prussia and Austria, and a few intrigues, Russia may hereafter change the fluctuating stream of European politics, and by one powerful campaign overturn the Turkish monarchy.

The final treaty with the Turks was concluded at Jassy, the 9th of January, 1792. Catharine then applied herself to the improvement of Oczakow, and rendered it a place of great strength, importance, and commerce. At the same time she was not inattentive to European politics. When the coalition of sovereign powers was formed against France, Gustavus III. the late king of Sweden, was to have conducted that expedition which was afterwards made against France by the king of Prussia and the Prince of Brunswick. Catharine, on this occasion, promised to assist him and the alliance with twelve thousand Russian troops, and an annual subsidy of three hundred thousand rubles. She assured the pope that she would support him in the resumption of Avignon, and published a strong manifesto against the French revolution and the progress of the new principles of liberty; but the only active part she took against that revolution was sending twelve ships of the line and eight frigates to join the English fleet, which were paid for by a subsidy, victualled and repaired in the British ports, and then re-

turned home without rendering any further service. But her attention was principally directed to Poland, and the efforts which that people made in the cause of liberty. Whilst she amused the world with manifestoes against France, she beheld, with pleasure, the greatest powers of Europe wasting their strength and treasure; and, undisturbed by any foreign interference, made a second partition of Poland, the circumstances of which the reader will find briefly narrated in our account of that unfortunate country.

By her intrigues, she, in like manner, annexed to the crown of Russia the fertile and populous country of Courland. She invited the duke of Courland to her court under the pretext that she wished to confer with him on some affairs of importance; and during his absence the states of Courland assembled, and the nobles proposed to renounce the sovereignty of Poland, and annex the country to the empire of Russia. The principal members of the great council opposed this change; but the Russian general Pahlen appeared in the assembly, and his presence silenced all objections. The next day (March 18, 1795) an act was drawn up, by which Courland, Semigallia, and the circle of Pilten, were surrendered to the empress of Russia. The act was sent to Petersburg, and the submission of the states accepted by the empress. The duke of Courland was in no condition to refuse his acquiescence: he received very considerable presents from the empress, in compensation, and retired to live on some extensive estates he had purchased in Prussia.

But the acquisition, by intrigue and artifice, of countries incapable of resistance, was not sufficient to satisfy the ambition of Catharine. Incessantly anxious to extend her dominions, she turned her arms against Persia, under the pretext of defending Lolf Ali Khan, a descendant of the race of the Sophis; but in reality to seize on the Persian provinces which border on the Caspian sea. Her general Valearian Zouboff penetrated, at the head of a numerous army, into the province of Daghestan, and laid siege to Derbent. Having carried a high tower which defended the place, he put all the garrison to the sword, and prepared to storm the city. The Persians, terrified at the barbarous fury of the Russians, demanded quarter; and the keys of the city were delivered up to Zouboff by the commandant, a venerable old man, a hundred and twenty years of age, who had before surrendered Derbent to Peter I. at the beginning of the present century. Aga Mahmed was advancing to the relief of Derbent, when he learned that the place was already in the power of the Russians. Zouboff drew out his army, and gave him battle; but victory declared in favour of the Persians, who forced the Russians to retire into Derbent; in consequence of which defeat, a strong body of Russian troops were ordered to reinforce the army of Zouboff.

These martial preparations, and plans of ambition, were, however, interrupted by her death. On the morning of the 9th of November, 1796, she appeared very cheerful, and took her coffee as usual. Soon after she retired into the closet, where continuing unusually long, her attendants became alarmed, and at length opened the door, when they found her on the floor in a state of insensibility, with her feet against the door. Doctor Rogerfon, her first physician, was immediately called, who bled her twice. At first she appeared rather to revive, but was unable to utter a word, and expired at ten o'clock at night.

Catharine II. in her youth had been handsome, and preserved in the close of life a graceful and majestic air. She was of a middle stature, well proportioned, and, as she carried her head very erect, appeared taller than she really was. Her forehead was open, her nose aquiline, her mouth well-made, and her chin somewhat long, though not so as to have a disagreeable effect. Her countenance did not want for expression; but she was too well practised in the courtly habits of dissimulation to suffer it to express what she wished to conceal.

With respect to her political character, she was undoubtedly a great sovereign. From the commencement of her reign she laboured, and with the greatest success, to increase the power and political consequence of her country. She encouraged learning and the arts, and made every exertion to extend, encourage, and enlarge the commerce of her subjects. She effected many and important regulations in the interior police, and particularly in the courts of justice. She abolished the torture, and adopted an excellent plan for the reformation of prisons. The new code of laws, for which she gave instructions, will contribute still more to mitigate the rigour of despotism. In the execution, indeed, of her plans for the aggrandisement of her empire, she appears to have acknowledged no right but power, no law but interest. Of her private life, her panegyrists, if prudent, will speak but little. They will dwell lightly on the means by which she mounted the throne. The only palliation of that conduct, which the most friendly ingenuity can suggest, will be derived from the frequent and bloody usurpations which, since the death of Peter the Great, had almost become the habit of the Russian court. But there are some acts, at the recital of which we should shudder, even if the scene were laid in Morocco. The mysterious fate of prince Iwan, in 1763, cannot be obliterated from history; the blood spilt in the long-conceived scheme of expelling the Turks from Europe, and re-establishing the eastern empire in the person of a second Constantine, will not be expiated, in the estimation of humanity, by the gigantic magnificence of the project. Above all, the fate of Poland, the dissensions and civil wars industriously somented in that unhappy kingdom, for a period of thirty years—the horrible massacres which attended its final subjugation, and the impious mockery of returning solemn thanks to heaven for the success of such atrocious crimes, will be a foul and indelible stain on the memory of Catharine.

The character of her successor Paul I. as far as it has been displayed in the first year of his reign, appears to be milder and more pacific than that of his mother. Immediately on his accession to the throne, he ordered hostilities to cease between Russia and Persia; and a peace was soon after concluded between the two countries. He set at liberty the unfortunate Kosciuszko, the general of the Polish patriots, with liberty either to reside in his dominions or retire to America, which latter country the general chose for his asylum, but whence he has since returned to Europe, and now resides in France. He behaved with an honourable liberality towards the deposed king of Poland; and restored to their estates a great number of Polish exiles and fugitives.

He has since, however, taken a very active part in the war against France, and aided the allies with very powerful armies, which have hitherto had great success. Whether this interference originates in a sincere wish to protect the rights of the neighbouring princes, and restore tranquillity to Europe, by restraining the exorbitant ambition of France;

or whether it originates in secret views of self-interest and aggrandisement, time alone must discover.

Catharine II, the empress of all the Russias, was born May 2, 1729, and ascended the throne July 9th, 1762, upon the deposition and death of her husband. She was married to that prince while he was duke of Holstein-Gottorp, Sept. 1, 1743, and died Nov. 9, 1796.

Paul I the present emperor of Russia, was born Oct. 1, 1754. He has been twice married, and by his present consort, who was princess of Wirtemberg, has issue.

1. Alexander, born Dec. 23, 1777, married to the princess Louisa of Baden, May 21, 1793.

2. Constantine, born May 8, 1779, married to the princess of Saxo Cobourg, February 14, 1796.

3. Alexander Powlowna, born in Aug. 1783.

4. Helena, born Dec. 24, 1784.

5. A princess, born in March 1786.

6. Another princess, born in May, 1788.

7. Another princess, born in 1792.

## SCOTLAND AND ITS ADJACENT ISLES.

ACCORDING to the general plan of this work, we shall treat of the islands belonging to Scotland, before we proceed to the description of that ancient kingdom; and to avoid prolixity, comprehend under one head those of Shetland, Orkney, and the Hebrides\*, or Western Isles.

**SITUATION AND EXTENT.]** The islands of Shetland lie north-east of the Orcales, or Orkney-islands, between 60 and 61 degrees of north latitude, and form part of the shire of Orkney.

The Orcales lie north of Dungsby-head, between 59 and 60 degrees of north latitude; divided from the continent by a tempestuous strait, called Pentland Frith, 24 miles long and 12 broad.

The Hebrides, or Western isles, are very numerous, and some of them large; situated between 55 and 59 degrees of north latitude.

**CLIMATE.]** There is very little difference in the climate of these islands, the air being keen, piercing, and salubrious; so that many of the natives live to a great age. In the Shetland and Orkney islands they can see to read at midnight in June and July; and during four of the summer months, they have frequent communications, both for business and curiosity, with each other, and with the continent; the rest of the year, however, these islands are almost inaccessible, through fogs, darkness, and storms. It is a certain fact, that a Scotch fisherman was imprisoned in May, for publishing the account of the prince and princess of Orange being raised to the throne of England, the preceding November; and he would probably have been hanged, had not the news been confirmed by the arrival of a ship.

**CHIEF ISLANDS AND TOWNS.]** The largest of the Shetland islands, which are forty-six in number (though many of them are uninhabited),

\* Anciently called the *Hebrides*. The origin of the modern name Hebrides is not known, except it be a corruption of *Hebrides*.

is Mainland, which is 60 miles in length, and 20 in breadth. Its principal town is Lerwick, which contains 300 families; the whole number of families in the island not exceeding 800. Shalloway is another town, where the remains of a castle are still to be seen; and it is the seat of a presbytery. On this island the Dutch begin to fish for herrings at midsummer, and their fishing-season lasts six months.

The largest of the Orkney islands, which are about thirty in number (though several of them are unpeopled), is called Pomona. Its length is 33 miles, and its breadth, in some places, nine. It contains nine parish churches, and four excellent harbours.

The Isle of Mull, in the Hebrides, is twenty-four miles long, and in some places almost as broad. It contains two parishes, and a castle called Duart, which is the chief place in the island. The other principal western islands are Lewis, or Harris (for they both form but one island), which belongs to the shire of Ross, and is 100 miles in length, and 13 or 14 in breadth; its chief town is Stornway. Sky, belonging to the shire of Inverness, is 40 miles long, and, in some places, 30 broad; fruitful and well peopled. Bute, which is about ten miles long, and three or four broad, is famous for containing the castle of Rothsay, which gave the title of duke to the eldest sons of the kings of Scotland, as I now does to the prince of Wales. Rothsay is likewise a royal burgh; and the islands of Bute and Arran form the shire of Bute. The isles of Ra and Jura are part of Argyleshire, and contain together about 370 square miles; but they have no towns worthy notice. North Uist contains an excellent harbour, called Lochmaddy, famous for herring-fishing. Iona, once the seat and sanctuary of western learning, and the burying-place of many kings of Scotland, Ireland, and Norway, is still famous for its reliques of sanctimonious antiquity, as shall be hereafter mentioned. Some authors have been at great pains to describe the island of St. Kilda, or Hirt, for no other reason, apparently, but because it is the remotest of all the north-west islands, and very difficult of access; for it does not contain above thirty-five families.

INHABITANTS, CUSTOMS, POPULATION, LANGUAGE, AND RELIGION. } The inhabitants of Shetland and Orkney were formerly subject to the Normans, who conquered them in 1099, a few years after they landed in England under William the Conqueror. In the year 1263 they were in possession of Magnus of Norway, who sold them to Alexander king of Scots, by whom they were given as fiefs to a nobleman of the name of Speire. After this, they were claimed by, and became subject to, the crown of Denmark. Christian I. in the reign of James III. conveyed them in property to the crown of Scotland, as a marriage portion with his daughter Margaret; and all future pretensions were entirely ceded on the marriage of James VI. of Scotland with Anne of Denmark. The isles of Shetland and Orkney form a stewartry, or shire, which sends a member to parliament. At present the people in general differ little from the Lowlanders of Scotland; except that their manners are more simple, and their minds less cultivated. Men of fortune there have improved their estates wonderfully of late years, and have introduced into their families many elegancies and luxuries. They build their dwelling and other houses in a modern taste, and are remarkable for the fineness of their linen. As to the common people, they live upon butter, cheese, fish, sea and land fowl (of which they have great plenty), particularly geese; and their chief drink is whey, which they have the art to ferment, so as to give it a vinous quality. In some of the northern islands, the Norwegian, which is

called the Norfe language, is still spoken. Their vast intercourse with the Dutch, during the fishing season, renders that language common in the Shetland and Orkney islands. The people there are as expert as the Norwegians in seizing the nests of sea-fowls, which build in the most frightful precipices and rocks. Their temperance preserves them from many diseases. They cure the scurvy and the jaundice, to which they are subject, with the powder of snail-shells and scurvy-grass, of which they have plenty. Their religion is the Protestant; and according to the discipline of the church of Scotland; and their civil institutions are much the same with those of the country to which they belong.

Nothing can be affirmed with certainty as to the population of these three divisions of islands. We have the most undoubted evidences of history, that, about 400 years ago, they were much more populous than they are now: for the Hebrides themselves were known often to send 10,000 fighting men into the field, without prejudice to their agriculture. At present their numbers are said not to exceed 48,000. The people of the Hebrides are clothed and live like the Scotch Highlanders, who shall hereafter be described. They are similar in persons, constitutions, customs, and prejudices; but with this difference, that the more polished manners of the Lowlanders are every day gaining ground in the Highlands. Perhaps the descendants of the ancient Caledonians, in a few years, will be discernible only in the Hebrides.

Those islands alone retain the ancient usages of the Celts, as described by the oldest and best authors; but with a strong tincture of the feudal constitution. Their shanachies or story-tellers supply the place of the ancient bards, so famous in history; and are the historians, or rather genealogists, as well as poets, of the nation and family. The chief is likewise attended, when he appears abroad, with his musician, who is generally a bagpiper, and dressed in the manner of the English minstrels of former times, but, as it is said, much more sumptuously\*. Notwithstanding the contempt into which that music is fallen, it is almost incredible with what care and attention it was cultivated among these islanders so late as the beginning of the present century. They had regular colleges and professors, and the students took degrees according to their proficiency. Many of the Celtic rites, some of which were too barbarous to be retained or even mentioned, are now abolished. The inhabitants, however, still preserve the most profound respect and affection for their several chieftains, notwithstanding all the pains that have been taken by the British legislature to break those connexions, which experience has shown to be so dangerous to government. The common people are but little better lodged than the Norwegians and Laplanders; though they certainly fare better; for they have oatmeal, plenty of fish and fowl; cheese, butter, milk, and whey; and also mutton, beef, goat, kid, and venison. They indulge themselves, like their forefathers, in a romantic poetical turn; and the agility of both sexes in the exercises of the field; and in dancing to their favourite music, is remarkable.

The reader would not pardon an author, who, in treating of this subject, should omit that remarkable mantology, or gift of prophecy, which distinguishes the inhabitants of the Hebrides, under the name of *second sight*. It would be equally absurd to attempt to disprove the reality of the instances of this kind that have been related by reputable authors, as to admit all that has been said upon the subject. The adepts

\* See Percy's Reliques of Ancient English Poetry, in 3 vols.

of the second sight pretend that they have certain revelations, or rather presentations, either really or typically, which swim before their eyes, of certain events that are to happen in the compass of 24 or 48 hours. We do not, however, from the best information, observe that any two of those adepts agree as to the manner and form of those revelations, or that they have any fixed method for interpreting their typical appearances. The truth seems to be, that those islanders, by indulging themselves in lazy habits, acquire visionary ideas, and overheat their imaginations, till they are presented with those phantasms, which they mistake for fatidical or prophetic manifestations. They instantly begin to prophesy; and it would be absurd to suppose, that, amidst many thousand predictions, some did not happen to be fulfilled; and these being well attested, give a sanction to the whole.

Many learned men have been of opinion, that the Hebrides being the most westerly islands where the Celts settled, their language must remain there in its greatest purity. This opinion, though very plausible, has failed in experience. Many Celtic words, it is true, as well as customs, are there found; but the vast intercourse which the Hebrides had with the Danes, the Norwegians, and other northern people, whose language is mixed with Sclavonian and Teutonic, which last has no affinity with the Celtic, has rendered their language a compound; so that it approaches in no degree to the purity of the Celtic, commonly called Erse, which was spoken by their neighbours in Lochaber and the opposite coasts of Scotland, the undoubted descendants of the Celts, among whom their language remains more unmix'd.

The religion professed in the Hebrides is chiefly presbyterian, as established in the church of Scotland: but popery and ignorance still prevail among some of the islanders, whilst superstitious practices and customs seem to be almost grafted in their nature.

**SOIL, MINES, AND QUARRIES.]** Though it is not in the power of natural philosophy to assign the cause, yet it is certain that the soil, both of the northern and western islands belonging to Scotland, has suffered an amazing alteration. Many of these islands have evidently been the habitations of the Druids, whose temples are still visible in most of them; and those temples were surrounded by groves, though little or no timber now grows in the neighbourhood. The stumps of former trees however are discernible, as are many vestiges of grandeur, even since the admission of the Christian religion; which prove the decrease of the riches, power, and population of the inhabitants. Experience daily shows, that if the soil of the northern or western islands till of late was barren, cold, and uncomfortable, it was owing to their want of culture; for such spots of them as are now cultivated produce corn, vegetables, and garden-stuff, more than sufficient for the inhabitants; and even fruit-trees are now brought to maturity. Tin, lead, and silver mines, marle, slate, free-stone, and even quarries of marble, have been found upon these islands. They are not destitute of fine fresh water, nor of lakes and rivulets that abound with excellent trout. At the same time it must be owned, that the present face of the soil is bare, and unornamented with trees, excepting a few that are reared in gardens.

**TRADE AND MANUFACTURES.]** These are all in their infancy in those islands. The reader will easily suppose that their staple commodities consist of fish, especially herrings, which are the best in the world, and, when properly cured, are equal even to those of the Dutch. They carry on likewise a considerable trade in down and feathers; and their sheep

afford them wool, which they manufacture into coarse cloths; and linen manufactures begin to make a progress in these islands. They carry their black cattle alive to the adjacent parts of Scotland, where they are disposed of in sale or barter; as are large quantities of their mutton, which they sell in the hide. Upon the whole, application and industry, with some portion of public encouragement, are only wanting to render these islands at once ornamental and beneficial to the mother country, as well as to their inhabitants.

[**BEASTS, BIRDS, AND FISHES.**] Little can be said on this head that is peculiar to these islands. In the countries already described, mention has been made of most of the birds and fishes that have been discovered here; only it is thought that they contain a species of falcon or hawk, of a more noble and docile nature than any that are to be found elsewhere. The Shetland isles are famous for a small breed of horses, which are incredibly active, strong, and hardy, and frequently seen in the streets of London, yoked to the splendid carriages of the curious and wealthy. The coasts of these islands, till within these twenty years, seemed, however, to have been created, not for the inhabitants, but for strangers. The latter furnish the former with wines, strong liquors, spice, and luxuries of all kinds, for their native commodities, at the gain of above 100 per cent. But it is to be hoped that this pernicious traffic now draws to an end. Three thousand buffes have been known to be employed in one year by the Dutch in the herring fishery, besides those fitted out by the Hamburgers, Bremeners, and other northern ports.

[**RARITIES AND CURIOSITIES.**] These islands exhibit many pre-artificial and natural, } gnant proofs, in their churches, the vestiges of old forts, and other buildings, both sacred and civil, of what has been already observed, that they were formerly more populous than they are now. The use and construction of some of those works are not easily accounted for at present. In a gloomy valley belonging to Hoy, one of the western islands, is a kind of hermitage, cut out of a stone called a dwarf stone, 36 feet long, 18 broad, and nine thick; in which is a square hole, about two feet high for an entrance, with a stone of the same size for a door. Within this entrance is the resemblance of a bed, with a pillow cut out of the stone, large enough for two men to lie on: at the other end is a couch, and in the middle a hearth, with a hole cut out above for a chimney. It would be endless to recount the various vestiges of the Druidical temples remaining in these islands, some of which have required prodigious labour, and are stupendous erections, of the same nature as the famous Stonehenge near Salisbury; others seem to be memorials of particular persons or actions, consisting of one large stone standing upright; some of them have been sculptured, and others have served as sepulchres, and are composed of stones cemented together. Barrows, as they are called in England, are frequent in these islands; and the monuments of Danish and Norwegian fortifications might long employ an able antiquary to describe. The gigantic bones, found in many burial places here, give room to believe that the former inhabitants were of larger size than the present. It is likewise probable, from some ancient remains, particularly catacombs, and nine silver fibule or clasps, found at Stennis, one of the Orkneys, that the Romans were well acquainted with these parts.

The cathedral of Kirkwall, the capital of the Orkneys, is a fine Gothic building, dedicated to St. Magnus, but now converted into a parish church. Its roof is supported by 14 pillars on each side, and its steeple, in which is a good ring of bells, by four large pillars. The three gates

of the church are chequered with red and white polished stone, embossed and elegantly towered.

The Hebrides are still more distinguished than the Orkney or Shetland isles for their remains of antiquity; and it would far exceed the bounds allotted to this head were we even to mention every remarkable monument found in them, dedicated to civil, religious, or warlike purposes. We cannot, however, avoid taking particular notice of the celebrated Isle of Iona, called St. Columba-Kill. Not to enter into the history or origin of the religious erections upon this island, it is sufficient to say, that it seems to have served as a sanctuary for St. Columba, and other holy men of learning, while Ireland, England, and Scotland, were desolated by barbarism. It appears that the northern pagans often landed here, and paid no regard to the sanctity of the place. The church of St. Mary, which is built in the form of a cathedral, is a beautiful fabric. It contains the bodies of some Scotch, Irish, and Norwegian kings, with some Gaelic inscriptions. The tomb of Colmanba, who lies buried here, is uninscribed. The steeple is large, the cupola is 21 feet square, the doors and windows are curiously carved, and the altar is of the finest marble. Innumerable are the inscriptions of ancient customs and ceremonies, that are discernible upon this island, and which give countenance to the well-known observation, that, when learning was nearly extinct on the continent of Europe, it found a refuge in Scotland, or rather in these islands.

The islands belonging to Scotland contain likewise some natural curiosities peculiar to themselves: the phaeoli, or Molucca beans, have been found in the Orkneys, driven, as supposed, from the West Indies, by the westerly winds, which often force ashore many curious shells and marine productions, highly esteemed by naturalists. In the parish of Harn, a large piece of stag's horn was found very deep in the earth, by the inhabitants who were digging for marle; and certain bituminous effluvia produce surprising phenomena, which the natives believe to be supernatural.

But some of the most astonishing appearances in nature have remained undescribed, and, till lately, unobserved even by the natives of these islands;—a discovery reserved for the inquisitive genius of Mr. Banks, now Sir Joseph Banks, who, in relating his voyage through the Hebrides, anno 1772, says: “We were no sooner arrived, than we were struck with a scene of magnificence which exceeded our expectations, though founded, as we thought, upon the most sanguine foundations: the whole of that end of the island (viz. Staffa, a mile in length, and half a mile in breadth) supported by ranges of natural pillars, mostly above fifty feet high, standing in natural colonnades, according as the bays or points of land formed themselves: upon a firm basis of solid unformed rock, above these, the stratum, which reaches to the soil or surface of the island varied in thickness as the island itself formed into hills or valleys; each hill, which hung over the columns below, forming an ample pediment; some of these, above sixty feet in thickness from the base to the point, formed, by the sloping of the hill on each side, almost in the shape of those used in architecture.

“Compared to this, what are the cathedrals or palaces built by man? mere models or playthings; imitations as diminutive, as his works will always be, when compared to those of nature. Where is now the boast of the architect? Regularity, the only part in which he fancied himself to exceed his mistress, Nature, is here found in her possession: and here it has been for ages undescribed. Proceeding farther to the N. W. you meet

with the highest ranges of pillars, the magnificent appearance of which is past all description: here they are bare to their very basis, and the stratum below them is also visible." Mr. Banks particularises sundry other appearances in this and a neighbouring island, which is wholly composed of pillars without any stratum. In some parts of Staffa, instead of being placed upright, the pillars were observed to lie on their sides, each forming a segment of a circle; but the most striking object in this field of scenery is Fingal's Cave, which Mr. Banks describes in the following manner:—"With our minds full of such reflections, we proceeded along the shore, treading upon another *Giant's Causeway*, every stone being regularly formed into a certain number of sides and angles; till, in a short time, we arrived at the mouth of a cave, the most magnificent, I suppose, that has ever been described by travellers\*. The mind can hardly form an idea more magnificent than such a space, supported on each side by ranges of columns, and roofed by the bottoms of those which have been broken off in order to form it; between the angles of which a yellow stalagmitic matter has exuded, which serves to define the angles precisely, and at the same time vary the colour, with a great deal of elegance; and to render it still more agreeable, the whole is lighted from without; so that the farthest extremity is very plainly seen from without; and the air within being agitated with the flux and reflux of the tide, is perfectly dry and wholesome, free entirely from the damp of vapours, with which natural caverns in general abound."

Mr. Pennant, who also made a voyage to these islands in the same year, had a glance of Staffa, in his passage from Iona to Mull, but was prevented by stormy weather from approaching it. "On the west," says he, "appears the beautiful groupe of the Treashunish isles. Nearest lies Staffa, a new *Giant's Causeway*, rising amidst the waves, but with columns of double the height of that in Ireland; glossy and resplendent, from the beams of the eastern sun." And in the isle of Sky, a considerable way northward, he resumes the subject: "We had in view, a fine series of genuine basaltic columns, resembling the *Giant's Causeway*; the pillars were above twenty feet high, consisting of four, five, and six angles, but mostly of five. At a small distance from these, on the slope of a hill, is a tract of some roods entirely formed of the tops of several series of columns, even and close set, forming a reticulated surface of amazing beauty and curiosity. This is the most northern basaltic I am acquainted with; the last of four in the British dominions, all running from south to north, nearly in a meridian; the *Giant's Causeway* appears first; Staffa, &c. succeeds; the rock Humbla about twenty leagues farther; and finally, those columns of Sky; the depth of the ocean, in all probability, conceals the vast link of this chain."

LEARNING, LEARNED MEN, AND HISTORY.] See Scotland.

\* The dimensions of the cave are thus given by Mr. Banks:

Length of the cave from the arch without	371 Feet.
From the pitch of the arch	250
Breadth of ditto at the mouth	53
At the further end	20

## EXTENT AND SITUATION.

	MILES.		DEGREES.
Length .....	300	} between	{ 54 and 59 North latitude.
Breadth .....	190		{ 1 and 6 West longitude.

**NAMES.]** THE Celts or Gauls are supposed to have been the original inhabitants of this kingdom. The Scots, a Scythian tribe, invaded it about the beginning of the fourth century, and having conquered the Picts, the territories of both were called Scotland; and the word Scot is no other than a corruption of Scyth, or Scythian, being originally, from that immense country, called Scythia by the ancients. It is termed, by the Italians, Scotia; by the Spaniards, Escotia; by the French, Ecoffe; and Scotland by the Scots, Germans, and English.

**BOUNDARIES.]** Scotland, which contains an area of 27,794 square miles, is bounded on the south by England; and on the north, east, and west by the Deucaledonian, German, and Irish Seas, or more properly, the Atlantic Ocean.

**DIVISIONS AND SUBDIVISIONS.]** Scotland is divided into the counties south of the Frith of Forth, the capital of which, and of all the kingdom, is Edinburgh; and those to the north of the same river, where the chief town is Aberdeen. This was the ancient national division; but some modern writers, with less geographical accuracy, have divided it into Highlands and Lowlands, on account of the different habits, manners, and customs of the inhabitants of each.

Eighteen counties, or shires, are allotted to the southern division, and fifteen to the northern: and those counties are subdivided into sheriffdoms, stewartries, and bailiwicks, according to the ancient tenures and privileges of the landholders.

Shires.	Sheriffdoms and other Subdivisions.	Chief Towns.
1 Edinburgh (297*)	} Mid Lothian ..... } East Lothian ..... } The Merches, and } Lauderdale ..... } Tiviotdale, Lidisdale, } Eskdale, & Eweisdale	Edinburgh, W. long. 3. N. lat. 56. Musselburgh, Leith, and Dalkeith.

CLIMATE, SOIL, AIR, AND WATER.] In the northern parts, daylight, at midsummer, lasts eighteen hours and five minutes, and the day and night in winter are in the same proportion. The air of Scotland is more temperate than could be expected in so northerly a climate. This arises partly from the variety of its hills, valleys, rivers, and lakes, but still more, as in England, from the vicinity of the sea, which affords those warm breezes, that not only soften the natural keenness of the air, but, by keeping it in perpetual agitation, render it pure and healthful, and prevent those epidemic distempers that prevail in many other countries. In the neighbourhood of some high mountains, however, which are generally covered with snow, the air is keen and piercing for about nine months in the year. The soil in general is not so fertile as that of England; and in many places less fitted for agriculture than for pasture. At the same time, there are particular plains and valleys of the most luxuriant fertility. The finer particles of earth, incessantly washed down from the mountains, and deposited in these valleys, afford them a vegetative nourishment; which is capable of carrying the strongest plants to perfection; though experience has proved, that many vegetables and hortulane productions do not come so soon to maturity in this country as in England. There is, indeed, a great variety of soils in Scotland, the face of which is agreeably diversified by a charming intermixture of natural objects. The vast inequalities of the ground, if unfavourable to the labours of the husbandman, are particularly pleasing to a traveller, and afford those delightful situations for country houses, of which many of the Scottish nobility and gentry have so judiciously availed themselves. It is their situation, more than any expensive magnificence, that occasions the seats of the dukes of Argyle and Athol, of lord Hopetoun, and many others, to fix the attention of every traveller. The water in Scotland, as every where else, depends on the qualities of the soil through which it passes. Water passing through a heavy soil is turbid and noxious; but, filtrating through sand or gravel, is clear, light, and salutary to the stomach. This last is in general the case in Scotland, where the water is better than that of more southern climates, in proportion as the land is worse.

MOUNTAINS.] The principal mountains in Scotland are the Grampian-hills, which run from east to west, from near Aberdeen to Cowal in Argyleshire, almost the whole breadth of the kingdom. Another chain of mountains, called the Pentland-hills, runs through Lothian, and joins those of Tweedale. A third, called Lammer-Muir, rises near the eastern coast, and runs westward through the Merse. Besides those continued chains, among which we may reckon the Cheviot or Tiviot Hills on the borders of England, Scotland contains many detached mountains, which, from their conical figure, are sometimes called by the Celtic name, *Laws*. Many of them are stupendously high, and of beautiful forms, but too numerous to be particularised here.

RIVERS, LAKES, AND FORESTS.] The largest river in Scotland is the Forth, which rises in Montrose near Callendar, and passing by Stirling, after a number of beautiful meanders, discharges itself near Edinburgh into that arm of the German Sea, to which it gives the name of Frith of Forth. Second to the Forth is the Tay, which issues out of Loch-Tay, in Broadalbin, and, running south-east, passes the town of Perth, and falls into the sea at Dundee. The Spey, which is called the most rapid river in Scotland, issues from a lake of the same name in Badenoch, and, running from south-west to north-east, falls into the sea near Elgin; as do the rivers Dee and Don, which run from west to east, and disembogue them-

selves at Aberdeen after many bays. Berwick, which is the easternmost of its rise in Scotland, and, after passing Dumbarton, into the Isle of Bute. The superior size, which enrich and beautify the soil of: *Essex*, which is famous for inland Britain: was public-spirit by which a sea, to the

The face of the most inland timber. Their quality, as those most of which is famous but such a however, made for series; but succeeded continued

seives at Aberdeen. The Tweed rises on the borders of Lanerksire, and, after many beautiful serpentine turnings, discharges itself into the sea at Berwick; where it serves as a boundary between Scotland and England, on the eastern side. The Clyde is a large river on the west of Scotland, has its rise in Annandale, runs north west through the valley of that name, and, after passing by Lanerk, Hamilton, the city of Glasgow, Rensfrew, Dumbarton, and Greenoch, falls into the Frith of Clyde, opposite to the Isle of Bute. Besides those capital rivers, Scotland contains many of an inferior size, well provided with salmon, trout, and other fish, which equally enrich and beautify the country. Several of those rivers have the name of *Ea*, which is the old Celtic word for water. The greatest improvement for inland navigation that has been attempted in that part of Great Britain was undertaken, at a very considerable expence, by a society of public-spirited gentlemen, for joining the rivers Forth and Clyde together; by which a communication has been opened between the east and west seas, to the advantage of the whole kingdom.

The lakes of Scotland (there called *Lochs*) are too many to be particularly described. Those called Loch-Tay, Loch-Lomond, Loch-Nefs, Loch-Au, and one or two more, present us with such picturesque scenes as are scarcely equalled in Europe, if we except Ireland. Several of these lakes are beautifully fringed with woods, and contain plenty of fresh-water fish. The Scotch sometimes give the name of a Loch to an arm of the sea; for example, Loch-Fyn, which is 60 miles long, and four broad, and is famous for its excellent herrings. The Loch of Spinie, near Elgin, is remarkable for its number of swans and cygnets, which often darken the air with their flights; owing, as some think, to the plant *olorina*, which grows in its waters, with a straight stalk, and a cluster of seeds at the top. Near Loch-Nefs is a hill almost two miles perpendicular, on the top of which is a lake of cold fresh water, about 30 fathoms in length, too deep ever yet to be fathomed, and which never freezes; whereas, but 17 miles from thence, the Lake Lochanwyn, or Green Lake, is covered with ice all the year round. The ancient province of Lochaber receives that name from being the mouth of the lochs, by means of which the ancient Caledonians, the genuine descendents of the Celts, were probably enabled to preserve themselves independent on, and unmixed with, the Lowlanders. Besides these rivers and lochs, and others too numerous to mention, the coasts of Scotland are in many parts indented with large, bold, navigable Bays or arms of the sea, as the Bay of Glenluce and Wigtown Bay; sometimes they are called Friths, as the Solway Frith, which separates Scotland from England on the west; the Frith of Forth, Murray Frith, and those of Cromarty and Dornoch.

The face of Scotland, even where it is most uninviting, presents us with the most incontrovertible evidences of its having formerly abounded with timber. The deepest mosses, or morasses, contain large logs of wood; and their waters being impregnated with turpentine, have a preserving quality, as appears by the human bodies which have been discovered in those mosses. The Sylva Caledonia, or Caledonian forest, the remains of which are now thought to be Ettrick wood, in the south of Scotland, is famous in antiquity for being the retreat of the Caledonian wild boars; but such an animal is not now to be seen in Scotland. Several woods, however, still remain in that country; and many attempts have been made for reducing them into charcoal, for the use of furnaces and founderies; but lying at a great distance from water-carriage, though the works succeeded perfectly in the execution, they were found impracticable to be continued. Fir trees grow in great perfection almost all over Scotland;

and form beautiful plantations. The Scotch oak is excellent in the Highlands, where some woods reach 20 or 30 miles in length, and four or five in breadth; but, through the inconyeniency already mentioned, without being of much emolument to the proprietors.

**METALS AND MINERALS.]** Though Scotland does not at present boast of its gold mines, yet it is certain that it contains such, or at least that Scotland formerly afforded a considerable quantity of that metal for its coinage. James V. and his father, contracted with certain Germans for working the mines of Crawford-Moor: and it is an undoubted fact, that when James V. married the French king's daughter, a number of covered dishes, filled with coins of Scotch gold, were presented to the guests by way of dessert. The civil wars and troubles which followed, under his daughter, in the minority of his grandson, drove those foreigners, the chief of whom was called Cornelius, from their works, which since that time have never been resumed. Some small pieces of gold have been found in those parts, washed down by the floods. It likewise appears by the public records, that those beautiful coins, struck by James V. called bonnet pieces; were fabricated of gold found in Scotland, as were other medals of the same metal.

Several landlords in Scotland derive a large profit from their lead-mines, which are said to be very rich, and to produce large quantities of silver; but we know of no silver mines that are worked at present. Some copper-mines have been found near Edinburgh; and many parts of Scotland, in the east, west, and northern counties, produce excellent coal of various kinds, large quantities of which are exported, to the vast emolument of the public. Lime-stone is here in great plenty, as is free-stone; so that the houses of the better sort are constructed of the most beautiful materials. The indolence of the inhabitants of many places of Scotland, where no coal is found, prevented them from supplying that defect by plantations of wood: and the peat-mosses being in many parts, of the north especially, almost exhausted, the inhabitants are put to great difficulties for fuel: however, the taste for plantations of all kinds, that now prevails, will soon remedy that inconyeniency.

Lapis lazuli is said to be dug up in Lanerkshire; alum-mines have been found in Bamffshire; crystal, variegated pebbles, and other transparent stones, which admit of the finest polish for seals, are found in various parts; as are talc, flint, sea-shells, potter's clay, and fuller's earth. The stones which the country people call elf-arrow-heads, and to which they assign a supernatural origin and use, were probably the flint heads of arrows used by the Caledonians and ancient Scots. No country produces greater plenty of iron ore, both in mines and stones, than Scotland; of which the proprietors now begin to reap the profits, in their founderies, as at Carron, and other metalline manufactures.

**VEGETABLE AND ANIMAL PRODUCTIONS, BY SEA AND LAND.** } It is certain that the soil of Scotland may be rendered, in many parts, nearly as fruitful as that of England. It is even said that some tracts of the Low-countries at present exceed in value English estates of the same extent, because they are so far less exhausted and worn out than those of the southern parts of the islands; and agriculture is now perhaps as well understood, both in theory and practice, among many of the Scotch landlords and farmers, as it is in any part of Europe.

Such is the mutability of things, and the influence of commerce, that a very considerable part of the landed property has lately (perhaps happily for the public) fallen into new hands. The merchants of Glasgow, who are the life and soul of that part of the kingdom, while they are

daily introduce the progress of the war, and the active genius of the sea, which, being but are now brought which the soil is

daily introducing new branches of commerce, are no less attentive to the progress of agriculture, by which they do their country in particular, and the whole island in general, the most essential service. The active genius of these people extends even to moors, rocks, and marshes, which, being hitherto reckoned useless, were consequently neglected, but are now brought to produce certain species of grain or timber, for which the soil is best adapted.

But the fruits of skill and industry are chiefly perceivable in the counties lying upon the river Forth, called the Lothians, where agriculture is thoroughly understood, and the farmers, who generally rent from 3 to 500*l.* per ann. are well fed, well clothed, and comfortably lodged. The reverse, however, may be observed of a very considerable part of Scotland, which still remains in a state of nature, and where the landlords, ignorant of their real interest, refuse to grant such leases as would encourage the tenant to improve his own farm. In such places, the husbandmen barely exist upon the gleanings of a scanty farm, seldom exceeding 20 or 30*l.* per ann. the cattle are lean and small, the houses mean beyond expression, and the face of the country exhibits the most deplorable marks of poverty and oppression. Indeed, from a mistaken notion of the landed people in general, the greatest part of the kingdom lies naked and exposed, for want of such hedge-rows and planting as adorn the country of England. They consider hedges as useless and cumbersome, as occupying more room than what they call stone inclosures, which, except in the Lothians already mentioned, are generally no other than low paltry walls, of loose stones huddled up without lime or mortar, which yield a bleak and mean appearance.

The soil in general produces wheat, rye, barley, oats, hemp, flax, hay, and pasture. In the southern counties the finest garden fruits, particularly apricots, nectarines, and peaches, are said to fall little, if at all, short of those in England; and the same may be said of the common fruits. The uncultivated parts of the Highlands abound in various kinds of salubrious and pleasant-tasted berries; though it must be owned that many extensive tracts are covered with a strong heath. The sea-coast produces the *alga-marina*, dulce or dulish, a most wholesome nutritive weed, in great quantities, and other marine plants, which are eaten for nourishment or pleasure.

The fishes on the coast of Scotland are much the same with those of the islands and countries already described; but the Scots have improved in their fisheries as much as they have in their manufactures and agriculture; for societies have been formed, which have carried that branch of national wealth to a perfection that never was before known in that country; and bid fair to emulate the Dutch themselves in curing as well as catching their fish. In former times, the Scots seldom ventured to fish above a league's distance from the land; but they now ply in the deep waters as boldly and successful as any of their neighbours. Their salmon, which they can send more early, when prepared, to the Levant and southern markets, than the English and Irish can, are of great service to the nation, as the returns are generally made in specie, or beneficial commodities.

This country contains few or no kinds either of wild or domestic animals that are not common with their neighbours. The red-deer and roe-buck are found in the Highlands; but their flesh is not comparable to English venison. Hares, and all other animals for game, are here plentiful; as are the grouse and heath-cock, which is a most delicious bird, as likewise the capperkail, and the ptarmigan, which is

of the pheasant kind; but these birds are scarce even in the Highlands, and, when discovered, are very shy. The numbers of black cattle that cover the hills of Scotland towards the Highlands, and sheep that are fed upon the beautiful mountains of Tweeddale, and other parts of the south, are almost incredible, and formerly brought large sums into the country; the black cattle especially, which, when fattened on the southern pastures, have been reckoned superior to English beef. It is to be hoped, however, that this trade is now on its decline, by the vast increase of manufactures, whose demand for butcher's meat must lessen the exportation of cattle into England. Some are of opinion, that a sufficient stock, by proper methods, may be raised to supply both markets, to the great emolument of the nation.

Formerly the kings of Scotland were at infinite pains to mend the breed of the Scotch horses, by importing a larger and more generous kind from the continent: but the truth is, notwithstanding all the care that was taken, it was found that the climate and soil of Scotland were unfavourable to that noble animal; for they diminished both in size and spirit; so that, about the time of the union, few horses, natives of Scotland, were of much value. Great efforts have been made of late to introduce the English and foreign breeds, and much pains have been taken for providing them with proper food and management; but with what success time alone can discover.

POPULATION, INHABITANTS, } The population of Scotland is generally fixed at about a million and a half of souls; this calculation rests merely upon vague conjectures, as we know of no attempt that has been made to support even its probability. If we form an estimate upon any known principle, the inhabitants of Scotland are far more numerous. It is to be regretted that some public encouragement has not been given to bring this matter nearer to a certainty, which might be done by the returns of the clergy from their several parishes. The only records at present that can be appealed to are those of the army; and, by the best information, they make the number of soldiers furnished by Scotland, in the war which began in 1755, to amount to 80,000 men. We are, however, to observe, that about 60,000 of these were raised in the islands and Highlands, which form by far the least populous part of Scotland. It belongs, therefore, to political calculation to compute whether the population of Scotland does not exceed two millions, as no country in the world, exclusive of the army, sends abroad more of its inhabitants. If we consult the most ancient and creditable histories, the population of Scotland, in the thirteenth century, must have been excessive, as it afforded so many thousands to fall by the swords of the English, without any sensible decrease of the inhabitants.

The people of Scotland are generally raw-boned; and a kind of characteristic feature, that of high cheek-bones, reigns in their faces; they are lean, but clean-limbed, and can endure incredible fatigues. Their adventurous spirit was chiefly owing to their laws of succession, which invested the elder brother, as head of the family, with the inheritance, and left but a very scanty portion for the other sons. This obliged the latter to seek their fortunes abroad, though no people have more affection for their native soil than the Scotch have in general. It is true, this disparity of fortune among the sons of one family prevails in England likewise; but the resources which younger brothers have in England are numerous, compared to those of a country so narrow, and so little improved, either by commerce or agriculture, as Scotland was formerly.

An intelligent reader may easily perceive that the ridiculous family-pride, which is perhaps not yet entirely extinguished in Scotland, was owing to the feudal institutions which prevailed there in all the horrors of blood and barbarity. The family differences, especially of the Highlanders, familiarised them to blood and slaughter; and the death of an enemy, however effected, was always a subject of triumph. These passions did not live in the breasts of the common people only; for they were authorised and cherished by their chieftains, many of whom were men who had seen the world, were conversant in the courts of Europe, masters of polite literature, and amiable in all the duties of civil and social life. Their kings, excepting some of them who were endued with extraordinary virtues, were considered in little other light than commanders of their army in time of war; for in time of peace their civil authority was so little felt that every clan or family, even in the most civilised parts of Scotland, looked upon its own chieftain as its sovereign. These prejudices were confirmed even by the laws, which gave those petty tyrants a power of life and death upon their own estates; and they generally executed their hasty sentences in four and twenty hours after the party was apprehended. The pride which those chieftains had of outvying each other in the number of their followers created perpetual animosities, which seldom or never ended without bloodshed; so that the common people, whose best qualification was a blind devotion to the will of their master, and the aggrandisement of his name, lived in a state of continual hostility.

The late Archibald, duke of Argyle, was the first chieftain we have heard of, who had the patriotism to attempt to reform his dependents, and to banish from them those barbarous ideas. His example has been followed by others; and there can scarcely be a doubt, but that a very few years will reconcile the Highlanders to all the milder habits of society.

From what has been said, it appears that the ancient modes of living among the Scotch nobility and gentry are as far from being applicable to the present time, as the forms of a Roman senate are to that of a popish conclave; and no nation, perhaps, ever underwent so quick and so sudden a transition of manners.

The peasantry have their peculiarities; their ideas are confined; but no people can form their tempers better than they do to their stations. They are taught from their infancy to bridle their passions, to behave submissively to their superiors, and live within the bounds of the most rigid economy. Hence they save their money and their constitutions; and few instances of murder, perjury, robbery, and other atrocious vices, occur at present in Scotland. They seldom enter singly upon any daring enterprise; but when they act in concert, the secrecy, sagacity and resolution, with which they carry on any desperate undertaking, is not to be paralleled; and their fidelity to one another, under the strongest temptations arising from their poverty, is still more extraordinary. Their mobs are managed with all the caution of conspiracies; witness that which put Porteus to death in 1736, in open defiance of law and government, and in the midst of 20 000 people: and though the agents were well known, and some of them tried, with a reward of 500*l.* annexed to their conviction, yet no evidence could be found sufficient to bring them to punishment. The fidelity of the Highlanders of both sexes, under a still greater temptation, to the young pretender, after his defeat at Culloden, could scarcely be believed, were it not well attested.

They affect a fondness for the memory and language of their fore-

fathers beyond perhaps any people in the world; but this attachment is seldom or never carried into any thing that is indecent or disgusting, though they retain it abroad as well as at home. They are fond of ancient Scotch dishes, such as the haggis, the sheep's head singed, the fish in sauce, the chicken broth, and mixed collops. These dishes, in their original dressing, were savoury and nutritive for keen appetites; but the modern improvements that have been made in the Scotch cookery have rendered them agreeable to the most delicate palates.

The inhabitants of most parts of Scotland, who live chiefly by pasture, have a natural vein for poetry; and the beautiful simplicity of the Scotch tunes is relished by all true judges of nature. Love is generally the subject; and many of the airs have been brought upon the English stage, with variations, under new names, but with this disadvantage, that, though rendered more conformable to the rules of music, they are mostly altered for the worse, being stripped of their original simplicity, which, however irregular, is the most essential characteristic, is so agreeable to the ear, and has such powers over the human breast. Those of a more lively and merry strain have had better fortune, being introduced into the army in their native dress, by the fife, an instrument for which they are remarkably well suited. It has been ridiculously supposed that Rizzio, the unhappy Italian secretary of Mary queen of Scots, reformed the Scotch music. This is a falsehood invented by his country, in envy to the Scots. Their finest tunes existed in their church music, long before Rizzio's arrival; nor does it appear that Rizzio, who was chiefly employed by his mistress in foreign dispatches, ever composed an air during the short time he lived in Scotland: but were there no other evidences to confute this report, the original character of the music itself is sufficient.

The lower people in Scotland are not so much accustomed as the English are to clubs, dinners, and other convivial entertainments; but when they partake of them, for that very reason they seem to enjoy them more completely. One institution there is, at once social and charitable, and that is, the contributions raised for celebrating the weddings of people of an inferior rank. These festivities partake of the ancient Saturnalia; but though the company consists promiscuously of the high and the low, the entertainment is as decent as it is jovial. Each guest pays according to his inclination or ability, but seldom under a shilling a head, for which they have a wedding dinner and dancing. When the parties happen to be servants in respectable families, the contributions are so liberal that they often establish the young couple in the world.

The common people of Scotland retain the solemn decent manner of their ancestors at burials. When a relation dies in a town, the parish beadle is sent round with a passing-bell; but he stops at certain places, and with a slow melancholy tone announces the name of the party deceased, and the time of his interment, to which he invites all his fellow countrymen. At the hour appointed, if the deceased was beloved in the place, vast numbers attend. The procession is sometimes preceded by the magistrates and their officers, and the body is carried in a coffin, covered by a velvet pall, with chair-poles, to the grave, where it is interred, without any oration or address to the people, or prayers, or farther ceremony, than the nearest relation thanking the company for their attendance. The funerals of the nobility and gentry are performed in much the same manner as in England, but without any funeral service. The Highland funerals were generally preceded by bagpipes, which played certain dirges, called *coronachs*, and were accompanied by the voices of the attendants of both sexes.

Dancing is a favourite amusement in this country; but little regard is paid to art or gracefulness: the whole consists in agility, and in keeping time to their own tunes, which they do with great exactness. One of the peculiar diversions practised by the gentlemen, is the *Golf*, which requires an equal degree of art and strength: it is played with a bat and a ball; the latter is smaller and harder than a cricket-ball; the bat is of a taper construction, till it terminates in the part that strikes the ball, which is loaded with lead and faced with horn. The diversion itself resembles that of the *Mall*, which was common in England in the middle of the last century. An expert player will send the ball an amazing distance at one stroke; each party follows his ball upon an open heath, and he who strikes it in fewest strokes into a hole wins the game. The diversion of *Curling* is likewise, I believe, peculiar to the Scots. It is performed upon ice, with large flat stones, often from twenty to two hundred pounds weight each, which they hurl from a common stand to a mark at a certain distance; and whoever is nearest the mark is the victor. These two may be called the standing winter and summer diversions in Scotland. The natives are expert at all the other diversions common in England, *cricket* excepted, of which they have no notion; the gentlemen considering it as too athletic and mechanical.

[LANGUAGE AND DRESS.] These two articles are placed under the same head, because they had formerly an intimate relation to each other, both of them being evidently Celtic. The Highland plaid is composed of a woollen stuff, sometimes very fine, called *tartan*. This consists of various colours, forming stripes which cross each other at right angles; and the natives value themselves on the judicious arrangement, or what they call sets of those stripes and colours, which, where skilfully managed, produce a pleasing effect to the eye. Above the shirt, the Highlander wears a waistcoat of the same composition with the plaid, which commonly consists of twelve yards in width, and which they throw over the shoulder into very nearly the form of a Roman toga, as represented in ancient statues; sometimes it is fastened round the middle with a leathern belt, so that part of the plaid hangs down before and behind like a petticoat, and supplies the want of breeches. This they call being dressed in a *phelig*, but which the Lowlanders call a *kilt*, and which is probably the same word with Celt. Sometimes they wear a kind of petticoat of the same variegated stuff, buckled round the waist; and this they term the *phelibeg*, which seems to be of Milesian extraction. Their stockings are likewise of tartan, tied below the knee with tartan garters formed into tassels. The poorer people wear upon their feet brogues made of untanned or undressed leather; for their heads a blue flat cap is used, called a bonnet, of a particular woollen manufacture. From the belt of the phelibeg hung generally their knives and a dagger, which they called a dirk, and an iron pistol, sometimes of fine workmanship, and curiously inlaid with silver. The introduction of the broad sword of Andrea Ferrara, a Spaniard (which was always part of the Highland dress), seems to be no earlier than the reign of James III. who invited that excellent workman to Scotland. A large leathern purse, richly adorned with silver, hanging before them, was always part of a Highland chieftain's dress.

The dress of the Highland women consisted of a petticoat and jerkin, with strait sleeves, trimmed or not trimmed, according to the quality of the wearer; over this they wore a plaid, which they either held close under their chins with the hand, or fastened with a buckle of a particular

fashion. On the head they wore a kerchief of fine linen of different forms. The women's plaid has been but lately difused in Scotland by the ladies, who wore it in a graceful manner, the drapery falling towards the feet in large folds. A curious virtuoso may find a strong resemblance between the variegated and fimbriated draperies of the Scots, and those of the Tuscans (who were unquestionably of Celtic origin) as they are to be seen in the monuments of antiquity.

The attachment of the Highlanders to this dress rendered it a bond of union, which often proved dangerous to the government. Many efforts had been made by the legislature, after the rebellion in 1715, to disarm them, and oblige them to conform to the Low country dresses. The disarming scheme was the most successful; for when the rebellion in 1745 broke out, the common people had scarcely any other arms than those which they took from the king's troops. Their overthrow at Culloden rendered it no difficult matter for the legislature to force them into a total change of their dress. Its conveniency, however, for the purposes of the field, is so great, that some of the Highland regiments still retain it. Even the common people have of late resumed the use of it; and, for its lightness and the freedom it gives to the body, many of the Highland gentlemen wear it in the summer time.

The dress of the higher and middle ranks of the Low-country differs little or nothing from the English; but many of the peasantry still retain the bonnet, for the cheapness and lightness of the wear. The dress of the women of all ranks is much the same in both kingdoms.

The Garse, or Celtic, is still spoken in the Highlands; but the language of the Low-countries, which is of the same origin with the English, is continually extending. The English and Scotch are written in the same manner; and the pronanciation of the latter is scarcely more different from that of London than are those of the northern and western English counties.

**PUNISHMENTS.]** These are pretty much the same in Scotland as in England, only that of beheading is performed by an instrument called the Maiden; the model of which, it is well known, was brought from Halifax in England, to Scotland, by the regent, earl Morton; and it was first used for the execution of himself.

**RELIGION.]** Ancient Scottish historians, with Bede and other writers, generally agree that Christianity was first taught in Scotland by some of the disciples of St. John the Apostle, who fled to this northern country to avoid the persecution of Domitian, the Roman emperor; though it was not publicly professed till the beginning of the third century, when a prince, whom Scotch historians call Donald the First, his queen, and several of his nobles, were solemnly baptised. It was farther confirmed by emigrations from South Britain, during the persecutions of Aurelius and Dioclesian, when it became the established religion of Scotland, under the management of certain learned and pious men, named Culdees, who seem to have been the first regular clergy in Scotland, and were governed by overseers or bishops chosen by themselves from among their own body, and who had no pre-eminence of rank over the rest of their brethren.

Thus, independent of the church of Rome, Christianity seems to have been taught, planted, and finally confirmed in Scotland as a national church, where it flourished in its native simplicity, till the arrival of Palladius, a priest sent by the bishop of Rome in the fifth century, who found means to introduce the modes and ceremonies of the Romish church, which at length prevailed, and Scotland became involved in that

darkness which upon the pope was of many other nations.

The Culdees remained a distinct clergy, till the pope's power in this island disappeared. Wickliffe was the work of reformers in the receive them, and the finishing of Henry VIII.

Soon after the arts, and sciences of Calvin, and for his brethren catholic religion. The great nobles, did not succeed in some of the most scandalous beggary; nor in their

darkness, which for ages overspread Europe; though its dependence upon the pope was very slender, when compared to the blind subjection of many other nations.

The Culdees, however, long maintained their original manners, and remained a distinct order, notwithstanding the oppression of the Romish clergy, till the age of Robert Bruce in the 14th century, when they disappeared. But it is worthy of observation, that the opposition to popery in this island, though it ceased in Scotland upon the extinction of the Culdees, was in the same age revived in England by John Wickliffe, a man of parts and learning, who was the forerunner, in the work of reformation, to John Hus and Jerom of Prague, as the latter were to Martin Luther and John Calvin. But though the doctrines of Wickliffe were nearly the same with those propagated by the reformers in the 16th century, and the age seemed greatly disposed to receive them, affairs were not yet fully ripe for that great revolution; and the finishing blow to popery in England was reserved to the reign of Henry VIII.

Soon after that important event took place in England, when learning, arts, and sciences began to revive in Europe, the absurdities of the church of Rome, as well as the profligate lives of her clergy, did not escape the notice of a free and inquiring people, but gave rise to the reformation in Scotland. It began in the reign of James V. made great progress, under that of his daughter Mary, and was at length completed through the preaching of John Knox, who had adopted the doctrines of Calvin, and was the chief reformer of Scotland. It was natural for his brethren to imagine, that, upon the abolition of the Roman-catholic religion, they were to succeed to the revenues of that clergy. The great nobility, who had parcelled out those possessions for themselves, did not at first discourage this notion; but no sooner had Knox succeeded in his designs, which through the fury of the mob destroyed some of the finest ecclesiastical buildings in the world, than the parliament, or rather the nobility, monopolised all the church livings, and most fraudalously left the reformed clergy to live almost in a state of beggary; nor could all their efforts produce any great struggle or alteration in their favour.

The nobility and great landholders left the doctrine and discipline of the church to be modelled by the preachers, and they were confirmed by parliament. Succeeding times rendered the presbyterian clergy of great importance to the state; and their revenues have been so much mended, that, though no stipend there exceeds 250*l.* a year, few fall short of 100*l.* If the present expensive mode of living continues in Scotland, the established clergy will have many unanswerable reasons to urge for the increase of their revenues.

The bounds of this work do not admit of entering at large upon the doctrinal and economical part of the church of Scotland. It is sufficient to say that its first principle is a parity of ecclesiastical authority among all its presbyters; that it agrees in its censures with the reformed churches abroad in the chief heads of opposition to popery; but that it is modelled principally after the Calvinistical plan established at Geneva. This establishment, at various periods, proved so tyrannical over the laity, by having the power of the great and lesser excommunication, which were attended by a forfeiture of estate, and sometimes of life, that the kirk sessions, and other bodies, have been abridged of all their dangerous powers over the laity, who were extremely jealous of their being revived. Even that relic of popery, the oblig-

ing fornicators of both sexes to sit upon what they call a repenting stool, in the church, and in full view of the congregation, begins to wear out, it having been found that the Scotch women, on account of that penance, were the greatest infanticides in the world. In short, the power of the Scotch clergy is at present very moderate, or at least very moderately exercised; nor are they accountable for the extravagancy of their predecessors. They have been, ever since the Revolution, firm adherents to civil liberty, and the house of Hanover, and acted with remarkable intrepidity during the rebellion in 1745. They dress without clerical robes: but some of them appear in the pulpit in gowns, after the Geneva-form, and bands. They make no use of set forms in worship. The rents of the bishops, since the abolition of episcopacy, are paid to the king, who commonly appropriates them to pious purposes. A thousand pounds a year is always sent by his majesty for the use of protestant schools erected by act of parliament in North Britain, and the western isles; and the Scotch clergy, of late, have planned out funds for the support of their widows and orphans. The number of parishes in Scotland are eight hundred and ninety, of which thirty-one are collegiate churches, that is, where the cure is served by more than one minister.

The highest ecclesiastical authority in Scotland is the general assembly, which we may call the ecclesiastical parliament of Scotland. It consists of commissioners, some of whom are laymen; under the title of ruling elders, from presbyteries, royal burghs, and universities. A presbytery, consisting of less than twelve ministers, sends two ministers and one ruling elder; if it contains between twelve and eighteen ministers, it sends three, and one ruling elder; if it contains between eighteen and twenty-four ministers, it sends four ministers and two ruling elders; but if the presbytery has twenty-four ministers, it sends five ministers and two ruling elders. Every royal burgh sends one ruling elder, and Edinburgh two; whose election must be attested by the respective kirk sessions of their own burghs. Every university sends one commissioner, usually a minister of their own body. These commissioners are chosen yearly, six weeks before the meeting of the assembly. The ruling elders are often persons of the first quality of the country.

The king presides by his commissioners (who is always a nobleman) in this assembly, which meets annually in May; but he has no voice in their deliberations. This assembly chooses a clergyman for its moderator, or speaker. Appeals are brought from all the other ecclesiastical courts in Scotland to the general assembly; and no appeal lies from its determination in religious matters.

Provincial synods are next in authority to the general assembly. They are composed of a number of the adjacent presbyteries, over whom they have a power; and there are fifteen of them in Scotland; but their acts are reversible by the general assembly.

Subordinate to the synods, are presbyteries, of which there are sixty-nine in Scotland, each consisting of a number of contiguous parishes. The ministers of these parishes, with one ruling elder chosen half-yearly out of every session, compose a presbytery. These presbyteries meet in the head town of that division; but have no jurisdiction beyond their own bounds, though within these they have cognisance of all ecclesiastical causes and matters. A chief part of their business is the ordination of candidates for livings, in which they are regular and solemn. The patron of a living is bound to nominate or present in six months after a

The defects the extinction of Scotland.

vacancy; otherwise the presbytery fills the place *jure devoluto*; but that privilege does not hold in royal burghs.

A kirk session is the lowest ecclesiastical judicatory in Scotland, and its authority does not extend beyond its own parish. The members consist of the ministers, elders, and deacons. The deacons are laymen, and act nearly as church-wardens do in England, by having the superintendency of the poor, and taking care of other parochial affairs. The elder, or, as he is called, the ruling elder, is a place of great parochial trust, and he is generally a lay-person of quality or interest in the parish. The elders are supposed to act in a kind of co-ordinacy with the minister, and to be assisting to him in many of his clerical duties, particularly in catechising, visiting the sick, and at the communion table.

The office of ministers, or preaching presbyters, includes the offices of deacons and ruling elders; they alone can preach, administer the sacraments, catechise, pronounce church censures, ordain deacons and ruling elders, assist at the imposition of hands upon other ministers, and moderate or preside in all ecclesiastical judicatories.

The established religion of Scotland formerly partook of all the austerities of Calvinism, and of too much of the intolerance of popery: but at present it is mild and gentle; and the sermons and other theological writings of many of the modern Scotch divines are equally distinguished by good sense and moderation. In the Low-lands there are a great number of seceding congregations. They maintain their own preachers, though scarcely any two congregations agree either in principle or practice with each other. We do not, however, find that they oppose the civil power; or at least the instances are rare and inconsiderable: and perhaps many of these *secessions* are justifiable on account of the great abuses of patronage, by which many parishes have unworthy or incapable ministers imposed upon them, as is the case in many places in England.

A different set of dissenters, in Scotland, consist of the episcopallians, a few quakers, many baptists, and other sectaries, who are denominated from their preachers. Episcopacy, from the time of the Restoration in 1660, to that of the Revolution in 1688, was the established religion of Scotland; and would probably have continued so, had not the bishops, who were in general very weak men, and creatures of the duke of York, afterwards James VII. and II. refused to recognise King William's title. The partisans of that unhappy prince retained the episcopal religion: and king William's government was rendered so unpopular in Scotland, that, in queen Anne's time, the episcopallians were more numerous in some parts than the presbyterians; and their meetings, which they held under the act of toleration, as well attended. A Scotch episcopalian thus becoming another name for a Jacobite, they received some checks after the rebellion in 1715; but they recovered themselves so well, that, at the breaking out of the rebellion in 1745, they became again numerous; after which the government found means to invalidate the acts of their clerical order. Their meetings, however, still subsist, but thinly; the decline of the nonjurors having suppressed episcopacy in Scotland. The English bishops supply them with clergy qualified according to law, whose chapels are chiefly filled by the English, and such Scotch hearers of that persuasion as have places under the government.

The defection of some great families from the cause of popery, and the extinction of others, have rendered its votaries inconsiderable in Scotland. They are chiefly confined to the northern parts, and the

islands: and though a violent opposition was lately raised against them, they appear to be as quiet and inoffensive as protestant subjects.

Scotland, during the time of episcopacy, contained two archbishoprics, St. Andrew's and Glasgow; and twelve bishoprics, Edinburgh, Dunkeld, Aberdeen, Murray, Brechin, Dumblain, Roth, Cuthness, Orkney, Galloway, Argyle, and the Isles.

[LEARNING AND LEARNED MEN.] For this article we may refer to the literary history of Europe for 1400 years past. The western parts and isles of Scotland produced St. Patrick, the celebrated apostle of Ireland; and many others since, whose names alone would make a long article. The writings of Adamnanus, and other authors who lived before and at the time of the Norman invasion, which are still extant, are specimens of their learning. Charles the Great, or Charlemagna, most unquestionably held a correspondence by letters with the kings of Scotland, with whom he formed a famous league; and employed Scotchmen in planning, settling, and ruling his favorite universities, and other seminaries of learning, in France, Italy, and Germany. It is an undoubted truth, though a seeming paradoxical fact, that Barbour, a Scotch poet, philosopher, and historian, though prior in time to Chaucer, having flourished in the year 1369, wrote, according to the modern ideas, as pure English as that bard; and his versification is perhaps more harmonious. The destruction of the Scotch monuments of learning and antiquity has rendered their early annals lame, and often fabulous; but the Latin style of Buchanan's history is equal in classical purity to that of any modern productions. The letters of the Scotch kings to the neighbouring princes are incomparably the finest compositions of the times in which they were written, and are free from the barbarisms of those sent them in answer. This has been considered as a proof that classical learning was more cultivated at the court of Scotland than at any other in Europe.

The discovery of the logarithms, a discovery which in point of ingenuity and utility may vie with any that has been made in modern times, is the indisputable right of Napier of Merchiston. And since his time, the mathematical sciences have been cultivated in Scotland with great success. Keil, in his physico-mathematical works, to the clearness of his reasoning, has sometimes added the colouring of a poet. Of all writers on astronomy, Gregory is allowed to be one of the most perfect and elegant. Maclaurin, the companion and the friend of Sir Isaac Newton, was endowed with all that precision and force of mind which rendered him peculiarly fitted for bringing down the ideas of that great man to the level of ordinary apprehensions, and for diffusing that light through the world which Newton had confined within the sphere of the learned. His Treatise on Fluxions is regarded by the best judges in Europe as the clearest account of the most refined and subtle speculations on which the human mind ever exerted itself with success. While Maclaurin pursued this new career, a geometrician no less famous distinguished himself in the almost deserted track of antiquity. This was the late Dr. Simpson, so well known for his illustrations of the ancient geometry. His Elements of Euclid, and, above all, his Conic Sections, are sufficient of themselves to establish the scientific reputation of his native country.

This, however, does not rest on the character of a few mathematicians and astronomers: the fine arts have been called sisters, to denote their affinity. There is the same connection between the sciences, particularly those which depend on observation. Mathematics, and physics, properly so called, were, in Scotland, accompanied by the other

branches of study the names of Brown, and Greg

branches of study to which they are allied. In medicine particularly, the names of Pitcairn, Arbuthnot, Monro, Smellie, Whytt, Cullen, Brown, and Gregory, hold a distinguished place.

Nor have the Scots been unsuccessful in cultivating the belles lettres. Foreigners who inhabit warmer climates, and conceive the northern nations incapable of tenderness and feeling, are astonished at the poetic genius and delicate sensibility of Thomson.

But of all literary pursuits, that of rendering mankind more virtuous and happy, which is the proper object of what is called *morals*, ought to be regarded with peculiar honour and respect. The philosophy of Dr. Hutcheson, not to mention other works more subtle and elegant, but less convincing and less instructive, deserves to be read by all who would know their duty, or who would wish to practise it. Next to Locke's Essay on the Human Understanding, it is perhaps the best dissection of the human mind that has appeared in modern times; and it is likewise the most useful supplement to that Essay.

It would be endless to mention all the individuals who have distinguished themselves in the various branches of literature; particularly as those who are alive (some of them in high esteem for historical composition) dispute the palm of merit with the dead, and cover their country with laurels, which neither envy can blast, nor time can destroy.

UNIVERSITIES.] The universities of Scotland are four, viz. St. Andrews\*, founded in 1411 — Glasgow†, 1454, — Aberdeen||, 1477, — and Edinburgh ‡, 1582.

It is with pleasure we inform our readers, that a considerable progress has been made in the erection of a new university at Edinburgh, to which our most gracious sovereign has been a very liberal benefactor. This edifice promises to be a noble monument of national taste and spirit.

CITIES, TOWNS, AND OTHER EDIFICES, } Edinburgh, the capital of  
 PUBLIC AND PRIVATE. } Scotland, naturally claims  
 the first place in this division. The castle, before the use of artillery,  
 was deemed to be impregnable. It was probably built by the Saxon  
 king Edwin, whose territory reached to the Frith of Forth, and who  
 gave his name to Edinburgh, as it certainly did not fall into the hands of  
 the Scots till the reign of Indulphus, who lived in the year 953.  
 The town was built for the benefit of protection from the castle; and  
 a more inconvenient situation for a capital can scarcely be conceived;  
 the High-street, which is on the ridge of a hill, lying east and west;  
 and the lanes running down its sides north and south. In former times,  
 the town was surrounded by water, excepting towards the east; so that,  
 when the French landed in Scotland during the regency of Mary of  
 Guise, they gave it the name of Lillebourg. This situation suggested  
 the idea of building very lofty houses, divided into stories, each of  
 which contains a suite of rooms, generally large and commodious, for  
 the use of a family; so that the High-street of Edinburgh, which is  
 chiefly of hewn stone, broad, and well paved, makes a most august ap-  
 pearance, especially as it rises a full mile in a direct line and gradual  
 ascent from the palace of Holyrood-house on the east, and is termi-  
 nated on the west by the rude majesty of its castle, built upon a lofty  
 rock, inaccessible on all sides, except where it joins to the city. The  
 castle not only overlooks the city, its environs, gardens, the new town,  
 and a fine rich neighbouring country, but commands a most extensive  
 prospect of the river Forth, the shipping, the opposite coast of Fife, and  
 even some hills at the distance of 40 or 50 miles, which border upon  
 the Highlands. This crowded population, however, was so extremely  
 inconvenient, that the English, who seldom went farther into the coun-  
 try, returned with the deepest impression of Scotch nastiness, which  
 became proverbial. The castle has some good apartments, a tolerable  
 train of artillery, and has not only a large magazine of arms and ammu-  
 nition, but contains the regalia, which were deposited here under the  
 most solemn legal instruments of their never being removed from thence.  
 All that is known at present of those regalia is contained in the instru-  
 ment which was taken at the time of their being deposited, where they  
 are fully described.

Facing the castle, as I have already observed, at a mile's distance, stands  
 the abbey, or rather palace, of Holy-rood house. The inner quadrangle of  
 this palace, begun by James V. and finished by Charles I. is of magnifi-  
 cent modern architecture, built according to the plan and under the di-  
 rection of sir William Bruce, a Scotch gentleman of family, and one of the  
 greatest architects of that age. Round the quadrangle runs an arcade,  
 adorned with pilasters; and the inside contains magnificent apartments  
 for the duke of Hamilton, who is hereditary keeper of the palace, and for  
 other noblemen. Its long gallery contains figures, some of which are  
 from portraits, but all of them painted by modern artists, of the kings  
 of Scotland down to the time of the Revolution. James VII. when duke  
 of York, intended to have made great improvements about this palace;  
 for at present nothing can be more uncomfortable than its situation; at the  
 bottom of bleak, unimproved crags and mountains, with scarcely a single  
 tree in its neighbourhood. The chapel belonging to the palace, as it  
 stood when repaired and ornamented by that prince, is thought to have  
 been a most elegant piece of Gothic architecture. It had a very lofty roof,  
 and two rows of stone galleries, supported with curious pillars. It was  
 the conventual church of the old abbey. Its inside was demolished and

ruined of all its rich  
 which even broke

ripped of all its rich ornaments, by the fury of the mob at the Revolution, which even broke into the repositories of the dead, and discovered a vault, till that time unknown, which contained the bodies of James V. his first queen, and Henry Darnley. The walls and roof of this ancient chapel gave way and fell down on the 2d and 3d of December, 1768, occasioned by the enormous weight of a new stone roof, laid over it some years before, which the walls were unable to support.

The hospital, founded by George Herriot, goldsmith to James VI., commonly called Herriot's Work, stands to the south-west of the castle, in a noble situation. It is the finest and most regular specimen which Inigo Jones (who went to Scotland as architect to queen Anne, wife of king James VI.), has left us of his Gothic manner, and far exceeding any thing of that kind to be seen in England. One Balcanguhille, a divine, whom Herriot left his executor, is said to have prevailed upon Jones to admit some barbarous devices into the building, particularly the windows, and to have insisted that the ornaments of each should be somewhat different from those of the others. It is, notwithstanding, upon the whole, a delightful fabric, and adorned with gardens not inelegantly laid out. It was built for the maintenance and education of poor children belonging to the citizens and tradesmen of Edinburgh, and is under the direction of the city magistrates.

Among the other public edifices of Edinburgh, before the Revolution, was the college, which claims the privileges of an university, founded by king James VI. and by him put under the direction of the magistrates, who have the power of chancellor and vice-chancellor. Little can be said of its buildings, which were calculated for the sober literary manners of those days; they are, however, improveable, and may be rendered elegant. What is of far more importance, it is supplied with excellent professors in the several branches of learning; and its schools for every part of the medical art are reckoned equal to any in Europe. This college is provided with a library, founded by one Clement Little, which is said to have been of late greatly augmented; and a museum belonging to it was given by sir Andrew Balfour, a physician. It contains several natural and some literary curiosities, which one would little expect to find at Edinburgh.

The Parliament Square, or, as it is there called, Close, was formerly the most ornamental part of this city: it is formed into a very noble quadrangle, part of which consists of lofty buildings: and in the middle is a fine equestrian statue of Charles II. The room built by Charles I. for the parliament-house, though not so large, is better proportioned than Westminster-hall; and its roof, though executed in the same manner, has been by good judges held to be superior. It is now converted into a court of law, where a single judge, called the lord-ordinary, presides by rotation: in a room near it sit the other judges; and adjoining are the public offices of the law, exchequer, chancery, shrievalty, and magistracy of Edinburgh; and the valuable library of the lawyers. This equals any thing of the kind to be found in England, or perhaps in any part of Europe, and was at first entirely founded and furnished by lawyers. The number of printed books it contains is amazing; and the collection has been made with exquisite taste and judgment. It contains likewise the most valuable manuscript remains of the Scottish history, chartularies, and other papers of antiquity, with a series of medals. Adjoining the library is the room where the public records are kept; but both it, and that which contains the library, though lofty in the roof, are miserably dark and dismal. It is said that preparations are now

carrying on for lodging both the books and papers in rooms far better suited to their importance and value.

The high church of Edinburgh, called that of St. Giles, is now divided into four churches, and a room where the general assembly sits. It is a large Gothic building, and its steeple is surmounted by arches, formed into an imperial crown, which has a good effect to the eye. The churches, and other edifices of the city, erected before the Union, contain little but what is common to such buildings; but the excellent pavement of the city, which was begun two centuries ago by one Merlin, a Frenchman, deserves particular attention.

The modern edifices in and near Edinburgh, such as the Exchange, public offices, its hospitals, bridges, and the like, demonstrate the vast improvement of the taste of the Scots in their public works. Parallel to the city of Edinburgh, on the north, the nobility, gentry, and others, have almost completed a new town, upon a plan which does honour to the present age. The streets and squares are laid out with the utmost regularity, and the houses are built with stone, in an elegant taste, with all the conveniences that render those of England so delightful and commodious. The fronts of some are superbly finished, displaying at the same time the judgment of the builder, and the public spirit of the proprietor.

Between the old and the new town lies a narrow bottom or vale, which, agreeably to the original plan, was to have been formed into a sheet of water, bordered by a terras-walk, and the ascent towards the new town covered with pleasure-gardens, shrubberies, &c. But this elegant design fell to nothing, through the narrow ideas of the magistrates, who finding greater benefits by letting the ground to inferior tradesmen upon building leases, this spot, formed by nature as an agreeable opening to a crowded city, became a nuisance to those gentlemen who had been so liberal in ornamenting the buildings upon the summit. A decision of the house of lords (in which a certain great luminary of the law, equally distinguished for his taste and good sense, heartily concurred) put a stop to these mean erections. At the west or upper end of this vale, the castle, a solid rock, not less than twenty stories high, looks down with awful magnificence. The eastern extremity is bounded by a striking object of art, a lofty bridge, the middle arch being ninety feet high, which joins the new-buildings to the city, and renders the descent on each side the vale (there being no water in this place) more commodious for carriages. I am the more particular in describing this place, that the reader may form some idea of its pleasant situation, standing on an eminence, with a gentle declivity on each side, in the heart of a rich country; the view southward, that of a romantic city, its more romantic castle, and distant hills rising to an amazing height; while the prospect northward gives full scope to the eye, delights the imagination, and fills the mind with such ideas as the works of nature alone can inspire. One agreeable prospect, however, is still wanting, a handsome clean inn or tavern, with a genteel coffee-room, towards the side that overlooks the Forth; and which might easily be accomplished by subscription; and, from the great resort of travellers, could not fail to bring a profitable return.

Edinburgh may be considered, notwithstanding its castle, and an open wall which incloses it on the south side, of a very modern fabric, but in the Roman manner, as an open town; so that in fact it would have been impracticable for its inhabitants to have defended it against the rebels, who took possession of it in 1745. Edinburgh contains a playhouse, which has now the sanction of an act of parliament; and concerts, as-

semblies, balls, music-meetings, and other polite amusements, are as frequent and brilliant here, as in any part of his majesty's dominions, London and Bath excepted.

Edinburgh is governed by a lord provost, four bailies, a dean of guild, and a treasurer, annually chosen from the common-council. Every company, or incorporated trade, chooses its own deacon, and here are 14; namely, surgeons, goldsmiths, skinners, furriers, hammer-men, wrights or carpenters, masons, tailors, bakers, butchers, cordwainers, weavers, fullers, and bonnet-makers. The lord provost is colonel of the town-guard, a military institution to be found in no part of his majesty's dominions but in Edinburgh; they serve for the city watch, and patrol the streets, are useful in suppressing small commotions, and attend the execution of sentences upon delinquents. They are divided into three companies, and wear a uniform; they are immediately commanded by three officers under the name of captains. Besides this guard, Edinburgh raises sixteen companies of trained bands, which serve as militia. The reveuues of the city consist chiefly of that tax which is now common in most of the bodies corporate in Scotland, of two Scotch pennies, amounting in the whole to two thirds of a farthing, laid on every Scotch pint of ale (containing two English quarts) consumed within the precincts of the city. This is a most judicious impost, as it renders the poorest people insensible of the burden. Its product, however, has been sufficient to defray the expense of supplying the city with excellent water, brought in leaden pipes from the distance of four miles; of erecting reservoirs, enlarging the harbour of Leith, and completing other public works, of great expense and utility.

Leith, though near two miles distant, may be properly called the harbour of Edinburgh, being under the same jurisdiction. It contains nothing remarkable but the remains of two citadels (if they are not the same), which were fortified and bravely defended by the French, under Mary of Guise, against the English, and afterwards repaired by Cromwell. The neighbourhood of Edinburgh is adorned with noble seats, which are daily increasing; some of them yield to few in England; but they are too numerous to be particularised here. I cannot however avoid mentioning the marquis of Abercorn's, a short way from the city, the duke of Buccleugh's house at Dalkeith, that of the marquis of Lothian at Newbottle, and Hopetoun-house, so called from the earl its owner. About four miles from Edinburgh is Roslin, noted for a stately Gothic chapel, esteemed one of the most curious pieces of workmanship in Europe; founded in the year 1440, by William St. Clair, prince of Orkney, and duke of Oldenburg.

Glasgow, in the shire of Lanerk, situated on a gentle declivity sloping towards the river Clyde, 44 miles west of Edinburgh, is, for population, commerce, and riches, the second city in Scotland, and, considering its size, the first in Great Britain, and perhaps in Europe, as to elegance, regularity, and the beautiful materials of its buildings. The streets cross each other at right angles, and are broad, straight, well paved, and consequently clean. The houses make a grand appearance, and are in general four or five stories high, and many of them, towards the centre of the city, are supported by arcades, which form piazzas, and give the whole an air of magnificence. Some of the modern-built churches are in the finest style of architecture; and the cathedral is a stupendous Gothic building, hardly to be paralleled in that kind of architecture. It contains three churches, one of which stands above another, and is furnished with a very fine spire springing from a tower; the whole being reckoned a

masterly and matchless fabric. It was dedicated to St. Mungo, or Kentigern, who was bishop of Glasgow in the 6th century. The cathedral is upwards of 600 years old, and was preserved from the fury of the rigid reformers by the resolution of the citizens. The town house is a lofty building, and has very noble apartments for the magistrates. The university is esteemed the most spacious and best built of any in Scotland, and is at present in a thriving state. In this city are several well-endowed hospitals; and it is particularly well supplied with large and convenient inns, proper for the accommodation of strangers of any rank. They have lately built a handsome bridge across the river Clyde; but our bounds do not allow us to particularise that, and the other public-spirited undertakings of this city, carrying on by the inhabitants, who do honour to the benefits arising from their vast commerce, both foreign and internal, which they carry on with amazing success. In Glasgow are seven churches, and eight or ten meeting houses for sectaries of various denominations. The number of its inhabitants has been estimated at 60,000.

Aberdeen bids fair to be the third town in Scotland for improvement and population. It is the capital of a shire, to which it gives its name, and contains two towns, New and Old Aberdeen. The former is the shire town, and evidently built for the purpose of commerce. It is a large well-built city, and has a good quay, or tide-harbour: in it are three churches, and several episcopal meeting-houses, a considerable degree of foreign commerce and much shipping, a well-frequented university, and about 20,000 inhabitants. Old Aberdeen, near a mile distant, though almost joined to the New by means of a long village, has no dependence on the other; it is a moderately large market town, but has no haven. In each of these two places there is a well-endowed college, both together being termed the university of Aberdeen, although quite independent of each other.

Perth, the capital town of Perthshire, lying on the river Tay, trades to Norway and the Baltic; is finely situated, has an improving linen manufactory, and lies in the neighbourhood of one of the most fertile spots in Great Britain, called the Carse of Gowry. This town is supposed to have increased one-third since the year 1745; and contains about 11,000 inhabitants. Dundee, by the general computation, contains about 10,000 inhabitants; it lies near the mouth of the river Tay; it is a town of considerable trade, exporting much linen, grain, herrings, and peltry, to sundry foreign parts; and has three churches. Montrose, Aberbrothick, and Brechin, lie in the same county, of Angus: the first has a great and flourishing foreign trade, and the manufactures of the other two are in an improving state.

The ancient Scots valued themselves upon trusting to their own valour, and not to fortifications, for the defence of their country. This was a maxim more heroic perhaps than prudent, as they have often experienced; and, indeed, at this day, their forts would make but a sorry figure if regularly attacked. The castles of Edinburgh, Stirling, and Dumbarton, formerly thought places of great strength, could not hold out 48 hours, if besieged by 6000 regular troops with proper artillery. Fort William, which lies in the West Highlands, is sufficient to bridle the inhabitants of that neighbourhood; as are Fort George and Fort Augustus, in the north and north-west: but none of them can be considered as defences against a foreign enemy.

I shall not pretend to enter upon a description of the noble edifices that, within the course of this and the last century, have been erected for private persons in Scotland, because they are so numerous that to

particularise them exceeds the bounds of my plan. It is sufficient to say, that many of them are equal to some of the most superb buildings in England and foreign countries: and the reader's surprisè at this will cease, when he is informed that the genius of no people in the world is more devoted to architecture than that of the nobility and gentry of Scotland; and that there is no country in Europe, on account of the cheapness of materials, where it can be gratified at so moderate an expence. This may likewise account for the stupendous Gothic cathedrals, and other religious edifices, which anciently abounded in Scotland: but at the time of the Reformation they were mostly demolished by a furious and tumultuous mob, who, in these practices, received too much countenance from the reforming clergy, exasperated at the long and sore sufferings they had endured from the popish party.

ANTIQUITIES AND CURIOSITIES,  
NATURAL AND ARTIFICIAL.

The Roman and other antiquities found in Scotland have of themselves furnished matter for large volumes. The stations of the Roman legions, their castella, their pretentures or walls reaching across the island, have been traced with great precision by antiquaries and historians; so that, without some new discoveries, an account of them could afford no instruction to the learned, and but little amusement to the ignorant; because at present they can be discovered only by critical eyes. Some mention of the chief, however, may be proper. The course of the Roman wall, (or, as it is called by the country people, *Graban's Dyke*, from a tradition that a Scottish warrior of that name first broke over it), between the Clyde and Forth, which was first marked out by Agricola, and completed by Antoninus Pius, is still discernible, as are several Roman camps in the neighbourhood\*. Agricola's camp, at the bottom of the Grampian hills, is a striking remain of Roman antiquity. It is situated at Ardoch, in Perthshire, and is generally thought to have been the camp occupied by Agricola, before he fought the bloody battle, so well recorded by Tacitus, with the Caledonian king, Galgacus, who was defeated. Some writers think that this remain of antiquity at Ardoch was, on account of the numerous Roman coins and inscriptions found near it, a Roman castellum or fort. Be that as it will, it certainly is the most entire and best preserved of any Roman antiquity of that kind in North Britain, having no less than five rows of ditches and six ramparts on the south side; and of the four gates which lead into the area, three are very distinct and plain, viz. the prætoria, decumana, and dextra.

The Roman temple, or building in the form of the Pantheon at Rome,

\* Near the western extremity of this wall, at Duntocher in Dumbartonshire, a countryman, in digging a trench on the declivity of a hill upon which are seen the remains of a Roman fort, turned up several uncommon tiles; which exciting the curiosity of the peasantry in that neighbourhood, it was not long before they broke in upon an entire subterraneous building, from which they dug out a cart-load of these materials. A gentleman, who was then upon a journey through that part of Scotland, found means, upon the second day, to stop all farther proceedings, in hopes that some public-spirited persons would, by taking off the surface, explore the whole without demolishing it. The tiles are of seven different sizes; the smallest being seven, and the largest twenty-one inches square. They are from two to three inches in thickness, of a reddish colour, and in a perfectly sound condition. The lesser ones composed several rows of pillars, which form a labyrinth of passages about eighteen inches square; and the larger tiles being laid over the whole, serve as a roof to support the earth above, which is found to be two feet in depth. The building is surrounded by a subterraneous wall of hewn stone. The bones and teeth of animals, with a sooty kind of earth, were found in the passages; from which some have conjectured this building to have been occupied as a hot-bed for the use of the neighbouring garrison.

or of the dome of St. Paul's at London, stood upon the banks of the river Carron in Stirlingshire, but has been lately barbarously demolished by a neighbouring Goth, for the purpose of mending a mill-pond. Its height was twenty-two feet, and its external circumference at the base was eighty-eight feet; so that upon the whole it was one of the most complete Roman antiquities in the world. It is thought to have been built by Agricola, or some of his successors, as a temple to the god Terminus, as it stood near the pretenture which bounded the Roman empire in Britain to the north. Near it are some artificial conical mounds of earth, which still retain the name of Duni-pace, or Duni-pacis; which serve to evidence that there was a kind of solemn compromise between the Romans and the Caledonians, that the former should not extend their empire farther to the northward.

Innumerable are the coins, urns, utensils, inscriptions, and other remains of the Romans, that have been found in different parts of Scotland: some of them to the north of the wall, where, however, it does not appear that they made any establishment. By the inscriptions found near the wall, the names of the legions that built it, and how far they carried it on, may be learned. The remains of Roman highways are frequent in the southern parts.

Danish camps and fortifications are easily discernible in several northern counties; and are known by their square figures and difficult situations. Some houses or stupendous fabrics remain in Ross-shire; but whether they are Danish, Pictish, or Scottish, does not appear. The elevations of two of them are to be seen in Gordon's *Itinerarium Septentrionale*. I am of opinion that they are Norwegian or Scandinavian structures, and built about the fifth century, to favour the descents of that people upon those coasts.

Two Pictish monuments, as they are thought to be, of a very extraordinary construction, were lately standing in Scotland; one of them at Abernethy in Perthshire, the other at Brechin in Angus; both of them are columns, hollow in the inside, and without the stair-case; that of Brechin is the most entire, being covered at the top with a spiral roof of stone, with three or four windows above the cornice; it consists of sixty regular courses of hewn free-stone, laid circularly, and regularly tapering towards the top. If these columns are really Pictish, that people must have had among them architects that far exceeded those of any coeval monuments to be found in Europe, as they have all the appearance of an order; and the building is neat, and in the Roman style of architecture. It is, however, difficult to assign them to any but the Picts, as they stand in their dominions; and some sculptures upon that at Brechin denote it to be of Christian origin. It is not indeed impossible that these sculptures are of a later date. Besides these two pillars, many other Pictish buildings are found in Scotland, but not of the same taste.

The vestiges of erections by the ancient Scots themselves are not only curious but instructive, as they regard many important events of their history. That people had amongst them a rude notion of sculpture, in which they transmitted the actions of their kings and heroes. At a place called Aberlemno, near Brechin, four or five ancient obelisks are still to be seen, called the Danish stones of Aberlemno. They are erected as commemorations of the Scotch victories over that people; and are adorned with bas-reliefs of men on horseback, and many emblematical figures and hieroglyphics, not intelligible at this day, but minutely described by Mr. Gordon. Many other historical monuments of the Scots may be discovered on the like occasions; but it must be

acknowledged that  
of boundless and  
many of them are

acknowledged that the obscurity of their sculptures has opened a field of boundless and frivolous conjectures; so that the interpretations of many of them are often fanciful. It would, however, be unpardonable, if I should neglect to mention the stone near the town of Forres, or Fortrose, in Murray, which far surpasses all the other in magnificence and grandeur, "and is (says Mr Gordon) perhaps one of the most stately monuments of that kind in Europe. It rises about 23 feet in height above ground, and is, as I am credibly informed, no less than 12 or 15 feet below; so that the whole height is at least 35 feet, and its breadth near 5. It is all one single and entire stone; great variety of figures in relievo are carved thereon, and some of them still distinct and visible; but the injury of the weather has obscured those towards the upper part." Though this monument has been generally looked upon as Danish, yet I have little doubt of its being Scotch, and that it was erected in commemoration of the final expulsion of the Danes out of Murray, where they held their last settlement in Scotland, after the defeat they received from Malcolm, a few years before the Norman invasion.

At Sandwick, in Ross-shire, is a very splendid ancient obelisk, surrounded at the base with large, well-cut flag stones, formed like steps. Both sides of the column are covered with various enrichments, in well-finished carved work. The one face presents a sumptuous cross, with a figure of St. Andrew on each hand, and some uncouth animals and flowerings underneath. The central division on the reverse exhibits a variety of curious figures, birds, and animals.

The ruins of the cathedral of Elgin are very striking; and many parts of that fine building have still the remains of much grandeur and dignity in them. The west door is highly ornamented; there is much elegance in the carvings, and the whole edifice displays very elaborate workmanship.

Among the remains of ancient castles, may be mentioned Kildrummy castle in the north of Scotland; which was formerly a place of great strength and magnificence, and often used as an asylum to noble families in periods of civil war. Inverurie castle, the ancient seat of the earl-marschals of Scotland, is also a large and lofty pile, situated on a steep bank of the river; two very high towers bound the front, and, even in their decaying state, give the castle an air of much grandeur and antiquity. Vast rows of venerable trees, inclosing the adjoining garden, add to the effect of the decayed buildings. Near the town of Huntly are the ruins of Huntly castle. On the avenue that leads to it, are two large square towers, which had defended the gateway. The castle seems to be very old, and a great part of it is demolished; but there is a massy building of a more modern date, in which some of the apartments, and in particular, their curious ceilings, are still in tolerable preservation. They are painted with a great variety of subjects, in small divisions, in which are contained many emblematical figures.

Besides these remains of Roman, Pictish, Danish, and Scottish antiquities, many Druidical monuments and temples are discernible in the northern parts of Scotland, as well as in the isles, where we may suppose that paganism took its last refuge. They are easily perceived by their circular forms; but though they are equally regular, yet none of them are so stupendous as the Druidical erections in South Britain. There is in Perthshire a barrow which seems to be a British erection, and the most beautiful of the kind perhaps in the world. It exactly resembles the figure of a ship with the keel uppermost. The common people call it

Ternay, which some interpret to be *terra navis*, the ship of earth. It seems to be of the most remote antiquity, and perhaps was erected to the memory of some British prince, who acted as auxiliary to the Romans; for it lies near Auchterarder, not many miles distant from the great scene of Agricola's operations.

The traces of ancient volcanoes are not unfrequent in Scotland. The hill of Finehaven is one instance; and the hill of Bergonium, near Dunstaffage castle, is another, yielding vast quantities of pumices or scorias of different kinds, many of which are of the same species with those of the Icelandic volcanoes. Among other natural curiosities of this country, mention is made of a heap of white stones, most of them clear like crystal, together with great plenty of oyster and other sea shells; they are found on the top of a mountain called Scorna-Lappich, in Ross-shire, twenty miles distant from the sea. Slains, in Aberdeenshire, is said to be remarkable for a petrifying cave, called the Dropping Cave, where water oozing through a spongy porous rock at the top, quickly consolidates after it drops to the bottom. Other natural curiosities belonging to Scotland have their descriptions and histories; but they generally owe their extraordinary qualities to the credulity of the vulgar, and vanish when they are skilfully examined. Some caverns that are to be found in Fifeshire, and are probably natural, are of extraordinary dimensions, and have been the scenes of inhuman cruelties.

[COMMERCE AND MANUFACTURES.] In these respects Scotland has, for some years past, been in a very improving state. Without entering into the disputed point, how far Scotland was benefited by its union with England, it is certain that the expedition of the Scots to take possession of Darien, and to carry on the East and West-India trade, was founded upon true principles of commerce, and (so far as it went) executed with a noble spirit of enterprise. The miscarriage of that scheme, after receiving the highest and most solemn sanctions, is a disgrace to the annals of that reign in which it happened; as the Scots had then a free, independant, and unconnected parliament. We are to account for the long languor of the Scottish commerce, and may other misfortunes which that country sustained, by the disgust the inhabitants conceived on that account, and some invasions of their rights afterwards, which they thought inconsistent with the articles of union. The entails and narrow settlements of family estates, and some remains of the feudal institutions, might contribute to the same effect.

Mr Pelham, when at the head of the administration in England, after the extinction of the rebellion in 1745, was the first minister who discovered the true value of Scotland, which then became a more considerable object of governmental inquiry than ever. All the benefits received by that country, for the relief of the people from their feudal tyranny, were effected by that great man. The bounties and encouragements granted to the Scots, for the benefit of trade and manufactures, during his administration, made them sensible of their own importance. Mr Pitt, a succeeding minister, pursued Mr Pelham's wise plan, and justly boasted in parliament, that he availed himself of the courage, good sense, and spirit of the Scots, in carrying on the most extensive war that ever Great Britain was engaged in. Let me add to the honour of the British government, that the Scots have been suffered to avail themselves of all the benefits of commerce and manufactures they can claim, either in right of their former independency, the treaty of union, or posterior acts of parliament.

This is manifest from the extensive trade they lately carried on with

the British settlements in America and the West Indies, and with all the nations to which the English themselves trade; so that the increase of their shipping within these thirty years past has been very considerable. The exports of those ships are composed chiefly of Scottish manufactures, fabricated from the produce of the soil and the industry of its inhabitants. In exchange for these, they import tobacco, rice, cotton, sugar, and rum, from the British plantations; and from other countries, their products, to the immense saving of their nation. The prosperity of Glasgow and its neighbourhood has been greatly owing to the connection and trade with Virginia and the West Indies.

The fisheries of Scotland are not confined to its own coasts, for the Scots have a great share in the whale-fishery carried on upon the coast of Spitzbergen; and their returns are valuable, as the government allows them a bounty of 40s. for every ton of shipping employed in that article. The late improvements of their fisheries, which I have already mentioned, and which are daily increasing, open inexhaustible funds of wealth; their cured fish being, by foreigners, and the English planters in America, preferred to those of Newfoundland.

The busses, or vessels employed in the great herring fishery on the western coasts of Scotland, are fitted out from the north-west parts of England, the north of Ireland, as well as the numerous ports of the Clyde and neighbouring islands. The grand rendezvous is at Campbeltown, a commodious port of Argyleshire, facing the north of Ireland, where sometimes 300 vessels have been assembled. They clear out on the 12th of September, and must return to their different ports by the 13th of January. They are also under certain regulations respecting the number of tons, men, nets, &c. the whole being judiciously calculated to promote the best of national purposes, its strength, and its commerce. But though the political existence of Great Britain depends upon the number and bravery of her seamen, this noble institution has hitherto proved ruinous to many of those who have embarked in it, and, unless vigorously supported, must fail of attaining its object.

To encourage this fishery, a bounty of 50s. per ton was granted by parliament; but, whether from the insufficiency of the fund appropriated for this purpose, or any other cause, the bounty was withheld from year to year, while in the mean time the adventurers were not only sinking their fortunes, but also borrowing to the utmost limits of their credit. The bounty has since been reduced from 50 to 30s. with the strongest assurances of its being regularly paid when due. Upon the strength of these promises they have again embarked in the fishery; and it is to be wished that no consideration whatever may tend to withdraw an inducement so requisite to place their fishery on a permanent footing.

The benefits of these fisheries are perhaps equalled by manufactures carrying on at land; particularly that of iron at Carron, in Stirlingshire.

Their linen manufactory, notwithstanding a strong rivalry from Ireland, is in a flourishing state. The thread manufacture of Scotland is equal, if not superior, to any in the world; and the lace fabricated from it has been deemed worthy of royal wear and approbation. It has been said, some years ago, that the exports from Scotland to England and the British plantations, in linen, cambrics, checks, Osnaburghs, inkle, and the like commodities, amounted annually to 400,000*l.* exclusive of their home consumption; and there is reason to believe that the sum is considerably larger at present. The Scots are likewise making very

promising efforts for establishing woollen manufactures; and their exports of caps, stockings, mittens, and other articles of their own wool, begin to be very considerable. The Scots, it is true, cannot pretend to rival the English in their finer cloths; but they make at present some broad-cloth proper for the wear of people of fashion in an undress, and in quality and fineness equal to what is commonly called Yorkshire cloth. Among the other late improvements of the Scots, we are not to forget the vast progress they have made in working the mines, and smelting the ore, of their country. Their coal trade to England is well known; and of late they have turned even their stone to account, by their contracts for paving the streets of London. If the great trade in cattle, which the Scots carried on of late with the English, is now diminished, it is owing to the best of national causes, that of an increase of home consumption.

The trade carried on by the Scots with England, is chiefly from Leith, and the eastern ports of the nation; but Glasgow was the great emporium for the American commerce, before the commencement of the unhappy breach with the colonies. The late junction of the Forth to the Clyde will render the benefits of trade mutual to both parts of Scotland. In short, the more that the seas, the situation, the soil, the harbours, and rivers of this country, come to be known, the better adapted it appears for all the purposes of commerce, both foreign and domestic.

With regard to other manufactures, not mentioned, some of them are yet in their infancy. The town of Paisley alone employs an incredible number of hands in fabricating a particular kind of flowered and striped lawns, which are a reasonable and elegant wear. Sugar-houses, glass-works of every kind, delf-houses, and paper-mills, are erected everywhere. The Scotch carpeting makes neat and lasting furniture; and some essays have been lately made, with no inconsiderable degree of success, to carry that branch of manufacture to as great perfection as in any part of Europe. After all that has been said, many years will be required before the trade and improvements in Scotland can be brought to maturity. In any event they never can give umbrage to the English, as the interests of the two people are, or ought to be, the same.

Having said thus much, I cannot avoid observing the prodigious disadvantages under which both the commercial and landed interest of Scotland lie from her nobility and great land-holders having too fond an attachment for England, and foreign countries, where they spend their ready money. This is one of the evils arising to Scotland from the Union, which removed the seat of her legislature to London; but it is greatly augmented by the resort of volunteer absentees to that capital. While this partiality subsists, the Scots will probably continue to be distressed for a currency of specie. How far paper can supply that defect, depends upon an attention to the balance of trade; and the evil may, perhaps, be somewhat prevented, by money remitted from England for carrying on the vast manufactures and works now set on foot in Scotland. The gentlemen who reside in Scotland have wisely abandoned French claret and brandy (though too much is still made use of in that country), for rum produced in the British plantations; and their own malt liquors are now come nearly to as great perfection as those in England; and it is said that they have lately exported large quantities of their ale to London, Dublin, and the plantations.

REVENUES.] See England.

CORNS.] In the reign of James II. the coinage of coins was the reign of James II. sixpence; and about 1700 more than an English shilling till after the union of the vast resort of the people to such a degree that the Scotch shilling fell to and their pennies in proportion were found; and they were of value of a Scotch penny out. A Scotch halfpenny first stamped with the king's but perhaps it is only a low piece of money of the Scotch shilling coins, but denomination of money in Scotland reckon by the Scotch.

LAW AND CONSTITUTION. The preservation of the king was greatly limited by the situation upon him, and by exercising a despotism over the common people that equalled the king's authority was and great landholders and oppressors their tenants.

The ancient king's oath, containing the promise of assistance, that the king should enjoy true peace during his reign, shall prohibit and hinder the king from doing any thing of justice and mercy, and may show mercy unto the poor.

The parliament of Scotland has a portion of land, and this parliament appointed, and committed

**COINS.]** In the reign of Edward II. of England, the value and denominations of coins were the same in Scotland as in England. Towards the reign of James II. a Scotch shilling answered to about an English sixpence; and about the reign of queen Mary of Scotland, it was not more than an English groat. It continued diminishing in this manner till after the union of the two crowns under her son James VI. when the vast resort of the Scotch nobility and gentry to the English court occasioned such a drain of specie from Scotland, that by degrees a Scotch shilling fell to the value of one twelfth of an English shilling, and their pennies in proportion. A Scotch penny is now very rarely to be found; and they were succeeded by bodles, which were double the value of a Scotch penny, and are still current, but are daily wearing out. A Scotch halfpenny was called a babe; some say, because it was first stamped with the head of James III. when he was a babe or baby; but perhaps it is only a corruption of two French words *bas piece*, signifying a low piece of money. The same observation that we have made of the Scotch shilling, holds of their pounds or marks; which are not coins, but denominations of sums. In all other respects, the currency of money in Scotland and England is the same, as very few people now reckon by the Scotch computation.

**ORDER OF THE THISTLE.]** This is a military order instituted, as the Scotch writers assert, by their king Achaius, in the ninth century, upon his making an offensive and defensive league with Charlemagne, king of France; or, as others say, on account of his victory over Athelstan, king of England, when he vowed in the kirk of St. Andrew, that he and his posterity should ever bear in their ensigns the figure of that cross on which the saint suffered. It has been frequently neglected, and as often resumed. It consists of the sovereign and 12 companions, who are called Knights of the Thistle, and have on their ensign this significant motto, *Nemo me impune lacesset*; "None shall safely provoke me."

**LAWS AND CONSTITUTION.]** The ancient constitution and government in Scotland has been highly applauded, as excellently adapted to the preservation of liberty; and it is certain that the power of the king was greatly limited, and that there were many checks in the constitution upon him, which were well calculated to prevent his assuming or exercising a despotic authority. But the Scottish constitution of government was too much of the aristocratic kind to afford to the common people that equal liberty which they had a right to expect. The king's authority was sufficiently restrained; but the nobles, chieftains and great landholders, had it too much in their power to tyrannise over and oppress their tenants, and the common people.

The ancient kings of Scotland, at their coronation, took the following oath, containing three promises, viz.

"In the name of Christ, I promise these three things to the Christian people my subjects: First, that I shall give order, and employ my force and assistance, that the church of God, and the Christian people, may enjoy true peace during our time under our government. Secondly, I shall prohibit and hinder all persons, of whatever degree, from violence and injustice. Thirdly, in all judgments I shall follow the prescriptions of justice and mercy, to the end that our clement and merciful God may show mercy unto me and to you."

The parliament of Scotland anciently consisted of all who held any portion of land, however small, of the crown, by military service. This parliament appointed the time of its own meetings and adjournments, and committees to superintend the administration during the in-

tervals of parliament; it had a commanding power in all matters of government; it appropriated the public money, ordered the keeping of it, and called for the accounts; it armed the people, and appointed commanders; it named and commissioned ambassadors; it granted and limited pardons; it appointed judges and courts of judicature; it named officers of state and privy-counsellors; it annexed and alienated the revenues of the crown, and restrained grants by the king. The king of Scotland had no negative voice in parliament; nor could he declare war, make peace, or conclude any other public business of importance, without the advice and approbation of parliament. The prerogative of the king was so bounded, that he was not even entrusted with the executive part of the government. And so late as the minority of James IV. who was contemporary with, and son-in-law to, Henry VII. of England, the parliament pointed out to him his duty, as the first servant of his people; as appears by the act still extant. In short, the constitution was rather aristocratical than monarchical. The abuse of these aristocratical powers, by the chieftains and great landholders, gave the king, however, a very considerable interest among the lower ranks; and a prince who had sense and address to retain the affections of his people, was generally able to humble the most overgrown of his subjects; but when, on the other hand, a king of Scotland, like James III. showed a disrespect to his parliament, the event was commonly fatal to the crown. The kings of Scotland, notwithstanding this paramount power in the parliament, found means to weaken and elude its force; and in this they were assisted by the clergy, whose revenues were immense, and who had very little dependence upon the pope, and were always jealous of the powerful nobility. This was done by establishing a select body of members, who were called *the lords of the articles*. These were chosen out of the clergy, nobility, knights, and burgeses. The bishops, for instance, chose eight peers, and the peers eight bishops; and these sixteen jointly chose eight barons (or knights of the shire), and eight commissioners for burghs; and to all these were added eight great officers of state, the chancellor being president of the whole.

Their business was to prepare all questions and bills, and other matters brought into parliament; so that in fact, though the king could give no negative, yet being, by his clergy, and the places he had to bestow, always sure of the lords of the articles, nothing could come into parliament that could call for his negative. It must be acknowledged that this institution seems to have prevailed by stealth; nor was it ever brought into any regular system; even its modes varied; and the greatest lawyers are ignorant when it took place. The Scots, however, never lost sight of their original principles; and though Charles I. wanted to form these lords of the articles into regular machines for his own despotic purposes, he found it impracticable; and the melancholy consequences are well known. At the revolution, the Scots gave a fresh instance how well they understood the principles of liberty, by omitting all pedantic debates about *abdication*, and the like terms, and voting king James at once to have forfeited his crown; which they gave to the prince and princess of Orange.

This spirit of resistance was the more remarkable, as the people of Scotland had groaned under the most insupportable ministerial tyranny ever since the Restoration. If it be asked, Why did they submit to that tyranny?—the answer is, In order to preserve that independency upon England, which Cromwell and his parliament endeavoured to destroy by uniting them with England. They therefore chose rather to submit

to a temporary  
their oppressors.

to a temporary evil; but they took the first opportunity to get rid of their oppressors.

Scotland, when it was a separate kingdom, cannot be said to have had any peers, in the English sense of the word. The nobility, who were dukes, marquises, earls, and lords, were by the king made hereditary members of parliament; but they formed no distinct house; for they sat in the same room with the commons, who had the same deliberative and decisive vote with them in all public matters. A baron, though not a baron of parliament, might sit upon a lord's assize in matters of life and death; nor was it necessary for the assizers, or jury, to be unanimous in their verdict. The feudal customs, even at the time of the Restoration, were so prevalent, and the rescue of the great criminal was commonly so much apprehended, that seldom above two days passed between the sentence and execution.

Great uncertainty occurs in the Scotch history, by confounding parliaments with conventions: the difference was, that a parliament could enact laws as well as lay on taxes; a convention, or meeting of the states, only met for the purpose of taxation. Before the Union, the kings of Scotland had four great, and four lesser officers of state; the great were, the lord high chancellor, high treasurer, privy seal, and secretary; the four lesser were, the lords register, advocate, treasurer-depute, and justice-clerk. Since the Union, none of these continue, excepting the lords privy-seal, register, advocate, and justice-clerk; a third secretary of state has occasionally been nominated by the king for Scottish affairs, but under the same denomination as the other two secretaries. The above officers of state sat in the Scotch parliament by virtue of their offices.

The officers of the crown were, the high-chamberlain, constable, admiral, and marshal. The offices of constable and marshal were hereditary. A nobleman has still a pension as admiral; and the office of marshal is exercised by a knight-marshal.

The office of chancellor of Scotland differed little from the same in England. The same may be said of the lords treasurer, privy-seal, and secretary. The lord-register was head-clerk to the parliament, convention, treasury, exchequer, and session, and keeper of all public records. Though this office was only during the king's pleasure, yet it was very lucrative by disposing of his deputation, which lasted during life. He acted as teller to the parliament; and it was dangerous for any member to dispute his report of the numbers upon division. The lord advocate's office resembles that of the attorney-general in England, only his powers are far more extensive; because, by the Scotch laws, he is the prosecutor of all capital crimes before the judiciary, and likewise concurs in all pursuits before sovereign courts, for breaches of the peace, and also in all matters civil, wherein the king or his donator hath interest. Two solicitors are named by his majesty, by way of assistants to the lord-advocate. The office of justice-clerk entitles the possessor to preside in the criminal court of justice, while the justice-general, an office I shall describe hereafter, is absent.

The ancient constitution of Scotland admitted of many other offices both of the crown and state; but they are either now extinct, or too inconsiderable to be described here. That of Lyon king at arms, or the rex facialis, or grand herald of Scotland, is still in being; and it was formerly an office of great splendor and importance, inasmuch that the science of heraldry was preserved there in greater purity than in any other country in Europe. He was even crowned solemnly in parliament with a golden circle; and his authority (which is not the case in Eng-

land), in all armorial affairs; might be carried into execution by the civil law.

The privy council of Scotland, before the Revolution, had, or assumed, inquisitorial powers, even that of torture; but it is now sunk in the parliament and privy-council of Great Britain; and the civil and criminal causes in Scotland are chiefly cognisable by two courts of judicature.

The first is that of the college of justice, which was instituted by James V. after the model of the French parliament, to supply an ambulatory committee of parliament, who took to themselves the names of the lords of council and session, which the present members of the college of justice still retain. This court consists of a president and fourteen ordinary members, besides extraordinary ones named by the king, who may sit and vote, but have no salaries and are not bound to attendance. This court may be called a standing jury in all matters of property that lie before them. The civil law is their directory in all matters that come not within the municipal laws of the kingdom. It has been often matter of surprise, that the Scots were so tenacious of the forms of their courts, and the essence of their laws, as to reserve them by the articles of the Union. This, however, may be easily accounted for, because those laws and forms were essential to the possession of estates and lands, which in Scotland are often held by modes incompatible with the laws of England. The lords of council and session act likewise as a court of equity; but their decrees are (fortunately perhaps for the subject) reversible by the British house of lords, to which an appeal lies. The supreme criminal judge was named the Justiciar, and the court of justiciary succeeded to his power.

The justice-court is the highest criminal tribunal in Scotland; but in its present form it was instituted so late as the year 1672, when a lord-justice-general, removable at the king's pleasure, was appointed. This lucrative office still exists in the person of one of the chief nobility; but the ordinary members of the court are the justice-clerk and five other judges, who are always nominated from the lords of session. In this court the verdict of a jury condemns or acquits; but, as I have already hinted, without the necessity of their being unanimous.

Besides these two great courts of law, the Scots, by the articles of the Union, have a court of exchequer. This court has the same power, authority, privilege, and jurisdiction, over the revenue of Scotland, as the court of exchequer in England has over the revenue there; and all matters and things competent to the court of exchequer in England relating thereto, are likewise competent to the exchequer of Scotland. The judges of the exchequer in Scotland exercise certain powers which formerly belonged to the treasury, and are still vested in that of England.

The court of admiralty in Scotland was, in the reign of Charles II. by act of parliament, declared to be a supreme court, in all causes competent to its own jurisdiction: and the lord high admiral is declared to be the king's lieutenant and justice-general upon the seas, and in all ports, harbours, and creeks of the same: and upon fresh waters and navigable rivers, below the first bridge, or within flood-mark; so that nothing competent to its jurisdiction can be meddled with, in the first instance, but by the lord high-admiral and judges of his court. Sentences passed in all inferior courts of admiralty may be brought again before his court: but no appeal lies from it to the lords of the session, or any other judicatory, unless in cases not maritime. Causes are tried in this court by the civil law, which in some cases is likewise the common law of Scotland, as well as by the laws of Oleron, Wisby, and the Hanse-Towns, and other

maritime practices a place of lord-admiral's salary annexed to it the admiralty is competent perquisites pertaining

maritime practices and decisions common upon the continent. The place of lord-admiral of Scotland is little more than nominal: but the salary annexed to it is reckoned worth 1000*l.* a year; and the judge of the admiralty is commonly a lawyer of distinction, with considerable perquisites pertaining to his office.

The college or faculty of advocates, which answers to the English inns of court, may be called the seminary of Scotch lawyers. They are within themselves an orderly court, and their forms require great precision and examination to qualify its candidates for admission. Subordinate to them is a body of inferior lawyers, or, as they may be called, attorneys, who call themselves writers to the signet, because they alone can subscribe the writs that pass the signet; they likewise have a by-government for their own regulation. Such are the different law-courts that are held in the capital of Scotland: we shall pass to those that are inferior.

The government of the counties in Scotland was formerly vested in sheriffs and stewards, courts of regality, baron-courts, commissaries, justices of the peace, and coroners.

Formerly sheriffdoms were generally hereditary; but by a late act of parliament, they are now all vested in the crown; it being enacted, that all high sheriffs, or stewards, shall, for the future, be nominated and appointed annually by his majesty, his heirs, and successors. In regard to the sheriff-deputes, and steward-deputes, it is enacted that there shall only be one in each county, or stewartry, who must be an advocate, of three years standing at least. For the space of seven years, these deputies are to be nominated by the king, with such continuance as his majesty shall think fit; after which they are to enjoy their office *ad vitam aut culpam*, that is, for life, unless guilty of some offence. Some other regulations have been likewise introduced, highly for the credit of the sheriff's courts.

Stewartries were formerly part of the ancient royal domain; and the stewards had much the same power in them as the sheriff had in his county.

Courts of regality of old were held by virtue of a royal jurisdiction vested in the lord, with particular immunities and privileges; but these were so dangerous and so extravagant, that all the Scotch regalities are now dissolved by act of parliament.

Baron courts belong to every person who holds a barony of the king. In civil matters they extend to causes not exceeding forty shillings sterling; and in criminal cases, to petty actions of assault and battery; but the punishment is not to exceed twenty shillings sterling, or setting the delinquent in the stocks for three hours in the day-time. These courts, however petty, were in former days invested with the power of life and death, which they have now lost.

The courts of commissaries in Scotland answer to those of the English diocesan chancellors, the highest of which is kept at Edinburgh; wherein, before four judges, actions are pleaded concerning matters relating to wills and testaments; the right of patronage to ecclesiastical benefices, tithes, divorces, and causes of that nature; but in almost all other parts of the kingdom, there sits but one judge on these causes.

According to the present institution, justices of the peace in Scotland exercise pretty much the same powers as those in England. In former times their office, though of very old standing, was insignificant, being cramped by the powers of the great feudal tyrants, who obtained an act of parliament, that they were not to take cognisance of riots till fifteen days after the fact.

The institution of coroners is as old as the reign of Malcolm II. the great legislator of Scotland, who lived before the Norman invasion of England. They took cognisance of all breaches of the king's peace; and they were required to have clerks to register depositions and matters of fact, as well as verdicts of jurors: the office, however, is at present much disused in Scotland.

From the above short view of the Scotch laws and institutions, it is plain that they were radically the same with those of the English. The latter allege, indeed, that the Scots borrowed the contents of their *Regiam Majestatem*, their oldest law-book, from the work of Glanville, who was a judge under Henry II. of England. The Scots, on the other hand, say that Glanville's work was copied from their *Regiam Majestatem*, even with the peculiarities of the latter, which do not now, and never did, exist in the laws of England.

The royal burghs in Scotland form, as it were, a commercial parliament, which meets once a year at Edinburgh, consisting of a representative from each burgh, to consult upon the common good of the whole. Their powers are pretty extensive; and before the Union they made laws relating to shipping, to masters and owners of ships, to mariners and merchants by whom they were freighted; to manufactures, such as plaiding, linen, and yarn; to the curing and packing of fish, salmon, and herrings, and to the importing and exporting several commodities. The trade between Scotland and the Netherlands is subject to their regulation; they fix the staple port, which was formerly at Dort, and is now at Campvere. Their conservator is indeed nominated by the crown; but then their convention regulates his power, approves his deputies, and appoints his salary: so that in truth the whole staple trade is subjected to their management. Upon the whole, this is a very singular institution, and sufficiently proves the vast attention which the government of Scotland formerly paid to trade. It took its present form in the reign of James III. 1487, and had excellent consequences for the benefit of commerce.

The conformity between the practice of the civil law of Scotland, and that in England, is remarkable. The English law-reports are of the same nature with the Scotch practice; and their acts of *federunt* answer to the English rules of court; the Scottish wadsets and reversions, to the English mortgages and defeasances; their pointing of goods, after letters of horning, is much the same as the English executions upon outlawries; and an appeal against the king's pardon, in cases of murder, by the next of kin to the deceased, is admitted in Scotland as well as in England. Many other usages are the same in both kingdoms. I cannot, however, dismiss this head without one observation, which proves the similarity between the English and Scotch constitutions, which I believe has been mentioned by no author. In old times, all the freeholders in Scotland met together in presence of the king, who was seated on the top of a hillock, which, in the old Scottish constitution, is called the Moot, or Mute-hill; all national affairs were here transacted; judgments given, and differences ended. This Moot-hill I apprehend to be of the same nature as the Saxon Folcmote, and to signify no more than the hill of meeting.

HISTORY.] Though the writers of ancient Scotch history are too fond of system and fable, yet it is easy to collect, from the Roman authors, and other evidences, that Scotland was formerly inhabited by different people. The Caledonians were probably the first inhabitants; the Picts undoubtedly were the Britons who were forced north-

wards by the Belgic Julius Cæsar, and numbers of their Romans. The Scots the ancient Scythians, and, as has been said, gave their own name to the Forth appell'd the Britons, who first was Dumbarton: by the Scots.

It does not appear that the laws of Scotland, as Agricola, anno 79. says, by Tacitus not only transmitted towards Dunkeld, made by Galdus of both people; a freedom and independence the noble historian ever, that Tacitus yet they certainly which was the co-

Galdus, otherwise of their monarch put, yet nothing than that the Caledonians and latter was never f-

wards by the Belgic Gauls, about fourscore years before the descent of Julius Cæsar, and who, settling in Scotland, were joined by great numbers of their countrymen, that were driven northwards by the Romans. The Scots most probably were a nation of adventurers from the ancient Scythia, who had served in the armies of the continent, and, as has been already hinted, after conquering the other inhabitants, gave their own name to the country. The tract lying southward of the Forth appears to have been inhabited by the Saxons, and by the Britons, who formed the kingdom of Alcuith, the capital of which was Dumbarton: but all these people in process of time were subdued by the Scots.

It does not appear that the Caledonians, the ancient Celtic inhabitants of Scotland, were attacked by any of the Roman generals before Agricola, anno 79. The name of the prince he fought with was Galdus, by Tacitus named Galgacus; and the history of that war is not only transmitted with great precision, but corroborated by the remains of the Roman encampments and forts, raised by Agricola in his march toward Dunkeld, the capital of the Caledonians. The brave stand made by Galdus against that great general, does honour to the valour of both people; and the sentiments of the Caledonian, concerning the freedom and independency of his country, appear to have warmed the noble historian with the same generous passion. It is plain, however, that Tacitus thought it for the honour of Agricola to conceal some part of this war; for though he makes his countrymen victorious, yet they certainly returned southward to the province of the Horesti, which was the county of Fife, without improving their advantage.

Galdus, otherwise called Corbred; was, according to the Scotch historians, the twenty-first in a lineal descent from Fergus I. the founder of their monarchy; and though this genealogy has of late been disputed, yet nothing can be more certain, from the Roman histories, than that the Caledonians, or Scots, were governed by a succession of brave and wise princes, during the abode of the Romans in Britain. Their valiant resistance obliged Agricola himself, and, after him, the emperors Adrian and Severus, to build the two famous pretences or walls, one between the Friths of Clyde and Forth already mentioned, and the other between Tinmouth and the Solway-Frith, which will be described in our account of England, to defend the Romans from the Caledonians and Scots; and which prove that the independence of the latter was never subdued.

Christianity was introduced into Scotland about the year 201 of the Christian æra, by Donald I. The Picts, who, as before-mentioned, were the descendants of the ancient Britons forced northwards by the Romans, had at this time gained a footing in Scotland; and, being often defeated by the ancient inhabitants, they joined the Romans against the Scots and Caledonians, who were of the same original, and considered themselves as one people; so that the Scots monarchy suffered a short eclipse; but it broke out with more lustre than ever, under Fergus II. who recovered his crown; and his successors gave many severe overthrows to the Romans and Britons.

When the Romans left Britain in 1448, the Scots, as appears by Gildas, a British historian, were a powerful nation, and, in conjunction with the Picts, invaded the Britons; and having forced the Roman walls, drove them to the very sea; so that the Britons applied to the Romans for relief; and in the famous letter, which they called *their groans*, they tell them, that they had no choice left, but that of being swallowed up

by the sea, or perishing by the swords of the barbarians: for so all nations were called who were not Romans, or under the Roman protection.

Dongar, was then king of Scotland; and it appears from the oldest histories, and those that are least favourable to monarchy, that the succession to the crown of Scotland still continued in the family of Fergus, but generally descended collaterally; till the inconveniencies of that mode of succession were so much felt, that by degrees it fell into disuse; and it was at last settled in the descending line.

About the year 796, the Scots were governed by Achais, a prince so much respected, that his friendship was courted by Charlemagne, and a league was concluded between them, which continued inviolate while the monarchy of Scotland had an existence. No fact of equal antiquity is better attested than this league, together with the great service performed by the learned men of Scotland, in civilising the vast dominions of that great conqueror, as has been already observed under the article of Learning. The Picts still remained in Scotland, as a separate nation, and were powerful enough to make war upon the Scots; who, about the year 843, when Kenneth Mac Alpin was king of Scotland, finally subdued them; but not in the savage manner mentioned by some historians, by extermination. For he obliged them to incorporate themselves with their conquerors, by taking their names, and adopting their laws. The successors of Kenneth Mac Alpin maintained almost perpetual wars with the Saxons on the southward, and the Danes and other barbarous nations towards the east; who, being masters of the sea, harassed the Scots by powerful invasions. The latter, however, were more fortunate than the English: for while the Danes were erecting a monarchy in England, they were every where overthrown in Scotland by bloody battles, and at last driven out of the kingdom. The Saxon and Danish monarchs who then governed England were not more successful against the Scots, who maintained their freedom and independency, not only against foreigners, but against their own kings, when they thought them endangered. The feudal law was introduced among them by Malcolm II.

Malcolm III. commonly called Malcolm Canmore, from two Gaëlic words which signify a *large head*, but most probably from his great capacity, was the eighty-sixth king of Scotland, from Fergus I. the supposed founder of the monarchy; the forty-seventh from its restorer, Fergus II. and the twenty-second from Kenneth III. who conquered the kingdom of the Picts. Every reader who is acquainted with the tragedy of Macbeth, as written by the inimitable Shakspeare, who keeps close to the facts delivered by historians, can be no stranger to the fate of Malcolm's father, and his own history, previous to his mounting the throne in the year 1057. He was a wife and a magnanimous prince, and in no respect inferior to his cotemporary the Norman conqueror, with whom he was often at war. He married Margaret, daughter to Edward, surnamed the Outlaw, son to Edmund Ironside, king of England. By the death of her brother Edgar Atheling, the Saxon right to the crown of England devolved upon the posterity of that prince, who was one of the wisest and worthiest women of the age; and her daughter Maud was accordingly married to Henry I. of England. Malcolm, after a glorious reign, was killed, with his son, treacherously, it is said, at the siege of Alnwick, by the besieged.

Malcolm III. was succeeded by his brother Donald VII. and he was dethroned by Duncan II. whose legitimacy was disputed. They were

succeeded by Edgar, the son of Malcolm III. who was a wise and valiant prince; he was succeeded by Alexander I. and upon his death David I. mounted the throne.

Notwithstanding the endeavours of some historians to conceal what they cannot deny, I mean the glories of this reign, it yet appears that David was one of the greatest princes of that age, whether we regard him as a man, a warrior, or a legislator. The noble actions he performed in the service of his niece, the empress Maud, in her competition with king Stephen for the English crown, give us the highest idea of his virtues, as they could be the result only of duty and principle. To him Henry II. the mightiest prince of his age, owed his crown; and his possessions in England, joined to the kingdom of Scotland, placed David's power nearly on an equality with that of England, when confined to this island. His actions and adventures, and the resources he always found in his own courage, prove him to have been a hero of the first rank. If he appeared to be too lavish to churchmen, and in his religious endowments, we are to consider these were the only means by which he could then civilise his kingdom; and the code of laws I have already mentioned to have been drawn up by him, do his memory immortal honour. They are said to have been compiled under his inspection by learned men, whom he assembled from all parts of Europe in his magnificent abbey of Melros. He was succeeded by his grandson Malcolm IV. and he by William, surnamed, from his valour, The Lion. William's son, Alexander II. was succeeded, in 1249, by Alexander III. who was a good king. He married, first, Margaret, daughter to Henry III. of England, by whom he had Alexander, the prince who married the earl of Flanders's daughter; David, and Margaret who married Hangowin, or, as some call him, Eric, son to Magnus IV. king of Norway, who bore to him a daughter named Margaret, commonly called the Maiden of Norway; in whom king William's whole posterity failed; and the crown of Scotland returned to the descendants of David earl of Huntingdon, brother to king Malcolm IV. and king William.

This detail has been given, because it is connected with great events. Upon the death of Alexander III. John Baliol, who was great-grandson to David earl of Huntingdon by his eldest daughter Margaret, and Robert Bruce (grandfather to the great king Robert Bruce) grandson to the same earl of Huntingdon by his youngest daughter Isabel, became competitors for the crown of Scotland. The laws of succession, which were not so well established in Europe as they are at present, rendered the case very difficult. Both parties were almost equally matched in interest; but after a confused inter-regnum of some years, the great nobility agreed in referring the decision to Edward I. of England, the most politic and ambitious prince of his age. He accepted the office of arbiter: but having long had an eye to the crown of Scotland, he revived some obsolete absurd claims of its dependency upon that of England; and, finding that Baliol was disposed to hold it by that disgraceful tenure, Edward awarded it to him; but afterwards dethroned him, and treated him as a slave, without Baliol's resenting it.

After this, Edward used many endeavours to annex the crown of Scotland to his own, which were often defeated; and though Edward for a short time made himself master of Scotland, yet the Scots were ready to revolt against him on every favourable opportunity. Those of them who were so zealously attached to the independency of their country, as to be resolved to hazard every thing for it, were indeed but

few, compared to those in the interest of Edward and Baliol, which was the same: and for some time they were obliged to temporise. Edward availed himself of their weakness and his own power. He accepted of a formal surrender of the crown of Baliol, to whom he allowed a pension, but detained him in England; and sent every nobleman in Scotland, who is in the least suspected, to different prisons in or near London. He then forced the Scots to sign instruments of their subjection to him, and most barbarously carried off or destroyed all the monuments of their history, and the evidence of their independency; and particularly the famous fatical or prophetic stone, which is still to be seen in Westminster Abbey.

These severe proceedings, while they rendered the Scots sensible of their slavery, revived in them the ideas of their freedom; and Edward, finding their spirits were not to be subdued, endeavoured to caress them, and affected to treat them on a footing of equality with his own subjects, by projecting a union, the chief articles of which have since taken place between the two kingdoms. The Scotch patriots treated this project with disdain, and united under the brave William Wallace, the truest hero of his age, to expel the English. Wallace performed actions that entitled him to eternal renown, in executing this scheme. Being however no more than a private gentleman, and his popularity daily increasing, the Scotch nobility, among whom was Robert Bruce, the son of the first competitor, began to suspect that he had an eye upon the crown, especially after he had defeated the earl of Surry, Edward's vice-roy of Scotland, in the battle of Stirling, and had reduced the garrisons of Berwick and Roxburgh, and was declared by the states of Scotland their protector. Their jealousy operated so far, that they formed violent cabals against the brave Wallace. Edward, upon this, once more invaded Scotland, at the head of the most numerous and best disciplined army England had ever seen; for it consisted of 80,000 foot, 3000 horsemen completely armed, and 4000 light-armed; and was attended by a fleet to supply it with provisions. These, besides the troops who joined him in Scotland, formed an irresistible body; Edward, however, was obliged to divide it, reserving the command of 40,000 of his best troops to himself. With these he attacked the Scotch army under Wallace at Falkirk, while their disputes ran so high, that the brave regent was deserted by Cumming, the most powerful nobleman in Scotland, and at the head of the best division of his countrymen. Wallace, whose troops did not exceed 30,000, being thus betrayed, was defeated with vast loss, but made an orderly retreat; during which he found means to have a conference with Bruce, and to convince him of his error in joining with Edward. Wallace still continued in arms, and performed many gallant actions against the English; but was betrayed into the hands of Edward, who most ungenerously put him to death at London, as a traitor. Edward died as he was preparing to renew his invasion of Scotland with a still more desolating spirit of ambition, after having destroyed 100,000 of her inhabitants.

Bruce died soon after the battle of Falkirk, but not before he had inspired his son, who was a prisoner at large about the English court, with the glorious resolution of vindicating his own rights, and his country's independency. He escaped from London, and with his own hand killed Cumming, for his attachment to Edward; and after collecting a few patriots, among whom were his own four brothers, he assumed the crown, but was defeated by the English (who had a great army in Scotland) at the battle of Methven. two friends to the western isles and parts of Scotland, where his fatigues and sufferings were as inexpressible, as the courage with which he and his few friends bore them (the lord Douglas especially) was incredible. Though his wife and daughters were sent prisoners to England, where the best of his friends and two of his brothers were put to death, yet such was his persevering spirit, that he recovered all Scotland, excepting the castle of Stirling, and improved every advantage that was given him by the dissipated conduct of Edward II. who raised an army more numerous and better appointed than that of his father, to make a total conquest of Scotland. It is said that it consisted of 100,000 men, though this has been supposed to be an exaggerated computation: however, it is admitted that the army of Bruce did not exceed 30,000; but all of them veterans, who had been bred up in a detestation of tyranny.

Edward, who was not deficient in point of courage, led his powerful army towards Stirling, then besieged by Bruce, who had chosen, with the greatest judgment, a camp near Bannockburn. The chief officers under Edward were, the earls of Gloucester, Hereford, Pembroke, and sir Giles Argenton. Those under Bruce were, his own brother sir Edward, who, next to himself, was reckoned to be the best knight in Scotland, his nephew, Randolph, earl of Murray, and the young lord, Walter, high-steward of Scotland. Edward's attack of the Scotch army was exceedingly furious, and required all the courage and firmness of Bruce and his friends to resist it, which they did so effectually, that they gained one of the most complete victories that is recorded in history. The great loss of the English fell upon the bravest part of their troops, who were led on by Edward in person against Bruce himself. The Scotch writers make the loss of the English to amount to 50,000 men. There certainly never was a more total defeat, though the conquerors lost 4000. The flower of the English nobility were either killed or taken prisoners. Their camp, which was immensely rich, and calculated for the purpose rather of a triumph than a campaign, fell into the hands of the Scots; and Edward himself, with a few followers, favoured by the goodness of their horses, were pursued by Douglas to the gates of Berwick, from whence he escaped in a fishing-boat. This great and decisive battle happened in the year 1314\*.

The remainder of Robert's reign was a series of the most glorious successes; and so well did his nobility understand the principles of civil liberty, and so unfettered were they by religious considerations, that, in a letter they sent to the pope, they acknowledged that they had set aside Baliol for debasing the crown, by holding it of England; and that they would do the same by Robert, if he should make the like attempt. Robert, having thus delivered Scotland, sent his brother Edward to Ireland, at the head of an army, with which he conquered the greatest part of that kingdom, and was proclaimed its king; but by exposing himself too much, he was killed. Robert, before his death, made an ad-

\* That the Scots of those days were better acquainted with Mars than the Muses, may be seen from a scolding ballad made on this memorable victory, which begins as follows:

Maidens of England fore may you mourn,  
For your lemans you have lost at Bannockburn.

With heve a low!

What ho! ween'd the king of England,  
So soon to have won all Scotland?

With rumbly low.

vantageous peace with England; and died in 1328, with the character of being the greatest hero of his age.

The glory of the Scots may be said to have been in its zenith under Robert I. who was succeeded by his son David II. He was a virtuous prince; but his abilities, both in war and peace, were eclipsed by his brother-in-law and enemy, Edward III. of England, whose sister he married. Edward, who was as eager as any of his predecessors to effect the conquest of Scotland, espoused the cause of Baliol, son to Baliol the original competitor. His progress was at first amazingly rapid; and he and Edward defeated the royal party in many bloody battles; but Baliol was at last driven out of his usurped kingdom by the Scotch patriots. David had the misfortune to be taken prisoner by the English at the battle of Durham; and, after continuing above eleven years in captivity, paid 100,000 marks for his ransom; and died in peace, without issue, in the year 1371.

The crown of Scotland then devolved upon the family of Stuart, by its head having been married to the daughter of Robert I. The first king of that name was Robert II. a wise and brave prince. He was succeeded by his son Robert III. whose age and infirmities disqualified him from reigning; so that he was forced to trust the government to his brother, the duke of Albany, an ambitious prince, who seems to have had an intention to procure the crown for his own family. Robert, upon this, attempted to send his second son to France; but he was most ungenerously intercepted by Henry IV. of England; and, after suffering a long captivity, he was obliged to pay an exorbitant ransom. During the imprisonment of James in England, the military glory of the Scots was carried to its greatest height in France, where they supported that tottering monarchy against England, and their generals obtained some of the first titles of the kingdom.

James, the first of that name, upon his return to Scotland, discovered great talents for government, enacted many wise laws, and was beloved by the people. He had received an excellent education in England during the reigns of Henry IV. and V. where he saw the feudal system, refined from many of the imperfections which still adhered to it in his own kingdom; he determined therefore to abridge the overgrown power of the nobles, and to recover such lands as had been unjustly wrested from the crown during his minority and the preceding reigns; but the execution of these designs cost him his life; he being murdered in his bed by some of the chief nobility in 1437, and the forty-fourth year of his age.

A long minority succeeded; but James II. would probably have equalled the greatest of his ancestors both in warlike and civil virtues, had he not been suddenly killed by the accidental bursting of a cannon, in the thirtieth year of his age, as he was besieging the castle of Roxburgh, which was defended by the English.

Suspicion, indolence, immoderate attachment to females, and many of the errors of a feeble mind, are visible in the conduct of James III. and his turbulent reign was closed by a rebellion of his subjects, being slain in battle in 1488, aged thirty-five.

His son, James IV. was the most accomplished prince of the age: he was naturally generous and brave: he loved magnificence, he delighted in war, and was eager to obtain fame. He encouraged and protected the commerce of his subjects, so that they greatly increased in riches; and the court of James, at the time of his marriage with Henry VII.'s daughter, was splendid and respectable. sure him of his family distemper, a predilection for the French, in whose cause he rashly entered, and was killed, with the flower of his nobility, by the English, in the battle of Flodden, anno 1513, and the fortieth of his age.

The minority of his son, James V. was long and turbulent: and when he grew up, he married two French ladies; the first being daughter to the king of France, and the latter of the house of Guise. He instituted the court of session, enacted many salutary laws, and greatly promoted the trade of Scotland, particularly the working of the mines. At this time the balance of power was so equally poised between the contending princes of Europe, that James's friendship was courted by the pope, the emperor, the king of France, and his uncle Henry VIII. of England, from all whom he received magnificent presents. But James took little share in foreign affairs; he seemed rather to imitate his predecessors in their attempts to humble the nobility: and the doctrines of the reformation beginning to be propagated in Scotland, he permitted, at the instigation of the clergy, a religious persecution; though it is generally believed, that had he lived longer, he would have seized all the church revenues, in imitation of Henry. Having rather slighted some friendly overtures made to him by the king of England, and thereby given great umbrage to that prince, a war at length broke out between them. A large army, under the command of the duke of Norfolk, entered Scotland, and ravaged the country north of the Tweed. After this short expedition, the English army retired to Berwick. Upon this the king of Scotland sent ten thousand men to the western borders, who entered England at Solway-Frith; and he himself followed them at a small distance, ready to join them upon occasion. He soon after gave great offence to the nobility and the army, by imprudently depriving their general, lord Maxwell, of his commission, and conferring the command on Oliver Sinclair, a private gentleman, who was his favourite. The army were so much disgusted with this alteration, that they were ready to disband, when a small body of English horse appeared, not exceeding five hundred. A panic seized the Scots, who immediately took to flight, supposing themselves to be attacked by the whole body of the English army. The English horse, seeing them flee with such precipitation, closely pursued them, and slew great numbers, taking prisoners seven lords, two hundred gentlemen, and eight hundred soldiers, with twenty-four pieces of ordnance. This disaster so much affected king James, that it threw him into a fit of illness, of which he soon after died, on the 14th of December, 1542.

His daughter and successor, Mary, was but a few hours old at the time of her father's death. Her beauty, her misconduct, and her misfortunes, are alike famous in history. It is sufficient here to say, that, during her minority, and while she was wife to Francis II. of France, the reformation advanced in Scotland; that being called to the throne of her ancestors while a widow, she married her own cousin-german, the lord Darnley, whose untimely death has given rise to so much controversy. The consequence of her husband's death, and of her marriage with Bothwell, who was considered as his murderer, was an insurrection of her subjects, from whom she fled into England, where she was ungenerously detained a prisoner for eighteen years, and afterwards, on motives of state-policy, beheaded by queen Elizabeth in 1587, in the forty-sixth year of her age.

Mary's son, James VI. of Scotland, succeeded, in right of his blood

from Henry VII. upon the death of queen Elizabeth, to the English crown, after showing considerable abilities in the government of Scotland. This union of the two crowns, in fact, destroyed the independency, as it impoverished the people, of Scotland: for, the seat of government being removed to England, their trade was checked; their agriculture neglected, and their gentry obliged to seek for situations in other countries. James, after a splendid but troublesome reign over his three kingdoms, left them, in 1625, to his son, the unfortunate Charles I. That prince by his despotic principles and conduct induced both his Scottish and English subjects to take up arms against him; and, indeed, it was in Scotland that the sword was first drawn against Charles. But when the royal party was totally defeated in England, the king put himself into the power of the Scottish army; they at first treated him with respect, but afterwards delivered him up to the English parliament, on condition of their paying 400,000 pounds to the Scots, which was said to be due to them for arrears. However, the Scots afterwards made several bloody but unsuccessful attempts to restore his son, Charles II. That prince was finally defeated by Cromwell, at the battle of Worcester, 1651, after which, to the time of his restoration, the common-wealth of England and the protector gave law to Scotland.

The state of parties in England, at the accession of queen Anne, was such, that the Whigs once more had recourse to the Scots, and offered them their own terms, if they would agree to the incorporate union as it now stands. It was long before the majority of the Scotch parliament would listen to the proposal; but, at last, partly from conviction, and partly through the effects of money distributed among the needy nobility, it was agreed to; since which event, the history of Scotland becomes the same with that of England.

count, friendly to the longevity of the inhabitants in general, especially those who live on a dry soil. To this situation likewise we are to ascribe that perpetual verdure for which England is remarkable, occasioned by refreshing showers and the warm vapours of the sea.

NAME AND DIVISIONS. } Antiquaries are divided with regard to  
 ANCIENT AND MODERN. } the etymology of the word *England*; some derive it from a Celtic word, signifying a level country, but the common etymology appears to be preferable, according to which it is derived from Anglen, a province now subject to his Danish majesty, which furnished a great part of the original Saxon adventurers into this island. In the time of the Romans, the whole island went by the name of *Britannia*. The word *Brit*, according to Mr. Camden, signified painted or stained; the ancient inhabitants being famous for painting their bodies: other antiquaries, however, do not agree in this etymology. The western tract of England, which is almost separated from the rest by the rivers Severn and Dee, is called Wales, or the *land of strangers*, because inhabited by the Belgic Gauls, who were driven thither by the Romans, and were strangers to the old natives.

When the Romans provinciated England, they divided it into,

1. Britannia Prima, which contained the southern parts of the kingdom.
2. Britannia Secunda, containing the western parts, comprehending Wales. And
3. Maxima Caesariensis, which reached from the Trent as far northward as the wall of Severus, between Newcastle and Carlisle, and sometimes as far as that of Adrian in Scotland, between the Forth and Clyde.

To these divisions some add the Flavia Caesariensis, which they suppose to contain the midland counties.

When the Saxons invaded England, about the year 450, and when they were established in the year 582, their chief leaders appropriated to themselves, after the manner of other northern conquerors, the countries which each had been the most instrumental in conquering; and the whole formed a heptarchy, or political confederacy, consisting of seven kingdoms. In time of war, a chief was chosen from the seven kings, by public consent; so that the Saxon heptarchy appears to have somewhat resembled the constitution of Greece, during the heroic ages.

Kingdoms erected by the Saxons, usually styled the Saxon Heptarchy.

It is the more neceſſary to preſerve theſe diviſions, as they account for different local cuſtoms, and many very eſſential modes of inheritance, which to this day prevail in England, and which took their riſe from different inſtitutions under the Saxons. Since the Norman invaſion, England has been divided into counties, a certain number of which, excepting Middleſex and Cheſhire, are comprehended in fix circuits, or annual progreſſes of the judges, for adminiſtering juſtice to the ſubjects who are at a diſtance from the capital. The circuits are :

Total .. 558

Besides the fifty-two counties into which England and Wales are divided, there are counties corporate, consisting of certain districts, to which the liberties and jurisdictions peculiar to a county have been granted by royal charter. Thus the city of London is a county distinct from Middlesex; the cities of York, Chester, Bristol, Exeter, Norwich, Worcester, and the towns of Kingston-upon-Hull, and Newcastle-upon-Tyne, are counties of themselves, distinct from those in which they lie. The same may be said of Berwick-upon-Tweed, which lies in Scotland, and has within its jurisdiction a small territory of two miles on the north side of the river.

Under the name of a town, boroughs and cities are contained; for

every borough or city is a town, though every town is not a borough or city. A borough is so called, because it sends up burgeses to parliament; and this makes the difference between a village or town, and a borough. Some boroughs are corporate, and some not corporate; and though decayed, as Old Sarum, they still send burgeses to parliament. A city is a corporate borough, that has, or has had, a bishop; for if the bishoprick be dissolved, yet the city remains. To have suburbs, proves it to be a city. Some cities are also counties, as before mentioned.

SOIL, AIR, SEASONS, AND WATER.] The soil of England and Wales differs in each county, not so much from the nature of the ground, though that must be admitted to occasion a very considerable alteration, as from the progress which the inhabitants of each county have made in the cultivation of lands and gardens, the draining of marshes, and many other local improvements, which are here carried to a much greater degree of perfection than they are perhaps in any other part of the world, if we except China. To enter upon particular specimens and proofs of these improvements, would require a large volume. All that can be said, therefore, is, in general, that, if no unkindly season happen, England produces corn not only sufficient to maintain her own inhabitants, but to bring large sums of ready money for her exports.

The soil of England seems to be particularly adapted for rearing timber; and the plantations of trees round the houses of noblemen and gentlemen, and even of peasants, are delightful and astonishing at the same time. Some have observed a decay of that oak timber which anciently formed the great fleets that England put to sea; but as no public complaints of this kind have been heard, it may be supposed that great stores are still in reserve; unless it may be thought that our shipyards have lately been partly supplied from America or the Baltic.

As to air, little can be added to what has been already said concerning the climate\*. In many places it is certainly loaded with vapours wafted from the Atlantic ocean by westerly winds; but they are ventilated by winds and storms, so that in this respect England is, to foreigners and people of delicate constitutions, more disagreeable than unlabrurous. It cannot, however, be denied that in England the weather is so excessively capricious and unfavourable to certain constitutions, that many of the inhabitants are induced to fly to foreign countries, in hopes of obtaining a renovation of their health.

After what we have observed on the English air, the reader may form some idea of its seasons, which are so uncertain, that they admit of no description. Spring, summer, autumn, and winter, succeed each other, but in what month their different appearances take place, is very un-

\* The climate of England has more advantages than are generally allowed it, if we admit the opinion of king Charles the Second upon this subject, which is corroborated by that of sir William Temple: and it may be observed, that they were both travellers. "I must needs add one thing," says sir William, in his *Miscellanea*, part ii. p. 114, edit. 8vo. 1690, "in favour of our climate, which I heard the king say, and I thought new and right, and truly like a king of England, that loved and esteemed his own country. It was in reply to some company that were reviling our climate, and extolling those of Italy and Spain, or at least of France. He said, "He thought that was the best climate where he could be abroad in the air with pleasure, or at least without trouble or inconvenience, the most days in the year, and the most hours in the day; and this he thought he could be in England, more than in any country he knew in Europe." "And I believe," adds sir William, "it is true, not only of the hot and the cold, but even among our neighbours in France and the Low Countries themselves, where the heats or the colds, and changes of seasons, are less treatable (or moderate) than they are with us."

determined. The spring begins sometimes in February, and sometimes in April. In May the face of the country is often covered with hoar-frost instead of blossoms. The beginning of June is sometimes as cold as the middle of December; yet at other times the thermometer rises in that month as high as it does in Italy. Even August has its vicissitudes of heat and cold; and, upon an average, September, and next to it October, are the two most agreeable months in the year. The natives sometimes experience all the four seasons within the compass of one day, cold, temperate, hot, and mild weather. This inconspicuity, however, is not attended with the effects that might be naturally apprehended. A fortnight, or at most three weeks, generally make up the difference with regard to the maturity of the fruits of the earth; and it is hardly ever observed that the inhabitants suffer by a hot summer. Even the greatest irregularity and the most unfavourable appearance of the seasons are not, as in other countries, attended with famine, and very seldom with scarcity. Perhaps this, in a great measure, may be owing to the vast improvements of agriculture; for when scarcity has been complained of, it generally, if not always, proceeded from the excessive exportations of grain, on account of the drawback and the profit of the returns.

The champaign parts of England are generally supplied with excellent springs and fountains; though a discerning palate may perceive that they frequently contain some mineral impregnation. In some very high lands, the inhabitants are distressed for water, and supply themselves by trenches, or digging deep wells. The constitutions of the English, and the diseases to which they are liable, have rendered them extremely inquisitive after salubrious waters, for the recovery and preservation of their health; so that England contains as many mineral wells, of known efficacy, as perhaps any country in the world. The most celebrated are the hot-baths of Bath and Bristol in Somersetshire, and of Buxton and Matlock in Derbyshire: the mineral waters of Tunbridge, Epsom, Harrowgate, and Scarborough. Sea-water is used as commonly as any other for medical purposes: and so delicate are the tones of the English fibres, that the patients can perceive, both in drinking and bathing, a difference between the sea-water of one coast and that of another.

FACE OF THE COUNTRY, } The industry of the English is such,  
AND MOUNTAINS. } to supply the absence of those favours  
which nature has so lavishly bestowed upon some foreign climates, and in many respects even to exceed them. No nation in the world can equal the cultivated parts of England in beautiful scenes. The variety of high-lands and low-lands, the former gently swelling, and both of them forming the most luxuriant prospects, the corn and meadow grounds, the intermixtures of inclosures and plantation, the noble seats, comfortable houses, cheerful villages, and well-stocked farms, often rising in the neighbourhood of populous towns and cities, decorated with the most vivid colours of nature, are objects of which an adequate idea cannot be conveyed by description. The most barren spots are not without their verdure; but nothing can give us a higher idea of the English industry, than observing that some of the pleasantest counties in the kingdom are naturally the most barren, but rendered fruitful by labour. Upon the whole, it may be safely affirmed, that no country in Europe equals England in the beauty of its prospects, or the opulence of its inhabitants.

Though England is full of delightful rising grounds, and the most enchanting slopes, yet it contains few mountains. The most noted are

the Peak in Derbyshire, the Endle in Lancashire, the Wolds in Yorkshire, the Cheviot-hills on the borders of Scotland, the Chiltern in Bucks, Malvern in Worcestershire, Cotswould in Gloucestershire, the Wrekin in Shropshire; with those of Plinlimmon and Snowdon in Wales. In general, however, Wales and the northern parts may be termed mountainous.

**RIVERS AND LAKES.]** The rivers in England add greatly to its beauty as well as its opulence. The Thames rises on the confines of Gloucestershire, a little S. W. of Cirencester; and, after receiving the many tributary streams of other rivers, it passes to Oxford, then by Abingdon, Wallingford, Reading, Marlow, and Windfor. From thence to Kingston, where formerly it met the tide, which, since the building of Westminster-bridge, is said to flow no higher than Richmond; from whence it flows to London, and, after dividing the counties of Kent and Essex, it widens in its progress, till it falls into the sea at the Nore, from whence it is navigable for large ships to London-bridge. It was formerly a reproach to England among foreigners, that so capital a river should have so few bridges; those of London and Kingston being the only two it had, from the Nore to the last-mentioned place, for many ages. This inconveniency was in some measure owing to the dearth of materials for building stone-bridges, but perhaps more to the fondness which the English, in former days, had for water-carriage, and the encouragement of navigation. The great increase of riches, commerce, and inland trade, is now multiplying bridges; and the world cannot parallel, for commodiousness, architecture, and workmanship, those lately erected at Westminster and Black Friars. Battersea, Putney, Kew, Richmond, Walton, and Hampton-court, have now bridges likewise over the Thames, and others are projecting by public-spirited proprietors of the grounds on both sides.

The river Medway, which rises near Tunbridge, falls into the Thames at Sheerness, and is navigable for the largest ships as far as Chatham. The Severn, reckoned the second river for importance in England, and the first for rapidity, rises at Plinlimmon-hill in North-Wales; becomes navigable at Welsh-Pool; runs east to Shrewsbury: then, turning south, visits Bridgnorth, Worcester, and Tewkesbury; where it receives the Upper Avon; after having passed Gloucester, it takes a south-west direction; is, near its mouth, increased by the Wye and Ustre, and discharges itself into the Bristol Channel, near King-road, where lie the great ships which cannot get up to Bristol. The Trent rises in the Moorlands of Staffordshire, and, running south-east by Newcastle-under-Line, divides that county into two parts; then, turning north-east on the confines of Derbyshire, visits Nottingham, running the whole length of that county to Lincolnshire, and, being joined by the Ouse and several other rivers towards the mouth, obtains the name of the Humber, falling into the sea south-east of Hull.

The other principal rivers in England are the Ouse (a Gaëlic word signifying *water* in general) which falls into the Humber, after receiving the waters of many other rivers. Another Ouse rises in Bucks, and falls into the sea near Lynn in Norfolk. The Tyne runs from west to east through Northumberland, and falls into the German sea at Tinmouth, below Newcastle. The Tees runs from west to east, dividing Durham from Yorkshire, and falls into the German sea below Stockton. The Tweed runs from west to east, on the borders of Scotland, and falls into the German sea at Berwick. The Eden runs from south to north through Westmerland and Cumberland, and, passing by Carlisle, falls into Solway-Frith below that city. The Lower Avon runs west through

Wiltshire to Bath, and then, dividing Somersetshire from Gloucestershire, runs to Bristol, falling into the mouth of the Severn below that city. The Derwent runs from east to west through Cumberland, and, passing by Cockermouth, falls into the Irish sea a little below. The Ribble runs from east to west through Lancashire, and, passing by Preston, discharges itself into the Irish sea. The Mersey runs from the south-east to the north-west through Cheshire, and then, dividing Cheshire from Lancashire, passes by Liverpool, and falls into the Irish sea a little below that town; and the Dee rises in Wales, and divides Flintshire from Cheshire, falling into the Irish channel below Chester.

The lakes of England are few; though it is plain from history and antiquity, and indeed, in some places, from the face of the country, that meres and fens have been frequent in England, till drained and converted into arable land. The chief lakes remaining are Soham mere, Witlesea mere, and Ramsey mere, in the isle of Ely, in Cambridge-shire. All these meres in a rainy season are overflowed, and form a lake of 40 or 50 miles in circumference. Winander mere lies in Westmorland, and some small lakes in Lancashire go by the name of Derwent waters.

FORESTS.] The first Norman kings of England, partly for political purposes, that they might the more effectually enslave their new subjects, and partly from the wantonness of power, converted immense tracts of grounds into forests for hunting: and these were governed by laws peculiar to themselves, so that it was necessary, about the time of passing the Magna-Charta, to form a code of the forest-laws; and Justices in Eyre, so called from their sitting in the open air, were appointed to see them observed. By degrees those vast tracts were disforested: and the chief forests, properly so called, remaining out of no fewer than 69, are those of Windsor, New-Forest, the Forest of Dean, and Sherwood Forest. These forests produced formerly great quantities of excellent oak, elm, ash, and beech, besides walnut-trees, poplar, maple, and other kinds of wood. In ancient times England contained large woods, if not forests, of chestnut trees, which exceeded all other kinds of timber for the purposes of building, as appears from many great houses still standing, in which the chestnut beams and roofs remain still fresh and undecayed, though some of them are above 600 years old.

METALS AND MINERALS.] Among the minerals, the tin-mines of Cornwall deservedly take the lead. They were known to the Greeks and Phœnicians, the latter especially, some ages before the Christian æra; and since the English have found a method of manufacturing their tin into plates and white iron, they are of immense benefit to the nation. An ore called mundic is found in the beds of tin, which was very little regarded, till, above 70 years ago, sir Gilbert Clark discovered the art of manufacturing it; and it is said now to bring in 150,000*l.* a year, and to equal in goodness the best Spanish copper, yielding a proportionable quantity of lapis calaminaris for making brass. Those tin works are under peculiar regulations, by what are called the stannary laws; and the miners have parliaments and privileges of their own, which are in force at this time. The number of Cornish miners is said to amount to 100,000. Some gold has likewise been discovered in Cornwall, and the English lead is impregnated with silver. The English-coined silver is particularly known by roses, and that of Wales by the prince's cap of feathers. Devonshire, and other counties of England, produce marble; but the best kind, which resembles Egyptian granite, is excessively hard to work. Quarries of freestone are found in many places. North-

Northumberland and Cheshire yield alum and salt-pits. The English fuller's earth is of such consequence to the clothing trade, that its exportation is prohibited under severe penalties. Pit and sea-coal is found in many counties of England; but the city of London, to encourage the nursery of seamen, is chiefly supplied from the pits of Northumberland, and the bishopric of Durham. The cargoes are shipped at Newcastle and Sunderland, and the exportation of coals to other countries is very considerable. The mines of Northumberland alone send every year upwards of 600,000 chaldron of coals to London; and 1500 vessels are employed in carrying them to that harbour along the eastern coast of England.

VEGETABLE AND ANIMAL PRODUCTIONS BY SEA AND LAND } This is so copious a subject, and such improvements have been made in gardening and agriculture, ever since the best printed accounts we have seen, that much must be left to the reader's own observation and experience. The corn trade of England has already been noticed; but nothing can be said with any certainty concerning the quantities of wheat, barley, rye, peas, beans, vetches, oats, and other grain, growing in the kingdom. Excellent institutions for the improvement of agriculture are now common in England; and their members are so public-spirited as to print periodical accounts of their discoveries and experiments, which serve to show that agriculture and gardening may be carried to a much higher state of perfection than they are in at present. The publications of the Bath Society upon the subject of agriculture are well known; and such has been the attention of the nation to this important object, that his present majesty has been pleased, August 31, 1793, by letters patent under the great seal, to constitute a board for the encouragement of agriculture and internal improvement. The proper cultivation of the soil is an object so peculiarly interesting to the community at large, that those who most assiduously attend to it are perhaps to be accounted the most meritorious citizens of their country.

Honey and saffron are natives of England. It is almost needless to mention, to the most uninformed reader, in what plenty the most excellent fruits, apples, pears, plums, cherries, peaches, apricots, nectarines, currants, gooseberries, raspberries, and other hortulan productions, grow here; and what quantities of cyder, perry, metheglin, and the like liquors, are made in some counties. The cyder of Devon and Herefordshire, when kept, and made of proper apples, and in a particular manner, is often preferred, by judicious palates, to French white wine. It is not enough to mention those improvements, did we not observe the natives of England have made the different fruits of the world their own, sometimes by simple culture, but often by hot-beds and other means of forcing nature. The English pine-apples are delicious, and now plentiful. The same may be said of other natives of the East and West-Indies, Persia, and Turkey. The English grapes are pleasing to the taste; but their flavour is not exalted enough for making of wine: and indeed wet weather injures the flavour of all the other fine fruits raised here. Our kitchen gardens abound with all sorts of greens, roots, and salads, in perfection; such as artichokes, asparagus, cauliflowers, cabbages, coleworts, broccoli, peas, beans, kidney-beans, spinach, beets, lettuce, celery, endive, turnips, carrots, potatoes, mushrooms, leeks, onions, and shallots.

Woad for dying is cultivated in Bucks and Bedfordshire, as hemp and flax are in other counties. In nothing, however, have the English been more successful than in the cultivation of clover, cinquefoil, trefoil,

saintfoin, lucern, and other meliorating grasses for the soil. It belongs to a botanist to recount the various kinds of useful and salutary herbs, shrubs, and roots, that grow in different parts of England. The soil of Kent, Essex, Surry, and Hampshire, is most favourable to the difficult and tender culture of hops, which are now become a very considerable article of trade.

With regard to ANIMAL PRODUCTIONS, I shall begin with the quadrupeds. The English oxen are large and fat; but some prefer for the table the smaller breed of the Scotch and Welch cattle, after grazing in English pastures. The English horses are the best in the world, whether we regard their spirit, strength, swiftness, or docility. Incredible have been the pains taken, by all ranks, for improving the breed of this favourite and noble animal; and the success has been answerable; for they now unite all the qualities and beauties of Indian, Persian, Arabian, Spanish, and other foreign horses. The irresistible spirit and weight of the English cavalry render them superior to all others in war: and an English hunter will perform incredible things in a fox or stag-chase. Those which draw carriages in the streets of London are often particularly beautiful. The exportation of horses has of late become a considerable article of commerce. The breed of asses and mules begins likewise to be improved and encouraged in England.

The English sheep are of two kinds; those that are valuable for their fleece, and those that are proper for the table. The former are very large, and their fleeces constitute the original staple commodity of England. In some counties the inhabitants are as curious in their breed of rams as in those of their horses and dogs; and in Lincolnshire, particularly, it is no uncommon thing for one of these animals to sell for 50*l*. It must, however, be owned, that those large fat sheep are very rank eating. It is thought that in England twelve millions of fleeces are shorn annually, which, at a medium of 2*s*. a fleece, makes 1,200,000*l*. The other kind of sheep which are fed upon the Downs, such as those of Banstead, Bagshot heath, and Devonshire, where they have what the farmers call the short bite, is little, if at all, inferior in flavour and sweetness to venison.

The English mastiffs and bull-dogs are said to be the strongest and fiercest of the canine species in the world; but either from the change of soil, or feeding, they degenerate in foreign climates. James I. of England, by way of experiment, turned out two English bull-dogs upon one of the fiercest lions in the Tower, and they soon conquered him. The mastiff, however, has all the courage of the bull-dog, without his ferocity, and is particularly distinguished for his fidelity and docility. All the different species of dogs that abound in other countries, for the field as well as domestic uses, are to be found in England.

What has been observed of the degeneracy of the English dogs in foreign countries is applicable to the English game-cocks, which afford much barbarous diversion to our sportmen. The courage of these birds is astonishing, and one of the true breed never leaves the pit alive without victory. The proprietors and feeders of this generous animal are likewise extremely curious as to his blood and pedigree.

Tame fowls are much the same in England as in other countries; turkeys, peacocks, common poultry, such as cocks, pullets, and capons, geese, swans, ducks, and tame pigeons. The wild sort are bustards, wild geese, wild ducks, teal, widgeon, plover, pheasants, partridges, woodcocks, grouse, quail, landrail, snipe, wood-pigeons, hawks of different kinds, kites, owls, herons, crows, rooks, ravens, magpies, jack-

snaws and jays, blackbirds, and a great variety of other birds. The wheat-corn is the staple commodity of its flesh and bones. Few countries are so rich in fish. Her rivers are full of perch, smelts, carp, bream, plaice, flounders, called char, which is the staple of the north, and, as for the sea, haddock, whitefish, and mackerel, are found towards the coast. The red mullet. Several species of shell-fish, they are to be found upon the proper banks, require to be boiled, and escallops, one of the most delicate, and the periwinkles, and the English Sea.

With regard to insects, such as bees, and the rest of Europe, for natural history.

POPULATION, INCREASE, CUSTOMS, &c. The poetic powers exercised by the inhabitants in England, may be done, by the same means, and probably sooner, than by any other means, they must be encouraged by a judicious influx of the inhabitants to America. The great number of the inhabitants that render an increase of her population seems probable. Spain, before the discovery of the Indies, exclusive of the islands, was carried off, by the decay of population during the wars in which they were then employed.

At the same time, the naturally more populous is accidentally that excessive use is destructive of the soil, and of cultivated land, and perhaps more than is necessary, dependent of this, such a numerous population, make another objection.

daws and jays, blackbirds, thrushes, nightingales, goldfinches, linnets, larks, and a great variety of small birds; canary birds also breed in England. The wheat-ear is by many preferred to the ortolan, for the delicacy of its flesh and flavour, and is peculiar to England.

Few countries are better supplied than England with river and sea-fish. Her rivers and ponds contain plenty of salmon, trout, eels, pike, perch, smelts, carp, tench, barbel, gudgeons, roach, dace, grey mullet, bream, plaice, flounders, and craw-fish, besides a delicate lake-fish called char, which is found in some fresh-water lakes of Wales and Cumberland, and, as some say, no where else. The sea-fish are cod, mackerel, haddock, whiting, herrings, pilchard, skate, soles. The john-dory, found towards the western coast, is reckoned a great delicacy, as is the red mullet. Several other fish are found on the same coast. As to shell-fish, they are chiefly oysters, the propagation of which, upon their proper banks, requires a peculiar culture. Lobsters, crabs, shrimps, and scallops, one of the most delicious of shell-fishes, cockles, wilks, periwinkles, and muscles, with many other small shell-fish, abound in the English Sea. The whales chiefly visit the northern coast; but great numbers of porpoises and seals appear in the channel.

With regard to reptiles, such as adders, vipers, snakes, and worms; and insects, such as ants, gnats, wasps, and flies, England nearly resembles the rest of Europe; and the difference, if any, becomes more proper for natural history than geography.

POPULATION, INHABITANTS, MANNERS, CUSTOMS, AND DIVERSIONS. } The exemption of the English constitution from the despotic powers exercised in foreign nations, not excepting republics, is one great reason why it is very difficult to ascertain the number of inhabitants in England; and yet it is certain that this might occasionally be done, by parliament, without any violation of public liberty, and probably soon will take place. With regard to political calculations, they must be very fallible, when applied to England. The prodigious influx of foreigners who settle in the nation, the emigrations of inhabitants to America and the islands, their return from thence, and the great number of hands employed in shipping, are all of them matters that render any calculation extremely precarious. Upon the whole, it seems probable that England is more populous than the estimators of her inhabitants are willing to allow. The war with France and Spain, before the American, annually employed about 200,000 Englishmen, exclusive of Scotch and Irish, by sea and land; and its progress carried off, by various means, very near that number. The decay of population was indeed sensibly felt, but not so much as it was during the wars in queen Anne's reign, though not half of the numbers were then employed in the sea and land service.

At the same time, it is not probable that England is at present naturally more populous than she was in the reign of Charles I. though she is accidentally so. The English of former ages were strangers to that excessive use of spirituous liquors, and other modes of living, that are destructive of propagation. On the other hand, the vast quantities of cultivated lands in England, since those times, it might reasonably be presumed, would be favourable to mankind; but this advantage is perhaps more than counterbalanced by the prevailing practice of encroaching farms, which is certainly unfavourable to population; and, independent of this, upon an average, perhaps a married couple has not such a numerous progeny now as formerly. I will take the liberty to make another observation, which falls within the cognisance of almost

every man, and that is the incredible increase of foreign names upon our parish books and public lists, compared to what they were even in the reign of George I.

After what has been premised, it would be presumptuous to pretend to ascertain the number of inhabitants in England and Wales: but, in my own private opinion, there cannot be fewer than 7,000,000.

Englishmen, in their persons, are generally well-sized, regularly featured; commonly fair, rather than otherwise, and florid in their complexions. It is, however, to be presumed, that the vast number of foreigners that are intermingled and intermarried with the natives have given a taint to their persons and complexions, different from those of their ancestors ten years ago. The women, in their shape, features, and complexion, appear so graceful and lovely, that England may be termed the native country of female beauty. But beside the external graces so peculiar to the women in England, they are still more to be valued for their prudent behaviour, thorough cleanliness, and a tender affection for their husbands and children, and all the engaging duties of domestic life.

Of all the people in the world, the English keep themselves the most cleanly. Their nerves are so delicate, that people of both sexes are sometimes forcibly, nay mortally, affected by imagination; insomuch that, before the practice of inoculation for the small-pox took place, it was thought improper to mention that loathsome disease by its true name in any polite company. This over-sensibility has been considered as one of the sources of those singularities which so strongly characterise the English nation. They sometimes magnify the slightest appearances into realities, and bring the most distant dangers immediately home to themselves; and yet, when real danger approaches, no people face it with greater resolution or constancy of mind. They are fond of clubs and convivial associations; and when these are kept within the bounds of temperance and moderation, they prove the best cure for those mental evils, which are so peculiar to the English, that foreigners have pronounced them to be national.

The same observations hold with regard to the higher orders of life, which must be acknowledged to have undergone a remarkable change since the accession of the House of Hanover, especially of late years. The English nobility and gentry of great fortunes now assimilate their manners to those of foreigners, with whom they cultivate a more frequent intercourse than their forefathers did. They do not now travel only as pupils, to bring home the vices of the countries they visit, under the tuition perhaps of a despicable pedant, or family dependant; but they travel for the purposes of society; and at the more advanced ages of life, while their judgments are mature, and their passions regulated. This has enlarged society in England, which foreigners now visit as commonly as Englishmen visited them, and the effects of the intercourse become daily more visible, especially as it is not now, as formerly, confined to one sex.

Such of the English noblemen and gentlemen as do not strike into those high walks of life, affect what we call a snug rather than a splendid way of living. They study and understand, better than any people in the world, conveniency in their houses, gardens, equipages, and estates; and they spare no cost to purchase it. It has however been observed, that this turn renders them less communicative than they ought to be: but, on the other hand, the few connections they form are sincere, cheerful, and indissoluble. The like habits descend pretty far

into the lower ranks, and are often discernible among tradesmen. This love of snugness and conveniency may be called the ruling passion of the English people, and is the ultimate end of all their application, labours, and fatigues. A good economist, with a brisk run of trade, is generally, when turned of fifty, in a condition to retire from business; that is, either to purchase an estate, or settle his money in the funds. He then commonly resides in a comfortable house in the country, often his native county, and expects to be treated on the footing of a gentleman; but his style of living is always judiciously suited to his circumstances.

The humanity of the English is discovered in nothing more than in the large subscriptions for public charities, raised by all degrees of both sexes. An Englishman feels all the pains which a fellow-creature suffers; and poor and miserable objects are relieved in England with the greatest liberality. The very persons who contribute to those collections are at the same time assessed in proportion to their property for their parochial poor, who have a legal demand for their maintenance; and upwards of three millions sterling is said to be collected yearly in this country for charitable purposes. The institutions, however, of extra-parochial infirmaries, hospitals, and the like, are in some cases reprehensible. The vast sums bestowed in building them, the contracts made by their governors, and even the election of physicians, who thereby, qualified or unqualified, acquire credit, which is the same as profit, very often beget heats and cabals, which are very different from the purposes of disinterested charity, owing to the violent attachments and prepossessions of friends, and too often even to party considerations.

The English listen to the voice of misfortunes in trade, whether real or pretended, deserved or accidental, and generously contribute to the relief of the parties, sometimes even by placing them in a more creditable condition than ever. The lowest-bred of the English are capable of these and the like generous actions: but they often make an ostentatious display of their own merits, which diminishes their value. There is, among the generality of the English of all ranks, an unpardonable preference given to wealth, above most other considerations. Riches, both in public and private, are often thought to compensate for the absence of almost every good quality. This offensive failing arises partly from the people being so much addicted to trade and commerce, the great object of which is gain; and partly from the democratical part of their constitution, which makes the possession of property a qualification for the legislature, and for almost every other species of magistracy, government, honours, and distinctions.

An Englishman of education and reading is the most accomplished gentleman in the world: he is, however, shy and reserved in his communications. This unamiable coldness is so far from being affected, that it is a part of their natural constitution. Living learning and genius often meet not with their suitable regard, even from the first-rate Englishmen; and it is not unusual for them to throw aside the best productions of literature, if they are not acquainted with the author. While the state distinction of Whig and Tory subsisted, the heads of each party affected to patronise men of literary abilities; but the pecuniary encouragements given them were but very moderate; and the very few who met with preferments in the state might have earned them by a competent knowledge of business, and that pliability which the dependents in office generally possess. We scarcely have an in-

stance, even in the munificent reign of queen Anne, or of her predecessors, who owed so much to the press, of a man of genius, as such, being made easy in his circumstances. Mr. Addison had about 3000*l.* a year of the public money to assist him in his travels; and Mr. Pope, though a Roman-catholic, was offered, but did not accept of, the like pension from Mr. Craggs, the whig secretary of state; and it was remarked, that his tory friend and companion, the earl of Oxford, when sole minister, did nothing for him, but bewail his misfortune in being a papist. Indeed, a few men of distinguished literary abilities, as well as some without, have of late received pensions from the crown; but, from the conduct of some of them, it should seem that state and party services have been expected in return.

The unevenness of the English in their conversation is very remarkable: sometimes it is delicate, sprightly, and replete with true wit; sometimes it is solid, ingenious, and argumentative; sometimes it is cold and phlegmatic, and borders upon disgust; and all in the same person. In many of their convivial meetings they are very noisy, and their wit is often offensive, while the loudest are the most applauded. This is particularly apt to be the case in large companies; but, in smaller and more select parties, all the pleasures of rational conversation and agreeable society are enjoyed in England in a very high degree. Courage is a quality that seems to be congenial to the English nation. Boys, before they can speak, discover that they know the proper guards in boxing with their fists; a quality that, perhaps, is peculiar to the English, and is seconded by a strength of arm that few other people can exert. This gives the English soldier an infinite superiority in all battles that are to be decided by the bayonet screwed upon the musket. The English courage has likewise the property, under able commanders, of being equally passive as active. Their soldiers will keep up their fire in the mouth of danger; but when they deliver it, it has a most dreadful effect upon their enemies; and in naval engagements they are unequalled. The English are not remarkable for invention, though they are for their improvements upon the inventions of others; and in the mechanical arts they excel all nations in the world. The intense application which an Englishman gives to a favourite study is incredible, and, as it were, absorbs all his other ideas. This creates the numerous instances of mental absence that are to be found in the nation.

All that has been said concerning the English is to be understood of them in general, as they are at present; for it is not to be dissembled, that every day produces strong indications of great alterations in their manners. The great fortunes made during the late and the preceding wars, the immense acquisitions of territory by the peace of 1763, and, above all, the amazing increase of territorial as well as commercial property in the East Indies, introduced a species of people among the English, who have become rich without industry, and, by diminishing the value of gold and silver, have created a new system of finances in the nation. Time alone can show the event; hitherto the consequence seems to have been unfavourable, as it has introduced among the commercial ranks a spirit of luxury and gaming that is attended with the most fatal effects, and an emulation among merchants and traders of all kinds, to equal or surpass the nobility and the courtiers. The plain frugal manners of men of business, which prevailed so lately as the accession of the present family to the crown, are now disregarded for tasteless extravagance of dress and equipage, and the most expensive amusements

and diversions,  
of the kingdom.

and diversions, not only in the capital, but all over the trading towns of the kingdom.

Even the customs of the English have, since the beginning of this century, undergone an almost total alteration. Their ancient hospitality subsists but in few places in the country, or is revived only upon electioneering occasions. Many of their favourite diversions are now disused. Those remaining are operas, dramatic exhibitions, ridottos, and sometimes masquerades in or near London; but concerts of music, and card and dancing assemblies, are common all over the kingdom. Stag and fox-hunting, and horse-races, of which many of the English are fond, even to infatuation, have already been mentioned. Somewhat, however, may be offered by way of apology for those diversions: the intense application which the English give to business, their sedentary lives, and luxurious diet, require exercise; and some think that their excellent breed of horses is increased and improved by those amusements. The English are remarkably cool, both in losing and winning at play; but the former is sometimes attended with acts of suicide. An Englishman will rather murder himself, than bring a sharper, who he knows has fleeced him, to condign punishment, even though warranted by law. Next to horse-racing and hunting, cock-fighting, to the reproach of the nation, is a favourite diversion among the great as well as the vulgar. Multitudes of both classes assemble round the pit at one of those matches, and enjoy the pangs and death of this generous animal; every spectator being concerned in a bet, sometimes of high sums. The athletic diversion of cricket is still kept up in the southern and western parts of England, and is sometimes practised by people of the highest rank. Many other pastimes are common in England, some of them of a very robust nature, such as cudgelling, wrestling, bowls, skittles, quoits, and prison-base; not to mention duck-hunting, foot and ass-races, dancing, puppet-shows, May-garlands, and, above all, ringing of bells, a species of music which the English boast they have brought into an art. The barbarous diversions of boxing and prize-fighting, which were as frequent in England as the shows of gladiators in Rome, are now prohibited, though often practised; and all places of public diversion, excepting the royal theatres, are under regulations by act of parliament. Other diversions, which are common in other countries, such as tennis, fives, billiards, cards, swimming, angling, fowling, coursing, and the like, are familiar to the English. Two kinds, and those highly laudable, are perhaps peculiar to them; and these are rowing and sailing. The latter, if not introduced, was patronised and encouraged by his present majesty's father, the late prince of Wales, and may be considered as a national improvement. The English are amazingly fond of skating, in which, however, they are not very expert; but they are adventurous in it, often to the danger and loss of their lives. The game acts have taken from the common people a great fund of diversion, though without answering the purposes of the rich; for the farmer and country people destroy the game in their nests, which they dare not kill with the gun. This monopoly of game, among so free a people as the English, has been considered in various lights.

**DRESS.]** In the dress of both sexes, before the present reign of George III. they followed the French; but that of the military officers partook of the German, in compliment to his late majesty. The English, at present, bid fair to be the dictators of dress to the French themselves, at least with regard to elegance, neatness, and richness of attire. People of quality and fortune, of both sexes, appear, on high occasions, in cloth

of gold and silver; the richest brocades, satins, silks, and velvets, both flowered and plain: and it is to the honour of the court, that the foreign manufactures of all these are discouraged. Some of these rich stuffs are said to be brought to as great perfection in England as they are in France, or any other nation. The quantities of jewels that appear on public occasions are incredible, especially since the vast acquisitions of the English in the East Indies. The same nobility, and persons of distinction, on ordinary occasions, dress like creditable citizens, that is, neat, clean, and plain, in the finest cloth and best of linen. The full dress of a clergyman consists of his gown, cassock, scarf, beaver-hat and rose, all of black; his undress is a dark-grey frock, and plain linen. The physicians, the formality of whose dress, in large tapers, and swords, was formerly remarkable, is not ridiculous, begin now to dress like other gentlemen and men of business. Few Englishmen, tradesmen, merchants, and lawyers, as well as men of landed property, are without some passion for the sports of the field; on which occasions, they dress with remarkable propriety in a light frock, narrow-brimmed hat, &c. The people of England love rather to be neat than fine in their apparel; but since the accession of his present majesty, the dresses at court, on particular occasions, are superb beyond description. Few, even of the lowest tradesmen, on Sundays, carry about them, less than 10*l.* in cloathing, comprehending hat, wig, stockings, shoes, and linen; and even many beggars in the streets appear decent in their dress. In short, none but the most abandoned of both sexes are otherwise; and the appearance of an artisan or manufacturer, in holiday times, is commonly an indication of his industry and morals.

**RELIGION.** Eusebius, and other ancient writers, positively assert, that Christianity was first preached in South Britain by the apostles and their disciples; and it is reasonable to suppose that the success of the Romans opened a way for the triumphs of the gospel of peace. It is certain also, that many of the soldiers and officers in the Roman armies were Christians; and as their legions were repeatedly sent over to England to extend as well as preserve their conquests, it is probable that thus Christianity was diffused among the natives. If any of the apostles visited this country and our heathen ancestors, it was St. Paul, whose zeal, diligence, and fortitude, were abundant. But who was the first preacher, or when the precise year and period, the want of records leaves us at a loss; and all the traditions about Joseph of Arimathea and St. Peter's preaching the gospel in Britain, and Simon Zelotes suffering martyrdom here, are romantic fables, and monkish legends. We have good authority to say, that, about the year 150, a great number of persons professed the Christian faith here: and, according to archbishop Usher, in the year 162, there was a school of learning to provide the British churches with proper teachers; and from that period it seems as if Christianity advanced its benign and salutary influences among the inhabitants in their several districts. It is unnecessary to repeat what has been said in the introduction respecting the rise and fall of the church of Rome in Europe; we shall only observe in this place, that John Wickliffe, an Englishman, educated at Oxford in the reign of Edward III. has the honour of being the first person in Europe who publicly called in question, and boldly refuted, those doctrines which had passed for certain during so many ages. The constitution of the church is episcopal, and it is governed by bishops, whose benefices were converted by the Norman conqueror into temporal baronies, in right of which every bishop has a seat and vote in the house of peers. of the inferior clergy are now freehold; but in many places their tithes are impropriated in favour of the laity. The economy of the church of England has been accused for the inequality of its livings; some of them extending from three hundred to fourteen hundred a year, and many, particularly in Wales, being too small to maintain a clergyman, especially if he has a family, with any tolerable decency; but this seems not easily to be remedied, unless the dignified clergy would adopt and support the reforming scheme. The crown, as well as private persons, has done great things towards the augmentation of poor livings.

The dignitaries of the church of England, such as deans, prebendaries, and the like, have generally large incomes, some of them exceeding in value those of bishoprics; for which reason the revenues of a rich deanery, or other living, are often annexed to a poor bishopric. At present, the clergy of the church of England, as to temporal matters, are in a most flourishing situation, because the value of their tithes increases with the improvements of lands, which of late have been amazing in England. The sovereigns of England, ever since the reign of Henry VIII. have been called, in public writs, the supreme heads of the church; but this title conveys no spiritual meaning; as it only denotes the regal power to prevent any ecclesiastical differences, or, in other words, to substitute the king in place of the pope before the reformation, with regard to temporalities, and the internal economy of the church. The kings of England never intermeddle in ecclesiastical disputes, unless by preventing the convocation from sitting to agitate them, and are contented to give a sanction to the legal rights of the clergy.

The church of England, under this description of the monarchical power over it, is governed by two archbishops, and twenty-four bishops, besides the bishop of Sodor and Man, who, not being possessed of an English barony, does not sit in the house of peers\*. The two archbishops are those of Canterbury and York, who are dignified with the address of Your Grace. The former is the first peer of the realm, as well as metropolitan of the English church. He takes precedence, next to the royal family, of all dukes and officers of state. He is enabled to hold ecclesiastical courts upon all affairs that were formerly cognisable in the court of Rome, when not repugnant to the law of God, or the

\* To the following list I have subjoined the sum each see is charged in the king's books; for though that sum is far from being the real annual value of the see, yet it assists in forming a comparative estimate between the revenues of each see and those of another.

king's prerogative. He has the privilege consequently of granting, in certain cases, licences and dispensations, together with the probate of wills, when the party dying is worth upwards of five pounds. Besides his own diocese, he has under him the bishops of London; Winchester, Ely, Lincoln, Rochester, Litchfield and Coventry, Hereford, Worcester, Bath and Wells, Salisbury, Exeter, Chichester, Norwich, Gloucester, Oxford, Peterborough, Bristol; and, in Wales, St. David's, Landaff, St. Asaph, and Bangor.

The archbishop of Canterbury has, by the constitution and laws of England, such extensive powers, that, ever since the death of archbishop Laud (whose character will be hereafter given), the government of England has prudently thought proper to raise to that dignity men of very moderate principles; but they have generally been men of considerable learning and abilities. This practice has been attended with excellent effects, with regard to the public tranquillity of the church, and consequently of the state.

The archbishop of York takes place of all dukes not of the blood royal, and of all officers of state, the lord chancellor excepted. He has in his province, besides his own diocese, the bishoprics of Durham, Carlisle, Chester, and Sodor and Man. In Northumberland, he has the power of a palatine, and jurisdiction in all criminal proceedings.

The bishops are addressed by the appellation of Your Lordship, styled "Right reverend fathers in God," and take the precedence of all temporal barons. They have all the privileges of peers; and the bishoprics of London, Winchester, Durham, Salisbury, Ely, and Lincoln, require no additional revenues to support their prelates in the rank of noblemen. English bishops are to examine and ordain priests and deacons, to consecrate churches and burying places, and to administer the rite of confirmation. Their jurisdiction relates to the probate of wills; to grant administration of goods to such as die intestate; to take care of perishable goods when no one will administer; to collate to benefices; to grant institutions to livings; to defend the liberties of the church; and to visit their own dioceses once in three years.

Deans and prebendaries of cathedrals have been already mentioned; but it would perhaps be difficult to assign their utility in the church, farther than to add to the pomp of worship, and to make provision for clergymen of eminence and merit; but interest often prevails over merit in the appointment. England contains about sixty archdeacons, whose office is to visit the churches twice or thrice every year; but their offices are less lucrative than they are honourable. Subordinate to them are the rural deans, formerly styled arch-priesters, who signify the bishop's pleasure to his clergy, the lower class of which consists of priests and deacons.

The ecclesiastical government of England is, properly speaking, lodged in the convocation, which is a national representative or synod, and answers pretty nearly to the ideas we have of a parliament. They are convoked at the same time with every parliament; and their business is to consider of the state of the church, and to call those to an account who have advanced new opinions inconsistent with the doctrines of the church of England. Some clergymen of an intolerant and persecuting spirit during the reign of queen Anne, and in the beginning of that of George I. raised the power of the convocation to a height that was inconsistent with the principles of religious toleration, and indeed of civil liberty; so that the crown was obliged to exert its prerogative of calling the members together, and of dissolving them; and, ever since, they have not been permitted to sit for any time in which they could do business.

The court of arches is the most ancient consistory of the province of Canterbury; and all appeals in church matters, from the judgment of the inferior courts, are directed to this. The processes run in the name of the judge, who is called dean of the arches; and the advocates who plead in this court must be doctors of the civil law. The court of audience has the same authority with this, to which the archbishop's chancery was formerly joined. The prerogative court is that wherein wills are proved, and administration taken out. The courts of peculiars, relating to certain parishes, have a jurisdiction among themselves, for the probate of wills; and are therefore exempt from the bishop's courts. The see of Canterbury has no less than fifteen of these peculiars. The court of delegates receives its name from its consisting of commissioners delegated or appointed by the royal commission; but it is no standing court. Every bishop has also a court of his own, called the consistory court. Every archdeacon has likewise his court, as well as the dean and chapter of every cathedral.

The church of England is now, beyond any other national church, tolerant in its principles. Moderation is its governing character; and in England no religious sect is prevented from worshipping God in that manner which their consciences approve. Some severe laws were, indeed, lately in force against those protestant dissenters who did not assent to the doctrinal articles of the church of England; but these laws were not executed; and, in 1779, religious liberty received a considerable augmentation, by an act which was then passed for granting a legal toleration to dissenting ministers and schoolmasters, without their subscribing any of the Articles of the church of England. Not to enter upon the motives of the reformation under Henry VIII. it is certain that episcopal government, excepting the few years from the civil wars under Charles I. to the restoration of his son, has ever since prevailed in England. The wisdom of acknowledging the king the head of the church, is conspicuous, in discouraging all religious persecution and intolerance; and if religious sectaries have multiplied in England, it is from the same principle that civil licentiousness has prevailed; that is, a tenderness in matters that can affect either conscience or liberty. The bias which the clergy had towards popery in the reign of Henry VIII. and his son, and even so late as that of Elizabeth, occasioned an interposition of the civil power for a farther reformation. Thence arose the *puritans*, so called from their maintaining a singular purity of life and manners. Many of them were worthy pious men, and some of them good patriots. Their descendants are the modern presbyterians, who retain the same character, and have true principles of civil and religious liberty; but their theological sentiments have undergone a considerable change. Their doctrine, like the church of Scotland, was originally derived from the Geneva plan instituted by Calvin, and tended to an abolition of episcopacy, and to vesting the government of the church in a parity of presbyters. But the modern English presbyterians, in their ideas of church government, differ very little from the independents, or congregationalists, who are so called from holding the independency of congregational churches, without any respect to doctrine; and, in this sense, almost all the *dissenters* in England are now become *independents*. As to points of doctrine, the presbyterians are generally Armenians. Many of their ministers have greatly distinguished themselves by their learning and abilities; and some of their writings are held in high estimation by many of the clergy, and other members of the established church. The same may be said of some of the independent and baptist ministers. The independents are generally Calvinists. The baptists do not believe that

infants are proper subjects of baptism; and in the baptism of adults they practise immersion into water. They are divided into two classes, which are styled general baptists, and particular baptists. The general baptists are Armenians, and the particular baptists are Calvinists. The moderate clergy of the church of England treat the protestant dissenters with affection and friendship: and though the hierarchy of their church, and the character of bishops, are capital points in their religion, they consider their differences with the presbyterians, and even with the baptists, as not being very material to salvation; nor indeed do many of the established church think that they are strictly and conscientiously bound to believe the doctrinal parts of the Thirty-nine articles, which they are obliged to subscribe before they can enter into holy orders. Several of them have of late contended in their writings, that all subscriptions to religious systems are repugnant to the spirit of Christianity, and to reformation. Some doctrines, which were formerly generally considered as too sacred to be opposed, or even examined, are now publicly controverted, particularly the doctrine of the Trinity. Places of worship have been established, in which that doctrine has been openly renounced; and several clergymen have thrown up valuable livings in the church, and assigned their disbelief of that doctrine as the motive of their conduct.

The *Methodists* are a sect of a late institution, and their founder is generally looked upon to be Mr. George Whitfield, a divine of the church of England; but it is difficult to describe the tenets of this numerous sect. They pretend to great fervour and devotion: and their founder thought that the form of ecclesiastical worship, and prayers, whether taken from a common-prayer book, or poured forth extempore, was a matter of indifference: he accordingly made use of both these methods. His followers are rigid observers of the doctrinal articles of the church of England, and profess themselves to be Calvinists. But the sect of methodists is split among themselves, some of them acknowledging Mr. Whitfield, and others Mr. Wesley, for their leader. Mr. Whitfield died in the year 1770; but the places of worship, erected by him near London, are still frequented by persons of the same principles, and they profess a great respect for his memory. Some of the Calvinistic doctrines were opposed by Mr. Wesley and his followers, particularly that of predestination. He erected a very large place of public worship near Moorfields, and had under him a considerable number of subordinate preachers, who submitted to their leader very implicitly, propagate his opinions, and make profelytes throughout the kingdom with great industry. After a very long life, spent in the most strenuous endeavours to do good, and having been blest in reforming the morals of thousands of the lower ranks of society, he died in 1791. There are also a variety of subordinate sects (some of whom are from Scotland, particularly the *Sandemanians*) who have their separate followers, but very few at London and other places in England.

The *Quakers* are a religious sect which took its rise about the middle of the last century. A summary account of their tenets having been published by themselves, the following is abstracted from it.

“ They believe in one eternal God, the Creator and preserver of the universe, and in Jesus Christ his Son, the Messiah and Mediator of the new covenant.

“ When they speak of the miraculous conception, birth, life, miracles, death, resurrection, and ascension of our Saviour, they use Scriptural terms, and acknowledge his divinity.

“ To Christ alone they give the title of the Word of God, and not to

the scriptures, a ordination to the

the scriptures, although they highly esteem these sacred writings, in subordination to the spirit from which they were given forth.

“ They believe (and it is their distinguishing tenet), that every man coming into the world is endued with a measure of the light, grace, or good spirit of Christ, by which, as it is attended to, he is enabled to distinguish good from evil, and to correct the corrupt propensities of his nature, which mere reason is altogether insufficient to overcome.

“ They think the influence of the Spirit especially necessary to the performance of worship; and consider as obstructions to pure worship, all forms which divert the attention of the mind from the secret influence of this unction from the Holy One. They think it incumbent on Christians to meet often together, and to wait in silence to have a true sight of their condition bestowed upon them; believing even a single sigh arising from such a sense to be more acceptable to God than any performances, however specious, which originate in the will of man.

“ As they do not encourage any ministry but that which is believed to spring from the influence of the Holy Spirit, so neither do they restrain this influence to persons of any condition in life, or to the male sex alone; but as male and female are one in Christ, they allow such of the female sex as are endued with a right qualification for the ministry, to exercise their gifts for the general edification of the church.

“ Respecting baptism, and what is termed the Lord's supper, they believe that the baptism with water, administered by John, belonged to an inferior and decreasing dispensation.

“ With respect to the other rite, they believe that communion between Christ and his church is not maintained by any external performance; but only by a real participation of his divine nature by faith.

“ They declare against oaths and war; abiding literally by Christ's positive injunction, “ Swear not at all.” From the precepts of the gospel, from the example of our Lord, and from his spirit in their hearts, they maintain that wars and fightings are repugnant to the gospel.

“ They disuse the names of the months and days which were given in honour of the heroes or false gods of the heathens; and the custom of speaking to a single person in the plural number, as having arisen also from motives of adulation. Compliments, superfluity of apparel and furniture, outward shows of rejoicing and mourning, and observations of days and times, they esteem to be incompatible with the simplicity and sincerity of a Christian life; and public diversions, gaming, and other vain amusements of the world, they condemn as a waste of time, and diverting the attention of the mind from the sober duties of life.

“ This society hath a discipline established among them, the purposes of which are the relief of the poor—the maintenance of good order—the support of the testimonies which they believe it is their duty to bear to the world and the help and recovery of such as are overtaken in faults.

“ It is their decided judgment that it is contrary to the gospel to sue each other at law. They enjoin all to end their differences by speedy and impartial arbitration according to rules laid down. If any refuse to adopt this mode, or, having adopted it, to submit to the award, it is the rule of the society that such be disowned.”

It is well known that William Penn, one of this society, founded the province of Pennsylvania, and introduced therein a plan of civil and religious liberty, particularly of the latter, at that time unexampled. The government of the province was at first, and for many years, chiefly in the hands of the quakers; but as persons of other persuasions

increased, and became partakers of power, they grew uneasy at the pacific plan of the quakers, and at length succeeding to establish such modes of defence for their country as did not accord with the principles of the latter, these gradually withdrew themselves from active employments of the state. For some time previous to the late revolution, few of them were found in any other station than that of private citizens; and, during its progress, their refusing to arm exposed them to much suffering, by disallows levied on them, in order to procure their quota in support of the war.

Many families in England still profess the Roman catholic religion, and its exercise is under very mild and gentle restrictions. Though the penal laws against papists in England appear at first to be severe, yet they are either not executed, or with so much lenity, that the Roman catholic feels himself under few hardships. Legal evasions are found out for the double taxes upon their landed property; and as they are subject to none of the expenses and troubles (unless voluntary) attending public offices, parliamentary elections, and the like burthens, the English papists are in general in good circumstances as to their private fortunes. Some of the penal laws against them have also lately been repealed, much to the satisfaction of all liberal-minded men, though a vehement outcry was afterwards raised against the measure by ignorance and bigotry. The papists now seem to be convinced that a change of government, instead of bettering, would hurt their situation, because it would increase the jealousy of the legislature, which must undoubtedly expose them daily to greater burdens and heavier penalties. This sensible consideration has of late made the Roman catholic to appear as dutiful and zealous subjects as any his majesty has. Scarcely any English papists, excepting those who were bred or had served abroad, were engaged in the rebellion of the year 1745: and though those at home were most carefully observed, few, or none of them, were found guilty of disloyal practices.

As England has been famous for the variety of its religious sects, so it has also for its *Free-thinkers*; but that term has been applied in very different senses. It has sometimes been used to denote opposers of religion in general, and in particular of revealed religion; but it has also been applied to those who have been far from disbelieving Christianity, and who have only opposed some of those doctrines which are to be found in public creeds and formularies, but which they conceive to be no part of the original Christian system. As to those who are truly *deists* or *infidels*, there is abundant reason to believe that this class of men is much more numerous in some popish countries than in England. Christianity is so much obscured and disfigured by the fopperies and superstitions of the Roman church, that men who think freely are naturally apt to be prejudiced against it, when they see it in so disadvantageous a form; and this appears to be in fact very much the case abroad. But in England, where men have every opportunity of seeing it exhibited in a more rational manner, they have less cause to be prejudiced against it; and therefore are more ready to enter into an examination of the evidence of its divine origin. Nor does it appear that the writings of the *deists* against Christianity have been of any real service to it. On the contrary, they have caused the arguments in its favour to be used with greater force and clearness, and have been the means of producing such defences of it, as all the acuteness of modern infidelity has been unable to overthrow.

[LANGUAGE.] The English language is known to be a compound

of almost every French, and the words that are common to other Europe, but, relatively, it is less, than either Spanish, and more. It is, in its accent, the inhabitants of different parts of the people; for a difference in the tone and education speak or understand Spanish: but it is difficult in understanding the learned professions.

LEARNING AND another word for cultivated both, rance over the wanting a continuation themselves by the bare catalogue of volume.

The English character of their for the ease, the veniency of its Cambridge; in which were reformed industrious Leland published a third persons who whom he has larly a son and ward the Confessly devoted to M

of almost every other language in Europe, particularly the Saxon, the French, and the Celtic. The Saxon, however, predominates; and the words that are borrowed from the French, being radically Latin, are common to other nations, particularly the Spaniards and the Italians. To describe it abstractedly, would be superfluous to an English reader; but, relatively, it enjoys all the properties, without many of the defects, of other European languages. It is more energetic, manly, and expressive, than either the French or the Italian; more copious than the Spanish, and more eloquent than the German, or the other northern tongues. It is, however, subject to some considerable provincialities in its accent, there being much difference in the pronunciation of the inhabitants of different counties; but this chiefly affects the lowest of the people; for as to well-educated and well-bred persons, there is little difference in their pronunciation all over the kingdom. People of fortune and education in England, of both sexes, also commonly either speak or understand the French, and many of them the Italian and Spanish: but it has been observed that foreign nations have great difficulty in understanding the few English who talk Latin; which is perhaps the reason why that language is much disused in England, even by the learned professions.

[LEARNING AND LEARNED MEN.] England may be looked upon as another word for the seat of learning and the Muses. Her great Alfred cultivated both, in the time of the Saxons, when barbarism and ignorance overspread the rest of Europe; nor has there, since his time, been wanting a continual succession of learned men, who have distinguished themselves by their writings or studies. These are so numerous, that a bare catalogue of their names, down to this day, would form a moderate volume.

The English institutions for the benefit of study partake of the character of their learning. They are solid and substantial, and provide for the ease, the disencumbrance, the peace, the plenty, and the convenience of its professors; witness, the two universities of Oxford and Cambridge; institutions that are not to be matched in the world, and which were respected even amidst the barbarous rage of civil war. The industrious Leland, who was himself a moving library, was the first who published a short collection of the lives and characters of those learned persons who preceded the reign of his master Henry VIII. among whom he has inserted several of the blood-royal of both sexes, particularly a son and daughter of the great Alfred, Editha, the queen of Edward the Confessor, and other Saxon princes, some of whom were equally devoted to Mars and to the Muses.

In speaking of the dark ages, it would be unpardonable to omit the mention of that prodigy of learning and natural philosophy, Roger Bacon, who was the forerunner in science to the great Bacon, lord Verulam, as the latter was to sir Isaac Newton. Among the other curious works written by this illustrious man, we find treatises upon grammar, mathematics, physics, the flux and reflux of the British sea, optics, geography, astronomy, chronology, chemistry, logic, metaphysics, ethics, medicine, theology, philology, and upon the impediments of knowledge. He lived under Henry III. and died at Oxford about the year 1294. The honourable Mr. Walpole (the late lord Orford) has preserved the memory of some noble and royal English authors, who have done honour to learning and the Muses; and to his work we must refer. Since the Reformation, England resembles a galaxy of literature\*; and

\* See the Biographia Britannica.

it is but doing justice to the memory of cardinal Wolsey, though otherwise a dangerous and profligate minister, to acknowledge that both his example and encouragement laid the foundation of the polite arts, and greatly contributed to the revival of classical learning in England. As many of the English clergy had different sentiments in religious matters at the time of the Reformation, encouragement was given to learned foreigners to settle in England. Edward VI. during his short life, greatly encouraged these foreigners, and showed dispositions for cultivating the most useful parts of learning, had he lived. Learning, as well as liberty, suffered an almost total eclipse in England, during the bloody bigoted reign of queen Mary. Elizabeth, her sister, was herself a learned princess. She advanced many persons of consummate abilities to high ranks, both in church and state; but she seems to have considered their literary accomplishments to have been only secondary to their civil. In this she showed herself a great politician; but she would have been a more amiable queen, had she raised genius from obscurity: or though she was no stranger to Spencer's Muse, she suffered herself to be so much imposed upon by a tasteless minister, that the poet languished and died in obscurity. Though she relished the beauties of the divine Shakspeare, yet we know not that he was distinguished by any particular acts of her munificence; but her parsimony was nobly supplied by her favourite the earl of Essex, the politest scholar of his age, and his friend the earl of Southampton, who were liberal patrons of genius.

The encouragement of learned foreigners in England continued to the reign of James I. who was very munificent to Casaubon, and other foreign authors of distinction, even of different principles. He was himself no great author; but his example had a considerable effect upon his subjects; for in his reign were formed those great masters of polemic divinity, whose works are almost inexhaustible mines of knowledge. Nor must it be forgotten, that the second Bacon, who has been already mentioned, was by him created viscount Verulam, and lord high chancellor of England. He was likewise the patron of Camden and other historians, as well as antiquaries, whose works are to this day standards in those studies. Upon the whole, therefore, it cannot be denied, that English learning is under obligations to James I. though, as he had a very pedantic taste himself, he was the means of diffusing a similar taste among his subjects.

His son Charles I. cultivated the polite arts, especially sculpture, painting, and architecture. He was the patron of Rubens, Vandyke, Inigo Jones, and other eminent artists; so that, had it not been for the civil wars, he would probably have converted his court and capital into a second Athens; and the collections he made for that purpose, considering his pecuniary difficulties, were stupendous. His favourite, the duke of Buckingham, imitated him in that respect, and laid out the amazing sum of 400,000 pounds upon his cabinet of paintings and curiosities.

The earl of Arundel was another Mæcenas of that age, and greatly distinguished himself by his collection of antiquities, particularly his famous marble inscriptions, called the Arundelian marbles now preserved at Oxford. Charles and his court had little or no relish for poetry; but such was his generosity in encouraging genius and merit of every kind, that he increased the salary of his poet laureat, the famous Ben Jonson, from 100 marks to 100 pounds per annum, and a tierce of Spanish wine; which salary is continued to this day.

The public encouragement of learning and the arts suffered indeed

an eclipse, during the time of the civil wars, and the succeeding interregnum. Many very learned men, however, found their situations under Cromwell, though he was no stranger to their political sentiments, so easy, that they followed their studies, to the vast benefit of every branch of learning: and many works of great literary merit appeared even in those times of distraction. Usher, Walton, Willis, Harrington, Wilkins, and a prodigious number of other great names, were unmolested and even favoured by that usurper; and he would also have filled the universities with literary merit, could he have done it with any degree of safety to his government.

The reign of Charles II. was chiefly distinguished by the great proficiency to which it carried natural knowledge, especially by the institution of the Royal Society. The king was a good judge of those studies; and, though irreligious himself, England never abounded more with learned and able divines than in his reign. He loved painting and poetry, but was far more munificent to the former than the latter. The incomparable *Paradise Lost*, by Milton, was published in his reign, but was not read or attended to in proportion to its merit, though it was far from being disregarded so much as has been commonly apprehended. The reign of Charles II., notwithstanding the bad taste of his court in several of the polite arts, by some is reckoned the Augustan age in England, and is dignified with the names of Boyle, Halley, Hooke, Sydenham, Harvey, Temple, Tillotson, Barrow, Butler, Cowley, Waller, Dryden, Wycherley, and Otway. The pulpit assumed more majesty, a better style, and truer energy, than it had ever known before. Classic literature recovered many of its native graces; and though England could not, under him, boast of a Jones and a Vandyke, yet sir Christopher Wren introduced a more general regularity than had ever been known before in architecture. Nor was sir Christopher Wren merely distinguished by his skill as an architect\*. His knowledge was very extensive; and his discoveries in philosophy, mechanics, &c. contributed much to the reputation of the new-established Royal Society. Some excellent English painters (for Lely and Kneller were foreigners) also flourished in this reign.

That of James II. though he likewise had a taste for the fine arts, is chiefly distinguished in the province of literature by those compositions that were published by the English divines against popery, and which, for strength of reasoning and depth of erudition, never were equalled in any age or country.

The names of Newton and Locke adorned the reign of William III. and he had a particular esteem for the latter, as he had also for Tillotson and Burnet, though he was far from being liberal to men of genius. Learning flourished, however, in his reign, merely by the excellency of the soil in which it had been planted.

The most uninformed readers are not unacquainted with the improvements which learning, and all the polite arts, received under the auspices of queen Anne, and which put her court at least on a footing

\* Mr. Horace Walpole (the late lord Orford) says, that a variety of knowledge proclaims the universality, a multiplicity of works the abundance, and St. Paul's the greatness, of sir Christopher's genius. So many great architects as were employed on St. Peter's, have not left, upon the whole, a more perfect edifice than this work of a single mind. The noblest temple, the largest palace, and the most sumptuous hospital, in such a kingdom as Britain, are all the works of the same hand. He restored London, and recorded its fall. He built about fifty parish churches, and designed the Monument.

with that of Lewis XIV. in its most splendid days. Many of the great men who had figured in the reigns of the Stuarts and William, were still alive, and in the full exercise of their faculties, when a new race sprung up in the republic of learning and the arts. Addison, Prior, Pope, Swift, lord Bolingbroke, lord Shaftesbury, Arbuthnot, Congreve, Steele, Rowe, and many other excellent writers both in verse and prose, need but to be mentioned, to be admired; and the English were as triumphant in literature as in war. Natural and moral philosophy kept pace with the polite arts; and even religious and political disputes contributed to the advancement of learning, by the unbounded liberty which the laws of England allow in speculative matters, and which has been found highly advantageous in the promotion of true and valuable knowledge.

The ministers of George I. were the patrons of erudition, and some of them were no mean proficient themselves. George II. was himself no Mæcenas: yet his reign yielded to none of the preceding, in the numbers of learned and ingenious men it produced. The bench of bishops was never known to be so well provided with able prelates as it was in the early years of his reign; a full proof that his nobility and ministers were judges of literary qualifications. In other departments of erudition, the favour of the public generally supplied the coldness of the court. After the rebellion in the year 1745, when Mr. Pelham was considered as being first minister, this screen between government and literature was in a great measure removed, and men of genius began to taste the royal bounty. Since that period, a great progress has been made in the polite arts in England. The Royal Academy has been instituted, some very able artists have arisen, and the annual public exhibitions of painting and sculpture have been extremely favourable to the arts, by promoting a spirit of emulation, and exciting a greater attention to works of genius of this kind among the public in general. But, notwithstanding these favourable circumstances, the fine arts have been far from meeting with that public patronage to which they have so just a claim. Few of our public edifices are adorned with paintings or with statues. The sculptors meet with little employment, nor is the historical painter much patronised; though the British artists of the present age have proved that their genius for the fine arts is equal to that of any other nation.

Besides learning, and the fine arts in general, the English excel in what we call the learned professions. Their courts of justice are adorned with greater abilities and virtues, perhaps, than those which any other country can boast of. A remarkable instance of which occurs in the appointments, for the last 200 years, of their lord-chancellors, who hold the highest and the most uncontrollable judicial seat in the kingdom: and yet it is acknowledged by all parties; that, during that time, their bench has remained unpolled by corruption, or partial affections. The few instances that may be alleged to the contrary fix no imputation of wilful guilt upon the parties. The great lord-chancellor Bacon was censured indeed for corrupt practices; but malevolence itself does not say that he was guilty any farther than in too much indulgence to his servants. The case of one of his successors is still more favourable to his memory, as his censure reflects disgrace only upon his enemies; and his lordship was, in the judgment of every man of candour and conscience, fully acquitted. Even Jeffries, infernal as he was in his politics, never was accused of partiality in the causes that came before him as chancellor.

It must be acknowledged that neither pulpit nor bar eloquence have been sufficiently studied in England: but this is owing to the genius of the people, and their laws. The sermons of their divines are often learned, and always sound as to the practical and doctrinal part; for the many religious sects in England require to be opposed rather by reasoning than eloquence. An unaccountable notion has however prevailed even among some of the clergy themselves, that the latter is incompatible with the former; as if the arguments of Cicero and Demosthenes were weakened by those powers of language with which they are adorned. A short time, perhaps, may remove this prepossession, and convince the clergy, as well as the laity, that true eloquence is the first and fairest handmaid of argumentation. We do not, however, mean to insinuate that the preachers of the English church are destitute of the graces of elocution: so far from that, no clergy in the world can equal them in the purity and perspicuity of language; though, if they studied more than they do the powers of elocution, they would probably preach with more effect. If the semblance of those powers, coming from the mouths of ignorant enthusiasts, is attended with the amazing effects we daily see, what must not be the consequence if they were exerted in reality, and supported with spirit and learning?

The laws of England are of so peculiar a cast, that the several pleadings at the bar do not admit, or but very sparingly, of the flowers of speech; and there is reason to think that a pleading in the Ciceronian manner would make a ridiculous appearance in Westminster-hall. The English lawyers, however, though they deal little in eloquence, are well versed in rhetoric and reasoning.

Parliamentary speaking not being confined to that precedent which is required in the courts of law, no nation in the world can produce so many examples of true eloquence as the English senate in its two houses; witness the fine speeches made by both parties in parliament in the reign of Charles I. and those that have been printed since the accession of the present family.

Medicine and surgery, botany, anatomy, chemistry, and all the arts or studies for preserving life, have been carried to a great degree of perfection by the English. The same may be said of music, and theatrical exhibitions. Even agriculture and mechanism are now reduced in England to sciences, and that, too, without any public encouragement but such as is given by private noblemen and gentlemen, who associate themselves for that purpose. In ship-building, clock-work, and the various branches of cutlery, they stand unrivalled.

UNIVERSITIES.] We have already mentioned the two universities of Oxford and Cambridge, which have been the seminaries of more learned men than any in Europe, and some have ventured to say, than all other literary institutions. It is certain that their magnificent buildings, which in splendor and architecture rival the most superb royal edifices, the rich endowments, the liberal ease and tranquillity enjoyed by those who inhabit them, surpass all the ideas which foreigners, who visit them, conceive of literary societies. So respectable are they in their foundations, that each university sends two members to the British parliament, and their chancellors and officers have a civil jurisdiction over their students, the better to secure their independency. Their colleges, in their revenues and buildings, exceed those of many other universities.

In Oxford there are twenty colleges and five halls: the former are very liberally endowed, but in the latter the students chiefly maintain themselves. This university is of great antiquity: it is supposed to have

been a considerable place even in the time of the Romans; and Camden says, that "wise antiquity did, even in the British age, consecrate this place to the Muses." It is said to have been styled an university before the time of king Alfred; and the best historians admit, that this most excellent prince was only a restorer of learning here. Alfred built three colleges at Oxford; one for divinity, another for philosophy, and a third for grammar.

The university of Cambridge consists of twelve colleges, and four halls; but though they are distinguished by different names, the privileges of the colleges and halls are in every respect the same.

The senate-house at Cambridge is a most elegant edifice, executed entirely in the Corinthian order, and is said to have cost sixteen thousand pounds. Trinity college library is also a very magnificent structure; and in Corpus Christi college library is a valuable collection of ancient manuscripts, which were preserved at the dissolution of the monasteries, and given to this college by archbishop Parker.

ANTIQUITIES AND CURIOSITIES, } The antiquities of England are  
NATURAL AND ARTIFICIAL. } either British, Roman, Saxon, Danish, or Anglo-Normannic; but these, excepting the Roman, throw no great light upon ancient history. The chief British antiquities are those circles of stones, particularly that called Stonehenge in Wiltshire, which probably were places of worship in the times of the Druids. Stonehenge is, by Inigo Jones, Dr. Stukeley, and others, described as a regular circular structure. The body of the work consists of two circles and two ovals, which are thus composed: the upright stones are placed at three feet and a half distance from each other, and joined at the top by over-thwart stones, with tenons fitted to the mortises in the uprights, for keeping them in their due position. Some of these stones are vastly large, measuring two yards in breadth, one in thickness, and above seven in height; others are less in proportion. The uprights are wrought a little with a chissel, and sometimes tapered; but the transoms, or over-thwart stones, are quite plain. The outside circle is nearly one hundred and eighty feet in diameter, between which and the next circle there is a walk of three hundred feet in circumference, which has a surprizing and awful effect upon the beholders.

Monuments of the same kind as that of Stonehenge are to be met with in Cumberland, Oxfordshire, Cornwall, Devonshire, and many other parts of England, as well as in Scotland, and the isles, which have been already mentioned.

The Roman antiquities in England consist chiefly of altars and monumental inscriptions, which instruct us as to the legionary stations of the Romans in Britain, and the names of some of their commanders. The Roman military ways give us the highest idea of the civil as well as military policy of those conquerors. Their vestiges are numerous: one is mentioned by Leland, as beginning at Dover, and passing through Kent to London, from thence to St. Alban's, Dunstable, Stratford, Towcester, Littleburn, St. Gilbert's Hill near Shrewbury, then by Stratton, and so through the middle of Wales to Cardigan. The great Via Militaris, called Hermen-street, passed from London through Lincoln, where a branch of it, from Pontefract to Doncaster, strikes out to the westward, passing through Tadcaster to York, and from thence to Aldby, where it again joined Hermen-street. There would, however, be no end of describing the vestiges of the Roman roads in England, many of which serve as foundations to our present highways. The great earl of Arundel, the celebrated English antiquary, had formed a noble

plan for describing the Roman roads in London; but the remainder of the plan is not yet published. One particular where also is a well chosen situation for the baths and parts, that Roman walls the borders are bleuded men and a number of have been found Roman power commonly called Cumberland, being about stakes and turrets at communication ditch, or via

plan for describing those which pass through Suffex and Surry towards London; but the civil war breaking out, put an end to the undertaking. The remains of many Roman camps are discernible all over England; one particularly, very little defaced, near Dorchester in Dorsetshire, where also is a Roman amphitheatre. Their situations are generally so well chosen, and their fortifications appear to have been so complete, that there is some reason to believe that they were the constant habitations of the Roman soldiers in England; though it is certain, from the baths and tessellated pavements that have been found in different parts, that their chief officers or magistrates lived in towns or villas, Roman walls have likewise been found in England; and, perhaps, upon the borders of Wales, many remains of their fortifications and castles are blended with those of a later date. The private cabinets of noblemen and gentlemen, as well as the public repositories, contain a vast number of Roman arms, coins, fibulæ, trinkets, and the like, which have been found in England; but the most amazing monument of the Roman power in England is the pratenture or wall of Severus, commonly called the Picts' wall, running through Northumberland and Cumberland; beginning at Tiumouth, and ending at Solway-Frith, being about eighty miles in length. The wall at first consisted only of stakes and turf, with a ditch; but Severus built it with stone forts and turrets at proper distances, so that each might have a speedy communication with the other: and it was attended all along by a deep ditch, or vallum, to the north, and a military high-way to the south.

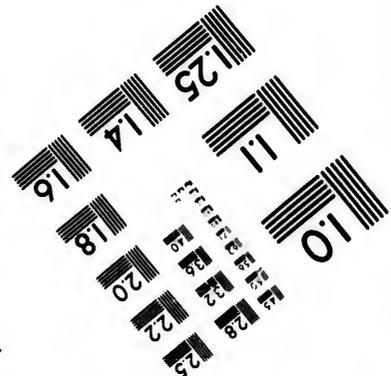

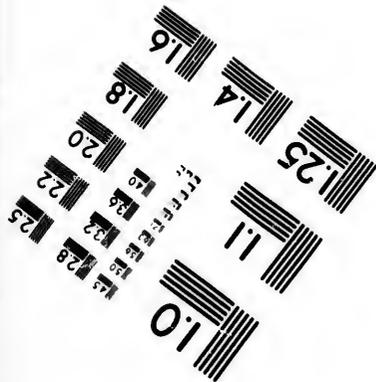

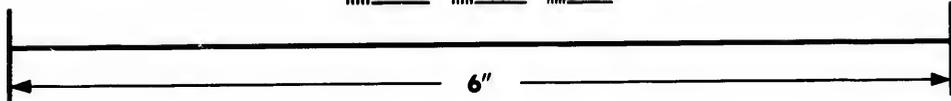

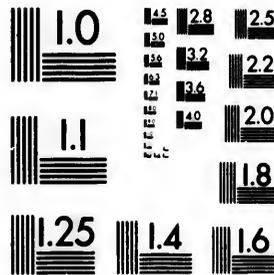

The Saxon antiquities in England consist chiefly in ecclesiastical edifices, and places of strength. At Winchester is shown the round table of king Arthur, with the names of his knights. The antiquity of this table has been disputed by Camden and later writers, perhaps with reason; but if it be not British, it certainly is Saxon. The cathedral of Winchester served as the burying place of several Saxon kings, whose bones were collected together by bishop Fox, in six large wooden chests. Many monuments of Saxon antiquity present themselves all over the kingdom, though they are often not to be discerned from the Normannic; and the British Museum contains several striking original specimens of their learning. Many Saxon charters, signed by the king and his nobles, with a plain cross instead of their names, are still to be met with. The writing is neat and legible, and was always performed by a clergyman, who affixed the name and quality of every donor, or witness, to his respective cross. The Danish erections in England are hardly discernible from the Saxon. The form of their camps is round, and they are generally built upon eminences; but their forts are square.

All England is full of Anglo-Normannic monuments, which we choose to call so, because, though the princes under whom they were raised were of Norman original, yet the expense was defrayed by Englishmen, with English money. York-minster, and Westminster-hall and abbey, are, perhaps, the finest specimens to be found in Europe of that Gothic manner which prevailed in building before the recovery of the Greek and Roman architecture. All the cathedrals and old churches in the kingdom are more or less in the same taste, if we except St. Paul's. In short, those erections are so common, that they scarcely deserve the name of curiosities. It is uncertain whether the artificial excavations found in some parts of England are British, Saxon, or Norman. That under the old castle of Ryegate in Surry is very remarkable, and seems to have been designed for secreting the cattle and effects of the natives, in times of war and invasion. It contains an oblong-square hall, round

which runs a bench, cut out of the same rock, for sitting upon; and tradition says that it was the room in which the barons of England met during the wars with king John. The rock itself is soft and very practicable; but it is hard to say where the excavation, which is continued in a square passage, about six feet high, and four wide, terminates, because the work is fallen in, in some places.

The natural curiosities of England are so various, that a general account can only be given. The Bath waters are universally celebrated, both for drinking and bathing. Spas of the same kind are found at Scarborough, and other parts of Yorkshire; at Tunbridge in Kent; Epsom and Dulwich in Surry; and at Acton and Islington in Middlesex. There also are many remarkable springs, of which some are impregnated either with salt, as that at Droitwich in Worcestershire; or sulphur, as the famous well of Wigan in Lancashire; or bituminous matter, as that at Pitchford in Shropshire. Others have a petrifying quality, as that near Lutterworth in Leicestershire; and a dropping well in the West riding in Yorkshire. And, finally, some ebb and flow, as those of the Peak in Derbyshire, and Laywell near Torbay, whose waters rise and fall several times in a hour. To these we may add that remarkable fountain near Richard's castle in Herefordshire, commonly called Bone-well, which is generally full of small bones, like those of frogs or fish, though often cleared out. At Ancliff, near Wigan in Lancashire, is the famous burning well; the water is cold, neither has it any smell, yet there is so strong a vapour of sulphur issuing out with the stream, that, upon applying a light to it, the top of the water is covered with a flame, like that of burning spirits, which lasts several hours, and emits so strong a heat that meat may be boiled over it. The fluid itself will not burn when taken out of the well\*.

Derbyshire is celebrated for many natural curiosities. The Mam Tor, or Mother Tower, is said to be continually mouldering away, but never diminishes. The Elden Hole, about four miles from the same place, is a chasm in the side of a mountain, near seven yards wide, and fourteen long, diminishing in extent within the rock; but of what depth is not known. A plummet once drew 884 yards of line after it, whereof the last eighty were wet, without finding a bottom. The entrance of Poole's Hole, near Buxton, for several paces, is very low, but soon opens into a very lofty vault, like the inside of a Gothic cathedral. The height is certainly very great, yet much short of what some have asserted, who reckon it a quarter of a mile perpendicular, though, in length it exceeds that dimension: a current of water, which runs along the middle, adds, by its sounding stream, re-echoed on all sides, very much to the astonishment of all who visit this vast cavern. The drops of water which hang from the roof, and on the sides, have an amusing effect; for they not only reflect numberless rays from the candles carried by the guides, but, as they are of a petrifying quality, they harden in several places into various forms, which, with the help of a strong imagination, may pass for lions, fountains, organs, and the like. The entrance into that stupendous cavern at Castleton, which is, from its hideousness, named the Devil's Arse, is wide at first, and upwards of thirty feet perpendicular. Several cottagers dwell under it, who, in a great measure, subsist by guiding strangers into the cavern, which is crossed by four streams of water, and then is thought impassable. The vault,

\* This extraordinary heat has been found to proceed from a vein of coals, which had been since dug from under this well; at which time the uncommon warmth ceased.

in several places, makes a beautiful appearance, being chequered with various coloured stones.

Some spots of England are said to have a petrifying quality. We are told, that, near Whitby in Yorkshire, are found certain stones resembling the folds and the wreaths of a serpent; also other stones of several sizes, and so exactly round, as if artificially made for cannon balls; which, being broken, do commonly contain the form and likeness of serpents, wreathed in circles, but generally without heads. In some parts of Gloucestershire, stones are found resembling cockles, oysters, and other testaceous marine animals. Those curiosities, however, are often magnified by ignorance and credulity.

CITIES, TOWNS, FORTS, AND OTHER } London\*, the metropolis  
EDIFICES, PUBLIC AND PRIVATE. } of the British empire, is  
the first in this division. It appears to have been founded between the reigns of Julius Cæsar and Nero; but by whom, is uncertain; for we are told by Tacitus, that it was a place of great trade in Nero's time, and soon after became the capital of the island. It was first walled round with hewn stones and British bricks, by Constantine the Great; and the walls formed an oblong square, in compass about three miles, with seven principal gates. The same emperor made it a bishop's see; for it appears that the bishops of London and York, and another English bishop, were at the council of Arles, in the year 314: he also settled a mint in it, as is plain from some of his coins.

London, in its large sense, including Westminster, Southwark, and part of Middlesex, is a city of surprising extent, of prodigious wealth, and of the most extensive trade. This city, when considered with all its advantages, is now what ancient Rome once was; the seat of liberty, the encourager of arts, and the admiration of the whole world. London is the centre of trade; it has an intimate connection with all the counties in the kingdom; it is the grand mart of the nation, to which all parts send their commodities, from whence they are again sent back into every town in the nation, and to every part of the world. From hence innumerable carriages by land and water are constantly employed; and from hence arises the circulation in the national body, which renders every part healthful, vigorous, and in a prosperous condition; a circulation that is equally beneficial to the head and the most distant members. Merchants are here as rich as noblemen: witness their incredible loans to government; and there is no place in the world where the shops of tradesmen make such a noble and elegant appearance, or are better stocked.

It is situated on the banks of the Thames, a river which, though not the largest, is the richest and most commodious for commerce of any in the world; it being continually filled with fleets sailing to or from the most distant climates; and its banks, from London-bridge to Blackwall, are almost one continued great magazine of naval stores, containing three large wet docks, 32 dry docks, and 33 yards for the building of ships for the use of the merchants, beside the places allotted for the building of boats and lighters; and the king's yards down the river, for the building of men of war. As this city is about sixty miles distant from the sea, it enjoys, by means of this beautiful river, all

\* London is situated in 51° 31' north latitude, 400 miles south of Edinburgh, and 270 south-east of Dublin; 180 miles west of Amsterdam, 210 north-west of Paris, 500 south-west of Copenhagen, 600 miles north-west of Vienna, 790 south-west of Stockholm, 800 north-east of Madrid, 820 north-west of Rome, 850 north-east of Lisbon, 1360 north-west of Constantinople, 1414 south-west of Moscow.

the benefits of navigation, without the danger of being surpris'd by foreign fleets, or of being annoy'd by the moist vapours of the sea. It rises regularly from the water side, and, extending itself on both sides along its banks, reaches a prodigious length from east to west, in a kind of amphitheatre, towards the north, and is continued for near 20 miles on all sides, in a succession of magnificent villas, and populous villages, the country-seats of gentlemen and tradesmen; whither the latter retire for the benefit of fresh air, and to relax their minds from the hurry of business. The regard paid by the legislature to the property of the subject has hitherto prevented any bounds being fixed for its extension.

The irregular form of this city makes it difficult to ascertain its extent. However, its length from east to west is generally allowed to be above seven miles, from Hyde-park Corner to Poplar; and its breadth in some places three, in others two, and in others, again, not much above half a mile. Hence the circumference of the whole is almost 18 miles; or, according to a modern measurement, the extent of continued buildings is 35 miles, two furlongs, and 39 rods. But it is much easier to form an idea of the large extent of a city so irregularly built, by the number of the people, who are computed to be near a million; and from the number of edifices devoted to the service of religion.

Of these, besides St. Paul's cathedral, and the collegiate church at Westminster, here are 102 parish churches, and 69 chapels, of the established religion; 21 French protestant chapels; 11 chapels belonging to the Germans, Dutch, Danes, &c.; 26 independent meetings; 34 presbyterian meetings; 20 baptist meetings; 19 popish chapels, and meeting houses for the use of foreign ambassadors, and people of various sects; and three Jews' synagogues. So that there are 305 places devoted to religious worship, in the compass of this vast pile of buildings, without reckoning the 21 out-parishes usually included in the bills of mortality, and a great number of methodist tabernacles.

There are also in and near this city 100 alms-houses; about 20 hospitals and infirmaries; 3 colleges; 10 public prisons; 15 flesh-markets; 1 market for live cattle; 2 other markets more particularly for herbs; and 23 other markets for corn, coals, hay, &c.; 15 inns of court; 27 public squares, besides those within single buildings, as the Temple, &c.; 3 bridges; 49 halls for companies; 8 public schools, called free-schools; and 131 charity schools, which provide education for 5034 poor children: 207 inns, 447 taverns, 551 coffee-houses, 5975 ale-houses; 1000 hackney-coaches; 400 ditto chairs; 7000 streets, lanes, courts, and alleys; and 150,000 dwelling-houses, containing, as has been already observed, about 1,600,000 inhabitants, who, according to a late estimate, consume annually the following articles of provisions:

Black cattle	- - - - -	98,244
Sheep and lambs	- - - - -	711,123
Calves	- - - - -	194,760
Swine	- - - - -	186,932

Butter, pounds weight, about	- - - - -	16,000,000

Cheese, pounds weight, about	20,000,000
Gallons of milk	7,000,000
Barrels of strong beer	1,172,494
Barrels of small beer	798,495
Tons of foreign wines	3,044
Gallons of rum, brandy, and other distilled waters, above	11,000,000
Pounds weight of candles, above	11,000,000

London-bridge was first built of stone in the reign of Henry II. about the year 1163, by a tax laid upon wool, which, in the course of time, gave rise to the notion that it was built upon wool-packs: from that time it has undergone many alterations and improvements, particularly since the year 1756, when the houses were taken down, and the whole rendered more convenient and beautiful. The passage for carriages is 31 feet broad, and 7 feet on each side for foot passengers. It crosses the Thames, where it is 915 feet broad, and has at present 19 arches of about 20 feet wide each; but the centre one is considerably larger.

Westminster-bridge is reckoned one of the most complete and elegant structures of the kind known in the world. It is built entirely of stone, and extended over the river at a place where it is 1,223 feet broad; which is above 300 feet broader than at London-bridge. On each side is a fine balustrade of stone, with places of shelter from the rain. The width of the bridge is 44 feet; having on each side a fine foot-way for passengers. It consists of 14 piers, and 13 large and two small arches, all semicircular, that in the centre being 76 feet wide, and the rest decreasing four feet each from the other; so that the two least arches of the 13 great ones are each 52 feet. It is computed that the value of 40,000*l.* in stone and other materials is always under water. This magnificent structure was begun in 1738, and finished 1760, at the expense of 389,000*l.* defrayed by the parliament.

Blackfriars-bridge is not inferior to that of Westminster, either in magnificence or workmanship; but the situation of the ground on the two shores obliged the architect to employ elliptical arches; which, however, have a very fine effect; and many persons even prefer it to Westminster-bridge. This bridge was begun in 1760, and finished in 1770, at the expense of 152,840*l.*, to be discharged by a toll upon the passengers. It is situated almost at an equal distance between those of Westminster and London, commands a view of the Thames from the latter to Whitehall, and discovers the majesty of St. Paul's in a very striking manner.

The cathedral of St. Paul's is the most capacious, magnificent, and regular protestant church in the world. The length within is 500 feet; and its height, from the marble pavement to the cross on the top of the cupola, is 340. It is built of Portland stone, according to the Greek and Roman orders, in the form of a cross, after the model of St. Peter's at Rome, to which, in some respects, it is superior. St. Paul's church is the principal work of sir Christopher Wren, and, undoubtedly, the only work of the same magnitude that ever was completed by one man. He lived to a great age, and finished the building 37 years after he himself laid the first stone. It takes up six acres of ground, though the whole length of this church measures no more than the width of St. Peter's. The expense of rebuilding it, after the fire of London, was defrayed by a duty on coals, and is computed at a million sterling.

Westminster abbey, or the collegiate church of Westminster, is a ve-

nerable pile of building in the Gothic taste. It was first built by Edward the Confessor; king Henry III. rebuilt it from the ground, and Henry VII. added a fine chapel to the east end of it; this is the repository of the deceased British kings and nobility; and here are also monuments erected to the memory of many great and illustrious personages, commanders by sea and land, philosophers, poets, &c. In the reign of queen Anne, 4000*l.* a year, out of the coal duty, was granted by parliament for keeping it in repair.

The inside of the church of St. Stephen, Walbrook, is admired for its lightness and elegance, and does honour to the memory of sir Christopher Wren. The same may be said of the steeples of St. Mary-le-Bow, and St. Bride's, which are supposed to be the most complete in their kind of any in Europe, though architecture has laid down no rule for such erections. Few churches in and about London are without some beauty. The simplicity of the portico in Covent-Garden is worthy the purest ages of ancient architecture. That of St. Martin's in the Fields would be noble and striking, could it be seen from a proper point of view. Several of the new churches are built in an elegant taste, and even some of the chapels have gracefulness and proportion to recommend them. The banqueting-house at Whitehall is but a very small part of a noble palace designed by Inigo Jones, for the royal residence; and, as it now stands, under all its disadvantages, its symmetry and ornaments are in the highest style and execution of architecture.

Westminster hall, though on the outside it makes a mean and no very advantageous appearance, is a noble Gothic building, and is said to be the largest room in the world, the roof of which is not supported by pillars; it being 230 feet long, and 70 broad. The roof is the finest of its kind. Here are held the coronation-feasts of our kings and queens; also the courts of chancery, king's-bench, and common-pleas; and, above stairs, that of exchequer.

That beautiful column, called the Monument, erected at the charge of the city, to perpetuate the memory of its being destroyed by fire, is justly worthy of notice. This column, which is of the Doric order, exceeds all the obelisks and pillars of the ancients, it being 202 feet high, with a stair-case in the middle to ascend to the balcony, which is about 30 feet short of the top, from whence there are other steps, made for persons to look out at the top of all, which is fashioned like an urn, with a flame issuing from it. On the base of the monument, next the street, the destruction of the city, and the relief given to the sufferers by Charles II. and his brother, are emblematically represented in bas-relief. The north and south sides of the base have each a Latin inscription, the one describing its dreadful desolation, and the other its splendid reurrection; and on the east side is an inscription, showing when the pillar was begun and finished. The charge of erecting this monument, which was begun by sir Christopher Wren in 1671, and finished by him in 1677, amounted to upwards of 13,000*l.*

The Royal Exchange is a large and noble building, and is said to have cost above 80,000*l.*

The terrace in the Adelphi is a very fine piece of architecture, and has laid open one of the finest prospects in the world.

We might here give a description of the Tower, Bank of England, the New Treasury, the Admiralty-office, and the Horse-guards at Whitehall, the Mansion-house, or house of the Lord-mayor, the Custom-house, Excise-office, India-house, and a vast number of other public buildings;

beside the magnificent house, Marlborough, the earl of Chester's, and the late Berkeley-square; Bedford's, and many others of the nobility, large volume.

beside the magnificent edifices raised by our nobility; as lord Spencer's house, Marlborough-house, and Buckingham-house in St. James's-park; the earl of Chesterfield's-house near Hyde-park; the duke of Devonshire's, and the late earl of Bath's, in Piccadilly; lord Shelburne's in Berkeley-square; Northumberland-house in the Strand; the duke of Bedford's, and Montague-house, in Bloomsbury; with a number of others of the nobility and gentry; but these would be sufficient to fill a large volume.

This great and populous city is happily supplied with abundance of fresh water, from the Thames and the New River, which is not only of inconceivable service to every family, but, by means of fire plugs every where dispersed, the keys of which are deposited with the parish-officers, the city is in a great measure secured from the spreading of fire; for these plugs are no sooner opened, than there are vast quantities of water to supply the engines.

This plenty of water has been attended with another advantage; it has given rise to several companies, who insure houses and goods from fire. The premium is small, and the recovery, in case of loss, is easy and certain. Every one of these offices keeps a set of men in pay, who are ready at all hours to give their assistance in case of fire; and who are, on all occasions, extremely bold, dexterous, and diligent: but though all their labours should prove unsuccessful, the person who suffers by this devouring element has the comfort that must arise from a certainty of being paid the value (claimed upon oath) of what he has insured.

Before the conflagration in 1666, London (which, like most other great cities, had arisen from small beginnings) was totally inelegant, inconvenient, and unhealthy; of which latter misfortune many melancholy proofs are authenticated in history, and which, without doubt, proceeded from the narrowness of the streets, and the unaccountable projections of the buildings, that confined the putrid air, and, joined with other circumstances, such as the want of water, rendered the city seldom free from pestilential devastation. The fire which consumed the greatest part of the city, dreadful as it was to the inhabitants at that

\* The British Museum is deposited in Montague-house. Sir Hans Sloane, bart. (who died in 1753) may not improperly be called the founder of the British Museum; for its being established by parliament was only in consequence of his leaving, by will, his noble collection of natural history, his large library, and his numerous curiosities, which cost him 50,000*l.* to the use of the public, on condition that the parliament would pay 20,000*l.* to his executors. To this collection were added the Cottonian library, the Harleian manuscripts, collected by the Oxford family, and purchased likewise by the parliament, and a collection of books given by the late major Edwards. His late majesty, in consideration of its great usefulness, was graciously pleased to add thereto the royal libraries of books and manuscripts collected by the several kings of England.

The Sloanian collection consists of an amazing number of curiosities; among which are the library, including books of drawings, manuscripts, and prints, amounting to about 50,000 volumes. Medals and coins, ancient and modern, 20,000. Cameos and intaglios, about 700. Seals, 268. Vessels, &c. of agate, jasper, &c. 542. Antiquities, 1,125. Precious stones, agate, jasper, &c. 2,156. Metals, minerals, ores, &c. 2,725. Crystals, spars, &c. 1,864. Fossils, flints, stones, 1,275. Earths, sands, salts, 1,055. Bitumens, sulphurs, amber, &c. 399. Toics, mica, &c. 388. Corals, sponges, &c. 2,421. Testacea or shells, &c. 5,843. Echini, echinitæ, &c. 659. Aseriet, trochi, entrochi, &c. 241. Crustacea, crabs, lobsters, &c. 363. Stella-marina, star-fishes, &c. 173. Fish, and their parts, &c. 1,555. Birds, and their parts, eggs, and the nests of different species, 1,172. Quadrupeds, &c. 1,886. Vipers, serpents, &c. 521. Insects, &c. 5,439. Vegetables, 12,506. Hortus siccus, or volumes of dried plants, 334. Human, as calculi, anatomical preparations, 756. Miscellaneous things natural, 9,098. Mathematical instruments, 55.—A catalogue of all the above is written in a number of large volumes.

time, was productive of consequences which made ample amends for the losses sustained by individuals; a new city arose on the ruins of the old; but, though more regular, open, convenient, and healthy than the former, yet it by no means had the character of magnificence or elegance, in many particulars; and it is ever to be lamented (such was the insatiation of those times) that the magnificent, elegant, and useful plan of the great sir Christopher Wren was totally disregarded and sacrificed to the mean and selfish views of private property; views which did irreparable injury to the citizens themselves, and to the nation in general; for had that great architect's plan been followed, what has often been asserted must have been the result; the metropolis of this kingdom would, incontestably, have been the most magnificent and elegant city in the universe, and of consequence must, from the prodigious resort of foreigners of distinction and taste who would have visited it, have become an inexhaustible fund of riches to this nation. But as the deplorable blindness of that age has deprived us of so valuable an acquisition, it is become absolutely necessary that some efforts should be made to render the present plan in a greater degree answerable to the character of the richest and most powerful people in the world.

The plan of London, in its present state, will in many instances appear, to very moderate judges, to be as injudicious a disposition as can easily be conceived for a city of trade and commerce, on the border of so noble a river as the Thames. The wharfs and quays on its banks are extremely mean and inconvenient; and the want of regularity and uniformity in the streets of the city of London, and the mean avenues to many parts of it, are also circumstances that greatly lessen the grandeur of its appearance. Many of the churches, and other public buildings, are likewise thrust up in corners, in such a manner as might tempt foreigners to believe that they were designed to be concealed. The improvements of the city of London for some years past have however been very great; and the new streets, which are numerous, are in general more spacious, and built with greater regularity and elegance.

In the centre of the town, and upon the banks of the noblest river in Europe, was a chain of inelegant, ruinous houses, known by the name of Durham yard, the Savoy, and Somerset-house. The first, being private property, engaged the notice of the ingenious Adams, who opened the way to a piece of scenery, which no city in Europe can equal. On the site of Durham-yard was raised, upon arches, the pile of the Adelphi, celebrated for its enchanting prospect, the utility of its wharfs, and its subterraneous apartments, answering a variety of purposes of general benefit. Contiguous to the Adelphi stands the Savoy, the property of government, hitherto a nuisance; and, adjoining to the Savoy, towards the Temple, stood Somerset-house, where, being the property of government also, a pile of buildings for public offices has been erected; and here, in a very magnificent edifice, are elegant apartments appropriated for the use of the Royal Society, the Royal Academy of painting and sculpture, and the Society of Antiquaries.

Though a variety of circumstances have hitherto been disadvantageous to the embellishment of the metropolis, it must at the same time be acknowledged, that a spirit of improvement seems universal among all degrees of people. The very elegant and necessary method of paving and enlightening the streets is felt in the most sensible manner by all ranks and degrees of people. The roads are continued for several miles around, upon the same model; and, exclusive of lamps regularly placed on each side at short distances, are rendered more secure by watchmen

stationed within call of each other. Nothing can appear more brilliant than those lights, when viewed at a distance, especially where the roads run across; and even the principal streets, such as Pall-Mall, New Bond-street, Oxford-street, &c. convey an idea of elegance and magnificence.

Among the list of improvements worthy notice, may be included the Six-Clerks' office, in Chancery-lane, and that very substantial building in the Old Bailey, which does honour to a people celebrated for their cleanliness and for their humanity. Here the unfortunate debtor will no longer be annoyed by the dreadful rattle of chains, or by the more horrid sounds issuing from the lips of those wretched beings who set defiance to all laws divine and human: and here also the offender, whose crime is not capital, may enjoy all the benefits of a free open air.

Windsor-castle is the only fabric that deserves the name of a royal palace in England; and that chiefly through its beautiful and commanding situation, which, with the form of its construction, rendered it, before the introduction of artillery, impregnable. Hampton-court was the favourite residence of king William. It is built in the Dutch taste, and has some good apartments, and, like Windsor, lies near the Thames. Both these palaces have some good pictures; but nothing equal to the magnificent collection made by Charles I. and dissipated in the time of the civil wars. The cartoons of Raphael, which, for design and expression, are reckoned the master-pieces of painting, have by his present majesty been removed from the gallery built for them at Hampton-court to the Queen's palace, formerly Buckingham-house, in St. James's Park. The palace of St. James's is commodious, but has the air of a convent; and that of Kenfington, which was purchased from the Finch family by king William, is remarkable only for its gardens. Other houses, though belonging to the king, are far from deserving the name of Royal.

Next to these, if not superior, in magnificence and expensive decorations, are many private seats in the neighbourhood of London, and in every part of the kingdom, in which the amazing opulence of the English nation shines forth in its fullest point of view. In these also the princely fortunes of the nobility are made subservient to the finest classical taste; witness the seats of the marquis of Buckingham and earl Pembroke. At the seat of the latter, more remains of antiquity are to be found than are in the possession of any other subject in the world.

But those capital houses of the English nobility and gentry have an excellency distinct from what is to be met with in any other part of the globe, which is, that all of them are complete without and within, all the apartments and members being suitable to each other, both in construction and furniture, and all kept in the highest preservation. It often happens, that the house, however elegant and costly, is not the principal object of the seat, which consists in its hortulane and rural decorations, vistas, opening landscapes, temples, all of them the result of that enchanting art of imitating nature, and uniting beauty with magnificence.

It cannot be expected that we should here enter into a particular detail of all the cities and towns of England, which would far exceed the limits of this work: we shall therefore only touch upon some of the most considerable.

Bristol is reckoned the second city in the British dominions, for trade, wealth, and the number of its inhabitants. It stands upon the north and south side of the river Avon; and the two parts of the city are

connected by a stone bridge. The city is not well built; but it is supposed to contain 15,000 houses, and 95,000 inhabitants. Here is a cathedral and eighteen parish churches, besides seven or eight other places of worship. On the north side of a large square, called Queen's square, which is adorned with rows of trees, and an equestrian statue of William the Third, there is a custom-house, with a quay half a mile in length, said to be one of the most commodious in England, for shipping and landing of merchants' goods. The exchange, where the merchants and traders meet, is all of freestone, and is one of the best of its kind in Europe.

York is a city of great antiquity, pleasantly situated on the river Ouse. It is very populous, and surrounded with a good wall, through which are four gates and five posterns. Here are seventeen parish churches, and a very noble cathedral, or minster, it being one of the finest Gothic buildings in England. It extends in length 525 feet, and in breadth 210 feet. The nave, which is the largest of any in the world, excepting that of St. Peter's church at Rome, is four feet and a half wider, and eleven feet higher, than that of St. Paul's cathedral at London. At the west end are two towers, connected and supported by an arch which forms the west entrance, and is reckoned the largest Gothic arch in Europe. The windows are finely painted, and the front of the choir is adorned with statues of all the kings of England, from William the Norman to Henry VI.; and here are thirty-two stalls, all of fine marble, with pillars, each consisting of one piece of alabaster. Here is also a very neat Gothic chapter-house. Near the cathedral is the assembly-house, which is a noble structure, and which was designed by the late earl of Burlington. The city has a stone bridge of five arches over the river Ouse.

The city of Exeter was for some time the seat of the West-Saxon kings; and the walls, which at this time inclose it, were built by king Athelstan, who encompassed it also with a ditch. It is one of the first cities in England, as well on account of its buildings and wealth, as its extent, and the number of its inhabitants. It has six gates, and, including its suburbs, is more than two miles in circumference. There are sixteen parish churches, besides chapels, and five large meeting-houses, within the walls of this city. The trade of Exeter, in serges, perpetuans, longells, druggets, kerseys, and other woollen goods, is very great. Ships come up to this city by means of sluices.

The city of Gloucester stands on a pleasant hill, with houses on every descent, and is a clean, well-built town, with the Severn on one side, a branch of which brings ships up to it. The cathedral here is an ancient and magnificent structure; and there are also five parish churches.

Litchfield stands in a valley, three miles south of the Trent, and is divided by a stream which runs into that river. The cathedral was founded in the year 1148: it was much damaged during the civil war, but was so completely repaired soon after the Restoration, that it is now one of the noblest Gothic structures in England. Litchfield is thought to be the most considerable city in the north-west of England, except Chester.

Chester is a large, populous, and wealthy city; with a noble bridge, that has a gate at each end, and twelve arches, over the Dee, which falls into the sea. It has eleven parishes, and nine well-built churches. The streets are generally even and spacious, and, crossing one another in straight lines, meet in the centre. The walls were first erected by Edelfleda, a Mercian lady, in the year 908, and join on the south side of the

city to the castle, from which there is a pleasant walk round the city upon the walls, except where it is intercepted by some of the towers over the gates; and from thence there is a prospect of Flintshire, and the mountains of Wales.

Warwick is a town of great antiquity, and appears to have been of eminence even in the time of the Romans. It stands upon a rock of free-stone, on the banks of the Avon: and a way is cut to it through the rocks, from each of the four cardinal points. The town is populous, and the streets are spacious and regular, and all meet in the centre of the town.

The city of Coventry is large and populous: it has a handsome town-house, and twelve noble gates. Here is also a spacious market-place, with a cross in the middle, 60 feet high, which is adorned with statues of several kings of England, as large as life.

Salisbury is a large, neat, and well-built city, situated in a valley, and watered by the Upper Avon on the west and south, and by the Bourne on the east. The streets are generally spacious, and built at right angles. The cathedral, which was finished in 1358, at the expense of above 26,000*l.* is, for a Gothic building, the most elegant and regular in the kingdom. It is in the form of a lantern, with a beautiful spire of freestone in the middle, which is 410 feet high, being the tallest in England. The length of the church is 478 feet, the breadth is 76 feet, and the height of the vaulting 80 feet. The church has a cloister, which is 150 feet square, and of as fine workmanship as any in England. The chapter-house, which is an octagon, is 150 feet in circumference, and yet the roof bears all upon one small pillar in the centre, so much too weak, in appearance, for the support of such a prodigious weight, that the construction of this building is thought one of the greatest curiosities in England.

The city of Bath took its name from some natural hot baths, for the medicinal waters of which this place has been long celebrated, and much frequented. The seasons for drinking the Bath waters are the spring and autumn; the spring season begins with April, and ends with June; the autumn season begins with September, and lasts to December; and some patients remain here all the winter. In the spring, this place is most frequented for health, and in the autumn for pleasure, when at least two thirds of the company, consisting chiefly of persons of rank and fortune, come to partake of the amusements of the place. In some seasons there have been no less than 8000 persons at Bath, besides its inhabitants. Some of the buildings lately erected here are extremely elegant, particularly Queen's-square, the North and South Parade, the Royal Forum, the Circus and Crescent.

Nottingham is pleasantly situated on the ascent of a rock, overlooking the river Trent, which runs parallel with it about a mile to the south, and has been made navigable. It is one of the neatest places in England, and has a considerable trade.

No nation in the world has such dock-yards, and all conveniences for construction and repairs of the royal navy, as Portsmouth (the most regular fortification in England), Plymouth (by far the best dock-yard), Chatham, Woolwich, and Deptford. The royal hospital at Greenwich, for superannuated seamen, is scarcely exceeded by any royal palace, for its magnificence and expense.

COMMENCE AND MANUFACTURES.] It is well known that commerce and manufactures have raised the English to be the first and most powerful people in the world. Historical reviews, on this head, would be

tedious. It is sufficient then to say, that it was not till the reign of Elizabeth that England began to feel her true weight in the scale of commerce. She planned some settlements in America, particularly Virginia, but left the expense attending them to be defrayed by her subjects; and indeed she was too parsimonious to carry her own notions of trade into execution. James I. entered upon great and beneficial schemes for the English trade. The East-India company owes to him their success and existence; and British America saw her most flourishing colonies rise under him and his family. The spirit of commerce went hand in hand with that of liberty; and though the Stuarts were not friendly to the latter, yet, during the reigns of the princes of that family, the trade of the nation was greatly increased. It is not intended to follow commerce, through all her fluctuations, but only to give a general representation of the commercial interest of the nation.

The present system of English politics may properly be said to have taken rise in the reign of queen Elizabeth. At this time the protestant religion was established, which naturally allied us to the reformed states, and made all the popish powers our enemies.

We began in the same reign to extend our trade, by which it became necessary for us also to watch the commercial progress of our neighbours, and, if not to incommode and obstruct their traffic, to hinder them from impairing ours.

We then likewise settled colonies in America, which was become the great scene of European ambition; for, seeing with what treasures the Spaniards were annually enriched from Mexico and Peru, every nation imagined that an American conquest or plantation would certainly fill the mother-country with gold and silver.

The discoveries of new regions, which were then every day made, the profit of remote traffic, and the necessity of long voyages, produced, in a few years, a great multiplication of shipping. The sea was considered as the wealthy element; and, by degrees, a new kind of sovereignty arose, called *naval dominion*.

As the chief trade of Europe, so the chief maritime power, was at first in the hands of the Portuguese and Spaniards, who, by a compact to which the consent of other princes was not asked, had divided the newly-discovered countries between them: but the crown of Portugal having fallen to the king of Spain, or being seized by him, he was master of the shipping of the two nations with which he kept all the coasts of Europe in alarm, till the armada he had raised at a vast expense for the conquest of England was destroyed; which put a stop, and almost an end, to the naval power of the Spaniards.

At this time the Dutch, who were oppressed by the Spaniards, and feared yet greater evils than they felt, resolved no longer to endure the insolence of their masters; they therefore revolted, and, after a struggle in which they were assisted by the money and forces of Elizabeth, created an independent and powerful commonwealth.

When the inhabitants of the Low-Countries had formed their system of government, and some remission of the war gave them leisure to form schemes for future prosperity, they easily perceived, that, as their territories were narrow, and their numbers small, they could preserve themselves only by that power which is the consequence of wealth; and that by a people, whose country produced only the necessaries of life, wealth was not to be acquired but from foreign dominions, and by transportation of the products of one country into another.

From this necessity, thus justly estimated, arose a plan of commerce,

which was for many years prosecuted with an industry and success perhaps never seen in the world before; and by which the poor tenants of mud-walled villages, impassable bogs erected themselves into high and mighty states, whilst the greatest monarchs at defiance, whose alliance was courted by the proudest, and whose power was dreaded by the fiercest nations. By the establishment of this state, there arose to England a new ally, and a new rival.

When queen Elizabeth entered upon the government, the customs produced only 36,000*l.* a year: at the Restoration, they were let to farm for 400,000*l.* and produced considerably above double that sum before the Revolution. The people of London, before we had any plantations, and when our trade was inconsiderable, were computed about 100,000; at the death of queen Elizabeth, they were increased to 150,000, and are now above six times that number. In those days we had not only naval stores, but ships, from our neighbours. Germany furnished us with all things made of metal, even to nails; wine, paper, linen, and a thousand other things, came from France. Portugal furnished us with sugars: all the produce of America was brought to us from Spain; and the Venetians and Genoese retailed to us the commodities of the East-Indies at their own price. The legal interest of money was twelve per cent. and the common price of our land, ten or twelve years' purchase. We may add, that our manufactures were few, and those but indifferent; the number of English merchants very small; and our shipping much inferior to what lately belonged to the American colonies.

Great-Britain is, of all other countries, the most proper for trade; as well from its situation as an island, as from the freedom and excellency of its constitution, and from its natural products, and considerable manufactures. For exportation, our country produces many of the most substantial and necessary commodities; as butter, cheese, corn, cattle, wool, iron, lead, tin, copper, leather, copperas, pit-coal, alum, saffron, &c. Our corn sometimes preserves other countries from starving. Our horses are the most serviceable in the world, and highly valued by all nations for their hardiness, beauty, and strength. With beef, mutton, pork, poultry, biscuit, we victual not only our own fleets, but many foreign vessels that come and go. Our iron we export manufactured in great guns, carcasses, bombs, &c. Prodigious, and almost incredible is the value likewise of other goods from hence exported, viz. hops, flax, hemp, hats, shoes, household-stuff, ale, beer, red-herrings, pilchards, salmon, oysters, liquorice, watches, ribbands, toys, &c.

There is scarcely a manufacture in Europe but what is brought to great perfection in England. The woollen manufacture is the most considerable, and exceeds in goodness and quantity that of any other nation. Hardware is another capital article: locks, edge-tools, guns, swords, and other arms, are of superior excellence; household utensils of brass, iron, and pewter, also, are very great articles; and our clocks and watches are in great esteem.

Of the British commerce, that branch which we enjoyed exclusively, viz. the commerce with our colonies, was long regarded as the most advantageous. Yet, since the separation of the American States from Great Britain, the trade, the industry, and manufactures of the latter, have continually increased. New markets have opened, the returns from which are more certain and less tedious than those from America. By supplying a greater variety of markets, the skill and ingenuity of our artificers have taken a wider range; the productions of their labour have

been adapted to the wants, not of rising colonies, but of nations the most wealthy and the most refined; and our commercial system, no longer resting on the artificial basis of monopoly, has been rendered more solid as well as more liberal. The trade of England to the United States, in a variety of articles, is likewise very considerable.

The principal islands belonging to the English in the West Indies, are Jamaica, Barbadoes, St. Christopher's, Grenada, Antigua, St. Vincent, Dominica, Anguilla, Nevis, Montserrat, the Bermudas or Somers' Islands, and the Bahama or Lucayan Islands in the Atlantic ocean, besides Martinico and St. Lucia, lately taken from the French.

The English trade with their West-India Islands consists chiefly in sugars, rum, cotton, logwood, cocoa, coffee, pimento, ginger, indigo, materials for dyers, mahogany and manchineel planks, drugs and preserves; for these, the exports from England are shaburgs, a coarse kind of linen, with which the West-Indians now clothe their slaves; linen of all sorts, with broad-cloth and kerseys, for the planters, their overseers, and families; silks and stuffs for their ladies, and household servants; hats; red caps for their slaves of both sexes; stockings and shoes of all sorts; gloves and millinery ware, and perukes; laces for linen, woollen, and silks; strong beer, pale beer, pickles, candles, butter, and cheese; iron-ware, as saws, files, axes, hatchets, chisels, adzes, hoes, mattocks, gouges, planes, augurs, nails, lead, powder, and shot; brass and copper wares; toys, coals, and pantiles; cabinet-wares, snuffs; and in general whatever is raised or manufactured in Great Britain; also negroes from Africa, and all sorts of India goods.

The trade of England to the East Indies constitutes one of the most stupendous political as well as commercial machines that is to be met with in history. The trade itself is exclusive, and lodged in a company, which has a temporary monopoly of it, in consideration of money advanced to the government. This company exports to the East Indies all kinds of woollen manufacture, all sorts of hard-ware, lead, bullion, and quicksilver. Their imports consist of gold, diamonds, raw-silks, drugs, tea, pepper, artack, porcelain or China ware, salt-petre for home-consumption; and of wrought silks, muslins, calicoes, cottons, and all the woven manufactures of India, for exportation to foreign countries.

To Turkey, England sends, in her own bottoms, woollen cloths, tin, lead, and iron, hardware, iron utensils, clocks, watches, verdigris, spices, cochineal, and logwood. She imports from thence raw silks, carpets, skins, dyeing drugs, cotton, fruits, medicinal drugs, coffee, and some other articles. Formerly, the balance of this trade was about 500,000*l.* annually, in favour of England. The English trade was afterwards diminished through the practices of the French; but the Turkey trade at present is at a very low ebb with the French as well as the English.

England exports to Italy woollen goods of various kinds, peltry, leather, lead, tin, fish, and East-India goods; and brings back raw and thrown silk, wines, oil, soap, olives, oranges, lemons, pomegranates, dried fruits, colours, anchovies, and other articles of luxury: the balance of this trade, to England, is annually about 200,000*l.*

To Spain, England sends all kinds of woollen goods, leather, tin, lead, fish, corn, iron and brass manufactures, haberdashery wares, assortments of linen from Germany and elsewhere, for the American colonies; and receives in return, wines, oils, dried fruits, oranges, lemons, olives, wool, indigo, cochineal, and other dyeing drugs, colours, gold and silver coin.

of England, whose fleets and armies have more than once saved her from destruction. England sends to this country almost the same kind of merchandises as to Spain, and receives in return vast quantities of wines, with oils, salt, dried and moist fruits, dying drugs, and gold coin.

The treaty of commerce between England and France has been so variously represented, that it is not easy accurately to estimate its advantages; but whatever they were, a total suspension of them has now taken place, by the present war.

England sends to Flanders, Ferges, flannels, tin, lead, sugars, and tobacco; and receives in return, laces, linen, cambrics, and other articles of luxury, by which England loses upon the balance 250,000L. sterling yearly. To Germany England sends cloths and stuffs, tin, pewter, sugars, tobacco, and East-India merchandise; and brings thence vast quantities of linen, thread, goat-skins, tinned plates, timbers for all uses, wines, and many other articles. Before the late war, the balance of this trade was thought to be 500,000L. annually, to the prejudice of England: but that sum is now greatly reduced, as most of the German princes find it their interest to clothe their armies in English manufactures. I have already mentioned the trade with Denmark, Norway, Sweden, and Russia, which formerly was against England; but the balance was lately vastly diminished by the great improvements of her American colonies, in raising hemp, flax, making pot-ashes, iron-works, and tallow, all which used to be furnished to her by the northern powers. The goods exported to Poland, chiefly by the way of Dantzick, are many, and the duties upon them low. Many articles are sent thence, for which there is no longer any demand in other countries. Poland consumes large quantities of our woollen goods, hardware, lead, tin, salt, sea-coal, &c. and the export of manufactured tobacco is greater to Poland than to any other country. The balance of trade may be estimated much in our favour.

To Holland, England sends an immense quantity of many sorts of merchandise; such as all kinds of woollen goods, hides, corn, coals, East-India and Turkey commodities, tobacco, tar, sugar, rice, ginger, and other American productions; and makes return in fine linen, lace, cambrics, th. ea. l. tapes, intle, madder, boards, drugs, whalebone, train-oil, toys, and many other things; and the balance is usually supposed to be much in favour of England.

England sends to the coast of Guinea sundry sorts of coarse woollen and linen, iron, pewter, brass, and hardware manufactures, lead, shot, swords, knives, fire-arms, gun-powder, and glass manufactures. And, besides its drawing no money out of the kingdom, it lately supplied the African colonies with negro slaves, amounting in number to above 100,000 annually. The other returns are in gold-dust, gum, dying and other drugs, red-wood, guinea-grains, and ivory.

To Arabia, Persia, China, and other parts of Asia, England sends much foreign silver coin and bullion, and sundry English manufactures of woollen-goods, and of lead, iron, and brass; and brings home from those remote regions, muslins and cottons of many various kinds, callicoes, raw and wrought silk, chintz, teas, porcelain, gold-dust, coffee, salt-petre, and many other drugs. And so great a quantity of those various merchandises are exported to foreign European nations, as more than abundantly compensates for all the silver bullion which England carries out.

During the infancy of commerce to foreign parts, it was judged expedient to grant exclusive charters to particular bodies or corpora-

tions of men; hence the East-India, South-Sea, Hudson's-Bay, Turkey, Russia, Royal-African companies; but the trade to Turkey, Russia, and Africa, is now laid open; though the merchant who proposes to trade thither, must become a member of the company, be subject to their laws and regulations, and advance a small sum at admission, for the purpose of supporting consuls, forts, &c.

The balance of trade in favour of England has been estimated, many years ago, at three millions sterling. The increase of the commerce of this country will clearly appear from a comparative statement of the imports and exports at different periods; the value of which, including foreign merchandize and manufactures in the years undermentioned, was as follows:

	Imports.	Exports.
1772,	14,500,000l. ....	17,719,000l.
1783,	13,325,000l. ....	14,741,000l.
1792,	19,629,000l. ....	24,878,000l.
1797,	21,450,000l. ....	28,325,000l.

As the quantity of circulating specie may in some measure indicate the extent of commerce, we may judge of the increase of the latter, by comparing the sums which the three last monarchs found it necessary to coin. By George I. 8,725,921l. sterling, were coined. In the long reign (thirty-three years) of George II. 11,966,576l. sterling; and in the first twenty-four years of his present majesty's reign the sums coined amounted to 33,089,274l. sterling.

The inland trade is far more considerable, being valued at upwards of 42,000,000l. sterling. The coasting trade is said to give employment to about 100,000 people. The oyster fishery employs about 10,000.

Our bounds will not afford room to enter into a particular detail of the places where those English manufactures, which are mentioned in the above account, are fabricated; a few general strictures, however, may be proper.

Cornwall and Devonshire supply tin and lead; and woollen manufactures are common to almost all the western counties. Dorsetshire makes cordage for the navy, feeds an incredible number of sheep, and has large lace-manufactures. Somersetshire, besides furnishing lead, copper, and lapis calaminaris, has large manufactures of bone-lace, stockings, and caps. Bristol is said by some to employ 2000 vessels of all sizes, coasters as well as ships employed in foreign voyages: it has many very important manufactures; its glass-bottle and drinking-glass one alone occupying fifteen large houses: its brass-wire manufactures are also very considerable. Extensive manufactures of all kinds (glass, jewellery, clocks, watches, and cutlery, in particular) are carried on in London, and its neighbourhood; the gold and silver manufactures of London, through the encouragement given them by the court and the nobility, already equal, if they do not exceed, those of any country in Europe. Colchester is famous for its manufacture of bairie and serges. Exeter for serges and long ells; and Norwich for its excellent stuffs, camlets, druggets, and stockings. Birmingham, though no corporation, is one of the largest and most populous towns in England, and carries on an amazing trade in excellent and ingenious hardware manufactures, particularly snuff and tobacco-boxes, buttons, shoe-buckles, etwees, and many other sorts of steel and brass wares; it is here, and in Sheffield, which is famous for cutlery, that the true genius of Eng-

lish art and inventions for fabrications of iron manufactures in their iron works from 50 to 60,000 tons. #### A SHORT VIEW OF THE HISTORICAL SEA COMPANIES

In order to companies, it and particularly the current of affairs and activities of that answer all the to make this the credit of consists in its required. This this company be turned into are a kind of as well as coin The method

lish art and industry is to be seen; for such are their excellent inventions for fabricating hardwares, that they can afford them for a fourth part of the price at which other nations can furnish the same of an inferior kind: the cheapness of coals and all necessaries, and the convenience of situation, no doubt, contribute greatly to this. One company of iron manufacturers in Shropshire use every day 500 tons of coals in their iron works. In Great Britain there is made every year from 50 to 60,000 tons of pig-iron, and from 20 to 30,000 tons of bar-iron.

The northern counties of England carry on a prodigious trade in the coarser and slighter woollen manufactures; witness those of Halifax, Leeds, Wakefield, and Richmond; and, above all, Manchester, which, by its variety of beautiful cottons, dimities, ticken, checks, and the like stuffs, is become a large and populous place, though only a village, and its highest magistrate a constable. Beautiful porcelain and earthen-ware have of late years been manufactured in different places of England, particularly in Worcestershire and Staffordshire. The English carpets, especially those of Axminster, Wilton, and Kidderminster, though but a late manufacture, greatly excel in beauty any imported from Turkey, and are extremely durable; and consequently are a vast saving to the nation. Paper, which, till very lately, was imported in vast quantities from France and Holland, is now made in every corner of the kingdom.

The parliament, of late, has given encouragement for reviving the manufacture of salt-petre, which was first attempted in England by Sir Walter Raleigh, but was dropt afterwards in favour of the East-India company.

After all that has been said on this head, the seats of manufactures, and consequently of trade, in England, are fluctuating; they will always follow those places where living is cheap and taxes are easy: for this reason they have been observed of late to remove towards the northern counties, where provisions are in plenty, and the land-tax very low; add to this, that probably, in a few years, the inland navigations, which are opening in many parts of England, will make great improvements as to its internal state.

*A SHORT VIEW of the STOCKS, or PUBLIC FUNDS in ENGLAND, with an HISTORICAL ACCOUNT of the EAST-INDIA, the BANK, and the SOUTH-SEA COMPANIES.*

In order to give a clear idea of the money-transactions of the several companies, it is proper we should say something of money in general, and particularly of paper-money, and the difference between that and the current specie. Money is the standard of the value of all the necessaries and accommodations of life; and paper-money is the representative of that standard to such a degree, as to supply its place, and to answer all the purposes of gold and silver coin. Nothing is necessary to make this representative of money supply the place of specie, but the credit of that office or company who delivers it; which credit consists in its always being ready to turn it into specie whenever required. This is exactly the case of the Bank of England; the notes of this company are of the same value as the current coin, as they may be turned into it whenever the possessor pleases. From hence, as notes are a kind of money, the counterfeiting them is punished with death, as well as coining.

The method of depositing money in the Bank, and exchanging it for

notes (though they bear no interest), is attended with many conveniences, as they are not only safer than money in the hands of the owner himself, but as the notes are more portable, and capable of a much more easy conveyance, since a Bank-note for a very large sum may be sent by the post, and, to prevent the designs of robbers, may, without damage, be cut in two, and sent at two several times. Or bills, called Bank-post-bills, may be had by application to the Bank, which are particularly calculated to prevent losses by robberies, they being made payable to the order of the person who takes them out, at a certain number of days after sight; which gives an opportunity to stop bills at the Bank, if they should be lost, and prevents their being so easily negotiated by strangers, as common Bank-notes are: and whoever considers the hazard, the expence, and trouble, there would be in sending large sums of gold and silver to and from distant places, must also consider this as a very singular advantage. Besides which, another benefit attends them; for if they are destroyed by time, or other accident, the Bank will, on oath being made of such accident, and security being given, pay the money to the person who was in possession of them.

*Bank-notes* differ from all kinds of stock in these three particulars: 1. They are always of the same value. 2. They are paid off without being transferred: and, 3. They bear no interest; while *Stocks* are a share in a company's fund, bought without any condition of having the principal returned. *India-bonds* indeed (by some persons, though erroneously, denominated stock) are to be excepted; they being made payable at six months notice, either on the side of the company, or of the possessor.

By the word *Stock* was originally meant a particular sum of money contributed to the establishing a fund to enable a company to carry on a certain trade, by means of which the person became a partner in that trade, and received a share in the profit made thereby, in proportion to the money employed; But this term has been extended farther, though improperly, to signify any sum of money which has been lent to the government, on condition of receiving a certain interest till the money is repaid, and which makes a part of the national debt. As the security both of the government and the public companies is esteemed preferable to that of any private person; as stock is negotiable, and may be sold at any time; and as the interest is always punctually paid when due, they are enabled to borrow money at a lower interest than what might be obtained from lending it to private persons, where there is often some danger of losing both principal and interest.

But as every capital stock or fund of a company is raised for a particular purpose, and limited by government to a certain sum, it necessarily follows, that, when that fund is completed, no stock can be bought of the company; though shares, already purchased, may be transferred from one person to another. This being the case, there is frequently a great disproportion between the original value of the shares, and what is given for them when transferred; for if there are more buyers than sellers, a person who is indifferent about selling will not part with his share without a considerable profit to himself; and, on the contrary, if many are disposed to sell, and few inclined to buy, the value of such shares will naturally fall, in proportion to the impatience of those who want to turn their stock into specie.

These observations may serve to give our reader some idea of the nature of that unjustifiable and dishonest practice called *stock-jobbing*, the mystery of which consists in nothing more than this: the persons

concerned in the contracts to buy some particular as their contract rumours, and become unwilling are to receive stock

The persons of any real stock deliver the quantity such a sum of money stock was at when be at when the persons not worth 100,000 pounds in this case, call or tossing up, an

As the stock panies, are dist different nature with an account with the East-I

EAST-INDIA in queen Eliza Its shares, or f pital only 369. to make in 10 which the sha value, and the

concerned in that practice, who are denominated Stock-jobbers, make contracts to buy or sell, at a certain distant time, a certain quantity of some particular stock; against which time they endeavour, according as their contract is, either to raise or lower such stock, by spreading rumours, and fictitious stories, in order to induce people either to sell out in a hurry, and consequently cheap, if they are to deliver stock; or to become unwilling to sell it, and consequently to make it dearer, if they are to receive stock.

The persons who make these contracts are not in general possessed of any real stock; and when the time comes that they are to receive or deliver the quantity they have contracted for, they only receive or pay such a sum of money as makes the difference between the price the stock was at when they made the contract, and the price it happens to be at when the contract is fulfilled; and it is no uncommon thing for persons not worth 100 pounds to make contracts for the buying or selling 100,000 pounds stock. In the language of Exchange-Alley, the buyer is, in this case, called the Bull, and the seller the Bear; one is for raising or tossing up, and the other for lowering or trampling upon the stock.

Besides these, there is another set of men, who, though of a higher rank, may properly enough come under the same denomination. These are the great monied men, who are dealers in stock, and contractors with the government whenever any money is to be borrowed. These, indeed, are not fictitious but real buyers and sellers of stock; but by raising false hopes, or creating groundless fears, by pretending to buy or sell large quantities of stock on a sudden, by using the fore-mentioned set of men as their instruments, and other similar practices, they are enabled to raise or fall stocks one or two per cent. at pleasure.

However, the real value of one stock above another, on account of its being more profitable to the proprietors, or any thing that will really, or only in imagination, affect the credit of a company, or endanger the government by which that credit is secured, must naturally have a considerable effect on the stocks. Thus, with respect to the interest of the proprietors, a share in the stock of a trading company, which produces 5l. or 6l. per cent. per annum, must be more valuable than an annuity with government security, that produces no more than 3l. or 4l. per cent. per annum: and consequently such stock must sell at a higher price than such an annuity. Though it must be observed, that a share in the stock of a trading company, producing 5l. or 6l. per cent. per annum, will not fetch so much money at market as a government annuity producing the same sum, because the security of the company is not reckoned equal to that of the government, and the continuance of their paying so much per. annum is more precarious, as their dividend is, or ought to be, always in proportion to the profits of their trade.

As the stocks of the East-India, the Bank, and the South-Sea companies, are distinguished by different denominations, and are of a very different nature, we shall give a short history of each of them, together with an account of the different stocks each is possessed of, beginning with the East-India company, as the first established.

**EAST-INDIA COMPANY.]** The first idea of this company was formed in queen Elizabeth's time; but it has since undergone great alterations. Its shares, or subscriptions, were originally only 50l. sterling, and its capital only 369,891l. 5s. but the directors having a considerable dividend to make in 1676, it was agreed to join the profits to the capital; by which the shares were doubled, and consequently each became of 100l. value, and the capital 739,782l. 10s. to which capital, if 963,639l. the

profits of the company to the year 1685, be added, the whole stock will be found to be 1,703,102l. Though the establishment of this company was vindicated in the clearest manner by sir Josiah Child, and other able advocates: yet the partiality which the duke of York, afterwards James II. had for his favourite African trade; the losses it sustained in wars with the Dutch; and the revolutions which had happened in the affairs of Hindostan, damped the ardour of the people to support it; so that at the time of the revolution, when the war broke out with France, it was in a very indifferent situation. This was in a great measure owing to its having no parliamentary sanction; in consequence of which, its stock often sold for one half less than it was really worth; and it was resolved that a new company should be erected under the authority of parliament.

The opposition given to all the public-spirited measures of king William, by faction, rendered this proposal a matter of considerable difficulty; but at last, after many parliamentary inquiries, the new subscription prevailed; and the subscribers, upon advancing two millions to the public at 8 per cent. obtained an act of parliament in their favour. The old company, however, retained a great interest both in the parliament and nation; and the act being found in some respects defective, so violent a struggle between the two companies arose, that, in the year 1702, they were united by an indenture tripartite. In the year 1708, the yearly fund of 8 per cent. for two millions, was reduced to 5 per cent. by a loan of 1,200,000l. to the public, without an additional interest; for which consideration the company obtained a prolongation of its exclusive privileges; and a new charter was granted to them, under the title of "The United Company of Merchants trading to the East Indies." Its exclusive right of trade was prolonged from time to time; and a farther sum was lent by the company in 1730; by which, though the company's privileges were extended for thirty-three years, yet the interest of their capital, which then amounted to 3,190,000l. was reduced to 3 per cent. and called the India 3 per cent. annuities.

Those annuities are different from the trading stock of the company, the proprietors of which, instead of receiving a regular annuity, have, according to their different shares, a dividend of the profits arising from the company's trade: and that dividend rises or falls according to the circumstances of the company, either real, or, as is too often the case, pretended. A proprietor of stock to the amount of 1000l. whether man or woman, native or foreigner, has a right to be a manager, and to give a vote in the general council. Two thousand pounds is the qualification for a director. The directors are twenty-four in number, including the chairman, and deputy-chairman, who may be re-elected in turn, six a year, for four years successively. The chairman has a salary of 200l. a year, and each of the directors 150l. The meetings, or courts of directors, are to be held at least once a week; but are commonly oftener, being summoned as occasion requires. Out of the body of directors are chosen several committees, who have the peculiar inspection or certain branches of the company's business; as the committee of correspondence, a committee of treasury, a house committee, a committee of warehouse, a committee of shipping, a committee of accounts, a committee of law-suits, and a committee to prevent the growth of private-trade; who have under them a secretary, cashier, clerks, and warehouse-keepers.

Secondly, the regulating the conduct of the company's servants in India, in order to remedy the evils which have prevailed there.

Thirdly, the providing for the punishment of those persons who shall nevertheless continue in the practice of crimes which have brought disgrace upon the country.

Accordingly, six persons are to be nominated by the king as commissioners for the affairs of India, of whom one of the secretaries of state, and the chancellor of the exchequer for the time being, shall be two; and the president is to have the casting vote, if equally divided. New commissioners to be appointed at the pleasure of the crown. This board is to superintend, direct, and controul all acts, operations, and concerns, which in any wise relate to the civil and military government or revenues of the British territorial possessions in the East Indies. They are sworn to execute the several powers and trusts reposed in them, without favour or affection, prejudice or malice, to any person whatever. The court of directors of the company are to deliver to this board all minutes, orders, and resolutions of themselves, and of the courts of proprietors, and copies of all letters, orders, and instructions, proposed to be sent abroad, for their approbation or alteration; none to be sent until after such previous communication, on any pretence whatsoever. The directors are still to appoint the servants abroad; but the king has a power, by his secretary of state, to recall either of the governors or members of the councils, or any person holding any office under the company in their settlements, and make void their appointment. By this bill there is given to the governor and council of Bengal a controul over the other presidencies, in all points which relate to any transactions with the country powers, to peace and war; or to the application of their forces or revenues; but the council of Bengal are subjected to the absolute direction of the company at home, and, in all cases, except those of immediate danger and necessity, restrained from acting without orders received from hence.

Soon after the passing of this act, Mr. Dundas, who had long given unwearied application to the affairs of India, being placed at the head of the board of controul, introduced the laudable practice of bringing annually before a committee of the house of commons a statement of the financial concerns of the company abroad, exhibiting the balance upon the comparison of the revenues and charges of the several settlements. As the company's right to their exclusive trade was, by an act passed in 1781, to terminate in March 1794, it became necessary to make provision for that event; which was effectually done by Mr. Dundas's bill proposed the 25th of February 1793, which, meeting the approbation of parliament, had the singular good fortune of giving equal satisfaction to the public and the company: to the public, because instead of 400,000*l.* they were to receive 500,000*l.* per annum, from the revenues of India; and to the company, because they were still to preserve their power and privileges, as far as they contributed to promote the interests of their commerce.

The information which preceded or accompanied this salutary bill gave the most favourable view of the company's affairs, and of the great national benefits which have already occurred, and which might be expected in future to flow in still greater abundance from the Indian trade and territory. The revenues of the countries ceded to the company, by Tippoo Sultan, were stated at 300,000*l.*; and the future revenues of the British possessions in India were estimated at nearly

7,000,000l.; leaving a net surplus, after deducting the interest on the debts in India, and the civil, military and commercial charges of 1,050,000l. per annum. The annual sales of India goods in Europe were estimated at nearly 5,000,000l. which exceeds the prime cost and charges, by 743,600l.; and the net surplus on the whole of the revenues and trade of the East-India company, after paying 8 per cent. dividend on the capital stock of 5,000,000l. is estimated at 1,239,241l. per annum.

In July 1797, Mr. Dundas stated the total amount of the foreign revenues at 8,154,872l. and the charges upon them at 6,517,057l. leaving a net surplus of 1,637,815l. He, at the same time, stated the amount of the receipts and sales of company at home, at 7,316,916l.

**BANK OF ENGLAND.** The company of the Bank was incorporated by parliament, in the 5th and 6th years of king William and queen Mary, by the name of the Governors and Company of the Bank of England, in consideration of the loan of 1,200,000l. granted to the government; for which the subscribers received almost 8 per cent. By this charter, the company are not to borrow under their common seal, unless by act of parliament; they are not to trade, or suffer any person in trust for them to trade, in any goods or merchandize; but they may deal in bills of exchange, in buying or selling bullion, and foreign gold and silver coin.

By an act of parliament passed in the 8th and 9th years of William III. they were empowered to enlarge their capital stock to 2,201,171l. 10s. It was then also enacted, that Bank stock should be a personal and not a real estate; that no contract, either in word or writing, for buying or selling Bank stock, should be good in law, unless registered in the books of the Bank within seven days, and the stock transferred in fourteen days; and that it should be felony, without the benefit of clergy, to counterfeit the common seal of the Bank, or any sealed Bank-bill, or any Bank-note, or to alter or erase such bills or notes.

By another act passed in the 7th of queen Anne, the company were empowered to augment their capital to 4,402,343l. and they then advanced 400,000l. more to the government; and in 1714, they advanced another loan of 1,500,000l.

In the third year of the reign of king George I. the interest of their capital stock was reduced to 5 per cent. when the Bank agreed to deliver up as many Exchequer bills as amounted to 2,000,000l. and to accept an annuity of 100,000l.; and it was declared lawful for the Bank to call from their members, in proportion to their interests in their capital stock, such sums of money as in a general court should be found necessary. If any member should neglect to pay his share of the monies so called for, at the time appointed, by notice in the London Gazette, and fixed upon the Royal Exchange, it should be lawful for the Bank not only to stop the dividend of such a member, and to apply it toward payment of the money in question, but also to stop the transfers of the share of such defaulter, and to charge him with the interest of 5 per cent. per annum, for the money so omitted to be paid; and if the principal and interest should be three months unpaid, the Bank should then have power to sell so much of the stock belonging to the defaulter as would satisfy the same.

After this, the Bank reduced the interests of the 2,000,000l. lent to the government, from 5 to 4 per cent. and purchased several other annuities, which were afterwards redeemed by the government, and the national

debt, due to the Bank, reduced to 1,600,000*l.* But in 1742, the company engaged to supply the government with 1,600,000*l.* at 3 per cent. which is now called the 3 per cent. annuities; so that the government was now indebted to the company 3,200,000*l.* the one half carrying 4, and the other 3 per cent.

In the year 1746, the company agreed that the sum of 986,800*l.* due to them in the Exchequer bills unsatisfied, on the duties for licences to sell spirituous liquors by retail, should be cancelled, and in lieu thereof to accept an annuity of 39,442*l.* the interest of that sum at 4 per cent. The company also agreed to advance the farther sum of 1,000,000*l.* into the Exchequer, upon the credit of the duties arising by the malt and land-tax, at 4 per cent. for Exchequer bills to be issued for that purpose; in consideration of which, the company were enabled to augment their capital with 986,800*l.* the interest of which, as well as that of the other annuities, was reduced to three and a half per cent. till the 25th of December, 1757, and from that time to carry only 3 per cent.

And in order to enable them to circulate the said Exchequer bills, they established what is now called Bank circulation; the nature of which not being well understood, we shall take the liberty to be a little more particular in its explanation than we have been with regard to the other stocks.

The company of the Bank are obliged to keep cash sufficient to answer not only the common, but also any extraordinary demand that may be made upon them; and whatever money they have by them over and above the sum supposed necessary for these purposes, they employ in what may be called the trade of the company; that is to say, in discounting bills of exchange, in buying of gold and silver, and in government securities, &c. But when the Bank entered into the above-mentioned contract, as they did not keep unemployed a larger sum of money than what they deemed necessary to answer their ordinary and extraordinary demands, they could not conveniently take out of their current cash so large a sum as a million, with which they were obliged to furnish the government, without either lessening that sum they employed in discounting, buying gold and silver, &c. (which would have been very disadvantageous to them), or inventing some method that should answer all the purposes of keeping the million in cash. The method which they chose, and which fully answers their end, was as follows:

They opened a subscription, which they renew annually, for a million of money, wherein the subscribers advance 10 per cent. and enter into a contract to pay the remainder, or any part thereof, whenever the Bank shall call upon them, under the penalty of forfeiting the 10 per cent. so advanced; in consideration of which, the Bank pays the subscribers 4 per cent. interest for the money paid in, and one fourth per cent. for the whole sum they agree to furnish; and in case a call should be made upon them for the whole or any part thereof, the Bank farther agrees to pay them at the rate of 5 per cent. per annum for such sum, till they repay it; which they are under an obligation to do at the end of the year. By this means the Bank obtains all the purposes of keeping a million of money by them; and though the subscribers, if no call is made upon them (which is in general the case), receive six and a half per cent. for the money they advance, yet the company gains the sum of 23,500*l.* per annum by the contract: as will appear by the following account:

The Bank receives from the government for the advance of a million	} £. 30,000
The Bank pays to the subscribers who advance 100,000l. and engage to pay (when called for) 900,000l. more	
<hr/>	
The clear gain to the Bank therefore is	£. 29,500

This is the state of the case, provided the company should make no call on the subscribers, which they will be very unwilling to do, because it would not only lessen their profit, but affect the public credit in general.

Bank stock may not improperly be called a trading stock, since with this they deal very largely in foreign gold and silver, in discounting bills of exchange\*, &c. Besides which, they are allowed by the government very considerable sums annually, for the management of the annuities paid at their office: all which advantages render a share in their stock very valuable, though it is not equal in value to the East-India stock. The company make dividends of the profits half-yearly, of which notice is publicly given, when those who have occasion for their money may readily receive it: but private persons, if they judge convenient, are permitted to continue their funds, and to have their interest added to the principal†.

We shall here give a brief account of some recent events of considerable importance in the history of this great company. In the beginning of the year 1797, a scarcity of specie prevailing, and an alarm having been excited by the reports of an invasion, the run became so great on several banks in the north, that they were unable to make their payments, and obliged to draw largely on the Bank, which having before advanced great sums to government for foreign loans and public services, found the drain of its specie so great as to be compelled to represent the pressing necessity of the case to the minister. An order of the privy-council was in consequence issued, prohibiting the Bank from paying in specie, either notes or dividends; and a bill was brought into parliament to sanction this order, and extend the prohibition to the 24th of June following; after which, it was still further extended to one month after the next session of parliament; and in that session continued till one month after the termination of the present war. The Bank is, however, allowed to resume its payments in cash at any intermediate period, by communicating its intention to the speaker of the house of commons, and giving one month's notice. To facilitate commercial intercourse, bank-notes of one and two pounds were issued, and Spanish dollars, stamped by the Bank, were made current at 4s. 9d. But this being above their real value, and the price of silver soon after falling, such numbers of counterfeit stamps appeared, that it was judged advisable to call them all in; which was done, the Bank advertising, the beginning of October 1797, that they would give cash for them till the last day of that month, but no longer. After the first week, as it was apparent that a considerable loss must be sustained by the lower and middling classes if all the counterfeit stamps were refused, the Bank, much to its honour, consented to receive all that were not base silver.

On the occasion of this prohibition of payment, a secret committee of the House of Commons was appointed to examine the state of the

\* At 4 per cent, till the year 1743, when it was advanced to 5.

† The Bank-Company is supposed to have now twelve millions of circulating paper,

outstanding demands on the Bank of England, and its funds for discharging the same. The statement of these demands and funds, to the 25th of February 1797, was as follows:

Outstanding demands .....	£. 13,770,390
Funds for discharging those demands, not including the permanent debt due from government, of 11,686,800l.* which bears an interest of three per cent. † .....	17,597,286
Surplus of effects of the Bank, exclusive of the above-mentioned permanent debt of 11,686,800l. }	£. 3,826,890

This company is under the direction of a governor, deputy-governor, and twenty-four directors, who are annually elected by the general-court, in the same manner as in the East-India company. Thirteen, or more, compose a court of directors for managing the affairs of the company.

**SOUTH-SEA COMPANY.]** During the long war with France in the reign of queen Anne, the payment of the sailors of the royal navy being neglected, and they receiving tickets instead of money, were frequently obliged by their necessities to sell these tickets to avaricious men, at a discount of 40l. and sometimes 50l. per cent. By this and other means, the debts of the nation, unprovided for by parliament, and which amounted to 9,471,321l. fell into the hands of these usurers. On which Mr. Harley, at that time chancellor of the exchequer, and afterwards earl of Oxford, proposed a scheme to allow the proprietors of these debts and deficiencies 6l. per annum, and to incorporate them, in order to their carrying on a trade to the South-Sea; and they were accordingly incorporated under the title of "The Governor and Company of Merchants of Great Britain trading to the South-Seas, and other parts of America, and for encouraging the fishery," &c.

Though this company seemed formed for the sake of commerce, it is certain that the ministry never thought seriously, during the course of the war, about making any settlement on the coast of South America, which was what flattered the expectations of the people: nor was it indeed ever carried into execution, or any trade ever undertaken by this company, except the Assiento, in pursuance of the treaty of Utrecht, for furnishing the Spaniards with negroes, of which this company was

\* This debt arises, and is formed by the following items:

The original sum at the time the charter was granted.....	£. 1,200,000
Further sum lent to Government in 1709.....	400,000
Ditto, in 1742 .....	1,600,000
Now called the original fund .....	3,200,000
Residue of 2,000,000l. Exchequer bills cancelled in 1716 .....	500,000
South-Sea stock purchased in 1722 .....	4,000,000
Loan to Government in 1728 .....	1,750,000
Ditto, in 1729 .....	1,250,000
Ditto, in 1746 .....	986,800
	£. 11,686,800

† Of the outstanding demands, the Bank-notes in circulation amounted to 8,640,250l. and the drawing account unpaid dividends, Exchequer bills, and other debts, to 5,150,140l. The funds for discharging these consisted of advances on Government-security, to the amount of 10,672,450l.; and cash, bullion, bills discounted, and other credits, to the amount of 6,924,750l.

deprived, upon receiving 100,000*l.* in lieu of all claims upon Spain, by a convention between the courts of Great Britain and Spain, soon after the treaty of Aix-la-Chapelle, in 1748.

Some other sums were lent to the government in the reign of queen Anne, at 6 per cent. In the third of George I. the interest of the whole was reduced to 5 per cent. and they advanced two millions more to the government at the same interest. By the statute of the 6th of George I. it was declared, that this company might redeem all or any of the redeemable national debts; in consideration of which, the company were empowered to augment their capital according to the sums they should discharge: and for enabling them to raise such sums for purchasing annuities, exchanging for ready money new Exchequer bills, carrying on their trade, &c. they might, by such means as they should think proper, raise such sums of money as in a general court of the company should be judged necessary. The company were also empowered to raise money on the contracts, bonds, or obligations under their common-seal, on the credit of their public stock. But if the sub-governor, deputy-governor, or other members of the company, should purchase lands or revenues of the crown upon account of the corporation, or lend money by loan or anticipation on any branch of the revenue, other than such part only on which a credit of loan was granted by parliament, such sub-governor, or other member of the company, should forfeit triple the value so lent.

The fatal South-Sea scheme, transacted in the year 1720, was executed upon the last-mentioned statute. The company had at first set out with good success; and the value of their stock, for the first five years, had risen faster than that of any other company; and his majesty, after purchasing 10,000*l.* stock, had condescended to be their governor. Things were in this situation, when, taking advantage of the above statute, the South-Sea bubble was projected; the pretended design of which was, to raise a fund for carrying on a trade to the South-Sea, and purchasing annuities, &c. paid to the other companies: and proposals were printed and distributed, showing the advantages of the design, and inviting persons into it. The sum necessary for carrying it on, together with the profits that were to arise from it, were divided into a certain number of shares, or subscriptions, to be purchased by persons disposed to adventure therein. And the better to carry on the deception, the directors engaged to make very large dividends, and actually declared that every 100*l.* original stock would yield 50*l.* per annum; which occasioned so great a rise of their stock, that a share of 100*l.* was sold for upwards of 800*l.* This was in the month of July; but before the end of September, it fell to 150*l.* by which multitudes were ruined, and such a scene of distress occasioned, as is scarcely to be conceived. Most of the directors were severely fined, to the loss of nearly all their property; even those who had no share in the deception, because they ought to have opposed and prevented it.

By a statute of the 6th of George II. it was enacted, that, from and after the 24th of June, 1733, the capital stock of this company, which amounted to 14,651,103*l.* 8*s.* 1*d.* and the shares of the respective proprietors, should be divided into four equal parts; three-fourths of which should be converted into a joint stock, attended with annuities after the rate of 4 per cent. until redemption by parliament, and should be called the New-South-Sea annuities, and the other fourth part should remain in the company as a trading capital stock, attended with the residue of the annuities or funds payable at the exchequer to the company for their

whole capital, till redemption; and attended with the same sums always allowed for the charge of management, with all effects, profits of trade, debts, privileges, and advantages, belonging to the South-Sea company: that the accountant of the company should, twice every year, at Christmas and Midsummer, or within one month after, state an account of the company's affairs, which should be laid before the next general court, in order to their declaring a dividend; and all dividends should be made out of the clear profits, and should not exceed what the company might reasonably divide without incurring any further debt; provided that the company should not at any time divide more than 4 per cent. per annum, untill their debts were discharged; and the South-Sea company, and their trading stock, should, exclusively from the new joint stock of annuities, be liable to all debts and incumbrances of the company; and that the company should cause to be kept, within the city of London, an office and books, in which all transfers of the new annuities should be entered, and signed by the party making such transfer, or his attorney; and the person to whom such transfer should be made, or his attorney, should underwrite his acceptance; and no other method of transferring the annuities should be good in law.

The annuities of this company, as well as the other, are now reduced to 3l. per cent.

This company is under the direction of a governor, sub-governor, deputy-governor, and twenty-one directors; but no person is qualified to be governor, his majesty excepted, unless such governor has, in his own name and right, 5000l. in the trading stock; the sub-governor is to have 4000l. the deputy-governor 3000l. and a director 2000l. in the same stock. In every general court, every member having, in his own name and right, 500l. in trading stock, has one vote; if 2000l. two votes; if 3000l. three votes, and if 5000l. four votes.

The East-India company, the Bank of England, and the South-Sea company, are the only incorporated bodies to which the government is indebted, except the million bank, whose capital is only one million, constituted to purchase the reversion of the long Exchequer orders.

The interest of all the debts owing by the government was some years since reduced to 3 per cent. excepting only the annuities for the year 1758, the *me-annuit.es*, and the exchequer orders; but the South-Sea company still continues to divide 4 per cent. on their present capital stock, which they are enabled to do from the profits they make on the sums allowed to them for management of the annuities paid at their office, and from the interest of annuities which are not claimed by the proprietors.

As the prices of the different stocks are continually fluctuating above and below *par*; so when a person, who is not acquainted with transactions of that nature, reads in the papers the prices of stocks, where Bank stock is marked perhaps 127, India ditto 134 or 134½, South-Sea ditto 97½, &c. he is to understand that 100l. of those respective stocks fell at such a time for those several sums.

In comparing the prices of the different stocks one with another, it must be remembered, that the interest due on them from the time of the last payment is taken into the current price, and the seller never receives any separate consideration for it, except in the case of India bonds, where the interest due is calculated to the day of the sale, and paid by the purchaser, over and above the premium agreed for. But as the interest on the different stocks is paid at different times, this, if not rightly understood, would lead a person, not well acquainted with them, into considerable mistakes in his computation of their value; some al-

ways having a quarter makes an appearance reality there is none at all for 85½l. or 85½l. 84½l. or 84½l. 15s. the per cent.; but the old them than the new ar- cance. There is, how species of annuities se same real value; one o and there not being, f buy into them, as int is apprehended that debt, they will begin tal of which is the fir

While the annuit paid, and the princi not to be had in othe and all Europe be in nies will be converte can never want cash nations, credit is fou or that of the people interest of both prin

CONSTITUTION A tion as that of Engla be in theory, it will rience has proved th to antiquity, the E It must at the same time, many amend are the same with as belonging to th the English nation. the name of Goth Saxons, who came their laws and ma tioned by Tacitus. conquered lands, i abilities to serve hi considered as the co ing against all inv leaders, the old inv last assumed the ti quered. This chan the Britons, and th create their power military affairs.

All civil matter ficers and the peo were appointed. The subdivision of division of hundre and overseers we The sheriff was t

annuities having a quarter's interest due on them more than others, which makes an appearance of a considerable difference in the price, when in reality there is none at all; thus, for instance, Old South-Sea annuities sell for 85*l.* or 85*l.* 10*s.* while New South-Sea annuities fetch only 84*l.* or 84*l.* 15*s.* though each of them produces the annual sum of 3 per cent.; but the old annuities have a quarter's interest more due on them than the new annuities, which amounts to 15*s.* the exact difference. There is, however, one or two causes that will always make one species of annuities sell somewhat lower than another, though of the same real value; one of which is, the annuities making but a small capital, and there not being, for that reason, so many people at all times ready to buy into them, as into others where the quantity is larger; because it is apprehended that whenever the government pays off the national debt, they will begin with that particular species of annuity, the capital of which is the smallest.

While the annuities, and interest for money advanced, are regularly paid, and the principal insured by both prince and people (a security not to be had in other nations), foreigners will lend us their property, and all Europe be interested in our welfare; the paper of the companies will be converted into money and merchandise, and Great Britain can never want cash to carry her schemes into execution. In other nations, credit is founded on the word of the prince, if a monarchy; or that of the people, if a republic; but here it is established on the interest of both prince and people, which is the strongest security.

[CONSTITUTION AND LAWS.] Tacitus, in describing such a constitution as that of England, seems to think, that, however beautiful it may be in theory, it will be found impracticable in the execution. Experience has proved this to be a mistake; for, by contrivances unknown to antiquity, the English constitution has existed for above 500 years. It must at the same time be admitted, that it has received, during that time, many amendments, and some interruptions; but its principles are the same with those described by the above-mentioned historian, as belonging to the Germans, and the other northern ancestors of the English nation, and which are very improperly blended under the name of Gothic. On the first invasion of England by the Saxons, who came from Germany and the neighbouring countries, their laws and manners were pretty much the same as those mentioned by Tacitus. The people had a leader in time of war. The conquered lands, in proportion to the merits of his followers, and their abilities to serve him, were distributed among them; and the whole was considered as the common property, which they were to unite in defending against all invaders. Fresh adventurers coming over under separate leaders, the old inhabitants were driven into Wales; and those leaders at last assumed the titles of kings over the several districts they had conquered. This change of appellation made them more respectable among the Britons, and their neighbours the Scots and Picts, but did not increase their power, the operations of which continued to be confined to military affairs.

All civil matters were proposed in a general assembly of the chief officers and the people, till, by degrees, sheriffs and other civil officers were appointed. To Alfred we owe that master-piece of judicial policy, the subdivision of England into wapentakes and hundreds, and the subdivision of hundreds into tithings, names that still subsist in England; and overseers were chosen to direct them for the good of the whole. The sheriff was the judge of all civil and criminal matters within the

the throne of these kingdoms depends, is, "that the crown, by common law and constitutional custom, is hereditary, and this in a manner peculiar to itself; but that the right of inheritance may, from time to time, be changed, or limited, by act of parliament: under which limitations the crown still continues hereditary."

That the reader may enter more clearly into the deduction of the following royal succession, by its being transferred from the house of Tudor to that of Stuart, it may be proper to inform him, that, on the death of queen Elizabeth without issue, it became necessary to recur to the other issue of her grandfather Henry VII. by Elizabeth of York his queen, whose eldest daughter Margaret having married James IV. king of Scotland, king James the Sixth of Scotland, and of England the First, was the lineal descendant from that alliance. So that in his person, as clearly as in Henry VIII. centred all the claims of the different competitors from the Norman invasion downward: he being indisputably the lineal heir of William I. And, what is still more remarkable, in his person also centred the right of the Saxon monarchs, which had been suspended from the Norman invasion till his accession. For Margaret, the sister of Edgar Atheling, the daughter of Edward the Outlaw, and grand-daughter of king Edmund Ironside, was the person in whom the hereditary right of the Saxon kings (supposing it not abolished by the Conquest) resided. She married Malcolm III. king of Scotland; and Henry II. by a descent from Matilda their daughter, is generally called the restorer of the Saxon line. But it must be remembered, that Malcolm, by his Saxon queen, had sons as well as daughters; and that the royal family of Scotland, from that time downward, were the offspring of Malcolm and Margaret. Of that royal family king James I. was the direct and lineal descendant; and therefore united in his person every possible claim, by hereditary right, to the English as well as Scottish throne, being the heir both of Egbert and William the Norman.

At the Revolution in 1688, the convention of estates, or representative body of the nation, declared that the misconduct of king James II. amounted to an abdication of the government, and that the throne was thereby vacant.

In consequence of this vacancy, and from a regard to the ancient line, the convention appointed the next protestant heirs of the blood-royal of king Charles I. to fill the vacant throne, in the old order of succession; with a temporary exception, or preference to the person of king William III.

On the impending failure of the protestant line of king Charles I. (whereby the throne might again have become vacant) the king and parliament extended the settlement of the crown to the protestant line of king James I. viz. to the princess Sophia of Hanover, and the heirs of her body, being protestants; and she is now the common stock, from whom the heirs of the crown must descend\*.

The true ground and principle, upon which the Revolution proceeded, was entirely a new case in politics, which had never before happened in our history; the abdication of the reigning monarch, and the vacancy of the throne thereupon. It was not a defeasance of the right of succession, and a new limitation of the crown, by the king and both houses of parliament; it was the act of the nation alone, upon a conviction that there was

\* A chronology of English Kings, since the time that this country became united under one monarchy, in the person of Egbert, who subdued the other princes of the

no king in being. For in a full assembly of the lords and commons, met in convention upon the supposition of this vacancy, both houses came to this resolution; "that king James II. having endeavoured to subvert the constitution of the kingdom, by breaking the original contract between king and people; and, by the advice of Jesuits and other wicked persons, having violated the fundamental laws, and having withdrawn

Saxon heptarchy, and gave the name Angle-land to this part of the island; the Saxons and the Angles having, about four centuries before, invaded and subdued the ancient Britons, whom they drove into Wales and Cornwall.

himself out of this kingdom, has abdicated the government; and that the throne is thereby vacant." Thus ended at once, by this sudden and unexpected revolution, the old line of succession, which, from the Norman invasion, had lasted above 600 years, and from the union of the Saxon heptarchy in king Egbert, almost 900.

Though in some points the revolution was not so perfect as might have been wished, yet from thence a new æra commenced, in which the bounds of prerogative and liberty have been better defined, the principles of government more thoroughly examined and understood, and the rights of the subject more explicitly guarded by legal provisions, than in any other period of the English history. In particular, it is worthy observation, that the convention, in this their judgment, avoided with great wisdom the extremes into which the visionary theories of some zealous republicans would have led them. They held that this misconduct of king James amounted to an endeavour to subvert the constitution, and not to an actual subversion or total dissolution of the government. They, therefore, very prudently voted it to amount to no more than an abdication of the government, and a consequent vacancy of the throne; whereby the government was allowed to subsist, though the executive magistrate was gone; and the kingly office to remain, though James was no longer king. And thus the constitution was kept entire; which, upon every sound principle of government, must otherwise have fallen to pieces, had so principal and constituent a part as the royal authority been abolished, or even suspended.

Hence it is easy to collect, that the title to the crown is at present hereditary, though not quite so absolutely hereditary as formerly; and the common stock or ancestor, from whom the descent must be derived, is also different. Formerly the common stock was king Egbert; then William the Conqueror; afterward, in James I.'s time, the two common stocks united, and so continued till the vacancy of the throne in 1688; now it is the princess Sophia, in whom the inheritance was vested by the new king and parliament. Formerly the descent was absolute, and the crown went to the next heir without any restriction; but now, upon the new settlement, the inheritance is conditional; being limited to such heirs only of the body of the princess Sophia as are protestant members of the church of England, and are married to none but protestants.

And in this due medium consists the true constitutional notion of the

right of succession to the imperial crown of these kingdoms. The extremes between which it steers have been thought each of them to be destructive of those ends for which societies were formed and are kept on foot. Where the magistrate, upon every succession, is elected by the people, and may, by the express provision of the laws, be deposed (if not punished) by his subjects, this may sound like the perfection of liberty, and look well enough when delineated on paper: but in practice will be ever found extremely difficult and dangerous. On the other hand, divine indefeasible hereditary right, when coupled with the doctrine of unlimited passive obedience, is surely, of all constitutions, the most thoroughly slavish and dreadful. But when such an hereditary right as our laws have created and vested in the royal stock is closely interwoven with those liberties which are equally the inheritance of the subject, this union will form a constitution, in theory the most beautiful of any, in practice the most approved, and, in all probability, in duration the most permanent. This constitution it is the duty of every Briton to understand, to revere, and to defend.

The principal duties of the king are expressed in his oath at the coronation, which is administered by one of the archbishops or bishops of the realm, in the presence of all the people, who, on their parts, do reciprocally take the oath of allegiance to the crown. This coronation oath is conceived in the following terms:

"*The archbishop, or bishop, shall say, Will you solemnly promise and swear to govern the people of this kingdom of England, and the dominions thereunto belonging, according to the statutes in parliament agreed on, and the laws and customs of the same?—The king or queen shall say, I solemnly promise so to do.*

"*Archbishop or bishop. Will you, to your power, cause law and justice, in mercy, to be executed in all your judgments?—King or queen. I will.*

"*Archbishop or bishop. Will you to the utmost of your power maintain the laws of God, the true profession of the gospel, and the protestant reformed religion established by the law? And will you preserve unto the bishops and clergy of this realm, and to the churches committed to their charge, all such rights and privileges as by the law do or shall appertain unto them, or any of them?—King or queen. All this I promise to do.*

"*After this, the king or queen, laying his or her hand upon the holy gospel, shall say, The things which I have here before promised, I will perform and keep: so help me God. And then kiss the book.*"

This is the form of the coronation oath, as it is now prescribed by our laws: and we may observe, that, in the king's part in this original contract, are expressed all the duties that a monarch can owe to his people; viz. to govern according to law; to execute judgment in mercy; and to maintain the established religion. With respect to the latter of these three branches, we may farther remark, that by the act of union, 5 Anne, c. 8, two preceding statutes are recited and confirmed; the one of the parliament of Scotland, the other of the parliament of England; which enact, the former, that every king at his accession shall take and subscribe an oath, to preserve the protestant religion, and presbyterian church government in Scotland: the latter, that, at his coronation, he shall take and subscribe a similar oath, to preserve the settlement of the church of England within England, Ireland, Wales, and Berwick, and the territories thereunto belonging.

The king of Great Britain, notwithstanding the limitations of the power of the crown, already mentioned, is the greatest monarch reigning

over a free people. He makes it high treason to can he, in himself, be cognizance of his act, they infringe the laws, though he has no right limits or the boundaries no new laws, nor raise the laws; but he can do; make treaties of peace, for the defence of the suppression of robbery by sea and land, or castles, &c.; summon a prorogue, or dissolve if it has passed both houses no more force than it gives that the kings of He possesses the right the great officers of fine, is the fountain of knighthood are derived Great Britain.

OF THE PARLIAM shape, are, as has been government in this instance, in his valuable in the main the constituted out so long ago a Charter granted by the archbishops, bishops, all other tenants in to meet at a certain scutages when needed at least from the year writs of that date, parliament."

The parliament is not be intermitted a sitting there in his realm; the lords of the king in one another. The king incorporation or body to be *caput, principis* king meets them, there can be no power of dissolving

It is highly necessary that the executive the legislature. The present established institutions suggested are therefore cannot now has by law, v

over a free people. His person is sacred in the eye of the law, which makes it high treason to murder as to imagine or intend his death; neither can he, in himself, be deemed guilty of any crime; the law taking no cognizance of his actions, but only in the persons of his ministers, if they infringe the laws of the land. As to his power, it is very great, though he has no right to extend his prerogative beyond the ancient limits or the boundaries prescribed by the constitution; he can make no new laws, nor raise any new taxes, nor act in opposition to any of the laws; but he can make war or peace; send and receive ambassadors; make treaties of league and commerce; levy armies, and fit out fleets, for the defence of his kingdom, the annoyance of his enemies, or the suppression of rebellions; grant commissions to his officers, both by sea and land, or revoke them at pleasure; dispose of all magazines, castles, &c.; summon the parliament to meet, and, when met, adjourn, prorogue, or dissolve it at pleasure; refuse his assent to any bill, though it has passed both houses; which, consequently, by such a refusal, has no more force than if it had never been moved; but this is a prerogative that the kings of England have very seldom ventured to exercise. He possesses the right of choosing his own council; of nominating all the great officers of state, of the household, and the church; and, in fine, is the fountain of honour, from whom all degrees of nobility and knighthood are derived. Such is the dignity and power of a king of Great Britain.

[OF THE PARLIAMENT.] Parliaments, or general councils, in some shape, are, as has been before observed, of as high antiquity as the Saxon government in this island, and coeval with the kingdom itself. Blackstone, in his valuable Commentaries, says, "It is generally agreed, that in the main the constitution of parliament, as it now stands, was marked out so long ago as the 17th of king John, A.D. 1215, in the Great Charter granted by that prince; wherein he promises to summon all archbishops, bishops, abbots, lords, and greater barons, personally; and all other tenants in chief under the crown, by the sheriff and bailiffs, to meet at a certain place, with forty days' notice, to assess aids and scutages when necessary. And this constitution hath subsisted, in fact, at least from the year 1206, 40 Henry III. there being still extant writs of that date to summon knights, citizens, and burghesses to parliament."

The parliament is assembled by the king's writs, and its sitting must not be intermitted above three years. Its constituent parts are, the king sitting there in his royal political capacity, and the three estates of the realm; the lords spiritual, the lords temporal, who sit together with the king in one house, and the commons, who sit by themselves in another. The king and these three estates, together, form the great corporation or body politic of the kingdom, of which the king is said to be *caput, principium, et finis*. For, upon their coming together, the king meets them, either in person, or by representation; without which there can be no beginning of a parliament; and he also has alone the power of dissolving them.

It is highly necessary, for preserving the balance of the constitution, that the executive power should be a branch, though not the whole, of the legislature. The crown cannot begin of itself any alterations in the present established law; but it may approve or disapprove of the alterations suggested and consented to by the two houses. The legislative therefore cannot abridge the executive power of any rights which it now has by law, without its own consent; since the law must perpetuate

Scots 45; in all, 358. And every member, though chosen by one particular district, when elected and returned, serves for the whole realm. For the end of his coming thither is not particular, but general; not merely to serve his constituents, but also the commonwealth, and to advise his majesty, as appears from the writ of summons.

These are the constituent parts of parliament, the king, the lords spiritual and temporal, and the commons; parts, of which each is so necessary, that the consent of all three is required to make any new law that shall bind the subject. Whatever is enacted for law by one, or by two only, of the three, is no statute; and to it no regard is due, unless in matters relating to their own privileges.

The power and jurisdiction of parliament, says sir Edward Coke, is so transcendent and absolute, that it cannot be confined, either for causes or persons, within any bounds. It hath sovereign and uncontrollable authority in making, confirming, enlarging, restraining, abrogating, repealing, reviving, and expounding of laws, concerning matters of all possible denominations, ecclesiastical or temporal, civil, military, maritime, or criminal; this being the place where that absolute despotic power, which must in all governments reside somewhere, is intrusted by the constitution of these kingdoms. All mischiefs and grievances, oppressions and remedies, that transcend the ordinary course of the laws, are within the reach of this extraordinary tribunal. It can regulate or new-model the succession to the crown; as was done in the reigns of Henry VIII. and William III. It can alter and establish the religion of the land; as was done in a variety of instances in the reigns of Henry VIII. and his three children, Edward VI. Mary, and Elizabeth. It can change and create afresh even the constitution of the kingdom, and of parliaments themselves; as was done by the act of union, and the several statutes for triennial and septennial elections. It can, in short, do every thing that is not naturally impossible; and therefore some have not scrupled to call its power, by a figure rather too bold, *the omnipotence of parliament*. But then its power, however great, was given to it in trust; and therefore ought to be employed according to the rules of justice, and for the promotion of the general welfare of the people. And it is a matter most essential to the liberties of the kingdom, that such members be delegated to this important trust as are most eminent for their probity, their fortitude, and their knowledge; for it was a known apophthegm of the great lord-treasurer Burleigh, "that England could never be ruined but by a parliament;" and, as sir Matthew Hale observes, this being the highest and greatest court, over which none other can have jurisdiction in the kingdom, if by any means a misgovernment should any way fall upon it, the subjects of this kingdom are left without all manner of legal remedy.

In order to prevent the mischiefs that might arise by placing this extensive authority in hands that are either incapable or else improper to manage it, it is provided, that no one shall sit or vote in either house of parliament, unless he be twenty-one years of age. To prevent innovations in religion and government, it is enacted, that no member shall vote or sit in either house, till he hath, in the presence of the house, taken the oaths of allegiance, supremacy, and abjuration, and subscribed and repeated the declaration against transubstantiation, the invocation of saints, and the sacrifice of the mass. To prevent dangers that may arise to the kingdom from foreign attachments, connections, or dependencies, it is enacted, that no alien, born out of the dominions

alteration or amendment to be made by the lords in the mode of taxing the people by a money-bill. Under this appellation are included all bills by which money is directed to be raised upon the subject, for any purpose, or in any shape whatsoever, either for the exigencies of government, and collected from the kingdom in general, as the land-tax, or for private benefit, and collected in any particular district, as by turnpikes, parish-rates, or in any other manner.

The method of making laws is much the same in both houses. In each house, the act of the majority binds the whole; and this majority is declared by votes publicly and openly given; not, as at Venice, and many other senatorial assemblies privately or by ballot. This latter method may be serviceable, to prevent intrigues and unconstitutional combinations; but it is impossible to be practised with us, at least in the house of commons, where every member's conduct is subject to the future censure of his constituents, and therefore should be openly submitted to their inspection.

To bring a bill into the house of commons, if the relief sought by it is of a private nature, it is first necessary to prefer a petition, which must be presented by a member, and usually sets forth the grievance desired to be remedied. This petition (when founded on facts that may be in their nature disputed) is referred to a committee of members, who examine the matter alleged, and accordingly report it to the house; and then (or, otherwise, upon the mere petition) leave is given to bring in the bill. In public matters the bill is brought in upon motion made to the house without any petition. (In the house of lords, if the bill begins there, it is, when of a private nature, referred to two of the judges to examine and report the state of the facts alleged, to see that all necessary parties consent, and to settle all points of technical propriety.) This is read a first time; and, at a convenient distance, a second time; and after each reading, the speaker opens to the house the substance of the bill, and puts the question whether it shall proceed any farther. The introduction of the bill may be originally opposed, as the bill itself may, at either of the readings; and if the opposition succeeds, the bill must be dropt for that session; as it must also, if opposed with success in any of the subsequent stages.

After the second reading, it is committed; that is, referred to a committee, which is either selected by the house, in matters of small importance; or else, if the bill is a matter of great or national consequence, the house resolves itself into a committee of the whole house. A committee of the whole house is composed of every member; and, to form it, the speaker quits the chair (another member being appointed chairman), and may sit and debate as a private member. In these committees, the bill is debated, clause by clause, amendments made, the blanks filled up, and sometimes the bill is entirely new-modelled. After it has gone through the committee, the chairman reports it to the house, with such amendments as the committee have made; and then the house re-considers the whole bill again, and the question is repeatedly put upon every clause and amendment. When the house have agreed or disagreed to the amendments of the committee, and sometimes added new amendments of their own, the bill is then ordered to be engrossed, or written in a strong gross hand, on one or more long rolls of parchment sewed together. When this is finished, it is read a third time, and amendments are sometimes then made to it; and, if a new clause be added, it is done by tacking a separate piece of parchment on the bill, which is called a rider. The speaker then again opens the contents, and,

caſion, that the commons of Great Britain appear in their higheſt luſtre. The titles of all bills that have paſſed both houſes are read; and the king's anſwer is declared by the clerk of the parliament in Norman French. If the king conſents to a public bill, the clerk uſually declares, *le roy le veut*, "the king wills it ſo to be;" if to a private bill, *ſoit fait comme il eſt deſiré*, "be it as it is deſired." If the king reſuſes his aſſent, it is in the gentle language of *le roy ſ'aviſera*, "the king will adviſe upon it." When a money-bill is paſſed, it is carried up and preſented to the king by the ſpeaker of the houſe of commons, and the royal aſſent is thus expreſſed, *le roy remercie ſes loyals ſubjects, accepte leur benevolence, et auſſi le veut*, "the king thanks his loyal ſubjects, accepts their benevolence, and wills it ſo to be." In caſe of an act of grace, which originally proceeds from the crown, and has the royal aſſent in the firſt ſtage of it, the clerk of the parliament thus pronounces the gratitude of the ſubject: *les prelates, ſeigneurs, et commons, en ce preſent parliament aſſembles, au nom de tout vos autres ſubjects, remercient tres humblement votre majeſte, et prient à Dieu vous donner en ſanté bonne vie et longue*: "the prelates, lords, and commons, in this preſent parliament aſſembled, in the name of all your other ſubjects, moſt humbly thank your majeſty, and pray to God to grant you in health and wealth long to live." 2. By the ſtatute 33 Henry VIII. c. 21, the king may give his aſſent by letters patent under his great ſeal, ſigned with his hand, and notified, in his abſence, to both houſes aſſembled together in the high houſe, by commiſſioners conſiſting of certain peers named in the letters. And, when the bill has received the royal aſſent in either of theſe ways, it is then, and not before, a ſtatute or act of parliament.

The ſtatute or act is placed among the records of the kingdom; there needing no formal promulgation to give it the force of a law, as was neceſſary by the civil law with regard to the emperor's edicts; becauſe every man in England is, in judgment of law, party to the making of an act of parliament, being preſent thereat by his repreſentatives. However, copies thereof are uſually printed at the king's preſs, for the information of the whole land.

From the above general view of the Engliſh conſtitution, it appears that no ſecurity for its permanency, which the wit of man can deviſe, is wanting. If it ſhould be objected that parliaments may become ſo corrupted, as to give up or betray the liberties of the people, the anſwer is, that parliaments, as every other body politic, are ſuppoſed to watch over their political exiſtence, as a private perſon does over his natural life. If a parliament were to act in that manner, it muſt become *ſelo de ſe*, an evil that no human proviſions can guard againſt. But there are great reſources of liberty in England; and though the conſtitution has been even overturned, and ſometimes dangerously wounded, yet its own innate powers have recovered and ſtill preſerve it.

The king of England, beſides his high court of parliament, has ſubordinate officers and miniſters to aſſiſt him, and who are reſponſible for their advice and conduct. They are made by the king's nomination, without either patent or grant; and, on taking the requiſite oaths, they become immediately privy-counſellors during the life of the king that chooſes them, but ſubject to removal at his pleaſure.

The duty of a privy counſellor appears from the oath of office, which conſiſts of ſeven articles: 1. To adviſe the king according to the beſt of his cunning and diſcretion. 2. To adviſe for the king's honour, and good of the public, without partiality through affection, love, need, doubt, or dread. 3. To keep the king's counſel ſecret. 4. To avoid corruption.

5. To help and strengthen the execution of what shall be there resolved, 6. To withstand all persons who would attempt the contrary. And, lastly, in general, 7. To observe, keep, and do all that a good and true counsellor ought to do to his sovereign lord.

As no government can be so complete as to be provided with laws that may answer every unforeseen emergency, the privy-council, in such cases, can supply the deficiency. It has been ever known, that, upon great and urgent occasions, such as that of a famine, or the dread of one, they can supersede the operation of the law, if the parliament is not sitting; but this is considered as illegal, and an act of parliament must pass for the pardon and indemnification of those concerned.

The office of secretary of state was formerly divided into a southern and a northern department. The southern contained France, Spain, Portugal, Italy, the Swiss cantons, Constantinople, and, in short, all the states in the southern parts. The northern comprehended the different states of Germany, Prussia, Poland, Russia, Sweden, Denmark, Holland, Flanders, and the Hanseatic towns. This distinction is now abolished; and there is one secretary for foreign affairs, and another for the home department. During the American war, there was a third secretary of state, whose office was revived in 1794, by the title of secretary for the war department.

The cabinet council is a committee of the privy council, consisting of a select number of ministers and noblemen, according to the king's opinion of their integrity and abilities, or attachment to the views of the court; but though its operations are powerful and extensive, a cabinet-council is not essential to the constitution of England.

This observation naturally leads us to mention the person who is so well known by the name of the *first minister*; a term unknown to the English constitution, though the office, in effect, is perhaps necessary. The constitution points out the lord high chancellor as minister; but the affairs of his own court give him sufficient employment. When the office of the first lord of the treasury is united with that of chancellor of the exchequer (offices which we shall explain hereafter) in the same person, he is considered as first minister. The truth is, his majesty may make any of his servants his first minister. But though it is no office, yet there is a responsibility annexed to the name and common repute, that renders it a post of difficulty and danger. We shall now take a short review of the nine great officers of the crown, who, by their posts, take place next to the princes of the royal family and the two primates.

The first is the lord high steward of England. This is an office very ancient, and formerly was hereditary, or at least for life: but now, and for centuries past, it is exercised only occasionally; that is, at a coronation, or to sit as a judge on a peer or peers, when tried for a capital crime. In coronations, it is held for that day only, by some high nobleman. In cases of trials, it is exercised generally by the lord chancellor, or lord keeper, whose commission as high steward ends with the trial, by breaking his white rod, the badge of his office.

The lord high chancellor presides in the court of chancery, to moderate the severities of the law, in all cases where the property of the subject is concerned; and he is to determine according to the dictates of equity and reason. He is an officer of the greatest weight and power of any now subsisting in the kingdom, and is superior in precedence to every temporal lord. He is a privy-counsellor by his office; and, according to some, prolocutor of the house of lords by prescription.

To him belongs the appointment of all justices of the peace; he is visitor, in right of the king, of all hospitals and colleges of the king's foundation, and patron of all the king's livings under the value of 20*l.* per annum in the king's books. He is the general guardian of all infants, idiots, and lunatics, and hath the superintendance of all charitable uses in the kingdom, over and above the extensive jurisdiction which he exercises in his judicial capacity in the court of chancery.

The post of lord high treasurer has of late been vested in a commission, consisting of five persons, who are called lords of the treasury; but the first commissioner is supposed to possess the power of lord high treasurer. He has the management and charge of all the revenues of the crown kept in the exchequer; as also the letting of the leases of all crown lands, and the gift of all places belonging to the customs in the several parts of the kingdom.

The lord president of the council was an officer formerly of great power, and hath precedence next after the lord chancellor and lord treasurer. His duty is to propose all the business transacted at the council-board, and to report to the king, when his majesty is not present, all its debates and proceedings. It is a place of great dignity as well as difficulty, on account of the vast number of American and West-Indian causes, captures, and the like affairs that come before the board; all which may be abridged, to the vast convenience of the subject, by an able president.

The office of lord privy-seal consists in his putting the king's seal to all charters, grants, and the like, which are signed by the king, in order to their passing the great seal; and he is responsible if he should apply the privy-seal to any thing against the law of the land.

The office of lord great chamberlain of England is hereditary in the duke of Ancester's family. He attends the king's person, on his coronation, to dress him: he has likewise charge of the house of lords during the sitting of parliament; and of sitting up Westminster-hall for coronations, trials of peers, or impeachments.

The office of lord high constable has been disused since the attainder and execution of Stafford duke of Buckingham, in the year 1521, but is occasionally revived for a coronation.

The duke of Norfolk is hereditary earl marshal of England. Before England became so commercial a country as it has been for a hundred years past, this office required great abilities, learning, and knowledge of the English history, for its discharge. In war time he was judge of army causes, and decided according to the principles of the civil law. If the cause did not admit of such a decision, it was left to a personal combat, which was attended with a vast variety of ceremonies; the arrangement of which, even to the smallest trifle, fell within the marshal's province. To this day he or his deputy regulates all points of precedence according to the archives kept in the herald's office, which is entirely within his jurisdiction. He directs all solemn processions, coronations, proclamations, general mournings, and the like.

The office of lord high admiral of England\* is now likewise held by commission, and is equal in its importance to any of the preceding, especially since the increase of the British naval power. The English admiralty is a board of direction as well as execution, and is in its proceedings independent of the crown itself. All trials upon life and death,

\* The last lord high admiral was George prince of Denmark, and husband to queen Anne.

in maritime affairs, are appointed and held under a commission immediately issuing from that board; and the members must sign even the death-warrants for execution: but it may be easily conceived, that, as they are removable at pleasure, they do nothing that can clash with the prerogative of the crown, and conform themselves to the directions they receive from his majesty. The board of admiralty regulates the whole naval force of the realm; and names all its officers, or confirms them when named: so that its jurisdiction is very extensive. The commissioners appoint vice-admirals under them: but an appeal from them lies to the high court of admiralty, which is of a civil nature. This court is held in London; and all its processes and proceedings run in the lord high admiral's name, or those of the commissioners, and not in that of the king. The judge of this court is commonly a doctor of the civil law, and its proceedings are according to the method of the civil law; but all criminal matters, relating to piracies, and other capital offences committed at sea, are tried and determined according to the laws of England, by witnesses and a jury, ever since the reign of Henry VIII. It now remains to treat of the courts of law in England.

**COURTS OF LAW.]** The court of chancery, which is the court of equity, is next in dignity to the high court of parliament, and is designed to relieve the subject against frauds, breaches of trust, and other oppressions, and to mitigate the rigour of the law. The lord high chancellor sits as sole judge, and, in his absence, the master of the rolls. The form of proceeding is by bills, answers, and decrees; the witnesses being examined in private: however, the decrees of this court are only binding to the persons of those concerned in them, for they do not affect their lands and goods; and, consequently, if a man refuses to comply with the terms, they can do nothing more than send him to the prison of the Fleet. This court is always open; and if a man be sent to prison, the lord chancellor, in any vacation, can, if he sees reason for it, grant a *habeas corpus*.

The clerk of the crown likewise belongs to this court; he, or is deputy, being obliged always to attend on the lord chancellor as often as he sits for the dispatch of business. Through his hands pass all writs for summoning the parliament or choosing of members, commissions of the peace, pardons, &c.

The King's Bench, so called either from the kings of England sometimes sitting there in person, or because all matters determinable by common law between the king and his subjects are here tried, except such affairs as properly belong to the court of Exchequer. This court is, likewise, a kind of check upon all the inferior courts, their judges, and justices of the peace. Here preside four judges, the first of whom is styled lord chief justice of England, to express the great extent of his jurisdiction over the kingdom: for this court can grant prohibitions in any cause depending either in spiritual or temporal courts; and the house of peers does often direct the lord chief justice to issue out his warrant for apprehending persons under suspicion of high crimes. The other three judges are called justices, or judges, of the King's Bench.

The court of Common Pleas takes cognizance of all pleas debatable, and civil actions depending between subject and subject; and in it, besides all real actions, fines and recoveries are transacted, and prohibitions are likewise issued out of it, as well as from the King's Bench. The first judge of this court is styled lord chief justice of the Common Pleas, or common bench: beside whom there are likewise three other judges, or justices of this court. None but serjeants at law are allowed to plead here.

The court of Exchequer, the crown, and has a jurisdiction according to equity. In the baron of the Exchequer are styled barons, because they are styled barons, because they are allowed to be judges in the court of Exchequer, who have a jurisdiction in administering the law according to equity, as the Exchequer preside, as the king's treasury, revenue, &c. terminated. Besides the Exchequer, the king's court of the revenue, custom, except the accounts of remembrances, whose receivers of the revenue

\* Sheriffs were formerly in counties the sheriffs were morland. The city of I sex vested in their body

The court of Exchequer was instituted for managing the revenues of the crown, and has a power of judging both according to law and according to equity. In the proceedings according to law, the lord chief baron of the Exchequer, and three other barons, preside as judges. They are styled barons, because formerly none but barons of the realm were allowed to be judges in this court. Besides these, there is a fifth, called currior baron, who has not a judicial capacity, but is only employed in administering the oath to sheriffs and other officers, and also to several of the officers of the custom-house. But when this court proceeds according to equity, then the lord treasurer and the chancellor of the Exchequer preside, assisted by the other barons. All matters touching the king's treasury, revenue, customs, and fines, are here tried and determined. Besides the officers already mentioned, there belong to the Exchequer, the king's remembrancer, who takes and states all accounts of the revenue, customs, excise, parliamentary aids and subsidies, &c. except the accounts of the sheriffs and their officers; the lord treasurer's remembrancer, whose business it is to make out processes against sheriffs, receivers of the revenue, and other officers.

For putting the laws effectually in execution, a high-sheriff is annually appointed for every county (except Westmorland and Middlesex) by the king; whose office is both ministerial and judicial. He is to execute the king's mandate, and all writs directed to him out of the king's courts of justice; to impanel juries; to bring causes and malefactors to trial; to see sentence, both in civil and criminal affairs, executed; and at the assize to attend the judges, and guard them all the time they are in his county. He is likewise to decide the elections of knights of the shire, of coroners and verderers; to judge of the qualifications of voters, and to return such as he shall determine to be duly elected. It is also part of his office to collect all public fines, distresses, amerciaments, into the Exchequer, or where the king shall appoint, and to make such payments out of them as his majesty shall think proper.

As his office is judicial, he keeps a court called the county court, which is held by the sheriff, or his under-sheriffs, to hear and determine all civil causes in the county, under forty shillings: this, however, is no court of record; but the court, formerly called the sheriff's tourn, was one; and the king's leet, through all the county: for in this court inquiry was made into all criminal offences against the common law, where by the statute law there was no restraint. This court, however, has been long since abolished. As the keeper of the king's peace, both by common law and special commission, he is the first man in the county, and superior in rank to any nobleman therein, during his office. He may command all the people of his county to attend him, which is called the *posse comitatus*, or power of the county.

Under the sheriff are various officers, as the under-sheriffs, clerks, lewards of courts, bailiffs (in London called serjeants), conitables, gaolers, bealdes, &c.

The next officer to the sheriff is the *justice of peace*, several of whom are commissioned for each county: and to them is intrusted the power of putting great part of the statute law in execution, in relation to the highways, the poor, vagrants, treasons, felonies, riots, the preservation of the game, &c. &c. and they examine and commit to prison all who

\* Sheriffs were formerly chosen by the inhabitants of the several counties. In some counties the sheriffs were formerly hereditary, and still continue in the county of Westmorland. The city of London hath also the inheritance of the shrievalty of Middlesex vested in their body by charter.

break or disturb the peace, and disquiet the king's subjects. In order to punish the offenders, they meet every quarter at the county-town, when a jury of twelve men, called the grand inquest of the county, is summoned to appear. This jury, upon oath, is to inquire into the cases of all delinquents, and to present them by bill, guilty of the indictment, or not guilty: the justices commit the former to gaol for their trial at the next assizes, and the latter are acquitted. This is called the quarter-sessions for the county. The justice of peace ought to be a person of great good sense, sagacity, and integrity, and to be not without some knowledge of the law: for otherwise he may commit mistakes, or abuse his authority; for which, however, he is amenable to the court of King's Bench.

Each county contains two coroners, who are to inquire, by a jury of neighbours, how and by whom any person came by a violent death, and to enter it on record as a plea of the crown. Another branch of their office is to inquire concerning shipwreck, and certify whether wreck or not, and who is in possession of the goods. In his ministerial office, he is the sheriff's substitute.

The civil government of cities is a kind of small independent policy of itself; for every city hath, by charter from the king, a jurisdiction within itself, to judge in all matters civil and criminal; with this restraint only, that all civil causes may be removed from their courts to the higher courts at Westminster; and all offences that are capital are committed to the judge of the assize. The government of cities differs according to their different charters, immunities, and constitutions. They are constituted with a mayor, aldermen, and burgeses, who, together, make the corporation of the city, and hold a court of judicature, where the mayor presides as judge. Some cities are counties, and choose their own sheriffs; and all of them have a power of making bye-laws for their own government. Some have thought the government of cities, by mayor, aldermen, and common-council, is an epitome of the English government, by king, lords, and commons.

The government of incorporated boroughs is much after the same manner: in some there is a mayor, and in others two bailiffs; all which, during their mayoralty or magistracy, are justices of the peace within their liberties, and consequently esquires.

The cinque-ports are five havens, formerly esteemed most important ones, that lie on the east part of England towards France, as Dover, Sandwich, Romney, Hastings, and Hythe, to which Winchelsea and Rye have been since added, with similar franchises in many respects. These cinque ports were endowed with particular privileges by our ancient kings, upon condition that they should provide a certain number of ships, at their own charge, to serve in the wars for forty days, as often as they were wanted.

For the better government of villages, the lords of the soil or manor (who were formerly called barons) have generally a power to hold courts, called courts-leet and courts-baron, where their tenants are obliged to attend and receive justice. The business of courts-leet is chiefly to prevent and punish nuisances; and at courts-baron the conveyances and alienations of the copyhold tenants are enrolled, and they are admitted to their estates on descent or purchase.

A constable is a very ancient and respectable officer of the peace, under the English constitution. Every hundred has a high-constable, and every parish in that hundred a constable; and they are to attend the high-constable upon proper occasions. They are assisted by another ancient

officer called the tythingman of an hundred, or ten freemen of the Saxons, and each freeman's constable is to keep the peace. He can imprison offenders, and it is his duty to execute the law, and to be directed to him from that part of the old Saxon courts, for the more easy recovery of freemen's rights; and it has of late years been thought proper to appoint others of the same name.

Besides these, there are also appointed officers for the relief of the poor, who are to receive exceeding forty shillings a year.

There neither is, nor was, many fences as that of the king. Every man imprisoned in the minister-hall, called his majesty's gaol, is the cause of commitment, and is immediately admitted to a proper court of justice.

The rights of individuals are, without the least exception, the same, and under his majesty's name, the king may be called. The king cannot take away the life of any man, unless he has, by some ill-usage, forfeited his right, or is in danger, and the repetition of the same makes it necessary that he should be on such a suspicion of treason, when the temporary suspension of the law is to pardon; but neither the king, nor any authority, can condemn any man guilty by twelve men's verdict, unless the judges may not be in the case to the jury, or the pleasure of their lordship. The danger the life of a man is chargeable with a fine, or other act injurious to his liberty, for the high-constable, upon oath before a magistrate, if brought, the first thing is to give liberty on giving bail for a capital offence, he is to keep his life till the evidence is brought in, or unless twelve of the jury do this, he is to give liberty on opinion is definitely either party is an alien, or other denizens, it is to be indulged to strangers.

officer called the tythingman, who formerly superintended the tenth part of an hundred, or ten free burghs, as they were called in the time of the Saxons, and each free burgh consisting of ten families. The business of constable is to keep the peace in all cases of quarrels and riots. He can imprison offenders till they are brought before a justice of peace; and it is his duty to execute, within his district, every warrant that is directed to him from that magistrate, or a bench of justices. The neglect of the old Saxon courts, both for the preservation of the peace, and the more easy recovery of small debts, has been regretted by many eminent lawyers; and it has of late been found necessary to revive some of them, and to appoint others of a similar nature.

Besides these, there are courts of conscience in many parts of England, for the relief of the poor, in the recovery of payment of small debts, not exceeding forty shillings.

There neither is, nor ever was, any constitution provided with so many fences as that of England is, for the security of personal liberty. Every man imprisoned has a right to bring a writ before a judge at Westminster-hall, called his Habeas Corpus. If that judge, after considering the cause of commitment, shall find that the offence is bailable, the party is immediately admitted to bail, till he is condemned or acquitted in a proper court of justice.

The rights of individuals are so attentively guarded, that the subject may, without the least danger, sue his sovereign, or those who act in his name, and under his authority: he may do this in open court, where the king may be cast, and be obliged to pay damages to his subject. The king cannot take away the liberty of the meanest individual, unless he has, by some illegal act of which he is accused or suspected upon oath, forfeited his right to liberty; or except when the state is in danger, and the representatives of the people think the public safety makes it necessary that he should have the power of confining persons on such a suspicion of guilt; such as the case of a rebellion within the kingdom, when the legislature has sometimes thought proper to pass a temporary suspension of the Habeas Corpus act. The king has a right to pardon; but neither he, nor the judges to whom he delegates his authority, can condemn a man as a criminal, except he be first found guilty by twelve men, who must be his peers or his equals. That the judges may not be influenced by the king or his ministers to misrepresent the case to the jury, they have their salaries for life, and not during the pleasure of their sovereign. Neither can the king take away or endanger the life of any subject, without trial, and the persons being first chargeable with a capital crime, as treason, murder, felony, or some other act injurious to society; nor can any subject be deprived of his liberty, for the highest crime, till some proof of his guilt be given upon oath before a magistrate; and he has then a right to insist upon his being brought, the first opportunity, to a fair trial, or to be restored to liberty on giving bail for his appearance. If a man is charged with a capital offence, he must not undergo the ignominy of being tried for his life till the evidences of his guilt are laid before the grand jury of the town or county in which the fact is alleged to be committed, and not unless twelve of them agree to a bill of indictment against him. If they do this, he is to stand a second trial before twelve other men, whose opinion is definitive. By the 28 Edward III. it is enacted, that where either party is an alien born, the jury shall be one half aliens, and the other denizens, if required, for the more impartial trial;—a privilege indulged to strangers in no other country in the world, but which is as

ancient with us as the time of king Ethelred \*. In some cases, the man (who is always supposed innocent till there be sufficient proof of his guilt) is allowed a copy of the indictment, in order to assist him to make his defence. He is also furnished with the pannel, or list of the jury, who are his true and proper judges, that he may learn their characters, and discover whether they want abilities, or whether they are prejudiced against him. He may in open court peremptorily object to twenty of the number †; and to as many more as he can give reason for their not being admitted as his judges; till at last twelve unexceptionable men, the neighbours of the party accused, or living near the place where the supposed fact was committed; are approved of, who take the following oath, that they shall well and truly try, and true deliverance make between the king and the prisoner, whom they shall have in charge, according to the evidence. By challenging the jury, the prisoner prevents all possibility of bribery, or the influence of any superior power; by their living near the place where the fact was committed, they are supposed to be men who knew the prisoner's course of life, and the credit of the evidence. These only are the judges from whose sentence the prisoner is to expect life or death; and upon their integrity and understanding, the lives of all that are brought in danger ultimately depend; and from their judgment there lies no appeal: they are therefore to be all of one mind, and, after they have fully heard the evidence, are to be confined without meat, drink, or candle, till they are unanimous in acquitting or condemning the prisoner. Every jurymen is therefore vested with a solemn and awful trust: if he without evidence submits his opinion to that of any other of the jury, or yields in complaisance to the opinion of the judge; if he neglects to examine with the utmost care; if he questions the veracity of the witnesses, who may be of an infamous character; or, after the most impartial hearing, has the least doubt upon his mind, and yet joins in condemning the person accused, he will wound his own conscience, and bring upon himself the complicated guilt of perjury and murder. The freedom of Englishmen consists in its being out of the power of the judge on the bench to injure them, for declaring a man innocent whom he wishes to bring in guilty. Were not this the case, juries would be useless; for far from being judges themselves, they would only be the tools of another, whose province is not to guide, but to give a sanction to their determination. Tyranny might triumph over the lives and liberties of the subject, and the judge on the bench be the minister of the prince's vengeance.

Trial by jury is so capital a privilege, and so great a security to the liberty of the subject, that it is much to be regretted that persons of education and property are often too ready to evade serving the office. By this means juries frequently consist of ignorant and illiterate persons, who neither have knowledge enough to understand their rights and the privileges of Englishmen, nor spirit enough to maintain them. No man should be above serving so important an office, when regularly called upon; and those who, from indolence or pride, decline discharging this duty to their country, seem hardly to deserve that security and liberty which the inhabitants of England derive from this invaluable institution. Juries have, indeed, always been considered as giving the most effectual check to tyranny: for in a nation like this, where a king can do nothing against law, they are a security that he shall never make the laws, by a

bad administration, the instruments of cruelty and oppression. Were it not for juries, the advice given by father Paul, in his maxims of the republic at Venice, might take effect in its fullest latitude. "When the offence is committed by a nobleman against a subject," says he, "let all ways be tried to justify him; and if that is not possible to be done, let him be chastised with greater noise than damage. If it be a subject that has affronted a nobleman, let him be punished with the utmost severity, that the subjects may not get too great a custom of laying their hands on the patrician order." In short, was it not for juries, a corrupt nobleman might, whenever he pleased, act the tyrant, while the judge would have that power which is now denied to our kings. But by our happy constitution, which breathes nothing but liberty and equity, all imaginary indulgence is allowed to the meanest, as well as the greatest. When a prisoner is brought to take his trial, he is freed from all bonds; and, though the judges are supposed to be counsel for the prisoner, yet as he may be incapable of vindicating his own cause, other counsel are allowed him: he may try the validity and legality of the indictment, and may set it aside, if it be contrary to law. Nothing is wanted to clear up the cause of innocence, and to prevent the sufferer from sinking under the power of corrupt judges, and the oppression of the great. The racks and tortures that are cruelly made use of in other parts of Europe, to make a man accuse himself, are here unknown, and none punished without conviction, but he who refuses to plead in his own defence.

As the trial of malefactors in England is very different from that of other nations, the following account may be useful to foreigners and others, who have not seen those proceedings.

The court being met, and the prisoner called to the bar, the clerk commands him to hold up his hand, then charges him with the crime of which he is accused, and asks him whether he is *guilty* or *not guilty*. If the prisoner answers *guilty*, his trial is at an end; but if he answers *not guilty*, the court proceeds on the trial, even though he may before have confessed the fact: for the law of England takes no notice of such confession; and unless the witnesses, who are upon oath, prove him guilty of the crime, the jury must acquit him; for they are directed to bring in their verdict according to the evidence given in court. If the prisoner refuses to plead, that is, if he will not say in court whether he is *guilty* or *not guilty*, he might, till lately, by the law of England, be pressed to death, with a load of iron upon his breast; but, at present, the same sentence is passed on him as in case of conviction.

When the witnesses have given in their evidence, and the prisoner has, by himself or his counsel, cross examined them, the judge recites to the jury the substance of the evidence given against the prisoner, and bids them discharge their conscience: when, if the matter be very clear, they commonly give their verdict without going out of the court; and the foreman, for himself and the rest, declares the prisoner *guilty* or *not guilty*, as it may happen to be. But if any doubt arises among the jury, and the matter requires debate, they all withdraw into a room with a copy of the indictment, where they are locked up till they are unanimously agreed on the verdict; and if any one of the jury should die during this their confinement, the prisoner will be acquitted.

When the jury have agreed on the verdict, they inform the court by an officer who waits without, and the prisoner is again set to the bar to hear his verdict. This is unalterable, except in some doubtful cases, when the verdict is brought in *special*, and is therefore to be determined by the twelve judges of England.

If the prisoner be found guilty, he is then asked what reason he can give why sentence of death should not be passed upon him? There is now properly no benefit of clergy; it is changed to transportation, or burning in the hand. Upon a capital conviction, the sentence of death, after a summary account of the trial, is pronounced on the prisoner, in these words: *The law is, That thou shalt return to the place from whence thou camest, and from thence be carried to the place of execution, where thou shalt be hanged by the neck till thy body be dead; and the Lord have mercy on thy soul!* whereupon the sheriff is charged with the execution.

All the prisoners found *not guilty* by the jury, are immediately acquitted and discharged, and in some cases obtain a copy of their indictment from the court, to proceed at law against their prosecutors.

OF PUNISHMENTS.] The law of England includes all capital crimes under *high treason*, *petty treason*, and *felony*. The first consists in plotting, conspiring, or rising up in arms against the sovereign, or in counterfeiting the coin. The traitor is punished by being drawn on a sledge to the place of execution, when, after being hanged upon a gallows for some minutes, the body is cut down alive, the heart taken out and exposed to public view, and the entrails burnt; the head is then cut off, and the body quartered; after which the head is usually fixed on some conspicuous place. All the criminal's lands and goods are forfeited, his wife loses her dowry, and his children both their estates and nobility.

But though coining of money is adjudged high treason, the criminal is only drawn upon a sledge to the place of execution, and there hanged.

Though the sentence passed upon all traitors is the same, yet, with respect to persons of quality, the punishment is generally altered to beheading: a scaffold is erected for that purpose, on which the criminal placing his head upon a block, it is struck off with an axe\*.

The punishment for misprision of high treason, that is, for neglecting or concealing it, is imprisonment for life, the forfeiture of all the offender's goods, and the profits arising from his lands.

*Petty treason* is when a child kills his father, a wife her husband, a clergyman his bishop, or a servant his master or mistress. This crime is punished by the offender's being drawn on a sledge to the place of execution, and there hanged upon a gallows till dead. Women guilty both of this crime and of high treason were sentenced to be burnt alive; but this law has been very lately repealed, and the punishment of burning abolished.

*Felony* includes murders, robberies, forging notes, bonds, deeds, &c. These are all punished by hanging: only murderers † are to be executed soon after sentence is passed, and then delivered to the surgeons in order to be publicly dissected. Persons guilty of robbery, when there were some alleviating circumstances, used sometimes to be transported for a term of years, to his majesty's plantations; but since the American war, they are now generally condemned to hard labour in works of public utility, upon the river, &c. for a certain number of years; and lately some have been sent to Africa, Nova Scotia, and Botany Bay.

Other crimes punished by the laws are,

*Man-slaughter*, which is the unlawful killing of a person without premeditated malice, but with a present intent to kill; as when two who

\* This is not to be considered as a different punishment, but as a remission of all the parts of the sentence mentioned before, excepting the article of beheading.

† By a late act, murderers are to be executed within twenty-four hours after sentence is pronounced; but as Sunday is not reckoned a day, they are generally tried on a Saturday, so that they obtain a respite till Monday.

formerly meant no harm to the other; in this case the first time, and on the second time, the offender is to be hanged. *Chance-medley* is the killing of a man, for which the offender was doing an unlawful act, and death.

*Slop-lifting*, and receiving stolen goods, are punished with hard labour for life, or imprisonment.

*Petty-larceny*, or receiving stolen goods, is punished by whipping.

*Libelling*, using false words to defame another, are commonly punished by imprisonment.

For striking, so as to cause a wound, is punished with losing the hand.

For striking in the face, the punishment is imprisonment for life, or the forfeiture of the offender's estate.

Drunkards, vagabonds, and idle persons, are punished by being set in the stocks.

OF HUSBAND AND WIFE.] The law of England includes all capital crimes under *high treason*, *petty treason*, and *felony*.

The first consists in plotting, conspiring, or rising up in arms against the sovereign, or in counterfeiting the coin.

The traitor is punished by being drawn on a sledge to the place of execution, when, after being hanged upon a gallows for some minutes, the body is cut down alive, the heart taken out and exposed to public view, and the entrails burnt; the head is then cut off, and the body quartered; after which the head is usually fixed on some conspicuous place.

All the criminal's lands and goods are forfeited, his wife loses her dowry, and his children both their estates and nobility.

But though coining of money is adjudged high treason, the criminal is only drawn upon a sledge to the place of execution, and there hanged.

Though the sentence passed upon all traitors is the same, yet, with respect to persons of quality, the punishment is generally altered to beheading: a scaffold is erected for that purpose, on which the criminal placing his head upon a block, it is struck off with an axe\*.

The punishment for misprision of high treason, that is, for neglecting or concealing it, is imprisonment for life, the forfeiture of all the offender's goods, and the profits arising from his lands.

*Petty treason* is when a child kills his father, a wife her husband, a clergyman his bishop, or a servant his master or mistress. This crime is punished by the offender's being drawn on a sledge to the place of execution, and there hanged upon a gallows till dead.

Women guilty both of this crime and of high treason were sentenced to be burnt alive; but this law has been very lately repealed, and the punishment of burning abolished.

*Felony* includes murders, robberies, forging notes, bonds, deeds, &c. These are all punished by hanging: only murderers † are to be executed soon after sentence is passed, and then delivered to the surgeons in order to be publicly dissected.

Persons guilty of robbery, when there were some alleviating circumstances, used sometimes to be transported for a term of years, to his majesty's plantations; but since the American war, they are now generally condemned to hard labour in works of public utility, upon the river, &c. for a certain number of years; and lately some have been sent to Africa, Nova Scotia, and Botany Bay.

Other crimes punished by the laws are,

*Man-slaughter*, which is the unlawful killing of a person without premeditated malice, but with a present intent to kill; as when two who

formerly meant no harm to the other; in this case the first time, and on the second time, the offender is to be hanged.

*Chance-medley* is the killing of a man, for which the offender was doing an unlawful act, and death.

*Slop-lifting*, and receiving stolen goods, are punished with hard labour for life, or imprisonment.

*Petty-larceny*, or receiving stolen goods, is punished by whipping.

*Libelling*, using false words to defame another, are commonly punished by imprisonment.

For striking, so as to cause a wound, is punished with losing the hand.

For striking in the face, the punishment is imprisonment for life, or the forfeiture of the offender's estate.

formerly meant no harm to each other, quarrel, and the one kills the other; in this case the criminal is allowed the benefit of his clergy, for the first time, and only burnt in the hand.

*Chance-medley* is the accidental killing of a man without an evil intent; for which the offender is also to be burnt in the hand, unless the offender was doing an unlawful act; which last circumstance makes the punishment death.

*Shop-lifting*, and receiving goods, knowing them to be stolen, are punished with hard labour for a number of years, or burning in the hand.

*Perjury*, or keeping disorderly houses, are punished with the pillory and imprisonment.

*Petty-larceny*, or small theft, under the value of twelve-pence, is punished by whipping.

*Libelling*, using false weights and measures, and forestalling the market, are commonly punished with standing on the pillory.

For striking, so as to draw blood, in a king's court, the criminal is punished with losing his right hand.

For striking in Westminster-hall while the courts of justice are sitting, the punishment is imprisonment for life, and forfeiture of all the offender's estate.

Drunkards, vagabonds, and loose, idle, disorderly persons, are punished by being set in the stocks, or by paying a fine.

[OF HUSBAND AND WIFE.] The first private relation of persons is that of marriage, which includes the reciprocal rights and duties of husband and wife: or, as most of our elder law books call them, *baron* and *feme*. The holiness of the matrimonial state is left entirely to the ecclesiastical law; the punishment, therefore, or annulling of incestuous or other unscriptural marriages, is the province of spiritual courts.

There are two kinds of divorce; the one total, the other partial. The total divorce must be for some of the canonical causes of impediment, and those existing before the marriage; as consanguinity, affinity, or corporeal imbecility. The issue of such marriage, as it is thus entirely dissolved, are bastards.

The other kind of divorce is, when the marriage is just and lawful, and therefore the law is tender of dissolving it; but, for some supervenient cause, it becomes improper, or impossible, for the parties to live together; as in the case of intolerable ill temper, or adultery, in either of the parties. In this case the law allows alimony to the wife (except when, for adultery, the parliament grants a total divorce, as has happened frequently of late years), which is that allowance which is made to a woman for her support out of the husband's estate, being settled at the discretion of the ecclesiastical judge, on the consideration of all the circumstances of the case, and the rank and quality of the parties.

In the civil law, the husband and the wife are considered as two distinct persons; and may have separate estates, contracts, debts, and injuries; and therefore in our ecclesiastical courts a woman may sue, and be sued, without her husband.

But though our law in general considers man and wife as one person, yet there are some instances in which she is separately considered as inferior to him, and acting by his compulsion. And therefore all deeds executed, and acts done, by her, during her coverture, are void; except it be a fine, or the like matter of record, in which case she must be solely and secretly examined, to learn if her act be voluntary. She cannot by will devise land to her husband, unless under special circumstances; for,

at the time of making it, she is supposed to be under his coercion. And some felonies, and other inferior crimes committed by her through constraint of her husband, the law excuses her; but this extends not to treason or murder.

The husband also (by the old, and likewise by the civil law) might give his wife moderate correction. For, as he is to answer for her misbehaviour, the law thought it reasonable to intrust him with this power of restraining her by domestic chastisement; in the same moderation that a man is allowed to correct his servants or children; for whom the master or parent is also liable in some cases to answer. But in the politer reign of Charles II. this power of correction began to be doubted; and a wife may now have security of the peace against her husband; or, in return, a husband against his wife: yet the lower ranks of people, who were always fond of the old common law, still claim and exert their ancient privilege: and the courts of law will still permit a husband to restrain a wife of her liberty, in case of any gross misbehaviour.

These are the chief legal effects of marriage during the coverture; upon which we may observe, that even the disabilities which the wife lies under are for the most part intended for her protection and benefit. So great a favourite is the female sex with the laws of England.

REVENUES OF THE BRITISH GOVERNMENT. } The king's ecclesiastical revenues consist in, 1. The custody of the temporalities of vacant bishoprics; from which he receives little or no advantage. 2. Corodies and pensions, formerly arising from allowances of meat, drink, and clothing, due to the king from an abbey or monastery, and which he generally bestowed upon favourite servants; and his sending one of his chaplains to be maintained by the bishop, or to have a pension bestowed upon him till the bishop promoted him to a benefice. These corodies are due of common right, but now, I believe, disused. 3. Extra-parochial tithes. 4. The first-fruits and tenths of benefices. But such has been the bounty of the crown to the church, that these four branches now afford little or no revenue.

The king's ordinary temporal revenue consists in, 1. The demesne lands of the crown, which at present are contracted within a narrow compass. 2. The hereditary excise; being part of the consideration for the purchase of his feudal profits, and the prerogatives of purveyance and pre-emption. 3. An annual sum issuing from the duty on wine licences; being the residue of the same consideration. 4. His forests. 5. His courts of justice, &c. In lieu of all which, 900,000*l.* per annum is now granted for the support of his civil list.

The extraordinary grants are usually called by the synonymous names of aids, subsidies, and supplies, and are granted, as has been before hinted, by the commons of Great Britain in parliament assembled; who, when they have voted a supply to his majesty, and settled the *quantum* of that supply, usually resolve themselves into what is called a committee of ways and means, to consider of the ways and means of raising the supply so voted. And in this committee, every member (though it is looked upon as the peculiar province of the chancellor of the exchequer) may propose such scheme of taxation as he thinks will be least detrimental to the public. The resolutions of this committee (when approved by a vote of the house) are in general esteemed to be (as it were) final and conclusive. For, though the supply cannot be actually raised upon the subject till directed by an act of the whole parliament, yet no moneyed man will scruple to advance to the government any quantity of ready

cash, if the proposed terms be advantageous, on the credit of the bare vote of the house of commons, though no law be yet passed to establish it.

The annual taxes are, 1. The land tax, or the ancient subsidy raised upon a new assessment. 2. The malt-tax, being an annual excise on malt, mum, cider, and perry.

The perpetual taxes are, 1. The customs, or tonnage and poundage of all merchandize exported or imported. 2. The excise duty, or inland imposition, on a great variety of commodities. 3. The salt duty. 4. The post-office, or duty for the carriage of letters. 5. The stamp duty on paper, parchment, &c. 6. The duty on houses and windows. 7. The duty on licences for hackney coaches and chairs. 8. The duty on offices and pensions.

The gross receipt of these annual and permanent taxes, including the balances of the preceding year, amounted in the year 1797, according to the report of the Select Committee of Finance, to the following sums:

	Charges of management.			
	£.	s. d.	£.	s. d.
Customs.....	6,527,882	19 3½	416,627	2 11½
Excise including malt annual	12,038,218	5 9	535,128	1 10
Stamps.....	2,262,568	12 8	100,903	13 6
Land and assessed taxes.....	3,485,341	16 10	150,906	1 7½
Salt.....	548,333	0 6½	33,301	4 2½
Post-office.....	1,109,179	1 10	296,279	4 5½
1s. in the pound on pensions..	36,038	14 10½	578	2 6
6d. in the pound on ditto.....	50,538	6 3	841	14 1
Hackney-coaches.....	26,365	13 1½	2,255	0 11½
Hawkers and pedlars.....	8,219	9 6	2,915	13 0

The net produce of all these taxes, deducting the balances of the preceding year, repayments on over entries, drawbacks, bounties in nature of drawbacks, and other allowances on the customs, excise, stamps, and salt, is stated, by the same committee, to have amounted, in that year, to 18,720,093l.; and the whole of the permanent revenue to 20,503,000l. How these immense sums are appropriated is next to be considered. And this is, first and principally, to the payment of the *interest* of the national debt.

In order to take a clear and comprehensive view of the nature of this NATIONAL DEBT, it must first be premised, that, after the Revolution, when our new connections with Europe introduced a new system of foreign politics, the expenses of the nation, not only in settling the new establishment, but in maintaining long wars, as principals on the continent, for the security of the Dutch barrier, reducing the French monarchy, settling the Spanish succession, supporting the house of Austria, maintaining the liberties of the Germanic body, and other purposes, increased to an unusual degree; inasmuch that it was not thought advisable to raise all the expenses of any one year by taxes to be levied within that year, lest the unaccustomed weight of them should create murmurs among the people. It was therefore the bad policy of the times to anticipate the revenues of their posterity, by borrowing immense sums for the current service of the state, and to lay no more taxes upon the subject than would suffice to pay the annual interest of the sums so borrowed: by this means converting the principal debt into a new species of property; transferable from one man to another, at any time and in any quantity; a system which seems to have had its original in the state of Florence, A. D. 1344; which government then owed about

60,000*l.* sterling; and being unable to pay it, formed the principal into an aggregate sum, called, metaphorically, a mount or bank; the shares whereof were transferable like our stocks. This laid the foundation of what is called the NATIONAL DEBT: for a few long annuities, created in the reign of Charles II. will hardly deserve that name; and the example then set has been so closely followed since, that the capital of the funded debt, British and foreign, on the 1st of February 1799, amounted to 465,152,531*l.* and the annual charge of it to 19,552,037*l.*

Of this funded debt the commissioners for buying up the national debt had redeemed, on the 1st of February 1799, 37,381,771*l.* The unfunded debt, at the same time, amounted to 15,295,674*l.*

To check, in some measure, the too rapid accumulation of a debt already so enormous, a part of the supplies for the years 1798 and 1799 have been raised within the year. In 1798, a voluntary subscription was entered into for the service of government, which produced about a million and a half; and the taxes called the assessed taxes were trebled, and in some instances quadrupled, with allowance of relief in certain cases: these produced about five millions. In the year 1799, an act passed for levying a tenth of all income, upwards of 200*l.* per annum, with a tax, according to a certain scale, on all income from 200*l.* to 60*l.* per annum. The expected produce of this tax is estimated at ten millions; but by the returns already made, it seems likely to produce little more than two-thirds of that sum.

The total expenditure of the year 1797, for the interest of the public debt, the civil list, the army, navy, foreign loans and remittances, pensions, bounties, extraordinary and secret services, &c. amounted, according to the report of the Select Committee of Finance, to 52,105,603*l.* 18*s.* 2½*d.*; and the total of the ordinary revenue and extraordinary resources, including a lottery and a loan of twenty-seven millions, to 55,020,890*l.* 1*s.* 0½*d.*

It is indisputably certain, that the present magnitude of our national incumbrances very far exceeds all calculations of commercial benefit, and is productive of the greatest inconveniences. For, first, the enormous taxes that are raised upon the necessaries of life, for the payment of the interest of this debt, are a hurt both to trade and manufactures, by raising the price as well of the artificer's subsistence, as of the raw material, and of course, in a much greater proportion, the price of the commodity itself. Secondly, if part of this debt be owing to foreigners, either they draw out of the kingdom annually a considerable quantity of specie for the interest, or else it is made an argument to grant them unreasonable privileges, in order to induce them to reside here. Thirdly, if the whole be owing to subjects only, it is then charging the active and industrious subject, who pays his share of the taxes, to maintain the indolent and idle creditor who receives them. Lastly, and principally, it weakens the internal strength of a state, by anticipating those resources which should be reserved to defend it in case of necessity. The interest we now pay for our debts would be nearly sufficient to maintain any war, that any national motives could require. And if our ancestors in king William's time had annually paid, so long as their exigencies lasted, even a less sum than we now annually raise upon their account, they would, in time of war, have borne no greater burdens than they have bequeathed to and settled upon their posterity in the time of peace, and might have been eased the instant the exigence was over.

The produce of the several taxes, before mentioned were originally separate and distinct funds; being securities for the sums advanced on each

several tax, and for them only. But at last it became necessary, in order to avoid confusion, as they multiplied yearly, to reduce the number of these separate funds, by uniting and blending them together, superadding the faith of parliament for the general security of the whole. So that there are now only three capital funds of any account: the *aggregate fund*; the *general fund*, so called from such union and addition; and the *South-Sea fund*; being the produce of the taxes appropriated to pay the interest of such part of the national debt as was advanced by that company and its annuitants: whereby the separate funds, which were thus united, are become mutual securities for each other; and the whole produce of them, thus aggregated, liable to pay such interest or annuities as were formerly charged upon each distinct fund; the faith of the legislature being moreover engaged to supply any casual deficiencies.

The customs, excises, and other taxes, which are to support these funds, depending on contingencies, upon exports, imports, and consumption, must necessarily be of a very uncertain amount: but they have always been considerably more than sufficient to answer the charge upon them. The surplusses, therefore, of the three great national funds, the aggregate, general, and South-Sea funds, over and above the interest and annuities charged upon them, are directed by statute 3 Geo. I. c. 7, to be carried together, and to attend the disposition of parliament; and are usually denominated the *sinking-fund*, because originally destined to be held sacred, and to be applied inviolably to the redemption of the national debt. To this have been since added many other entire duties, granted in subsequent years; and the annual interest of the sums borrowed on their respective credits, is charged on, and payable out of the produce of, the sinking-fund. However, the net surplusses and savings, after all deductions paid, amount, annually, to a very considerable sum. For, as the interest on the national debt has been at several times reduced (by the consent of the proprietors, who had their option either to lower their interest, or be paid their principal), the savings from the appropriated revenues must needs be extremely large. On this sinking-fund depends, in a great measure, our hopes of discharging or moderating our incumbrances; and therefore the prudent application of the large sums, now arising from this fund, is a point of the utmost importance, and well worthy the serious attention of parliament.

Between the years 1727 and 1732, several encroachments were made upon the sinking fund; and in the year 1733, half a million was taken from it by sir Robert Walpole, under pretence of easing the landed interest. The practice of alienating the sinking fund being thus begun, has continued; and in 1736, it was anticipated and mortgaged; and every subsequent administration has broken in upon it, thus converting this excellent expedient for saving the kingdom, into a supply for the worst purposes.

In some years, the sinking fund has produced from two to three millions *per annum*, and if only 1,212,000*l.* of it had been inviolably applied to the redemption of the public debts, from the year 1733, instead of only eight millions and a half paid off by it, as is the case at present, one hundred and sixty millions would have been paid, and the nation have been extricated and saved. Different schemes have been formed for paying the public debts: but no method can be so expeditious and effectual as an unalienable sinking fund, as this money is improved at *compound interest*, and therefore in the most perfect manner; but money procured by a loan bears only simple interest. "A nation

therefore, whenever it applies the income of such a fund to current expenses rather than the redemption of its debts, chooses to lose the benefit of compound interest in order to avoid paying simple interest, and the loss in this case is equal to the difference between the increase of money at compound and simple interest\*.”

No permanent provision had ever been made for the progressive and permanent payment of this immense debt until 1786; when parliament had the wisdom and the firmness to pass an act for vesting unalienably, in commissioners, the sum of one million annually: in which act every possible precaution was taken that could be devised for preventing the surplus from being diverted, at any future time, and for carrying to the account of the commissioners, for the purposes of the act, the interest of such stock as should be purchased, and such temporary annuities as should fall in under the provisions of this act. 37,381,771l. of the capital of the debt had been purchased in February 1799.

Before any part of the *aggregate fund* (the surplusses whereof are one of the chief ingredients that form the sinking-fund) can be applied to diminish the principal of the public debt, it stands mortgaged by parliament to raise an annual sum for the maintenance of the king's household and the civil list. For this purpose, in the late reigns, the produce of certain branches of the excise and customs, the post-office, the duty on wine-licences, the revenues of the remaining crown-lands, the profit arising from courts of justice (which articles include all the hereditary revenue of the crown), and also a clear annuity of 120,000l. in money, were settled on the king for life, for the support of his majesty's household, and the honour and dignity of the crown. And as the amount of these several branches were uncertain (though in the last reign they were computed to have sometimes raised almost a million), if they did not rise annually to 800,000l. the parliament engaged to make up the deficiency. But his present majesty having, soon after his accession, spontaneously signified his consent, that his own hereditary revenues might be so disposed of, as might best conduce to the utility and satisfaction of the public, and having accepted the limited sum of 800,000l. (now increased to 900,000l.) per annum, for the support of his civil list, the said hereditary and other revenues are now carried into and made part of the aggregate fund; and the aggregate fund is

\* Dr. Price's calculation plainly shows what this difference is:—"One penny put out at our Saviour's birth, at 5 per cent. compound-interest, would, in the year 1781, have increased to a greater sum than would be contained in 200,000,000 of earthen, all solid gold; but if put out to simple interest, it at the same time would have amounted to no more than seven shillings and sixpence. All governments that alienate funds destined for reimbursements, choose to improve money in the *last* rather than the *first* of these ways." He adds: "A million borrowed annually, for twenty years, will pay off, in this time, 55 millions 3 per cent. stock, if discharged at 60l. in money for every 100l. stock; and in 40 years more, without any farther aid from loans, 333 millions (that is, 338 millions in all) would be paid off.

"The addition of nineteen years to this period would pay off 1000 millions.

"A surplus of half a million per annum, made up to a million by borrowing half a million every year for twenty years, would discharge the same sums in the same periods.

"In short, so necessary is it at present to expedite, by every possible means, the redemption of our debts, that, let the surplus which can be obtained for a sinking-fund be what it will, an addition to it, by annual loans, will be proper, in order to give it greater efficiency, and a better chance of saving the kingdom.—The increase of taxes, which such a measure must occasion, would be so inconsiderable and so gradual, as to be scarcely perceptible; and, at the same time, it would manifest such a determined resolution in our rulers, to reduce our debts, as might have the happiest influence on public credit."

charged with the payment of the annuity to the crown. The expenses defrayed by the civil list are those that, in any shape, relate to civil government, as the expenses of the household, all salaries to officers of state, to the judges, and every one of the king's servants; the appointments to foreign ambassadors, the maintenance of the queen and royal family, the king's private expenses, or privy-purse, and other very numerous outgoings, as secret-service money, pensions, and other bounties. These, sometimes, have so far exceeded the revenues appointed for that purpose, that application has been made to parliament to discharge the debts contracted on the civil list, which is properly the whole of the king's revenue, in his own distinct capacity; the rest being rather the revenue of the public, or its creditors, though collected and distributed again in the name and by the officers of the crown.

The amount of the capitals and interest of the different public funds, in July 1799, may be seen in the following page.

Camden speaks of magistrates, confirmed. Soon after the measures were abolished militia, to recognize them, and to provide ordination; and principally built the two last of the fions are re-enacted present militia to maintain number of years, and officers are not compelled to invasion, or act in a manner. They are

MILITARY AND MARINE STRENGTH } The *military stats* includes  
 OF GREAT BRITAIN. } the whole of the soldiery, or  
 such persons as are peculiarly appointed among the rest of the people,  
 for the safeguard and defence of the realm.

In a land of liberty it is extremely dangerous to make a distinct order of the profession of arms. In such, no man should take up arms, but with a view to defend his country and its laws: he puts not off the citizen when he enters the camp; but it is because he is a citizen and would wish to continue so, that he makes himself for a while a soldier. The laws and constitution of these kingdoms know no such state as that of a perpetual standing soldier, bred up to no other profession than that of war; and it was not till the reign of Henry VII. that the kings of England had so much as a guard about their persons.

It seems universally agreed by all historians, that king Alfred first settled a national militia in this kingdom, and by his prudent discipline made all the subjects of his dominions soldiers.

In the mean time we are not to imagine that the kingdom was left wholly without defence, in case of domestic insurrections, or the prospect of foreign invasions. Besides those who, by their military tenures, were bound to perform forty days' service in the field, the statute of Winchester obliged every man, according to his estate and degree, to provide a determinate quantity of such arms as were then in use, in order to keep the peace; and constables were appointed in all hundreds, to see that such arms were provided. These weapons were changed by the statute 4 and 5 Ph. and M. c. 2. into others of more modern service; but both this and the former provisions were repealed in the reign of James I. While these continued in force, it was usual, from time to time, for our princes to issue commissions of array, and send into every county officers in whom they could confide, to muster and array (or set in military order) the inhabitants of every district; and the form of the commission of array was settled in parliament in the 5 Henry IV. But at the same time it was provided, that no man should be compelled to go out of the kingdom at any rate; nor out of his shire, but in cases of urgent necessity; nor should provide soldiers unless by consent of parliament. About the reign of king Henry VIII. lord-lieutenants began to be introduced, as standing representatives of the crown, to keep the counties in military order; for we find them mentioned as known officers in the statute 4 and 5 Ph. and M. c. 3. though they had not been then long in use; for Camden speaks of them in the time of queen Elizabeth as extraordinary magistrates, constituted only in times of difficulty and danger.

Soon after the restoration of king Charles II. when the military tenures were abolished, it was thought proper to ascertain the power of the militia, to recognise the sole right of the crown to govern and command them, and to put the whole into a more regular method of military subordination; and the order in which the militia now stands by law, is principally built upon the statutes which were then enacted. It is true, the two last of them, are apparently repealed; but many of their provisions are re-enacted, with the addition of some new regulations, by the present militia laws; the general scheme of which is, to discipline a certain number of the inhabitants of every county, chosen by lot for five years, and officered by the lord-lieutenant, the deputy-lieutenants, and other principal land-holders, under a commission from the crown. They are not compellable to march out of their counties, unless in case of an invasion, or actual rebellion; nor in any case to be sent out of the kingdom. They are to be exercised at stated times; and their discipline in

§ These expires in 1809 and 1810.

general is liberal and easy : but when drawn out in actual service, they are subject to the rigours of martial law, as necessary to keep them in order. This is the constitutional security which our laws have provided for the public peace, and for protecting the realm against foreign or domestic violence, and which the statutes declare is essentially necessary to the safety and prosperity of the kingdom.

But as the mode of keeping standing armies has universally prevailed over all Europe of late years, it has also for many years past been annually judged necessary by our legislature, for the safety of the kingdom, the defence of the possessions of the crown of Great Britain, and the preservation of the balance of power in Europe, to maintain, even in time of peace, a standing body of troops, under the command of the crown; who are, however, *ipso facto*, disbanded at the expiration of every year, unless continued by parliament. The land forces of these kingdoms, in time of peace, amount to about 40,000 men, including troops and garrisons in Ireland, Gibraltar, the East Indies, and America; but in time of war, the number is much greater. The whole of the regular force in the year 1798, amounted to 78,627 men; and the militia and fencibles, including 6,911 fencible cavalry, to 62,202 men, making in all of regular and irregular force 140,829 men. To govern this body of troops, an annual act of parliament passes, "to punish mutiny and desertion, and for the better payment of the army and their quarters." This regulates the manner in which they are to be dispersed among the several innkeepers and victuallers throughout the kingdom; and establishes a law-martial for their government.

The MARITIME state is nearly related to the former, though much more agreeable to the principles of our free constitution. The royal navy of England has ever been its greatest defence and ornament; it is its ancient and natural strength; the floating bulwark of the island; an army, from which, however strong and powerful, no danger can ever be apprehended to liberty; and accordingly it has been assiduously cultivated, even from the earliest ages. To so much perfection was our naval reputation arrived in the twelfth century, that the code of maritime laws, which are called the Laws of Oleron, and are received by all nations in Europe as the ground and substruction of all their marine constitutions, was confessedly compiled by our king Richard I. at the isle of Oleron, on the coast of France, then part of the possessions of the crown of England. And yet, so vastly inferior were our ancestors in this point to the present age, that, even in the maritime reign of queen Elizabeth, sir Edward Coke thinks it matter of boast that the royal navy of England then consisted of 33 ships. The present condition of our marine is in a great measure owing to the salutary provisions of the statute called the navigation act; whereby the constant increase of English shipping and seamen was not only encouraged, but rendered unavoidably necessary. The most beneficial statute for the trade and commerce of these kingdoms, is that navigation act; the rudiments of which were first framed in 1650, partly with a narrow view; being intended to mortify the sugar islands, which were disaffected to the parliament, and still held out for Charles II. by stopping the gainful trade which they then carried on with the Dutch; and at the same time to clip the wings of those our opulent and aspiring neighbours. This prohibited all ships of foreign nations from trading with any English plantations without licence from the council of state. In 1651, the prohibition was extended also to the mother country; and no goods were suffered to be imported into England, or any of its dependencies in any other than English bottoms, or in the ships of that Euro-

pean nation, of which the merchandize imported was the genuine growth or manufacture. At the Restoration, the former provisions were continued by statute 12 Car. II. c. 18. with this very material improvement; that the masters and three-fourths of the mariners shall also be English subjects.

The complement of seamen, in time of peace, usually hath amounted to 12 or 15,000. In time of war, they formerly amounted to about 30,000 men; and after the commencement of the American war, to above 100,000, including marines. The vote of parliament for the service of the years 1798 and 1799 was for 120,000 seamen, including marines.

This navy is commonly divided into three squadrons, namely, the red, white, and blue, which are so termed from the differences of their colours. Each squadron has its admiral: but the admiral of the red squadron has the principal command of the whole, and is styled vice-admiral of Great Britain. Subject to each admiral is also a vice and rear-admiral. But the supreme command of our naval force is, next to the king, in the lords commissioners of the admiralty. Notwithstanding our favourable situation for a maritime power, it was not until the vast armament sent to subdue us by Spain, in 1588, that the nation, by a vigorous effort, became fully sensible of its true interest and natural strength, which it has since so happily cultivated.

We may safely affirm, that the British navy is able to cope with all the other fleets of Europe. The brilliant victories of lords St. Vincent, Duncan, and Nelson, and the late surrender of the whole Dutch fleet lying in the Texel, have established the unrivalled superiority of Britain over all the maritime powers of Europe. In the course of the present war she has taken from her enemies, including the Dutch ships surrendered for the Stadtholder, 83 ships of the line, 111 frigates, 223 other ships of war; and 713 privateers, amounting in the whole to 1132 ships. At the beginning of the year 1800, the British naval force consisted of 144 ships of the line, in commission, 22 fifty-gun ships, 200 frigates, and 292 other ships of war: in the whole 658 ships; and including receiving-ships, ships in ordinary and building, 902, of which 224 were of the line.

We shall close this account of the military and maritime strength of England, or rather of Great Britain, by observing, that though sea-officers and sailors are subject to a perpetual act of parliament, which answers the annual military act that is passed for the government of the army, yet neither of those bodies are exempted from legal jurisdiction in civil or criminal cases, but in a few instances, of no great moment. The soldiers, particularly, may be called upon by a civil magistrate to enable him to preserve the peace against all attempts to break it. The military officer who commands the soldiers on those occasions is to take his directions from the magistrate; and both he and they, if their proceedings are regular, are indemnified against all consequences, be they ever so fatal. Those civil magistrates who understand the principles of the constitution are however extremely cautious in calling for the military on these occasions, or upon any commotion whatever; and, indeed, with good reason; for the frequent employment of the military power in a free government is exceedingly dangerous, and cannot be guarded against with too much caution.

Coins.] In Great Britain, money is computed by pounds, shillings, and pence; twelve pence making a shilling, and twenty shillings one pound; which pound is only an imaginary coin. The gold pieces consist only of guineas, and half guineas; the silver, of crowns, half crowns, shillings, sixpences, groats, and even down to a silver penny; and the

copper, of halfpence and farthings; to which have lately been added penny and two-penny piece. In a country like England, where the intrinsic value of silver is nearly equal, and in some coins, where the intrinsic value is superior to the nominal, the coinage of silver money is a matter of great consequence; and yet the present state of the national currency seems to demand a new coinage of shillings and six-pences; the intrinsic value of the latter being in many of them worn down to half their nominal value. This can only be done by an act of parliament, and by the public losing the difference between the bullion of the new and the old money. Besides the coins already mentioned, five and two guinea pieces are coined at the tower of London, but these are not generally current; nor is any silver coin that is lower than six-pence. The coins of the famous Simon, in the time of Cromwell, and in the beginning of Charles II.'s reign, are remarkable for their beauty.

ROYAL TITLES, ARMS, } The title of the king of England is, By  
AND ORDERS. } the Grace of God, of Great Britain, France,  
and Ireland, King, Defender of the Faith. The designation of the kings of England was formerly his or her Grace, or Highness, till Henry VIII. to put himself on a footing with the emperor Charles V. assumed that of Majesty; but the old designation was not abolished till towards the end of queen Elizabeth's reign. The title of Defender of the Faith, above mentioned, was given to Henry VIII. by the pope, on account of a book written by the king against Luther and the Reformation. Besides the titles already given, the king of Great Britain has others from his German dominions, as Elestor of Hanover, Duke of Brunswick Lunenburg, &c.

Since the accession of the present royal family of Great Britain, anno 1714, the royal achievement is marshalled as follows: quarterly, in the first grand quarter, *Mars, three lions passant guardant, in pale Sol*, the imperial ensigns of England, impaled with the royal arms of Scotland, which are, *Sol, a lion rampant, within a double tressure flowered, and counter-flowered with fleurs-de-lis, Mars*. The second quarter is the royal arms of France, viz. *Jupiter, three fleurs-de-lis, Sol*. The third, the ensigns of Ireland, which is *Jupiter, an harp, Sol, stringed Luna*. And the fourth grand quarter is his present majesty's own coat, viz. *Mars, two lions passant guardant, Sol*, for Brunswick, impaled with Lunenburg, which is *Sol, semee of hearts, proper, a lion rampant, Jupiter*; having ancient Saxony, viz. *Mars, an horse courant, Luna, enté (or grafted) in base: and in a field sur tout, Mars, the diadem, or crown of Charlemagne*; the whole within a garter, as sovereign of that most noble order of Knighthood.

The motto of *Dieu et mon Droit*, that is *God and my Right*, is as old as the reign of Richard I. who assumed it to show his independency upon all earthly powers. It was afterwards revived by Edward III. when he laid claim to the crown of France. Almost every king of England had a particular badge or cognisance; sometimes a white hart, sometimes a fetlock with a falcon, by which it is said Edward IV. alluded to the infidelity of one of his mistresses: and sometimes a portcullis, which was that of the house of Lancaster, many of the princes of which were born in the castle of Beaufort. The white rose was the bearing of the house of York; and that of Lancaster, by way of contradistinction, adopted the red. The thistle, which is now part of the royal armorial bearings, belonged to Scotland, and was very significant when joined to its motto, *Nemo me impune iacebit*, "None shall provoke me unpunished."

The titles of the king's eldest son are, Prince of Wales, duke of Corn-

wall and Rothfay, earl of Chester, electoral prince of Brunswick and Lunenburg, earl of Carrick, baron of Rensfrew, lord of the Isles, great-steward of Scotland, and captain-general of the artillery company.

The order of the GARTER, the most honourable of any in the world, was instituted by Edward III. January 19, 1344. It consists of the sovereign, who is always king or queen of England, of 25 companions, called Knights of the Garter, who wear a medal of St. George killing the dragon, supposed to be the tutelar saint of England, commonly enamelled on gold, suspended from a blue ribband, which was formerly worn about their necks, but since the latter end of James I. now crosses their bodies from their shoulder. The garter, which is of blue velvet, bordered with gold, buckled under the left knee, and gives the name to the order, was designed as an ensign of unity and combination; on it are embroidered the words, *Honi soit qui mal y pense*, "Evil to him who evil thinks."

Knights of the BATH, so called from their bathing at the time of their creation, are supposed to be instituted by Henry IV. about the year 1399: but the order seems to be more ancient. For many reigns they were created at the coronation of a king or queen, or other solemn occasions, and they wear a scarlet ribband hanging from the left shoulder, with an enamelled medal, the badge of the order, a rose issuing from the dexter side of a sceptre, and a thistle from the sinister, between three imperial crowns placed within the motto, *Tria juncta in unum*, "Three joined in one." This order being discontinued, was revived by king George I. on the 8th of May, 1725; and the month following, eighteen noblemen, and as many commoners of the first rank, were installed knights of the order with great ceremony, at Westminster, where the place of instalment is Henry VII.'s chapel. Their robes are splendid and showy, and the number of knights is undetermined. The bishop of Rochester is perpetual dean of the order, which has likewise a register and other officers.

The order of the THISTLE, as belonging to Scotland, is mentioned in the account of that country; as is also the order of St. Patrick, newly instituted for Ireland, in our account of that kingdom.

The origin of the English peerage, or nobility, has been already mentioned. Their titles, and order of dignity, are dukes, marquisses, earls, viscounts, and lords or barons.

Baronets can scarcely be said to belong to an order, having no other badge than a bloody hand in a field argent, in their arms. They are the only hereditary honour under the peerage, and would take place even of the knights of the Garter, were it not that the latter are always privy counsellors; there being no intermediate honour between them and the parliamentary barons of England. They were instituted by James I. about the year 1615. Their number was then two hundred, and each paid about 1000l. on pretence of reducing and planting the province of Ulster in Ireland: but at present their number amounts to 700.

A knight is a term used almost in every nation in Europe, and in general signifies a soldier serving on horseback; a rank of no mean estimation in ancient armies, and entitling the parties themselves to the appellation of *Sir*. Other knighthoods formerly took place in England; such as those of *bannerets*, bachelors, knights of the carpet, and the like; but they are now disused. Indeed, in the year 1773, at a review of the royal navy at Portsmouth, the king conferred the honour of Knights Bannerets on two admirals and three captains. They have no particular

badge on their garments, but their arms are painted on a banner placed in the hands of the supporters.

It is somewhat difficult to account for the origin of the word *esquire*, which formerly signified a person bearing the arms of a nobleman or knight, and they were therefore called *Armigeri*. This title denoted any person, who, by his birth or property, was entitled to bear arms; but it is at present applied promiscuously to any man who can afford to live in the character of a gentleman, without trade; and even a tradesman, if he is a justice of peace, demands the appellation. This degree, so late as in the reign of Henry IV. was an order, and conferred by the king; by putting about the party's neck a collar of SS. and giving him a pair of silver spurs. Gower the poet appears, from his effigies on his tomb in Southwark, to have been an esquire by creation. Serjeants at law; and other serjeants belonging to the king's household, justices of the peace, doctors in divinity, law, and physic, take place of other esquires; and it is remarkable, that all the sons of dukes, marquises, earls, viscounts, and barons, are in the eye of the law no more than esquires, though commonly designated by noble titles. The appellation of gentleman, though now bestowed so promiscuously, is the root of all English honour; for every nobleman is presumed to be a gentleman, though every gentleman is not a nobleman.

**HISTORY.]** It is generally agreed that the first inhabitants of Britain were a tribe of the Gauls, or Celts, that settled on the opposite shore; a supposition founded upon the evident conformity in their language, manners, government, religion, and complexion.

When Julius Cæsar, about fifty-two years before the birth of Christ, meditated the conquest of Britain, the natives, undoubtedly, had great connections with the Gauls, and other people of the continent, in government, religion, and commerce, rude as the latter was. Cæsar wrote the history of his two expeditions, which he pretended were accompanied with vast difficulties, and attended by such advantages over the islanders, that they agreed to pay tribute. It plainly appears, however, from contemporary and other authors, as well as Cæsar's own narrative, that his victories were incomplete and indecisive; nor did the Romans receive the least advantage from his expedition, but a better knowledge of the island than they had before. The Britons, at the time of Cæsar's descent, were governed in the time of war by a political confederacy, of which Cassibelan, whose territories lay in Hertfordshire, and some of the adjacent counties, was the head; and this form of government continued among them for some time.

In their manner of life, as described by Cæsar, and the best authors, they differed little from the rude inhabitants of the northern climates that have been already mentioned; but they certainly sowed corn, though perhaps they chiefly subsisted upon animal food and milk. Their clothing was skins,—and their fortifications, beams of wood. They were incredibly dexterous in the management of their chariots; and they fought with lances, darts, and swords. Women sometimes led their armies to the field, and were recognised as sovereigns in their particular districts. They favoured the primogeniture or seniority in their succession to royalty, but set it aside on the smallest inconvenience attending it. They painted their bodies with woad, which gave them a bluish or greenish cast; and they are said to have had figures of animals and heavenly bodies on their skins. In their marriages they were not very delicate, for they formed themselves into what we may call matrimonial clubs. Twelve or fourteen men married as many wives, and each wife

was in common husband.

The Britons lived the allies than the between Rome and Claudius Cæsar, took an expedition against Britain. and Boadicea, the The former was Rome, where his admiration of the Boadicea being and defeated, discola, general to arms northward where his success of ground being in this island, to protect the Britons; and we became familiar this assertion; chiefly as a nurse strength of body this was the case the Britons, who island. I have mans in Britain is certain, that great vassalage where the native world. was in common to them all; but her children belonged to the original husband.

The Britons lived, during the long reign of Augustus Cæsar, rather as the allies than the tributaries of the Romans; but the communications between Rome and Great Britain being then extended, the emperor Claudius Cæsar, about forty-two years after the birth of Christ, undertook an expedition in person, in which he seems to have been successful; against Britain. His conquests, however, were imperfect; Caractacus, and Boadicea, though a woman, made noble stands against the Romans. The former was taken prisoner after a desperate battle, and carried to Rome, where his undaunted behaviour before Claudius gained him the admiration of the victors, and is celebrated in the histories of the times. Boadicea being oppressed in a manner that disgraces the Roman name, and defeated, disdained to survive the liberties of her country; and Agricola, general to Domitian, after subduing South Britain, carried his arms northwards, as has been already seen in the history of Scotland, where his successors had no reason to boast of their progress, every inch of ground being bravely defended. During the time the Romans remained in this island, they erected those walls which have been often mentioned; to protect the Britons from the invasions of the Caledonians, Scots, and Picts; and we are told, that the Roman language, learning, and customs, became familiar in Britain. There seems to be no great foundation for this assertion; and it is more probable that the Romans considered Britain chiefly as a nursery for their armies abroad, on account of the superior strength of body and courage of the inhabitants when disciplined. That this was the case, appears plainly enough from the defenceless state of the Britons, when the government of Rome recalled her forces from that island. I have already taken notice, that, during the abode of the Romans in Britain, they introduced into it all the luxuries of Italy; and it is certain, that under them the South Britons were reduced to a state of great vassalage, and that the genius of liberty retreated northwards, where the natives had made a brave resistance against these tyrants of the world. For though the Britons were unquestionably very brave, when incorporated with the Roman legions abroad, yet we know of no struggle they made in later times, for their independency at home, notwithstanding the many favourable opportunities that presented themselves. The Roman emperors and generals, while in this island, assisted by the Britons, were frequently employed in repelling the attacks of the Caledonians and Picts (the latter are thought to have been the southern Britons retired northwards): but they appear to have had no difficulty in maintaining their authority in the southern provinces.

Upon the mighty inundations of those barbarous nations, which, under the names of Goths and Vandals, invaded the Roman empire with infinite numbers, and with danger to Rome itself\*, the Roman legions were withdrawn out of Britain, with the flower of the British youth, for the defence of the capital and centre of the empire; and that they might leave the island with a good grace, they assisted the Britons in rebuilding with stone the wall of Severus between Newcastle and Carlisle, which they lined with forts and watch towers; and having done this good office, took their last farewell of Britain about the year 448, after having been masters of the most fertile parts of it, if we reckon from the invasion of Julius Cæsar, near 500 years.

The Scots and Picts finding the island finally deserted by the Roman

\* See the Introduction.

legions, now regarded the whole as their prize, and attacked Severus's wall with redoubled forces, ravaged all before them with a fury peculiar to northern nations in those ages, and which a remembrance of former injuries could not fail to inspire. The poor Britons, like a helpless family deprived of their parent and protector, already subdued by their own fears, had again recourse to Rome, and sent over their miserable epistle for relief (still upon record), which was addressed in these words: *To Actius, iberic consul: The groans of the Britons; and after other lamentable complaints, said, That the barbarians drove them to the sea, and the sea back to the barbarians; and they had only the hard choice left of perishing by the sword or by the waves.* But having no hopes given them by the Roman general of any succours from that side, they began to consider what other nation they might call over to their relief. Gildas, who was himself a Briton, describes the degeneracy of his countrymen at this time in mournful strains, and gives some confused hints of their officers, and the names of some of their kings, particularly one Vortigern, chief of the *Danmonii*, by whose advice the Britons struck a bargain with two Saxon chiefs, Hengist and Horsa, to protect them from the Scots and Picts. The Saxons were in those days masters of what is now called the English Channel; and their native countries, comprehending Scandinavia and the northern parts of Germany, being overstocked with inhabitants, they readily accepted the invitation of the Britons; whom they relieved, by checking the progress of the Scots and Picts, and had the island of Thanet allowed them for their residence. But their own country was so populous and barren, and the fertile lands of Britain so agreeable and alluring, that in a very little time Hengist and Horsa began to meditate a settlement for themselves; and fresh supplies of their countrymen arriving daily, the Saxons soon became formidable to the Britons, whom, after a violent struggle of near 150 years, they subdued, or drove into Wales, where their language and their descendants still remain.

Literature at this time in England was so rude, that we know but little of its history. The Saxons were ignorant of letters; and public transactions among the Britons were recorded only by their bards and poets, a species of men whom they held in great veneration.

It does not fall within the design of this work to relate the separate history of every particular nation that formed the heptarchy. It is sufficient to say, that the pope in Austin's time supplied England with about 400 monks, and that the popish clergy took care to keep their kings and laity in the most deplorable ignorance, but always magnifying the power and sanctity of his holiness. Hence it was that the Anglo-Saxons, during their heptarchy, were governed by priests and monks, who, as they saw convenient, persuaded their kings either to shut themselves up in cloisters, or to undertake pilgrimages to Rome, where they finished their days; no less than thirty Anglo-Saxon kings, during the heptarchy, resigned their crowns in that manner; and among them was Ina, king of the West-Saxons, though in other respects he was a wise and brave prince. The bounty of those Anglo-Saxon kings to the See of Rome was therefore unlimited; and Ethelwald, king of Mercia, imposed an annual tax of a penny upon every house, which was afterwards known by the name of Peter's-pence, because paid on the holiday of *St. Peter ad vincula*, August 1st\*.

\* This tax was imposed at first for the support of a college at Rome, for the education of English youth, founded by Ina, king of Wessex, under the name of *Rome-School*; but in process of time the popes claimed it as a tribute due to St. Peter and his successors.

Under all those disadvantages of bigotry and barbarity, the Anglo-Saxons were happy in comparison of the nations on the continent; because they were free from the Saracens, or successors of Mahomet, who had erected an empire in the East upon the ruins of the Roman, and began to extend their ravages over Spain and Italy. London was then a place of very considerable trade; and if we are to believe the Saxon chronicles quoted by Tyrrel, Withred, king of Kent, paid at one time to Ina, king of Wessex, a sum in silver equal to 90,000*l.* sterling in the year 694. England, therefore, we may suppose to have been about this time a refuge for the people of the continent. The venerable but superstitious Bede, about the year 740, composed his church history of Britain, from the coming in of the Saxons down to the year 731. The Saxon Chronicle is one of the oldest and most authentic monuments of history that any nation can produce. Architecture, such as it was, with stone and glass working, was introduced into England; and we read, in 709, of a Northumbrian prelate who was served in silver plate. It must however be owned, that the Saxon coins, which are generally of copper, are many of them illegible, and all of them mean. Ale and alehouses are mentioned in the laws of Ina, about the year 728; and in this state was the Saxon heptarchy in England, when, about the year 800, most of the Anglo-Saxons, tired out with the tyranny of their petty kings, united in calling to the government of the heptarchy, Egbert, who was the eldest remaining branch of the race of Cerdic, one of the Saxon chiefs who first arrived in Britain. On the submission of the Northumbrians in the year 827, he became king of all England.

Charles the Great, otherwise Charlemagne, was then king of France, and emperor of Germany. Egbert had been obliged, by state jealousies, to fly to the court of Charles for protection from the persecutions of Eadburga, daughter of Offa, wife to Brithric, king of the West Saxons. Egbert acquired, at the court of Charles, the arts both of war and government, and therefore soon united the Saxon heptarchy in his own person, but without subduing Wales. He changed the name of his kingdom into that of Engle-land or England; but there is reason to believe that some part of England continued still to be governed by independent princes of the blood of Cerdic, though they paid perhaps a small tribute to Egbert, who died in the year 838, at Winchester, his chief residence.

Egbert was succeeded by his son Ethelwolf, who divided his power with his eldest son Athelstan. By this time England had become a scene of blood and ravages, through the renewal of the Danish invasions; and Ethelwolf, after some time bravely opposing them, retired in a fit of devotion to Rome, to which he carried with him his youngest son, afterwards the famous Alfred, the father of the English constitution. The gifts which Ethelwolf made to the clergy on this occasion (copies of which are still remaining) are so prodigious, even the tithes of all his dominions, that they show his intellect to have been disturbed by his devotion, or that he was guided by the arts of Swithin, bishop of Winchester. Upon his death, after his return from Rome, he divided his dominions between two of his sons (Athelstan being then dead), Ethelbald and Ethelbert: but we know of no patrimony that was left to young Alfred. Ethelbert, who was the surviving son, left his kingdom, in 866, to his brother Ethelred; in whose time, notwithstanding the courage and conduct of Alfred, the Danes became masters of the sea-coast, and the finest counties in England. Ethelred being killed, his brother Alfred mounted the throne in 871. He was one of the greatest princes, both in peace and war, mentioned in history. He fought seven

battles with the Danes with various success; and when defeated, he found resources that rendered him as terrible as before. He was, however, at one time reduced to an uncommon state of distress, being forced to live in the disguise of a cow-herd; but still he kept up a secret correspondence with his brave friends, whom he collected together; and by their assistance he gave the Danes many signal overthrows, till at last he recovered the kingdom of England, and obliged the Danes, who had been settled in it, to swear obedience to his government; even part of Wales courted his protection; so that he was probably the most powerful monarch that had ever reigned in England.

Among the other glories of Alfred's reign, was that of raising a maritime power in England, by which he secured her coasts from future invasions. He rebuilt the city of London, which had been burnt down by the Danes, and founded the university of Oxford about the year 895: he divided England into counties, hundred, and tythings: or rather he revived those divisions, and the use of juries, which had fallen into disuse by the ravages of the Danes. Having been educated at Rome, he was not only a scholar; but an author; and he tells us, that upon his accession to the throne he had scarcely a lay subject who could read English, or an ecclesiastic who understood Latin. He introduced stone and brick building into general use in palaces as well as churches; though it is certain that his subjects, for many years after his death, were fond of timber buildings. His encouragement of commerce and navigation may seem incredible to modern times: but he had merchants who traded in East-India jewels; and William of Malmshury says, that some of their gems were deposited in the church of Sherborne in his time. He received from one Othar, about the year 890, a full discovery of the coast of Norway and Lapland, as far as Russia; and he tells the king, in his memorial, printed by Hakluyt, "that he sailed along the Norway coast, so far north as commonly the whale-hunters used to travel." He invited numbers of learned men into his dominions, and found faithful and useful allies in the two Scotch kings, his contemporaries, Gregory and Donald, against the Danes. He is said to have fought no less than fifty-six pitched battles. He was inexorable against his corrupt judges, whom he used to hang up in the public highways, as a terror to evil doers. He died in the year 901, and his character is so completely amiable and heroic, that he is justly distinguished with the epithet of the Great.

Alfred was succeeded by his son Edward the Elder, under whom, though a brave prince, the Danes renewed their invasions. He died in the year 925, and was succeeded by his eldest son Athelstan. This prince was such an encourager of commerce, as to make a law, that every merchant who made three voyages on his own account to the Mediterranean, should be put upon a footing with a *thane* or nobleman of the first rank. He caused the Scriptures to be translated into the Saxon tongue. He encouraged coinage; and we find by his laws, that archbishops, bishops, and even abbots, had then the privilege of coining money. His dominions appear, however, to have been confined towards the north, by the Danes, although his vassals still kept a footing in those countries. He was engaged in perpetual wars with his neighbours, the Scots in particular, in which he was generally successful, and died in 941. The reigns of his successors, Edmund, Edred, and Edwy, were weak and inglorious, they being either engaged in wars with the Danes, or disgraced by the influence of priests. Edgar, who mounted the throne about the year 959, revived the naval glory of England, and is said to have been rowed down the river Dee by eight kings, his vassals,

he sitting at the helm, the priests, particularly the monks, were very happy, though he was north of the Tyne ward, who was by Ethelred, by the nation, at this time green became possible countrymen made get rid of them, by way of tax, and called In the year 1002 Ethelred consented is improbable that that kind were used only to enrage the his queen and two France, at that time Normandy. he sitting at the helm; but, like his predecessors, he was the slave of priests, particularly St. Dunstan. His reign, however, was pacific and happy, though he was obliged to cede to the Scots all the territory to the north of the Tyne. He was succeeded in 975 by his eldest son Edward, who was barbarously murdered by his step-mother, whose son Ethelred, by the aid of priests, mounted the throne in 978. The English nation, at this time, was over-run with barbarians, and the Danes by degrees became possessed of the finest parts of the country, while their countrymen made sometimes dreadful descents in the western parts. To get rid of them, he agreed to pay them 30,000*l.* which was levied by way of tax, and called *Danegeld*, and was the first land-tax in England. In the year 1002 they had made such settlements in England, that Ethelred consented to a general massacre of them by the English; but it is improbable that it was ever put into execution. Some attempts of that kind were undoubtedly made in particular counties; but they served only to enrage the Danish king Swein, who, in 1013, drove Ethelred, his queen and two sons, out of England into Normandy, a province of France, at that time governed by its own princes, styled the dukes of Normandy. Swein being killed, was succeeded by his son Canute the Great; but Ethelred returning to England, forced Canute to retire to Denmark, from whence he invaded England with a vast army, and obliged Edmund Ironside (so called for his great bodily strength), Ethelred's son, to divide with him the kingdom. Upon Edmund's being assassinated, Canute succeeded to the undivided kingdom; and dying in 1035, his son, Harold Harefoot, did nothing memorable; and his successor Hardicanute was so degenerate a prince, that the Danish royalty ended with him in England.

The family of Ethelred was now called to the throne; and Edward, who is commonly called the Confessor, mounted it, though Edgar Atheling, by being descended from an elder branch, had the lineal right, and was alive. Upon the death of the Confessor, in the year 1066, Harold, son to Goodwin, earl of Kent, mounted the throne of England.

William duke of Normandy, though a bastard; was then in the unrivalled possession of that great duchy, and resolved to assert his right to the crown of England. For that purpose he invited the neighbouring princes, as well as his own vassals, to join him, and made liberal promises to his followers, of lands and honours in England, to induce them to assist him effectually. By these means he collected 40,000 of the bravest and most regular troops in Europe; and while Harold was embarrassed with the fresh invasions from the Danes, William landed in England without opposition. Harold, returning from the north, encountered William at the place now called Battle, which took its name from that event, near Hastings in Suffex, and a most bloody battle was fought between the two armies; but Harold being killed, the crown of England devolved upon William, in the year 1066.

We have very particular accounts of the value of provisions and manufactures in those days; a palfrey cost 1*s.*; an acre of land (according to bishop Fleetwood in his *Chronicon. Pretiosum*) 1*s.*; a hide of land, containing 120 acres, 100*s.*; but there is great difficulty in forming the proportion of value which those shillings bore to the present standard of money, though many ingenious treatises have been written on that head. A sheep was estimated at 1*s.*, an ox was computed at 6*s.*, a cow at 4*s.*, a man at 3*l.* The board-wages of a child the first year was 8*s.* The tenants of Shireburn were obliged at their choice to pay either 6*d.* or four hens. Silk and cotton were quite unknown. Linen was not much

though, at his coronation, he took the same oath that used to be taken by the ancient Saxon king.

He caused a general survey of all the lands in England to be made, or rather to be completed (for it was begun in Edward the Confessor's time), and an account to be taken of the villains or servile tenants, slaves, and live-stock, upon each estate; all which were recorded in a book called Doom's-day-book, which is now kept in the Exchequer. But the repose of this fortunate and victorious king was disturbed, in his old age, by the rebellion of his eldest son Robert, who had been appointed governor of Normandy, but now assumed the government, as sovereign of that province, in which he was favoured by the king of France. And here we have the rise of the wars between England and France; which have continued longer, drawn more noble blood, and been attended with more memorable achievements, than any other national quarrel we read of in ancient or modern history. William, seeing a war inevitable, entered upon it with his usual vigour: and with incredible celerity, transporting a brave English army, invaded France, where he was every where victorious; but died before he had finished the war, in the year 1087, the sixty-first year of his age, and twenty-first of his reign in England; and was buried in his own abbey at Caen in Normandy.

By the Norman conquest England not only lost the true line of her ancient Saxon kings, but also her principal nobility, who either fell in battle in defence of their country and liberties, or fled to foreign countries, particularly Scotland; where, being kindly received by king Malcolm, they established themselves; and, what is very remarkable, introduced the Saxon or English, which has been the prevailing language in the Lowlands of Scotland to this day.

On the other hand, England, by virtue of the conquest, became much greater, both in dominion and power, by the accession of so much territory upon the continent. For though the Normans, by the conquest, gained much of the English land and riches, yet England gained the large and fertile dukedom of Normandy, which became a province to this crown. England likewise gained much by the great increase of naval power, and multitude of ships, wherein Normandy then abounded. This, with the perpetual intercourse between England and the continent, gave us an increase of trade and commerce, and of treasure to the crown and kingdom, as appeared soon afterwards. England, by the conquest, gained likewise a natural right to the dominion of the Channel, which had been before acquired only by the greater naval power of Edgar, and other Saxon kings. For the dominion of the narrow seas seem naturally to belong, like that of rivers, to those who possess the banks or coasts on both sides; and thus the former title was confirmed by so long a coast as that of Normandy on one side, and of England on the other side of the Channel. This dominion of the Channel, though we have long ago lost all our possessions in France, we have continued to defend and maintain by the bravery of our seamen, and the superior strength of our navy to any other power.

The succession to the crown of England was disputed between the Conqueror's sons Robert and William (commonly called Rufus, from his being red-haired), and was carried in favour of the latter. He was a brave and intrepid prince, but no friend to the clergy, who have therefore been unfavourable to his memory. He was likewise hated by the Normans, who loved his elder brother; and, consequently, he was engaged in perpetual wars with his brothers and rebellious subjects. About this time the crusades of the Holy Land began; and Robert,

who was among the first to engage, accommodated matters with William for a sum of money, which he levied from the clergy. William behaved with great generosity towards Edgar Atheling and the court of Scotland, notwithstanding all the provocations he had received from that quarter; but was accidentally killed, as he was hunting in New Forest in Hampshire, in the year 1100, and the forty-fourth year of his age.

This prince built Westminster-hall, as it now stands, and added several works to the tower, which he surrounded with a wall and a ditch. In the year 1100 happened that inundation of the sea, which overflowed great part of earl Goodwin's estate in Kent, and formed those shallows in the Downs, now called the Goodwin-Sands.

He was succeeded by his brother, Henry I. surnamed Beauclerc, on account of his learning, though his brother Robert was then returning from the Holy Land. Henry may be said to have purchased the throne; first, by his brother's treasures, which he seized at Winchester; secondly by a charter, in which he restored his subjects to the rights and privileges they had enjoyed under the Anglo-Saxon kings; and, thirdly, by his marriage with Matilda, daughter of Malcolm III. king of Scotland, and niece to Edgar Atheling, of the ancient Saxon line. His reign, in a great measure, restored the clergy to their influence in the state; and they formed, as it were, a separate body, dependent upon the pope, which afterwards created great convulsions in England. Henry, partly by force, and partly by stratagem, made himself master of his brother Robert's person, and duchy of Normandy; and, with the most ungenerous means, detained him a prisoner for twenty-eight years, till the time of his death; in the mean while, quieting his conscience by founding an abbey. He was afterwards engaged in a bloody, but successful war, with France; and, before his death, he settled the succession upon his daughter, the empress Matilda, widow to Henry IV. emperor of Germany, and her son Henry, by her second husband Geoffry Plantagenet, earl of Anjou. Henry died of a surfeit, in the seventy-eighth year of his age, in 1135.

Notwithstanding the late settlement of succession, the crown of England was claimed and seized by Stephen, earl of Blois, the son of Adela, fourth daughter to William the Conqueror. Matilda and her son were then abroad; and Stephen was assisted in his usurpation by his brother the bishop of Winchester, and the other great prelates, that he might hold the crown dependent, as it were, upon them. Matilda, however, found a generous protector in her uncle David, king of Scotland; and a worthy subject in her natural brother Robert, Earl of Gloucester, who headed her party before her son grew up. A long and bloody war ensued, the clergy having absolved Stephen and all his friends from their guilt of breaking the act of succession; but at length the barons, who dreaded the power of the clergy, inclined towards Matilda; and Stephen, who depended chiefly on foreign mercenaries, having been abandoned by the clergy, was defeated and taken prisoner in 1141; and, being carried before Matilda, she scornfully upbraided him, and ordered him to be put in chains.

Matilda was proud and weak: the clergy were bold and ambitious; and, when joined with the nobility, who were factious and turbulent, were an over-match for the crown. They demanded to be governed by the Saxon laws, according to the charter that had been granted by Henry I. upon his accession; and finding Matilda refractory, they drove her out of England in 1142. Stephen, having been exchanged for the

earl of Gloucester, who had been taken prisoner likewise, upon his obtaining his liberty, found that his clergy and nobility had in fact excluded him from the government, by building 1100 castles, where each owner lived as an independent prince. We do not, however, find that this alleviated the feudal subjection of the inferior ranks. Stephen was ill enough advised to attempt to force them into compliance with his will, by declaring his son Eustace heir-apparent to the kingdom; and this exasperated the clergy so much, that they invited over young Henry of Anjou, who had been acknowledged duke of Normandy, and was son to the empress; and he accordingly landed in England with an army of foreigners.

This measure divided the clergy from the barons, who were apprehensive of a second conquest; and the earl of Arundel, with the heads of the lay-aristocracy, proposed an accommodation, to which both parties agreed. Stephen, who about that time lost his son Eustace, was to retain the name and office of king; but Henry, who was in fact invested with the chief executive power, was acknowledged his successor. Though this accommodation was only precarious and imperfect, yet it was received by the English, who had suffered so much during the late civil wars, with great joy; and Stephen dying very opportunely, Henry mounted the throne, without a rival, in 1154.

Henry II. surnamed Plantagenet, was by far the greatest prince of his time. He soon discovered extraordinary abilities for government; and had performed, in the sixteenth year of his age, actions that would have dignified the most experienced warriors. At his accession to the throne, he found the condition of the English boroughs greatly bettered, by the privileges granted them in the struggles between their late kings and the nobility. Henry perceived the good policy of this, and brought the boroughs to such a height, that if a bondman or servant remained in a borough a year and a day, he was by such residence made free. He erected Wallingford, Winchester, and Oxford, into free boroughs, for the services the inhabitants had done to his mother and himself; by discharging them from every burthen, excepting the fixed *see-farm* rent of such towns; and this throughout all England, excepting London. This gave a vast accession of power to the crown, because the crown alone could support the boroughs against their feudal tyrants; and enabled Henry to reduce his overgrown nobility.

Without being very scrupulous in adhering to his former engagements, he resumed the excessive grants of crown-lands made by Stephen, which were represented as illegal. He demolished many of the castles that had been built by the barons; but, when he came to attack the clergy, he found their usurpations not to be shaken. He perceived that the root of all the enormous disorders lay in Rome, where the popes had exempted churchmen, not only from lay-courts, but civil taxes. The bloody cruelties and disorders occasioned by those exemptions, all over the kingdom, would be incredible, were they not attested by the most unexceptionable evidence. Unfortunately for Henry, the head of the English church, and chancellor of the kingdom, was the celebrated Thomas Becket. This man, powerful from his office, and still more so by his popularity, arising from a pretended sanctity, was violent, intrepid, and a determined enemy to temporal power of every kind, but at the same time cool and politic. The king assembled his nobility at Clarendon, the name of which place is still famous for the constitutions there enacted, which, in fact, abolished the authority of the Romish See over the English clergy. Becket, finding it in vain to resist the stream,

signed those constitutions till they could be ratified by the pope, who, as he foresaw, rejected them. Henry, though a prince of the most determined spirit of any of his time, was then embroiled with all his neighbours; and the See of Rome was in its meridian grandeur. Becket having been arraigned and convicted of robbing the public while he was chancellor, fled to France, where the pope and the French king espoused his quarrel. The effect was, that all the English clergy who were on the king's side were excommunicated, and the laity absolved from their allegiance. This disconcerted Henry so much, that he submitted to treat, and even to be insulted by his rebel prelate, who returned triumphantly through the streets of London in 1170. His return swelled his pride, and increased his insolence, till both became insupportable to Henry, who was then in Normandy. Finding that he was in fact only the first subject in his own dominions, he was heard to say, in the anguish of his heart, "Is there none who will revenge his monarch's cause upon this audacious priest?" These words reached the ears of four knights, Reginald Fitzurse, William de Tracy, Hugh de Morville, and Richard Brito; who, without acquainting Henry with their intentions, went over to England, where they beat out Becket's brains before the altar of his own church at Canterbury, in the year 1171. Henry was in no condition to second the blind obedience of his knights; and the public resentment rose so high, on the supposition that he was privy to the murder, that he submitted to be scourged by monks at the tomb of the pretended martyr.

Henry, in consequence of his well-known maxim, endeavoured to cancel all the grants which had been made by Stephen to the royal family of Scotland, and actually resumed their most valuable possessions in the north of England. This occasioned a war between the two kingdoms, in which William king of Scotland was taken prisoner; and, to deliver himself from captivity, was obliged to pay liege homage to king Henry for his kingdom of Scotland, and for all his other dominions. It was also agreed, that liege homage should be done, and fealty sworn to Henry, without reserve or exception, by all the earls and barons of the territories of the king of Scotland from whom Henry should desire it, in the same manner as by his other vassals. The heirs of the king of Scotland; and the heirs of his earls, barons, and tenants in chief, were likewise obliged to render liege homage to the heirs of the king of England.

Henry likewise distinguished his reign by the conquest of Ireland; and by marrying Eleanor, the divorced queen of France, but the heiress of Guienne and Poitou, he became almost as powerful in France as the French king himself, and the greatest prince in Christendom. In his old age, however, he was far from being fortunate. He had a turn for pleasure, and embarrassed himself in intrigues with women, particularly the fair Rosamond, which were resented by his queen Eleanor, who even engaged her sons, Henry (whom his father had unadvisedly caused to be crowned in his own life-time), Richard, and John, into repeated rebellions, which affected their father so much, as to throw him into a fever, and he died at Chinon, in France, in the year 1189, and fifty-seventh of his age. The sum he left in ready money at his death has perhaps been exaggerated; but the most moderate accounts make it amount to 200,000 pounds of our money.

During the reign of Henry, corporation charters were established all over England; by which, as I have already hinted, the power of the barons was greatly reduced. Those corporations encouraged trade; but

manufactures, especially to Spain and Italy: for Henry and his queen, count, printed by Mr. introduced the use of glass buildings.

manufactures, especially those of silk, seem still to have been confined to Spain and Italy: for the silk coronation robes, made use of by young Henry and his queen, cost 87l. 10s. 4d. in the sheriff of London's account, printed by Mr. Maddox: a vast sum in those days. Henry introduced the use of glass in windows into England, and stone arches in buildings.

In this reign, and in those barbarous ages, it was a custom in London for great numbers, to the amount of a hundred or more, of the sons and relations of eminent citizens, to form themselves into a licentious confederacy: to break into rich houses and plunder them, to rob and murder passengers, and to commit, with impunity, all sorts of disorders. Henry, about the year 1176, divided England into six parts, called *circuits*, appointing judges to go at certain times of the year and hold *assizes*, or administer justice to the people, as is practised at this day.

Henry so far abolished the barbarous and absurd practice of forfeiting ships which had been wrecked on the coast, that if one man or animal were alive in the ship, the vessel and goods were restored to the owners. This prince was also the first who levied a tax on the moveable and personal estates of his subjects, nobles as well as people. To show the genius of these ages, it may not be improper to mention the quarrel between Roger archbishop of York, and Richard archbishop of Canterbury. We may judge of the violence of military men and laymen, when ecclesiastics could proceed to such extremities. The pope's legate having summoned an assembly of the clergy at London, both the archbishops claimed the privilege of sitting on his right hand; which question of precedency begot a controversy between them. The monks and retainers of archbishop Richard fell upon Roger, in the presence of the cardinal and of the synod, threw him on the ground, trampled him under foot, and so bruised him with blows, that he was taken up half dead, and his life was with difficulty saved from their violence.

Richard I. surnamed *Cœur de Liou*, from his great courage, was the third but eldest surviving son of Henry II. The clergy had found means to gain him over; and for their own ends they persuaded him to make a most magnificent but ruinous crusade to the Holy Land, where he took Ascalon, and performed actions of valour that gave countenance even to the fables of antiquity. After several glorious but fruitless campaigns, he made a truce of three years with Saladin emperor of the Saracens; and in his return to England was treacherously surprised by the duke of Austria, who, in 1193, sent him a prisoner to the emperor Henry VI. His ransom was fixed by the sordid emperor at 150,000 marks; about 300,000 pounds of our present money.

Whilst the Scottish kings enjoyed their lands in England, they found it their interest, once generally in every king's reign, to perform homage; but when they were deprived of their laid lands, they paid it no more\*.

Woollen broad-cloaths were made in England at this time. An ox sold for three shillings, which answers to nine shillings of our money, and a sheep at four pence, or one shilling. Weights and measures were now ordered to be the same all over the kingdom. Richard was slain in

It appears, however, that William I. king of Scotland, and his subjects, consented to acknowledge the king of England and his heirs, to all perpetuity. . . be their sovereigns and liege lords, and that they did homage for the kingdom of Scotland accordingly: but this advantage was given up by Richard I. Vide lord Lyttleton's *History of Henry II.* Vol. v. p. 220, 223, 235, 8vo. edit.

besieging the castle of Chalons in the year 1199, the forty-second of his age; and tenth of his reign.

The reign of his brother John, who succeeded him, is infamous in the English history. He is said to have put to death Arthur the eldest son of his brother Geoffrey, who had the hereditary right to the crown. The young prince's mother, Constance, complained to Philip, the king of France; who, upon John's non-appearance at his court as a vassal, deprived him of Normandy. John, notwithstanding, in his wars with the French, Scotch, and Irish, gave many proofs of personal valour; but became at last so apprehensive of a French invasion, that he rendered himself a tributary to the pope, and laid his crown and regalia at the foot of the legate Pandulph, who kept them for five days. The great barons resented his meanness, by taking arms; but he repeated his shameful submissions to the pope; and after experiencing various fortunes of war, John was at last brought so low, that the barons obliged him in 1216 to sign the great deed so well known by the name of *Magna Charta*. Though this charter is deemed the foundation of English liberty, yet it is in fact no other than a renewal of those immunities which the barons and their followers had possessed under the Saxon princes, and which they claimed by the charters of Henry I. and Henry II. As the principles of liberty, however, came to be more enlarged, and property to be better secured, this charter, by various subsequent acts and explanations, came to be applicable to every English subject, as well as to the barons, knights, and burghesses. John had scarcely signed it, but he retracted, and called upon the pope for protection, when the barons withdrew their allegiance from John, and transferred it to Lewis, the eldest son of Philip Augustus, king of France. This gave umbrage to the pope; and the barons being apprehensive of their country becoming a province to France, they returned to John's allegiance; but he was unable to protect them, till the pope refused to confirm the title of Lewis. John died in 1216, in the eighteenth year of his reign, and the forty-ninth of his age, just as he had a glimpse of resuming his authority.

The city of London owes some of her privileges to him. The office of mayor, before his reign, was for life; but he gave them a charter to choose a mayor out of their own body, annually, and to elect their sheriffs and common council annually, as at present.

England was in a deplorable situation when the crown devolved upon Henry III. the late king's son, who was but nine years of age. The earl of Pembroke was chosen his guardian; and the pope taking part with the young prince, the French were defeated and driven out of the kingdom, and their king obliged to renounce all claims upon the crown of England. The regent, earl of Pembroke, who had thus retrieved the independency of his country, died 1219, and the regency devolved upon the bishop of Winchester. The king was of a soft pliable disposition, and had been persuaded to violate the Great Charter. Indeed he seemed always endeavouring to evade the privileges which he had been compelled to grant and confirm. An association of the barons was formed against him and his government; and a civil war breaking out, Henry seemed to be abandoned by all but his Gascons and foreign mercenaries. His profusion brought him into inexpressible difficulties; and the famous Stephen Montfort, who had married his sister, and was made earl of Leicester, being chosen general of the association, the king and his two sons were defeated, and taken prisoners, at the battle of Lewes. A difference happening between Montfort and the earl of

Gloucester, a nobleman of great authority, prince Edward, Henry's eldest son, obtained his liberty, and assembling as many as he could of his father's subjects, who were jealous of Montfort, and weary of the tyranny of the barons, he gave battle to the rebels, whom he defeated at Evesham, August 4th, 1265, and killed Montfort. The representatives of the commons of England, both knights and burgessees, formed now part of the English legislature, in a separate house; and this gave the first blow to feudal tenures in England: but historians are not agreed in what manner the commons before this time formed any part of the English parliaments or great councils. Prince Edward being afterwards engaged in a crusade, Henry, during his absence, died in 1272, the sixty-fourth year of his age, and fifty-sixth of his reign, which was uncomfortable and inglorious; and yet, to the frugality of this reign, the people in great measure owe the liberties of the present day. Interest had in that age mounted to an enormous height. There are instances of 50 per cent. being paid for money, which tempted the Jews to remain in England, notwithstanding the grievous oppressions they laboured under, from the bigotry of the age, and Henry's extortions. In 1255 Henry made a fresh demand of 8000 marks from the Jews, and threatened to hang them if they refused compliance. They now lost all patience, and desired leave to retire with their effects out of the kingdom: but the king replied, "How can I remedy the oppression you complain of? I am myself a beggar; I am despoiled; I am stripped of all my revenues; I owe above 200,000 marks; and if I had said 300,000 I should not exceed the truth; I am obliged to pay my son prince Edward 15,000 marks a year; I have not a farthing, and I must have money from any hand, from any quarter, or by any means." King John, his father, once demanded 10,000 marks from a Jew at Bristol; and, on his refusal, ordered one of his teeth to be drawn every day till he should consent. The Jew lost seven teeth, and then paid the sum required of him. Trial by *ordeal* was now entirely disused, and that by *duel* discouraged. Bracton's famous law-treatise was published in this reign.

Edward returning to England, on the news of his father's death, invited all who held of his crown *in capite* to his coronation dinner, which consisted (that the reader may have some idea of the luxury of the times) of 278 bacon hogs, 450 hogs, 440 oxen, 430 sheep, 22,600 hens and capons, and 13 fat goats. (See Rymer's *Fœdera*.) Alexander III. king of Scotland, was at the solemnity, and on the occasion 500 horses were let loose, for those that could catch them to keep them.

Edward was a brave and politic prince; and being perfectly well acquainted with the laws, interests, and constitution of his kingdom, his regulations, and reformation of the laws, have justly given him the title of the English Justinian. He passed the famous Mortmain act, whereby all persons "were restrained from giving, by will or *otherwise*, their estates to (those *so called*) religious purposes, and the societies that never die, without a licence from the crown." He granted certain privileges to the Cinque Ports, which, though now very inconsiderable, were then obliged to attend the king when he went beyond sea, with fifty-seven ships, each having twenty armed soldiers on board, and to maintain them at their own costs for the space of fifteen days. He reduced the Welch to pay him tribute, and annexed that principality to his crown, and was the first who gave the title of Prince of Wales to his eldest son.

His vast connections with the continent were productive of many

benefits to his subjects, particularly by the introduction of reading-glasses and spectacles; though they are said to have been invented in the late reign, by the famous friar Bacon. Windmills were erected in England about the same time, and the regulation of gold and silver workmanship was ascertained by an assay, and mark of the goldsmiths' company. After all, Edward's continental wars were unfortunate both to himself and the English, by draining them of their wealth; and it is thought that he too much neglected the woollen manufactures of his kingdom. He was often embroiled with the pope, especially upon the affairs of Scotland; and he died in 1307, in the sixty-ninth year of his age, and thirty-fifth of his reign, while he was engaged in a new expedition against Scotland. He ordered his heart to be sent to the Holy Land, with 22 000 pounds for the maintenance of the *Holy Sepulchre*.

His son and successor Edward II. showed early dispositions for encouraging favourites; but Gaveston, his chief minion, a Gascon, being banished by his father Edward, he mounted the throne with vast advantages, both political and personal, all which he soon forfeited by his own imprudence. He recalled Gaveston, and loaded him with honours, and married Isabella, daughter of the French king, who restored to him part of the territories which Edward I. had lost in France. The barons, however, obliged him once more to banish his favourite, and to confirm the Great Charter, while king Robert Bruce recovered all Scotland, excepting the castle of Stirling; near to which, at Bannockburn, Edward in person received the greatest defeat England ever suffered, in 1314. Gaveston being beheaded by the barons, they fixed upon young Hugh Spencer as a spy upon the king; but he soon became his favourite. He, through his pride, avarice, and ambition, was banished, together with his father, whom he had procured to be made earl of Winchester. The queen, a furious, ambitious woman, persuaded her husband to recall the Spencers, while the common people, from their hatred to the barons, joined the king's standard, and, after defeating them, restored him to the exercise of all his prerogatives. A cruel use was made of those successes; and many noble patriots, with their estates, fell victims to the queen's revenge; but at last she became enamoured with Roger Mortimer, who was her prisoner, and had been one of the most active of the anti-royalist lords. A breach between her and the Spencers soon followed; and going over to France with her lover, she found means to form such a party in England, that, returning with some French troops, she put the eldest Spencer to an ignominious death, made her husband prisoner, and forced him to abdicate his crown in favour of his son Edward III. then fifteen years of age. Nothing now but the death of Edward II. was wanting to complete her guilt; and he was most barbarously murdered in Berkley-castle, by ruffians, supposed to be employed by her and her paramour Mortimer, in the year 1327.

Upon an average, the difference of living, then and now, seems to be nearly as five or six is to one; always remembering that their money contained thrice as much silver as our money or coin of the same denomination does. Thus, for example, if a goose then cost 2½d. that is 7½d. of our money, or, according to the proportion of six to one, it would now cost us 3s. 9d. The knights Templars were suppressed in this reign, owing to their enormous vices.

Edward III. mounted the throne in 1327. He was then under the tuition of his mother, who cohabited with Mortimer; and they endeavoured to keep possession of their power by executing many popular

measures, and putting land, for which Mortimer as he was, was soon perfon at the head of Mortimer was put to mon gallews at Tyburn twenty-eight years found means to quarried his sister. D acted as Edward's trib same homage to Edward I. Soon after, (without issue), who the French pretended lip of Valois claimed he was opposed by the three last mentioned. The former ward pursued his claim. On this occasion, of France, which was land, more favourable knew no subordination and disobedience in the field. now vast property independent of a feudal providing themselves exercises and property of Edward, was that in 1340 he took the and quartered the *Dieu et mon droit*, "above 100,000 French of Wales, who was than thirty-four), the of the French far more loss consisted of no fifty private men. the prince of Wales advantages of number seated, and their king is thought that that of all the English the prince treated his garland.

Edward's glories Philippa, daughter the good fortune ventured to invade was fought, and the glory to see two were afterwards three millions of gold at the palace of the

measures, and putting an end to all national differences with Scotland, for which Mortimer was created earl of March. Edward, young as he was, was soon sensible of their designs. He surprised them in person at the head of a few chosen friends in the castle of Nottingham. Mortimer was put to a public death, hanged as a traitor on the common gallows at Tyburn, and the queen herself was shut up in confinement twenty-eight years, to her death. It was not long before Edward found means to quarrel with David, king of Scotland, though he had married his sister. David was driven to France by Edward Baliol, who acted as Edward's tributary, king of Scotland, and general, and did the same homage to Edward for Scotland as his father had done to Edward I. Soon after, upon the death of Charles the Fair, king of France (without issue), who had succeeded by virtue of the Salic law, which the French pretended, cut off all female succession to that crown, Philip of Valois claimed it, as being the next heir-male by succession; but he was opposed by Edward, as being the son of Isabella, who was sister to the three last mentioned kings of France, and first in the female succession. The former was preferred; but the case being doubtful, Edward pursued his claim, and invaded France with a powerful army.

On this occasion, the vast difference between the feudal constitutions of France, which were then in full force, and the government of England, more favourable to public liberty, appeared. The French king knew no subordination. They and their men were equally undisciplined and disobedient, though far more numerous than their enemies in the field. The English freemen, on the other hand, having now vast property to fight for, which they could call their own, independent of a feudal law, knew its value, and had learned to defend it by providing themselves with proper armour, and submitting to military exercises and proper subordination in the field. The war, on the part of Edward, was therefore a continued scene of success and victory. In 1340 he took the title of king of France, using it in all public acts, and quartered the arms of France with his own, adding this motto, *Dieu et mon droit*, "God and my right." At Cressly, August 26th, 1346, above 100,000 French were defeated, chiefly by the valour of the prince of Wales, who was but sixteen years of age (his father being no more than thirty-four), though the English did not exceed 30,000. The loss of the French far exceeded the number of the English army, whose loss consisted of no more than three knights and one esquire, and about fifty private men. The battle of Poitiers was fought in 1356, between the prince of Wales and the French king John, but with great superior advantages of numbers on the part of the French, who were totally defeated, and their king and his favourite son Philip taken prisoners. It is thought that the number of French killed in this battle was double that of all the English army; but the modesty and politeness with which the prince treated his royal prisoners formed the brightest wreath in his garland.

Edward's glories were not confined to France. Having left his queen Philippa, daughter to the earl of Hainault, regent of England, she had the good fortune to take prisoner David king of Scotland, who had ventured to invade England, about six weeks after the battle of Cressly was fought, and remained a prisoner eleven years. Thus Edward had the glory to see two crowned heads his captives at London. Both kings were afterwards ransomed; David for 100,000 marks, and John for three millions of gold crowns; but John returned to England, and died at the palace of the Savoy. After the treaty of Bretigni, into which

Edward III. is said to have been frightened by a dreadful storm, his fortunes declined. He had resigned his French dominions entirely to the prince of Wales; and he sunk in the esteem of his subjects at home, on account of his attachment to his mistress, one Alice Pierce. The prince of Wales, commonly called the Black Prince\*, from his wearing that armour, while he was making a glorious campaign in Spain, where he reinstated Peter the Cruel on that throne, was seized with a consumptive disorder, which carried him off in the year 1372. His father did not long survive him; for he died, dispirited and obscure, at Shene in Surry, in the year 1377, the sixty-fifth of his age, and fifty-first of his reign.

No prince ever understood the balance and interests of Europe better than Edward did; and he was one of the best and most illustrious kings that sat on the English throne. Bent on the conquest of France, he gratified the more readily his people in their demands for protection and security to their liberties and properties; but he thereby exhausted his regal dominions; neither was his successor, when he mounted the throne, so powerful a prince as he was in the beginning of his reign. He has the glory of inviting over and protecting fullers, dyers, weavers, and other artificers from Flanders, and of establishing the woollen manufacture among the English, who, till his time, generally exported the unwrought commodity. The rate of living in his reign seems to have been much the same as in the preceding; and few of the English ships, even of war, exceeded forty or fifty tons. But notwithstanding the vast increase of property in England, villanage still continued in the royal, episcopal, and baronial manors. Historians are not agreed whether Edward made use of artillery in his first invasion of France: but it certainly was well known before his death. The magnificent castle of Windsor was built by Edward III. and his method of conducting that work may serve as a specimen of the condition of the people of that age. Instead of alluring workmen by contracts and wages, he assembled every county in England to send him so many masons, tilers, and carpenters, as if he had been levying an army. Soldiers were enlisted only for a short time: they lived idle all the rest of the year, and commonly all the rest of their lives; one successful campaign, by pay and plunder, and the ransom of prisoners, was supposed to be a small fortune to a man, which was a great allurements to enter into the service. The wages of a master-carpenter was limited through the whole year to three-pence a day, a common carpenter to two-pence, money of that age.

Dr. John Wickliffe, a secular priest, educated at Oxford, began, in the latter end of this reign, to spread the doctrines of reformation, by his discourses, sermons, and writings; and he made many disciples of all ranks and stations. He was a man of parts, learning, and piety, and has the honour of being the first person in Europe who publicly called in question those doctrines which had generally passed for certain and undisputed, during so many ages. The doctrines of Wickliffe, being derived from his search into the scriptures, and into ecclesiastical antiquity, were nearly the same with those propagated by the reformers in the sixteenth century. But though the age seemed strongly disposed to receive them, affairs were not yet fully ripe for this great revolution,

which was reserved for a more free and inquiring age. He had many friends in the university of Oxford, and at court, and was powerfully protected against the evil designs of the pope and bishops by John of Gaunt, duke of Lancaster, one of the king's sons, and other great men. His disciples were distinguished by the name of Wickliffites or Lollards.

Richard II. son of the Black Prince, was only eleven years of age when he mounted the throne. The English arms were then unsuccessful both in France and Scotland; but the doctrines of Wickliffe took root under the influence of the duke of Lancaster, the king's uncle, and one of his guardians, and gave enlarged notions of liberty to the villains, and lower ranks of people. The truth is, agriculture was then in its flourishing state, that corn, and other victuals, were suffered to be transported, and the English had fallen upon a way of manufacturing, for exportation, their leather, horns, and other native commodities; and with regard to the woollen manufactures, they seem, from records, to have been exceeded by none in Europe. John of Gaunt's foreign connections with the crowns of Portugal and Spain were of prejudice to England; and so many men were employed in unsuccessful wars, that the commons of England, like powder receiving a spark of fire, all at once flamed out into rebellion, under the conduct of Ball, a priest, Wat Tyler, Jack Straw, and others, the lowest of the people. The conduct of these insurgents was very violent, and in many respects extremely unjustifiable; but it cannot justly be denied that the common people of England then laboured under many oppressions, particularly a *poll-tax*, and had abundant reason to be discontented with the government.

Richard was not then above sixteen; but he acted with great spirit and wisdom. He faced the storm of the insurgents, at the head of the Londoners, while Walworth the mayor, and Philpot an alderman, had the courage to put Tyler, the leader of the malcontents, to death, in the midst of his adherents. Richard then associated to himself a new set of favourites. His people and great lords again took up arms; and being headed by the duke of Gloucester, the king's uncle, they forced Richard once more into terms; but being insincere in all his compliances, he was upon the point of becoming more despotic than any king in England ever had been, when he lost his crown and life by a sudden catastrophe.

A quarrel happened between the duke of Hereford, son to the duke of Lancaster, and the duke of Norfolk; and Richard banished them both, with particular marks of injustice to the former, who now became duke of Lancaster by his father's death. Richard carrying over a great army to quell a rebellion in Ireland, a strong party formed in England, the natural result of Richard's tyranny, who offered the duke of Lancaster the crown. He landed from France at Ravenspur in Yorkshire, and was soon at the head of 60,000 men, all of them English. Richard hurried back to England, where, his troops refusing to fight, and his subjects, whom he had affected to despise, generally deserting him, he was made prisoner with no more than twenty attendants; and being carried to London, he was deposed in full parliament, upon a formal charge of tyranny and misconduct; and soon after he is supposed to have been starved to death in prison, in the year 1399, the thirty-fourth of his age, and the twenty-third of his reign. He had no issue by either of his two marriages.

Though the nobility of England were possessed of great power at the time of this revolution, yet we do not find that it abated the influence

of the commons. They had the courage to remonstrate boldly in parliament against the usury, which was but too much practised in England, and other abuses of both clergy and laity, and the destruction of the feudal powers soon followed.

Henry the Fourth \*, son of John of Gaunt duke of Lancaster, fourth son of Edward III. being settled on the throne of England, in prejudice to the elder branches of Edward III.'s family, the great nobility were in hopes that this glaring defect in his title would render him dependent upon them. At first some conspiracies were formed against him among his great men, as the dukes of Surry and Exeter, the earls of Gloucester and Salisbury, and the archbishop of York; but he crushed them by his activity and steadiness, and laid a plan for reducing their overgrown power. This was understood by the Percy family, the greatest in the north of England, who complained of Henry having deprived them of some Scotch prisoners, whom they had taken in battle; and the dangerous rebellion broke out under the old earl of Northumberland, and his son the famous Henry Percy, surnamed Hotspur; but it ended in the defeat of the rebels, chiefly by the valour of the prince of Wales. With equal good fortune, Henry suppressed the insurrection of the Welch, under Owen Glendower; and by his prudent concessions to his parliament, to the commons particularly, he at last conquered all opposition, while, to salve the defect of his title, the parliament entailed the crown upon him, and the heirs male of his body lawfully begotten, thereby shutting out all female succession. The young duke of Rothsay, heir to the crown of Scotland (afterwards James I. of that kingdom), falling a prisoner into Henry's hands about this time, was of infinite service to his government; and, before his death, which happened in 1413, in the forty-sixth year of his age, and thirteenth of his reign, he had the satisfaction to see his son and successor, the prince of Wales, disengage himself from many youthful follies, which till then had disgraced his conduct.

The English marine was now so greatly increased, that we find an English vessel of 200 tons in the Baltic, and many other ships of equal burden carrying on a great trade all over Europe, but with the Hanse towns in particular. With regard to public liberty, Henry IV., as I have already hinted, was the first prince who gave the different orders in parliament, especially that of the commons, their due weight. It is however a little surprising, that learning was at this time in a much lower state in England, and all over Europe, than it had been 200 years before. Bishops, when testifying synodal acts, were often forced to do it by proxy, in the following terms, viz. "As I cannot read myself, N. N. hath subscribed for me" or, "As my lord bishop cannot write himself, at his request, I have subscribed." By the influence of the court, and the intrigues of the clergy, an act was obtained in the sessions of parliament 1401, for the burning of heretics, occasioned by the great

\* The throne being now vacant, the duke of Lancaster stepped forth, and having crossed himself on his forehead and on his breast, and called upon the name of Christ, he pronounced these words, which I shall give in the original language, because of their singularity.

*In the name of Father, Son, and Holy Ghost, I, Henry of Lancaster, challenge this reume of Ynglande, and the crown, with all the membris, and the appurtenances; als I that am descended by right line of the blode (meaning a claim in right of his mother) coming from the gode king Henry Thirde, and threge that right that God of his grace hath sent me, with helpe of kyn, and of my frendes, to recover it; the which reume was in point to be untoned by default of governance, and ondoying of the gode lawes.*

increase of the Wickliffites or Lollards; and immediately after, one Sawtre, parish-priest of St. Ofithe in London, was burnt alive by the king's writ, directed to the mayor and sheriffs of London.

The balance of trade with foreign parts was against England at the accession of Henry V. in 1413: so greatly had luxury increased. The Lollards, or the followers of Wickliffe, were excellently numerous; and sir John Oldcastle and lord Cobham having joined them, it was pretended that he had agreed to put himself at their head, with a design to overturn the government; but this appears to have been a groundless accusation, from a bloody zeal of the clergy, though he was put to death in consequence of it. His only real crime seems to have been the spirit with which he opposed the superstition of the age; and he was the first of the nobility who suffered on account of religion. Henry was about this time engaged in a contest with France, which he had many incitements for invading. He demanded a restitution of Normandy, and other provinces that had been taken from England in the preceding reigns; also the payment of certain arrears due for king John's ransom since the reign of Edward III.; and availing himself of the distracted state of that kingdom by the Orleans and Burgundy factions, he invaded it, where he first took Harfleur, and then defeated the French in the battle of Agincourt, which equalled those of Crécy and Poitiers in glory to the English, but exceeded them in its consequences, on account of the vast number of French princes of the blood, and other great noblemen, who were there killed. Henry, who was as great a politician as a warrior, made such alliances, and divided the French among themselves so effectually, that he forced the queen of France, whose husband, Charles VI. was a lunatic, to agree to his marrying her daughter, the princess Catharine, to disinherit the dauphin, and to declare Henry regent of France during her husband's life, and him and his issue successors to the French monarchy, which must at this time have been exterminated, had not the Scots (though their king still continued Henry's captive) furnished the dauphin with vast supplies, and preserved the French crown for his head. Henry, however, made a triumphal entry into Paris, where the dauphin was proscribed; and after receiving the fealty of the French nobility, he returned to England to levy a force that might crush the dauphin and his Scottish auxiliaries. He probably would have been successful, had he not died of a pleuritic disorder, 1442, the thirty-fourth year of his age, and the tenth of his reign.

Henry V.'s vast successes in France revived the trade of England, and at the same time increased and established the privileges and liberties of the English commonalty. As he died when he was only thirty-four years of age, it is hard to say, if he had lived, whether he might not have given the law to all the continent of Europe, which was then greatly distracted by the divisions among its princes; but whether this would have been of service or prejudice to the growing liberties of his English subjects we cannot determine.

By an authentic and exact account of the ordinary revenues of the crown during this reign, it appears that they amounted only to 55,714*l.* a year, which is nearly the same with the revenues in Henry III.'s time: and the kings of England had neither become much richer nor poorer in the course of 200 years. The ordinary expenses of the government amounted to 52,507*l.* so that the king had of surplus only 3,207*l.* for the support of his household, for his wardrobe, for the expenses of embassies, and other articles. This sum was not nearly sufficient even

in time of peace; and, to carry on his wars, this great conqueror was reduced to many miserable shifts: he borrowed from all quarters, he pawned his jewels, and sometimes the crown itself; he ran in arrears to his army; and he was often obliged to stop in the midst of his career of victory, and to grant a truce to the enemy. I mention these particulars that the reader may judge of the simplicity and temperance of our predecessors three centuries ago, when the expenses of the greatest king in Europe were scarcely equal to the pension of a superannuated courtier of the present age.

It required a prince equally able with Henry IV. and V. to conform the title of the Lancaster house to the throne of England. Henry VI. surnamed of Windsor, was no more than nine months old, when, in consequence of the treaty of Troyes, concluded by his father with the French court, he was proclaimed king of France as well as England. He was under the tuition of his two uncles, the dukes of Bedford and Gloucester, both of them princes of great accomplishments, virtues, and courage, but unable to preserve their brother's conquests. Upon the death of Charles VI. the affections of the French for his family revived in the person of his son and successor Charles VII. The duke of Bedford, who was regent of France, performed many glorious actions, and at last laid siege to Orleans, which, if taken, would have completed the conquest of France. The siege was raised by the valour and good conduct of the Maid of Orleans, a phenomenon hardly to be paralleled in history, she being born of the lowest extraction, and bred a cow keeper, and some time a helper in stables in public inns. She must, notwithstanding, have possessed an amazing fund of sagacity as well as valour. After an unparalleled train of heroic actions, and placing the crown upon her sovereign's head, she was taken prisoner by the English in making a rally during the siege of Compiègne, who burnt her alive for a witch, at Rouen, May 30, 1431.

The death of the duke of Bedford, and the agreement of the duke of Burgundy, the great ally of the English, with Charles VII. contributed to the entire ruin of the English interest in France, and the loss of all their fine provinces in that kingdom, notwithstanding the amazing courage of Talbot the first earl of Shrewsbury, and their other officers. The capital misfortune of England, at this time, was its disunion at home. The duke of Gloucester lost his authority in the government; and the king married Margaret of Anjou, daughter to the needy king of Sicily, a woman of a high spirit, but an implacable disposition; while the cardinal of Winchester, who was the richest subject in England, if not in Europe, presided at the head of the treasury, and by his avarice ruined the interest of England, both at home and abroad. Next to the cardinal, the duke of York, who was lord lieutenant of Ireland, was the most powerful subject in England. He was descended by the mother's side from Lionel, an elder son of Edward III. and prior in claim to the reigning king, who was descended from John of Gaunt, Edward's youngest son: and he affected to keep up the distinction of a white rose; that of the house of Lancaster being red. It is certain that he paid no regard to the parliamentary entail of the crown upon the reigning family: and he lost no opportunity of forming a party to assert his right; but acted at first with a most profound dissimulation. The duke of Suffolk was a favourite of the queen, who was a professed enemy to the duke of York; but being impeached in parliament, he was banished for five years, and had his head struck off on board a ship, by a common sailor. This was followed by an insurrection of

20,000 Kentish men, who sent to the duke of York by the valour of the perfectly secure against the English rival in England from his friends; but being he professed the mo

Margaret, by the army there, and the feat, till at last he returned to London.

20,000 Kentish men, headed by one Jack Cade, a man of low condition, who sent to the court a list of grievances; but he was defeated by the valour of the citizens of London, and the queen seemed to be perfectly secure against the duke of York. The inglorious management of the English affairs in France befriended him; and upon his arrival in England from Ireland, he found a strong party of the nobility his friends; but being considered as the fomentor of Cade's rebellion, he professed the most profound reverence to Henry.

The persons in high power and reputation in England, next to the duke of York, were the earl of Salisbury, and his son the earl of Warwick. The latter had the greatest land estate of any subject in England; and his vast abilities, joined to some virtues, rendered him equally popular. Both father and son were secretly on the side of York; and during a fit of illness of the king, that duke was made protector of the realm. Both sides now prepared for arms; and the king recovering, the queen with wonderful activity assembled an army; but the royalists were defeated in the first battle of St. Alban's, and the king himself was taken prisoner. The duke of York was once more declared protector of the kingdom; but it was not long before the queen resumed all her influence in the government, and the king, though his weakness became every day more and more visible, recovered all his authority.

The duke of York upon this threw off the mask, and, in 1459, he openly claimed the crown; and the queen was again defeated by the earl of Warwick, who was now called the king-maker. A parliament upon this being assembled, it was enacted that Henry should possess the throne for life, but that the duke of York should succeed him, to the exclusion of all Henry's issue. All, excepting the magnanimous queen, agreed to this compromise. She retreated northwards; and the king being still a prisoner, she pleaded his cause so well, that, assembling a fresh army, she fought the battle of Wakefield, where the duke of York was defeated and slain, in 1460.

It is remarkable; that, though the duke of York and his party openly asserted his claim to the crown, they still professed allegiance to Henry; but the duke of York's son, afterwards Edward IV. prepared to revenge his father's death, and obtained several victories over the royalists. The queen, however, advanced towards London; and defeating the earl of Warwick, in the second battle of St. Alban's, she delivered her husband; but the disorders committed by her northern troops disgusted the Londoners so much, that she durst not enter London, where the duke of York was received, on the 28th of February 1461, while the queen and her husband were obliged to retreat northwards. She soon raised another army, and fought the battle of Towton, the most bloody perhaps that ever happened in any civil war. After prodigies of valour had been performed on both sides, the victory remained with young king Edward, and near 40,000 men lay dead on the field of battle. Margaret and her husband were once more obliged to fly to Scotland, where they met with generous protection.

This civil war was carried on with greater animosity than any perhaps ever known. Margaret was as blood-thirsty as her opponents; and when prisoners on either side were made, their deaths, especially if they were of any rank, were deferred only for a few hours.

Margaret, by the concessions she made to the Scots, soon raised a fresh army there, and in the north of England, but met with defeat upon defeat, till at last her husband, the unfortunate Henry, was carried prisoner to London.

The duke of York, now Edward IV. being crowned on the 29th of June, fell in love with, and privately married, Elizabeth the widow of sir John Gray, though he had some time before sent the earl of Warwick to demand the king of France's sister in marriage, in which embassy he was successful, and nothing remained but the bringing over the princess into England. When the secret of Edward's marriage broke out, the haughty earl, deeming himself affronted, returned to England inflamed with rage and indignation, and, from being Edward's best friend, became his most formidable enemy; and gaining over the duke of Clarence, Edward was made prisoner; but escaping from his confinement, the earl of Warwick and the French king, Lewis XI. declared for the restoration of Henry, who was replaced on the throne, and Edward narrowly escaped to Holland. Returning from thence, he advanced to London, under pretence of claiming his dukedom of York; but being received into the capital, he resumed the exercise of royal authority, made king Henry once more his prisoner, and defeated and killed Warwick in the battle of Barnet. A few days after he defeated a fresh army of Lancastrians, and made queen Margaret prisoner, together with her son prince Edward, whom Edward's brother, the duke of Gloucester, murdered in cold blood, as he is said (but with no great show of probability) to have done his father Henry VI. then a prisoner in the tower of London, a few days after, in the year 1471.

Edward, partly to amuse the public, and partly to supply the vast expenses of his court, pretended sometimes to quarrel, and sometimes to treat, with France: but his irregularities brought him to his death (1483) in the twenty-third year of his reign, and forty-second of his age.

Notwithstanding the turbulence of the times, the trade and manufactures of England, particularly the woollen, increased during the reigns of Henry VI. and Edward IV. So early as 1440, a navigation act was thought of by the English, as the only means to preserve to themselves the benefit of being the sole carriers of their own merchandize; but foreign influence prevented Henry's passing the bill for that purpose. The invention of printing, which is generally supposed to have been imported into England by William Caxton, and which received some countenance from Edward, is the chief glory of his reign; but learning in general was then in a poor state in England. The lord Tiptoft was its great patron, and seems to have been the first English nobleman who cultivated what are now called the belles lettres. The books printed by Caxton are mostly re-translations, or compilations from the French or monkish Latin; but it must be acknowledged, at the same time, that literature, after this period, made a more rapid and general progress among the English than it did in any other European nation. The famous Littleton, judge of the Common Pleas, and Fortescue, chancellor of England, flourished at this period.

Edward IV. left two sons by his queen, who had exercised her power with no great prudence, by having rehabilitated many of her obscure relations. Her eldest son, Edward V. was about thirteen; and his uncle, the duke of Gloucester, taking advantage of the queen's unpopularity among the great men, found means to bastardise her issue, by act of parliament, under the scandalous pretext of a pre-contract between their father and another lady. The duke, at the same time, was declared guardian of the kingdom, and at last accepted the crown, which was offered him by the Londoners; having first put to death all the nobility and great men whom he thought to be well affected to the late king's family. Whether the king and his brother were murdered in the

Tower, by his direction, is doubtful. The most probable opinion is, that they were clandestinely sent abroad by his orders, and that the elder died, but that the younger survived, and was the same who was well known by the name of Perkin Warbeck. Be this as it will, the English were prepossessed so strongly against Richard, as being the murderer of his nephews, that the earl of Richmond, who still remained in France, carried on a secret correspondence with the remains of Edward IV.'s friends; and by offering to marry his eldest daughter, he was encouraged to invade England at the head of about 2000 foreign troops; but they were soon joined by 7000 English and Welch. A battle between him and Richard, who was at the head of 15,000 men, ensued at Bosworth-field, in which Richard, after displaying most astonishing acts of personal valour, was killed, having been first abandoned by a main division of his army, under lord Stanley and his brother, in the year 1485.

Though the same act of bastardy affected the daughters as well as the sons of the late king, yet no disputes were raised upon the legitimacy of the princess Elizabeth, eldest daughter to Edward IV. and who, as had been before concerted, married Henry of Lancaster, earl of Richmond, thereby uniting both houses, which happily put an end to the long and bloody wars between the contending houses of York and Lancaster. Henry, however, rested his right upon conquest, and seemed to pay little regard to the advantages of his marriage. He was the first who instituted that guard called *Yeomen*, which still subsists; and, in imitation of his predecessor, he gave an irrecoverable blow to the dangerous privileges assumed by the barons, in abolishing liveries and retainers, by which every malefactor could shelter himself from the law, on assuming a nobleman's livery, and attending his person. The despotic court of star-chamber owed its original to Henry; but at the same time, it must be acknowledged, that he passed many acts, especially for trade and navigation, that were highly for the benefit of his subjects; and, as a finishing stroke to the feudal tenures, an act passed, by which the barons and gentlemen of landed interest were at liberty to sell and mortgage their lands, without fines or licences for the alienation.

This, if we regard its consequences, is perhaps the most important act that ever passed in an English parliament, though its tendency seems only to have been known to the politic king. Luxury, by the increase of trade, and the discovery of America, had broken with irresistible force into England; and moneyed property being chiefly in the hands of the commons, the estates of the barons became theirs, but without any of their dangerous privileges; and thus the baronial powers were gradually extinguished in England.

Henry, after encountering and surmounting many difficulties both in France and Ireland, was attacked in the possession of his throne by a young man, one Perkin Warbeck, who pretended to be the duke of York, second son to Edward IV. and was acknowledged as such by the duchess of Burgundy, Edward's sister. We shall not follow the adventures of this young man, which were various and uncommon; but it is certain that many of the English, with the courts of France and Scotland, believed him to be what he pretended. Henry endeavoured to prove the death of Edward V. and his brother, but never did it to the public satisfaction; and though James IV. of Scotland dismissed Perkin out of his dominions, being engaged in a treaty of marriage with Henry's eldest daughter; yet, by the kind manner in which he entertained

and dismissed him, it is plain that he believed him to be the real duke of York, especially as he refused to deliver up his person; which he might have done with honour, had he thought him an impostor. Perkin, after various unfortunate adventures, fell into Henry's hands, and was shut up in the Tower of London, from whence he endeavoured to escape along with the innocent earl of Warwick; for which Perkin was hanged, and the earl beheaded. In 1499. Henry's eldest son, Arthur prince of Wales, was married to the princess Catharine of Arragon, daughter to the king and queen of Spain; and he dying soon after, such was Henry's reluctance to refund her great dowry, 200,000 crowns of gold, that he consented to her being married again to his second son, then prince of Wales, on pretence that the first match had not been consummated. Soon after, Henry's eldest daughter, the princess Margaret, was sent with a most magnificent train to Scotland, where she was married to James IV. Henry, at the time of his death, which happened in 1509, the fifty-second year of his age, and twenty-fourth of his reign, was possessed of 1,800,000*l.* sterling, which is equivalent to five millions at present; so that he may be supposed to have been master of more ready money than all the kings in Europe besides possessed, the mines of Peru and Mexico being then only beginning to be worked. He was immoderately fond of replenishing his coffers, and often asked his parliament to grant him subsidies for foreign alliances which he intended not to pursue.

The vast alteration which happened in the constitution of England during Henry VII.'s reign has been already mentioned. His excessive love of money, and his avarice, was the probable reason why he did not become master of the West Indies, he saving the first order of the discovery from Columbus; whose proposals being rejected by Henry, that great man applied to the court of Spain and he set out upon the discovery of a new world in the year 1492, which he effected after a passage of thirty-three days, and took possession of the country in the name of the king and queen of Spain. Henry, however, made some amends by encouraging Cabot, a Venetian, who discovered the main land of North America in 1498; and we may observe, to the praise of this king: that sometimes, in order to promote commerce, he lent to merchants sums of money without interest, when he knew that their stock was not sufficient for those enterprizes which they had in view. From the proportional prices of living, produced by Maddox, Fleetwood, and other writers, agriculture and breeding of cattle must have been prodigiously advanced before Henry's death. An instance of this is given in the case of lady Anne, sister to Henry's queen, who had an allowance of 20*s.* per week for her exhibition, sustentation, and convenient diet of meat and drink; also for two gentlewomen, one woman child, one gentleman, one yeoman, and three grooms (in all eight persons), 5*l.* 11*s.* 8*d.* per annum, for their wages, diet, and cloathing; and for the maintenance of seven horses, 16*l.* 9*s.* 4*d.* *i. e.* for each horse, 2*l.* 7*s.* 0*d.*  $\frac{1}{2}$ , yearly, money being still  $\frac{1}{4}$  times as weighty as our modern silver coin. Wheat was at that day no more than 3*s.* 4*d.* a quarter, which answers to 5*s.* of our money; consequently it was about seven times as cheap as at present: so that, had all other necessaries been equally cheap, the could have lived as well as on 1260*l.* 10*s.* 6*d.* of our modern money, or ten times as cheap as at present.

The fine arts were as far advanced in England at the accession of Henry VIII. 1509, as in any European country, if we except Italy; and perhaps no prince ever entered with greater advantages than he did

on the exercise of royalty. Young, vigorous, and rich, without any rival, he held the balance of power in Europe; but it is certain that he neglected those advantages in commerce with which his father became too lately acquainted. Imagining he could not stand in need of a supply, he did not improve Cabot's discoveries; and he suffered the East and West Indies to be engrossed by Portugal and Spain. His vanity engaged him too much in the affairs of the continent; and his flatterers encouraged him to make preparations for the conquest of all France. These projects, and his establishing what is properly called a *naval royal*, for the permanent defence of the nation (a most excellent measure), led him into incredible expenses. He became a candidate for the German empire, during its vacancy; but soon resigned his pretensions to Francis I. of France, and Charles of Austria, king of Spain, who was elected in 1519. Henry's conduct, in the long and bloody wars between those princes, was directed by Wolsey's views upon the pope's claim, which he hoped to gain by the interest of Charles; but finding himself twice deceived, he persuaded his master to declare himself for Francis, who had been taken prisoner at the battle of Pavia. Henry, however, continued to be the dupe of all parties, and to pay great part of their expenses, till at last he was forced to lay vast burdens upon his subjects.

Henry continued all this time the great enemy of the reformation, and the champion of the popes and the Romish church. He wrote a book against Luther, "*Of the Seven Sacraments*," about the year 1521, for which the pope gave him the title of *Defender of the Faith*, which his successors retain to this day; but, about the year 1527, he began to have some scruple with regard to the validity of his marriage with his brother's widow. I shall not say how far on this occasion he might be influenced by scruples of his conscience, or aversion to the queen, or the charms of the famous Anne Boleyn, maid of honour to the queen, whom he married, before he had obtained from Rome the proper bulls of divorce from the pope. The difficulties he met with in this process ruined Wolsey, who died heart-broken, after being stript of his immense power and possessions.

A variety of circumstances, it is well known, induced Henry at last to throw off all relation to, or dependence upon, the church of Rome, and to bring about a reformation; in which, however, many of the Romish errors and superstitions were retained. Henry never could have effected this mighty measure, had it not been for his despotic disposition, which broke out on every occasion. Upon a slight suspicion of his queen's inconstancy, and after a sham trial, he cut off her head in the Tower, and put to death some of her nearest relations; and in many respects he acted in the most arbitrary manner; his wishes, however unreasonable, being too readily complied with, in consequence of the shameful servility of his parliaments. The dissolution of the religious houses, and the immense wealth that came to Henry by seizing all the ecclesiastical property in his kingdom, enabled him to give full scope to his sanguinary disposition; so that the best and most innocent blood of England was shed on scaffolds, and seldom any long time passed without being marked with some illustrious victim of his tyranny.—Among others, was the aged countess of Salisbury, descended immediately from Edward IV. and mother to cardinal Pole; the marquis of Exeter, the lord Montague, and others of the blood royal, for holding a correspondence with that cardinal.

His third wife was Jane Seymour, daughter to a gentleman of fortune

and family; but she died in bringing Edward VI. into the world. His fourth wife was Anne, sister to the duke of Cleves. He disliked her so much, that he scarcely bedded with her; and obtaining a divorce, he suffered her to reside in England on a pension of 3000*l.* a year. His fifth wife was Catharine Howard, neice to the duke of Norfolk, whose head he cut off for ante-nuptial incontinency. His last wife was Catharine Par, in whose possession he died, after she had narrowly escaped being brought to the stake, for her religious opinions, which favoured the reformation. Henry's cruelty increased with his years, and was now exercised promiscuously on protestants and catholics. He put the brave earl of Surry to death, without a crime being proved against him; and his father, the duke of Norfolk, must have suffered the next day, had he not been saved by Henry's own death, 1547, in the 56th year of his age, and the 38th of his reign.

The state of England, during the reign of Henry VIII. is, by the means of printing, better known than that of his predecessors. His attention to the naval security of England was highly commendable; and it is certain that he employed the unjust and arbitrary power he frequently assumed, in many respects, for the glory and interest of his subjects. Without inquiring into his religious motives, it must be candidly confessed, that, had the reformation gone through all the forms prescribed by the laws and the courts of justice, it probably never could have taken place, or at least not for many years; and whatever Henry's personal crimes or failings might have been, the partition he made of the church's property among his courtiers and favourites, and thereby rescuing it from dead hands, undoubtedly promoted the present greatness of England. With regard to learning and the arts, Henry was a generous encourager of both. He gave a pension to Erasmus, the most learned man of his age. He brought to England, encouraged, and protected Hans Holbein, that excellent painter and architect; and in his reign noblemen's houses began to have the air of Italian magnificence and regularity. He was a constant and generous friend to Cranmer: and though he was, upon the whole, rather whimsical than settled in his own principles of religion, he advanced and encouraged many who became afterwards the instruments of a more pure reformation.

In this reign the Bible was ordered to be printed in English. Wales was united and incorporated with England. Ireland was created into a kingdom, and Henry took the title of king instead of lord of Ireland.

Edward VI. was but nine years of age at the time of his father's death; and after some disputes were over, the regency was settled in the person of his uncle the earl of Hertford, afterwards the protector, and duke of Somerset, a declared friend and patron of the reformation, and a bitter enemy to the See of Rome.

The reader is to observe in general, that the reformation was not effected without many public disturbances. The common people, during the reigns of Henry and Edward, being deprived of the last relief they had from abbeys and religious houses, and being ejected from their small corn-growing farms, had often taken arms, but had been as often suppressed by the government; and several of these insurrections were crushed in this reign.

The reformation, however, went on rapidly, through the zeal of Cranmer, and others, some of them foreign divines. In some cases, particularly with regard to the princess Mary, they lost sight of that moderation which the reformers had before so strongly recommended; and

some cruel sanguina Edward's youth eximents, as Bridewell, which still exist and of a deep consumption of his reign.

some cruel sanguinary executions, on account of religion, took place. Edward's youth excuses him from blame; and his charitable endowments, as Bridewell, and St. Thomas's hospitals, and also several schools which still exist and flourish, show the goodness of his heart. He died of a deep consumption in 1553, in the 10th year of his age, and the 7th of his reign.

Edward, on his death-bed, from his zeal for religion, had made a very unconstitutional will; for he set aside his sister Mary from the succession, which was claimed by lady Jane Grey, daughter to the duchess of Suffolk, younger sister to Henry VIII. This lady, though she had scarcely reached her 17th year, was a prodigy of learning and virtue; but the bulk of the English nation recognised the claim of the princess Mary, who cut off lady Jane's head. Her husband, lord Guildford Dudley, son to the duke of Northumberland, also suffered in the same manner.

Mary being thus settled on the throne, suppressed an insurrection under Wyatt, and proceeded like a female fury to re-establish popery, which she did all over England. She recalled cardinal Pole from banishment, made him instrumental in her cruelties, and lighted up the flames of persecution, in which archbishop Cranmer, the bishops Ridley, Hooper, and Latimer, and many other illustrious confessors of the English reformed church, were consumed; not to mention a vast number of other sacrifices of both sexes, and all ranks, that suffered through every quarter of the kingdom. Bonner, bishop of London, and Gardiner, bishop of Winchester, were the chief executioners of her bloody mandates: and had she lived, she would have endeavoured to exterminate all her protestant subjects.

Mary now married Philip II. of Spain, who, like herself, was an unfeeling bigot to popery; and the chief praise of her reign is, that, by the marriage articles, provision was made for the independency of the English crown. By the assistance of troops which she furnished to her husband, he gained the important battle of St. Quintin; but that victory was so ill improved, that the French, under the duke of Guise, soon after took Calais, the only place then remaining to the English in France, and which had been held ever since the reign of Edward III. This loss, which was chiefly owing to cardinal Pole's secret connections with the French court, is said to have broken Mary's heart, who died in 1558, in the 42d year of her life, and 6th of her reign. "In the heat of her persecuting flames (says a contemporary writer of credit) were burnt to ashes, 1 archbishop, 4 bishops, 21 divines, 8 gentlemen, 84 artificers, and 100 husbandmen, servants, and labourers, 26 wives, 20 widows, 9 virgins, 2 boys, and 2 infants; one of them whipped to death by Bonner, and the other, springing out of the mother's womb from the stake as she burned, thrown again into the fire." Several also died in prison, and many were otherwise cruelly treated.

Elizabeth, daughter to Henry VIII. by Anne Boleyn, mounted the throne under the most discouraging circumstances, both at home and abroad. Popery was the established religion of England; her title to the crown, on account of the circumstances attending her mother's marriage and death, was disputed by Mary queen of Scots, grandchild to Henry VII.'s eldest daughter, and wife to the dauphin of France; and the only ally she had on the continent was Philip king of Spain, who was the life and soul of the popish cause, both abroad and in England. Elizabeth was no more than 25 years of age at the time of her

inauguration; but her sufferings under her bigoted sister, joined to the superiority of her genius, had taught her caution and policy; and she soon conquered all difficulties.

In matters of religion she succeeded with surprising facility; for in her first parliament in 1559, the laws establishing popery were repealed, her supremacy was restored, and an act of uniformity passed soon after. And it is observed, that of 9400 beneficed clergymen in England, only about 120 refused to comply with the reformation. With regard to her title, she took advantage of the divided state of Scotland, and formed a party there, by which Mary, now become the widow of Francis II. of France, was obliged to renounce, or rather to suspend, her claim. Elizabeth, not contented with this, sent troops and money, which supported the Scotch malcontents, till Mary's unhappy marriage with lord Darnley, and then with Bothwell, the supposed murderer of the former, and her other misconduct and misfortunes, drove her to take refuge in Elizabeth's dominions, where she had often been promised a safe and honourable asylum. It is well known how unfaithful Elizabeth was to this profession of friendship, and that she detained the unhappy prisoner 18 years in England, then brought her to a sham trial, pretending that Mary aimed at the crown, and, without sufficient proof of her guilt, cut off her head—an action which greatly tarnished the glories of her reign.

The same Philip who had been the husband of her late sister, upon Elizabeth's accession to the throne, offered to marry her: but she dexterously avoided his address; and by a train of skilful negotiations between her court and that of France, she kept the balance of Europe so undetermined, that she had leisure to unite her people at home, and to establish an excellent internal policy in her dominions. She supported the protestants of France against their persecuting princes and the papists, and gave the dukes of Anjou and Alençon, brothers of the French king, the strongest assurances that one or other of them should be her husband; by which she kept that court, who dreaded Spain, at the same time in so good humour with her government, that it showed no resentment when she cut off queen Mary's head.

When Philip was no longer to be imposed upon by Elizabeth's arts, which had amused and baffled him in every quarter, it is well known that he made use of the immense sums he drew from Peru and Mexico in equipping the most formidable armament that perhaps ever had been put to sea, and a numerous army of veterans, under the prince of Parma, the best captain of that age, and that he procured a papal bull for absolving Elizabeth's subjects from their allegiance. The largeness of the Spanish ships proved disadvantageous to them on the seas where they fought; the lord admiral Howard, and the brave sea-officers under him, engaged, beat, and chased the Spanish fleet for several days; and the seas and tempests finished the destruction which the English arms had begun, and few of the Spanish ships recovered their ports. Next to the admiral, lord Howard of Effingham, sir Francis Drake, captain Hawkins, and captain Frobisher, distinguished themselves against this formidable invasion, in which the Spaniards are said to have lost 81 ships of war, large and small, and 13,500 men.

Elizabeth had for some time supported the revolt of the Hollanders from Philip, and had sent them her favourite, the earl of Leicester, who acted as her viceroy and general in the Low Countries. Though Leicester behaved ill, yet her measures were so wise, that the Dutch established their independency; and then she sent forth her fleets under

Drake, Raleigh, the earl of Cumberland, and other gallant naval officers, into the East and West Indies, whence they brought prodigious treasures, taken from the Spaniards, into England.

Elizabeth in her old age grew distrustful, peevish, and jealous. Though she undoubtedly loved the earl of Essex, she teased him by her capriciousness into the madness of taking arms, and then cut off his head. She complained that she had been betrayed into this sanguinary measure; and this occasioned a sinking of her spirits, which brought her to her grave in 1603, the seventieth year of her age, and 45th of her reign, having previously named her kinsman James VI. king of Scotland, and son to Mary, for her successor.

The above form the great lines of Elizabeth's reign; and from them may be traced, either immediately or remotely, every act of her government. She supported the protestants in Germany against the house of Austria, of which Philip king of Spain was the head. She crushed the papists in her own dominions for the same reason, and made a farther reformation in the church of England, in which state it has remained ever since. In 1600 the English East-India company received its first formation, that trade being then in the hands of the Portuguese (in consequence of their having first discovered the passage to India by the Cape of Good Hope, by Vasco de Gama, in the reign of Henry VII.), who at that time were subjects to Spain; and factories were established in China, Japan, India, Amboyna, Java, and Sumatra.

As to Elizabeth's internal government, the successes of her reign have disguised it; for she was far from being a friend to personal liberty, and she was guilty of many stretches of power against the most sacred rights of Englishmen. The severe statutes against the puritans, debarring them of liberty of conscience, and by which many suffered death, must be condemned.

We can scarcely require a stronger proof that the English began to be tired of Elizabeth, than the joy testified by all ranks at the accession of her successor, notwithstanding the long inveterate animosities between the two kingdoms. James was far from being destitute of natural abilities for government; but he had received wrong impressions of the regal office, and too high an opinion of his own dignity, learning, and political talents. It was his misfortune that he mounted the English throne under a full conviction that he was entitled to all the unconstitutional powers that had been occasionally exercised by Elizabeth and the house of Tudor, and which various causes had prevented the people from opposing with proper vigour. The nation had been wearied and exhausted by the long and destructive wars between the houses of Lancaster and York, in the course of which the ancient nobility were in great part cut off; and the people were inclined to endure much, rather than again involve themselves in the miseries of civil war. Neither did James make any allowance for the glories of Elizabeth, which, as I have observed, disguised her most arbitrary acts; and none for the free, liberal sentiments, which the improvement of knowledge and learning had diffused through England. It is needless to point out the vast increase of property through trade and navigation, which enabled the English at the same time to defend their liberties. James's first attempt of great consequence was to effect an union between England and Scotland; but though he failed in this through the aversion of the English to that measure, on account of his loading his Scotch courtiers with wealth and honours, he showed no violent resentment at the disappointment. It was an advantage to him at the beginning of his reign, that the

courts of Rome and Spain were thought to be his enemies; and this opinion was increased by the discovery and defeat of the gunpowder treason\*.

James and his ministers were continually inventing new ways to raise money, as by monopolies, benevolences, loans, and other illegal methods. Among other expedients, he sold the titles of baron, viscount, and earl, at a certain price; made a number of knights of Nova Scotia, each to pay such a sum, and instituted a new order of knights-baronets, which was to be hereditary, for which each person paid 100*l*.

His pacific reign was a series of theological contests with ecclesiastical casuists, in which he proved himself more a theologian than a prince; and in 1617 he attempted to establish episcopacy in Scotland; but the zeal of the people baffled his design.

James gave his daughter, the princess Elizabeth, in marriage to the elector Palatine, the most powerful protestant prince in Germany, and he soon after assumed the crown of Bohemia. The memory of James has been much abused for his tame behaviour, after that prince had lost his kingdom and electorate by the imperial arms; but it is to be observed, that he always opposed his son-in-law's assuming the crown of Bohemia; that, had he kindled a war to re-instate him in that and his electorate, he probably would have stood single in the same, excepting the feeble and uncertain assistance he might have received from the electors dependants and friends in Germany. It is certain, however, that James furnished the elector with large sums of money to retrieve them, and that he actually raised a regiment of 2200 men under sir Horace Vere, who carried them over to Germany, where the Germans, under the marquis of Anspach, refused to second them against Spinola the Spanish general.

James has been greatly and justly blamed for his partiality to favourites. His first was Robert Carr, a private Scotch gentleman, who was raised to be first minister and earl of Somerset. His next favourite was George Villiers, a private English gentleman, who, upon Somerset's disgrace, was admitted to an unusual share of favour and familiarity.

\* This was a scheme of the Roman-catholics to cut off at one blow the king, lords, and commons, at the meeting of parliament; when it was also expected that the queen and prince of Wales would be present. The manner of enlisting any new conspirator was by oath, and administering the sacrament; and this dreadful secret, after being religiously kept near eighteen months, was happily discovered in the following manner: about ten days before the long-wished-for meeting of parliament, a Roman-catholic peer received a letter, which had been delivered to his servant by an unknown hand, earnestly advising him to shew off his attendance in parliament at that time; but which contained no kind of explanation. The nobleman, though he considered the letter as a foolish attempt to frighten and ridicule him, thought proper to lay it before the king, who, studying the contents with more attention, began to suspect some dangerous contrivance by gunpowder; and it was judged advisable to inspect all the vaults below the houses of parliament; but the search was purposely delayed till the night immediately preceding the meeting, when a justice of peace was sent with proper attendants; and before the door of the vault, under the upper house, finding one Fawkes, who had just finished all his preparations, he immediately seized him, and at the same time discovered in the vault 36 barrels of powder, which had been carefully concealed under faggots and piles of wood. The match, with every thing proper for setting fire to the train, were found in Fawkes's pocket, whose countenance bespoke his savage disposition, and who, after regretting that he had lost the opportunity of destroying so many heretics, made a full discovery; and the conspirators, who never exceeded eighty in number, being seized by the country people, confessed their guilt, and were executed in different parts of England. Notwithstanding this horrid crime, the bigotted catholics were so devoted to Garnet, a Jesuit, one of the conspirators, that they fancied miracles to be wrought by his blood, and in Spain he was considered as a martyr.

with his sovereign: James had at that time formed a system of policy for attaching himself intimately to the court of Spain, that it might assist him in recovering the Palatinate; and to this system he had sacrificed the brave sir Walter Raleigh on a charge of having committed hostilities against the Spanish settlements in the West Indies. James having lost his eldest son, Henry Prince of Wales, who had an invincible antipathy to a popish match, threw his eyes upon the infant of Spain as a proper wife for his son Charles, who had succeeded to that principality. Buckingham, who was equally a favourite with the son as with the father, fell in with the prince's romantic humour; and, against the king's will, they travelled in disguise to Spain, where a most solemn farce of courtship was played; but the prince returned without his bride; and had it not been for the royal partiality in his favour, the earl of Bristol, who was then ambassador in Spain, would probably have brought Buckingham to the block.

James was all this while perpetually jarring with his parliament, whom he could not persuade to furnish money equal to his demands; and at last he agreed to his son's marrying the princess Henrietta Maria, sister to Lewis XIII. and daughter to Henry the Great of France. James died before the completion of this match; and it is thought that, had he lived, he would have discarded Buckingham. His death happened in 1625, in the 59th year of his age, after a reign over England of twenty-two years. As to the progress of the arts and learning under his reign, it has been already described. James encouraged and employed that excellent painter sir Peter Paul Rubens, as well as Inigo Jones, who restored the pure taste of architecture in England; and in his reign, poetical genius, though not much encouraged at court, shone with great lustre. Mr. Middleton also at this time projected the bringing water from Hertfordshire to London, and supplying the city with it by means of pipes. This canal is still called the *New River*.

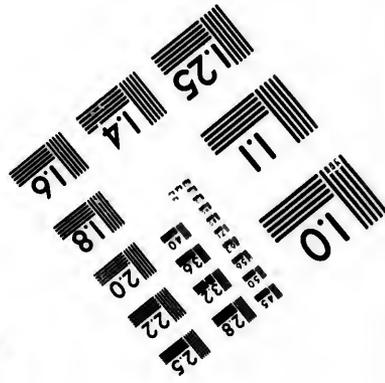

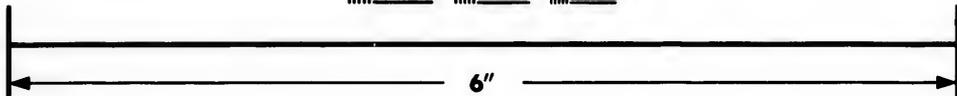

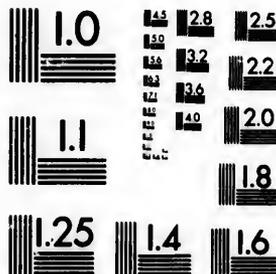

The death of the duke of Buckingham, the king's favourite, who was assassinated by one Felton, a subaltern officer, in 1628, did not deter Charles from his arbitrary proceedings, which the English patriots in that enlightened age justly considered as so many acts of tyranny. He, without authority of parliament, laid arbitrary impositions upon trade, which were refused to be paid by many of the merchants and members of the house of commons. Some of them were imprisoned, and the judges were checked for admitting them to bail. The house of commons resented those proceedings by drawing up a protest, and denying admittance to the gentleman-usher of the black rod, who came to adjourn them, till it was finished. This served only to widen the breach, and the king dissolved the parliament; after which he exhibited informations against nine of the most eminent members, among whom was the great Mr. Selden, who was as much distinguished by his love of liberty, as by his uncommon erudition. They objected to the jurisdiction of the court; but their plea was over-ruled, and they were sent to prison during the king's pleasure.

Every thing now operated towards the destruction of Charles. The commons would vote no supplies without some redress of the national grievances; upon which, Charles, presuming on what had been practised in reigns when the principles of liberty were imperfectly or not at all understood, levied money upon monopolies of salt, soap, and such necessaries, and other obsolete claims, particularly for knighthood; and raised various taxes without authority of parliament. His government becoming every day more and more unpopular, Burton, a divine,

**Brynne**, a lawyer, and **Bastwick**, a physician, men of no great eminence or abilities, but warm and resolute, published several pieces which gave offence to the court, and which contained some severe strictures against the ruling clergy. They were prosecuted for these pieces in the star-chamber in a very arbitrary and cruel manner; and punished with so much rigour, as excited an almost universal indignation against the authors of their sufferings. Thus was the government rendered still more odious; and unfortunately for Charles, he put his conscience into the hands of **Laud**, archbishop of Canterbury, who was as great a bigot as himself, both in church and state. **Laud** advised him to prosecute the puritans, and, in the year 1637, to introduce episcopacy into Scotland. The Scots upon this formed secret connections with the discontented English, and invaded England in August, 1640, where Charles was so ill served by his officers and his army, that he was forced to agree to an inglorious peace with the Scots, who made themselves masters of Newcastle and Durham; and being now openly beloved by the house of commons, they obliged the king to comply with their demands.

Charles had made **Wentworth**, earl of **Strafford**, a man of great abilities, president of the council of the North, and lord-lieutenant of Ireland; and he was generally believed to be the first minister of state. **Strafford** had been a leading member of the opposition to the court; but he afterwards, in conjunction with **Laud**, exerted himself so vigorously in carrying the king's despotic schemes into execution, that he became an object of public detestation. As lord-president of the North, as lord-lieutenant of Ireland, and as a minister and privy-counsellor in England, he behaved in a very arbitrary manner, and was guilty of many actions of great injustice and oppression. He was, in consequence, at length, on the 22d of May, 1641, brought to the block, though much against the inclinations of the king, who was in a manner forced by the parliament and people to sign the warrant for his execution. **Archbishop Laud** was also beheaded; but his execution did not take place till a considerable time after that of **Strafford**, the 10th of January, 1645. In the fourth year of his reign, Charles had passed the *petition of right* into a law which was intended by the parliament as the future security of the liberty of the subject. It established particularly, "That no man hereafter be compelled to make or yield any gift, loan, benevolence, tax, or such like charge, without common consent by act of parliament;" but he afterwards violated it in numerous instances, so that an universal discontent at his administration prevailed throughout the nation. A rebellion also broke out in Ireland, on October 23, 1641, where the protestants, without distinction of age, sex, or condition, to the amount of many thousands, were massacred by the papists; and great pains were taken to persuade the public that Charles secretly favoured them out of hatred to his English subjects. The bishops were expelled the house of peers, on account of their constantly opposing the designs and bills of the other house; and the leaders of the English house of commons still kept up a correspondence with the discontented Scots. Charles was ill enough advised to go in person to the house of commons, January 4, 1642, and there demanded that lord **Kimbolton**, **Mr. Pym**, **Mr. Hampden**, **Mr. Hollis**, **Mr. Arthur Haselrig**, and **Mr. Stroud**, should be apprehended; but they had previously made their escape. This act of Charles was resented as high treason against his people; and the commons rejected all the offers of satisfaction he could make them.

Notwithstanding the many acts of tyranny and oppression, of which the king and his ministers had been guilty, yet, when the civil war broke out, there were great numbers who repaired to the regal standard. Many of the nobility and gentry were much attached to the crown, and considered their own honours as connected with it; and a great part of the landed interest was joined to the royal party. The parliament, however, took upon themselves the executive power, and were favoured by most of the trading towns and corporations; but its great resource lay in London. The king's general was the earl of Lindsey, a brave but not an enterprising commander; but he had great dependence on his nephews, the princes Rupert and Maurice, sons to the elector Palatine, by his sister the princess Elizabeth. In the beginning of the war, the royal army had the ascendancy; but in the progress of it, affairs took a very different turn. The earl of Essex was made general under the parliament, and the first battle was fought at Edgehill in Warwickshire, the 23d of October, 1642. Both parties claimed the victory, though the advantage lay with Charles; for the parliament was so much distressed, that they invited the Scots to come to their assistance, and they accordingly entered England anew, with about 20,000 horse and foot. Charles attempted to remove the parliament to Oxford, where many members of both houses met; but his enemies were still sitting at Westminster, and continued to carry on the war against him with great animosity. The independent party, which had scarcely before been thought of, began now to increase and to figure at Westminster. They were averse to the presbyterians, who till then had conducted the war against the king, nearly as much as to the royalists; and such was their management, under the direction of the famous Oliver Cromwell, that a plan was formed for dismissing the earls of Essex and Manchester, and the heads of the presbyterians, from the parliament's service, on the suggestion that they were not for bringing the war to a speedy end, or not for reducing the king too low; and for introducing Fairfax, who was an excellent officer, but more manageable, though a presbyterian, and some independent officers. In the mean while the war went on with resentment and loss on both sides. Two battles were fought at Newbury, one on September 20th, 1643, and the other October 27th, 1644, in which the advantage inclined to the king. He had likewise many other successes; and having defeated sir William Waller, he pursued the earl of Essex, who remained still in command, into Cornwall, whence he was obliged to escape by sea; but his infantry surrendered themselves prisoners to the royalists, though his cavalry delivered themselves by their valour.

The first fatal blow the king's army received was at Marston-moor, July 2d, 1644, where, through the imprudence of prince Rupert, the earl of Manchester defeated the royal army, of which 4000 were killed, and 1500 taken prisoners. This victory was owing chiefly to the courage and conduct of Cromwell; and though it might have been retrieved by the successes of Charles in the West, yet his whole conduct was a series of mistakes, till at last his affairs became irretrievable. It is true, many treaties of peace, particularly one at Uxbridge, were set on foot during the war; and the heads of the presbyterian party would have agreed to terms that very little bounded the king's prerogative. They were outwitted and over-ruled by the independents; who were assisted by the stiffness, insincerity, and unamiable behaviour of Charles himself. In short, the independents at last succeeded in persuading the members at Westminster that Charles was not to be trusted, whatever his concessions

might be. From that moment the affairs of the royalists continually became more desperate; Charles by piece-meal lost all his towns and forts, and was defeated by Fairfax and Cromwell, at the decisive battle of Naseby, June 14, 1645, owing partly, as usual, to the misconduct of prince Rupert. This battle was followed with fresh misfortunes to Charles, who retired to Oxford, the only place where he thought he could be safe.

The Scots were then besieging Newark, and no good understanding subsisted between them and the English parliamentarians; but the best and most loyal friend Charles had, thought it prudent to make their peace. In this melancholy situation of his affairs, he escaped in disguise from Oxford, and came to the Scotch army before Newark, on May 6, 1646, upon a promise of protection. The Scots, however, were so intimidated by the resolutions of the parliament at Westminster, that, in consideration of 400,000*l.* of their arrears being paid, they put the person of Charles into the hands of the parliament's commissioners, probably not suspecting the consequences.

The presbyterians were now more inclined than ever to make peace with the king; but they were no longer masters, being forced to receive laws from the army and the independents. The army now avowed their intentions. They first by force took Charles out of the hands of the commissioners, June 4, 1647, and then dreading that a treaty might still take place with the king, they imprisoned 41 of the presbyterian members, voted the house of peers to be useless, and that of the commons was reduced to 150, most of them officers of the army. In the mean while, Charles, who unhappily promised himself relief from those dissensions, was carried from prison to prison, and sometimes cajoled by the independents with hopes of deliverance, but always narrowly watched. Several treaties were let on foot, but all miscarried; and he had been imprudent enough, after his effecting an escape, to put himself into colonel Hammond's hands, the parliament's governor of the Isle of Wight. A fresh negotiation was begun, and almost finished, when the independents, dreading the general disposition of the people for peace, and strongly persuaded of the insincerity of the king, once more seized upon his person, brought him prisoner to London, carried him before a court of justice of their own erecting; and, after an extraordinary trial, his head was cut off, before his own palace at Whitehall, on the 30th of January, 1648-9, being the 49th year of his age, and the 24th of his reign.

Charles is allowed to have had many virtues; and some have supposed that affliction had taught him so much wisdom and moderation, that, had he been restored to his throne, he would have become an excellent prince; but there is abundant reason to conclude, from his private letters, that he retained his arbitrary principles to the last, and that he would again have regulated his conduct by them, if he had been re-instated in power. It is however certain, that, notwithstanding the tyrannical nature of his government, his death was exceedingly lamented by great numbers; and many in the course of the civil war, who had been his great opponents in parliament, became converts to his cause, in which they lost their lives and fortunes. The surviving children of Charles were Charles and James, who were successively kings of England, Henry duke of Gloucester, who died soon after his brother's restoration, the princess Mary, married to the prince of Orange, and mother to William prince of Orange, who was afterwards king of England, and the princess Henrietta Maria, who was married to the duke of Orleans, and whose daughter was married to Victor Amadeus, duke of Savoy, and king of Sardinia.

They who brought Charles to the block were men of different persuasions and principles; but many of them possessed very extraordinary abilities for government. They omitted no measure that could give a perpetual exclusion to kingly power in England; and it cannot be denied, that, after they erected themselves into a commonwealth, they made very successful exertions for retrieving the glory of England by sea. They were joined by many of the presbyterians, and both parties hated Cromwell and Ireton, though they were forced to employ them in the reduction of Ireland, and afterwards against the Scots, who had received Charles II. as their king. By cutting down the timber upon the royal domains, they produced a fleet superior to any that had ever been seen in Europe. Their general, Cromwell, invaded Scotland; and though he was there reduced to great difficulties, he totally defeated the Scots at the battles of Dunbar and Worcester. The same commonwealth passed an act of navigation; and declaring war against the Dutch, who were thought till then invincible by sea, they effectually humbled those republicans in repeated engagements.

By this time, Cromwell, who hated subordination to a parliament, had the address to get himself declared commander in chief of the English army. Admiral Blake, and the other English admirals, carried the terror of the English name by sea to all quarters of the globe; and Cromwell, having now but little employment, began to be afraid that his services would be forgotten; for which reason he went, April 20, 1653; without any ceremony, with about 300 musqueteers, and dissolved the parliament, opprobriously driving all the members, about a hundred, out of their house. He next annihilated the council of state, with whom the executive power was lodged; and transferred the administration of government to about 140 persons, whom he summoned to Whitehall, on the 4th of July, 1653.

The war with Holland, in which the English were again victorious, still continued. Seven bloody engagements by sea were fought in little more than the compass of one year; and in the last, which was decisive in favour of England, the Dutch lost their brave admiral, Van Tromp. Cromwell all this time wanted to be declared king; but he perceived that he must encounter unsurmountable difficulties from Fleetwood and his other friends, if he should persist in his resolution. He was, however, declared *lord protector* of the commonwealth of England; a title under which he exercised all the power that had been formerly annexed to the regal dignity. No king ever acted, either in England or Scotland, more despotically in some respects than he did; yet no tyrant ever had fewer real friends; and even those few threatened to oppose him, if he should take upon him the title of king. Historians, in drawing the character of Cromwell, have been imposed upon by his amazing success, and dazzled by the lustre of his fortune; but when we consult his secretary Thurloe's, and other state papers, the imposition in a great measure vanishes. After a most uncomfortable usurpation of four years, eight months, and thirteen days, he died on the 3d of September, 1658, in the 60th year of his age.

It is not to be denied that England acquired much more respect from foreign powers, between the death of Charles I. and that of Cromwell, than she had been treated with since the death of Elizabeth. This was owing to the great men who formed the republic which Cromwell abolished, and who, as it were instantaneously, called forth the naval strength of the kingdom. In the year 1656, the charge of the public amounted

to one million three hundred thousand pounds, of which a million went to the support of the navy and army, and the remainder to that of the civil government. In the same year Cromwell abolished all tenures *in capite*, by knight's service, and the socage in chief, and likewise the courts of wards and liveries. Several other grievances that had been complained of during the late reigns were likewise removed. Next year the total charge or public expense of England amounted to two millions three hundred twenty-six thousand nine hundred and eighty-nine pounds. The collections by assessments, excise, and customs, paid into the exchequer, amounted to two millions three hundred and sixty-two thousand pounds, four shillings.

Upon the whole, it appears that England, from the year 1648 to the year 1658, was improved equally in riches and in power. The legal interest of money was reduced from 8 to 6 per cent. a sure symptom of increasing commerce. The famous and beneficial navigation act, that palladium of the English trade, was now planned and established, and afterwards confirmed under Charles II. Monopolies of all kinds were abolished, and liberty of conscience to all sects was granted, to the vast advantage of population and manufactures, which had suffered greatly by Laud's intolerant schemes, having driven numbers of artisans to America, and foreign countries. To the above national meliorations we may add the modesty and frugality introduced among the common people, and the citizens in particular, by which they were enabled to increase their capitals. It appears, however, that Cromwell, had he lived, and been firmly settled in the government, would have broken through the sober maxims of the republicans; for some time before his death he affected great magnificence in his person, court, and attendants. He maintained the honour of the nation much, and in many instances interposed effectually in favour of the protestants abroad. Arts and sciences were not much patronised, and yet he had the good fortune to meet, in the person of Cooper, an excellent miniature painter; and his coins, done by Simon, exceed in beauty and workmanship any of that age. He certainly did many things worthy of praise; and, as his genius and capacity led him to the choice of fit persons for the several parts of administration, so he showed some regard to men of learning, and particularly to those intrusted with the care of youth at the universities.

The fate of Richard Cromwell, who succeeded his father Oliver as protector, sufficiently proves the great difference there was between them, as to spirit and parts, in the affairs of government. Richard was placed in his dignity by those who wanted to make him the tool of their own government; and he was soon after driven, without the least struggle or opposition, into obscurity. It is vain for historians of any party to ascribe the restoration of Charles II. (who, with his mother and brothers, during the usurpation, had lived abroad on a very precarious subsistence) to the merits of any particular persons. The presbyterians were very zealous in promoting it; but it was effected by the general concurrence of the people, who seemed to have thought that neither peace nor protection were to be obtained, but by restoring the ancient constitution of the monarchy. General Monk, a man of military abilities, but of no principles, except such as served his ambition or interest, had the sagacity to observe this; and, after temporising in various shapes, being at the head of the army, he acted the principal part in restoring Charles II. For this he was created duke of Albemarle, confirmed in the command of the army, and loaded with honours and riches.

Charles II. had to have a parliament the first mention of asparagus, and shallots, the English made a sugar regular acts Charles knew was warped by same consequence in the suffering and in being the increase of pleasure, which been severely his necessities, by parliament, this, his conduct France, which to the welfare his memory.

Among the his giving was the chief advice and great ability other ministers, surable hours, on with great Charles's misfortune for the war, found means way as far as after this, the States-General Sweden having liance.

In 1671, the bankers, up the exchequer tended to the eve of a fleet and army York command station. The of Charles, in the Low of the French XIV. who very unforeseen

Charles II. being restored in 1660, in the first year of his reign seemed to have a real desire to promote his people's happiness. Upon his confirming the abolition of all the feudal tenures, he received from the parliament a gift of the excise for life; and in this act, coffee and tea are first mentioned. By his long residence, and that of his friends, abroad, he imported into England the culture of many useful vegetables; such as that of asparagus, artichokes, cauliflowers, and several kinds of beans, peas, and fallads. Under him, Jamaica, which had been conquered by the English under the auspices of Cromwell, was greatly improved; and made a sugar colony. The Royal Society was instituted, and many popular acts respecting trade and colonisation were passed. In short, Charles knew and cultivated the true interests of his kingdom, till he was warped by pleasure, and sunk in indolence, - failings that had the same consequences as despotism itself. He appeared to interest himself in the sufferings of his citizens, when London was burnt down in 1666; and in being rebuilt with greater lustre and conveniences is a proof of the increase of her trade; but there were no bounds to Charles's love of pleasure, which led him into the most extravagant expenses. He has been severely censured for selling Dunkirk to the French king to supply his necessities, after he had squandered the immense sums granted him by parliament. The price was about 250,000*l.* sterling. But, even in this, his conduct was more defensible than in his secret connections with France, which were of the most scandalous nature, utterly repugnant to the welfare of the kingdom, and such as must ever reflect infamy on his memory.

Among the evidences of his degeneracy as a king, may be mentioned his giving way to the popular clamour against the lord Clarendon, as the chief adviser of the sale of Dunkirk; a man of extensive knowledge, and great abilities, and more honest in his intentions than most of his other ministers, but whom he sacrificed to the sycophants of his pleasurable hours. The first Dutch war, which began in 1665, was carried on with great resolution and spirit under the duke of York; but, through Charles's misapplication of the public money, which had been granted for the war, the Dutch, while a treaty of peace was depending at Breda, found means to insult the royal navy of England, by sailing up the Medway as far as Chatham, and destroying several capital ships of war. Soon after this, a peace was concluded at Breda between Great Britain and the States-General, for the preservation of the Spanish Netherlands; and Sweden having acceded to the treaty, 1668, it was called the *triple alliance*.

In 1671, Charles was so ill advised as to seize upon the money of the bankers, which had been lent him at 8*l.* per cent. and to shut up the exchequer. This was an indefensible step; and Charles pretended to justify it by the necessity of his affairs, being then on the eve of a fresh war with Holland. This was declared in 1672, and had almost proved fatal to that republic; for in this war the English fleet and army acted in conjunction with those of France. The duke of York commanded the English fleet, and displayed great gallantry in that station. The duke of Monmouth, the eldest and favourite natural son of Charles, commanded 6000 English forces, who joined the French in the Low Countries; and all Holland must have fallen into the hands of the French, had it not been for the vanity of their monarch, Lewis XIV. who was in a hurry to enjoy his triumph in his capital, and some very unforeseen circumstances. All confidence was now lost between

Charles and his parliament, notwithstanding the glory which the English fleet obtained at sea against the Dutch. The popular clamour at last obliged Charles to give peace to that republic, in consideration of 200,000*l.* which was paid him.

In some things Charles acted very despotically. He complained of the freedom taken with his prerogative in coffee-houses, and ordered them to be shut up; but in a few days after they were opened again. Great rigour and severity were exercised against the presbyterians, and all other nonconformists to episcopacy, which was again established with a high hand in Scotland as well as in England. His parliament addressed him, but in vain, to make war with France, in the year 1677; for he was entirely devoted to that crown, regularly received its money as a pensioner, and hoped, through its influence and power, to be absolute. It is not, however, to be denied, that the trade of England was now incredibly increased, and Charles entered into many vigorous measures for its protection and support.

Charles's connections with France gave him no merit in the eyes of his parliament, which grew every day more and more exasperated against the French and the papists; at the head of whom was the king's eldest brother, and presumptive heir of the crown, the duke of York. Charles dreaded the prospect of a civil war, and offered many concessions to avoid it. But many of the members of parliament were bent upon such a revolution as afterwards took place, and were secretly determined that the duke of York never should reign. In 1678, the famous Titus Oates, and some others, pretended to discover a plot, charging the papists with a design to murder the king, and to introduce popery by means of Jesuits in England and from St. Omer's. Though nothing could be more ridiculous, and more self-contradictory, than some parts of their narrative, yet it was supported with the utmost zeal on the part of the parliament. The aged lord Stafford, Coleman, secretary to the duke of York, with many Jesuits, and other papists, were publicly executed on the testimony of evidences supposed now to have been perjured by those who believe the whole plot to have been a fiction. The queen herself escaped with difficulty; the duke of York was obliged to retire into foreign parts; and Charles, though convinced, as it is said, that the whole was an imposture, yielded to the torrent. At last it spent its force. The earl of Shaftesbury, who was at the head of the opposition, pushed on the total exclusion of the duke of York from the throne. He was seconded by the ill-advised duke of Monmouth; and the bill, after passing the commons, miscarried in the house of peers. All England was again in a flame; but the king, by a well-timed adjournment of the parliament to Oxford, seemed to recover the affections of his people to a very great degree.

The duke of York and his party made a scandalous use of their victory. They fabricated on their side a pretended plot of the protestants for seizing and killing the king, and altering the government. This plot was as false as that with which the papists had been charged. The excellent lord Russell, who had been remarkable in his opposition to the popish succession, Algernon Sydney, and several other distinguished protestants, were tried, condemned, and suffered death; and the king set his foot on the neck of opposition. Even the city of London was intimidated into the measures of the court, as were almost all the corporations in the kingdom. The duke of Monmouth and the earl of Shaftesbury were obliged to fly, and the duke of York returned in triumph to

Whitehall. It was thought, however, that Charles repented of some of his arbitrary steps, and intended to have recalled the duke of Monmouth; and have executed some measures for the future quiet of his reign; when he died, February 6th, 1684-5, in the 55th year of his age, and 25th of his reign. He had married Catharine, infanta of Portugal, with whom he received a large fortune in ready money, besides the town and fortress of Tangier in Africa, but he left behind him no lawful issue. The descendants of his natural sons and daughters are now amongst the most distinguished of the British nobility.

The reign of Charles has been celebrated for wit and gallantry, but both were coarse and indelicate. The court was a nursery of vice, and the stage exhibited scenes of impurity. Some readers were found, who could admire Milton as well as Dryden, and never perhaps were the pulpits of England so well supplied with preachers as in this reign. Our language was harmonised, refined, and rendered natural; and the days of Charles may be called the Augustan age of mathematics and natural philosophy. Charles loved and understood the arts more than he encouraged or rewarded them, especially those of English growth; but this neglect proceeded not from narrow-mindedness, but indolence and want of reflection. If the memory of Charles II. has been traduced for being the first English prince who formed a body of standing forces, as regards to his person, it ought to be remembered, at the same time, that he carried the art of ship-building to the highest perfection; and that the royal navy of England, at this day, owes its finest improvements to his and his brother's knowledge of naval affairs and architecture. As to his religion, James, soon after his death, published to the world, that his brother, notwithstanding his repeated professions of regard to the protestant faith, was a papist, and died such; of which there are now incontestable proofs.

All the opposition which, during the late reign, had shaken the throne, seems to have vanished at the accession of James II. The popular affection towards him was increased by the early declaration he made in favour of the church of England, which, during the late reign, had formally pronounced all resistance to the reigning king to be unlawful. This doctrine proved fatal to James, and almost ruined protestantism. The army and people supported him in crushing an ill-concerted rebellion of the duke of Monmouth, who pretended to be the lawful son of Charles II. and as such had assumed the title of king. That duke's head being cut off, July 15, 1685, and some hundreds of his followers hanged, drawn, and quartered, in the West of England, exhibiting a scene of barbarity scarcely ever known in this country, by the instrumentality of Jefferies and colonel Kirke, James desperately resolved to try how far the practice of the church of England would agree with her doctrine of non-resistance. The experiment failed him. He had recourse to the most offensive and at the same time most injudicious measures to render popery the established religion of his dominions. He pretended to a power of dispensing with the known laws; he instituted an illegal ecclesiastical court; he openly received and admitted into his privy council the pope's emissaries; and gave them more respect than was due to the ministers of a sovereign prince. He sent an embassy to Rome, and received at his court the pope's nuncio. The encroachments he made upon both the civil and religious liberties of his people are almost beyond description, and were disapproved of by the pope himself, and all sober Roman-catholics. His sending to prison, and prosecuting for a libel, seven bishops, for presenting a petition against

reading his declaration for liberty of conscience, and their acquitted upon a legal trial, alarmed his best protestant friends.

In this extremity, many great men in England and Scotland, though they wished well to James, applied for relief to William prince of Orange, in Holland, a prince of great abilities, and the inveterate enemy of Louis XIV. who then threatened Europe with chains. The prince of Orange was the nephew and son-in-law of James; having married the princess Mary, that king's eldest daughter; and he at last embarked with a fleet of 500 sail for England, avowing it to be his design to restore the church and state to their true rights. Upon his arrival in England, he was joined not only by the Whigs, but by many whom James had considered as his best friends; and even his daughter the princess Anne, and her husband, George prince of Denmark, left him, and joined the prince of Orange. James might still have reigned; but he was surrounded with French emissaries and ignorant Jesuits, who wished him not to reign rather than not to restore popery. They secretly persuaded him to send his queen, and son, real or pretended, then but six months old, to France, and to follow them in person,—which he did; and thus, in 1688, ended his reign in England; which event in English history is termed *the Revolution*.

It is well known that king William's chief object was to humble the power of France, and his reign was spent in an almost uninterrupted course of hostilities with that power, which were supported by England, at an expense she had never known before. The nation had grown cautious, through the experience of the two last reigns; and he gave his consent to the *bill of rights*, by which the liberties of the people were confirmed and secured; though the friends of liberty in general complained that the bill of rights was very inadequate to what ought to have been insisted on, at a period so favourable to the enlargement and security of liberty, as a crown bestowed by the free voice of the people. The two last kings had made a very bad use of the whole national revenue, which was put into their hands, and which was found to be sufficient to raise and maintain a standing army. The revenue was therefore now divided: part was allotted for the current national service of the year, and was to be accounted for to parliament; and part, which is still called the civil list money, was given to the king, for the support of his house and dignity.

It was the just sense the people of England had of their civil and religious rights alone that could provoke them to agree to the late revolution, for they never in other respects had been at so high a pitch of wealth and prosperity as in the year 1688. The tonnage of their merchant ships, as appears from Dr. Davenant, was, that year, nearly double what it had been in 1666; and the tonnage of the royal navy, which, in 1660, was only 62,594 tons, was in 1688 increased to 101,032 tons. The increase of the customs, and the annual rental of England, was in the same proportion. The war with France, which, on the king's part, was far from being successful, required an enormous expense; and the Irish continued, in general, faithful to king James. But many English, who wished well to the Stuart family, dreaded their being restored by conquest; and the parliament enabled the king to reduce Ireland, and to gain the battle of the Boyne against James, who there lost all the military honour he had acquired before. The marine of France proved superior to that of England in the beginning of the war; but in the year 1692, that of France received an irrecoverable blow in the defeat at La Hogue.

Invasions were threatened, and conspiracies discovered every day against the government; and the supply of the continental war forced the parliament to open new resources for money. A land-tax was imposed, and every subject's lands were taxed, according to their valuations given in by the several counties. Those who were the most loyal gave the highest valuations, and were the heaviest taxed; and this preposterous burthen continues; but the greatest and boldest operations in finances that ever took place was established in that reign, which was the carrying on the war by borrowing money upon the parliamentary securities, and which form what are now called the *public funds*. The chief projector of this scheme is said to have been Charles Montague, afterwards lord Halifax. His principal argument for such a project was, that it would oblige the moneyed part of the nation to befriend the Revolution interest, because, after lending their money, they could have no hopes of being repaid but by supporting that interest; and the weight of taxes would oblige the commercial people to be more industrious.

William, notwithstanding the vast service he had done to the nation, and the public benefits which took place under his auspices, particularly in the establishment of the bank of England; and the re-coining the silver money, met with so many mortifications from his parliament, that he actually resolved upon an abdication, and had drawn up a speech for that purpose, which he was prevailed upon to suppress. He long bore the affronts he met with, in hopes of being supported in his war with France; but at last, in 1697, he was forced to conclude the peace of Ryswick, with the French king, who acknowledged his title to the crown of England. By this time William had lost his queen\*, but the government was continued in his person. After peace was restored, the commons obliged him to disband his army, all but an inconsiderable number, and to dismiss his favourite Dutch guards. Towards the end of his reign, his fears of seeing the whole Spanish monarchy in possession of France at the death of the catholic king Charles II. which was every day expected, led him into a very impolitic measure, which was the partition treaty with France, by which that monarchy was to be divided between the houses of Bourbon and Austria. This treaty was highly resented by the parliament, and some of his ministry were impeached for advising it. It was thought William saw his error when it was too late. His ministers were acquitted from their impeachment; and the death of king James discovered the insincerity of the French court, which immediately proclaimed his son king of Great Britain.

This perfidy rendered William again popular in England. The two houses passed the bill of abjuration, and an address for a war with France. The last and most glorious act of William's reign was his passing the bill for settling the succession to the crown in the house of Hanover, on the 12th of June, 1701. His death was hastened by a fall from his horse, soon after he had renewed the grand alliance against France, on the 8th of March, 1702, in the 53d year of his age, and the 14th of his reign in England. This prince was not made by nature for popularity. His manners were cold and forbidding; he seemed also sometimes almost to lose sight of those principles of liberty, for the support of which he had been raised to the throne; and though he owed his royalty to the Whigs; yet he often favoured the Tories. The former had the mortification of seeing those who had acted the most inimical to their party, and the free principles of the constitution, as the marquess of

\* She died of the small-pox, Dec. 28, 1694, in the thirty-third year of her age.

Hallifax, the earl of Danby, and lord Nottingham, taken into favour, and resume their places in the cabinet; and the whole influence of government extended to silence all inquiries into the guilt of those who had been the chief instruments in the cruel persecutions of the past reign, and to the obtaining such an act of indemnity as effectually screened every delinquent from the just retaliation of injured patriotism. The rescue and preservation of religion and public liberty were the chief glory of William's reign; for England under him suffered severely both by sea and land; and the public debt, at the time of his death, amounted to the then unheard-of sum of 14,000,000l.

Anne, princess of Denmark, by virtue of the act of settlement, and being the next protestant heir to her father James II. succeeded to the throne. As she had been ill treated by the late king, it was thought she would have deviated from his measures; but the behaviour of the French in acknowledging the title of her brother, who has since been well known by the name of the Pretender, left her no choice; and she resolved to fulfil all William's engagements with his allies, and to employ the earl of Marlborough, who had been imprisoned in the late reign on a suspicion of Jacobitism, and whose wife was her favourite, as her general. She could not have made a better choice of a general and statesman, for that earl excelled in both capacities. No sooner was he placed at the head of the English army abroad, than his genius and activity gave a new turn to the war, and he became as much the favourite of the Dutch as his wife was of the queen.

Charles II. of Spain, in consequence of the intrigues of France, and at the same time resenting the partition treaty, to which his consent had not been asked, left his whole dominions by will to Philip, duke of Anjou, grandson of Lewis XIV.; and Philip was immediately proclaimed king of Spain; which laid the foundation of the family alliance between France and that nation. Philip's succession was disputed by the second son of the emperor of Germany, who took upon himself the title of Charles III. and his cause was favoured by the empire, England, Holland, and other powers who joined in a confederacy against the house of Bourbon, now become more dangerous than ever by the acquisition of the whole Spanish dominions.

The capital measure of continuing the war against France being determined on, the queen found no great difficulty in forming her ministry, who were for the most part Tories; and the earl of Godolphin, who (though afterwards a leading Whig) was thought all his life to have a predilection for the late king James and his queen, was placed at the head of the treasury. His son had married the earl of Marlborough's eldest daughter; and the earl could trust no other with that important department.

In the course of the war, several glorious victories were obtained by the earl; who was soon made duke of Marlborough. Those of Blenheim and Ramillies gave the first effectual checks to the French power. By that of Blenheim in 1704, the empire of Germany was saved from immediate destruction. Though prince Eugene was that day joined in command with the duke, yet the glory of the day was confessedly owing to the latter. The French general Tallard was taken prisoner, and sent to England; and 20,000 French and Bavarians were killed, wounded, or drowned in the Danube, besides about 13,000 who were taken, and a proportionable number of cannon, artillery, and trophies of war. About the same time, the English admiral, sir George Rooke, reduced Gibraltar, which still remains in our possession. The battle of Ramil-

lies, in 1706, was alone. The loss generally supposed on prisoners; but

lies, in 1706, was fought and gained under the duke of Marlborough alone. The loss of the enemy there has been variously reported; it is generally supposed to have been 8000 killed or wounded, and 6000 taken prisoners; but the consequences showed its importance.

After the battle of Ramillies, the states of Flanders assembled at Ghent, and recognised Charles for their sovereign, while the confederates took possession of Louvain, Brussels, Mechlin, Ghent, Oudenarde, Bruges, and Antwerp; and several other considerable places in Flanders and Brabant acknowledged the title of king Charles. The next great battle gained over the French was at Oudenarde, 1708, where they lost 3000 on the field, and about 7000 taken prisoners; and the year after, September 11, 1709, the allies forced the French lines at Malplaquet near Mons, after a bloody action, in which the French lost 15,000 men. These flattering successes of the English, were balanced, however, by great misfortunes.

The queen had sent a very fine army to assist Charles III. in Spain, under the command of lord Galway; but in 1707, after he had been joined by the Portuguese, the English were defeated in the plains of Almanza, chiefly through the cowardice of their allies. Though some advantages were obtained at sea, yet that war in general was carried on to the detriment, if not the disgrace, of England. Prince George of Denmark, husband to the queen, was then lord high-admiral. At the same time England felt severely the scarcity of hands in carrying on her trade and manufactures.

As Lewis XIV. professed a readiness for peace, and sued earnestly for it, the Whigs at last gave way to a treaty, and the conferences were held at Gertruydenburg, 1710. They were managed on the part of England by the duke of Marlborough and the lord Townshend, and by the marquis de Torcy for the French. But all the offers of the latter were rejected by the duke and his associates, as only designed to amuse and divide the allies; and the war was continued.

The unreasonable haughtiness of the English plenipotentiaries at Gertruydenburg (as some term it), and the then expected change of the ministry in England, saved France; and affairs from that day took a turn in its favour. Means were found to convince the queen, who was faithfully attached to the church of England, that the war, in the end, if continued, must prove ruinous to her and her people, and that the Whigs were no friends to the national religion. The general cry of the deluded people was, that "the church was in danger," which, though groundless, had great effects. One Sacheverel, an ignorant, worthless preacher, had espoused this clamour in one of his sermons, with the ridiculous, impracticable doctrines of passive obedience and non-resistance. It was, as it were, agreed by both parties to try their strength in this man's cause. He was impeached by the commons, and found guilty by the lords, who ventured to pass upon him only a very small censure. After this trial, the queen's affections were entirely alienated from the duchess of Marlborough, and the Whig administration. Her friends lost their places, which were supplied by Tories; and even the command of the army was taken from the duke of Marlborough, in 1712, and given to the duke of Ormond, who produced orders for a cessation of arms; but they were disregarded by the queen's allies in the British pay. And, indeed, the removal of the duke of Marlborough from the command of the army, while the war continued, was an act of the greatest imprudence, and excited the astonishment of all Europe. So numerous had been his successes; and so great his reputation, that his very name was almost equi-

valent to an army. But the honour and interest of the nation were sacrificed to private court intrigues, managed by Mrs. Masham, a relation of the dukes of Marlborough, who had supplanted her benefactors, and by Mr. Harley.

Conferences were opened for peace at Utrecht, in January 1712, to which the queen and the French king sent plenipotentiaries; and the allies being defeated at Denain, they grew sensible they were no match for the French, now that they were abandoned by the English. In short, the terms were agreed upon between France and England. The reader needs not be informed of the particular cessions made by the French, especially that of Dunkirk; but after all, the peace would have been still more indefensible and shameful than it was, had it not been for the death of the emperor Joseph, by which his brother Charles III. for whom the war was chiefly undertaken, became emperor of Germany, as well as king of Spain; and the dilatoriness, if not bad faith, of the English allies, in not fulfilling their engagements, and throwing upon the British parliament almost the whole weight of the war; not to mention the exhausted state of the kingdom. Such was the state of affairs at this critical period; and I am apt to think from their complexion, that the queen was, by some secret influence, which never has yet been discovered, and was even concealed from some of her ministers, inclined to call her brother to the succession. The rest of the queen's life was rendered uneasy by the jarring of parties, and the contentions among her ministers. The Whigs demanded a writ for the electoral prince of Hanover, as duke of Cambridge, to come to England; and she was obliged hastily to dismiss her lord-treasurer, when she fell into a lethargic disorder, which carried her off the first of August 1714, in the fiftieth year of her age, and the thirteenth of her reign\*. Notwithstanding the exhausted state of England before the peace of Utrecht was concluded, yet the public credit was little or nothing affected by her death, though the national debt then amounted to about fifty millions; so firm was the dependence of the people upon the security of parliament.

Anne had no strength of mind, by herself, to carry any important resolve into execution; and she left public measures in so indecisive a state, that, upon her death, the succession took place in terms of the act of settlement, and George I. elector of Hanover, son of the princess Sophia, grand-daughter of James I. was proclaimed king of Great-Britain,—his mother, who would have been next in succession, having died but a few days before. He came over to England with strong professions against the Tory ministry, most of whom he displaced. This did not make any great alteration to his prejudice in England; but many of the Scots, by the influence of the earl of Mar, and other chiefs, were driven into rebellion in 1715, which was happily suppressed the beginning of the next year.

\* With her ended the line of the Stuarts, who, from the accession of James I. anno 1603, had swayed the sceptre of England 111 years, and that of Scotland 543 years from the accession of Robert II. anno 1371. James, the late pretender, son of James II. and brother to queen Anne, upon his father's decease, anno 1701, was proclaimed king of England, by Lewis XIV. at St. Germain's, and for some time treated as such by the courts of Rome, France, Spain, and Turin. He resided at Rome, where he kept up the appearance of a court, and continued firm in the Romish faith till his death, which happened in 1765. He left two sons, viz. Charles Edward, born in 1720, who was defeated at Culloden in 1746, and upon his father's death repaired to Rome, where he continued for some time, and afterwards resided at Florence, under the title of count Albany, but died lately. Henry, his second son, who enjoys a dignified place in the church of Rome, and is known by the name of cardinal York.

After all, the nation was in such a disposition that the ministry durst not venture to call a new parliament; and the members of that which was sitting voted a continuance of their duration from three to seven years; which is thought to have been the greatest stretch of parliamentary power ever known. Several other extraordinary measures took place about the same time. Mr. Shippen, an excellent speaker, and member of parliament, was sent to the Tower for saying that the king's speech was calculated for the meridian of Hanover rather than that of London; and one Matthews, a young journeyman printer, was hanged for composing a silly pamphlet, that in later times would not have been thought worthy of animadversion. The truth is, the Whig ministry were excessively jealous of every thing that seemed to affect their master's title: and George I. though a sagacious, moderate prince, undoubtedly rendered England too subservient to his continental connections, which were very various and complicated. He quarrelled with the czar of Muscovy about their German concerns; and, had not Charles XII. king of Sweden, been killed so critically as he was, Great Britain probably would have been invaded by that northern conqueror, great preparations being made for that purpose,—he being incensed at George, as elector of Hanover, for purchasing Bremen and Verden of the Danes, which had been a part of his dominions.

In 1719, George quarrelled with Spain on account of the quadruple alliance that had been formed between Great Britain, France, Germany, and the States General; and his admiral, sir George Byng, by his orders, destroyed the Spanish fleet at Syracuse. A trifling war with Spain then commenced, but it was soon ended by the Spaniards delivering up Sardinia and Sicily, the former to the duke of Savoy, and the latter to the emperor.

A national punishment, different from plague, pestilence, and famine, overtook England in the year 1720, by the sudden rise of the South Sea stock, one of the trading companies; but of this we have already given an account, under the article SOUTH-SEA COMPANY.

The Jacobites thought to avail themselves of the national discontent at the South-Sea scheme, and England's connections with the continent, which every day increased. One Lyster, a lawyer, was tried and executed for high treason. Several persons of great quality and distinction were apprehended on suspicion: but the storm fell chiefly on Francis Atterbury, lord bishop of Rochester, who was deprived of his see, and sent in parliament, and banished for life. There was some irregularity in the proceedings against him; and therefore the justice of the bishop's sentence has been questioned, though there is little or no reason to doubt there was sufficient proof of his guilt.

So fluctuating was the state of Europe at this time, that, in September 1725, a fresh treaty was concluded at Hanover, between the kings of Great Britain, France, and Prussia, to counterbalance an alliance that had been formed between the courts of Vienna and Madrid. A squadron was sent to the Baltic, to hinder the Russians from attacking Sweden, another to the Mediterranean, and a third, under admiral Hoyer, to the West Indies, to watch the Spanish plate-fleets. This last was a fatal as well as an inglorious expedition. The admiral and most of his men perished by epidemical diseases, and the hulks of his ships rotted so as to render them unfit for service. The management of the Spaniards was little better. They lost near 10,000 men in the siege of Gibraltar, which they were obliged to raise.

A quarrel with the emperor was the most dangerous to Hanover of

any that could happen; and though an opposition in the house of commons was formed by sir William Wyndham and Mr. Pulteney, the parliament continued to be more and more lavish in granting money and subsidies for the protection of Hanover, to the kings of Denmark and Sweden, and the landgrave of Hesse-Cassel. Such was the state of affairs in Europe, when George I. suddenly died on the 11th of June 1727, at Osnaburg, in the sixty-eighth year of his age; and the thirteenth of his reign. The reign of George I. is remarkable for an incredible number of bubbles and cheating projects, by which it was reckoned that almost a million and a half was won and lost; and for the great alteration of the system of Europe, by the concern which the English took in the affairs of the continent. The institution of the sinking fund, for diminishing the national debt, took place likewise at this period. The value of the northern parts of the kingdom began now to be better understood than formerly, and the state of manufactures began to shift. This was chiefly owing to the unequal distribution of the land-tax, which rendered it difficult for the poor to subsist in certain counties, which had been forward in giving in the true value of their estates when that tax took place.

Sir Robert Walpole was considered as first minister of England when George I. died; and some differences having happened between him and the prince of Wales, it was generally thought, upon the accession of the latter to the crown, that sir Robert would be displaced. That might have been the case, could another person have been found equally capable to manage the house of commons, and to gratify that predilection for Hanover which George II. inherited from his father. No minister ever understood better the temper of the people of England, and none, perhaps, ever tried it more. He filled all places of power, trust, and profit, and almost the house of commons itself, with his own creatures; but peace was his darling object, because he thought that war must be fatal to his power. During his long administration he never lost a question that he was in earnest to carry. The excise scheme was the first measure that gave a shock to his power: and even that he could have carried, had he not been afraid of the spirit of the people without-doors, which might have either produced an insurrection, or endangered his interest in the next general election.

His pacific system brought him, however, into inconveniences both at home and abroad. It encouraged the Spaniards to continue their depredations upon the British shipping in the American seas, and the French to treat the English court with insolence and neglect. At home, many of the great peers thought themselves slighted, and they interested themselves more than ever they had done in elections. This, together with the disgust of the people at the proposed excise scheme, and passing the *Gin Act* in the year 1736, increased the minority in the house of commons to 130, some of whom were as able men and as good speakers as ever had sat in a parliament; and taking advantage of the increasing complaints against the Spaniards, they attacked the minister with great strength of argument and with great eloquence. In justice to Walpole, it should be observed, that he filled the courts of justice with able and upright judges, nor was he ever known to attempt any perversion of the law of the kingdoms. He was so far from checking the freedom of debate, that he bore with equanimity the most scurrilous abuse that was thrown out against him. He gave way to one or two prosecutions for libels, in compliance to his friends, who thought themselves affected by them; but it is certain, that the press of England never was more

open and free than it is at present, it undoubtedly supports it, by its manufactures.

Queen Caroline to the minister: he complained, only of the power he put himself a it was generally admiral Vernon, with a squadron of six ships of the line; but being tempted, especially by the British lives were lost by Vernon's success. open and free than during his administration. And as to his pacific system, it undoubtedly more than repaid to the nation all that was required to support it, by the increase of her trade, and the improvements of her manufactures.

Queen Caroline, consort to George II. had been always a firm friend to the minister: but she died November 20th, 1737, when a variance subsisted between the king and his son, the prince of Wales. The latter complained, that through Walpole's influence he was deprived not only of the power but the provision to which his birth entitled him; and he put himself at the head of the opposition with so much firmness, that it was generally foreseen Walpole's power was drawing to a crisis. Admiral Vernon, who hated the minister, was sent, in 1739, with a squadron of six ships to the West Indies, where he took and demolished Porto Bello; but being a hot, intractable man, he miscarried in his other attempts, especially that upon Carthagena, in which some thousands of British lives were wantonly thrown away. The opposition exulted in Vernon's success, and afterwards imputed his miscarriages to the minister's starving the war, by with-holding the means for carrying it on. The general election approaching, so prevalent was the interest of the prince of Wales in England, and that of the duke of Argyle in Scotland, that a majority was returned to parliament who were no friends to the minister; and, after a few trying divisions, he retired from the house, on the 9th of February, 1742, was created earl of Orford, and on the 11th resigned all his employments.

George II. bore the lot of his minister with the greatest equanimity, and even conferred titles of honour, and posts of distinction, upon the heads of the opposition. By this time, the death of the emperor Charles VI. the danger of the pragmatic sanction (which meant the succession of his daughter to all the Austrian dominions), through the ambition of France, who had filled all Germany with her armies, and many other concurrent causes, induced George to take the leading part in a continental war. He was encouraged to this by lord Carteret, afterwards earl of Granville, an able but headstrong minister, whom George had made his secretary of state, and indeed by the voice of the nation in general. George accordingly put himself at the head of his army, fought and gained the battle of Dettingen, June 16, 1743; but would not suffer his general, the earl of Stair, to improve the blow, which was thought to proceed from tenderness for his electoral dominions.

Great Britain was then engaged in a very expensive war both against the French and Spaniards; and her enemies thought to avail themselves of the general discontent that had prevailed in England on account of Hanover, and which, even in parliamentary debates, was thought by some to exceed the bounds of decency. This naturally suggested to them the idea of applying to the Pretender, who resided at Rome; and he agreed that his son Charles, who was a sprightly young man, should repair to France, from whence he set sail, and narrowly escaped with a few followers, in a frigate, to the western coasts of Scotland, between the islands of Mull and Sky, where he discovered himself, assembled his followers, and published a manifesto exciting the nation to a rebellion. It is necessary, before we relate the true cause of this enterprise, to make a short retrospect to foreign parts.

The war of 1741 proved unfortunate in the West Indies, through the fatal divisions between admiral Vernon, and general Wentworth, who commanded the land troops: and it was thought that about 20,000 British soldiers and seamen perished in the impracticable attempt on Car-

thagena, and by the inclemency of the air and climate during other idle expeditions. The year 1742 had been spent in negotiations with the courts of Peteriburg and Berlin, which, though expensive, proved of little or no service to Great Britain: so that the victory of Dettingen left the French troops in much the same situation as before. A difference between the admirals Matthews and Leisock had given an opportunity to the Spanish and French fleets to escape out of Toulon with but little loss; and soon after, the French, who had before only acted as allies to the Spaniards, declared war against Great Britain, who, in her turn, declared war against the French. The Dutch, the natural allies of England, during this war, carried on a most lucrative trade; nor could they be brought to act against the French till the people entered into associations and insurrections against the government. Their marine was in a miserable condition; and when they at last sent a body of troops to join the British and Austrian armies, which had been wretchedly commanded for one or two campaigns, they did it in such a manner, that it was plain they did not intend to act in earnest. When the duke of Cumberland took upon himself the command of the army, the French, to the great reproach of the allies, were almost masters of the barrier of the Netherlands, and were besieging Tournay. The duke attempted to raise the siege; but, by the coldness of the Austrians, and the cowardice of the Dutch, whose government all along held a secret correspondence with France, he lost the battle of Fontenoy, and 7000 of his best men; though it is generally allowed that his dispositions were excellent, and both he and his troops behaved with unexampled intrepidity. To counterbalance such a train of misfortunes, admiral Anson returned this year to England with an immense treasure (about a million sterling), which he had taken from the Spaniards in his voyage round the world; and commodore Warren, with colonel Pepperel, took from the French the important town and fortress of Louisburg, in the island of Cape Breton.

Such was the state of affairs abroad in August, 1745, when the Pretender's eldest son, at the head of some Highland followers, surprised and disarmed a party of the king's troops in the western Highlands, and advanced with great rapidity to Perth. The government never so thoroughly experienced, as it did at that time, the benefit of the public debt for the support of the Revolution. The French and the Jacobite party (for such there was at that time in England) had laid a deep scheme of distressing the Bank; but common danger abolished all distinctions, and united them in the defence of one interest, which was private property. The merchants undertook, in their address to the king, to support it by receiving bank notes in payment. This reasonable measure saved public credit; but the defeat of the rebels by the duke of Cumberland at Culloden, in the year 1746, did not restore tranquillity to Europe. Though the prince of Orange, son-in-law to his majesty George II. was, by the credit of his majesty, and the spirit of the people of the United Provinces, raised to be their stadtholder, the Dutch never could be brought to act heartily in the war. The allies were defeated at Val, near Maastricht, and the duke of Cumberland was in danger of being made prisoner. Bergen-op-zoom was taken in a manner that has never yet been explained. The allies suffered other disgraces on the continent; and it now became the general opinion in England, that peace was necessary to save the duke and his army from total destruction. By this time, however, the French marine and commerce were in danger of being annihilated by the English at sea, under

the command of the admirals Anson, Warren, Hawke, and other gallant officers; but the English arms were not so successful as could have been wished under rear-admiral Boscawen in the East Indies. In this state of affairs, the successes of the French and English during the war may be said to have been balanced, and both ministers turned their thoughts to peace.

The preliminaries for peace were signed in April, 1748, and a definitive treaty was concluded at Aix-la-Chapelle in October; the basis of which was the restitution, on both sides, of all places taken during the war. The next year the interest of the national debt was reduced from four to three and a half per cent. for seven years, after which the whole was to stand reduced to three per cent.

This was the boldest stroke of financing that ever was attempted perhaps in any country, consistently with public faith; for the creditors of the government, after a small ineffectual opposition, continued their money in the funds; and a few who sold out even made interest to have it replaced on the same security, or were paid off their principal sums out of the sinking fund.

A new treaty of commerce was signed at Madrid, between Great Britain and Spain, by which, in consideration of 100,000*l.* the South Sea company gave up all their future claims to the *asiento* contract, by virtue of which that company had supplied the Spanish West Indies with negroes. In March, 1750, died, universally lamented, his royal highness Frederic, prince of Wales. In May, 1751, an act passed for regulating the commencement of the year, by which the old style was abolished, and the new style established, to the vast conveniency of the subjects. This was done by sinking eleven days in September, 1752, and from that time beginning the year on the first of January. In 1753, the famous act passed for preventing clandestine marriages.

The open encroachments of the French, who had built forts on our back settlements in America, and the dispositions they made for sending over vast bodies of veteran troops to support those encroachments, produced wonderful spirit in England; especially after admiral Boscawen was ordered, with eleven ships of the line, besides a frigate and two regiments, to sail to the banks of Newfoundland, where he came up with and took two French men of war, the rest of their fleet escaping up the river St. Laurence, by the Straits of Belleisle. No sooner was it known that hostilities were begun, than the people of England poured their money into the government's loan, and orders were issued for making general reprisals in Europe as well as in America; and that all the French ships, whether outward or homeward bound, should be stopped, and brought into British ports. These orders were so effectual, that, before the end of the year 1755, above 500 of the richest French merchant ships, and above 8000 of their best sailors, were brought into the kingdom.

In July, 1755, general Braddock, who had been injudiciously sent from England to attack the French, and reduce the forts on the Ohio, was defeated and killed, by falling into an ambuscade of the French and Indians near Fort du Quêne (now called Fort Pitt, or Pittsburg); but major-general Johnson defeated a body of French near Crown Point, of whom he killed about 1000.

In proportion as the spirits of the public were elevated by the formidable armaments which were prepared for carrying on the war, they were sunk with an account that the French had landed 11,000 men in Minorca, to attack Fort St. Philip there; that admiral Byng, who had been sent

out with a squadron, at least equal to that of the French, had been baffled, if not defeated, by their admiral Gallissoniere, and that at last Minorca was surrendered by general Blakeney. The public outcry was such, that the king gave up Byng to public justice, and he was shot at Portsmouth for not doing all that was in his power against the enemy.

It was about this time that Mr. Pitt was placed, as secretary of state, at the head of administration. He had long been known to be a bold, eloquent, and energetic speaker, and he soon proved himself to be as spirited a minister. The miscarriages in the Mediterranean had no consequence but the loss of Fort St. Philip, which was more than repaired by the vast success of the English privateers, both in Europe and America. The successes of the English in the East Indies, under colonel Clive, are almost incredible. He defeated Suraja Dowla, nabob of Bengal, Bahar, and Orixá, and placed Jassier Ally Cawn in the ancient seat of the nabobs of those provinces. Suraja Dowla, who was in the French interest, a few days after his being defeated, was taken by the new nabob, Jassier Ally Cawn's son, and put to death. This event laid the foundation of the great extent of territory which the English now possess in the East Indies.

Mr. Pitt introduced into the cabinet a new system of operations against France, than which nothing could be better calculated to restore the spirits of his countrymen, and to alarm their enemies. Far from dreading an invasion, he planned an expedition for carrying the arms of England into France itself; and the descent was to be made at Rochefort under general sir John Mordaunt, who was to command the land troops. Nothing could be more promising than the dispositions for this expedition. It sailed on the 8th of September 1757; but admiral Hawke brought both the sea and land forces back on the 6th of October, to St. Helen's, without any attempt having been made to land on the coast of France.

The French having attacked the electorate of Hanover with a most powerful army, the English parliament voted large supplies of men and money in defence of the electoral dominions. The duke of Cumberland had been sent thither to command an army of observation, but was so powerfully pressed by a superior army, that he found himself obliged to lay down his arms; and the French, under the duke of Richelieu, took possession of that electorate and its capital. At this time, a scarcity, next to a famine, raged in England; and the Hessian troops, who, with the Hanoverians, had been sent to defend the kingdom from an invasion threatened by the French, remained still in England. So many difficulties concurring, in 1758, a treaty of mutual defence was agreed to between his majesty and the king of Prussia: in consequence of which, the parliament voted 670,000*l.* to his Prussian majesty; and also large sums, amounting in the whole to nearly two millions a year, for the payment of 50,000 of the troops of Hanover, Hesse-Cassel, Saxe-Gotha, Wolfenbuttle, and Buckeburg. This treaty, which proved afterwards so burthensome to England, was intended to unite the protestant interest in Germany.

George II. with the consent of his Prussian majesty, declaring that the French had violated the convention concluded between them and the duke of Cumberland at Closterseven, ordered his Hanoverian subjects to resume their arms under prince Ferdinand of Brunswick, a Prussian general, who instantly drove the French out of Hanover: and the duke of Marlborough, after the English had repeatedly insulted the French coasts by destroying their stores and shipping at St. Malo and Cherbourg, marched into Germany, and joined prince Ferdinand with

12,000 British troops, which were afterwards increased to 25,000. A war ensued, in the course of which the English every where performed wonders, and were every where victorious; but nothing decisive followed, and the enemy opened every campaign with advantage. Even the battle of Minden, the most glorious, perhaps, in the English annals, in which about 7000 English defeated 80,000 of the French regular troops, contributed nothing to the conclusion of the war, or towards weakening the French in Germany.

The expenses of the war were borne with cheerfulness, and the activity and spirit of Mr. Pitt's administration were greatly applauded. Admiral Boscawen and general Amherst, in August 1758, reduced and demolished Louisburg in North America, which had been restored to the French by the treaty at Aix-la-Chapelle, and was become the scourge of the British trade, and took five or six French ships of the line; Frontenac and Fort du Quêne, in the same quarter, fell also into the hands of the English; acquisitions that far overbalanced a check which the English received at Ticonderoga, and the loss of above 300 of the English guards, as they were returning under general Bligh from the coast of France.

The English affairs in the East Indies this year proved equally fortunate; and the lords of the admiralty received letters from thence, with an account that admiral Pococke had engaged the French fleet near Fort St. David's on the 29th of March, in which engagement a French man of war, called the *Bien-aimé*, of 74 guns, was so much damaged that they ran her on shore; that on the 3d of August following, he engaged the French fleet a second time near Pondicherry, when, after a brisk firing of ten minutes, the French bore away with all the sail they could make, and got safe into the road of Pondicherry; and that on the 14th of December following, general Lally, commander of the French army in those parts, marched to besiege Madras, which was defended by the English colonels Lawrence and Draper; and after a brisk cannonade, which lasted till the 16th of February following, the English having received a reinforcement of 600 men, general Lally thought proper to raise the siege, and retire with precipitation, leaving behind him forty pieces of cannon.

The year 1759 was introduced by the taking of the island of Gorée, on the coast of Africa, by commodore Keppel. Three capital expeditions had been planned for this year in America, and all of them proved successful. One of them was against the French islands in the West Indies, where Guadaloupe was reduced. The second expedition was against Quebec, the capital of Canada. The command was given, by the minister's advice, to general Wolfe, a young officer of a truly military genius. Wolfe was opposed, with far superior force, by Montcalme, the best and most successful general the French had. Though the situation of the country which Wolfe was to attack, and the works the French threw up to prevent a descent of the English, were deemed impregnable, yet Montcalme never relaxed in his vigilance. Wolfe's courage and perseverance, however, surmounted incredible difficulties; he gained the heights of Abraham, near Quebec, where he fought and defeated the French army, but was himself killed, as was Montcalme; general Monkton, who was next in command, being wounded, the completion of the French defeat, and the glory of reducing Quebec, was reserved for brigadier-general (now lord viscount) Townshend.

General Amherst, who was the first English general in command in America, conducted the third expedition. His orders were to reduce all

Canada, and to join the army under general Wolfe on the banks of the river St. Lawrence. Mr. Amherst in this expedition was so well provided with every thing that could make it successful, that there scarcely appeared any chance for its miscarriage; and thus the French empire in North America became subject to Great Britain.

The affairs of the French being now desperate, and their credit ruined, they resolved upon an attempt to retrieve all by an invasion of Great Britain: but on the 8th of August, 1759, admiral Boscawen attacked the Toulon squadron, commanded by M. de la Clue, near the Straits of Gibraltar, took *Le Centaure* of 74, *Le Téméraire* of 74, and *Le Modeste* of 74 guns; and burnt *L'Océan* of 80, and *Le Redoutable* of 74 guns. The rest of the fleet, consisting of seven ships of the line and three frigates, made their escape in the night; and on Nov. 20, sir Edward Hawke defeated the Brest fleet, commanded by admiral Conflans, off the island of Dumet, in the bay of Biscay. The *Formidable*, a French man of war of 80 guns, was taken; the *Thésée* of 74, and the *Superbe* of 70 guns, were sunk; and the *Soleil Royal* of 80, and the *Héros* of 74 guns, were burnt, and afterwards the *Juste* of 74 perished in the mouth of the Loire. Seven or eight French men of war of the line got up the river Vilaine, by throwing their guns overboard; and the rest of the fleet, consisting of five ships of the line and three frigates, escaped in the night. The English lost, on this occasion, the *Essex* of 64, and the *Resolution* of 74 guns, which ran ashore in the chase. After this engagement, the French gave over all thoughts of their invasion of Great Britain.

In February 1760, captain Thurot, a French marine adventurer, who had, with three sloops of war, alarmed the coasts of Scotland, and actually made a descent at Carrickfergus in Ireland, was, on his return from thence, met, defeated, and killed by captain Elliot, the commodore of three ships, inferior in force to the Frenchman's squadron. In short, Great Britain now reigned as sole mistress of the main, and succeeded in every measure that had been projected for her own safety and advantage.

The war in Germany, however, continued still as undecided as it was expensive; and many in England began to consider it now as foreign to the internal interests of Great Britain. The French again and again showed dispositions for treating; and the charges of the war, which began now to amount to little less than eighteen millions sterling yearly, inclined the British minister to listen to their proposals. A negotiation was accordingly entered upon, which proved abortive, as did many other projects for accommodation; but on the 25th of October 1760, George II. died suddenly (from a rupture in the right ventricle of the heart) full of years and glory, in the 77th year of his age, and 34th of his reign, and was succeeded by his grandson, now George III. eldest son to the late prince of Wales.

The memory of George II. is reprehensible on no head but his predilection for his electoral dominions. He never could admit that there was any difference between them and his regal dominions; and he was sometimes ill enough advised to declare so much in his speeches to parliament. We are, however, to remember, that his people gratified him in this partiality, and that he never acted by power or prerogative. He was not very accessible to conversation; and therefore it was no wonder, that, having left Germany after he had attained to man's estate, he still retained foreign notions both of men and things. In government he had no favourite, for he parted with sir Robert Walpole with great indifference, and showed very little concern at the subsequent revolu-

tions among his subjects, but placable, fear the memory of the factions, either public or ordinary course of the courts of justice.

deans among his servants. In his personal disposition he was passionate, but placable, fearless of danger, fond of military parade, and enjoyed the memory of the campaigns in which he served when young. His affections, either public or private, were never known to interfere with the ordinary course of justice; and though his reign was distracted by party, the courts of justice were never better filled than under him.

King George III. ascended the throne with great advantages. His being a native of England prejudiced the people in his favour; he was in the bloom of youth, in his person tall and comely, and, at the time of his accession, Great Britain was in the highest degree of reputation and prosperity, and the most salutary unanimity and harmony prevailed among the people. The first acts of his reign seemed also calculated to convince the public that the death of his predecessor should not relax the operations of the war. Accordingly, in 1761, the island of Belleisle, on the coast of France, surrendered to his majesty's ships and forces under commodore Keppel and general Hodgson; as did the important fortrefs of Pondicherry, in the East Indies, to colonel Coote and admiral Stevens. The operations against the French West Indies still continued under general Monkton, lord Rollo, and sir James Douglas; and in 1762, the island of Martinico, hitherto deemed impregnable, with the islands of Grenada, St. Lucia, Grenadillas, St. Vincent, and others of less note, were subdued by the British arms with inconceivable rapidity.

As his majesty could not espouse a Roman catholic, he was prevented from intermarrying into any of the great families of Europe; he therefore chose a wife from the house of Mecklenburg Strelitz, the head of a small but sovereign state in the north-west of Germany; and the conduct of his excellent consort has hitherto been such as most highly to justify his choice. She was conveyed to England in great pomp, and the nuptials were celebrated on the very night of her arrival, viz. Sept. 8, 1761; and on the 22d of the same month the ceremony of the coronation was performed with great magnificence in Westminster-abbey.

In the mean time, Mr. Pitt, who had conducted the war against France with such eminent ability, and who had received the best information of the hostile intentions and private intrigues of the court of Spain, proposed in council an immediate declaration of war against that kingdom. But he was over-ruled in the council, all the members of which declared themselves of a contrary opinion, excepting his brother-in-law, earl Temple. Mr. Pitt now found the decline of his influence; and it was supposed that the earl of Bute, who had a considerable share in directing the education of the king, had acquired an ascendancy in the royal favour\*. Mr. Pitt, however, said, "that, as he was called to the ministry by the voice of the people, to whom he considered himself as accountable for his conduct, he would no longer remain in a situation which made him responsible for measures that he was not allowed to guide." He therefore resigned the seals, and lord Temple also gave up the post which he held in the administration. But the next day the king settled a pension of three thousand pounds a year upon Mr. Pitt, and at the same time a title was conferred upon his lady and her issue; and the pension was to be continued for three lives.

The war still continued to be carried on with vigour after the resignation of Mr. Pitt, and the plans were pursued that he had previously con-

\* It was on the 25th of March, 1761, that the earl of Bute was appointed one of the principal secretaries of state; and on the 5th of October following Mr. Pitt resigned the seals.

certed. Lord Egremont was appointed to succeed him, as secretary for the southern department. It was at length also found indispensably necessary to engage in a war with Spain; the famous family compact among all the different branches of the Bourbon family being generally known; and accordingly war was declared against that kingdom, on the 4th of January, 1762. A respectable armament was fitted out under admiral Pococke, having the earl of Albemarle on board to command the land forces; and the vitals of the Spanish monarchy were struck at by the reduction of the Havannah, the strongest and most important fort which his catholic majesty held in the West Indies, after a siege of two months and eight days. The capture of the Hermione, a large Spanish register ship, bound from Lima to Cadiz, the cargo of which was valued at a million sterling, preceded the birth of the prince of Wales, and the treasure passed in triumph through Westminster to the bank in the very hour he was born. The loss of the Havannah, with the ships and treasures there taken from the Spaniards, was succeeded by the reduction of Manilla and the Philippine islands in the East Indies, under general Draper and admiral Cornish, with the capture of the Trinidad, reckoned worth three millions of dollars. To counteract those dreadful blows given to the family compact, the French and Spaniards employed their last resource, which was to quarrel with and invade Portugal, which had been always under the peculiar protection of the British arms. Whether this quarrel was real or pretended, is not easy to decide. It certainly embarrassed his Britannic majesty, who was obliged to send thither armaments both by sea and land.

The negotiations for peace were now resumed; and the enemy at last offered such terms as the British ministry thought admissible and adequate on the occasion. The defection of the Russians from the confederacy against the king of Prussia, and his consequent successes, produced a cessation of arms in Germany, and in all other quarters; and on the 10th of February, 1763, the definitive treaty of peace between his Britannic majesty, the king of France, and the king of Spain, was concluded at Paris, and acceded to by the king of Portugal: March 10, the ratifications were exchanged at Paris: the 22d, the peace was solemnly proclaimed at Westminster and London; and the treaty having on the 18th been laid before the parliament, it met the approbation of a majority of both houses.

By this treaty the extensive province of Canada, with the islands of Newfoundland, Cape Breton, and St. John, were confirmed to Great-Britain; also the two Floridas, containing the whole of the continent of North America, on this side the Mississippi (except the town of New Orleans, with a small district round it), were surrendered to us by France and Spain, in consideration of restoring to Spain the island of Cuba; and to France the islands of Martinico, Guadaloupe, Mariegalante, and Desirade; and in consideration of our granting to the French the two small islands of St. Pierre and Miquelon on the coast of Newfoundland, and quitting our pretensions to the neutral island of St. Lucia, they yielded to us the islands of Grenada and the Grenadillas, and quitted their pretensions to the neutral islands of St. Vincent, Dominica, and Tobago. In Africa we retained the settlement of Senegal, by which we nearly engrossed the whole gum-trade of that country; but we returned Gorée, a small island of little value. The article that relates to the East Indies was dictated by the directors of the English company, which restores to the French all the places they had at the beginning of the war, on condition that they shall maintain nei-

other forts nor forces in the province of Bengal; and the city of Manilla was restored to the Spaniards; but they confirmed to us the liberty of cutting logwood in the bay of Honduras in America. In Europe, likewise, the French restored to us the island of Minorca, and we restored to them the island of Belleisle. In Germany, after six years spent in marches and counter-marches, numerous skirmishes and bloody battles, Great Britain acquired much military fame, but at the expense of thirty millions sterling! As to the objects of that war, it was agreed that a mutual restitution and oblivion should take place, and each party sit down at the end of the war in the same situation in which they began it. And peace was restored between Portugal and Spain, both sides to be upon the same footing as before the war.

The war to which a period was now put was the most brilliant, and distinguished with the most glorious events, in the British annals. No national prejudices or party disputes then existed. The same truly British spirit by which the minister was animated, fired the breast of the soldier and seaman. The nation had then arrived at a degree of wealth unknown to former ages; and the moneyed man, pleased with the aspect of the times, confiding in the abilities of the minister, and courage of the people, cheerfully opened his purse. The sums of 18, 19, and 22 millions, raised by a few citizens of London, upon a short notice, for the service of the years 1759, 1760, and 1761, were no less astonishing to Europe, than the success which attended the British fleets and armies in every quarter of the world.

But the peace, though it received the sanction of a majority of both houses of parliament, was far from giving universal satisfaction to the people. And from this period various causes contributed to occasion a great discontent to prevail throughout the nation.

On the 30th of April, 1763, three of the king's messengers entered the house of John Wilkes, esq. member of parliament for Aylesbury, and seized his person, by virtue of a warrant from the secretary of state, which directed them to seize "the authors, printers, and publishers of a seditious and treasonable paper, entitled the North Briton, N<sup>o</sup> 45." The papers published under this title severely arraigned the conduct of the administration, and represented the earl of Bute as the favourite of the king, and the person from whom measures of government of a very pernicious tendency originated. The 45th number contained strictures on the king's speech. Mr. Wilkes was suspected to be the author, but his name was not mentioned in the warrant by which he was apprehended. He objected to being taken into custody by such a warrant, alleging that it was illegal. However, he was forcibly carried before the secretaries of state for examination, and they committed him close prisoner to the Tower, his papers being also seized. He was likewise deprived of his commission as colonel of the Buckinghamshire militia. A writ of habeas corpus being procured by his friends, he was brought up to the court of Common-Pleas; and the matter being there argued, he was ordered to be discharged. This affair made a great noise; people of all ranks interested themselves in it; and Westminster-hall resounded with acclamations when he was set at liberty. An information, however, was filed against him in the court of King's-Bench, at his majesty's suit, as author of the North Briton, N<sup>o</sup> 45. On the first day of the meeting of parliament after these transactions, Mr. Wilkes stood up in his place, and made a speech, in which he complained to the house, that in his person the rights of all the commons of England, and the privileges of parliament, had been violated by his imprisonment,

the plundering of his house, and the seizure of his papers. The same day a message was sent to acquaint the house of commons with the information his majesty had received, that John Wilkes, esq; a member of that house, was the author of a most seditious and dangerous libel, and the measures that had been taken thereupon. The next day a duel was fought in Hyde Park, between Mr. Wilkes and Mr. Martyn, another member of parliament, and secretary of the treasury, in which Mr. Wilkes received a dangerous wound in the belly with a pistol bullet. Both houses of parliament soon concurred in voting the North Briton, N<sup>o</sup> 45, to be a false, scandalous, and seditious libel, and ordered it to be burnt by the common hangman. This order was accordingly executed, though not without great opposition from the populace; and Mr. Harley, one of the sheriffs who attended, was wounded, and obliged to take shelter in the mansion-house. Another prosecution was commenced against Mr. Wilkes, for having caused an obscene and profane poem to be printed, entitled "An Essay on Woman." Of this, only twelve copies had been privately printed: and it did not appear to have been intended for publication. Finding, however, that he should continue to be prosecuted with the utmost rigour, when his wound was in some degree healed, he thought proper to quit the kingdom. He was soon after expelled the house of commons; verdicts were also given against him, both on account of the North Briton and the Essay on Woman; and towards the end of the year 1764 he was outlawed. Sundry other persons had been taken up for being concerned in printing and publishing the North Briton; but some of them obtained verdicts against the king's messengers for false imprisonment.

In the mean time, the earl of Bute, who had been made first lord of the treasury, resigned that office, and was succeeded by Mr. George Grenville: and under this gentleman's administration an act was passed; said to have been framed by him, which was productive of the most pernicious consequences to Great Britain; "an act for laying a *stamp duty* in the British colonies of North America," which received the royal assent on the 22<sup>d</sup> of March, 1765. Some other injudicious previous regulations had also been made, under pretence of preventing smuggling in America; but which in effect so cramped the trade of the colonies, as to be prejudicial both to them and the mother country. As soon as it was known in North America that the *stamp-act* was passed, the whole continent was kindled into a flame. As the Americans had hitherto been taxed by their own representatives in their provincial assemblies, they loudly asserted that the British parliament, in which they were not represented, had no right to tax them. Indeed, the same doctrine had been maintained in the British parliament, when the stamp-act was under consideration: on which occasion it was said, that it was the birth-right of the inhabitants of the colonies, even as the descendants of Englishmen, not to be taxed by any but their own representatives; that, so far from being actually represented, they were not even virtually represented there, as the meanest inhabitants of Great Britain are, in consequence of their intimate connection with those who are actually represented; and that therefore the attempt to tax the colonies in the British parliament was oppressive and unconstitutional. On the other hand, it was contended, that the colonies, who had been protected by Great Britain, ought, in reason and justice, to contribute towards the expence of the mother-country. "Those children of our own planting," said Mr. George Grenville, speaking of the Americans, "nourished by our indulgence, until they are grown to a good degree

of strength and opulence, and protected by our arms, will they grudge to contribute their mite to relieve us from the heavy load of national expense which we lie under?"

When the stamp-act, printed by royal authority, reached the colonies, it was treated with every mark of indignation and contempt. Several acts of violence were likewise committed, with a view of preventing the operations of the stamp-act; and associations were also formed in the different colonies, whereby the people bound themselves not to import or purchase any British manufactures, till that act should be repealed. The inhabitants of the different colonies also established committees from every colony to correspond with each other, concerning the general affairs of the whole, and even appointed deputies from these committees to meet in CONGRESS at New York. They assembled together in that city, in October 1765; and this was the first congress held on the American continent.

These commotions in America occasioned so great an alarm in England, that the king thought proper to dismiss his ministers. The marquis of Rockingham was appointed first lord of the treasury; and some of his lordship's friends succeeded to the vacant places. In March, 1766, an act was passed for repealing the American stamp-act. This was countenanced and supported by the new ministry; and Mr. Pitt, though not connected with them, yet spoke with great force in favour of the repeal. He also asserted, that the profits of Great Britain from the trade of the colonies, through all its branches, was two millions a year.

At the time that the stamp-act was repealed, an act was also passed for securing the dependence of the American colonies on Great Britain.

The marquis of Rockingham, and his friends, continued in administration but a short time; though, during their continuance in power, several public measures were adopted, tending to relieve the burthens of the people, and to the security of their liberties. But on the 30th of July, 1766, the duke of Grafton was appointed first lord of the treasury, in the room of the marquis of Rockingham; the earl of Shelburne, secretary of state, in the room of the duke of Richmond; Charles Townshend, chancellor of the exchequer; and Mr. Pitt, afterwards created earl of Chatham, was appointed lord privy seal; but that eminent statesman's acceptance of a peerage, as it removed him from the house of commons, greatly lessened his weight and influence. Indeed, this political arrangement was not of any long continuance; and sundry changes followed. Mr. C. Townshend, who was a gentleman of great abilities and eloquence, made for some time a considerable figure both in the cabinet and in parliament; but on his death, the place of chancellor of the exchequer was supplied by lord North, who afterwards became first lord of the treasury, and obtained a great ascendancy in the administration.

In the year 1768, Mr. Wilkes, who had for a considerable time resided in France, came over to England, and again became an object of public attention. The limits of our work will not permit us to enter into all the particulars respecting the prosecution of this gentleman, and the subsequent transactions concerning him: for these we must refer to our quarto edition. It is well known that verdicts were found against him on account of the North Briton, and for the indecent poem, "Essay on Woman;" that he suffered a long imprisonment of two years, and paid two fines of 500*l.* each; that he displayed great abilities during his contests with the ministry, and was chosen member for the county of Middlesex, on the 28th of March, 1768. He was also again expelled

for being the author of some prefatory remarks on a letter which he published, written by one of the secretaries of state to the chairman of the quarter-sessions at Lambeth, in which the secretary had recommended to the magistrates, previous to the unhappy affair of St. George's Fields, their calling in the assistance of the military, and employing them *effectually*, if there should be occasion. In the vote for his expulsion, his former offences, for which he was now suffering imprisonment, were complicated with this charge; and a new writ was ordered to be issued for the election of a member for the county of Middlesex.

The rigour with which Mr. Wilkes was prosecuted only increased his popularity, which was also much augmented by the spirit and firmness which on every occasion he displayed. Before his expulsion, he had been chosen an alderman of London: and on the 10th of February, 1769, he was re-elected, at Brentford, member for the county of Middlesex, without opposition. The return having been made to the house, it was resolved, that Mr. Wilkes, having been expelled that session, was incapable of being elected a member of that parliament. The late election, therefore, was again declared void, and a new writ issued for another. He was once more unanimously re-elected by the freeholders, and the election was again declared void by the house of commons. After this, a new election being ordered, colonel Luttrell, in order to recommend himself to the court, vacated the seat which he already had in parliament, by the acceptance of a nominal place, and declared himself a candidate for the county of Middlesex. Though the whole weight of court interest was thrown into the scale in this gentleman's favour, yet a majority of near four to one appeared against him on the day of election; the numbers for Wilkes being 1143, and for Luttrell only 236. Notwithstanding this, two days after the election, it was resolved in the house of commons, that Mr. Luttrell ought to have been returned a knight of the shire for the county of Middlesex; and the deputy clerk of the crown was ordered to amend the return, by erasing the name of Mr. Wilkes, and inserting that of colonel Luttrell in its place. The latter accordingly took his seat in parliament; but this was thought so gross a violation of the rights of the electors, that it excited a very general discontent, and loud complaints were made against it in every part of the kingdom.

After the term of Mr. Wilkes's imprisonment was expired in the year 1771, he was chosen one of the sheriffs for London and Middlesex; and was afterwards again chosen member for the county of Middlesex in the subsequent parliament, and permitted quietly to take his seat there; in the year 1775, he executed the office of lord-mayor of the city of London; and was afterwards elected to the lucrative office of chamberlain of that city. In the year 1783, after the change of lord North's administration, on Mr. Wilkes's motion, all the declarations, orders, and resolutions of the house of commons respecting his election for the county of Middlesex were ordered to be expunged from the journals of that house, "as being subversive of the rights of the whole body of electors of this kingdom." And it should be remembered, that, in consequence of his manly and spirited contests with the government, general warrants were declared to be illegal, and an end was put to such warrants, and to the unlawful seizure of an Englishman's papers by state messengers.

After the repeal of the stamp act, which was received with great joy in America, all things became quiet there: but unhappily new attempts were made to tax them in the British parliament, though, besides the ex-

perience of the ill success of the stamp-act, governor Pownal, a gentleman well acquainted with the disposition of the colonists, said in the house of commons, in 1767, "It is a fact which this house ought to be apprised of in all its extent, that the people of America, universally, unitedly, and unalterably, are resolved not to submit to any internal tax imposed upon them by any legislature, in which they have not a share by representatives of their own election." He added, "this claim must not be understood as though it were only the pretences of party leaders and demagogues; as though it were only the visions of speculative enthusiasts; as though it were the mere ebullition of a faction which must subside; as though it were only temporary and partial:—it is the cool, deliberate, principled maxim of every man of business in the country." The event verified the justice of these observations; yet the same year, an act was passed, laying certain duties on paper, glass, tea, &c. imported into America, to be paid by the colonies: for the purpose of raising a revenue to the government. About two years after, it was thought proper to repeal these duties, excepting that on tea; but as it was not the *amount* of the duties, but the *right* of the parliament of Great Britain to impose taxes in America, which was the subject of dispute, the repealing the other duties answered no purpose while that on tea remained; which accordingly became a fresh subject of contest between the mother-country and the colonies.

In order to induce the East-India company to become instrumental in enforcing the tea-duty in America, an act was passed, by which they were enabled to export their teas, duty free, to all places whatsoever. Several ships were accordingly freighted with teas for the different colonies by the company, who also appointed agents there for the disposal of that commodity. This was considered by the Americans as a scheme calculated merely to circumvent them into a compliance with the revenue law, and thereby pave the way to an unlimited taxation. For it was easily comprehended, that if the tea was once landed, and in the custody of the consignees, no associations, or other measures, would be sufficient to prevent its sale and consumption: and it was not to be supposed, that, when taxation was established in one instance, it would be restrained in others. These ideas being generally prevalent in America, it was resolved by the colonists to prevent the landing of the tea-cargoes amongst them, at whatever hazard. Accordingly, three ships laden with tea having arrived in the port of Boston, in December, 1773, a number of armed men, under the disguise of Mohawk Indians, boarded these ships, and in a few hours discharged their whole cargoes of tea into the sea, without doing any other damage, or offering any injury to the captains or crews. Some smaller quantities of tea met afterwards with a similar fate at Boston, and a few other places; but in general, the commissioners for the sale of that commodity were obliged to relinquish their employments; and the masters of the tea-vessels, from an apprehension of danger, returned again to England with their cargoes. At New York, indeed, the tea was landed under the cannon of a man of war; but the persons in the service of government there were obliged to consent to its being lock'd up from use. And in South Carolina some was thrown into the river, as at Boston, and the rest put into damp warehouses, where it perished.

These proceedings in America excited so much indignation in the government of England, that, on the 31st of March, 1774, an act was passed for removing the custom-house officers from the town of Boston, and shutting up the port. Another act was soon after passed "for better

regulating the government in the province of Massachusetts Bay." The design of this act was to alter the constitution of that province as it stood by the charter of king William; to take the whole executive power out of the hands of the people, and to vest the nomination of the counsellors, judges, and magistrates of all kinds, including sheriffs, in the crown, and in some cases in the king's governor, and all to be removable at the pleasure of the crown. Another act was also passed, which was considered as highly injurious, cruel, and unconstitutional, empowering the governor of Massachusetts Bay to send persons accused of crimes there to be tried in England for such offences. Some time after, an act was likewise passed "for making more effectual provision for the government of the province of Quebec," which excited a great alarm both in England and America. By this act, a legislative council was to be established for all the affairs of the province of Quebec, except taxation; which council was to be appointed by the crown, the office to be held during pleasure; and his majesty's Canadian Roman-catholic subjects were entitled to a place in it. The French laws, and a trial without jury, were also established in civil cases, and the English laws, with a trial by jury, in criminal; and the popish clergy were invested with a legal right to their tithes from all who were of their own religion. No assembly of the people, as in other British colonies, was appointed,—it being said in the act, that it was then inexpedient: but the king was to erect such courts of criminal, civil, and ecclesiastical jurisdiction, as he should think proper. The boundaries of the province of Quebec were likewise extended, by the act, thousands of miles at the back of the other colonies, whereby, it was said, a government little better than despotic was established throughout an extensive country.

The measures of government respecting America had so universally exasperated the colonists, that provincial or town meetings were held in every part of the continent, in which they avowed their intentions of opposing, in the most vigorous manner, the measures of administration. Agreements were entered into in the different colonies, whereby the subscribers bound themselves, in the most solemn manner, and in the presence of God, to suspend all commercial intercourse with Great Britain from the last day of the month of August, 1774, until the Boston port bill, and the other late obnoxious laws, were repealed, and the colony of Massachusetts Bay fully restored to its chartered rights. Other transactions succeeded; and the flame continued to increase and extend in America, till at length twelve of the colonies, including that whole extent of the country which stretches from Nova Scotia to Georgia, had appointed deputies to attend a General Congress, which was to be held at Philadelphia, and opened the 5th of September, 1774. They met accordingly, and the number of delegates amounted to fifty-one, who represented the several English colonies; of New Hampshire (2 delegates), Massachusetts Bay (4), Rhode Island and Providence plantations (2), Connecticut (3), New York (7), New Jersey (4), Pennsylvania (7), the lower counties on Delaware (3), Maryland (4), Virginia (7), North Carolina (3), and South Carolina (5 delegates); Georgia afterwards acceded to the confederacy, and sent deputies to the Congress.

They drew up a petition to the king, in which they enumerated their several grievances, and solicited his majesty to grant them peace, liberty, and safety. They likewise published an address to the people of Great Britain, another to the colonies in general, and another to the inhabitants of the province of Quebec. The congress broke up on the 26th of October, having resolved, that another congress should be held in

the same place which they recommended for that purpose.

Shortly after the commencement of Great Britain happily subsisted in an infirm state in the strongest measures. troops from England urging, that a produce year would be well side, would re-stantaneously was rejected by he brought in The methods commodation jecty's troops w restraining the their fishery or afterwards made the treasury, for rica, claimed by in their genera by the king in communicated them as delus them. the same place on the 10th of May following, unless the grievances of which they complained should be redressed before that time; and they recommended to all the colonies to choose deputies, as soon as possible, for that purpose.

Shortly after these events, some measures were proposed in the parliament of Great Britain, for putting a stop to the commotions which unhappily subsisted in America. The earl of Chatham, who had been long in an infirm state of health, appeared in the house of lords, and expressed in the strongest terms his disapprobation of the whole system of American measures. He also made a motion for immediately recalling the troops from Boston, as a measure which should be instantly adopted; urging, that an hour then lost, in allaying the ferment in America, might produce years of calamity. He alleged that this conciliatory measure would be well-timed; and, as a mark of affection and good-will on our side, would remove all jealousy and apprehension on the other, and instantaneously produce the happiest effects to both. His lordship's motion was rejected by a large majority, 68 against 18; as was also a bill which he brought in soon after for settling the American troubles, by 61 to 32. The methods proposed in the house of commons for promoting an accommodation met also with a similar fate. The number of his majesty's troops was ordered to be augmented; and an act was passed for restraining the commerce of the New England colonies, and to prohibit their fishery on the Banks of Newfoundland. A motion was, indeed, afterwards made in the house of commons, by lord North, first lord of the treasury, for suspending the exercise of the right of taxation in America, claimed by the British parliament, in such of the colonies as should, in their general assemblies, raise such contributions as were approved of by the king in parliament. This motion was carried, and afterwards communicated to some provincial assemblies: but it was rejected by them as delusive and unsatisfactory, and only calculated to disunite them. The petition from the congress to the king was ordered by his majesty to be laid before the parliament; whereupon Dr. Franklin, and two other American agents, solicited to be heard at the bar of the house of commons, on behalf of the colonies, in support of that petition; but their application was rejected; it being said, that the American congress was no legal assembly, and that therefore no petition could be received from it by the parliament with propriety.

It was on the 19th of April, 1775, that the first blood was drawn in this unhappy civil war, at Lexington and Concord in New England. This was occasioned by general Gage sending a body of troops to destroy some military stores that were at Concord. They succeeded in their design, but were extremely harassed, and forced to a quick retreat; 65 of them were killed, 170 wounded, and about 20 made prisoners. The Americans were computed not to have lost more than 60, including killed and wounded. Immediately after, numerous bodies of the American militia invested the town of Boston, in which general Gage and his troops were. In all the colonies they prepared for war with the utmost dispatch; and a stop was almost every-where put to the exportation of provisions. The continental congress met at Philadelphia on the 10th of May 1775, as proposed, and soon adopted such measures as confirmed the people in their resolutions to oppose the British government to the utmost. Among their first acts, were resolutions for the raising of an army, and the establishment of a large paper currency for its payment. They assumed the appellation of "The United Colonies of America," who were securities for realising the nominal value of this currency.

They also strictly prohibited the supplying of the British fisheries with any kind of provisions; and, to render this order the more effectual, stopp'd all exportation to those colonies, islands, and places, which still retained their obedience.

In the mean time, a body of provincial adventurers, amounting to about 240 men, surpris'd the garrisons of Ticonderoga and Crown Point. These fortresses were taken without the loss of a man on either side: and the provincials found in the forts a considerable number of pieces of cannon, besides mortars, and sundry kinds of military stores. The force of Great Britain, in America was now augmented, by the arrival at Boston from England of the generals Howe, Burgoyne, and Clinton, with considerable reinforcements. But the continental congress were so little intimidated by this, that they voted, a few days after, that the compact between the crown and the people of Massachusetts Bay was dissolved, by the violation of the charter of William and Mary; and therefore recommended to the people of that province, to proceed to the establishment of a new government, by electing a governor, assistants, and house of assembly, according to the powers contained in their original charter.

Our limits will not permit us here to relate, as in the quarto edition, all the particulars of this fatal war. We can only mention some of the most important transactions. On the 17th of June, 1775, a bloody action took place at Bunker's Hill, near Boston, in which the king's troops had the advantage, but with the loss of 226 killed, and more than 800 wounded, including many officers. After this action, the Americans immediately threw up works upon another hill, opposite to it, on their side of Charlestown neck; so that the troops were as closely invested in that peninsula as they had been in Boston. About this time the congress appointed George Washington, esq. a gentleman of large fortune in Virginia, of great military talents, and who had acquired considerable experience in the command of different bodies of provincials during the last war, to be general and commander in chief of all the American forces. They also published a declaration, in which they styled themselves, "The Representatives of the United Colonies of North America," and assigned their reasons for taking up arms. It was written in a very animated strain, and contained the following passage: "In our own native land, in defence of the freedom that is our birth-right, and which we ever enjoyed till the late violation of it; for the protection of our property, acquired solely by the honest industry of our forefathers and ourselves; against violence actually offered, we have taken up arms. We shall lay them down when hostilities shall cease on the part of the aggressors, and all danger of their being renewed shall be removed, and not before." A second petition to the king was voted by the congress, in which they earnestly solicited his majesty to adopt some method of putting a stop to the unhappy contest between Great Britain and the colonies. This petition was presented by Mr. Penn, late governor, and one of the proprietors of Pennsylvania, through the hands of lord Dartmouth, secretary of state for the American department; but Mr. Penn was soon after informed, that no answer would be given to it. The refusal of the king to give an answer to this petition, for near three millions of people, by their representatives, contributed exceedingly towards farther exasperating the minds of the Americans. It was a rash and unhappy determination of the cabinet-council; and their advice to the king on this point was fatal, if not highly criminal. An address now also was published, by the congress, to the inhabitants of Great Britain, and to the people of Ireland.

But as no conciliatory measures were adopted, hostilities still continued; and an expedition was set on foot by the Americans against Canada, to which they were induced by an extraordinary commission given to general Carleton, the governor of Canada; by which he was empowered to embody and arm the Canadians, to march out of the country for the subjugation of the other colonies, and to proceed even to capital punishments against all those whom he should deem rebels and opposers of the laws. The American expedition against Canada was chiefly conducted by Richard Montgomery, a gentleman of an amiable character, and of considerable military skill, on whom the congress conferred the rank of brigadier-general. On the 31st of December, Montgomery attempted to gain possession of Quebec by storm, but was killed in the first fire from a battery, as advancing in the front of his men: Arnold was also dangerously wounded; about sixty of their men were killed and wounded, and 300 taken prisoners. The besiegers immediately quitted their camp, and retired about three miles from the city, and the siege was for some months converted into a blockade. On general Carleton's receiving considerable reinforcements and supplies of provisions from England, in May 1776, Arnold was obliged to make a precipitate retreat: Montreal, Chamblée, and St. John's, were retaken, and all Canada recovered by the king's troops.

During these transactions, the royal army at Boston was reduced to great distress for want of provisions; the town was bombarded by the Americans; and general Howe, who now commanded the king's troops, which amounted to upwards of seven thousand men, was obliged to quit Boston, and embark for Halifax, leaving a considerable quantity of artillery and some stores behind. The town was evacuated on the 17th of March, 1776, and general Washington immediately took possession of it. On the 4th of July following, the congress published a solemn declaration, in which they assigned their reasons for withdrawing their allegiance from the king of Great Britain. In the name, and by the authority of the inhabitants of the united colonies, they declared that they then were, and of right ought to be, "free and independent states;" that they were absolved from all allegiance to the British crown, and that all political connection between them and the kingdom of Great Britain was totally dissolved; and also that, as free and independent states, they had full power to levy war, conclude peace, contract alliances, establish commerce, and do all other acts and things which independent states may of right do." They likewise published articles of confederation and perpetual union between the united colonies, in which they assumed the title of "The United States of America."

In July 1776, an attempt was made by commodore sir Peter Parker, and lieutenant-general Clinton, upon Charlestown in South Carolina. But this place was so ably defended by the Americans, under general Lee, that the British commodore and general were obliged to retire, the king's ships having sustained considerable loss; and a twenty-eight gun ship, which ran a-ground, was obliged to be burnt by the officers and seamen. However, a much more important and successful attack against the Americans was soon after made under the command of general Howe, then joined with a large body of Hessians, and a considerable number of Highlanders, so that his whole force was now extremely formidable. The fleet was commanded by his brother, vice-admiral lord Howe; and both the general and the admiral were invested with a power, under the title of "Commissioners for granting peace to the colonies,"

of granting pardon to those who would lay down their arms. But their offers of this kind were treated by the Americans with contempt. An attack upon the town of New York seems to have been expected by the provincials, and therefore they had fortified it in the best manner they were able. On Long Island, near New York, the Americans had also a large body of troops encamped, and several works thrown up. General Howe first landed on Staten Island, where he met with no opposition; but early in the morning of the 22d of August, a descent was made by the British troops upon Long Island, and towards noon about fifteen thousand were landed. They had greatly the advantage of the Americans, by their superior skill and discipline, and being better provided with artillery, and every kind of military accommodation; and the American passes were far from being properly secured. Some actions and skirmishes happened between them during several successive days, in which the British troops engaged their enemies with great ardour, and the Americans suffered exceedingly. Finding themselves so much overpowered, they at length resolved to quit the island; and general Washington came over from New York to conduct their retreat, in which he displayed great ability. In the night of the 29th of July, the American troops were withdrawn from the camp, and their different works; their baggage, stores, and part of their artillery, were conveyed to the water-side, embarked, and passed over a long ferry to New York, with such extraordinary silence and order, that the British army did not perceive the least motion, and were surprised in the morning at finding the American lines abandoned, and seeing the last of their rear-guard in their boats, and out of danger. The provincials had been so surrounded by the British troops, and the latter had displayed such superior military skill, that it was a subject of wonder that the greatest part of the American army should be able to effectuate their retreat. In the different actions previous to this, the loss of the Americans had been very considerable. Upwards of a thousand of them were taken prisoners, including three generals, three colonels, and many inferior officers; their number killed and wounded was computed to be still greater; they lost also five field-pieces, and a quantity of ordnance was found in their different redoubts and forts on the island; whilst the whole loss of the British troops, if faithfully published, did not amount to more than three hundred killed and wounded.

New York was now soon abandoned, and the royal army obtained some other considerable advantages over the Americans, at the White Plains, taking Fort Washington, with a garrison of 2500 men, and Fort Lee with a great quantity of stores; which losses obliged the American general to retreat through the Jerseys to the river Delaware, a distance of ninety miles. Also on the 8th of December, general Clinton and sir Peter Parker obtained possession of Rhode Island; and the British troops covered the Jerseys. This was the crisis of American danger. All their forts were taken, the time of the greatest part of their army to serve was expired, and the few that remained with their officers were in a destitute state, with a well-clothed and disciplined army pursuing. Had general Howe pushed on at that time to Philadelphia; after Washington, it has been maintained there would have been an end to the contest; but this delay gave time for volunteer reinforcements of gentleman, merchant, farmer, tradesman, and labourer, to join general Washington, who, in the night of the 25th of December, amidst snow, storms, and ice, with a small detachment, crossed the Delaware, and surprised a brigade of the Hessian troops at Trenton. He took upwards of 900 of

them prisoners, three standard of arms. them prisoners, with whom he repaired the river; having also taken three standards, six pieces of brass cannon, and near one thousand stand of arms. Immediately after this surprise of the Hessians, and depositing them in safety, Washington recrossed the river to resume his former posts at Trenton. The British troops collected in force to attack him, and only waited for the morning; but the Americans, by a happy stroke of generalship, defeated the plan. Washington, to disguise his retreat in the night, ordered a line of fires in front of his camp, as an indication of their going to rest, and to conceal what was acting behind them. He then moved completely from the ground with his baggage and artillery, and, by a circuitous march of eighteen miles, reached Princetown early in the morning, carried the British post at that place, and set off with near 300 prisoners on his return to Delaware, just as the British troops at Trenton were under arms, and proceeding to attack him, supposing him in his former position.

In the month of September 1777, two actions of some importance happened between the armies of general Howe and general Washington, in both of which the former had the advantage; and soon after, the city of Philadelphia surrendered to the king's troops. But an expedition, that had for some time been concerted, of invading the northern colonies by way of Canada, proved extremely unsuccessful. The command of this expedition had been given to lieutenant-general Burgoyne, a very experienced officer. He set out from Quebec with an army of near 10,000 men, and an extraordinary fine train of artillery, and was joined by a considerable body of Indians. For some time he drove the Americans before him, and made himself master of Ticonderoga; but at length he encountered such difficulties, and was so vigorously opposed by the Americans, under Gates and Arnold, that, after two severe actions, in which great numbers fell, general Burgoyne, and his army of 5600 men, were obliged to lay down their arms, October 17, 1777.

About the same time, sir Henry Clinton and general Vaughan made a successful expedition against the Americans up the North River; they made themselves masters of several forts; but the Americans complained, that in this expedition, and some others, the British troops had wantonly set fire to houses and towns, particularly Esopus, and carried on the war in a manner not usual among civilised nations. These devastations greatly increased the aversion of the Americans to the British government, which had already taken a deep root. General Howe soon after returned to England, and the command of the British army in America devolved upon general Clinton; but it was now found necessary to evacuate Philadelphia; and accordingly Clinton retreated with the army to New York, in June 1778. The British troops were attacked on their march by the Americans; but the retreat was so ably conducted, of the American general, Lee, behaved so ill, that their loss did not amount to 300, killed and wounded.

During part of this unhappy war between Great Britain and the colonies, the latter received considerable supplies of arms and ammunition from France; and the French court thought this a favourable opportunity for lessening the power of Great Britain. Some French officers also entered into the American service; and on the 6th of February, 1778, a treaty of alliance was concluded at Paris, between the French king and the Thirteen United Colonies; and in this treaty it was declared, that the essential and direct end of it was "to maintain effectually the liberty, sovereignty, and independence, absolute and unlimited,

of the United States of North America, as well in matters of government as of commerce."

The parliament and people of Great Britain now began to be in general alarmed at the fatal tendency of the American war; and in June, 1778, the earl of Carlisle, William Eden, and George Johnstone, esqrs. arrived at Philadelphia, as commissioners from his majesty, to settle the disputes between the mother-country and the colonies. But it was now too late: the terms which, at an earlier period of the contest, would have been accepted with gratitude, were now rejected with disdain; and the congress positively refused to enter into any treaty with the British commissioners, if the independency of the United States of America were not previously acknowledged, or the British fleets and armies withdrawn from America. Neither of these requisitions being compelled with, the war continued to be carried on with mutual animosity.

The conduct of France towards Great Britain, in taking part with the revolted colonies, occasioned hostilities to be commenced between the two nations, though without any formal declaration of war on either side. On the 27th of June, 1778, the *Licorne* and *La Belle Poule*, two French frigates, were taken by admiral Keppel. Orders were immediately issued by the French court for making reprisals on the ships of Great Britain; and on the 27th of July a battle was fought off Brest, between the English fleet, under the command of admiral Keppel, and the French fleet, under the command of count d'Orvilliers. The English fleet consisted of 30 ships of the line, and the French of 32, besides frigates: they engaged for about three hours; but the action was not decisive, no ship being taken on either side, and the French fleet at length retreated into the harbour of Brest. Of the English 133 were killed in the action, and 373 wounded; and the loss of the French is supposed to have been very great. After the engagement, there was much murmuring throughout the English fleet, because a decisive victory had not been obtained over the French; at last the blame was thrown upon sir Hugh Palliser, vice-admiral of the blue, who was charged in a newspaper with misconduct, and disobedience of orders. Though no regular accusation was brought against him, he required of admiral Keppel publicly to vindicate his conduct from the unfavourable reports that were propagated relative to him. This the admiral declined; which gave rise to some altercation between them; and sir Hugh Palliser afterwards thought proper to exhibit to the Board of Admiralty (of which he was himself a member) articles of accusation against admiral Keppel, though, for many months after the action, he had continued to act under him, and professed the greatest respect to him. A mode of conduct so extraordinary was very generally and severely censured; but the lords of the Admiralty ordered a court-martial to be held for the trial of admiral Keppel. When the court-martial was held, admiral Keppel was acquitted in the most honourable manner; and sir Hugh Palliser's charge against him was declared by the court to be "malicious and ill-founded." But sir Hugh Palliser being afterwards tried by another court-martial, partly composed from some of the captains of his own division, he likewise was acquitted; his disobedience to the admiral's orders was considered as being occasioned by the disabled state of his ship; a slight censure only was passed on him for not making the state of his ship known to the admiral; and his conduct in other respects was declared to have been meritorious.

In the East Indies also an engagement happened between some English ships of war, under the command of sir Edward Vernon, and some French ships under the command of mons. de Troujolly, on the 10th of August, in which the former obliged the latter to retire; and on the 17th of October following Pondicherry surrendered to the arms of Great Britain. In the course of the same year, the island of St. Lucia, in the West Indies, was taken from the French; but the latter made themselves masters of Dominica, and the following year they obtained possession of the islands of St. Vincent and Grenada. In September, 1779, the count D'Estaing arrived at the mouth of the river Savannah, with a large fleet, and a considerable body of French troops, to the assistance of the Americans. The French and Americans soon made an united attack upon the British troops at Savannah, under the command of general Prevost; but the latter defended themselves so well, that the French and Americans were driven off with great loss, and D'Estaing soon after totally abandoned the coast of America. At the close of the year 1779, several French ships of war, and merchant ships, were taken in the West Indies, by a fleet under the command of sir Hyde Parker.

By the intrigues of the French court, Spain was at length brought to engage with France in the war against England. One of the first enterprises in which the Spaniards engaged was the siege of Gibraltar, which was defended by the garrison with great vigour. The naval force of Spain was also added to that of France, now become extremely formidable, and their combined fleets seemed for a time to ride almost triumphant in the British Channel. So great were their armaments, that the nation was under no inconsiderable apprehensions of an invasion; but they did not venture to make an experiment of that kind; and after parading for some time in the Channel, thought proper to retire to their own ports, without effecting any thing. On the 8th of January 1780, sir George Brydges Rodney, who had a large fleet under his command, captured seven Spanish ships and vessels of war belonging to the royal company of Caraccas, with a number of trading vessels under their convoy; and in a few days after, the same admiral engaged, near Cape St. Vincent, a Spanish fleet, consisting of eleven ships of the line, and two frigates, under Don Juan de Langara. Four of the largest Spanish ships were taken, and carried into Gibraltar, and two others driven on shore, one of which was afterwards recovered by the English. A Spanish 70 gun ship, with 600 men, was also blown up in the action. In April and May three actions likewise happened in the West Indies, between the English fleet under admiral Rodney, who was now arrived in that part of the world (having previously thrown supplies into Gibraltar), and the French fleet under the count de Guichen; but none of these actions were decisive, nor was any ship taken on either side. In July following, admiral Geary took twelve valuable French merchant ships from Port au Prince; but on the 8th of August, the combined fleets of France and Spain took five English East-Indiamen, and fifty English merchant ships bound for the West Indies, which was one of the most complete naval captures ever made, and a very severe stroke to the commerce of Great Britain. Such a prize never before entered the harbour of Cadiz.

On the 4th of May, 1780, sir Henry Clinton made himself master of Charlestown, South Carolina; and on the 16th of August earl Cornwallis obtained a very signal victory over general Gates in that province, in which about a thousand American prisoners were taken.

Soon after, major-general Arnold deserted the service of the congress, made his escape to New York, and was made a brigadier-general in the royal service. Major André, who negotiated this desertion, and was concerting measures with him for betraying the important post of West Point into the hands of the English, was taken in the American lines, in his return to New York, and, being considered as a spy, suffered death accordingly, much regretted for his amiable qualities.

The great expenses of the American war, and the burthens which were thereby laid upon the people, naturally occasioned much discontent in the nation, and seemed to convince persons of all ranks of the necessity of public economy. Meetings were therefore held in various counties of the kingdom, at the close of the year 1779, and the beginning of the year 1780, at which great numbers of freeholders were present, who agreed to present petitions to the house of commons, stating the evils which the profuse expenditure of the public money occasioned, &c.

Some trivial attempts were made in parliament to remedy the grievances stated in the petitions; but nothing important was effected: the ministry soon found means to maintain their influence in parliament; a diversity of sentiment occasioned some disunion among the popular leaders; the spirit which had appeared among the people, by degrees subsided; and various causes at length conspired to bring the greatest part of the nation to a patient acquiescence in the measures of administration.

The middle of the year 1780 was distinguished by one of the most disgraceful exhibitions of religious bigotry that had ever appeared in this country; especially if it be considered as happening in an age in which the principles of toleration were well understood, and very prevalent. An act of parliament had been lately passed "for relieving his majesty's subjects, professing the Romish religion, from certain penalties and disabilities imposed upon them in the 11th and 12th years of the reign of king William III." This act was generally approved by men of sense and of liberal sentiments, by whom the laws against papists were justly deemed too severe. The act at first seemed to give little offence to persons of any class in England; but in Scotland it excited much indignation, though it did not extend to that kingdom. Resolutions were formed to oppose any law for granting indulgences to papists in Scotland; and a Romish chapel was burned, and the houses of several papists demolished in the city of Edinburgh. The contagion of bigotry at length reached England; a number of persons assembled themselves together, with a view of promoting a petition to parliament, for a repeal of the late act in favour of the papists, and they assumed the title of the Protestant Association. It was then resolved, in order to give the more weight to their petition, that it should be attended by great numbers of petitioners in person: and a public advertisement was issued for that purpose, signed by lord George Gordon,

Fifty thousand persons are supposed to have assembled with this view, on Friday the 2d of June, in St. George's Fields; from whence they proceeded, with blue cockades in their hats, to the house of commons, where their petition was presented by their president. In the course of the day several members of both houses of parliament were grossly insulted and ill-treated by the populace: and a mob assembled the same evening, by which the Sardinian chapel in Lincoln's-inn Fields, and another Romish chapel in Warwick-street, Golden-square, were entirely demolished. A party of the guards were then sent for, to put a stop to the farther pro-

gress of these violences, and thirteen of the rioters were taken; five of whom were afterwards committed to Newgate, escorted by the military. On the Sunday following, another mob assembled, and destroyed a popish chapel in Rope-maker's-alley, Moorfields. On Monday they demolished a school-house, and three dwelling-houses, in the same place, belonging to the Romish priests, with a valuable library of books, and a mals-house, in Virginia-street, Ratcliff-highway. They also destroyed all the household furniture of sir George Saville, one of the most respectable men of the kingdom, because he had brought in the bill in favour of the papists. On Tuesday great numbers again assembled about the parliament-house, and behaved so tumultuously, that both houses thought proper to adjourn. In the evening, a most daring and violent attempt was made to force open the gates of Newgate, in order to release the rioters who were confined there; and the keeper having refused to deliver the keys, his house was set on fire, the prison was soon in flames, and great part of it consumed, though a new stone edifice of uncommon strength; and more than three hundred prisoners made their escape, many of whom joined the mob. A committee of the Protestant Association now circulated hand-bills, requesting all true protestants to show their attachments to their best interest, by a legal and peaceable deportment: but none of them stepped forth, notwithstanding their boasted numbers, to extinguish the flames they had occasioned: violence, tumult, and devastation, still continued. The Protestant Association, as they thought proper to style themselves, had been chiefly actuated by ignorance and bigotry; and their new confederates were animated by the love of mischief, and the hope of plunder. Two other prisons, the houses of lord Mansfield, and sir John Fielding, and several other private houses, were destroyed the same evening. The following day, the King's Bench prison, the New Bridewell in St. George's Fields, some popish chapels, several private houses of the papists, and other buildings, were destroyed by the rioters; some were pulled down, and others set on fire; and every part of the metropolis exhibited violence and disorder, tumults and conflagrations.

During these extraordinary scenes, there was a shameful inactivity in the lord-mayor of London, and in most of the other magistrates of the metropolis, and its neighbourhood; and even the ministry appeared to be panic-struck, and to be only attentive to the preservation of their own houses, and of the royal palace. The magistrates, at the beginning of the riots, declined giving any orders to the military to fire upon the insurgents; but at length, as all property began to be insecure, men of all classes began to see the necessity of vigorous opposition to the rioters: large bodies of troops were brought to the metropolis from many miles round it; and an order was issued, by the authority of the king in council, "for the military to act without waiting for directions from the civil magistrates, and to use force for dispersing the illegal and tumultuous assemblies of the people." The troops exerted themselves with diligence in the suppression of these alarming tumults, great numbers of the rioters were killed, many were apprehended, who were afterwards tried and executed for felony\*, and the metropolis was at length restored to order and tranquillity. The manner in which these tumults were suppressed by the operations of the military, without any authority from the civil magistrate, however necessary from the peculiar circum-

\* Lord George Gordon was himself committed to the Tower, and tried for high treason,—but acquitted.

and the letters published with great parade and triumph in the New York papers, to expose the poverty, weakness, and disunion of the Americans, Washington soon turned the tables on the British commanders, and derived public advantage from this source of vexation and prejudice. He wrote letters to the southern officers and others, informing them of his total inability to relieve Virginia, unless by a direct attack with the French troops on New York. He asserted it was absolutely determined on, and would soon be executed. These letters were intercepted (as was intended they should be), with others of the like kind from the French officers; and the project was successful. Sir Henry Clinton was thus amused and deceived, and kept from forming any suspicion of the real design of the enemy.

By a variety of judicious military manœuvres, Washington kept New York and its dependencies in a continual state of alarm for about six weeks, and then suddenly marched across the Jerseys, and through Pennsylvania, to the head of Elk, at the bottom of the Chesapeake, from which the light troops were conveyed by shipping down the bay; and the bulk of the army, after reaching Maryland by forced marches, were also there embarked, and soon joined the other body under marquis de la Fayette. Sir Henry Clinton, receiving information that the count de Grasse was expected every moment in the Chesapeake, with a large French fleet to co-operate with Washington, now seriously attempted to re-inforce lord Cornwallis, but without success; for on the 5th of September, after a partial action of a few hours between the British fleet under admiral Graves, and that of the French under De Grasse, Graves returned to New York to rest, and left the French masters of the navigation of the Chesapeake. Presently the most effectual measures were adopted by general Washington for surrounding lord Cornwallis's army; and on the last of September it was closely invested in York Town, and at Gloucester on the opposite side of the river, with a considerable body of troops on one side, and a large naval force on the other. The trenches were opened in the night between the 5th and 7th of October, with a large train of artillery. The works which had been raised by the British sunk under the weight of the enemies' batteries; the troops were much diminished by the sword and sickness, and worn down by constant watching and fatigue; and all hope of relief failing, the 19th of October lord Cornwallis surrendered himself, and his whole army, by capitulation to general Washington as prisoners of war\*. Fifteen hundred seamen underwent the fate of the garrison; but these, with the Guadaloupe frigate of 24 guns, and a number of transports, were assigned to M. de Grasse, as a return for the French naval assistance.

Such was the issue of the Virginian war. The capture of this army, under lord Cornwallis, was too heavy a blow to be soon or easily recovered; it threw a gloom over the whole court and cabinet at home, and put a total period to the hopes of those who had flattered themselves with the subjugation of the colonies by arms. The surrender of this second British army may be considered as the closing scene of the continental war in America; for the immense expence of carrying it on, so distant from the seat of preparations and power; the great accumulation of public debt it had brought upon the nation; the plentiful effusion of human blood it had occasioned; the diminution of trade, and the vast increase of taxes—these were evils of such a magnitude, arising from this ever to

\* The American return made the number of prisoners 7247, land and marine,

be lamented contest, as could scarcely be overlooked, even by the most insensible and stupid. Accordingly, on the first of March 1782, after repeated struggles in the house of commons, the house addressed the king, requesting him to put a stop to any farther prosecution of the war against the American colonies. This was a most important event: it rendered a change of measures and of councils absolutely necessary, and diffused universal joy throughout the kingdom. Those country gentlemen who had generally voted with the ministry saw the dangers to which the nation was exposed in an expensive war with France, Spain, and Holland, without a single ally; and feeling the pressure of the public burthens, they at length deserted the standard of administration, and a complete revolution in the cabinet was effected, March 27th, 1782, under the auspices of the marquis of Rockingham, who was appointed first lord of the treasury.

The first business of the new ministry was the taking measures for effectuating a general peace. Mr. Grenville was invested with full powers to treat at Paris with all the parties at war, and was also directed to propose the independency of the Thirteen United Provinces of America in the first instance, instead of making it a condition of a general treaty. The commanders in chief in America were also directed to acquaint the congress with the pacific views of the British court, and with the offer to acknowledge the independency of the United States.

Peace every day became more desirable to the nation. A series of losses agitated the minds of the people. January 14th, 1782, the French took Nevis. On the 5th of February, the island of Minorca surrendered to the Spaniards; and on the 13th of the same month, the island of St. Christopher's was given up to the French. The valuable island of Jamaica would soon probably have shared the same fate, had not the British fleet, under admiral Rodney, fallen in with that of the French under the count de Grasse, in their way to join the Spanish fleet at St. Domingo. The van of the French was too far advanced to support the centre, and a signal victory was obtained over them. The French admiral, in the *Ville de Paris* of 110 guns (a present from the city of Paris to the French king), was taken, with two seventy-fours, and one of 64 guns; a 74 gun ship blew up by accident soon after she was in our possession, and another 74 sunk during the engagement. A few days after, two more of the same fleet, of 64 guns each, were captured. By this victory of the 12th of April, the design against Jamaica was frustrated. The new ministry had superseded admiral Rodney, and intended to have prosecuted the inquiry into his transactions at St. Eustatius; but this victory silenced all complaints, and procured him the dignity of an English peer.

May 18th, the Bahama islands surrendered to the Spaniards; but the credit of the British arms was well sustained at Gibraltar, under general Elliot, the governor; and the formidable attack, on the 13th of September, with floating batteries of 212 brass cannon, &c. in ships from 1400 to 600 tons burden, ended in disappointment, and the destruction of all the ships and most of the assailants in them. The garrison was relieved by lord Howe, in the month of October, who offered battle to the combined force of France and Spain, though twelve sail of the line inferior. The military operations after this were few, and of little consequence. Negapatnam, a settlement in the East-Indies, and Trincomalee on the island of Ceylon, were taken from the Dutch by the British forces; but the French, soon receiving considerable succours from Europe, took Cuddalore, retook Trincomalee, forced the British fleet in several actions,

but none decisive, and enabled Hyder Ally to withstand, with various successes, all the efforts of sir Eyre Coote, and his troops.

The death of the marquis of Rockingham, on the 1st of July, occasioned a violent commotion in the cabinet, and lessened the hopes which had been formed of important national benefits from the new administration. Lord Shelburne succeeded the marquis as first lord of the treasury, and, it is said, without the knowledge of his colleagues.

By the treaty of peace between Great Britain and France\*, Great Britain ceded to France all her possessions before the war, the island of Tobago in the West Indies, and the river of Senegal in Africa, with its dependencies and the forts on the river; and gave up a few districts in the East Indies, as dependencies on Pondicherry and Karical; it agreed also to restore the islands of St. Lucia, St. Pierre, and Miquelon, and the island of Gorée; with Pondicherry, Karical, Mahe, Chandernagore, and the comptoire of Surat, in the East Indies, which had been conquered from the French during the war. To prevent disputes about boundaries in the Newfoundland fishery, it was agreed, that the French line for fishing should begin from Cape St. John on the eastern side, and, going round by the north, should have for its boundary Cape Ray on the western side; and Great Britain renounced every claim by former treaties with respect to the demolition of Dunkirk. France on the other hand was to restore to Great Britain the islands of Grenada, and the Grenadines, St. Christopher's, St. Vincent, Dominica, Nevis, and Montserrat; and guaranteed Fort James, and the river Gambia, agreeing that the gum trade should remain in the same condition as before the war, 1755. The allies of each state in the East Indies were to be invited to accede to the pacification; but if they were averse to peace, no assistance on either side was to be given to them.

By the treaty with Spain, Great Britain gave up to that power East Florida, and also ceded West Florida and Minorca, which Spain had taken during the war. To prevent all causes of complaint and misunderstanding for the future, it was agreed that British subjects should have the right of cutting and carrying away logwood in the district lying between the river Wallis or Bellize, and Rio Hondo, taking the course of the said rivers for unalterable boundaries. Spain agreed to restore the islands of Providence and the Bahamas to Great Britain; but they had been retaken before the peace was signed.

In the treaty with the United States of America, the king of Great Britain acknowledged New Hampshire, Massachusetts Bay, Rhode Island and Providence Plantations, Connecticut, New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, North Carolina, South Carolina, and Georgia, to be *free, sovereign, and independent states*; and for himself, his heirs and successors, relinquished all claims to the government, property, and territorial rights of the same; and every part thereof. To prevent all disputes in future on the subject of boundaries between these states and the remaining provinces of Great Britain, lines were very minutely drawn, which will be noticed in the proper place, and some favourable clauses were obtained for the loyalists. The navigation of the Mississippi to remain open to both parties, as also the Newfoundland fisheries.

In the treaty with the Dutch, great difficulties arose: but at length it was stipulated, that Great Britain should restore Trincomalé in the island of Ceylon, but the French had already taken it; and that the Dutch

\* Preliminary articles settled January 20, 1783.

should yield to us the town of Negapatnam, with its dependencies, in the East Indies, with liberty to treat for its restitution on the point of an equivalent.

Thus a period was put to a most calamitous war, in which Great Britain lost the best part of her American colonies, and many thousand valuable lives, and expended or squandered nearly 150 millions of money. The terms of peace were, to many, a subject of great regret; but, had the war continued, it would have been necessary to have borrowed annually 17 millions and a half, by which a million *per annum* would have been added to the taxes, and 25 millions, at least, to the capital of the public debt, according to the usual mode of funding. The address of thanks for the peace was carried in the house of lords by a majority of 72 to 59, but lost in the house of commons by a majority of 224 to 208.

The majority of the commons thus enlisting under the banners of the famous coalition leaders, Mr. Fox and lord North, plainly indicated a ministerial revolution to be near at hand, unless the cabinet would call a new parliament. As they did not, the peace-makers were obliged to withdraw from power. The two gentlemen just mentioned were made secretaries of state, and the duke of Portland first lord of the treasury, on April the 2d, 1783. All plans of reformation in public offices, and for preserving the nation, which lord Shelburne proposed, seemed now to be laid aside. Every thing went on just as the coalition administration pleased, till Mr. Fox brought into parliament his famous bill for new regulating the government of the East-India Company, and their commercial affairs and territories,—a plan of which bill, its progress and fate, we have already given in our account of that trading company. This bill being rejected in the house of lords, on December 17, by a majority of 19, occasioned a great ferment in the cabinet, and in both houses of parliament.

A royal message was sent between twelve and one of the morning of the 19th of December, to desire the two secretaries to send the seals of their office immediately; and Mr. Pitt succeeded the duke of Portland as first lord of the treasury, bringing in his friends into the respective departments, which formed the tenth administration since his majesty's accession.

Some leading independent gentlemen (as they styled themselves) interposed to unite the contending parties, which had filled parliament and the country with distraction; but their endeavours to form what they called a firm, efficient, extended, and united administration, proved unsuccessful.

At last, after strong and repeated contests between the two parties, on the 25th of March, 1784, a proclamation was issued for dissolving the parliament, and calling a new one, agreeable to the desires and addresses of a great part of the kingdom. Just at that critical period, the great seal was stolen from the house of the lord chancellor, which occasioned many suspicions, as if done by more than ordinary felons; but nothing farther appeared, and a new seal was presently made. On the 18th of May the new parliament assembled, and the commons chose Mr. Cornwall, the speaker of the late house, for their speaker. The next day, his majesty addressed them from the throne. A very feeble opposition was made to the address of thanks in the house of lords, and it soon appeared that the appeal to the people had turned out greatly in Mr. Pitt's favour; for on May 24th, on a division of the house for an

addresses to the king's speech, the numbers for it, without any alteration or amendment, were 282 against 114.

Mr. Pitt brought in his famous East-India bill the 5th of July, the leading particulars of which we have given in our account of that company, with a few observations upon it.

The business of parliamentary reform having been taken up by Mr. Pitt, he accordingly introduced a specific plan for that purpose on the 18th of April, 1785. The plan was to give one hundred members to the popular interest of the kingdom, and to extend the right of election to above one hundred thousand persons, who, by the existing provisions of law, were excluded from it. This accession to the popular interest was to be principally obtained by the suppression of decayed boroughs, and the transfer of their representatives to the counties; so that the number of the house of commons would remain the same.—After a debate of considerable length, it was rejected by a majority of 74; the noes being 248, and the ayes 174.

Among the various measures agitated by parliament in 1786, the plan for establishing a sinking fund, and employing a million annually for reducing the national debt, engaged their most immediate attention. This million is produced by the yearly income of the state exceeding the permanent level of its expenditure, by the sum of 900,000*l.* which may be increased to a million by means in no wise burthensome to the people. This measure, which had the concurrence of every man who desired the emancipation of the state from the accumulated load of debt and taxes, was carried into a law, which created commissioners for carrying the purposes of this valuable act into execution.

We come now to a very important transaction of the present times, the impeachment of Mr. Warren Hastings, late governor-general of Bengal. On the 17th of February, 1786, Mr. Burke, who took the lead in this tedious and expensive business, explained the mode of proceeding he was desirous to adopt; and, in the course of the session, moved for a multitude of papers to ground and substantiate his charges upon. These were produced, and Mr. Hastings heard at the bar of the house of commons in his defence. The debates which arose on the subject terminated in resolutions, that certain of the charges contained matter of impeachment against the late governor-general of Bengal. Mr. Hastings was therefore impeached by the commons at the bar of the house of peers. His trial occupied a considerable portion of eight sessions of parliament; and, on the 25th of April, 1795, the lord chancellor pronounced the decision of the peers in the following words:—"Mr. Hastings, the house of lords, after a very minute investigation, have acquitted you of all the charges of high crimes and misdemeanours preferred against you by the commons, and every article thereof; and you and your bail are discharged, upon paying your fees."

Thus ended a trial, which, for length of time, exceeded any in the history of the world, having lasted seven years and three months.

The consolidation of the customs and excise was the most important circumstance deserving of attention in the year 1787. This was a measure of incredible labour and detail, as well as of infinite advantage to commerce, by facilitating and simplifying the intricacies attendant on mercantile transactions, and the payment of duties; a regulation which was duly and permanently effected.

The trade carried on by this country, and other European nations, upon the coast of Africa, for the purpose of purchasing negro slaves, to be employed in the cultivation of the West-India islands and certain

parts of the continent of America, does not appear, till of late years, to have been considered with that general attention which such a practice might have been expected to excite; a practice so abhorrent in its nature to the mild principles of modern policy and manners. The first public attempt, we believe, that was made to put a stop to this traffic, was by the Quakers of the southern provinces of America. In Great Britain the same society appears also to have taken the lead, and, after the example of their American brethren, presented a similar petition to the parliament of this kingdom.

The cause soon after became extremely popular. A great number of pamphlets were published upon this subject: several eminent divines recommended it from the pulpit, and in printed discourses; and petitions were presented to the legislature from the two universities, and from several of the most considerable towns and corporations in the kingdom.

His majesty's ministers thought it proper to institute an inquiry, before a committee of the privy-council, into the facts and allegations contained in the representations of both parties. The first public notice that was taken of the subject was an information communicated by Mr. Wilberforce, soon after the meeting of parliament, of his intention to bring forward a measure respecting the slave-trade. That gentleman being much indisposed, Mr. Pitt came forward on the 9th of May, 1788, in the name of his friend, and moved the following resolution: "That this house will, early in the next session of parliament, proceed to take into consideration the circumstances of the slave-trade, complained of in the petitions presented to the house, and what may be fit to be done thereupon;" which was unanimously carried. After this, on the 21st of May, sir William Dolben moved the house for leave to bring a bill to regulate the transportations of the natives of Africa to the British colonies in the West-Indies\*.

By the bill now proposed, the number of slaves to be transported in any ship was to be regulated according to its bulk or tonnage, allowing nearly one ton to each man. This was only intended as a temporary relief, till some more permanent expedient could be devised by the legislature. Having passed through the commons, it was carried up to the lords, where it also passed, after having received several amendments; some of which being thought to interfere with the privileges of the lower house, a new bill was brought in, which passed both houses, and received the royal assent.

The year 1788 being the hundredth anniversary of the glorious revolution in 1688, the fourth of November being the birth-day of king

\* That there was a necessity for adopting this proposition, will most clearly appear from the facts which were proved in the course of the debate. It appeared that five feet six inches in length, and sixteen inches in breadth, was the share of room allowed on an average to each slave. The lower deck of the vessels was entirely covered with bodies, and the space between the floor of that deck and the roof above, which seldom amounted to five feet eight inches, was divided by a platform also covered with bodies. Five persons in every hundred perished, at the lowest computation, in a voyage of six weeks' continuance; which, according to the most accurate estimates of human life, was seventeen times the usual rate of mortality. It was indeed much more, because, in the estimate of mortality, persons of every age were included, while in an African voyage the aged were entirely excluded, and few infants were admitted. Such was the ruinous nature of the trade in the most favourable circumstances; but, in the voyage to the more distant parts of Africa, the mortality was stated to be twice as great; and, consequently, thirty-four persons perished at the lowest estimation, for one that would have died in the ordinary course of nature.

William, the instrument, under Providence, who completed that event, and the fifth of this month being the anniversary of his landing, were observed by many societies in London, and other parts of the kingdom, not only with festivity, but with devotion and thanksgiving.

In the space of only four years, which had elapsed since the complete triumph of the sovereign and the nation over the "Coalition," Great Britain, under the conduct of a minister, who had not yet attained his thirtieth year, had risen from a state of unexampled depression; to her ancient superiority among the European kingdoms.

In this state of public felicity, the nation was suddenly alarmed in the autumn of 1788. by the reports of his majesty being attacked with an unexpected and dangerous illness. The precise nature of it was for several days unascertained and unexplained, even to those whose residence near the court should have enabled them to obtain early and authentic information. Meanwhile, Fame augmented the evil; and the death of the sovereign was believed to have either already taken place, or to be imminent and inevitable.

Time, however, gradually divulged the truth, and changed the apprehensions of the nation for the situation of the king. His disorder was understood to have fallen upon the brain, and to have produced, as might be expected, a temporary privation of reason. A species of interregnum in fact took place; though unaccompanied by any of those circumstances which usually characterise and accompany that unfortunate state. The kingdom, anxious, and with eyes directed towards their sovereign, betrayed no symptoms of confusion, anarchy, or civil commotion. The first minister continued to exercise, by a general submission and consent, the powers delegated to him before the king's indisposition; and the political machine, well constructed, and properly organised, sustained no derangement or injury whatsoever from this shock, except those inseparably connected with delay in the transactions or negotiations pending with foreign courts.

The two houses of parliament, in consequence of the preceding prorogation, met in a few days subsequent to these extraordinary events. The general agitation and curiosity, even if they had not been aided by other emotions of hope and fear, of ambition, and of public duty, would alone have produced a numerous attendance. Mr. Pitt opened the subject of their meeting in a very concise and pathetic manner; lamented the occasion, expressed his hope that the cause would speedily be removed, and, in pursuance of that idea, advised an immediate adjournment of a fortnight. As soon as the adjournment was at an end, Mr. Fox laid claim to the vacant sceptre in the name and on the behalf of the heir apparent, as belonging and devolving to him of right.

Mr. Pitt demanded the discussion and decision of so great and leading a principle, which led to conclusions unlimited and undefined, as well as subversive of the tenure on which a king of England had originally received his crown; and parliament, roused to a sense of the necessity of declaring itself solely competent to fill the vacant throne, proceeded to that great act without circumlocution or delay; and having pronounced upon this important preliminary, then decided that the prince of Wales should be invited and requested to accept the regency under certain limitations.

The month of December elapsed in these contests, and the year 1789 commenced under the most gloomy presages. Mutual alperity and reproach embittered every debate. No appearance of concilience or

recovery, so ardently anticipated by the nation, had yet manifested themselves in the malady of the king.

A second examination of the physicians who had attended his majesty during the course of his disorder, which took place before a committee of the house of commons, and which was certainly not conducted on the part of opposition with either delicacy or judgment, tended to throw very little light on the great object of public inquiry—the probable duration of this afflicting malady.

A very short period, probably not exceeding three days, must have completed the bill, which was to declare the incapacity of the sovereign to conduct the national affairs, and to transfer the sceptre, though with diminished influence, to his son. The members of administration were on the point of resigning their charges, and the new ministry, already settled, prepared to enter on office: while the English people, fondly attached by every sense of loyalty and affection to their monarch, as well as from gratitude and esteem to the first minister, in dejection and silence looked on, and saw the government transferred to others, who, whatever abilities they might collectively possess, certainly did not enjoy the general approbation and confidence.

But the term of interregnum and misfortune was now arrived; and the impending calamity, which had menaced England with the evils of a regency, was suddenly and unexpectedly dissipated. The disorder, under which the king had suffered during three months, and whose violence had hitherto appeared to baffle all medical skill and exertion, gradually, but rapidly, subsided. Sanity of mind and reason resumed their seat, and left no trace of their temporary subversion. Time confirmed the cure, and restored to his subjects a prince, rendered supremely and peculiarly dear to them by the recent prospect and apprehension of his loss. The vision of regency faded and disappeared, as the sovereign came forward to public view, and was totally extinguished by his resumption of all the regal functions. The demonstrations of national joy far exceeded any recorded in the English annals, and were probably more real and unfeigned than ever were offered on similar occasions. No efforts of despotism, or mandates of arbitrary power, could have produced the illuminations which not only the capital, but almost every town and village throughout the kingdom, exhibited in testimony of its loyalty; and these proofs of attachment were renewed, and even augmented, on the occasion of his majesty's first appearance in public, and his solemn procession to St. Paul's (on the 23d of April, 1789) to return thanks to heaven for his recovery.

Whilst the ancient government of France was entirely overthrown, and a revolution the most unexpected was effected, it is difficult to imagine a picture of more complete serenity than England presented. At peace with all the world, in the bosom of repose, she saw her commerce and manufactures extend, her credit augment, and her name excite respect among the most distant nations; while many of the great surrounding European kingdoms were either involved in foreign war, or desolated by domestic troubles. In this happy situation, a storm unexpectedly and suddenly arose from a quarter, where it would seem that no foresight or precautions could have anticipated the danger. Among the new and unexplored paths of commerce, which the spirit of a discerning and adventurous people had attempted to open since the peace of 1763, were particularly two, which appeared to promise the most beneficial returns. The first was a whale fishery, similar to that which had been carried on for ages near the coast of Greenland; but transferred

to the southern stormy seas which the Atlantic Ocean. In the metred rapidly, advantages; nor the fious of the Spanish that ocean which

That, upon usage in all the venturers had dispute. Not ship of war from by M. Martine arecations of this settlement ship remaining soon joined by

to the southern hemisphere, near the extremity of Patagonia, and in the stormy seas which surrounded Cape Horn, as well as in the Pacific Ocean. In the course of a few years, this branch of trade had augmented rapidly, and was found on trial to afford very important advantages; nor had it received any impediments from the vague pretensions of the Spanish crown to the sovereignty of the shores washed by that ocean which was the scene of their exertions.

The second of these enterprises, original in its own nature, able in its conception, bold in its execution, and having no precedent for its guidance, was directed to countries and to objects almost as much unknown to geographical as to commercial knowledge or experience.

The north-west coast of America, the part of the earth to which this embarkation was destined, extending northward from California and New Albion to the Frozen Sea, had been partly explored, and faintly traced, by captain Cook; but much remained for future enterprise and industry to accomplish, before this discovery could be converted to any purpose of public utility. He had, however, ascertained the existence of the continent; and he had received from the barbarous natives, with whom he established a species of barter, some valuable specimens of furs, in exchange for European commodities of a far inferior nature.

The hope of procuring a considerable quantity of those rare and costly skins, for the sale of which a very advantageous market presented itself at Canton in China, was the leading inducement to the adventurers who engaged in the expedition.

Animated by these views, and having received the most affirmative marks of the protection of government previous to their departure, five ships were fitted out from London in 1785, and the two succeeding years. Four of these vessels, after doubling Cape Horn, arrived safely on the north-west coast of America. The sanguine expectations which had been entertained of effecting a lucrative exchange of commodities with the natives were fully and speedily realized. Cargoes of the finest furs were procured, and sold to the Chinese, even under great commercial discouragements and pecuniary impositions, at so high a price as amply to re-imburse and enrich the adventurers. Other attempts of a similar nature were made from Bengal; and two vessels were successively dispatched from the Ganges to the same coast in the year 1786. A factory was established at Nootka Sound, a port situated in the fiftieth degree of northern latitude, on the shore of America. Possession of it was solemnly taken in the name of the sovereign and crown of England; amicable treaties were concluded with the chiefs of the neighbouring districts; and a tract of land was purchased from one of them, on which the new proprietors proceeded to form a settlement, and to construct storehouses. Every thing bore the appearance of a rising colony, and each year opened new sources of commerce and advantage.

That, upon every principle of the law of nations, upon the established usage in all similar cases, and as being the first settlers, the British adventurers had an undoubted title to the place in question, is beyond dispute. Notwithstanding this, in the month of May 1789, a Spanish ship of war from St. Blas in Mexico, called the *Princesa*, commanded by M. Martinez, and mounting 20 guns, anchored there. The various avocations of trade having led the greater part of the persons employed of this settlement to different parts of the coast, the only English trading ship remaining in the Sound was the *Iphigenia*. The *Princesa* was soon joined by a Spanish snow of 16 guns; and for some time, mutual

civilities passed between the Spaniards and English. These, however, were at length interrupted by an order being sent to capt. Douglas (the commander of the *Iphigenia*) to come on board of the *Princesa*; when he was informed by M. Martinez, that he had the king of Spain's orders to seize all vessels which he might find upon that coast, and that he (capt. Douglas) was his prisoner. In consequence of this, M. Martinez took possession of the *Iphigenia* in the name of his catholic majesty, and conveyed the prisoners on board the Spanish ship, where they were ironed. M. Martinez also took possession of the settlement, hoisted the Spanish flag, and proceeded to erect various buildings, on which he employed, together with his own men, some of the crew of the *Iphigenia*. He afterwards permitted captain Douglas to resume the command of his ship; and on representing that he had been stripped of his merchandise and other stores, M. Martinez gave him a small supply of stores and provision (for which he took bills on the owners), by means of which, about a fortnight after he was first detained, he was enabled to proceed to China.

Shortly afterwards, the English vessels, the *North-West-America*, the *Argonaut*, and the *Princess-Royal*, arriving separately at Nootka from their trading voyages, were captured by M. Martinez, their crews were made prisoners, and their cargoes seized. After some detentions, the crew of the *North-West-America* were sent to China, the two other vessels with their crews were sent to Blas in Mexico, and some Chinese, who had been brought to the settlement by our people, were detained and employed as labourers.

Of the *North-West-America*, sent to China, no authentic account has been received; but on the arrival of the two vessels at St. Blas, a representation of their case having been made to the Spanish governor, the ships were restored (on the officers giving security to indemnify the governor, should it be proved they were lawful prizes), the crews were furnished with provisions, stores, and money, to enable them to resume their voyage.

Of these transactions only a partial, vague, and uncircumstantial account was known by his majesty's ministers till the 30th of April, 1790, when captain Mears presented his memorial to Mr. Grenville. This paper indeed conveyed an intelligence of a very different nature from that which had been previously received. Within one week after the affair was communicated, the most active and formidable preparations were made, a positive demand of preliminary satisfaction and restitution was sent to Madrid, and the people of England were called upon to adopt the national vindication. The first communication of this business to the public was by his majesty's message to parliament on the 5th of May.

An attention to the honour of their country made it therefore necessary for our ministers to call upon the court of Spain itself to give direct satisfaction for an injury committed by an officer acting under its immediate commission, and grounded on its pretensions of an exclusive right to the whole continent of America. To this it was necessary for his catholic majesty to acknowledge, that such an injury had been committed; and this was most expressly declared and signed by count de Florida Blanca, in the name and by the order of his catholic majesty, at Madrid, the 24th July, 1790. The acknowledgment of the injury was an expression which implied a concession that the court of Spain had no right to use force in preventing British subjects from visiting the coasts in question for the purposes of trade and settlement.

The public were waiting with painful anxiety for the determination of the objects of the depending negotiation; deprecating indeed the dreadful alternative of appealing to the sword for the vindication of our rights; yet satisfied of the justice of our cause, and confidently looking forward to an honourable and happy termination of a contest originating in the violent proceedings and unfounded claims of the court of Spain, when the agreeable news arrived that a convention was agreed upon between his Britannic majesty and the king of Spain; and signed at the Escorial the 28th of October, 1790, by their plenipotentiaries, Alphonse Fitz-Herbert, esq. on the part of his Britannic majesty, and by the count de Florida Blanca on that of his catholic majesty; which was finally ratified by the court of Spain, and exchanged with Mr. Fitz-Herbert against his majesty's ratification on the 22d of November, 1790, at the palace of the Escorial, by his catholic majesty's minister.

To defray the expense attending the naval and military armaments, Mr. Pitt proposed to raise not merely the interest of the debt recently incurred, but to extinguish the principal itself, in the space of four years,—though amounting to about three millions sterling.

But though Great Britain was thus happily rescued from war in this quarter of the globe, accident of ambition involved our Indian possessions in contest and in blood. At so remote a distance, it is difficult to judge accurately of causes and effects; but, as nearly as a diligent inquiry has enabled us to collect the truth, we shall give it in our historical narrative of that country, under which it will more naturally fall.

The cause of toleration received, in the year 1791, an accession which must be peculiarly grateful to the friends of freedom. It is remarkable, that, notwithstanding the radical freedom of our constitution, no nation in Europe has been more jealous of their religious establishment; and scarcely have the Roman-catholic states themselves loaded with a more oppressive weight of civil penalties those who dissented in religious opinion. It has for almost half a century been the talk of the legislature to root out, gradually and cautiously, from the code of our laws, these disgraceful statutes. They are not yet entirely removed; but in proportion as the peaceful influence of philosophy shall extend over the minds of men, we have little doubt but all parties will see the absurdity of sacrificing the cardinal virtue Charity at the shrine of vain speculation; and, as the fears and jealousies of mankind shall subside, in the course of a few years, every trace of persecution will fade away. As the Roman church was the grand object of terror in the first ages of reformation, it was scarcely matter of surprise that our statute-book should be loaded with the most rigorous and sanguinary edicts directed against the professors of that obnoxious faith; and though in the year 1780 some of these were removed, yet in the year 1791, in a well-known book, Burn's Ecclesiastical Law, not less than seventy pages were to be found entirely occupied with the bare enumeration of the penal statutes in force against the Roman catholics. Among these were some of the most sanguinary nature—It was high-treason and death to make a convert to the Roman-catholic faith—Severe penalties were enacted on papists for hearing mass, by some statutes; and by others they were compelled to attend the established worship, however contrary to their consciences. That such laws should have been framed in times of difficulty and danger, in times when the church of Rome flourished in all the vigour of temporal power, and urged her authority by all the rigours of persecution and all the artifices of bigotry, is not surprising; it is

only surprising that they should have been suffered to remain in force for centuries of peace and tranquillity, when the power of the pope is annihilated even in countries professing his religion, and when all the obnoxious principles of that religion are disavowed by its professors. A reform in the penal statutes became the more necessary, since, in the course of the year 1790, a large body of catholic dissenters had formally protested against the temporal power of the pope, against his assumed authority of releasing men from their civil obligations, or dispensing with the sacredness of oaths.

It was upon these principles, and supported by these arguments, that Mr. Mitford moved, on the 21st of February, 1791; for a committee of the whole house to enable him "to bring in a bill to relieve, upon conditions and under restrictions, persons called protesting-catholic dissenters, from certain penalties and disabilities, to which papists, or persons professing the popish religion, are by law subject." This bill, Mr. Mitford added, would be similar to that which had passed in Ireland some years since; and as no ill consequence had resulted in a country where the Roman catholics were so much more numerous than in this, he should hope the house would see no impropriety in the proposition. The house entered upon the subject with a liberality which does them infinite honour; and the bill proceeded through its several stages without opposition.

The rights of juries had long been in an indefinite and indeterminate state, particularly in the case of libels; and disputes, disgraceful in themselves, and injurious to the administration of justice, had frequently arisen between the court and the jury, between the judges and the counsel; even among the professors of the law a difference of opinion had long existed. While the herd of mere technical practitioners earnestly supported the indefeasible authority of the bench, that oracle of constitutional jurisprudence, lord Camden, Mr. Erskine, and many others of the greatest eminence, held the rights of an English jury as too sacred to suffer the great constitutional principle on which that institution was founded to be undermined by the fallacious doctrine of precedents.

On the 25th of May, in this year, Mr. Fox presented his bill for removing doubts with respect to the rights of juries in criminal cases. The bill sets forth that juries, in cases of libels, should have a power of judging the whole matter, and of finding a general verdict of guilty or not guilty. With a slight opposition from the legal profession, it completed its progress through the house of commons. In the house of lords, where the influence of the law is more predominant, it experienced a very different reception, and was strongly opposed. However, in the following year, this great constitutional point was at last decided by the lords and commons, that JURIES ARE JUDGES OF BOTH

#### THE LAW AND THE FACT.

Early in the sessions of 1791, Mr. Wilberforce made a motion, in a committee of the house of commons appointed for receiving and examining evidence on the slave-trade, "that the chairman be instructed to move for leave to bring in a bill to prevent the further importation of African negroes into the British colonies." Although this question was supported with great ability and eloquence by Mr. Francis, Mr. W. Smith, the chancellor of the exchequer, and Mr. Fox, yet it was negatived by a majority of 75. One immediate consequence of this was the establishment of a company for the express purpose of cultivating

West-Indian, and other tropical productions at Sierra Leone, on the coast of Africa, the bill for chartering which was introduced on the 28th of March, by Mr. Thornton.

In pursuance of a message from his majesty, a bill was brought into parliament for settling the constitution of Canada, a matter of great importance, and long in agitation. The province is to be divided into two governments, called Upper and Lower Canada; and it is hoped that this division will put an end to the debates between the old French inhabitants and the British settlers, as each will have a majority in their own department. Each government has a council and a house of assembly; the members of the council being such for life, and reserving power to the British sovereign of annexing to certain honours an hereditary right of sitting in the council; the taxes to be levied and disposed of by the legislature of each division.

On the 28th of March, 1791, a message was delivered from his majesty, importing that the endeavours which he had used, in conjunction with his allies, to effect a pacification between Russia and the Porte, not having proved successful, his majesty judged it requisite, in order to add weight to his representations, to make some further augmentation of his naval force. In consequence of a majority in support of this measure, a very large naval armament was prepared. Our fleet, collected to support the cause of the Turks against Russia, amounted, in April, to thirty-three ships of the line; and after maintaining this large equipment for four months at an enormous expense, it was at last dismissed. The proposed Russian war was certainly most unpopular; and the reception which the proposition of it met with in the house of commons ought perhaps to have induced the immediate detection of a measure, which, however meritorious its intentions might be, was not crowned by the public favour. No valuable purpose was attained by this armament. Russia has yielded little or nothing more than her first proposal; and we have not so effectually assisted the Turks, as to have any claim to their gratitude. The minister's popularity was considerably injured by these expensive and injudicious preparations, in which Europe was astonished to behold, for the first time, Britain acting in a subservient capacity to the narrow and interested politics of Prussia.

Soon after the rising of the parliament, the nation was disgraced by a series of outrages and violence, as unprovoked and wanton as have ever darkened the annals of a civilized people, and which, for the space of four days, spread terror and alarm through the large opulent town of Birmingham, and the adjacent country.

Concerning the French revolution, much difference of sentiment prevailed in this country; and much heat and ill-temper the discussion of that subject appeared unnecessarily to provoke. A considerable body of the Whig party in Great Britain rejoiced in the emancipation of a neighbouring nation, and flattered themselves that they saw, in the establishment of the first French constitution, not only the annihilation of despotism in that country, but the commencement of a new system of politics in Europe, the basis of which was peace, happiness, and mutual concord.

In most of the larger towns in Great Britain, associations were formed for the celebration of that event, by anniversary dinners on the 14th of July; but the opposite party were not indifferent spectators of these proceedings. The populace were inflamed by the most injurious insinuations conveyed in newspapers and pamphlets; the friends of the French

revolution were (certainly falsely as to the majority) stigmatised as determined republicans; and the act of joining in a convivial meeting on the odious 14th of July was represented as an attempt to overturn the British constitution in church and state.

Notwithstanding the pains which had been taken to depreciate these associations, the meeting in London consisted of not less than 1800 respectable gentlemen, many of them literary characters of high reputation.—As, however, rumours had been spread to the disadvantage of the meeting, and the populace appeared to collect in a tumultuous manner round the Crown and Anchor tavern, where the meeting was held, the company dispersed at an early hour.

At Birmingham the causes of discord were more numerous than even in London. A violent animosity had subsisted for years between the high church party and the dissenters of that place; and the religious controversies which took place between Dr. Priestley and some of the clergy of Birmingham greatly contributed to increase this animosity.

In such circumstances, it is not surprising that the ignorant part of the inhabitants should confound the cause of the French revolution with that of the dissenters, especially since the majority of that persuasion have, since the Revolution in 1688, been firmly attached to the Whig system, and since Dr. Priestley, whom the populace considered as at the head of the dissenters there, had distinguished himself by opposing the celebrated pamphlet of Mr. Burke.

A festive meeting in commemoration of the French revolution was projected at Birmingham on Thursday the 14th of July; and on the preceding Monday, six copies of a most inflammatory and seditious hand-bill, proposing the French revolution as a model to the English, and exciting them to rebellion, were left by some person unknown in a public-house. As the contents of this hand-bill were pretty generally circulated, they caused some ferment in the town; the magistrates thought it proper to offer a reward of 100 guineas for discovering the author, printer, or publisher of the obnoxious paper; and the friends of the meeting intended for the 14th thought it necessary at the same time to publish an advertisement, explicitly denying the sentiments and doctrines of the seditious hand-bill, and disavowing all connexion with its author or publishers.

The views and intentions of the meeting having, however, been much misrepresented, the majority of the gentlemen who projected it thought it advisable to relinquish the scheme: accordingly notice was given to that effect; but the intention was revived, and the company met at the appointed time to the amount of between eighty and ninety. The ingenious Mr. Keir, well known for his great attainments in chemistry and other branches of philosophy, and a member of the established church, was placed in the chair.

The gentlemen had scarcely met, before the house was surrounded by a tumultuous crowd, who testified their disapprobation by hisses and groans, and by the shout of "church and king," which became the watch-word on this occasion. At five o'clock the company dispersed; and soon afterwards the windows in the front of the hotel were demolished, notwithstanding the appearance and interference of the magistrates.

Dr. Priestley did not attend the festival, but dined at home, at Fairhill, with a friend (the celebrated Mr. A. Walker, the philosopher) from London. After supper they were alarmed with the intelligence that the mob were assembled at the new dissenting meeting-house (Dr. Priestley's),

and were threatening both the doctor and his house. The rioters soon set the meeting-house on fire, and nothing remained that could be consumed. The old meeting-house shared almost a similar fate. After this they proceeded to Dr. Priestley's house, the doctor and his family having just had time to escape to a small distance, where they could distinctly hear every shout of the mob, and the blows of the instruments which were used to break down the doors. The whole of the doctor's library, his valuable philosophical apparatus, his manuscripts and papers, were destroyed by the mob. The next day this infuriated multitude demolished the elegant mansion of Mr. Ryland, where, finding a profusion of liquor, a dreadful scene of intoxication ensued, and several of the wretched rioters perished in the cellars by suffocation, or by the falling in of the roof. The country residence of Mr. Taylor, the houses of Mr. Hutton (the ingenious historian of Birmingham), of Mr. Humphrey, of Mr. Ruffel, and several others, were destroyed by the resistless fury of the mob, who continued their depredations until Sunday night, when three troops of the fifteenth regiment of light-dragoons arrived. The town was then illuminated, and all was acclamation and joy.—Of the unfortunate and insulted wretches who were taken in the act of rioting, five were tried at Worcester, and one was found guilty and executed. At Warwick twelve were tried; but only four received sentence of death, of whom one was reprieved.—For the honour of our country, we indulge the earnest hope that the disgraceful scenes which were acted at Birmingham in 1791 will never be revived; but that, while the continent of Europe is unhappily drenched in human blood, this island will remain as conspicuous for its harmony, order, and tranquillity, as for its constitutional freedom and national prosperity.

The marriage of the duke of York with the princess-royal of Prussia took place on the 29th of September, this year, at Berlin; and on the 25th of October they arrived in England, and were received with public joy and applause. The Prussian monarch gave to the princess a portion of 100,000 crowns. A formal renunciation is made, in favour of the male succession, of all right of inheritance arising from the house of Prussia and Brandenburg, as usually done on the marriages of the Prussian princesses. The sum of 4000l. sterling is annually assigned for pin-money and other expences; and 8000l. annually of jointure, in case of the death of her husband. In consequence of this union, and to enable his royal highness to live in a style suitable to his exalted station, and to the high rank of the illustrious personage to whom he was allied, parliament voted the sum of 18,000l. per annum to his royal highness. His majesty also settled an additional 7000l. per annum upon him out of his Irish revenue; which, with 12,000l. per annum that he before enjoyed, make the sum of 37,000l. per annum. The revenues arising from the bishoprick of Osnaburg are said to amount to about 17,000l. per annum.

On the 2d of April, 1792, the house of commons, in a committee of the whole house on the African slave-trade, came to a resolution, 230 against 85, for the gradual abolition. This subject was supported by the united talents of Mr. Wilberforce, Mr. Fox, and Mr. Pitt, for the immediate abolition. Mr. Dundas took a middle course, and argued for the gradual relinquishment of a traffic, which every good man must abhor, as degrading and debasing our fellow-creatures to a level with beasts. This bill, however, met with a different reception in the house of lords.

The royal proclamation on the 21st of May, 1792, against seditious writings, which was followed by orders for the embodying the militia of the kingdom, engaged a considerable share of the public attention. It had the intended effect, and excited numerous addresses, testifying the loyalty of the people.

In the beginning of the year 1793, numerous associations were formed throughout the kingdom against republican principles and theories, or, as the phrase usually adopted by such associations was, against republicans and levellers. To say that there were no persons who had embraced republican principles, and would have been willing to concur in changing the form of the government of this country, would be absurd; but there appears no reason to suppose that the cause for alarm was so great, as many imagined, and others at least affected to believe. The truth lies between the two extremes. The controversies occasioned by the pamphlets of Messrs. Burke and Calonne, and particularly the writings of Mr. Paine, writings well adapted to the comprehension of the lower class of people, and pregnant with pointed remarks on some existing abuses, though, perhaps, with little of sound policy or principle to recommend them, had undoubtedly contributed to render the example of the French revolution, in some degree contagious. But the disaffected party was neither numerous nor respectable. The church, the aristocracy, and all the most opulent of the community, were averse to any change or innovation whatever. It was among the lower part of the middle class of society that democratical opinions were chiefly entertained, and among them more probably as a matter of conversation, than as a project to be reduced to practice. The violent proceedings of the French, however, had terrified the well-disposed part of the people, and almost disgusted them with the very name of reform. From the period of the fatal 10th of August, the converts from the French system were numerous; the proscription and persecution of the emigrants rapidly increased the number; and the premeditated ill-treatment and unjust death of the king almost entirely annihilated the spirit of republicanism in this country. The public wanted only to be excited to give the most forcible proofs of its attachment to a constitution which had so wisely provided against the intolerable persecutions of tyranny, and the no less deplorable mischiefs of faction.

The first disposition manifested by Great Britain to break with France regarded the navigation of the Scheldt, which the French had determined to open for the benefit of Antwerp and the Netherlands. This impediment however might perhaps have been removed, from the little disposition which was evinced by Holland to assert its right to the exclusive navigation, and from the readiness of the French to refer the whole affair to a negotiation.

The next exception which was taken by the English ministry was to the decree of fraternity, which was offered by the French convention to the revolting subjects of any monarchical (or, as they said, tyrannical) government, and which was construed into a direct affront to this country, and a plot against her peace.

The alien bill, which the French complained was an infraction of the commercial treaty, was the next cause of dispute; and this offence was augmented by the prohibition to export corn to France, while it was freely allowed to the powers at war with that country.

At length, towards the end of January, M. Chauvelin was officially informed by the English court, that his character and functions, so long suspended, had entirely terminated by the fatal death of the king of

France; that their residence had been fixed; and, it was but arriving, he thought

France; that he had no more any public character here, where his further residence was forbidden. Eight days were allowed for his departure; and this notification was published in the gazette. M. Maret had been sent by the executive council of France with enlarged powers, and, it was said, with very advantageous proposals to Great Britain; but arriving in England exactly at the period of M. Chauvelin's dismissal, he thought it prudent immediately to return home.

Mr. secretary Dundas, on the 28th of January, presented to the house of commons a message from the king, in which his majesty expressed the necessity of making a further augmentation of his forces by sea and land, for maintaining the security and rights of his own dominions, for supporting his allies, and for opposing views of aggrandisement and ambition on the part of France. The question in relation to this subject was carried by a great majority in favour of ministers.

On the 25th of March, 1794, lord Grenville and S. Comte Woronzow signed a convention at London, on behalf of his Britannic majesty and the empress of Russia, in which their majesties agree to employ their respective forces in carrying on the "just and necessary war" in which they were engaged against France; and they reciprocally promise *not to lay down their arms* but by common consent. Notwithstanding this solemn treaty, Catharine took no active part whatever in the war. Another treaty was concluded between his Britannic majesty and the king of Sardinia, signed at London the 25th of April, by which Great Britain engaged to pay 200,000*l.* per annum to the king of Sardinia, and three months in advance. A treaty was likewise concluded between his highness the prince of Hesse-Cassel and his Britannic majesty; the former was to furnish 8,000 men for the war, during *three years*; in return for which, England was to pay 100,000*l.* levy-money, and 56,000*l.* sterling per annum for six years. In this treaty, Great Britain engages to pay the landgrave a sum of money for each Hessian that is slain; so that the more of his men are killed, he will get the more money.

For the military operations of the war, we must refer our readers to our account of France, to the history of which country they most properly appertain.

The prosecutions which have taken place in England and Scotland for seditious words, and for libellous and dangerous publications, may certainly be considered as strongly characterising the spirit of the times; we shall therefore give a concise account of some of the principal of these trials.

At Edinburgh, Thomas Muir, esq. was tried before the high-court of justiciary, for seditious practices. In the indictment, the prisoner was charged with wickedly and feloniously exciting, by means of seditious speeches and harangues, a spirit of disloyalty and disaffection to the king and the established government; of producing and reading aloud in public meetings a seditious and inflammatory writing called "An Address from the Society of United Irishmen in Dublin, to the Delegates for Promoting a Reform in Scotland," tending to produce in the minds of the people an insurrection and opposition to the established government. The jury being named, Mr. Muir objected to most of them: he observed, that as the gentlemen, however respectable, were all subscribers to the Goldsmiths'-hall association, and had offered a reward for discovering those who had circulated what they called seditious writings, they had already prejudged him, and were therefore improper

persons to pass upon his assize; but this objection was repelled by the court.

The most material witness against the accused was Anne Fisher, a servant to his father: she said that she carried from him to the printer a Declaration of Rights, marked with some corrections, to be printed: she added, that she had heard Mr. Muir talk to the countrymen coming to the shop of his father, very often, concerning Paine's Rights of Man, which she heard him say was a very good book; that he wished his hair-dresser to purchase them, and keep them in his shop to enlighten the people; that Mr. Muir said, when the reform took place, he would be member for Calder; that members would then be allowed thirty or forty shillings a day, and that none but honest men would be admitted, to keep the constitution clean; and that she had caused an organist in the streets of Glasgow to play *ca-ira* at Mr. Muir's desire.

After a trial of sixteen hours' duration, the jury returned a verdict, finding the prisoner guilty. The court then proceeded to pronounce sentence, and ordered him to be transported beyond the seas, to such place as his majesty, with the advice of his privy-council, should judge proper, for fourteen years. He was soon after sent to Botany-Bay, whence he found means to escape in an American vessel, and after a variety of extraordinary adventures and escapes, if the accounts that have been received are authentic, arrived in France, where he was received with public congratulations, as the martyr of liberty, and where he still continues.

On the 17th of September, of the same year, the reverend Mr. Palmer, an Unitarian clergyman, residing at Dundee, was tried by the circuit court of judicary, before lords Esgrave and Abercrombie. The indictment charged him with being present at a meeting held at Dundee, denominating itself "A Society of the Friends of the People;" that he did there put into the hands of George Mealmaker a writing of a seditious import, in the form of an address to their friends and fellow-citizens, containing, among other seditious expressions, the following words: "You are plunged into a war by a wicked minister and a compliant parliament, who seem careless and unconcerned for your welfare; the end and design of which is almost too horrid to relate; the destruction of a whole people merely because they will be free."—When the court proceeded to the examination of witnesses, George Mealmaker, weaver in Dundee, acknowledged himself to be the author of the paper in question; it appeared, however, that Mr. Palmer had corrected it, ordered it to be printed, and circulated it. The verdict was returned the same day, finding the prisoner guilty; in consequence of which he was sentenced to transportation for fourteen years. This gentleman was sent to the hulks with Mr. Muir, and sailed with him to Botany-Bay.

On the 21st of January, 1794, the two houses met. The speech from the throne enumerated with some degree of minuteness the advantages obtained by the allies, and exhorted to a spirited prosecution of the war, and to a reliance on the resources of the country, and the strength of our allies, for ultimate success. The address to his majesty, in which the parliament agreed to support him in the continuance of the war, was carried in favour of ministry by a very great majority.

In March following, the secession of the king of Prussia from the great cause of the allies agitated the political world for several weeks, when it was announced that the whole proceeded from his inability to supply his troops from the resources of his own country, and therefore that he must be subsidised to enable him to employ his forces for the

great purpose of restoring regular government to France. The parliament, influenced by the arguments which were advanced by the ministers, voted the sum of 2,500,000*l.* to be granted to his majesty, to enable him to fulfil the stipulations of the treaty lately concluded with Prussia for the more vigorous prosecution of the war, and for such exigencies as might arise in the year 1794. Notwithstanding this fresh treaty, the Prussian monarch soon after entirely relinquished the war, having found full occupation for himself and his troops in endeavouring to suppress the insurrections in Poland, which we shall particularly notice in our narrative of the events of that unfortunate country.

On the 12th of May, 1794, a message from his majesty was brought down to the house by Mr. secretary Dundas, in which he informed them "that the seditious practices which had been for some time carried on by certain societies in London, in correspondence with societies in different parts of the country, had lately been pursued with increased activity and boldness, and had been avowedly directed to the object of assembling a pretended general convention of the people, in contempt and defiance of the authority of parliament; that his majesty had given orders for seizing the books and papers of these societies, which were to be laid before the house; and that it was recommended to the house to consider them, and to pursue such measures as were necessary in order to prevent their pernicious tendency."

The same day Mr. Thomas Hardy, a shoemaker in Piccadilly, who had acted as secretary to the London Corresponding Society, and Mr. Daniel Adams, the secretary to the Society for Constitutional Information, were apprehended, by a warrant from Mr. Dundas, for treasonable practices, and their books and papers seized. Mr. Horne Tooke, Mr. Jeremiah Joyce, preceptor to lord Mahon, and Mr. Thelwall, who had for some time entertained the town as a political lecturer, were afterwards, in the course of the week, arrested and committed to the Tower, on a charge of high treason.

On the day following the seizure of the papers of these societies, they were brought down sealed to the house of commons by Mr. Dundas, and referred to a committee of secrecy, consisting of twenty-one members.

In consequence of the first report of the committee of secrecy, with respect to the plans which had been formed by these societies for holding a general convention of the people, and intimating their suspicions that large stands of arms had been collected by these societies in order to distribute them among the lower orders of the people; the chancellor of the exchequer moved "for leave for a bill to empower his majesty to secure and detain such persons as his majesty suspected were conspiring against his person and government." By this bill the temporary suspension of the *Habeas Corpus* act is affected. It was carried, on the minister's motion, by a majority of 162.

On the first of June 1794, the British fleet under the command of admiral lord Howe obtained a signal victory over that of the French, in which two ships were sunk, one burnt, and six brought into Portsmouth harbour.

On the 10th of September a special commission of oyer and terminer was issued for the prisoners confined on a charge of high-treason in the Tower of London; and on the second of October it was opened at the sessions-house, Clerkenwell, by the lord chief justice Byre, in an elaborate charge to the grand jury; and in the course of their proceedings the jury found a bill of indictment against Thomas Hardy, John Horne Tooke, and ten others; and on the 28th of October, Thomas Hardy,

the late secretary to the London Corresponding Society, was put on his trial at the Old-Bailey. Mr. Wood opened the pleadings, and stated nine overt acts of high treason with which the prisoner was charged. When he had finished, sir John Scott, the attorney-general, in a speech of nine hours, went into a very minute detail of the subject of these prosecutions for high-treason. The counsel for the prosecution then proceeded to produce their evidence, which consisted of papers that had been found in the custody of different persons, and seized under the warrant of the privy-council.

Previously to the court's breaking up, about twelve o'clock, a conversation ensued respecting the gentlemen of the jury, who wished to be discharged on their honour; to which Mr. Erskine, on behalf of the prisoner, consented; but the court were of opinion that the law would not permit the jury to separate after having been once impanelled. The jury were therefore consigned to the care of the sheriffs, by whom preparations for their accommodation in the sessions-house had been previously made; and, the next day, the jury having complained that their accommodations were uncomfortable, and incapable of affording them the necessary rest, they were provided that evening, and all the subsequent evenings of the trial, with beds at the Hummums in Covent-Garden.

The 29th, 30th, and 31st of October, were employed in the production of evidence for the crown, both documentary and oral, which latter took up great part of the morning of November 1. This being finished, Mr. Erskine, in behalf of the prisoner, addressed the jury for the space of six hours. The remainder of the day was occupied in the examination of witnesses for the prisoner; many of whom gave him an excellent character.

The court adjourned at half past twelve on Sunday morning November 2; till the Monday following, when the counsel for the prisoner proceeded with their evidence; after which Mr. Gibbs likewise addressed the court in his favour. He was followed by the solicitor-general in reply. The next day the solicitor-general concluded his reply, and the lord-president commenced the summing up the evidence; which he resumed the following day, and finished about noon. The jury then retired, and, after having been absent two hours and a half, returned, and delivered their verdict—Not guilty.

On Monday, November 17, the court again met, and proceeded on the trial of John Horne Tooke, esq. on the same charge of high-treason. This trial was conducted in the same manner as the preceding, and ended on the Saturday following about eight in the evening, when the jury retired, and, in a few minutes, returned with their verdict—Not guilty.

On Monday the 6th of December, the court again met, and John Augustus Bonney, Jeremiah Joyce, Stewart Kyd, and Thomas Holcroft (who much to his honour, though not in custody, had surrendered himself as soon as the bill was found against him by the grand jury), were arraigned; and a jury was sworn in; when the attorney-general informed the court that he should decline going into the evidence against the prisoners, as it was the same that had been adduced on the two late trials, and on which, after the most mature consideration, a verdict of acquittal had been given. The prisoners were of course acquitted and discharged.

Mr. Thelwall was then put to the bar, and, after a trial of five days, acquitted.

Thus ended these memorable trials, the issue of which the country awaited with the utmost agitation and anxious suspense, until the just and temperate verdict of an honest jury had defended the law of the land against the dangerous innovation of constructive treasons.

On the 8th of April, 1795, were celebrated the nuptials of his royal highness the prince of Wales, with her highness the princess Caroline of Brunswick: on which occasion a bill was passed for enabling his majesty to grant a suitable establishment to his royal highness, and for regulating the liquidation of his debts. Another bill was likewise passed for preventing future princes of Wales from incurring debts.

Towards the close of this year, a dreadful and oppressive scarcity pervaded the kingdom. The price of the half-peck loaf rose in the metropolis to half-a-crown; and in some other places it was still higher. Several instances occurred of persons who perished through absolute want; and the poor were every-where in the utmost distress. A committee of the house of commons was appointed to consider of the high price of corn. They drew up, and entered into, an engagement to use only brown bread, and reduce the consumption of wheat in their families, by every possible expedient. This engagement was signed by the principal persons in the ministry, and a great number of the members of both houses.

On the 29th of October, the king opened the session of parliament. Immense crowds were assembled, who at length became riotous, loudly exclaiming, "No war!—No Pitt!—No famine!" A few voices, it is said, were heard to exclaim—"Down with George!"—In the park; and in the streets adjacent to Westminster-hall, some stones and other things were thrown, nine of which, it is asserted, struck the state-coach; and one of them, which was suspected to have proceeded from a window in Margaret-street, near the abbey, perforated one of the windows, by a small circular aperture; from which circumstance it was supposed, by some, to have been a bullet discharged from an air-gun, or some similar engine of destruction; but no bullet was found; and whatever it was, it neither touched the king nor the noblemen who attended him. As his majesty returned from the house through the park, though the gates of the Horse-guards were shut to exclude the mob, this precaution was not sufficient to prevent a renewal of the outrages; and another stone was thrown at the carriage as it passed opposite to Spring-garden terrace. After the king had alighted at St. James's, the populace attacked the state-carriage; and, in its way through Pall-Mall to the Mews, it was almost demolished.

In consequence of these daring insults and outrages, a proclamation was issued, offering a reward of one thousand pounds to any person or persons, other than those actually concerned in doing any act by which his majesty's royal person was immediately endangered, who should give information so that any of the authors and abettors in that outrage might be apprehended and brought to justice.

Several persons were apprehended on suspicion of having insulted his majesty, one of whom, named Kyd Wake, a journeyman printer, was brought to trial, and found guilty of hooting, groaning, and hissing at the king. He was sentenced to stand in the pillory at Gloucester, on a market-day, to be imprisoned, and kept to labour, during five years, in the penitentiary house at Gloucester, and, at the expiration of his imprisonment, to find security for one thousand pounds for his good behaviour for ten years.

In the two houses, after an address had been voted testifying their in-

indignation and abhorrence at the daring outrages offered to his majesty, two bills were immediately brought in, the one by lord Grenville in the upper house, entitled, "An act for the safety and preservation of his majesty's person and government against treasonable and seditious practices and attempts;" and the other by Mr. Pitt, in the house of commons, entitled, "An act to prevent seditious meetings and assemblies." These bills were vigorously opposed in both houses, though only by the usual minorities, in point of numbers. Petitions, with very numerous signatures, were likewise presented against them from every part of the kingdom. They, however, passed, and are now become a part of the law of the land.

On the 8th of December, a message from his majesty was brought down to the house of commons, signifying a disposition to enter into a negotiation with France, the government of that country having at length assumed such a form as to render a treaty with it practicable. Mr. Wickham, the British plenipotentiary to the Swiss Cantons, was appointed, in consequence, to make some overtures, through the medium of Mr. Barthelemi, the French envoy at Basle; but this feeble attempt at negotiation soon terminated without effect.

An apparently much more serious offer of this nature was made the following year. About the latter end of the month of September, 1796, through the intervention of the Danish minister at Paris, a passport was applied for and obtained for a confidential person to be sent to Paris from the court of London, commissioned to discuss with the French government the means most proper for conducting to the re-establishment of peace. Lord Malmesbury was the person appointed by the British court to undertake this mission. His lordship accordingly repaired to Paris, where he continued about two months. It was proposed, on the part of England, as the basis of the treaty, that France should restore the Netherlands to the emperor, and evacuate Italy; in which case England engaged to restore all the conquests made on that power in the East and West Indies. The French directory replied, that they could not consent to proposals contrary to the constitution, to the laws, and to the treaties which bind the republic. Thus ended this negotiation.

The beginning of the year 1797 was distinguished by an extraordinary event as perhaps ever occurred in this or any other war—the invasion of Great Britain by a force of twelve hundred men, without artillery, and almost without accoutrements. The alarm at first was general, and great, throughout the whole of Pembroke-shire, on the coast of which the landing was made; but the men surrendered on the approach of a very inadequate force, and almost without resistance. On inquiry, it appeared that they consisted entirely of galley-slaves, and other criminals, from Brest; and the object was supposed to be at once to create an alarm on the British coast, and to rid the French republic of a number of desperate persons; but whatever the intentions of the enemy might be, they met, on the whole, with a complete disappointment; for not only the expedition proved entirely fruitless, but, as two of the ships which disembarked the men were returning into Brest harbour, they were captured by the St. Fiorenzo and Nymph frigates.

The apprehensions excited by this circumstance had scarcely subsided, when a more serious cause of alarm occurred to agitate the minds of the public. The bank of England discontinued the issuing of specie in their customary payments. A run (to speak in the commercial phraseology) had taken place upon some of the country banks; and the great demand for specie from the bank of England induced the directors to lay the

state of their company before the minister; in consequence of which an order of council was made on the 26th of February, prohibiting the farther issue of specie from the bank. This order was afterwards sanctioned and ratified by an act of parliament, by which the restriction was continued to midsummer, and afterwards by another act, continuing it to the end of the present war.

On the third of March, government received intelligence of an important advantage obtained by the British fleet, under the command of sir John Jervis, over a Spanish fleet of much superior force, on the 14th of February, off Cape St. Vincent. The English admiral, by a successful manœuvre, separated the rear of the enemy's fleet from the main body, and captured two ships of 112 guns, one of 84, and one of 74.

The seamen of England, who had so long been the defence and the glory of the nation, seemed suddenly to conspire its overthrow. In the middle of April a most alarming mutiny broke out on board the grand Channel fleet at Spithead, under the command of lord Bridport. The sailors required an advance of their pay, and certain regulations to be adopted relative to the allowance of provisions. They appointed delegates, two for each ship, who for several days had the entire command of the whole fleet, over which no officer had the least authority. In this critical situation, government deemed it most expedient to promise a full compliance with all their demands; on which they cheerfully returned to their duty. But in a week or two afterwards, no act of indemnity having been offered in parliament for the security of those concerned in the mutiny, they again rose, deprived their officers of their authority, and the dispute seemed to wear a more gloomy aspect than before. A bill, securing to the seamen what they had been promised, was therefore hastily passed through both houses, and lord Howe went down to Portsmouth to act as mediator. The delegates of the fleet declared themselves satisfied, and harmony and good order was immediately restored.

The ferment, however, still remained in other parts of the navy; and soon after, the seamen of some ships lying at SheerNESS began to mutiny, and behaved riotously; and so contagious was the spirit of insurrection now become amongst the seamen, that almost all the ships of admiral Duncan's fleet at Yarmouth appointed delegates, and sailed away to the Nore, to join the ships from SheerNESS. New grievances were required to be redressed, and new and extravagant demands to be complied with; government was now convinced that to yield would only be to encourage a repetition of similar proceedings; and every disposition was therefore made to force these ships to submission. All communication between them and the shore was cut off, and no provisions or water suffered to go to them. The mutineers, to supply themselves with these, detained all vessels coming up the river, and took out of them whatever they chose, for which their delegates, the principal of whom was one Richard Parker, a man of strong natural abilities, gave draughts on the treasury, as taken for the use of the navy of England. At length, being reduced to great want of water, and dissensions and distrust prevailing among themselves, several ships left the mutinous fleet, and surrendered themselves at SheerNESS. Some of these were fired upon by the others; but at length they all came in, and gave up their delegates, who, with a number of others that were considered as principals in the mutiny, were tried by a court-martial. Some of them were executed, others sentenced to different punishments, and the rest pardoned. Richard Parker, who had acted as commander of the fleet while in a state of mutiny, was the

first who was killed and executed. He displayed great presence of mind, and suffered with the utmost firmness and fortitude.

As if to erase this stain from the annals of the British navy, the fleet of admiral Duncan, consisting principally of the ships which had been engaged in this unhappy and disgraceful mutiny, sailed soon after to watch the motions of the Dutch fleet in the Texel, where it remained for some time blockaded, till, on its venturing out, an engagement ensued, in which the English fleet obtained a complete victory, taking the Dutch admiral De Winter, the vice-admiral, and nine ships.

In consequence of this signal victory, admiral Duncan was created viscount Duncan; and on account of this and the other naval successes of the war, the 19th of December was appointed to be observed as a thanksgiving day, on which day his majesty and both houses of parliament went in solemn procession to St. Paul's, to return thanks to heaven for the victories gained by his fleets.

In the course of this year, another attempt was made by the British cabinet to negotiate a treaty of peace with France. The preliminaries of a peace between the French republic and the emperor having been signed at Leoben, in the month of April, by which the Netherlands were given up to France, the difficulty which had broken off the last negotiation appeared to be in some measure removed, and applications were again made to the French government for passports for a person who might enter into discussions relative to the basis of a future treaty. Lord Malmesbury was again appointed to this mission; but the French directory objected to his coming to Paris, and appointed Lisle for the place of the conference with commissioners they sent thither for that purpose. What the Netherlands, however, had been in the former attempt to treat, the Cape of Good Hope and Ceylon proved in the present; and, after a stay of nearly three months, lord Malmesbury, not being able to declare himself empowered to consent to the surrender of all the conquests made from France or her allies, was abruptly ordered to depart, and, on the 26th of September, returned as before, not having effected the object of his mission.

In the following month, the definitive treaty between the French republic and the emperor was concluded and ratified; and the French, having little other employment for their armies, began to talk loudly of an immediate invasion of England. The directory assembled a large army along the coasts opposite to Great Britain, which they called the army of England; and a variety of idle reports were propagated relative to preparations said to be making in the ports of France; among others, that rafts of an enormous size and peculiar construction were building for the conveyance of troops. The British ministry did not suffer these ridiculous exaggerations, nor even the evident absurdity and rashness of any attempt at an invasion of England, in the face of a fleet so decidedly superior to that of every enemy united, to produce an improper security, but took such measures of precaution as were most proper for the general defence of the kingdom, and to guard the different parts of the country from the mischievous consequences of a sudden attack. But the threats of the enemy were not even attempted to be carried into execution; and the directory soon after turned their views towards another quarter of the globe, by fitting out, at Toulon, a formidable expedition, which, about the latter end of May, sailed for Egypt, under the command of the celebrated Buonaparte, probably with a view to prepare the way, by the conquest of that country, for an attack on the British settlements in India.

In the course of the number of troops at the ports of Holland, Kirk and Ostend was therefore fitted out by Home Popham, and troops at Ostend and works of the intended for transport, reembark, the vessel found to be impracticable round them in the bay, landed with him, and surrender themselves.

Towards the most brilliant victory has obtained in the course of the present war, who had been in the fleet which, after having received the mouth of the Nile, dispositions for the capture of Aboukir. There were sent and above a thousand men, seventy-four. The fleet in a compact line of battle, protected in the action, therefore, the danger of an attempt. He had and he strengthened but in approach. Culloden, as it was named before the action, vanishing in its retreat, they were so fondly desirous to break, and he ably commenced; and the victory was yet wounds, and, loss of life by a cannon, two of the French the whole van was to a completion served on board with great rapidity, dreadful explosion succeeded, which carried to a bay, surrounding ships cut at intervals the line, and two the line were taken.

In the course of the preparations made for the invasion of England, a number of transports had been fitted out at Flushing, and some other of the ports of Holland, which were to come round by the canals to Dunkirk and Ostend, in order to avoid the British cruizers. An expedition was therefore fitted out in May 1798, under the command of captain Home Popham, and major-general Coote, which landed a body of troops at Ostend, who blew up and entirely destroyed the sluice-gates and works of the canal at that place, and burnt several vessels that were intended for transports. Unfortunately, when the troops were ready to reembark, the wind had changed, and the sea ran so high, that it was found to be impossible; and the enemy, in the mean time, collected round them in such force, that general Coote, and those who had landed with him, amounting to nearly a thousand men, were obliged to surrender themselves prisoners.

Towards the latter end of this year, intelligence was received of the most brilliant victory ever gained at sea, even by the British navy, which has obtained such unequalled glory, on so many occasions, in the course of the present war. On the first of August, admiral sir Horatio Nelson, who had been detached by earl St. Vincent, in pursuit of the French fleet which, as was mentioned above, sailed from Toulon in May, having received a reinforcement of ten sail of the line, arrived off the mouth of the Nile, where he found the enemy, and immediately made dispositions for an attack. The French fleet was at anchor in the bay of Aboukir. The admiral's ship carried a hundred and twenty guns, and above a thousand men; three had eighty guns each, and nine had seventy-four. They were drawn up near the shore in a strong and compact line of battle, flanked by four frigates and many gun-boats, and protected in the van by a battery planted in a small island. Their situation, therefore, was extremely advantageous for defence; but the great danger of an attack did not deter the British admiral from making the attempt. He had as many ships of the line as the French commander, and he strengthened his line by the introduction of a ship of fifty guns; but in approaching the enemy, he was deprived of the assistance of the Collioden, as it struck upon a shoal, from which it could not be extricated before the next morning. Three other vessels were hastily advancing in its rear; but the accident warned them of the danger, and they were so fortunate as to avoid the shoal. The admiral was extremely desirous to break the line of the French, and surround a part of the fleet, and he ably executed his purpose. At sun-set the engagement commenced; and both parties fought with the utmost fury. While the victory was yet undecided, the French admiral Brueys received two wounds, and, having changed his situation, was, soon after, deprived of life by a cannon shot. When the action had continued for two hours, two of the French ships were captured; a third struck soon after; and the whole van was in the power of the English, who eagerly proceeded to a completion of their victory. About nine at night, a fire was observed on board L'Orient, the French admiral's ship, which increased with great rapidity till about ten o'clock, when she blew up with a dreadful explosion. An awful pause and silence for about three minutes succeeded, when the wreck of the masts and yards, which had been carried to a vast height, fell down into the water, and on board the surrounding ships. After this awful scene, the engagement was prosecuted at intervals till day-break; and only two of the French ships of the line, and two frigates, escaped capture or destruction. Nine sail of the line were taken, and one, besides L'Orient, was burned, her own

captain setting fire to her. A frigate also was burned by her commander. Captain Hood, in the *Zealous*, pursued the retiring vessels; but he was soon recalled by the admiral, as none of the ships could support him in the chase.

This signal victory not only gave the British fleet the entire command of the Mediterranean, but appeared to infuse fresh courage into all the powers on the continent to renew their exertions against France. The Turks declared war with the republic, and the king of Naples attacked and took possession of Rome, then in the power of the French. But the reverse he afterwards experienced, and the other events of the campaign in Italy will be related in our summary of the affairs of France.

About the same time that intelligence of this glorious victory was received, sir John Borlase Warren defeated, off the coast of Ireland, a French Squadron consisting of one ship of the line, the *Hoche*, and eight frigates, with troops and ammunition on board. On the 11th of October they were desferied by the British Squadron. At half past seven on the morning of the 12th the action commenced; and at eleven, the *Hoche*, after a gallant defence, struck: the frigates then made sail away, and the signal for a general chase was immediately made by the admiral. After a running fight of five hours, three of the frigates were captured; and three others afterwards became prizes. Thus the whole Squadron, two frigates excepted, fell into the hands of the British; and the hopes of the French, as well as of the malcontents in Ireland, were completely defeated.

To complete the successes of the year, the fortress of Ciudadella, and the island of Minorca, surrendered on the 15th of November to general Stuart and commodore Duckworth. This acquisition was made without the loss of a man.

In the beginning of May, 1799, a new war having taken place in India with Tippoo Saib, Seringapatam, his capital, was taken, and himself killed in the assault, by the British troops under the command of lieutenant-general Harris. Of the capture of this important place, and the consequent addition of the greater part of the Mysore country to the territory of the East-India company, a further account will be found in our history of the British transactions and conquests in Hindoostan.

In the month of August following, an expedition was fitted out in the West Indies under the command of lieutenant-general Trigue, and vice-admiral lord Hugh Seymour, consisting of two ships of the line, five frigates, and several transports carrying stores and provisions: it arrived on the 10th of that month off the mouth of the river Surinam; when the fort New Amsterdam, and the town of Paramaribo, the capital of the Dutch colony of Surinam, surrendered by capitulation to the British commanders without attempting resistance.

But the principal military operation undertaken by Great Britain, in this year, was the expedition fitted out to rescue Holland from the yoke of the French, in which about 30,000 British troops were employed, who were joined in Holland by 17,000 Russians, taken into the pay of England. The first division of this armament, under sir Ralph Abercrombie, sailed from Deal and Margate on the 13th of August, for the Helder-point, at the mouth of the Texel; but encountered such unfavourable and violent gales, that the troops could not effect a landing at the place of their destination till the morning of the 27th. A hotly contested action then took place between the British and the French and Dutch troops; but the valour of the former ultimately triumphed; and the enemy evacuated the batteries and works of the Helder; and seven

Dutch men of war and thirteen Indiamen surrendered to the fleet under admiral Mitchell, who immediately after stood down into the Texel, and offered battle to the Dutch fleet lying there, the whole of which, consisting of twelve ships of war, surrendered to the English admiral, the Dutch sailors refusing to fight, and compelling their officers to give up their ships for the service of the prince of Orange.

On the 13th the duke of York arrived in Holland, with the second division, and took upon him the command of the army; and on the 19th an engagement took place between the British and Russians and the French, in which the former failed in their attack, in consequence of the Russians suffering themselves to be thrown into disorder by their impetuosity and haste, which occasioned them to suffer severely—their loss amounting to 1500 men, and their general, who was taken prisoner. The army, however, soon recovered from the effects of this check, and, on the 2d of October, after a hard-fought battle of twelve hours, compelled the enemy to retreat, and took possession of the town of Alkmaar. But here the success of the expedition terminated. The enemy had received a reinforcement of about 6,000 men, and occupied a strongly fortified position, which it would be necessary to carry before the army could advance; besides which, the state of the weather, the ruined condition of the roads, and the consequent total want of the supplies necessary for the army, presented such insurmountable difficulties, that in two days afterwards it was judged expedient to withdraw the troops from their advanced position; and as it now appeared that there could be no hope of success in any attempt to prosecute further the object of the expedition, the duke, in conjunction with vice-admiral Mitchell, concluded an armistice with general Brune, who commanded the French and Batavian armies, the principal conditions of which were, that eight thousand French and Batavian prisoners, taken before that campaign, should be restored to their respective countries; that the combined English and Russian army should evacuate the territory, coasts, islands, and internal navigation of the Dutch republic, by the 30th of November, 1799, without committing any devastation by inundations, cutting the dykes, or otherwise injuring the sources of navigation; and that the mounted batteries taken possession of at the Helder, or at other positions, should be restored in the state in which they were taken, or, in case of improvement, in the state in which they then were, together with all the Dutch artillery taken in them.

Such was the termination of an expedition, the failure of which, when it was planned, was considered as almost impossible; and which, in fact, commenced with such brilliant advantages, and so fair a prospect of complete success. Yet it must not be forgotten, that the capture of the Dutch fleet has nearly annihilated the naval power of the new Batavian republic, and secured still more to Britain the sovereignty of the seas, which is her only protection, the source of all her wealth and all her glory.

In the month of November, a new revolution took place in the government of France. The celebrated Buonaparte having returned from Egypt, displaced the directory, and assumed a kind of dictatorial power, under the title of *First Consul*, according to a new constitution which he procured to be framed and accepted. In order to induce the people to consent to this change, by which he was invested with the supreme authority, he promised them that he would take effectual measures to put an end to the miseries and destruction of war. In pursuance of this promise, on the very day on which he entered on his new dignity, he

addressed a note immediately to the king of Great Britain, in which he expressed a wish to contribute effectually to a general pacification; and in a second note, afterwards transmitted by M. Talleyrand, to the English ministry, proposed, "an immediate suspension of arms, and that plenipotentiaries on each side should repair to Dunkirk, or any other town as advantageously situated, for the quickness of the respective communications, and who should apply themselves, without any delay, to effect the re-establishment of peace and a good understanding between the French republic and England."—The British ministry, however, showed no disposition to accede to the overture, probably conceiving the new government of France not to have as yet acquired sufficient stability to be treated with, and encouraged, by the success which had attended the arms of the allies in the preceding campaign, to hope that they should be able still more effectually to humble and weaken France by a continuance of the war.

Yet we trust we shall not be deemed either wanting in respect for the government, or deficient in real love for our country, should we recommend to the rulers of nations to recollect the uncertainty of the event of a campaign, and how frequently the jealousies of allied powers, whose views and interests cannot be the same, dissolve the firmest leagues, and frustrate the best concerted plans; how expensive, and frequently ruinous, are the triumphs of war; and how extensively beneficial and solid are the advantages of peace, even though purchased by considerable concessions, and the sacrifice of a false honour.

#### GENEALOGICAL LIST OF THE ROYAL FAMILY OF GREAT BRITAIN.

George-William-Frederic III. born June 4, 1738; proclaimed king of Great Britain, France, and Ireland, and elector of Hanover, October 26, 1760; and married, September 8, 1761, to the princess Sophia-Charlotte, of Mecklenburg Strelitz, born May 16, 1744, crowned September 22, 1761, and now have issue:

1. George-Augustus-Frederic, prince of Wales, born August 12, 1762; married, April 8, 1793, to her highness the princess Caroline of Brunswick; has issue, Jan. 7, 1796, a princess.

2. Prince Frederic, born August 16, 1763; elected bishop of Osnaburg, February 27, 1764; created duke of York and Albany, November 7, 1784, K. G. and K. B.; married, September 29, 1791, Frederica-Charlotta-Ulrica-Catharina, princess royal of Prussia.

3. Prince William-Henry, born August 21, 1765; created duke of Clarence, K. G. and K. T.

4. Charlotte-Augusta-Matilda, princess royal of England, born September 29, 1766; married, May 18, 1797, to his serene highness Frederic-William, hereditary prince of Wurtemberg-Stuttgart.

5. Prince Edward, born November 2, 1767; created duke of Kent, April, 1799.

6. Princess Augusta-Sophia, born November 8, 1768.

7. Princess Elizabeth, born May 27, 1770.

8. Prince Ernest-Augustus, born June 5, 1771; created duke of Cumberland, April, 1799.

9. Prince Frederic-Augustus, born January 27, 1773.

10. Prince Adolphus-Frederic, born February 24, 1774.

11. Princess Mary, born April 25, 1776.

12. Princess Sophia, born November 9, 1777.

13. Princess A

Area in square miles, 7011.	

[NAME AND LANGUAGE.] The Welch, according to the best antiquaries, are descendants of the Belgic Gauls, who made a settlement in England about fourscore years before the first descent of Julius Cæsar, and thereby obtained the name of Galles or Walles (the G and W being promiscuously used by the ancient Britons), that is, Strangers. Their language is a dialect of the Celtic, or language of the ancient Gauls, probably little changed by time, and is highly commended for its pathetic and descriptive powers.

[BOUNDARIES.] Wales was formerly of greater extent than it is at present, being bounded only by the Severn and the Dee; but after the Saxons had made themselves masters of all the plain country, the Welch, or ancient Britons, were shut up within more narrow bounds, and obliged gradually to retreat westward. It does not however appear that the Saxons ever made any farther conquests in their country than Monmouthshire and Herefordshire, which are now reckoned part of England. This country is divided into four circuits, comprehending twelve counties. See ENGLAND.

[CLIMATE, SOIL, AND WATER.] The seasons are nearly the same as in the northern parts of England, and the air is sharp, but wholesome. The soil of Wales, especially towards the north, is mountainous, but contains rich valleys, which produce crops of wheat, rye, and other corn. Wales contains many quarries of freestone and slate, several mines of lead, and abundance of coal-pits. This country is well supplied with wholesome springs; and its chief rivers are the Clwyd, the Wheeler, the Dee, the Severn, the Elwy, and the Afen, which furnish Flintshire with great quantities of fish.

[MOUNTAINS.] It would be endless to particularise the mountains of this country. Snowdon, in Caernarvonshire, and Plinlimmon, which

lies partly in Montgomery and partly in Cardiganshire, are the most famous; and their mountainous situation greatly assisted the natives in making so noble and long a struggle against the Roman, Anglo-Saxon, and Norman powers.

VEGETABLE AND ANIMAL PRODUCTIONS BY SEA AND LAND. } In these particulars Wales differs little from England. Their horses are smaller, but can endure vast fatigue; and their black cattle are small likewise, but excellent beef; and their cows are remarkable for yielding large quantities of milk. Great numbers of goats bred on the mountains. Some very promising mines of silver, copper, lead, and iron, have been discovered in Wales. The Welch silver may be known by its being stamped with the ostrich feathers, the badge of the prince of Wales.

POPULATION, INHABITANTS, MANNERS, AND CUSTOMS. } The inhabitants of Wales are supposed to amount to about 300,000; and though not in general wealthy, they are provided with all the necessaries and many of the conveniences of life. The land-tax of Wales brought in some years ago about forty-three thousand seven hundred and fifty-two pounds a-year. The Welch are, if possible, more jealous of their liberties than the English, and far more irascible; but their anger soon abates; and they are remarkable for their sincerity and fidelity. They are very fond of carrying back their pedigrees to the most remote antiquity; but we have no criterion for the authenticity of their manuscripts, some of which they pretend to be coeval with the beginning of the Christian era. It is however certain, that great part of their history, especially the ecclesiastical, is more ancient, and better attested, than that of the Anglo-Saxons. Wales was formerly famous for its bards and poets, particularly Thalieffin, who lived about the year 450, and whose works were certainly extant at the time of the Reformation, and clearly evince that Geoffrey of Monmouth was not the inventor of the history which makes the present Welch the descendants of the ancient Trojans. This poetical genius seems to have influenced the ancient Welch with an enthusiasm for independency; for which reason Edward I. is said to have made a general massacre of the bards: an inhumanity which was characteristic of that ambitious prince. The Welch may be called an unmixed people, and are remarkable for still maintaining the ancient hospitality, and their strict adherence to ancient customs and manners. This appears even among gentlemen of fortune, who in other countries commonly follow the stream of fashion. We are not however to imagine, that many of the nobility and gentry of Wales do not comply with the modes and manner of living in England and France. All the better sort of the Welch speak the English language, though numbers of them understand the Welch.

RELIGION. ] The massacre of the Welch clergy by Augustine, the popish apostle of England, because they would not conform to the Romish ritual, has been already mentioned. Wales, after that, fell under the dominion of petty princes, who were often weak and credulous. The Romish clergy insinuated themselves into their favour, by their pretended power of absolving them from crimes; and the Welch, when their ancient clergy were extinct, conformed themselves to the religion of Rome. The Welch clergy, in general, are but poorly provided for; and in many of the country congregations they preach both in Welch and English. Their poverty was formerly a great discouragement to religion and learning; but the measures taken by the society for propagating Christian knowledge have in a great degree removed the reproach of

ignorance from the poorer sort of the Welch. In the year 1749, a hundred and forty-two schoolmasters were employed to remove from place to place for the instruction of the inhabitants; and their scholars amounted to 72,264. No people have distinguished themselves more, perhaps, in proportion to their abilities, than the Welch have done by acts of national munificence. They print, at a vast expence, Bibles, Common-prayers, and other religious books, and distribute them gratis to the poorer sort. Few of their towns are unprovided with a free-school.

The established religion in Wales is that of the church of England; but the common people in many places are so tenacious of their ancient customs, that they retain several of the Romish superstitions, and some ancient families among them are still Roman-catholics. It is likewise said that Wales abounds with Romish priests in disguise. The principality also contains great numbers of protestant dissenters.

For BISHOPRICKS,—see England. In former times, Wales contained more bishopricks than it does now; and about the time of the Norman invasion, the religious foundations there far exceeded the wealth of all the other parts of the principality.

LEARNING AND LEARNED MEN.] Wales was a seat of learning at a very early period; but it suffered an eclipse by the repeated massacres of the bards and clergy. Wickliffism took shelter in Wales, when it was persecuted in England. The Welch and Scotch dispute about the nativity of certain learned men, particularly four of the name of Gildas. Giraldus Cambrensis, whose history was published by Camden, was certainly a Welchman; and Leland mentions several learned men of the same country, who flourished before the Reformation. The discovery of the famous king Arthur's and his wife's burying-place was owing to some lines of Thalieffin, which were repeated before Henry II. of England, by a Welch bard. Since the Reformation, Wales has produced several excellent antiquaries and divines. Among the latter were Hugh Broughton, and Hugh Holland, who was a Roman-catholic, and is mentioned by Fuller in his Worthies. Among the former were several gentlemen of the name of Llhuyd, particularly the author of that invaluable work, the Archæologia. Rowland, the learned author of the *Mona Antiqua*, was likewise a Welchman; as was that great statesman and prelate, the lord-keeper Williams, archbishop of York in the time of king Charles I. After all, it appears, that the great merit of the Welch learning, in former times, lay in the knowledge of the antiquities, language, and history of their own country. Wales, notwithstanding all that Dr. Hicks and other antiquaries have said to the contrary, furnished the Anglo-Saxons with an alphabet. This is clearly demonstrated by Mr. Llhuyd, in his Welch preface to his *Archæologia*, and is confirmed by various monumental inscriptions of undoubted authority. (See Rowland's *Mona Antiqua*.) The excellent history of Henry VIII. written by lord Herbert of Cherbury, may be adduced as another production of Welch literature.

With regard to the present state of literature among the Welch, it is sufficient to say, that some of them make a considerable figure in the republic of letters, and that many of their clergy are excellent scholars. The Welch Pater-noster is as follows:

*Ein Tud, yr bawn seyt, yn y nefodd, sancteiddier dy entw: deued dy deyr-  
nar; bydded dy cwylyys ar y ddaear, megis y mac yn y nefod: dyro in i bed-  
dyro ein bara beunyddiol; a maddcu i ni ein dyledion, fel y madd:uron ni*

*F\* dylechwyr; ac nac arwain ni i bresfedigaeth citbr gwared ni rhag drwg: canys eiddot ti yw'r deyrnas, a'r gallu, a'r gogoniant, yn eos cofodded.* Amen.

**CITIES, TOWNS, FORTS, AND OTHER EDIPICES, PUBLIC AND PRIVATE.** } Wales contains no cities or towns that are remarkable either for populousness or magnificence. Beaumaris is the chief town of Anglesey\*, and has a harbour for ships. Brecknock trades in clothing. Cardigan is a large populous town, and lies in the neighbourhood of lead and silver mines. Caermarthen has a large bridge, and is governed by a mayor, two sheriffs, and aldermen, who wear scarlet gowns, and other ensigns of state. Pembroke is well inhabited by gentlemen and tradesmen; and part of the country is so fertile and pleasant, that it is called Little England. The other towns of Wales have nothing particular. It is, however, to be observed, that Wales, in ancient times, was a far more populous and wealthy country than it is at present; and though it contains no regular fortifications, yet many of its old castles are so strongly built, and so well situated, that they might be turned into strong forts at a small expence: witness the vigorous defence which many of them made in the civil wars between Charles I. and his parliament.

**ANTIQUITIES AND CURIOSITIES, NATURAL AND ARTIFICIAL.** } Wales abounds in remains of antiquity. Several of its castles are stupendously large; and in some, the remains of Roman architecture are plainly discernible. The architecture of others is doubtful; and some appear to be partly British and partly Roman. In Brecknockshire are some rude sculptures, upon a stone six feet high, called the Maiden-stone; but the remains of the Druidical institutions, and places of worship, are chiefly discernible in the Isle of Anglesey, the ancient Mona, mentioned by Tacitus, who describes it as being the chief seminary of the Druidical rites and religion. Cherphilly-castle in Glamorganshire is said to have been the largest in Great Britain, excepting Windsor; and the remains of it show it to have been a most beautiful fabric. One half of a round tower has fallen quite down, but the other overhangs its basis more than nine feet, and is as great a curiosity as the leaning tower of Pisa in Italy.

Among the natural curiosities of this country, are the following: At a small village called Newton, in Glamorganshire, is a remarkable spring nigh the sea, which ebbs and flows contrary to the tide. In Merionethshire is Kader Idris, a mountain remarkable for its height, which affords a variety of Alpine plants. In Flintshire is a famous well, known by the name of St. Wenefred's well, at which, according to the legendary tales of the common people, miraculous cures have been performed. The spring boils with vast impetuosity out of a rock, and is formed into a beautiful polygonal well, covered with a rich arch, supported by pillars, and the roof is most exquisitely carved in stone. Over the spring is also a chapel, a neat piece of Gothic architecture, but in a very ruinous state. King James II. paid a visit to the well of St. Wenefred in 1686, and was rewarded for his piety by a present which was made him of the very shift in which his great grandmother, Mary Stuart, lost her head. The spring is supposed to be one of the finest in the British do-

\* The Isle of Anglesey, which is the most western county of North Wales, is surrounded on all sides by the Irish Sea, except on the south-east, where it is divided from Britain by a narrow strait, called Menai, which in some places may be passed on foot at low water. The island is about 24 miles long, and 18 broad, and contains 74 parishes. It was the ancient seat of the British Druids.

ARMS.] The ar  
land, only by the :

minions; and by two different trials and calculations lately made, is found to throw out about twenty-one tons of water in a minute. It never freezes, or scarcely varies in the quantity of water either in dry or rainy seasons; but in consequence of the latter it assumes a wheyish tinge. The small town adjoining to the well is known by the name of Holywell. In Caernarvonshire is the high mountain of Penmanmawr, across the edge of which the public road lies, and occasions no small terror to many travellers; from one hand the impending rocks seem every minute ready to crush them to pieces; and the great precipice below, which hangs over the sea, is so hideous, and (till very lately, when a wall was raised on the side of the road) full of danger, that one false step was of dismal consequence. Snowdon hill has been found, by triangular measurement, to be 1240 yards in perpendicular height.

There are a great number of pleasing prospects and picturesque views in Wales: and this country is highly worthy the attention of the curious traveller.

COMMERCE AND MANUFACTURES.] The Welch are on a footing, as to their commerce and manufactures, with many of the western and northern counties of England. Their trade is mostly inland, or with England, into which they import numbers of black cattle. Milford haven, which is reckoned the finest in Europe, lies in Pembrokeshire; but the Welch have hitherto reaped no great benefit from it, though of late considerable sums have been granted by parliament for its fortification. The making it the principal harbour in the kingdom would meet with great opposition in parliament, from the numerous Cornish and West-country members, the benefit of whose estates must be greatly lessened by the disuse of Plymouth and Portsmouth, and other harbours. The town of Pembroke employs near 200 merchant ships, and its inhabitants carry on an extensive trade. In Brecknockshire are several woollen manufactures; and Wales in general carries on a great coal trade with England and Ireland.

CONSTITUTION AND GOVERNMENT.] Wales was united and incorporated with England, in the 27th of Henry VIII.; when, by act of parliament, the government of it was modelled according to the English form; all laws, customs, and tenures, contrary to those of England, being abrogated, and the inhabitants admitted to a participation of all the English liberties and privileges, particularly that of sending members to parliament, viz. a knight for every shire, and a burgess for every shire-town, except Merioneth. By the 34th and 35th of the same reign, there were ordained four several circuits for the administration of justice in the said shires, each of which was to include three shires; so that the chief-justice of Chester has under his jurisdiction the three several shires of Flint, Denbigh, and Montgomery. The shires of Caernarvon, Merioneth, and Anglesey, are under the justices of North Wales. Those of Caermarthen, Pembrokeshire, and Cardigan, have also their justices; as have likewise those of Radnor, Brecknock, and Glamorgan. By the 18th of queen Elizabeth, one other justice-assistant was ordained to the former justices; so that now every one of the said four circuits has two justices, viz. one chief-justice, and a second justice assistant.

REVENUES.] As to the revenues, the crown has a certain though small property in the product of the silver and lead mines; but it is said that the revenue accruing to the prince of Wales, from his principality, does not exceed 7 or 8000l. a year.

ARMS.] The arms of the prince of Wales differ from those of England, only by the addition of a label of three points. His cap, or badge

of ostrich feathers, was occasioned by a trophy of that kind, which Edward the Black Prince took from the king of Bohemia, when he was killed at the battle of Poitiers, and the motto is *Ieb dien, I serve*. St. David, commonly called St. Taffy, is the tutelary saint of the Welch; and his badge is a leek, which is worn on his day, the 1st of March.

**HISTORY.]** The ancient history of Wales is uncertain, on account of the number of petty princes who governed it. That they were sovereign and independent, appears from the English history. It was formerly inhabited by three different tribes of Britons; the Silures, the Dimetæ, and the Ordovices. These people were never entirely subdued by the Romans, though part of their country, as appears from the ruins of castles, was bridled by garrisons. The Saxons, as has been already observed, conquered the counties of Monmouth and Hereford, but they never penetrated farther, and the Welch remained an independent people, governed by their own princes and their own laws. About the year 870, Roderic, king of Wales, divided his dominions among his three sons; and the names of these divisions were, Dimetia, or South Wales; Poveſia, or Powis land; and Venedotia, or North Wales. This division gave a mortal blow to the independency of Wales. About the year 1112, Henry I. of England planted a colony of Flemings on the frontiers of Wales, to serve as a barrier to England. The Welch made many brave attempts to maintain their liberties against the Norman kings of England. In 1237, the crown of England was first supplied with a pretext for the future conquest of Wales; their old and infirm prince Llewellyn, in order to be safe from the persecutions of his undutiful son Gryffyn, having put himself under the protection of Henry III. to whom he did homage.

But no capitulation could satisfy the ambition of Edward I. who resolved to annex Wales to the crown of England; and Llewellyn, prince of Wales, disdainful of the subjection to which old Llewellyn had submitted, Edward raised an army at a prodigious expense, with which he penetrated as far as Flint, and, taking possession of the Isle of Anglesey, drove the Welch to the mountains of Snowdon, and obliged them to submit to pay a tribute. The Welch, however, made several efforts under young Llewellyn; but, at last, in 1282, he was killed in battle. He was succeeded by his brother David, the last independent prince of Wales, who, falling into Edward's hands through treachery, was by him most barbarously and unjustly hanged; and Edward, from that time, pretended that Wales was annexed to his crown of England. It was about this time, probably, that Edward perpetrated the inhuman massacre of the Welch bards. Perceiving that this cruelty was not sufficient to complete his conquest, he sent his queen, in the year 1284, to be delivered in Caernarvon castle, that the Welch, having a prince born among themselves, might the more readily recognise his authority. This prince was the unhappy Edward II.; and from him the title of prince of Wales has always since descended to the eldest sons of the English kings. The history of Wales and England becomes now the same. It is proper, however, to observe, that the kings of England have always found it their interest to soothe the Welch with particular marks of their regard. Their eldest sons not only held their titular dignity, but actually kept a court at Ludlow; and a regular council, with a president, was named by the crown, for the administration of all the affairs of the principality. This was thought so necessary a piece of policy, that when Henry VIII. had no son, his daughter Mary was created princess of Wales.

## ISLE OF MAN.

THE Mona mentioned by Tacitus was not this island, but the Isle of Anglesey. Some think it takes its name from the Saxon word *Mang* (or among), because, lying in St. George's Channel, it is almost at an equal distance from the kingdoms of England, Scotland, and Ireland; but Mona seems to have been a generical name with the ancients for any detached island. Its length from north to south is rather more than thirty miles, its breadth from eight to fifteen; and the latitude of the middle of the island is fifty-four degrees sixteen minutes north. It is said that on a clear day three Britannie kingdoms may be seen from this island. The air here is wholesome, and the climate, only making an allowance for the situation, pretty much the same as that in the north of England, from which it does not differ much in other respects. The hilly parts are barren, and the campaign fruitful in wheat, barley, oats, rye, flax, hemp, roots, and pulse. The ridge of mountains, which, as it were, divide the island, both protects and fertilises the valleys, where there is good pasturage. The better sort of inhabitants have good sizeable horses, and a small kind, which is swift and hardy; nor are they troubled with any noxious animals. The coasts abound with sea fowl; and the puffins, which breed in rabbit holes, are almost lumps of fat, and esteemed very delicious. It is said that this island abounds with iron, lead, and copper mines, though unwrought; as are the quarries of marble, slate, and stone.

The Isle of Man contains seventeen parishes, and four towns on the sea coasts. Castle-town is the metropolis of the island, and the seat of its government; Peel of late years begins to flourish; Douglas has the best market and best trade in the island, and the richest and most populous town, on account of its excellent harbour, and its fine mole, extending into the sea. It contains about 900 houses, and is a neat pleasant town; the buildings lofty, but the streets narrow and close. Ramsey has likewise a considerable commerce, on account of its spacious bay, in which ships may ride safe from all winds, excepting the north-east. The reader, by throwing his eyes on the map, may see how conveniently this island is situated for being the storehouse of smugglers, which it was till within these few years, to the inexpressible prejudice of his Majesty's revenue; and this necessarily leads us to touch upon the history of the island.

During the time of the Scandinavian rovers on the seas, who have been before mentioned, this island was their rendez-vous, and their chief force was here collected; from whence they annoyed the Hebrides, Great Britain, and Ireland. The kings of Man are often mentioned in history; and though we have no regular account of their succession, and know but few of their names, yet they undoubtedly were for some ages masters of those seas. About the year 1263, Alexander II. king of Scotland, a spirited prince, having defeated the Danes, laid claim to the superiority of Man, and obliged Owen or John, its king, to acknowledge him as lord paramount. It seems to have continued tributary to the kings of Scotland, till it was reduced by Edward I.; and the kings of England, from that time, exercised the superiority over the island; though we find it still possessed by the posterity of its Danish princes, in the reign of Edward III. who dispossessed the last queen of the island,

and bestowed it on his favourite, Montague, earl of Salisbury. His family honours and estate being forfeited, Henry IV. bestowed Man, and the patronage of the bishoprick, first upon the Northumberland family, and, that being forfeited, upon sir John Stanley, whose posterity, the earls of Derby, enjoyed it, till, by failure of heirs male, it devolved upon the duke of Athol, who married the sister of the last lord Derby. Reasons of state rendered it necessary for the crown of Great Britain to purchase the customs of the island from the Athol family; and the bargain was completed by 70,000*l.* being paid to the duke in 1765. The duke, however, retains his territorial property in the island, though the form of its government is altered; and the king has now the same rights, powers, and prerogatives, as the duke formerly enjoyed. The inhabitants also retain many of their ancient constitutions and customs.

The established religion in Man is that of the church of England. The bishop of Sodor and Man enjoys all the spiritual rights and pre-eminences of the other bishops, but does not sit in the British house of peers—his see never having been erected into an English barony. One of the most excellent prelates who ever adorned the episcopal character, was Dr. Thomas Wilson, bishop of Man, who presided over the diocese upward of fifty-seven years, and died in the year 1755, aged ninety-three. He was eminently distinguished for the piety and the exemplariness of his life, his benevolence and hospitality, and his unremitting attention to the happiness of the people entrusted to his care. He encouraged agriculture, established schools for the instruction of the children of the inhabitants of the island, translated some of his devotional pieces into the Manks' language, to render them more generally useful to them, and founded parochial libraries in every parish in his diocese. Some of his notions respecting government and church discipline were not of the most liberal kind: but his failings were so few, and his virtues so numerous and conspicuous, that he was a great blessing to the Isle of Man, and an ornament to human nature. Cardinal Fleury had so much veneration for his character, that, out of regard to him, he obtained an order from the court of France, that no privateer of that nation should ravage the Isle of Man.

The ecclesiastical government is well maintained in this island, and the livings are comfortable. The language, which is called the Manks, and is spoken by the common people, is radically Erse, or Irish, but with a mixture of other languages. The New Testament and the Common prayer book have been translated into the Manks' language. The natives, who amount to about 30,000, are inoffensive, charitable, and hospitable. The better sort live in stone houses, and the poorer in thatched; and their ordinary bread is made of oatmeal. Their products for exportation consist of wool, hides, and tallow; which they exchange with foreign shipping for commodities they may have occasion for from other parts. Before the south promontory of Man is a little island, called the Calf of Man: it is about three miles in circuit, and separated from Man by a channel about two furlongs broad.

This island affords some curiosities which may amuse an antiquary. They consist chiefly of Runic sepulchral inscriptions and monuments, of ancient brass daggers, and other weapons of that metal, and partly of pure gold, which are sometimes dug up, and seem to indicate the splendor of its ancient possessors.

## ISLE OF WIGHT.

THIS island is situated opposite the coast of Hampshire, from which it is separated by a channel, varying in breadth from two to seven miles; it is considered as part of the county of Southampton, and is within the diocese of Winchester. Its greatest length, extending from east to west, measures nearly twenty-three miles; its breadth, from north to south, above thirteen. The air is in general healthy, particularly in the southern parts: the soil is various; but so great is its fertility, that it was many years ago computed, that more wheat was grown here in one year than could be consumed by the inhabitants in eight; and it is supposed that its present produce, under the great improvements of agriculture, and the additional quantity of land lately brought into tillage, has more than kept pace with the increase of population. A range of hills, which afford fine pasture for sheep, extends from east to west, through the middle of the island. The interior parts of the island, as well as its extremities, afford a great number of beautiful and picturesque prospects, not only in the pastoral but also in the great and romantic style. Of these beauties the gentlemen of the island have availed themselves, as well in the choice of situations for their houses, as in their other improvements. Domestic fowls and poultry are bred here in great numbers; the outward-bound ships and vessels at Spithead, the Mother-bank, and Cowes, commonly furnishing themselves from this island.

Such is the purity of the air, the fertility of the soil, and the beauty and variety of the landscapes of this island, that it has been called the garden of England; it has some very fine gentlemen's seats; and it is often visited by parties of pleasure on account of its delightful scenes.

The island is divided into thirty parishes; and, according to a very accurate calculation made in the year 1777, the inhabitants then amounted to eighteen thousand and twenty-four, exclusive of the troops quartered there. Most of the farm-houses are built with stone, and even the cottages appear neat and comfortable, having each its little garden.

The town of Newport stands nearly in the centre of the island, of which it may be considered as the capital. The river Medina empties itself into the channel at Cowes harbour, distant about five miles, and, being navigable up to the quay, is very commodious for trade. The three principal streets of Newport extend from east to west, and are crossed at right angles by three others, all which are spacious, clean, and well paved.

Carisbrook castle, in the Isle of Wight, has been rendered remarkable by the confinement of king Charles I. who, taking refuge here, was detained a prisoner, from November 1647, to September 1648. After the execution of the king, this castle was converted into a place of confinement for his children; and his daughter, the princess Elizabeth, died in it. There are several other forts in this island, which were all erected about the 36th year of the reign of Henry VIII. when many other forts and blockhouses were built in different parts of the coast of England.

The **SCILLY ISLES**, anciently the **SILURES**, are a cluster of dangerous rocks, to the number of 140, lying about thirty miles from the Land's End in Cornwall, of which county they were reckoned a part. By their situation between the English Channel and St. George's Channel, they have been the destruction of many ships and lives. Sir Cloudesley Shovel, returning from a fruitless expedition against Toulon, was lost here in October, 1707. St. Mary's is the largest of these islands, being about nine or ten miles in circumference, and containing as many houses and inhabitants as all the rest. The number of the latter is about 700; several of the other islands are well inhabited, and have large and secure harbours.

In the English Channel are four islands subject to England: these are Jersey, Guernsey, Alderney, and Sark; which, though they lie much nearer to the coast of Normandy than to that of England, are within the diocese of Winchester. They lie in a cluster in Mount St. Michael's bay, between Cape la Hague in Normandy, and Cape Frebelle in Britany. The computed distance between Jersey and Sark is four leagues; and between that and Guernsey, seven leagues; and between the same and Alderney, nine leagues.

**JERSEY**, anciently **CÆSAREA**, was known to the Romans, and lies farthest within the bay, in forty-nine degrees seven minutes north latitude, and in the second degree twenty-six minutes west longitude, 18 miles west of Normandy, and 84 miles south of Portland. The north side is inaccessible through lofty cliffs; the south is almost level with the water; the higher land, in its midland part, is well planted, and abounds with orchards, from which is made an incredible quantity of excellent cider. The valleys are fruitful and well cultivated, and contain plenty of cattle and sheep. The inhabitants neglect tillage too much, being intent upon the culture of cider, the improvement of commerce, and particularly the manufacture of stockings. The honey in Jersey is remarkably fine; and the island is well supplied with fish and wild-fowl of almost every kind, some of both being peculiar to the island, and very delicious.

The island is not above twelve miles in length; but the air is so salubrious, that, in Camden's time, it was said there was here no business for a physician. The inhabitants in number are about 20,000, and are divided into twelve parishes. The capital town of St. Helier, or Hilary, which contains above 400 houses, has a good harbour and castle, and makes a handsome appearance. The property of this island belonged formerly to the Carterets, a Norman family, who have been always attached to the royal interest, and gave protection to Charles II. both when king and prince of Wales, at a time when no part of the British Cominions durst recognise him. The language of the inhabitants is French, with which most of them intermingle English words. Knit stockings and caps form their staple commodity; but they carry on a considerable trade in fish with Newfoundland, and dispose of their cargoes in the Mediterranean. The governor is appointed by the crown of England, but the civil administration rests with a bailiff, assisted by twelve jurors. As this island is the principal remain of the duchy of Normandy depending on the kings of England, it preserves the old feudal forms, and particularly the assembly of states, which is, as it were, a miniature of the British parliament, as settled in the time of Edward I.

**GUERNSEY** is thirteen miles and a half from south-west to north-east, and twelve and a half where broadest, east and west; has only ten parishes, to which there are but eight ministers, four of the parishes being united, and Alderney and Sark, which are appendages of Guern-

sey, forming each a separate parish with its appropriate minister. Though this is naturally a finer island than that of Jersey, yet it is far less valuable; because it is not so well cultivated, nor is it so populous. It abounds in cider. The inhabitants speak French. Want of fuel is the greatest inconvenience that both islands labour under. It is divided into ten parishes, with only eight churches. The convention of the states consists of a governor, coroners, jurats, clergy, and constables. The inhabitants carry on a considerable trade to Newfoundland and the Mediterranean. The staple manufacture is knit-stockings. The only harbour here is at St. Peter le Port, which is guarded by two forts, one called the Old-Castle, and the other Castle-Cornet. Guernsey is likewise part of the ancient Norman patrimony.

ALDERNEY is about eight miles in compass, and is by much the nearest of all these islands to Normandy, from which it is separated by a narrow strait, called the Race of Alderney, which is a dangerous passage in stormy weather, when the two currents meet; otherwise it is safe, and has depth of water for the largest ships. To the west lie a range of rocks extending near three leagues, called the Caskets, among which are several very dangerous whirlpools or eddies. The sons of king Henry I. were cast away and drowned here, passing to Normandy: here, likewise, the Victory man of war, commanded by admiral Balchen, was lost. This island is healthy, and the soil is remarkable for a fine breed of cows.

SARK is a small island depending upon Guernsey; the inhabitants are long-lived, and enjoy from nature all the conveniences of life; their number is about 300. The inhabitants of the three last-mentioned islands, together, are thought to be about 20,000. The religion of all the four islands is that of the church of England.

## IRELAND.

### SITUATION, BOUNDARIES, AND EXTENT.

THE island of Ireland is situated on the west side of England, between 6 and 10 degrees of west longitude, and between 51 and 55 degrees 30 minutes north latitude, or between the middle parallel of the eighth clime, where the longest day is 16½ hours, and the 24th parallel, or the end of the tenth clime, where the longest day is 17½ hours.

The extent or superficial content of this kingdom is, from the nearest computation and survey, found to be in length 285 miles from Fairhead north, to Mittenhead south; and from the east part of Down, to the west part of Mayo, its greatest breadth 160 miles; and to contain 11,067,712 Irish plantation acres, which makes 17,927,864 acres of English statute measure, and is held to bear proportion to England and Wales as 18 to 30. Mr. Templeman, who makes the length 275, and the breadth 150 miles, gives it an area of 27,457 square miles, with 127 inhabitants to each. From the east part of Wexford to St. David's in Wales, it is reckoned 45 miles, but the passage between Donaghadee and Portpatrick in Scotland is little more than twenty miles, and the passage from Dublin to Holyhead in North Wales, about 52 miles.

NAMES AND DIVISIONS. Many conjectures have been formed as to the Latin (Hibernia), the Irish (Erin), as well as the English name of this island. It probably takes its rise from a Phœnician or Gaelic term, signifying the farthest habitation westward.

It is rather extraordinary, that even modern authors are not agreed as to the divisions of Ireland; some dividing it into five circuits, and some into four provinces, those of Leinster, Ulster, Connaught, and Munster. The last division is the most common, and likewise the most ancient.

**CLIMATE, SEASONS, AND SOIL.]** The climate of Ireland differs not much from that of England, excepting that it is more moist; the seasons in general being much wetter. From the reports of various registers, it appears that the number of days on which rain had fallen in Ireland was much greater than in the same years in England. But without the evidence of registers, it is certain that moisture (even without rain) is not only more characteristic of the climate of this island than that of England, but is also one of the worst and most inconvenient circumstances. This is accounted for by observing, that, "the westerly winds, so favourable to other regions, and so benign even in this, by qualifying the rigour of the northern air, are yet hurtful in the extreme. Meeting with no lands on this side of America to break their force, and proving in general too powerful for the counteraction of the shifting winds from the eastern and African continents, they wait hither the vapours of an immense ocean. By this cause, the sky in Ireland is much obscured; and, from the nature of rest and condensation, these vapours descend in such constant rains, as threaten destruction to

the fruits of the earth in some seasons. This unavoidable evil from natural causes is aggravated by the increase of it from others, which are either moral or political. The hand of industry has been long idle in a country where almost every advantage must be obtained from its labour, and where discouragements on the labourer must necessarily produce a state of languor. Ever since the neglect of agriculture in the ninth century, the rains of so many ages subsiding on the lower grounds, have converted most of the extensive plains into mossy morasses, and near a tenth part of this beautiful isle is become a repository for stagnated waters, which, in the course of evaporation, impregnate the air with noxious exhalations\*. But, in many respects, the climate of Ireland is more agreeable than that of England—the summers being cooler, and the winters less severe. The piercing frosts, the deep snows, and the dreadful effects of thunder and lightning, which are so frequently observed in the latter kingdom, are never experienced here.

The dampness above alluded to, being peculiarly favourable to the growth of grass, has been urged as an argument why the inhabitants should confine their attention to the rearing of cattle, to the total desertion of tillage, and consequent injury to the growth of population; but the soil is so infinitely various, as to be capable of almost every species of cultivation suitable to such latitude, with a fertility equal to its variety. This is so conspicuous, that it has been observed by a respectable English traveller, that “natural fertility, acre for acre, over the two kingdoms, is certainly in favour of Ireland; of this there can scarcely be a doubt entertained, when it is considered that some of the more beautiful, and even best cultivated counties in England, owe almost every thing to the capital art and industry of its inhabitants.”

We shall conclude this article with the further sentiments of the same author (Mr. Young), whose knowledge of the subject, acquaintance with the kingdom, and candour, are unimpeachable:

“The circumstance which strikes me as the greatest singularity of Ireland is the rockiness of the soil; which should seem at first sight against that degree of fertility; but the contrary is the fact. Stone is so general, that I have good reason to believe the whole island is one vast rock of different strata and kinds rising out of the sea. I have rarely heard of any great depths being sunk without meeting with it. In general it appears on the surface in every part of the kingdom; the flattest and most fertile parts, as Limerick, Tipperary, and Meath, have it at no great depth, almost as much as the more barren ones. May we not recognise in this the hand of bounteous Providence, which has given, perhaps, the most stony soil in Europe to the moistest climate in it? If as much rain fell upon the clays in England (a soil very rarely met with in Ireland, and never without much stone), as falls upon the rocks of her sister island, those lands could not be cultivated. But the rocks here are clothed with verdure; those of lime stone, with only a thin covering of mould, have the softest and most beautiful turf imaginable.

“The rockiness of the soil in Ireland is so universal, that it predominates in every sort. One cannot use with propriety the terms clay, loam, sand, &c. it must be a stony clay, a stony loam, a gravelly sand. Clay, especially the yellow, is much talked of in Ireland; but it is for want of proper discrimination. I have once or twice seen almost a pure clay upon the surface; but it is extremely rare. The true yellow clay is usually found in a thin stratum, under the surface mould, and

over a rock; harsh, tenacious, stony, strong loams, difficult to work, are not uncommon, but they are quite different from English clays.

"Friable sandy loams, dry, but fertile, are very common, and they form the best soils in the kingdom for tillage and sheep. Tipperary and Roscommon abound particularly in them. The most fertile of all are the bullock pastures of Limerick, and the banks of the Shannon in Clare, called the Corcaffes. These are a mellow, putrid, friable loam.

"Sand, which is so common in England, and yet more common through France, Germany, and Poland, quite from Gibraltar to Peterburg, is no where met with in Ireland, except in narrow slips of hillocks, upon the sea-coast. Nor did I ever meet with or hear of a chalky soil.

"Besides the great fertility of the soil, there are other circumstances, which come within my sphere to mention. Few countries can be better watered by large and beautiful rivers; and it is remarkable that by much the finest parts of the kingdom are on the banks of these rivers. Witness the Suir, Blackwater, and Liffey, the Boyne, the Nore, the Barrow, and part of the Shannon; they wash a scenery that can hardly be exceeded. From the rockiness of the country, however, there are few of them that have not obstructions, which are great impediments to inland navigation.

"The mountains of Ireland give to travelling that interesting variety, which a flat country can never abound with; and, at the same time, they are not in such number as to confer the character of poverty which usually attends them. I was either upon or very near the most considerable in the kingdom, Mangerton, and the Reeks in Kerry; the Galties in Cork; those of Mourne in Down; Crow-Patrick and Nephin, in Mayo; these are the principal in Ireland; and they are of a character in height and sublimity, which should render them the object of every traveller's attention. The soil, though rocky, is extremely fertile, perhaps beyond that of England itself, when properly cultivated. Pasturage, tillage, and meadow ground abound in this kingdom; but of late tillage was too much discountenanced, though the ground is excellent for the culture of all grains; and in some of the northern parts of the kingdom, abundance of hemp and flax are raised, a cultivation of infinite advantage to the linen manufacture. Ireland rears vast numbers of black cattle and sheep, and the Irish wool is excellent. The prodigious supplies of butter and salt provisions (fish excepted) shipped at Cork, and carried to all parts of the world, afford the strongest proofs of the natural fertility of the Irish soil."

The bogs of Ireland are very extensive: that of Allen extends 80 miles, and is computed to contain 300,000 acres. There are others also which are very extensive, and smaller ones scattered over the whole kingdom; but it has been observed, that these are not in general more than are wanted for fuel.

RIVERS, BAYS, HARBOURS, } The numerous rivers, enchanting  
AND LAKES. } lakes, spacious bays, commodious havens, harbours, and creeks, with which Ireland abounds, greatly enrich and beautify this country. The Shannon issues from Lough-Allen, in the county of Leitrim, serves as a boundary between Connaught and the three other provinces, and, after a course of 150 miles, forming in its progress many beautiful lakes, falls into the Atlantic Ocean, between Kerry-point and Loop-head, where it is nine miles broad. The navigation of this river is interrupted by a ridge of rocks spreading quite across it, south of Killaloe; but this might be remedied by a short

canal, at the expense of 100,000 l. to be made with other falls into the ocean. The Channel at Drogheda is only remarkable for its harbour. The Channel of the kingdom, at the Channel at Waterford.

But the bays, upon the coast, form the finest harbours in any country. Considerable are the harbours of Waterford, Dundalk, Drogheda, Galway, Sligo, &c.

Ireland contains many lakes, called loughs. Many of them are very remarkable for their beauty. The most beautiful are the lakes of Killarney, which takes its name from the mountains, rocks, and woods which cover the lakes themselves. The bling over the plain. On the top of one of them is about a quarter of an acre. From the surface of the lake, it has a most astonishing view, but not unfrequently the water is so turbid as to form one of the most beautiful lakes in the world. The proprietor of the lake, which is called the lake of Killarney, has the most proper plan of these pieces of land. The peal of thunder is heard to die away among the mountains, and rain is falling. Among the vast and frightful horrid precipices, which have their

canal, at the expense of 10 or 12,000l.; and communication might also be made with other rivers, to the great benefit of the nation. The Ban falls into the ocean near Coleraine; the Boyne falls into St. George's Channel at Drogheda, as does the Liffey at the bay of Dublin; and is only remarkable for watering that capital, where it forms a spacious harbour. The Barrow, the Nore, and the Suir, water the south part of the kingdom, and, after uniting their streams below Ross, fall into the Channel at Waterford haven.

But the bays, havens, harbours, and creeks, which every-where indent the coast, form the chief glory of Ireland, and render that country beyond any country in Europe best fitted for foreign commerce. The most considerable are those of Carrickfergus, Strangford, Dundrum, Carlingford, Dundalk, Dublin, Waterford, Dungarvan, Cork, Kinsale, Ballymore, Glandore, Dunmanus, Bantry, Kenmare, Dingle, Shannonsmouth, Galway, Sligo, Donegall, Killebegs, Lough-Swilly, and Lough-Foyle.

Ireland contains a vast number of lakes, or, as they were formerly called, loughs, particularly in the provinces of Ulster and Connaught. Many of them produce large quantities of fine fish; and the great Lake Neagh, between the counties of Antrim, Down, and Armagh, is remarkable for its petrifying quality. Some of the Irish lakes afford the most beautiful and romantic prospects, particularly that of Killarney, which takes its name from a small town in the county of Kerry. This lake, which may be divided into three, is entirely surrounded with mountains, rocks, and precipices, the immense declivities of which are covered with woods, intermixed with ever-greens, from near their tops to the lakes themselves; among which are a number of rivulets tumbling over the precipices, some from heights of little less than 300 feet. On the top of one of the surrounding mountains is a small round lake, about a quarter of a mile in diameter, called the Devil's Punch-Bowl. From the surface of the lake to the top of the cavity, or brim of the bowl, may be about 300 yards; and when viewed from the circular top, it has a most astonishing appearance. The depth of it is vastly great, but not unfathomable, as the natives pretend. The discharge of the superfluous waters of this bowl, through a chasm into the middle lake, forms one of the finest cascades in the world, visible for 150 yards. The echoes among the hills surrounding the southern parts of the lake, which is mostly inclosed, are equally delightful and astonishing. The proprietor, the earl of Kenmore, has placed some cannon in the most proper places, for the amusement of travellers; and the discharge of these pieces is tremendous, resembling most the rolling of a violent peal of thunder, which seems to travel the surrounding scenery, and die away among the distant mountains. Here also musical instruments, especially the horn and trumpet, afford the most delightful entertainment, and raise a concert superior to that of a hundred performers. Among the vast and craggy heights that surround the lake, is one stupendous and frightful rock, the front of which towards the water is a most horrid precipice, called the *eagle's nest*, from the number of those birds which have their nests in that place.

[INLAND NAVIGATION.] The inland navigation of Ireland is very improveable, as appears from the canals that have lately been cut through different parts of the kingdom; one in particular, reaching an extent of 60 miles, between the Shannon and the Liffey at Dublin, which opens a communication from the Channel to the Atlantic Ocean. In surveying the grounds for this canal, it was found necessary to carry it through a bog 24 miles over, which, from the spongy nature of the soil became

a work of incredible labour and expence, in strengthening the sides, and other works, to prevent falling in.

**MOUNTAINS.]** The Irish language has been more happy in distinguishing the size of mountains than perhaps any other. A *knock* signifies a low hill, unconnected with any other eminence; *sieve* marks a craggy high mountain, gradually ascending and continued in several ridges; a *binn*, or *binn*, signifies a pinnacle, or mountain of the first magnitude, ending in a sharp or abrupt precipice. The two last are often seen and compounded together in one and the same range. Ireland, however, when compared with some other countries, is far from being mountainous. The mountains of Mourne and Iveagh, in the county of Down, are reckoned among some of the highest in the kingdom; of which *Slieu Denard* has been calculated at a perpendicular height of 1056 yards. Many other mountains are found in Ireland, which contain beds of primeals, coals, stone, slate, and marble, with veins of iron, lead, and copper.

**FORESTS.]** The chief forests in Ireland lie in Leinster, the King's and Queen's counties, and those of Wexford and Carlow. In Ulster there are great forests, as in the county of Donegall, and in the north part of Tyrone; also in the county of Fermanagh, along *Lough Erne*, and in the north part of the county of Down, wherein is found good timber; and the oak is esteemed as good as any of the English growth, and as fit for ship-building.

**METALS AND MINERALS.]** The mines of Ireland are late discoveries. Several contain silver and lead; and it is said that thirty pounds of their lead-ore produce a pound of silver; but the richest silver mine is at Wicklow; where some gold-ore has likewise been discovered, but it does not seem likely to prove very productive. A copper and lead mine have been discovered at Tipperary; as likewise iron-ore, and excellent free-stone for building. In one part of the kingdom is a stream of water, very much impregnated with copper, which yields great quantities of that metal. The method taken to obtain it, is by putting broad plates of iron into a place where the water falls from some height, so that they may receive the whole power of the falling water. The acid, which holds the copper in solution, lets it fall in order to dissolve the iron, to which it has a stronger affinity. On the iron the other metal appears in its proper form, incrusting the plate, and gradually penetrating it; so that, at last a plate of copper is left instead of iron. Hence, it is said by the vulgar, that this water has a power of changing iron into copper; but this is a mistake; for the iron is all dissolved and carried down the stream by the acid, which formerly held the copper in solution; while the latter, deprived of its solvent, which then rendered it invisible, only makes its appearance when the water lets it fall. Some of the Irish marble-quarries contain a kind of porphyry, being red striped with white. Quarries of fine slate are found in most of the counties. The coals that are dug at Kilkenny emit very little smoke; and it contains a crystalline stream which has no sediment. Those peculiarities, with the serenity of the air in that place, have given rise to the well-known proverb, "that Kilkenny contains fire without smoke, water without mud, and air without fog."

**VEGETABLE AND ANIMAL PRODUCTIONS BY SEA AND LAND.]** There is little that falls under this head that is peculiar to Ireland, her productions being much the same as those of England and Scotland. Ireland affords excellent turf and moss, which are of vast service for firing, where wood and coals are scarce. A few wolves

were formerly found in Ireland; but they have long since been exterminated by their wolf-dogs, which are much larger than mastiffs, shaped like greyhounds; yet as gentle and governable as spaniels. What has been already observed about the Irish exportation of salt provisions sufficiently evinces the prodigious numbers of hogs and sheep, as well as black cattle, bred in that kingdom. Rabbits are said to be more plentiful there than in England. The fish that are caught upon the coasts of Ireland are likewise in greater plenty than on those of England, and some of them larger and more excellent in their kind.

At the commencement of the present century, the number of inhabitants in Ireland was thought to be about two millions; whereas, in 1672, there were, according to sir William Petty, no more than 1,100,000. But from the accounts laid before the house of commons in 1786; (as returned by the hearth-money collectors); the number of houses in Ireland amounted to 474,234. If we add to this the probable increase since, and allow for the numbers intentionally or unavoidably overlooked in such returns, we may reasonably conclude that the present actual amount is 300,000.

We are next to consider what average number of persons we should allow to each house. In the peasants' cottages in Ireland (perhaps the most populous in the world), Mr. Young in some parts found the average 6 and  $6\frac{1}{2}$ ; others have found it in different places to be 7; and Dr. Hamilton, in his account of the island of Raghery, enumerates the houses, and discovered the average therein to be 8. In the cities and principal towns, the houses, particularly in the manufacturing parts, generally contain several families; and from different accounts, the numbers in such are from 10 up so high as 70\*.

From these *data*, then, it will not perhaps be erroneous, if we fix the average for the whole island at 8 persons to each house; which, multiplied by the number of houses, makes the population of Ireland amount to four millions.

As to the manners of the ancient Irish, Dr. Leland observes, that if we make our inquiries on this subject in English writers, we find their representations odious and disgusting: if from writers of their own race, they frequently break out into the most animated encomiums of their great ancestors. The one can scarcely allow them any virtue: the other, in their enthusiastic ardour, can scarcely discover the least imperfection in their laws, government, or manners. The historian of England sometimes regards them as the most detestable and contemptible of the human race. The antiquary of Ireland raises them to an illustrious eminence above all other European countries. Yet when we examine their records, without regard to legendary tales or poetic fictions, we find them, even in their most brilliant periods, advanced only to an imperfect civilisation; a state which exhibits the most striking instances both of the virtues and the vices of humanity.

With respect to the present descendants of the old Irish, or, as they are termed by the protestants, the *mere Irish*, they are generally represented as an ignorant, uncivilised, and blundering sort of people. Impatient of abuse and injury, they are implacable and violent in all their affections; but quick of apprehension, courteous to strangers, and patient of hardship. Though in these respects there is, perhaps, little difference between them and the more uninformed part of their neigh-

\* Dr. Tisdal enumerated the inhabitants of two parishes in Dublin, in 1731, and averaged the number in each house at 12 $\frac{1}{2}$ . The numbers varied from 10 to 70. Phil. Surv. of South of Ireland.

bours, yet their barbarisms are more easy to be accounted for, from accidental than natural causes. By far the greater number of them are papists; and it is the interest of their priests, who govern them with absolute sway, to keep them in the most profound ignorance. They have also laboured under many discouragements, which in their own country have prevented the exertion both of their mental and bodily faculties; but when employed in the service of foreign princes, they have been distinguished for intrepidity, courage, and fidelity. Many of their surnames have an *O*, or *Mac*, placed before them, which signify grandson and son. Formerly the *O* was used by their chiefs only, or such as piqued themselves on the antiquity of their families. Their music is the bagpipe, but their tunes are generally of a melancholy strain; though some of their latest airs are lively, and, when sung by an Irishman, are extremely diverting. The old Irish is generally spoken in the interior parts of the kingdom, where some of the old uncouth customs still prevail, particularly their funeral howlings; but this custom may be traced in many countries of the continent. Their custom of placing a dead corpse before their doors, laid out upon tables, having a plate upon the body to excite the charity of passengers, is practised even in the skirts of Dublin, though one would wish to see it abolished. Their convivial meetings on Sunday afternoon, with dancing to the bagpipe, and more often quarrelling among themselves, is offensive to every stranger. But, as we have already observed, these customs are chiefly confined to the more unpolished provinces of the kingdom, particularly Connaught—the common people there having the least sense of law and government of any in Ireland, while their tyrannical landlords or leaseholders squeeze the poor without mercy. The common Irish, in their manner of living, seem to resemble the ancient Britons, as described by Roman authors, or the present Indian inhabitants of America. Mean huts or cabins built of clay and straw, partitioned in the middle by a wall of the same materials, serve the double purposes of accommodating the family, who live and sleep promiscuously, having their fires of turf in the middle of the floor, with an opening through the roof for a chimney; the other being occupied by a cow, or such pieces of furniture as are not in immediate use.

Their wealth consists of a cow, sometimes a horse, some poultry, and a spot for potatoes. Coarse bred, potatoes, eggs, milk, and sometimes fish, constitute their food; for, however plentifully the fields may be stocked with cattle, these poor natives seldom taste butchers' meat of any kind. Their children, plump, robust, and hearty, scarcely know the use of clothes, and are not ashamed to appear naked in the roads, and gaze upon strangers.

In this idle and deplorable state, many thousands have been lost to the community, and to themselves, who, if they had but an equal chance with their neighbours, of being instructed in the real principles of Christianity, and being inured and encouraged to industry and labour, would have added considerable strength to government.

The descendants of the English and Scots, since the conquest of Ireland by Henry II. though not the most numerous, form the wealthiest part of the nation. Of these are most of the nobility, gentry, and principal traders, who inhabit the eastern and northern coasts, where most of the trade of Ireland is carried on, especially Belfast, Londonderry, and other parts of the province of Ulster, which, though the poorest soil, is, next to Dublin and its neighbourhood, by far the best cultivated and most flourishing part of the kingdom. of Scots in the reign of James I. and other presbyterians who fled from persecution in that country in the succeeding reigns, planted themselves, and established that great staple of Irish wealth, the linen manufacture, which they have since carried on and brought to the utmost perfection. From this short review, it appears, that the present inhabitants are composed of three distinct classes of people; the old Irish, poor, ignorant, and depressed, who inhabit, or rather exist upon, the interior and western parts; the descendants of the English, who inhabit Dublin, Waterford, and Cork; and who gave a new appearance to the whole coast facing England; by the introduction of arts, commerce, science, and more liberal and cultivated ideas of the true God and primitive Christianity; thirdly, emigrants from Scotland in the northern provinces, who, like the others, are so zealously attached to their own religion and manner of living, that it will require some ages before the inhabitants of Ireland are so thoroughly consolidated and blended as to become one people. The gentry, and better sort of the Irish nation, in general differ little in language, dress, manners, and customs, from those of the same rank in Great Britain, whom they imitate. Their hospitality is well known; but in this they are sometimes suspected of more ostentation than real friendship.

**RELIGION.]** The established religion and ecclesiastical discipline of Ireland is the same with that of England. Among the bulk of the people in the most uncultivated parts, popery, and that too of the most absurd, illiberal kind, is prevalent. The Irish papists still retain their nominal bishops and dignitaries, who subsist on the voluntary contributions of their votaries. But even the blind submission of the latter to their clergy does not prevent protestantism from making a very rapid progress in the towns and communities. How far it may be the interest of England, that some kind of balance between the two religions should be kept up, we shall not here inquire.

Ireland contains at least as many sectaries as England, particularly presbyterians, baptists, quakers, and methodists, who are all of them connived at or tolerated. Great efforts have been made, ever since the days of James I. in erecting free-schools for civilising and converting the Irish papists to protestantism. The institution of the incorporated society for promoting English protestant working schools, though of no older date than 1717, has been amazingly successful, as have been many institutions of the same kind, in introducing industry and knowledge among the Irish.

**ARCHBISHOPRICKS AND BISHOPRICKS.]** The archbishopricks are four; Armagh, Dublin, Cashel, and Tuam.

The bishopricks are eighteen, viz. Clogher, Clonfert, Cloyne, Cork, Derry, Down, Dromore, Elphin, Kildare, Killala, Kilmore, Killaloe, Leighlin, Limerick, Meath, Ossory, Raphoe, and Waterford.

**LANGUAGE.]** The language of the Irish is fundamentally the same with the British and Welch, and a dialect of the Celtic, which is made use of by the Scotch Highlanders, opposite the Irish coast. It is, however, in a great measure defaced by provincial alterations, but not so altered as to render the Irish, Welch, and Highlanders, unintelligible to each other. The usage of the Irish language occasions among the common people, who speak both that and the English, a disagreeable tone in speaking, which diffuses itself among the vulgar in general, and even among the better sort who do not understand Irish. It is probable, that a few ages hence the latter will be accounted among the dead languages.

**LEARNING AND LEARNED MEN.]** Learning seems to have been cultivated in Ireland at a very early period. Mr. O'Halloran says, that the Irish "appear to have been, from the most remote antiquity, a polished people, and that with propriety they may be called the fathers of letters." We are even told that Egypt received arts and letters from Niulus the Phoenician, who is represented as the great ancestor of the Irish nation. But certainly no literary monuments have yet been discovered in Ireland earlier than the introduction of Christianity into this country; and the evidence of any transaction, previous to this period, rests entirely on fabulous tradition, or, at least, very doubtful authority.

It is said, that when St. Patrick\* landed in Ireland, he found many holy and learned Christian preachers there, whose votaries were pious and obedient. Camden observes, that "the Irish scholars of St. Patrick profited so notably in Christianity, that, in the succeeding age, Ireland was termed *Sanctorum Patria*. Their monks so greatly excelled in learning and piety, that they sent whole flocks of most learned men into all parts of Europe, who were the first founders of Lieuxc-abbey, in Burgundy; of the abbey of Bobie, in Italy; of Wirzburg, in Franconia; St. Gall, in Switzerland; and of Malmesbury, Lindisfarra, and many other monasteries, in Britain." We have also the testimony of venerable Bede, that, about the middle of the seventh century, many nobles, and other orders of the Anglo-Saxons, retired from their own country into Ireland, either for instruction, or for an opportunity of living in monasteries of stricter discipline; and that the Scots (as he styles the Irish) maintained them, taught them, and furnished them with books, without fee or reward: "a most honourable testimony," says lord Lyttleton, "not only to the learning, but likewise to the hospitality and bounty of that nation." Dr. Leland remarks, that a conflux of foreigners to a retired island, at a time when Europe was in ignorance and confusion, gave peculiar lustre to this seat of learning: nor is it improbable or surprising, that seven thousand students studied at Armagh, agreeable to the accounts of Irish writers, though the seminary of Armagh was but one of the many colleges erected in Ireland.

In modern times, the Irish have also distinguished themselves in the republic of letters. Archbishop Usher does honour to literature itself. Dean Swift, who was a native of Ireland, has perhaps never been equalled in the walks of wit, humour, and satire. The sprightliness of Farquhar's wit is well known to all lovers of the drama. And among the men of distinguished genius whom Ireland has produced, may also be particularly mentioned sir Richard Steele, bishop Berkeley, Parnel, Sterne, Goldsmith, and the late celebrated Mr. Burke.

**UNIVERSITY.]** Ireland contains but one university, which is denominated Trinity-college. It consists of two squares, in the whole of which are thirty-three buildings, of eight rooms each. Three sides of one of the squares are of brick, and the fourth is a very superb library; but being built of bad stone, it is unfortunately mouldering away. The inside is beautiful and commodious, and embellished with the busts of several ancient and modern worthies. A great part of the books on one side were collected by archbishop Usher, who was one of the original members of this body, and the most learned man it ever produced. The

\* It has been affirmed, that St. Patrick was a Scotchman; but Mr. O'Halloran denies this, and says, that "it appears from the most authentic records, that Patrick was from Wales."

new square, three sides of which have been built within about twenty years, by parliamentary bounty, and from thence called Parliament-square, is of hewn stone; and the front of it, next the city of Dublin, is ornamented with pilasters, festoons, &c. The provost's house has an elegant little front, entirely of Portland-stone. The chapel is a very mean structure, as is also the old hall, wherein college exercises are performed; but the new hall, in which the members of the college dine, is a fair and large room. In their museum, is a set of figures in wax, representing females in every state of pregnancy. They are done upon real skeletons, and are the labours of almost the whole life of a French artist.

This seminary was founded and endowed by queen Elizabeth; but the original foundation consisted only of a provost, three fellows, and three scholars; which has from time to time been augmented to twenty-two fellows, seventy scholars, and thirty sizers. However, the whole number of students is at present about four hundred, who are of three classes—fellow-commoners, pensioners, and sizers or servitors. Of the fellows, several are called seniors; and the annual income of each of these is about seven hundred pounds. The provostship is supposed to be worth three thousand pounds a year. Trinity-college has a power of conferring degrees of bachelors, masters, and doctors, in all the arts or faculties. The visitors are, the chancellor or vice-chancellor, and the archbishop of Dublin.

ANTIQUITIES AND CURIOSITIES, } The wolf dogs of Ireland have  
NATURAL AND ARTIFICIAL. } already been mentioned. The  
Irish gothawks and gersfalcons are celebrated for their shape and beauty. The moose-deer is thought to have been formerly a native of this island, their horns being sometimes dug up of so great a size, that one pair has been found near eleven feet from the tip of the right horn to the tip of the left; but the greatest natural curiosity in Ireland is the Giant's Causeway in the county of Antrim, about eight miles from Colerain, which is thus described by Dr. Pococke, late bishop of Ossory, a celebrated traveller and antiquary. He says, that he measured the most westerly point at high water, to the distance of 360 feet from the cliff; but he was told, that at low water it extended 60 feet farther upon a descent, till it was lost in the sea. Upon measuring the eastern point, he found it 540 feet from the cliff; and saw as much more of it as of the other, where it winds to the east, and is, like that, lost in the water.

“ The causeway is composed of pillars, all of angular shapes, from three sides to eight. The eastern point, where it joins the rock, terminates in a perpendicular cliff, formed by the upright sides of the pillars, some of which are thirty-three feet four inches high. Each pillar consists of several joints or stones, lying one upon another, from six inches to about one foot in thickness; and, what is very surprising, some of these joints are so convex, that their prominences are nearly quarters of spheres, round each of which is a ledge, which holds them together with the greatest firmness, every stone being concave on the other side, and sitting in the exactest manner the convexity of the upper part of that beneath it. The pillars are from one to two feet in diameter, and generally consist of about forty joints, most of which separate very easily; and one may walk along upon the tops of the pillars as far as to the edge of the water.

“ But this is not the most singular part of this extraordinary curiosity, the cliffs themselves being still more surprising. From the bottom,

which is of black stone, to the height of about sixty feet, they are divided at equal distances by stripes of a reddish stone, that resembles a cement, about four inches in thickness; upon this there is another stratum of the same black stone, with a stratum of five inches thick of the red. Over this is another stratum, ten feet thick, divided in the same manner; then a stratum of the red stone twenty feet deep, and above that a stratum of upright pillars; above these pillars lies another stratum of black stone, twenty feet high; and above this again, another stratum of upright pillars, rising in some places to the tops of the cliffs, in others not so high, and in others again above it, where they are called the chimneys. The face of these cliffs extends about three English miles.

The cavities, the romantic prospects, cataracts, and other pleasing and uncommon natural objects to be met with in Ireland, are too numerous to be called rarities; and several pamphlets have been employed in describing them. As to the artificial rarities in Ireland, the chief are the round Pharos, or stone towers, found upon the coasts, and supposed to be built by the Danes and Norwegians in their piratical incursions, who made use of them as spy-towers or barbicans, light-houses or beacons.

CITIES, TOWNS, FORTS, AND OTHER }  
 EDIFICES, PUBLIC AND PRIVATE. } Dublin, the capital of Ire-  
 land, is, in magnitude and  
 the number of inhabitants, the second city in the British dominions; much about the size of Stockholm, Copenhagen, Berlin and Marfeilles, and is supposed to contain about 156,000 inhabitants. It is situated 270 miles north-west of London, and near sixty miles west from Holyhead in North Wales, the usual station of the passage-vessels between Great Britain and Ireland. Dublin stands about seven miles from the sea, at the bottom of a large and spacious bay, to which it gives name, upon the river Liffey, which divides it almost into two equal parts, and is banked in, through the whole length of the city, on both sides, which form spacious and noble quays, where vessels below the first bridge load and unload before the merchants' doors and warehouses. A stranger, upon entering the bay of Dublin, which is about seven miles broad, and in stormy weather extremely dangerous, is agreeably surprised with the beautiful prospect on each side, and the distant view of Wicklow mountains; but Dublin, from its low situation, makes no great appearance. The increase of Dublin within these last twenty years is incredible, and it is generally supposed that 7000 houses have been added to the city and suburbs since the reign of queen Anne. The number of houses in the year 1777, was 17,151, and are now estimated at not less than 22,000. This city, in its appearance, bears a near resemblance to London. The houses are of brick; the old streets are narrow and mean, but the new streets are as elegant as those of the metropolis of Great Britain. Sackville-street, which is sometimes called the Mall, is particularly noble. The houses are elegant, lofty, and uniformly built, and a gravel-walk runs through the whole at an equal distance from the sides.

The river Liffey, though navigable for sea vessels as far as the custom-house, or centre of the city, is but small, when compared with the Thames at London. Over it are two handsome bridges, lately built, of stone, in imitation of that at Westminster, and there are three others that have little to recommend them. Formerly the centre of Dublin, towards the custom-house, was crowded and inconvenient for commercial purposes; but of late a new street has been opened, leading from Essex bridge to the castle, where the lord-lieutenant resides. A new exchange has been lately erected, an elegant structure of white stone, richly

embellished with semi-columns of the Corinthian order, a cupola, and other ornaments.

The barracks are pleasantly situated on an eminence near the river. They consist of four large courts, in which are generally quartered four battalions of foot, and one regiment of horse; from hence the castle and city guards are relieved daily. They are said to be the largest and completest building of the kind in Europe, being capable of containing 3000 foot and 1000 horse.

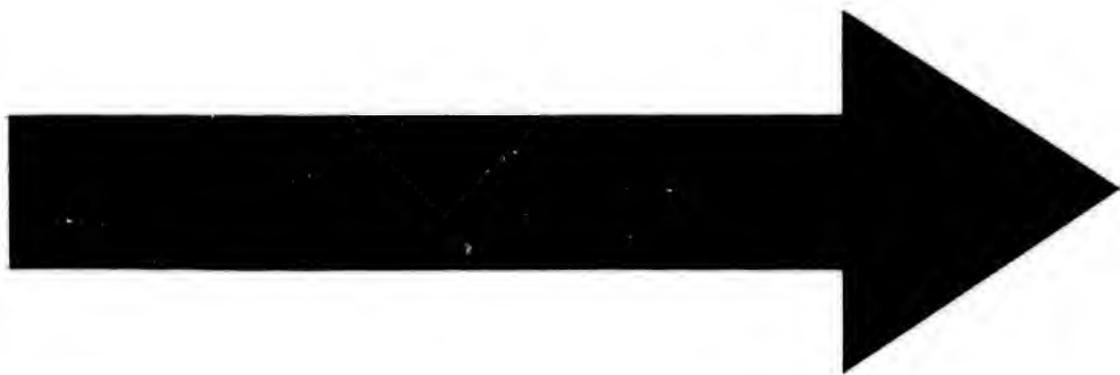

The linen-hall was erected at the public expence, and opened in the year 1728, for the reception of such linen cloths as were brought to Dublin for sale, for which there are convenient apartments. It is entirely under the direction of the trustees for the encouragement of the linen manufactory of Ireland, who are composed of the lord chancellor, the primate, the archbishop of Dublin, and the principal part of the nobility and gentry. This national institution is productive of great advantage, by preventing many frauds which otherwise would be committed in a capital branch of trade, by which many thousands are employed, and the kingdom greatly enriched.

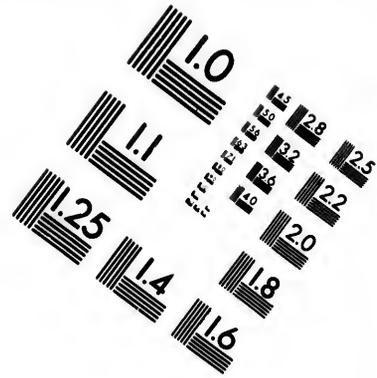

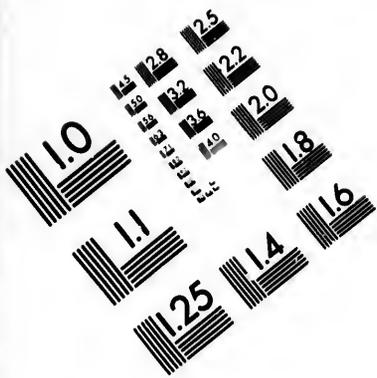

Stephen's Green is a most extensive square, round which is a gravel-walk of near a mile. Here genteel company walk in the evenings, and on Sundays after two o'clock, and in fine weather make a very gay appearance. Many of the houses round the green are very stately; but a want of uniformity is observable throughout the whole. Ample amends will be made for this defect by another spacious square near Stephen's Green, now laid out and partly built. The houses being lofty, uniform, and carried on with stone as far as the first floor, will give the whole an air of magnificence, not exceeded by any thing of the kind in Britain, if we except Bath. The front of Trinity-college, extending above 300 feet, is built of Portland-stone in the finest taste.

The parliament house was begun in 1729, and finished in 1739, at the expence of 40,000*l*. This superb pile was in general of the Ionic order, and was justly accounted one of the foremost architectural beauties. The portico in particular was, perhaps, without parallel; the internal parts had also many beauties, and the manner in which the building was lighted has been much admired. This superb building, on the 27<sup>th</sup> of February, 1792, was observed to be in flames, about five o'clock in the afternoon, when the house of lords, as well as the commons, was sitting, and in full debate. When the alarm was given, one of the members made his way to the roof, and looking down into the house from one of the ventilators, confirmed the apprehensions of those within, by saying the dome was surrounded by fire, and would tumble into the house in five minutes. The volume of fire, by which the dome was surrounded, soon made apertures on all sides, by melting the copper from the wood-work, and thus exhibiting the cavity of the dome filled with flames like a large furnace, which at about half past six tumbled into the house with one great crash. The valuable library, and all the papers of importance, were saved. It has since been rebuilt, and restored to its former elegance and beauty.

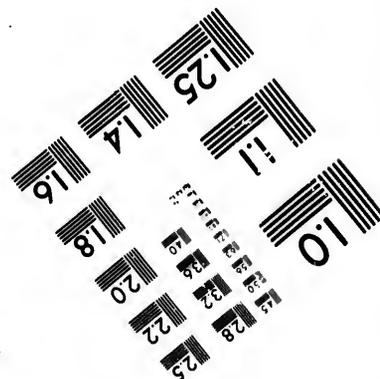

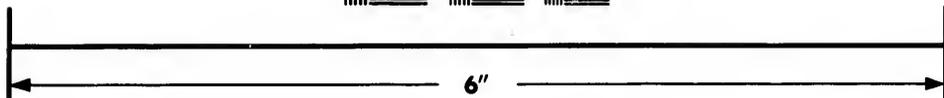

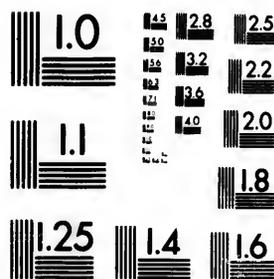

But one of the greatest and most laudable undertakings that this age can boast of, is the building of a stone wall about the breadth of a moderate street, and of a proportionable height, and three miles in length, to confine the channel of the bay, and to shelter vessels in stormy weather.

The civil government of Dublin is by a lord-mayor, &c. the same as in London. Every third year, the lord-mayor, and the twenty-four

companies, by virtue of an old charter, are obliged to perambulate the city, and its liberties, which they call riding the franchises. Upon this occasion the citizens vie with each other in show and ostentation, which is sometimes productive of disagreeable consequences to many of their families. In Dublin there are two large theatres, that are generally well filled, and which serve as a kind of nursery to those in London. In this city are eighteen parish-churches, eight chapels, three churches for French, and one for Dutch protestants, seven presbyterian meeting-houses, two for methodists, two for quakers, and sixteen Roman catholic chapels. A royal hospital, like that at Chelsea, for invalids; a lying-in hospital, with gardens; built and laid out in the finest taste; an hospital for lunatics, founded by the famous Dean Swift, who himself died a lunatic; and sundry other hospitals for patients of every description. Some of the churches have been lately rebuilt, and others are rebuilding, in a more elegant manner. And, indeed, whatever way a stranger turns himself in this city, he will perceive a spirit of elegance and magnificence; and if he extends his view over the whole kingdom, he will be convinced that works of ornament and public utility are no where more encouraged than in Ireland, chiefly through the munificence of parliament.

It has, however, been matter of surprise, that, with all this spirit of national improvement, few or no good inns are to be met with in Ireland. In the capital, which may be classed among the second order of cities of Europe, there is not one inn which deserves that name. This may, in some measure, be accounted for, by the long and sometimes dangerous passage from Chester and Holyhead to Ireland, which prevents the gentry of England, with their families, from visiting that island; but as it is now proposed to make turnpike-roads to Portpatrick in Scotland, from whence the passage is short and safe, the roads of Ireland may, by this means, become more frequented, especially when the rural beauties of that kingdom are more generally known. For though, in England, France, and Italy, a traveller meets with views the most luxuriant and rich; he is sometimes cloyed with a sameness that runs through the whole; but in North Britain and Ireland, the rugged mountains, whose tops look down upon the clouds, the extensive lakes, enriched with bushy islands, the cavities, glens, and cataracts, have a wonderful effect upon the imagination of every admirer of nature, however rough and unadorned with artificial beauties.

Cork is deservedly reckoned the second city in Ireland, in magnitude, riches, and commerce. It lies 129 miles south-west of Dublin, and contains above 8500 houses. Its haven is deep, and well sheltered from all winds; but small vessels only can come up to the city, which stands about seven miles up the river Lee. This is the chief port of merchants in the kingdom; and there is, perhaps, more beef, tallow, and butter shipped off here, than in all the other ports of Ireland put together. Hence there is a great resort of ships to this port, particularly of those bound from Great Britain to Jamaica, Barbadoes, and all the Caribbee islands, which put in here to victual and complete their lading. It appears, that in the reign of Edward IV. there were 11 churches in Cork; though there are now only seven, and yet it has ever since that time been esteemed a thriving city: but it must be observed, that, besides the churches, there are at this time six mass-houses, two dissenting meeting-houses, another for quakers, and a chapel for French protestants. Kinsale is a populous and strong town, with an excellent harbour, and considerable commerce and shipping; and it is, moreover, occasionally a station for the navy royal; for which end this port is furnished with

proper naval officers. Cork for riches is ranked by Dun-  
del. Limerick lies on both sides.

Belfast is a large Water, where it rising linen is deemed the capital, but little (called) stands on features, with so is situated so near Donegall, the county of Tyrone. All which considerable ones facturing of linen dom, which, by enabled to pay for land; and likewise into England, by

to £4,575,256, and their inland manufactures and their lord-lieutenant by their examples, no other.

PUBLIC TRADING management of manu-

proper naval officers and storekeepers. Waterford is reckoned next to Cork for riches and shipping, and contains 2561 houses. It is commanded by Duncannon Fort, and on the west side of the town is a citadel. Limerick is a handsome, populous, commercial, strong city; it lies on both sides the Shannon, and contains 5257 houses.

Belfast is a large sea-port and trading town at the mouth of the Lagan Water, where it falls into Carrickfergus Bay. Downpatrick has a flourishing linen manufacture. Carrickfergus (or Knockfergus), by some deemed the capital town of the province, has a good harbour and castle, but little commerce. Derry (or Londonderry, as it is most usually called) stands on Lough-Foyl, is a strong little city, having linen manufactures, with some shipping. All this extreme north part of Ireland is situated so near to Scotland, that they are in sight of each other's coasts: Donegall, the county town of the same name (otherwise called the county of Tyrconnel), is a place of some trade; as is likewise Enniskilling. All which last mentioned places, and many more (though less considerable ones), are chiefly and industriously employed in the manufacturing of linen and linen-thread, to the benefit of the whole kingdom, which, by its vast annual exportations of linen into England, is enabled to pay for the great annual importations from England into Ireland; and likewise to render the money constantly drawn from Ireland into England, by her absentees, less grievous to her.

Though Ireland contains no strong places, according to the modern improvements in fortification, yet it has several forts and garrisons, that serve as comfortable sinecures to military officers. The chief are Londonderry, and Culmore Fort, Cork, Limerick, Kinsale, Duncannon, Ross-Castle, Dublin, Charlemont, Galway, Carrickfergus, Maryborough, and Athlone. Each of these forts is furnished with deputy-governors, under various denominations, who have pecuniary provisions from the government.

It cannot be pretended, that Ireland is as yet furnished with any public edifices, to compare with those to be found in countries where sovereigns and their courts reside; but it has some elegant public buildings, which do honour to the taste and public spirit of the inhabitants. The castle, Essex-bridge, and several edifices about Dublin, already mentioned, are magnificent and elegant pieces of architecture; and many noble Gothic churches, and other buildings, are to be seen in Ireland.

The Irish nobility, and gentry of fortune, now vie with those of England in the magnificent structure of their houses, and the elegance of their ornaments. In speaking of the public buildings of this kingdom, we must not forget the numerous barracks where the soldiers are lodged, equally to the ease and conveniency of the inhabitants.

[COMMERCE AND MANUFACTURES.] The exports of Ireland are linen cloth, yarn, lawns, and cambrics, horses, and black cattle, beef, pork, green hides, tanned leather, calf-skins dried, tallow, butter, candles, cheese, ox and cow-horns, ox-hair, horse-hair, lead, copper ore, herrings, dried fish, rabbit-skins and fur, otter-skins, goat-skins, salmon, and some other particulars. In the year 1799, the exports from Ireland amounted to £4,575,256, and her imports to £4,396,009. The Irish have carried their inland manufactures, even those of luxury, to a considerable height; and their lord-lieutenants and their courts have of late encouraged them by their examples, and, while they are in that government, make use of no other.

[PUBLIC TRADING COMPANIES.] The Dublin Society for the encouragement of manufactures and commerce, was incorporated in 1760:

The linen-hall, erected at Dublin, is under as just and nice regulations as any commercial house in Europe.

**CONSTITUTION AND GOVERNMENT.]** Ireland formerly was only entitled the dominion or lordship of Ireland, and the king's style was no other than Dominus Hiberniæ, lord of Ireland, till the 33d year of king Henry VIII. when he assumed the title of king, which is recognised by act of parliament in the same reign. But as England and Scotland are now one and the same kingdom, and yet differ in their municipal laws, so England and Ireland are distinct kingdoms, and yet in general agree in their laws. For, after the conquest of Ireland by king Henry II. the laws of England were received and sworn to by the Irish nation, assembled at the council of Lismore. And as Ireland, thus conquered, planted, and governed, continued in a state of dependence, it was thought necessary that it should conform to, and be obliged by, such laws as the superior state thought proper to prescribe.

But this state of dependence being almost forgotten, and ready to be disputed by the Irish nation, it was thought necessary some years ago to declare how that matter stood: and therefore, by statute 6th of George I. it was declared, "that the kingdom of Ireland ought to be subordinate to, and dependent upon, the imperial crown of Great Britain, as being inseparably united thereto; and that the king's majesty, with the consent of the lords and commons of Great Britain in parliament, hath power to make laws to bind the people of Ireland." This determination of the British parliament, however, occasioned much dissatisfaction among the Irish, who at length, after many struggles, feeling their own strength by means of their volunteer associations, and encouraged and favoured by the several parties contending for the administration in England, the Irish obtained in the year 1782 a formal repeal of the above galling statute, which was considered as a renunciation on the part of the parliament of Great Britain of every claim of legislation over Ireland.

The constitution of the Irish government, as it stands at present, with regard to distributive justice, is nearly the same with that of England. A chief governor, who generally goes by the name of lord-lieutenant, is sent over from England by the king, whom he represents; but his power is in some measure restrained, and in others enlarged, according to the king's pleasure, or the exigency of the times. On his entering upon this honourable office, his letters patent are publicly read in the council-chamber; and having taken the usual oaths before the lord-chancellor, the sword, which is to be carried before him, is delivered into his hands, and he is seated in the chair of state, attended by the lord-chancellor, the members of the privy-council, the peers and nobles, the king at arms, a serjeant at mace, and other officers of state; and he never appears publicly without being attended by a body of horse-guards. Hence, with respect to his authority, his train, and splendor, there is no viceroy in Christendom that comes nearer to the grandeur and majesty of a king. He has a council composed of the great officers of the crown; namely, the chancellor, treasurer, and such of the archbishops, bishops, earls, barons, judges, and gentlemen, as his majesty is pleased to appoint. The parliament here, as well as in England, is the supreme court, which is convened by the king's writ, and generally sits once every year. It consists, as in England, of a house of lords, and commons. Of the former, many are English or British peers, or commons of Great Britain; a few are papists, who cannot sit without being properly qualified; and the number of commons amounts to about three hundred. Since the accep-

tion of his preferential. The repeal of many instances, passed by the royal approbation, they pass the great England is now voted by both houses beginning of the year.

For the regulation held annually for chancery, king's writs of the several are now nominated appears that the constitution in Ireland as in England.

**COINS.]** The coins and the like pass in Ireland for money as at present.

**MILITARY STRENGTH.]** The threats of a French army kept up in Ireland land, Irish militia men voted by the last year (1800):

ordered to march to the assistance of the British army in the year 1800.

**ORDER OF ST. PATRICK.]** The institution of the order, in 1783. It consists of the lord-lieutenant, the bishop of Dublin, and the knights of the order. The bishop of Dublin is the head of the order. The knights of the order are appointed by the lord-lieutenant, and their robes are of a cross.

tion of his present majesty, Irish parliaments have been rendered ostentatious. The representation of the people in the senate of Ireland is, in many instances, like that of England, partial and imperfect. The acts passed by the houses of lords and commons are sent to England for the royal approbation, when, if approved of by his majesty and council, they pass the great seal of England, and are returned. An union with England is now under discussion in the Irish parliament; it has been voted by both houses, and will probably be carried into effect in the beginning of the year 1801.

For the regular distribution of justice, there are in Ireland four terms held annually for the decision of causes; and four courts of justice,—the chancery, king's bench, common-pleas, and exchequer. The high sheriffs of the several counties were formerly chosen by the people, but are now nominated by the lord-lieutenant. From this general view, it appears that the civil and ecclesiastical institutions are almost the same in Ireland as in England.

**REVENUES.]** In Ireland the public revenue arises from hereditary and temporary duties, of which the king is the trustee, for applying it to particular purposes: but there is, besides this, a private revenue arising from the ancient demesne lands, from forfeitures for treason and felony, prize of wines, light-house duties, and a small part of the casual revenue, not granted by parliament; and in this the crown has the same unlimited property that a subject has in his own freehold. The extent of that revenue is perhaps a secret to the public.

The revenue of Ireland is supposed at present to amount to two millions sterling, of which the Irish complain greatly, and justly, that above 100,000*l.* is granted in pensions, and a great part to absentees. Very large sums are also granted by their own parliament for more valuable purposes, the improvement of their country and civilising the people; such as the inland navigation, bridges, highways, churches, premiums, protestant schools, and other particulars, which do honour to the wisdom and patriotism of that parliament.

**COINS.]** The coins of Ireland are at present of the same denominations and the like fabric with those of England, only an English shilling passes in Ireland for thirteen pence. What the ancient coins of the Irish were is at present a matter of mere curiosity and great uncertainty.

**MILITARY STRENGTH.]** In consequence of the late rebellion, and the threats of a French invasion, a very considerable military force is now kept up in Ireland; consisting of regular troops and militia from England, Irish militia, and yeomanry. The following is the number of men voted by the Irish house of commons to be maintained for the present year (1800):

Regular force	45,839
Militia	27,104
Yeomanry	53,537
Total	126,500

**ORDER OF ST. PATRICK.]** This order was instituted February 5, and the installation of the first knights was performed on the 17th of March, 1783. It consists of the sovereign and fifteen other knights companions. The lord-lieutenants of Ireland for the time being officiate as grand masters of the order, and the archbishop of Armagh is the prelate, the archbishop of Dublin the chancellor, and the dean of St. Patrick the register of the order. The knights are installed in the cathedral of St. Patrick, Dublin. Their robes are splendid, and the badge is three crowns united together on a cross, with the motto round, *Quis separabit?* 1783, fastened

by an Irish harp to the crown imperial. A star of eight points encircles it on the coat.

**HISTORY.]** The history of Ireland has been carried to a very remote antiquity, and may, with greater justice than that of almost any other country, be distinguished into the legendary and authentic. In the reign of Edward II. an Ulster prince boasted to the pope of an uninterrupted succession of one hundred and ninety-seven kings of Ireland, to the year 1170. Even the more moderate Irish antiquaries carry their history up to 500 years before the Christian æra, at which time they assert that a colony of Scythians, immediately from Spain, settled in Ireland, and introduced the Phœnician language and letters into this country: and that however it might have been peopled still earlier from Gaul or Britain, yet Heber, Heremon, and Ith, the sons of Milesius, gave a race of kings to the Irish, distinguished from their days by the name of Gadelians and Scuits, or Scots. But as our limits will not permit us to enlarge on the dark and contested parts of the Irish history, we shall only observe, that it was about the middle of the fifth century that the great apostle of Ireland, St. Patrick, was employed in the propagation of Christianity in this country, though there had been Christian missionaries here long before, by whose means it had made a considerable progress among the inhabitants of Ireland. After this period, Ireland was occasionally invaded by the Saxon kings of England; but in the years 795 and 798, the Danes and Norwegians, or, as they were called, Easterlings, invaded the coast of Ireland, and were the first who erected some edifices in that kingdom. The common habitations of the Irish, till that time, were hurdles covered with straw and rushes, and but very few of solid timber. The natives defended themselves bravely against the Easterlings, who built Dublin, Waterford, Limerick, Wexford, and Cork; but they resided chiefly at Dublin, or in its neighbourhood, which, by the old Irish, was called Fingal, or the Land of Strangers. The natives, about the year 962, seem to have called to their assistance the Anglo Saxon king Edgar, who had then a considerable maritime power; and this might have given occasion for his clergy to call him king of great part of Ireland. It is certain that Dublin was about that time a flourishing city, and that the native Irish gave the Easterlings several defeats, though supported by their countrymen from the continent, the Isle of Man, and the Hebrides.

In the twelfth century, Henry the Second of England formed a design of annexing Ireland to his dominions. He is said to have been induced to this by the provocation he had received from some of the Irish chieftains, who had afforded considerable assistance to his enemies. His design was patronised by the pope, and a fair pretext of attacking Ireland offered about the year 1168. Dermot Mac Murrugh, king of Leinster, and an oppressive tyrant, quarrelled with all his neighbours, and carried off the wife of a petty prince, O'Roik. A confederacy being formed against him, under Roderic O'Connor (who, it seems, was the paramount king of Ireland), he was driven from his country, and took refuge in the court of Henry II. who promised to restore him, upon taking an oath of fidelity to the crown of England, for himself and all the petty kings depending on him, who were very numerous. Henry, who was then in France, recommended Mac Dermot's cause to the English barons, and particularly to Strongbow, earl of Pembroke, Robert Fitz-Stephen, and Maurice Fitzgerald. Those noblemen undertook the expedition upon much the same principles as the Norman and Breton lords did the conquest of England under William I. and Strongbow was

to marry Mac Dermot's daughter Eva. In 1169, the adventurers reduced the towns of Wexford and Waterford; and the next year, Strongbow arriving with a strong reinforcement, his marriage was celebrated.

The descendants of the Danes continued still possessed of Dublin, which, after some ineffectual opposition made by the king O'Connor, was taken and plundered by the English soldiers: but Mac Turkil, the Danish king, escaped to his shipping. Upon the death of Dermot, Henry II. became jealous of earl Strongbow, seized upon his estates in England and Wales, and recalled his subjects from Ireland. The Irish about the same time, to the amount of above 60,000, besieged Dublin, under king O'Connor; but though all Strongbow's Irish friends and allies had now left him, and the city was reduced to great extremity, he forced the Irish to raise the siege with great loss; and going over to England, he appeased Henry by swearing fealty to him and his heirs, and resigning into his hands all the Irish cities and forts he held. During Strongbow's absence, Mac Turkil returned with a great fleet, attempted to retake the city of Dublin, but was killed at the siege; and in him ended the race of the Easterling princes in Ireland.

In 1172, Henry II. attended by 400 knights, 4000 veteran soldiers, and the flower of his English nobility, landed near Waterford; and not only all the petty princes of Ireland, excepting the king of Ulster, but the great king Roderick O'Connor, submitted to Henry, who pretended that O'Connor's submission included that of Ulster, and that consequently he was the paramount sovereign of Ireland. Be that as it will, he affected to keep a magnificent court, and held a parliament at Dublin, where he parcelled out the states of Ireland, as William the Conqueror had done in England, to his English nobility. He then settled a civil administration at Dublin, as nearly similar as possible to that of England, to which he returned in 1173, having first settled an English colony from Bristol in Dublin, with all the liberties, free customs, and charters, which the citizens of Bristol enjoyed. From that time Dublin began to flourish.— Thus the conquest of Ireland was effected by the English almost with as much ease as that of Mexico was by the Spaniards, and for much the same reasons,—the rude and unarmed state of the natives, and the differences that prevailed among their princes or leaders.

Henry gave the title of lord of Ireland to his son John, who, in 1185, went over in person to Ireland; but John and his giddy Norman courtiers made a very ill use of their power, and rendered themselves hateful to the Irish, who were otherwise very well disposed towards the English. Richard I. was too much taken up with the crusades to pay any great regard to the affairs of Ireland; but king John, after his accession, made amends for his former behaviour towards the Irish. He enlarged his father's plan of introducing into Ireland English laws and officers, and he erected that part of the provinces of Leinster and Munster, which was within the English pale, into twelve counties. We find, however, that the descendants of the ancient princes in other places paid him no more than a nominal subjection. They governed by their old Brehon laws, and exercised all acts of sovereignty within their own states; and indeed this was pretty much the case so late as the reign of James I. The unsettled reign of Henry III. his wars and captivity, gave the Irish a very mean opinion of the English government during his reign; but they seem to have continued quiet under his son Edward I. Gaveston, the famous favourite of Edward II. acquired great credit while he acted as lieutenant of Ireland; but the successes of the Scotch king, Robert Bruce, had almost proved fatal to the English in-

terest in Ireland, and suggested to the Irish the idea of transferring their allegiance from the kings of England to Edward Bruce, king Robert's brother. That prince accordingly invaded Ireland, where he gave repeated defeats to the English governors and armies; and being supported by his brother in person, he was actually crowned king at Dundalk, and narrowly missed being master of Dublin. The younger Bruce seems to have been violent in the exercise of his sovereignty, and he was at last defeated and killed by Bermingham, the English general. After this, Edward II. ruled Ireland with great moderation, and passed several excellent acts with regard to that country.

But during the minority of Edward III. commotions were again renewed in Ireland, and not suppressed without great loss and disgrace on the side of the English. In 1333 a rebellion broke out, in which the English inhabitants had no inconsiderable share. A succession of vigorous, brave governors, at last quieted the insurgents; and about the year 1361, prince Lionel, son to Edward III. having married the heiress of Ulster, was sent over to govern Ireland, and, if possible, to reduce its inhabitants to an entire conformity with the laws of England. In this he made a great progress, but did not entirely accomplish it. It appears, at this time, that the Irish were in a very flourishing condition, and that one of the greatest grievances they complained of was, that the English sent over men of mean birth to govern them. In 1394, Richard II. finding that the execution of his despotic schemes in England must be abortive without farther support, passed over to Ireland with an army of 34,000 men, well armed and appointed. As he made no use of force, the Irish looked upon his presence to be a high compliment to their nation, and admired the magnificence of his court. Richard, on the other hand, courted them by all the arts he could employ, and bestowed the honour of knighthood on their chiefs. In short, he behaved so as entirely to win their affections. But in 1399, after having acted in a very despotic manner in England, he undertook a fresh expedition to Ireland, to revenge the death of his lord-lieutenant, the earl of March, who had been killed by the wild Irish. His army again struck the natives with consternation, and they threw themselves upon his mercy. It was during this expedition that the duke of Lancaster landed in England; and Richard, upon his return, finding himself deserted by his English subjects on account of his tyranny, and that he could not depend upon the Irish, surrendered his crown to his rival.

The Irish, after Richard's death, still retained a warm affection for the house of York; and, upon the revival of that family's claim to the crown, embraced its cause. Edward IV. made the earl of Desmond lord-lieutenant of Ireland for his services against the Ormond party and other adherents of the house of Lancaster, and he was the *first Irish chieftain* that obtained this honour. Even the accession of Henry VII. to the crown of England did not reconcile the Irish to his title as duke of Lancaster: they therefore readily joined Lambert Simnel, who pretended to be the eldest son of Edward IV. but for this they paid dear, being defeated in their attempt to invade England. This made them somewhat cautious at first of joining Perkin Warbeck, notwithstanding his plausible pretences to be the duke of York, second son of Edward IV. He was, however, at last recognised as king by the Irish; and, in the preceding pages, under the history of England, the reader may learn the event of his pretensions. Henry behaved with moderation towards his favourers, and was contented with requiring the Irish nobility to take a fresh oath of allegiance to his government. This lenity had the desired effect der-

ing the administration of the two earls of Kildare, the earl of Su ry, and the earl of Ormond. Henry VIII. governed Ireland by supporting its chiefs against each other: but they were tampered with by the emperor Charles V. upon which Henry made his natural son, the duke of Richmond, his lord-lieutenant. This did not prevent the Irish from breaking out into rebellion in the year 1540, under Fitz-Gerald, who had been lord-deputy, and was won over by the emperor; but was at last hanged at Tyburn. After this the house of Austria found their account, in their quarrels with England, to form a strong party among the Irish.

About the year 1542, James V. king of Scotland, formed some pretensions to the crown of Ireland, and was favoured by a strong party among the Irish themselves. It is hard to say, had he lived, what the consequence of his claim might have been. Henry understood that the Irish had a mean opinion of his dignity, as the kings of England had hitherto assumed no higher title than that of lords of Ireland. He therefore took that of king of Ireland, which had a great effect with the native Irish, who thought that allegiance was not due to a lord; and, to speak the truth, it is somewhat surprising that this expedient was not thought of before. It produced a more perfect submission of the native Irish to Henry's government than ever had been known; and even O'Neil, who pretended to be successor to the last paramount king of Ireland, swore allegiance to Henry, who created him earl of Tyrone.

The pope, however, and the princes of the house of Austria, by remitting money, and sometimes sending over troops to the Irish, still kept up their interest in that kingdom, and drew from them vast numbers of men to their armies, where they proved as good soldiers as any in Europe. This created inexpressible difficulties to the English government, even in the reign of Edward VI; but it is remarkable that the Reformation took place in the English part of Ireland with little or no opposition. The Irish seem to have been very quiet during the reign of queen Mary; but they proved thorns in the side of queen Elizabeth. The perpetual disputes she had with the Roman-catholics, both at home and abroad, gave her great uneasiness; and the pope and the house of Austria always found new resources against her in Ireland. The Spaniards possessed themselves of Kinsale; and the rebellions of Tyrone, who baffled and outwitted her favourite general the earl of Essex, are well known in English history.

The lord-deputy Mountjoy, who succeeded Essex, was the first Englishman who gave a mortal blow to the practices of the Spaniards in Ireland; by defeating them and the Irish before Kinsale, and bringing Tyrone prisoner to England, where he was pardoned by queen Elizabeth in 1602. This lenity, shown to such an offender, is a proof of the dreadful apprehensions Elizabeth had from the popish interest in Ireland. James I. confirmed the possessions of the Irish; but such was the influence of the pope and the Spaniards, that the earls of Tyrone and Tyrconnel, and their party, planned a new rebellion, and attempted to seize the castle of Dublin; but their plot being discovered, their chiefs fled beyond seas. They were not idle abroad: for in 1608, they instigated Sir Calum O'Dogherty to a fresh rebellion, by promising him speedy supplies of men and money from Spain. Sir Calum was killed in the dispute, and his adherents were taken and executed. The attainders of the Irish rebels, which passed in the reigns of James and Elizabeth, vested in the crown 511,405 acres, in the several counties of Donegall, Tyrone, Colerain, Fermanagh, Cavan, and Armagh; and en-

abled the king to make that protestant plantation in the north of Ireland, which, from the most rebellious province of the kingdom, became, for many years, the most quiet and industrious.

Those prodigious attainders, however just and necessary they might be, operated fatally for the English in the reign of Charles I. The Irish Roman-catholics in general were influenced by their priests to hope not only to repossess the lands of their forefathers, but to restore the popish religion in Ireland. They therefore entered into a deep and detestable conspiracy for massacring all the English protestants in that kingdom. In this they were encouraged by the unhappy dissensions that broke out between the king and his parliaments in England and Scotland. Their bloody plan being discovered by the English government at Dublin, prevented that city from falling into their hands. They, however, partly executed, in 1641, their horrid scheme of massacre; but authors have not agreed as to the numbers who were murdered; perhaps they have been exaggerated by warm protestant writers: some of the more moderate have estimated the numbers of the sufferers at 40,000; other accounts speak of 10,000 or 12,000, and some have diminished that number\*. What followed in consequence of this rebellion, and the reduction of Ireland by Cromwell, who retaliated the cruelties of the Irish papists upon themselves, belongs to the history of England. It is certain that they suffered so severely, that they were quiet during the reign of Charles II. His popish successor, and brother, James II, even after the Revolution took place, found an asylum in Ireland; and was encouraged to hope, that, by the assistance of the natives there, he might remount his throne: but he was deceived, and his own pusillanimity co-operated with his disappointment. He was driven out of Ireland by his son-in-law, after the battle of the Boyne, the only victory that king William ever gained in person; a victory, however, on which depended the safety of the protestant religion, and the liberties of the British empire. Had James been victorious, he probably would have been re-instated on the throne, and nothing else could be expected than that, being irritated by opposition, victorious over his enemies, and free from every restraint, he would have trampled upon all rights, civil and religious, and pursued more arbitrary designs than before. The army of William consisted of 36,000 men, that of James of 33,000, but advantageously situated. James, it is true, fought at the head of an undisciplined rabble: but his French auxiliaries were far from behaving as heroes. It must be acknowledged, however, that he left both the field and the kingdom: too soon for a brave man.

The forfeitures that fell to the crown, on account of the Irish rebellions and the Revolution, are almost incredible; and had the acts of parliament, which gave them away, been strictly enforced, Ireland must have been peopled with British inhabitants. But many political reasons occurred for not driving the Irish to despair. The friends of the Revolution and the protestant religion were sufficiently gratified out of the forfeited estates. Too many of the Roman-catholics might have been forced abroad; and it was proper that a due balance should be preserved between the Roman-catholic and the protestant interest. It was therefore thought prudent to relax the reins of government, and not to put

\* Mr. Hume, after enumerating the various barbarities practised by the papists upon the protestants, says, "by some computations, those who perished by all those cruelties are made to amount to an hundred and fifty, or two hundred thousand; by the most moderate, and probably the most reasonable account, they must have been near 40,000." *Hist. of England*, vol. vi. p. 377. edit. 8vo. 1763.

the forfeitures too rigorously into execution. The experience of half a century has confirmed the wisdom of the above considerations. The lenity of the measures pursued in regard to the Irish Roman-catholics; and the great pains taken for the instruction of their children, with the progress which knowledge and the arts have made in that country, have greatly diminished the popish interest. The spirit of industry has enabled the Irish to know their own strength and importance; to which some accidental circumstances have concurred. All her ports were opened for the exportation of wool and woollen yarn to any part of Great Britain; and of late years, acts of parliament have been made occasionally for permitting the importation of salt beef, pork, butter, cattle, and tallow, from Ireland to Great Britain.

But though some laws and regulations had occasionally taken place favourable to Ireland, it must be acknowledged, that the inhabitants of that country laboured under considerable grievances, in consequence of sundry unjust and injudicious restraints of the parliament of England, respecting their trade. These restraints had injured Ireland, without benefiting Great Britain. The Irish had been prohibited from manufacturing their own wool, in order to favour the woollen manufactory of England; the consequence of which was, that the Irish wool was smuggled over into France, and the people of that country were thereby enabled to rival us in our woollen manufacture, and to deprive us of a part of that trade. An embargo had also been laid on the exportation of provisions from Ireland, which had been extremely prejudicial to that kingdom. The distresses of the Irish manufacturers, as well as those of Great Britain, had likewise been much increased by the consequences of the American war. These circumstances occasioned great murmuring in Ireland, and some attempts were made for the relief of the inhabitants of that kingdom in the British parliament, but for some time without success; for a partiality in favour of the trade of England prevented justice from being done to Ireland. But several incidents, which happened afterwards, at length operated strongly in favour of that kingdom. When a large body of the king's troops had been withdrawn from Ireland; in order to be employed in the American war, a considerable number of Irish gentlemen, farmers, traders, and other persons, armed and formed themselves into volunteer companies and associations, for the defence of Ireland against any foreign invaders. By degrees, these volunteer associations became numerous and well-disciplined; and it was soon discovered, that they were inclined to maintain their rights at home, as well as to defend themselves against foreign enemies. When these armed associations became numerous and formidable, the Irish began to assume a higher tone than that to which they had before been accustomed; and it was soon manifest, that their remonstrances met with unusual attention, both from their own parliament and from that of Great Britain. The latter, on the 11th of May, 1779, presented an address to the king, recommending to his majesty's most serious consideration the distressed and impoverished state of the loyal and well-deserving people of Ireland; and desiring him to direct that there should be prepared and laid before parliament such particulars relative to the trade and manufactures of Great Britain and Ireland as should enable the national wisdom to pursue effectual measures for promoting the common strength, wealth, and commerce of his majesty's subjects in both kingdoms. To this address the king returned a favourable answer; and in October, the same year, both houses of the Irish parliament also presented addresses to his majesty, in which they declared, that nothing but

granting Ireland a free trade could save it from ruin. Notwithstanding which, it being soon after suspected, by many of the people of that kingdom, that the members of their parliament would not exert themselves with vigour in promoting the interests of the nation, a very daring and numerous mob assembled before the parliament-house in Dublin, crying out for a *free trade* and a *short money bill*. They assaulted the members, and endeavoured to compel them to swear that they would support the interest of their country by voting for a short money-bill; and they demolished the house of the attorney general. The tumult at length subsided; and two Irish money-bills for six months only, were sent over to England, where they passed the great seal, and were immediately returned, without any dissatisfaction being expressed by government at this limited grant.

In the mean-time the members of the opposition in the English parliament very strongly represented the necessity of an immediate attention to the complaints of the people of Ireland; and of a compliance with their wishes. The arguments on this side of the question were also enforced by the accounts which came from Ireland; that the volunteer associations in that kingdom amounted to forty thousand men, unpaid, self-appointed, and independent of government, well armed and accoutred, daily improving in discipline, and which afterwards increased to eighty thousand. The British ministry appeared for some time to be undetermined what part they should act in this important business; but the remembrance of the fatal effects of rigorous measures respecting America, and the very critical situation of Great Britain, at length induced the first lord of the treasury to bring in such bills as were calculated to afford effectual commercial relief to the people of Ireland. Laws were accordingly passed, by which all those acts were repealed which had prohibited the exportation of woollen manufactures from Ireland, and other acts by which the trade of that kingdom to foreign countries had been restrained; and it was likewise enacted, that a trade between Ireland and the British colonies in America and the West Indies, and the British settlements on the coast of Africa, should be allowed to be carried on in the same manner, and subject to similar regulations and restrictions with that carried on between Great Britain and the said colonies and settlements.

These laws in favour of Ireland were received with much joy and exultation in that kingdom: and the Irish nation being indulged in their requisitions respecting trade, now began also to aim at important constitutional reformations: and in various counties and cities of Ireland, the right of the British parliament to make laws, which should bind that kingdom, was denied in public resolutions. By degrees, the spirit which had been manifested by the Irish parliament, seemed a little to subside; and a remarkable instance of this was, their agreeing to a perpetual mutiny-bill, for the regulation of the Irish army, though that of England had always been passed, with a true constitutional caution, only from year to year. This was much exclaimed against by some of the Irish patriots; and it is indeed not easy to clear their parliament from the charge of inconsistency: but this bill was afterwards repealed, and the commercial advantages afforded them by several acts in their favour greatly contributed to promote the prosperity of Ireland. As before observed, by the act repealing the statute of the 6th of George I. they were fully and completely emancipated from the jurisdiction of the British parliament; and the appellat jurisdiction of the British house of peers in Irish causes was likewise given up.

In the year 1783, the government, the nobility, and the people of Ireland, united each other in countenancing and giving an asylum to many families of the Genevese who were banished from their city, and to others who voluntarily exiled themselves for the cause of liberty, not willing to submit to an aristocracy of their own citizens, supported by the swords of France and Sardinia. A large tract of land in the county of Waterford was allotted for their reception, a town was marked out, entitled *New Geneva*, and a sum of money granted for erecting the necessary buildings. These preparations for their accommodation were, however, rendered ultimately useless, by some misunderstanding (not fully comprehended) which arose between the parties; and the scheme accordingly fell to the ground.

Upon the occasion of the unhappy malady with which the king was afflicted, the lords and commons of Ireland came to a resolution to address the prince of Wales, requesting him to take upon him the government of that kingdom during his majesty's indisposition, under the style and title of *Prince Regent of Ireland*, and to exercise and administer, according to the laws and the constitution of the realm, all the royal authorities, jurisdictions, and prerogatives, to the crown and government thereof belonging. The marquis of Buckingham (being then lord-lieutenant) having declined presenting the address, as contrary to his oath and the laws, the two houses resolved on appointing delegates from each; the lords appointed the dukes of Leinster, and the earl of Charlemont; and the commons, four of their members. The delegates proceeded to London, and, in February, 1789, presented the address to his royal highness, by whom they were most graciously received; but his majesty having, to the infinite joy of all his subjects, recovered from his severe indisposition, the prince returned them an answer fraught with the warmest sentiments of regard for the kingdom, and of gratitude to parliament, for the generous manner in which they proposed investing him with the regency, though the happy recovery of his royal father had now rendered his acceptance of it unnecessary.

The parliament of Ireland has extended liberal indulgences to the Roman-catholics of that kingdom, by establishing the legality of intermarriage between them and the protestants, by admitting them to the profession of the law, and the benefit of education, and by removing all obstructions upon their industry in trade and manufactures. A reciprocal preference in the corn trade with Britain has been established. Further progress has been made in checking the immoderate use of spirituous liquors; and some wise institutions have been ordained for the regulation of charitable foundations.

In the year 1793, in consequence of the concessions of government, a bill passed the legislature, by which the Roman-catholics, being freeholders, are entitled to vote for members to serve in parliament. The patriots of Ireland have been less successful in their attempts to procure a reform in parliament itself, as, notwithstanding the resolution in the beginning of the session to inquire into the state of the representation, nothing effectual has been done; the times, it is alleged, discouraging useful innovations, from the just dread of ruinous or hurtful ones.

Notwithstanding the catholics of Ireland had been restored, in some measure, to their civil rights, by the concession of the elective franchise, it does not appear that either their own leaders or their parliamentary adherents were satisfied with what had been granted; or were likely to be contented with less than a total repeal of all remaining discrimina-

the attention of government. But the violence of party disputes which followed on the recall of earl Fitzwilliam considerably increased the number of its adherents, and added to them several persons of abilities and influence, in particular Mr. Arthur O'Connor, who had distinguished himself by his able support of earl Fitzwilliam's administration in the house of commons; Dr. M'Nevin, who had been chairman of the committee for enforcing the claims set forth in the catholic petition; and Mr. Oliver Bond, an opulent citizen of Dublin, who had been an active supporter of the same principles. From the confession of these very persons, it appears, however, that, when they joined the society the views of its leaders were no longer confined to parliamentary or constitutional relief of any kind; since in the year 1795, through the medium of Mr. Tone, and other Irish refugees who had fled to France, a regular communication was opened between the French directory and the United Irishmen; and in the course of the summer of 1796, lord Edward Fitzgerald proceeded to Switzerland; and had an interview, near the French frontier, with general Hoche, when it is believed the whole plan of an invasion was finally adjusted. An attempt to carry it into execution was made in the December following, when the French fleet took the opportunity afforded by a thick fog to elude the vigilance of admiral Colpoys; by whom they had been for several months blocked up in Brest, and set sail for Ireland. But the fleet was dispersed by violent storms: a part of it, however, consisting of eight two-deckers, and nine other vessels of different classes, anchored, on the 24th, in Bantry bay. The violence of the weather preventing any attempt to effect a landing, they quitted the coast on the 27th in the evening; but an officer and seven men were driven on shore in a boat belonging to one of the French ships. This officer, upon examination, stated that the fleet, when it left Brest, consisted of about fifty sail, and that it had on board twenty-five thousand men, commanded by general Hoche. A considerable degree of alarm was excited in Ireland by the appearance of this armament, but the people in general in this part of the kingdom evinced the most determined loyalty, and manifested the greatest readiness to meet and resist the enemy wherever they might attempt a descent.

The failure of the expedition under Hoche did not, however, discourage the members of the Irish Union; they, on the contrary, endeavoured more firmly to cement their alliance with France, and established a regular communication and correspondence with that country. New arrangements were made for an invasion, and Dr. M'Nevin, about this time, transmitted to the French government a memorial, in which he stated that 150,000 United Irishmen were enrolled and organized in the province of Ulster. During the summer of 1797, great preparations were therefore made for a second attempt, both at Brest and in the Texel; it having been determined that the Dutch should supply a fleet and land forces to co-operate in this design. But this plan was rendered abortive by the memorable victory of lord Duncan over the Dutch fleet, on the 11th of October of that year.

In the beginning of the year 1798, Mr. O'Connor came to England, with an intention, as it afterwards appeared, of going over to France, in conjunction with John Binns, an active member of the London Corresponding Society, James Coigley, an Irish priest, and a person of the name of Allen. Being, however, suspected, they were apprehended, and tried at Maidstone, where they were all acquitted except Coigley, on whom had been found a treasonable, though extremely absurd paper, purporting to be an address from the "Secret Committee of England to

the Executive Directory of France. He was therefore convicted and executed. O'Connor, after his acquittal, was detained on another charge of treason preferred against him, and sent back to Ireland.

In the course of these different negotiations with the enemy, the violence of some of the disaffected party in Ireland could scarcely be restrained from breaking out into open insurrection, without waiting for the promised assistance from the Gallic republic; but they were overruled by those who had more coolness and caution. The government of Ireland, in the mean time, received only obscure and perplexed intelligence of these proceedings, which appear to have been conducted with so much art and secrecy as to prevent administration from discovering, for a considerable time, the real views and conduct of the society. But at length they received information that a seditious meeting was to be held at the house of a person of the name of Alexander, at Belfast, on the 14th of April, 1797; and, in consequence, colonel Barber, with a detachment of soldiers, proceeded on that day to the place of meeting, where he found two societies or committees actually sitting, and seized their papers and minutes, among which were the printed declaration and constitution of the United Irishmen, various reports from provincial and county committees, and several other important documents, which left them no longer in doubt respecting the extent and the views of this formidable conspiracy. About the same time, likewise, the magistrates in other parts of the kingdom discovered other papers that were circulated by the society, and which served to confirm the discoveries already made, and to throw additional light on the proceedings of the conspirators.

The most active and vigorous measures were now adopted by government; a very considerable addition was made to the military force of the kingdom; a bill was passed, prohibiting seditious meetings; the habeas corpus act was suspended; whole counties were proclaimed out of the King's peace, and seizures made of great quantities of concealed arms. In the enforcement of these measures, many acts of rigour, and even cruelty, appear to have been committed by the agents of government; but it should be at the same time remembered, that numerous acts of atrocious barbarity were likewise committed by the rebels. The loyalists knew that if the schemes of their enemies proved successful, the plunder and confiscation of their property was the least evil they had to fear. The concealment and obscurity of the danger they knew to be imminent might well excite a dread which rendered them incapable of listening to the dictates of moderation, or even, in some cases, of justice.

These rigorous measures were, likewise, in some degree, still further justified by the more complete discovery which government soon after made of the traitorous designs and proceedings of the society. Among other members of it, was a Mr. Reynolds, who had formerly been a silk-manufacturer of some note in the city of Dublin. He had been sworn an United Irishman in February, 1797, and in the winter following appointed treasurer for the county of Kildare, in which he resided, and also a colonel in the rebel army. This person, whether moved by remorse and returning love for his country, or by other motives, it is not necessary to inquire, disclosed to government, about the latter end of February, 1798, the nature and extent of the conspiracy, and a meeting of delegates being summoned for the 12th of March, at the house of Mr. Oliver Bond, he gave information of it, in consequence of which fourteen of the delegates were apprehended, with their secretary, M'Can; and at

the same time Dr. M'Nevin, counsellor Emmett, and some other active members of the societies, were taken into custody. A warrant had been issued against lord Edward Fitzgerald, but he escaped; he was afterwards, however, discovered in the place of his concealment; when, on the police officers entering the room, the unhappy nobleman made a desperate defence: he wounded two of the principal of them, Mr. Justice Swan, and captain Ryan, dangerously; and was himself so severely wounded, that he languished a few days only before he expired.

The seizure of the delegates gave a fatal blow to all the plans of the United Irishmen. A new directory was chosen, but their proceedings were soon disclosed by another informer, a captain Armstrong, who had pretended to enter into the conspiracy with the intention of discovering their schemes and betraying them to government. The confusion and alarm into which the rebels were thrown by the discovery of their plots, and the apprehending of their leaders, determined them to make a desperate effort, and a general insurrection was resolved on by the military committee, to take place on the 23d of March. But government being perfectly informed of the intentions of the conspirators, caused several of the principal of them to be apprehended; on the 19th and 21st the city and county of Dublin were proclaimed, by the lord-lieutenant and council, in a state of insurrection; the guards of the castle and all the principal objects of attack were trebled, and the whole city in fact converted into a garrison. The insatuated multitude, however, implicitly obedient to the directions they had received from their leaders, rose at the time appointed in various parts of the country, and, on the 25th, appeared in great force, their number amounting to not less than 15,000, in the neighbourhood of Wexford and Enniscorthy, and attacked and cut in pieces the whole of a party of the North-Cork militia, except colonel Foote, and two privates. They then made an attack, on the 28th, on the town of Enniscorthy, which they carried sword in hand; and on the 30th made themselves masters of Wexford, where they liberated from prison Mr. Beauchamp Baginval Harvey, who was afterwards nominated to the chief command of their army. Under him, as their general, they attacked the town of New Ross, but were repulsed with great slaughter. They were likewise repulsed in their attacks on some other places. The royal forces, however, suffered a check on the 4th of June, when the strong post of the rebels being attacked by colonel Walpole, he was unfortunately killed in the beginning of the action, and his corps, being in a situation in which it was unable to act, was forced to retire to Arklow. Encouraged by this success, the rebel army, on the 9th, presented itself before Arklow, where general Needham commanded a considerable body of the king's troops; but the position that general had taken, and the dispositions he made, were such that they were defeated with great loss.

On the 21st of June, general Lake made his grand attack on the strong position of the rebels on Vinegar-hill, near Enniscorthy, having gradually collected troops from every part till he had almost surrounded them. They maintained their ground obstinately for an hour and a half, but at length fled with precipitation, leaving behind them a great number of killed and wounded, and thirteen small pieces of ordnance of different calibres.

Immediately after this action, a large body of the king's forces advanced to Wexford, which general Moore entered so opportunely, as to prevent the town from being laid in ashes. The rebels before they evacuated the town, offered to treat; but general Lake refused to sign any

terms with rebels with arms in their hands; though to the deluded multitude he promised pardon, on condition of delivering up their leaders and returning to their allegiance. The rebel troops immediately evacuated the town; their general, Bagenal Harvey, had quitted them soon after the battle of New Ross, but being discovered and taken with some others in a cave, he was tried by a court-martial, and executed on the bridge of Wexford.

In the beginning of June alarming commotions likewise took place in the North of Ireland; and the insurrection soon became almost general in the counties of Down and Antrim; but on the 12th the rebels received a complete defeat at Ballynahinch, where they lost upwards of four hundred men. They fought with great obstinacy, and their leader Munro was taken prisoner, and afterwards executed.

The English government, in the mean time, though not dissatisfied with the conduct of lord Camden, resolved to give Ireland a military lord-lieutenant; and the marquis Cornwallis arrived at Dublin in that capacity on the 20th of June, and immediately assumed the reins of government. The conduct of his lordship was temperate and judicious. On the 17th of July he sent a message to the house of commons by lord Castlereagh, intimating that he had received his majesty's commands to acquaint them "that he had signified his gracious intention of granting a general pardon for all offences committed on or before a certain day, upon such conditions, and with such exceptions, as might be compatible with the general safety."—But "these offers of mercy to the repentant were not to preclude measures of vigour against the obstinate."

A special commission was now opened in Dublin for the trial of the principal delinquents,—several of whom were tried and executed. Among them Mr. Oliver Bond was tried, convicted, and condemned, and in his fate the other conspirators began to foresee their own. The rebellion appeared to be completely crushed; the fugitive rebels were every where returning to their allegiance, and delivering up their arms, and no hope remained of any effectual assistance from France. In this situation a negotiation was opened between the Irish government and the state prisoners, the issue of which was, that government consented to pardon Mr. Bond, and desist from any farther prosecution of the other leaders of the conspiracy, who on their parts engaged to make a full confession of all the proceedings and plans of the society; after which they were to be permitted to transport themselves to any country not at war with his majesty. The information they communicated was laid before the Irish house of commons, and has furnished materials for the brief account here given. Mr. Oliver Bond survived his pardon only a few days, and Mr. Arthur O'Connor, Dr. M'Neven, and the rest, after having been a considerable time confined in Ireland, were removed to prisons in Scotland, where they still remain.

After the failure of the expedition under general Hoche, France, fortunately for Great Britain, made no attempt to assist the Irish insurgents till it was too late; and the aid they then sent was very feeble and inadequate to the end proposed. On the 22d of August, some frigates and transports from France appeared in Killala Bay, and landed about a thousand men, with a quantity of arms and ammunition. The number of insurgents who joined the invaders was not considerable; but the French general Humbert, by his conduct, proved himself an officer of ability, and worthy of command where there was a fairer prospect of

success. He advanced w

success. He advanced without loss of time to Castlebar, where general Lake was collecting his forces, attacked, and compelled him to retreat with the loss of six pieces of cannon and a few men, after which he advanced towards Tuam; but on the 7th of September the marquis Cornwallis came up with the French in the vicinity of Castlebar, when they retreated, and the next morning, after a slight resistance, surrendered at discretion. The rebels who had joined them were dispersed, and a great number of them killed or taken. Another effort was afterwards made by the French to support, or rather to rekindle the flames of rebellion in Ireland. On the 17th of September a fleet sailed from France, consisting of one ship of the line (the *Hoche*) and eight frigates, with troops and ammunition on board, destined for Ireland; but this armament was completely defeated by the squadron under the command of Sir John Borlase Warren, as has been already related in our summary of the affairs of England.

The few remaining troops of rebels, who were dispersed among the woods and mountains, now successively laid down their arms. A chief of the name of Holt, at the head of a number of banditti, continued for some time to commit depredations in the mountainous parts of the county of Wicklow; but at last it was believed that he made terms with government, and was permitted to save his life by relinquishing for ever his native country.

Every estimate of the number of those who lost their lives in this deplorable contest must necessarily be vague and uncertain. Some have stated it at thirty thousand, while others have swelled it to a hundred thousand,—of whom they say, nine tenths were of the insurgents; the loss of the royalists being about ten thousand men. Slaughter and desolation have at length procured a kind of peace; but the great problem is to discover by what means the flames of discord may be prevented from bursting out afresh. As the most effectual preventative of a repetition of these calamities, government has recommended, and appears determined to effect, a legislative union of the two kingdoms. A proposition for such an union was submitted to the parliament of England and Ireland on the same day (January 22, 1799), and in both houses of the English parliament, the address, which is considered as an approbation of the measure, passed without division. A similar address was carried in the Irish house of lords by a majority of thirty-three, but rejected in the commons by a majority of two, which the next day increased to six against the measure, which was therefore laid aside for that time. Government, however, by no means totally abandoned it; for in the beginning of the next session, on the 15th of January, 1800, the proposition was again submitted to the parliament of Ireland; when the address in the house of lords passed without a debate, and, after an animated discussion in the commons, which lasted till the noon of the following day, was approved by a majority of forty-two. The articles of this union, which have since been voted, import,

“That the kingdoms of Great Britain and Ireland shall, upon the 1st day of January, which shall be in the year of our Lord 1801, and for ever after, be united into one kingdom, by the name of the United Kingdom of Great Britain and Ireland:”—“that of the peers of Ireland at the time of the union, four spiritual lords, by rotation of sessions, and twenty-eight temporal peers for life, shall be the number to sit and vote in the house of lords; and one hundred commoners (viz. two for each county of Ireland, two for the city of Dublin, two for the city of Cork, and one for each of the thirty-two most considerable cities, towns, and boroughs),

be the number of representatives of Ireland in the house of commons of the parliament of the United Kingdom."

It is also provided by these articles "that, for the space of twenty years after the union shall take place, the contribution of Great Britain and Ireland respectively towards the expenditure of the united kingdom in each year shall be defrayed in the proportion of fifteen parts for Great Britain, and two parts for Ireland," this proportion at the expiration of that time to be subject to revision and regulation from other considerations.

That this plan of union will be ultimately carried into effect, little doubt appears now to remain. How far it will prove a remedy for the distressed condition and discontent of the poor time must discover. At first how it seems difficult to say how a legislative union can remove the cause of the civil commotions which have lately distracted that unfortunate kingdom; how it can lessen religious prejudices, or prevent, what it seems rather calculated to increase, the expenditure of Irish property at a distance from the country whence it is derived. Yet must it not be denied that unity in government has many advantages, and is indeed essentially necessary; and that a close connection and firm consolidation of the three kingdoms, with an impartial and equal distribution of protection and rights, fairly granted and faithfully maintained, must tend to infuse new life into every part of the united nation, while it adds to the prosperity, the wealth, and the power of the whole.

## FRANCE.

HAVING gone over the British isles, we shall now return to the continental, beginning with the extensive and powerful country of France, being the nearest to England, though part of Germany and Poland lies to the northward of France.

### SITUATION AND EXTENT.

These are the original eighty-three departments into which France was divided by the first national assembly. But, by later decrees, the department of Rhône and Loire has been divided into two departments: the department of the RHÔNE, the chief town Lyons; and that of the LOIRE, the chief town Montbrisson. Corsica has likewise been divided into two departments: Golo, the chief town Bastia; and LIAMONE, the chief town Ajaccio. Savoy has also been annexed to the republic, under the name of the department of MOUNT BLANC,—the chief town Chambéry; as has likewise a part of Switzerland, lately belonging to the bishop of Basle, by the name of the department of MOUNT TERRI-

**NICE**,—the chief town *Porentrui*. The county of Nice has been declared a department of France, by the name of the **MARITIME ALPS**,—the chief town, *Nice*. The territory of Avignon and county of Venaissin, which, in the original division, were included in Corsica, now form the department of **VAUCLUSE**,—the chief town *Avignon*. These make the number of the departments eighty-nine, to which the French add nine more, into which they have divided Belgium, or the Austrian Netherlands, ceded to them by the late treaty of Campo Formio; but as these latter have been so lately annexed to the French republic, and as the war between France and the emperor so soon recommenced, and still continues, they cannot as yet be considered as forming a part of France. Every department is subdivided into *districts*, and each district into *cantons*.

[**NAME AND CLIMATE.**] France took its name from the Franks, or *Freemen*, a German nation, restless and enterprising, who conquered the Gauls, the ancient inhabitants: and the Roman force not being able to repress them, they were permitted to settle in the country by treaty. By its situation, it is the most compact kingdom perhaps in the world, and well fitted for every purpose both of power and commerce; and since the beginning of the 15th century, the inhabitants have availed themselves of many of their natural advantages. The air, particularly that of the interior parts of the country, is in general mild and wholesome; but some late authors think it is not nearly so salubrious as is pretended; and it must be acknowledged, that the French have been but too successful in giving the inhabitants of Great Britain false prepossessions in favour of their own country. It must indeed be owned, that their weather is more clear and settled than in England. In the northern provinces, however, the winters are more intensely cold, and the inhabitants not so well supplied with firing, which in France is chiefly of wood.

[**SOIL AND WATER.**] France is happy in an excellent soil, which produces corn, wine, oil, and almost every luxury of life. Some of their fruits have a higher flavour than those of England; but neither the pasturage nor tillage are comparable to ours. The heats, in many parts, burn up the ground, so that it has no verdure; and the soil barely produces as much rye and chefnuts as serve to subsist the poor inhabitants: but the chief misfortune attending the French soil is, that the inhabitants, having been uncertain of enjoying the full fruits of their labour, have not applied themselves sufficiently to agriculture. But nature has done wonders for them; and both animal and vegetable productions are found there in vast plenty.

Notwithstanding great efforts made in agriculture, much of the land remains uncultivated; and although some provinces, as Alsace and Languedoc, yield an exuberance of corn, it is frequently imported.—Indeed all Europe, one year with another, does not produce sufficient corn for its own consumption; and it is necessary to have supplies from the luxuriant harvests of America.

The French had endeavoured to supply the loss arising from their precarious title to their lands, by instituting academies of agriculture, and proposing premiums for its improvement, as in England; but those expedients, however successful they may be in particular instances, can never become of national utility in any but a free country, where the husbandman is sure of enjoying the fruit of his labour. No nation is better supplied than France is with wholesome springs and water; of which the inhabitants make excellent use, by the help of art and engines,

for all the conveniences of life. Of their canals and mineral waters, distinct notice will be hereafter taken.

**MOUNTAINS.]** The chief mountains in France, or its borders, are the Alps, which divide France from Italy; the Pyrenees, which divide France from Spain; the Vosges, which separate the department of that name from the departments of Upper Saoné and Upper Rhine; Mount Jura, which divides France from Switzerland; the Cevennes, in the late province of Languedoc; and Mont d'Or in Puy de Dome.

**RIVERS AND LAKES.]** The principal rivers in France are the Loire, the Rhône, the Garonne, and the Seine. The Loire takes its course north and north-west, being, with all its windings from its source to the sea, computed to run about 500 miles. The Rhône flows on the south-west to Lyons, and then runs on due south, till it falls into the Mediterranean. The Garonne rises in the Pyrenean mountains, takes its course first north-east, and has a communication with the Mediterranean by means of a canal, the work of Lewis XIV. The Seine, soon after its rise, runs to the north-west, visiting Troyes, Paris, and Rouen, in its way, and falls into the English Channel at Havre. To these we may add the Saoné, which falls into the Rhône at Lyons; the Charente, which rises near Havre de Grace, and discharges itself in the Bay of Biscay at Rochefort. The Rhine, which rises in Switzerland, is the eastern boundary between France and Germany, and receives the Moselle and the Sarre in its passage. The Somme, which rises in the department of Aisne, and passing by St. Quentin, Peronne, and Amiens, falls into the English Channel below Abbeville. The Var, which rises in the Alps, and runs south, dividing France from Italy, and falling into the Mediterranean, west of Nice. The Adour rises in the department of the Upper-Pyrenees, and, running from east to west by Tarbes and Dax, falls into the Bay of Biscay, below Bayonne.

The vast advantage, both in commerce and conveniency, which arises to France from those rivers, is wonderfully improved by the artificial rivers and canals which form the chief glory of the reign of Lewis XIV. That of Languedoc was begun in the year 1666, and completed in 1680; it was intended for a communication between the Ocean and the Mediterranean, for the speedier passage of the French fleet: but though it was carried on at an immense expence for 100 miles, over hills and valleys, and even through a mountain in one place, it has not answered that purpose. By the canal of Calais, travellers easily pass by water from thence to St. Omer, Graveline, Dunkirk, Ypres, and other places. The canal of Orléans is another noble work, and runs a course of eighteen leagues, to the immense benefit of the public and the royal revenue. France abounds with other canals of the like kind, which render her inland navigation inexpressibly commodious and beneficial.

Few lakes are found in this country. There is one at the top of a hill near Alegre, which the vulgar report to be bottomless. There is another at Issoire, in Puy de Dome: and one at La Besse, into which if a stone be thrown, it causes a noise like thunder.

**MINERAL WATERS, AND } REMARKABLE SPRINGS. }** The waters of Bareges, which lie near the borders of Spain, under the Pyrenean mountains, have of late been preferred to all the others of France, for the recovery of health. The best judges think, however, that the cures performed by them are more owing to their accidental success with some great persons, and the salubrity of the air and soil, than to the virtues of the waters. The waters of Sultzbach, in the department of the Upper Rhine, are said to cure the palsy, weak nerves, and the stone.

At Bagueis, not far from Bareges, are several wholesome minerals and baths, to which people resort as to the English baths, at spring and autumn. Forges, in the department of the Lower Seine, is celebrated for its mineral waters; and those of St. Amand cure the gravel and obstructions. It would be endless to enumerate all the other real or pretended mineral wells in France, as well as many remarkable springs; but there is one near Aigne, in Puy de Dome, which boils violently, and makes a noise like water thrown upon lime; it has little or no taste, but has a poisonous quality, and the birds that drink of it die instantly.

**METALS AND MINERALS.]** France has many unworked *mines*, which would be very productive, if duly attended to; but at present do not yield minerals sufficient for consumption; steel alone is imported, to the annual value of 125,000*l.* The late province of Languedoc is said to contain veins of gold and silver. Alsace has mines of silver and copper, but they are too expensive to be wrought. Alabaster, black marble, jasper, and coal, are found in many parts of the kingdom. Bretagne abounds in mines of iron, copper, tin, and lead. Salt-petre is made in every part of the kingdom, and *sea-salt* is now procured free from oppressive duty, but not remarkable for its purity. At Laverdau, in Cominges, there is a mine of chalk. At Berry there is a mine of oker, which serves for melting of metals, and for dyeing, particularly the best drab cloth; and in the province of Anjou are several quarries of fine white stone. Some excellent turquoises (the only gem that France produces) are found in Languedoc; and great care is taken to keep the mines of marble and free-stone open all over the kingdom.

**VEGETABLE AND ANIMAL PRODUCTIONS BY SEA AND LAND.** France abounds in excellent roots, in all kinds of seasonings and fallads, and in excellent fruits of all kinds, particularly grapes, figs, prunes, chestnuts, cider in the northern provinces, and capers in the southern. It produces annually, though not enough for consumption, above twelve million pounds of tobacco, besides hemp, flax, manna, saffron, and many drugs. Alsace, Burgundy, Lorraine, and especially the Pyrenean mountains, supply it plentifully with timber and other wood. Silk is so plentifully produced, besides what is imported, as to afford a considerable trade. The cattle and horses are neither very numerous nor very good; but it has many flocks of fine sheep; yet so great is the consumption, that both sheep and wool are imported. The province of Gatinois produces great quantities of saffron. The wines of Champagne, Burgundy, Bourdeaux, Gascony, and other provinces of France, are so well known, that they need only be mentioned. It is sufficient to observe, that though they differ very sensibly in their taste and properties, yet all of them are excellent, particularly those of Champagne, Burgundy, Bourdeaux, Pontacke, Hermitage, and Frontinac: and there are few constitutions, be they ever so valetudinary, to which some one or other of them is not adapted.

Wine, the staple, is made to the value of 15,000,000*l.* annually, more than an eighth part of which, besides brandy and vinegar, was exported. Olive oil is made in large quantities, particularly in the provinces next the Mediterranean; but the consumption is so great, that much of it is imported from Italy; the inferior sort supplies the soap manufactories, of which there are thirty-six at Marceilles.

Oak, elm, ash, and other timber, common in England, is found in France; but it is said, that the internal parts of the kingdom begin to feel the want of fuel. A great deal of salt is made at Rhé, and about Roche-

fort, on the coast of Saintonge. Languedoc produces an herb called kali, which, when burnt, makes excellent barilla, or pot-ashes. The French formerly were famous for horticulture, but they are at present far inferior to the English both in the management and disposition of their gardens. Prunes and capers are produced at Bourdeaux, and near Toulon.

France contains few animals, either wild or tame, that are not to be found in England, excepting wolves. Their horses, black cattle, and sheep, are far inferior to the English; nor is the wool of their sheep so fine. The hair and skin of the chamois, or mountain-goats, are more valuable than those of England. We know of no difference between the marine productions of France and those of England, but that the former is not so well served, even on the sea-coast, with salt-water fish. There is a considerable herring fishery, and one for anchovies, to the annual amount of 83,000*l.* besides more important fisheries upon the coast of America and Newfoundland.

FORESTS.] The chief forests of France are those of Orléans, which contains 14,000 acres of wood of various kinds, oak, elm, ash, &c. and the forest of Fontainebleau, near as large; and near Morchisimoir is a forest of tall, straight timber, of 4000 trees. Besides these, large numbers of woods, some of them deserving the name of forests, lie in different provinces; but too remote from sea-carriage to be of much national utility.

POPULATION, INHABITANTS, MANNERS, } According to the latest  
CUSTOMS, AND DIVERSIONS. } and best calculations,  
France contained at the commencement of the revolution about 25,000,000 of inhabitants. It was lately supposed, by some speculative men, that the population of France had for many years been upon the decline; but, upon an accurate investigation, the reverse appeared to be the fact; though this country certainly lost a great number of valuable inhabitants by the revocation of the edict of Nantes\*.

The French, in their persons, are rather lower than their neighbours; but they are well proportioned and active, and more free than other nations, in general, from bodily deformities. The ladies are celebrated more for their sprightly wit than personal beauty: the peasantry in general are remarkably ordinary, and are best described by being contrasted with women of the same rank in England. The nobility and gentry accomplish themselves in the academical exercises of dancing, fencing, and riding, in the practice of which they excel all their neighbours in skill and gracefulness. They are fond of hunting; and the gentry, before the revolution, had left off their heavy jack-boots, their huge war-saddle, and monstrous curb bridle in that exercise, and accommodate themselves to the English manners.

The genius and manners of the French are well known, and have been the subject of many able pens. A national vanity is their predominant character: and they are perhaps the only people ever heard of, who have derived great utility from a national weakness. It supports them under misfortunes, and impels them to actions to which true courage inspires other nations. This character has been conspicuous both in the higher and middling ranks, where it produces excellent officers; and in the

\* In the year 1598, Henry IV. who was a protestant, and justly styled the Great, after fighting his way to the crown of France, passed the famous edict of Nantes, which secured the protestants the free exercise of their religion; but his edict was revoked by Lewis XIV. which, with the succeeding persecutions, drove those people to England, Holland, and other protestant countries, where they established the silk manufacture, to the great prejudice of the country that persecuted them.

common soldiers of France, who, it must confessed, in the present war against the allied powers, have exhibited prodigies of valour.

The French affect freedom and wit; but fashionable dresses and diversions engross too much of their conversation. Their diversions are much the same with those of the English; but their gallantry is of a very different complexion. Their attention to the fair degenerates into gross soppery in the men, and in the ladies it is kept up by admitting of indecent freedoms; but the seeming levities of both sexes are seldom attended with that criminality, which, to people not used to their manners, they seem to indicate; nor are the husbands so indifferent as we are apt to imagine about the conduct of their wives. The French are excessively credulous and litigious: but of all people in the world they bear adversity and reduction of circumstances with the best grace; though in prosperity many of them are apt to be insolent, vain, arbitrary, and imperious.

The French have been much censured for insincerity; but this charge has been carried too far, and the imputation is generally owing to their excess of civility, which renders their candour suspicious. The French, in private life, have certainly many amiable qualities; and a great number of instances of generosity and disinterestedness may be found amongst them.

It is doing the French no more than justice to acknowledge, that, as they are themselves polite, so they have given a polish to the ferocious manners and even virtues of other nations. Before the revolution, they were disposed to think very favourably of the English. They both imitate and admire our writers; the names of Bacon, Locke, Newton, Milton, Pope, Addison, Hume, Robertson, Richardson, and many others of the last and present century, are sacred among the French of any education.

With several defects, the French have many good qualities; politeness of manners, attention to strangers, and a general taste for literature among those in the better ranks of life.

**DRESS.]** The French dress of both sexes is so well known, that it is needless to expatiate upon them here; but, indeed, their dress in cities and towns is so variable, that is next to impossible to describe it. They certainly have more invention in that particular than any of their neighbours, and their constantly changing their fashions is of infinite service to their manufactures.

**RELIGION.]** By the laws of the constitution, framed by the first national assembly, no man was to be molested for his opinions, or interrupted in the exercise of his religion. The territorial possessions of the Gallican church were claimed as national property, and disposed of through the medium of a paper money, called assignats, for the creditors of the state; and the clergy made dependent upon pensionary establishments, paid out of the national treasury; out of which was also paid the expenses of worship, the religious, and the poor. All monastic establishments were suppressed; but the friars and nuns were allowed to observe their vows, and nuns optionally to remain in their convents, or retire upon pensions.

By the subsequent constitutions, it is declared that there is no predominant religion in France; and that none is patronised or paid by the state; but that all sects and modes of worship shall enjoy equal toleration. The clergy are obliged to take an oath to observe the laws of the constitution\*. They notify to the bishop of Rome their union in doc-

\* Many of the clergy, called refractory priests, from a conscientious refusal of this oath, have been ejected from their benefices, and many of the popular curates made bishops.

trine, but do not pay him fees, or acknowledge any subordination to his authority. They vote as active citizens, and are eligible to some lay-offices in the districts, but to no principal ones.

ARCHBISHOPRICS, BISHOPRICS, &c.] France, under the late monarchical government, contained eighteen archbishoprics; and one hundred and nine bishoprics. By the first national assembly it was divided into nine metropolitan circles, having a METROPOLITAN BISHOP, with a synod in each, besides one for Paris. The metropolitan bishop is confirmed by the eldest bishop in his circle. Appeals are made from the bishops to their synods.

A BISHOP was appointed to each of the eighty-three *departments*, which form so many dioceses. They were appointed by the electoral assembly of the department, and confirmed by the metropolitan bishop, but must have held an ecclesiastical office fifteen years. The salaries were from 500l. to 840l. per annum. Each diocese has also a *seminary*, with three vicars, and a vicar-general, to prepare students for holy orders; and these vicars form a council for the bishop.

VICARS of bishops are chosen by the bishop from among the clergy of his diocese who have done duty ten years.

MINISTERS of parishes or *cures* in the districts are confirmed by the bishop, and they must have been vicars to ministers five years.

VICARS of ministers are chosen by the minister from among the priests admitted in the diocese by the bishop.

France contains more than two millions of non-catholics; and the *protestants*, who are greatly increasing, are, in proportion to the catholics, as one to twelve. There are already many regular congregations, viz. German Lutherans, French and Swiss Calvinists, Bohemian anabaptists, and Walloon or Flemish dissenters, besides many chapels for the ambassadors. It also contains many Jews.

LANGUAGE.] One of the wisest measures of Lewis XIV. was his encouragement of every proposal that tended to the purity and perfection of the French language. He succeeded so far as to render it the most universal of all the living tongues; a circumstance that tended equally to his greatness and his glory; for his court and nation thereby became the school of arts, sciences, and politeness. The French is chiefly composed of words radically Latin, with many German derivatives introduced by the Franks. It is now rather on the decay: its corner-stones, fixed under Lewis XIV. are, as it were, loosened; and, in the present mode of writing and expressing themselves, the modern French too often disregard that purity of expression which alone can render a language classical and permanent.

As to the properties of the language, they are undoubtedly greatly inferior to the English: but they are well adapted to subjects void of elevation or passion; and well accommodated to dalliance, compliments, and common conversation.

The Lord's Prayer in French is as follows:—*Nôtre Père, qui es aux cieux, ton nom soit sanctifié. Ton regne vienne. Ta volonté soit faite en la terre comme au ciel. Donne nous aujourd'hui notre pain quotidien. Pardonne nous nos offenses, comme nous pardonnons à ceux qui nous ont offensés. Et ne nous induis point en tentation, mais nous délivre du mal: car à toi est le regne, la puissance, et la gloire aux siècles des siècles. Amen.*

LEARNING AND LEARNED MEN.] The French, like the other nations of Europe, were for many centuries immersed in barbarity. The first learning they began to acquire, was not of that kind which im-

proves the understanding, corrects the taste, or regulates the affections. It consisted in a subtle and quibbling logic, which was more adapted to pervert than to improve the faculties. But the study of the Greek and Roman writers, which first arose in Italy, diffused itself among the French, and gave a new turn to their literary pursuits. This, together with the encouragement which the polite and learned Francis I. gave to all men of merit, was extremely beneficial to French literature. During this reign, many learned men appeared in France, who greatly distinguished themselves by their writings; among whom were Budæus, Clement Marot, Peter du Chatel, Rabelais, and Peter Ramus. The names of Henry and Robert Stephens are also mentioned by every real scholar with respect. It was not, however, till the seventeenth century, that the French began to write with elegance in their own language. The Académie Française was formed for this purpose; and though their labours, considered as a body, were not so successful as might have been expected, some particular academicians have done great service to letters. In fact, literary copartnerships are seldom very successful. Of this we have a remarkable example in the present case. The Academy published a dictionary for improving the French language, which was universally despised; Furetières, a single academician, published another, that met with universal approbation.

Lewis XIV. was the Augustus of France. The protection he gave to letters, and the pensions he bestowed on learned men, both at home and abroad, which, by calculation, did not amount to above 12,000*l.* per annum, have gained him more glory than all the military enterprises upon which he expended so many millions. The learned men who appeared in France during this reign are too numerous to be mentioned. The tragic poets, Racine and Corneille, have deservedly obtained a very high reputation: the first was distinguished for skill in moving the passions; the second, for majesty; and both, for the strength and justness of their painting, the elegance of their taste, and their strict adherence to the rules of the drama. Moliere would have exhausted the subjects of comedy, were they not every-where inexhaustible, and particularly in France. In works of satire and criticism, Boileau, who was a close imitator of the ancients, possessed uncommon merit. But France has not yet produced an epic poem that can be mentioned with Milton's; nor a genius of the same extensive and universal kind with Shakspeare, equally fitted for the gay and the serious, the humorous and the sublime. In the eloquence of the pulpit and of the bar, the French are greatly our superiors; Bossuet, Bourdaloue, Flechier, and Massillon, have carried pulpit eloquence to a degree of perfection which we may approach to, but can hardly be expected ever to surpass. The genius, however, of their religion and government was extremely unfavourable to all improvements in the most useful branches of philosophy. All the establishments of Lewis XIV. for the advancement of science, were not able to counterbalance the influence of the clergy, whose interest it was to keep mankind ignorant in matters of religion and morality; and the influence of the court and ministry, who had an equal interest in concealing the natural rights of mankind, and every sound principle of government. The French have not therefore so many good writers on moral, religious, or political subjects, as have appeared in Great Britain. But France has produced some great men, who do honour to humanity; whose career no obstacle could stop; whose freedom no government, however despotic, no religion, how-

ever superstitious, could curb or restrain. As an historian, De Thou is entitled to the highest praise; and who is ignorant of Pascal, or of the archbishop of Cambray? Few men have done more service to religion, either by their writings or their lives. As for Montequieu, he is the legislator of nations: his works are read in every country and language; and wherever they are read, they enlighten and invigorate the human mind. And indeed the distinguished literary productions of the reign of Lewis XV. universally breathe sentiments incompatible with superstition or despotism; but too many of them incur the opposite reproach of irreligion and licentiousness.

In the belles lettres, the lighter kinds of poetry, and lively essays, no nation ever produced more agreeable writers: among whom we may place Montaigne, D'Argens, and Voltaire, as the most considerable.

Before the immortal Newton appeared in England, Descartes was the greatest philosopher in modern times. He was the first who applied algebra to the solution of geometrical problems; which naturally prepared the way for the analytical discoveries of Newton. Many eminent mathematicians have flourished in the present age, particularly Clairaut, Bezout, and D'Alembert; the latter of whom, to the precision of a geometer, has united the talents of a fine writer.

Since the beginning of the present century, the French have almost vied with the English in natural philosophy. Buffon would deserve to be reckoned among men of science, were he not still more remarkable for his eloquence than for his philosophy. He is to be regarded as a philosophical painter of nature; and, under this view, his *Natural History* is the first work of its kind.

Their painters, Poussin, Le Brun, and, above all, Le Sueur, did honour to the age of Lewis XIV. They have none at present to compare with them in the more noble kind of painting: but M. Greuse, for portraits and conversation pieces, never perhaps was excelled.

Sculpture is in general better understood in France than in most other countries of Europe: Their engravings on copper-plates have been universally and justly celebrated; but such a liberal patronage has been afforded to English artists, that they are now thought to excel their ingenious neighbours, and have rivalled them also in the manufacture of paper proper for such impressions. Their treatises on ship-building and engineering stand unrivalled; but in the practice of both they are outdone by the English. No genius has hitherto equalled Vauban in the theory or practice of fortification. The French were long our superiors in architecture; though we now are their equals in this art.

The French Encyclopædia, first published in the latter years of Lewis XV. and now republished in a new form, is, perhaps, the best dictionary of arts and sciences ever compiled in any country.

UNIVERSITIES, PUBLIC COLLEGES, } Before the revolution, there  
AND ACADEMIES. } were in France twenty-eight  
universities or public colleges, as follow: Aix, Angers, Arles, Avignon, Belançon, Bourdeaux, Bourges, Caen, Cahers, Dol, Douay, La Fleche, Montauban, Montpellier, Nantes, Orange, Orléans, Paris, Perpignan, Poitiers, Pont-à-Mousson, Richelieu, Rheims, Soissons, Strasbourg, Toulouse, Tournon, and Valence. Among these, the Sorbonne at Paris was the most celebrated.

The following literary establishments were supported out of the national treasury: the French Academy, Academy of Belles Lettres, Academy of Sciences, Royal Society of Medicine, King's Library, Observatory, and the Free School of Design. Under the republic, primary,

central, and special schools have been established; a primary school for each canton, a central school for each department, and special schools for the higher sciences, such as astronomy, and for those arts which require a particular education for the public service, such as medicine and surgery. Education in these establishments is at the public expense, but the scholars are maintained by their parents or friends.

An academy called the *National Institute* has likewise been founded; the installation of which took place in the hall of the former Academy of Sciences, in the palace of the National Museum, formerly the Louvre. It is composed of a hundred and forty-four members; among the first of whom were found the names of La Lande, La Place, Fourcroy, Reynel, Marmontel, Volney, Bertholet, Bitauhe, &c. This national academy holds four public meetings in a year; its conferences point out and promote the progress of the arts and sciences, but it has no authority whatever over the schools.

ANTIQUEITIES AND CURIOSITIES, } Few countries, if we except  
NATURAL AND ARTIFICIAL. } Italy, can boast of more valuable  
remains of antiquity than France. Some of the French antiquities belong to the time of the Celts; and, consequently, compared to them, those of Rome are modern. Father Mabillon has given us a most curious account of the sepulchres of their kings, which have been discovered so far back as Pharamond; and some of them, when broken open, were found to contain ornaments and jewels of value. At Rheims, and other parts of France, are to be seen triumphal arches; but the most entire is at Orange, erected on account of the victory obtained over the Cimbri and the Teutones, by Caius Marius and Lucatius Catulus. After Gaul was reduced to a Roman province, the Romans took delight in adorning it with magnificent edifices, both civil and sacred; some of which are more entire than any to be met with in Italy itself. The ruins of an amphitheatre are to be found in Chalons, and likewise at Vienne. Nismes, however, exhibits the most valuable remains of ancient architecture of any place in France. The famous Pont du Gard was raised in the Augustan age, by the Roman colony of Nismes, to convey a stream of water between two mountains for the use of that city: it consists of three bridges, or tiers of arches, one above another; the height is 174 feet, and the length extends to 723. Many other ruins of antiquity are found at Nismes; but the chief are the temple of Diana, and the amphitheatre, which is thought to be the finest and most entire of the kind of any in Europe; but, above all, the house erected by the emperor Adrian, called the *Maison Carrée*. The architecture and sculpture of this building are so exquisitely beautiful, that it enchants even the most ignorant: and it is still entire, being very little affected either by the ravages of time, or the havoc of war. At Paris, in la Rue de la Harpe, may be seen the remains of the *Thermae*, supposed to have been built by the emperor Julian, surnamed the Apostate, about the year 356, after the same model as the baths of Dioclesian. The remains of this ancient edifice are many arches, and within them a large saloon. It is fabricated of a kind of mastic, the composition of which is not now known, intermixed with small square pieces of free-stone and bricks. But the most extraordinary of all artificial curiosities is the subterraneous cavern at Paris. For the first building of that city, it was necessary to get the stone in the environs. As Paris was enlarged, the streets and suburbs extended to and were built on the ancient quarries from which the stone had been taken; and hence proceed the caverns or frightful cavities which are found

under the houses in several quarters of the city. Eight persons some years since perished in one of them, a gulf of 150 feet deep, which excited the police and government to cause the buildings of several quarters to be privately propped up. All the suburbs of St. James's, Harpe-street, and even the street of Tournon, stand upon the ancient quarries; and pillars have been erected to support the weight of the houses; but as the lofty buildings, towers, and steeples, now tell the eye, that what is seen in the air is wanting under the feet, so it would not require a very violent shock to throw back the stones to the places from whence they were raised.

At Arles in Provence is an obelisk of oriental granite, 52 feet high, and seven feet diameter at the base, and all but one stone. Roman temples and aqueducts are frequent in France. The most remarkable are in Burgundy and Guienne; the passage cut through the middle of a rock near Briançon in Dauphiné is thought to be a Roman work, if not of greater antiquity. The round buckler of massy silver, taken out of the Rhône in 1665, being twenty inches in diameter, and weighing twenty-one pounds, containing the story of Scipio's continence, is thought to be coeval with that great general.

Some of the modern works of art, particularly the canals, have been before noticed. There are some subterraneous passages and holes, especially at St. Aubin in Brittany, and Niont in Dauphiné, really stupendous.

[CITIES AND TOWNS.] These are numerous in France; of which we shall mention only Paris, Lisle, and their principal sea-ports, Brest and Toulon.

Lisle, in French Flanders, is thought to be the most regular and strongest fortification in Europe, and was the master-piece of the famous Vauban. It is generally garrisoned with above ten thousand regulars: and, for its magnificence and elegance, it is called Little Paris. Its manufactures of silk, cambric, and camblets, are very considerable; and its inhabitants amount to about sixty thousand. Every reader is acquainted with the history of Dunkirk, which the French were obliged by the treaty of Utrecht to demolish; but it is still a thorn in the side of the English, by being a harbour for their smugglers. The rest of French Flanders, and its Netherlands, abound with fortified towns, which carry on very gainful manufactures.

Proceeding southward, we come to the Isle of France; the capital of which, and of the whole kingdom, is Paris. This city has been so often described, that it may appear superfluous to mention it more particularly, were it not that the vanity of the French has given it a preference, which it by no means deserves, to all the capitals in the world, in every respect, not excepting even population. Many of the English have been imposed upon in this point; particularly by computing from the births and burials within the bills of mortality, which exclude the most populous parishes about London. Another mistake lies in computing from births and marriages. The number of dissenters of all kinds in and about London, who do not register the births of their children, is very great; the registers of others are not known by the public; and many of the poorer sort will not afford the small expense of such a registering. Another peculiarity existing in London is, that many of the Londoners, who can afford the expense, when they find themselves consumptive, or otherwise indisposed, retire into the country, where they are buried, and thereby excluded from the bills of mortality. The population of Paris, therefore, where

the registers are more exact and accessible to the poor, and where the religion and the police were before the revolution more uniform and strict, is far more easily ascertained than that of London; and by the best accounts it does not exceed seven or eight hundred thousand, which is far short of the inhabitants of London and the contiguous parishes.

Paris is divided into three parts,—the city, the university, and that which was formerly called the town. The city is old Paris; the university and the town are the new. Paris contains more works of public magnificence than utility. Its palaces are showy, and some of its streets, squares, hotels, hospitals, and churches, superbly decorated with a profusion of paintings, tapestry, images, and statues; but Paris, notwithstanding its boasted police, is greatly inferior to London in many of the conveniences of life, and the solid enjoyments of society. Without entering into more minute disquisitions, Paris, it must be owned, is the paradise of splendour and dissipation. The tapestry of the Gobelins\* is unequalled for beauty and richness. The Louvre is a building that does honour to architecture itself: it was adorned by many excellent institutions for the arts and sciences, particularly the three academies, and ennobled by the residence of the learned. The Tuilleries, the palace of Luxembourg, where a valuable collection of paintings are shown, the royal palace and library, the guild-hall, and the hospital for invalids, are superb to the highest degree. The city of Paris is said to be fifteen miles in circumference. The hotels of the French noblesse at Paris take up a great deal of room with their court-yards and gardens; and so do their convents and churches. The streets are very narrow, and the houses very high, many of them seven stories. The houses are built of stone, and often contain a different family on every floor. The river Seine, which runs through the centre of the city, is not half so large as the Thames at London; it is too far distant from the sea for the purposes of navigation, and is not furnished, as the Thames, with vessels or boats of any sort; over it are many stone and wooden bridges, which have nothing to recommend them. The streets of Paris are generally crowded, particularly with coaches, which give that capital the appearance of wealth and grandeur; though, in reality, there is more show than substance. The glittering carriages that dazzle the eyes of strangers are mostly common hacks, hired by the day or week to the numerous foreigners who visit that city; and, in truth, the greatest part of the trade of Paris arises from the constant succession of strangers that arrive daily from every nation and quarter of the globe. This ascendancy is undoubtedly owing to the reputation of their language, their public buildings, their libraries, and collections of paintings, that are open to the public; the cheapness of provisions, excellency of the French wines, and, above all, the purity of the air and climate in France. With all these advantages, Paris, in general, will not bear a comparison with London, in the more essential circumstances of a thriving foreign and domestic trade, the cleanness of their streets, neatness of their houses, especially within; the plenty of water, and that of a better quality than the Seine, which, it is said, disagrees with strangers, as do likewise their small wines. In the houses of Paris most of the floors are of brick, and have no other kind of cleaning than that of being sprinkled with water, and swept once a day. These brick floors, the stone

\* One *Gobel*, a noted dyer at Rheims, was the first who settled in this place, in the reign of Francis I. and the house has retained his name ever since: and here the great Colbert, about the year 1667, established that valuable manufactory.

stairs, the want of wainscoting in the rooms, and the thick party walls of stone, are, however, good preservatives against fire, which seldom does any damage in this city. Instead of wainscoting, the walls are covered with tapestry or damask. The beds in general are very good, and well ornamented with tester and curtains. Their shops are but poorly stored with goods; and the shop-keepers and tradesmen are an indolent, loitering people. There is a remarkable contrast between this class of persons and those of the same rank in London. In Paris, the women pack up parcels, enter the orders, and do most of the drudgery business of the shop, while the husband loiters about, talks of the great, of fashions and diversions, and the invincible force of their armies. The splendour of the grand monarch used to be also with them a favourite topic of conversation, previous to the change in their political system. The Parisians, however, as well as the natives of France in general, are remarkably temperate in their living; and to be intoxicated with liquor is considered as infamous. Bread, and all manner of butchers' meat and poultry, are extremely good in Paris; the beef is excellent; the wine they generally drink is a very thin kind of Burgundy. The common people, in the summer season, live chiefly on bread, butter, grapes, and small wine. The Parisians, till lately, scarcely knew the use of tea; but they have coffee in plenty. The police of Paris used to be so well attended to, that quarrels, accidents, or felonies, seldom happened; and strangers from all quarters of the globe, let their appearance be ever so uncommon, met with the most polite treatment. The streets were patrolled at night by horse and foot; so judiciously stationed, that no offender could escape their vigilance. They likewise visited the publicans precisely at the hour of twelve at night, to see that the company were gone; for in Paris no liquor could be had after that time. The public roads in France were under the same excellent regulation, which, with the torture of the rack, prevented robberies in that kingdom; but, for the same reason, when robberies did happen, they were always attended with the death of the unfortunate traveller; and indeed this is the general practice in every country of Europe, Great Britain excepted.

The environs of Paris are very pleasant, and contain a number of fine seats, small towns, and villages; some of them, being scattered on the edges of hills rising from the Seine, are remarkably delightful.

The palace of Versailles, which stands twelve miles from Paris, though magnificent and expensive beyond conception, and adorned with all that art can furnish, is a collection of buildings, each of exquisite architecture, but not forming a whole, agreeable to the grand and sublime of that art. The gardens, and water-works (which are supplied by means of prodigious engines, across the Seine at Marli, about three miles distance), are astonishing proofs of the fertile genius of man, and highly worthy of a stranger's attention. Trianon, Marli, St. Germain en Laye, Meudon, and other royal palaces, are laid out with taste and judgment; each has its peculiar beauties for the entertainment and amusement of that luxurious court which lately occupied them; but some of them are in a shameful condition, both as to repairs and cleanliness.

Brest is a small but very strong town, upon the English channel, with a most spacious and finely fortified road and harbour, the best and safest in all the kingdom; yet its entrance is difficult, by reason of many rocks lying under water. At Brest there was a court of admiralty, an academy for sea affairs, docks, and magazines for all kinds of naval stores, rope-yards, store-houses, &c. inasmuch that it may be termed the

capital receptacle for the navy of France, for which it is admirably well adapted.

Lewis XIV. rendered Toulon, from a pitiful village, a sea-port of great importance. He fortified both the town and harbour for the reception and protection of the navy. Its old and its new harbour lie contiguous; and, by means of a canal, ships pass from the one to the other, both of them having an outlet into the spacious outer harbour. Its arsenal, established also by that king, has a particular store-house for each ship of war; its guns, cordage, &c. being separately laid up. Here are spacious workshops, for blacksmiths, joiners, carpenters, locksmiths, carvers, &c. Its rope-walk, of stone, is 320 toises or fathoms in length, with three-arched walks. Its general magazine supplies whatever may be wanting in the particular store-houses, and contains an immense quantity of all kinds of stores, disposed in the greatest order.

COMMERCE AND MANUFACTURES.] Next to Henry IV. justly stiled the Great, the famous Colbert, minister to Lewis XIV. may be called the father of the French commerce and manufactures. Under him there was a great appearance that France would make as illustrious a figure as a trading, as she did then as a warlike people; but the truth is, the French do not naturally possess that undaunted perseverance which is necessary for commerce and colonisation, though no people, in theory, understand them better. It is to be considered at the same time, that France, by her situation, by the turn of her inhabitants for certain manufactures, and the happiness of her soil, must be always possessed of great inland and neighbouring trade.

The silk manufacture was introduced into France so late as the reign of Henry IV; and in the age of his grandson Lewis XIV. the city of Tours alone employed 8000 looms, and 800 mills. The city of Lyons then employed 18,000 looms; but after the impolitic and unjust revocation of the edict of Nantes, the expulsion of the protestants, and the ruinous wars maintained by France, they decreased to 4000; and their silk manufacture is now rivalled by that of England, where the French protestants took refuge, and were happily encouraged. Next to Tours and Lyons, Paris, Chatillon, and Nismes, are most celebrated for silk manufactures. France before the revolution contained 1,500 silk mills, 21,000 looms for stuffs, 12,000 for ribbons and lace, 20,000 for silk stockings, all of which employed two millions of people. They also manufacture gloves and stockings from spider-silk. On the other hand, the French woollen cloths and stuffs, more especially at Abbeville, Amiens, and Paris, are said to be now little inferior to those of England, and have greatly injured them, particularly in the Turkish market, assisted by the clandestine importation of English and Irish wool, and workmen from this country.

In manufactures, the French have always been distinguished for their invention, and the English for their superior improvement. Abbeville is famous for cloth, linen, sail-cloth, and soap; Auvergne for fine thread, lace, stuffs, and paper; Nismes for fine serges; Cambray for cambrics; St. Quentin for lawns; and Picardy for plate glass.

The districts adjoining the British channel contain many sheep of the English breed, which are said to degenerate by removal from their native soil.

Besides the infinite advantage arising to her inland commerce, from her rivers, navigable canals, and a connection with two seas, her foreign trade before the revolution might be said to extend itself all over the globe. It

is a doubtful point whether France was a loser by its cession of Canada and part of Louisiana by the peace of 1763. But the island of St. Domingo, of which she long possessed the most valuable part, and now has the whole, ceded to her by the late treaty with Spain, is a most improvable acquisition, and the most valuable of all her foreign colonies. In the West Indies, she likewise held, till the present war, the important sugar islands of Martinico, Guadaloupe, St. Lucia, St. Bartholomew, Deleada, and Marigalante. Her possessions in North America are only a small tract upon the Mississippi.

The French possessions in the East Indies were never very considerable; but such as they are, they are now in the hands of the English.

Mr. Anderson gives the following account of the trade of France before the revolution: "Her land trade to Switzerland and Italy is by way of Lyons—to Germany, through Metz and Strasbourg—to the Netherlands, through Lille—to Spain (a most profitable one), through Bayonne and Perpignan. As for her naval commerce, her ports in the Channel, and on the Western Ocean, are frequented by all the trading nations in Europe, to the great advantage of France, more especially respecting what is carried on with England, Holland, and Italy. The trade from her Mediterranean ports (more particularly from Marseilles) with Turkey and Africa, has long been very considerable. The negro trade from Guinea supplies her sugar colonies, besides the gold, ivory, and drugs got from thence."

The exports are wine, vinegar, brandy, oil, silks, satins, linens, woollen cloth, tapestries, laces, gold and silver embroideries, toys, trinkets, perfumery, paper, prints, books, drags, dyes, &c. The imports are hardware, earthen ware, cottons, metals, hemp, flax, silk, wool, horses, East and West India goods, &c. Before the revolution it employed one million tons of shipping, with near 50,000 seamen; the imports were valued at 9,583,333*l.* the exports at 12,500,000*l.* and it had a *balance of trade* of more than two millions in its favour; but its trade and manufactures have since greatly declined.

**PUBLIC TRADING COMPANIES.]** It has no trading companies (having abolished all monopolies) but a bank or *caisse d'escompte*, and a bank of extraordinaries. A plan has lately been proposed for establishing a bank similar to that of England; but it will probably meet the fate of all former plans of the same nature.

**CONSTITUTION AND GOVERNMENT.]** France, by the revolution in 1789, founded a *new constitution*, upon the principle that all men are free, and equal in their rights. After the death of the king, in the year 1793, another constitution was framed, and adopted, which was again succeeded by another, usually called *the constitution of the third year*. By this constitution the government was vested in a directory of five members, and a legislative body composed of a council of ancients, of two hundred and fifty members, and a council of five hundred.

But in November, 1799, this constitution was likewise overthrown, and a new form of government erected, consisting of what is called a conservative senate of eighty members; a tribunate of one hundred; a legislative body of three hundred; and three consuls, nominated for ten years, and indefinitely re-eligible. The first consul possesses such attributes, and exercises such functions, as give him the most ample power; and this office is now held by general Buonaparte, the author of this revolution and constitution. How long this form of government may remain unaltered by a new revolution, among this mutable and violent people, time must discover.

After the reader has been told of the excellency of the climate, and fertility of the soil of France; her numerous manufactures and extensive commerce; her great cities, her numerous towns, sea-ports, rivers, and canals; the cheapness of provisions, wines and liquors; the formidable armies and fleets she has sent forth, to the terror of Europe; and the natural character of her inhabitants, their sprightliness and gaiety; he will undoubtedly conclude that her people are the most opulent and happy in Europe. The reverse, however, appears to be the state of that nation at present; and we do not find that in any former period they were more rich or more happy.

The most obvious causes of this national poverty took their rise from the ambition and vanity of their kings and courtiers, which led them into schemes of universal dominion, the aggrandisement of their name, and the enslaving of Christendom. Their wars, which they sometimes carried on against one-half of Europe, and in which they were generally unfortunate, led them into difficulties to which the ordinary revenues were inadequate; and hence proceeded the arbitrary demands upon the subject, under various pretences, in the name of loans, free-gifts, &c. When these failed, other methods, more despotic and unwarrantable, such as raising and reducing the value of money as it suited their own purposes, national bankruptcies, and other grievous oppressions, were adopted, which gave the finishing blow to public credit, and shook the foundations of trade, commerce, and industry, the fruits of which no man could call his own.

When we consider the motives of these wars, a desire to enslave and render miserable the nations around them, that man must be devoid of humanity whose breast is not raised with indignation upon the bare mention of the blood that has been spilt, the miseries and desolations that have happened, and the numerous places that have fallen a sacrifice to their ambition. It appears too plain, that, while they thus grasp after foreign conquest, their country exhibits a picture of misery and beggary. Their towns, very few excepted, make a most dismal and solitary appearance. The shops are mean beyond description. That this is the appearance of their towns, and many of their cities, we may appeal to the observation of any one who has been in that kingdom. We have in another place mentioned the natural advantages of France, where the hills are covered with grapes, and most extensive plains produce excellent crops of corn, rye, and barley. Amidst this profusion of plenty, the peasant and his family barely existed upon the gleanings, exhibiting a spectacle of indigence hardly credible; and to see him ploughing the ground with a lean cow, ass, and a goat yoked together, excited in an English traveller that pity to which human-nature is entitled. The French peasant is now become a citizen; but time must decide whether his situation be essentially and permanently amended.

REVENUES.] Some authors make the amount of the assessed taxes for the year 1792 only 300,000,000 livres, equal to 12,500,000l. sterling, and, with the incidental taxes, in all 15,500,000l. sterling—near nine millions less than before the revolution, when the noblesse and clergy were exempted.

All excises and excisemen, tythes, and game laws, are now abolished, and the roads maintained at public expense.

The REVENUE in the year 1788, before the revolution, was 20 millions and a half sterling; and its ordinary expenditure exceeded the revenue five millions and a half.

been principally defrayed by the seizure of church lands, confiscations, requisitions and contributions imposed on the conquered countries, which are very different from permanent revenue.

In the year 1797, Gilbert, a member of the council of five hundred, stated the revenue for the 6th year at 479,593,579 livres, or 19,980,000l. sterling.

On the 13th of October, 1799, the executive directory sent a message to the council of five hundred, stating the amount of the receipts of the 7th year of the republic at 476,000,000 livres, or somewhat above 19,800,000l. sterling. The expenses of the year they stated, at the same time, at 726,000,000 livres; or 30,250,000l. sterling.

The public DEBT, 1784, was £. 141,666,000.

[MILITARY AND MARINE STRENGTH.] There is no nation in Europe where the art of war, particularly that part of it relating to gunnery and fortification, is better understood than in France. Besides other methods for cultivating it, there was a royal military academy established purposely for training up 500 young gentlemen at a time, in the several branches of this great art.

[ARMY.] The peace establishment of the army, for the year 1792, was,

Infantry, . . . . .	111,000
Cavalry, . . . . .	30,000
Artillery, . . . . .	11,000

Total, . . 152,000

These are called *troops of the line*, and, along with the volunteer national guards, formed an army, on the frontiers, of 224,000 men.

The *municipal army*, or national guards, are a kind of embodied militia for the interior defence of the kingdom, and amount to between three and four millions.

The *gendarmerie* are an auxiliary body of troops for the protection of laws and police.

This was the establishment before the war; but since the attack made upon the French by the allied powers, the number of troops they have brought into the field almost exceeds belief. In the year 1794, they had 980,000 effective men in arms; which force was distributed as follows:

The army of the north, . . . . .	220,000
The united armies of the Rhine and Moselle, . .	280,000
The army of the Alps, . . . . .	60,000
The army of the eastern Pyrenees, . . . . .	80,000
The army of the south, . . . . .	60,000
The army of the west, . . . . .	80,000

Total, . . 780,000

[NAVY.] The report of the minister, towards the close of the year 1791, states the ships in good condition to be eighty-six of the line, and seventy-eight frigates, besides fireships, corvettes, galleys, and cutters. But the repeated victories of the English by sea, in the course of the present war, have now extremely reduced, and, indeed, nearly annihilated, the navy of France.

ROYAL TITLES, ARMS, NOBILITY, } THE NATIONAL ASSEMBLY, de-  
AND ORDERS. } sired of establishing the French

constitution on the principles it has declared, abolished, irrevocably, those institutions which are injurious to liberty and equality of rights.

There is no longer any *nobility*, nor *peerage*, nor *hereditary distinctions*, nor *difference of orders*, nor *feudal government*, nor *patrimonial jurisdiction*, nor any of the *titles*, *denominations*, and *prerogatives*, which are derived from them; nor any of the orders of *chivalry*, *corporations*, or *decorations*, for which proofs of nobility were required; nor any kind of superiority but that of public functionaries in the exercise of their functions.

Royalty, which was one branch of the ancient constitution, is now abolished, and the unfortunate monarch decapitated.

HISTORY.] The history of no country is better authenticated than that of France, and it is particularly interesting to an English reader. This kingdom, which was by the Romans called Transalpine Gaul, or Gaul beyond the Alps, to distinguish it from Cisalpine Gaul, on the Italian side of the Alps, was probably peopled from Italy, to which it lies contiguous. Like other European nations, it soon became a desirable object to the ambitious Romans; and, after a brave resistance, was annexed to their empire, by the invincible arms of Julius Cæsar, about forty-eight years before Christ. Gaul continued in the possession of the Romans, till the downfall of that empire in the fifth century, when it became a prey to the Goths, the Burgundians, and the Franks, who subdued but did not extirpate the ancient natives. The Franks themselves, who gave it the name of France, or Frankenland, were a collection of several people inhabiting Germany, and particularly the Sali, who lived on the banks of the river Sale, and who cultivated the principles of jurisprudence better than their neighbours. These Sali had a rule, which the rest of the Franks are said to have adopted, and has been by the modern Franks applied to the succession of the throne, excluding all females from the inheritance of sovereignty, and is well known by the name of the *Salic Law*.

The Franks and Burgundians, after establishing their power, and reducing the original natives to a state of slavery, parcelled out the lands among their principal leaders; and succeeding kings found it necessary to confirm their privileges, allowing them to exercise sovereign authority in their respective governments, until they at length assumed an independency, only acknowledging the king as their head. This gave rise to those numerous principalities that were formerly in France, and to the several parliaments; for every province became, in its policy and government, an epitome of the whole kingdom; and no laws were made, or taxes raised, without the concurrence of the grand council, consisting of the clergy and of the nobility.

Thus, as in other European nations, immediately after the dissolution of the Roman empire, the first government in France seems to have been a kind of mixed monarchy, and the power of their kings extremely circumscribed and limited by the feudal barons.

The first Christian monarch of the Franks (according to Daniel, one of the best French historians) was Clovis, who began his reign anno 481, and was baptised, and introduced Christianity, in the year 496; the mind of Clovis had been affected by the pathetic tale of the passion and the death of Christ; and, insensible of the beneficial consequences of the mysterious sacrifice, he exclaimed, with religious fervour, "Had I been present with my valiant Franks, I would have revenged his injuries!" But though he publicly professed to acknowledge the truth of the gospel, its divine precepts were but little respected. From this period the French history exhibits a series of great events; and we find the monarch generally engaged in domestic broils, or foreign wars. The first race of their kings,

prior to Charlemagne over-ran Europe, deals upon their people whom we have called master of Germany, the Romans by the which proved famous, a fierce warrior of Scandinavia, 900, obliged the leader, who made himself a Christian France, which William duke of in the year 10 France, as it engaged for which it was the assistance it

prior to Charlemagne, found a cruel enemy in the Saracens, who then over-ran Europe, and retaliated the barbarities of the Goths and Vandals upon their posterity. In the year 800, Charlemagne, king of France, whom we have often mentioned as the glory of those dark ages, became master of Germany, Spain, and part of Italy, and was crowned king of the Romans by the pope; he divided his empire, by will, among his sons; which proved fatal to his family and posterity. Soon after this, the Normans, a fierce warlike people from Norway, Denmark, and other parts of Scandinavia, ravaged the kingdom of France; and, about the year 900, obliged the French to yield Normandy and Bretagne to Rollo their leader, who married the king's daughter, and was persuaded to profess himself a Christian. This laid the foundation of the Norman power in France, which afterwards gave a king to England, in the person of William duke of Normandy, who subdued Harold, the last Saxon king, in the year 1066. This event proved unfortunate and ruinous to France, as it engaged that nation in almost perpetual wars with England, for which it was not an equal match, notwithstanding its numbers, and the assistance it received from Scotland.

The rage of crusading, which broke out at this time, was of infinite service to the French crown, in two respects: in the first place it carried off many thousands of its turbulent subjects, and their leaders, who were almost independent of the king: in the next, the king succeeded to the estates of many of the nobility, who died abroad without heirs.

But, passing over the dark ages of the crusades, their expedition to the Holy Land, and wars with England, which have already been mentioned, we shall proceed to that period when the French began to extend their influence over Europe, in the reign of Francis I. contemporary with Henry VIII. of England. This prince, though he was brave to excess in his own person, and had defeated the Swifs, who till then were deemed invincible, was an unfortunate warrior. He had great abilities and great defects. He was a candidate for the empire of Germany, but lost the imperial crown—Charles V. of the house of Austria, and king of Spain, being chosen. In the year 1520, Francis having invited Henry VIII. of England to an interview, the two kings met in an open plain, near Calais, where they and their attendants displayed their magnificence, with such emulation and profuse expence, as gave it the name of the *Field of the Cloth of Gold*. Feats of chivalry, parties of galantry, together with such exercises and pastimes as were in that age reckoned manly or elegant, rather than serious business, occupied both courts during eighteen days that they continued together\*. Francis made some successful expeditions against Spain, but suffered his mother, of whom he was very fond, to abuse his power: by which he disobliged the constable of Bourbon, the greatest of his subjects, who joined in a

\* The French and English historians describe the pomp of this interview, and various spectacles, with great minuteness. One circumstance mentioned by the *maréchal de Fleuranges*, who was present, and which appears singular in the present age, is commonly omitted. "After the tournament," says he, "the French and English wrestlers made their appearance, and wrestled in presence of the kings and the ladies; and as there were many stout wrestlers there, it afforded excellent pastime; but as the king of France had neglected to bring any wrestlers out of Bretagne, the English gained the prize.—After this the kings of France and England retired to a tent, where they drank together, and the king of England seizing the king of France by the collar, said, "My brother, I must wrestle with you," and endeavoured once or twice to trip up his heels; but the king of France, who was a dexterous wrestler, twisted him round, and threw him on the earth with prodigious violence. The king of England wanted to renew the combat, but was prevented."—*Memoires de Fleuranges*, 12mo, Paris, 1753, p. 329.

confederacy against him with the emperor and Henry VIII. of England. In his adventurous expedition into Italy, he was taken prisoner at the battle of Pavia, in the year 1524, and obliged to agree to dishonourable terms, which he never meant to perform, to regain his liberty. His non-performance of those conditions was afterwards the source of many wars between him and the emperor; and he died in 1547.

France, at the time of his death, notwithstanding the variety of disagreeable events during the late reign, was in a flourishing condition. Francis I. was succeeded by his son Henry II. who, upon the whole, was an excellent and fortunate prince. He continued the war with the emperor of Germany to great advantage for his own dominions; and was so well served by the duke of Guise, that, though he lost the battle of St. Quentin against the Spaniards and the English, he retook Calais from the latter, who never since had any footing in France. He married his son the dauphin to Mary queen of Scots, in hopes of uniting that kingdom to his crown; but in this scheme, he, or rather his country, was unfortunate, as may be seen in the history of Scotland. He was killed in the year 1559, at an unhappy tilting-match, by the count of Montgomery.

He was succeeded by his son, Francis II. a weak, sickly, inactive prince, and only thirteen years of age, whose power was entirely engrossed by a prince of the house of Guise, uncle to his wife, the beautiful queen of Scotland. This engrossment of power encouraged the Bourbon, the Montmorenci, and other great families, to form a strong opposition against the government. Antony, king of Navarre, was at the head of the Bourbon family; but the queen-mother, the famous Catharine of Medicis, being obliged to take part with the Guises, the confederacy, which had adopted the cause of Huguenotism, was broken in pieces, when the sudden death of Francis happened, in the year 1560.

This event took place while the prince of Condé, brother to the king of Navarre, was under sentence of death for a conspiracy against the court; but the queen-mother saved him, to balance the interest of the Guises; so that the sole direction of affairs fell into her hands, during the minority of her second son, Charles IX. Her regency was a continued series of dissimulation, treachery, and murder. The duke of Guise, who was the scourge of the protestants, was assassinated by one Poltrot, at the siege of Orléans; and the murderer was unjustly thought to have been instigated by the famous Coligni, admiral of France, who was then at the head of the protestant party. Three civil wars succeeded. At length the court pretended to grant the Huguenots a very advantageous peace, and a match was concluded between Henry, the young king of Navarre, a protestant, and the French king's sister. The heads of the protestants were invited to celebrate the nuptials at Paris, with the infernal view of butchering them all, if possible, in one night. The project proved but too successful, though it was not completely executed, on St. Bartholomew's day, 1572. The king himself assisted in the massacre, in which the admiral Coligni fell. The signal for the inhuman slaughter of so many thousands was to be made by striking the great bell of the palace. At that dreadful knell, the work of death was begun, and humanity recoils from the horrors of the fatal night of St. Bartholomew; yet the reader may expect, amidst the general carnage, that some few moments should be devoted to the fate of Coligni. He had long retired to rest, when he was aroused by the noise of the assassins, who had surrounded his house. A German, named Besime, entered his chamber; and the admiral, apprehending his intentions, prepared to meet death with that

fortitude which had ever distinguished him. Incapable of resistance, from the wounds he had received by two balls in a late attempt to assassinate him, with an undismayed countenance, he had scarce uttered the words "Young man, respect these grey hairs, nor stain them with blood," when Beime plunged his sword into his bosom, and, with his barbarous associates, threw the body into the court. The young duke of Guise contemplated it in silence; but Henry, count d'Angoulême, natural brother to Charles, spurned it with his foot, exclaiming, "Courage, my friends! we have begun well; let us finish in the same manner." It is said that about 30,000 protestants were murdered at Paris, and other parts of France: and this brought on a fourth civil war. Though a fresh peace was concluded in 1573 with the protestants, yet a fifth civil war broke out the next year, when the bloody Charles IX. died without heirs.

His third brother, the duke of Anjou, had some time before been chosen king of Poland; and hearing of his brother's death, he with some difficulty escaped to France, where he took quiet possession of that crown, by the name of Henry III.

Religion at that time supplied to the reformed nobility of France the feudal powers they had lost. The heads of the protestants could raise armies of Huguenots. The governors of provinces behaved in them as if they had been independent of the crown; and the parties were so equally balanced, that the name of the king alone turned the scale. A *holy league* was formed for the defence of the catholic religion, at the head of which was the duke of Guise. The protestants, under the prince of Condé and the duke of Alençon, the king's brother, called the German princes to their assistance; and a sixth civil war broke out in 1577, in which the king of Spain took the part of the league, in revenge of the duke of Alençon, declaring himself lord of the Netherlands. The civil war was finished within the year, by another pretended peace. The king, from his first accession to the crown, had plunged himself into a course of infamous debauchery and religious extravagances. He was entirely governed by his profligate favourites, but he possessed natural good sense. He began to suspect that the proscriptions of the protestants, and the setting aside from the succession the king of Navarre, on account of his religion, which was aimed at by the holy league, was with a view to place the duke of Guise, the idol of the Roman-catholics, on the throne, to which that duke had some distant pretensions. To secure himself on the throne, a seventh civil war broke out in 1579, and another in the year 1585, both of them to the disadvantage of the protestants, through the abilities of the duke of Guise. The king thought him now so dangerous, that, after inviting him in a friendly manner to court, both he, and his brother the cardinal, were, by his majesty's orders, and in a manner under his eyes, basely assassinated in 1588. The leaguers, upon this, declared that Henry had forfeited his crown, and was an enemy to religion. This obliged him to throw himself into the arms of the protestants; but while he was besieging Paris, where the leaguers had their greatest force, he was in his turn assassinated by one Clement, a young enthusiastic monk, in 1589. In Henry III. ended the line of Valois.

The readers of history are well acquainted with the difficulties, on account of his religion, which Henry IV. king of Navarre\*, head of

\* A small kingdom lying upon the Pyrenean mountains, of the greatest part of which, Upper Navarre, Henry's predecessors had been unjustly dispossessed by Ferdinand, king of Spain, about the year 1512.

the house of Bourbon, and the next heir by the Salic law, had to encounter before he mounted the throne. The leaguers were headed by the duke of Maine, brother to the late duke of Guise; and they drew from his cell the decrepit cardinal of Bourbon, uncle of the king of Navarre, to proclaim him king of France. Their party being strongly supported by the power of Spain and Rome, all the glorious actions performed by Henry, his courage and magnanimity, seemed only to make him more illustriously unfortunate: for he and his little court were sometimes without common necessaries. He was, however, personally beloved; and no objection lay against him, but that of religion. The leaguers, on the other hand, split among themselves; and the French nation in general were jealous of the Spaniards. Henry, after experiencing a variety of good and bad fortune, came secretly to a resolution of declaring himself a Roman-catholic. This was called a measure of prudence, if not of necessity, as the king of Spain had offered his daughter Isabella Clara Eugenia to be queen of France, and would have married her to the young duke of Guise.

In 1593, Henry went publicly to mass, as a mark of his conversion. This complaisance wrought wonders in his favour; and having with great difficulty obtained absolution from the pope, all France submitted to his authority, and he had only the crown of Spain to contend with; which he did for several years with various fortune. In 1598, he published the famous edict of Nantes, which secured to his old friends, the protestants, the free exercise of their religion; and next year the treaty of Vervins was concluded with Spain. Henry next chastised the duke of Savoy, who had taken advantage of the late troubles in his kingdom; and applied himself with wonderful attention and success (assisted in all his undertakings by his minister, the great Sully) to cultivate the happiness of his people, by encouraging manufactures, particularly that of silk, the benefit of which France experiences at this day. Having re-established the tranquillity, and in a great measure secured the happiness of his people, he formed connections with the neighbouring powers, for reducing the ambition of the house of Austria; for which purpose, it is said, he had formed great schemes, and collected a formidable army; others say (for his intention does not clearly appear), that he designed to have formed Christendom into a great republic, of which France was to be the head, and to drive the Turks out of Europe; while others attribute his preparations to more ignoble motives; that of a criminal passion for a favourite princess, whose husband had carried her for protection into the Austrian dominions. Whatever may be in these conjectures, it is certain, that, while he was making preparations for the coronation of his queen, Mary of Medicis, and was ready to enter upon his grand expedition, he was assassinated in his coach, in the streets of Paris, by one Ravailiac, another young enthusiast like Clement, in 1610.

Lewis XIII. son to Henry IV. was but nine years of age at the time of his father's death. As he grew up, he discarded his mother and her favourites, and chose for his minister the famous cardinal Richelieu, who put a period, by his resolute and bloody measures, to the remaining liberties of France, and to the religious establishment of the protestants there, by taking from them Rochelle, though Charles I. of England, who had married the French king's sister, made some weak efforts, by his fleet and arms, to prevent it. This put an end to the civil wars on account of religion in France. Historians say, that in these wars above a million of men lost their lives; that 150,000,000 livres were spent in carrying them on; and that nine cities, four hundred villages, two

thousand churches were burnt or Richelieu, popery, supported against the conspiracies which months before famous Lewis During the administration great, and the trifling cause Condé flame courtier, and Turenne, who France was in mother having he found meniards, and among them his own hand ever sat upon death of Ma the hands of and manufac cessful.

To write Ignorance a former, he the interests purposes of neighbours, tion. By the year 16 to take the where they their own made and against him at the head well served having pr under the Eugene, re of it had one contin cation of part of his Just as he collecting English T and concl liverance mind wor

thousand churches, two thousand monasteries, and ten thousand houses, were burnt or otherwise destroyed during their continuance.

Richelieu, by a masterly train of politics, though himself bigoted to popery, supported the protestants of Germany, and Gustavus Adolphus, against the house of Austria. After quelling all the rebellions and conspiracies which had been formed against him in France, he died some months before Lewis XIII. who, in 1643, left his son, afterwards the famous Lewis XIV. to inherit his kingdom.

During that prince's non-age, the kingdom was torn in pieces under the administration of his mother, Anne of Austria, by the factions of the great, and the divisions between the court and parliament, for the most trifling causes, and upon the most despicable principles. The prince of Condé flamed like a blazing star; sometimes a patriot, sometimes a courtier, and sometimes a rebel. He was opposed by the celebrated Turenne, who from a protestant had turned papist. The nation of France was involved at once in civil and domestic wars; but the queen-mother having made choice of cardinal Mazarin for her first minister, he found means to turn the arms even of Cromwell against the Spaniards, and to divide the domestic enemies of the court so effectually among themselves, that when Lewis assumed the reins of government in his own hands, he found himself the most absolute monarch that had ever sat upon the throne of France. He had the good fortune, on the death of Mazarin, to put the domestic administration of his affairs into the hands of Colbert, who formed new systems for the glory, commerce, and manufactures of France, in all of which he was extremely successful.

To write the history of this reign, would be to write that of all Europe. Ignorance and ambition were the only enemies of Lewis; through the former, he was blind to every patriotic duty of a king, and promoted the interests of his subjects only that they might the better answer the purposes of his greatness: by the latter he embroiled himself with all his neighbours, and wantonly rendered Germany a dismal scene of devastation. By his impolitic and unjust revocation of the edict of Nantes in the year 1685, and his persecutions of the protestants, he obliged them to take shelter in England, Holland, and different parts of Germany, where they established the silk manufacture, to the great prejudice of their own country. He was so blinded by flattery, that he arrogated to himself the divine honours paid to the pagan emperors of Rome. He made and broke treaties for his own conveniency, and at last raised against himself a confederacy of almost all the other princes of Europe; at the head of which was king William III. of England. He was so well served, that he made head for some years against this alliance; but having provoked the English by his repeated infidelities, their arms under the duke of Marlborough, and the Austrians under the prince Eugene, rendered the latter part of his life as miserable as the beginning of it had been splendid. His reign, from the year 1702 to 1712, was one continued series of defeats and calamities; and he had the mortification of seeing those places taken from him, which, in the former part of his reign, were acquired at the expense of many thousand lives. Just as he was reduced, old as he was, to the desperate resolution of collecting his people, and dying at their head, he was saved, by the English Tory ministry deserting the cause, withdrawing from their allies, and concluding the peace of Utrecht in 1713. He survived his deliverance but two years; and, in his last hours, displayed a greatness of mind worthy of his elevated situation: "Why do you weep?" said he

to his domestics, "Did you think me immortal?" He died on the 1st of September, 1715, and was succeeded by his great-grandson, Lewis XV.

The partiality of Lewis XIV. to his natural children might have involved France in a civil war, had not the regency been seized upon by the duke of Orléans, a man of sense and spirit, and the next legitimate prince of the blood, who having embroiled himself with Spain, the king was declared of age in 1722, and the regent, on the 5th of December, 1723, was carried off by an apoplexy.

Among the first acts of the government of Lewis XV. was his nominating his preceptor, afterwards cardinal Fleury, to be his first minister. Though his system was entirely pacific, yet the situation of affairs in Europe, upon the death of the king of Poland in 1734, more than once embroiled him with the house of Austria. The intention of the French king was to replace his father-in-law, Stanislaus, on the throne of Poland. In this he failed, through the interposition of the Russians and Austrians; but Stanislaus enjoyed the title of king, and the revenues of Lorraine, during the remainder of his life. The connection between France and Spain forced the former to become principals in a war against Great Britain, which was terminated by the peace of Aix-la-Chapelle in 1748.

In the year 1757, Francis Damien, an unhappy wretch, whose sullen mind, naturally unsettled, was inflamed by the disputes between the king and his parliament relative to religion, embraced the desperate resolution of attempting the life of his sovereign. - In the dusk of the evening, as the king prepared to enter his coach, he was suddenly wounded, though slightly, with a penknife, between the fourth and fifth ribs, in the presence of his son, and in the midst of his guards. The daring assassin had mingled with the crowd of courtiers, but was instantly betrayed by his distracted countenance. He declared it was never his intention to kill the king; but that he only meant to wound him, that God might touch his heart, and incline him to restore the tranquillity of his dominions by re-establishing the parliament, and banishing the archbishop of Paris, whom he regarded as the source of the present commotions. In these frantic and incoherent declarations he persisted, amidst the most exquisite tortures; and after human ingenuity had been exhausted in devising new modes of torment, his judges, tired out with his obstinacy, consigned him to a death, the inhumanity of which is increased by the evident madness that stimulated him to the desperate attempt, and which might fill the hearts of savages with horror; he was conducted to the common place of execution, amidst a vast concourse of the populace; stripped naked, and fastened to the scaffold by iron gyes. One of his hands was then burnt in liquid flaming sulphur; his thighs, legs, and arms, were torn with red-hot pincers; boiling oil, melted lead, rosin, and sulphur, were poured into the wounds; and, to complete the horrid catastrophe, he was torn to pieces by hortes.

The Jesuits having rendered themselves universally odious by their share in the conspiracy against the late king of Portugal, fell in France under the lash of the civil power, for certain fraudulent mercantile transactions. They refused to discharge the debts of one of their body, who had become bankrupt for a large sum, and who was supposed to act for the benefit of the whole society. As a monk, indeed, he must necessarily do so. The parliaments, eagerly seized an opportunity of humbling their spiritual enemies. The Jesuits were every-where cited before those high tribunals in 1761, and ordered to do justice to their creditors. They seemed to acquiesce in the decision, but delayed pay-

ment under various pretences. New suits were commenced against them in 1762, on account of the pernicious tendency of their writings. In the course of these proceedings, which the king endeavoured in vain to prevent, they were compelled to produce their *Institute*, or the rules of their order, hitherto studiously concealed. That mysterious volume, which was found to contain maxims subversive of all civil government, and even of the fundamental principles of morals, completed their ruin. All their colleges were seized, all their effects confiscated; and the king, ashamed or afraid to protect them, not only resigned them to their fate, but finally expelled them the kingdom by a solemn edict, and utterly abolished the order of Jesus in France.

Elated with this victory over ecclesiastical tyranny, the French parliaments attempted to set bounds to the absolute power of the crown, and seemed determined to confine it within the limits of law. Not satisfied with refusing, as usual, to register certain oppressive edicts, or with remonstrating against them, they ordered criminal prosecutions to be commenced against the governors of several provinces, acting in the king's name, who had enforced the registration of those edicts. The magnanimity of these assemblies had awakened new ideas in the bosoms of the French; they were taught by the late remonstrances to consider their inherent rights; and this flame, in the succeeding reign, burst forth with accumulated force, and overwhelmed the throne of despotism.

As to the war with Great Britain, which was ended by the peace of Fontainebleau in 1763, the chief events attending it, so humiliating to France, have been already mentioned in the history of England, and therefore need not be recapitulated here.

Corsica, a small island in the Mediterranean, had long resisted with manly firmness the oppressive councils of the Genoese, who claimed the sovereignty over it by right of conquest. But, unable to support those pretensions, Genoa transferred them to France, on condition that Lewis should put her in full possession of the adjacent island of Capraia, which the Corsicans had lately invaded and reduced. To execute his engagements, powerful armaments were fitted out by Lewis, at Antibes and Toulon; twenty battalions of French, were landed in Corsica; and the natives, whose free suffrages had summoned Paoli, one of their principal chiefs, to the supreme government of the island, determined to defend their liberties to the utmost.

A sharp and bloody war, such as suited the inferior numbers of the inhabitants and the nature of the country, was carried on in all the fastnesses and mountainous parts of the island; and it was not till after the French had fatally experienced, in two successive campaigns, the enthusiastic courage which animates the champions of freedom, that they overwhelmed, by their superior numbers, this unfortunate people; nor had Lewis much reason to triumph in an acquisition, to attain which he had sacrificed several thousands of his bravest troops, and only extended his dominion over a rugged and unproductive island.

The late unfortunate king, Lewis XVI. succeeded his grandfather, Lewis XV. on the 10th of May, 1774. Several regulations were made after his accession, highly favourable to the general interests of the nation, particularly the suppression of the Mousquetaires, and some other corps, which, being adapted more to the parade of guarding the royal person than any real military service, were supported at a great expense, without an adequate return of benefit to the state. One remarkable circumstance which attended this reign, was the placing of

M. Necker, a protestant, and a native of Switzerland, at the head of the French finances, in 1776. Possessed of, distinguished and acknowledged abilities, his appointment would have excited no surprise, had it not been contrary to the constant policy of France, which had carefully excluded the aliens of her country and faith from the controul of the revenue. Under the direction of Necker, a general reform took place in France, through every department in the revenue. When hostilities commenced, in 1777, between France and Great Britain, in consequence of the assistance afforded by the former to the revolted British colonies in America, the people of France were not burthened with new taxes for carrying on the war; but the public revenue was augmented by the economy, improvements, and reformation, that were introduced into the management of the finances. In consequence of this national economy, the navy of France was also raised to so great a height as to become truly formidable to Great Britain.

Actuated by a laudable zeal to extend the limits of science, Lewis fitted out several vessels for astronomical discoveries. The chevalier de Borda was instructed to ascertain the exact position of the Canary islands and Cape de Verd, and the different degrees of the coast of Africa, from Cape Spartel to the island of Gorée. The chevalier Grenier, who had traversed the Indian seas to improve the charts and correct the errors of former navigators, was likewise liberally rewarded.

The visit of the emperor of Germany to the court of Paris was another occurrence that excited the attention of Europe. He chose to travel under the humble title of count Falkenstein; he was received by Lewis with that respect which was due to the imperial dignity, and the regard that he was impatient to testify to the brother of his royal consort. During six weeks that the emperor remained at Paris, his hours were incessantly devoted to examine the various establishments of that capital, and in viewing the manufactures. With the same spirit of inquiry, he made a tour through the different provinces of the kingdom, and in his journey endeavoured to glean whatever might be advantageous to his own dominions.

Amidst the fury of war, Lewis displayed a regard for science. Previous to the commencement of hostilities, the English had sent two vessels into the South seas, commanded by captains Cook and Clerke, to explore the coasts and islands of Japan and California; the return of those vessels was hourly expected in Europe; and Lewis, with a considerate humanity which reflects the highest honour on his character, by a circular letter to all his naval officers, commanded them to abstain from all hostilities against these ships, and to treat them as neutral vessels. The letters mentioned also, in terms of the greatest respect, captain Cook, who had long distinguished himself in successive voyages of discovery. But death allowed not that celebrated navigator to enjoy this grateful testimony to his merit; for, in one of the newly-discovered islands, he had already fallen a victim to the blind fury of the savage inhabitants.

At the beginning of the year 1780, in consequence of the representations of Mr. Necker, a variety of unnecessary offices in the household of the queen were abolished; and sundry other important regulations adopted for the ease of the subject, and the general benefit of the kingdom. Could we implicitly credit his memorial, he changed the excess of the disbursements (at least one million sterling) of the year 1776, into an excess of revenue in the year 1780, to the amount of 445,000*l*. But the measures of Mr. Necker were not calculated to procure him friends

at court: the vain, the interested, and the ambitious, naturally became his enemies; and the king appears not to have possessed sufficient firmness of mind to support an upright and able minister. He was therefore displaced, and is said to have been particularly opposed by the queen's party.

The freedom of America had been the grand object of France; and that having been acknowledged in the fullest and most express terms by Great Britain, the preliminary articles of peace were signed at Paris on the 20th of January, 1783; but the immense expenses incurred were found at last to be much more than the revenues of the kingdom could by any means support; and the miserable exigencies to which government was reduced contributed no doubt to bring about the late revolution.

In the various wars of France with England, particularly in the last and present centuries, no object appeared of more consequence to her naval operations than the obtaining a port in the Channel. With a view of obviating this want, the ablest engineers in that kingdom have proceeded, by the most astonishing and stupendous works, to render the port of Cherbourg capable of receiving and protecting a royal navy. For several years after the last peace, they prosecuted this work at an annual expense of upwards of 200,000*l*.

In the year 1786 a treaty of navigation and commerce was concluded between the two courts of London and Versailles, as we have already noticed in our account of England.

The ambition of the French government made its subjects acquainted with liberty, by assisting the insurgents in America and Holland, and excited a spirit amongst the people, which could not well admit of the continuance of arbitrary power at home. The dismissal of monsieur Necker from the direction of public affairs, and succeeding ministers being endowed neither with his integrity nor abilities, the finances of the nation were on the point of being entirely ruined. When the edict for registering the loan at the conclusion of 1785, which amounted to the sum of three millions three hundred and thirty thousand pounds, was presented to the parliament of Paris, the murmurs of the people, and the remonstrances of that assembly, assumed a more legal and formidable form. The king, however, signified to the select deputations that were commissioned to convey to him their remonstrances, that he expected to be obeyed without farther delay. The ceremony of registering took place on the next day, but was accompanied with a resolution, importing, that public economy was the only genuine source of abundant revenue, the only means of providing for the necessity of the state, and restoring that credit which borrowing had reduced to the brink of ruin.

This proceeding was no sooner known, than the king required the attendance of the grand deputation of parliament; he erased from their records the resolution that had been adopted; and declared himself satisfied with the conduct of monsieur de Calonne, his comptroller-general.

However gratified by the support of his sovereign, monsieur de Calonne could not fail of feeling himself deeply mortified by the opposition of the parliament. An anxious inquiry into the state of the public finances had convinced him that the expenditure had far exceeded the revenues; in the present situation, to impose new taxes was impossible, to continue the method of borrowing was ruinous, and to have recourse only to economical reforms would be found wholly inadequate; and

he hesitated not to declare, that it would be impossible to place the finances on a solid basis, but by the reformation of whatever was vicious in the constitution of the state. To give weight to this reform, the minister was sensible that something more was necessary than royal authority; he perceived that the parliament was neither a fit instrument for introducing a new order into public affairs, nor would submit to be a passive machine for sanctioning the plans of a minister, even if those plans were the emanations of perfect wisdom.

Under these circumstances, the only alternative that seemed to remain was to have recourse to some other assembly, more dignified and solemn in its character, and that should consist, in a greater degree, of members from the various orders of the state, and the different provinces of the kingdom. But the true and legitimate assembly of the nation, the states-general, had not met since the year 1614. Another assembly had occasionally been substituted in the room of the states-general;—this was distinguished by the title of the *notables*, or men of note, and consisted of a number of persons from all parts of the kingdom, chiefly selected from the higher orders of the state, and nominated by the king himself. This assembly had been convened by Henry the Fourth, and again by Lewis the Thirteenth; and was now once more summoned by the authority of the present monarch; and the 29th of January, 1787, was the period appointed for their opening.

It was under great difficulties that monsieur de Calonne first met the assembly of the notables, and opened his long-expected plan. He began by stating, that the public expenditure had for centuries past exceeded the revenues; that a very considerable deficiency had of course existed; and, that, at his own accession to office, it was three millions three hundred and thirty thousand pounds.

To remedy this evil, the comptroller-general recommended a territorial impost, in the nature of the English land-tax, from which no rank or order of men were to be exempted; and an inquiry into the possessions of the clergy, which hitherto had been exempted from bearing a proportion of the public burthens. The various branches of internal taxation were also to undergo a strict examination; and a considerable resource was presented in mortgaging the demerine lands of the crown.

Before monsieur Necker retired from the management of the finances, he had published his "Compte rendu au Roi," in which France was represented as possessing a clear surplus of four hundred and twenty-five thousand pounds sterling. This performance had been read with avidity, and had been considered as an æra in the history of France. The credit of this statement was ably vindicated by monsieur de Brienne, archbishop of Toulouse, and by the count de Mirabeau, a still more formidable enemy to Calonne. His eloquence, however, might have successfully vindicated his system and reputation against the calculations of Brienne, and invectives of Mirabeau, but the genius of the comptroller-general sunk under the influence of the three great bodies of the nation. The grand and essential object of reform was to equalise the public burthens, and, by rendering the taxes general, to diminish the load of the lower and most useful classes of the people. The ancient nobility and the clergy had ever been free from all public assessment; the crowds of new noblesse, who had purchased their patents, were by that shameful custom exempted, both themselves and their posterity, from contributing proportionably to the expenses of the state: the magistracies likewise throughout the kingdom enjoyed their share of exemptions: so that the whole weight of the taxes fell on those who were least able to

bear them. Thus the nobility, the clergy, and the magistracy, were united against the minister; and the event was such as might be expected. The intrigues of those three bodies raised against him so loud a clamour, that, finding it impossible to stem the torrent, monsieur de Calonne not only resigned his place on the 12th of April, but soon after retired to England from the storm of persecution.

The notables proceeded in their inquiries; and it was now suggested that an assembly of the states should be called, as the notables were not competent to impose a new tax. As the deliberations of the notables were not carried on in secret, this proposal was instantly circulated through the capital, and supposed to be a new discovery. The notables were soon after dissolved, without having accomplished any thing except the justification of monsieur Necker.

The stamp-act, however, was established, and a bed of justice was held by the king on the 5th of August, 1787, at which the parliament of Paris was obliged to attend, and the edict was registered, notwithstanding their protest to the contrary. But the parliament, though defeated, were far from subdued: on the day after the king had held his bed of justice, they entered a formal protest against the concession that had been extorted from them.

Painful as every appearance of violence must have proved to the mild disposition of Lewis, he could not consent to surrender, without a struggle, that authority which had been so long exercised by his predecessors. Since the commencement of the present discontents, the capital had been gradually filled with considerable bodies of troops; and about a week after the parliament had entered the protest, an officer of the French guards, with a party of soldiers, went at break of day to the house of each individual member, to signify to him the king's command, that he should immediately get into his carriage and proceed to Troyes, a city of Champagne, about seventy miles from Paris, without writing or speaking to any person out of his own house before his departure. These orders were served at the same instant; and before the citizens of Paris were acquainted with the transaction, the parliament were already on the road to the scene of their banishment.

So great was the resentment of the whole nation on account of the banishment of the parliament, that after a month's exile it was recalled. This was scarcely done, when they were desired to register a loan; at which they hesitated, notwithstanding all the manœuvres of the ministers. At last the king came to the house, and held what is called a royal session. The edicts were now registered; but the duke of Orléans protested, in the presence of the king, against the legality of the proceeding. The parliament protested against the legality of the session itself, but to no purpose. The duke of Orléans, with four others, were banished; the king called for the journals of the house, destroyed the protest, and forbade it to be inserted again. Great clamours were raised by the banishment of the duke of Orléans, and the other members of parliament; remonstrances were presented by the parliaments of Paris, Bourdeaux, and Rennes; but the exiles were not recalled till the spring of 1788.

No alternative remained now to Lewis, but to plunge his country into all the calamity of civil war, or to comply with the wishes of his people, and re-establish the states-general. In the first case, he must have expected to encounter the majority of the people, animated by the exhortations and examples of their magistrates: the peers of the realm had expressed the strongest disapprobation of his measures, nor could he even depend any longer on the princes of his blood; but what afforded

most serious matter of alarm was the spirit lately displayed among the military, who, during the disturbances in the provinces, had reluctantly been brought to draw their swords against their countrymen; and many of those officers, who had recently served in America, publicly proclaimed their abhorrence of despotism.

It was under these impressions, in the beginning of August, an *arrêt* was published, which fixed the meeting of the states-general to the first of May in the ensuing year, viz. 1789; at the same time every step was taken to secure the favourable opinion of the public. New arrangements took place in the administration; and monsieur Necker, whom the confidence of the people had long followed, was again introduced into the management of the finances; the torture, which by a former edict had been restricted in part, was entirely abolished; every person accused was allowed the assistance of counsel, and permitted to avail himself of any point of law; and it was decreed, that, in future, sentence of death should not be passed on any person, unless the party accused should be pronounced guilty by a majority at least of three judges.

The eyes of all Europe were now turned on the states-general, or national assembly, whose re-establishment, in the month of May, 1789, presented a new era in the government of France. But the moment of this meeting was far from auspicious to the court, but greatly so to the interests of the nation. The minds of the French had long been agitated by various rumours; the unanimity that had been expected from the different orders of the states was extinguished by the jarring pretensions of each; and their mutual jealousies were attributed by the suspicions of the people to the intrigues of the court, who were supposed already to repent of the hasty assent that had been extorted. A dearth that pervaded the kingdom increased the general gloom and discontent; and the people, pressed by hunger and inflamed by resentment, were ripe for revolt. The sovereign also, equally impatient of the obstacles he incessantly encountered, could not conceal his chagrin; the influence of the queen in the cabinet was again established, and was attended by the immediate removal of monsieur Necker. This step, which evinced a total change of resolutions, and which, from the popularity of the minister, was likely to produce a violent fermentation in every order of men; was followed by others equally injudicious. The states-general were driven into the Salle des Etats, where they held their meetings, by detachments of the guards, who surrounded them, and who waited only the orders of the court to proceed to greater extremities against the obnoxious representatives of the nation.

Had these manifestations of vigour been only sustained by instantly attacking and entering Paris, it is not to be doubted, that, unprepared as it still was, and unwilling to expose to the licence of an incensed soldiery the lives and properties of its citizens, the capital would have been without difficulty reduced to obedience. But the delay which succeeded gave the inhabitants time to recover from their first emotions of surprise and apprehension. They saw the timidity and imbecility of the government, which, having sounded the charge, dared not advance to the attack. They profited by this want of exertion; and passing from one extreme rapidly to another, they almost unanimously took up arms against their rulers. Joined by the French guards, who, from a long residence in the capital, had been peculiarly exposed to seduction, and who at this decisive moment abandoned their sovereign, the Parisians broke through every obstacle by which they had hitherto been restrained. The supplies of arms and ammunition which had been provided

for their subjugation, were turned against the crown; and the Hôtel des Invalides, the great repository of military stores, after a faint resistance, surrendered.

The prince de Lambesc, who alone, of all the officers commanding the royal troops in the vicinity of Paris, attempted to carry into execution the plan for disarming the capital, was repulsed in a premature and injudicious attack, which he made at the head of his dragoons, near the entrance of the garden of the Tuilleries. Already the *Prévôt des Marchands*, monsieur de Fleffelles, convicted of entertaining a correspondence with the court, and detected in sending private intelligence to monsieur de Launay, governor of the Bastille, had been seized by the people, and fallen the first victim to general indignation. His head, borne on a lance, exhibited an alarming spectacle of the danger to which adherence to the sovereign must expose in a time of anarchy and insurrection.

The Bastille alone remained; and while it continued in the power of the crown, Paris could not be regarded as secure from the severest chastisement. It was instantly invested, on the 14th of July, 1789, by a mixed multitude, composed of citizens and soldiers who had joined the popular banner. De Launay, who commanded in the castle, by an act of perfidy unjustifiable under any circumstances, and which rendered his fate less regretted, rather accelerated than delayed the capture of that important fortress. He displayed a flag of truce, and demanded a parley; but abusing the confidence which these signals inspired, he discharged a heavy fire from the cannon and musquetry of the place upon the besiegers, and made considerable carnage. Far from intimidating, he only augmented, by so treacherous a breach of faith, the rage of an incensed populace. They renewed their exertions with a valour raised to frenzy, and were crowned with success. The Bastille, that awful engine of despotism, whose name alone diffused terror, and which for many ages had been sacred to silence and despair, was entered by the victorious assailants. De Launay, seized and dragged to the *Place de Grève*, was instantly dispatched, and his head carried in triumph through the streets of Paris.

In this prison were found the most horrible engines for putting to the severest tortures those unhappy persons whom the cruelty or jealousy of despotism had determined to destroy. An iron cage, about twelve tons in weight, was found with the skeleton of a man in it, who had probably lingered out a great part of his days in that horrid mansion. Among the prisoners released by its destruction, were major White a Scotsman, earl Massarene an Irish nobleman, and the count de Lorges. The former appeared to have his intellectual faculties almost totally impaired by the long confinement and miseries he had endured; and, by being unaccustomed to converse with any human creature, had forgotten the use of speech. Earl Massarene, at his arrival on the British shore, eagerly jumped out of the boat, fell down on his knees, and, kissing the ground thrice, exclaimed, "God bless this land of liberty!" The count de Lorges, at a very advanced period of life, was also liberated, and exhibited to the public curiosity in the Palais Royal. His squalid appearance, his white beard which descended to his waist, and, above all, his imbecility, resulting probably from the effect of an imprisonment of thirty-two years, were objects highly calculated to operate upon the senses and passions of every beholder. It is indeed impossible not to participate in the exultation which a capital and a country, so long op-

pressed, must have experienced at the extinction of this detestable and justly-dreaded prison of state.

With the Bastille expired the despotism of the French princes, which long prescription, submission, and military strength, seemed to render equally sacred and unassailable; which neither the calamities of the close of Lewis XIV.'s reign, the profligacy and enormities of the succeeding regency, nor the state of degradation into which the monarchy sunk under Lewis XV. had ever shaken: that power, which appeared to derive its support almost as much from the loyalty and veneration as from the dread and terrors of the subject, fell prostrate in the dust, and never betrayed any symptom of returning life.

The next morning after the capture of the Bastille, the monarch appeared in the national assembly, but without the pomp and parade of despotism. His address was affectionate and consolatory. He lamented the disturbances at Paris; disavowed all consciousness of any meditated attack on the persons of the deputies; and added, that he had issued orders for the immediate removal of the troops from the vicinity of the metropolis. The tear of sympathy started into almost every eye. An expressive silence first pervaded the assembly, which presently was succeeded by a burst of applause and acclamation. On the 16th, the king having intimated to the national assembly his intention of visiting Paris the following day, he accordingly, on the morning of the 17th, left Versailles in a plain dress, and with no other equipage than two carriages with eight horses each; in the first of which he rode himself; a part of the national assembly in their robes accompanied him on foot; and the militia of Versailles composed his only guard till the procession arrived at the Seve, where they were relieved by the Paris militia, with the marquis de la Fayette at their head: and from this place the suite of the monarch amounted to about 20,000 men. The progress was remarkably slow; and no shout was to be heard but *Vive la nation!* Mr. Bailly, on presenting the keys of the city, addressed his majesty in a short speech, the exordium of which was:—"These, sir, are the keys which were presented to Henry IV. He came to re-conquer his people; it is our happiness to have re-conquered our king." On receiving the complimentary addresses of the mayor, &c. the king exclaimed, with an air of pathetic emotion, which scarcely allowed him utterance, "My people may always rely upon my affection." He received from the hands of the mayor the national cockade; and when he showed himself at the window with this badge of patriotism, the joy of the people could no longer be restrained; the shout of *Vive le Roi!* which had scarcely been heard in the former part of the day, filled the whole atmosphere, and resounded from one extremity of the city to the other. The return of the king to Versailles was a real triumph. The citizens, almost intoxicated with joy, surrounded his carriage; his countenance, which in the morning bore the aspect of melancholy, was now cheerful and smiling; and he appeared sincerely to partake in the general satisfaction.

The events which followed, are, by the candid of all parties, allowed to be enveloped in an almost impenetrable veil of obscurity. An incident which occurred at Versailles contributed to excite a most unhappy commotion. On the 1st of October an entertainment was given by the gardes-du-corps, or king's body-guards, to the officers of a regiment of Flanders, who had just joined them in the service of guarding the monarch. Several of the officers of the national guard, with others of the military, were invited. At the second course, four toasts were given;

"the king, the queen, the dauphin, and the royal family." "The nation" was proposed, but, according to a number of witnesses, expressly rejected by the *gardes-du-corps*. After this, the queen, having been informed of the gaiety of the scene, persuaded his majesty, who was just returned from hunting, to accompany her, with the heir apparent, to the saloon. She appeared with the dauphin in her arms, affectionate as she was lovely, and carried the royal infant through the saloon, amidst the acclamations and murmurs of the spectators. Fired with enthusiasm, the soldiers drank the health of the king, the queen, and the dauphin, with their swords drawn; and the royal guests bowed respectfully and retired.

The entertainment, which had hitherto been conducted with some degree of order, now became a scene of entire confusion. Nothing was omitted to inflame the passions of the military. The music played the favourite air—"O Richard, O my king, the world abandons thee!" the ladies of the court distributed *white cockades*, the anti-patriot ensign; and even some of the national guard, it is said, had the weakness to accept them.

During these transactions the city of Paris was afflicted with all the evils of famine. At this juncture the news arrived of the fatal banquet at Versailles, with every circumstance greatly magnified. Early on the morning of the memorable 5th of October, a woman sallied out from the quarter of St. Eustache, and entering the *corps-de-garde*, and seizing a drum, paraded the adjacent streets beating an alarm, and exciting the people by clamours respecting the scarcity of bread. She was soon joined by a very numerous mob, chiefly of women, to the amount of 800, who proceeded to Versailles, where the king, upon hearing their complaints, signed an order for bringing corn from Senlis and Lagny, and for removing every obstacle which impeded the supply of Paris. This order was reported to the women, and they retired with gratitude and joy.

This band of Amazons were no sooner dispersed, than it was succeeded by another. The national assembly continued sitting; but the session was tumultuous, and interrupted by the shouts and harangues of the Parisian fish-women, who filled the galleries; their applause was mingled with affecting murmurs and complaints, the multitude crying out that they were actually starving, and that the majority of them had eaten nothing for upwards of twenty-four hours. The president therefore humanely ordered that provisions should be sought for in every part of the town; and the hall of the assembly was the scene of a miserable, scanty, and tumultuous banquet. Indeed, such was the dreadful famine, that the horse of one of the *gardes-du-corps* being killed in a tumult, he was immediately roasted, and greedily devoured by the mob.

Darkness and a deluge of rain added to the horrors of the night. The wretched multitudes who had travelled from Paris, were exposed, almost famished, to the inclemencies of the weather, in the open streets: within the castle all was trepidation; nothing was to be heard from without but imprecations, and the voices of enraged multitudes demanding the life of the queen and the *gardes-du-corps*. Toward midnight, however, all appeared tolerably still and peaceable, when the beating of drums, and the light of innumerable torches, announced the approach of the Parisian army.

The day began to break at about half past five; and at this period crowds of women and other desperate persons, breathing vengeance, and thirsting for blood, advanced to the castle, which, in an hour of fatal

security, was left unguarded in several places. An immense crowd found its way into every part. The queen had been awakened a quarter of an hour before by the clamours of the women who assembled upon the terrace; but her waiting-woman had satisfied her, by saying, "that they were only the women of Paris, who, she supposed, not being able to find a lodging, were walking about." But the tumult approaching, and becoming apparently more serious, she rose, dressed herself in haste, and ran to the king's apartment by a private passage. In her way she heard the noise of a pistol and a musquet, which redoubled her terror. "My friends," said she to every person she met, "save me and my children!" In the king's chamber she found the dauphin, who had been brought there by one of her women; but the king was gone. Awakened by the tumult, he had seen from a window the multitude pressing towards the stair-case; and alarmed for the queen, he hastened to her apartment, and entered it at one door at the moment she had quitted it by the other. He returned without loss of time; and having with the queen brought the princess-royal into the chamber, they prepared to face the multitude.

In the mean time the noise and tumult increased, and appeared at the very door of the chamber. Nothing was to be heard but the most dreadful exclamations, with violent and repeated blows against the outer door, a pannel of which was broken, and instant death was expected by the royal company. Suddenly, however, the tumult seemed to cease—every thing was quiet, and a moment after a gentle rap was heard at the door. The door was opened, and in an instant the apartments were filled with the Parisian guard. The officer who conducted them ordered them to ground their arms. "We come," said he, "to save the king;" and turning to such of the gardes-du-corps as were in the apartments, "We will save you also, gentlemen; let us from this moment be united."

The royal family now ventured to show themselves at the balcony, and received the most lively acclamations of respect from the soldiers and the people. A single voice, or a few voices, exclaimed—"The king to Paris!" and this was instantly followed by an universal acclamation enforcing the same demand. The king addressed them:—"You wish me to go to Paris:—I will go, on the condition that I am to be accompanied by my wife and children."—He was answered by reiterated acclamations of *Vive le roi!* It was two in the afternoon before the procession set out. During the progress all was gaiety and joy among the soldiers and spectators: and such was the respect in which the French nation still held the name and person of their king, that the multitude were superstitiously persuaded that the royal presence would actually put an end to the famine. On his arrival, the king was congratulated by the municipality, and declared his approbation of the loyalty which the city of Paris manifested.

The spirit of the nation was so entirely averse from the principles of the high aristocratic party, that numbers of them, particularly the king's two brothers, and some of the first rank and fortune, took refuge in foreign countries, where they applied themselves indefatigably to the purpose of exciting war against their country.

Great preparations were made for the celebration of a grand confederation, in which the representatives of the nation, the king, the soldiery; and all who were in ostensible situations, should solemnly, and in the face of the whole nation, renew their oaths of fidelity to the new constitution; and this confederation was decreed to take place on the

14th of July, 1790, in honour of the taking of the Bastille, and of the first establishment of Gallic liberty. The *Champ de Mars*, so famous for having been the rendez-vous of the troops which in the preceding year were intended to overawe the capital, was chosen for this solemnity. This piece of ground, which is about 400 toises, or 800 yards, in diameter, is bounded on the right and left by lofty trees, and commands at the further extremity a view of the Military Academy. In the middle of this vast plain an altar was erected for the purpose of administering the civic oath; and round it an immense amphitheatre was thrown up, of a league in circumference, and capable of containing 400,000 spectators. The entrance was through triumphal arches. The king's throne was placed under an elegant pavilion in the middle, and on each side of it were seats for the members of the national assembly.

The important 14th of July at length arrived. The national guards of the departments, distinguished by their respective standards, the battalions of infantry, and the different troops of cavalry, the marine of France, and the foreigners who served under its banners, being arranged in military order, the king and the national assembly took a solemn oath to maintain the constitution; the armed citizens repeated it amongst the applauses of innumerable spectators. They swore to live free, or die; and this oath was taken on the same day through the whole extent of the kingdom.

The escape of the king and queen with their infant children, and monsieur and madame, on the 20th of June, 1791, menaced France with the convulsions of anarchy and the horrors of civil war. The route of the royal fugitives, which had been expected to have been towards the Austrian Netherlands, the nearest frontier of the kingdom, was in fact directed towards Metz, from the presence of so gallant and accomplished a royalist as M. de Bouillé in that quarter, from its vicinity to the prince of Condé's army in Germany, and from the probable reluctance of Leopold to hazard the tranquillity of his Netherlands, by permitting any incursion from them into France.—They reached St. Menehould, a small town about 150 miles from Paris. The king was there recognised by the postillion, who said to him, "*Mon roi, je vous connois, mais je ne vous trahirai pas.*" "I know you, my king, but I will not betray you." But the post-master, M. Drouet, less full of monarchic prejudice, adopted a different conduct. He avoided, with great dexterity and presence of mind, betraying his knowledge of the rank of the royal travellers, being much struck with the resemblance which his majesty's countenance bore to his effigy on an assignat of 50 livres. The carriages taking the road to Varennes, he went a cross-road to rejoin them; and arriving before them at Varennes, he alarmed the town and assembled the national guards, who, notwithstanding the detachment of hussars by which they were escorted, disarmed them, and the King was then made a prisoner; and at six o'clock in the afternoon of the 25th of June, their majesties, with the dauphin and madame royale, arrived at the Tuilleries.

The new constitution was presented to the king on the 3d of September, 1791, who on the 13th signified his acceptance of it in writing, and the following day appeared in the assembly, introduced by a deputation of sixty members, and solemnly consecrated the assent which he had already given, and concluded with an oath, "To be faithful to the nation and to the law, and to employ the powers vested in him for the maintenance of the constitution, and the due execution of the law." Soon after this, the second national council assembled, with abilities far inferior to the first.

The dubious and undecided conduct of the emperor, and the refuge and protection found in the German empire by the emigrant princes, excited France to vigorous resolutions; and a manifesto, addressed to all states and nations, made its appearance. The forcible measures pursued had the effect of intimidating the German princes; and the emigrants were constrained to an ignominious dispersion from the frontiers. But the protection of the emperor and the Prussian king afforded them asylums more remote and less obtrusive. Irresolution seemed to preside in the councils of the emperor, a monarch more eminent for the mild virtues of peace than for the exertions of war. He had acknowledged the national flag; he had declared that he regarded the king of the French as absolutely free; while the league of Pilnitz (which, as was avowed by the court of Vienna, was not only intended to secure Germany from such a revolution as France had experienced, but even to extinguish the dreaded source), and the protection afforded to the emigrants, were infallible proofs that the emperor could not be regarded as a friend. His sudden death, on the first of March, 1792, excited great consternation among the aristocrats, and afforded joy and exultation to the supporters of the constitution. Another event no less unexpected happened in the death of the Swedish monarch, on the 29th of the same month; and the superstitious vulgar imagined that they beheld the peculiar protection of heaven in the removal of the two chief foes of France in so short a time.

In the progress of the negotiations between the national assembly and the court of Vienna, the young Hungarian king, excited by the influence of Prussia, began to exhibit more animosity, and to use severer language. At length, on the 5th of April, M. de Noailles, in his dispatches to the French minister for foreign affairs, explained the propositions of the Imperial court, that satisfaction should be given to the German princes proprietors of Alsace; that Avignon, which had been appropriated by France, should be restored to the pope; and that the internal government of France should be invested with sufficient efficiency, that the other powers might have no apprehensions of being troubled by France. These terms produced a declaration of war against Francis I. king of Hungary and Bohemia, decreed by the assembly, and ratified by the French king, on the 24th of April.

The first movement of the French was stained with defeat, and with the unpropitious murder of Theobald Dillon, their leader, who fell a prey to the suspicious and savage ferocity of some of his soldiers, who fled from the enemy, but attacked their general. The court of Vienna had, in the beginning of July, published a declaration explaining the cause of the war, and retorting on the French nation some of the heavy charges contained in its declaration of war against the king of Hungary and Bohemia, now emperor of Germany. On the 20th day of the same month, the Prussian monarch issued a concise exposition of the reasons which determined him to take up arms against France. He pleaded his alliance with the emperor, and that, as sovereign of a German state, he was bound to interfere to prevent the violation of the rights of the German princes of Alsace and Lorraine, and the invasion of the territories of others: and he honestly concluded by avowing that it was his intention to repress the too great liberty of France, which might afford a dangerous example to neighbouring countries. At the same time the duke of Brunswick, general of the combined armies of Austria and Prussia, published, at Coblenz, a declaration to the inhabitants of France, conceived in the most haughty and presumptuous terms; he

declared his intention of putting a stop to the anarchy which prevailed in France, and of restoring the king to his power; and yet he afterwards says his design was not to interfere in the internal government. It is unnecessary to dwell on the other parts of this insolent memorial, in which France was already regarded as a conquered country, and directions were given to the magistrates, national guards, and inhabitants at large: but the threat that the city of Paris should be given up to military execution, in case the least outrage should be offered to the king, queen, or royal family, is worthy of a Hun.

The excesses of the night between the 9th and 10th of August we relate with pain. At midnight the alarm-bell sounded in every quarter of Paris, the *générale* was beat, and the citizens flew to arms. The palace of the Tuilleries was attacked by the multitude; and the king, queen, and royal family, were forced to take refuge in the national assembly. At first the Swiss guards (who were obnoxious to the people, and had been ineffectually proscribed by repeated decrees of the assembly, the king not being allowed to have a foreign guard) repelled the populace; but these being re-inforced by the Marseillois, and federates from Brest, bodies which the Jacobins seem to have brought to Paris to balance the Swiss, and by national guards, the gates of the palace were burst open. The artillery joined the assailants. The consequences were, that, after a slaughter of about four hundred on each side, the Swiss guards were exterminated, and the palace ransacked.

The month of September seemed pregnant with the total ruin of French freedom, while the three following months reversed the scene, and exhibited a tide of success on the part of France, perhaps unexampled in modern history.—It is with infinite concern that we direct the attention of our readers to the prison scene, which occurred on the 2d and 3d of September. The horrid massacre of the defenceless prisoners, and other aristocrats, which took place at that period, is an eternal disgrace to the Parisian populace, who, in their fury, spared not even that gentle sex which all civilised nations hold in the highest respect. The number of the slain has doubtless been exaggerated, as usual; yet supposing that, by the most moderate account, only two thousand perished, the enormity of the deed remains the same. Some extenuation might be offered for the affair of the 10th of August, in which a people, who supposed themselves betrayed to slavery and all its evils, so recently experienced and shaken off, assumed their revenge and their cause into their own hands; but no defence can be offered for this unnecessary crime. Had the combined armies besieged Paris, it is difficult to conceive what aid they could have found from two or three thousand aristocrats, and many of these secured in chains.

A national convention had been called, to determine on the charges brought against the king. They met on the 24th of September; and, on the first day of the meeting, the abolition of royalty in France was decreed by acclamation: and the following day it was ordered that all public acts should be dated “the first year, &c. of the French republic.” But hardly was this convention constituted, when a violent faction appeared, headed by Marat \*, Robespierre, and others, who repeat-

\* Marat fell by the hands of female vengeance. Marie Anne Charlotte Corday, strongly impressed with the calamities which he had brought upon her country, took a journey to Paris, in July, 1793, on purpose to put a period to his existence. Meeting Marat as he was coming from the bath, and entering into conversation with him (more certainly to identify his person), she plunged a dagger into his breast; upon

edly degraded its transactions by their fanaticism; and being supported by the Jacobins and Parisian populace, proved too powerful for the convention to punish as it wished. Repeated instances have proved that the convention was not free, but must vote as the mob of Paris dictated; the moderation of the members being often obliged to yield to the indecent applauses and hisses of the galleries.

So rapid was the progress of the French arms, and so great were the distresses in the combined armies, arising from a scarcity of provisions, from a long rainy season, and from a considerable mortality among the Prussians (by the French accounts, estimated at one half), that the Prussians retreated from the dominions of France; whose example the Austrians soon followed.

Even at the very time that Paris was in the greatest danger, the invasion of Savoy was ordered. On the 21st of September general Montequion entered the Savoyard territories, seized on the frontier posts and castles without resistance, and two days after took Montmelian. Chambery and all Savoy soon followed; but the conquest, not being resisted, was productive of no military glory. The imprudence of the national convention, in permitting Savoy to incorporate itself with France, has excited wonder. After frequent declarations that the French would enter into no war with any view to conquest, their conduct in this respect was absurd and impolitic. It subjected them to the merited reproach that, under the pretence of liberty, they maintained the destructive maxims of their ancient government; and that their wishes to increase their territory, perhaps to subjugate Europe, remained the same. Admiral Truguet, commanding a squadron in the Mediterranean, captured Nice, Villa Franca, and the fortress of Montalban, belonging to the king of Sardinia.

The conquest of Savoy was regarded as a trifle; but when Custine began his acquisitions in Germany, every eye was turned to the rapidity and importance of his progress, till diverted by the wonders of Dumouriez. Spire yielded to the French arms on the 30th of September, and Worms soon after followed; ample supplies of provisions and ammunition were found in these cities. Custine, pursuing his course along the left bank of the Rhine, next captured Mentz; and afterwards Frankfurt. He was eager to proceed to Coblenz, that noted seat of the counter-revolutionists; but the Prussians and Austrians at length indicated a renewal of hostilities by garrisoning that town, and encamping in the adjacent country.

The conquest of the Austrian Netherlands forms the next grand object. Dumouriez had promised to pass his Christmas at Brussels; and what was regarded as an idle vaunt proved very modest, for that city was in his hands by the 14th of November. That able general, having entered the Netherlands on the first or second of that month, with an army of forty thousand men, and with a most formidable train of artillery, in repeated engagements with the Austrian army, commanded by the duke of Saxe-Teschen, governor of the Austrian Netherlands, and by general Beaulieu, which however exceeded not twenty thousand, occupied the first five days. At length, on the 6th of November, a decisive battle was fought at Jemappé, which decided the fate of the Netherlands. The contest was very general: all the points of the enemy's

which he fell, and soon expired. Glorifying in having exterminated a monster, she delivered herself up to the officers of justice, and with the utmost firmness submitted to her fate, in having her head severed by the guillotine, in the 25th year of her age.

banks and lines were attacked at once; all the bodies of the French were in action, and almost every individual fought personally. The cannonade began at seven in the morning; Dumouriez ordered the village of Carignon to be attacked, because he could not attempt the heights of Jemappe till he had taken that village. At noon the French infantry formed in columns, and rapidly advanced to decide the affair by the bayonet. After an obstinate defence, the Austrians at two o'clock retired in the utmost disorder.

Dumouriez immediately advanced, and took possession of the neighbouring town of Mons, where the French were received as brethren. The tidings arriving at Brussels, the court was struck with an indescribable panic, and instantly fled to Ruremond, whence it was again to be driven by the arms of Miranda. Tournay surrendered to a detachment on the 8th of November. Dumouriez having refreshed his troops at Mons, advanced to Brussels, where, after an indecisive engagement between his van and the Austrian rear, he was received with acclamations on the 14th of that month.—Ghent, Charleroi, Antwerp, Malines or Mechlin, Louvain, Ostend, Namur, in short all the Austrian Netherlands, except Luxembourg, successively followed the example of the capital; and the conquests of Louis XIV. were not more rapid.

Many of the priests, who were banished, came to England, and were received with great benevolence: this was followed by the decree of the national convention against the emigrants, by which they are declared dead in law, their effects confiscated, and themselves adjudged to immediate death, if they appear in France.

Another decree of the 19th of November attracted the attention of every nation in Europe. It is in the following terms: "The national convention declare, in the name of the French nation, that they will grant fraternity and assistance to all those people who wish to procure liberty; and they charge the executive power to send orders to the generals to give assistance to such people, and to defend citizens who have suffered, or are now suffering, in the cause of liberty." This decree, and others of a similar tendency, seemed to institute a political crusade against all the powers of Europe.

No sooner had Antwerp yielded to the French arms, than in order to conciliate the Belgians, the opening of the navigation of the Scheldt, shut up by the treaty of Munster, 1648, was projected and ordered; notwithstanding this treaty, so far as respects the shutting up of the navigation of this river, had been confirmed to the Dutch in succeeding treaties, guaranteed both by the courts of Versailles and London. The Dutch regarded this measure as injurious to their trade, for Antwerp might prove a dangerous rival to Amsterdam. The infraction of this treaty is one of the reasons which induced the parliament of Great Britain to oppose the unwarrantable pretensions of the French.

The memorable trial of the king commenced on the 11th of December. The issue is too well known. The firmness of this unfortunate monarch during his trial, and at the place of execution, on the 21st of January, 1793, increased the commiseration of every indifferent spectator; and callous indeed must be the person who does not partake of the sympathy which was felt through all Europe upon this transaction.

It would be a tedious and disagreeable undertaking to trace minutely and gradually the progress of the dispute between France and England. Without affixing any degree of credit to the reports that Great Britain had early but secretly acceded to the concert of princes, and the treaty of Pilnitz, it is natural to believe that the British ministry had long

viewed with a jealous eye the progress of the French revolution towards a turbulent democracy. We must, however, do the French nation the justice to confess, that the unanimous voice of that people was clamorous from the first for peace and alliance with England. A series of events changed this inclination. A bill for forcibly transporting aliens out of the kingdom was introduced into parliament. The ports of Great Britain were shut against the exportation of corn to France, while it was permitted to her enemies. In the end, the ambassador of the republic, M. Chauvelliin, was ordered, under the authority of the alien bill, at a short notice, out of the kingdom: immediately after which dismissal, the convention declared that the French republic was at war with the king of England, and the stadtholder of the United Provinces.

In consequence of these measures, general Dumouriez proceeded with a large body of troops to invade Holland, exhorting the Batavians, in a violent manifesto, to reject the tyrannic aristocracy of the stadtholder and his party, and to become a free republic. The Dutch made preparations for defending themselves; and the English cabinet seconded their efforts, by an immediate embarkation of troops, to the command of which the duke of York was appointed.

The subjugation of Holland was the first project of general Dumouriez; and when the ease with which he had effected the conquest of the Netherlands, and the courage and ability displayed by him and his army at the famous battle of Jemappe, were considered, there seemed reason to apprehend that he would soon make an impression on these provinces; and the easy surrender of Breda and Gertruydenberg encouraged him to boast that he would terminate the contest by a speedy approach to Amsterdam. Certain events, however, ensued, which effectually prevented the performance of this promise.

General Miranda, who had besieged the city of Maestricht, and summoned the governor to surrender, was attacked by prince Frederic of Brunswick, and defeated with considerable loss. The Austrians, after this, divided themselves into three columns, two of which marched towards Maestricht, and the siege of that place was immediately raised. The third pursued the advanced guard of the republic; and the absence of several commanding officers was supposed to have greatly facilitated the success of the Prussians in these rencounters.

On the 14th of March, the Imperialists advanced from Tongres towards Tirlemont, by St. Tron, and were attacked by general Dumouriez successively on the 15th and following days. The first attempts were attended with success. The Austrian advanced posts were obliged to retire to St. Tron, through Tirlemont, which they had already passed. On the 18th, a general engagement took place at Neerwinden, the French army being covered on the left by Dormael, and on the right by Landen. The action continued with great obstinacy on both sides, from seven in the morning till five in the afternoon, when the French were obliged to fall back, and the Austrian cavalry coming up, put them entirely to flight. The loss in each army was great. The French displayed considerable courage and address, but were overpowered by the superior numbers, and perhaps by the more regular discipline, of their enemies.

Dumouriez was now suspected of treachery, and general Miranda intimated his suspicions, in a confidential letter to Pétion, dated the 21st of March. Four commissioners were immediately sent from Paris, with powers to suspend and arrest all generals and military officers whom they should suspect, and bring them to the bar of the convention. These

commissioners, on the 1st of April, proceeded to St. Amand, the headquarters of Dumouriez, and, being admitted to his presence, explained to him the object of their mission. After a conference of some hours, the general, not finding that he could persuade them to favour his intentions, gave the signal for a body of soldiers who were in waiting, and ordered the minister of war, Bournonville, who was sent to supersede him, and the commissioners, Camus, Blancal, La Marque, and Quinette, immediately to be conveyed to general Clairfait's head-quarters at Tournay, as hostages for the safety of the royal family.

Dumouriez, notwithstanding his splendid talents, found himself grossly mistaken with respect to the disposition of his army; they had resented the affront so imprudently offered to their general; but when he came to explain to them his plan, and propose the restoration of royalty in the person of the prince, they all forsook him; and he was obliged to fly with a very few attendants, making his escape through a dreadful discharge of musketry, which the whole column poured upon him and his associates.

The latter end of June, and the beginning of July, were chiefly distinguished, in the north, by some petty skirmishes between the two grand armies. In the latter part of July, the Austrians obtained some successes of more importance. The garrison of Condé, after sustaining a blockade of three months, surrendered on the 10th, by capitulation, to the prince of Cobourg; and Valenciennes, on the 20th of the same month, to the duke of York, not without some suspicions of treachery in both cases.

Encouraged by these successes, a large detachment from the combined army, under the command of the duke of York, proceeded, without loss of time, to attack the port and town of Dunkirk. On the 22d of August, the duke of York marched from Furnes to attack the French camp at Ghiveldé, which was abandoned at his approach, and he was almost immediately enabled to take the ground which it was his intention to occupy during the siege. On the 24th, he attacked the outposts of the French, who, with some loss, were driven into the town. In this action, the famous Austrian general Dalton, and some other officers of note, were killed. The succeeding day, the siege might be said regularly to commence. A considerable naval armament from Great Britain was to have co-operated in the siege; but, by some neglect, admiral Macbride was not able to sail so early as was expected. In the mean time, the hostile army was extremely harassed by the gun-boats of the French; a successful sortie was effected by the garrison on the 6th of September; and the French collecting in superior force, the duke of York, on the 7th, after several severe actions, in which the allied forces suffered very considerably, was compelled to raise the siege, and leave behind him his numerous train of artillery. General Houchard was afterwards impeached by the convention, and beheaded, for not having improved his success to the best advantage, as it was asserted that he had it in his power to capture almost the whole of the duke of York's army.

The disaffection of the southern provinces of France was at this time productive of serious dangers to the new republic. It is well known that the deputies and people of these provinces were among the most active to promote the dethroning of the king on the 10th of August, 1792. It is, therefore, somewhat extraordinary, that the same men should be among the first to rebel against the authority of the convention. The formidable union which took place, under the name of *federate republicanism*, between the cities of Marseilles, Lyons, and Tou-

lon, in the course of the months of June and July, seemed to threaten almost the dissolution of the existing authorities. A considerable army was, however, dispatched against Lyons, and the city closely besieged. The Marseillois, in the mean time, opened their gates on the approach of the republican army, and submitted; but the people of Toulon entered into a negotiation with the English admiral, lord Hood, who was then cruising in the Mediterranean; and he took possession both of the town and shipping, in the name of Lewis XVII. and under the positive stipulation that he should assist in restoring the constitution of 1789.

Among the victims of popular resentment, which fell about this period, was the celebrated general Custine, whose former services, whatever might have been his subsequent demerits, ought to have secured him more lenient treatment. He was recalled to Paris, from the command of the northern army, in the beginning of July, and on the 22d, committed, by a decree of the convention, a prisoner to the Abbey. He was tried by the revolutionary tribunal, and accused of having maintained an improper correspondence with the Prussians while he commanded on the Rhine, and of having neglected various opportunities of throwing reinforcements into Valenciennes. It is needless to say that he was found guilty: to be suspected was then to be condemned; and the populace of Paris, now accustomed to such scenes, beheld the sacrifice of their former defender with calm indifference, or with blind exultation.

The trial and condemnation of the queen immediately followed that of general Custine. She had been removed, on the night of the 1st of August, from the Temple, to a small and miserable apartment in the prison of the Conciergerie, where she remained till she was brought before the revolutionary tribunal, on the 15th of October. The act of accusation consisted of several charges, many of which were frivolous and incredible; and few of them appeared to be sufficiently substantiated by evidence; but had the conduct of Marie Antoinette been more unexceptionable than there is reason to believe it was, it is not very probable that she would have escaped. After an hour's consultation, therefore, the jury brought in their verdict—"Guilty of all the charges."

The queen heard the sanguinary sentence with dignity and resignation; perhaps, indeed, it might be considered by her less as a punishment than as a release. On the 16th of October, at about eleven o'clock in the forenoon, she was conducted in a coach, from the prison of the Conciergerie, to a scaffold prepared in the Place de la Révolution, where her unfortunate husband had previously suffered. The people who crowded the streets as she passed, exhibited no signs of piety or compunction. Her behaviour, as her last sufferings approached, was decent and composed. She met her fate in the thirty-eighth year of her age.

Soon after the convention had brought the queen to the scaffold, they entered upon the trial of Brissot, and his supposed accomplices. Brissot was charged with having said and written, at the commencement of the revolution, that Fayette's retiring from the public service was a national misfortune; that he distinguished himself three times in the Jacobin club by speeches, of which one provoked the ruin of the colonies, another the massacre of the patriots in the Champ de Mars, and the third the war against Austria.

Upon these and other vague accusations, Brissot, and twenty-one more of the convention, were brought to trial before the revolutionary tribunal, on the 24th of October; a few days afterwards the jury de-

clared all the accused had existed against the and the tribunal immediate death. Valazé, after the remaining twenty

The wretched and soon after brought to the sovereignty from well founded the charveyed in a cart, on the of execution, and full proaches of the popul

clared all the accused members to be accomplices in a conspiracy which had existed against the unity and indivisibility of the French republic; and the tribunal immediately condemned them all to the punishment of death. Valazé, after he had heard his sentence, stabbed himself; and the remaining twenty-one were executed on the 30th of October.

The wretched and intriguing Egalité, late duke of Orléans, was soon after brought to the block. He was accused of having aspired to the sovereignty from the commencement of the revolution; but how well founded the charge was, it is not easy to determine. He was conveyed in a cart, on the evening of the 6th of November, to the place of execution, and suffered with great firmness, amidst the insults and reproaches of the populace.

In the south of France, neither the exertions of the allies, nor the surrender of the Toulonese, were sufficient to produce the expected consequence of establishing a monarchical government. On the 30th of November, the garrison of Toulon made a vigorous sortie, in order to destroy some batteries which the French were erecting on certain heights within cannon-shot of the city. The detachment sent for this purpose accomplished it, and the French troops were surpris'd and fled. The allies, too much elated with their success, pursued the fugitives till they unexpectedly encountered a considerable force, which had been sent to cover their retreat. At this moment, general O'Hara, commander in chief at Toulon, came up, and while he was exerting himself to bring off his troops with regularity, received a wound in his arm, and was made prisoner by the republicans. Near a thousand of the British, and allied forces, were killed, wounded, or taken prisoners on this occasion.

Soon after the capture of the British general O'Hara, the city of Toulon was evacuated by the allies. On the morning of the 19th of December, the attack began before all the republican forces had time to come up. It was chiefly directed against an English redoubt (Fort Mulgrave) defended by more than three thousand men, twenty pieces of cannon, and several mortars. This formidable post was attacked about five o'clock in the morning, and at six the republican flag was flying upon it.

The town was then bombarded from noon till ten o'clock the same night, when the allies and part of the inhabitants, having first set fire to the town and shipping, precipitated their flight. Two chaloupes, filled with the fugitives, were sunk by the batteries. The precipitation with which the evacuation was effected caused a great part of the ships and property to fall into the hands of the French, and was attended with the most melancholy consequences to the wretched inhabitants, who, as soon as they observed the preparations for flight, crowded to the shores, and demanded the protection which had been promised them on the faith of the British crown. A scene of confusion, riot, and plunder ensued, and though great efforts were made to convey as many as possible of the people into the ships, thousands were left to all the horrors of falling into the hands of their enraged countrymen. Many of them plunged into the sea, and made a vain attempt to swim on board the ships; others were seen to shoot themselves on the beach, that they might not endure the greater tortures they might expect from the republicans. During all this, the flames were spreading in every direction, and the ships that had been set on fire were threatening every instant to explode, and blow all around them into the air. This is but a faint description of the scene on shore, and it was scarcely less dreadful

on board the ships. Loaded with the heterogeneous mixture of nations; with aged men and infants, as well as women; with the sick from all the hospitals, and with the mangled soldiers from the posts just deserted, their wounds still undrest—nothing could equal the horrors of the sight, except the still more appalling cries of distraction and agony, that filled the ear, for husbands, fathers, and children, left on shore.

In the latter end of March, the party called the Hebertists, consisting of Hebert, Momoro, Vincent, and some others, were arrested, brought to trial before the revolutionary tribunal, and twenty of them executed. A few days after, the celebrated Danton, Fabre d'Eglantine, Bazire, Chabot, and others, were arrested as conspirators against the republic, tried in a very summary way, and sentenced to death; which sentence was executed on the 5th of April, 1794.

In consequence of these executions, the government of France, however nominally republican, became almost entirely vested in one man, the usurper Robespierre—a name which will probably be transmitted with infamy to late posterity. Under his sanguinary administration, the prisons of Paris, at one time, contained between seven and eight thousand persons. Of the number of those tried and executed, we have no precise account; but they in general appeared rather to be sacrificed in multitudes to a jealous and cowardly cruelty, than condemned with even the shadow of justice. In one of these barbarous slaughters, the princess Elizabeth, the sister of the late unfortunate monarch, having been condemned on the most frivolous pretexs, was executed the last of twenty-six persons, who were carried to the scaffold on the same day.

But, after the death of Danton, the fall of this tyrannical demagogue rapidly approached. A strong party was secretly formed against him in the convention, headed by Tallien, Legendre, and some others. Finding themselves sufficiently strong, Tallien moved the arrest of Robespierre and his creatures; which decree was passed with applause from every quarter. The president then ordered one of the ushers of the hall to take Robespierre into custody; but such was the awe which the presence of this man was accustomed to inspire, that the officer hesitated to perform his duty, till Robespierre himself made a sign of obedience; and followed the usher out of the hall. The prisoners were conducted by a few peace-officers to the prison of the Luxembourg; but the administrator of the police on duty there, who was one of their creatures, refused to receive them; and they were then led, rather in triumph, than as prisoners, to the Hôtel de Ville.

In the mean time, Henriot, another leader of the party, had also been arrested, but found means to escape and raise his partisans, who took post with him and Robespierre in the Hôtel de Ville, where they pretended to form themselves into a new convention, and declared the other representatives traitors to their country. The people, however, did not espouse their cause; the national guard, who had at first obeyed their orders with reluctance, forsook them; and the deputies who had been dispatched for that purpose, attacked them in the Hôtel de Ville. Bourdon de l'Oise, after having read the proclamation of the convention, rushed into the hall of the commune, with a sabre and pistols; the insurgents were completely deserted, and now endeavoured to turn their arms against themselves. Robespierre the elder discharged a pistol in his mouth, which, however, failed of its effect, and only wounded him in the jaw, while he received another wound from a gendarme in the side. The younger Robespierre threw himself out of a window; and

broke a leg and an arm, and stabbed himself twice in the chest, and fell from the window.

The prisoners were brought to trial before the revolutionary tribunal; and their sentences were pronounced, in the month of July, and nineteen of them were executed on the 28th of July.

In the campaign of 1795, the French were successful on every side. They gained the battle of Fleurus, and the army of the Rhine, under the command of the prince of Cobourg, was defeated near Landrecy, while the victors, under the command of the prince of Cobourg, were taken; and the French army, under the command of the prince of Cobourg, defeated the army of the prince of Cobourg at the battle of Colong and Borny.

The United Provinces of the Netherlands, after the states of Friesland, on the 17th of October, these states refused to break their alliance with the French, and alliance with the French, and appeared to be the same as on the 17th of October, a proclamation, prohibiting the people upon a public or political assembly.

On the 7th of October, the French army, under the command of the prince of Cobourg, defeated the army of the prince of Cobourg at the battle of Colong and Borny. The French army, under the command of the prince of Cobourg, defeated the army of the prince of Cobourg at the battle of Colong and Borny.

On the 7th of October, the French army, under the command of the prince of Cobourg, defeated the army of the prince of Cobourg at the battle of Colong and Borny. The French army, under the command of the prince of Cobourg, defeated the army of the prince of Cobourg at the battle of Colong and Borny.

It was in vain that the French army, under the command of the prince of Cobourg, defeated the army of the prince of Cobourg at the battle of Colong and Borny. The French army, under the command of the prince of Cobourg, defeated the army of the prince of Cobourg at the battle of Colong and Borny.

partisans of the

broke a leg and an arm; Le Bas shot himself upon the spot; Couthon stabbed himself twice with a knife; and Henriot was thrown out of a window.

The prisoners were immediately conveyed before the revolutionary tribunal; and their persons being identified, they were condemned to suffer death, in the Place de la Révolution, where the two Robespierres, and nineteen others, were executed at seven in the evening of the 28th of July, 1794.

In the campaign of this year, the arms of the new republic were successful on every side against the allies. In Flanders, general Jourdan gained the battle of Fleurus; and Charleroi, Ypres, Bruges, and Courtray, surrendered to the French; Ostend was evacuated; general Clairfait defeated near Mons, which immediately surrendered; and the prince of Cobourg compelled to abandon the whole of the Netherlands, while the victors, without opposition, entered Brussels and Antwerp. Landrecy, Quésnoy, Valenciennes, and Condé, were successively retaken; and the French armies, pursuing their success, took Aix-la-Chapelle, defeated Clairfait near Juliers, and made themselves masters of Cologne and Bonn. Maestricht and Nimeguen were likewise taken.

The United Provinces began now to be seriously alarmed. The states of Friesland were the first to feel their danger, and, in the month of October, these states determined to acknowledge the French republic, to break their alliance with England, and to enter into a treaty of peace and alliance with France. In some other provinces, resolutions hostile to the stadtholder and his government were likewise passed; and such appeared to be the temper of the people, even at Amsterdam, that, on the 17th of October, the government of Holland published a proclamation, prohibiting the presenting of any petition or memorial upon public or political subjects, and all popular meetings or assemblies of the people upon any occasion.

On the 7th of December, the French made a feeble attempt to cross the Waal, but were repulsed with loss; but on the 15th the frost set in with unusual rigour, and opened a new road to the French armies. In the course of a week, the Maes and the Waal were both frozen over; and on the 27th, a strong column of French crossed the Maes, near the village of Driel. They attacked the allied army for an extent of above twelve leagues, and, according to the report of general Pichegru, "were, as usual, victorious in every quarter." The army of the allies retreated before them, and, in its retreat, endured incredible hardships from the severity of the weather and the want of necessaries. On the 10th of January, 1795, general Pichegru, having completed his arrangements, made his grand movement. The French crossed the Waal at different points, with a force, according to some accounts, of 70,000 men. A general attack was made upon Walmoden's position, between Nimeguen and Arnheim. The allies were defeated in every quarter; and, utterly unprepared either for resistance or for flight, suffered equally from the elements and the enemy.

It was in vain that the stadtholder issued manifestoes, proclamations, and exhortations to the Dutch peasantry, conjuring them to rise in a mass for the defence of the country. The French continued to advance, and the allies to fly before them, till Utrecht surrendered to them on the 16th of January, Rotterdam on the 18th, and Dort on the succeeding day. The utmost consternation now prevailed among the partisans of the stadtholder. The princess of Orange, with the younger

and female part of the family, and with all the plate, jewels, and moveables that could be packed up, escaped on the 15th. The stadtholder and the hereditary prince did not leave Holland till the 19th. His serene highness embarked at Scheveling, in an open boat, with only three men to navigate her, and arrived safe at Harwich. In England, the palace of Hampton-court was assigned him for his residence, where he still remains.

On the 20th of January, general Pichegru entered Amsterdam in triumph, at the head of 5,000 men, and was received by the inhabitants with the loudest acclamations. The whole of the United Provinces either submitted to or was reduced by the French, in a few weeks. An assembly of the provisional representatives of the people met on the 27th of January, and the whole government was changed, and modelled nearly after the French plan.

In the mean time, the king of Prussia, finding he could derive no advantage from the war, began to relax his efforts. The Prussian and Austrian forces, as well as their leaders, were on bad terms with each other; but it was not suspected that any defection was about to place, on the part of the Prussians, till they began to retreat towards the Rhine, which they soon after passed. A negotiation between Prussia and France followed, which ended in a treaty of peace, signed at Basle, on the 5th of April, 1795, by which his Prussian majesty entirely abandoned the coalition.

The Prussian negotiation was followed by the treaty made between the French republic and Spain, in which country the arms of France had made a progress equally successful and rapid. Fontarabia, which guards the entrance of Spain, and which had cost the duke of Berwick 8,000 men, had been taken, almost immediately, by a detachment from the French army; Rosas was likewise taken; and the troops of the republic had made themselves masters of the greater part of the rich provinces of Biscay and Catalonia, and were, in fact, in full march for the capital of the kingdom. Orders were therefore dispatched to M. D'Yriarte, at Basle, immediately to conclude a treaty; which was accordingly signed by the Spanish minister and M. Barthelemi, at Basle, on the 22d of July.

About the middle of this year, died the infant son of the unfortunate Lewis XVI. An unjust and close imprisonment, if it did not produce, at least, it is probable, hastened his fate. He had always been an unhealthy child, and subject to a serofulous complaint, a disorder in which confinement and inactivity are frequently fatal. For some time previous to his decease, he had been afflicted with a swelling in his knee, and another in his wrist. His appetite failed, and he was at length attacked with a fever. It does not appear that medical aid was denied him, or neglected. The disease, however, continued to increase; and on the morning of the 9th of June, he expired in the prison of the Temple, where he had been confined from the fatal autumn of 1792.

Moved perhaps by this event, or influenced by the general sympathy of the people of France, the committee of public safety, in the beginning of July, proposed the exchange of the princess, sister of the dauphin, who was likewise a prisoner in the Temple, for the deputies delivered up to Austria by the treachery of Dumouriez, and the two ambassadors, Semonville and Maret, who had been seized, contrary to the law of nations, on a neutral territory, by an Austrian corps. The emperor, after some hesitation, acceded to the proposal; and before the

conclusion of the year, the princess was delivered to the Austrian envoy, at Basle in Switzerland, and the deputies were restored to their country.

In the course of this year, an expedition was planned by the English ministry, to invade the coast of France, in that part where the royalists, known by the name of Chouans, were in arms against the republicans. The force employed consisted chiefly of emigrants, under the command of M. Puffaye, M. d'Hervilly, and the count de Sombreuil. They landed in the bay of Quiberon, and took the fort of the same name; but soon after experienced a sad reverse—the fort being surprised by the republican troops, under the command of general Hoche, who killed or made prisoners the greater part of the emigrants, Chouans, and English, in the fort, amounting nearly to 10,000 men. The count de Sombreuil, the bishop of Dol, with his clergy who accompanied him, and most of the emigrant officers, who were made prisoners, were tried by a military tribunal, and put to death. Before the month of April, in the ensuing year (1796), the force of the insurgents in this part of France was entirely broken, and their chiefs, Charette and Stoffet, taken prisoners, and put to death.

In Germany, the French army had crossed the Rhine near Mannheim, and blockaded Mentz, to which they had already laid siege for several months. In this attempt, however, they were unsuccessful: they suffered a defeat from the Austrians, and were compelled to re-pass the river. A suspension of arms, for three months, was soon after agreed to by the generals of the contending armies, which was ratified by the respective powers.

In the succeeding year (1796), the campaign opened in the south, on the 9th of April, when the rapid and signal victories of the republican troops, under the command of the then obscure and little known, but now justly celebrated Buonaparte, ended, in little more than a month, the war with Sardinia. The battles of Milleffimo, Dego, Mondovi, Monte Lerino, and Monte Notte, compelled his Sardinian majesty to accept such terms as the conquerors thought proper to offer; and a treaty of peace, by which he ceded Savoy and Nice to France, was signed on the 17th of May.

Buonaparte pursued his success, and again defeating Beaulieu, the Austrian general, at the battle of the bridge of Lodi, forced the shattered remains of the Austrian army to retire towards Mantua, pursued by one part of the republican forces, while the remainder entered Milan on the 18th of May, without further resistance, and the French armies gained possession of the whole of Lombardy.

The armistice which had been concluded on the Rhine, was afterwards prolonged, but at length declared to be at an end on the 31st of May; when the army of the Sambre and Meuse, under general Jourdan, gaining considerable advantages over the Austrians, advanced into the heart of the empire; while another army, under general Moreau, passed the Rhine at Strathbourg, took the fort of Kehl, a post of great importance, on the opposite bank, and penetrating through Bavaria, nearly to Ratisbon, endeavoured to form a junction with the army of Jourdan. This attempt, however, did not succeed; both armies experienced a reverse of fortune, and were obliged to retreat till they recrossed the Rhine. The situation of general Moreau was highly critical, and his retreat is acknowledged, on all sides, to have been conducted with great military skill. The archduke Charles, who commanded the Austrian army, followed Moreau in his retreat, and laid

siege to the fort of Kehl, which he re-took, after a most obstinate resistance on the part of the French.

To restore the affairs of Italy, the emperor assembled a new army, composed of the flower of the German troops serving on the Rhine, and gave the command of it to general Wurmsler, one of the oldest and ablest of the Imperial generals. This force, on its first arrival, was successful. The French were repulsed, defeated, and compelled to raise the siege of Mantua. Buonaparte, however, soon returned to the charge; and, after a series of hourly-contested actions, the army of Wurmsler was so reduced and harassed, that he was obliged to shut himself up in Mantua, where he was closely besieged by the victors, who at the same time made incursions into the Tyrol, and, by the battle of Roveredo, and the possession of Trent, became masters of the passes that led to Vienna. The Austrians, at the same time, made a great effort, under general Alvinzy, to rescue the gallant Wurmsler and his besieged army; but the battle of Arcole completely defeated their design, and Mantua was soon after obliged to surrender.

The victories of Buonaparte compelled the pope, the king of Naples, and the inferior princes of Italy, to conclude such treaties as the French thought proper to dictate. The victors likewise founded a new republic in Italy; at first called the Cispadane, but afterwards the Cisalpine republic, to which they annexed such parts of the papal territory as they judged convenient.

After the taking of Mantua, the victorious Buonaparte penetrated into the Tyrol, and directed his course towards the Imperial capital. The archduke Charles was opposed to him, but was unable to check his progress. The republican armies had at length advanced so near to Vienna, that the utmost alarm and confusion prevailed in that city. The bank suspended its payments, and the emperor was preparing to forsake his capital, and remove to Olmutz. In this critical situation of his affairs, his Imperial majesty opened a negotiation with Buonaparte; a short armistice was agreed to, and the preliminaries of peace between the emperor and king of Hungary, and the French republic, were signed at Leoben, in the month of April, 1797.

In the mean time, a tumult having taken place at Venice, in which a number of the French soldiers were murdered in the hospitals of that city, the French armies, on their return, abolished the ancient government of Venice, planted the tree of liberty in St. Mark's Place, established a municipality, and proposed to annex the city and territory to the new Cisalpine republic. But the conclusion of the definitive treaty of peace with the emperor being protracted, on account of the French refusing to restore Mantua, as it is alleged it was stipulated they should, in the preliminaries, they at length agreed to cede to him the city and a part of the territory of Venice, in compensation for Mantua.

The definitive treaty of peace between France and the emperor was signed at Campo Formio, on the 17th of October, 1797. By this treaty the emperor ceded to France the whole of the Netherlands, and all his former territory in Italy. He received in return the city of Venice, Istria, and Dalmatia, and the Venetian islands in the Adriatic: the French were to possess the other Venetian islands.

While the negotiation which terminated in this treaty was carrying on, the disputes of two contending parties were producing a new revolution in France. On the 5th of March the two councils drew the lots which deprived one third of their members of their seats in the legislature, and the new deputies elected in their room took their seats on the 20th of the

same month. It soon appeared a considerable accession very freely canvassed; revised, and the severity relaxed. The proceedings Genevoise, and Helvetic were an open rupture inevitable. same month. It soon appeared that the anti-directorial party had received a considerable accession of strength. The conduct of the directory was very freely canvassed, retrenchment of expense in both civil and military offices was proposed; the laws relative to polygamy were ordered to be revised, and the severity of those against priests and emigrants was greatly relaxed. The proceedings of the directory, with respect to the Venetian, Genoese, and Helvetic republics, were severely censured, and it was evident that an open rupture between the directory and the councils was inevitable. Unfortunately for the party in opposition to the directory, the armies took part with the latter. The army of Italy transmitted to the directory a most violent address relative to these disputes, and its example was followed by the other armies of the republic. The opposition party were slow and irresolute in the measures they took for their defence: they probably relied with too much confidence on their supposed strength, as they had a decisive majority in the council of five hundred, and two out of the five directors, Carnot and Barthelemi, were in their interests. Barras, however, and his party, supported by the armies, resolved on a prompt and violent measure, which effectually decided the contest.

On the morning of the 4th of September, at the early hour of three o'clock, Barras, and the two directors who acted with him, ordered the alarm-guns to be fired, and the halls of the councils to be surrounded with a military force. General Augereau, who was charged with the execution of these orders, repaired to the barracks, and addressed the guard of the legislative body, assuring them that he came only to preserve the republic from the conspiracy of royalists. The soldiers declared, with shouts of approbation, that he had only to command, and they were ready to obey. Thus reinforced by the very men to whom alone the councils could look for defence, Augereau entered the hall of the five hundred, and seized Pichegru, the president, with his own hands, and ordered about eighteen others of the most conspicuous characters to be arrested and committed to the temple. The halls were shut up, and the members of both councils appointed to meet in other places which were pointed out to them. Carnot and Barthelemi were implicated in the fate of their friends in the councils. The former took advantage of the tumult and fled; the latter calmly awaited the storm, and was put under arrest. Barthelemi, Pichegru, and a number of the deputies who were seized by Augereau, were afterwards transported to Cayenne, whence the two former, and some others, have since found means to return to Europe.

The power of the directory, or rather of the party of Barras, being now rendered complete by this decisive victory over the councils, they projected new schemes of ambition and conquest, in order to give employment to the armies, and afford them an opportunity of enriching themselves by plunder. A tumult having taken place at Rome, in which a French general was killed, they subverted the government of that city, deposed the pope, and erected a new republic, which they called the Roman republic. They likewise found a pretext to invade and levy heavy contributions on Switzerland, which they endeavoured to transform into a new republic, under the title of the Helvetic republic, the government of which would, in consequence, be delivered into the hands of their own officers and partisans. Of these invasions the reader will find a farther account under the heads of Italy and Switzerland.

In the beginning of the year 1798, a congress of deputies from the states of the German empire met at Rastadt, to negotiate a peace between France and the empire, on the basis of the treaty of Campo Formio: Buonaparte repaired thither, met the assembled plenipotentiaries, and ex-

changed with count Meerfeldt the ratification of the treaty of peace with the court of Vienna, after which he returned to Paris, leaving the commissioners, Treillard and Bonnier, to conduct the negotiations, which were protracted to a great length.

After the conclusion of peace with the empire, the army became a burthen which it was found difficult to support; and though a part of it had been employed in the plundering of Rome, and the oppression of Switzerland, there still remained a large body of troops in a state of inactivity that might ultimately prove dangerous to the government. An immediate invasion of England was therefore announced to be resolved on, and an army collected along the coasts of France opposite to Great Britain, to which was given the pompous title of the Army of England. Convinced, however, of the impracticability of such an invasion, if ever it were really intended, the project was changed for another, likewise sufficiently absurd, which was an expedition to Egypt, under the command of Buonaparte; and the ultimate object of which, it is believed, was to penetrate, either by the Isthmus of Suez, or by the Red Sea, to the Indian Ocean, embark the troops, and, by a co-operation with Tippoo Sultan, endeavour to effect the overthrow of the British empire in the East. While preparations were secretly making for this expedition, the public were amused with strange and monstrous stories of rafts to be constructed for the invasion of England, and troops were collected on the northern coast of France, while the navy of the republic were secretly repairing to Toulon. At length the preparations being completed, Buonaparte embarked on board the fleet, under the command of admiral Brueys, with about 40,000 men, chiefly the veterans of the Italian army, and sailed from Toulon in the latter end of May. On the 9th of June he arrived off the island of Malta, where he demanded leave to water the fleet, which was refused by the grand-master, in consequence of which the French on the following day landed a body of troops. The little island of Gozzo was taken by one detachment, while the southern parts of Malta were reduced by another. The greater part of the inhabitants took refuge in the garrison, which, however, made but a feeble resistance, the grand-master on the 11th agreeing to a capitulation, by which the whole island and its dependencies were surrendered to the French republic.

After leaving a garrison of 4,000 men in Malta, Buonaparte proceeded on his voyage, about the 21st of June, and arrived at Alexandria on the 1st of July, having escaped the British squadron which was detached in pursuit of him under the command of admiral Nelson. His usual good fortune appeared to attend him in all his first attempts. The town of Alexandria was taken by assault, on the night of the 5th, with the loss of between two and three hundred men, and on the 21st the French army appeared before Cairo, which was defended by Morad Bey with a considerable body of the Mamelukes; but on the 23d it was attacked and carried. The beys, however, attempted to rally, and collected a formidable force in the neighbourhood of Cairo; but the battle of the pyramids, which was fought on the 26th, rendered the French masters of the greater part of the country. In that engagement, twenty-three beys, with all the forces they could bring into the field, were completely defeated. Two thousand of the Mamelukes were slain, and four hundred camels with their baggage, and fifty pieces of cannon, were taken, with a very trifling loss on the part of the French.

The conquest of Egypt now appeared to be complete; but on the 1st of August the expedition received a terrible blow in the defeat and destruction of the fleet, by Admiral Nelson, of which an account has already

been given in our history. French land-forces, however, secure his conquest, Buonaparte, by some advantages, he retook the English squadron, which was bringing his aid, Sir Sydney acting impulsed in every assault, to Egypt with the shattered party soon after took an end, as we shall presently see, of a very revolution in the empire.

The unprincipled attack on the French republic, which had been incensed the Turks, to be sent from Great Britain, entered the Porte and with England, raised to act against France, itself of the assistance of the emperor, applied to the emperor, none which they deem it worth to declare against these orders on the 1st of general Bernadotte, at the Rhine at Waldeck, in surrender, while general immediately opened its proceedings; the French, which though it had these hostile movements, the rence of the court of congress soon after was tentiaries basely and in by some Austrian hussars.

The cabinet of Vienna, Austrian army, under Leclerc, on the 4th of Europe, was renewed the French. A body of haufen towards Snaheim whom they defeated. They were also occupied the whole in the month of January the sovereignty of Prussia to the island whence having again taken being at first so defeated, and obliged.

But soon after the French arms experienced Jourdan attacked and obliged to retire in Kray beat the French

been given in our historical summary of the affairs of England. The French land-forces, however, remained in possession of Egypt; and, to secure his conquest, Buonaparte advanced into Syria; where, after gaining some advantages, he received a decisive check before St. John d'Acre. The English Squadron, under Sir Sydney Smith, intercepted a flotilla which was bringing his battering artillery and ammunition from Egypt; and, Sir Sydney acting in concert with the Turks, he was completely repulsed in every assault, and obliged to raise the siege, and retreat back to Egypt with the shattered remains of his army. From Egypt, Buonaparte soon after took an opportunity to make his escape to France; where, as we shall presently see, he became the author of a new and extraordinary revolution in the constitution and government.

The unprincipled attack on Egypt, contrary to the faith of treaties, so incensed the Turks, that they immediately declared war against the French republic; and the emperor of Russia having accepted a subsidy from Great Britain, entered into a treaty of alliance with the Ottoman Porte and with England, and gave orders for a large body of troops to be raised to act against France. Austria likewise appeared disposed to avail itself of the assistance of this new ally; and the French directory having applied to the emperor for an explanation on this subject, and received none which they deemed satisfactory, sent orders to general Jourdan to pass the Rhine, with the avowed intention of forcing the diet of Ratisbon to declare against the march of the Russian troops. He executed these orders on the 1st of March, 1799; and nearly about the same time, general Bernadotte, at the head of an army of observation, passed the Rhine at Waldeck, invested Philipsburg, and summoned that fortress to surrender, while general Ney sent a similar summons to Manheim, which immediately opened its gates to him. Yet, notwithstanding these proceedings, the French ambassadors declared to the congress of Rastadt, which though it had sat so long, had as yet come to no conclusion, that these hostile movements were undertaken solely to prevent the interference of the court of Petersburg, and accelerate a general peace. The congress soon after was broken up, and two of the three French plenipotentiaries basely and inhumanly murdered, as they were leaving the town, by some Austrian hussars, or persons who had assumed that disguise.

The cabinet of Vienna being now certain of the aid of Russia, the Austrian army, under the command of the archduke Charles, passed the Lech, on the 4th of March, and the war, which has so long desolated Europe, was renewed. Fortune, at first, appeared to declare in favour of the French. A body of troops of that nation, advancing through Schaffhausen towards Suabia, were opposed by a detachment of Austrians, whom they defeated, taking the general and three thousand men prisoners. They were also successful for a short time in Italy. Their troops occupied the whole of Tuscany; and the king of Sardinia was reduced, in the month of January, to the cruel necessity of formally renouncing the sovereignty of Piedmont, and retiring with his family and adherents to the island whence he derived his title. The king of Naples likewise, having again taken up arms, and invaded the Roman republic, after being at first so successful as to obtain possession of Rome, was totally defeated, and obliged to take refuge in the island of Sicily.

But soon after the commencement of hostilities with Austria, the French arms experienced a fatal reverse. On the 25th of March, general Jourdan attacked the Austrians near Stockach, but was defeated, and obliged to retire in disorder; and on the 26th of the same month general Kray beat the French on the Adige near Verona, and again defeated

them on the 30th. On the 14th of April, marshal Suwarrow arrived with the first column of the Russian troops, and the successes of the allies became rapid and uninterrupted. On the 24th of the same month, the Austrians and Russians passed the Oglio, and drove the French before them. They then crossed the Adda, and Suwarrow, on the 27th, defeated Moreau at Cassano; and so decisive was his victory, that general Serrurier and three thousand men were taken prisoners, and Milan opened its gates to the conquerors on the 30th. Peschiera was taken on the 6th of May, and, on the 10th, Pizzighetone surrendered to general Kray: on the 12th the Austrians entered Bologna, and took twelve hundred prisoners; and on the 23d they took possession of Ferrara. In Piedmont, the French, notwithstanding the efforts of Moreau, Macdonald, and Joubert, beheld themselves successively deprived of all their strong holds. The Austrians entered Turin on the 27th of May, and the citadel surrendered on the 20th of June. Mantua, after a short siege for so strong a place, surrendered on the 30th of July, the city of Alexandria on the same day; and such was the success of the campaign, that the French were obliged to abandon the whole of Italy, Genoa, and a small portion of the adjoining territory only excepted. On the 25th of August a desperate battle was fought between the French and the Austrians and Russians at Novi, in the territory of Genoa, in which the French are supposed to have lost not less than ten thousand men; but this victory was purchased with a loss nearly as great on the part of the allies.

On the side of Switzerland, the affairs of the republic at first wore a less disastrous aspect—Massena having obtained some slight advantages. These, however, were soon counterbalanced by events more favourable to the allies; the French general being obliged to abandon Zurich, which was immediately occupied by the Austrian troops under Hotze.

Italy being now rescued from the power of the French, it was resolved that Suwarrow should proceed with his army to Switzerland, to drive the French back into their own territories, and enter France; where he was to endeavour to re-establish the fallen monarchy. The directory were now convinced of their danger, and made every exertion to reinforce their armies in Switzerland, and the most active preparations for a vigorous defence. General Massena, who commanded the republican army in that country, displayed great military genius, and evinced uncommon abilities in all his enterprises. Knowing that if Suwarrow effected a junction with the troops already acting against him, he must be inevitably overpowered, he determined to attack the latter; and in a variety of actions, during four whole days between the 14th and 20th of September, repeatedly defeated the Austrian and Russian armies—many thousands being killed and taken prisoners, among the former of which was the brave Austrian general Hotze.

Suwarrow, in consequence, on his arrival in Switzerland, found it impossible to join his defeated and dispirited allies; his plans were all rendered abortive; he was under the necessity of immediately withdrawing into Germany; and during his retreat over mountains covered with snow, and through roads nearly impassable, he suffered as much loss as could have ensued after a signal defeat.

On the 13th of October, the celebrated Buonaparte, having found means to escape from Egypt, and elude the vigilance of the British cruizers, arrived in France, accompanied by general Berthier and some other officers. The recent losses which the republic had sustained, and the imminent danger which threatened its very existence, had greatly weakened the authority of the directory, and prepared the way for the

total alteration of the constitution, which had been projected by the Directory, and the terrifying spirit of Buonaparte.

The first step towards the alteration of the constitution, which, on the 15th of October, five articles, the chief of which were contained in the next day, were commissioned to carry into effect. The first should be appointed commander in chief of the neighbourhood, of the guard, and of the stationary militia. The second, communicated by messenger, was to be the executive directory, and the third, extraordinary couriers, and the fourth, of ancient procedure, and the fifth, of the prosperity of their own country, and the sixth, of the common prosperity of the inhabitants of Paris. The seventh, the presence of the legislative body, would show whether the constitution of preparing the means of preparing the means appeared at the bar, and the eighth, addressed the council of the republic was perishing, and the ninth, had just passed had the public founded on truth in my name, and the tenth, the members present received, and the eleventh, broke up with satisfaction.

On the same day, by a message from the latter, adjourned in to meet at St. Cloud they appointed a committee to report on the situation of the republic. Many members excluded, the secretary read a letter which accompanied the report, and had the happiness to of confidence shown by the national representatives then surmounted, and returned with joy to complete, and more re which he had been

While some of the members, another director in hall, attended by the president. A members, some of deavoured to seize and one attempted off by a grenadier. All the members laid down his bad,

total alteration of the constitution and government, which had probably been projected by the Abbé Sieyès, and which the popularity and enterprising spirit of Buonaparte enabled him to carry into execution.

The first step towards this revolution was taken by the council of ancients; which, on the 9th of November, passed a decree consisting of five articles, the chief of which were, that the legislative body should, on the next day, be removed to St. Cloud; that Buonaparte should be commissioned to carry into execution this decree; and, for this purpose, should be appointed commandant of all the troops in Paris or its neighbourhood, of the guard of the legislative body, of that of the directory, and of the stationary national guard; that this decree should be communicated by message to the council of five hundred, and to the executive directory, and transmitted to all the communes of the republic by extraordinary couriers. After this decree had been passed, the council of ancients proceeded to publish an address to the French nation, justificatory of their own conduct, and asserting "that the common safety, and common prosperity, were the objects of this constitutional measure: the inhabitants of Paris were desired to remain tranquil, since the presence of the legislative body would soon be restored to them, and the result would show whether the legislative body was worthy and capable of preparing the means of happiness."—General Buonaparte soon after appeared at the bar, accompanied by several officers of his staff, and addressed the council in a short speech, in which he represented that the republic was perishing, and they knew it, but that the decree they had just passed had saved it:—"Yes," said he, "we will have a republic founded on true liberty, and national representation. I swear it in my name, and that of my companions in arms." Most of the members present received these exclamations with applause; and the assembly broke up with shouts of "Live the Republic."

On the same day, the council of five hundred, having been informed, by a message from the council of ancients, of the decree passed by the latter, adjourned in consequence to the following day, when they were to meet at St. Cloud. In the sitting which was held there on the 10th, they appointed a committee of seven members, commissioned to make a report on the situation of affairs. The sitting was very tumultuous, many members exclaiming, "No dictator! No dictatorship!"—The secretary read a letter from the director Barras, stating that "the glory which accompanied the return of the illustrious warrior, to whom he had had the happiness to open the career of renown, the distinguished marks of confidence shown him by the legislative body, and the decree of the national representation, had convinced him that the perils of liberty were then surmounted, and the interest of the armies secured,—and that he returned with joy to the rank of a simple citizen, happy to transfer, complete, and more respectable than ever, the destinies of the republic, of which he had been one of the depositories."

While some of the members were urging the propriety of choosing another director in the room of Barras, general Buonaparte entered the hall, attended by some officers and grenadiers, and walked up towards the president. A violent agitation immediately ensued among the members, some of whom rushed precipitately from their seats, and endeavoured to seize him by the collar; others cried, "out-law him!" and one attempted to stab him with a dagger, but the blow was warded off by a grenadier. The tumult increased to a most violent degree. All the members quitted their seats;—the president, Lucien Buonaparte, laid down his badge of office on the table, and resigned; upon which the

doors of the hall were opened, and an officer entered with a guard, exclaiming, "General Buonaparte orders the hall to be cleared."—The order was carried into effect in a few minutes.

The sittings were resumed in the evening, and Lucien Buonaparte took the president's chair. A decree was passed, abolishing the directory, and appointing a consular government of three, namely, Sieyès, Buonaparte, and Roger Ducos, who all appeared, and took the oath to be faithful to the republic; after which, the council adjourned its sittings till the 20th of February. On the same day, the council of ancients met also at St. Cloud, the proceedings of which were almost a copy of those of the council of five hundred. They likewise voted the abolishing of the directory, the appointment of a consular executive of three persons, and then adjourned till the 20th of February. By the same decrees, sixty-one members were expelled from the legislative body; and thus was the national representation, and the vaunted constitution of the third year, overturned by one man, and the bayonets of a few soldiers.

A new constitution has since been framed, which has been accepted by the armies, and, apparently, at least, by the people. By this constitution the whole of the executive, and, indeed, almost all other power, appears to be vested in the first consul, general Buonaparte. With what moderation or success he may employ it, time must discover. He has completely quelled the insurrections in the western departments of France. He professes an ardent desire of peace, and his applications to the government of Great Britain on that subject have been already mentioned in our account of the affairs of England. He has made similar applications to the court of Vienna, which, as Russia appears to have withdrawn from the coalition against France, may possibly at length lead to a treaty of peace, though, at present, the most active preparations are making on both sides for a renewal of the campaign.

#### GENEALOGICAL LIST OF THE LATE ROYAL FAMILY OF FRANCE.

Lewis XVI. the late unfortunate king of the French, was born August 24, 1754; married, April 9, 1770, to Maria-Antoinetta, archduchess of Austria, born November 2, 1755; succeeded his grand-father Lewis XV. May 10, 1774; crowned at Rheims, June 11, 1775; beheaded January 21, 1793.—The issue of Lewis XVI. and Maria-Antoinetta is,

1. Madame Maria-Theresa-Charlotta, born December 19, 1778.

#### Brothers and Sisters to his late Majesty.

1. Lewis-Stanislaus-Xavier, count de Provence, born November 17, 1755; married, May 14, 1771, Maria-Josepha-Louisa, daughter of the king of Sardinia, born September 2, 1753.

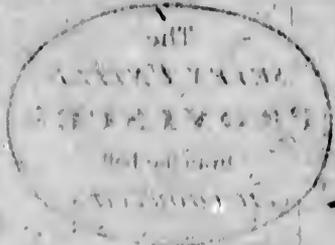

2. Charles-Philip, count d'Artois, born October 9, 1757; married, November 6, 1773, to Maria-Theresa, daughter of the king of Sardinia, born Jan. 21, 1776, by whom he has issue:

Louisa-Antoine, born Jan. 24, 1778.

A princefs, born August 5, 1780.

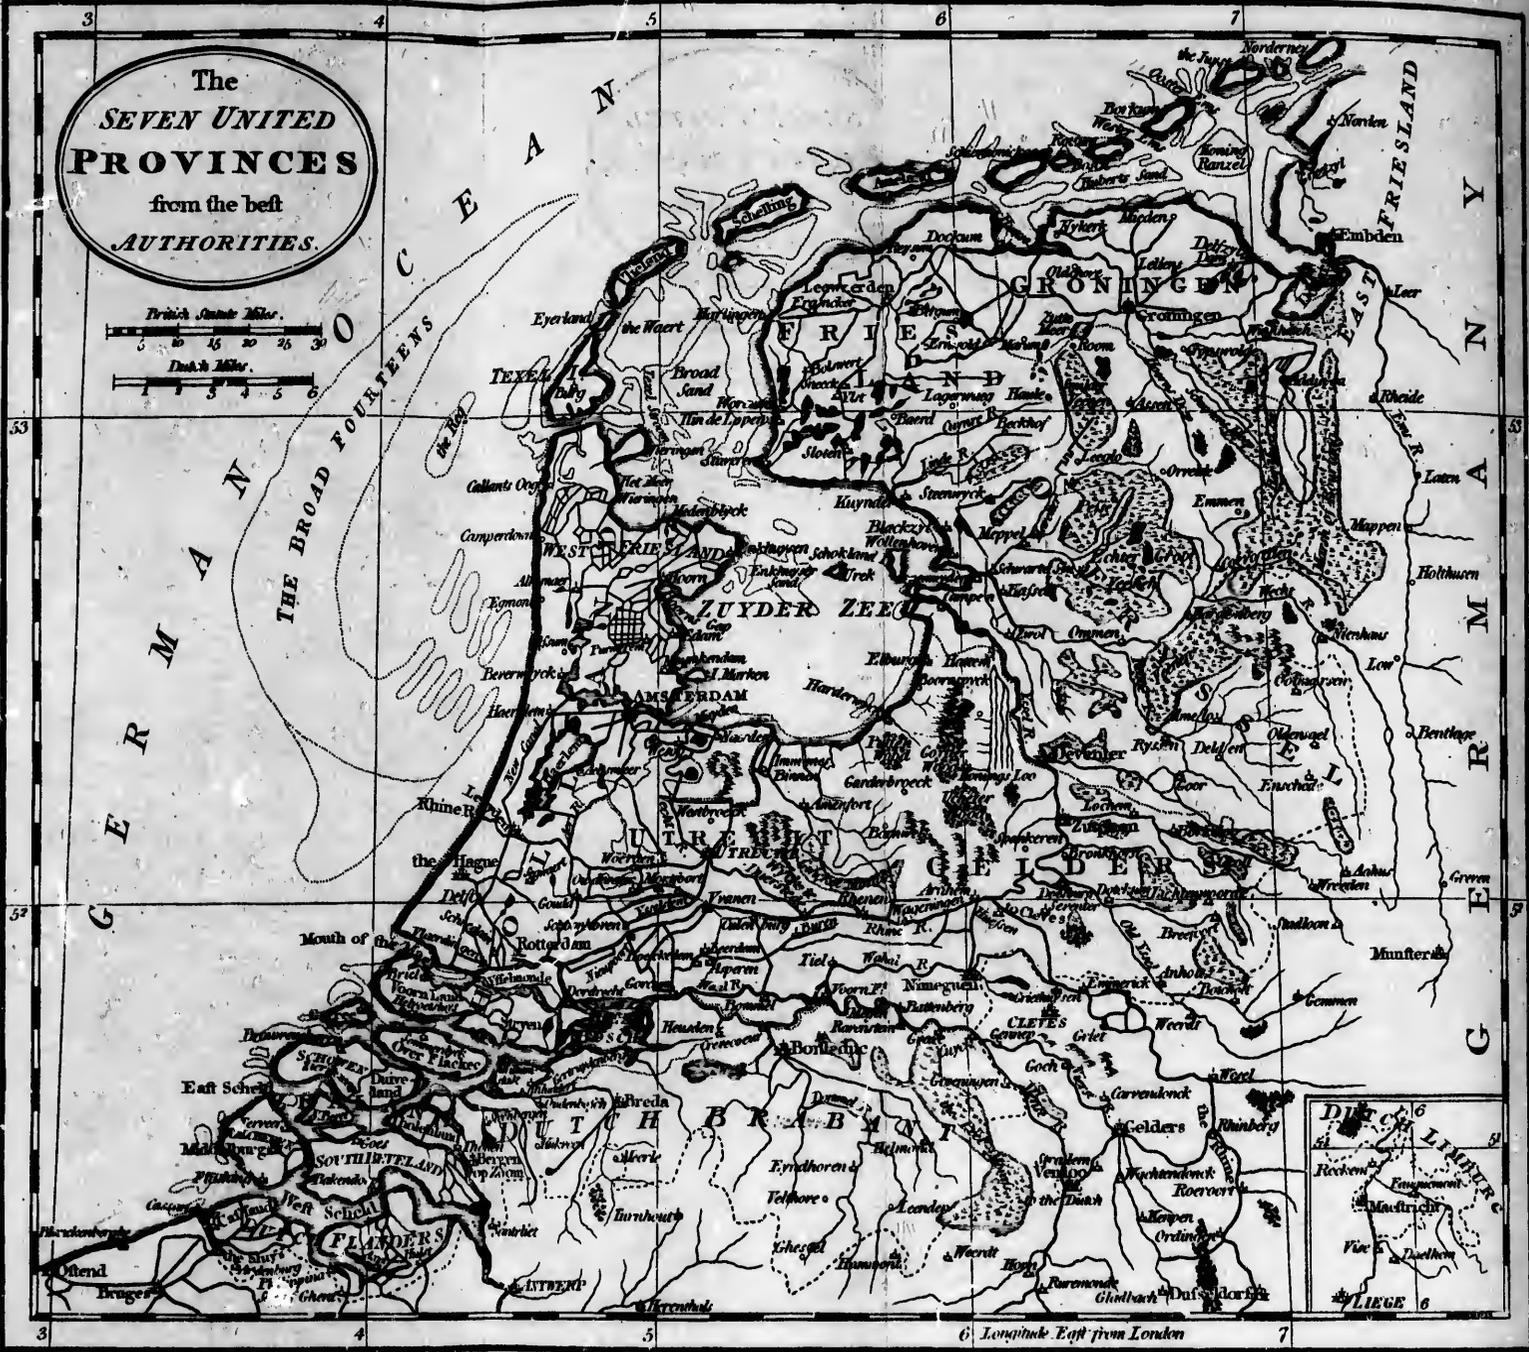

Another princefs, born Jan 8, 1783.

3. Maria-Adelaide-Clotilda-Xaveria, born Sept. 23, 1759.

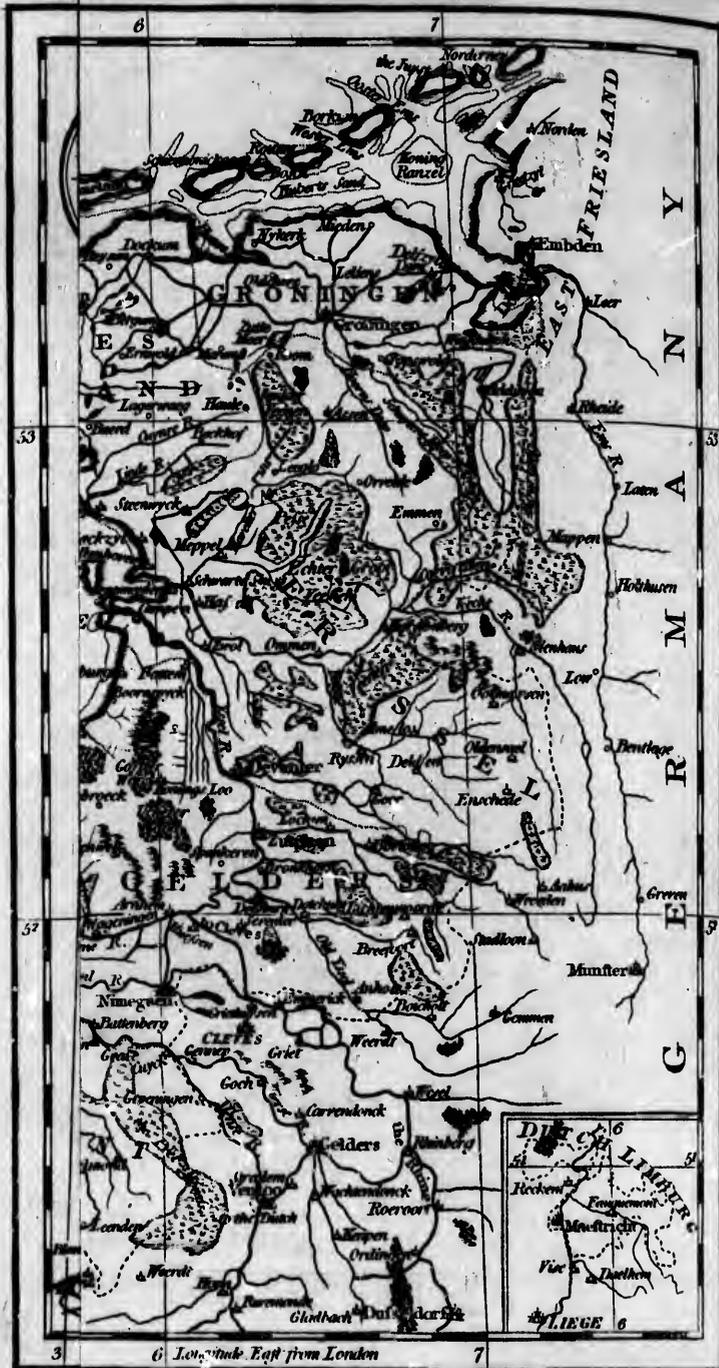

Small, faint text located below the oval stamp, possibly a date or a reference number, which is difficult to decipher due to its low contrast and bleed-through.

## NETHERLANDS.

THE seventeen provinces, which are known by the name of the Netherlands, were formerly part of Gallia Belgica, and afterwards of the circle of Belgium, or Burgundy, in the German empire. They obtained the general name of the Netherlands, Pais-Bas, or Low Countries, from their situation in respect of Germany.

Breadth 260		2 and 7 East longitude.

They are bounded by the German Sea, on the north; by Germany, east; by Lorraine and France, south; and by the British Channel, west.

We shall, for the sake of perspicuity, and to avoid repetition, treat of the seventeen provinces under two great divisions: first, the *Northern*, which contains the Seven United Provinces, usually known by the name of HOLLAND: secondly, the *Southern*, containing the French, and late Austrian, Netherlands. The United Provinces are, properly speaking, eight, viz. Holland, Overijssel, Zealand, Friesland, Utrecht, Groningen, Guelderland, and Zutphen; but the two latter forming only one sovereignty, they generally go by the name of the Seven United Provinces\*.

### SITUATION AND EXTENT OF THE SEVEN UNITED PROVINCES.

Miles.		Degrees.
Length 150	}	between { 51 and 54 North latitude.
Breadth nearly the same.		3 and 7 East longitude.

Containing 10,000 square miles, with 275 inhabitants to each.

The following, from Templeman's Survey of the Globe, is the most satisfactory account we meet with of the geographical division, including the Texel, and other islands:

\* Since the conquest of Holland by the French, and the establishment of a republic on the plan of that of France, the country, including the whole Dutch territory in the Netherlands, has been divided into fifteen departments, of which the following are the names and chief towns:

DEPARTMENTS.	CHIEF TOWNS.
Amsterdam .....	Amsterdam
Utrecht .....	Utrecht
Friesland .....	Leeuwarden
Delft .....	Delft
The Ems .....	Groningen
Rees and Aa .....	Affen

**AIR, SEASONS, SOIL; AND FACE } OF THE COUNTRY.** These provinces lie opposite to England, at the distance of 90 miles, upon the east side of the English Channel, and are only a narrow slip of low swampy land, lying between the mouths of several great rivers, and what the industry of the inhabitants have gained from the sea by means of dykes, which they have raised, and still support, with incredible labour and expense. The air of the United Provinces is therefore foggy and gross, until it is purified by the frost in winter, when the east wind usually sets in for about four months, and their harbours are frozen up. The moisture of the air causes metals to rust, and wood to mould, more than in any other country, which is the reason of their perpetually rubbing and scouring, and of the brightness and cleanliness in their houses, so much taken notice of. The soil is unfavourable to vegetation; but, by the industry of the inhabitants in making canals, it is rendered fit for pasture, and in many places for tillage. Holland, with all its commercial advantages, is not a desirable country to live in, especially to foreigners. Here are no mountains, nor rising grounds, no plantations, purling streams, or cataracts. The whole face of the country, when viewed from a tower or steeple, has the appearance of a continued marsh or bog, drained, at certain distances, by innumerable ditches; and many of the canals, which in that country serve as high-roads, are in the summer months highly offensive to the smell.

**RIVERS AND HARBOURS.]** The chief rivers of the United Provinces are,—the Rhine, one of the largest rivers in Europe; the Maese, the Scheldt, and the Vecht. There are many small rivers that join these, and a prodigious number of canals; but there are few good harbours in the United Provinces; the best are those of Rotterdam, Helvoetsluys, and Flushing; that of Amsterdam, though one of the largest and safest in Europe, has a bar at the entrance of it, over which large vessels cannot pass without being lightened.

**VEGETABLE AND ANIMAL PRO- } DUCTIONS, BY SEA AND LAND.** The quantity of grain produced here is not sufficient for home consumption; but, by draining their bogs and marshes, they have many excellent meadows, which fatten lean German and Danish cattle to a vast size; and they make prodigious quantities of the best butter and cheese in Europe. Their country produces turf, madder, tobacco, some fruit, and iron; but all the pit-coal and timber used there, and, indeed, most of the comforts, and even the necessaries of life, are imported. They have a good breed of sheep, whose wool is highly valued; and their horses and horned cattle are of a larger size than in any other nation in Europe. It is said that there are some wild bears and wolves here.

Storks build and hatch on their chimneys; but being birds of passage, they leave the country about the middle of August, with their young, and return the February following. Their river-fish is much the same as ours; but their sea-fish is generally larger, owing perhaps to their fishing in deep water. No herrings visit their coasts; but they have many excellent oyster-beds about the islands of the Texel, producing very large and well-tasted oysters. Notwithstanding all these inconveniences, the industry of the Hollanders furnishes as great a plenty of the necessaries and commodities of life, and upon as easy terms (except to travellers and strangers), as can be met with in any part of Europe.

POPULATION, INHABITANTS, MANNERS, CUSTOMS, AND DIVERSIONS. } The Seven United Provinces are perhaps the best peopled of any spot of the same extent in the world. They contain, according to the best accounts, 113 cities and towns, 1400 villages, and 2,758,632 inhabitants, according to a public account given in 1785; besides the twenty-five towns, and the people in what is called the Lands of the Generality, or conquered countries and towns of other parts of the Netherlands. The manners, habits, and even the minds of the Dutch (for so the inhabitants of the United Provinces are in general called), seem to be formed by their situation, and to arise from their natural wants. Their country, which is preserved by mounds and dykes, is a perpetual incentive to labour; and the artificial drains, with which it is everywhere intersected, must be kept in perpetual repair. Even what may be called their natural commodities, their butter and cheese, are produced by a constant attention to the laborious parts of life. Their principal food they earn out of the sea, by their herring-fisheries; for they dispose of most of their valuable fish to the English, and other nations, for the sake of gain. The air and temperature of their climate incline them to phlegmatic, slow dispositions, both of body and mind; and yet they are irascible, especially if heated with liquor. Even their virtues are owing to their coldness with regard to every object that does not immediately concern their own interests; for, in all other respects, they are quiet neighbours and peaceable subjects.

The valour of the Dutch becomes warm and active, when they find their interests at stake; witness their sea-wars with England and France. Their boors, though slow of understanding, are manageable by fair means. Their seamen are plain, blunt, but rough, surly, and an ill-natured sort of people, and appear to be insensible of public spirit and affection for each other. Their tradesmen in general are reckoned honest in their dealings, and very sparing of their words. Smoking tobacco is practised by old and young, of both sexes; and as they are generally plodding upon ways and means of getting money, no people are so unscrupulous. A Dutchman of low rank, when drunk, is guilty of every species of brutality. The Dutch have also been known to exercise the most dreadful inhumanities for interest abroad, where they thought themselves free from discovery; but they are in general quiet and inoffensive in their own country, which exhibits but few instances of murder, rapine, or violence. As to the habitual tippling and drinking charged upon both sexes, it is owing, in a great measure, to the nature of their soil and climate. In general, all appetites and passions seem to run lower and cooler here than in most other countries, that of avarice excepted. Their tempers are not airy enough for joy, or any unusual strains of pleasant humour, nor warm enough for love; so that the softer passions seem no natives of this country; and love itself is little better

than a mechanical affection, arising from interest, conveniency, or habit; it is talked of sometimes among the young men, but as a thing they have heard of, rather than felt, and as a discourse that becomes them, rather than affects them.

In whatever relates to the management of pecuniary affairs, the Dutch are certainly the most expert of any people; as to the knowledge of acquiring wealth, they unite the no less necessary science of preserving it. It is a kind of general rule for every man to spend less than his income, be that what it will; nor does it often enter into the heads of this sagacious people, that the common course of expense should equal the revenue; and when this happens, they think, at least, they have lived that year to no purpose; and the report of it used to discredit a man among them, as much as any vicious or prodigal extravagance does in other countries. But this rigid frugality is not so universal among the Dutch as it was formerly; for a greater degree of luxury and extravagance has been introduced among them, as well as the other nations of Europe. Gaming is likewise practised by many of their fashionable ladies, and some of them discover more propensity to gallantry than was known here in former times. No country can vie with Holland in the number of those inhabitants whose lot, if not riches, is at least a comfortable sufficiency, and where fewer failures or bankruptcies occur. Hence, in the midst of a world of taxes and contributions, they flourish and grow rich. From this systematic spirit of regularity and moderation, joined to the most obstinate perseverance, they succeeded in the stupendous works of draining their country of those immense deluges of water, that had overflowed so large a part of it during many ages, while, at the same time, they brought under their subjection and command the rivers and seas that surround them, by dykes of incredible thickness and strength, and made them the principal bulwarks on which they rely for the protection and safety of their territories, against the danger of an enemy. This they have done by covering their frontiers and cities with innumerable sluices; by means of which, at the shortest notice, the most rapid inundations are let in, and they become, in a few hours, inaccessible. From that frugality and perseverance by which they have been so much characterised, they were enabled, though labouring under the greatest difficulties, not only to throw off the Spanish yoke, but to attack that powerful nation in the most tender parts, by seizing her rich galleons, and forming new establishments in Africa, and the East and West Indies, at the expense of Spain, and thereby becoming, from a despicable province, a most powerful and formidable enemy. Equally wonderful was the rise of their military and marine establishments, maintaining, during their celebrated contention with Lewis XIV. and Charles II. of England, not less than 150,000 men, and upwards of eighty ships of the line. But a spirit of frugality being now less universal among them, the rich traders and mechanics begin to approximate to the luxuries of the English and French; and their nobility and high magistrates, who have retired from trade, rival those of any other part of Europe in their table, buildings, furniture, and equipages.

The diversions of the Dutch differ not much from those of the English, who seem to have borrowed from them the neatness of their drinking-booths, skittle and other grounds, and small pieces of water, which form the amusements of the middling ranks, not to mention their hand-organs, and other musical inventions. They are the best skaters upon the ice in the world. It is amazing to see the crowds in a hard frost upon the ice, and the great dexterity both of men and women in darting along, or rather flying, with inconceivable velocity.

**DRESS.]** Their dress formerly was noted for the large breeches of the men, and the jerkins, plain mobs, short petticoats, and other oddities of women; all which, added to the natural thickness and clumsiness of their persons, gave them a very grotesque appearance. These dresses now prevail only among the lower ranks, and more particularly amongst the sea-faring people.

**RELIGION.]** Since the irruption of the French into Holland, the new government of the Batavian republic has declared that no religion is established or paid by the state; but prior to that event the established religion here was the presbyterian and Calvinism; none but presbyterians were admitted to any office or post in the government, excepting in the army; yet all religions and sects were tolerated, and have their respective meetings or assemblies for public worship, among which the papists and Jews were very numerous. And, indeed, this country may be considered as a striking instance of the benefits arising to a nation from universal toleration. As every man is allowed to worship God according to the dictates of his own conscience, persons of the most opposite opinions live together in the most perfect harmony and peace. No man in this republic has any reason to complain of being oppressed on account of his religious principles; nor any hopes, by advancing his religion, to form a party, or to break in upon the government; and, therefore, in Holland, men live together as citizens of the world; their differences in opinion make none in affection, and they are associated together by the common ties of humanity and bonds of peace, under the protection of the laws of the state, with equal encouragement to arts and industry, and equal freedom of speculation and inquiry.

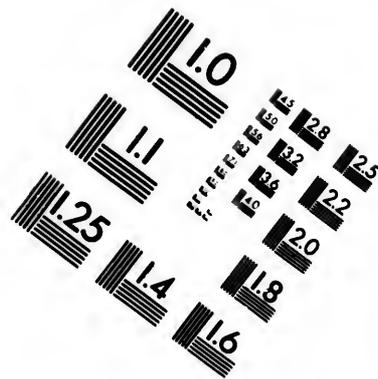

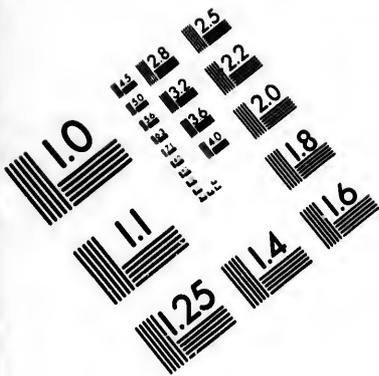

**LANGUAGE.]** The natural language of the United Provinces is Low Dutch, which is a corrupted dialect of the German; but the people of fashion speak English and French. The Lord's Prayer runs thus: *Onse Vader, die in de hemel zyn, wven naam worde gebedlycht: wy koningryk kome: wve wille geschiede gelyck in den hemel zoo ook op den arden, ons dagelicks broot geef ons beeden, ende vergeeft onse schulden geijk ook wy vergeeven onse schuldnaaren: ende enlaat ons nit in verfoeking, maer ertast ons van der boesen.* Amen.

**LEARNING AND LEARNED MEN.]** Erasmus and Grotius, who were both natives of this country, stand almost at the head of modern learning. Haarlem disputes the invention of printing with the Germans, and the magistrates keep two copies of a book intitled *Speculum Salvationis*, printed by Koster in 1440; and the most elegant editions of the classics came from the Dutch presses of Amsterdam, Rotterdam, Utrecht, Leyden, and other towns. The Dutch have excelled in controversial divinity, which insinuated itself so much into the state, that, before principles of universal toleration prevailed, it had almost proved fatal to the government; witness the violent disputes about Arminianism, free-will, predestination, and the like. Besides Boerhaave, they have produced excellent writers in all branches of medicine. Grævius, Gronovius, father and son, and Burman, are ranked among the principal of their numerous commentators upon the classics. In the other departments of literature, the Dutch publications are mechanical, and arise chiefly from their employments, in universities, church, or state.

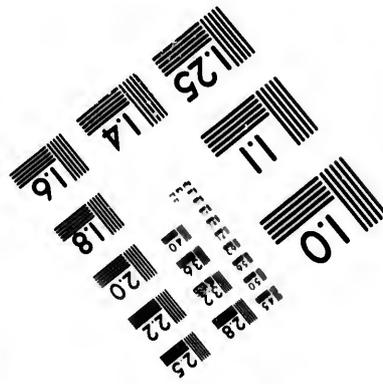

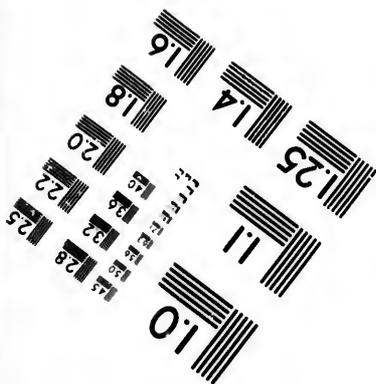

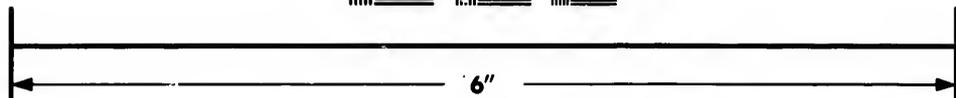

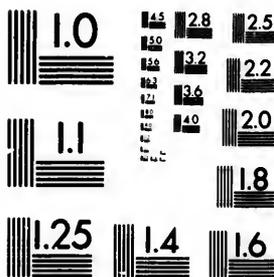

**UNIVERSITIES.]** These are Leyden, Utrecht, Groningen, Harderwicke, and Franeker.

The university of Leyden, which was founded in 1575, is the largest and most ancient in all the United Netherlands. Its library, besides a number of printed books, has two thousand oriental manuscripts, many

of which are in Arabic; and a large sphere adapted to the Copernican system, and moving by clock-work. Here is also a physic-garden, and an anatomical theatre.

The university of Utrecht, in the province of the same name, was changed from a school into an university, in 1636; but it has not all the privileges of the other universities, being entirely subject to the magistrates of the city. The physic-garden here is very curious; and for the recreation of the students, on the east side of the city, just without the gate, is a beautiful mall, consisting of seven straight walks, two thousand paces in length, regularly planted with limes; but that in the middle is properly the mall.

There are abundance of youth, of the principal nobility and gentry from most countries in Europe, at these seminaries of literature; and as every one may live as he pleases, without being obliged to be profuse in his expenses, or so much as quitting his night-gown for either weeks or months together, foreigners of all ranks and conditions are to be seen here. The force of example is strikingly exhibited at these universities; for frugality in expense, order, a composed behaviour, attention to study, and assiduity in all things, being the characteristics of the natives, strangers who continue amongst them soon adopt their manners and forms of living. And though the students live as they please, and study as much or as little as they think fit, yet they are in general remarkable for their sobriety and good manners, and the assiduity and success with which they apply themselves to their studies. No oaths are imposed, nor any religious tests; so that Roman-catholic parents, and even Jews, send their children here with as little scruple as protestants.

ANTIQUITIES AND CURIOSITIES, } The prodigious dykes, some of  
NATURAL AND ARTIFICIAL. } which are said to be seventeen  
ells in thickness, mounds, and canals, constructed by the Dutch, to preserve their country from those dreadful inundations by which it formerly suffered so much, are works equally stupendous and singular. A stone quarry near Mæstricht, under a hill, is worked into a kind of subterraneous palace, supported by pillars twenty feet high. The stadthouse of Amsterdam is perhaps the best building of that kind in the world: it stands upon 13,659 large piles, driven into the ground; and the inside is equally convenient and magnificent. Several museums, containing antiquities and curiosities, artificial and natural, are to be found in Holland and the other provinces, particularly in the university of Leyden; such as the effigies of a peasant of Russia, who swallowed a knife ten inches in length, and is said to have lived eight years after it was taken out of his stomach; but the truth of this seems to be doubtful. A shirt made of the entrails of a man. Two Egyptian mummies, being the bodies of two princes of great antiquity. All the muscles and tendons of the human body, curiously set up by professor Stalpert Vander Weil.

CITIES, TOWNS, AND OTHER EDIFICES, } Amsterdam, which is  
PUBLIC AND PRIVATE. } built upon piles of wood, is thought to contain 241,000 people, and to be, next to London, the most commercial city in the world. Its conveniences for commerce, and the grandeur of its public works, are almost beyond description. In this, and all other cities of the United Provinces, the beauty of the canals, and walks under trees planted on their borders, are admirable; but above all, we are struck with the neatness and cleanliness that is every-where observed within doors. This city, however, labours under two great disadvantages—bad air, and the want of fresh wholesome water, which

obliges the inhabitants of Amsterdam to be next to Amsterdamm computed at 56,000 government in the presence and beauty of strangers of all districts of its provisions, and to be about 40,000 noted as an emporium of fine cities, as well as a wealthy trading place Great of Muscovy, and laboured as a colony subject to Prussia, and

Their capital magnificence, opulent the viceroys appear of the Dutch subject on the mother country Island of Ceylon, and the ships of all nations taken by the English army of 80,000 men

obliges the inhabitants to preserve the rain water in reservoirs. Rotterdam is next to Amsterdam for commerce and wealth; its inhabitants are computed at 56,000. The Hague, though but a village, is the seat of government in the United Provinces, and is celebrated for the magnificence and beauty of its buildings, the resort of foreign ambassadors and strangers of all distinctions who live in it, the abundance and cheapness of its provisions, and the politeness of its inhabitants, who are computed to be about 40,000; it is no place of trade, but it has been for many years noted as an emporium of pleasure and politics. Leyden and Utrecht are fine cities, as well as famous for their universities. Saardam, though a wealthy trading place, is mentioned here as the workshop where Peter the Great of Muscovy, in person, served his apprenticeship to ship-building, and laboured as a common handicraft. The upper part of Guelderland is subject to Prussia, and the capital city Guelder.

INLAND NAVIGATION, CANALS, AND } The usual way of passing  
MANNER OF TRAVELLING. } from town to town is by covered boats, called treckscoits, which are dragged along the canal by horses on a slow uniform trot, so that passengers reach the different towns, where they are to stop, precisely at the appointed instant of time. This method of travelling, though to strangers rather dull, is extremely convenient to the inhabitants, and very cheap. By means of these canals, an extensive inland commerce is not only carried on through the whole country, but, as they communicate with the Rhine and other large rivers, the productions of every country are conveyed at a small expense into various parts of Germany and Flanders. A treckscoit is divided into two different apartments, called the roof and the ruim; the first for gentlemen, and the other for common people. Near Amsterdam and other large cities, a traveller is astonished when he beholds the effects of an extensive and flourishing commerce. Here the canals are lined for miles together with elegant neat country-houses, seated in the midst of gardens and pleasure grounds, intermixed with figures, busts, statues, temples, &c. to the very water's edge. Having no objects of amusement beyond the limits of their own gardens, the families in fine weather spend much of their time there, smoking, reading, or viewing the passengers, to whom they appear complaisant and polite.

[COMMERCE AND MANUFACTURES.] An account of the Dutch commerce would comprehend that of almost all Europe. There is scarcely a manufacture that they do not carry on, or a state to which they do not trade. In this they are assisted by the populousness of their country, the cheapness of their labour, and, above all, by the water-carriage, which, by means of their canals, gives them advantages beyond all other nations. The United Provinces are the grand magazine of Europe: and goods may be purchased here sometimes cheaper than in the countries where they grow. The East-India company has had the monopoly of the fine spices for more than a hundred years, and, till the late and present wars with England, was extremely opulent and powerful. Their capital city in India is Batavia, which is said to exceed in magnificence, opulence, and commerce, all the cities of Asia. Here the viceroys appear in greater splendour than the stadtholder; and some of the Dutch subjects in Batavia scarcely acknowledge any dependence on the mother country. They have other settlements in India; but the Island of Ceylon, and the Cape of Good Hope, the grand rendez-vous of the ships of all nations, outward or homeward bound, have been lately taken by the English. When Lewis XIV. invaded Holland with an army of 80,000 men, the Dutch made some dispositions to slip them-

selves off to their settlements in India; so great was their aversion to the French government. Not to mention their herring and whale fisheries, which they have carried off from the native proprietors, they are distinguished for their pottery, tobacco-pipes, Delft-ware, finely refined salt; their oil-mills, and starch-manufactures; their hemp, and fine paper manufactures; their fine linen and table damasks; their saw-mills for timber, either for shipping or houses, in immense quantities; their great sugar-baking; their vast woollen, cotton, and silk manufactures; wax-bleaching; leather-dressing; the great quantity of coin and specie, assisted by their banks, especially by that of Amsterdam; their East-India trade; and their general industry and frugality. Their commerce, however, must have greatly suffered during the present war, and especially since the French entered the country.

**PUBLIC TRADING COMPANIES.]** Of these, the capital is the East-India, incorporated in 1602, by which formerly the Dutch acquired immense wealth, divided forty per cent. and sometimes sixty, about the year 1660; at present the dividends are much reduced; but in a hundred and twenty four years, the proprietors, on an average, one year with another, divided somewhat above twenty-four per cent. So late as the year 1760, they divided fifteen per cent.; but the Dutch West-India company the same year divided no more than two and a half per cent. This company was incorporated in 1621. The bank of Amsterdam was thought to be inexhaustibly rich, and was under an excellent direction: it is said, by sir William Temple, to contain the greatest treasure, either real or imaginary, that is known any-where in the world. What may seem a paradox, is, that this bank is so far from paying any interest, that the money in it is worth somewhat more than the current cash is in common payments. Mr. Anderson supposes, that the cash, bullion, and pawned jewels in this bank, which are kept in the vaults of the stadthoufe, amount to thirty-six (though others say only to thirty) millions sterling.

**CONSTITUTION AND GOVERNMENT.]** Before the French entered Holland, in January, 1795, the United Provinces formed a common confederacy, yet each province had an internal government or constitution independent of the others; this government was called the *states* of that province; and the delegates from them formed the *states-general*, in whom the sovereignty of the whole confederacy was vested; but though a province should send two or more delegates, yet such province had no more than one voice in every resolution; and before that resolution could have the force of a law, it must be approved of by every province, and by every city and republic in that province. This formality in times of great danger and emergency has been set aside. Every resolution of the states of a particular province must be carried unanimously.

The *council of state* consisted likewise of deputies from the several provinces; but its constitution was different from that of the states general; it was composed of twelve persons, whereof Guelderland sent two; Holland, three; Zealand, two; Utrecht, two; Friesland, one; Overysel, one; and Groningen, one. These deputies, however, did not vote provincially, but personally. Their business was to prepare estimates, and ways and means for raising the revenue, as well as other matters that were to be laid before the states-general. The states of the provinces were styled "Noble and Mighty Lords," but those of Holland, Noble and Most Mighty Lords; and the states-general, "High and Mighty Lords," or, "The Lords the States-general of the United Ne-

therlands;" or, "The bodies, was the charter provincial deputies, formed a separate body five colleges in the Friesland. In Holland their representatives the lead in all public six senators, who were was filled up by the fit to represent the cities

The above particular of them, it is impossible from the death holderhip was made of the family of Orange stitution already described of every province; and could change the deputy and city. By this he general, though he held the title, he had more besides the influence as he had several principal stadtholder is William stadtholder William of Britain, and died in 17

Though Holland under government was far from enjoy that degree of liberty was indeed rather an the people were not sufficient, not even in served, that very few payments freely; and they ly cautious, that they could into public life.

With respect to the province has its tribunals lies from the petty and where distributed with

After the departure of the French, in 1795, a government, and frame a first plan they present assemblies; but another According to this constitution government is vested in and a directory: the present fortnight, and a part of every year, as in France.

**REVENUES.]** The late tioned their taxes according Those taxes consisted of and hearth money; so t

therlands;" or, "Their High Mightinesses." Subordinate to these two bodies, was the chamber of accounts, which was likewise composed of provincial deputies, who audited all public accounts. The admiralty formed a separate board, and the executive part of it was committed to five colleges in the three maritime provinces of Holland, Zeland, and Friesland. In Holland the people had nothing to do either in choosing their representatives or their magistrates. In Amsterdam, which took the lead in all public deliberations, the magistracy was lodged in thirty-six senators, who were chosen for life, and every vacancy among them was filled up by the survivors. The same senate also elected the deputies to represent the cities in the province of Holland.

The above particulars are mentioned, because, without a knowledge of them, it is impossible to understand the history of the United Provinces from the death of king William to the year 1747, when the stadtholdership was made hereditary in the male and female representatives of the family of Orange. This office in a manner superseded the constitution already described. The stadtholder was president of the states of every province; and such was his power and influence, that he could change the deputies, magistrates, and officers, in every province and city. By this he held the moulding of the assembly of the states-general, though he had no voice in it: in short, though he had not the title, he had more real power and authority than some kings; for, besides the influence and revenue he derived from the stadtholdership, he had several principalities and large estates of his own. The present stadtholder is William V. prince of Orange and Nassau, son of the late stadtholder William Charles, who married Anne, princess royal of Great Britain, and died in 1751.

Though Holland under this constitution was called a republic, yet its government was far from being of the popular kind: nor did the people enjoy that degree of liberty which might at first view be apprehended. It was indeed rather an oligarchy than a commonwealth; for the bulk of the people were not suffered to have the least share in any part of the government, not even in the choice of the deputies. It may also be observed, that very few persons in this state dared speak their real sentiments freely; and they were generally educated in principles so extremely cautious, that they could not relinquish them when they entered more into public life.

With respect to the administration of justice in this country, every province has its tribunal, to which, except in criminal causes, appeal lies from the petty and county courts; and it is said that justice is now where distributed with more impartiality.

After the departure of the stadtholder, on the conquest of Holland by the French, in 1795, a convention was assembled to administer the government, and frame a constitution for the new Batavian republic. The first plan they presented was rejected by the people in the primary assemblies; but another was afterwards drawn up, which was accepted. According to this constitution, which is a close copy of that of France, the government is vested in a legislative body, consisting of two chambers, and a directory: the presidents of the two chambers are changed every fortnight, and a part of the legislative body and the directory go out every year, as in France.

REVENUES.] The late government of the United Provinces proportioned their taxes according to the abilities of each province or city. Those taxes consisted of an almost general excise, a land-tax, poll-tax, and hearth money; so that the public revenue amounted annually to

about two millions and a half sterling. The province of Holland paid nearly half of this revenue. The following is the rate at which each of the seven United Provinces contributed towards the public expense:

Of every million of ducats, the province of	} 420,000	
Holland contributes		
Zealand - - - - -		130,000
Friesland - - - - -		170,000
Utrecht - - - - -		85,000
Groningen - - - - -		75,000
Guelderland - - - - -		70,000
Overyffel - - - - -	50,000	

Of the 420,000 ducats paid by the province of Holland, the city of Amsterdam furnished upwards of 320,000. The taxes in these provinces are so heavy, and so many, that it is not without reason, a certain author asserts, that the only thing which has escaped taxation there is the air they breathe. But for the encouragement of trade, the duties on goods and merchandise are exceedingly low. The expenses occasioned by the present war, and the contributions required by their new allies the French, cannot but have considerably increased their taxes. In the year 1797, after the defeat of the Dutch fleet by admiral Duncan, a tax of eight per cent. on all income was imposed for the re-establishment of their navy. A forced loan of three per cent on all capital and property, and a tax of seven per cent. besides, on all income, have likewise been lately decreed.
